976. The distance from Sydney to Adelaide by railway is 1,085½ miles; from Adelaide to Broken Hill, 345 miles; from Sydney to Broken Hill, *via* Nyngan, is 733 miles. Therefore it is nearly one-half the distance shorter. In the one case it is 1,430 miles, and in the other it is 733. Taking 30 miles per hour as the speed, going *via* Adelaide would take forty-eight hours; but going *via* Nyngan would only occupy twenty-eight

- A. Brown, Esq., M.P.  
18 Mar., 1891.
- twenty-eight hours. Does it not stand to reason that business men would prefer a trip occupying twenty-eight hours, to one occupying forty-eight hours? The shorter route would be an economy of time, and it would be of some importance to the traffic, but I think that most business men going to Broken Hill would prefer to go *via* Melbourne and Adelaide.
977. But if you had to go to Broken Hill, would you not prefer to go one way and return the other, making the round journey? It might possibly work in that way.
978. Therefore there is a probability, even allowing for the mercantile passengers, that its being the shorter route would tell in favour of the Nyngan line? Yes.

THURSDAY, 19 MARCH, 1891.

Present:—

THE HONORABLE JOHN LACKEY (CHAIRMAN).

The HON. ANDREW GARRAN.	• HENRY COPELAND, Esq.
The HON. FREDERICK THOMAS HUMPHERY.	JAMES EBENEZER TONKIN, Esq.
The HON. WILLIAM JOSEPH TRICKETT.	WILLIAM SPRINGTHORPE DOWEL, Esq.
The HON. GEORGE HENRY COX.	EDWARD WILLIAM O'SULLIVAN, Esq.
JACOB GARRARD, Esq.	WILLIAM McCOURT, Esq.

JAMES PATRICK GARVAN, Esq.

The Committee further considered the proposed Railway from Cobar to Cockburn.

David Kirkcaldie, Esq., Chief Traffic Manager, Railway Department, sworn, and examined:—

- D. Kirkcaldie, Esq.  
19 Mar., 1891.
979. *Mr. Tonkin.*] What are you? Chief Traffic Manager of the Railways.
980. You have held that position for some time? Yes.
981. You know this proposed Extension now under consideration? Yes.
982. Have you any particular statistics or figures that you wish to put before the Committee in favour of the construction of this line? None whatever.
983. Have you any idea of the traffic that is likely to accrue from the construction of the line? No, there are no statistics prepared.
984. Do you know that certain evidence was taken by the Sectional Committee that traversed that part of the country with reference to the probable traffic? Yes.
985. Have you looked through that evidence? I have.
986. As a whole do you agree with it? Yes, as a whole, but not entirely. Still, it is not very far out, I think.
987. Do you think from that evidence that this line when constructed will pay interest on the capital invested and the working expenses? I should not like to say that.
988. Do you think there will be a very great deficit? It will depend entirely on whether there is going to be a large development of the mining industry in the country through which the line will go.
989. Could you tell the Committee what the charge for wool would be from Wilcannia to Sydney? I could not. It will depend entirely upon circumstances.
990. Could you give the approximate cost? The rates from Bourke at the present time are £5 Os. 3d. for scoured wool, and £4 Os. 3d. for greasy wool per ton—the distance being 50½ miles. I may mention that these are arbitrary rates fixed to compete with river carriage. It will be 61½ miles from Wilcannia, and, on the same basis, the rates from there would be, approximately, £6 and £5 per ton.
991. Is that in the same ratio as the Bourke rate? Yes. But I am not going to say that we could get those rates.
992. Were not the rates lower formerly than they are now, or is that the usual rate? The Bourke rates were lower at one time by about £1 a ton than they are now.
993. Why were they raised? Through an agreement made between the Railway Commissioners of New South Wales, Victoria, and South Australia.
994. When the rates were £1 a ton less, did the traffic pay working expenses? Yes, it paid working expenses, but the anomaly was accentuated of charging lower rates from Bourke than from stations nearer Sydney.
995. If you were competing for the river traffic at Wilcannia is it likely that you would reduce the rates to Wilcannia? It would depend entirely upon the state of the river. If it is navigable we shall have to do that or lose the traffic, in my opinion.
996. Do you know that the evidence taken at Wilcannia from two or three reliable men there gives returns of over £90,000 a year, which was reported to be the amount of the working expenses and the interest on the invested capital? Yes, I know that.
997. Did you read that portion of the evidence? Yes.
998. Do you agree with it? No; I think it is over-estimated.
999. Do you think that this is the fact, that in 1889, 27,000 bales of wool left Wilcannia? Yes, I can quite understand that.
1000. On the basis of that amount of wool leaving the place, do you think £90,000 a year an over-estimate of the traffic inward and outward? I do.
1001. You think it is very largely over-estimated? I should not say very largely; but in my opinion it is over-estimated.
1002. Is the over-estimate material as to whether the railway will pay? I think it is.
1003. Mr. Doake, in giving evidence on the proposed line from Nyngan to Cobar, was asked this question: "If we take the amount of goods which go up and down the river, and charge £4 per ton as railway carriage, would not that make up almost sufficient to pay the required amount of £90,000 for interest and working expenses of the proposed railway?" His answer to that was: "The amount of wool held over last year in this district was estimated at 27,000 bales, representing a value of £330,000, lying in sheds and other places round about there. There were 8,000 bales stored in Wilcannia alone?" That was because of the unnavigable state of the river, I presume.
1004. Then the next question is: "Has not this year been an exceptional year with regard to the quantity of wool going down the river?" The answer was: "A large amount of wool went down to Broken Hill last year";—would £4 a ton be an average freight on inwards and outwards goods between Wilcannia and Sydney? I do not think so.
- 1005.

1005. You think it would be more? That would depend entirely upon circumstances. I mean to say that the rates to Bourke are more, and the distance to Wilcannia is considerably greater than the distance to Bourke. D. Kirkcaldie,  
Esq.  
19 Mar., 1891.
1006. Do you know what freight would be charged per truck from Wilcannia to Sydney? It depends upon the class of traffic—crude ores from Broken Hill to Lithgow would be about £7 5s. 6d. per truck load of 6 tons.
1007. That would be about 25s. a ton? Yes.
1008. Is there such a wonderful difference between the charges for any other merchandise and minerals as the difference between 25s. and £5? The rate I gave you was for crude ores; the rate for coal would be somewhat more, and general goods very considerably more.
1009. Then Mr. McLachlan's statement is a mistake;—the rate which he gives is £1 2s. 2d. per ton from Lithgow to Broken Hill? The rate from Eskbank to Broken Hill for coal would be £8 2s. 5d. per 6-ton truck.
1010. Are you sure you have not made a mistake as to the amount? Yes; I am speaking of the charge for coal; crude ores carried in large quantities on the up journey are charged a little less.
1011. Is not the charge a little under  $\frac{1}{2}$ d. a ton per mile? Yes.
1012. The distance from Wilcannia to Sydney being 615 miles, how much does that come to? I have been speaking of the rates from Lithgow to Broken Hill, and Broken Hill to Lithgow.
1013. Is there any difference between the charge for minerals and the charge for coal? There is a difference in the freight between coal and crude ores; but I may say that the coal rates apply either to the up or the down journey, while the rate for crude ores applies to the up journey only. That is the reason why the crude ore rates are lower.
1014. Is there much difference between them? From Eskbank to Broken Hill the rate for coal is £8 2s. 5d. per truck load, not exceeding 6 tons.
1015. That is  $\frac{1}{2}$ d. per ton on coal and a little less for minerals coming towards Sydney? The rate for a 6-ton truck of coal from Eskbank to Broken Hill is £8 2s. 5d. The rate for crude ore from Broken Hill to Eskbank would be £7 5s. 6d. per truck of 6 tons.
1016. Have you any idea what amount of coal would be likely to be consumed at Broken Hill and Wilcannia? No.
1017. You did not take that into consideration in estimating the freight? No.
1018. If there was a very large traffic in coal or other merchandise, would that have a tendency to reduce the freight? No; we could not well carry it for less than we are doing now.
1019. Does it make no difference to you whether you have a long or a short journey? Yes; the longer the journey the less per ton per mile is charged—the rates are based on a graduated scale.
1020. You have no idea of the quantity of coal that is likely to be consumed weekly? Not the slightest. It was stated that if the Cobar mine opened again the consumption there would be 30,000 tons a year. The manager of that mine told me some years ago that they consumed about 75,000 tons of wood, and it is calculated that about  $2\frac{1}{2}$  tons of wood are equal to 1 ton of coal.
1021. Are these payable freights,—will they meet the working expenses, or are they differential rates, causing a loss to the railway? I do not think they cause a loss; but unless we are going to get general goods to carry in addition to minerals, we shall not have a profitable traffic.
1022. Is it not probable that you will have a return traffic of other merchandise—for instance, you might have to carry wool back? That will depend a good deal upon the rate that will be charged, and the navigableness of the river, I think.
1023. But you anticipate some other traffic besides minerals? Yes; we should naturally get some.
1024. Have you taken into consideration the position which the railway would be placed in if the colonies are federated? No.
1025. Suppose that  $\frac{1}{2}$ d. per ton were charged on the Adelaide line, is it likely that you would take the traffic to Broken Hill? I do not think so, if the rates per ton per mile are to be the same on all railways.
1026. To bring that traffic into Sydney, you would have to have a differential rate to compete with the Adelaide railway? Yes; we should have to compete with the South Australian railways, and the Darling River.
1027. And you are prepared to do that? We shall have to do it, if the line is constructed.
1028. If you did not intend to enter into competition with Victorian and South Australian railways, the Commissioners would not advise the construction of this line at all, would they? As a means of yielding a net revenue, I am not prepared to say that they would.
1029. Looking at it from a national point of view? From that point of view, it is a different thing altogether. The line will undoubtedly open up new country, and may result in a development of the mining industry.
1030. Putting the national view of it on one side, do you believe that this line, after being constructed, will return a sufficient revenue to pay the working expenses? I do not think so.
1031. Do you know anything of the country between Cobar and Wilcannia? I have been at Wilcannia.
1032. Do you know anything of the country between Wilcannia and Cobar? No.
1033. Have you any idea of the amount of traffic in the shape of wool and merchandise carried to that portion of the country? Not exactly.
1034. I am speaking now of 300 miles south of the river, between Bourke and Wilcannia; that country would be tapped by the railway;—do you think that would conduce towards supporting the railway? Yes; we should get a portion of that traffic.
1035. Do you think that the traffic which goes to Hay and then to Melbourne would find an outlet by this railway? Not so far north as that, I think.
1036. Do you think that if a railway were constructed from Forbes to Parkes, and along the valley of the Lachlan, that that would obviate the loss attached to produce going through Hay to Melbourne? Yes, I think so; but if you did that, my opinion is that you should not tap Wilcannia at all; but some point further down. Then you would cut into country the produce of which goes to Victoria at present. Nearly all the produce from the country around Hillston and Mossgiel goes to Victoria.
1037. You think this railway will not obviate that? I think not.
1038. You think that the traffic will still go southwards? Yes; all wool which now goes to Hay from these districts will, I think, still go there.
1039. Do you think that this railway will in any way assist to bring the traffic which now proceeds to Hay?

- D. Kirkcaldie, Esq.  
19 Mar., 1891.
- I should not like to say that there would not be any; but I do not think that we should get very much of it.
1040. Then this railway, you take it, will merely obtain a traffic from Wilcannia and Broken Hill, from which any large returns can be derived? Principally.
1041. You do not expect much from the intermediate country? Not a great deal, except, of course, wool and such like traffic.
1042. Do you think that the railway from Nyngan to Cobar is going to pay? I do not think so.
1043. Am I to understand from you that the whole of this line is going to be a loss to the country? I am afraid so; there will not be much net revenue for a considerable time, in my opinion.
1044. Do you think it will be a serious loss to the country? I think that for some years it must result in a considerable loss to the railways; to the country generally it would in many respects be a great benefit.
1045. What reason have you to think that in a few years that part of the country will improve in population and increase the traffic on the railway? It depends entirely upon whether there are any large developments in the district, or whether in time it may not be possible to irrigate large portions of the country.
1046. You do not expect more returns from wool? I do not think so, to any large extent.
1047. Then there is not likely to be a large increase of population from the mineral discovery? Yes, there might be from mineral discoveries.
1048. Then for twenty or thirty years the line might be a dead loss to the country? It might be.
1049. Do you think that by the construction of this line we shall bring much traffic from Broken Hill towards Sydney which would otherwise go to Adelaide or Port Pirie? I scarcely think so.
1050. You think that that will still gravitate to Adelaide? Yes; the only inducement, I think, would be to send crude ores to the mines, and I am afraid that they are too far away to make that profitable.
1051. To Lithgow? Yes, but I think it is too far away.
1052. Do you know what it costs per ton to send coal from Newcastle to Adelaide or Port Pirie? I think something like £1, but I am not sure.
1053. Do you know whether the gradients on the line from Adelaide to Broken Hill are anything like as level as the gradients from Cobar to Broken Hill? I know that the line from Cobar to Broken Hill would be a splendid road all the way. From Port Pirie it is a very flat country, too.
1054. Then there would be no material difference in the gradients? No; they can take very good loads on the South Australian line.
1055. Is it a narrow gauge there? Yes, from Port Pirie.
1056. In the event of this line being constructed, do you propose to have some intermediate stations where you will increase the trains after you get over the heavy haulage country—some places where the same engine will be able to take a train twice the size? Yes; we have that now for the western country about 8 miles west of Dubbo.
1057. If coal were discovered at Dubbo, do you think that that would make a material difference? Yes.
1058. You would be able then to compete with the water carriage? Yes; because we could take maximum loads from Dubbo.
1059. Instead of having to go over the heavy gradients at Bathurst and Orange, if you did get coal at Dubbo, that would make a material difference? Yes.
1060. Would you think that the line would then become a payable line? Yes, probably, if there were large mines at Dubbo.
1061. Do you know whether this line would tap any heavy timber country which would create a traffic? I am not aware.
1062. Is there much timber about Dubbo that would create a traffic? Yes; I believe there is some very good timber in the district.
1063. Do you know that it is a very large item of commerce at Broken Hill? Yes.
1064. Would that materially affect the paying capabilities of the line? It would, to some extent.
1065. Then you have no hesitation in saying that, in your opinion, this line is not going to pay if constructed? It will, in my opinion, be a line which for a number of years will not yield a net revenue. If it is to be constructed, it must rather be regarded as a national line—a line to open up the country.
1066. Do the Commissioners advocate the construction of railway lines on a national basis or upon a purely commercial basis? It depends entirely on circumstances. A line like this is different from anything else that we have come in contact with. The main trunk lines were made years before the Commissioners took office; this is more like a main trunk line than anything else.
1067. Have you any knowledge of the country north of Wilcannia? I have travelled between Wilcannia and Bourke.
1068. That would be north-east; I mean north or west of north, including Mount Browne and Milparinka? No, I do not know anything about that.
1069. You cannot say whether the line will get extra traffic from that part? No.
1070. *Mr. Copeland.*] What was the return of the railway at Bourke last year? The revenue earned at Bourke for passenger traffic, £10,962 7s. 8d., for the year ended 30th June, 1890, and the return for the goods traffic for the same period was £56,343 15s. 3d.
1071. What was the traffic the first year after the line was opened? I have not got that here.
1072. Has the traffic increased to any appreciable extent since the line to Bourke was opened? Yes; there is a great deal more traffic now than there used to be.
1073. And it has shown a tendency to increase? Yes.
1074. I should like to know what was your impression about that railway before it was made;—did you think that it would pay? Yes, because there is an immense country around Bourke which is served by the railway.
1075. Would there not be an equally large area of country north-west of Wilcannia which would be served by the proposed railway? The worst part of the river is passed when you get to Wilcannia. The most difficult part of the Darling is between Wilcannia and Bourke.
1076. Would you not intercept a considerable amount of Queensland traffic? It is a question—if the traffic got as far down as Wilcannia, and the river were navigable, it would probably be sent on by river.
1077. I am speaking of overland traffic which comes down to Wilcannia? Yes; if the river was not open we should get a portion of that. A good deal of it goes across to Broken Hill from a considerable distance west of the Paroo.
1078. If the river is open shall we get any of the traffic on the railway? That, again, would depend entirely upon the rates. The rates by the river are very low, goods being carried from Adelaide to Bourke at about £3 a ton.
- 1079.

1079. Is it not a fact that, although the river has been for some time open, this year a very largely increased quantity of wool has been carried by the railway from Bourke? Yes.
1080. Would that not warrant you in anticipating that if a railway is made to Wilcannia the people, for similar reasons, will send their wool by train from Wilcannia? They might do so; but, on the other hand, the distance from Wilcannia to Sydney is 111 miles further by rail, while it is much nearer to Adelaide.
1081. Do you think that the rates are so heavy that that would be sufficient to deter the traffic from going an extra 111 miles, when it has to travel such a great distance in any case? Not altogether; but when you get to Wilcannia you are a long way down the river towards Adelaide.
1082. Many people send their wool to where their business connections are, and if they happen to have business connections in Sydney, they must of necessity send their wool to Sydney if possible? I think so; but a great many stations in that district are owned by Victorian and South Australian people.
1083. Is there any difference in that respect between the country round Wilcannia and the country round Bourke? Yes; the stations in the Bourke district are held more largely by New South Wales people.
1084. I suppose you have no knowledge whatever about the stock carrying capabilities of the country, except that the stock is likely to increase? It will increase in the good seasons and decrease in times of drought.
1085. Has it increased round Bourke during the last few years? Yes; during the last four or five years.
1086. Do you think the squatters with long leases will considerably increase the carrying capacity of their runs by making improvements so as to increase the produce of wool? Yes; if they secure plenty of water.
1087. You know that they are securing water as fast as they can in all that country, and apparently there is a very large area that contains water underground? Yes.
1088. As they are tapping these supplies the country will become more capable of carrying stock? Yes.
1089. We have evidence here which was taken by a Sectional Committee, and Mr. Kelly, Inspector of Stock, was asked—"Would the extent of country carrying stock be influenced by the proposed railway?" And his answer was—"There are about 30,000,000 acres of pastoral country which would be influenced by the railway." Do you think that if any country contains 30,000,000 acres of pastoral land, they would not attempt to develop it by making a railway through it? No doubt they would.
1090. He says that that extends about 200 miles north of the railway, about ninety miles south, and about sixty miles to the south-west—that is, taking in the country from the Queensland Border on the north-west, and going direct to Broken Hill and Silverton? No doubt if there had been a railway there five or six years ago, a large number of the sheep that died would have been saved.
1091. Do you not think there is a reasonable chance, if the railway rates are moderate, of getting a very large proportion of the wool brought to Sydney? The imposition of river dues would secure it.
1092. Do you know what length of time an ordinary river passage takes? I think it is six or seven weeks from Goolwa to Bourke.
1093. Do you think, considering the high value of a cargo of wool, that people would not make sure, from a business point of view, of the quick delivery of their wool even if they had to pay a higher rate, instead of having to run the risk of the wool being delayed on the river for a year or two, which has sometimes happened? Many of them do that now. But they can always tell how long a river like the Darling is going to be navigable, and make their arrangements accordingly.
1094. Is it not a common thing for them to get their wool stuck on the river? It used to be, and will be again, I have no doubt; but for the last year or two it has not happened that I am aware of.
1095. Have you taken into consideration the difference in the rate of insurance. Of course, when they send wool down the river they have to pay insurance rates, but if they send it by rail they will have little or nothing to pay for insurance? Yes, I have taken that into consideration.
1096. In taking the goods by the river there is not only six or seven weeks' interest on the value of the cargo to be considered, but the possibility of a year or two's interest in case the cargo gets stuck. Would not that influence the traffic? Yes, to some extent.
1097. Do you not think it is the desire of any business man as soon as his wool is in bales to get it into the market as quickly as possible? Yes.
1098. Would not that have a tendency to make them use the railway? It would, to a certain extent. But a quantity of goods arrived at Bourke by steamer last week, so that the advantage of railway communication does not deter the people there from getting goods by the river.
1099. You would not anticipate getting the whole of the trade, but you are aware, I suppose, that business people—storekeepers particularly—when they know that the way will always be open to them, so that they can get their supplies just when they want them, instead of having to send an order a month before hand, get in a large stock by the river and thus suffer a loss, are they not likely to say, "We will pay a higher rate and get the goods by train as we want them"? It does influence them to a certain extent, but not altogether, because the difference between the river freight and the railway rates is so great that they not infrequently say, "Well, we can afford to get 300 tons of stuff at once and we can store it."
1100. What is the charge for a bale of wool from Newcastle to Sydney? The charge is about 17s. 6d. a ton.
1101. What is the freight by steamer? I believe it is about 12s. 6d. a ton.
1102. At any rate it is cheaper to send the wool by steamer than to send it by rail? Yes.
1103. But as a matter of fact, does not the bulk of it come by rail? Yes; but not from Newcastle. It comes past Newcastle from the northern district.
1104. Could they not save 1s. or 2s. if they consigned the wool to Newcastle and then sent it from Newcastle to Sydney by rail? Yes; but the squatters do not like their wool to be too often handled.
1105. Would not that apply to the steamers? I do not think so in this case.
1106. Wool does not deteriorate by handling? No; but the bales get marked, and do not improve in appearance by being handled too often.
1107. Would it not have a better appearance if it came down from Wilcannia by train instead of being knocked about on the trip, running the risk of being destroyed by fire, &c.? No doubt. I base my opinion upon our experience at Hay. Although we have had a railway there for about ten years, very much more wool goes down the river than comes to Sydney.
1108. Would it not be likely to bring a large traffic in case of droughts? Yes; and I look upon that as one of the great advantages of such a railway as this. In time of drought it would enable us to save the stock in the dry country.
1109. That would not only benefit the country but benefit the railway? Yes; but it would be a greater benefit to the country than to the railway.

D. Kirkcaldie,  
Esq.  
19 Mar., 1891.

- D. Kirkealdie, Esq.  
19 Mar., 1891.
1110. Have you ever used the railway for trucking purposes in time of drought? Yes.
1111. To any great extent? Yes; very largely.
1112. And the country to the west of Wilcannia is more liable to drought than it is near Bourke? Undoubtedly.
1113. What rates do you charge for starving stock—have you a special rate? There is not one now. There was a special rate when the drought existed. At one time we charged half-rates, then later on we charged three-quarters of the ordinary rate.
1114. Did it pay? No; it was not a paying rate.
1115. I suppose it gave you traffic when you would otherwise have been without it? Yes.
1116. I suppose even half-rates pay better than keeping the trucks idle? I am afraid not—our ordinary stock rates are very low.
1117. Still you keep the railway employed instead of having to pay wages and the interest on the railway stock? Yes; but the great advantage is the saving of live stock.
1118. You consider that that is a great feature, as the railways are owned by the State? Quite so.
1119. Of course, you anticipate that by preserving the stock you are increasing the quantity of wool in the future? Yes.
1120. Do you think that in a case like this, where the gradients are so very easy, and you can take such enormous loads over a great part of the country, say between Eskbank and Broken Hill, it would be possible for you, if it brought a very largely increased traffic, to charge even a less rate than  $\frac{1}{2}$ d. per ton per mile? It would not pay unless the traffic were exceedingly large.
1121. Can you say how it is that they charge a much less rate in America for minerals? Yes; they get a large general goods traffic as well. If we got a large general goods traffic we could afford to carry minerals at a very low rate.
1122. Do you not carry minerals in mineral trains only? Not necessarily. It is from general goods traffic that we principally derive our net revenue. The coal and ores do not yield much profit as a rule.
1123. Would they not leave a profit suppose you took them from Nyngan to Broken Hill, over a grade of 1 in 100—would it not pay you to run trains and charge  $\frac{1}{2}$ d. per ton per mile for minerals? I do not think it would.
1124. Do you know that it pays private companies to do this in America? Yes; where there is a large general goods traffic as well; then railways can afford to carry minerals cheaply.
1125. Do you carry general goods in mineral trains? When necessary we do.
1126. The effect of a mineral traffic would be to give you an ordinary goods traffic would it not? That does not follow.
1127. When people are sending minerals backwards and forwards, does not that necessarily open up the passenger and goods traffic? Not necessarily to any great extent.
1128. Do not people have to travel backwards and forwards? Not to any large extent. If the supplies for storekeepers and others were to go from Sydney by railway that would be a very different thing.
1129. Can you explain what connection there is between the rates of separate goods trains, and the rates of separate mineral trains? There is none.
1130. Then if you carry the minerals in separate trains, how can you say that it would not pay you to carry ores at low rates unless you get a large quantity of goods as well? I do not think that we should get the general goods at all.\*
1131. Suppose that you did not get any general goods at all, or any passengers, would it not be possible to charge one-third of a penny per ton per mile over a country with a grade of 1 in 75 or 1 in 100? Perhaps it would if we got full train loads in both directions, and plenty of them.
1132. Well, if you carry coal to Broken Hill and bring ores back, will not that be likely to give you full train loads? Yes. But would coal go to Broken Hill, and would ores come from there at the same time?
1133. Suppose that coal and timber only were to go to Broken Hill? Then if the trucks were to come back empty it would not pay.
1134. But do you not make considerable deductions for cargo going long journeys? We do. The rate at the present time for 200 miles is £3 18s. 8d. per truck—about 13s. a ton.
1135. What rate is that per ton per mile? That is about three farthings per ton per mile.
1136. Do you charge lower rates now than you did a few years ago? No. I think these rates have been in existence for about ten years.
1137. There is not a tendency then to work the railways at a cheaper rate? We look upon the mineral rates as very low already. Where we give special concessions is generally on the up journey, so that we can get back loading for trucks that would otherwise frequently run empty.
1138. Were the rates not fixed ten years ago at a paying figure? Yes.
1139. Has not the cost of working the railways been reduced during the last ten years? Yes, but at that time our railways did not extend so far into the interior as they do now; therefore the reduction was more apparent than real.
1140. If it paid you ten years ago, at the rate you fixed for short journeys, would it not pay you all the better at the same rates for long journeys? Not necessarily. At that time we had not the traffic to carry for long distances.
1141. But ten years ago you had no long distances, compared with the distance to Wilcannia and Broken Hill? No.
1142. Then if you fixed a rate ten years ago for short distances and it is paying, you ought to make a reduction now? Yes: so we do. The charge for 200 miles is about three farthings per ton per mile? For 500 miles it is a good deal less.
1143. Is it not a fact you are working the railways now considerably cheaper than you were ten years ago? Yes.
1144. Would not that be an additional reason for still further reducing the rates? No; because, as I have already said, although the present rates were fixed about ten years ago, they existed in name only as far as long distances were concerned, because we had no long distance traffic to carry, such as we have now.
1145. Can you explain how it is that in America they can afford to carry minerals at a third of a penny per

\* NOTE (on revision) :—What I wish to convey is that mineral traffic taken by itself does not yield much net revenue; but it leads to the conveyance of other traffic which does.

D. Kirkcaldie,  
Esq.  
10 Mar., 1891.

- per mile, if you cannot do it here, seeing that those are commercial companies that must have their dividend? They have a very much larger population and derive their principal profit from other traffic.
1146. It does not matter about population with mineral trains. If you were to take a train load of coal or ore into the Sahara desert, where there was not a soul, or to Tibbooburra, or any other part of New South Wales—if you were paid for taking a train load, and you got a full load, what has population to do with it? Everything, in this way. A railway company may say, "We will carry the coal without any net revenue. We will even sacrifice revenue upon it as long as we can get a large number of people settled on the line of railway, and the supplies they consume will give all the revenue that we want." No railway company looks for much net revenue from mineral traffic.
1147. Still, you do not mean to say you are working the mineral traffic on a principle of philanthropy;—do you? It is throwing a sprat to catch a mackerel.
1148. Your mineral rates are paying rates, are they not? Yes, they cover expenditure.
1149. If they gave a paying return 10 years ago for short distances, and now you have an opportunity of doubling or trebling these journeys with only one loading and unloading, ought you not to be able to reduce the rates per ton per mile? That is done.
1150. When was it done? It has always been done.
1151. The rates you are charging now were fixed 10 years ago? Yes.
1152. When the journeys were comparatively short? Yes.
1153. But you had not such long journeys years ago—such as the journey from Lithgow to Broken Hill? No; and although the low rates appeared in the rate book they were not operative.
1154. They were fixed 10 years ago on the working expenses of ten years ago, which were higher than they are now? Yes.
1155. I still have not solved the problem as to what population has to do with mineral traffic. Suppose you are kept continually carrying coal to Broken Hill, and bringing back minerals, how would population affect that? The opening up of mines would lead to settlement, and settlement creates payable traffic.
1156. Is there not a probability of mines being opened up if this railway is taken through the country? If that follows there would be settlement, and we should expect to derive our net revenue from the commodities which the people would consume.
1157. Is it not worth considering, from a railway point of view, whether you could not carry minerals between Broken Hill and Sydney, or Eskbank, or Lithgow, at even a less rate, with the prospect of opening up new mining fields? Yes, if one could be sure that the new fields are there.
1158. I suppose you know that the Cobar Copper Company have had to cease work for some years on account of their not having a railway;—suppose that when they get the railway they resume work, would not that have a tendency to cause people to prospect for other mines? It may. I rather think it was due to the low price of copper than the want of cheap transit that caused the Cobar Copper Mining Company to shut down.
1159. *Mr. O'Sullivan.*] I understood you to say that there had been no report made on the probable traffic on this line by the Department? None that I am aware of.
1160. Did not Mr. Harper some time ago go out and make a report? That was on the Nyngan to Cobar line.
1161. Did he not go to Wilcannia? No.
1162. Did the Commissioners go over the route? The Commissioners went over the route, and any opinion expressed by them must necessarily, therefore, be much more valuable than mine, but I am not aware that they made any estimate of the traffic.
1163. Then all the evidence that you have given is only based upon assumption? That is all.
1164. You have no data to go upon? None whatever.
1165. In looking over the evidence, you will find that Mr. Cameron, manager of the Marfield Station; Mr. McPherson, manager of the Paddington Station; and Mr. Moule, proprietor of the Fulham Station, say that they have been in the habit of sending their wool to Melbourne by way of Hay? I do not think that the wool from Paddington Station has always gone there.
1166. They all state that if a railway ran out into that district they would utilise it? I have said that we should no doubt get some of the wool that now goes to Hay.
1167. Do you take those three stations as indicative of many others out there? To some extent.
1168. In addition to serving as a valuable starving stock route in time of drought the railway would have a large fodder trade, would it not? Yes.
1169. Large quantities would be sent out to stock that could not be removed? Yes; but there is very little money in that. Our rates for fodder are exceedingly low.
1170. Are you aware of the statement made by the manager of the Cobar mine that they will re-open if sufficient inducement is offered by the Railway Commissioners? No.
1171. Has not Mr. Russell Barton made such an offer? I have not heard of it.
1172. Wilcannia is on a travelling stock route from Queensland is it not? Yes.
1173. Is it not likely that we can get a considerable stock trade by the railway going out there? I think we get that at Bourke.
1174. You think that a line to Wilcannia would pay but the remainder would be a loss? No; I did not say that.
1175. You are against the line? No, I am not against the line; it will open up the country; but as a net revenue paying line I am not very hopeful of it.
1176. But you think as a revenue line it will be a failure? I do not think there is much net revenue in it.
1177. Of course, you know there is a considerable trade at Wilcannia and the districts at the back? Yes.
1178. We should tap that trade which goes to South Australia or Melbourne? Yes.
1179. As a matter of fact there is a road straight from Wilcannia to Mount Browne? Yes.
1180. Therefore there is a possibility that we might tap the trade of the whole of that region? Yes, except for the river.
1181. Do not the storekeepers of Wilcannia, and other towns out there, have to lay in very large stores for fear the river should go down? Yes.
1182. And lose money by deterioration of their goods and having to pay interest on the money invested? Yes.
1183. If they had a certain and speedy means of transit to Sydney, is it not likely that the storekeepers would send to Sydney for their goods as they want them? They would at times, but not altogether.
1184. Do you not think it would be more to their commercial interest than to have a lot of goods wasted and having to pay insurance for river carriage? It is not always found so from experience.
1185. *Mr. Trickett.*] You investigated the line from Nyngan to Cobar? I did.

- D. Kirkealdie, Esq.  
19 Mar., 1891.
1186. Judging by your minutes, you had reason to increase your estimate of the probable traffic from time to time. On the 4th March, 1887, you put down the probable traffic at £6,908? About £7,000 a year.
1187. And afterwards you found that that was too little and you increased the estimate by £1,000? Yes, for the conveyance of mails.
1188. After that Mr. Harper was sent up? Yes, but I went up again myself before Mr. Harper.
1189. What was the result of your inquiry? The summary of what has been done says:—The Traffic Manager reported that since his previous reports had been sent in, he had ascertained that some traffic had gone by way of Girilambone, Byrock, and Coolabar, and that his estimate might be increased to £8,412. Of course, previously I had simply taken the traffic which had gone to Nyngan—not the traffic to and from other stations.
1190. Therefore you increased your estimate? Yes; by about £800.
1191. Then on the 1st May, 1887, Mr. Harper was sent by the Department, was he not? Yes; but I think I made a report on that again on the 28th April, 1887, after I had met a deputation of Cobar people. I put the traffic at £14,683.
1192. Then, again, in May Mr. Harper went up and made it £11,990, so that in a short time, when you came to inquire into it, you found that your estimate was considerably below the mark? My report requires to be read in connection with that. If my report in full were read, you would find the reason which induced me to alter my estimate; besides, I think Mr. Harper did not visit the district for the purpose of compiling any statistics until the end of 1887, or the beginning of 1888, and his report included a traffic which I had purposely excluded.
1193. Will you tell the reason? Yes; in my last estimate, that of £14,683, there was an amount of £7,054, for the conveyance of firewood. I got the tonnage from the Great Cobar Copper Company.
1194. You think that that is a doubtful item? I think it is a very doubtful item.
1195. You think that more reliance is to be placed on your estimate of about £9,000? Yes.
1196. In your report of the 4th March, 1889, you say that there is not a single acre of cultivated land along the whole route from Nyngan to Cobar. I would like to ask you if you stopped at a place kept by a Mr. Hall? I did not visit Cobar. I was guided by the reports put before me.
1197. Are you aware that he has a selection of 40 acres which is cultivated? I am not aware.
1198. This is a question which he was asked—"How much cultivated land have you?" And he replied, "30 acres under wheat and a little oats and barley. Those crops are very successful. It is about eight years since I put in the first crop, and I was more or less successful every year until last winter, which was exceptional, owing to the want of rain. Oats, as a rule, are not so successful as wheat. I have had wheat 4 feet 6 inches and 5 feet high, when the oats were not 18 inches high. I have had good crops here when the crops at Dubbo and Wellington have been a failure?" Mr. Hall has been increasing his cultivation for some years, but at that particular time my report was substantially correct, I think.
1199. Did you know that good crops could be produced? Yes; I think I mentioned in my report, first of all, that if there was a development of the mining industry, and next, irrigation, it would be an immense benefit to the district, and would very likely increase the value of the Crown lands there.
1200. Then the paragraph in your report would hardly be correct, that you did not see a single acre of cultivated land along the route, when this place of Hall's had been in existence so long? There was very little at the time to the best of my knowledge.\*
1201. The Sectional Committee called at "Budd's Hotel," and the owner said, confirming what the Committee saw:—"I have a selection that I am converting into a freehold. I have 40 acres, most of it under cultivation." And the Committee saw fruit trees growing in a very satisfactory manner;—did you not see that? No.
1202. But "Budd's Hotel" was at the place where a station was supposed to be, about 14 miles this side of Cobar? I do not know anything of it.
1203. Then you are not aware that it does exist, that the place has been cultivated, and kept in an improving condition by the storage of water? No.
1204. You are not in a position to say, with regard to the extension of the line from Cobar to Wilcannia and Broken Hill, that much such cultivation exists along the route? No; there is some nice cultivation at Wilcannia.
1205. From inquiries that you made, were you not informed that want of water was the only deterrent to cultivation? Yes.
1206. And that with a proper rainfall, and, in the absence of that, good conservation of water, they could cultivate almost anything? Yes; I should say that anything could grow if there were reasonable rainfalls.
1207. Did you make any inquiry as to whether people who took up homestead leases could make a good living in that part of the country? I scarcely think they could make money at that alone.
1208. Could they make sufficient to live upon? I could not tell. When I went down there five years ago, the manager of a station told me that he would not take a 10,000-acre block for nothing if he had to live on it.
1209. Was he manager of a large station? He was.
1210. You did not ask any small settler? No.
1211. Of course, you are aware of the cost of constructing ordinary roads in such country? Yes.
1212. Mr. Cummings, Government Road Superintendent, has stated that it would cost £200,000, independent of maintenance, to construct a road to Broken Hill, and that the cost of maintenance would be £2,000 a year;—do you think that these figures are correct? I could not say.
1213. If they are, they would be a considerable set off against the cost of the railway? Yes.
1214. With regard to the river traffic, are you aware that the Government have from time to time spent very large sums of money in snagging the river? Yes.
1215. Could you tell the amount? I made inquiries some three or four years ago, and was informed that they had been spending money at the rate of about £10,000 a year for about nineteen years, the amount being something like £190,000 to £200,000. I am referring to the Darling, the Murray, and the Murrumbidgee Rivers.
1216. If the river is to be kept navigable I suppose the Government would have to keep it clear? They will have to keep it clear in any case, I presume.
- 1217.

\*NOTE (on revision):—I only wrote from reports. My minute said:—"Both Mr. Harper, the Goods Superintendent, and Mr. Hornidge, the District Inspector, have been making very careful inquiries into this matter, and from them I gather that there is not an acre of country under cultivation along the whole route of the proposed line, &c."

1217. Even if the railway is constructed? Yes; in order to serve places which cannot be served by a railway. D. Kirkcaldie,  
Esq.
1218. So that there would be no saving in respect to that? No; the river would still have to be snagged.
1219. Have you considered the question of a railway in connection with the locking of the Darling? I have not come to a definite opinion about it. 10 Mar., 1891.
1220. You have not come to the conclusion that the two things would work hand in hand? I think they might be made to work hand in hand very well.
1221. Would it not be desirable to lock the Darling if we make the railway? Yes.
1222. You said, in answer to a question, that the railway would afford them the means of getting a lot of stock away in bad seasons;—are you aware that in 1888–9 800,000 head of sheep died of starvation in the Wilcannia district? I know that the number was very large.
1223. Could not a large number of these have been removed with proper means of communication? Yes.
1224. You stated that the position with regard to Wilcannia and Sydney, and Bourke and Wilcannia was different, on account of the difficulty of the navigation of the Darling above Wilcannia;—is that so very great that it would make a material difference in the traffic? Yes; boats can get to Wilcannia when they cannot go any further north.
1225. Is it a very long distance from Wilcannia to Bourke? About 500 or 600 miles by river.
1226. Do you not think that the people in every case would use the railway in preference to the river? I do not think so. They would use it at times as it suited them.
1227. Do you not think they would get into such a way of trading with Sydney merchants that they would give the river the go-by? That has not been our experience.
1228. Do you know what the rate of insurance is for sending by the river? I do not know what it is. Some years ago it was about 45s. per cent.
1229. When the Sectional Committee were in Wilcannia, great stress was laid by the storekeepers there on the fact that if they had regular means of communication they need not get nearly such large stocks? Yes.
1230. And that they could get their goods more frequently if a railway were made;—would not that tend to keep up the traffic? It would. But the storekeepers of Bourke have told me over and over again the same thing, and yet they sometimes get large quantities of goods by the river.
1231. When the river has been dry they have often had to get goods from Adelaide, *via* Broken Hill? Yes; and also by way of Bourke.
1232. Have not the rates of carriage for those goods been almost ruinous? They have been very high.
1233. Coming to as much as £21? I would not say that. Five or six years ago they were paying £10 a ton for the carriage of goods from Bourke to Wilcannia.
1234. The following evidence was given in October, 1889, by Mr. Thomas Byrne, of Wilcannia:—"Do you produce a bill of lading for certain goods from Adelaide to Broken Hill? Yes; the charge is £9 per ton."—"Do you also produce the way-bill for the same lot of goods from Broken Hill to Wilcannia? Yes; the freight for that distance is £15 per ton. Therefore the freight for the whole distance came to about £24?" I should say that the £15 rate was very exceptional, the distance being only 115 miles.
1235. The same gentleman produced a number of way-bills, showing that the average charge from Adelaide by the river came from £5 to £5 10s. a ton. What do you say would be the lowest charge which you could make from Wilcannia to Sydney? I could not say. We could not possibly fix any rates now, as they would depend upon the state of the river.
1236. You have various charges under various circumstances, the charge for minerals being about the lowest? Yes.
1237. As low as ½d. a mile? About that.
1238. What is the lowest charge for long distances for wool and store goods? The charge for wool from Bourke to Sydney, scoured, is about 2·38d. per ton, and greasy wool 1·9d. per ton per mile.
1239. Have you looked at this subject from the point of view of increased population in the district of the line? I have not.
1240. Not having travelled through the country, you have not inquired fully into that? No.
1241. *Dr. Garran.*] You say that the present traffic at Wilcannia will not pay interest on a railway from Cobar? Not if we have to compete with a free and navigable river.
1242. How much increase would make it pay—would 50 per cent. more make it pay? No increase at all will make it pay, if we have to compete with the river rates.
1243. Then you say that whatever the trade of Wilcannia may be, no railway to it can pay if it has to compete with the river? I think not, while the river is navigable.
1244. Then on its merits, commercially, such a railway is condemned? Yes; I do not think it is a railway that you are going to look to for much net revenue for years to come.
1245. Not even if the traffic doubles? No.
1246. Not even if it quadruples? No. But if the river were not navigable it would be a very different question.
1247. The river is not navigable one year in three? About one in three.
1248. Then we should get the traffic two years out of the three? Yes.
1249. Would it pay then? No.
1250. Then you do not think it would pay even in the absence of river competition? Yes; I think it would if there were no competition.
1251. Two years out of the three it would pay? No; I do not think it would.
1252. If you could double the present trade would it pay? Yes.
1253. Then two years out of three the railway would pay if the traffic were doubled? Yes.
1254. If the gold-fields to the north-west were developed, the traffic would double, would it not? I do not know that it would double—it would increase.
1255. Do you think the addition from Wilcannia to Silverton would make the difference between a paying and a non-paying line? I do not think so.
1256. If you had a line made from Wilcannia, and it was not paying, you do not think that continuing to Broken Hill to Cockburn would make it pay? I do not think so.
1257. You have told us that the proposed line will not give us much more pastoral business than you have now? It will, to some extent.
1258. Not very much? I do not think so.

- D. Kirkcaldie, Esq.  
19 Mar., 1891.
1259. Suppose a line is made from Forbes to Menindie, would that catch the traffic which you now lose? Yes, if it went between Mosgiel and Hillston. From that district we lose a large quantity of wool, which goes to Melbourne by way of Hay.
1260. If such a line as that were made would any traffic to the northward cross it to go to Melbourne? I do not think so.
1261. The traffic south of it might? Yes, some considerable distance south.
1262. Would you catch the traffic for 20 miles to the southward? I think we should.
1263. Would the traffic that you would get be a considerable item in the revenue of such a line? It would.
1264. Do you think that such a line would pay on its own account? I think it would in a comparatively short time. It is, I believe, all very nice country down the valley of the Lachlan.
1265. Suppose the construction of such a line as that were carried out near the river, and it would settle a large agricultural population? Then that would pay.
1266. You think it would? Undoubtedly.
1267. Have you been over it? No, but I am told that it is very good agricultural country.
1268. Is the country good along the Willandra Billabong? I do not know.
1269. If there is any prospect of irrigating and settling the country, a railway made there would pay? Yes. If there is irrigation and large settlement on the proposed line it would pay.
1270. Is there any chance of irrigation? I am afraid not, for the present.
1271. Is there any chance of irrigation on the Forbes route? Not from the river to any great extent.
1272. We are told that that line would be 62 miles shorter to Broken Hill than the one round by Cobar,— would that make a difference to the coal traffic? It would, but not to a very great extent.
1273. Suppose you got coal from Lithgow or Wallerawang, would that make the difference between a paying and a non-paying line? No.
1274. It would still have too heavy a handicap? Yes.
1275. You do not think either line would be justifiable, commercially speaking? I do not think so.
1276. But of the two the more southerly would have the best prospect? I think so.
1277. And it would make the best trunk line across the country? Yes, I think it would more rapidly become the best paying line.

TUESDAY, 24 MARCH, 1891.

Present:—

THE HONORABLE JOHN LACKEY (CHAIRMAN).

The Hon. ANDREW GARRAN.	}	WILLIAM SPRINGTHORPE DOWEL, Esq.
The Hon. FREDERICK THOMAS HUMPHERY.		EDWARD WILLIAM O'SULLIVAN, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.		CHARLES ALFRED LEE, Esq.
HENRY COPELAND, Esq.		WILLIAM MCCOURT, Esq.
JAMES EBENEZER TONKIN, Esq.		JAMES PATRICK GARVAN, Esq.

The Committee further considered the proposed Railway from Cobar to Cockburn.

David Kirkcaldie, Esq., Chief Traffic Manager, Railway Department, sworn, and further examined:—

- D. Kirkcaldie, Esq.  
21 Mar., 1891.
1278. *Mr. Dowel.* Have you visited Broken Hill? No.
1279. Do you know what is the population of that town? I think about 16,000.
1280. Would you be surprised to learn that the population of Broken Hill is estimated to be 25,000 or 26,000? That is larger than I thought.
1281. You stated in reply to a question that you considered population necessary to make a railway pay? Yes.
1282. Do you know of any town through which any railway in New South Wales passes that has anything at all like a population of 26,000? Not except Newcastle.
1283. What is the population of Newcastle? I think it is about the same; taking the suburbs it would be 60,000 or 70,000.
1284. You estimate the population of Newcastle at about 26,000? Yes; somewhere about that.
1285. Having such a large population at Broken Hill, do you not think it absolutely necessary that the people residing there should be placed in communication with the metropolis of New South Wales? Yes; but that was not exactly what I gave evidence on. I was speaking of the paying capabilities of the line. So far as it is a national undertaking what you say is right.
1286. Would not the consumption by the population of Broken Hill cause a large traffic on the railway? No doubt it would.
1287. Would they not be consumers to a large extent of coal, coke, timber, galvanized iron, and general merchandise? Yes.
1288. Would that not be the means of giving a large amount of revenue? It entirely depends upon whether that traffic would go from New South Wales, or whether it would not go from South Australia, as being the shorter distance.
1289. Do you know any country there through which the proposed line will pass? No. I have been only to Wilcannia.
1290. You stated in your evidence that the country was not suitable for irrigation? No, I did not say that; I think it is admirably suited for irrigation.
1291. Did you say that the Lachlan country was not fit for irrigation? I said it could not be irrigated from the river to any great extent.
1292. Would you be surprised to learn that there are works of an extensive character in existence, carried on by private enterprise, on the Lachlan? Yes, I should be surprised to hear that works of an extensive character were carried on there.
1293. And you would be surprised to learn that some of the land there is carrying as many as ten sheep to an acre in consequence of irrigation? I should not be at all surprised to hear that it is so in parts where irrigation is carried on.
1294. Are not the capabilities of the country on the proposed line as good as they would be on the Lachlan? Yes; but you must have a most extensive system of irrigation to irrigate to some purpose. Having such a system, I think the country is capable of carrying anything.
- 1295.

1295. Knowing what you do of the country, would you recommend that this line should be constructed? D. Kirkcaldie, Esq. Well, as a net revenue paying line, as I said before, I do not think there would be much taken out of it for years to come. But if it is to be regarded as a national line, to open up the country and connect Broken Hill with the metropolis, that is an entirely different question. 24 Mar., 1891.
1296. I suppose you are aware that the Broken Hill people are desirous of having the railway constructed? I should think they would be.
1297. What would you suppose would be the principal reasons they would give for having the railway constructed—would they not want to use it? They might use it as a lever to force down the rates on the South Australian railways.
1298. For that particular purpose only? They might do that—I do not say that they would; it has been done in other places.
1299. *Mr. Lee.*] You are thoroughly acquainted with the outgoings and incomings of the line from Junee to Hay? Yes, but I have not the statistics before me now.
1300. You are aware that it is not a paying line? Yes.
1301. What traffic do you depend upon from Hay? The principal traffic from Hay is live stock.
1302. Do you get any wool? Some, but not much.
1303. Any agricultural produce, or minerals? No.
1304. Being so thoroughly acquainted with the traffic from that part of the country, do you think we have a right to expect a larger traffic from Broken Hill and the intermediate country on that line? No; the country is of the same character. I have been told that the Broken Hill country is capable of large development as regards the mining industry.
1305. You are keeping in view the large population of Broken Hill? Yes.
1306. Do you anticipate that you could get a proportion of that-trade? I scarcely think we could get a large proportion of it.
1307. Do you think we should get any at all? Not very much of the general goods traffic, I am afraid.
1308. Do you think the conditions regulating the traffic on the Hay line are different from those in the case of the Broken Hill line? I do not think they are appreciably different.
1309. Is there at Hay the population that there is at Broken Hill? No.
1310. Would it not be reasonable to infer that with a population of that magnitude a fair proportion of the traffic would come to the metropolis? We might get a proportion, but we should not get very much. I am speaking principally of the wool and general goods traffic. The great bulk of the wool from Hay goes to Victoria.
1311. Are the conditions similar as between the Hay line and the proposed Broken Hill line? I think so.
1312. You would not make an exception in favour of the large population at Broken Hill? I do not think so,—it is too near Adelaide and Port Pirie to be of much benefit to us as far as general goods are concerned.
1313. Leaving that traffic as problematical, you would not like to give a definite opinion as to which way the traffic would go? I could not give a definite opinion on that.
1314. Your opinion is that the traffic would continue to go to South Australia? I think it will.
1315. Do you think that if the line were constructed it would be the means of drawing traffic from Broken Hill to the river on one side, and towards Cobar to the river on the other, to be transported by steamer? It would probably do that.
1316. That would be more likely to occur when the river is navigable? Yes.
1317. Could they then carry it by water at a lower rate than you could carry it by rail? Yes.
1318. Including transshipment charges? Yes. I am talking now of Wilcannia.
1319. But would a short distance traffic of that kind pay,—from Broken Hill to Wilcannia, and from Cobar to Wilcannia? Yes; we would fix our rates so as to make it pay.
1320. Then it would make very little difference whether you carried to the intermediate stations or right through? Yes, it would make a big difference.
1321. Which would pay the Department best? We always prefer to get hold of long distance traffic.
1322. Then if a trade sprang up on the river of the character that I have indicated, it would materially interfere with the calculations of the Department? Yes.
1323. And in that case you would fall back on the system of river dues? We have no power to levy river dues.
1324. That would be your recommendation? Yes.
1325. *Mr. Garvan.*] Do you think that if the railway were constructed we should get a live stock or wool traffic to Sydney? Yes; it would attract a certain amount of wool traffic.
1326. It would first have to come to Wilcannia? Yes.
1327. A distance of about 130 miles? You would not draw any wool traffic from Broken Hill.
1328. At Wilcannia the river, I understand, is navigable nearly the whole year round? It is more often navigable there than it is further north.
1329. During what portion of the year is the river navigable at Wilcannia? I could not say.
1330. Have you ever known the river at Wilcannia to be unnavigable for more than a year? I have not.
1331. With the freights that are ruling on the river, could you, with wool delivered at Wilcannia, compete and make a profit in the carriage of wool and live stock to Sydney? No. At the same time, squatters frequently would pay more in order to get their wool to its destination quickly. It does not follow that we could not get a higher rate for the carriage of wool by railway than is paid to send it by river to South Australia and Victoria. But the very low rate of river carriage militates against it.
1332. It is found at present that from Bourke, where the river is not nearly so navigable as at Wilcannia, it is difficult to maintain the traffic on the railway? The wool traffic from Bourke has gone on increasing year by year, but there has been a quantity of general goods taken up the river to Bourke during the last fortnight.
1333. Is the whole of the wool that comes to Bourke carried by railway? Not all, but the great bulk of it is.
1334. And are the rates of charge from Bourke of a paying character? Yes.
1335. As good as the rates from Dubbo to Sydney? No. The Bourke rates are £5 0s. 3d. per ton for scoured wool, and £4 0s. 3d. for greasy wool. From Dubbo the rates are £4 10s. 7d. for scoured wool, and £3 9s. for greasy wool.
1336. How many miles is it to Dubbo? The distance from Bourke is 225 miles greater.
1337. Is the rate for wool from Dubbo a very paying rate? Yes. 1338.

- D. Kirkcaldie, Esq.  
24 Mar., 1891.
1338. It would want to be a good paying rate to enable you to carry from Bourke without a loss? Yes, but still we only charge at the same rate from Dubbo that we do from any similar distance in a non-competitive district.
1339. Have you made any actual calculations as to whether the rates from Dubbo to Bourke are paying rates or not? No.
1340. Has it been made by the Department? No.
1341. Could you tell me by what process you arrived at the conclusion that the charges from Bourke, as compared with the charges from Dubbo, are paying rates? To begin with, we have a very small staff to maintain beyond Dubbo; the country is level, we do not require so many stations, we can take double the sized train loads beyond Dubbo that we can take on this side. In every possible way we can minimise the working expenses on a level railway as compared with a railway having heavy gradients.
1342. As far as the wool trade is concerned from Broken Hill, you do not anticipate that you can bring any of the trade to Sydney? I do not think so.
1343. What will pay if we construct the line? It seems to be a very important question whether we shall get an immense quantity of coal to carry from the Lithgow mines to Broken Hill, and crude ores from Broken Hill to Lithgow. If we get that, probably it will result in the development of traffic in another direction; but that, of course, is speculative.
1344. You say if you could accomplish this, but do you see anything, from your knowledge of that traffic, to lead you to the conclusion that we should get it? I could not say that. Some people seem to think that we should. Some mining authorities say so. I should not like to express an opinion about it.
1345. We have had evidence that the coal at Lithgow is not pre-eminently fitted for smelting purposes? I could not express an opinion on that.
1346. To the extent that that coal is inferior coal, it would militate against the possibility of a trade? No doubt.
1347. Do you think it would not be more desirable to construct a railway to the nearest port on a more navigable part of the Darling River than Wilcannia; for instance, there is a point near Menindie, about 80 miles from Broken Hill, as against Wilcannia 120 miles; for certain purposes of trade would it not be better to connect with the navigable part of the river only 80 miles distant? Yes, I think so.
1348. Would the line from Broken Hill to Menindie be likely to get more trade than a line from Broken Hill to Wilcannia? I do not think so.
1349. In other words you hardly think there would be any trade at all coming from Broken Hill towards the river? I do not think so.
1350. Do you see any probability if the railway is made of any population being settled for agricultural or other purposes? Not unless they get an extensive system of irrigation. There may be a development of mining which I am not qualified to speak upon. I have been told that there are mines in the Cobar district which may be opened up if the railway is made.
1351. What kind of mines? I have heard that there is silver, copper and gold.
1352. But as a matter of cost of bringing the produce of any mine, except a coal mine, the freight is not so important an object as making it a paying or non-paying line? Not of itself; but if you open up a large mineral field a settlement of 10,000 or 15,000 people would develop a traffic of its own.
1353. You have been asked whether Broken Hill, by reason of its population, has not some strong claim to connect with the metropolis, but is it not a fact that it is already connected with the metropolis of South Australia, and connected through that place with the metropolis of Victoria and that of New South Wales. Does not that meet the demands of the population? No doubt it does.
1354. Is not the metropolis of South Australia more naturally the commercial centre of Broken Hill than the metropolis of New South Wales? I think so.
1355. If you had the management of the railways of South Australia, do you think that anyone managing the New South Wales railways could take the traffic from you? I do not think so.
1356. It is quite possible that there may be some capable man with views similar to your own, managing the South Australian railways? Yes.
1357. In South Australia they could make it impossible for New South Wales to get the trade? Yes, as far as railway rates are concerned.
1358. *Mr. Humphery.*] I think you said that very little wool comes by rail from Hay? Yes; the traffic from there is principally live stock.
1359. That comes in time of drought? No, they have always a good river in the Murrumbidgee, especially in the wool season.
1360. Is the river always navigable? Yes, almost always at that season.
1361. Into what part of South Australia is the wool taken from Hay? It goes principally to Victoria, down the river to Echuca, and from there to Melbourne by rail.
1362. Very little goes to South Australia? Comparatively little—a great deal of Darling wool goes to South Australia. Very little of the Murrumbidgee wool.
1363. What is the distance by water from Hay to Echuca? I think about 500 miles, speaking from recollection.
1364. Do you know how long it occupies in transit by water? About a week, sometimes longer.
1365. What is the distance from Sydney to Hay? 454 miles.
1366. What is the railway rate for wool from Hay to Sydney? £4 3s. 9d. per ton for scoured wool, and £3 4s. 9d. for greasy wool.
1367. Do you know what the freight by water is from Hay to Echuca? I think they are taking it as low as £2 5s. and £2 15s. per ton.
1368. And from Echuca to Melbourne? I am giving the rate right through.
1369. Then the freight, including water carriage, from Hay to Melbourne is about £2? It ranges from £2 5s. to £2 15s. per ton.
1370. Does the rate that you charge leave a margin of profit? Yes.
1371. Can you afford to carry wool at a lower rate than you have mentioned? Yes; rather than lose it altogether, but we should create an anomaly, which is already great enough, in charging lower rates for longer distances.
1372. Could you carry at a lower rate, and still leave a profit? We could.
1373. Can you say why the Commissioners have not carried at a lower rate to compete for the traffic? Because

Because they do not care to create further anomalies. They would rather carry a smaller quantity at the higher rate than a larger quantity at a lower rate. It is questionable whether we should get any more revenue from the larger quantity.

D. Kirkcaldie,  
Esq.  
24 Mar., 1891.

1374. Would similar conditions exist if the railway were extended to Wilcannia? Yes.
1375. Could you afford to carry wool from Wilcannia to Sydney, 615 miles, at a less rate than is charged by water? No, we could not do that.
1376. What is the lowest rate at which you could carry traffic from Wilcannia to Sydney? That would be a matter of expediency.
1377. Could you calculate it? No.
1378. Do you know what the freight is from Wilcannia to Goolwa? I think altogether it is about £3 a ton right through to Adelaide.
1379. If our freights from Hay to Sydney, 454 miles, are £4 3s. 9d. and £3 4s. 9d., do you think it possible to carry goods from Wilcannia to Sydney, 615 miles, at a less rate than from Hay to Sydney? If we have the railway we shall try and get the traffic, whatever rates we have to quote for it.
1380. But you have a railway to Hay;—why do you not try and get the traffic there? Because we find it better to keep the traffic we have and get the rates we are receiving for it.
1381. But you get very little wool? We get a fair quantity of general goods. Not unfrequently supplies for Hay come from Melbourne by sea and go by the railway from Sydney.
1382. You have almost abandoned the wool traffic? We have not done very much in that direction.
1383. At Wilcannia would you do the same? To a very large extent the stations there are held by Victorian and South Australian owners.
1384. When the line is extended you hope for very little wool traffic? I do not think there will be much.
1385. You depend principally on goods traffic? I mean wool adjacent to the river.
1386. What is the distance from Wilcannia to Goolwa? I could not tell—I should say about 1,000 miles.
1387. Do you know what time is occupied in transit between Wilcannia and Goolwa? I think from three weeks to a month.
1388. Would that give you an advantage? It does give us an advantage to some extent.
1389. Would it not save interest to the producer if he used the railway? Yes.
1390. It would enable the producer to get a more speedy advance upon his wool? Yes.
1391. Mr. Garvan asked whether Adelaide was not the natural capital for Broken Hill, owing to the existing means of communication with Adelaide and Port Pirie. Do you think it at all probable that we should be able to successfully compete against South Australia? As far as the railway rates are concerned, I should say that we can hardly hope to do so.
1392. Unless we regard it as a national line, the line ought not to be constructed? I think it must be regarded as a national line. It will open up a great deal of country which will be of great benefit in times of drought, but, taken all round, as a net revenue paying line I do not think there is very much in it.
1393. Do you not think it would be profitable? Not from a railway point of view, I think.
1394. *Mr. Trickett.*] You were asked some questions about a railway line from Forbes to Menindie? Yes.
1395. On that route do you know of any centre where the annual outward tonnage is about 8,000 tons of wool, and where the annual inward tonnage is between 7,000 and 8,000 tons of goods? No, not on that route.
1396. It has been sworn by several witnesses at Wilcannia that that is the annual traffic of that town. If that is true, and a line of railway went from Forbes to Menindie, instead of from Cobar to Cockburn, would not that traffic be lost to the line? Not necessarily. I think it might come down to Menindie, and we might catch it there.
1397. But the river is not always navigable? It is generally for a portion of the year, between Wilcannia and Menindie.
1398. How do you account for the evidence that wool has been kept there sometimes eighteen months at a stretch? I daresay that may have arisen. I myself saw a boat five years ago at Wilcannia which had been there eighteen months, and then they had to take out the goods and cart them to Bourke.
1399. With regard to the traffic from Hay, you say that the river there is always navigable? In the wool season.
1400. That is not always the case at Wilcannia? Not always, but it is to an extent.
1401. I should like you to explain how, if a railway were constructed from Forbes to Menindie, the very large goods traffic that I have mentioned would be secured? I do not say that it would be secured; I would not say that.
1402. I asked if it would not be lost, and you said you thought that the railway would get the benefit of it? To a certain extent I think it would.
1403. How would it come? By steamer to Menindie. We get a good deal of traffic now from the boats at Bourke.
1404. It might be taken that way if the river were navigable? Yes.
1405. You stated that the country is of a good character, though I do not think you have been there? I understand that it is.
1406. If it has been sworn by a gentleman who examined the route that a great deal of it is of a swampy character, you could not contradict it? I could not.
1407. *Mr. Copeland.*] You stated, in reply to Mr. Trickett, that if the railway were taken *via* Forbes to Menindie, you think there would be a traffic to that railway? Yes.
1408. That you would have a traffic from the railway up to Wilcannia by the river, and from Wilcannia down, by the river, to the railway at Menindie? Yes.
1409. That would necessitate an additional loading and unloading, would it not? Yes.
1410. They would have to cart their goods to the river, place them in the steamers, then unload the steamers into the trains. If you are likely to get any traffic to the railways under those circumstances, are you not much more likely to get the Wilcannia traffic when the railway goes to Wilcannia direct? I think there is more chance of getting it if the railway goes to Wilcannia.
1411. You are more likely to get it than you would be if it went to Menindie, and had to make use of the river in addition to the railway? Yes.

- D. Kirkcaldie, Esq.  
24 Mar, 1891.
1412. You would not consider it a favourable circumstance if the traffic on the railway had to depend upon the river being navigable between Wilcannia and Menindie? No; and I may say, that at Hay we lose a very large quantity of wool. No wool comes by the river to the railway at Hay. At Bourke a good deal of wool comes to the railway by river.
1413. But you would not like to have the railway traffic dependent upon whether the river was navigable or not? No.
1414. If the river was not navigable, the railway would have to stop working if it went to Menindie? Yes.
1415. So you would prefer to see the railway taken direct to Wilcannia? Yes. My only object in keeping south is to catch the traffic at Hillston, Mossgiel, Ivanhoe, and all that district to the north of Hay, which traffic goes to Hay, and by river to Melbourne.
1416. If a railway was constructed from Hay to Wentworth, would you expect to intercept any traffic? I do not think so. We should be altogether too far down the river then.
1417. The traffic would be too far on its journey? Yes.
1418. Would not the same argument apply as between Wilcannia and Menindie? I scarcely think so. Besides, as I say, we want to get the traffic from Hillston and Mossgiel. An enormous quantity of wool goes from there every year.
1419. Do not you think that within 100 miles south of Wilcannia they would make use of the railway, carting their goods from 50 to 100 miles north, to get railway communication? It is very doubtful.
1420. Would it make much difference when once the wool is on the bullock dray, whether they carried it 5 miles or 50 miles? The charge is so much per ton per mile.
1421. That is coming through the agents. But if this railway went through Wilcannia many people would consign their own wool, would they not? A great many would.
1422. And drive out with their own teams? Yes.
1423. In that case when once the wool was on the dray, would it make any material difference to the owner whether his bullock teams were travelling two days or three days? Distance is a great consideration.
1424. Do you think that the fact of having to take wool 50 miles to get to a railway would prevent him from using the line? It would if they had any other easy means of conveyance. A squatter would not drive 50 miles if he could catch a steamer within 5 miles.
1425. All the wool is not produced on the bank of the river—in every case they have to drive some distance to get to the river. Assuming that from the advantages it would afford they would be inclined to patronise the railway as against the river, then I ask would they not be likely to drive a distance of from 50 to 100 miles south of the railway, in order to use the line? I think they will make use of the railway rather than the river, if the difference in the rate is not too great.
1426. So you will expect to get the traffic from the country 50 to 100 miles south of the railway? Yes, if they are not too near the river.
1427. And anywhere from 200 miles north of the railway? Yes.
1428. Between Wilcannia and Broken Hill? Yes.
1429. Would you not anticipate the building of a railway in addition to this railway to Wilcannia—a railway from Hay to Wentworth? I do not think so, as long as we have to compete with the river.
1430. Supposing the river was locked, and you had river dues? Well then I should have no hesitation in pushing on the railway.
1431. I suppose you would not have much objection to having river dues without the river being locked? I should not. We are now charging less by railway than they paid by river some years ago.
1432. Looking at that western country, what area would you set down as a fair distance that should intervene between two parallel railways? That would be very difficult to say.
1433. In that western country what area should there be between the Wilcannia line and the Bourke line—especially as they extend out west? I should say as nearly as possible they should equi-distant.
1434. What distance ought there to be between the two? I could not say. We can command the northern traffic to a large extent. As we are situated now, we do not command a great portion of the country between Condobolin and the Darling—Hillston, Ivanhoe, Mossgiel, and that way.
1435. But supposing you had 100 miles north of the railway and 100 miles south of it, that would be a width of 200 miles of country with a railway in the centre. Would not that 200 miles extending out westward be sufficient country to warrant you in building a railway in the middle of it? Under the circumstances, I may say no. I would rather keep more to the south for the reasons I have stated.
1436. You would, perhaps, prefer 50 miles to the south of the railway to 150 miles to the north of it? Yes; something like that.
1437. Would you consider that area of country, 200 miles in width, sufficient to feed the railway? Two hundred miles of country like that may be too little—say 250 to 300.
1438. Then if you had 250 miles to the north the width would have to be 600 miles? I did not understand your question. Perhaps 200 miles would be a fair thing.
1439. So that you would have 100 miles for each line? Yes.
1440. That being the case, do you think there would not be sufficient country between these two lines to Hay and Wentworth, and the Cobar to Wilcannia line, to feed both those railways? I do not see anything in the Hay to Wentworth line, because you are practically tapping the Murray. Any traffic which gets to Wentworth will not stop there to go by railway.
1441. I mean as far as Hay is concerned. Taking the line from Junee to Hay, is there not country enough to warrant you in building another line from Forbes to Condobolin, and on to Menindie, anticipating that there will be a traffic, perhaps, not in the first few years, but in a short time? Yes.
1442. I suppose there are only about 100 miles between those two lines? About that.
1443. Then you would anticipate that all the traffic (say) from 50 to 60 miles south of the Bourke line would gravitate towards the Wilcannia line? Not 50 or 60 miles. There is a distance of over 200 miles from Bourke to Wilcannia.
1444. That would be going by the river? No by the road.
1445. *Mr Dowel.*] What is the estimated distance by railway from Sydney to Broken Hill, via Melbourne and Adelaide? *Via Melbourne and Adelaide* 1393½ miles.
1446. What are the present passenger rates for that distance? I have not got them here.

1447. You could not say? Not without the books.
1448. You can supply that information to the Committee? Yes.\*
1449. What is the estimated distance from Sydney to Broken Hill, *via* Nyngan, Cobar, and Wilcannia? 732 miles.
1450. What rate would you propose to charge first and second class passengers for that distance? The ordinary mileage rate would be £5 6s. 3d. first class, and £3 9s. 3d. second class. First class return £7 19s. 6d., second class return £5 4s.
1451. Do you not think that a very large proportion of the passenger traffic from Broken Hill would prefer to go the shorter distance—732 miles—instead of by the longer route—1393½ miles? Yes.
1452. Would it not be a considerable saving as regards time and cost? Yes, but I do not know whether there is very much of a passenger traffic between Broken Hill and Sydney.
1453. Out of that population of 26,000 at Broken Hill, do you not think the passenger traffic will be something considerable? There would be a passenger traffic. I do not know that it would be very large, Broken Hill being so near to Adelaide.
1454. You are aware that a very large number of people from New South Wales are continually going backwards and forwards between Sydney and Broken Hill? I do not know that any very large number do so.
1455. Under any circumstances you think that this railway would take some passengers, as it would be the shorter route? Yes.
1456. *Mr. McCourt.*] When other railway proposals were submitted to the Committee did the Commissioners supply any estimate of the probable expenses? I think they did.
1457. Has that been done in this case? Not that I am aware of.
1458. Could it not be done? I do not think so.
1459. Could you not do it? Not with anything like accuracy.
1460. Do you think it would be any guide? I do not think it has been done in regard to any main trunk lines. It has not been done since the Commissioners took office, except with regard to branch lines. This is not a branch line but a main trunk line, the construction of which is a matter of policy.
1461. If a careful estimate were made by an expert, would it be any guide to the Committee? I am afraid it would be only very approximate, and not much of a guide.
1462. There was an estimate of the line from Nyngan to Cobar? Yes; there was no difficulty about that.
1463. What is the estimated loss per annum of that line? I think it was estimated at something like £10,000 or £11,000 a year.
1464. That is a portion of this line, is it not? Yes.
1465. And would there be a proportionate loss on the line to Broken Hill? It is impossible to say.
1466. If an expert went over the country, could he not form a fair estimate of the probable income of the line? I do not think he could. If there were no other route by which the traffic could go, he could form an estimate. There was no difficulty in forming an estimate with regard to the line from Nyngan to Cobar, because the traffic cannot be taken any other way than by the railway to Sydney.
1467. You just now said that the Railway Commissioners could so arrange that it would be possible for New South Wales to get the traffic? Yes, if they have very low rates.
1468. In making an estimate, would they consider that? Yes, and for that reason we could not prepare any estimate that would be at all reliable.
1469. Are you aware that the principal portion of the country through which the line would go is practically locked up for twenty-eight years under the Land Act? I am not aware of that.
1470. If the line were constructed, as well as competing for the Broken Hill trade, would you not compete for the Wilcannia trade? Yes.
1471. That is considerably nearer Adelaide and Port Pirie, is it not? It is not nearer, but they have the river conveyance.
1472. It is nearer, is it not? It must be a long distance from Wilcannia to Wentworth, and from there to Port Pirie.
1473. It would be about 400 miles from Wilcannia to Adelaide? About 452 miles by rail.
1474. So you would have to compete for the Wilcannia trade? Yes. I do not think the Wilcannia trade would go to Adelaide by rail, because they would have one gauge to Broken Hill, another to Terowie, and a third from Terowie to Adelaide.
1475. *Mr. Copeland.*] *Mr. Dowel* asked a question with reference to the amount of the different fares, but did not take into consideration the time that would be occupied in the journey. What would be a fair estimate of the time that it would take to do this journey at 20 miles an hour? We should do more than that.
1476. Including stoppages? Yes; it would be a level country and we could travel pretty fast. I should say that the through rate would be about 24 or 25 miles an hour.
1477. Say 20 miles an hour, including stoppages? That would be a moderate estimate.
1478. The distance from Sydney is 732 miles? Yes.
1479. Therefore the journey would occupy 36½ hours, but on the other route from Sydney to Melbourne, Melbourne to Adelaide, and Adelaide to Broken Hill, the journey would occupy 69 hours 40 minutes, so that there would be an actual saving in time of 33 hours? Yes, of course. They travel much faster from here to Melbourne, and Melbourne to Adelaide.
1480. Yes, but a great deal of time would be lost in going round by Melbourne and Adelaide? I should say that the journey from Broken Hill to Sydney direct would be one half of what it is *via* Adelaide.
1481. In round numbers it would save a day and a half? Yes.
1482. Would not that be a very great consideration for most people? Yes, to those who travel.
1483. So that would have a tendency to give you a direct traffic? Yes.
1484. *Mr. O'Sullivan.*] I should like your opinion as to the probability of a passenger traffic between South Australia and Queensland if a line *via* Werris Creek were carried out. The distance from Brisbane to Adelaide is 1,807 miles, against 1,414 miles, the distance *via* Nyngan, Werris Creek, and Wilcannia. That would make it 393 miles shorter. Is it not possible that a large passenger traffic will arise between Queensland and South Australia by the shorter route? I do not think so. 1485.

\* NOTE (on revision):—It is as follows:—£8 16s. 6d. first class, £5 16s. 11d. second class; first class return £13 5s. 3d., second class return £8 16s. 7d.

- D. Kirkcaldie, Esq.  
24 Mar., 1891.
1485. Is there not already a fair passenger traffic between those places? I do not think so.  
1486. There is considerable traffic by sea, is there not? Yes, but the traffic between Queensland and New South Wales is much greater than the traffic between Queensland and Victoria, and the traffic between Queensland and Victoria is greater than the traffic between Queensland and South Australia.  
1487. You do not think that shortening the route by 393 miles would make any difference? Not as far as through passenger traffic is concerned.

Richard Nicholas Williams, Esq., late Manager, Great Cobar Copper Mine, sworn, and examined:—

- R. N. Williams, Esq.  
24 Mar., 1891.
1488. *Mr. Copeland.*] You were for many years manager of the Cobar mine, were you not? Yes; I was manager of the Great Cobar Copper Mine.  
1489. And since operations were stopped in that mine you have managed one or more companies at Broken Hill? Yes.  
1490. So that you have had experience at both Broken Hill and Cobar? Yes.  
1491. You are aware that this is an inquiry respecting a proposed line from Cobar to Cockburn? Yes.  
1492. So that the question of traffic between Sydney and Cobar is not directly of so much importance as the possibility of a traffic beyond Cobar. Do you know anything of the country between Cobar and Wilcannia? I have not been so far as Wilcannia, but I know a great deal of the country about Cobar.  
1493. Do you know anything of the country west of Cobar? Yes; I have been out west a good distance.  
1494. Have you any information that would lead you to the conclusion that there is mineral country west of Cobar? As far as I know, to the west of Cobar there are indications of silver, indications of copper, and indications of gold. I have travelled that route through to Mount Hope, and back as far as Melrose.  
1495. Yes, that is to the south. The information that we want is with regard to the country in the direction of Wilcannia. Do you know the country between Broken Hill and Wilcannia? I have been out a few miles from Broken Hill, and I have seen several copper and tin lodes.  
1496. There are no companies at work between Cobar and Wilcannia? No.  
1497. And no mining being carried on of any kind? No; there has been considerable prospecting between Cobar and Wilcannia, but that has been confined to copper and lead. I have seen several samples, but the country has not been opened up.  
1498. So that the mineral richness of the country, as far as you are aware, is quite problematical? Yes.  
1499. It may be very rich and give employment to large numbers of people, or it may be very poor? It may be.  
1500. And you have no personal knowledge as to the geological features of the country between the two places? No.  
1501. Nor between Wilcannia and Broken Hill? No.  
1502. I suppose you came prepared to give the Committee a good deal of information, as I know you can do, with reference to Cobar itself? Yes; I can give information in reference to Cobar, and supply you with substantial data as to the coal, coke, and firewood consumed at Broken Hill.  
1503. We will give our attention to the Broken Hill mines. What company did you manage? The Broken Hill South.  
1504. You have had experience in mining, both copper and silver. I believe? Yes.  
1505. Your mining experience extends over how many years? Over thirty years.  
1506. You were connected with mining in England, were you not? Yes.  
1507. Have you had experience in any other country besides England? I was five or six years in the United States. I was nearly five years in the Lake Superior copper mines. About 1864 I was in Pennsylvania and Maryland, connected with silver mines there. I was connected with the opening of the Great Calumet Hecla mines.  
1508. You have had considerable scientific experience in connection with minerals? Yes; I have had a great deal of practical experience.  
1509. You have a good practical geological knowledge? Yes.  
1510. What opinion have you formed as to the stability of the silver mines at Broken Hill? I think that there cannot be any doubt as to their stability. I think that there are supplies of ore connected with the Broken Hill mines all round, and a few miles north and south, and outside the district. From my knowledge of the Broken Hill district, there is almost an everlasting supply of ore. But it must be remembered that that supply must consist in the future principally of sulphide ores.  
1511. Is there any warrant for believing that these sulphides, as greater depth is obtained, will continue to be of a payable character? The general impression as regards these sulphide ores is that they will become richer.  
1512. In other parts of the world have not silver mines invariably worked out when a great depth was reached? Yes, when they have been confined to veins, not free leads and fissures, they have contracted and disappeared; but a true fissure will not disappear unless you get to a very great depth.  
1513. If you come to a change of rock will not that be likely to change the mineral constituents of the lode? It is possible; it depends upon the kind of country you start in. If you get into a slate or an aqueous formation and get into the real primary rock, you may find it alter the circumstances of the case. But we have very seldom met with those rocks where we have had to start with real fissure lodes.  
1514. Is there any granite at Broken Hill? I have not seen granite in the Broken Hill district.  
1515. Is there no likelihood of granite coming in and putting out the silver? I think not.  
1516. Have you seen similar rock formation carrying good silver ore in other parts of the world? There are similar rocks in other parts of the world—I believe some in Nevada, in the United States. There are some in some parts of the Cobar district. There are similar rocks in the Billigo district, but at the same time they are not the same kind of rocks.  
1517. The Billigo mine proved a failure? So far it has been a failure. The operations have been confined to a few acres. They have not been extended any distance to prove anything. They sank one shaft, and that is all that has been done.  
1518. Do these sulphides come in at the water level? As a rule they do; but I think that the water level depends more on the surrounding country. If you have a mountainous country at the back your water level in the mine is generally much shallower than it would have been had there been level country at the back.

R. N.  
Williams,  
Esq.

24 Mar., 1891.

1519. Do you think there is any probability of these sulphides changing into iron sulphides when you get to a greater depth? I should not think so. Some think they will enter into carbonates, but I cannot see where it is possible that they can ever come into carbonates again, except they may meet what is termed a "pipe."
1520. Is there much iron pyrites? Yes, a great deal of iron pyrites. But where there is a little copper pyrites you find iron associated with that, and zinc blend.
1521. And galena? You find galena associated with the whole of it.
1522. Then you believe there is every warrant to expect Broken Hill to be a permanent mining field? Yes, I am quite certain of it.
1523. That being the case, you would anticipate a considerable amount of traffic in fluxes, timber, copper, coal, and all that sort of thing? Yes. Although I feel confident there is a great permanency for the mines of Broken Hill, I anticipate also that in a few years they must have some means of providing the mines with cheaper fuel than they obtain at present, otherwise they will not be able to treat sulphide ores at a profit.
1524. How do you anticipate their being able to obtain cheaper fuel? I cannot see any way, unless you can do it by extending this railway from Cobar to Cockburn, then opening up the Lithgow and, probably, the Dubbo fields.
1525. Do you know the Dubbo coal deposit? I have been over the ground once only.
1526. I believe that the Cobar Company had some Dubbo coal? Yes; 15 tons were sent up which had been got out by some private person at Dubbo. It was sent to Nyngan, and the Great Cobar Company paid the carriage up to Cobar for me to make experiments with it. I used that 15 tons.
1527. What for? For smelting purposes.
1528. You did not make coke of it, but used it direct? Used it direct. It was only taken, I think, about 14 feet from the surface. It was a hard dry coal, and it was very deficient in carbon.
1529. Was it a splint or bituminous coal? Splint.
1530. And very deficient in carbon? Very deficient. I used it in conjunction with wood, mixing both together for the furnaces.
1531. You did not use it for steam purposes? No.
1532. What was the result of your experiment? It was not altogether favourable. We considered that that kind of coal, unless our furnaces were altered, would be useless. We did not change the grates; we had to use a grate about 5 feet long to take the lengths of wood. When coal is used, the grates are only about 2 feet. Our reverberatory furnaces were out of proportion; but only having 15 tons of this fuel, we did not think it desirable to change the furnaces.
1533. Do you think that that coal could be converted into coke? I do not think that the coal, of which we had 15 tons, would make coke, or be fit for steaming purposes.
1534. Then it is virtually of no account? Yes; but there are deeper seams, and from the little that has been done on the Dubbo field you cannot say that anything has been proved. Two or three holes have been made, but what has been done amounts to nothing.
1535. What has been done has proved the coal to be practically worthless? Yes, as far as I am aware of.
1536. The practice, I think, is not to use natural coal for smelting silver? That all depends on circumstances. You do not use coal in connection with the water-jackets.
1537. Do they use coke in calcining furnaces? No, coal or wood; it is better than coke.
1538. Do you think, then, if the railway were carried through to Broken Hill there would be a prospect of developing the coal trade? I think so.
1539. In western coal? In Lithgow coal.
1540. Have you had any experience of it? I have seen it used at Cow Flat years ago. The Lithgow coal is very useful and good coal for any smelting purposes in connection with the reverberatory furnaces.
1541. Do you know Mr. Lewis Lloyd's furnace? Yes.
1542. He uses small coal? Yes, very fine.
1543. For which he pays about 2s. 6d. a ton? Yes.
1544. He does his smelting in a satisfactory manner, does he not, with small coal? Yes.
1545. You are of opinion that a trade in coal would spring up if the railway was opened? Yes.
1546. And that the coal in the western district could be used for smelting operations as well as for steam purposes? Yes, especially if they treated the sulphide ores on the ground. Lithgow coal would then come into great use.
1547. At about what level are the sulphides found in Broken Hill? They vary. At the South the sulphides are 200 feet below the surface. Further south, 100 feet; still further south they crop out almost at the surface. As you go north they become deeper, and further north they rise again and appear on the surface. You can see that the cluster of mines around the Proprietary mine are simply in a basin.
1548. Do you know anything of the country around Broken Hill? Yes.
1549. Do you think they have permanent lodes? I do not think that any of them have been opened so far as to enable us to say whether they are permanent or not. I should say that the Pinnacles was a permanent lode.
1550. And the Round Hill? I never saw that.
1551. And these lodes being sulphides from the surface they are not likely to change their minerals? Not unless some phenomenon is met with in sinking.
1552. You have no doubt about the permanency of the field? I have no doubt about it at all. The whole question will resolve itself into a question of the price of coal and labour by-and-by.
1553. You have had experience of timber in mines. Do you think there is a likelihood of our developing a timber traffic between Broken Hill and Dubbo in connection with the mines? I think so. In the Proprietary mine they are using 200,000 cubic feet of timber per week.
1554. That is softwood? Yes, and hardwood, mixed.
1555. Brought from where? A great deal of it is Oregon timber, and some blue gum, brought from South Australia. It cost about 22s. 6d. per 100 feet.
1556. Speaking as a mining man, do you think it would be economical to continue the use of pine wood for underground timbering? I am very doubtful about it. One advantage about pine is that it is light for men to handle. The question is whether Oregon timber will stand without taking the dry rot. In some mines, where there is a strong iron solution, that wood becomes hard, and is not liable to dry rot; but in other mines, which are very dry, it is subject to dry rot.

R. N.  
Williams,  
Esq.  
24 Mar., 1891.

1557. You think there would be a trade in hardwood timber for the mines? I think so. All the shafts that have been sunk in Broken Hill are timbered with hardwood. The slabbing is done with hardwood sawn timber.

1558. I suppose they are not likely to have to come eastward of Wilcannia for limestone, iron, or fluxing? It is questionable whether they will have to come that far for limestone. The consumption of coke in Broken Hill to-day is something like 7,000 tons a month.

1559. Do you know where they got it from? A large portion of it comes from England, and some is colonial made. The cost is from £5 to £5 5s. a ton, and it is as high as £5 8s. a ton delivered at Broken Hill.

1560. You are quite sure as to that price; it was stated in evidence the other day that the coke cost them only £4 3s. a ton? They have had coke delivered within the last six months at prices as high as £5 8s.—the average price being about £5 5s. per ton.

1561. That is English coke? Yes.

1562. Do you know the price of the colonial coke? Yes; Australian coke costs about £4 5s. 9d., or £4 6s. per ton.

1563. Do you know where it is made? I think some comes from Bulli, and some from Newcastle; but I am not clear as to where they got it.

1564. I suppose that the Australian coke all goes round by sea to Adelaide? Yes, it cannot go any other way at present.

1565. Do you know anything as to the comparative qualities of the two kinds of coke—colonial and English? I have never made any analysis of it, but I understand that the heating qualities of the two are about the same. The colonial coke, as a rule, contains rather more ash than the English coke. I think the colonial coke contains from 10 up to as high as 15 per cent. of ash, whilst the English contains 4 or 5 up to 7 or 8. So that in getting 100 tons in they pay for 8 tons of colonial made over and above the English, as that is simply ash.

1566. Is the ash that remains very deleterious in connection with the smelting? I do not think so. I do not think it injures the smelting in the slightest degree.

1567. Has it not to be fluxed and to be formed into slag? It may require a little more fluxing sometimes, but there is an advantage in that. It is found of some assistance in some mines to sift all the ash that comes out of the coals and mix it with the charge. I do not think anybody could decide the question, except a metallurgist, in a particular mine.

1568. Would you advocate the continuance of the practice of obtaining supplies of coke from England? I cannot see that it is necessary at all. I visited Sunny Corner the other day and found that they were using colonial coke and doing very good work with it, and I heard no complaint whatever against it. It is not quite so strong all round as English coke. As far as I can ascertain from the workings at Sunny Corner, I imagine that the colonial coke is quite good enough for smelting any ore at Broken Hill. There is a little prejudice against colonial coke there.

1569. The ore at Broken Hill is sulphide ore, is it not? At the deeper levels. The ores now being treated are carbonates.

1570. The ores which have been smelted with colonial coke are sulphide ores? Yes, and very refractory ores, containing a large amount of zinc and silica.

1571. Therefore the Sunny Corner ores, which are now being smelted with colonial coke, are quite as difficult to smelt as any ores likely to be found at Broken Hill? Yes.

1572. We may reasonably assume that if they can carry on smelting with colonial coke at present at Sunny Corner there is nothing to prevent them doing it at Broken Hill? I cannot see anything to prevent them. It is a matter of a few shillings. If 100 tons of English coke cost £500 you would have in that 5 per cent. of ash. You would have to obtain 107 or 108 tons of colonial coke at the same price to be equal to that 100 tons of English coke.

1573. Then you think that there would be no difficulty in getting a considerable portion of the coke trade? I do. I may inform you that at present it is estimated that they are consuming about 2,500 tons of coal per month for steaming purposes in connection with the mines at Broken Hill. But there are several mines there that do not use coal at all—they use wood for steaming purposes.

1574. Do you know what coal they are using? Principally Newcastle coal; that coal is costing now, delivered at the mines, £2 11s. 7d. per ton.

1575. Some of the others are using wood, are they not? Yes, several.

1576. Will their supplies not rapidly disappear? You have to go back 12 or 14 miles now to find timber; it is only small scrub.

1577. So they will have more and more to depend on coal? Yes; the consumption of coal and mining timber is increasing every week.

1578. And I suppose, looking at the field as a whole, the place has scarcely been touched yet, except the mines on the Hill itself? Yes.

1579. But there are many places likely to be developed into payable mines? There are many outside places. I cannot see anything to prevent them; they have not been opened yet.

1580. *Mr. Tonkin.*] In the event of their deciding to treat sulphide ores at Broken Hill, would it not be advisable to use reverberatory furnaces instead of water-jackets? That is a question which is being considered now throughout the colony and in the United States. It is a question of cost against cost. Whenever I have gone into any calculations comparing the two costs, I have found that there has been very little difference between them. Sometimes, according to local circumstances, it has been in favour of the reverberatory furnace; but in places like Broken Hill, where there is no wood and coal, you would be almost compelled to use coke. The great advantage, and the only advantage claimed in America in using the water-jacket furnace, is that it does not require so much skilled labour as is required in connection with the reverberatory furnace. Every man using a reverberatory furnace must be a trained man, but if you have one good man in a shift using the water-jacket he can work it.

1581. Could you give the Committee any idea of the proportion of coke used in smelting a ton of sulphide ore with the water-jacket furnace, and the coal required to smelt the same class of ore in a reverberatory furnace? For every 6 tons of ore the water-jacket furnace takes 1 ton of coke—say 1 against 6. In smelting with the reverberatory furnaces it is generally asserted that it takes ton for ton of coal, but according to my experience it does not take quite that.

R. N.  
Williams,  
Esq.

24 Mar., 1891.

1582. Then you would want about five times as much coal as you would coke? Yes.
1583. Are the expenses, beyond the fuel itself, much more in connection with the water-jacket furnaces? The labour is about the same, and the expense of working the machinery and keeping it in order; but the water-jacket furnace is apt to burst. If the reverberatory furnace goes wrong, it is only a matter of shifting a brick and putting in a little clay. If the water-jacket furnace bursts, you have to throw it away and use another one, which is expensive. You can calculate, in dealing with a good free smelting ore, that 15 cwt. of coal will smelt a ton.
1584. Did you hear the Traffic Manager state the price to be charged per ton for carrying coal to Broken Hill? No.
1585. Suppose that coal could be delivered from Lithgow at the Broken Hill mines for £1 6s. 6d. per ton, would not that materially reduce the present price of coal there? If you can deliver the coal for £1 6s. 6d. a ton, that will leave a margin of £1 a ton.
1586. Supposing that statement to be correct, have you any doubt about our commanding the coal traffic? I have no doubt that if you go to Broken Hill and say that you can supply them with coal at a certain price, they would give a contract for thousands of tons. There is no doubt that you will have a difficulty to contend with, as the South Australian people will lower their rate to compete with you.
1587. Suppose the coal is delivered at Port Pirie at £1 5s., do you think it is possible for them to compete with us? They cannot. There is one thing against them which will be a difficulty all through; they have not got the same gauge on their line.
1588. In the event of coal being delivered at a reduction of 10s. or 12s. per ton as compared with the present prices, do you think it would materially increase the consumption? Yes. If you could lower the price in connection with the mines at Broken Hill 20 per cent., no more wood would be got in for steaming purposes.
1589. Do you think that there would be any of this low grade ore sent by return trucks to Lithgow if it could be delivered at  $\frac{1}{2}$ d. a ton or less? I should say there is every probability that the future will bring forward something of that description. The time would come when coal would be taken from Bowenfels to Broken Hill, and they would find it to their advantage to send back low grade ores to be treated at Lithgow with cheap coal.
1590. Are you aware that they are carting it from Sunny Corner? Yes.
1591. And you know also that at Broken Hill there is a very large amount of ore sent down to be treated at Adelaide and Port Pirie? Yes.
1592. Is it not a moot question whether they should treat it at Port Pirie and Adelaide, or at Broken Hill? It is.
1593. It is doubtful which pays best? Yes; but in treating ores at the mine you have certain advantages. You have low grade, medium grade, and rich grade ores. It would not pay you to treat the medium and rich grade ores and throw away the low grade, but it would pay you to mix the three together. It would not pay to leave the low grade ore in the mine, nor would it pay to send the low grade ore any great distance. To send it to Dry Creek, or to Port Pirie, you would have the carriage to pay, and there would not be sufficient value in the ore to cover the cost, whereas to utilise it it would come in as a flux.
1594. Do not the carbonate ores to a certain extent act as flux for sulphide ores? Yes.
1595. Do they treat both ores in the same furnaces? I think from what I know of Broken Hill that there they are using a much larger proportion of carbonates than of sulphides.
1596. Is it not usual in all cases to pick the eyes out of the mine first? In too many instances.
1597. The easily treated carbonate ores are seized upon and treated first? Yes; I have seen that done, but I have seen exceptions. Where I have seen exceptions it has been generally brought about by good straight argument from the mine management against it.
1598. But as a rule managers wish to make big returns at a small outlay? As a rule the mining manager feels himself insecure in his position and he says, "It is my business to make the best returns possible whilst I am here." There are men who adopt that course and make hay whilst the sun shines. A manager with no connection with the mine, no shares, and who is as honest and fearless as if the property were his own, works the mine better and gets no thanks for it.
1599. Do you know anything of the country between the Broken Hill Proprietary Mines and Wilcannia? I do not know anything about that country.
1600. You could not say whether there is likely to be any mining development there? I have seen, on several occasions, very good ore brought to Cobar from that district, and I have assayed a great number of samples, and I have been inclined to think for many years that there must be a mineral district about Wilcannia somewhere.
1601. Would it pay at the present price to work copper at such a long distance away? It all depends on the size of the lode and the smelting facilities.
1602. Do you know anything of the tin deposit? I have seen tin at Broken Hill, but never went to see the tin mines. The general impression is that there are payable mines of tin about Broken Hill. That is an impression which I have obtained from other people—I do not know anything about it myself.
1603. If the Lithgow coal can be delivered at about 12s. a ton less than Newcastle coal, do you think they will take Lithgow coal in preference to Newcastle coal? I am quite certain that they would.
1604. Is it equal for steaming and smelting? I have not heard it objected to for smelting and steaming purposes.
1605. Have you any knowledge of the manner in which coke has been made in this country? Only what I have heard from others. My impression is that they do not clean their coal well.
1606. Do you think the coal is not good enough if properly crushed and washed;—could they not manufacture coke here with a less percentage of ash? I think they could improve very greatly on it.
1607. Have you taken particular notice of the Bulli coke? No, not of any except what I have seen used at Sunny Corner.
1608. Have you ever heard of the coke being too strong for smelting purposes? No; but I have heard of a coke being too friable.
1609. Too strong in the furnace? That is a very peculiar coke. There is some produced so hard that it is not fit for smelting even in water-jacket furnaces.
1610. You would not call it too strong a coke? No, too hard. I should say that the heat was too intense.
1611. What I mean is that it carries the mineral on the top of it and does not give way in time to keep the furnace going? I do not think there is any coke here of that description.

R. N.  
Williams,  
Esq.  
24 Mar., 1891.

1612. Do you know Mr. Richards? Not personally, but by repute.  
 1613. Do you know him to be an able man? Yes.  
 1614. Would you be surprised to hear that he stated that the Bulli coke was too strong, and that he had to use common gas coke? I am surprised at that. A great deal depends on whether you use full charges or medium charges. The sulphide ores at Sunny Corner contain a great deal of zinc, and if it is highly charged in the depth between the fluid and the ore in a state of calcination a ring of zinc is formed, and the top ore has to pass through that ring of zinc. It is then a question whether the coke is too strong or whether they are charging too heavily. No man can decide that except he is at the mine.  
 1615. You believe that the colonial coke can be made of better quality than it has been? Of course I do. It is my impression that if the Bowenfels people sink deeper they will be able to get a better class of coal and be able to make a better class of coke.  
 1616. Do you think it is possible that at Dubbo they may get better coal if they go deeper? I think so. I have had conversation with the Rev. Father Curran, who resides in that district, and he is of opinion that there are better seams there at deeper levels.  
 1617. Would you advise this Committee, from your own knowledge, to recommend the construction of this line with the view of getting a coal and mineral traffic between Broken Hill and Bowenfels? My feeling runs in connection with the interests of mining generally, and with the view of opening up the western district, the development of the mines at Lithgow, and the probability of opening up mines at Dubbo, I should say that you are justified in extending the railway from Cobar to Broken Hill. If Dubbo can be made to produce an average quality of coal it must command the whole western trade. As far as the question of the new railway paying is concerned I can say nothing.  
 1618. What you say is independent of any other developments that may crop up hereafter? Yes.  
 1619. You think we should be justified in recommending the line if only to connect the Broken Hill mines? I should say that you are justified for the sake of Broken Hill alone, but if I thought for a moment that there was not going to be anything discovered between Broken Hill and Wilcannia, and Cobar and the western districts, I would say that you should not construct the line to Broken Hill. But the time will come when at Broken Hill, Wilcannia, and other places there will be a chain of mines connected with Lithgow.  
 1620. I suppose you know the district between Broken Hill and Wilcannia, to the north, to be rich country? I know the district.  
 1621. Would not that be likely to carry a large population if there was a railway even to Wilcannia and Broken Hill? No doubt that would assist very much.  
 1622. Do you think that if the coal at Dubbo were anything like as good as the Lithgow coal it would take command of the western district? I think so.  
 1623. Why? Because Dubbo is so much nearer, and after you pass Dubbo it is all level country.  
 1624. And consequently you can carry at a minimum rate? Yes.  
 1625. Then would you recommend that the railway should be constructed in the interests of the country? I think so.  
 1626. And if it can be shown that Wilcannia will return a very large percentage of the cost and working expenses, you would advocate it from a paying point of view? I should think so.  
 1627. You have no doubt that the line will command a great amount of coal traffic to Broken Hill? Yes; I have no doubt that if you can carry coal to Broken Hill at £1 6s. 6d. per ton you must monopolise the trade. I do not see how it is possible to take Newcastle coal round to Broken Hill at that price.  
 1628. And that trade will be at least from 2,000 to 3,000 tons a month? Yes, it is that, and increasing.  
 1629. And actually would increase if the price were reduced? Yes.

WEDNESDAY, 25 MARCH, 1891.

Present:—

THE HONORABLE JOHN LACKBY (CHAIRMAN).

The Hon. ANDREW GARRAN.	WILLIAM SPRINGTHORPE DOWEL, Esq.
The Hon. FREDERICK THOMAS HUMPHERY.	EDWARD WILLIAM O'SULLIVAN, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	CHARLES ALFRED LEE, Esq.
HENRY COPELAND, Esq.	WILLIAM McCOURT, Esq.
JAMES EBENEZER TONKIN, Esq.	JAMES PATRICK GARVAN, Esq.

The Committee further considered the proposed Railway from Cobar to Cockburn.

Richard Nicholas Williams, Esq., late Manager, Great Cobar Copper Co., sworn, and further examined:—

R. N.  
Williams,  
Esq.  
25 Mar., 1891.

1630. *Mr. Tonkin.*] You say that the consumption of coke is at present 7,000 tons a month? Yes.  
 1631. And the consumption of coal about 2,500 tons? Yes.  
 1632. If there was a great reduction, something like 20 per cent. in the cost of the coal, could you give an estimate of what the increase would be in the consumption? I should think, allowing for the increase of machinery, and dispensing with the present consumption of wood, the quantity might be doubled. It would be nearly 5,000 tons a month.  
 1633. Is there any probability of an increase in the consumption of coke? There is a certainty, especially as they are building new smelting works. If they commence smelting the consumption of coke will increase.  
 1634. You think we should not be over estimating it if we estimated the consumption of the two articles at 12,000 tons a month? No, the estimate would be rather under than over the mark.  
 1635. *Mr. O'Sullivan.*] I should like to have your opinion with regard to a comparison between Broken Hill and Nevada or Virginia City? I have never been to Virginia City.  
 1636. You have had considerable American experience? Yes, I spent a good deal of time at Michigan, Lake Superior.  
 1637. You have gathered a great deal of knowledge about the Comstock and other mines? The knowledge I have gained of the Comstock mines has been what I have read and from men I have met. I have no personal knowledge of that district.

1638.

R. N.  
Williams,  
Esq.

25 Mar., 1881.

1638. As a matter of fact, that lode is almost worked out now? No, I think it is still continuing downwards.
1639. But all the rich ores are worked out? The richer portion has been taken out, but the return from the deeper part of the mine continues to pay a dividend.
1640. How long have those mines been worked? I think over twenty years.
1641. From knowledge you have acquired, do you think the mine at Broken Hill will last even longer than those? I think so. There is one point in connection with the Broken Hill mines which I should like to make clear. The question was asked whether the richer ores are worked out first, leaving the baser ores to be treated afterwards. Of course, in treating baser ores the expenses are increased, and in an inland district like Broken Hill there is a difficulty which must in the future be overcome by means of cheaper fuel than they are using now.
1642. You hold the opinion that two things are requisite for the long continuance of the Broken Hill mines, and those two things are cheaper fuel and cheaper labour? Yes, those are requisite things.
1643. Have you given much attention to the country round Silverton? I have passed through there, but only by train. I have never inspected the mines.
1644. Have you formed an opinion upon that portion of the country? No, I have no knowledge of their mines.
1645. *Mr. Lee.*] Have you given any attention as to how the existing population of Broken Hill obtain their subsistence at the present time? I have paid a little attention to that. Coming in connection with business people I observed where they were getting their supplies from. The population of Broken Hill is about 26,000, and I calculate that the consumption in connection with the mines alone, including coke, coal, firewood, iron, powder, and fuses must at present amount to about 15,000 tons a month.
1646. Does not that population exist directly and indirectly through the mining industry? Directly, because there is nothing there to support a population except the mines.
1647. No other industry of any kind? None, except the pastoral industry.
1648. Suppose those mines were to collapse altogether, what would be the position of Broken Hill then? If the mines were to collapse I should think that that district would drift into a state of stagnation.
1649. Do you think that the population would leave the district? A large majority of them would be sure to do so.
1650. Do you think the mining sufficiently remunerative to sustain the present population? I think so.
1651. Have you given any attention to the quality of the mines outside the Proprietary mine? Yes.
1652. Are you of opinion that there are mines yet in an undeveloped state likely to require a large amount of labour? Yes, in the course of time. If they sink to a greater depth there is a greater possibility of their finding payable lodes, although at the present I do not think that it pays to mine outside the Broken Hill Proprietary, the Central, the South, the Junction, the British, Block 14, Block 11, and also the Consols. Then there is the Pinnacles, 13 or 14 miles south; I think that is paying.
1653. What effect would three years of severe drought have upon the place? It could not affect the mining interests, except that it might injure the water supply for the population.
1654. Would that cause the mining operations to be suspended? No, because the drought would not affect the water obtained from the mines. It would affect the supply of drinking water.
1655. How long did you reside there? About four months.
1656. Could you tell the Committee what is the feeling among the people there as regards the metropolis of this colony—is there any indication on the part of the people of a desire to trade with this colony, or do they simply wish to trade with the nearest capital? Among the business people in the town there is a decided feeling in favour of Sydney; but there is a portion of the population in Broken Hill who have no sympathy with Sydney—they sympathise more with Melbourne and Adelaide. There is another line of thought which arises amongst them: their railways are in private hands, and a great many, some residing in the district, and others in Melbourne and Adelaide, have an interest in them.
1657. Therefore they would not like to see a main trunk line made from Sydney? Of course not.
1658. They are somewhat opposed to it? Yes.
1659. I presume that there are certain business relations existing between the Broken Hill people and the business houses of Sydney? Yes.
1660. Do you think that that interest would be increased with better means of communication? I think so.
1661. If there is a railway direct from Sydney to Broken Hill it would be increased? No doubt a main trunk line from Sydney would give considerable advantages for transit. Merchandise from Sydney would be delivered in a few days, whereas on the other line, owing to the necessity for transshipment at Terowie, merchandise often gets delayed, and does not arrive at Broken Hill for three or four weeks.
1662. In consequence of the change of gauge? Yes; articles are rolled on one side at the place of transshipment and forgotten, then people have to wire to get them up.
1663. Does not that cause great loss? Yes, because the merchandise is lying there and the owners cannot put it on the market, and the interest on the money is going on. If the goods could be delivered more quickly interest would be saved, and a great number of people in running their businesses would keep smaller stocks than they have to do at present.
1664. Do you think that if direct communication were afforded by means of the proposed line the business people would be likely to use it, even at a higher rate of carriage? That I could hardly say. I should imagine that the people would not be inclined to pay much higher rates. They would wish to go to the cheapest market.
1665. Would not the improved means of communication have something to do with it? Yes.
1666. There are certain classes of goods, particularly with people running small stocks, which it is desirable to get frequently and quickly, and in that case would they not pay a higher rate? Yes; for small articles. There are many things sold at Broken Hill much dearer than they are sold in Sydney. Although the district is in New South Wales, their prices are regulated by Adelaide prices. Whilst I was there, wanting several small articles, we called at different shops, and the prices were astonishing to us, the consequence being that we got the articles from Sydney much cheaper by post.
1667. Do you think there is any feeling against Sydney which would induce the people not to use the line—has there not been for some time a feeling that they have been left out in the cold? Some people make use of that feeling, but I think that among the better disposed people that is not considered to be the case. They know that in a new place they cannot have everything they require immediately, and I think that sensible people look at it in that light.

- R. N. Williams, Esq.  
25 Mar., 1891.
1668. Do you think that if they are brought into direct contact with the metropolis it will overcome that feeling? Yes.
1669. I take it that the main stay for Broken Hill must be the treatment of large quantities of low grade ores? Yes.
1670. The question also is how cheaply those ores can be treated? Yes.
1671. Fuel would be a most important factor? Yes.
1672. Do you think there is any probability of large quantities of low grade ores being brought to the nearest coal mines at 26s. 6d. per ton? I should think there would be.
1673. You bear in mind that in taking out the fuel at 26s. 6d. a ton there would be a return freight in the shape of bullion? Yes.
1674. The question is whether it would not be more profitable to bring the ore to the coal mines? Yes, that is the question. But another question will crop up, and that will be whether it will be more beneficial for the mining people to get coal to supply a certain amount of output on the ground, and return back loading to some mine where they can get good cheap coal.
1675. You are clearly of opinion that the mines under ordinary circumstances should give a large output for the next ten years? Yes.
1676. Do you think there is any doubt about it? I do not think there is any doubt. But during the next ten years they will have to pay more attention than they have done to the smelting of sulphide ores.
1677. It is a fact that in most mines the best ore is the first to be made use of? That is the case in all mines.
1678. Outside that there is a large quantity of lower grade ores? A very large quantity—in fact, I believe there are millions of tons.
1679. If, therefore, the exportation of these takes place in large quantities it means that there must be a very large importation of mining machinery? I think so.
1680. Which will bring freight to the railway? Yes.
1681. You have already said that you know very little about the mining between there and Wilcannia? I know very little about that.
1682. You have had experience in other mines in the colonies? Yes. I have been in the colonies over twenty years, and I have been conducting mines in South Australia.
1683. You know that the treatment of low grade ores so far has been almost a failure? Yes.
1684. Is there any known process by which these ores are likely to be turned to account? There is no known process for treating very low grade ores except by cheap fuel. Fuel is the important thing.
1685. Next comes saving machinery? Yes. I could enumerate two or three instances where we have had the advantage of cheap fuel and have done fairly well, where, under the same conditions of ore and the price of fuel, at Broken Hill we could not do anything. At the Currawang copper mines, the Phoenix, we had the advantage of an abundant supply of wood which we got at 3s. 6d. and 4s. 6d. a ton. The average percentage of that mine for years did not amount to 5 per cent. It was worked at an average of 4½ per cent., and we made a profit out of 4½ per cent. ore through having cheap fire bricks and cheap fuel. If we had had to treat that ore at Broken Hill we should not have looked at it. There are other mines in the colony which I could name, existing under similar circumstances, where we have done very well, but had we been at the disadvantage of having to pay high rates for fuel we could not have done anything.
1686. *Mr. Copeland.*] Will you state what it costs to reduce ore at Sunny Corner? As far as I know the cost of smelting is 24s. or 25s. a ton.
1687. What is it at Broken Hill? Mining and smelting at Sunny Corner cost 34s. a ton. At Broken Hill it has been over £5, and it is now between £4 and £5. At Sunny Corner they have the advantage of cheaper fuel.
1688. Are not Sunny Corner ores more difficult to smelt than Broken Hill ores? Yes, and they are of a lower grade.
1689. *Mr. Lee.*] I suppose it is reasonable to assume that payable ores would be found at still greater depths than they are found at now? Yes, rich ores are still going down below the 400 ft. level.
1690. The lower they go the greater the permanency of the mining field? No doubt.
1691. Can you have any doubt whatever of the sustaining of the population at Broken Hill? Do you know of any cause for it to dwindle away? I know of none, except this—there are 26,000 people there now, and in the mines they are treating a large per cent. of the higher class ores, and the future of that field—it may not be for a year or two—must depend upon the products obtained from the sulphide ores. Then the question arises whether they can treat the sulphide ores under the present conditions of high priced fuel. I am afraid they cannot.
1692. Even under those conditions, do you think there is any possibility of that population falling away during the next ten years? I should not think so.
1693. As a mining expert, you have to consider these matters from every point of view, I presume? Yes; it is eighteen months since I left there, and to be positive on that point I should require information from almost every mine, and we should have an opportunity of going to the mines and forming an estimate of what is in sight. That is beyond my reach.
1694. Do you think the bullion could be carried from Broken Hill to Sydney for shipment? I think so.
1695. What is about the weekly or monthly output of bullion? I have not any idea; I think it is something considerable, amounting to some thousands of tons. I think it is something over 1,500 tons a week. It has been increased since the Central has been worked. The Central is turning out 80 or 90 tons a week.
1696. That bullion at the present time, I understand, is sent by ship from Port Pirie to Sydney for transshipment to England? A great deal of it is, not all; some of it finds its way into Port Adelaide and is shipped there.
1697. Do you know of any reason why it should not come by rail? I can assign no reason. I think it must naturally come here.
1698. Do you happen to know what the freight is from Broken Hill to Sydney? I do not know what it is, but I know they have to ship it under a considerable disadvantage, and it takes three weeks to deliver it in Sydney; whereas, if there was a railway from Sydney to Broken Hill, it could be delivered here in forty-eight hours.
1699. Which, I presume, would be a great consideration in the transshipment of valuable metals? There would be a fortnight's interest on the money, and that would be something considerable on so many thousand pounds; and there is the insurance. 1700.

R. N.  
Williams,  
Esq.  
25 Mar., 1891.

1700. Having direct communication would have considerable influence with the consignees of that bullion? No doubt.
1701. Have you any interest in any mine or land on the proposed line? I have not a share in any railway or land in Broken Hill, or in any Broken Hill mine.
1702. Your attendance here is purely voluntary? Yes. I have eighty shares in one coal mine at Cobar, but I do not know whether it is at work.
1703. *Dr. Garran.*] You say that the future of Broken Hill will depend very largely on the treatment of sulphides? Yes.
1704. Do you know in any part of the world where there are sulphides of similar quality to those sulphides being successfully treated? They are treating sulphides at Sunny Corner and Lithgow successfully at the present time. At Peelwood many years ago, where we had reverberatory furnaces, we treated them successfully. In some parts of North America they are shipping ores to the works, and they are treating them there successfully, but I do not know of any scientific process that has been made a thorough success.
1705. Then the problem that has to be solved at Broken Hill is in partial solution elsewhere? Yes.
1706. But the results have not been very satisfactory? No.
1707. Are the conditions more or less favourable at Broken Hill than at the places you have mentioned? I think about equal.
1708. Taking the dearthness of fuel and flux at Broken Hill, the difficulties are not greater than in other places? I consider that they are about equal, I mean that the ores are about equal to the ores operated upon in other parts. At Broken Hill, of course, they have a considerable disadvantage in having to pay so much for fuel.
1709. Is the quality of the ore similar? Yes.
1710. And other conditions are not so favourable? No.
1711. Then to a certain extent we have to treat the ores by the same process, no better having been invented than any that now exists? Yes.
1712. If a better process should be invented there is a great future for Broken Hill? Yes; and should any process not be invented, I believe that the difficulty will be solved by the use of cheap fuel.
1713. But how are we to send cheap fuel to an inland place hundreds of miles away? That is the question.
1714. There are no coal mines in the immediate neighbourhood of Broken Hill? No.
1715. The coal must be imported from Port Pirie, or it must be brought from the western coal fields of New South Wales? Yes. I think that if the Dubbo coal fields turn out coal of a good quality the difficulty will be solved then.
1716. Do you know enough of the Dubbo district to say that that is a practicable coal field? I think there is every probability that if deeper seams were opened up suitable coal would be obtained from that district.
1717. That is a point that has to be developed? Yes.
1718. You cannot give evidence on that yet? We cannot base any calculations on anything that has been done in the Dubbo district yet.
1719. We must take Lithgow as the point of departure at present? Yes.
1720. We have coal there that will do for smelting purposes? Yes.
1721. And out of which we can make a certain quality of coke? Yes.
1722. If the line is to pay it will depend largely upon the traffic from a mineral district? Yes.
1723. Do you know of any other mineral district on the route likely to throw a paying traffic on the line? Personally I do not know of any district likely to yield large returns in the future, but I think there is every probability of minerals being found of a payable quality and quantity in the districts leading from Cobar to Wilcannia, and from Wilcannia to Broken Hill.
1724. You think that district may benefit the line? I think it is a mineral district.
1725. That is a speculation? Yes.
1726. All you can say is that the line follows a route which has mineral possibilities? Yes.
1727. We cannot say more than that at present? No.
1728. On the line between Broken Hill and Wilcannia do you know of any fluxes or limestone? No doubt there are some about 20 miles from Cobar; and there is limestone, but I do not know of what quality.
1729. Would they be on the line of railway? Near the line.
1730. Sufficiently near to throw a traffic on to it? I think they would be 20 miles from the line, but the best limestone we are getting is in the neighbourhood of Lithgow and Sunny Corner.
1731. When you were at Broken Hill were you aware that much of the vegetables and fruit were brought from Burra Burra? Yes.
1732. Do you think that if we carried the line to the nearest point of the Darling we could supply Broken Hill more cheaply than at present? I am doubtful whether you could supply it cheaper. Round the district of Burra Burra there is a great deal of settlement, and a great deal of work has been done. It is easy to lay out a new scheme for producing agricultural products, but it would take a long time to enable you to compete with the people now settled in that locality.
1733. Is it a dry district? It is fairly dry, but not so dry as Broken Hill.
1734. But would it not be easy to raise vegetables as cheaply there? Yes; I think with irrigation you could raise the vegetables you require in the immediate district of Broken Hill.
1735. Without going further? Yes.
1736. If we dammed the streams and collected the water we could irrigate? Yes.
1737. Do you think that will be done? I think it will be.
1738. And it is not necessary to go so far afield as the Darling? No.
1739. How far is Burra Burra from Broken Hill? About 200 miles.
1740. The Darling is only 65 miles; if we could grow vegetables as cheap there should we not have the supply of Broken Hill? Yes.
1741. At any rate that is the nearest point at which a large water supply can be obtained, as far as is known at present? Yes.
1742. You have the whole length of the Darling—a large mass of water. Is there a place nearer to Broken Hill from which you could supply this produce? No, that would command a great deal of attention and supply a great want.

R. N.  
Williams,  
Esq.  
25 Mar., 1891.

1743. The line to the Darling would be a great advantage to Broken Hill? It would for supplying the people with vegetables and fodder.
1744. Would that kind of produce give a paying traffic? That I could not say.
1745. The supply of milk would be conveyed by that line? Yes, the principal supply of milk for Broken Hill comes by the Adelaide line.
1746. How far? From Burra Burra, and even beyond.
1747. That is 200 miles? Yes.
1748. Could we not supply them from the Darling cheaper? If you could produce the stuff there I daresay you could.
1749. Could we not dam the Darling water back for miles? No doubt all that western country is very favourable for irrigation.
1750. They want a market? Yes, and water.
1751. You have water in the Darling, and a market at Broken Hill? Yes.
1752. If you put the two together would you not get a traffic? No doubt, as there is a great market at Broken Hill.
1753. *Mr. Tonkin.*] Will you tell us the cost of limestone delivered at the mines of Broken Hill? I am not exactly aware of the cost at present, it varies so much. I believe that a great deal of it would cost from £1 up to 30s. or £2 a ton. Some has been delivered for 17s. 6d.
1754. Do you know what the contract price is now? I do not.
1755. It is too low at any rate to think of carting it from Lithgow? I do not think you could cart limestone.
1756. You do not think any traffic can be got from that? No.
1757. Even if it were delivered for 33s. a ton? I do not think so.
1758. *Mr. McCourt.*] You spoke of cheap fuel. What would be the lowest price at which it could be used for low grade ores? I do not know the lowest price. In the first instance, I should have to be thoroughly acquainted with the value of the ores, the number of ounces of silver they contained, and the percentage of lead. That I have no means of getting at.
1759. If the ores are of very low grade would the coal have to be very cheap? Yes.
1760. The coal supplied now costs £2 7s. 8d. a ton? Yes.
1761. What do you think would be the lowest price coal could be delivered at from Lithgow? I have no idea.
1762. £1 6s. 6d. would be the freight? Well, it could be delivered there for 30s.
1763. Could low grade ore be worked with coal at 30s. a ton? Very low grade ore could not. If you could get sulphides containing 10 or 15 oz. of silver, and 10 per cent. of lead, you could treat that with coal at 30s. a ton.
1764. Is there much of that class of ore at Broken Hill? Yes, a great quantity.
1765. That would yield that much? Yes; there is a great quantity there that will go 12 oz. or 15 oz. and give 50 or 60 per cent. of lead.
1766. It would pay to work that using coal at 30s. a ton? Yes.
1767. Would not that ore go to Port Pirie for smelting purposes? I do not think they can deliver coal at Port Pirie any cheaper than that; and if they should start smelting works for reducing low grade ores at Port Pirie, and the coal cost per ton, delivered at Port Pirie, an amount equal to what it would cost delivered at Broken Hill, they would be at a disadvantage in sending their ores from the mine to Port Pirie.
1768. You spoke about sending low grade ore to Lithgow? There may be a possibility of doing that.
1769. Only a possibility? Only a possibility—I cannot say that they would do so.
1770. Do you know the price of coal delivered at Port Pirie now? I do not.
1771. *Mr. Humphery.*] What quantity of coal would you require to smelt 1 ton of low grade ore? About 15 cwt.
1772. What would be the value of 10 oz. of silver? About £2.
1773. And of lead? Two shillings a unit.
1774. And you get £3 of silver and lead as against what cost? The cost of 15 cwt. of coal. It could be done with a little less than 15 cwt., I think.
1775. *Mr. Dowel.*] You expressed a favourable opinion with regard to the permanency of the lodes at Broken Hill? Yes.
1776. Can you inform the Committee what is the depth of some of the principal silver mines outside the colony with which you are acquainted? Some in America are 2,000 feet deep.
1777. Is not the Comstock deeper? It is nearly 3,000 feet deep.
1778. You inspected the principal mines at Broken Hill? Yes; I went through the principal mines.
1779. What was the depth of some of those mines? The Central at the present time is 400 feet deep, the South is about 500 feet, and the main shaft is not connected with the lode. The Proprietary is between 300 and 400 feet deep. The British is not quite so deep. The Junction is 400 or 500 feet deep.
1780. Is there every appearance of their going further down? Yes.
1781. As regards the depth you have given us these particular items;—what about the width? I cannot say what is the width of the Comstock lode—but at Broken Hill the width varies from 10 or 15 feet up to many hundred feet. In the Central the sulphide lode is over 200 feet wide from the 400 feet level.
1782. You are not aware that the Comstock lode is 357 feet wide? I know it is a great width.
1783. Having made a personal inspection of these several mines, it is your opinion that there is no reason why the mines at Broken Hill should not go down to as great a depth as the Comstock mines? I know of no reason why they should not. The circumstances at Broken Hill are as favourable as those of the Comstock mines.
1784. In reference to low grade ores, are you not aware that as a matter of fact all low grade ores at the present time are mixed and worked up? I am not aware of that.
1785. What do you suppose becomes of the low grade ores? As far as I know they remain there intact. At the Pinnacles they are concentrating theirs on the ground, and sending them on to Dry Creek or Port Pirie. At the Proprietary mine they are concentrating them, and also at the British, and at Block 14. The proportion that is being used in smelting I do not think bears any comparison to that of the high grade ores.
1786. Then you would be surprised to learn that the manager of this particular mine has stated that the whole of the low grade ores are mixed with the richer ores? Yes, all low grade ores would be mixed.

But

But there is a difference between low grade, high grade, and sulphide ores. It is sulphides that I am speaking about. It is a different ore from a low grade carbonate. They are using all the low grade carbonate ores that they possibly can get and passing them through their concentrators.

1787. Is there a Leaching process? Yes.

1788. Can you say how that affects the quality of the low grade ores, whether it does not produce a much larger yield? The Leaching process extracts a certain percentage of silver that you cannot take out by concentration, because you have it ground very fine to disintegrate the finer ore. The tailings that come away contain a little of the native silver and chlorides, and these pass out into the Leaching works, and they get a larger percentage out of the tailings than they could get by concentration alone. Had it not been for the Leaching process that portion would have had to remain.

1789. Although costly the process is remunerative? It is not costly, it is a cheap process. But it is only adapted for certain classes of ore. You could not treat sulphide ores by the Leaching process.

1790. Are they not treating sulphide ores in that way? Not by the Leaching process—that is for the native silver and chlorides. For sulphides it is utterly useless.

1791. Do you see any reason why hardwood timber should not be substituted for the Oregon timber which is now used in the mines? I do not see why hardwood should not be used instead of the softer wood. All the shafts are timbered with hardwood, but the method they have of working the back stopes would place them at a disadvantage in using hardwood where they have to lift it with ropes from 40 feet to 100 feet.

1792. You are aware that the hardwood timber would be more durable and likely to resist a greater pressure? Yes.

1793. Could scantlings be made of the same description of wood? Yes.

1794. Have you any knowledge of the large ironbark forests at Dubbo? I have not, but I have a knowledge of the timber, having used it. Blue gum and red gum are equally useful.

1795. The hardwood would not be so liable to take fire would it? No.

1796. Would not that be an important consideration? Yes.

1797. Is any provision made in mines for extinguishing fire? None that I am aware of.

1798. Suppose any of those large mines which are so heavily timbered were to take fire, would it not be the destruction of them? Yes, unless they could get into the mine and block certain portions to cut off the draught.

1799. You are not able to furnish the Committee with an estimate as regards the bullion? No.

1800. Nor the quantity of ores taken from Broken Hill? No.

1801. Do you know anything of Terowie? I have passed through it.

1802. Do you know that in consequence of the break of gauge a number of agents are employed there? Yes.

1803. Would not that be in favour of the proposed line? Yes; considerably in its favour.

1804. That entails both cost and loss of time? Yes, and loss in the weight of ore. I used to send it down that way from the South, and the expense was very heavy, and the waste of ore considerable.

1805. I gather from what you say that you are of opinion that if the line is constructed a large proportion of the merchandise and goods traffic of all descriptions from the Broken Hill district will come to New South Wales? I think so.

1806. And you see no reason, although the Adelaide line may be shorter, why the traffic should not come here? No.

1807. More especially the passenger traffic? Yes.

1808. The shorter the distance to be travelled the less the cost and the greater the saving of time? Yes.

1809. That you think will cause the line to be freely used? I think so.

1810. Do you think there is any force in the statement made by a witness that in nine cases out of ten a person desiring to go to Broken Hill would proceed *via* Melbourne, Adelaide, and Terowie, as a matter of choice? I should think the choice would be a very bad one. I think nine-tenths of the people would go from here to Broken Hill instead of going round *via* Adelaide.

1811. A journey involving two distinct breaks? Yes. You could go from Sydney to Broken Hill, make an inspection of one or two mines, and be back in five or six days. But if you went round *via* Melbourne and Adelaide you would have to waste no time to be back in twelve days.

1812. You think the railway would be largely used by passengers? I think so.

1813. *Mr. Copeland.*] I think you have a personal knowledge of the Nevada mine at Sunny Corner? Yes.

1814. Do you know what that ore yields per ton? I think it varies considerably; but I think it contains something like 10 or 15 per cent. of lead, some being lower, some higher; and 10, 12, or 75 oz. of silver, with a small percentage of copper.

1815. What would your estimate be of the general run of the sulphide ores found at the greatest depth at Broken Hill? The general average hitherto of sulphide ores would be about 10 to 15 oz. There are instances where they have gone up to 30 and 40 oz., but those were merely pockets. It may reach as high as 20 oz., and from 10 to 50 per cent. of lead.

1816. Is there no copper? There are traces of copper.

1817. Do you know what Mr. Lewis Lloyd is paying for the cartage of sulphide ores from the Nevada mine to Rydal? I think something like 15s. a ton.

1818. He is paying 16s. or 18s. a ton? I am inclined to think he told me it was 16s. 6d.

1819. After paying 16s. 6d. for the carriage of those ores from the mine to Rydal, he then has to pay railway freight from Rydal to Lithgow, has he not? Yes.

1820. You know as a fact that although Mr. Lloyd has water-jacket furnaces erected on the mine, he is carting about 400 tons of ore per month from the mine by teams to Rydal, then sending it by railway to Lithgow and smelting the ore there? Yes.

1821. Do you know why he is doing that;—is it not because he can get cheap coal at Lithgow? That is one of the reasons. His smelting cost at Lithgow, as far as I ascertained from him, is about fifty per cent. under that at Sunny Corner, but he has the expense of the carriage from the mine to Lithgow against that.

1822. I think he uses small coal? Yes.

1823. For which he pays 2s. 6d. a ton? Yes.

1824. Would it not be possible for the Broken Hill people to send similar ore from Broken Hill to Lithgow, and would they not be able to smelt at a very cheap rate with coal at 2s. 6d. or 3s. a ton? I think so.

R. N.  
Williams,  
Esq.

25 Mar., 1891

R. N.  
Williams,  
Esq.

25 Mar., 1891.

1825. It has been stated here that the railway carriage from Broken Hill to Lithgow for ores would be about 25s. a ton, or a trifle under 24s. 9d. If you add on the carriage by horse teams from the Nevada mine to Rydal, then the railway freight from Rydal to Lithgow, I suppose that would amount within a few shillings to what the Broken Hill people would have to pay for sending ores direct from Broken Hill to Lithgow? To within 5s. or 6s.

1826. Do you think that that 5s. or 6s. would be likely to prevent them from sending their ores, seeing that at Lithgow they can get coal at 2s. 6d. or 3s. a ton? I do not think so.

1827. Instead of £2 per ton for coal delivered at Broken Hill? I should think they would send their ore where they could get the cheapest coal.

1828. Under the circumstances it would be very much cheaper, and actually save several shillings per ton, to send their ore to Lithgow instead of having the coal taken to Broken Hill? I think so.

1829. You stated just now that it only required about 15 cwt. of coal to smelt a ton of ore, and that being the case would it not be cheaper to get this 15 cwt. of coal from Port Pirie, instead of sending 20 cwt. of ore from Broken Hill to Lithgow? I do not think it would be cheaper. As regards the smelting of low grade ores in an inland district, I am more favourable towards establishing works at the coal fields, and letting the train get the carriage as cheap as possible, and having train loads both ways.

1830. Do you know whether there is any limestone in the vicinity of Lithgow? Yes.

1831. But they do not use it? Not in the reverberatory furnaces. It is not necessary to use it so much in those furnaces as in the water-jacket furnaces.

1832. Therefore, by that process by which they treat the sulphide ores at Lithgow, they save the cost of limestone? Yes; and the cost of ironstone.

1833. And get their coal at 2s. 6d. a ton, instead of at £2 8s. delivered at Broken Hill? Yes.

1834. Do you know what the average yield of the Sunny Corner mine was for the last half-year? I do not, though I have seen their balance sheet.

1835. Was it not something like 12 oz. of silver per ton? Yes, something like that.

1836. Do you know what amount of profit was made by the company for the half-year? No.

1837. I suppose you would not be surprised to hear that it was between £15,000 and £16,000? I am not surprised to hear that.

1838. Notwithstanding that the yield was only about 12 oz. of silver, with some lead? Yes; and they had a little gold.

1839. Dr. Garraan asked about the process of treating sulphide ores, and I understood you to imply that some process has been found of satisfactorily treating sulphide ores? That some process has yet to be discovered for treating low grade ores. The only known successful method has been the reverberatory smelting, and also amalgamation.

1840. Have you any idea what percentage of silver is left in the ore, either at the Nevada mine or at Sunny Corner? I think Sunny Corner runs from 1½ oz. to 2 oz. left in the slag.

1841. You do not anticipate discovering any new process likely to be much superior to that, do you? No.

1842. Do you know of any closer treatment than that in any part of the world? There is no closer process that I am aware of in dealing with low grade ores than smelting.

1843. Do they get all the silver out according to assay at Broken Hill, less the 2 oz.? I think they run pretty close to that—sometimes it is under it.

1844. Do you know anything at all about the Mount Browne country? I have not been in that part of the country, but I know that it is a mining district.

1845. *Mr. Tonkin.*] If it has been stated here that the principal mines of Broken Hill have established smelters in Adelaide, is that true? I am not aware of that.

1846. Do you know of any mine at Broken Hill which has established a smelter on its own account at Adelaide? I think the Junction did.

1847. Are they working it? I do not think they are.

1848. How many smelting works are there at Adelaide? The Dry Creek, the Australian Copper Co., and the Junction. Those are all.

1849. If a gentleman said that the principal mines at Broken Hill had established smelters in Adelaide, that is not true? It is not true.

1850. At Port Pirie the Australian Copper Co. are dealing very largely in smelting ore for the mines at Broken Hill? Yes, outside the Proprietary Company.\*

1851. *Mr. Copeland.*] Do you know anything about the Broken Hill mines sending ore to the Clyde works in Sydney? Yes, there have been parcels sent round here from Broken Hill. I think from both the South and the Central, and some other mines.

1852. Are they sending it in large parcels now? I think the largest that came here came from Tasmania. The Central people sent 300 or 400 tons. Of course, buyers of ores do not please all the people that they have to do business with any more than persons engaged in any other business. They sent round parcels of ore as a test to see which was the cheapest market. I think the parcels sent here have been test samples.

1853. You think they are not likely to send them in large quantities? No.

1854. *Mr. Garraan.*] Do you know the Broken Hill district well? Pretty well.

1855. Is it in any way retarded in its development by the want of railway communication? Hitherto I should not think it has been. It has been carried on regardless of railway communication, or of anything, or of anybody.

1856. At the present time has it got good railway communication? It has not good railway communication. The tramway there answers all the purposes of a railway, but it is not a good railway. I imagine that it could not be worked as cheaply as a broad gauge line from this colony.

1857. What is the defect in the railway communication? The narrow gauge and having to tranship the merchandise at Terowie.

1858. Is the defect owing only to the gauge? No.

1859. That does not operate in coming direct to Port Pirie, does it? No, the narrow gauge goes direct from the mines to Port Pirie.

1860. Is Port Pirie used as a shipping port for much of the produce going to and from Broken Hill? Yes, because the Proprietary, and the British Refining Works, being connected with Port Pirie, send their stuff there.

1861.

\* NOTE (on revision).— There is no Australian Copper Company at Port Pirie. The question evidently refers to the Smelting Company at Dry Creek.

R. N.  
Williams,  
Esq.  
25 Mar., 1891.

1861. So that the break of gauge does not affect a very large portion of the traffic? Not to Port Pirie, but the greatest quantity goes to Adelaide.
1862. If the railway were widened from Terowie to Broken Hill it would make a more satisfactory railway communication? Yes; then they could reduce their charges.
1863. If the Government of New South Wales decide to construct a railway to Broken Hill in order to obtain some of the trade there, is it not more than likely that the South Australian authorities will widen their gauge to Cockburn? I should think they would. They must be sufficiently posted up in their own business to see that that would be an absolute necessity.
1864. Then if South Australia did that, which is more than probable, would it be possible for the New South Wales railway to take the trade from Broken Hill? If I understand the matter aright the South Australian Government could not widen that gauge, because the railway is in the hands of a private company.
1865. Not from Terowie to Cockburn? From Terowie to Cockburn, and from Cockburn to Broken Hill. If they did not widen it in one part it would be useless to do it in the other. They must have permission from this Government to widen the line from Cockburn to Broken Hill.
1866. Do you know whether the Act permits the construction of the line with a wide gauge;—are the company restricted, or have they the power to make a line of any gauge they like? I understand that they could not go beyond the present gauge. It was to be a tramway not a railway, and one stipulation is, that they must use a certain gauge bringing it under the classification of a tramway. Had it not been for that, they would have made it of the same gauge as the Adelaide line.
1867. You do not think there will be any further development of the mining industry, even by the construction of a railway from Sydney? I do not think that a railway from Sydney to Broken Hill would stimulate mining—that is open up fresh fields, unless it brought passengers, speculators, from Sydney, into direct contact with the field. There are hundreds interested in the field who have never seen Broken Hill, and who would not go round by Melbourne and Adelaide; but if this railway were constructed no doubt a great number of Sydney people would visit Broken Hill, and that might lead to speculation. The development of a mining field depends upon what is known as “booming.”
1868. As you have an unbroken gauge from Broken Hill to Port Pirie, why is it that the whole trade does not go on that line instead of the greater portion going to Adelaide? I think one reason is that they have not the capacity for treating all ores sent away from the district, and the next is that having ores treated down there involves extra expense in bringing the bullion round to Sydney. At Adelaide they have a greater capacity for dealing with the ores, and the bullion is as easily shipped from Adelaide as from Port Pirie.
1869. Seeing that that district is connected directly with Port Pirie and with Adelaide, do you think there is any great necessity or great advantage to the district in proposing the construction of another railway line? That is, if I understand you rightly;—do I think there is any great advantage for connecting Broken Hill with Sydney?
1870. Yes; knowing that Broken Hill is already connected with Adelaide? I should think there would be considerable advantage to our own colony. I think the trade and commerce would be stimulated by having a connection from here to Broken Hill, whereas that trade goes in the opposite direction now.
1871. But can you get the trade of Broken Hill over our great length of railway at a paying price to this colony? I think you will get a large portion of it, but I am not sufficiently posted up in railway charges to say whether you would get it at a paying rate. If you could command a certain portion of that trade the people would not give you the trade unless it was of some advantage to their various firms.
1872. As a matter of fact, if the western boundary of New South Wales were half a degree further eastward, putting Broken Hill within the boundary of South Australia, would there be any justification for making this railway? If Broken Hill were within the boundary of South Australia, I think it would be an utter impossibility to get a railway in, because the tariff would interfere with the railway. If you went on the principle of two private companies competing with each other from each side, then the trade to Sydney would be worked to some advantage; but under existing circumstances—South Australia being a protectionist country—you could not get in.
1873. The fact of this country being freetrade will not enable us, with a line 730 miles in length, to compete with a line 230 miles in length? No; but if Broken Hill were in South Australia, and you carried goods at £1 a ton, and the charge on the South Australian railway was also £1, when you reached the Border you might have to pay 5s. duty. The cost of goods from Sydney would then be 25s., as against £1 from Adelaide. You could not compete.
1874. Regardless altogether of boundary charges, which are likely to be done away with very shortly, would not the fact of Broken Hill being so much nearer to Adelaide and Port Pirie give such advantages to the South Australian railways that the traffic must find its way to those ports? They would have an advantage as regards distance. At the same time I think that a railway from Sydney to Broken Hill will command a great deal of respect, and a great deal of the trade.
1875. Would it command half the trade? I should think it would.
1876. If you were managing a private company owning a railway on the Adelaide side, do you think that a person of similar ability, managing a railway on this side, could take the traffic from you? If two private companies were competing, and were running to make profits instead of at ruinous rates, the railway on the New South Wales side might not have the best of the profits, but I think they would get a fair share, because there would be a longer distance to run, and you can run long distances at lower rates than you can run short distances. The long distance would be against New South Wales, but you would have the advantage of bringing the bullion to be shipped directly from here.
1877. Could you bring the bullion to Sydney from Broken Hill as cheaply as you could take it from Broken Hill to Adelaide? It may not be possible to bring it so cheaply, but there would be a gain in the saving of time.
1878. How? It could be delivered here in forty-eight hours, whereas to go to Port Pirie it sometimes takes a fortnight.
1879. But is it necessary to ship the bullion to Sydney? I think it is done principally on account of Sydney being the terminus for the large ocean steamers, and they want bullion principally for ballast. It has to be put in the bottom of the ship. If the bullion was allowed to wait until the ship had taken in her dead weight the cargo could not be shifted to put it in. It is therefore an advantage to bring the bullion to Sydney.

- R. N. Williams, Esq.  
25 Mar., 1891.
1880. Are there no vessels trading direct between Adelaide and Europe? There are some, but not so many as there are from this port.
1881. Would not vessels trading direct take bullion from there as cheap as the others would take it from Sydney? I should think so.
1882. Then to the extent of the carrying capacity of the ships trading direct to Adelaide, there is no necessity to send bullion to Sydney? I should think not, unless there is some advantage in having business done through connections in Sydney.
1883. The Traffic Manager of the railways told us very definitely that wool which is produced in that neighbourhood could not possibly be brought from Broken Hill to Sydney in competition with the South Australian railways. Would not the same thing operate as regards the ore? That argument would not apply. Wool is a lighter material, though bulky. Bullion is a more dense form of weight and it is required for the loading of the ship. Wool is not required for the same purpose. It must be the top loading, and top loading could go to Port Pirie or Adelaide. But it is absolutely necessary to send the bullion here.
1884. Then if the preponderance of wool goes, will not the preponderance of bullion? No. Because of the great number of ocean ships starting from here. They call at Melbourne and Adelaide, and they can take their lighter cargo at any port.
1885. But what about vessels going direct from South Australia? They could load both bullion and wool.
1886. And to that extent there would be no necessity to send bullion to Sydney? I should think not.
1887. And it could be sent at a cheaper rate to South Australia? I should think it ought to be.
1888. And you have all these facilities for sending it there now? Yes.
1889. Then why should we go to the large expense of constructing hundreds of miles of railway for bringing the goods to Sydney when we cannot successfully compete with the existing railways? That is a question beyond my reach. It is a question for the Government to settle. Seeing that there is such a large population near the boundary of your own colony, that we have in the western district coal fields, and that the line would pass through an agricultural, pastoral, and mineral area that may be developed in the future, I think it would fairly warrant the construction of a railway to connect the large settled population with that district. On national grounds I should say that it ought to be carried out. I cannot say whether it would be a paying line.
1890. I understand you are of opinion that it is not a necessary work for the development of any industry at Broken Hill? I should say not an absolute necessity.
1891. Does the proposal to construct the railway, commend itself to your mind on national grounds? Yes, that is what I would recommend it for.
1892. Should I be justified in putting on the term "national" the construction that what is intended is a railway that is not necessary for the development of the district and which will not pay? It may not pay as far as I know; but I should think that in the course of time it will pay.
1893. You think it must eventually pay? I should say so.
1894. No matter what development takes place, would not there be the same competition, with the advantage on the side of the South Australian railways? Yes; because they are established.
1895. Then whatever quantity of trade you have to do the advantage will be on the side of the South Australian railways, and those advantages will not become less if the trade increases tenfold? I should think not.
1896. Then no matter how the trade develops, it will not give us any advantage in competing with South Australia? Not on the South Australian side. As far as within 50 or 100 miles of the Broken Hill district the country is settled in South Australia, whereas at Cockburn, Wilcannia, and Broken Hill there is scarcely any settled population. By extending the railway to there, passing near Cockburn, and through the Wilcannia district there may be a chance that the population will increase, and that would give a decided advantage to New South Wales. But the South Australian people cannot expect any great advantages beyond what they have at present. We have a comparatively new country to open up, and the advantages to accrue from opening it up must be secured by New South Wales.

TUESDAY, 14 APRIL, 1891.

Present:—

THE HONORABLE JOHN LACKEY (CHAIRMAN).

The Hon. ANDREW GARRAN.	JAMES EBENEZER TONKIN, Esq.
The Hon. FREDERICK THOMAS HUMPHERY.	WILLIAM SPRINGTHORPE DOWEL, Esq.
The Hon. GEORGE HENRY COX.	EDWARD WILLIAM O'SULLIVAN, Esq.
JACOB GARRARD, Esq.	CHARLES ALFRED LEE, Esq.
HENRY COPELAND, Esq.	WILLIAM McCOURT, Esq.

The Committee further considered the proposed Railway from Cobar to Cockburn.

The Hon. Joseph Palmer Abbott, Esq., M.P., Speaker of the Legislative Assembly, sworn, and examined:—

- Hon. J. P. Abbott Esq., M.P.,  
14 April, 1891.
1897. *Mr. Copeland.*] You are a member of Parliament? Yes; I am member for Wentworth. The Wentworth electorate formerly included what is now Sturt, and what is now Wilcannia. That was when I represented it at first. Sturt embraces Broken Hill and the most western part of the old electorate of Wentworth.
1898. Broken Hill is not in your electorate? No; it adjoins it.
1899. Will this proposed railway pass through any part of your electorate? No; it will not go near it.
1900. Have you visited Broken Hill? Yes. I went down the Murray as far as Wentworth, then up the Darling to Menindie, across from there to Broken Hill, and then from Broken Hill to Wilcannia, and from Wilcannia up to Bourke.
1901. How long ago? Five years ago. 1902.

NOTE (on revision):—At an early date the Great Cobar Copper Mining Company, Limited, will be glad to arrive at an understanding, for the carrying, by rail, at a minimum rate, from Lithgow to Cobar, about 30,000 tons of coal, also return loading to Lithgow in copper, regulus, and ores, equal to this amount of coal.—R. N. WILLIAMS.

1902. I suppose Broken Hill was not developed then? There was not a house where Broken Hill now is when I was there. They had just begun to speak about the Proprietary mine.

1903. Silverton was then in existence and was the chief place? Yes.

1904. Did you visit any of the mines? Yes; the Proprietary mine was the only one which had been opened when I was there on the Broken Hill line of ore. The other mines were nearer to Silverton.

1905. I suppose you are not prepared to give evidence as to your personal opinion with reference to the permanency of the mines or anything connected with them? No; my opinion upon that subject would be of no value.

1906. Have you prepared any statement? No. I did intend to do so, but, through being deprived of the use of my hand by an accident, I have not been able to do it. I desired to come before the Committee for the purpose of stating my opinions. I have been in the western district two or three times, and, in my opinion, the extension of the line of railway to Broken Hill with a view of developing the trade, or getting it from that part of the colony to Sydney, is an absurdity. You would have a line of haulage from Sydney of over 700 miles, as against 300 odd miles from Broken Hill to the nearest seaport in South Australia, and if the traffic is to be diverted from Broken Hill to New South Wales it can only be done by a system of differential duties, the cost of which must fall upon the people of the colony who are not interested particularly in the development of that trade. That is, if the people of Broken Hill cannot afford to pay the ordinary charges for the carriage of goods, someone else in the country will have to pay them. I think it will be many years before a population will be located in that western country who will become customers of the railway. It is generally supposed that if a railway is to be constructed at a very early date, or in the near future, it will become a paying concern—that it will pay the working expenses and the interest on the outlay; but I do not see what possible chance there is of any railway extended into that western district doing what the railways extended into other pastoral districts in the colony have not done. I know a great deal of the northern country and the line of railway from Werris Creek to Narrabri, but I say, as compared with the western country, the route from Nyngan to Cobar and Broken Hill, that the Narrabri country is densely populated, yet it is said that the line to Narrabri has not paid working expenses and the interest on the outlay. The line to Narrabri goes through some of the most magnificent country in Australia—grazing country—where the seasons are not so uncertain as they are in the west. Of course, many of the runs in the west are capable of yielding enormously in good seasons; but good seasons are exceptional there, and I do not see how small landholders can go into that country and develop it profitably to themselves, and unless that class go there cannot be customers for a line of railway. This railway must depend upon the traffic at their command if it is to be made remunerative. I do not think that the proposed route is the best way to take the line. If it is determined to make a railway to Broken Hill, I have always thought that the line had better go from Forbes towards Menindie, which is a straighter run through the country. A railway from Forbes to Menindie would fairly divide that dry country. You would have a railway to Bourke on the north, and a railway to Hay and the Murray River on the south. There is a large mineral country, as most members of the Committee know, about Mount Hope, gold and copper having been found there; but, of course, I do not suppose that there has been any development of it that would justify the construction of a railway. I think that unless you have some guarantee that in the near future you will find customers for the railway, it ought not to be built. Thinking the matter over, I have asked myself whether this western country is likely to be occupied by homestead lessees. Up to the present moment most of the homestead lessees have taken up their land either on frontages to the Darling, on the ana branches, or near the frontages to the Lachlan. They have never gone back from the water, and it is not likely that they will—because of the small carrying capacity of the land, and the cost of improvements, the area would not be sufficient to enable a man to make much money out of it. There is no doubt that the homestead lessees as a body will carry more stock per acre on their land than the squatters do, but they will take the best parts of the resumed areas, and when their selections are made the squatter will have less of the balance of the resumed area than he had before; so that what is gained in one respect is lost in another. To sum up shortly, I think that if you make a railway to that part of the country you would have to look principally to the produce of the district for traffic, and the produce is wool alone. I do not see what else there is to be produced in that country. If the construction of the proposed railway is determined upon—and as the railway has been carried so far as Cobar, in my opinion, it would be impolitic to stop at Cobar—the line ought to go on to the Darling, but not to the Darling unless the river is locked. The people out there cry out for a railway, and when they get it they will use it if it suits them. If the river is available they will not use the railway, and in good seasons, if the Darling is not locked, the river will be used as against the railway. If the river were locked, and dues were imposed equivalent to the railway charges, probably you would force the traffic on to the railway, but at present if the railway is carried beyond Wilcannia to Broken Hill, I have always thought it would take a great deal of produce which might come to Wilcannia to be sent by railway down to Adelaide instead of to Sydney—assuming that the produce comes here at all. But this railway would give the people west of the Darling great facilities to get to the nearer market in South Australia. I remember that when I was a member of this Committee, it was pointed out—I think by the Traffic Manager—in connection with a proposal to construct a railway for the carriage of coal, that it would be impossible to carry coal at a profit on the railway for less than 1d. per ton per mile. If that is so, the Committee can see at once that the cost of carrying coal to Broken Hill would be so heavy, as against water carriage, that the railway would never get the traffic.

1907. *Mr. Tonkin.*] The charge will be less than that? I suppose it will depend upon the gradients on the railway. *Mr. R. N. Williams* recently gave evidence before the Committee, and I saw from the *Daily Telegraph* that he said that the average monthly consumption of coal at Broken Hill for the last fifteen months was 70,000 tons, and of coke and coal 15,000 tons. A gentleman largely connected with the mines has written to inform me that the average monthly consumption of coke at Broken Hill for the last fifteen months has been 3,600 tons.

1908. It was a mistake; *Mr. Williams* said that the consumption was 7,000 tons? My authority, a gentleman largely connected with the Proprietary mine, says that the consumption of coke was 3,600 tons, and the consumption of coal 1,600 tons. I am only referring to what I saw in the press.

1909. *Mr. Copleland.*] You are of opinion, I suppose, that the railway should go from Cobar to Wilcannia? Yes. I think, having gone to Cobar, it would be a mistake to allow the railway to stop there, but it would be a pity to take the railway to Wilcannia without regulating the river traffic in some way. We have spent enormous sums in making the river a highway for the use of the people of the other colonies.

1910.

Hon.  
J. P. Abbott,  
Esq., M.P.

14 April, 1891.

Hon.  
J. P. Abbott,  
Esq., M.P.  
14 April, 1891.

1910. Did you notice a telegram from Broken Hill in the newspapers, to the effect that the ex-Mayor of Broken Hill, Mr. Lane, the manager of Block 14, states that there are 3,000 tons of coal per month, 2,150 tons of timber, and 6,300 tons of coke used, and that the amount of bullion carried away is 5,000 tons a month? Yes; I saw that. That is not far out of what my correspondent states. He says that the average consumption of coke at Broken Hill for the last fifteen months was 3,600 tons a month, and of coal 1,600 tons a month. That makes 5,200 tons.

1911. Mr. Lane says 6,000 tons of coke? My evidence, of course, is second-hand, and so is Mr. Lane's. I cannot say anything about it myself. I have lived in country districts, and I know what they do. If they want a railway they consider their own district—not the colony at large.

1912. At any rate, you would be favourable to the construction of the railway to Wilcannia? If the Darling is locked and dues are charged.

1913. As the railway is going to Cobar, would you stop short at Cobar? I do not think it would be wise to do that.

1914. From what you know from a personal visit to Wilcannia, do you not think that Wilcannia and the country round about for some hundreds of miles is deserving of a railway? Yes; there is a large mineral field away to the north-west of Wilcannia, which only wants capital and water to develop it. At Mount Browne, Milparinka, and Tibooburra, and quite close to Nuntherungie, within, I think, 70 or 80 miles of Wilcannia, there is a great prospect of the development of a very large silver field, according to what I have been told by people out there.

1915. In addition to that you are aware that there were some considerable gold mines developed—alluvial flats? Yes; I believe that the fields to the north-west are very rich, and only want water and money.

1916. I suppose you have also heard of very rich opal discoveries? Yes; between Wilcannia and Milparinka. I think that as the railway is going to Cobar it should undoubtedly go to Wilcannia.

1917. And I suppose it would benefit the squatters in the Paroo district as well? Yes, and the homestead lessees. I look upon the homestead lessees as a new class, who will make the very best use of the land which they take up—that is, if the land is legitimately taken up. They will have to work the land to the best advantage, or they cannot make anything out of it.

1918. I suppose you are aware that the land is gradually improving in its stock-bearing capabilities the longer it is stocked? I do not know that. They say that it is not. They say that the country is being destroyed by rabbits at the present time. The great fodder plants out there are salt bush and cotton bush, and on some of the runs these are being eaten out by being continually used. I do not think that the grass lasts out there through the summer. I have seen the district about Bourke in the beginning of summer, and again in the middle of summer, when the grass was gone, and they had to depend upon those plants.

1919. If I remember rightly, the evidence from the squatters was to the effect that the country was bearing more stock, becoming capable of bearing more from year to year? Exactly so. The country is being improved, small paddocks are being formed, and more water is being obtained. The more water you get the more stock the land will carry.

1920. Irrespective of that, the land is becoming capable of carrying more stock through being constantly fed upon? I very much doubt it, because in that western country they have to depend for fodder upon the plants that I have referred to in summer time, not upon grass. If those plants are continually eaten down, experience shows that they are destroyed. I know places on the Liverpool Plains where salt bush used to grow, but where you will not see a branch of it now.

1921. What has taken its place? Grass there, probably.

1922. Does not the country carry more stock now? Yes; because a better class of improvements has been put on it.

1923. Leaving the improvements out of the question, does not the herbage, or grass, bear more stock now than when the country was first settled? I do not think you can put it that way. When I first knew that country a paddock was an exceptional thing on the Liverpool Plains, but now the country is divided into paddocks. I am inclined to think that it is better improvements and the increase of the water supply that improves the country. I do not think that sheep improve it.

1924. Do you not think that the quality of the grass and the stock-bearing capacity of the land are improved by stock being fed upon it and manuring it? There is no doubt of that, if the land is not too heavy to stock. If the country is divided into paddocks, and the stock are shifted from one paddock to another, so that the grass is not continually eaten down, the grazing will improve. You have to consider the character of the country. On the Liverpool Plains they have a fair average rainfall—in the west they have not.

1925. When we have taken the railway to Wilcannia, do you think it desirable to stop short of Broken Hill, and leave a blank between Broken Hill and Wilcannia? Not if you want to assist the settlers there to get to their nearest market; but if you construct that railway, believing that you will get the produce of that country to Sydney, I think you will be much disappointed.

1926. Would it not be the duty of the country to give facilities to squatters and others working on the Darling to even get their produce to the Darling, supposing they did not use the railway at all to bring it to Sydney, would they, as fellow colonists, be entitled to that amount of consideration that would enable them to bring their traffic to their easiest get-away? Undoubtedly. I think it is the duty of the Government to promote the interests of all the settlers whom they govern. But the question arises, can we afford to do what is not absolutely necessary.

1927. Do you think it desirable to isolate a section of the community, and cut them off from communication with the metropolis? They are not cut off. We have a railway to Bourke now, and I am assured that that railway could do all that is required between Bourke and Sydney by two trips a week.

1928. I suppose you are aware that the railway is improving in its paying qualities? It is hard to say what portions do pay, because of the method of keeping the accounts. Accounts are not kept showing the returns of particular sections.

1929. But we have the evidence of the Traffic Manager and of the Commissioners? They ought to know.

1930. Their evidence is to the effect that the railway does pay, and that the traffic is increasing considerably? Your Wilcannia line will go comparatively close to the Bourke line. If you want to go to Cockburn, the line from Forbes is the most direct, then you go through the valley of the Lachlan, where you can put people to earn a living.

1931.

1931. Would it not be possible to make that line also from Forbes to Menindie? It would depend upon the London money lenders very largely.

1932. Would you be in favour of a policy of isolating Broken Hill, and leaving it virtually in the hands of another colony, or of risking something, and sacrificing something, with the view of re-connecting that portion of New South Wales? I would not. I think it is unjust that the bulk of the people of this colony should be taxed for a railway which under no circumstances, in my opinion, can become remunerative.

1933. You spoke with reference to the difference in distance for sending goods to Broken Hill, *via* Adelaide, and overland from Sydney? Yes.

1934. Have you taken into consideration the freights that have to be paid to get coal, for instance, to Broken Hill, *via* Adelaide or Port Pirie? I have not.

1935. Have you gone into figures to see whether it would be possible to take coal cheaper by rail from Lithgow to Broken Hill, *via* Cobar, than to send it from Newcastle by the sea board, *via* Port Pirie? When I was on the Committee I heard one of the responsible officers of the Railway Department say that the Department could not possibly carry coal at a profit for less than 1d. per ton per mile.

1936. Which railway was that officer referring to? To the railways generally.

1937. It depends upon the grade what load they could carry? Whatever the ruling grade would be between Lithgow and Wilcannia, that would influence the whole traffic. There is a grade between Dubbo and Nyngan of 1 in 40, and that would be the ruling grade for the whole line.

1938. Would it not be possible to either cut out that grade or break the train? If you break the train, that would be an additional expense. You can only carry a certain load.

1939. Are you aware that they carry thousands and millions of tons in the United States for a third of a penny per ton per mile? I am.

1940. Can you give the Committee the reasons why we should not be able to carry coal at a similar rate, or at the most at  $\frac{1}{2}$ d. per ton, over that dead level of country? I think the manner of constructing our railways must influence the cost of carriage throughout, on account of the light loads which they would have to carry.

1941. The ruling grade between Nyngan and Cobar will be 1 in 100? It is not 1 in 100, but 1 in 70.

1942. It is 1 in 100? Then it has been altered. It was 1 in 70 when I was on the Committee.

1943. Taking the fact into consideration that from Nyngan to Cobar the gradient is 1 in 100, and that from Cobar to Wilcannia there are many miles of a dead level, so that much larger loads could be taken, do you not think that we should be able to carry coal at  $\frac{1}{2}$ d. per ton per mile? Yes; but there is no coal at Nyngan.

1944. The coal would be taken from Lithgow? Then you would have to get the coal to Nyngan over a ruling gradient of 1 in 40.

1945. To meet difficulties of that kind, they could break the train? That adds to the expense. I should like to see railways in every part of the colony if we could afford to make them.

1946. At the most, we could carry it at 1d. a mile from Lithgow to Dubbo, and beyond that from Narromine to Broken Hill it is level country? Yes, and a very cheap line. You were asking why the Americans can afford to carry at a so much lower rate than we can. One great reason is that the Americans have built railways of a temporary character and have improved them out of earnings very largely. Here we make our railways permanent, and the charge for interest begins from the date of construction, long before the railways begin to earn anything at all.

1947. At any rate, it has been proved by evidence that the railways can successfully compete with ocean carriage; that is to say, that we can supply Broken Hill with Lithgow coal, as against Newcastle coal carried round by sea, without differential rates at all, allowing a margin of several shillings per ton in favour of the railway. If that evidence has been given to the Committee, and assuming it to be correct, do you not think there is a possibility of the railway paying? No, I do not. If you were to take every ton of coal that is consumed at Broken Hill by railway, I do not see how it would pay. What other produce have you to and fro?

1948. That is the evidence of Mr. Lane? Mr. Lane is an interested man. I have no interest in the matter.

1949. His figures only coincide with the evidence taken by the Sectional Committee, with this exception: that the trade has developed since the Sectional Committee was in the district, and I think it only fair to presume that the figures are approximately correct—that is, that they are consuming 3,000 tons of coal per month, 2,150 tons of timber, and 6,300 tons of coke? It would be easy to get the returns from the custom-house there, and the Committee would have the most reliable information that could be got.

1950. We have had evidence from the companies themselves in support of the figures. We could not get evidence from our custom-house, as I do not think that these things are entered. But, assuming that these figures are correct, and that we could be in a position to supply a large quantity of coke, coal, and timber to Broken Hill, do you not think we should be justified in making the railway? Yes; if you have a few mines like Broken Hill on the route, but up to the present there are no other mines that have developed any large returns. There are no other mines paying the dividends of the Broken Hill mines, nor turning out so much.

1951. They are not open to the same extent, but I believe that they are richer? Blocks 10 and 14 are part of the Broken Hill mines. I spoke of what was originally the Broken Hill mine when I was there.

1952. Do you know anything of the Dubbo district, with regard to timber? No; I know more of the country towards Coonabarabran.

1953. I suppose you are aware that they are timbering the Broken Hill mines with Oregon pine? Yes.

1954. Would it not be a good thing if we could supply them with hardwood? Most certainly.

1955. Do you not think that the squatters, as well as the miners, would be greatly benefited by having this railway there to enable them to get their wire for fencing, to send their wool to market, and to get their supplies? I have not the slightest doubt that a railway of this kind would benefit every man who is a proprietor in that country, but it would not benefit the country at large. I should be glad to see two or three railways out west—one by Wentworth, the shortest cut to Adelaide; but as I am Member for the district I have never advocated it. I have seen the surveys for a railway going on along the Lachlan to Wentworth, but why I do not know.

1956. Are you of opinion that a railway should not be constructed in a new country till you can make sure of it paying from the commencement? No, I am not. I am of opinion that railways ought to be

Hon.  
J. P. Abbott,  
Esq., M.P.  
14 April, 1891.

constructed wherever you have a reasonable certainty of finding customers, or putting customers on the land; because every person who goes on the land must be a customer to the railway. You will have a stretch of country from Nyngan to Broken Hill which, when the railway is made, you will not put 1,000 people on. I have heard that wheat is grown out there, in fact I have seen it, and I have seen it in many parts of the north, but it is an exceptional thing.

1957. Do you think that the construction of a railway to Wilcannia would have a tendency to bring the wool to Sydney? I very much doubt it. You must consider where those men in that district do their financial business. From Wentworth to Wilcannia I do not think there is a station held by a New South Wales man. The capital employed there comes from either South Australia or Victoria, and the produce goes to the market of those capitalists who lend the money to improve that country.

1958. Do you think they would be likely to make use of the railways to get their wool more speedily to market? They will do whatever will pay the best.

1959. Do you know what it costs for insurance to send wool down the river? I have heard, but I forget.

1960. Is it not something like 4s. or 5s. a ton? I could not tell you. Of course, the great drawback to the squatters out there is the uncertainty of the river. I saw some timber lying in a boat intended to build a public-house at Bourke, and the boat had then been stuck on the river for fourteen months. A conditional license had been granted for the erection of the public-house, and the material was in the steamer. It is nothing uncommon for wool to lie on the bank of the river from one season to another.

1961. Do you not think that if the railway were made the squatters would be likely to make sure work of it, and send their wool by rail, even at a little extra cost, for the sake of getting it quicker to market, and saving the insurance rates as well? I do not think you have ever been a squatter. When a squatter takes a station he gets into the hands of a financial institution who direct the whole of his movements. He is not a free agent. He has to send his wool where he is told to send it.

1962. Do you think that the construction of a railway like this would have a tendency to open up new mineral country? I have no doubt whatever that it would largely help to do that, but water would do more in that country. Mount Hope and all those gold mines to the north-west have lacked development hitherto for the want of water. I know the mines about Tibooburra and Milparinka have often had to stop for want of water. The diggers have had to resort to what they call the dry-earth process; taking up the earth and blowing it away to get the gold.

1963. I suppose you remember that before the railway was built to Newcastle the general opinion was that nothing would ever be sent by rail, because it would be cheaper to send goods by steamer? Yes; but see what has been done at Newcastle. You can send some of the produce as cheap to Sydney as you can to Newcastle from the north.

1964. But, as a matter of fact, the passenger traffic has been very much diverted by the railway? No doubt; and I think that the improved facilities given have increased the traffic enormously on the Northern line. The railway has developed a traffic that all the steamers running between Sydney and Newcastle could not have developed.

1965. I suppose you remember that before the railway was made to Bourke the prediction was that we could never develop a trade from the Darling; that the squatters would still use the river to send their wool to Adelaide and Victoria;—I suppose you are aware also that the wool traffic has increased to something like double during recent years? Yes; but bear in mind that the produce has increased doubly. Country has been taken up under the Act of 1884 that was never touched before.

1966. Will not the produce increase between Cobar and Cockburn? I doubt it. There is not a stream between Wilcannia and Cockburn except Stephen's Creek, which is generally dry.

1967. Are not the squatters making their own water improvements? Yes, they are. I saw seven wells constructed on one station, and there was not a drop of water in any of them. That was the Pan Van block, to the east of Menindie, in the mallee country.

1968. Are they not getting a great deal of water by boring? No; we have never got any artesian water by boring to the east of the Darling. We have got some to the north-east.

1969. Have they not got it to the west? Yes; to the north-west. They never succeeded to the south of Wilcannia.

1970. Would not the wool from the north-western country come to Wilcannia? Yes; it does now—it must.

1971. If the railway were taken to Wilcannia, should we not receive that wool by train? I think we should if the railway was not continued to South Australia. We should receive a lot of it.

1972. But supposing it were continued to South Australia? Then the produce would probably go into that colony. I do not know the distance exactly.

1973. Supposing that the whole of the traffic was diverted from Wilcannia to Cockburn, would it not pay the Government just as well to take the traffic that way as to bring it the other way? Well, then, where are the earnings for the railway.

1974. From Wilcannia and Cockburn? You would only have the produce of the squatters and graziers; there is no other produce in that country.

1975. Suppose you took the traffic from Broken Hill, and that traffic went to Cockburn? The distance is over 30 miles. Yes; if the Government got that traffic by the railway from Broken Hill to Cockburn, I dare say it would pay them on the length of the line.

1976. I mean that the Government ought not to be restricted from building a railway, simply because they cannot bring the traffic in one particular direction, if they can give the people every facility for working their mines and squattages, notwithstanding that the traffic goes up towards Cockburn? I do not care where the traffic goes if we give facilities to develop the country without imposing a heavy burden on the rest of the community.

1977. I suppose you would not mind a little burden; you would not expect the line to pay from the commencement? No. We have a line from Werris Creek to Narrabri which has been constructed ten years. I do not think that that line is paying the working expenses, with the interest on the outlay, and that is a densely populated part compared with the western district.

1978. You would not tear up that railway? No; but I think it is a lesson when you propose to make another similar one.

1979. Suppose the question were submitted to yourself, would you refrain from making the railway because it would not pay working expenses from the commencement; and speaking of a railway, supposed to last for

for over ten years, may be looked upon as the commencement of the railway? I am one of those who believe that that line does pay if we had a proper estimate, but the book-keeping of the Department says that it does not. It is incredible to me. If that line does not pay, I do not know any line that will in a pastoral district.

Hon<sup>l</sup>  
J. P. Abbott,  
Esq., M. P.

14 April, 1891 :

1980. Coming back to the coal, coke, and timber traffic, if it can be shown by evidence that the railway can compete with sea-borne coal, would that alter your opinion as to the desirability of constructing the railway in view of this fact, that if we took coal to Broken Hill we should have 5,000 or 6,000 tons of bullion per month to bring back to Sydney? Yes; if you could assure me of all that, it would alter my opinion, but it is a matter of opinion, and I am just as capable of forming an opinion as the man who gave that evidence.

1981. But you have not been there since Broken Hill came into existence? No.

1982. *Mr. Tonkin.*] If the Railway Commissioners, through their Secretary and the Traffic Manager, state that they will carry coal, and that it will pay to carry coal from Lithgow to Broken Hill at £1 6s. 6d. a ton, would you believe that? Of course I would believe it. I should think the Railway Department, if they make statements of that kind, have some grounds for them. I think the Traffic Manager knows what he is talking about; but as far as I am aware the Traffic Manager denounced this railway as one that would not pay working expenses and interest on the outlay.

1983. Have you any idea of the price of the coal delivered at Broken Hill from Newcastle, *via* Port Pirie? I have seen statements about it, but I have never gone into it myself.

1984. If from the evidence you believe that coal could be delivered at from 12s. to 15s. less by the over-land route, that is from Lithgow, if this railway is constructed, do you think that would not be a sufficient reason for making the line? Certainly not. If you were to get the whole of the coal traffic for the district, in my opinion it would not be a sufficient reason for making the railway.

1985. Do you believe that there is a traffic of over 15,000 tons a month in coal, coke, and timber? I cannot form any opinion upon that.

1986. But if that statement has been made, would you believe it? I cannot form any opinion upon it. I only came here to point out the character of the country between Wilcannia and Broken Hill, and the improbability of settling a population on that country. I do not believe in making a railway in a country where you cannot settle population, who would become customers.

1987. You are in favour of sending the railway as far as Wilcannia? Only because it has gone to Cobar.

1988. You have read the evidence taken by the Sectional Committee at Wilcannia? I was on the Committee, and I have read some of the evidence.

1989. You know it was stated at Wilcannia that there was sufficient traffic to pay the working expenses of the whole line? I have lived in country districts, and so have you, and if you propose to build anything you like in a country town, you will find people prepared to swear that it will pay. I would never go to those places for evidence.

1990. All those witnesses probably are interested—but there were some who were not? I did not say that they wilfully stated what was not true, but they become so prejudiced about their district that they believe what they state is true.

1991. If there was a traffic of 15,000 tons in fuel alone? Well, what are the earnings of that?

1992. That would amount to £238,500 a year, at £1 6s. 6d. a ton, as stated by the Commissioners. That is for the supply of Broken Hill, without the intermediate stations, such as Wilcannia. Under these circumstances, would you advocate the construction of the line? I would, first of all, figure out the working expenses and the amount of the interest on the loans.

1993. The working expenses and the interest on the capital amount to £90,634 a year, right out to Cockburn? They say it would yield £238,000 a year, but that part of the line would not yield it. What would be its earnings?

1994. Suppose we reduce it to one-half, and that would be a long way under the estimate of the return—suppose we fix it at £120,000 a year? If you can show that you can make £100,000 a year by spending £90,000 a year, no one will say that it would be unwise to make the railway. You say that the railway will earn £238,000 a year by the carriage of fuel alone, and that the working expenses would be £90,000 a year. If you can show that, anyone will say, "Build the railway."

1995. Suppose that this came out in evidence, would that be likely to alter your opinion? Certainly. If you can show me that you can make £100,000 a year by spending £90,000, I say, "Build the railway."

1996. Take one-fourth, say £50,000, for that one item, without return loadings, though it is supposed that there would be 5,000 tons a month, and that is without Wilcannia traffic, under the circumstances do you think you would alter your opinion? I will say that if you could show that you will get a fraction above working expenses and interest, build this railway, or any other railway in the country, or if you can show that it will pay the interest immediately, build it. But, according to your figures, you will have a handsome profit. Then, of course, build the railway.

1997. The figures include the whole of the supposed consumption, which we probably could not get, but at any rate when we say that amount we might reasonably expect, according to the evidence, that we should have a large proportion of the traffic. Is that not so? I am not qualified to go into a question of the details of the traffic. I would say, as a citizen and a public man of some years' standing, that if you can show such returns as you indicate, you will be justified in building the railway. I do not believe you can show them.

1998. Have you any idea of what the returns will be from Wilcannia? I know that the Customs duties at Wilcannia are very heavy. There must be a very large traffic to Wilcannia, and if you can get that, there will be ample justification for building a railway to Wilcannia; but I do not see how you can get the traffic, considering the vested interests on the river, and the large number of steamboats that are running there. They will do what they can to get the traffic.

1999. Do you think that if we constructed a railway to Wilcannia, without continuing it to Broken Hill, it would result in great loss to the colony? I am not sure about that. I think that having gone to Cobar, you have no right to stop there.

2000. You would face the loss? I do not think you would make a proportionately greater loss than you are doing now. You would get some of the traffic at Wilcannia. But if you go beyond Wilcannia, you will take the whole of the western produce south to Adelaide, and you will not put customers on the land.

Hon  
J. P. Abbott,  
Esq., M.P.  
14 April, 1891.

land. That is my great objection to a railway being made into that country at present. There are scores of places where, by making a railway, you can put people on the land; but you will not put people on the land there. 10,000 acres are not enough for a homestead lessee. The homestead lessees have had remarkably good seasons, but the time will come when I fear they will collapse.

2001. *Dr. Garran.*] I understood you to say that the railway having been taken to Cobar, you think we had better continue it to the Darling? I think so.

2002. Is Wilcannia so important that it is necessarily the terminus—it is not the nearest point on the Darling? I do not think it is so important, but I would go to the Darling, with the view of the extension of the railway, if you look further on. But I think the most central place to go to would be Menindie. I forget the distance between Menindie and Wilcannia.

2003. You talk about the north-western portion of the colony—we could hit the Darling at a nearer point than Wilcannia, and by going in a more direct line. Do you think it important to make Wilcannia the terminus? The town is there, and it is a town of considerable importance. That is the reason for going there. I do not think you should lightly sacrifice vested and established interests.

2004. Is it so important that we should make it the terminus? Yes.

2005. You think that, practically, in any extension of the railway we are shut up to Wilcannia? I think so, having regard to the importance of Wilcannia. Most of those towns were built up through the improvement of the western runs. When those improvements ceased, those towns began to decay, and they are not of the same importance as they were many years ago. I noticed that particularly at Wentworth.

2006. Is it equally true of Wilcannia? They complained of it when I was there five years ago, but at that time the runholders had ceased to improve to any extent on account of the uncertainty about the rents. The financial institutions would not assist them when they did not know what rents they would have to pay. That threw out of employment some thousands of people who were customers to the town.

2007. Would the extension to Wilcannia lead to the improvement of the runs? I do not think so.

2008. Not even by homestead settlers? No; I think that the cost of improving that country and obtaining permanent water is too great for small men with the results which they can get from 10,000 acres.

2009. The railway would, then, probably for years, go through large sheep runs? Yes.

2010. And the traffic would consist of wool once a year, and the stores on the return trip? Yes; I think it is estimated that a man with good management ought to make £200 a year out of 1,000 sheep. I think that that country on the average will carry one sheep to 6 acres. By figuring that into 10,000 acres, the returns will be found to be small, and the homestead lessee will have to fence, make his fences rabbit-proof, and provide water. I have seen tanks constructed for two or three years without ever having any water in them.

2011. If the railway were made, it would not settle a large population between Cobar and Wilcannia? I do not think so.

2012. If the railway goes to Wilcannia you think there is a fair chance of getting a good deal of trade? You will get it from Wilcannia. I feel strongly about the Darling. The Government having spent large sums in making that river navigable have a right to be recouped. Our people do not make any use whatever of the Darling, but the Darling is used by the South Australians and Victorians for their steamers, and every one of these steamers is a floating store going up and down the river. They have hawkers' licenses. They ought to pay dues for the use of the river if we are to keep it navigable.

2013. That is a question independent of the making of the railway? No; I think that the two are interlocked. If you make a railway, and at the same time open another highway, and say to the people, "You can use the railway, or take this other route, for which we will charge nothing," they will use the other route instead of using the railway to get to market.

2014. You have spoken of the Lachlan River route;—do you think that along that line the railway would settle population? On patches in the Lachlan district I think it would. About a place called Oxley, on the Lachlan, there has been an enormous settlement of homestead lessees, and they are doing fairly well, but they have had good seasons since they started. There has been a very large increase of population there. All those people, of course, would be customers to the railway with goods and produce—not that I suppose their produce would be much more than that of the squatters whom they dispossessed, because, though they carry more stock, the squatter will carry less, owing to the loss of part of his land; but there will be more consumption by human beings settling there than there was before.

2015. Do you think that there would be such settlement along that line as would give a paying traffic to the railway, irrespective of the terminus at Broken Hill? Of a good deal of the Lachlan country I should say "Yes." From Forbes out to about Mount Hope it is the driest part of Australia.

2016. Do you know anything about the Willandra Billabong? I do not; but I imagine that it must be very good land there, because as much as ever could be got has been bought up.

2017. The squatters have already secured it? Yes.

2018. And a railway would practically run through private land, as the railway to Hay does? I imagine so, except when you get out west into the dry country, when you get into the mallee country east of the Darling.

2019. Do you think, as between Forbes and Menindie, and Menindie and Broken Hill, that the Government, by cutting up a certain portion of land on either side of the line of railway, so as to reduce the cost, could make the line pay? I very much doubt it. I do not see what people will give for land out there, and have to face the droughts.

2020. You do not think that people would buy it? I do not think people would go there.

2021. You know the district of Menindie? Yes.

2022. We have it in evidence that the milk, hay, and horse feed for Broken Hill come a distance of 200 miles? Yes; I am aware of that.

2023. We have it also that Menindie is only 65 miles from Broken Hill, and you have water there in the river as well as in the lake? Yes. I believe there is a great future for Menindie, by reason of its supply of water, which can be stored for a long time. I have been trying to get from the Lands Department a survey of small allotments about Menindie for people to settle on, and grow fruit to supply the Broken Hill market. I think it is nearly two years since I tried to get the survey, but up to the present time I have not succeeded. It appears that most of the land that was open to settlement has been taken up by homestead lessees—the rest being held under pastoral leases.

2024.

2024. There are large lakes there? Yes; and in dry seasons the lakes are the stand-by of the squatters on whose runs they are.
2025. Would it not be much easier to supply Broken Hill from that district than from Burra Burra? Yes; if you give people facilities for taking up the land and cultivating it they will soon do so. Then you can soon see what justification there will be for a railway.
2026. You say that so far as the railway would follow the Lachlan it would settle a population? I think so.
2027. And you think Broken Hill could be supplied from the lakes? Yes.
2028. And there is a gap of doubtful country? I am speaking of nothing but official knowledge of that country. When I was Minister for Mines I got information about the stations which were then under my charge.
2029. Supposing a line to Condobolin would promise to be a paying line, and a line from Broken Hill to Menindie also, would it be worth while then to compete with the line right through, even supposing the midway section from Condobolin was a loss? I am inclined to think it would, if you could settle people on the land, and I believe you could settle a large number about Menindie if the land was available.
2030. You think that if a line is made to Broken Hill at all it should go through Menindie? I do. I used to think otherwise until I saw Menindie.
2031. We are told that that is the shorter route by 62 miles? I think that the country between Broken Hill and Menindie, although it is very dry, is some of the richest country that I ever saw in the western district. I drove over the whole of it.
2032. Did you follow up the valley of Stephen's Creek? Two or three times we crossed Stephen's Creek, but we saw no water in it. The soil there is rich.
2033. Do you know what has been the effect of sinking wells on that route? I saw some fresh water from a well which they used for stock, but I should not like to drink that water. The soil about there is very like the Mildura soil—it is rich red soil, and apparently there is any depth of it; but it is very light—it is not sandy, but it is a kind of dirt that melts away in water. It is so light that it is not an uncommon thing to have to clear the troughs out with a spade. I saw one of the troughs having to be cleaned out with a spade after a dust storm.
2034. If water could be conveyed to the farmers on that land, could they produce large crops? I think they could.
2035. Is it possible to get water for irrigation by well-sinking there? I do not think so. I think the water they get is so mineralised that it is not fit for irrigation.
2036. They would have to get the water from the Darling? Yes.
2037. That would be very expensive? I do not know. A company have some water rights there, but I do not know what they are doing.
2038. If we made a line through Menindie to Broken Hill, do you think that the Menindie traffic would go by way of Broken Hill to Port Pirie? I do not think it would. I think it would drift up and down the river.
2039. It would not come to Sydney? I very much doubt it. The produce of those districts will follow the capital invested.
2040. But a railway might make a great change in the ownership of land there? Yes; there is very little land alienated there, and that will be a great advantage in the future.
2041. The land is only let to squatters? Very little of the land is alienated—both sides of the river are reserved.
2042. *Mr. Dowel.*] Would not the proposed route pass chiefly through Crown lands? Yes; it is all Crown lands except just in the towns.
2043. And would not the construction of the railway give an increased value to the Crown lands? It must to some extent.
2044. That would be in favour of the construction of the line? I do not think the Government could sell the land out there. The land could have been sold at one time; in the old days it was open for selection, but except along the Darling, or near water holes, no selection took place.
2045. Is it not a fact that the construction of railways and roads causes settlement? Yes, if you can get rain.
2046. You are aware that in the United States a large number of railways are constructed where they have no population? Yes.
2047. Why should not the same principle apply to this country? You lose sight of the fact that those American railways are built in districts which are essentially suitable for agricultural settlement. I say that our western country is not suitable for agricultural settlement in its present state. If you can get water into that country for irrigation, then I say that there is no richer part of the colony than it.
2048. Have you had any experience in pastoral pursuits? I have been living in country districts a long time.
2049. Do you know that cattle and sheep materially improve the carrying capacity of the land? No, I have heard some of our best men say that they do not.
2050. Would you be surprised to hear that in the Riverina district where the country formerly carried one sheep to 6 acres, it now carries four? No; I deny the inference. I say it is the increased improvement—the water and paddocks, which improve the carrying capacity of the country.
2051. Is it not a fact that when the land was first settled upon the soil was so loose that the rain would percolate through it and go right away at once, whereas now it lies on the surface? I could not tell you. I know that a great deal of country is largely improved by sheep. The Hunter district has been wonderfully improved by sheep; but I have heard some of our best men deny that sheep farming improves the country over the ranges.
2052. Suppose this railway is constructed along the proposed route, will it destroy the prospect of constructing a railway from Wentworth to Hay? No, certainly not. But I do not believe in a railway from Wentworth to Hay, and I have told the people so, and they have never asked me to say a word in favour of it. Yet I saw the surveyors on the Lachlan carrying out surveys for a railway which I am quite certain will never be proposed. The people would be delighted to have it, but the people of Wentworth are too sensible to agitate for what they know would injure the rest of the country.
2053. *Mr. O'Sullivan.*] You appear to think it might be safe to take the line to Wilcannia, but that it would

Hon.  
J. P. Abbott,  
Esq., M.P.  
14 April, 1891.

- Hon. J. P. Abbott, Esq., M.P.  
14 April, 1891.
- would be unprofitable to take it to Broken Hill? I do not say it will be profitable to take the line to Wilcannia, but having gone to Cobar you cannot afford to let the railway stop where it is.
2054. You do not approve of taking it to Broken Hill? No, I do not think there is any necessity for it.
2055. You appear to have come to that conclusion, because you think there will not be a sufficient amount of traffic? Yes, that is so.
2056. You say also that five years ago you were at Broken Hill, and that your opinion is of no value on that point? No. I say that my opinion is of no value as to the details of the traffic. I say that the railways have no value where you cannot put people on the land to be customers of the railway. My evidence is utterly worthless as to the probability of a traffic between Sydney and Broken Hill. I can form no opinion upon it.
2057. But supposing we had evidence to show that we are likely to command a very large trade, will not that justify the carrying out of the railway? I say that in my opinion it is not justifiable. It will be a wool railway, and you will have no other produce.
2058. But if the major portion of the evidence shows that there is other traffic—a large traffic in bullion, timber, and coal, should not the line be constructed? How can people who give evidence say that you will have this traffic? It is a matter of speculation.
2059. Is there not a probability that this railway will have several special lines of traffic that do not exist at present. It may create a passenger traffic from Queensland, *via* Werris Creek and Nyngan? I think it is a wild speculation to expect a railway like that to carry passengers across the country from Queensland.
2060. Is it not a fact that this railway will shorten the distance for passengers between Broken Hill and Sydney? Yes.
2061. Is there not likely to be a considerable passenger traffic from Broken Hill to Sydney? Are not the companies at present shifting the management of every mine of importance from Sydney to Melbourne, or Adelaide?
2062. Might not that arise from the length of transit? No; the bulk of the shareholders are in those places. I will mention, as an illustration, a company formed in Sydney—the Hydraulic Company of Sydney—a New South Wales institution, and one which you might regard as a most profitable investment, yet I suppose that nearly seven-tenths of the capital of that company came from Victoria and South Australia. What are they doing?—trying to shift the management of the company from Sydney to Victoria. The produce will drift to where the capital comes from.
2063. But will it go there simply because the capital comes from there, or because at present it is the cheapest transit? I suppose they will send the produce wherever it will pay the best. Many people think that in Melbourne they have a better market and get better prices for their wool.
2064. If they can make more profit by sending their wool to Sydney and getting their stores from here they will do so? Yes, no doubt.
2065. You think that the Darling trade will not be reached, but are you aware that there is evidence that in many years the Darling is unnavigable? Yes.
2066. Then the railway must command the whole of the trade? Yes; but you will often find that when the Darling is not navigable the roads are not passable.
2067. Yes, but the railway is? But how are you to get the produce to the railway—the stations do not adjoin the railway; some are 100 miles back. I have in mind a station, consisting of 1,250,000 acres of land, and I have known the proprietors of that station to have to send out supplies to the back blocks and shear there, because they could not bring their sheep in, and they had to leave the wool there until there was a change of season.
2068. Do you mean to say that the roads would not be passable because they would be so dry? They will not be passable owing to the want of water and grass.
2069. *Mr. Garrard.*] I think you expressed the opinion that river dues should be charged on the river as a matter of principle? I think so.
2070. If those dues were charged, do you think there would be a reasonable prospect of the railway paying? I am inclined to think that there would. I think it would divert the traffic to the railway. The producer is always anxious to get his money, and he will send his produce where he can get the quickest return.
2071. You think it would be justifiable to impose river dues for the purpose of getting the traffic at Wilcannia? Yes.
2072. If the railway is constructed further on—from Wilcannia to Broken Hill—the probabilities are that the river traffic might be arrested by the river dues at Wilcannia and sent on by railway to Port Pirie? I have always been of opinion that facilities should be given to our own people to get to the nearest market.

WEDNESDAY, 15 APRIL, 1891.

Present:—

THE HONORABLE JOHN LACKEY (CHAIRMAN).

THE HON. ANDREW GARRAN.

THE HON. FREDERICK THOMAS HUMPHERY.

THE HON. GEORGE HENRY COX.

JACOB GARRARD, Esq.

HENRY COPELAND, Esq.

JAMES EBENEZER TONKIN, Esq.

WILLIAM SPRINGTHORPE DOWEL, Esq.

EDWARD WILLIAM O'SULLIVAN, Esq.

CHARLES ALFRED LEE, Esq.

WILLIAM McCOURT, Esq.

The Committee further considered the proposed Railway from Cobar to Cockburn.

William Alison, Esq., M.P., sworn, and examined:—

W. Alison, Esq., M.P.  
15 April, 1891.

2073. *Chairman.*] Where do you reside? At Canonbar.

2074. You are interested in large station property in the western district, above Canonbar? Yes.

2075. Do you know the country between Cobar and Wilcannia? I know the country from 30 or 40 miles to the west of Cobar.

2076. You are aware that it is proposed to construct a line of railway from Cobar to Cockburn, by way of Wilcannia? Yes; but I am not able to give any information in regard to the country or the railway. I have come here to give evidence simply in reference to the fencing of the line. I would advise that the Committee recommend that the line be fenced in with wire netting.
2077. Do you know the character of the country well? Yes; it is chocolate soil.
2078. You know that a railway has been constructed to Cobar? Yes.
2079. It is proposed to construct it at a low cost? Yes.
2080. Does your knowledge of the country between Cobar and Wilcannia enable you to form an opinion as to whether a line of that sort should be extended? I think so. Most certainly, as far as I know the country, I think it most advisable to construct a cheap line, because there will be very little traffic, except wool, between Cobar and the Darling. In the present condition of the country, and until the rabbits are got down, there will be no settlement whatever.
2081. Suppose the rabbits were got under, do you think it is a country that would carry a thick population? No.
2082. But with its present population you think it is desirable to provide an economical means of communication in the shape of a railway? Yes.
2083. Of course the Government have to make ordinary roads of some sort? Yes.
2084. The present road between Wilcannia and Cobar is very unsatisfactory? Yes.
2085. And you think that an economical railway would be an improvement? Yes; I think it would be more economical than an ordinary road.
2086. Do you think that if the rabbits were got under, the population would increase very much? Not very much. There would be some homestead leases taken up. I know that some homestead leases that were taken up in that country have been thrown up since on account of the rabbits; so I infer that in future the country will be occupied by homestead lessees, more or less, if the rabbits are got rid of.
2087. What is your opinion about the cultivation of that country? Cultivation is possible, but I think the country is too dry—the seasons are too irregular to make it a good country for cultivation.
2088. The land is good enough if they had moisture? Yes.
2089. The rainfall is very small? Yes; I have seen three or four years in succession when we had only 25 inches of rain altogether, and we thought that the grass would never grow again.
2090. You were saying something about fencing. You suggest that the railway line should be fenced? Yes, with wire netting, because the Rabbit Bill forces the lessees to fence. If A desires B to join in fencing, B must join with him. If the railway is not fenced it will be a high road for rabbits to travel on. At present, between Nyngan and Cobar, the lessees of unfenced land have not an opportunity of completing their fences. There is a gap left by the railway line where the contractors' carts pass in and out. I know a station where they pay 30s. a week to a man to guard the gap, to prevent the rabbits from getting through. If the line is left open and unfenced, it will continue to be a high road along which the rabbits will travel. It has been suggested that there shall be what I have seen in New Zealand and Tasmania, cow-catchers, but I doubt whether they would stop the rabbits.
2091. Do you recommend any special system of fencing? I think that the description that is required by the Rabbit Act will be quite sufficient for that country.
2092. *Mr. Cox.*] On one or both sides of the line? On both sides. The rabbits are on both sides, and if the fencing is only on one side the rabbits will get round it, and they would only be stopped on one side.
2093. Still, you could have blocked a certain portion? You could have cow-catchers. I do not know of anything else. If the line is fenced at all, it will be a very small additional expense to put up wire netting. At the present time the railway fences require six wires, but a wire netting fence only requires three wires. I can put up a wire netting fence, of the description required by the Rabbit Act, for from £60 to £65 a mile.
2094. *Chairman.*] Everything new? Yes, everything new.
2095. *Mr. Cox.*] What would a six-wire fence cost? A six-wire fence with No. 10 would cost from £40 to £45 a mile.
2096. *Chairman.*] Is it in contemplation to fence the railway between Nyngan and Cobar? There are no fences except contiguous to centres of population, like Cobar and Nyngan. Another drawback is that sheep in that part of the world eat the soil very much, and I have no doubt that if the line is unfenced they will eat the soil on the railway line, besides which the rabbits will burrow under it and make it unsafe.
2097. Have you ever been along the route of this railway as far as Wilcannia? No.
2098. And you are not in a position to say whether the country in the neighbourhood of Wilcannia would be likely to attract population? Not at all.
2099. But you are impressed with the advisability of constructing the railway? Yes.
2100. And would you recommend the construction of the railway right to Cockburn? I could not have an opinion upon that.
2101. *Mr. Tonkin.*] How far west would you advocate the construction of the railway from Cobar? I think it ought to go to the Darling.
2102. To Wilcannia? Yes; I think it would be a mistake to leave it at Cobar.
2103. And from your knowledge of the country between Cobar and Wilcannia, you believe that the line will pay the interest on the cost of construction? It would if there was a little more settlement in the district; I do not know whether it will under present conditions. When the country has been cleared of rabbits it will change the aspect of things altogether.
2104. Would you recommend the construction of the line if it would not pay the cost of working? It will undoubtedly pay, and there will have to be a road made from Cobar. I think it would be better to make a cheap railway at once. I have always been of opinion that it is better to make cheap railways than ordinary roads.
2105. Particularly in that kind of country? Yes.
2106. But suppose it was decided to construct a railway without any fencing at a low cost, would you still think that the work ought to be carried out? I could not say. I daresay that the cheaper it can be made the better; but it would be a mistake to leave the line unfenced.
2107. You think it would certainly be better to have it fenced with a rabbit-proof fence? I think so. There would be no way to stop the rabbits unless the line is fenced.
- 2108.

W. Alison,  
Esq., M.P.  
15 April, 1891.

W. Alison,  
Esq., M.P.  
15 April, 1891.

2108. Do you think that the advantage gained by the construction of the rabbit-proof fence would compensate for it? Certainly. If the rabbits are kept down it will encourage settlement which otherwise cannot take place. I know several homestead lessees who have thrown up their holdings, simply because of the rabbits.
2109. You could not say whether the construction of the railway would tend to bring more produce in the shape of wool to Sydney? I certainly think it will.
2110. Do you know anything of the Darling at all? I do not know the Darling very well, except about Bourke and Louth.
2111. From Louth we receive all the wool now? Yes; but below that it goes to Adelaide.
2112. Do you think it would bring the wool to Sydney from below Louth? Yes, in dry seasons.
2113. But not whilst the river was available? No; I should think they would generally prefer the cheap carriage.
2114. I suppose you have not taken into consideration the probable return from the minerals of the country? No.
2115. You look upon it merely from a pastoral point of view? That is all.
2116. Then, of course you know that if it were the only question, we must lose money by the line? I should say so.
2117. That unless the country there becomes more populous the line would not pay, but still you advocate its construction? Yes.
2118. You think it will be beneficial to the country at large? Yes; there would have to be a certain amount of money spent in making an ordinary road; but if the line is made, that will be saved.
2119. Have you any idea of the difference of the cost of a cheap railway and an ordinary road? I have not.
2120. *Mr. O'Sullivan.*] Have these rabbit-proof fences proved successful in stopping the progress of the rabbits? Yes.
2121. Therefore, believing that to be a good remedy for the pest, you recommend the erection of two rabbit-proof fences along the line? I do.
2122. And you think that that would be an admirable barrier to prevent their progress? Yes; and it would encourage settlement.
2123. And you say that the fences may be constructed for about £60 a mile? It cost me from £60 to £70 a mile.
2124. Are you aware that the estimate of the Railway Department for ordinary wire fencing for a railway is £100 a mile? I was not.
2125. Therefore, the rabbit-proof fence could be constructed for £30 a mile less than the Railway Department estimate? I am sure of it—that is, if they put up a rabbit-proof fence equivalent to what is required by the Rabbit Act.
2126. Is it a fact that in dry seasons out there it is impossible to get wool for the railway or the river, owing to the absence of water and grass? Yes; I have known instances of that when the wool has been kept for a long time on the station.
2127. From the evidence that we have, it appears that in dry seasons the line may be useful for taking stores out to Wilcannia, and that it ought to bring back wool and other produce? Undoubtedly.
2128. Will those dry seasons which make the railway a success for carrying outstores deter the wool from being brought to the railway? No; it would reduce the distance so much.
2129. You think that the railway, by reducing the distance, would get over a good deal of the difficulty as to the want of grass and water? Yes, certainly. They could at the same time get feed up, which hitherto they have not been able to do.
2130. They could get fodder up from the eastern districts? Yes.
2131. And by that means they would be enabled to feed their bullocks where now they die for want of grass? Yes.
2132. Therefore, the railway is likely, under the circumstances, to tap a good deal of trade that goes to Adelaide and Melbourne? Yes.
2133. Do you think that the railway, if carried to Wilcannia and Broken Hill, would be found useful for shifting starving stock to cooler districts? Yes; I am sure of that. In the years from 1881 to 1885, the line, if it had existed, would have been largely used and would have saved an immense number of stock.
2134. I suppose if the line were worked at a reasonable rate, so that you could use it for sending stock away, it would save a considerable amount of national wealth? Yes.
2135. And indirectly benefit the whole community. Undoubtedly. It would have saved tens of thousands of sheep if it had been in existence eight or nine years ago.
2136. I suppose that sheep anywhere within 50 or 100 miles of the railway could be driven to the railway in a few days? Yes.
2137. And be taken to cooler districts where there is water and grass? Yes.
2138. Whereas, under other circumstances, they would succumb to the drought? Undoubtedly.
2139. I suppose there must be a road made from Cobar to Wilcannia, and one from Wilcannia to Broken Hill? I should say that there must be.
2140. And the cost that is saved to the country would be considerable? Yes.
2141. Both for construction and maintenance? Yes.
2142. Have you any idea of the cost of making the roads there? No; I could not give an estimate.
2143. Do you think, from the nature of the country, that they could make ordinary roads at a cost of less than £3,000 a mile? I think a road could be made for less than £3,000 a mile, because there is a good deal of country there in which the roads would not require much making. It is hard gravelly hills, which are almost macadamized roads now. I think that £1,500 a mile would be about the cost of making roads.
2144. Is not the soil very soft? Yes, in the gulleys; but on the ridges it is quite hard, and does not give way.
2145. Do you think that it would be a better national investment to make a railway at once? I do, most certainly.
2146. Without any return whatever? If it only paid interest on working expenses.
2147. Do you know where the squatters out there generally send their wool to? When you get 50 or 60 miles west of Cobar they send it to Adelaide.

W. Alison,  
Esq., M.P.  
15 April, 1891.

2148. I suppose that those on the east side send it to Sydney? Yes.
2149. But at present, most of the graziers 60 or 70 miles from Cobar, and in the district of Wilcannia, send their wool to Adelaide and Melbourne? Yes.
2150. If the railway were made that trade would come to Sydney? Yes, I think so. At any rate only in very good seasons, when the river was dry, would it go to Adelaide.
2151. *Mr. Cox.*] In the Government estimate, £36,000 is put down for fencing in both sides of this railway line, extending from Cobar to Cockburn, a distance of 306 miles? Yes.
2152. You say that it can be done for £35 a mile for wire netting on each side, £150 a mile for a double line? Yes.
2153. Consequently, according to your estimate, it can be done for £40,000, because 306 miles at £65 a mile, would come to £40,000;—with an addition of £4,000, you believe that wire netting can be put up? Certainly, if the calculation is correct.
2154. You stated, from your knowledge of the country, that you believe a road can be made for £1,500 a mile? Yes, as far as I know.
2155. Are you not aware that when you get near the banks of the Darling you get into very rotten soil? Yes.
2156. A good portion of the line will run along the banks of the Darling? Yes. I was only alluding to the country that I actually am acquainted with.
2157. But when it comes to the rotten soil on the Darling, the expense of making the roads will be increased? Yes.
2158. And a railway would be cheaper than an ordinary road? Yes.
2159. From the one you get a certain return, and from the other you get no return? Quite true.
2160. And for the reasons that you have stated, to protect the embankments from the ravages of the rabbits, and for the protection of the people settled on either side of the railway, you think it desirable to use wire netting? Yes, most advisable.
2161. Especially if it only costs the country £4,000 more? I do not see how the rabbits are to be kept down unless wire netting is used. It will come to this, that the lessees will have to fence both sides of the line themselves to suppress the rabbits.
2162. *Mr. Copeland.*] You said you believed that it would be cheaper to build a railway than to make an ordinary road? It would be cheaper indirectly. Cheaper from the various advantages it would afford in comparison with the road.
2163. Of course your evidence is given in reference to the line from Cobar to Cockburn? Yes.
2164. Have you ever made a calculation as to what it would cost to make a road from Cobar to Wilcannia? No.
2165. When you say that the railway would be cheaper than the road, you are not speaking from any calculation? No.
2166. You have never entered into a calculation as to what it would cost to make a road? No, but I have some knowledge of what roads have cost in other places.
2167. Did you ever enter into a calculation as to what it would cost to make a road from Wilcannia to Broken Hill? No; my evidence has reference principally to the country west of Cobar.
2168. Did you ever make a calculation as to what it would cost to make a railway from Cobar to Wilcannia? I have compared it with the cost of the line between Nyngan to Cobar, and it is much the same class of country.
2169. What information can you give with reference to the cost per mile of a road between Nyngan and Cobar? The ordinary road between Nyngan and Cobar has never been properly made.
2170. You know that there has been a section made between Nyngan and Cobar? Yes.
2171. Do you know what it cost to make that section? I do not.
2172. Then when you say that it would be cheaper to make a railway than to make an ordinary road, you are merely speaking poetically? If you like to put it that way. I am only speaking from inference, not from accurate knowledge.
2173. You do not know what it would cost to make a road in any part of the country between Nyngan and Cobar? I know that it would cost over £1,000 a mile to make anything like a decent road—between £1,000 and £1,500 a mile.
2174. Some miles of road have been made and maintained between Nyngan and Cobar, but you do not know what it has cost per mile? No.
2175. Do you know personally any part of the route between Cobar and Wilcannia? Only 50 or 60 miles west of Cobar.
2176. Have you travelled on that country? Yes.
2177. But have you travelled by the railway route or by the road? I simply know the country generally—I have not travelled on the railway route.
2178. You do not know the railway route? No.
2179. You cannot say whether there are any natural difficulties on the railway route? I know there are no particular natural difficulties, so far as I have seen the country.
2180. Generally speaking, the country is level? Yes, undulating.
2181. You cannot say whether the route of the line is level, or whether it traverses any of the little hills? There are very few little hills any distance west of Cobar that could not be avoided quite easily.
2182. You cannot say whether road metal would be obtainable in that district? I think it would be. I have seen many little hills in which stone could be got.
2183. Where are those little hills? West of Cobar.
2184. How far west? 10 or 15 miles.
2185. What sort of stone could be got from them? Not very good stone—it is stone of a slaty nature, I should think.
2186. Have you seen building stone in Cobar that has been obtained from hills a few miles from there? I have.
2187. Is there any stone harder than that obtainable west of Cobar? Not to my knowledge.
2188. How far are you acquainted with the country west of Cobar? Between 50 and 60 miles, and there are small hills quite that distance along the line.
2189. Do you think that metal for the railway would be obtainable for a distance of 60 miles? I could not say whether it is fit for railway purposes. I should think it is.

W. Alison,  
Esq., M.P.  
15 April, 1891.

2190. Do you know anything of the timber west of Cobar? There is no available timber west of Cobar at all.
2191. No ironbark or red gum—nothing fit for sleepers? No.
2192. Any timber fit for firewood? Yes, any wood would do for that; but there is no timber fit for building purposes.
2193. And none fit for mining? I should say not.
2194. Is there any timber available for cabinet purposes west of Cobar? I should think not.
2195. You know something about the timber generally in the western country? Yes. I do not think there is any timber there that would be of the least value for cabinet purposes.
2196. Then the country between Nyngan and Cobar, and between Cobar and Wilcannia, is virtually of no value as far as the export of timber is concerned? I should say not. I know by repute the country further west than I have been.
2197. You have had a good deal of experience in squatting pursuits? Yes.
2198. How many years experience have you had in connection with squattages? I have been 20 years engaged in the business.
2199. Can you tell the Committee what is your opinion generally of stocking the country;—do you think that it improves the carrying capabilities of the land? It does undoubtedly, especially stocking with sheep. They have improved that western country a great deal.
2200. Given 1,000 acres of ordinary country without any ring-barking, any provision for water, or any fencing, do you think that that 1,000 acres will be improved by simply depasturing stock on it? It does increase the carrying capacity of the land, but not to any very great extent. I should not think it would make any radical change. Where 10 acres carried a sheep, perhaps the land might be sufficiently improved to make 8 or 9 acres sufficient to carry a sheep.
2201. How many years do you reckon it would take to produce that result? I really could not tell you. I think two or three years. The land would improve, and the grass would grow thicker.
2202. Do you think if you took 1,000 acres of ordinary country, of which it took 10 acres to carry a sheep, that, after five years, 8 acres of that land would be sufficient to carry a sheep? I think so. It is a very vague sort of estimate to make. I do not know that I like making it. I am sure that stocking the land improves it, but to give any definite estimate is more than I can do.
2203. I should like you to give the Committee the benefit of your stocking experience? Stocking with sheep improves the country, but to what extent I do not feel competent to say, because the seasons vary so much that it is impossible to make an exact estimate.
2204. You have stated that depastured stock on land does improve its carrying capabilities;—would you say that if 1,000 acres of land had stock depastured on it for ten years, after that time 800 acres of that land would carry as much stock as the 1,000 acres carried originally? Yes; I think that in five years it would.
2205. Do you think that that ratio of improvement would continue? No; there would be a limit. I do not know that it would continue improving, or it would come to a sheep to an acre in twenty years, which I do not think it possible for the land to carry.
2206. Would it be a fair thing to estimate that the carrying capabilities of the land could be increased by 25 per cent. in ten years by stocking? No; I do not think it would. It is a very difficult thing to say. It would not continue improving indefinitely by stocking. Take virgin soil and put sheep on it, and suppose it will carry one sheep to ten acres. The grass will grow thicker, and it will afterwards carry one sheep to eight acres, but it will improve no further.
2207. How many years would it take to bring about that result? Say, roughly, from five to seven years. It really is a most vague thing.
2208. You think that the land having improved so as to require eight acres instead of ten acres to carry a sheep, there would be no further improvement? I do not think there would be, but I could not say positively.
2209. Suppose you were to ringbark the country and clear away the scrub, what would be the effect then? That would very materially increase the carrying capabilities of the land. Ringbarking always increases it very much indeed. If you ringbark a country which carries one sheep to ten acres, it will probably afterwards carry one sheep to five acres. The more thickly timbered the country is the better it is after it is rung.
2210. So that by ringbarking you would increase the carrying capabilities of the country by 50 per cent. Yes; if the country is thickly timbered.
2211. What would be the effect of scrubbing the country? When I speak of ringbarking I include scrubbing. When we ring the trees we usually cut down the scrub at the same time. Ringing and scrubbing in thickly-timbered country will double the carrying capacity of the land, but in thinly-timbered country it will not.
2212. What country are you thinking of at the present time? The country out west—the Cobar country and the country on the Bogan, which I have had particular experience of.
2213. You think that if the Cobar country were ringbarked, and the scrub cleared off, its carrying capabilities would be increased by 50 per cent.? Very nearly, if it is thickly timbered.
2214. How long would it be before that would be realised? About two and a half years after the ringing and scrubbing.
2215. That would be the general effect in the country, as well as on your own station? Yes.
2216. Of course it would be necessary to make provision for water conservation? Yes; you would have to make additional tanks.
2217. Having got the carrying capabilities of the land from a sheep to 10 acres to a sheep to 5 acres, do you think that is the limit of improvement? No; I think that the more water is provided, and the more small paddocks are made, the carrying capacity of the country will go on increasing.
2218. Have you ever tried any kind of foreign grasses? No.
2219. In ringing and clearing the scrub you have simply left the land to develop its own natural grasses? Yes.
2220. And you have never had any experience of the result of sowing prairie grasses? We have put down small fields of wheat and oats, and the results have been very good. We have got very large crops; but the places wherein I carried on this small cultivation were between sloping hills in the gulleys, and the

the rain used to irrigate them. That is all I have ever attempted to do in the way of cultivation. I have never sown grasses of any kind.

2221. Do not you think it would be desirable to try the effect of growing different grasses? Yes, it may be; but unless foreign grasses would grow without cultivation, we could not grow them on a very large scale. We might throw the seed broadcast, but we cannot go in for cultivating with the plough.

2222. Would it not be possible for your boundary riders to carry the grass seed and sow it? I doubt if it would pay. I have never tried it—never even thought of it.

2223. What is the general cost of ringbarking and scrubbing? I have paid, in the Bogan country, up to 1s. 9d. and 2s. an acre. I have paid different prices, varying from 10d. an acre on thinly-timbered country up to 2s. an acre on thickly-timbered country.

2224. Are you speaking of the Bogan district? Yes; the same class of country as the Cobar country.

2225. What is about the general average cost? I think out in the west the average cost is about 2s. an acre. That includes the cutting down of small pine and ringing the big trees. In some places the charge is 2s. 6d. an acre.

2226. What is the immediate effect of that work? The land carries more stock at once. The mere cutting down of the small timber does it.

2227. I suppose in the first year a direct benefit is derived from ringbarking the trees? Some benefit; but the first year's benefit would be from the scrubbage.

2228. I suppose that in the second year you would derive considerable benefit? Yes; but the full benefit would be derived in two and a half years.

2229. Do you burn off the scrub? No; I do not like burning at all. I have had fires on the run, but if pine is growing I prefer to cut it down. I do not like losing the grass.

2230. After the second or third year you derive the full benefit of the ringbarking and scrubbing? Yes; then you have to go to expense again in cutting the young pine down. I have had to cut it down twice—once when ringbarking and once afterwards.

2231. In the first instance, ringbarking and scrubbing costs about 2s. an acre? Yes.

2232. And how much in the second instance? Sixpence and 8d. an acre on the Bogan.

2233. After that is the country free? It is pretty well free; but in a few years' time the young pine may want cutting down again.

2234. Assuming that the squatters are prepared to spend 3s. an acre, I suppose that the carrying capabilities of the Western District might be increased by about 50 per cent.? I should say so, although I have known a good many runs which have gone to all this expense, and which are pretty well ruined by rabbits now. That makes the difficulty of calculating the improvement of the country. On some runs that I am acquainted with the rabbits have totally disarranged all their plans, and country that has been ringbarked and scrubbed is almost valueless.

2235. Leaving the rabbits out of the question, if the squatters generally expended from 1s. to 3s. an acre, they would be able to increase the carrying capacity of their runs by 50 per cent.? I think they would; but I do not know that that would include what they would have to lay out in constructing tanks, but they would get the benefit of that by the increased carrying capacity of the land.

2236. The effect of ringbarking and scrubbing would be to increase the carrying capability of the land by 50 per cent.? I think it would be, in a thickly timbered country.

2237. Supposing that the lessees provided plenty of water on the ground, how much would that increase the carrying capabilities of the runs? When I spoke of ringbarking, I included the water tanks. I did not intend to say that in addition to the ringbarking the tanks would increase it still more.

2238. What you meant to say was, that the ringbarking and scrubbing would give a 50 per cent. increase, but that that 50 per cent. increase would naturally cause a larger demand for water? Yes.

2239. Is that the maximum of what the squatters can do to improve the country? It is difficult to say where the maximum comes in. My experience teaches me that small paddocks and abundance of water will increase the carrying capacity of a run.

2240. I suppose that where many selections have been made the remainder of the run carries more stock than it did before the selections were made? Yes. I am astonished very often at the results obtained by making small paddocks and providing them with plenty of water.

2241. Do you know of any place that would go from 15 per cent. up to 100 per cent.;—do you know of any place now carrying 10,000 sheep which formerly carried 5,000 sheep, although there had been large selections taken out of the run? I cannot, just now, think of any place that would answer the illustration. I have seen selections of 2,500 acres which have been cut up into two or three paddocks, and they have carried nearly a sheep to 1½ acres, but before that we never reckoned on their carrying more than one sheep to 2½ or 3 acres.

2242. But the country out west is not supposed generally to carry a sheep to 3 acres, is it? I am referring to a different class of country altogether—the myall country.

2243. Do you think that the maximum carrying capability in the western country is a sheep to 5 acres? For some years to come I think it will be. Very few runs out west have carried up to that, even in good seasons, and in many seasons they have lost an enormous lot of stock. Some years you only get 8 inches of rain, and if you have two or three years like that all your stock are gone.

2244. But if you have this railway, would it not be of great service to squatters, enabling them to get their starving stock away? Yes.

2245. Would not that reduce the risk? It would, undoubtedly.

2246. I suppose that with a railway through the heart of the western district you would almost be able to make certain, 100 miles north or south of the line, of getting away the stock in the worst droughts? Yes; under that condition, people would send stock away before it became too late.

2247. Would you not be able to have more stock, knowing that you could get your stock away in case of a drought? I should think so.

2248. To what extent do you think you would be able to increase your stock? I do not think I could put it in the form of a percentage.

2249. You would be able to take the full benefit of the grass in a good season? Yes.

2250. You would be able to put the stock on the land when you had a good season, knowing that if a severe drought came on you could move the stock to other parts of the country? Yes; they would be able to carry more stock where, under other conditions, they would have to stock more lightly.

2251. Would it not make pastoral pursuits safer? Yes.

2252.

W. Alison,  
Esq., M.P.  
15 April, 1891.

- W. Alison; Esq., M.P.  
15 April, 1891
2252. You would be able to invest your money in sheep with greater certainty of avoiding loss? Undoubtedly.
2253. That being the case, you would be able to borrow money at a lower rate of interest? That depends upon other things.
2254. If you reduce the risk, would you not be able to borrow money at a lower rate? I do not think it would make much difference.
2255. Would it make any difference in the value of the land if you could put on an extra number of stock in good seasons with the certainty of being able to save them if a drought occurred? It would make it more valuable, but I do not think it would make any difference in the rates to the mortgagor. I do not think that a man who is near a railway line will get any better terms than a man who is further away.
2256. Would you not be likely to get money at a lower rate of interest if it were known that a railway ran within 50 or 100 miles of your station, and that no matter how severe a drought might occur you would be able to save your stock by bringing them into the eastern district? I cannot say what view the managers of financial companies would take of the matter. My experience teaches me to suppose that it would not make the slightest difference.
2257. I suppose that very often you have enormous quantities of grass that would go to waste? Yes.
2258. If you knew that you could get your stock away in time of drought, would you not increase the number of your stock? I do not know that I should. I might run a little more risk, but I could not put it into figures. It would not be a very great deal more, because if it comes to sending stock away it is a sort of thing that makes the remainder of the stock very badly off. I do not think that in stocking a run it would make a difference of more than 5 per cent. at the most.
2259. Can you generally base your calculation on the average carrying capabilities of the land? I do not know that I ever took it into consideration that I should be able to get stock away in a drought. I just endeavour, as far as possible, to stock the land safely, to keep the stock in fair ordinary seasons in good ordinary condition. I do not know that I should stock up the land so heavily as to take my chance of a bad season. I do not know that having a railway alongside the run would make much difference in my stocking.
2260. You think that if a railway were taken into the interior of the country, people would not take advantage of good seasons to put an extra number of sheep on the land? Not for the advantage of sending them away by railway.
2261. Then they would allow the grass to blow away with the wind? Every squatter has to waste a considerable quantity of grass rather than overstock his run. He may be able to send the sheep away in a very bad season, but he may get nothing for them. Everybody else may be as badly off as himself. This is a really good season, but I do not think that any man will stock unduly, because of the danger that he may not be able to sell his sheep if a bad season comes.
2262. Supposing that without selling them he could carry a larger number of sheep and get the wool, would not that be to his interest? Undoubtedly it would; different men look at it in different ways.
2263. Supposing that your run would carry double the number of sheep, and you could get double the quantity of wool, would not that be a benefit, knowing that if a drought came you could get your stock away? It is a great advantage, but most men prefer to keep a fair quantity of stock, instead of acting in that speculative kind of way. If a man doubles or quadruples his stock, as we could do now, he would find himself unable to sell them although he could get them away. On my land I could carry a sheep to the acre, but I would not run that risk.
2264. Which country are you alluding to? To any of the Cobar or Bogan country. The season is something wonderful—I never knew anything like it. The land would carry a sheep to the acre; but I am not going to buy a lot of stock, because I know that I might not be able to sell the stock afterwards, when everybody begins to get pinched as well as myself. There is a very deficient market now for store stock.
2265. Is there any deficient market for wool? No.
2266. And if you could carry stock from one year to another, knowing that if a drought did come the railway was there to carry the stock away, would not that justify you in fully stocking your land? Some men might do it.
2267. Will not every man stock according to the carrying capabilities of his run;—if his land will carry a sheep to 5 acres, it would not be to his interest to have one sheep to 10 acres? You would have to buy those sheep. You would be buying in a good season and perhaps have to sell in a bad season. You might buy them at 10s. a head and have to sell them at 6s. a head.
2268. Does not the same argument apply to the first thousand as well as to the last thousand? No; because there is a difference between stocking fairly and stocking unduly.
2269. Would that difference continue to exist if you had a railway to take the stock away? One would be safer; but the squatter would consider the question of being able to sell his sheep, and whether it would pay to send away the sheep and to hire paddocks. I consider my run fully stocked at the present time, and I have got one sheep to 4 or 5 acres. I consider the run fairly stocked, although it would carry a sheep to an acre, but I am not going to buy those sheep to put on it.
2270. Then it would be of no benefit to the squatting interest to make a railway through the western country? It would be beneficial, but I do not know how to appraise the benefit.
2271. Do you think that it would increase the value of the Crown land? I should think that it would.
2272. Suppose that the leases in the western district were falling in, do you think that the land would bring an increased rent from the fact of the railway having been made? Certainly, they would bring more rent.
2273. How widely would the beneficial influence of the railway extend;—would it extend 100 miles north or south of the railway? I should think so.
2274. You would expect them to feed the railway from a distance of 100 miles on each side of it? Yes.
2275. And you think that if the railway were taken through to Wilcannia, it would benefit the country for a distance of 100 miles to the north and to the south? Yes.
2276. Can you give the Committee any idea as to what it would cost to send a ton of wool 100 miles by your station teams? It has cost me prices varying from £2 10s. to £3 10s. to send wool from 70 to 75 miles.

2277. How much would it cost you to send it 50 miles? It has cost me 22s. 6d. a ton to send 20 miles. I have had to pay as much as 25s.
2278. What would be the cost for 50 miles in an average season? From 30s. to 35s. a ton.
2279. What would it cost for 100 miles? From £3 10s. to £4 10s.
2280. How much for 50 miles? From 30s. to 40s.
2281. Suppose it cost you 40s. a ton to send the wool 50 miles, would it cost you another 20s. to send it another 50 miles when it was loaded up? I suppose about that.
2282. Notwithstanding that it was already loaded, would a simple extension of the journey cost you another 20s. a ton? I can only tell you what I have paid.
2283. I suppose you have a good knowledge as to how the people on the Darling would send their wool, supposing the railway were made. Do you know what the insurance amounts to in sending wool down the Darling? I do not.
2284. You send in your wool from the Bogan to the railway? Yes.
2285. And also from Cobar? Yes.
2286. How much do you pay from Cobar? From £2 10s. to £3 10s. are the varying prices that I have paid.
2287. According to the season? Yes, and according to the state of the market for wagoners.
2288. Suppose the railway were taken from Cobar to Wilcannia, would you be likely to send the wool to the river? Not in the least likely. No one about Cobar would, I think. Of course it would depend upon the calculation as to prices.
2289. In calculating the prices would you not take the insurance into calculation? Yes; we have to take everything into consideration.
2290. Would a man less prosperously situated than yourself be likely to use the railway if he found that it would be a cheaper means of transit, and that he would sooner be able to draw against the wool? Yes. But whoever did that would take into calculation the loss of interest and the gain. Everything would have to be gone into very carefully.
2291. Supposing you could send your wool 2s. or 3s. per ton cheaper if you sent it to Wilcannia by teams, and thence by the river, knowing that it would take a week or a month in transit, would you do that? I would not; no man would.
2292. Every man would be likely to send his wool by the quickest route? Yes; there would have to be something considerable to induce him to send his wool away from the railway line.
2293. You think that if the railway were constructed to Wilcannia, the people would use it? Undoubtedly.
2294. All these things being considered, what do you think would be the effect on the expiration of the present squatters' leases, as you are aware the land will have to be re-appraised. Do you think that, in view of the hundreds and thousands of acres of land that would be benefited by the railway, the Government would be likely to derive an increased rent? Well, it is twenty-one years hence.
2295. Yes, and it will be some years before the railway is open. But do you think that the Government would get a higher rent at the end of the 21 years? The land must necessarily be more valuable if the railway is made than it would be without a railway—that is if the rabbits are got rid of, because the rabbit pest overshadows everything.
2296. Leaving the rabbits out? But you cannot leave them out. Unless they are destroyed the country will be given up altogether, and it will be of no value to the State.
2297. I travelled over your country, and could not find a rabbit even to eat? I could find you rabbits to eat morning, noon, and night, without going 100 yards from the house.
2298. At the termination of the present leases, do you think the Government will get an increased rent on account of the railway? I should say so.
2299. Do you think that if the Government provide facilities for getting the stock carried, for getting the wool away and getting stores, that the land will be worth more per acre than it is now? It ought to be more valuable with a railway than without it, but that is all I can say.
2300. Would it be worth 25 per cent more? It is impossible to say what changes may occur in 21 years.
2301. But allowing for the average seasons, the increase of the grazing capabilities of the land, and the advantages of railway communication, do you think that when the present leases terminate the land will be worth 25 per cent. more than it is now? I should say so—it ought to be.
2302. That increased rental would go to make up the loss that might be sustained by making this railway? We should expect a population would settle, and that the rabbits would be got rid of.
2303. If for the first two or three years the railway were found not to be paying working expenses, I suppose the squatters would not object to a moderate increase of the railway rates to make it a paying concern? I suppose not, but it would be a commercial transaction. If the rates were increased, except to a moderate extent, the wool would be sent away by the river. It would not be a matter of sentiment.
2304. What river could you send it down from the country between Nyngan and Cobar? You could not send it down any river from there, but the people west of Cobar could.
2305. They could avoid the railway and go to the river? Yes.
2306. And the people to the east would have to put up with the railway charges? Yes.
2307. But you would not anticipate being able to send goods at a cheaper rate down the river, taking into consideration the extra insurance rate? I do not know anything about that.
2308. *Mr. Dowell.*] Can you inform the Committee whether many of the runs, through which the proposed railway will pass, are owned by Victorians or South Australians? I do not know.
2309. Suppose that a majority of the stations through which the line would pass were owned by Victorian and South Australian people, do you think they would cease their business relations with Victoria and South Australia if the line were constructed? I do not think that business men are governed by sentiment. They would calculate the cost and act accordingly. If it is much dearer to send to Sydney than to Adelaide, they will not send to Sydney. If it is much dearer to send to Adelaide they will not send to Adelaide. I do not think that because a man is a Victorian he will necessarily have his wool sent to Victoria to be sold.
2310. Suppose that Parliament determines to construct the railway, do you think that river dues should be imposed to keep the traffic in the country? No, I do not think so. I believe in free traffic. I do not believe in that particular form of protection at all. Of course, charges might be made to defray the cost of keeping the river clear, but rather than stop the wool from going in any particular direction, it would be better to simply prohibit the squatters from sending their wool where they liked.

W. Alison,  
Esq., M.P.  
15 April, 1891.

- W. Alison, Esq., M.P.  
15 April, 1891.
2311. *Mr. Lee.*] Are you the lessee of any rabbit infested country? I am.
2312. Have you had it a considerable time? Yes, five or six years.
2313. Have you had any practical experience in dealing with the rabbit pest by means of wire netting? Yes.
2314. Can you give the Committee a definite statement as to the cost per mile for the erection of wire netting? Yes; it has cost me from £60 to £65 a mile.
2315. Would £65 a mile be a fair estimate for erecting it in large quantities? Yes; I feel confident that it can be done for that.
2316. Could it be done for that in that western country, where there is no timber available for posts? That will make a difference, which would add to the expense.
2317. Would it increase the cost? It would, but not very materially, I think.
2318. But where the timber is available the cost would be under the amount you have stated? I put the cost at £75 a mile for the Government. £65 a mile is what it cost me.
2319. According to your calculation, and comparing it with the Government system of fencing, a double line of fencing from Cobar to Cockburn could be erected at an extra cost of £7,600? Mr. Cox said £4,000.
2320. He reckoned it at £65—he misunderstood your figures? Yes.
2321. Have you found that wire netting has been effective in stopping the progress of the rabbits? Yes.
2322. Has it been effective in merely stopping their march through the country, or in enabling the lessees to deal with them? It has stopped the wave of rabbits that was coming along over the country. On the side from which the wave comes the rabbits are very thick, but on the other side there are hardly any.
2323. Is there any other means known to be more effective than wire-netting? None.
2324. Is it the general opinion of pastoralists that the land must be fenced in with wire netting before they can deal with the rabbits? Yes.
2325. You are quite clear on that point? I am. It is my own absolute opinion that without wire netting the thing is hopeless.
2326. Are many squatters in the western district using wire netting? Yes.
2327. And have they tried other means? They have tried every other means. Netting is the ground work for all operations against rabbits.
2328. Although you do not know the route of the line from Cobar to Cockburn personally, I presume that you know the country by repute? Yes.
2329. Is the whole of that country infested with rabbits? It is.
2330. Consequently the railway line will go all through the rabbit country? Undoubtedly.
2331. Do you think that this double barrier of wire netting will completely stop the march of the rabbits? It will, when private people have completed their fences up to it.
2332. I am speaking of the two railway fences? They will make a barrier, but the rabbits are on each side of it, travelling parallel with it.
2333. But I want to know if it will prevent them from going from side to side? It will.
2334. It is the habit of the rabbits to travel in large numbers? There has been a wave travelling north and north-west from the south-east.
2335. Your opinion is that if this double fence of effective netting were erected, it would be the means of saving the pastoral interests of the country, as well as giving the necessary protection to the railway line? Yes, it would serve both purposes.
2336. You hold a very strong opinion upon the question? Yes.
2337. You say it overshadows every other question? Yes, in that part of the world.
2338. Are we to understand that unless something is done to get rid of the rabbits, it will be almost useless to take a railway through that country? If the rabbits are not destroyed there will be comparatively little wool from that part of the country.
2339. If the rabbits are not dealt with, is the quantity of the wool likely to increase? No, it will decrease.
2340. Do you know of any runs that have been abandoned there? Yes, a run was abandoned there the other day, I believe, in consequence of the rabbits, and it was put up for auction, but I do not know whether it was sold. It was a run of 120,000 acres. The rent was ½d. an acre of the leasehold, and 13s. 6d. per section the resumed area, and yet it was abandoned.
2341. Is it a habit of the rabbits to roam at large or burrow? They roam at large—they do not burrow very much.
2342. Do you think that if they had access to the railway embankment they would burrow into it? They would, but not very much.
2343. Would that cause danger? It would unless the gangers looked out to prevent it.
2344. Your chief object in giving evidence is to show the danger to that part of the country unless something is done to get rid of the rabbit pest? Yes.
2345. And no artificial means must be given to facilitate their progress? No, but this unfenced railway line would afford such facilities.
2346. *Dr. Garran.*] Have you on the resumed half of your run any small selectors? Yes, homestead lessees.
2347. And free selectors? Yes, and free selectors in another division.
2348. Have any of them abandoned their holdings? No; I do not think they have.
2349. Do you know whether, between Nyngan and Cobar, the line passes through the resumed half or the reserved half? It passes through both.
2350. Do you think the effect of the railway will be to increase settlement along the route if it is taken to Wilcannia? Not until the rabbits are got rid of.
2351. Suppose the rabbits were got rid of, could the selectors make a living? Yes, they could make a living; but I know several settlers who took up homestead leases and had to abandon them because of the rabbit pest.
2352. If the rabbits are got rid of, will the tendency be to have the whole resumed area taken up by homestead lessees? A great deal depends upon the class of country.
2353. The country between Cobar and Wilcannia? Some of it is unfit to be taken up at all.
2354. Some of it is not fit even for homestead leases? No.
2355. Will there be a settled population on the line of railway? There would be eventually.
2356. It would take some time? Yes.

- 2357. Would they be able to supply a paying traffic to the railway? I could not say whether there would be a sufficient number of them to do that.
- 2358. Parts of the country are encouraging and parts are discouraging? Yes.
- 2359. *Mr. Tonkin.*] Independent of the railway, would the construction of this double line of rabbit-proof fencing from Nyngan to Wilcannia be a great benefit to the country at large? No, not particularly. The runs might be fenced in apart from the railway; but an injury would be done by leaving a gap in the fence. That is what is found on the present Nyngan to Cobar line. On one station they have to keep a man at the gap night and day to prevent rabbits from coming through.
- 2360. Of course you know that if the railway goes to Wilcannia it will come from the river, where the rabbits cannot get across? Yes.
- 2361. That will be almost a direct fence across the country? Yes.
- 2362. Would that not materially prevent the spread of rabbits? Undoubtedly.
- 2363. Even without further fencing? Yes; but it would require further subdivision before it would be of much value.
- 2364-5. Still, it would be of great benefit to the country? Yes; but if there were no railway line the squatters would fence the land in themselves.

W. Alison,  
Esq., M.P.  
15 April, 1891.

THURSDAY, 16 APRIL, 1891.

Present:—

JACOB GARRARD, Esq. (VICE-CHAIRMAN).

- |  |   |   |
|--|---|---|
| <p>The Hon. FREDERICK THOMAS HUMPHERY.<br/>The Hon. GEORGE HENRY COX.<br/>HENRY COPELAND, Esq.<br/>JAMES EBENEZER TONKIN, Esq.</p> | } | <p>WILLIAM SPRINGHORPE DOWEL, Esq.<br/>EDWARD WILLIAM O'SULLIVAN, Esq.<br/>CHARLES ALFRED LEE, Esq.<br/>WILLIAM MCCOURT, Esq.</p> |
|--|---|---|

The Committee further considered the proposed Railway from Cobar to Cockburn.

Wyman Brown, Esq., M.P., sworn, and examined:—

- 2366. *Vice-Chairman.*] You are the representative in Parliament of the Sturt electorate? Yes.
- 2367. *Mr. Copeland.*] Broken Hill is in your electorate? Yes.
- 2368. Have you prepared any statement, or do you wish to give any evidence, in reference to the proposed line? Having been intimately connected with the district almost from its infancy, I thought I might be able to assist the Committee in arriving at a conclusion as to the advisability of constructing the line. I desire to state that the Broken Hill mineral field is of enormous extent, as far as its resources are concerned, and I have no hesitation in saying that it will be permanent; in fact, I go so far as to say that not a man on this Committee will see it worked out.
- 2369. You were the Warden of the district? I was the Warden there from 1884 till 1890.
- 2370. And being a Gold-field's Warden, I suppose you had an opportunity to form an opinion as to the permanency of the field? I had every opportunity.
- 2371. In addition to that, you are a practical miner, are you not? Yes; I had sixteen years practical mining experience.
- 2372. Before you went there? Yes.
- 2373. And your opinion is that it will be a permanent silver field? I have no hesitation in saying so.
- 2374. Do you think that the Government would be justified in going to this large expenditure to build the proposed railway; is there hope of obtaining payable returns? I may tell you that at one time I was not particularly in favour of this line; but I have been given to understand that the Railway Commissioners, during their visit there, went into the matter thoroughly, and state that they can deliver coal as cheap as the companies are at present getting it. If such is the case, I have no hesitation in saying that the line will pay from the start.
- 2375. If it can be proved that coal and coke can be sent there as cheap as they can be sent by steam at present, you think it is a certainty that the line would be remunerative? I have no hesitation in saying so.
- 2376. Do you think they will be likely to send bullion back by rail? I understand that the Commissioners would run the line on commercial principles, and I imagine that it will pay them better to bring ore back at a low rate than to run empty trucks.
- 2377. How do you think the Silverton Tramway Company will be affected by the construction of this line? I do not think it will be affected very much. Of course, if coal is sent over this line it must reduce their traffic.
- 2378. Do you think there is likely to be any opposition on the part of the Tramway Company? I have not heard of any.
- 2379. Do you think there is any likelihood of their shares being depreciated by the construction of the railway? I should think their shares would necessarily go down in value, the same as in the case of any other company when opposition is started. The Silverton Tramway Company at present have a complete monopoly.
- 2380. And you are of opinion that it would be beneficial to the general interests of the district to have this line made? I have no doubt about it. I may say that there are thousands of acres of land on the banks of the Darling at Wilcannia which could be irrigated, and which would supply the people of Broken Hill with all the produce they require.
- 2381. And in advocating this railway, you believe you are advocating the best interests of the district? Yes; not only the best interests of the district, but also the best interests of the country.
- 2382. Have you any knowledge of the country between Cobar and Wilcannia? I know nothing about that part of the country.
- 2383. Do you know the country between Wilcannia and Broken Hill? Yes.
- 2384. Is there any likelihood of new fields being opened up between Wilcannia and Broken Hill? There is Black Mountain, 80 miles away. It is a mineral country, but up to the present time nothing there has been proved payable.

W. Brown,  
Esq., M.P.  
16 April, 1891.

- W. Brown, Esq., M.P.  
16 April, 1891.
2385. Is that near Nuntherungie? That is 10 miles from Black Mountain.
2386. How far would Black Mountain be from the railway? I could not say; it is about 60 miles from Broken Hill.
2387. From what you know of the district, do you think it is the proper route to take the line to Wilcannia and from there to Broken Hill? The railway having been made to Cobar, it should continue on the proposed line.
2388. If the line were not constructed to Cobar, would you suggest a different route? I should not like to suggest a route, but I have often thought that if the railway had not been carried to Cobar it should have gone by Oxley and Menindie.
2389. Why do you think it should go that way? I think it is a more direct line.
2390. Do you think that if the railway is constructed they would be likely to erect smelting works on the Darling? I hardly think so. I think if there were facilities for sending fluxes, ironstone, and coke to Broken Hill, they would get better results by smelting on the mine and by sending the ore away. I think that has been proved at Adelaide and Port Pirie.
2391. You do not think that there would be any likelihood of any traffic to Lithgow of smelting ore from the mines? My idea is that they can treat the ores more beneficially at the mines.
2392. Suppose the Railway Commissioners were to make very low rates, so as to have loaded trains both ways, carrying coal, coke, and timber to Broken Hill, and having the trains loaded up again back to Lithgow—do you think then that they would send the ore to the coal? I think there would be plenty of traffic back in the shape of bullion, and not ore. There must be at present 1,500 tons of bullion leaving Broken Hill every week.
2393. I think the evidence is that something like 5,000 tons per month leave Broken Hill? I thought there might be 6,000 tons a month. The Proprietary Company send 800 or 900 tons themselves, Block 14 about 250 tons, there is also a large quantity from the Central smelters, and the British have commenced turning out bullion within the last fortnight. That would increase the quantity considerably. Perhaps, since the estimate of 5,000 tons was given, the quantity may have increased to 6,000 tons per month.
2394. Is there any probability of other companies commencing by-and-by? I believe the South mine is going to begin. I am not sure that smelters are not now in course of construction.
2395. Is Block 10 going to begin? I have not heard of their taking any steps yet, but I have no doubt that they will start smelting when they can get a supply of water and fluxes.
2396. Do you think that the mines not now producing ore will be likely to succeed in obtaining it? Yes. I think there are plenty of mines there likely to produce payable ore;—not, perhaps, on that particular line, but there is a mineral field extending 80 miles by 30 or 40 miles, and all that I have spoken of do not include 3 miles of country.
2397. You think that the country has not arrived at maturity as regards its development? I think there are plenty of outside mines that will develop into good properties.
2398. You think that in the course of a few years there will be more men employed in obtaining ore than there are now? Decidedly. It would not surprise me to see 15,000 more people there in five years' time than there are now.
2399. Would you expect that by the time the railway was open the traffic would be considerably greater than it is now? I have no doubt about it.
2400. And you think that we should be quite safe in constructing the railway? I do.
2401. *Mr. Tonkin.*] What effect do you think it will have upon the returns of the railway if the coal can be delivered at Broken Hill at 10s. or 12s. a ton less than it costs now? That I cannot say. It is safe to estimate that at present they are using 1,500 tons of coal a week.
2402. Do you think that if they could get the coal at 10s. or 12s. a ton less they would take it at the cheaper rate? I should say that, the quality being equal, anyone buying coal would take the cheapest.
2403. Do you think that the consumption of coal would be increased if it could be got at a lower rate—that they would be able to treat a poorer grade of ores? No doubt; the cheaper the fuel the poorer class of ores will they be able to treat.
2404. Are they not throwing aside large quantities of ore, which it would pay to treat if it could be dealt with at a cheaper rate? No doubt.
2405. And if they could treat the ores cheaper, that would lead to a greater consumption of fuel? No doubt it would. The firewood is also getting scarce, and very soon all the houses will have to use coal. There is no firewood within 10 or 12 miles of Broken Hill.
2406. If the coal could be delivered 10s. a ton cheaper than it is obtained now, would it not be cheaper for household purposes than firewood? Very much cheaper.
2407. There would be a large consumption of coal? Yes. There is a gas company at Broken Hill which must be a large consumer of coal.
2408. How long has the gas company been there? Nearly two years. The hotels were all lit with gas when Sir Henry Parkes was there this time last year.
2409. Do you know anything of the country beyond Wilcannia to the north-west? That is more out Black Mountain way. I do not know anything about it.
2410. Do you know of any developments in mining between Wilcannia and Broken Hill? Not except Black Mountain and Nuntherungie.
2411. Do you know Calker's Wells? I do.
2412. Was there a discovery of gold there some time ago? No.
2413. Is there no work going on there? Not that I am aware of.
2414. Do you know whether there is any attempt at agriculture going on on the banks of the river there since the Broken Hill mines broke out? I cannot say that there is. It is too far away, and there is no means of getting the produce to Broken Hill.
2415. Do you think that if the railway were constructed it would induce people, instead of bringing their produce to the Sydney market, to take it to Adelaide;—do you think it would injure the colony in that respect? I do not.
2416. You think that if the line were constructed the people would not take advantage of it by sending the commerce the opposite way from that which we want it to go? I do not think so; but at Wilcannia they would be much nearer to Adelaide than to Sydney. They would be only 500 miles from Adelaide.
2417. Do you think that the break in the gauge would not have something to do with the cost of transit, that

that it would cost more where they have to unload and reload? There is no doubt that it would. The same thing applies to all produce going from Adelaide; everything has to be transhipped at Terowie.

2418. Do you know whether there is, on the part of the residents of Broken Hill, a sympathetic feeling with Adelaide? I do not know that there is any sympathetic feeling, but three out of every four of the people there are South Australians.

2419. That being so, do you think that if the railway were made they would deal with Adelaide, if possible, in preference to Sydney? I have no doubt that business men would go to the cheapest market, wherever it was. If they could get goods cheaper from Adelaide than from Sydney, no doubt they would go to Adelaide for them.

2420. Supposing that there was very little difference in the cost, do you think their sympathies would not then outweigh the slight difference, and that they would go to Adelaide in spite of the cost being a little more? I should hardly like to say what the sympathies of the people would be; but if they could get goods cheaper from Adelaide they would go to Adelaide.

2421. The whole of the business now goes to Adelaide? Not all; a good deal goes round from here, *via* Adelaide.

2422. Yes; but still it has to go through Adelaide? There is no other means of communication at present. I know one or two large storekeepers who have been round here purchasing from the Sydney merchants.

2423. Do you think we might anticipate a much larger passenger traffic if the railway were constructed? I have no doubt that nearly all the passenger traffic between Broken Hill and Sydney would be carried by the proposed railway.

2424. We are informed that the charge would be something like £5 4s. return, second-class, from Sydney to Broken Hill. I suppose that would have a great effect upon the passenger traffic? No doubt it would, and the time occupied would be very much shorter.

2425. The distance by this line would be 732 miles, whilst the distance by the present route is 1,393½ miles? Yes; it is a long journey.

2426. By the new line it would be nearly half the distance to the Sydney people? Yes.

2427. Do you think that that would have the effect of increasing the passenger traffic? I think it would.

2428. You think it would have a material effect upon the returns from the railway? I have no doubt that it would; but if the line is to pay at all, we must look to the heavy goods traffic. No doubt there will be a large passenger traffic, but a goods traffic is what will make the line pay.

2429. Coal and coke? Coal, coke, and timber. There is any quantity of timber on the Darling which can be taken to Broken Hill, if the line is constructed.

2430. Do you know of any forests there? I know that there is any quantity of timber all along the rivers.

2431. Suitable for mining? Yes; red gum is fit for mining, and there is a tremendous quantity of firewood. Coal is at present very dear.

2432. What is the general class of timber on the river? It is nearly all red gum.

2433. Is not that a very good timber for any purpose? It is; but this is rather crooked and warped.

2434. This Committee has been told by a witness that most of the mines at Broken Hill are erecting smelting works for themselves at Adelaide and Port Pirie;—is that true? I think not. The only smelting works that have been erected off the field are the Junction at Port Adelaide, and the British at Port Pirie. The British Company have found out their mistake, and I believe it is their intention to shift their smelting plant from Port Pirie, because they can treat the ores more beneficially at the mine. At the mines they can blend them better.

2435. Do you know whether they are treating any sulphide ores there at present? I do not. By blending the ores they get the natural fluxes together.

2436. *Mr. O'Sullivan.*] What reasons have you for expressing so much faith in the permanency of the Broken Hill field? Although the Proprietary mine is down 500 feet, they have a lode from 100 to 120 feet wide fully developed for three-quarters of a mile. That is enough to warrant the belief that the field is a permanent one.

2437. Do you think that other mines would be anything like that? Block 14 is quite as well developed, with about a similar result, but the lode will hardly average that width—it is something like 50 feet.

2438. Since the Sectional Committee visited Broken Hill in 1889, have there been indications of greater developments? They are continually sinking.

2439. But in the way of machinery? I am not sure; but I think that the Proprietary Company increased their plant by several smelters. The Central has erected smelters. Block 14 has an additional smelter, and the British started an 80 ton smelter the week before last. All these have been erected since 1889.

2440. How will the Silverton mines stand now? When you say Silverton, the nearest mine to Silverton is Umberumberka. That mine is still turning out good ore, and it employs from eighty to 100 men. It is developed to a greater depth than any mine on the field.

2441. Are there other mines showing indications of activity? I cannot say that there are.

2442. How does the Pinnacles work? It is an excellent property, but it has always been an unfortunate one. The ores have been very refractory, and they have great difficulty in treating them, but there is an enormous quantity of it.

2443. I suppose the whole of the country there may be looked upon as metalliferous? No doubt about it.

2444. You referred to Black Mountain;—in what condition is that place? I cannot say. It has been opened since my time, and I never visited the spot.

2445. At present, many of the mines are sending bullion to Port Pirie and thence to Sydney? Yes.

2446. If the bullion can be brought direct to Sydney there would be a saving in the railway freight to Port Pirie, would there not? I think so. I imagine that the Commissioners would have the bullion carried back at a cheap rate, instead of running the trucks empty from Broken Hill.

2447. Do many people from Sydney visit Broken Hill? Yes; a great many.

2448. If this railway were in existence, with a fair rate for passengers, there would be a very large addition of visitors to Broken Hill? I think there would be. Broken Hill is becoming one of the sights of the colonies. All Englishmen who come out here visit Broken Hill.

2449. What is the general feeling of Broken Hill in reference to the line? I see that the other day they had a large meeting in support of it.

- W. Brown, Esq., M.P., 16 April, 1891.
2450. The people there desire to see it constructed? They do.
- 2450½. What is the reason that we see signs of opposition to the line from certain quarters? I do not care what scheme you bring forward, you will always have opposition from some quarters. It may be difficult to give reasons for some of the opposition.
2451. We may conclude that the vast majority of the people would be glad to have the railway? Nine-tenths of them would.
2452. If there is an increase of 15,000 in the population during the next five years, that will make the population of Broken Hill nearly 40,000? Yes.
2453. Broken Hill will then be almost as large as Ballarat? It would be a very large place.
2454. *Mr. Humphery.*] Have you been over the route of the proposed railway between Broken Hill and Wilcannia? No.
2455. How far from Broken Hill would be the best permanent water between Broken Hill and Wilcannia? I doubt whether they would find any permanent water between Broken Hill and Wilcannia.
2456. The distance of Wilcannia from Broken Hill is 113 miles by the route of the railway? We call it 160 miles by coach.
2457. It is 622 miles from Sydney to Wilcannia, and 735 miles to Broken Hill, and 622 from 735 leaves 113 miles? The Commissioners, no doubt, have a survey on which to base their calculations.
2458. That distance would not be considered very great to send produce to be used at Broken Hill? I should think not.
2459. Where is the produce obtained at the present time? From South Australia.
2460. The whole of it? Yes.
2461. A distance of more than 300 miles? I do not know that; they may get it from settlements along the line.
2462. Is there at present any district from which agricultural produce is received nearer than 113 miles? No; decidedly not.
2463. What is the distance of the nearest agricultural district from Broken Hill? About 170 miles.
2464. Do you think that at Wilcannia they could produce, on the banks of the river, sufficient for the consumption of the Broken Hill population? I am sure they could.
2465. Would that not be a source of revenue to the railway? Yes; I have already said so.
2466. Would it lead to settlement at Wilcannia? It should do. The soil in the district will grow anything if it gets moisture.
2467. With regard to the smelting operations carried on at Broken Hill, would it not be very much better to take coal to Broken Hill than to send the ore to Lithgow or Sydney? That is my contention.
2468. Would the cost of transit be greater to send the ores to Sydney than to convey the coal from Lithgow to Broken Hill? My contention is that it is better to smelt at the mines. There are various classes of ore—some containing iron, some lead, and others a variety of different mixtures. The metallurgist at the mine says, "I want so many tons of such a class, and so many of another class." These are blended together and the ores are extracted. If the ores are sent away they do not get mixed so well. Perhaps one day you get all iron and another day all lead; consequently the results are not so good when the operations are carried on away from the mine.
2469. What is the percentage of silver and metal at the present time in the ore treated? Something like about one-sixth. For instance, the Proprietary smelt between 5,000 and 6,000 tons a week, and their bullion is nearly 1,000 tons a week.
2470. The cost of conveying coal from Broken Hill to Lithgow would be about ½d. a ton per mile, and that is estimated to amount to less than 30s.;—it is in evidence that 15 cwt. would smelt a ton of ore? I could not say. I have never known coal to be used for smelting ore.
2471. Have you gone into the details in connection with smelting? No, I do not understand it; but they are using an enormous quantity of coke.
2472. We have had some evidence about fencing the line; Mr. Alison thinks it necessary to have a rabbit-proof fence on both sides of the railway;—do you think that that would be necessary? It might assist the squatters very much. I read Mr. Alison's evidence this morning. The Silverton Tramway Company have only a wire fence, and I do not see that their line has been interfered with by the rabbits, though the rabbits there were about as thick as they could be last March, but I saw no destruction.
2473. Not destruction of the fences? No, nor of the earthwork.
2474. Mr. Alison recommends wire fencing to prevent the increase of the rabbits, and to check their movements to some extent? No doubt wire netting does check their movements; but I should think that the cost of wire netting to destroy rabbits should hardly be taken into consideration in connection with the cost of making the railway.
2475. You have not given the matter much consideration? I do not think that the railway should be charged with the cost of putting up wire fencing to exterminate rabbits. The wire netting is not necessary for the railway.
2476. You think the railway would not form a road by which rabbits could pass from one part of the country to another? No.
2477. I think the tendency of Mr. Alison's evidence was, that the railway would facilitate the movements of the rabbits? I do not see why it should. I think the rabbits would be more likely to keep off the railway.
2478. *Mr. Lee.*] Do you know what is the freight on bullion from Port Pirie to Sydney? I believe it is brought round for about 10s. a ton.
2479. What is the cost of the carriage from the mine to Port Pirie? I think about 18s. or £1. a ton.
2480. Do you think it is as low as that? I think so.
2481. According to the evidence given by the mining people before the Sectional Committee, it is much higher than that? I may have confounded the freight on the ore with that of the bullion.
2482. They state that the cost of the carriage of the bullion from the mine to Port Pirie is £1 19s. 3d.? I must have made a mistake.
2483. You think the carriage from Port Pirie to Sydney is about 10s.? Yes. That is a private arrangement between two steam-boat companies. I understand that the P. and O. and Orient Companies have it brought round from Port Pirie to be used for stiffening in their big boats.
2484. But they have to pay? Yes.

2485. You think £2 9s. 3d. a ton for carriage from the mine to Sydney would be overstating the freight? As I have said before, I cannot say what they pay for the carriage of the bullion from Broken Hill to Port Pirie.

W. Brown,  
Esq., M.P.  
16 April, 1891.

2486. Do you know at what rate coal could be carried from Lithgow to Broken Hill if the line is constructed? I have no idea.

2487. Do you know the price of coal at Lithgow? I do not. I simply take the Railway Commissioners' statement that they can deliver coal at Broken Hill cheaper than it can be got by Port Pirie and Terowie.

2488. If the Broken Hill people can get their coal 15s. a ton cheaper by rail than by water, which route will they use? It seems to me that there can be no doubt about which route they will use—the cheaper one.

2489. Do you think that the reduction in freight would lead to increased consumption of coal? Undoubtedly. I should think it would lead to the whole of the coal going over this railway.

2490. I presume that the transit of bullion from Broken Hill to Sydney is a matter of very great importance to the companies? It is of so much importance that, during the late strike, when they could not ship the bullion, the mines could not work.

2491. Why? Because they can get no advances until the bullion is on board the ship.

2492. The weekly output of bullion represents a very large sum of money? It represents about 180,000 oz. of silver, besides 600 or 700 tons of lead.

2493. What time does it take to send the bullion from the mines to Sydney? If it goes direct, with no delay, about a week. It takes it two or three days to get it to Port Pirie, and I think the cargo boats occupy six days in bringing it to Sydney. I should think altogether the time occupied is about ten days.

2494. Interest on the consignments of bullion is, in a year, a very important item? Yes.

2495. And that item would be taken into consideration when the question of transit by rail came up? No doubt it would if the company were pushed for money, but a company who have plenty of money would not consider it.

2496. You said that the shipment of bullion would be about 6,000 tons a month? Yes; but you have it in evidence that it is 5,000 tons a month; but it will be more than that now, because more smelters have been started.

2497. That would be 60,000 tons a year? Yes.

2498. The freight on that would be a large amount? It would.

2499. If the rate by railway were the same as the rate by steamer, do you think they would be in favour of using the railway, and thus saving interest? Yes.

2500. Would that be sufficient to influence the shipping of goods by rail instead of by water? As far as the water carriage is concerned, that is a question of contract with the P. and O. Company and the Orient Company, who take the bullion to England.

2501. What I wish to ascertain is this: In so large a matter as 60,000 tons of bullion a year, the question of a few shillings a ton would influence the shippers? No doubt it would.

2502. Quick transit of such costly material must mean a saving of interest? No doubt it does.

2503. Sixty thousand tons from one mine would be a large item? It is not from one mine; it comes from all the mines.

2504. If it would pay the Railway Department to take coal at £1 10s. 6d. a ton to Broken Hill, can it be reasonably inferred that a lower rate than the ordinary metal rate could be charged for the return freight of bullion? Yes.

2505. And would such reduced rate influence the Broken Hill people in sending their bullion by rail? It might influence them so far that in any future contract that they made with steam-boat companies to convey the bullion to England, they would arrange to start from Sydney instead of from Port Pirie.

2506. The question is as to the freight by rail. Irrespective of the store goods, you admit that the bullion is a very important item? Yes.

2507. Do you know any companies working between Cobar and Broken Hill? No.

2508. When were you at Broken Hill last? I was there last January.

2509. Having had so much experience of mining matters, can you say whether there is any evidence of decay in the Broken Hill mineral field? There is not the slightest, but every evidence of its advancing.

2510. Do you think it has been in existence sufficiently long to prove its permanence for the next ten years? I am sure of it.

2511. Do you think that the developments up to the present are sufficient to repay the present population for the next ten years? I say that in ten years the population will be much greater than it is now.

2512. Suppose that in the course of a few years the mines were to fail? If such a thing is possible, Broken Hill would lapse into pastoral country again.

2513. Would the whole of the population leave it? Nearly all would. I do not see that there would be anything to support them.

2514. In that case, if the railway were built, it would simply have the pastoral interests to depend upon? Yes; and the intercolonial traffic.

2515. I suppose you have given this question consideration from your point of view? I have. Speaking of the permanency of the field, I may mention that a private company have just constructed a tramway at a cost of £100,000, which showed that they have good faith in the permanency of the field.

2516. Yes; but the best calculations in mining sometimes fail? Yes; but I think the company made their calculations on a pretty sure foundation, having a two and a half years' contract ahead with the Proprietary Company.

2517. Outside of any local considerations, do you know of any reason for thinking that this railway will be detrimental to the interests of the country? No; as I have said, I was not a very strong supporter of this line a few years ago, until I heard and read the evidence which the Commissioners collected when they were in the district. From the evidence which they collected, and the Report which they furnished about supplying coal and coke at a cheaper rate than that at which it is being delivered now, my opinion was very much altered, and I am now a strong advocate of the line.

2518. *Mr. Dowel.*] Can you say how many proved mines there are on the Broken Hill line? Including the South, there are seven, I think.

2519. How many miles has the main lode been proved? About three miles.

2520. *Mr. Copeland.*] From where to where? I should commence at the Junction. Then there are the British, Block 14, the Proprietary Company, Block 10, the Central, and the South.

2521.

W. Brown,  
Esq., M.P.

16 April, 1891.

2521. *Mr. Douel.*] You say that there are seven proved payable mines on the line, extending a distance of about 3 miles? Yes.
2522. What mines within a radius of 40 miles are likely to be of a permanent character? That is a question which it is impossible for anyone to answer, considering that the mines I have mentioned are the only ones proved payable.
2523. Is it not a fact that there are a large number of mines in the radius which I have spoken of? There are a large number of mines being prospected.
2524. Has not the main lode been proved in parts 10 miles distant? When I was a Warden, evidence was once given before me that a certain lode was continuous, because there were two parallel lodes; but after prospecting we found that it was not continuous. I could not tell you how far it is continuous. If you ask me how far it is being developed, I will say 24 or 25 miles, from Thackaringa to Broken Hill.
2525. I want to know what mines within 40 miles are likely to be permanent? I think the Thackaringa mines are likely to be permanent, and the Pinnacles are likely to be permanent.
2526. I wish to show that there is a probability of mines being permanent, and not confined to the three mines you spoke of. Is there any good reason for supposing that discoveries will be made of a permanent character? Yes, as far as the Pinnacles and the mines of Thackaringa are concerned.
2527. Does the ore improve at a greater depth? Not in quality, because there they get into the sulphides, and the question now, as to the permanency of the field, depends on the treatment of sulphide ores.
2528. Are you referring to Broken Hill or to the whole district? There are very few of the others that have gone deep enough to reach the sulphide ores.
2529. What kind of ores are they getting? At the Pinnacles they are getting very refractory ores; there is a great deal of sulphide ore there. They also get refractory ores at Thackaringa. The future treatment of these sulphide ores is a very great question. Thousands of pounds are being spent in trying to find out some cheap way of treating them.
2530. Then you are not of opinion that the ores in the Proprietary mine are improving in quality as a greater depth is reached? I do not think that they are. I believe they are more difficult to treat.
2531. Can you say how many smelters are erected at Broken Hill? About sixteen.
2532. What quantity of coke per week does a smelter consume? The Proprietary Company at present use about 1,000 tons a week. They are running ten smelters.
2533. Do you think it likely that the number of these smelters will be doubled or trebled in the next five years? It is quite likely that it will be doubled.
2534. I believe they use English coke? At present the Proprietary Company are using English and German coke.
2535. For what reason? Because of its superiority.
2536. In what way? It does not show so much ash as the colonial coke.
2537. With proper grinding and washing could not all the impurities that produce that ash be removed? It is a matter of time. It seems to me a disgraceful thing that we should have to send to Germany and England for coke when we have so much coal here.
2538. You think that by an improved method of manufacturing coke we ought to be able to supply the demand for coke at Broken Hill? Yes; I have thought so for a long time.
2539. In the district affected by this railway are there any copper or tin mines? There are tin mines 40 miles distant.
2540. Which would be served by this railway? Yes.
2541. Are they likely to be of a permanent character? So far they have not been altogether a success, on account of the various difficulties in regard to the treatment of the ores, but I have no hesitation in saying that there are ores there that would pay for working, and many of them.
2542. You say you think that the success of this particular railway will depend, to a large extent, on goods traffic? Yes.
2543. Would not timber be an important item? Yes.
2544. And produce of all descriptions? Yes; the principal items would be coal and coke.
2545. Would not general merchandise be a large item? A considerable item, no doubt.
2546. So you have, no doubt, taken into consideration the traffic in coke, coal, timber, produce, and merchandise, and you think that a fair revenue would be derived from the railway? Yes; from that traffic and the carriage of bullion to the sea-board.
2547. Are you in a position to say what the population of Broken Hill is at present? No; but I have been told that there are 25,000 people there.
2548. How many miners are there? I do not know. Over 3,000 hands are employed by the Proprietary Company alone.
2549. What was the population when you were Warden there? Not so large as it is now.
2550. What is the population outside Broken Hill? In my time there were a great many at Eurowie.
2551. Can you give the Committee any idea of the number of men who were employed in the district when you were Warden there? It is a very hard matter to get at. I should think that there were fully 1,000 outside the Broken Hill lode. You could travel all over and find tents wherever there was a water-course. It was difficult to get at the population of a district comprising 11,000 square miles.
2552. Do you think that hardwood could be used for timbering the mines? No doubt, for many of the mines.
2553. Would it not be more advantageous and safer in case of fire than Oregon timber? I should say that it is stronger.
2554. Would it be as likely to take fire as Oregon timber? I should think not.
2555. Is there any provision in the mines for extinguishing fires? Not that I am aware of.
2556. *Mr. McCourt.*] If this line were constructed to Broken Hill, do you think that the Adelaide people would compete for the trade? Yes.
2557. If our Railway Commissioners say that they can carry the minerals at  $\frac{1}{2}$ d. a ton, do you think that the South Australian authorities would do the same? I am not sure that their rate is more than  $\frac{1}{2}$ d. a ton now.
2558. Do you not think the Adelaide people would compete at the same rate as our own Commissioners? I do not see why they should not.
2559. How far is Broken Hill from Port Pirie? About 260 miles.
2560. Do you know the cost per ton per mile for coal now? No.

2561.

2561. It has been said that it is £1 5s. 8d. a ton? According to the last report of the Proprietary Company they were paying £2 8s. a ton.
2562. It has been stated in evidence that the charge is £1 5s. 8d. a ton. At  $\frac{1}{2}$ d. a ton per mile it would not come to half that, would it? No, it would be about 10s.
2563. If the coal were delivered at Port Pirie at 10s. instead of £1 5s. 8d. a ton, would there be much difference between sending the coal over this railway and sending it round by Port Pirie? If the coal were carried at 15s. a ton cheaper, the charge would be reduced from £2 8s. to £1 13s.
2564. So that if the Adelaide railway authorities carried the coal at  $\frac{1}{2}$ d. a ton, there would be very little difference as regards the carriage of coal between Sydney and Port Pirie? I do not know at what rate the Silverton Tramway Company will carry it. That would have to be taken into consideration. South Australia can only compete as far as Cockburn.
2565. I presume that they would compete rather than lose the trade? I think they would.
2566. *Vice-Chairman.*] Do you know the nature of the country and the grades between Port Pirie and Broken Hill? Some of them are very steep.
2567. And small loads have to be carried, I suppose? The grades are very steep between Petersburg and Broken Hill.
2568. I suppose that the larger and rounder the coal is for smelting purposes the better? Yes, they use the best they can get. They do not use coal for smelting purposes, but for furnaces.
2569. Every handling of coal breaks it up? Yes.
2570. So that transhipping it at Port Pirie would make a difference in the value of the coal? I daresay it would.

W. Brown,  
Esq., M.P.  
16 April, 1891.

John James Weston, Esq., Manager of the New Mount Hope Copper Mining Company, sworn, and examined:—

2571. *Vice-Chairman.*] Are you Manager of the New Mount Hope Copper Mining Company? Yes.
2572. You desire to give evidence as to what is known as the Lachlan route being superior to the railway route under the consideration of the Committee? I have nothing to add to what I have said in my letter. I know you are discussing the advisability of making a railway from Broken Hill to Sydney. I have been told that the route *via* the Lachlan would be a better one than the one from Cobar. If that is the case, then I want to point out that the railway would get a certain amount of traffic from Mount Hope, and it would improve the mining industry there if carried in that direction.
2573. You have no knowledge of the country to which you refer? No.
2574. Have you ever been along the Lachlan valley? No.
2575. Have you ever been to Mount Hope? No.
2576. Have you been to Cobar? No.
2577. If a line is constructed to Cobar, and that line has been commenced, will it be of any use to your company? No, not to Mount Hope.
2578. How do you carry goods now? We take copper down to the Hay line, and sometimes to Orange, from 130 to 150 miles.
2579. How far are you from Cobar? I do not know—a great distance. I think about 100 miles, but there is no road.
2580. You cannot give any information as to the country or the produce of it, except that if railway facilities are afforded it might lead to the development of mining in and around Mount Hope? I think it would.

J. J. Weston,  
Esq.  
16 April, 1891.

Edward Heaton, Esq. (Wright, Heaton, and Co., Carriers), sworn, and examined:—

2581. *Vice-Chairman.*] You are a member of the firm of Wright, Heaton, and Co., carriers? Yes.
2582. Are you familiar with the whole of the western country which the proposed railway will pass through? I know the country from Bourke to Nyngan, and Cobar, and from there to Hillston, and on each side of the Lachlan all the way to Forbes. I have not been far beyond Cobar to the west or towards Wilcannia.
2583. You are more familiar with the Lachlan valley route than with the route of the proposed line? Between the Lachlan, the Murrumbidgee, and the Castlereagh, I knew every house and squattage, and every person who lived there years ago. I was constantly travelling through that country.
2584. Do you know the country between Wilcannia and Broken Hill? No.
2585. You know very little of the route of the line? Very little.
2586. But you know the country further south? Yes, and eastward.
2587. You have a pretty general knowledge as to the trade which gravitates to Sydney from the western district. Do you think that the proposal to make a line from Cobar to Cockburn would lead to increased trade being brought to Sydney? Only so far as mineral traffic could be secured at Broken Hill. As far as I know from our commercial relations with that country, the traffic tapers off as soon as we come near the Darling. It goes down the Darling when there is anything like a river.
2588. As carriers of wool, you do not anticipate that there would be a large amount of trade done by this railway. I do not; and I do not think that the quantity of wool grown in that district will ever be increased. I think it produces as much as it ever will do as long as the rabbits and pine scrub nuisances exist.
2589. As a matter of fact, the carrying capability of that country has very much increased has it not? No, it has not.
2590. I mean putting on one side the comparatively new pest? The original grasses that were so valuable have been eaten out, and the country is altogether poorer, and with its small rainfall I do not anticipate that it will ever become an agricultural country, except close to the river.
2591. What is your opinion as to the benefit to the soil from the running of sheep on it;—does it increase the carrying capability of the run? If you run too many sheep on the soil you destroy the run almost entirely.
2592. You think there have been too many, and that they have eaten off the grasses? Yes, and the rabbits have come and eaten up the scrub.
2593. How far west of Cobar do you think the wool will come to Cobar, supposing the railway is only constructed to Cobar? In dry seasons it would attract all the wool from close up to the river, but  
in

E. Heaton,  
Esq.  
16 April, 1891.

- E. Heaton, Esq.  
16 April, 1891.
- in wet seasons the wool would go down the river as it does now. A number of the wool sheds are close to the river.
2594. Is it once in five or three years that the river is available? We have had it good now close on three years, but before that we had it closed for two years.
- 2594½. In such times as those the railway would reap the benefit? Yes.
2595. What is your idea as to the righteousness of imposing dues on the river—not to divert freight, but to meet the expense of maintaining the river in a fair navigable condition? I think it has been a great oversight that dues have not been imposed to recoup the expenditure in keeping it open.
2596. If dues were imposed you think they would increase the amount of traffic to the railway? It certainly would in proportion to the amount you would impose. I regard dues upon a waterway just the same as rates on a railway. The traffic is increased and facilitated by the expenditure on the river, and those who use the river should pay something for it.
2597. You have given us an idea as to the distance from Cobar, that traffic would be drawn to Cobar from the west. How far from the south do you think the traffic would be drawn to Cobar? I think the best route would be from Forbes to Parkes, down to Condobolin, Euabalong, and the Willandra Billabong on to Menindie. Ultimately a railway will have to be built through that country, and following that line you follow a waterway.
2598. Where does the wool go to which is produced 100 miles south of Cobar? That brings you into the disputed country between Wilcannia on the west, Hay on the south, Orange on the east, and Nyngan on the north. That traffic would go to Hay, not to Menindie or Wilcannia.
2599. What is the distance between Cobar and Hay? Cobar is 180 miles north of Hay.
2600. Not more? Not more, straight through Hillston.
2601. May we take it that all wool produced over 80 miles south of Cobar would gravitate down to Hay, and not go to Cobar? I would not say that—a great deal depends on where the carriers live who draw the wool. If their homes are around Hay, they will go 20 or 30 miles further in that direction to get to their homes. If their homes are at Forbes or at Orange, they will prefer to go there.
2602. Do you engage these carriers, as a rule? We handle 80,000 bales of wool a year out of that, and the Murrumbidgee district, and the northern country.
2603. You make contracts with these local carriers to carry the wool from certain stations to certain points. If the carrier takes a longer route than is necessary and delays the goods, are you not likely to find fault with him? The delay would not be a very serious one—it would not be more than ten days at the most, and that would be compensated for by having less trainage. It might pay to take the wool to Trangie or Nevertire, instead of to Cobar, from the stations out there.
2604. Supposing you make a contract with a carrier to convey wool, say 50 miles south-west of Cobar to the nearest railway, and he for his own purposes went to Hay, would you not complain about that if it took three days to get to Cobar, and six days to get to Hay? No, when you get among the bullock teams you do not think much about six days or even a fortnight.
- 2604½. If you were anxious to get produce to the market, does not time enter into your calculations? We prefer a man to deliver the wool as quickly as possible, but we would not make any serious objection to any slight delay, because the man would give some good reasons for it. Possibly the man may be a carrier with a first-class team who would go over the ground much more quickly than with another.
2605. You do not think we shall get much increased wool traffic by the construction of this railway to Wilcannia? I do not, indeed. I think it will go by the river, still.
2606. Do you think that we should get much more wool if we went on the Lachlan valley route to Menindie? You will get nearly all there is now.
2607. As a matter of fact, very little wool comes by railway from Hay now? Not much.
2608. Does it not tap the river there, and is it not taken away by the boats? As a matter of fact, some is taken down by train, put on the steamers at Hay, and carried down the river. We carry very little wool from Hay. The wool from there goes down the river, and the wool from the stations south of the Murrumbidgee goes towards Deniliquin.
2609. Then your evidence would lead to the conclusion that a mistake has been made in authorising the making of the line to Cobar? I would not say that—Cobar is a great mineral district, but I do not think that the line should go beyond Cobar.
2610. As far as pastoral products are concerned? I do not think you will do much good by going beyond Cobar. We find that when we come within the range of the river we lose the traffic.
2611. There has been a very large increase in the carriage of wool from Bourke lately, has there not? That comes from up the river.
2612. Has not some of it come from below Bourke? Yes, down as far as Dunlop—40 or 60 miles.
2613. In view of the wool being blocked by the bad state of the river, do you think that the people as far as Wilcannia would send it by train? Yes, and in dry seasons people will send the wool now across the river until the South Australian Government compete with you. The South Australian railways take a good deal of our western wool.
2614. *Mr. Copeland.*] What is about the general value of a ton of wool, according to the market rates? Last year greasy wool was about 10d. a lb. This year it is about 8d.
2615. In what state do they send it from the western stations—do they wash it? A great deal is sent down in grease, but all the inferior wools are usually scoured, because it lessens the weight.
2616. The value of the wool would be about £30 a ton? Yes. It is about 20 per cent. less this year than it was last year.
2617. Can you say what the insurance rates are for sending the wool down the river? They are much the same as sending it *via* Sydney, because they take it at a through rate to London. If you insure wool only down the river the rate is very high—as much as 1 per cent. It costs as much to insure wool from Wilcannia or Bourke down to Sydney, as it does to insure it from Sydney to London. That is one of the drawbacks of sending wool by the river.
2618. Would not that have a tendency to induce them to send the wool by rail? It would.
2619. About how long does it generally take to get wool delivered in Adelaide or Melbourne, sending it down the river? Going down from Wilcannia in a fair flood I should imagine that fourteen days would be ample.
2620. You think fourteen days is about the average? No, that would be with a very good river.

2621. Leaving out special occasions like floods, what would be the average voyage? I have known a clip to be 13 months on the river, but that is an extreme case. F. Heaton,  
Esq.
2622. What would be the time under ordinary circumstances? The time occupied in taking wool from Bourke by the river would be about a month. 16 April, 1891.
2623. Would not the interest on the money be a consideration—if you could send the wool direct from Wilcannia to Sydney by train, would not that be very much preferable? Yes. And another very important thing to be borne in mind is that the wool sales in Sydney are becoming more in fashion. They are realising more, proportionately, than the sales in London, so that Sydney is becoming a greater market for wool. That is one of the things that would attract it by train more than anything else.
2624. Are there wool sales in Adelaide? Yes; but they are very limited compared with those at Sydney.
2625. You think Sydney a better market for selling wool than Adelaide? Yes.
2626. Is there any advantage in Melbourne or Sydney? Particular clips of wool sell better in Melbourne than in Sydney. I would not reckon that there is any great difference, but certain clips sell better there.
2627. There would only be two advantages in sending wool by rail instead of by the river—those being that owners would save in insurance rates, and save interest by getting their wool quicker to the market? Yes, and they have the offer of a good market here. As for the freight arrangements to London from Sydney or Melbourne they are about on a par.
2628. Can you say how Sydney compares with Adelaide as to freights to London? I could not say, but they are very nearly the same. I do not think there is 2s. 6d. difference.
2629. *Mr. Dowel.*] Have you any agencies at Broken Hill and Wilcannia? Messrs. M'Culloch and Co., of Melbourne, join with us in transactions there, and in Victoria and South Australia.
2630. Then you really have some interest through Broken Hill and Wilcannia agencies? Yes.
2631. Have you any knowledge of the station holders in that district? I have not.
2632. You could not say whether the stations in that district are owned chiefly by South Australians and Victorians? I do not know any Sydney owners beyond the river there.
2633. Do you know the principal means of communication in that district—is it by bullocks or horses? By bullocks and horses—some few camels are used.
2634. The trade carried on by camels is very small? Yes. I do not think there are more than 200 employed altogether.
2635. And they are employed chiefly between Broken Hill and Mount Browne? Yes, in the dry spaces.
2636. From your knowledge of that particular part of the country, do you think there is a probability of the railway, if constructed, being of a payable character? I do not think it will be payable beyond Cobar, unless you can secure the conveyance of the coke and coal, and I think that that would be secured by charging what they call agricultural rates.
2637. You are aware that there is a large population at Broken Hill? Yes.
2638. Would you anticipate any large amount of goods traffic from a town of 25,000 people? Yes; if they had not some other way to go at a cheaper rate. I think Port Pirie is the natural port for Broken Hill, but I think a railway down the valley of the Lachlan, going by Willandra, would open up a large amount of farming land, vast forests of red gum, and an immense amount of pine country, the produce of which would be useful to Broken Hill. The timber is very light in the Cobar country.
2639. As a matter of fact, you know nothing about the country through which the railway will pass? I have a general knowledge of the country south and east of it, and that would guide me in coming to a conclusion as to the country through which the railway will go.
2640. Knowing the large population of Broken Hill, and the large output from the mines, do you not think it likely that if the railway were made, and freights were low, a large proportion of the traffic would be carried on this particular line, say at  $\frac{1}{2}$ d. a mile, or something less? I think that having a seaport within 250 miles in one direction, and another 750 miles off in another direction, you can never drive the traffic towards Sydney. If I had any responsibilities at Broken Hill I should go to Port Pirie.
2641. But there is a great distance to be traversed between Broken Hill and Cobar? Yes.
2642. Would not the produce, say for instance wool, be likely to be carried by rail? I think we shall have to kill the rabbits before we talk about wool from there. Many of the stations in that district are nearly bare of stock.
2643. You are under the impression that there is very little wool to be obtained from there? Very little.
2644. *Mr. Tonkin.*] Is it your opinion that the railway will not pay if carried beyond Cobar? That is my opinion.
2645. Have you any idea of the number of bales of wool that leave Wilcannia every year by river? I have heard, but I cannot remember it now. I should imagine between 12,000 and 15,000 bales.
2646. Would you be surprised to hear that last year there were left from the previous year 17,000 bales that could not be carried? That must have been left from the previous dry years. It must have been a couple of years' wool.
2647. Would you be surprised to hear that the average number of bales a year that leave there is about 30,000? I should not.
2648. If half that number were carried by the railway would not that go a long way towards paying the working expenses and interest on capital? If you secure 30,000 bales from Wilcannia, you will get considerable additions to the traffic.
2649. Have you any idea as to what freight is paid for wool to Port Pirie or Adelaide? £3 15s., I understand, is about the standard rate.
2650. The average is stated to be £4 a ton? I know that flour has been taken from Adelaide, and delivered at Bourke at 27s. 6d. within the last few months. That put us out of it altogether.
2651. That is not a usual thing, is it? No; it is a phenomenally low price.
2652. It has not been taken up as a commercial speculation? Yes; as a commercial speculation. The flour was bought at Adelaide and shipped to Bourke.
2653. Perhaps it was obliged to be sold when it got there? No; the man was going up for wool who took the flour.
2654. Supposing the railway got £1 a ton from Wilcannia to Sydney, do you think that if the freights by river were £4 a ton, the railway would not command the biggest share of the business? If the river freight is £4 a ton, the railway could charge £5 a ton, because the insurance by the river would be £1 a ton

- E. Heaton, Esq.  
16 April, 1891.
2655. How do you know it would be £1 a ton? Because we have insured so much ourselves when sending it by river from Bourke.
2656. Do you know Mr. Doak, of Wilcannia? No; I never was in Wilcannia.
2657. Did you ever pay more than £1 a ton for insurance? I think we once paid 25s. a ton.
2658. Did you ever pay 50s. a ton? No.
2659. We have evidence that insurance has been paid amounting to 50s. per cent., do you think that would be correct? That must have been years ago. I was speaking of the charge for greasy wool.
2660. If wool has been carried by the river at £4 a ton, including the insurance, and the railway were constructed, and we could carry the wool to Sydney at £4 a ton, do you think the owners of the wool would not use the railway instead of the river? I think they would use the railway. But these 30,000 bales of wool have to be brought to that place by steamer from up and down the river.
2661. It would be just the same thing transferring it to the railway as transshipping it in the river;—if the boat brings the wool from the station it is unloaded into other boats to go to Adelaide, is it not? When it comes by teams it is unloaded into the boats going to Echuca or Adelaide, but if it comes from stations up or down the river, at those stations it is loaded into the same steamers that carry it right through to its destination.
2662. Then that would have a tendency to lessen the quantity that would come by rail? Yes; that would be the greatest factor to be considered.
2663. Suppose there are 30,000 bales at £4 a ton, do you think you would alter your mind as to the construction of the railway if we could get half of that? It is an easy matter to say 14,000 or 15,000 bales.
2664. How many bales are there to the ton? Six of greasy, and 8 or 9 of scoured wool.
2665. That would be £10,000;—do you not think that would be a material assistance in paying the working expenses of the railway? It certainly would.
2666. The estimated cost of working, and the interest on the cost of construction and on the rolling stock is £90,000;—if we got £10,000 from wool alone, would not that induce you to alter your mind in regard to the construction of this line from Cobar to Wilcannia? You count that £10,000 as if you had earned it all the way through, whereas you have to carry it from Cobar to Sydney for that £4 a ton, but you only get that proportion for a short distance.
2667. Do you not think that we should not take a lot of merchandise for the stations if we brought down the wool? Yes, when the river was not running. When the river is running I do not think you will take a truck load a week.
2668. You think that the river under any circumstances would beat the railway? Yes; your great pull will be when the river is down.
2669. When the river could not be used, do you think it would be a just thing for the Government, after having made a railway, to charge an increased price when people wanted to carry their goods by railway though they would use the river whenever they had the chance? I think you would have the same outcry that arose when the A.S.N. Company raised their fares whenever they had run any one else off.
2670. Do you think it would be fair to increase the freight when the people are obliged to bring their produce to the railway? No doubt; but it is a thing which the Government should not do.
2671. They should rather put a toll on the river? Yes.
2672. If there were river dues imposed—I do not mean to say exorbitant dues—then would the railway pay? I do not think you could put any dues on the river that would obstruct the traffic very materially, but you could put dues on that would help to swell the traffic on the railway in a small way, and help to pay the cost of keeping the river clear.
2673. Have you any knowledge of the amount of traffic likely to accrue from the mining interests at Broken Hill? I have not.
2674. You merely deal with the question from a pastoral point of view? Yes. And looking at the great quantity of wheat I have seen grown in the Murrumbidgee district, and in the Lachlan valley district, the country 150 miles down would become a great wheat producing area.
2675. Would that be better than the Darling? You cannot grow wheat on the Darling, the heat is too great.
2676. *Mr. O'Sullivan.*] Does it ever happen in a drought that your teams have to leave off work in consequence of the scarcity of grass and water? No, not if we can get water within 50 miles. We put water in the waggons and carry it.
2677. If the railway were made then, it would be possible to bring wool from the outlying stations, even in the time of drought? Yes.
2678. And the difficulty might be minimised by having fodder brought from the cool districts? Yes; from the high table lands round Orange, Carcoar, and Bathurst.
2679. So the construction of the railway would be a great benefit to the teamsters? Yes, and to the squatters, and persons who wanted flour and other supplies.
2680. Therefore, we need not apprehend that, in a dry season when the river is low, the railway would be useless? No. The railway would be used more and more in dry seasons. Another important element is the traffic that would arise from moving stock about. That would be a very great traffic. We have paid £35 a ton for the carriage of horse feed from Orange to Bourke.
2681. I suppose the fodder trade would be a considerable item? A very big item. There is another thing. I think the Government would do well, if possible, to secure steamers to move up and down the river in connection with the railway, to take wool from the wool sheds and bring it to the railway, and there might be a consolidated charge for the use of the steamers and the railway. That would be one of the most successful means of combating the competition of the river for the wool trade.
2682. To use the steamers as they use them in Darling Harbour? Yes.
2683. *Mr. Douel.*] Suppose the Railway Commissioners would carry the wool at  $\frac{1}{4}$ d. a ton per mile, which would be £1 5s. per ton from Wilcannia to Sydney, do you think that that rate would shut out competition by the river? It would, certainly.
2684. Would it be safe then, to say that the trade would come to Sydney? Yes, if that extremely small charge were made; but I do not think the Commissioners would do such a thing. You would have the whole of the country in arms against you. It would be said, "You carry wool 600 miles at £1 5s. a ton for the Wilcannia people, whilst you charge people only 150 miles away from Sydney £3 10s. a ton."
2685. What is the rate now? The rate from Bourke is £4 0s. 3d. for greasy wool, and £5 0s. 3d. for washed wool.

THURSDAY, 23 APRIL, 1891.

Present:—

THE HONORABLE JOHN LACKEY (CHAIRMAN).

The Hon. ANDREW GARRAN.

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. WILLIAM JOSEPH TRICKETT.

JACOB GARRARD, Esq.

JAMES EBENEZER TONKIN, Esq.

EDWARD WILLIAM O'SULLIVAN, Esq.

CHARLES ALFRED LEE, Esq.

WILLIAM MCCOURT, Esq.

JAMES PATRICK GARVAN, Esq.

The Committee further considered the proposed Railway from Cobar to Cockburn.

Alexander Brown, Esq., M.P., sworn, and further examined:—

2686. *Mr. Tonkin.*] Are the Committee to understand from your evidence that your principal objection to this line is that the commerce of the different parts of the colony should gravitate to the nearest port? That is one objection.

2687. Is that your main objection? It is not.

2688. Then, if that is an objection, you would be against the construction of a railway line to any other part of the colony, if it is nearer to the ports of another colony than to our own ports? I should, if the circumstances were exactly similar to the circumstances of this case.

2689. The trade from Hay and Hillston gravitates to the river and goes to Melbourne;—you would object to a railway being made to Hay? Unless there was some warrant for the construction of a railway. If there is no immediate prospect of the railway paying I should not construct it.

2690. Would you advocate that we should give up portions of our colony to the other colonies, because those portions are nearer to the capitals of other colonies than to the capitals of New South Wales? That is a very grave political question. Under the principle of federation, as we have seen it adopted by the Convention, the trade from those parts of the colony will go into its natural channels.

2691. You believe that that is a proper thing for it to do? I am not opposed to it on the broad question of nationality.

2692. Does not that mean giving up a portion of the commerce of the colony? Unquestionably; and if the resolutions of the Convention are carried out, then the trade will find its way into its various natural channels. Those artificial channels will be done away with.

2693. Do you not think that that will be one of the great objections on the part of the people of this colony to the federation scheme as laid down? I am sure it is one of the great objections that would be raised; but it is not an objection with me.

2694. Then you would curtail the extent of this colony to within a radius of so many miles of Sydney? I should say that whatever naturally belongs to the port of Sydney, Sydney would be entitled to, but I would not give Sydney any special advantage, by the expenditure of public money, to drag trade to Sydney which ought to go elsewhere.

2695. Could you inform the Committee what quantity of coal monthly has been sent from Newcastle to Port Pirie or Adelaide for consumption at Broken Hill? No; but it would be a very small quantity.

2696. Has colonial coal been supplied to Broken Hill from any other place besides Newcastle? I believe that some portion of it comes from New Zealand.

2697. Are the New Zealand people able to compete with Newcastle at Port Pirie? I think they are, as the coal is equally good. Some of the Westport coal is quite as good as the best Newcastle coal.

2698. Is Westport so situated that it can compete with the output at Newcastle? I think so; it is a very formidable antagonist.

2699. Do you know the quantity of coke that is sent from Newcastle to Broken Hill? I should think not more than about 400 or 500 tons per month.

2700. Then Newcastle sends a very small quantity compared with the quantity used? A very small quantity.

2701. Do you know what quantity of coke you ever sent to Orange and to Lewis Ponds? About 150 tons a month.

2702. Have you ever sent any to Mitchell, Sunny Corner? No, not myself.

2703. Have any of the others? I think that the Newcastle coke finds its way to Sunny Corner.

2704. A very small quantity? I could not say.

2705. Then you cannot say that, on account of the inferiority of the Lithgow coke, at those particular places they have had to use Newcastle coke? I cannot say that, but I should judge from the circumstances that if they will incur the extra expense of getting Newcastle coke, the coke in their immediate vicinity cannot be satisfactory for smelting purposes.

2706. Can you say of your own knowledge whether the coke that has been sent from Newcastle to Sunny Corner and Lewis Ponds has not been merely an experimental shipment? No; it was sent there for practical purposes.

2707. Beyond experimental? It was a question of supply.

2708. But have you any idea of the amount of coke used at Sunny Corner monthly? No.

2709. Do you object to the construction of this railway on the ground that it may possibly reduce the export of coal from Newcastle? I give you my word that that has not the slightest influence on my evidence in any way.

2710. You stated that the principal mines at Broken Hill have established smelters at Adelaide;—where did you get that evidence? I got that from the mines.

2711. Do you know how many smelters there are in South Australia? I do not; but I know that they are establishing smelting works. It has been decided to spend £70,000 in the erection of smelters at Port Pirie.

2712. Can you mention the names of the companies? It is in connection with the Broken Hill mine.

2713. Do you know that at present there are only three smelters in South Australia for Broken Hill ores? Possibly. I suppose one is the E. and A. Copper Company's smelting works, and there are the Dry Creek and the British Broken Hill.

- A. Brown,  
Esq., M.P.  
23 April, 1891.
2714. Do you know how long they have been established? One of them, I know, we used to supply with coke. That was the Dry Creek; but, unfortunately, the demand for our coke has fallen off. They get coke from England, because it pays them better.
2715. None have been established within the last three or four years? No; I think it was earlier than that.
2716. And, in spite of that, you say that they are now establishing smelters? It is proposed to spend £70,000 on smelting works in Adelaide.
2717. Do you know that that is against the evidence that has been taken by the Sectional Committee at Broken Hill? I am aware of it. After the questions which were asked of me here, I endeavoured to reconcile the information which I had furnished with the evidence of the Sectional Committee; but the value of coke has altered since the time when the Sectional Committee took evidence. There is no doubt that the two managers who gave evidence were both wrong.
2718. You say that the price of coal at present is £2 8s., delivered at Broken Hill? I think so.
2719. Do you know that there have been public meetings held at Broken Hill to discuss this matter with the mining managers, with reference to the erection of furnaces? What do you mean; is it with regard to the Broken Hill Company, or the numerous companies that have supposed mining properties there?
2720. I am speaking of the Broken Hill, Central, the British, the Junction, and all those? That is all Broken Hill.
2721. Do you know that there has been a meeting held, and pamphlets have been published by the mining managers, stating that they can smelt ore better at the mines than they can at Adelaide or Port Pirie? It is quite possible. There was some public meeting held at Broken Hill in connection with the proposed railway, but I do not know any town in the community at which, if you proposed to make a railway through it, they would not hold a large public meeting, if only for the sake of the thousands of pounds which would be spent in the locality.
2722. Have you any knowledge of smelting? Not of the actual work. I have had something to do with it.
2723. You know that certain fluxes have to be used? Yes.
2724. Which are expensive? Yes.
2725. Do you know that certain ore is got out of one mine which contains the necessary fluxes, and that it is used as a flux for mixing with poor ores out of another? I understand that some have more lead, some more tin, and some more silver than others, and they have to be mixed in certain proportions.
2726. Under the circumstances, does it not seem feasible that they could smelt better on the ground than at a distance of 300 or 400 miles from the mine? I think it can be done better at the mine, especially the smelting of the poor ore.
2727. Do you know that in all probability at the depth to which they will go they will get sulphide ores which will have to be treated? I should not be surprised. The history of silver mining in America is wrapped up with that question. Up to a certain stage the mines pay, and after that they are a failure. Mr. Mackay told me that the large mines in America had been abandoned because when they went deeper the ore became too poor for treatment.
2728. When you get into the sulphide ores, do you know that they do not require coke, but can use coal in their reverberatory furnaces? I do not know that—it is possible. But the same difficulty would exist with regard to coal that exists with regard to coke.
2729. In what way? The expense of the traffic.
2730. I want to show, if I possibly can, through you, that coke can be delivered at Broken Hill at a much less price. The difficulty in regard to coke, you say, is as to its quality? Yes.
2731. A great deal of colonial coke is used for smelting purposes at Sunny Corner, and that coke is made at Lithgow. If they can use Lithgow coke there, although it is not so good as the English, do you think they could not use it at Broken Hill? It is a question of the price at Broken Hill. If they can sell it at a price which will give those who use it a better result, it may be used, but they will give us no consideration for colonial coke.
2732. At what price do you say colonial coke can be delivered from Newcastle at Port Pirie? 23s. a ton, cost, freight, and insurance.
2733. What is the reason that the freight is 5s. 6d. more to Adelaide than to Port Pirie? Because of the distance it has to be carried. There is a difference between the two ports. They can get back freight from Port Adelaide, but not from Port Pirie.
2734. But the charge is higher to Adelaide than to Port Pirie;—the charge is 23s. to Port Pirie, and 28s. 6d. to Port Adelaide? I should have thought that the difference was owing to the difficulty of obtaining back freight. I cannot understand it. It may be that they get the bullion back from Port Pirie—Port Pirie has outstripped Port Adelaide.
2735. There must be some other reason for that difference of 5s. 6d. per ton as between the two ports? Well, the distance between Broken Hill and Port Pirie is less than the distance between Broken Hill and Adelaide.
2736. I am speaking of the freight from Newcastle? The rates I gave are from Broken Hill, backwards. You are speaking of the traffic in the opposite direction.
2737. Can you tell what would be the cost of coal delivered at Port Pirie from Newcastle? I should think 18s. or 19s. a ton, including the cost of the coal.
2738. That would be £2 2s.; how is it that the cost is £2 8s. at Broken Hill? I suppose there are other charges. The man who carries on the trade does not do it for nothing—he must have his profit.
2739. Is not that a very large profit where there is such a large consumption—some thousands of tons a month? There are not many thousands of tons a month.
2740. We have evidence that the consumption is 3,500 tons a month? That is a small quantity. It is not the output of the Wallsend mine for a day and a half.
2741. But it would be a lot of money for the profit of the middleman? Yes; but you have to take other things into consideration—the risk of the business, &c. Suppose that a man contracts for all the year round, he may get freight in summer at 8s. or 9s., and in winter it may be much higher.
2742. What is the price of the coal itself? 11s., less 2½ per cent.
2743. What is the freight? I daresay you could make a contract of 8s. or 9s. a ton. There was a time when we paid as much as £1 and £1 5s.

2744. Supposing the coal could be delivered from Lithgow at 11s. a ton less than it is delivered at now, do you think that that would not command a trade? That is a supposition—you say suppose that it can. Of course, if there is a difference of 11s. in the price, the consumer will naturally take the Lithgow coal.
2745. Have you heard that the Commissioners have stated that they will carry the coal from Lithgow to these mines for something like £1 6s. a ton? I have not heard that. It is possible that the Commissioners made that statement, but they are making fish of one and flesh of another if they do it.
2746. Do you know the gradients on the proposed line? I suppose that in that flat country there ought to be easy gradients.
2747. Does not that alter the cost of carriage? Not from Lithgow, because on the Lithgow line you would have to break up your loads for a certain distance.
2748. Then there is a large stretch of country which is a dead level? Yes; but for a certain distance they can only carry a certain quantity.
2749. But if the Commissioners have sworn that they can carry the coal at this price, and that it will pay them? I should attach every respect to the Commissioners' statement, but if they do carry coal at that price they would be dealing unfairly with the northern colliery proprietors.
2750. Do you imagine that the freight, as charged now from Port Pirie to Broken Hill, could be materially reduced? Not only do I imagine it, but I am able to state that, after I had given my evidence here on the last occasion, I had an opportunity of consulting the South Australian delegates, and I told them I had given evidence, that it was more than possible that the rates would be reduced 25 per cent. if we came into competition with them for the Broken Hill trade, and they assured me that they would reduce their rates 50 per cent. in order to secure the trade for South Australia.
2751. Of course, that is independent of whether it would pay or not? I only tell you what they said. The trade is of such importance to them that they will have it at any cost.
2752. Do you think that if South Australia is able to do that, New South Wales is not able also to carry at a loss to save her own commerce? I think South Australia has a natural right to that trade, whilst we can only obtain it by creating artificial advantages to bring it here.
2753. Are you looking at the cost of running the trains on the proposed line as though there would be no intermediate traffic? I cannot see where the intermediate traffic is to come from.
2754. I suppose you did not read the evidence which was taken at Wilcannia? I read the Sectional Committee's Report personally.
2755. But do you know that the evidence taken there tended to show that the traffic from this line would almost pay the working expenses? I am not surprised at that being stated at Wilcannia, where the line is likely to go. If you project a railway to any place, evidence will be forthcoming that it will be the most paying railway the country can undertake.
2756. But would you not have the evidence substantiated by independent testimony before you accepted it? I should.
2757. Do you think the Committee has not done that? I do not wish to say that. I would rather not give an opinion upon the proceedings of the Committee just now.
2758. Evidence has been given as to the quantity of wool coming from certain districts;—if you have the evidence of the Stock Inspector that there are in the district 2,000,000 sheep, should not that be considered? It ought to be considered.
2759. Suppose we have evidence that a certain amount of wool comes from that district? I do not think that a wool railway will ever pay.
2760. But it would assist? It would all contribute.
2761. It would mean a large amount of traffic? It would, in certain seasons of the year. You have a navigable river to compete with at certain times.
2762. You know that the river is very uncertain? It is not so certain as a railway, but they will take advantage of the river when they can do so. I do not think that they will pay 1d. a ton more for the carriage of goods, merely from patriotic motives, than they can get the goods carried for on the river.
2763. Is there a scarcity of wood about Broken Hill for domestic purposes? I should think there is.
2764. And will that not cause the consumption of coal to increase? Certainly, coal is the only fuel that you can substitute for the wood.
2765. Have you any knowledge of the country between Broken Hill and Wilcannia? I have not been over it, but I know the character of the country.
2766. Do you know the country on the banks of the Darling? I do.
2767. What is your opinion of the soil? It is not bad soil.
2768. Do you think it would grow anything if irrigated? I do. You are now getting into a very big question.
2769. Will it be a difficult matter to irrigate the land near the river? No; it is nearly a flat country.
2770. And from your knowledge of the soil, do you think it would grow all the necessary supplies for Wilcannia and Broken Hill? I should think so.
2771. Is there not a possibility of a large traffic arising on that line? Of course there is a possibility in everything, if you come to speculate; but I do not think the country is called upon to spend £1,250,000 as a mere matter of speculation.
2772. Do you think that there would be much of a passenger traffic on the line? You would have a certain proportion of passengers, but a great many of them would go by Melbourne and Adelaide, as they would generally have business in those two large centres.
2773. Do you know how many miles it is from Sydney to Broken Hill by this line? Seven hundred and thirty-five miles.
2774. Do you know the distance to Broken Hill, *via* Melbourne and Adelaide? Over 1,000 miles, I believe.
2775. It is 1,400 miles, that is double the length of this line;—is it not probable that people going to Broken Hill would take into consideration the length of the journey *via* Melbourne and Adelaide, and the extra time and cost of that route? I should not think so when they have business at those centres, which they generally have.
2776. Do you think it would give any material assistance towards paying expenses? A passenger traffic, properly conducted, is the best paying traffic in the world on either a railway or steamboat.
2777. Do you think that if we could bring Broken Hill 700 miles nearer to Sydney than it is at present,

A. Brown,  
Esq., M.P.  
23 April, 1891.

A. Brown, Esq., M.P.  
23 April, 1891.

there would not be a much larger passenger traffic? A railway makes traffic. I do not say that there would not be a traffic, but I do not think that there would be sufficient traffic to warrant the proposed expenditure.

2778. Have you any idea of the estimated cost of working the line? No.

2779. The estimated cost, including the interest on the capital expended at  $3\frac{1}{2}$  per cent., is £90,630 per year;—from your knowledge of any city where there is a population of say 25,000, do you think that that £90,000 a year is beyond what you would expect from railway freight? I do not understand the question.

2780. Taking the population at 25,000, and considering that the railway runs from that population to the capital of the country, do you not think that the returns from the line would be largely in excess of £90,000 a year? You mean to ask whether it would not be worth our while to spend in working expenses and interest £90,000 a year in order to serve a population of 25,000, and that the freights would more than recoup the expenditure?

2781. Exactly? Well, I doubt it.

2782. Why? Because £100,000, to speak in round numbers, is a lot of money.

2783. Is it a lot to take from 25,000 people in a year? It is a formidable sum.

2784. But you acknowledge that this particular industry would give rise to a great deal of traffic, and that the traffic to and from Broken Hill would be larger than the traffic of ordinary cities? If I were a business man and was asked to make a railway to a city containing that number of people, and I was to spend £100,000 a year and recoup myself from the traffic, I do not think I should do it.

2785. Do you think the Government would be warranted in constructing the line if it can be shown that it will pay immediately the working expenses, independent of the interest on the capital invested? No; I do not think they should be entitled to make the railway if it would not pay the interest on the capital.

2786. Then do you know that if that principle had been acted upon we should not have had a railway made in the colony? We have had a great deal of unprofitable expenditure on railways.

2787. Do you know how many railways there are in the country which are not paying interest on capital and working expenses? I know that there are a great many, and at the rate at which we are going there will be a great many more. Round about Sydney and Newcastle the railways must pay handsomely, but beyond those places I do not know how they can pay. I suppose that the 20 miles of railway in the immediate vicinity of Newcastle would have been the most profitable concern any railway company ever had, if the original company had kept it, instead of the Government taking it over.

2788. Do you believe that it is necessary to construct a line from Newcastle to Tenterfield? I do not think that the line has gone the right way.

2789. Was it necessary to construct a line in that direction at all? No.

2790. You would not have any railways except within 10 miles of a large centre of population? I do not think that we ought always to stop at the consideration whether the railway would absolutely pay, but we ought to have some prospect of its paying. You ought not to construct a railway merely because 10,000 or 20,000 people require it. There ought to be some prospect that the State will not suffer a great loss by the expenditure.

2791. Do you think that this country would have progressed at the rate it has done if we had not constructed railways until we knew that they would pay? No; I do not think it would.

2792. Then do you not think that it is beneficial to the country to make railways, even, though, for a time, they may not pay? I think there is a stage beyond which you cannot go. I think we should hold our hands now. We have done a great deal in railway construction.

2793. *Mr. O'Sullivan.*] You seem to be dubious about a sufficient amount of traffic being obtainable to justify the construction of this railway? Yes.

2794. Are you not aware that there are 5,000 tons of bullion coming to Sydney every month from Port Pirie? Yes.

2795. That means 60,000 tons a year? Yes.

2796. At the rate of £1 per ton that would be a considerable item in the receipts? Yes; but in order to secure that bullion, if you count upon that, you will have to compete against the steamer enterprise that carries it now. I can tell you, as a matter of fact, that the steamship companies have given me as much as 2s. 6d. a ton for bullion for the privilege of carrying it under certain circumstances. The steamship companies having control of the situation now, demand payment for it. In this particular case the steamers take this bullion and bring it round to Sydney, paying the intermediate freight, because it serves them as dead weight, to enable them to carry a larger quantity of wool than they could carry without it. If you are going to secure that bullion, which at present comes from Port Pirie, and goes home in the large steamers, you must reckon upon the competition of the steamship companies. The company at Broken Hill will pay you no more than they can get the bullion carried for by the present route, and the steamers want it.

2797. Those steamers going to Port Pirie take coal and bring back bullion? Yes; they bring it for the big ocean steamers that go to London.

2798. From the evidence of the railway authorities, it is pretty clear that if the railway were open to Broken Hill, the Commissioners would be able to deliver coal there as cheap as it is delivered at Broken Hill from Port Pirie? That opens up a very large question—the question of the coal traffic. It is being carried on now under an arrangement that is very unsatisfactory. In the north we are compelled to build our own private roads; we are compelled to build our own rolling stock; and in the case of one colliery it means a capital of £70,000 for rolling stock alone. In the north we are compelled to pay rates which are not chargeable in the south and in the west, and in the south and the west the Government find the wagons and draw the coal at a rate 30 per cent. lower than that charged in the north. If they are going to continue that policy from Lithgow to Broken Hill, I can understand the statement that they can carry coal for less than the cost of sending it round by Port Pirie.

2799. We can only go upon the evidence we have received, and if the evidence is to that effect, it is clear that there will not be much competition by steamers in carrying coal to, and bullion back from Port Pirie? You have to compete with steamers already engaged in the trade, and you are not going to cut them out. From Port Pirie you have the South Australian Government, and the Silverton Tramway Company, and if it becomes a question of competing rates by the steamship company, by the South Australian Government, and by the Silverton Tramway, the rates will be lowered, and they will fight for the trade.

A. Brown,  
Esq., M.P.  
23 April, 1891.

2800. Do you think that private proprietors will carry on a cut-throat competition with the Government, knowing that they must go to the wall? They are doing it now. I know two companies with a capital of £200,000, who are competing with the State; the State is making very little, and the companies are paying no dividends.

2801. We have sworn evidence that at Wilcannia the amount paid per annum in freight is about £80,000—that is, paid to the steamers carrying the traffic down the river. The railway will touch at Wilcannia, and in some seasons it will command the whole of the traffic. Is it not probable that a large proportion of that £80,000 will be paid to the railway instead of to the steamers? Certainly; it must necessarily be so, when there is no river competition; but you have competition to face at other times.

2802. There are certain seasons when the steamers will not be able to compete? They will endeavour to hold their own.

2803. I presume that you have a good idea of the magnitude of the shipping trade at Wilcannia? No; I have not.

2804. Would it surprise you to learn that in 1887 there were 218 vessels running to Wilcannia, representing 36,170 tons? Was the river well up at that time?

2805. Of course, it must have been? There was probably a large flood in the river, and when there is, the storekeepers will supply themselves cheaper by the river than by the railway.

2806. I presume there must have been a high river? Those appear to be abnormal figures.

2807. Yes, they are higher than the figures for 1886 or 1888. At all events these figures indicate that there is a very large traffic at Wilcannia? Yes.

2808. Are you aware that the produce sent away from Wilcannia in one year was of the value of £1,098,543? No; it would not take much wool to make £1,000,000.

2809. Do you know that the value of the imports in one year was £283,387? I did not.

2810. These figures show an enormous traffic, and is it not possible that a railway, running there with certainty and rapidity, would command that traffic? If you are going to ask me whether the railway should go to Wilcannia, I simply say that as you have it at Cobar, I would not let it stop where it is; but I should not take it beyond Wilcannia.

2811. I put it to you—is it not probable that a large amount of traffic would be picked up on the way to Broken Hill? You will get a portion of the Wilcannia trade, necessarily.

2812. From your knowledge of the requirements of Broken Hill, is it not possible that the traffic will represent a great deal of coal, timber, and stores that can be supplied from this country fairly well? You would have a chance of supplying them; but they will get them where they can get them cheapest.

2813. But they are to be supplied by this railway as cheap as they can be got by steamer? My contention is that you cannot do it as a matter of competition.

2814. Have we not a right to assume that the railway officials who have given evidence on the subject have worked the matter out, and they say they are prepared to do it? I have seen estimates of railways prepared, but when the railways were constructed they were found to be very unsatisfactory.

2815. Considering all this traffic in coal, timber, and stores, to say nothing of the passengers that will go to Broken Hill, that place having become the show place of Australasia, does it not seem that there is a probability of its being a profitable line? I should not think so.

2816. *Mr. Copeland.* Do you think it was undesirable for us to construct a railway from Sydney to Albury, instead of allowing the trade to go to its natural port—Melbourne? I think that the Riverina trade now, except for the differential rates, would find its way to Melbourne, and it ought to go there.

2817. Then you would not have constructed a railway to Albury? Not to obtain a trade by means of differential rates.

2818. Do you think that it is a desirable thing for the metropolitan cities of the different colonies not to be connected? No; I do not. Your question had reference to the trade. If it becomes a question of connecting the metropolitan cities, that is another thing. I say that the trade ought to go to the place to which it belongs, and we ought to have on our railways rates that would make them pay.

2819. Assuming that the trade of the Albury district is nearer to Melbourne, and, therefore, ought to go there, would you still refuse to connect Victoria with New South Wales by railway? No; I would not.

2820. Therefore you approve of the railway going to Albury? I do. I think that the metropolitan cities of the two colonies ought to be connected.

2821. You are aware that this railway to Broken Hill and Cockburn is a through railway to Adelaide? Yes.

2822. That is to say, that our railway at Cockburn will connect with the South Australian railway? Yes.

2823. Does not the same principle apply, that is, is it not desirable to connect Adelaide with Sydney? We are already connected with Adelaide through Melbourne, so that that argument does not apply.

2824. Would you advocate for all time to come that our traffic should be compelled to go that roundabout way from Sydney, *via* Melbourne, to reach Adelaide, when we can make a shorter cut? I would not advocate that that should be done for all time. I am only speaking of the immediate construction of this particular railway. I may be prepared to say ten years hence that circumstances warrant the construction of the line.

2825. Do you think that the South Australian people were justified in commencing their line to Port Darwin? I do not.

2826. You think they made a mistake? I think it a very premature undertaking on the part of South Australia.

2827. Do you think that, the Government owning the railway and owning the land, it was not desirable to construct the railway, almost irrespective of the existing traffic? I do not.

2828. You think that it is not desirable that they should go a little ahead of the present traffic and open up the country? That is not going a little ahead of the traffic, spending a million and a half of money where the prospect of the line paying is far distant.

2829. You admit that the railway ought to go to Wilcannia? I say that having got to Cobar, for which there was no earthly justification, you might, later on, just as well let the line go on to Wilcannia. Our finances may admit of the railway going to Wilcannia, but I do not think they will admit of its going to Broken Hill at present.

2830. Would you have advocated the taking of the railway to Bourke? I should not.

2831. Would you advocate the taking of the railway to Jennings? There you make a connection between Queensland and our own railway.

- A. Brown, Esq., M.P.  
23 April, 1891.
2832. Will not this railway make a connection with South Australia? Yes, in a way that we do not want. With Queensland we have no other connection, but we are already connected with Adelaide through Melbourne.
2833. Suppose this railway were to stop short at Broken Hill, passengers requiring to go to Adelaide using the Silverton tramway, do you think that would be more desirable? No; I do not think that there is anything to warrant the cost of taking the railway to Broken Hill. The Broken Hill Company is the only one that pays a dividend amongst the whole host of companies that there are there.
2834. Notwithstanding that, if this question were submitted to you—the country having already taken a railway to Cobar—you would advise that the railway be continued to Wilcannia? I should say so.
2835. Having got the railway to Wilcannia, have you ever estimated the cost per mile of taking it to Broken Hill? No; it must be something considerable, with the proposed bridge over the Darling.
2836. The bridge and viaduct are estimated to cost £92,000, and the railway from Wilcannia to Broken Hill, 119 miles, will cost £2,870 a mile, making a total of £359,530 for the railway; and it will be a railway over a level country, where the running expenses must, necessarily, be exceedingly low;—do you think it is not possible for the Commissioners to carry the traffic at a much lower rate than they could on any of the other lines, where the grades are 1 in 33 or 1 in 44, and the railways have cost, perhaps, £10,000 a mile? The Commissioners are handicapped in this instance by the very difficulties you speak of—costly lines with heavy grades. They are handicapped by the heavy grades over the mountains here.
2837. Then the country having gone to the cost of constructing these very expensive lines—costing from £10,000 to £15,000 a mile, when we come to the cheap country you would stop short? I would stop short for the present.
2838. And would not do anything for the settlement and development of the country? Not in our present condition.
2839. Have you any idea of what it would cost to make and maintain a road from Broken Hill to Wilcannia? I know it would cost a great deal in that country.
2840. Do you know it is in evidence that it would cost about £2,000 a mile to make an ordinary road, and only £2,870 per mile to make a railway? That must be a very fantastical estimate. I have been over a road between Narromine and Peak Hill, which, I am satisfied, did not cost £20 a mile.
2841. What kind of country is it? Sandy soil country.
2842. From my experience of roadmaking I do not think it is an over estimate; it was given by the Government Road Inspector—a man competent to make an estimate? I do not think that it would cost £2,000 a mile to make any road between Wilcannia and Broken Hill.
2843. What do you think it would cost to maintain the road? Not much, I should think; the traffic would be very small.
2844. Do you think that if a railway were made to Wilcannia there would not be a considerable increase of traffic between Broken Hill and Wilcannia, thus causing the road to be more expensive to maintain? Yes.
2845. Would you advocate the building of a road, supposing the railway to be taken to Wilcannia, and you admit that that is desirable? No, I do not admit it; but having committed ourselves to the cost of taking the railway to Cobar, I do not see any objection eventually to its going to Wilcannia. I would vote for it.
2846. You say you would vote for it, seeing that we have to take a railway to Cobar? I do not see the same reason against it now, but if the thing was proposed as a whole I should not be in favour of it.
2847. Suppose the railway were taken to Wilcannia, would not that develop a large trade between Broken Hill and the railway terminus? It would develop a trade, but whether a large trade is a matter of speculation.
2848. Would you make a road to assist that trade, or compel them for all time to travel without a road? They would have to get facilities in the shape of roads between the two places.
2849. Which is it preferable to make, then—an ordinary road that would cost £2,000 a mile, or a railway that would cost £2,870 a mile? It is a supposition that the road will cost £2,000 a mile, but assuming it to be correct, if you can build a railway for £2,870 a mile, I question very much whether you ought not to build the railway.
2850. With regard to the bullion, I understood you to imply that the bullion was brought round from Port Pirie at a nominal rate by the steamers? Not at a nominal rate now, because I had a contract to bring it round myself, but I have shipped bullion at nominal rates.
2851. What is the insurance on bullion from Port Pirie to Sydney? I cannot tell from memory—about  $\frac{1}{8}$  per cent.
2852. If we constructed a railway to Broken Hill, would you advise that it should stop at Broken Hill or that we should take it through to Cockburn, to compete with the Silverton tramway? No; I should not advise you to compete with the tramway, or to get into conflict with them at all. I do not think it would be fair to the Silverton Tramway Company.
2853. You would be in favour of the railway stopping at Broken Hill? I should.
2854. Have you any interest in the Silverton Tramway Company? None whatever.

Edward Bulwer Lytton Dickens, Esq., M.P., sworn, and examined:—

- E. B. L. Dickens, Esq., M.P.  
23 April, 1891.
2855. *Mr. Tonkin.*] You represent Wilcannia in the Legislative Assembly? Yes.
2856. Would you like to make any statement as to the proposed railway from Cobar to Cockburn? Yes. I have just returned from Wilcannia, and in doing so I found it necessary to travel *via* Adelaide and Melbourne, as being the easiest and shortest route at the present time. I have heard a considerable amount of the evidence given by Mr. Alexander Brown, member for Newcastle, and I disagree with him on very many points. I may say that I do not think Mr. Brown has that local knowledge of the country which is required in dealing with a matter of this sort, and which I myself possess, having known that country for the last twenty-three years. I consider that a railway of this sort is one of the great factors of civilisation, tending to open up and populate the country. As an example of this, I would like to point out the immense amount of settlement that there has been in the Bourke district since the railway was taken to that town. Anticipating a railway to Wilcannia, during my recent visit there, I noticed that there

there has been a large number of homestead leases applied for on the Darling River, within 50 miles of Wilcannia, and I feel confident if this railway is carried out all the available country on the resumed area in the Wilcannia district will be taken up within a short time. I cannot say for certain the exact number of homestead leases taken up, but I should say that within the last few weeks there must have been fifteen or more taken up.

E. B. L.  
Dickens,  
Esq., M.P.

23 April, 1891.

2857. That would be in 10,000-acre blocks? Yes; I think they are all 10,000-acre blocks. Mr. Brown answered a question as to the cost of making a road from Wilcannia to Broken Hill. The cost of making such a road would be very great, as a considerable extent of that country consists of loose, sandy soil, and most of the remainder of open plain, which gets very boggy and soft in time of rain, and even if the road was made to Wilcannia I do not think it would divert much trade in the direction of Sydney. Mr. Brown seemed to have some doubt as regards the credibility of the evidence given at Wilcannia before your Sectional Committee; but I can say from my own knowledge that all that evidence was very carefully prepared, and was, to the best of my knowledge, correct. I may state that the navigation of the River Darling is very uncertain. I have known it to be unnavigable for over two years at one time. On several occasions I have known it to be unnavigable for twelve months, and on three occasions I have seen the bed of the river as dry as the floor of this room. On many occasions I have known the clips of two shearings to be stored there in the station wool stores, and on that account I do not think that the river would compete with the railway very greatly to the disadvantage of the latter. I find that the number of bales of wool of last year's clip sent away from Wilcannia was 26,000, besides about 1,200 bales represented by the wool that went away on the backs of the sheep that travelled from the district. As regards the soil on the Darling, from my own experience I find that with a plentiful supply of water it will produce almost anything. There is no difficulty whatever in irrigating the land, as it is all very flat. Since the Sectional Committee visited Wilcannia and Broken Hill there have been very great developments at both places, and there have been some very valuable mineral discoveries made recently within 100 miles or less of Wilcannia, notably the Nuntherungie silver fields, which are situated about 85 miles from Wilcannia.

2858. In what direction is that—north or west? It is north-west.

2859. Out towards Mount Browne? Yes; out in that direction.

2860. *Dr. Garran.*] It would not be on the line of railway? No. There are also the opal fields, situated between 60 and 70 miles from Wilcannia, both of which places I have lately visited, and after a careful examination of them I fancy that they promise to turn out well in the future. In the last twelve months there have been no less than 180 mineral leases applied for in the Wilcannia district. An objection was made to this railway on the ground that it would be injudicious to construct any more railways until there was a universal gauge fixed in the various colonies, but as the New South Wales is the accepted and acknowledged gauge throughout the world at present, this objection, in my opinion, is a very trivial one. A great deal has been said about the expediency of locking the River Darling should this railway to Wilcannia and Broken Hill be constructed; but I think it would be a bad policy to lock the river. You would simply be opening up a highway to Victoria and South Australia, which would compete with the railway. There is a great deal more business done with Sydney from Wilcannia and Broken Hill than is generally imagined, and there are several merchants in Sydney who can give evidence on this point, if required. I think this is a very important point. A great complaint made by the merchants of Wilcannia and Broken Hill, in reference to the Sydney trade, is that they experience great delay in receiving their goods after they are ordered. I am sure that if a railway were constructed, and I say this after having had many conversations with people interested in the district, that a great deal more trade could be done with Sydney than is done now. A great deal more would have been done in the past if the people had had the means of easy and rapid communication. At Broken Hill firewood is getting very scarce. It is now from 16s. to 18s. a ton, and I believe it has to be carted long distances. No doubt in a few years the people of Broken Hill will be almost entirely dependent upon coal or coke. Wood will have to be brought long distances by train, or it will be impossible to get it at all. A gentleman who does business in a large way informed me yesterday that it cost him £3 a ton to get coal to his brick-making works. The cost of the coal to Broken Hill was £2 15s., and there is a further charge of 5s. for the delivery of the coal at the works.

2861. *Mr. Copeland.*] Where are the works located? Close to Broken Hill. I am also informed, from credible sources at Broken Hill, that Lithgow coal could be delivered at Broken Hill, by this railway at about 12s. a ton less than the coal carried by the present route. I feel confident that the extension of the railway to Cobar will not pay unless the line is carried further, and also that it will not have the effect of placing population on the land that the extension to Wilcannia would have, because persons taking up homestead leases naturally, in the first instance, settle upon land where there is permanent water, and from thence work outwards by degrees. Since the Sectional Committee visited Broken Hill the population has increased to a very large extent. The place is undoubtedly of far more importance now than it was then. During my experience of the Darling district I have known very heavy losses to occur in stock, owing to the impossibility of moving sheep in time of drought to country where there was pasturage and water. There is not the slightest doubt that in many cases these losses might have been avoided if there had been railway communication. One witness—I think the Chief Traffic Manager—in giving evidence before the Committee, seemed to think that the river would be a strong rival to the railway, and he compared the proposed railway to Wilcannia with the existing railway to Hay. In doing this he seemed to forget that at Hay, on the Murrumbidgee, there is always a navigable river at one period of the year—as both the Murrumbidgee and the Murray are annually fed by snow waters. This does not apply to the Darling. There is no regular time for a rise in the Darling, and when that river once becomes unnavigable it is impossible to say when the steamers will again be able to ply upon it. I think it was in 1888 that Wilcannia was virtually cut off from all communication with other parts. The river was unnavigable, and the road from Wilcannia to Broken Hill was in such a state that it was almost impossible for teams to travel. The freight by land from Broken Hill during a portion of that year was £20 a ton, and very few teamsters would undertake the journey even at that high rate. If the railway went to Wilcannia, I feel confident that that town would become a big slaughter depôt, as it appears now to be an acknowledged fact that it is possible to convey meat long distances in chilled cars. I am also informed by mining experts at Broken Hill that in all probability large quantities of ore, which are difficult of treatment, and which require large quantities of water in their treatment, would be conveyed to Wilcannia by railway, and would

E. B. J.  
Dickens,  
Esq., M.P.  
23 April, 1891.

would be dealt with there. Hence, not only would there be an abundant supply of water, but, also, in dealing with the ores at Wilcannia, the extra freight of 120 miles on the coal from Lithgow would be saved. I may state that I have made it my duty to have conversations on the subject with people in the district, especially at Broken Hill, who are interested in the railway, and there is a general desire to be connected with Sydney direct. There is also a general feeling at Broken Hill that unless this railway is constructed the best course would be to let them be annexed to South Australia.

2862. *Mr. Tonkin.*] Do you know whether there has been much increase in the population of Wilcannia since the Sectional Committee were there two years ago? I do not.

2863. Do you know Mr. Tully, Inspector of Stock? Yes.

2864. Is his evidence to be relied upon? Undoubtedly.

2865. He states that in the district of Wilcannia there are 3,000,000 sheep, between 17,000 and 20,000 head of cattle, and about 9,000 horses. Have you reason to believe that the number of stock has much increased or diminished? I should say that it has increased.

2866. That was during the late drought? Yes, there were heavy losses in 1888.

2867. Mr. Tully says that over 1,000,000 sheep were lost in that district during the drought? Yes.

2868. And you believe that statement to be correct? Undoubtedly.

2869. And should be accepted as evidence in favour of the construction of this line? Yes, I think so.

2870. Are rabbits doing much injury in that district? They have done, but they are nearly all dead now.

2871. What is the cause of that? They die in the dry season. When I was there, lately, they were dying in large numbers, but I am afraid they will increase again shortly.

2872. It has been suggested that if the railway were constructed it should be fenced in on each side with wire-proof fencing—would that in any way cope with the rabbit pest? To some extent.

2873. Would it be a material factor in the destruction of rabbits? To some extent, but from my own experience I do not put much faith in rabbit fencing.

2874. You do not think that that is the proper way to deal with them? I do; but I do not think it is much good unless you can have a system of subdivisions into small areas.

2875. If you get a fence across the country will it not be easy to subdivide from that fence? Yes, if you have the money to do it. But the lessees, unfortunately, are not in a position to undertake such a large expenditure.

2876. Do you know of any land under cultivation about Wilcannia? Yes; in a small way.

2877. What do they grow? Lucerne, wheat hay, and oat hay.

2878. Do you know the stock reserve just outside the town of Wilcannia? Yes.

2879. That is a very large reserve, is it not? Yes.

2880. It has been suggested that a portion of that reserve should be thrown open to selection in small farms, up to 100 acres each. Do you think that that would be a great advantage to the place? I think anything would that tends to settle the people on the land.

2881. Do you think that people would take small farms in that place? I do not think they would unless they had the railway.

2882. I mean supposing the railway were made? Yes, then they would.

2883. Do you think they would be able to make a living on small areas like that along the river? Yes, if you get the right sort of people—people of enterprise, who are prepared to spend money on irrigation.

2884. Do you think it probable that it would be done? I see no reason why it should not.

2885. We have it in evidence that it would be done. It was said that if the land were thrown open, even without a railway, the whole of it would be taken up by small industrial farmers. Do you think that that is probable? I very much doubt it, unless the railway is made. I should not be prepared to take up 100 acres under such circumstances.

2886. Mr. Brown said that rather than construct a railway to our extreme borders he would allow the trade of that country to gravitate to the nearest port, that is, to another colony. Do you think that that is a proper argument for anyone who has the interests of this country at heart? No; I think we ought to try to induce our outlying people to deal with us in Sydney.

2887. Under certain circumstances, where people are so far away from the capital of the colony, would you be in favour of constructing a line of railway, even supposing for the first few years it would not pay the necessary expenses? I would, and I think that a portion of this line ought to have been made four or five years ago.

2888. You would construct lines for the development of the country in some instances? Certainly.

2889. It was stated here that many of the runs about your district have been given up as worthless on account of the rabbits. Is that true? No.

2890. Do you know of any at all? Yes; I have known one or two, but that is right out on the South Australian or Queensland border, about Tibbooburra and Mount Browne. I do not know of any instances about Wilcannia.

2891. Has any large extent of land been thrown up in that way? No. Those cases that I know of were comparatively small holdings.

2892. Have you any doubt in your own mind that if this railway were constructed it would pay working expenses almost from the start, not including the interest on the outlay? I think it would.

2893. That would be assuming that the expenses were about £50,000 a year? I think the line would pay them.

2894. Have you heard the evidence with regard to the consumption of fuel at Broken Hill? I have not.

2895. Do you know the traffic in articles consumed there is 15,000 tons a month? I know it is an enormous quantity.

2896. Do you think we should not expect to have a fair percentage of that traffic? Certainly. If the statement I quoted now is correct, that you can land Lithgow coal there at 12s. a ton cheaper than is done at present.

2897. *Mr. O'Sullivan.*] How far is Mount Browne from Wilcannia? Roughly, it is something over 200 miles.

2898. Does the trade of that region go to Wilcannia? Yes, mostly.

2899. Does Wilcannia get the trade of the Paroo district? A portion of the Paroo trade goes to Bourke.

2900. How far is Menindie from Wilcannia? About 90 miles.

2901. I presume that Menindie does a certain amount of trade with Wilcannia? Not much—Menindie is below Wilcannia.

2902. Is there mutual intercourse between the two places? Nothing to speak of.

2903. Would not this railway going to Wilcannia benefit the Menindie district? That would be a different matter. At present all the trade from Menindie goes down the Darling to South Australia.

2904. It is probable that the railway would benefit Menindie? Yes, a great deal of the wool would go to Wilcannia.

2905. Do I understand that the rabbit pest is abating round Wilcannia? I should like to explain what I said on that point. What I say is, that owing to the late dry season the rabbits have died in large numbers, and large numbers have been destroyed. It is only in dry times that you can deal with them. In very dry times you can deal effectually with the rabbits, but when there is plenty of water it is impossible to deal with them at all. Owing to the destruction which has taken place amongst the rabbits from the dry weather and the trapping at the tanks, they have decreased to a very great extent, but in a few months they will be quite as numerous as ever. The same thing happened in the year 1888, when a great many rabbits were killed, and they seemed to die out, but since 1888 they have been more numerous than they ever were before.

2906. Have not Mr. Wynne and other pastoralists out there been successful in destroying the rabbits? Not more so than their neighbours.

2907. *Mr. Copeland.*] You said just now that some person who had brickyards paid £3 a ton for coal—£2 15s. to Broken Hill, and 5s. for the delivery at his brickyard? That is what he informed me yesterday.

2908. If the railway took the coal from the western district he would still have to pay for the delivery of his coal at his brickyards; therefore, it is not fair to estimate the cost as £3. At present coal is delivered in Broken Hill at £2 8s. a ton? He informed me that it cost £2 15s. delivered at the Broken Hill station.

2909. I believe you are a stock and station agent? Yes, and land agent.

2910. In case of a drought do you think that if the railway went to Wilcannia they would be likely to bring fodder of any kind by the railway for rams, stud sheep, working bullocks, and horses? They would, for horses, principally.

2911. Would they let the working bullocks die? The working bullocks can always get a living on the scrub—they fatten on the mulga.

2912. But they would have to feed the horses? Owing to the rabbits it is necessary to feed every working horse on the stations, and the expense is enormous.

2913. And the rams—would you let them die? No, we should buy feed for them.

2914. If they could get feed at Orange or Dubbo, would it not pay to take it by railway? Undoubtedly.

2915. Leaving out the fact that you are member for the district, and speaking as a private individual, would you be likely to pay for the carriage of fodder to feed the rams and stud ewes, or would you let them die; or would you, on the other hand, bring them away as starving stock by the railway? In that district they do not go in very largely for breeding high-class sheep; but, of course, rams are always a large item in the expenditure of a station. When you have good rams you would rather feed them than let them die, but the greatest amount of fodder would be required for the horses.

2916. Would the squatters be more likely to make use of the railway to remove their rams to better country, or would they take food to the rams? They would be more likely to take food to the rams.

2917. And I suppose they would be compelled to take fodder for the station horses? You must buy food for the horses even in good seasons, owing to the rabbits.

2918. Is it your opinion that the squatters could use the railway out in the far west to get stock away in time of drought? I am certain of it—that is supposing the season in other parts of the colony was a good one, and they could find food.

2919. Is there anything like a development of alluvial mining at Mount Browne that looks permanent? A great deal of gold has been got in shallow sinkings.

2920. But now they are testing deep leads—do you know whether they have got payable gold in the deep ground? I have not sufficient knowledge to speak with any authority on that point.

2921. Suppose the railway were taken to Wilcannia, would it be likely to get any traffic from the Paroo country? Yes; from the Lower Paroo traffic would come to Wilcannia.

2922. Would it come to Wilcannia, or go to Broken Hill and on to Adelaide? It would come to Wilcannia.

2923. What would be the inducement to bring it to Wilcannia, and thence to Sydney, rather than to Broken Hill and Adelaide? The land carriage to Broken Hill would be a great deal more, and it would not be a good road.

2924. Notwithstanding the longer railway route and the heavier railway rates, you think that the traffic would come to Wilcannia? Undoubtedly.

2925. Have you any knowledge as to where the squatters of that part of the country have their business connections. Are their business connections with Sydney, Adelaide, or Melbourne? One of the biggest properties in New South Wales is Momba, on the Lower Paroo, 50 miles from Wilcannia. It extends about 80 miles from Wilcannia up the Paroo. The owners of that station do their business in Adelaide.

2926. Then they would send their wool to Broken Hill? They never send it to Broken Hill. They have four woolsheds, but the homestead is only 50 miles from Wilcannia. They send it down the river when the river is navigable. I have known them send some of their wool to Bourke, *via* Wilcannia, a distance of 220 miles.

2927. Supposing the railway were taken to Broken Hill, about what distance do you think the squatters would make use of it south of the line. How far would they travel north to the railway. I am speaking of the line from Cobar to Wilcannia, and from Wilcannia out to Broken Hill? All the squatters, I should imagine, between Cobar and Wilcannia would use the line.

2928. From how far south; would they travel 100 miles north to get to a railway station, or would they come further south to Hay? I am not quite sure of the distance between Hay and the proposed railway line.

2929. *Mr. Tonkin.*] It is about 260 miles? It is a question that would be difficult to answer. It depends so much upon local circumstances as regards the road, watering-places, and so on.

2930. *Mr. Copeland.*] Suppose the railway were taken to Broken Hill; then you say that the Momba people

E. B. L.  
Dickens,  
Esq., M.P.  
23 April, 1891.

people and other squatters would not require to use the road. Being at Broken Hill, they would have the choice of using the railway to Adelaide direct, or using the railway to Sydney direct,—all the way, whichever way they went. Which route would they be likely to take from Wilcannia? It is, of course, simply a matter of £ s. d.

2931. I suppose you would not consider it objectionable that the people of Wilcannia should be allowed to take their trade to the nearest and best market? No; I think the trade would naturally come here.

2932. If they did go to Adelaide they would have to pay the Government of New South Wales for the use of the railway as far as Cockburn or Broken Hill? Yes.

2933. And if they used it, it would be likely to pay working expenses? Yes; and the break of guage on the Adelaide railway would cause an additional expense. I should be inclined to think, all things being equal, that the great bulk of the traffic would come to Sydney.

2934. In saying that, I take it for granted that you are not speaking so much as the political representative of the district as a resident of Wilcannia? When I say that, I give my honest opinion.

2935. And you believe that you represent the opinion of the Wilcannia people generally? I am certain that I do. I have lately been there, and have had an opportunity of talking to them.

2936. Do you know the population of Wilcannia, according to the census which has just been taken? I have not heard.

2937. What do you estimate the population of the town and suburbs to be? Roughly speaking, about 1,500. There is one thing I omitted to mention, and that is that there will a great quantity of travelling stock to be trucked from Wilcannia if the railway is made to that place. Large quantities of travelling stock come down from Queensland annually, especially fat cattle, in addition to the local fat stock, which consists principally of sheep. We have very few cattle in the district.

2938. Do you think cattle from Queensland would be trucked from Wilcannia? There is no doubt that large quantities will be trucked there.

2939. *Chairman.*] You think that in good seasons fat sheep would come from that district by the railway? Yes; it is getting more difficult every day to send stock to market, owing to the rabbits, the roads being bare. It is a hard matter to send stock to Melbourne, and the cost is very great. The cost, with the border duty, and one thing or another, amounts to something like 3s. 6d. to land a sheep in Melbourne from Wilcannia.

TUESDAY, 28 APRIL, 1891.

Present:—

THE HONORABLE JOHN LACKEY (CHAIRMAN).

The Hon. ANDREW GARRAN.

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. WILLIAM JOSEPH THICKETT.

The Hon. GEORGE HENRY COX.

JACOB GARRARD, Esq.

HENRY COPELAND, Esq.

JAMES EBENEZER TONKIN, Esq.

WILLIAM SPRINGTHORPE DOWEL, Esq.

EDWARD WILLIAM O'SULLIVAN, Esq.

CHARLES ALFRED LEE, Esq.

WILLIAM MCCOURT, Esq.

JAMES PATRICK GARVAN, Esq.

The Committee further considered the proposed Railway from Cobar to Cockburn.

Walter Macnicol, Esq., Secretary of the Silverton Tramway Company, Silverton, sworn, and examined:—

W. Macnicol, Esq.  
28 April, 1891.

2940. *Chairman.*] You are Secretary of the Silverton Tramway Company? Yes.

2941. How long have you been Secretary? Within a few days of three years.

2942. Your company has made contracts with some of the mining companies at Broken Hill for a term of years, has it not? Yes.

2943. What is the tonnage of bullion and ore sent from Broken Hill, and the tonnage of coke, coal, lime, timber, and flux taken to Broken Hill? From the 1st January, 1890, up to the 31st March, 1891, the total quantity of coke was 56,399 tons; coal, 21,904 tons; mine timber, 28,874 tons; bullion, 54,216 tons; and ore, 119,000 tons.

2944. Where is that to? To Port Pirie and Dry Creek, near Adelaide, and also to Adelaide itself.

2945. What proportion is sent by the mining companies with whom the Silverton Tramway Company has contracts? About 80 per cent. of that quantity is from the mines with whom the company has contracts for a long term of years—eight years. A small portion of the time has expired, and there are about seven and a half years to run.

2946. Does that include the general merchandise? No.

2947. Have you any contract for general merchandise? No; simply limited to the produce and requirements of the mines.

2948. Are you at all acquainted with the country between Cockburn and Wilcannia? I am not.

2949. You have heard, of course, of the projected construction of this proposed railway from Wilcannia to Cobar? Yes, I have.

2950. From your knowledge of the country and places, do you think that any enterprises or industries, mines, or things of that sort, would spring up, which would tend to give trade to the proposed railway if it were constructed? I could not say. I have not made much inquiry about that portion of the country between Broken Hill and Wilcannia, so I am not in a position to give any opinion at all that would be of any value.

2951. Is the population of Silverton increasing largely? No; I think not.

2952. Of Broken Hill? Yes, it has increased, but I cannot agree with the number stated, viz., 26,000, seeing that the whole of the miners do not exceed 5,000. I got information from Broken Hill last week as to the actual number of miners employed at the principal mines, and if they are of any use to the Committee I will give you the figures.

2953. I suppose a large number of the miners are married men? Yes; I should say at least half of them are married. The number that I got from the seven principal mines was 4,592 miners, and I should think that the total number employed by the other mines might, perhaps, make up the number to 5,000.

2954.

2954. Could you give us any information ; have you any returns of the tonnage of merchandise carried by your company ? Not with me. I was asked only to produce a list of the shareholders. I should have been very glad to have brought anything else if it had been indicated that it was required.
2955. Your company carries the whole of the merchandise at all events ? Oh, yes ; certainly.
2956. But you have no information, or approximate information, to give us as to the amount of tonnage ? I can give you, approximately, the tonnage of the general goods—everything else besides those items that I have named. The monthly tonnage would be about 3,000 tons for things other than those that I have mentioned.
2957. *Mr. Garrard.*] Inward and outward ? Yes. I am speaking of the total amount of tonnage.
2958. *Chairman.*] Is the work of the tramway increasing largely ? Yes ; it has increased very considerably since the 1st January, 1890 ; in fact there has been a steady increase in the tonnage.
2959. That increase is still going on ? Yes, apparently still going on.
2960. Have you any information to give us with regard to the passenger traffic ? The number of passengers that travel over the tramway both ways is about 900 per week, including those who travel to Silverton, and the local traffic. It is principally local traffic.
2961. Is this increasing or decreasing ? It is not increasing ; it is stationary. The first year, 1888, the traffic was more than it is now.
2962. Can you give us any approximate idea as to the number of through passengers included in the 900 per week ? No, I cannot. It is a small number. If I were to hazard a guess, I should say fifty or sixty a week, but I do not give you that as being correct.
2963. What are your rates for passenger traffic ? We charge, between Broken Hill and Cockburn, 10s. single, 15s. return ticket, first-class. Our Act authorises us to charge 4d. a mile, and that would come to 11s. 8d., but we charge only 10s.
2964. Have you a list of your shareholders ? Yes.
2965. Have you any objection to produce it ? Not at all. I brought it for that purpose.
2966. Do you issue half-yearly reports ? We do.
2967. Do you happen to have your last half-yearly report with you ? No.
2968. Did the company pay a dividend ? Yes.
2969. A large dividend ? Yes.
2970. Are you at liberty to state what it was ? I think so. Seeing that our balance-sheets are sent to every shareholder, and are public property, I cannot see any objection to my stating what the dividend was.
2971. What dividend did the company pay on the last occasion ? We pay dividends at the rate of 50 per cent. per annum on the paid up capital, which is £1 per share. We pay 10s. per annum per share.
2972. You publish your balance-sheet ? Of course—not in the newspapers, but it is printed and issued to every shareholder.
2973. You do not happen to have a copy with you ? No.
2974. Would you have any objection to giving one to the Committee ? No. If that had been stated in the summons I would have been glad to have brought you one.
2975. Perhaps you would be good enough to let us have one ? I will send one as soon as I go back.
2976. Does your company suppose that its prosperity would be affected at all by the construction of the proposed line ? We think it would not.
2977. As a company, they do not urge any objection ? Not at all.
2978. Are you in a position to gather the opinion of your company as to the propriety of constructing the proposed line ? No, but the opinion of my directors.
2979. Would they be in favour of the construction of the proposed line ? I cannot go so far as to say that they would be in favour of it, but they do not fear the competition. We think that the geographical position of the South Australian ports will always command the traffic.
2980. Would you, individually, regard the construction of this proposed line as a benefit to the community up there ? Yes ; I think it would probably be a benefit to the Broken Hill people to have this railway.
2981. Do you think that it would be an advantage to the large belt of country between the Darling and Broken Hill ? I do not think so.
2982. But taking a prospective view of the matter ? If there were any prospect of settlement ; but, so far as I can learn, there is very little.
2983. *Mr. Trickett.*] What is the length of your tramway ? Thirty-five miles.
2984. And it has a narrow gauge ? Yes ; a 3 ft. 6 in. gauge. It is exactly similar to the South Australian narrow gauge lines.
2985. Before reaching Adelaide or Port Pirie there is a break of gauge, is there not ? Yes ; at a place called Terowie.
2986. And that necessitates all the goods being re-handled ? Not all, by any means. A large proportion of the traffic is with Port Pirie, and a 3 ft. 6 in. gauge runs through to Port Pirie, so there is no transfer at all ; but in going to Adelaide there is a transfer on to the 5 ft. 3 in. gauge.
2987. Do the bulk of the goods come from, and go to, Port Pirie, or Adelaide ? Port Pirie ; and the coal, coke, and bullion all goes to or from Port Pirie ?
2988. So that there is no change of truck ? Not so far as those things are concerned.
2989. At the end of your line it becomes a Government railway, does it not, to Port Pirie ? At Cockburn the line becomes a Government railway.
2990. Does your company work with the Government ? We do. We have an agreement with them for a long term of years.
2991. Do they carry the goods and pay you so much, or *vice versa* ? We pay them a haulage rate. They supply the rolling stock and haul the goods to Broken Hill station, and we pay them a rate per mile.
2992. How long has the contract with the South Australian Railway Commissioners which is at present in existence been in force ? The present contract dates from the 1st July last year, and was made for ten years.
2993. Was that contract made at a much reduced rate compared with the one existing before ? No ; there was no reduction of the rate, but there is a larger tonnage to be hauled for the same money, which means virtually a reduction of rate.
2994. Was that a considerable reduction ? Fifty per cent. additional tonnage to be hauled for the same rate.

W. Macculcol,  
Esq.  
28 April, 1891. :

- W. Macnicol, Esq.  
28 April, 1891.
2995. Was not that reduction made almost directly the Nyngan to Cobar and Nyngan to Cockburn railway was mooted;—was it not the outcome of that? I think it was some considerable time before that.
2996. Not if it was made in July last, because this railway has been under consideration for eighteen months? Yes; I know that the Sectional Committee were at Broken Hill eighteen months ago. We were negotiating at that time. It was a long time before the agreement was actually concluded. Previous to that there was an agreement between the Tramway Company and the South Australian Railway Commissioners for a term of five years, and this was simply another agreement extending the operation of the previous one.
2997. On better terms? Yes, so far as the Tramway Company was concerned.
2998. You say that the last dividend was at the rate of 50 per cent? Yes.
2999. Can you tell us what the dividend was before the change in the haulage rates was made? I think the dividend immediately before that was at the rate of 40 per cent.
3000. Less than now? Yes.
3001. How do you account for that? The tonnage has increased. It is the increase in the tonnage that has given the additional revenue.
3002. That is by reason of the further development of the mines at Broken Hill? Precisely.
3003. Was not the Silverton tramway, in the first instance, laid in a cheap manner, and for being worked at a slow rate? No; it was laid just as it is now, but it was not completed. It was not ballasted, and station buildings were not erected when it was opened first, in January, 1888. It was in a very incomplete state.
3004. And the trams could travel only at a certain rate per hour? There was a good top on the road, and the trams could travel, I think, at almost the same rate as now, but the ballasting was not completed; the road was not boxed up.
3005. Had the company not to complete it at very great expense? No; it was not an undue expense, but just the ordinary expense in completing it.
3006. I understood that, in the first instance, it was laid down as a very cheap kind of railway, and to be travelled over at only a slow rate of speed, but that, as the traffic developed and became heavier, and the people wanted to travel faster, the company had to spend a very large sum of money to ballast the line? There has been a large sum of money spent, and it may have been the original intention to make such a line, but it was not after the company had the inception of it.
3007. Can you tell us what was spent to complete the line? I can tell you about the total amount spent altogether, viz., £227,000.
3008. I mean since it first commenced to run in its incomplete condition? I cannot tell you now.
3009. It was more in the nature of a surface railway, was it not, when it started—there was no stone ballast? There was gravel and stone ballast.
3010. But very light? All the bottom ballast was put on as it is put on on the South Australian railway—I mean the ballast under the sleepers.
3011. We are dealing with a railway over the same class of country, and I want to ascertain if it proved a failure in the first instance—if it became absolutely necessary to spend a great deal more money on ballast? It was proved to be absolutely necessary, for this reason: In that part of the country the sleepers, unless they are covered, crack under the heat of the sun, and it was found absolutely necessary to cover the sleepers with ballast—to box the line up.
3012. Were they square sleepers? Yes.
3013. All the best kind of sleepers? Every bit of timber used on the railway came from Western Australia—jarrah timber—with the exception of a few sleepers from South Australia, which were very inferior, and which are being replaced gradually.
3014. Have you with you a list of the rates for the carriage of goods to and from Port Pirie and Adelaide? No; I have not brought it with me.
3015. We had evidence as to those rates about fifteen months ago, when the Sectional Committee were at Broken Hill;—are they the same now? No; they are less.
3016. Very much less? Considerably less.
3017. How could we get a schedule of those rates? I could get you the rates from my office, but I have not got them here.
3018. *Chairman.*] You might be able to send those to us when you are sending the balance-sheet? Certainly.
3019. *Mr. Trickett.*] Do you know the district between Broken Hill and Wilcannia? I do not.
3020. You have not traversed it? I have never been in that part of the country.
3021. I suppose you are pretty well acquainted with the working of Broken Hill;—you often hear about it? Yes, naturally.
3022. Do you look upon it as a permanent field of industry as a silver mine? Yes.
3023. For a good many years to come? Yes.
3024. Have you ever considered the question of the low grade ores being sent to Lithgow, or to our western mines, and being treated at our coal mines? I have heard a good deal said about it.
3025. What is your view of that? That the ores will not be sent.
3026. Why? Because they will not pay to send, and, as far as I can learn from mining men, they must be treated on the field.
3027. Would it be as cheap to send the ore to the coal mines, where coal is so cheap, and where water is plentiful, as to truck all the smelting material to Broken Hill, and send the stuff away again? No. As far as I can learn, it would be cheaper and better in every way to smelt on the field, and men capable of giving an opinion say that in a little while no ores will be sent away from the Hill.
3028. Are you able to tell us what is the result, comparing the smelting at Broken Hill, and at Port Pirie, and Adelaide? No, I cannot tell you in figures.
3029. You cannot say what is the most profitable? No. All the ores sent away hitherto have been rich ores.
3030. I refer to the cheaper class of ore; it might possibly suit to treat the good ores locally, but as to the cheap ores, which they must come to in large quantities directly, do you not think it would be better to send them to the smelter, than to bring all the fuel and everything to the mine? My own opinion would be valueless as regards that, but I am quoting the opinion I have elicited from others.

3031. Practical men? Yes. I may state that the Broken Hill Proprietary Company is about to erect additional works at a cost of nearly £70,000, to treat ores that it cannot treat at present. W. Macnicol,  
Esq.
3032. Low grade ores? Not exactly low grade, but what they call the dry ore.
3033. Are they not erecting large smelting works at Port Pirie at the present time? There are large smelting works there already belonging to the British Company. 28 April, 1891.
3034. You are not aware that they are constructing more? No; I do not think that they contemplate constructing any more; in fact the British Company are about to do away with those works, and erect smelters to treat the ores at the mine at Broken Hill.
3035. Your company has, of course, got a long contract for the carrying of all materials over your line of tramway? Yes.
3036. Has that any force in making you give the opinion that you do not care about this railway being constructed? I do not think I have given such an opinion.
3037. I think you said a little while ago that you thought it would be a good thing for this railway to be constructed? I said that so far as I knew, my directors had no objection to the railway.
3038. If they had not secured this contract for the next six or seven years, do you think that they would still think so. I think their opinions would be the same.
3039. It does not affect them? I do not think it would.
3040. Why is that so? I am under the impression that in the face of competition the rates over the South Australian lines would be so reduced as to defy competition. I should think so, from the expressions of opinion that I have heard from prominent South Australian men.
3041. Would it be fair for me to ask you whether, if this proposed line were constructed, you could reduce your rates very much below those at which you are running at present? We could.
3042. And still run at a good profit? Still run at a profit;—I do not know that it would be a good one.
3043. Do you know how long it took to construct these 35 miles of tramway? I cannot say exactly. I was not Secretary of the company at the time, but I should say that it took about fifteen or sixteen months, perhaps eighteen. I am not positive.
3044. Have you been at Broken Hill lately? Six months ago I was at Broken Hill.
3045. *Mr. Copeland.*] How many companies have entered into this compact with you? Four companies.
3046. What are the names of the companies? The Proprietary, the British, Block 10, and the North Broken Hill.
3047. What is the nature of that agreement—is it that they shall exclusively do all the business in connection with their mines with your company? Simply for us to carry the produce of the mines—that is all that is included.
3048. And the mining material back? No.
3049. They have not entered into any agreement about the mining material? No.
3050. About the mining timber? Yes, that is one of the items. There are bullion, ore, coke, coal, flux, and mining timber,—six items.
3051. You did not say how much flux you carried on the line? The reason why I did not mention that was because it is a local traffic. At present it all comes from Silverton, and a place called the Accacia, about 8 miles from Broken Hill, and that is all on our line. The quantity at present is about 7,000 tons a month from those places.
3052. Then, during the continuance of this agreement, those particular four companies must do all their traffic with you, whether the New South Wales Government construct this proposed railway or not? Yes.
3053. That is, so far as their mining material and mining produce are concerned? Yes, just so.
3054. You have no agreement with reference to ordinary goods—merchandise and so forth? No, we have not.
3055. Do you know whether there are any other companies developing their mines besides those four companies? Yes.
3056. Have they entered into any agreement at all? I might say that all the companies at Broken Hill are at present under agreements with our company—I mean all the producing companies—all the companies that are raising ore. But the agreements with the companies other than those I have just mentioned will expire in 2½ years.
3057. Can you give us the names of those companies whose agreements will expire in 2½ years? Yes; the South Company, the Central Company, Block 14 Company, and the Junction Company.
3058. Those are all the companies that are producing ore besides the other four companies? Yes, at present.
3059. So that you have an exclusive agreement with four companies, which has about 7½ years to run, and another exclusive agreement with four other companies, which has 2½ years to run? Exactly.
3060. Then, in addition to those eight companies are there any other companies sinking or developing mines? Oh, yes; there are other companies sinking, but I think they have not struck—got any lode yet. There is the Pinnacles, of course, on the other line.
3061. Do you think that there are any progressive companies, not included in those eight, who are likely to find ore,—have you any opinion as to that? I have no opinion.
3062. You do not profess to have any mining knowledge—you are here simply as Secretary of the Tramway Company? Just so.
3063. On what date was this list of shareholders in your company made? One day last week. It was completed up to the very latest date to which I could get it before leaving Melbourne.
3064. It is dated 24th April? Yes.
3065. Did you have any transfers immediately before that? We have transfers of scrip every week.
3066. Does the Board meet every week? Yes.
3067. And you transfer at the Board meetings? Yes, every Friday.
3068. Were there any New South Wales transfers at the last Board meeting? I think there were not, so far as I can recollect. We have very few New South Wales shareholders.
3069. Did you have many when the company was incorporated? We never had many.
3070. Do you remember whether any members of our Parliament were shareholders in the company at any time? Yes; there is one now.
3071. What is his name? The Hon. R. H. D. White, a member of the Legislative Council. That is the only one. 3072.

- W. Maenicol, Esq. 3072. Is that the only one who has ever been a shareholder? The only member of Parliament, so far as I know, that has ever been a shareholder—so far as I can speak now from memory.
3073. *Mr. O'Sullivan.*] The proposed railway will run from Broken Hill to Cockburn, *via* the Pinnacles, will it not? So I understand.
3074. Therefore, it cannot, to a full extent, compete with you as you are running now—you going by a different route? The only traffic is from Broken Hill—the intermediate traffic is nothing.
3075. You say that you do not fear the competition at all, and can hold your own against it? I think so.
3076. Our Government had better carry out their powers of resumption, and resume your line? They cannot, under our Act, for sixteen years yet.
3077. I suppose, then, that you feel pretty sure that with the contracts you have entered into with the mine proprietors and the South Australian Government, you can defy competition? I should not like to use those words “defy competition.” As I said before, we need not, I think, fear competition.
3078. *Dr. Garvan.*] What are the terms on which the Government could resume? I almost forget the section of the Act. At the end of twenty-one years from the passing of the Act the price is to be based on the preceding seven years' average profits. I think that is it.
3079. It is dependent on the profits? The purchase is to be based on the profits for the preceding seven years, after the expiration of twenty-one years.
3080. *Mr. Tonkin.*] Do you know the names of the directors of the Proprietary Company? Yes, I think I know all of them.
3081. Can you tell us who they are? Yes; *Mr. M'Gregor, Mr. Wilson, Mr. Kelly, Mr. Drew, and Mr. MacBride.* I do not know whether there are any more,—I think there are only five.
3082. Do you know the directors of the British Company also? I am not sure. I think that two of those directors are also directors of the British, but I do not know the others.
3083. Is not *Mr. Jamieson* in the Proprietary? Yes, I think he is. I think he is acting for *Mr. M'Culloch.*
3084. You do not know the directors of the British? I know there are two of those, but I cannot mention others. I think *Mr. A. R. Blackwood* is one. I cannot tell you the number of local directors of the British Company either. It is managed in London.
3085. Do you know the directors of Block 10? No.
3086. Do you know the directors of the North? No.
3087. Can you tell this Committee whether these gentlemen, who are the directors of the Proprietary claim, are shareholders in the Tramway Company? Some of them are.
3088. *Mr. M'Gregor?* Yes.
3089. *Mr. Wilson?* Yes.
3090. *Mr. Kelly?* Yes.
3091. *Mr. Drew?* No, he is not.
3092. *Mr. MacBride?* Yes.
3093. *Mr. Jamieson* is representing some one else? Yes, I think so.
3094. Do you know that *Mr. Blackwood* is, who is in the British? Yes.
3095. Can you tell the Committee what you charge per ton from the Broken Hill mines to the South Australian Border—that is to Cockburn—or do you arrange with the South Australian Government to carry right through and take a percentage? No; we have our own rates and they have theirs.
3096. Would you kindly inform us what your rates are from Cockburn to Broken Hill? There are different rates for different items.
3097. I speak now, for instance, of coke, coal, and timber—that would be the inward loading? Coke, I think, is 6s. 2d. I am sorry I have not the rates with me, but I think I can give them correctly enough from memory.
3098. Well, approximately? Yes, I think that is our rate.
3099. For coal? 4s. 8d.
3100. For timber? 6s. 2d., the same as for coke. I think that is correct.
3101. Now for the outward loading—bullion? Bullion is 7s. 10d. or 7s. 9d., something like that.
3102. Ore? 4s. 8d.
3103. The flux, of course, only comes, as you say, a short distance? Yes, on our own line entirely.
3104. That comes from near Silverton, does it? The bulk of it from Silverton and the balance from a place about eight miles from Broken Hill called the *Acacia.*
3105. Can you give us an estimate of what it is charged per ton on your tramway? 2s. or 3s.
3106. What is the steepest grade on your tram line? 1 in 82 or 84—something like that.
3107. Do you know the grades on the line from Cockburn to Port Pirie or to Adelaide? No, I do not.
3108. Do you know the cost of carriage of traffic from Port Pirie to Cockburn—to where you take possession of the load? I cannot speak from memory about those rates. I have nothing to do with the traffic.
3109. You cannot tell us, either, what it is from Adelaide? No, I cannot tell you.
3110. Do you find the goods traffic increasing on your line? Yes, there has been a steady increase.
3111. Have you an idea of the total tonnage yearly—that is, for flux, coke, coal, timber, bullion, and ore? For last year, 1890, it would be something like 300,000 tons, I should imagine.
3112. That is without the merchandise for the consumption of the township? No, the total of the tonnage carried on the line.
3113. The figures you gave us were for fifteen months, were they not? Yes, up to the 31st March last.
3114. That, according to your figures, was 413,393 tons? Probably.
3115. The passenger fare from Broken Hill to Cockburn, I think you said, was 10s.? Yes.
3116. Is a large amount taken in passenger fares? No, a very small amount. The total passenger traffic over the line inwards and outwards is only 900 per week, and a large portion of that is local traffic between Silverton and Broken Hill, and Cockburn and Broken Hill. The passenger amount is very trifling.
3117. Is there any fuel, coke or coal, delivered at Broken Hill from any place at all except by your tram line? Nothing, except firewood. A little firewood is carted into the town.
3118. You are sure that you are correct in your estimate of the number of tons of coke and coal per month? That is the correct total for 15 months which I gave you.

3119. I am asking you this question because we have it in evidence that there is as much as 7,000 tons of coke a month used at Broken Hill? That is not correct. There has never been in one month coke used to that extent. W. Macnicol,  
Esq.  
28 April, 1891.
3120. Can you tell us whether there is any probability of the mines altering their style of working with regard to smelting—that is, that they intend to take more ore to the Port to smelt than they do at present, and not smelt so much at the mines? No, it is just the reverse.
3121. It has been represented that nearly the whole of the principal mines are erecting furnaces now in South Australia for the purpose of treating their ores at the Port? That is not correct.
3122. You are certain of that? Yes, it is just the reverse.
3123. The smelting works that are in South Australia number three or four? Four.
3124. Would you name them, please? Port Pirie, Dry Creek, and two at Port Adelaide. When I say two, I mean the smelter belonging to the Junction Company of Broken Hill, and one belonging to an English company—to the English and Australian Copper Company.
3125. How long have those works been erected to your knowledge—have they been erected within the last two years? Oh, yes. The English and Australian Copper Company's smelters must, I think, have been erected before that. I have no knowledge of them.
3126. Have they been erected within the last twelve months? More than twelve months. The Dry Creek works must have been erected more than twelve months ago.
3127. Can you give us an idea when the last of those works was erected? I think the Junction Company's smelters at Port Adelaide were the last.
3128. How long ago was that? Eighteen months ago, perhaps, as near as I can recollect.
3129. Do you think it is their intention to increase those works, or otherwise? I do not think so. I have heard nothing of it. I do not think it is their intention to increase them.
3130. *Mr. Humphery.*] Does your agreement with the various companies bind the companies not to use coal or coke from Bowenfels, or brought from New South Wales? Well, virtually it would.
3131. Is there any special condition that the companies are not to use any coal or coke which is not carried on your tramway? Yes; the agreement binds them to give the whole of the tonnage of those articles to the Silverton Tramway Company.
3132. Would that exclude the New South Wales coal and coke? It is all New South Wales coal now.
3133. But I mean carried from New South Wales by railway? Yes, it would exclude that.
3134. In what way would it exclude that? Unless it came over the Silverton tramway; the whole of the tonnage of coal and coke must come over the Silverton tramway.
3135. Cannot the companies to whom you have referred use any coal or coke except that which comes over the Silverton tramway? I think not, according to their contracts.
3136. Is that the contract? I think so.
3137. Would they be prevented from sending any of their ores over the New South Wales railway if this line were constructed? Yes; in a similar way.
3138. Is there a special condition binding them not to send? The agreement is simply that they shall give the whole of the tonnage of those articles to the Tramway Company for a term of years.
3139. Does it say from any particular port? It can only be between Broken Hill and Cockburn—the termini of the tramway.
3140. If the condition is between Broken Hill and Cockburn, that would not affect the traffic between Broken Hill and Bowenfels? I think it would. It would preclude them from taking coal or coke from any source except over the Silverton tramway.
3141. What is the penalty in the event of the companies using coal brought otherwise than over the Silverton tramway? I do not know. I do not think there is any penalty.
3142. Is there any condition in the contract which would enable the companies to withdraw? No. I do not think they can withdraw.
3143. Can they annul the contract? No; they have no power to annul the contract.
3144. Is there any objection to produce the contract or furnish a copy of it? I cannot say. If this Committee propose it to my directors I will be very glad to convey the request.
3145. It is very necessary that the Committee should have full information on that point, so that we may understand how far the companies are bound to send the whole of the traffic through Adelaide? Well, of course, that is the point. You understand that the Secretary is a servant of the Board of Directors, and I cannot commit the directors to that.
3146. Do you happen to know the rate charged for carrying coal and coke between Cockburn and Port Pirie? No. I cannot tell you the South Australian rate.
3147. Your rate is about 1½d. ? Yes; it is 1'60d. I think that is our rate.
3148. You do not know whether the South Australian Government's rate is more or less than that? It must be less.
3149. Can you say how much less? No; I do not remember their rates.
3150. Have you any agreement with local storekeepers similar to the agreement with the various silver mining companies? No; no agreement.
3151. *Mr. Dowel.*] Can you say if any considerable quantity of wool and live stock is carried between Port Pirie and your tramway? Yes; but I cannot tell the tonnage. I did not prepare myself with it.

George John Morgan, Esq., Mayor of Broken Hill, sworn, and examined:—

3152. *Mr. Tonkin.*] You are Mayor of Broken Hill? Yes.
3153. Have you been long in Broken Hill? Five years.
3154. Ever since its start? Yes, from about the first start of the town.
3155. You heard some evidence given just now by the Secretary of the Silverton Tramway Company with regard to the amount of traffic? Yes.
3156. Do you agree with that evidence? I think the traffic is under-estimated by him.
3157. For instance, 56,000 tons of coke for fifteen months? I have the Customs returns here, and if you like me to refer to them I will give you the amount. I obtained the statement from the Government Officer of Customs.

G. J. Morgan,  
Esq.

28 April, 1891.

- G. J. Morgan, 3158. Will you kindly make a general statement—perhaps it would save time for you to do that? Yes. One return here is with regard to the Proprietary mine. The whole of their tonnage for the year is 152,938? This return is made from actual quantities for the three months ended 31st March, 1891, the first three months of this year.
3159. With that three months have you reckoned that as one-fourth of the year? As a fourth of the year. The totals for a year are 15,808 tons of coal, 44,375 tons of coke, 14,125 tons of timber, 73,430 tons of limestone, 2,230 tons of ironstone (used for fluxing), 1,670 tons of firewood, and 1,300 tons from other sources.
3160. Is that for the one mine? That is for the Proprietary mine. That is the annual quantity, based on the last three months.
3161. What is the total? 152,938 tons.
3162. That is the total tonnage for one mine for twelve months? Yes.
3163. Do you think the three months they base these calculations upon are a fair average for twelve months? Not of the past. It is an increase on the past.
3164. Well, it is hardly a fair estimate; the total would be under that, would it not? The total for the last twelve months would be under that. That is based on the last three months. The increase for the last three months is considerable—both of the output and imports.
3165. Has that increase been gradual, or was that an exceptional three months? There has been a gradual increase for the last three years.
3166. There has not been an extraordinary increase of any kind? Not at all.
3167. So that would be a fair estimate for twelve months—that is nine months to come, in addition to those three? The chances are that there would be a greater increase.
3168. Then, in estimating 152,000 tons, you would say that that is a fair estimate of twelve months' work for that mine? Yes.
3169. Had you similar returns from any of the other mines? I have returns for the South, viz., coal, 5,750 tons; coke, 10,000 tons; timber, 1,500 tons; limestone, 9,000 tons; ironstone, 1,000 tons; general merchandize, 500 tons; total, 27,750 tons. The return for the Central Broken Hill mine is 3,200 tons of coal, 12,000 tons of coke, 2,000 tons of timber, 400 tons of general merchandize; total, 17,600 tons. The return for Broken Hill Proprietary Block 14 is: coal, 1,697 tons, coke, 4,823 tons; timber, 2,882 tons; limestone, 812 tons; ironstone, 100 tons; stores, 61 tons; general merchandize, 132 tons; total, 10,507 tons. The return for Broken Hill Junction is, coal, 650 tons. They had no returns for anything else. I got this information from the mine managers, as taken from their books.
3170. Have you any other return with regard to merchandize? I have the Customs return for that.
3171. These are all imports that you have given us up to the present? Yes; I have here the imports from the 1st July to 31st December, 1890. These returns I got from the Customs-house officer, as follows: coke, 19,562 tons; coal, 10,188 tons; timber, dressed and undressed, 12,579 tons. For machinery the tonnage is not given, but the value is £33,467. For beer, spirits, and wine, the value is £19,843; drapery and wearing apparel, £45,500; butter, eggs, and bacon, £17,667; tea, coffee, and sugar, £14,959; flour, bran, chaff, and oats, 5,809 tons, valued at £37,916; tobacco and cigars, £5,428; dynamite and powder, £10,076; boots and shoes, £15,217; coin, £31,009; hardware, £11,362; galvanised iron, &c., £15,697; railway plant, 237 tons, valued at £5,577; miscellaneous, £184,491. These are all imports for the last six months of last year.
3172. *Mr. Trickett.*] Are those returns taken from the Customs? Those are the returns that I got from the Customs-house officer before leaving. He also gave me a return from the 1st January to the 31st March, 1891, viz.: coke, 18,407 tons (compared with 19,000 for the previous six months); coal, 7,742 tons; timber, dressed and undressed, 12,067 tons; for machinery no tonnage is given, but the value was £16,232; beer, spirits, and wine, £9,814; drapery and wearing apparel, £30,028; butter, eggs, and bacon, £9,542; tea, coffee, and sugar, £8,507; flour, bran, and chaff, 3,875 tons, valued at £27,828; tobacco and cigars, £2,347; dynamite and powder, £7,754; boots and shoes, £7,702; coin, £7,000; hardware, £6,071; galvanized iron, £7,366; railway plant, 2,379 tons, valued at £26,434; miscellaneous, £116,230. Total for three months, £489,280. Total for the previous six months, £677,712.
3173. So that the proportionate increase for the last three months is considerable? Yes, nearly 50 per cent.
3174. Have you a list of the exports? Yes.
3175. For what period? From 1st July to 31st December, 1890, and from the 1st January to the 31st March, 1891—three months of this year as against six months of last year.
3176. Will you please hand that in? Yes. I may say that the total exports for the six months ending 31st December, 1890, amounted to 2,656,279 lbs., value £1,521,477; for the three months from 1st January to 31st March, 1891, 152,208 lbs., value £811,469. The total Customs revenue for 1888, was £65,334 14s. 11d.; 1889, £63,544 10s. 2d.; 1890, £73,722 2s. 9d.; and for the three months ending 31st March, 1891, £22,417 10s. 4d. There is a very marked increase there.
3177. Have you any returns from the post and telegraph office? No, I have not a return of the post and telegraph revenue at Broken Hill.
3178. That also is very large? Yes; it has increased very much. I had only two or three days to collect my information, and I went to the different mine managers, and to the Customs-house to get it.
3179. How long have you been at Broken Hill? Five years.
3180. In what kind of business? That of a builder and contractor.
3181. Therefore you would have peculiar opportunities of noticing the advancement of the place? Certainly.
3182. Has it been gradually advancing during the time you have been there? Yes. During the last four years the population has doubled itself in two years. From, say, 1886 to 1888, the population just doubled.
3183. Can you tell us what is now the population? The population in January last was 24,000.
3184. Do you think it is more or less now? It is increasing very fast.
3185. You think there are more people there now? Oh, yes; people are continually coming. All the mines are putting on more men continually, and the men bring their wives there and build houses.
3186. Do you know how many miners are employed on the Hill? About 6,000 or 7,000, I think.
3187. Is the class of building that is being erected there of a permanent character? All business buildings now are good substantial ones of stone, and a great many of the residents in the suburbs are erecting stone buildings in place of wood and iron ones.

3188. Therefore, so far as you can say, there is every prospect of the place being permanent in its character? Yes. G. J. Morgan,  
Esq.

3189. Do you experience much inconvenience in getting your supplies up there for building at the present time? Not very much now. Sometimes things are delayed. The great nuisance is the break of gauge at Terowie. If you are getting things from Adelaide, sometimes they lie there three or four days before they are transhipped. 28 April, 1891.

3190. The goods you require for building, &c., come from Adelaide? Chiefly.

3191. Therefore, you have the inconvenience of changing trucks? Yes.

3192. Do you think that is a great inconvenience? It is a serious inconvenience. I have been delayed sometimes over a week, especially in the wool season, when there is a lot of traffic on the line. It is sometimes very difficult to get stuff up the line.

3193. In what way do you think that the proposed railway would be a benefit to Broken Hill if the line were constructed? It would be a benefit, inasmuch as it would supply Broken Hill with coal, coke, and timber. That is the principal thing we look to. At present the carters have to go out about 15 or 16 miles for firewood for domestic use, and several people now, in the hotels especially, are burning coal instead of wood. Firewood has got too dear. They can get coal at £3 a ton, and they find it just as cheap as wood, and it will shortly be much cheaper, as there is no wood in the district, which is badly timbered; and if this line is constructed it will go through a quantity of timber, besides passing, I understand, through two coal mines.

3194. What is the feeling of the people up there with regard to this line of railway;—are they in favour of it or otherwise? Very strongly in favour of it. A requisition was sent, asking me to call a public meeting, and the room—the Carrington Hall, which was the largest room available at the time—was crowded, and people were very enthusiastic about the railway. The meeting was held about a fortnight ago.

3195. Have you considered the question of railway charges, and do you think that the railway could be constructed and could be run so as to be remunerative? I think so.

3196. What does it cost you per ton now to get your goods up there from Adelaide—the building material you use, for instance? For some time I have not been getting any up directly from Adelaide, but have bought from merchants in Broken Hill; in fact, I have not done much business during the last twelve months.

3197. Do you think the material could be brought up from Sydney and intervening places as cheaply as from Adelaide to Broken Hill? Yes; but I question if such things as building material could be brought by rail from Sydney any cheaper than from Adelaide.

3198. You think that the chief advantage would be the means of getting large quantities of fuel from our own coal mines? Large quantities of fuel and mine timber. The quantity of mine timber imported now is immense, as you will see from those returns; and a great many mines would use the timber that could be got near the river—the gum. I do not know that country myself, but I have been given to understand by some people that there is any quantity of timber near the river, and in the direction the proposed line would go, which could supply those mines.

3199. Do you think the storekeepers and others up there would prefer to get their goods from Sydney rather than from Adelaide? A great many of them would. A great many deal there now. The only difficulty in the way of getting things directly from Sydney is the loss of time in getting them. There are any number of storekeepers who would deal with Sydney merchants; but, if they were to send down an order from Broken Hill, by the time the order went and the goods came, there would be a delay of a month before they got them.

3200. Whereas, if this proposed railway were constructed, they would get them in a few days? Yes.

3201. When the Sectional Committee were making inquiries between Nyngan and Broken Hill, the evidence was that all the people had a kind of sympathy to trade with Sydney in preference to other places;—do you think that that feeling still exists? There may have been a little feeling, but the people there now begin to feel that they are New South Welshmen and not South Australians. The desire of nine-tenths of the people of Broken Hill, at any rate, is to be connected with Sydney, and to look to Sydney as their capital.

3202. You misunderstand me: I said that in most of the towns to which we went between Nyngan and Broken Hill, the evidence of storekeepers was entirely in the direction that if they had the opportunity to deal with Sydney, they would far rather get their goods from Sydney than from ports in South Australia;—do you think that that feeling exists at Broken Hill? That is the feeling in Broken Hill at the present time. I am quite sure of it.

3203. Do they have to get large stocks at a time now? They have. One of the largest drapery establishments there get the principal part of their goods from Sydney, and they told me a short time ago that they would get the whole of their goods from Sydney, but when stocks ran out they had to send to Adelaide for certain lines they had run out of. One of the firm goes to Sydney once every three or four months and orders large stocks, but before he goes down there again they run out of certain lines, and then it is too far and takes too long a time to run to Sydney to make up those particular lines, and they have to send to Adelaide, and sometimes to Melbourne, in order to get things to keep up their stock until they go to Sydney for their supplies.

3204. Owing to the duties that exist in Adelaide, I suppose those goods would be considerably dearer in Adelaide than in Sydney? Yes; considerably dearer.

3205. Have you heard any of the mining people there talk about sending the low grade ores to the coal mines of the western district to be treated? It has been talked of. The question is whether it would pay them better to send the ore or to get the coal, and that question they are not quite clear upon at the present time.

3206. It has not been thoroughly worked out? No; it has not been worked out.

3207. I suppose, on the other hand, that if they got large quantities of coal from Lithgow, or even from Dubbo, it would suit them much better to send their bullion right away to Sydney in one railway train, and to have it put alongside a vessel, than having to send it, as now, either to Port Pirie or to Adelaide, then by coasting steamers to Sydney, there to be transhipped and placed on board the mail boats;—I suppose there is no difference of opinion about that? There are no two opinions about that.

3208. Is that a matter that is often talked of at Broken Hill? Yes,

- G. J. Morgan, Esq.  
28 April, 1891.
3209. And the present arrangement is looked on as ridiculous? Yes; to send it through other colonies so as to get it to its destination here. I was speaking to Mr. Howell a few days before I left Broken Hill, and he told me that there are several companies who would get things from Sydney, but that it took too long to get them round.
3210. That is Mr. Howell, the manager of the Proprietary mine? Yes.
3211. Do you know Port Pirie well? Not much.
3212. You know of it? Yes.
3213. We have had it stated in evidence by one gentleman that they are continuing to build large smelting works there;—do you know if that is a fact or not? They are talking of removing their smelters to Broken Hill now that there is to be a water supply there. I am confident that they will not build any more smelters at Port Pirie. The question is whether they will not remove all their smelters from Port Pirie and Port Adelaide in connection with mines now at Broken Hill. I do not say the Dry Creek, because that is not connected with the mines. The British Company has already put up one and has another in course of erection on the mine, and I think that when that is completed they will remove the others from Port Pirie, and have them up there.
3214. With regard to the present water supply scheme for Broken Hill, do you think it is likely to be carried out with success? Whether it will be a success or not, I do not know.
3215. But you think it will be carried out? The Stephen's Creek scheme will be carried out. They are pushing it on as fast as they can.
3216. I ask that because it appears that one of the great elements in the success of the place is a good water supply;—what do you look forward to as the best means of supplying the Broken Hill district with water? We are looking forward to the Stephen's Creek scheme, and if that is a success, then, to the question whether the weir constructed will hold the water or not. No doubt sufficient water will fall, but the question is whether they will be able to conserve it. I myself think that the water should be brought from Lake Menindie, and that that would be a far preferable scheme. That is the place I think we shall have to go to for a permanent supply.
3217. Did you ever go into the merits of that scheme, as contained in the Bill passed authorising it? No; I did not.
3218. You are not able to say whether it is a feasible scheme or not? I think it is a feasible scheme; but the question is about raising the funds to carry it out. It is an expensive scheme.
3219. Are they carrying out the Stephen's Creek scheme with any degree of vigour? Yes; they are pushing it on as fast as possible, I believe.
3220. Is not the country about there generally good holding country for water? There are dams, but, of course, in putting down dams they generally pick out holding ground and test it before the dam is sunk; but this is rocky ground, and the question is as to whether the water will not percolate through the rock and get away.
3221. But it is a splendid watershed? Yes; there is no doubt about catching sufficient if they can keep it after they have got it.
3222. *Mr. O'Sullivan.*] Do the people of Broken Hill complain of the charges by the Tramway Company? Very bitterly.
3223. And I presume they would therefore like to see a competing line between Broken Hill and Cockburn? Certainly they would. The charges are very high at present.
3224. But, bearing in mind the fact that the Government cannot resume the tramway for sixteen years and a half, do you think the Government will be justified in constructing a line between Broken Hill and Cockburn? Well, I should think so, or as far as Broken Hill.
3225. Do you think it would suffice if they took the line to Broken Hill alone and did not go on to the Border? It would be a great boon to Broken Hill, so far as Broken Hill is concerned; but if they went on to the Border, of course we should have the freight rates reduced, but there would be the break of gauge difficulty.
3226. In going to the Border they would serve another district altogether from that which the tramway serves? Yes.
3227. Is there much population in that district, on what might be called the Pinnacles line? I should think there are about 200 or 300 people at the Pinnacles, and a number at Thackaringa; but I am not sure as to the population there.
3228. This proposed line would serve both the Pinnacles and Thackaringa? Yes.
3229. You told us that the population of Broken Hill was 24,000 last January? Yes.
3230. How did you arrive at that estimate? From the police returns.
3231. You mean in collecting the electoral roll? Yes.
3232. But they do not collect the whole of the population in doing that, do they? Yes; they take the number of people in each house.
3233. I gather from your evidence that there has been a great increase, not only in the population, but also in the imports and exports? Yes.
3234. You say that the imports increased at the rate of 50 per cent.? Yes.
3235. So that we may look upon Broken Hill now as a pretty staple and flourishing town? Yes.
3236. Likely to remain so for many years? Yes, and increase, I think, very much. If we get a good supply of water, I think that in two or three years we shall have 50,000 people there.
3237. *Mr. Dowell.*] Have you a fair knowledge of the country through which the proposed railway would pass? Very little beyond Broken Hill, or for 50 or 60 miles out.
3238. From your knowledge of that portion of the country through which the railway would pass, do you think the best route has been selected? I cannot speak about it after crossing the river. I have no knowledge of that side of the country at all—only from Broken Hill as far as Nuntherungie.
3239. In your official capacity, and from your long residence in that particular part of the country, you have come in contact with a great many persons outside the town of Broken Hill, have you not? Yes.
3240. What is the general expression of opinion of those persons in reference to the construction of this proposed line? All I have met have been strongly in favour of the construction of the proposed line, and most people are of opinion that the line would pay even from the start.
3241. In your opinion there is the probability of the line paying from the start? Yes; and that is the opinion expressed by several others.

3242. What causes you to form that opinion? The quantity of fuel and the heavy traffic, also, in carrying timber; and also because of other mines that would be passed by the railway. There are several mines, including the Black Mountain, which are being developed very fast, and Nuntherungie is likely to be a very good field. There are several good mines there. G. J. Morgan,  
Esq.  
28 April, 1891.

3243. From your knowledge of the various mines, do you think that their permanency may fairly be considered as established? About the Broken Hill mines there is no doubt. There will be mines there for the next 100 years.

3244. Can you say what distance the proved mines of permanent description extend over? At least 7 miles. The Broken Hill is about 3 miles. Then there is a very good mine that has been paying its way the last two years—that is the Globe Mine—1 miles north-east of Broken Hill, and in the same direction as the Broken Hill line would go. It has not been paying any dividends; but it has been paying working expenses, and for the erection of machinery the last two years.

3245. Can you say if there are any other minerals besides silver discovered or worked in that particular part of the country? Near the Black Mountain there has been a very good copper mine discovered, but the question is whether, it being so far inland, it would pay to work it, unless this proposed line were constructed. The shareholders think it would pay handsomely to work it for copper if this particular line were constructed. Twenty-three feet from the surface, they have taken out stuff, giving 80 per cent. of copper.

3246. And that mine, if developed, you think would be a considerable source of revenue for the proposed railway? Yes; and the Nuntherungie silver mines, and the Black Mountain mines.

3247. Has any tin of a payable character been discovered in that part of the country? I think so; there are several tin mines working; but they also are a long way inland, and the cartage is very expensive.

3248. Would the construction of the proposed line serve these particular mines? It would be very much nearer. They would be brought two-thirds nearer, I suppose, to a railway than what they are at present.

3249. You know the distance from Broken Hill to Sydney by the proposed route, do you not? Yes.

3250. You are aware that the proposed route would be very much shorter to Broken Hill, *via* Cobar? Yes; nearly half the distance.

3251. Do you think it is likely that the people would use this line particularly for passenger traffic? I think there would be a large passenger traffic.

3252. That the chief passenger traffic would go by the New South Wales line? Certainly.

3253. For what particular reason? The people on the Hill would undoubtedly, if they were connected with Sydney, do a large amount of business with Sydney, and therefore would have to go to Sydney to do the business. A great number of excursionists would also travel.

3254. The shorter distance to travel and the lower rate would be very considerable items in inducing those persons that now travel to use the New South Wales line? Certainly. Three times as many people would go to Sydney as go now, they having at present to pass round the other way.

3255. From a knowledge of all the surrounding circumstances, are you clearly of opinion that it would be advantageous to construct the line along the proposed route? I think it would.

3256. And you think that in a very short time it might be a payable undertaking? Yes.

3257. Have you heard any particular reasons urged why the line should not be constructed? I have not in our district.

3258. None? No.

3259. *Mr. Lee.*] When you say that the railway would, in your opinion, pay if constructed, are you estimating that it would have to carry the whole of the traffic to and from Broken Hill to make it pay? The whole of the traffic to Sydney.

3260. But having in view the quantity of stuff that is sent away from Broken Hill every year, and the quantity of coal and coke and timber received there every year, do you think it would require all that trade to make this railway to Sydney pay? Oh, no.

3261. Would one-fourth be sufficient to make the railway pay? One-half of it would make it pay, certainly.

3262. Are you aware that the four principal mines, with the Proprietary at the head of them, are bound down to the Silverton Tramway Company for the next seven and a half years? I heard so, but do not know it for a fact. I have also heard that the companies have power to annul the agreement. I do not think they are strictly bound to send all their ore and stuff by that line. They agreed that they would send all the stuff for a certain time, I think at a certain price; but one of the shareholders, Mr. Walter Sully, who is, I think, about the fourth largest shareholder, came down with me in the train, and he told me that he thought the companies could at any time annul the contract.

3263. But if it is held by the other parties that the contract is binding for the next seven and a half years, does it not follow, if that contract is good, that the greater portion of the goods traffic from Broken Hill could not go by the Cobar railway? If they are bound to them, it could not go, of course.

3264. Would it not be a most important item in railway carriage? Certainly it would.

3265. Would it not at the present time include nearly the whole of the bullion raised at Broken Hill? If they are bound in that way with the Tramway Company.

3266. And the carriage of coke? Yes.

3267. And the carriage of coal for the Broken Hill mines; if these items were taken out of the railway traffic for seven and a half years to come, do you think, in view of that, the prospects of paying the expenses of this contemplated line are favourable? Certainly not.

3268. Seven and a half years is rather a long period in the life of a mine, is it not? It may be in the life of some mines, but I do not think it would be at Broken Hill.

3269. Of course the general opinion is that Broken Hill is going to last for ever; but in seven and a half years the Proprietary mine must be considerably poorer than it is now? Of course, it must get poorer.

3270. And although it may continue to turn out for the next six or seven years the same amount of bullion as it now does, and has been doing for the past few years, still the fact remains that it would have so many hundreds of thousands of tons less to treat? Yes.

3271. Are you also aware that there are four other companies bound down to the Silverton Tramway Company for two and a half years? No; I am not.

3272. Namely, the South, the Central, Block 14, and the Junction? I am not aware of it. They may be, but I think differently. I know Mr. Lane, the manager of Block 14, is in favour of this line being constructed. 3273.

- G. J. Morgan, Esq., 3273. The Proprietary is the principal mine there—the one that yields the largest amount of bullion? At present it is.
3274. Uses the greatest amount of timber, coke, and coal? At present.
3275. If the trade of that particular mine has to be confined to the Silvertown Tramway Company for the next seven and a half years, are you of opinion that the railway, if constructed, would pay, *minus* the trade of the Proprietary mine? Oh, certainly.
3276. Taking the Proprietary mine out altogether, would the remainder of the trade be sufficient to pay the working expenses and the interest on the cost of the construction of the proposed line? Yes. The South mine is as large, and there is no reason why they should not turn out as much bullion as the Proprietary. The Proprietary had a start of the other mines.
3277. I presume that Broken Hill depends entirely on the mining industry? Yes.
3278. Suppose that were to fail in the future, what would become of Broken Hill? That is very hard to say.
3279. Is there anything round it to support the population? No, excepting the mines.
3280. When that day does come there may be a fine town and no inhabitants? Yes; but that will not be in our time.
3281. I suppose you anticipate, in consequence of the prospecting now going on, that further discoveries of minerals will be made? Very much. I think the Barrier is only in its infancy at the present time. There are hundreds of mines coming to the front besides the Broken Hill; in fact, two mines nine miles out of Broken Hill, near Stephen's Creek, lately paid dividends.

Thomas Talbot Wilton, Esq., Colliery Proprietor, sworn, and examined:—

- T. T. Wilton, Esq., 3282. *Mr. Copeland.* Where do you reside? At Wollahra.
3283. Have you any connection with Lithgow? Yes, with two collieries there.
3284. What are you—manager? I am one of the proprietors of the Lithgow Valley Colliery, which is owned by a small registered Company, with very few shareholders. We have two collieries—the Lithgow and the Hermitage.
3285. Can you tell the Committee what is the general selling price of coal at Lithgow? At present we have a Government contract in connection with the Eskbank mine, and are selling coal to the Government at 4s. per ton.
3286. That is round coal? Yes, over specified screens of  $\frac{3}{4}$ ths of an inch.
3287. Is that delivered into Government trucks? Yes. We are selling to private customers at 4s. 6d.
3288. Is there a large quantity of coal, available for many years' supply? So far as the next 100 years are concerned, it is almost illimitable.
3289. Do you know of any difficulty, or can you see any difficulty in the way of sending coal from Lithgow to Broken Hill, suppose this railway were opened to Broken Hill? I may say I had a conversation twelve months ago with Mr. Eddy upon that very point.
3290. Mr. Eddy, the Railway Commissioner? Yes; and he spoke of the necessity of our trying to make coke, as this railway had been projected, and I urged upon him what I thought would be the impossibility of doing this, because of the great distance and cost of carriage, but he said that they would be able to carry the coal there upon such a line as this would be—almost running level from Dubbo onwards—at a very reduced rate, and I understood him to say that no rate which we have now could be taken as a basis for that which would be charged for running the coal in large quantities over such a line as that;—that supposing a level line ran from Dubbo to Broken Hill, they would be able to mass three trains together, as they do from Penrith to Sydney. They run forty and forty-two trucks of coal together, and at several places on the mountains they take treble loads in that way, where there is tolerably level running, taking back empties and, indeed, full trains of coal. The impression that he gave me;—but I cannot say he said so directly—was that the coal would be taken at something like  $\frac{1}{2}$ d. per ton per mile over the entire distance.
3291. Have you gone into any calculation, or prepared any figures to show what price the coal would come to at  $\frac{1}{2}$ d. per ton per mile from Lithgow to Broken Hill? Yes. Though I have no doubt myself that coal would be got at Lithgow at 4s. 6d. per ton, I have calculated it at 5s. per ton. I take the distance from Lithgow to Broken Hill to be 638 miles 28 chains, along the proposed route. Taking it at 638 miles, the trainage only would be £1 6s. 7d. per ton, and say 5s. for the coal would make £1 11s. 7d. delivered in trucks at Broken Hill. Now the cheapest Newcastle coal at Broken Hill is, I understand, £2 7s. 6d. delivered at Broken Hill, and therefore the saving *via* Lithgow would be 15s. 11d. per ton. I think Mr. Alexander Brown, M.P., when here the other day, gave evidence that the cost of Newcastle coal delivered at Broken Hill was £2 7s. 6d. per ton. Other gentlemen gave evidence, and I remember that one spoke of some brickyards where the coal cost £3 per ton. But a gentleman stated here to-day that private consumers had to pay £2 15s.—at least, that is what I understood him to say. However, the large companies, who would have trucks under the most favourable circumstances, I think might be taken as paying the less charge of £2 7s. 6d. I am reckoning that as the charge, and am charging 6d. a ton more for coal from Lithgow than I know it could be got for.
3292. Do you think the Lithgow coal would be equally as serviceable to the Broken Hill mines and others as the Newcastle coal? I have no doubt whatever on that point. The Lithgow coal I am certain is a stronger coal, and it was proved in a trial made on the Pearl some years ago for steaming purposes when we first opened the mines. We then thought that it might be possible for us to do a shipping trade, which experience has since shown us was not possible, because there were no proper appliances. We delivered on board the Pearl 20 tons, with the view of getting a certificate. The Pearl went out, and a trial was made, and the result was that a knot more per hour was gained by the Lithgow coal than by the Newcastle coal. It stood 9 knots for Lithgow, 8 for Newcastle, and 7 for Illawarra coal, and that information was given to me by Commodore Goodenough himself.
3293. As a matter of fact, the Government do largely use your coal on the railways? Lithgow coal takes the express to Melbourne, and does all the work of the Western and Southern lines.
3294. Then so far as steam purposes are concerned, the western coal is a good coal? Yes.
3295. Do you know anything about it for smelting purposes? We have not had much experience. They had an ironworks, and used to make coke in a rough way to smelt the iron.

3296. Is there any coke made at Lithgow? Yes; but from what I understand, it does not bear comparison with either the English coke or the coke made at Newcastle. It requires a special treatment. There is no doubt about that. We have made many experiments. We have tried it in all sorts of ways. We can produce coke, but not in a satisfactory way, with the usual rough appliances. However, tests have been made by scientific men, and there is no doubt whatever that coke can be made from Lithgow coal, but it will require a most expensive plant to do it.
3297. When you say "most expensive," what do you mean? Well, with the market at present open, there would be no warrant now for putting up a plant to make coke successfully, by spending £15,000 or £20,000 for it.
3298. Do you think that if £15,000 or £20,000 were spent in appliances, a good coke, (say) equal to the Newcastle coke, could be made? I cannot say that. I have not sufficient scientific knowledge, but my impression is that it must be so.
3299. In the meantime, do you make much coke? We make none. There is some coke being made at the New Vale Colliery.
3300. Do they crush the coal before making it into coke? I do not think so. You see, we are all at sea about it. We fancy the coal would have to be washed. Taking the coal by itself, there is a larger percentage of ash in the Lithgow coal than in the Newcastle coal. It is believed that by washing and using improved methods of making coke, much of the ash would be got rid of, but we cannot get rid of it.
3301. You have no positive evidence, scientific or otherwise, as to the suitability of the western coal for making coke? No.
3302. So that, even supposing the proposed railway were constructed to Broken Hill, you cannot say positively that you would be able to supply people there with coke? I am certain of that.
3303. How are you certain? Because I know coke can be made.
3304. How do you know? From our own experience. We have produced very good looking coke.
3305. Have you had any tested? I cannot say that we have.
3306. You do not know how it would compare for smelting purposes with Newcastle coke? I do not.
3307. You cannot say positively that if the railway were opened to Broken Hill, anyone would enter into the business of coke-making on modern lines? I am pretty sure of that. There has been no inducement to start coke-making there. There has been only the one successful mine at Sunny Corner that offered itself as a possible customer. There is not temptation enough to put up a first class plant to supply that one company.
3308. The Sunny Corner Company uses Newcastle coke, does it not? Yes. I think it has used some coke from Cullen Bullen, and some from Lithgow.
3309. Some coke from Lithgow? Yes.
3310. I thought you said just now that you did not make coke? We do not.
3311. But in speaking to you, I am speaking to you as a representative of Lithgow? There is coke made at Lithgow.
3312. How much coke is made at Lithgow at the present time? I cannot say any very large quantity.
3313. Can you say anything about the coke that is made there? It bears a heavier percentage of ash than the Newcastle coke.
3314. There is some of it sent to Sunny Corner for smelting purposes;—is that so? There has been—I do not know if it is sent now—and to Lewis Ponds, I think.
3315. I suppose that if lime were required for smelting purposes at Lithgow, there would be no difficulty in getting it from Piper's Flat or Cullen Bullen? No; there are large deposits of it.
3316. What distance is Piper's Flat from the line? I cannot give you the distance exactly, but it is within a very short distance of the line.
3317. What distance is Lithgow from Wallerawang? Seven or 8 miles.
3318. And Piper's Flat is 5 miles from Wallerawang; so that within 14 or 15 miles by rail there is abundance of limestone? Yes.
3319. You cannot say how much coke is made per week or month? No; because no proper test has been made.
3320. You are of opinion that the coal is good, and will bear favourable comparison with Newcastle coal, but you cannot, from practical experience, say anything with reference to the coke? No. I should like to make a remark with regard to the evidence given by the Secretary of the Silverton Tramway Company, who spoke of a contract being made with the Proprietary Company for seven and a half years. If they are bound to take all their supplies over the tramway, it would pay that company to get coal from Lithgow, and to pay the Tramway Company their freight in addition on every ton, although they never sent a ton over their line, because they could get coal delivered at Broken Hill at a saving of 15s. 11d. per ton. They have to pay the company 4s. 8d.; they would still save 11s. 3d., even if they never sent a ton of coal along the tramway.
3321. That is to say, the coal would cost £1 11s. 7d. delivered at Broken Hill—5s. for the cost of the coal, and £1 6s. 7d. per rail? That is so.
3322. You say you could deliver coal at £1 11s. 7d., as against £2 7s. 6d., the price at present paid for Newcastle coal wholesale? Undoubtedly. It would pay the Proprietary Company, and the other companies that have made the contract, even though they paid the Tramway Company 4s. 8d. per ton, for, by having the Lithgow coal, they would effect a saving of nearly 10s. a ton.

T. T. Wilton,  
Esq.  
28 April, 1891.

WEDNESDAY, 29 APRIL, 1891.

Present:—

THE HONORABLE JOHN LACKEY (CHAIRMAN).

The Hon. ANDREW GARRAN.	HENRY COPELAND, Esq.
The Hon. FREDERICK THOMAS HUMPHREY.	WILLIAM SPRINGTHORPE DOWEL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	EDWARD WILLIAM O'SULLIVAN, Esq.
The Hon. GEORGE HENRY COX.	CHARLES ALFRED LEE, Esq.
JACOB GARRARD, Esq.	WILLIAM McCOURT, Esq.

JAMES PATRICK GARVAN, Esq.

The Committee further considered the proposed Railway from Cobar to Cockburn.

James Hurtle Cummins, Esq., of Broken Hill, sworn, and examined:—

- J. H. Cummins, Esq.  
29 April, 1891.
3323. *Mr. Trickett.*] What are you? Property owner.  
 3324. You are not in any business at Broken Hill? No.  
 3325. Have you long resided there? Over five years.  
 3326. In attending before the Committee, do you come of your own desire, or is it at the request of the people of Broken Hill? At the request of the people of Broken Hill.  
 3327. The outcome of a public meeting was that representatives should be sent to Sydney, was it not? Yes.  
 3328. Are you one of the selected gentlemen? Yes.  
 3329. We have had evidence as to the population of Broken Hill—the Mayor gave evidence that it is about 24,000;—do you agree with that statement? No.  
 3330. What is your estimate? In my opinion the population is now nearly 30,000. The census collected by the police was very incomplete.  
 3331. Has there been a rapid increase of population latterly? Yes.  
 3332. Within the last six months, say? Yes; the population is increasing now very rapidly.  
 3333. The police statistics were handed in at the end of last year, were they not? Yes; in December last.  
 3334. You say, then, the information was vague and incomplete? Yes; it was not carefully collected. There were a large number of people, I am sure, missed; and there has been an influx of people since then.  
 3335. Since the mines have settled down to work again, I suppose there has been a considerable increase? Yes.  
 3336. And you say the population now approaches 30,000? Yes.  
 3337. That, I presume, is the district of Broken Hill—not only the immediate town? That is the municipality of Broken Hill.  
 3338. Would that include Round Hill? Oh no.  
 3339. That is the town of Broken Hill? That is the town of Broken Hill—the municipality.  
 3340. Is there much population, say, within 4 or 5 miles surrounding? No; the town is in itself almost perfect. There are no straggling suburbs to it.  
 3341. Independently of the leading mines of Broken Hill, which we are well acquainted with, do you think that this proposed line of railway would serve any outside mines? Yes.  
 3342. Will you tell us what they are? There is a newly-discovered and somewhat undeveloped field, and good reports come from it—Black Mountain.  
 3343. Whereabouts is that? It is about 120 miles from Broken Hill.  
 3344. Nearer to Wilcannia? Somewhat nearer to Wilcannia.  
 3345. How far, do you think, from the proposed line of railway? About 40 or 50 miles.  
 3346. On which side—north or south? On the north-west.  
 3347. Are those silver mines? Yes; a lot of them are now under the management of one of the late underground managers of the Proprietary mine.  
 3348. Are they developed at all? No; they are in an active state of development just now.  
 3349. Are the reports concerning them good? Yes; I was speaking to the manager, Captain Piper, before I came down, and he has very favourable expectations of them.  
 3350. Are there any other mines that would be served by the proposed railway? There are a lot of mines in Rockwell paddock.  
 3351. Where is that? About 8 miles from Broken Hill.  
 3352. Nearer Wilcannia, on this line of railway? No, it will be about the same distance from Wilcannia. It would be no nearer to the proposed line. Very recently there has been a discovery of asbestos in the Rockwell paddock.  
 3353. From your knowledge of the district, is not the whole of that district supposed to be metalliferous? Yes; the Purnamoota district will, in my opinion, be a most important one some day.  
 3354. Would that be served by this line of railway? Yes. Before the discovery of Broken Hill there were 1,000 or 1,500 people mining in the district of Purnamoota.  
 3355. Did they rush off to the better field? Yes; and Purnamoota, since the discovery of Broken Hill, appears to be a neglected place. The Day Dream is another mine.  
 3356. Where is that? About 18 miles from Broken Hill.  
 3357. Is that abandoned now altogether? No, it is still working, and some of the most expert men—the most reliable men—tell me that the Day Dream is destined to be a really good and payable mine some day.  
 3358. I suppose they are merely prospecting now—they are not treating the stuff, are they? No.  
 3359. Sinking and stoping? I think the active workings would never have been abandoned only they were mismanaged. For instance, they sold all the slag that had gone to the smelters and realised an amount that went into many thousands, and other such mismanagement has led to the abandonment of the Day Dream. There are many other small mining properties in that locality. There is the Pinnacles mine to be served by this railway.  
 3360. That is working, is it not? It is working, but their ores are very difficult to treat.  
 3361. Sulphide ores? Not sulphide. They are refractory ores—carry a lot of silica. There is an immense body of ore there, though.

J. H.  
Cummins,  
Esq.

29 April, 1891.

3362. That is not the case with regard to the bulk of the ores at Broken Hill—they are not very difficult to treat? No. Taking them on the whole, the ores are very tractable.

3363. Some of the mines have a quantity of zinc, have they not? With the exception of the sulphide bodies.

3364. So far as your experience in the locality has gone, do you think it would be advantageous to the district if this line of railway were constructed? Yes.

3365. Do you also think that it would be remunerative? Yes.

3366. We have heard evidence here that the Silverton Tramway Company, running in connection with the railways to Adelaide and Port Pirie, had a long contract with several of the leading mines at Broken Hill;—how do you think that would affect this railway, if it were constructed? I think there must be some annulling covenant in that agreement, because at the time that agreement was made there was no competition to be feared by the company, and the mines outside the Proprietary had nothing to lose by entering into a contract, and I think it unlikely that such a contract was entered into without some condition of this kind.

3367. Some condition of what kind? Some condition on behalf of the mines.

3368. That it could be dropped if they wanted? Yes; and I think that if that was inserted the proprietors of the tramway must have somewhat anticipated the action of the Government of the colony in constructing this Cobar line. It would have had no other object in view.

3369. This long contract was made almost immediately after the Sectional Committee visited Broken Hill, was it not? Yes.

3370. You are pretty clear on that point, are you not—that when the agitation started for this line from Nyngan to Cobar and from Cobar to Broken Hill this contract was made;—the South Australian Railway Commissioners busied themselves, if I remember rightly, and in conjunction with this other line made a contract of that kind? Yes. The contract was entered into since the Sectional Committee sat at Broken Hill.

3371. Is not the want of a good water supply somewhat of a drawback to the prospects of Broken Hill at the present time? Yes.

3372. With regard to that, what are your views as to the future water supply? In my opinion the future water supply will be the Darling River, through Menindie and Speculation Lakes.

3373. What do you think of the Stephen's Creek scheme that is now being carried out? Three years ago, I, with a committee appointed, interviewed a lot of old hands on the Stephen's Creek, and they told us that sometimes for a period of two years there was not sufficient water running in the creek to cover the bed of it, and I think that the chances of getting storm waters up there to fill their weir, and the chances of its being silted up, renders the Stephen's Creek scheme an impracticable one.

3374. And uncertain? Most uncertain.

3375. But within the last year or so, is it not a fact that very large quantities of water have passed down the Stephen's Creek valley? Yes. With the exception of a year, or two years, out of the five that I have been on the Barrier the river has flooded. That was exceptional.

3376. Do you think the other scheme—the Lake Menindie one—is practicable? Yes; the only reliable one.

3377. But that at present is in abeyance, is it not; although there are Parliamentary rights given, they are not doing anything at present? It is now at a standstill. The people of Broken Hill are always clamouring for a supply of water from the Darling River.

3378. Is there any prospect of the people contributing the necessary money to carry out the scheme? An attempt has been made in connection with the Darling River scheme, which is known as the Stockdale scheme, to raise money in Broken Hill, and I think they have disposed of something like 20,000 shares.

3379. That, of course, would be totally inadequate to carry out the scheme? Quite.

3380. Is not the want of a good water supply a very great detriment to the district? Yes, particularly to the mines.

3381. Is that being felt every day? Yes. The sulphide ores and the refractory ores use a lot of water, particularly the sulphides; and the refractory ores have to be treated by the process of concentration.

3382. And that requires a large quantity of water? Yes. At the present time the concentrating works of the Proprietary mine and Block 14 mine are in disuse, owing to want of water, and the refractory ores are collecting at the mines.

3383. Can they not use the mineral water—the water they get from sinking—for this purpose? It requires all that water for the smelters and the engines. They have water in their dams for the engines, and the water in the shafts they use for the smelters.

3384. But your largest plant up there, at the Broken Hill Proprietary mine, seems always to be going, notwithstanding this want of water? At the present time the concentrators are not working, and for some months the Leaching plant, that turned out 10,000 ozs. of silver per week, was idle, owing to the want of water.

3385. We have had evidence here that large works are in course of construction, and are about to be constructed at Port Pirie, for the purpose of treating these ores down there—is that a fact? Does that refer to the Proprietary mine only?

3386. I do not know which mine. We know there are works there at present, but we had evidence from one gentleman here that large, extended, and new works of that character were going to be erected at Port Pirie to treat the ores down there instead of at Broken Hill? Not to my knowledge.

3387. It is not true, to your knowledge? No.

3388. On the other hand, are any of the companies at Broken Hill erecting, or about to erect, smelting works at Broken Hill? The Proprietary Company are about to erect works for the treatment of sulphide ore. So large will the works be that the consumption of coke will be twice as much as they use at present. They use now at the Proprietary mine 1,300 tons of coke per week. I had that from Mr. Howell only a few days ago.

3389. And as the works increase, of course, so will the necessary amount of coal and coke? For the sulphide ores to be treated the amount used at the Proprietary will be twice as much. From that, I take it the works will be very considerable.

3390. The works will be very considerably increased, and the fuel required will be very much more? Yes.

3391. Is any other company about to erect smelters there? In a conversation with Mr. Warren,

tho

J. H.  
Cummins,  
Esq.  
29 April, 1891.

the manager of Block 10, he said that if we had a water supply which was a reliable one, there was nothing to prevent Block 10 from erecting half a dozen smelters at once.

3392. Has that company got any very large quantity of ore at grass waiting treatment? Yes.

3393. Do you know how much? On one of the dumps there are 10,000 tons, or a little more. We were shown the dump and the figures in the books relating to the quantities, and there were 10,000 tons waiting for treatment when there is a water supply.

3394. That is at Block 10? Yes. It would take five times as much water to treat 1 ton of sulphide ore as it would to treat carbonate ore. That is why they cannot possibly treat the ore until there is an unlimited and certain supply of water.

3395. But with a good water supply, and with fuel supplied at a much cheaper rate than at the present time, could the ores be more profitably and better treated at Broken Hill than elsewhere? Yes; we have had experience to that effect. The Junction mine erected their own smelters at Port Adelaide, and they have not been successful because they could not always command the exact amount of tractable ores to blend. The British mine erected smelters at Port Pirie, and they had the same experience, with the result that the directors of the British have in blast a smelter at the mine and another in course of erection.

3396. They find that it is a great advantage to have two classes of ore at command so as to be able to work the furnaces? Yes.

3397. Is that opinion with regard to local treatment only your own, or is it the opinion of the experts at Broken Hill? The opinion of the experts. When I say "experts," I mean the mine managers. I got this information in conversation with men like that—mine managers, those directly connected with it. It is more than probable that the directors of the Junction mine will either erect new smelters or remove the smelters from Port Adelaide to the Junction mine at Broken Hill.

3398. Then I take it that generally, notwithstanding all the disadvantages of want of water and expense of fuel at Broken, the opinion of those who are competent to judge is, that it is better to treat the silver ores locally than away from the mines? Yes.

3399. Of course you are aware that all the fuel necessary for working the engines and smelting the ore now comes up by way of Adelaide or Port Pirie? Port Pirie.

3400. Would it not be of immense advantage to those mines if cheap fuel could be carried by rail from the western mines of this colony to Broken Hill at a cheap rate—say, about 36s. a ton? I am sure they would take advantage of the reduced prices of coal and coke, which could be supplied from Lithgow or elsewhere.

3401. Although the principal mines may have a contract for the carriage of their goods for a certain price with the Silverton Tramway Company and others, I suppose they have no contract that you know of to prevent them from getting coal from this colony if they require it? I do not think the contract can have been extended to that. It cannot be anything more than for the mere haulage.

3402. Then, notwithstanding that contract which they have, if they could get their coal and other fuel at a much cheaper rate from the colony to which they belong, you think they would get it? Yes; I am sure they would.

3403. Which port do you think is the most advantageous for shipping bullion from? I have made particular inquiries on that point, and I am told Sydney. From Sydney bullion is shipped cheaper than from any other port.

3404. For what reasons? It is such suitable ballast that they take it in preference to anything else, and taking it at the port of Sydney enables them to put it at the bottom of their ships—to trim their ships in a way they could not manage at any other ports between here and the outgoing ports.

3405. This being the terminal port of most of the mail steamers, if they carry large quantities of the bullion, that makes it necessary that it should be brought here to be put at the bottom of the ships? Yes. All the outgoing vessels which are international traders make this their starting point, and of course the mail steamers have necessarily to do so.

3406. The present round-about way of sending the bullion, viz., from Broken Hill, either to Port Pirie or to Adelaide, and then by coaster to Sydney, and then loading it into the mail steamers,—is that a practice which is talked of often with ridicule? No, because that is not generally known; but they say that every shilling even in a ton would be a consideration with their bullion, and if only a shilling per ton were saved the cheaper line would be availed of.

3407. If this line were constructed from Broken Hill right through to Cobar, and then *via* the Western line to Sydney, of course there would be only one handling of the bullion, which would be taken almost to the ship's side—would it not? Yes. Putting aside the existing agreement, I believe that after the construction of this proposed line there would never be a bar of bullion shipped elsewhere than from Sydney.

3408. How many smelters are there at work now, or in blast at Broken Hill? Either eighteen or nineteen—I think nineteen.

3409. And from your former evidence, you seem to think there is a probability of those increasing in number? Yes; there is a great probability of their increasing. There is more than a probability, I am sure, because there is talk now of erecting fresh ones. I think that within the next five years the probability is that that number will be doubled.

3410. I suppose the mines use a great deal of firewood at the present time. Yes.

3411. That is used for the engines or for smelting purposes? They use a great deal. The Junction mine so far has used nothing but wood.

3412. And I suppose that all the country round is pretty well cleared of all the timber that would burn? It has been cleared. Five years ago it was a forest for 20 miles or so round; but now within a radius of 12 or 15 miles there is no timber, and even beyond that there is very little, and what there is of it is scrubby. The cost of firewood at present is 30s. per ton.

3413. Would not this line of railway be of great advantage in bringing that kind of fuel to Broken Hill from our forest country in New South Wales? Yes; because the people estimate that 1 ton of coal would be almost equal to 3 tons of firewood.

3414. We have evidence from a mine proprietor at Lithgow that coal from Lithgow could be supplied at Broken Hill at 36s. a ton; and if that were so, would that not be a very great advantage, seeing that you are paying 30s. a ton now for firewood? Yes; all the householders would use coal for a certainty. That is beyond question.

J. H.  
Cummins,  
Esq.

29 April, 1891.

3415. Are you acquainted with the country between Wilcannia and Broken Hill? I do not know much of it, except by repute. I know the country for a distance of 20 or 25 miles on the road to Wilcannia, but beyond that I only know of it by repute.
3416. What is its reputed value for pastoral or agricultural purposes? It is a good pastoral country.
3417. What are its growing capabilities? It carries a lot of sheep. It is good stock country—salt bush and blue bush. The Mount Gipps run, which is a very famous one, is on the road to Wilcannia, and there are many others.
3418. Is not the soil good? The soil is good.
3419. It would grow almost anything, would it not, with water? Yes; with the exception of potatoes. I think every vegetable and cereal crop imaginable could be grown there, provided there were a supply of water.
3420. Independently of the mining industry, do you think that any new industries would spring up that would utilise this line of railway if it were constructed? Yes; notably the fluxings—ironstone fluxings. In expectation of this line being constructed, there are now some prospectors holding ironstone claims to supply the furnaces with the ironstone necessary for smelting. Ironstone in the locality of Broken Hill is now getting very scarce. We have found no good permanent deposits of it there yet. It all runs out after they go down a little. They claim to have good permanent reefs and beds of ironstone between Wilcannia and Broken Hill.
3421. I suppose that very large quantities of these fluxings are required for treating the ores, are they not? Yes. Fireclay is another commodity that they say could be procured near Wilcannia. Brick-making would be another very important industry along there.
3422. Anything else? No; nothing, with the exception of the gardening and brick-making and fluxings.
3423. Can you tell us about what proportion of fluxings is used in the furnaces;—for instance, for a ton of silver ore, what quantity of fluxing do they require? That is entirely regulated by the ores being treated. Every charge in a furnace may be different—they alter very considerably. I do not know the exact proportion to the different ores. I do not know even approximately. That seems to be known only to the metallurgists.
3424. Still, it is a very large quantity, is it not? Yes; the fluxings, I think, would average about 80 per cent. That would, I think, be a fair average.
3425. I ask that with a view of showing that the carriage of fluxings, if there were any found along this proposed line of railway, would be a very large item, would it not? Yes; now that they have a supply of lime from Tarrawingie, it is considered that one of the necessary commodities is a good supply of ironstone.
3426. The Tarrawingie fluxing ground is about how far from Broken Hill? From 35 to 40 miles. The line to that place will be completed this week.
3427. That is almost a surface railway, is it not;—have you seen any part of its construction? Yes.
3428. Is there any ballasting on it? Yes; so far as the extension of the town it is ballasted.
3429. Are they square or half-round sleepers? Square.
3430. Is it a good solid piece of work? Yes.
3431. And you say that almost the whole of the 40 miles is nearly completed? Yes. Mr. Lane came in from there this day week, and he told me that the line will be all down this week.
3432. That will be a line of railway capable of carrying big truck loads of this fluxing, will it not? Yes; it is constructed specially for the purpose of supplying limestone from Tarrawingie.
3433. Will you tell us how long that has been in course of construction? A very short time. It is not more than five months since they began laying the first plates. They began laying the plates some time in November.
3434. That is a very rapid piece of construction, is it not? Yes.
3435. Is that built by contract or by day work? It was let by contract to Sadler and Baxter.
3436. You say that as it approaches the town it is fairly well ballasted? Well ballasted, and now well consolidated. The line is thoroughly laid down.
3437. Does that ballast extend any distance beyond the town? I have not seen the line beyond the town.
3438. Have you not heard whether it is ballasted or not the whole distance? No; but if it is not ballasted the whole of the way, it must be ballasted a good many miles.
3439. Is it the same country right through—is it not that red soil country which would require ballasting? Yes.
3440. Have you heard it spoken of as a substantial line right through? Yes. The contractors were complimented by Mr. Lane and Mr. Warren, and also complimented very warmly by the visitors when they came back, on the stability of the line—the general construction of it.
3441. Do you know whether it is properly drained by culverts and box drains along the whole length of it? Yes; the parts of the line that I have seen are so.
3442. Drained so as to prevent its being washed away by surface water—protected in that way? Well it is almost unavoidable, its being washed away by heavy storm waters, because the country is so flat. It would not be washed away, but might be in such a state that the traffic would be stopped for perhaps a few hours or a day, but that might occur only at very long intervals. The lines in South Australia are often subjected to delays of this description.
3443. Owing to the flatness of the country? Yes. I think that is quite as good as the line from Terowie to Cockburn.
3444. And that has answered very well, has it not? Yes.
3445. What are your views as to the terminus of the line if it were constructed,—do you think it should terminate at Broken Hill, or go on to Cockburn? I think that Broken Hill should be the terminus, because there will be three gauges between here and Adelaide, and my experience of the broken gauge in South Australia is that it is very undesirable. You see, goods and other traffic from Adelaide direct to Broken Hill would not be likely, after changing from the broad to the narrow gauge at Terowie, to change again at the Border if this Cobar line were extended to the Border. It would make three changes between Adelaide and Broken Hill. Therefore, the traffic on this line between the Border and Broken Hill would not be worth taking into account, because the people would not transfer their goods unnecessarily, nor would they transfer themselves if they were passengers to Broken Hill.

J. H.  
Cammins,  
Esq.  
29 April, 1891.

3446. On other grounds, would it not be advisable—with a view of tending the traffic towards Sydney—to construct the proposed railway only to Broken Hill;—on that ground would it not be better to terminate it at the town? No; I think there will be a great passenger traffic.

3447. I mean, if we want to try to force the traffic towards Sydney it would be better that the line should terminate at Broken Hill rather than go on to Cockburn? Much better.

3448. I am glad you mentioned about the passenger traffic;—what do you think of the prospects of a passenger traffic? I think that visitors from Adelaide to Sydney will avail themselves of that line, because they could visit and inspect the mines. All the people now in Sydney, Melbourne, and Adelaide are so much wrapt up in the Broken Hill mines that they take almost every opportunity they can get of going to inspect the mines. The mines are very changeable, and the developments in some of them are very rapid. That is why I think that if this line were constructed to Broken Hill it would entice a very large passenger traffic, and that traffic might be enhanced by the fact that it will connect with the trans-continental line of South Australia—the great trunk line through to the Northern Territory. That line is destined, or they believe in South Australia that it is destined, to carry passengers almost half-way to England, because they could ship at Port Darwin.

3449. Do not visitors to Broken Hill from New South Wales complain very much of the roundabout way that they have to go in order to get to those mines now? Yes, every one of them complains. People do not visit the place because the journey is so long. People in business cannot afford the time, and with other classes of people the expense is a consideration.

3450. With regard to storekeepers' goods, how would this line suit them? From my knowledge of the prices of merchandise generally, I should think that if they could land the goods by means of this line at even 25 per cent. below the prices they are charging now for them at Broken Hill, compared with the Sydney prices, they would be selling at a profit. What I mean to say is, that the retail stores, although their prices are very reasonable, are 25 per cent. above the prices that I observe in Sydney. I am sure that goods could be delivered by this line at, say, 5 per cent. on the actual cost.

3451. I suppose a good many of the storekeepers up there get their goods from Sydney now, do they not? They tell me that when they buy large parcels they buy in Sydney, and they even go themselves if they possibly can.

3452. Of course it would be a great advantage to those buyers if they could get their goods directly by rail from Sydney? Yes.

3453. And they could supplement their stocks from time to time so much better? Yes. Any slight monetary advantage will overcome the sympathies which they may have with the other places in doing business. All the storekeepers say that they would like, if they could, to get their goods as quickly from Sydney as they get them from Adelaide, and Mr. Howell, of the Proprietary mine, tells me that when he has a breakdown of his machinery he can very often get the necessary duplicate or repairs in Sydney, which he cannot get in the other colonies, by reason of their having older manufacturing places. But at the very earliest it takes them fifteen days or so to get any part of machinery from here.

3454. Do you know of any other railway line talked of, or mooted, to supply Broken Hill, or to be connected with Broken Hill? Yes; there is a line now spoken of through Menindie.

3455. Whence? Broken Hill. The river from Menindie down is navigable.

3456. Down to what point? Down to the Murray—generally so—and I think the object of the intended company is that that might be carried out.

3457. Of course if that is carried out that will be another diversion of the traffic from New South Wales? Yes, a very considerable one.

3458. Is that freely talked of? Yes.

3459. So that on all those grounds you think it advisable that this railway should be constructed? Yes, for the benefit of the people of Broken Hill and the colony generally.

3460. *Mr. Copeland.*] The Proprietary Company's dams are all full at the present time, are they not? Oh, no, far from it.

3461. I thought I saw in the papers that they had a good supply of water for the present? The local paper stated that the Proprietary Company had about 3,000,000 gallons of water. That was an exaggeration. I had opportunities of knowing the quantity of water that was got, and I estimated it at not more than 1,000,000 gallons.

3462. Have you any experience in farming matters? Yes.

3463. Do you know anything of the soil at Wilcannia—as to its growing capabilities? Yes.

3464. What I wish to know is, whether, if the railway were taken from Wilcannia to Broken Hill, there would be any likelihood of fodder, vegetables, and such things being grown at Wilcannia, by irrigation, and sent on to Broken Hill? Yes; it is expected that, provided there is a line of railway, the whole country will be utilised for vegetable and cereal crops.

3465. Do you think the soil is of such a character that it could produce if it were irrigated? It is the very best of soil.

3466. It would produce abundantly? Yes. At the present time we have parcels of fruit sent in from the river.

3467. Is there any communication at the present time between Broken Hill and Wilcannia except by coach? No.

3468. So that it would be no use their growing anything at Wilcannia at present with a view of sending it on to Broken Hill? No.

3469. You think that if the railway were constructed they would be able to supply Broken Hill with vegetables, horse feed, and things of that kind? Yes.

3470. Are you practically acquainted with smelting? No; only from observation.

3471. Do you know anything of the insurance paid on bullion sent round by sea? No.

3472. With reference to flux—do they not get flux from Tarrawingie? They have not been getting any so far.

3473. But there is ironstone there, is there not, as well as lime? No.

3474. Where do they get their ironstone from now? The Proprietary have been using their own supplies on their own mines. Mr. Howell told me that he did not know what they would do for fluxes.

3475. But there is a flux company? Yes; but the flux company supplied limestone. I think there is the Silvertown Flux Company, but they have only been supplying limestone. You see it requires ironstone as well.

J. H.  
Cummins,  
Esq.

29 April, 1891.

3476. But Mr. Hogg, surveyor, was connected with an iron supply for fluxes somewhere; if I remember rightly, out Stephen's Creek way? I think you are referring to the Rutland Flux Company, which Mr. Hogg was connected with. I think that was only intended to supply limestone.
3477. But has there been no ironstone brought to Broken Hill hitherto? Yes.
3478. From where? South Australia supplied a lot. On the South Australian side of the Border there are several mines.
3479. Are there none anywhere nearer to Broken Hill? Rockwell paddock.
3480. Is there any tramway from there? No.
3481. Has there been any tram line laid to any of these iron deposits for flux purposes? No; the only tram line that has been laid for bringing fluxing material is to Tarrawingie. That will supply only limestone.
3482. Is there not a large iron lode there? I never heard of it. I think I am right in saying that there would be no ironstone brought in from the vicinity of Tarrawingie.
3483. Is there any iron deposit on the route of this railway between Broken Hill and Wilcannia, or near it? Yes.
3484. Whereabouts? The first one that I can mention, and you will, perhaps, understand where it is situated, is an old mine known as the Razorback.
3485. Is that near Stephen's Creek? Beyond Stephen's Creek.
3486. Nearer Wilcannia than Stephen's Creek? Yes; and there are many other places—in fact, a lot of prospectors are holding claims now with a view of some day working ironstone quarries.
3487. Are you quite sure that hitherto there has been no ironstone brought to the mines except from South Australia? Oh, yes, carted in, but no permanent lodes discovered—only surface lodes. They find them in beds and patches. There is no kind of permanent lode found.
3488. Do any of the deposits between Broken Hill and Wilcannia take that form of lodes? More or less.
3489. Are they large spaces? Yes; but I do not think that they will be beyond the average of ironstone. The country is impregnated with these ironstone deposits.
3490. Do you know what is paid for ironstone per ton? Yes; from 22s. to 24s. per ton, or perhaps an average of 24s.
3491. Delivered at the mine at Broken Hill? Yes.
3492. Does that contain any appreciable quantity of silver generally? Yes.
3493. So as to enhance its value? Up to 9 or 10 ounces of silver some of it, but that would be only small samples.
3494. Still, in using that ironstone for fluxing, they actually get it for nothing, on account of the silver it contains? Yes.
3495. The amount of silver it gives out will recoup them for purchasing the stone? Yes; they make no allowance for it.
3496. They get the silver thrown in? They have some fixed assay before they make any allowance for it.
3497. Is there more than one place where iron deposits can be found between Wilcannia and Broken Hill? Yes. That opens up a large scope, because they could cart it on either side of the line if they found it within 15 miles on either side of the line. That gives them a territory of 113 miles by 30 miles to work upon.
3498. Do you know anything of the line of country between Broken Hill and Wilcannia? Only what the prospectors and the people who have lived out there tell me, viz., that there is abundance of ironstone.
3499. Near the line? Yes.
3500. Is there any limestone that you know of? I have not been told of any particularly good deposits of limestone along there, and if there were it would not be availed of at the mines for some time, because the Tarrawingie flux lime is so very superior.
3501. Is there a very large deposit there? Yes.
3502. What form does that take—is it a hill of limestone? A "blow," something like Broken Hill.
3503. Has it been prospected to any depth? No. It has been prospected sufficiently to satisfy men like Mr. Howell for instance, who told me that the supply of flux there was undoubted.
3504. But you do not know whether they have sunk on it; you know that limestone is merely a deposit? Generally. They frequently sink too, but it does not go to any great depth.
3505. But it is more than likely that they have prospected it, for unless they were assured of its permanency they would not have constructed a line to it? I think it is beyond all doubt that there is a supply of it there for ever.
3506. You think that Broken Hill should be the terminus for this line; I suppose one reason why you think so is, that as the Silverton Tramway Company constructed their tramway they should be rewarded for it—that as they came to the rescue they ought to receive their reward, and not be interfered with by the Government competing with private enterprise—do you hold that opinion? No; I do not view it in that light. The Tramway Company, I think, laid down that line only to benefit themselves.
3507. Still they have benefited Broken Hill, have they not? Oh, yes.
3508. Supposing the Government were to construct a line from Broken Hill to Cockburn, and introduced competition, I suppose that would be an advantage to the Broken Hill people, by reducing the rates and the freights? It must certainly have the effect of reducing the freights on the tram line.
3509. Is there any complaint at the present time as to the high rates of freights or charges? Yes; the people have always expressed their dissatisfaction at the way that line has been conducted, and more particularly the charges that have been made.
3510. But I suppose that, independently of the charges, the tramway gives very great convenience and accommodation to the public? Oh, yes.
3511. You do not think Broken Hill would have been likely to be what it is had it not been for the Silverton Tramway Company? Oh, no; of course it could not have developed with the rapidity it has, inasmuch as bullock teams could not possibly have brought the timber there.
3512. To your knowledge, is any money ever expended on the road between Broken Hill and Wilcannia? I think there is a gang of repairers, or something of that kind—a flying gang of men under the District Surveyor or Engineer for Roads, or some other officer—but nothing of any consequence.
3513. What distance have you ever travelled towards Wilcannia from Broken Hill on the road? About 25 miles.

- J. H. Cummins, Esq.  
29 April, 1891.
3514. Was any part of it metalled any distance away from the town? No; none of it.
3515. Merely cleared of trees and of scrub? Yes.
3516. And a little draining done here and there on the road? Yes; a very little.
3517. *Mr. O'Sullivan.*] You appear to have a good knowledge of Broken Hill and the Barrier region? Yes.
3518. Have you formed an opinion as to how long these mines will last? Yes.
3519. What is that opinion? I can only echo the opinions of such men as Mr. Hatten, Mr. Howell, Mr. Lane, and Mr. Harper. They all say that in our lifetime we shall never see it worked out. The first two years that I lived at Broken Hill, I am sorry to say so now, I had my doubts about the permanency of it. Since the mines have been opened up it is beyond a doubt now. A short time ago, when I was underground at the Proprietary mine, I very carefully looked over it and tried to imagine where the ore could have come from that produced all the bullion. It surprised me to see the small space that has been made where the ore has been procured from. There is very little stoping done. It has been almost all done in the drives, and in fossicking the prospecting drives where the ore has been produced from. There is one block of ore now that is almost the full width of the lode and twice the length of that in Block 10. One of the underground managers took me round it the other day.
3520. But I suppose there is a limit even to that large quantity of ore? Mr. Thomas, of the Central mine, says that in his opinion the ores will get richer at 1,000 feet. He says he is satisfied that the ores at the Central at 1,000 feet will be richer than at the upper levels.
3521. I should like to get from you what is your opinion, after having heard the opinions of those experts, as to what would be the limit of time to which these ores will last;—can you fix any particular time? I could not say.
3522. You have read of the Comstock lode in Nevada? Yes.
3523. That lasted twenty-one years with rich ores, did it not? It lasted for a long time, but I cannot say how long.
3524. You know they went down to 1,200 feet? Yes.
3525. And that the rich ores have now given out, after twenty-one years' profitable working? They are not satisfied yet that they have given out.
3526. Still, it is pretty well understood that they have, and they are working the low grade ores, is that so? I cannot speak as to the Nevada mine.
3527. Can we rely upon these mines lasting twenty-one years in the same way? Yes.
3528. After these mines have worked out, and the mining is absolutely done, what is there to keep the population in the district? Oh, if the mines were to give out the population would go also. There is nothing to support the population there if the mines were to give out.
3529. There is nothing but grazing country, and I suppose there would only be a local trade, and the few industries that have been established in a place like Broken Hill might remain to supply the grazing population? Oh, that would be no consideration.
3530. So that when the mines actually cease, the population will, like the Arabs, fold up their tents and gently glide away? Yes; I do not know that it would be so very rapid either, because there is a lot of unexplored country about there.
3531. I should like your opinion on that point, too; the Barrier Ranges abound in minerals, do they not? Yes.
3532. At least there are various kinds of minerals found on the ranges? Yes.
3533. And the minerals have been proved up to Mount Browne? That is so.
3534. There are also rich spots in the district, such as Corona, Euriovie, and Thackaringa? Corona is not a rich spot.
3535. Are they still working at the Apollyon and the Maybell? The Maybell is working. I do not know about the Apollyon and the Corona. I do not think anything of them. I do not think they will ever get enough silver there to pay for their tents.
3536. So far as you know, the mineral wealth lies about Broken Hill, with a prospect of something good turning out of the Black Mountain? The Black Mountain, the Purnamoota district, and Rockwell. The Rockwell, in my opinion, will be a good mineral country, and there will be good mineral mines found there yet. At the time they worked there the boom was on, and people with any money rushed into anything, and all the capital went to the promoters, and the mines are now lying undeveloped, most of them with shafts sunk 100 and 150 feet. Having done this their funds gave out, and they have remained idle ever since.
3537. I suppose Broken Hill attracted the population from them? Not from Rockwell. Broken Hill is as old a place as Rockwell.
3538. You said just now, in answer to Mr. Trickett, that the population of Broken Hill proper was 30,000;—are you aware that the Mayor of Broken Hill yesterday said it was 24,000? Yes.
3539. How do you reconcile these statements? He based his estimate on the census collected by the police last December. I know, from the manner in which those figures were collected, that they are not reliable. A large number of the streets were missed; and I am sure there must have been as many people missed as would make up the difference. With the people that have come to live and settle at Broken Hill since then, there must be nearer 30,000 than 24,000 there now.
3540. The census was recently taken at Broken Hill, was it not? Yes.
3541. Has the fact as to the actual number of the population not leaked out yet? We are not likely to know what it is for another eight or ten months.
3542. I notice from papers that are kindly forwarded to us occasionally, that Mr. Lane, of Block 14, has been refused permission by his directors to attend on this deputation;—can you assign a reason for that? Yes; the Mayor of Broken Hill and myself interviewed the directors last Saturday in Melbourne, and they gave as a reason that either their secretary, Mr. Knox, or the directors themselves, were in a better position to give information concerning the mine than Mr. Lane is, and that either Mr. Knox or themselves, at the invitation of this Committee, would come over here and give evidence.
3543. There is no feeling of antagonism, then, upon the part of those directors to this proposal? No. We spoke about the advantages and the disadvantages, and about what was generally said up there, viz., that they were opposed to it, and they said that as directors of the mine they were not, and they felt that anything they could do to enrich the Broken Hill mine would be enriching their adjunct properties, such as the Tarrawingie mine, and the Silverton tram line.

J. H.  
Cummins,  
Esq.  
29 April, 1891.

3544. What is the object of the railway proposed to be constructed from Broken Hill to Menindie? In view of a report that the river Darling is likely in the near future to be locked, and that from the point at Menindie down it is generally during the longest period of the year navigable, and that it would take bullion and bring in firewood, fire bricks, fire clay, and all that sort of thing. There is a lot of timber.
3545. So that if a railway were constructed, say from Forbes to Broken Hill, *via* Menindie, it is quite possible that the Broken Hill people might use it as far as Menindie, and ship down the river to Melbourne, or do their business with Melbourne *via* the rivers? I cannot speak as to that. I do not know any of the country between Menindie and Forbes.
3546. You referred just now to the Rutland Flux Company; where is that? That is near Purnamoota.
3547. On the western side of Broken Hill? West or north-west.
3548. But is there not a flux company near the Gorge, on Stephen's Creek? No; there was a flux company in Silvertown, but I think it is defunct now, for some reason or other.
3549. If this line were taken to Broken Hill and stayed there, it would afford nearly all the accommodation that you would require there in connection with Sydney people, would it not? Yes.
3550. If the line stayed at Broken Hill there would be no competition with the Silvertown Tramway, and we could save the construction of about 30 miles of railway, could we not? Thirty-five miles.
3551. So, if we only go to Broken Hill with this railway, and that is its terminus, there would be a continuous line between Nyngan and Adelaide, and all the accommodation required would be given? Yes; I think it would be spoiling a good job to make the line on past Broken Hill to the Border.
3552. There is a possibility, is there not, that there would be 35 miles of unprofitable railway if this line went on to the Border? Yes. You see that if the gauges were similar it would not be necessary to have a double or competing line, but the dissimilarity of the gauges would give the other company so much the best of it that the odd gauge would have nothing whatever to do. It would be only so much useless gear.
3553. Whatever might be done ultimately with this line, the construction of a line to Broken Hill would, in your opinion, be a justifiable national work? Yes; I think that a progressive colony could do nothing less than extend the railways in a manner like that.
3554. *Mr. Copeland.*] You know the whole course of this lode about the Proprietary mine, I suppose? Yes.
3555. Been over it frequently? Yes.
3556. Can you tell the Committee, commencing at the north end, where the lode is payable, and where it has been proven—which mine is that in, farthest north? The Junction mine.
3557. That is on the main lode? Yes.
3558. That is the farthest north? Yes; they have had some rich ore from that.
3559. Are they getting payable ore now? Yes.
3560. Do you know anything about the width of the lode there? I do not know what the average width would be. In some places it is 20 or 30 feet in width there, and narrows down to a few inches. It is mostly found in pockets. The lode there is quite different from the lode at the British, where it becomes true and permanent, supported between two strong walls.
3561. What width is the lode in the British? I suppose it would average from 50 to 60 feet.
3562. Of good payable ore? Yes.
3563. Have you any idea of the average quality? I do not know; that is very hard to come at.
3564. At any rate the lode is from 50 to 60 feet wide? Yes.
3565. What is the distance from the British to the Central, or to Block 10? It is about  $1\frac{1}{2}$  mile from the north end of the British to the Central mine.
3566. Is the lode payable the whole length of that  $1\frac{1}{2}$  miles? Yes.
3567. Can you say what width the lode is in Block 14? The lode is not so regular when you get to the boundary of Block 13. Some parts of the lode in Block 14 are very rich, and some parts are very poor. They have not the same character of lode in Block 14 as is found in Block 13, or Block 12—the Proprietary mine.
3568. Well, what about Block 11? I cannot say what the width of the lode would average in Block 11; but Block 10 is the richest on the field, and the width there is fully 100 feet.
3569. That is all rich ore, is it not? Rich carbonate ore, and some of it kaolin ore.
3570. In Block 10, are they not getting very rich ore? Yes.
3571. From the north end of the British to the south end of Block 10 is a distance of about  $1\frac{1}{2}$  miles through which the lode has been traced to be highly payable and very wide? Yes.
3572. Are they not getting very rich ore in Block 10—500 oz. and all that sort of thing? No; I saw the last of the assays the day before I came down, and the bulk assays were about 260? The highest specimen assays might go four or five times that.
3573. That is Block 10? Yes.
3574. So the reports in the newspapers must be wrong, then? The bulk assays are 260. The sulphide ore is much poorer than than that. It would go from 30 to 40 oz.—40 oz. would be very rich in sulphide ore.
3575. Do you know anything about the width of the lode in Block 10—that is the southernmost part of the lode—I suppose that is where they are getting ore? I cannot speak as to the width of that. I have not been down for a long time.
3576. Do you know the depth that they have proved it to in Block 10? Five hundred feet.
3577. How deep have they proved it in the Central? About the same depth. After going 500 feet in the Central, beginning from the mouth of the shaft, as it were, because the shafts are at different altitudes—
3578. Down to about 500 feet they have proved good rich ore? Yes. The line for a distance of 2 miles is proved to have rich ore. The South mine very recently discovered carbonate ore.
3579. At what depth? At the 400-feet level.
3580. That is a line on the west, is it not? Yes.
3581. What is the greatest depth of payable ore on the field? They are much about the same.
3582. About 500 feet? Yes.
3583. The New Extended is down over that; they are down over 600 feet, are they not? Yes; but they have no ore yet.
3584. But they are sinking for it? They are looking for it.
3585. The Committee may conclude then, at any rate, that there are  $1\frac{1}{2}$  miles to 2 miles of proven payable ore to be worked upon? Yes; beyond all doubt.

- J. H. Cummins, Esq.  
29 April, 1891.
3586. Leaving out of question all the progressive mines that may or may not prove payable afterwards? Yes.
3587. *Dr. Garran.*] You said, in answer to Mr. Trickett, that there was a proposal to make a railway from Broken Hill to Menindie? Yes.
3588. Who is making that proposal;—who is moving in the matter? I had my information privately and confidentially, and would rather I was not asked.
3589. It is not the Silverton Tramway people? No.
3590. It is quite a separate movement? Yes.
3591. Do you know what traffic they expect on that line? Yes.
3592. What do they base their hopes of a dividend on? The carriage of bullion to the river, firewood from the river, brickmaking, and perhaps river passengers.
3593. They propose a line, I suppose, something like this line to Tarrawingie? Yes.
3594. A cheap line? Yes.
3595. A surface line? Yes.
3596. It would, roughly, follow the line of Stephen's Creek, I suppose? No; it would not follow the line of Stephen's Creek; it would cross Stephen's Creek.
3597. Where does Stephen's Creek empty itself when it is in flood? Into the River Darling.
3598. It reaches the Darling? No; it does not reach the Darling.
3599. Does it reach any of the lakes? No; it does not empty directly into any of the lakes.
3600. Did you ever travel over that route from Menindie to Broken Hill? I have been about 80 miles on that route.
3601. Is there any iron or limestone flux on that route? Yes.
3602. Good quantities? There are good quantities of it.
3603. But no large deposits like that at Tarrawingie? Oh, no. That in itself is as phenomenal as Broken Hill.
3604. That is an exceptional deposit? Yes.
3605. Do you think if this line were made that they would bring up any quantity of produce from the Darling River, and from the neighbourhood of those lakes? Yes.
3606. Are you not at present supplying yourselves at Broken Hill with fodder, green stuff, and milk from a very long distance? From Adelaide. The milk comes from as far away as 300 miles by rail. The fodder is got from a distance of from 200 to 250 miles.
3607. Is not the Darling very much nearer to you than those sources are? Oh, yes. This proposed line of railway, from Broken Hill to Menindie, would be about 65 miles.
3608. And you could supply Broken Hill with all those commodities at half the distance you can get them from now? Yes, and of much better quality. The re-trucking, in transshipping from the broad to the narrow gauge, knocks the stuff about so much that any local supply, even if it were inferior, would be taken in preference, because it would be fresher.
3609. Between Terowie and Broken Hill you have no supply? No.
3610. It all has to undergo the break of gauge? Yes; all the vegetables and stuff that could be easily grown at Menindie.
3611. Those farms where the stuff is grown in South Australia, all depend, I suppose, upon the rainfall—there is no irrigation upon any of those farms? No.
3612. But you would have the advantage of irrigation on the Darling? Yes.
3613. So, whether your line went to Menindie or to Wilcannia you would come within reach of water? Yes.
3614. And in either case could supply Broken Hill to great advantage? Yes; and the supply of garden stuff and fodder is generally spoken of as one of the industries that would spring up.
3615. Are you aware that a line between Sydney and Broken Hill, *via* Forbes, would be 62 miles shorter than a line *via* Cobar? I do not know that.
3616. You have not studied the question of distance? No, because I had not the opportunities for knowing what the country is.
3617. Is this project for going to Menindie seriously entertained by *bona fide* people? Yes.
3618. *Mr. Dowd.*] You stated in reply to a question that if the proposed railway were constructed you were of opinion that all the bullion would be carried by that railway—is that so? Yes.
3619. Can you inform the Committee what is the cost at the present time of carrying a ton of bullion to Sydney from Broken Hill? No, but I arrive at my opinion in this way,—from what it would cost in proportion to other goods, sent by the circuitous route to Sydney through Port Pirie.
3620. Can you inform the Committee whether some of the directors of the Broken Hill Proprietary Company are also directors of the Silverton Tramway Company? Yes, they are nearly all the same. All the directors of the Silverton Tramway Company are directors of the Proprietary Company.
3621. Can you say whether they view the proposed construction of this line from Broken Hill to Cockburn as a competitive line? So far as the line from the Hill to the Border is concerned they would undoubtedly view it as a competitive line.
3622. But would not the line, if constructed on the proposed route, serve a large number of mines which the Silverton Tramway Company could not possibly serve—such, for instance, as the Pinnacles? I do not know. It is difficult to say what they could not do with their line. I think they could manage to supply them.
3623. You have given the population of Broken Hill proper—is there any scattered or outlying population that would be served by the construction of this line? Yes.
3624. Is that population considerable in number? I might include Silverton; that would be served by the line. The population of Silverton is about 500; Purnamoota, about 100; Pinnacles, about 150; and Rockwell paddock, I suppose, 100.
3625. You gave Mr. Copeland a list of the mines on the Broken Hill main lode, which you consider would be of a permanent and payable character;—are there mines on the eastern side of this lode of that character—rich and payable? Yes. There have been recent developments in the British Consols quite unexpectedly. In fact, that was pronounced a duffer by some of the most reliable men on the Hill, and it was a surprise to everyone, and it is expected that there will be many more of that kind discovered.
3626. From your knowledge and experience during your long residence in that part of the country, are you of opinion that many rich mining discoveries will be made of a permanent character? Yes.

J. H. Cummins, Esq.

29 April, 1891.

- 3627. Outside those already discovered? Yes.
- 3628. And your opinion is fortified, I suppose, by the recent discoveries in the Consols? Yes. The discoveries in the Consols make it impossible to say where there is not silver now on the Barrier.
- 3629. All on the eastern side of the lode? Yes. Five years ago Consols would not have brought a £5 note if they had been put up to auction locally.
- 3630. Do you know of any other minerals in that district, besides silver, which have been discovered? Yes, asbestos. That is a very useful commodity in connection with machinery.
- 3631. Whereabouts has that been discovered? In the Rockwell.
- 3632. In large quantities? Yes; and a very good quality, they say.
- 3633. Any other minerals? No.
- 3634. No tin or copper? No tin in the Rockwell.
- 3635. But in the district through which this railway would pass? Yes; if the tin fields were ever to come to anything they would be served by this line.
- 3636. Any discoveries of copper? None that I am aware of.
- 3637. Still, generally speaking, you are of the opinion that if the line were constructed it would soon be a remunerative one? Yes.
- 3638. And that under any circumstances, it should be constructed as a national work? Yes. In a progressive colony I think that work should be carried out.
- 3639. I presume that you are continually in contact with a large number of town residents and outside population? Yes.
- 3640. What is the opinion of those people with reference to the construction of this line—favourable or otherwise? Decidedly favourable. I have never heard an adverse opinion except from some person signing himself "Local Resident"—some old crank or faddist that opposes everything. With the exception of that one letter, I have never heard of any opposition.
- 3641. The general opinion is that the line should be constructed? Yes.
- 3642. *Mr. Humphery.*] What distance from Broken Hill is the ironstone deposit to which you referred—did you say what distance it was? No, not particularly. The whole country is impregnated with deposits more or less in size and quality.
- 3643. In which direction? Particularly Rockwell, and just on the route of this railway line. That would be about the Razorback.
- 3644. Which railway line? The proposed line from Cobar to Broken Hill.
- 3645. You are not referring to any iron deposits, then, between Broken Hill and Menindie? No.
- 3646. Do you know of any in that direction? No particular ones. They can quarry it almost anywhere there. But it could only be picked up in small quantities. They have no large permanent bodies of it.
- 3647. And the proposed line from Cobar to Cockburn would serve you quite as well as the projected line, of which you spoke, to Menindie, in respect to ironstone? Not so well. I forgot to say that I have heard from people who have seen it, notably Mr. Alison, the Clerk of the Council at Broken Hill, that there are large iron reefs or deposits somewhere between Cobar and Wilcannia. I do not know for what reason he had it tested, but he says that it is of the very best quality.
- 3648. Well, then, the Cobar to Cockburn railway would serve you better than the line from Broken Hill to Menindie? Yes. He speaks so highly of this deposit of ironstone between Wilcannia and Cobar that I should think that that would, for fluxing purposes, supply ironstone in the same manner as Tarrawingie would limestone.
- 3649. Do you know about what quantity, approximately, of ironstone fluxing would be required annually to serve the existing mines, without taking into consideration any possible further discoveries? No; I cannot speak as to quantities.
- 3650. You have no idea what present requirements are? No, I can only speak generally; and from what I know now of the country round about, and from what I gather from the mine owners, one of the next things to which they will have to turn their attention is, where their supply of ironstone is coming from.
- 3651. You said that the consumption of coke was about 1,300 tons weekly? Yes.
- 3652. That is by the Proprietary mine? That is by the Proprietary only.
- 3653. Did you ascertain what quantity of coal was used by the Proprietary? No. They use it only as fuel.
- 3654. I suppose you are aware that the estimate given by the Mayor, of the total consumption of coal and coke at Broken Hill, is less than the figures you have given us as the consumption of coke alone at the Proprietary mine? I do not understand that.
- 3655. You were here during the examination of the Mayor, were you not? Yes.
- 3656. Did he not tell us that the consumption was about 3,500 tons of coke, and I think he said 1,500 tons of coal? Per week?
- 3657. No, per month I think he said; I think the evidence was 7,000 tons, and that was reduced to about 5,000 tons, and 1,500 tons a week was the total consumption of coal and coke? I do not know.
- 3658. You did not ascertain what the consumption of coal is? I can speak very positively about the amount of coke used per week, because Mr. Howell himself told me that it was 1,300 tons, which quantity would be exactly doubled when they treated the sulphide ores.
- 3659. The local paper—*The Silver Age*—of Thursday last, says that the consumption of coke at the Broken Hill mine is 900 tons per week, and the consumption of coal 400 tons? That is wrong.
- 3660. Do you not think it very probable that instead of 1,300 tons being the consumption of coke, the consumption is really 1,300 tons of coke and coal? No.
- 3661. You think not? I am quite clear about the 1,300 tons of coke. I had that information from Mr. Howell, the managing proprietor.

Lewis Lloyd, Esq., Proprietor of Burruga Copper Mines, sworn, and examined:—

- 3662. *Mr. Copeland.*] You are an ex-Member of the Legislative Assembly? Yes.
- 3663. You are also, I believe, the proprietor of a copper mine, are you not? Yes.
- 3664. What is the name of it? Burruga.
- 3665. You are also part proprietor of the Nevada mine, Sunny Corner? Yes.
- 3666. Are you getting ore from the Nevada? Yes, I am.
- 3667. About what quantity per month? I have been raising about 500 tons per month.

L. Lloyd, Esq.  
29 April, 1891.

3668.

- L. Lloyd, Esq., 3668. Where is the Burrage mine situated? In the Abercrombie Ranges.  
 3669. What do you do with the ore obtained from that mine? I am smelting that on the ground.  
 29 April, 1891. 3670. But you are getting about 500 tons of ore per month at the Nevada mine at Sunny Corner;—where do you smelt that ore? I am smelting that at Lithgow.  
 3671. What freight do you pay for sending it from the mine at Sunny Corner to Rydal? Fifteen shillings per ton.  
 3672. What is the distance? About 17 miles from the mine to Rydal.  
 3673. What railway freight do you pay from Rydal to Lithgow? One shilling and eightpence per ton, I think.  
 3674. Do you remember the mileage from Rydal to Lithgow? Sixteen or 17 miles.  
 3675. Have you any furnaces erected at the Nevada mine? Yes; there are two of them.  
 3676. You have two water-jacket furnaces? Yes; two blast furnaces.  
 3677. But hitherto you have not used those two furnaces, because it was cheaper to send the ore to Lithgow, I suppose;—is it so? Yes.  
 3678. What do you pay for coal for smelting purposes at Lithgow? Two shillings and sixpence a ton.  
 3679. That is for small coal? Yes.  
 3680. Do you find that suitable for smelting purposes? It is.  
 3681. You smelt with reverberatory furnaces, do you not? Yes.  
 3682. Are they suitable for your kind of ores? Yes; far better than any other class of furnace.  
 3683. The ore you are getting from the Nevada mine is mostly sulphide ore? Yes; very refractory—containing zinc, copper, lead, and a blend of different minerals.  
 3684. That is a very refractory sulphide ore? Yes.  
 3685. But you find no difficulty in smelting with reverberatory furnaces, and use coal instead of coke? Not the least.  
 3686. Do you use any limestone as flux? No.  
 3687. It does not require limestone when you use a reverberatory furnace? No; nor ironstone.  
 3688. Have you had many years' experience in smelting? I have been at it all my lifetime.  
 3689. You are the owner of these furnaces at Lithgow, are you not? Yes.  
 3690. How many furnaces have you erected? Five altogether.  
 3691. Of which you are working how many? Three sometimes. It depends on the quantity of ore I get down.  
 3692. Then you do not require to use coke nor to use limestone in smelting your ores? No.  
 3693. And those ores contain lead, sulphide of copper, zinc, and quartz gossan, and altogether it is a very refractory ore? Yes.  
 3694. From your experience as a smelter, do you think that the Silverton ores could be treated in the same way by reverberatory furnaces? I have no doubt of it.  
 3695. That is the sulphide ores? Yes; in fact, you cannot treat them in any other way.  
 3696. Do you think that if this railway, which we are considering now, were constructed to Broken Hill, we should be in a position to send coal from Lithgow to Broken Hill, which could be used for smelting purposes as well as for steam purposes? Undoubtedly, or bring the ore down to Lithgow—one of the two; bring the ore to the coal or send the coal up there.  
 3697. Do you think from your experience, that it is likely it would pay them to send the ore from Broken Hill to Lithgow to be smelted? It depends on the cost of trainage. I do not know what that would be.  
 3698. I suppose that as you get your small coal at 2s. 6d. per ton, other people would be able to get it at the same price? No doubt. There are thousands of tons there put on one side.  
 3699. You think that getting the coal so very cheap, would enable them to pay freight on sending their sulphide ores from Broken Hill to Lithgow? Yes.  
 3700. And by treating them in reverberatory furnaces they would not need to go to the expense of obtaining lime as a flux? No.  
 3701. Nor would they require iron, I suppose, as a flux either? No.  
 3702. The ores would flux themselves? Yes.  
 3703. Therefore, in adopting the plan of sending their ore from Broken Hill to Lithgow, they would save all the expense of purchasing lime and ironstone as they are doing at present? Yes. It would have to come to that in time after their carbonate ore is done.  
 3704. I suppose there is no question of the completeness of the smelting process by a reverberatory furnace—that is to say, it gets the silver out as thoroughly as the blast furnace does? It comes out exactly in the same way as in the blast furnace.  
 3705. You believe they will be compelled to fall back on reverberatory furnaces in treating their low grade sulphide ores? I have no doubt of that, because it has been so in America at the Great Auconda mine. They have had to fall back on the reverberatory furnace.  
 3706. In addition to your many years' experience in smelting in these colonies, I think you were also a miner at home, were you not? I was a smelter—I never was a miner.  
 3707. Have you seen any of the American mines? I never was in America.  
 3708. So your experience has been gained in the old country and in these colonies? Yes.

Francis Martin Drake, Esq., Metallurgist, sworn, and examined:—

- F. M. Drake, Esq., 3709. *Mr. Copeland.*] Where do you reside? At present at Denison Town, New South Wales.  
 3710. You have resided, I suppose, at Broken Hill? Yes.  
 28 April, 1891. 3711. For how long? I came down about the 1st April. I had been there about eleven months.  
 3712. What was your occupation there? I had charge of the Central Company's smelters.  
 3713. How many furnaces? Three.  
 3714. I suppose their process of smelting is by the water-jacket, is it not? Yes.  
 3715. They use limestone and ironstone as flux? Yes.  
 3716. You heard the evidence given by Mr. Lewis Lloyd just now, with reference to smelting with reverberatory furnaces? I did not catch it all.  
 3717. Are you of opinion that the sulphide ores could be smelted with reverberatory furnaces, and using coal instead of using coke? It is always a matter of cost—the one does the work as well as the other.

3718. The only difference, I suppose, is that you cannot put so much through with reverberatory as with blast? A reverberatory furnace requires more repairs and more skilled labour—a blast furnace requires a higher class of superintendence.

3719. But a reverberatory furnace will do its work quite as efficiently as a blast furnace? Yes.

3720. In that case you would not require to use limestone or ironstone as flux? In the reverberatory furnace you can use a more silicious charge—that is, you can carry more quartz in a charge than you can with the blast furnace, but I question whether you can clean the ore as well in the reverberatory process. It is a matter of argument between metallurgists as to whether the reverberatory furnace is better than the blast, or *vice versa*. The Americans have improved on the German system of blast furnace work, and that is the method—water-jacket—used at Broken Hill. But the old Cornishmen and Welshmen will not hear of it, and they still adhere to the reverberatory furnace.

3721. Are they not using reverberatory furnaces in America for sulphide ores? Yes. It all depends on the price of fuel.

3722. Supposing this proposed railway were taken to Broken Hill, do you think that when the ores get more mixed than they are at present and there are more of sulphides, they would be likely to use coal for fluxing purposes instead of coke? Not for a long time to come—not for a considerable time will they discard the blast furnace, in fact I question if they ever will unless they discover some quicker method of working reverberatories than they have at present.

3723. For sulphide ores would not a reverberatory furnace be better adapted than a blast furnace? As I said before, it is all a question of cost. The sulphide ores can be roasted as they do at Sunny Corner in heaps, and then put through the blast furnace, or they can be put directly into the reverberatory and worked up in one operation.

3724. They could be directly put into the reverberatory without being roasted? They have two operations in the reverberatory. They roast them for a time, and then increase the heat and smelt them in the same place.

3725. But it is not absolutely necessary to roast the ores before smelting them in the reverberatory furnace? No, not in heaps.

3726. But in a reverberatory furnace you save using lime as a flux; you cannot smelt in a blast furnace without limestone? Oh, no.

3727-8. Would it not be a great saving to save all the limestone they would otherwise use? Well, it might be.

3729. About what quantity do they generally use per ton of ore at Broken Hill? I cannot speak positively except as to the Central. At the Central we put through about 50 tons of ore to 15 tons of limestone and 15 tons of ironstone, roughly speaking.

3730. You would use about one-third limestone and about one-third ironstone? No; about 15 tons of each of the fluxes to 50 tons of the ore. That would be 50 to 30.

3731. A little less than one-third? Yes, three-eighths of the total quantity.

3732. Is there very much silica in that ore? It is probably more silicious than any other ore on the Hill except Block 10, and they do not smelt their ore.

3733. Would it not be a great consideration in using a reverberatory furnace for them to save those 15 tons of limestone and those 15 tons of ironstone? I do not think it would pay to do so. It would require so many furnaces to do the work and so many men that I do not think it will ever pay to use reverberatory furnaces there.

3734. It might not pay with carbonate ores, but would it not pay with sulphide ores? I do not think so. At Sunny Corner they are doing good work with blast furnaces—I think as cheaply as anybody does it.

3735. I suppose you cannot speak from experience as to the probabilities of the permanency of the mines; your occupation was only on the surface? Well, I have been on the mines, and I know the opinion of the exports there;—they all look forward to the place being a permanent one. I have great confidence in it myself, so far as I know. The deepest ore that is being taken out is only from a depth of (say) 450 feet in Block 10. I think that is the deepest ore which they are working at present.

3736. They are still carbonate ores, are they not? They are oxidised ores at the 450 feet level.

3737. Does it show any indication of turning into sulphides? No; the ore lies in layers. The sulphide underlies the kaolin, and that underlies the gossan, and these layers are getting deeper and deeper to the southward.

3738. With every indication of permanency? Yes; the further south the deeper the ore.

3739. How wide is the lode in Block 10? I cannot say as to that, I have never measured it, but I think it is 60 or 70 feet.

3740. Can you say what is about the average yield? I cannot remember. Captain Warren has told me these things, but I forget. He has sulphide ore up to 100 oz., and kaolin goes to 1,000.

3741. But what do the bulk assays go to with carbonate ores? I cannot say, but it can easily be worked out from their returns. I never have worked it out.

3742. So far as you know there is every indication of permanency in the lode as you go south? Well, it is permanent all the way through. They have it in the bottom levels of the Proprietary, which is to the north. What I meant to convey was that the oxidised ores were deeper as they went south.

3743. And then they have every reason to expect they will get a large supply of sulphide ores underneath those? They have. On the 400 feet level at the Central they have sulphide ores something over 300 feet in width in their main cross-cut.

3744. Do you know anything of the country between Broken Hill and Wilcannia? Nothing at all.

3745. Have you seen anything of the ironstone deposits which they use for flux? I have been at a place called Balaclava, which is in the Rockwell paddock, which is where we obtained almost all our supplies of iron flux.

3746. Is there a large deposit there? It is not a large one, but it is 7 or 8 feet wide in places, and in some other places 12 feet wide.

3747. That will very quickly run out, will it not? I thought it would run out when I was there, ten months ago, but it still comes in.

3748. Is it your opinion that there will be a large demand for ironstone if it can be found at other places? I am certain there will be. The Proprietary Company have hitherto used nothing but their own, but are making inquiries as to where they can get other. They have used their surface outcrops, containing 10 oz. sometimes, but averaging about 3 or 4.

P. M. Drake, Esq.  
29 April, 1891. 3749. If we have evidence that there are large deposits of iron ore between Broken Hill and Wilcannia, do you think they will be likely to be used and thus give traffic to the railway? You can be sure that they will be utilised if they can be delivered at a reasonable price. We, at the Central, pay 23s. a ton for ironstone.

3750. Do you think there is ore enough proven in these different mines to use up all the ironstone within a reasonable distance of Broken Hill? I cannot say as to that. My experience in mining districts has been that fresh things are continually being discovered.

3751. I mean the deposits that are known;—are they likely to be soon used up in being continuously drawn upon? I do not think they will be used at all if you can supply a better quality, which will not be very hard to do. Both the ironstone and the limestone obtained hitherto has been very poor indeed.

3752. Do you know what percentage of carbonate of lime that limestone contained? I do not remember that percentage, but the percentage of silica goes up to 17 per cent. However, that will be remedied by Tarrawingee giving no limestone that assays more than 4 or 5 per cent. silica.

3753. What percentage of silica does the iron ore contain? That carries 10 or 15 per cent. of silica. If there is 10 per cent. we think we are doing very well, but even that is 1 ton in 10 smelted which we should not smelt.

3754. And you not only smelt what you would not smelt, but you pay for it? Yes.

3755. You think that if there should be any deposit of iron ore found between Wilcannia and Broken Hill, it is sure to be made use of, and give us traffic on the railway, and the same as regards limestone? I am sure of it.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

Railway from Cobar to Cockburn.

APPENDIX.

A.

PRECIS OF PROCEEDINGS RELATING TO THE PROPOSED RAILWAY FROM COBAR TO COCKBURN.

Two routes have been suggested—rival routes they may be termed—for railway communication with Wilcannia and the West (1) by an extension of the proposed Nyngan-Cobar line, and (2) by an extension of the proposed Forbes line.

Under the date of 8/7/84, the Engineer-in-Chief submitted for the information of the Minister a map, showing the several routes to Silverton and the South Australian Border, with a statement of the mileages as under:—

	Distance from Sydney.	Miles to construct.
Via Hay and Menindie.....	745 miles	290 miles
Direct, via Hay.....	730 "	275 "
Via Orange, Forbes, and Wilcannia.....	742 "	470 "
Via Orange and Cudal.....	734 "	470 "
Via Nyngan and Cobar.....	749 "	371 "
Via Narromine.....	710 "	410 "
Via Orange and Menindie.....	694 "	430 "

27/7/84.—The Cobar line was advocated in a petition from residents of Cobar, and presented to the Legislative Assembly by Mr. R. Barton.

Mr. Kirkcaldie in reporting upon this proposal, stated that in his opinion the Forbes route was the best, as it spaced the country better, and would attract business that is now done with Melbourne, via Balranald.

Inspector Hornidge also was of opinion that unless very substantial concessions were made (in rates) we must not hope for any great accession of traffic from the Wilcannia district.

In a petition from persons interested, presented to the Minister by Mr. Barton, it is asserted that the construction of such a line (Cobar) would command the whole of the Middle Darling and Barrier Range traffic.

17/9/84.—A petition from the inhabitants of Menindie was presented to the Legislative Assembly praying for an extension of the railway from Hay to Menindie and Silverton.

2/1/87.—Mr. Kirkcaldie in reporting on this subject, said—"No doubt Cobar would be the nearest route to Wilcannia and Silverton, but a railway to the former town would be of no benefit whatever as far as securing the trade of those districts is concerned."

12/6/88.—A paragraph in the *Daily Telegraph* states that public feeling was, that the Cobar route was preferable to that by Forbes, as being shorter and more quickly made, but that the people would be satisfied to have a railway whatever route it might take.

28/2/89.—In reply to an inquiry by the Minister, the Engineer-in-Chief reported that the best route to adopt would be from Nyngan to Cobar, and thence, via Wilcannia, to Silverton, where a connection could be made with the South Australian railways. This would connect Adelaide with Sydney, and the distance would be nearly the same as via Melbourne, thus,—

Sydney to Adelaide, via Melbourne, 1,086 miles.

Sydney to Adelaide, via Silverton, 1,091 miles.

while in the first case, traffic would pass over 388 miles of New South Wales lines, and in the other case over 771 miles.

2/4/89.—The *Silver Age* in an article of this date, referring to the visit of the Railway Commissioners and to the duty confided to them, stated that surprise was felt that steps in the direction of an effort to secure the Barrier trade were only now being taken. South Australia, it was pointed out, had early recognised the value of the trade, and had carried a line to the Border. It had been frequently debated whether a railway (in communication with Sydney) to Broken Hill would pay, but the writer believed it only required proper management to make it in time "highly payable," not only to the Railway Department but to the colony. With an inexhaustible supply of coal at one end we should be able to run our trains cheaply, and compete with South Australia for the traffic.

2/5/89.—A memo. by Mr. B. R. Wise, submitted for the Minister's information, stated that he (Mr. Wise) had just returned from a tour of the Western districts, where he found all classes of the community complaining bitterly that they were shut out from the markets of this colony. It was universally maintained, that for a large proportion of that country Sydney was the best market if it were accessible. He found wool of the value of £250,000 lying in Wilcannia for want of the means of getting it away, and it had been there for twelve months; and in the same period 800,000 sheep had died of starvation, because there was no way of removing them to country where grass and water were attainable. During his stay in Wilcannia, eggs, and butter, and all kinds of fodder, were selling at fabulous prices, and yet Wilcannia was the entrepôt from which the stations as far back as Cooper's Creek drew their supplies. The demand for agricultural produce in Wilcannia was therefore very great, and, if communication were given with the districts further west, would be enormously increased. Wilcannia should be the entrepôt for all the country west of the Darling, for the southward of Queensland, and a portion of South Australia, and even for some parts of the gulf country in Queensland. To bring about this result—he would say nothing of rival routes—railway facilities must be given, and if this were not done the western trade would be lost to us and go to South Australia. The locking of the Darling should be carried out—not as an alternative but as a necessary consequence of railway communication. It would give us the command of the trade and bring traffic to the railway. The locking would throw the water back in the ans and creeks for a distance of 40 or 50 miles. This would encourage settlement and raise the value of Crown land "enormously."

14/5/89.—The Minister approved of a survey being made from Wilcannia to Silverton, but Mr. Deane intimated that the Railway Commissioners were of opinion that the line from Wilcannia should touch at Broken Hill, and be carried thence via the Pinnacles and Thackaringa, on to the South Australian Border.

4/7/89.—The *Sydney Morning Herald* says "there would scarcely be wisdom in constructing a line from Nyngan to Broken Hill or Silverton unless we were sure of a great deal of the trade of the districts referred to. It is purely a matter of pounds, shillings, and pence. We recognise a duty to the west, but it is possible that in doing a little right (to those districts) a great deal of wrong may be done (to the colony as a whole), as wrong would be done if a railway were constructed to the Darling country which would be taken advantage of only in part. Adelaide, the writer points out, "in her proximity to the Border," has enormous advantages in respect of the trade. If, "he asks," we establish a railway, will those advantages be increased or lessened? "This," he adds, "is the problem to be dealt with, while we see at the same time the necessity of preserving the integrity of the colony and of keeping our resources within our own Border."

The *Western Grazier*, a local paper, published some remarks addressed by a Mr. Donkes to the Railway Commissioner, on behalf of the Wilcannia Railway League. Mr. Donkes quoted statistics freely, but as they were, for a great part, of old date they are not of much value for the present purpose. One fact, however, which he mentioned is worthy of note, viz., that during the year losses of sheep to the extent of 1,000,000 or 1,250,000 had occurred, which might have been avoided if the means of removing the sheep to another district had been available.

24/8/89.—

24/8/89.—His Honor Judge Docker, in a memorandum addressed to the Minister stated—speaking from an experience of the district extending over twenty years—that few people in Sydney had any idea of the amount of traffic passing through Wilcannia, not only to the Darling, but to the wide country of the Paroo, away to the Queensland Border. The bulk of this traffic went to South Australia, and unless we were prepared to acquiesce in the practical annexation (to South Australia) of those important districts, railway facilities should be provided. He was of opinion that if all the traffic, of which Wilcannia was the entrepôt, were carried by railway it would fully justify the construction of a light line. But the soil of the Darling Valley was so fertile that, with the help of irrigation, he expected to see that river become the Nile of Australia, and he knew of no country which presented such facilities for a system of irrigation. A railway would not obtain all the traffic. The bulk of the heavy goods would inevitably go by the river when navigable, but the earnings of the railway for wool and fodder would probably make up for the deficiency in rainy weather. He did not see, however, why a revenue by dues or tolls should not be derived from the river, as it was the expensive snagging operations which had rendered it navigable; and this plan should certainly be adopted if the river were locked, which it ought to be. If the river were rendered permanently navigable it would act as a feeder—not a competitor—of a railway. If a line to Forbes had been made, the best route to Wilcannia would have been by an extension from that point to Euwalalong, and thence across the country to Mount Hope, but under existing circumstances, there could be no doubt that Nyngan should be the point of departure. The distance from Sydney would be only some 20 or 30 miles, while the amount of new construction would be considerably less.

6/8/89.—Mr. E. Quin addressed to the Minister a lengthy letter (of which a synopsis will be found with the papers) dealing exhaustively with circumstances and prospects of the proposed line. He is of opinion that the rabbit is a factor in the case, and that this evil must be successfully combated, and settlement thereby promoted before the line could be a success. One great advantage of the line would be that it would afford the certainty of a market at all times, and a means of saving stock in seasons of drought. Mr. Quin does not consider that the competition of the river would be so formidable as some persons imagine. The delay and uncertainty by the river are serious evils, and the cost of conveying goods by railway would not be greatly in excess of water carriage. He himself had had to pay £4 17s. 6d. per ton to Melbourne by the river. In times of drought, the saving of sheep, by having facilities for transporting them to food and water, would be enormous. It might also pay to transport the ores to a coal district (say Lithgow) for smelting. On the whole, in view of the enormous outlay and the serious contingencies involved, the question required the most careful consideration.

2/9/89.—Mr. Commissioner Eddy had an interview with the Minister to discuss the proposed line, and the following day addressed a communication to the Minister, setting forth that the South Australian gauge, as far as Terowie, is 5 ft. 3 in., and thence to Cockburn and on to Silverton, 3 ft. 6 in. The present, he thought, would be a favourable opportunity to settle the question of gauge, as it would be most disadvantageous for this colony to have to obtain rolling stock for a 3 ft. 6 in. or a 5 ft. 3 in. gauge. If the new line were made by this Government, it must be of the same gauge as the connecting link of South Australia, or we should not be able to participate in the traffic, and the object of constructing the line would be frustrated.

2/4/90.—Mr. E. Quin addressed the Minister, suggesting that, as the Darling was in extremely high flood, it would be a capital opportunity of obtaining information as to flood levels if a competent officer were sent down. Instructions accordingly were given.

11/4/90.—The Minister requested Mr. Deane to inform him if it would be possible to commence the work of making the line at four points at once, viz., Cobar, Cockburn, and the two banks of the river.

Mr. Deane replied that the arrangements would, to some extent, depend upon the progress of the Nyngan-Cobar section of the line. The railway works could certainly be commenced at the four points mentioned by the Minister, and the bridge over the Darling would in reality form a fifth section, and could be put in hand independently. Between the river and Broken Hill, 118 miles had to be constructed, of which 50 miles should be laid from Wilcannia. Between Wilcannia and Cobar was 158 miles, of which 60 miles might be laid from Wilcannia. The navigability of the river was such an uncertain matter that if the Government decided to construct the line arrangements might be made at once for the delivery of permanent way and bridge materials at Adelaide, in order that the first chance of getting up the Darling to Wilcannia might be seized. The line from Cobar to Wilcannia would have in part to be re-surveyed, which would take four months. The work could then be put in hand. Careful sections of the river and borings would have to be made on the subsidence of the flood. The Minister directed that this necessary work should be put in hand without delay.

3/7/90.—A deputation of members of the Legislative Assembly waited on the Minister to urge the immediate construction of the Wilcannia line, urging that the exceptionally good season would very much facilitate the progress of the work. Then again, a bridge would be required at Wilcannia, and as some of the ironwork must be brought from England a considerable time would be lost in getting it on the ground. The Minister gave the deputation a favourable reply, stating that the line, Nyngan to Cobar, had been proposed specially with a view to the construction of this line, and that he would do his best to have the work put in hand at four different points at the same time.

13/10/90.—Mr. Dickens, M.P., wrote to the Minister advocating the early submission of this line to the Public Works Committee. (1). Because it is an intercolonial work. (2). Because of the great delay which would ensue from not passing it in the current session. (3). Because the trade which should come to Sydney is being rapidly diverted into other channels; and (4). Because a Sectional Committee had already travelled over the ground, and the Railway Commissioners (1889) inspected the route, and in view, they said, of the uncertainty attending the carriage of produce by water; of the losses sustained by the pastoralists in times of drought; of the marvellous development of the mining industry; and of the proposal being of intercolonial importance; they recommended the construction of the line, suggesting that it should be taken from Broken Hill to the Border, *via* the Pinnacles and Thackaringa.

C. A. B., 16/5/91.

## B.

[*To Evidence of J. Barling, Esq*]

RAILWAY COMMISSIONERS' REPORT ON PROPOSED RAILWAY EXTENSION FROM COBAR TO WILCANNIA AND SILVERTON.

Office of the Railway Commissioners of New South Wales, Sydney, 15th July, 1889.

IN the reference to us of the proposed Nyngan and Cobar line we were requested to report in regard "to the question of ultimately extending the line to Wilcannia and thence to Silverton, with a view of connecting it with the South Australian system." We have therefore inspected the route from Cobar to Wilcannia and Broken Hill.

The question of railway communication with Wilcannia, Broken Hill, and the South Australian Border is of considerable magnitude, yet it is one that cannot, apparently, remain long undetermined, not only in the interest of the places named and the western district generally, but as a means of direct communication with South Australia from Sydney, and probably, at no distant date, by the construction of a line between the Northern and Western lines, a direct route from Brisbane. Lines of this character can only be dealt with upon national principles, yet there is also a commercial aspect.

While Wilcannia and the surrounding district at present depends upon water carriage for its supplies and as a means of getting wool to the seaboard, the carriage is uncertain, and it is fair to assume that a portion at least of the traffic would go by rail if such a means of transit were available.

The pastoralists are at the present almost helpless in times of drought, and their losses during the past season have been great. A railway would have a material effect on their prospects by affording the means of selling part of their stock in bad times, or of removing the same to more favoured feeding grounds.

The rates now paid for getting the stores used on the stations are excessive, in consequence of the great distances to be travelled to reach the railway at Hay, Nyngan, or Broken Hill.

Another very great consideration is the fact of the marvellous development of the mining industry at Broken Hill, where there is a population of 15,000 souls at present existing, and we were assured it would rapidly increase.

The whole of this trade is out of the hands of New South Wales, and the sympathies of the population are, to a great extent, with South Australia and Victoria, as the communication with New South Wales is so very difficult.

We were assured by the manager of one of the mines that his railway carriage account amounted to £18,000 per month, and were assured that if a through route existed with Sydney, a fair proportion of this traffic might be obtained in spite of our long route. It is probable also that a market would be opened up for coal and coke from our Western coal fields.

This

This route would also be as short from Sydney to Adelaide (and, of course, to places north of Adelaide shorter) as that now existing *via* Melbourne, but the New South Wales railways would receive a 771 miles' proportion instead of 387 miles, as at present to Albury.

With regard to our Northern system and Queensland, if a line is constructed from Werris Creek to the Western line, a shortening of distance between the North and South Australia of about 400 miles would be effected.

The line is only now being roughly surveyed from Wilcannia to Broken Hill, but making the lines throughout on as cheap a principle as possible without fencing, it is roughly estimated that it will cost as under :—

	£
Cobar to Wilcannia .....	497,000
Wilcannia to Broken Hill .....	390,000
Broken Hill to Cockburn, <i>via</i> the Pinnacles and Thackaringa .....	150,000
	£1,037,000
Interest at 3½ per cent. ....	36,205
Rough estimate of cost of working .....	51,000
Interest on rolling stock .....	3,330
	£90,634
Cost per annum.....	£90,634

Of course, it is impossible to offer a pronounced opinion upon the probable financial success of such a large undertaking from the outset, but there is no doubt ultimately it will be successful, and as it is most desirable to open up communication with remote portions of the colony of New South Wales, which are at present nearly, if not wholly, commercially connected with our sister colonies, we strongly advise the Government to adopt the scheme, and to commence it in about four sections, so as to get it opened throughout as quickly as possible.

We suggest the route for the line from Broken Hill to the South Australian Border at Cockburn, *via* the Pinnacles and Thackaringa, as the mining industry at the Pinnacles requires the aid of a railway to develop it, and a private company is also being projected to afford this facility, and we would advise the Government not to grant powers to another private company in the district.

The Bill now before Parliament for constructing an extension of the present Silverton tram-line to the River Darling at Menindie, a distance of about 80 miles, regarding which we have been asked to report, is also affected by this scheme. We are of opinion it would be unwise to authorise the line, yet it is desirable that access should be given with the river from Broken Hill, and if the Government decide to make the Wilcannia line we would advise the rejection of the Bill.

The seal of the Railway Commissioners of New South Wales was affixed hereto this 16th day of July, 1890, in the presence of,—

E. M. G. EDDY,	Chief Commissioner.
W. M. FEHON,	Commissioner.
W. V. READ.	CHARLES OLIVER, Commissioner.

This is the Report of the Railway Commissioners, as submitted by me to the Legislative Assembly this day.—B.S., 19/12/90.

#### [To Evidence of Harrie Wood, Esq.]

RETURN SHOWING THE NUMBER OF LEASES ISSUED AND IN FORCE, &C, IN THE DIVISIONS OF BROKEN HILL, SILVERTON, MILPARINKA, WILCANNIA, AND COBAR.

Sir, Department of Mines, Sydney, 19 March, 1891.  
I have the honor to forward herewith a return showing the number of leases issued, &c., &c., in the Divisions of Broken Hill, Silverton, Milparinka, Wilcannia, and Cobar. I have, &c.,  
HARRIE WOOD,  
Under Secretary.

The Secretary, Parliamentary Standing Committee on Public Works.

RETURN showing the number of leases issued and in force, &c., in the Divisions of Broken Hill, Silverton, Milparinka, Wilcannia, and Cobar.

#### *Broken Hill.*

NUMBER of mineral leases issued and in force, 144; total area held under lease, 5,402 acres 0 roods 23 perches; located in parishes of Moorkair, Cathcart, Mount Gipps, Yancowinna, Botaira, Sebastopol, Enmore, Tara, Pictou, Soudan, and Yancowinna North, in the county of Yancowinna; Dering, in the county of Farnell.

Number of gold-mining leases issued and in force, 9; total area held under lease, 340 acres 2 roods 8 perches; located in parish of Pictou, in the county of Yancowinna.

#### *Silverton.*

Number of mineral leases issued and in force, 701; total area held under lease, 26,963 acres 3 roods 20 perches; located in parishes of Stephen, Albert, Bomangaldy, Lewis, Bolaira, Mount Gipps, Parnamoota, Alma, Pictou, Balaklava, Robe, Sebastopol, Cathcart, Soudan, Moorkair, Bray, Nadbuck, Naradin, Wankeroo, Tara, Eamore, Umberumberka, Para, Yancowinna, Edgar, Sentinel, Ophara, Mundi Mundi, Dhoon, Coombarra, and Thackaringa, in the county of Yancowinna; Byjerkeroo, Corona, Coombarra, Badjerrigara, Torrowangae, Bligh, Cook, Alberta, Flood's Creek, Dering, and Fowler's Gap, in the county of Farnell; Gairdner's Creek and Bomgadali, in the county of Mootwingee; Doon, in the county of Menindie.

Number of gold-mining leases issued and in force, 3; total area held under lease, 30 acres 3 roods 6 perches; located in parishes of Robe and Yancowinna, in the county of Yancowinna; Badjerrigara, in the county of Farnell.

#### *Milparinka.*

Number of mineral leases issued and in force, 2; total area held under lease, 50 acres; located in parishes of Morden and Koornbergerry, in the county of Mootwingee.

Number of gold-mining leases issued and in force, 24; total area held under lease, 333 acres 1 rood 20 perches; located in parishes of Warratta, Orr, and Milring, in the county of Evelyn; Warratta and Mokely, in the county of Tongowoko; Koornbergerry, in the county of Mootwingee.

#### *Wilcannia.*

Number of mineral leases issued and in force, 42; total area held under lease, 1,809 acres; located in parishes of Bomangaldy, Albert, and Victoria, in the county of Yancowinna; Byngano, in the county of Mootwingee; Pampara, Kirk, and Woraro, in the county of Yungnulgra.

Number of gold-mining leases issued and in force, 8; total area held under lease, 164 acres 3 roods 27 perches; located in parishes of Parkes, in the county of Young; Williams, in the county of Yungnulgra.

#### *Cobar.*

Number of mineral leases issued and in force, 35; total area held under lease, 1,102 acres 0 roods 10 perches; located in parishes of Kalooglegay, Moquillamba, Cobar, Beo, and Mopone, in the county of Robinson; Geweroo, Babinda, and Honeybuckle, in the county of Flinders; Kawilta, in the county of Cowper.

Number of gold-mining leases issued and in force, 32; total area held under lease, 228 acres 0 roods 37 perches; located in parishes of Cobar and Moquillamba, in the county of Robinson.

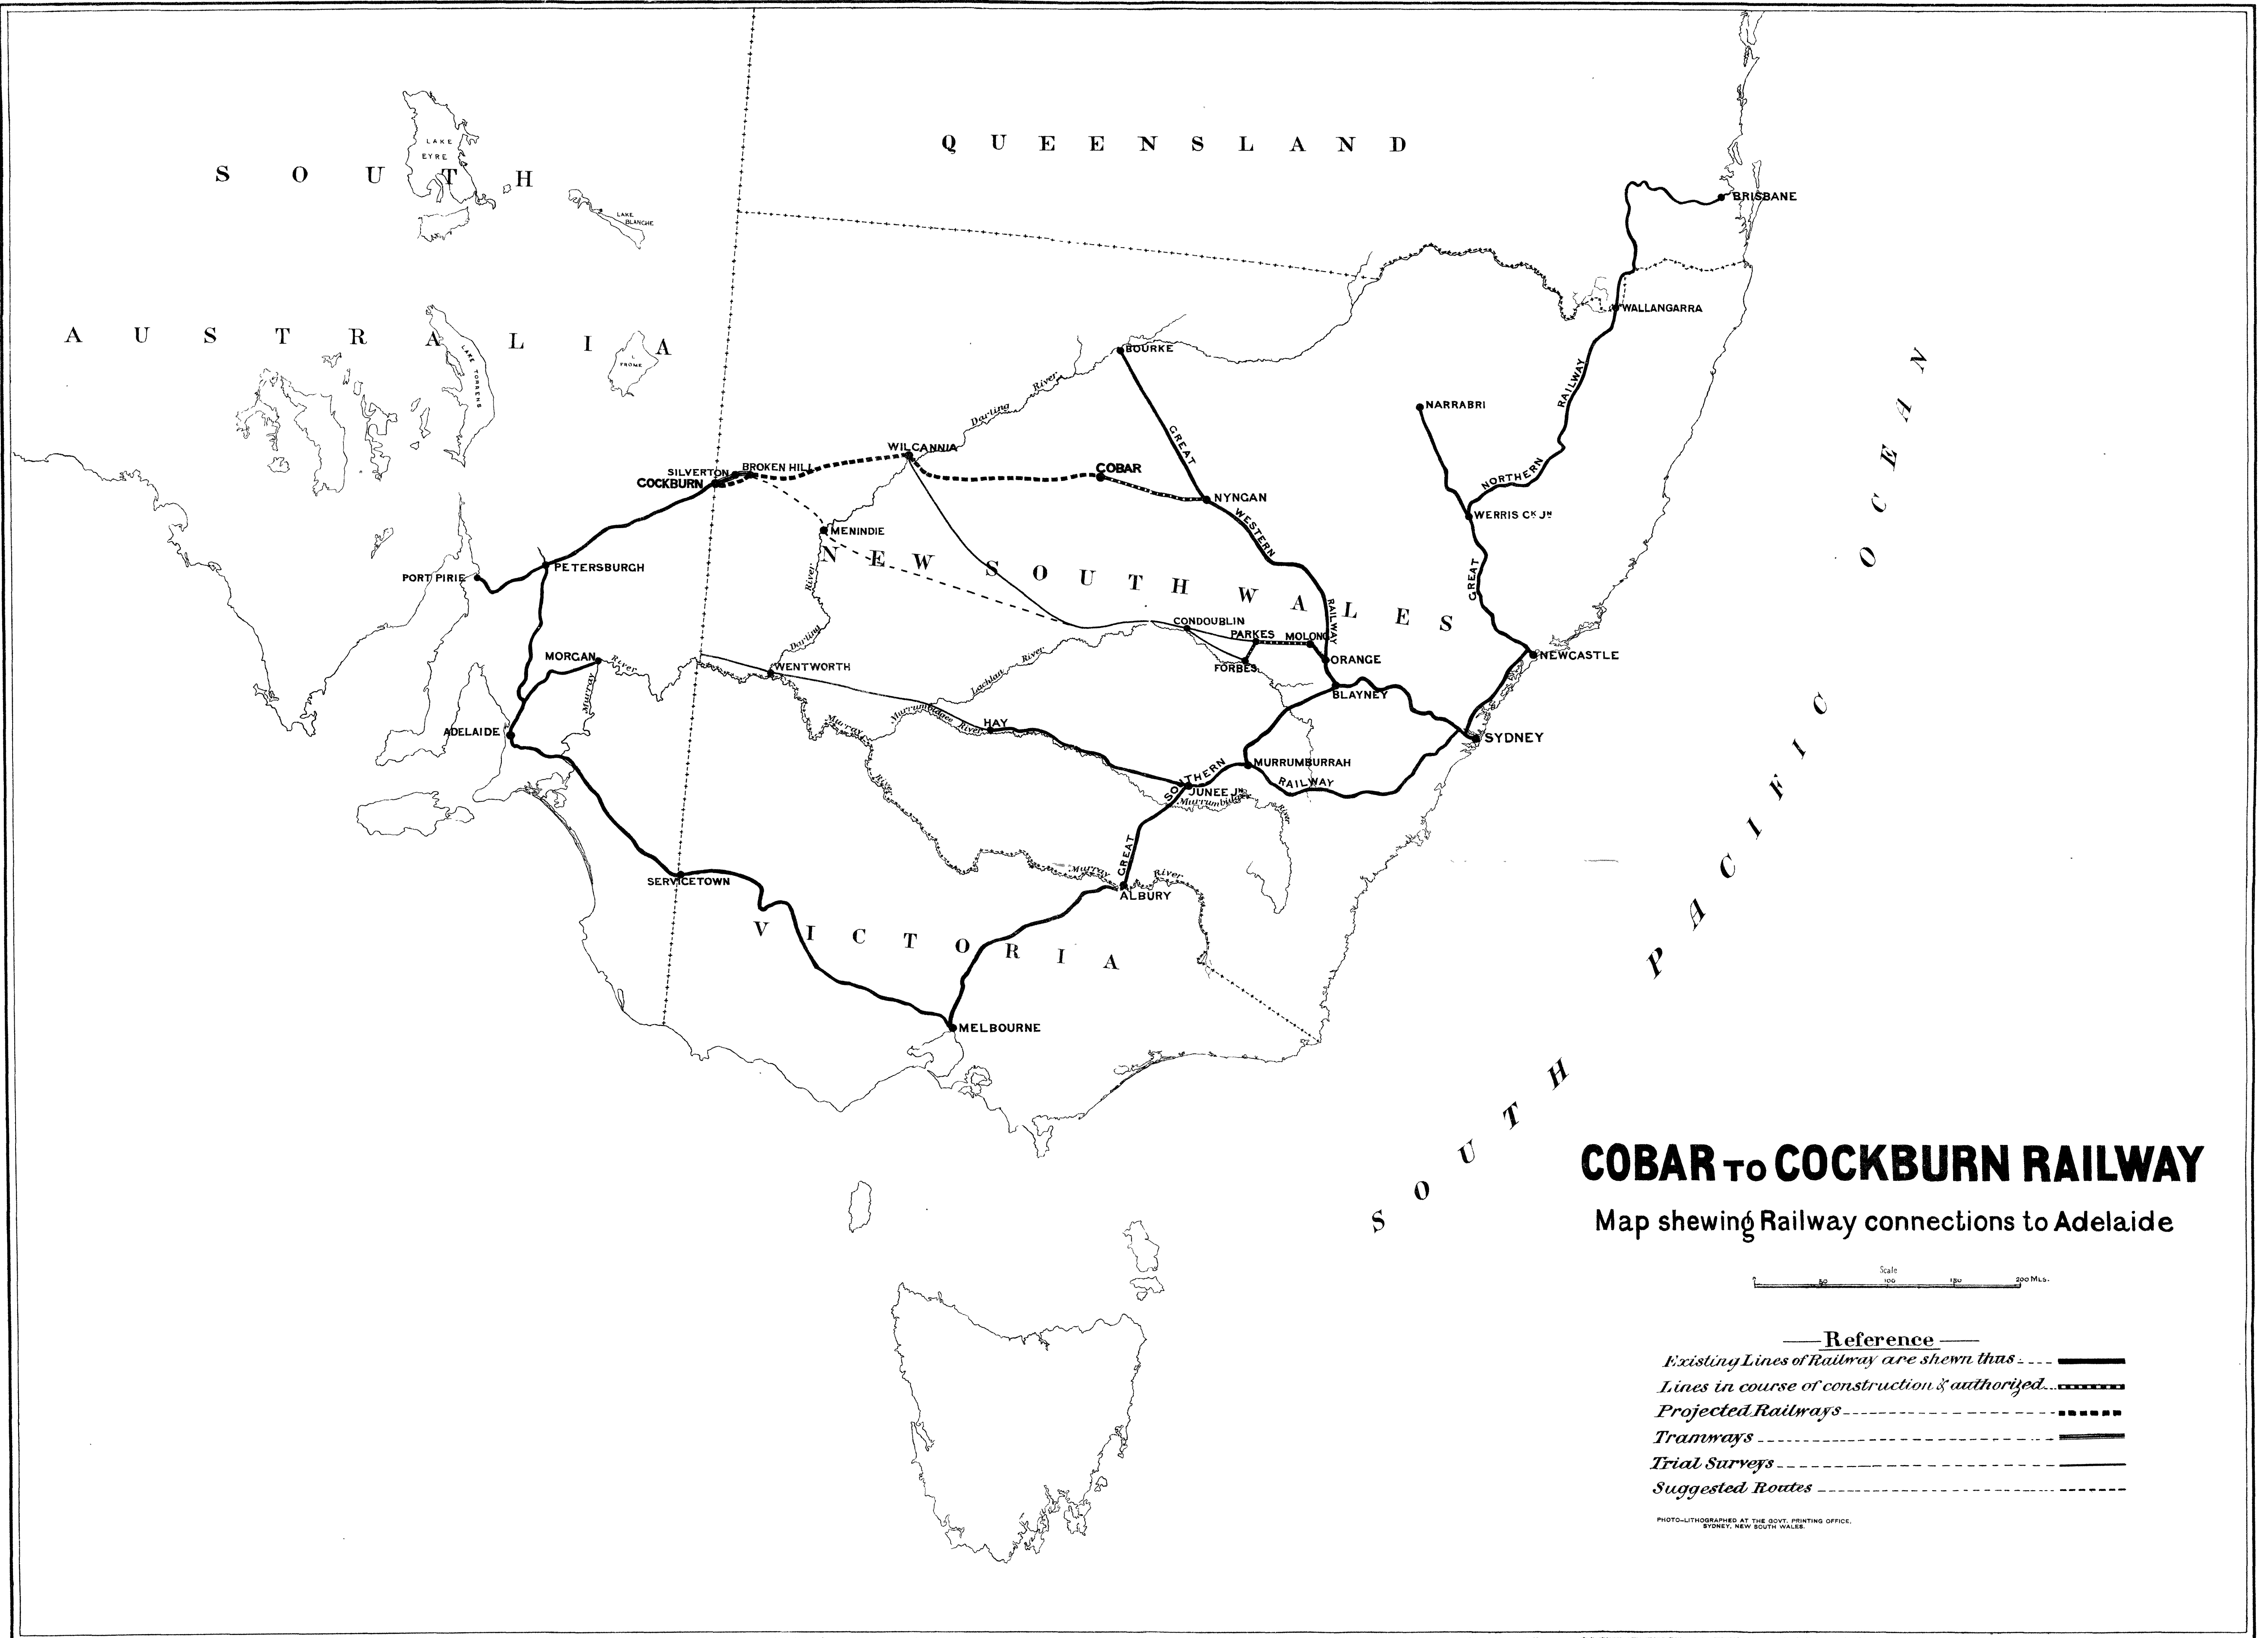

STATEMENT of miners' rights, business and mineral licenses issued, number of men, and value of the machinery employed in connection with the metallic mines in the north-western district of New South Wales during 1890.

1891.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

PROPOSED RAILWAY FROM RICHMOND TO KURRAJONG.

(REPORT OF MR. STANLEY ALEXANDER.)

*Ordered by the Legislative Assembly to be printed, 26 May, 1891.*

Mr. S. Alexander to The Under Secretary for Public Works.

Parramatta, 6 February, 1891.

The proposal to extend the Blacktown-Richmond branch railway through the Kurrajong district originated in a scheme which had for its main object the construction of an alternative line of railway across the mountains, to act as a duplicate to the existing line, on the assumption that duplication of this existing line, to include elimination of the steep gradients and zigzags, that have proved so expensive in working and the main cause of the congestion of the traffic, was practically impossible in point of cost, even if the features of the land admitted of the improvements being carried out at all.

2. This proposal was laid out as a trial survey in the year 1883 between Richmond and Wallerawang. The portion of it which traverses the Kurrajong district is known locally as Lloyd's line, and is shown in full red line on the attached map. The section of this shows the shape of the country, and together with the line laid down by Mr. Wark (shown in blue) sets forth the ruggedness of the features of the upper part of it very well.

3. Applications have been made from time to time since 1882 for the construction of a tramway into the Kurrajong district, but the opinion of the officers of the Department was distinctly against its practicability except by use of steep gradients. At the instance of Mr. G. Bowen, of Bowen Mount, a report was made by Mr. Railway Surveyor Hardy in August, 1889, which points out that the lower part of the district only can be reached, even by steep gradients and at heavy expense, and that the crossing of the Hawkesbury would entail the construction of a new bridge even for tramway purposes.

The line suggested by Mr. Hardy follows the South Kurrajong Road (shown by dotted red line), proposing to terminate near the junction of roads in the centre of the Kurrajong district, at a low elevation. This point is also passed by Mr. Lloyd's line, which, however, reaches it by way of the North Kurrajong Road past Brown's Corner.

4. The subject was resuscitated on the report by Mr. E. B. Price on the whole question of relief of the congestion of traffic on the Western line being published. This reported so distinctly in favour of a line into the Kurrajong district being a remunerative undertaking, that action was immediately taken by the district in pushing the matter, with the result that, on December 11, 1890, an investigation was promised.

5. The deputation that waited upon the Minister on this matter brought forward a fresh proposal, namely, to bridge the Hawkesbury by a new construction at about 22 feet above the bed, to traverse a spur called Thompson's Ridge, giving a more direct route, and, passing under the South Kurrajong Road by a tunnel, to terminate as high up the mountain as possible, at a point which, however, was not expected to be higher than the old stone School-house, an elevation of about 800 feet.

6. The next development of the agitation was a public meeting convened by Mr. William Wark, of the Ridge Kurrajong Heights, to which he presented a scheme of his own for a line of railway on a narrow (1 foot 11 inches) gauge, on the Decauville system, leaving the main line at Emu, crossing the Grose near its confluence with the Hawkesbury, and, passing Box Hill on the south-west part of parish Kurrajong—a district known as Grose Vale—to ascend by steep gradients and sharp curves to a level of 1,653 feet above the sea to the Heights. Notes on this proposal are appended to Mr. Wark's evidence. The opinion of the meeting was, that in view of the action already taken in support of a line from Richmond and the Minister's promise of an investigation, the proposition made by Mr. Wark was premature.

7. The inquiries upon which this report has been based were made in the district between the 20th and 31st of January of the current year.

8. The extent of country that will be directly benefited by the proposed extension is comprised within parishes Currenny and Kurrajong and part of Merroo (portions of county Cook). The whole of this country may fairly be taken to be within the influence of the proposed line, as there is no other outlet for traffic across the Hawkesbury except by the bridges at Windsor and Richmond. The extreme south-eastern part of Currenny only may be said to be midway between these bridges, and equally well served by either, but a railway station at Enfield will attract traffic from this part also. Sackville Reach is far enough away, and not as yet so accessible by road as to admit of its being used from this district.

9. From the north the old Bulga Road passes down through parish Merroo along the Comleroy Road. This is the old established stock route and main line of communication with Sydney from the northern parts of the Colony. The communication from parish Wheeny, lying north of parish Kurrajong, and from the west, is *via* Bell's Line of Road through Kurrajong. The lands on those outlying districts of Merroo and Wheeny are practically all in Crown hands. They will be benefited to some extent by a railway being brought nearer, but no reliance can be placed upon their development in a very long time to produce traffic enough to be appreciable as revenue of a railway. The timber alone may be counted on, and of this there is said to be very large quantities available.

10. The main lines of traffic that traverse the country to be served by the railway are thus seen to be the Bell's Line from the north-west and the old Bulga Road from the north. These meet at Brown's Corner, on the North Kurrajong Road, and pass over the Richmond Bridge;—all other existing roads are branches from these main thoroughfares. It is further seen that the districts which must be relied on to produce traffic for the proposed railway are confined within the parishes Kurrajong and Currency and the southern part of parish Merroo. Some settlement has extended a short distance into the latter parish along the Comleroy Road and along Blaxland's Ridge, a spur that trends north-east from that road down to the Colo, but the furthest settlement is only a few miles from Brown's Corner. Within parish Currency, along the Hawkesbury, on the part known as "The Terrace," the cultivated land extends but 2 miles from Enfield. A leading spur, called the "Bull Ridge," branches from the Comleroy Road at the School-house. This will be traversed by a road extending through to Sackville Reach, a distance of 12 miles, for 6 or 8 miles within parish Currency. There are large holdings of 640 and 1,280 acres on this spur which will be subdivided and sold in moderate-sized blocks when opportunity is favourable. The 640-acre block has already been offered in 17 farms at a reserve of £7 per acre, one of which has been sold. A large quantity of good timber is available on this spur and all over the parish. Railway sleepers have been supplied in quantities from some parts of it. The road to Wilberforce, branching at two points from the North Kurrajong Road, runs eastwards between the Currency Creek and the Hawkesbury, communicating with a large extent of the country. The communications within this parish are seen to be very favourable to its settlement.

11. Parish Currency comprises about 17,000 acres (26 or 27 square miles), and parish Kurrajong about 25,000 acres (under 40 square miles).

12. The order in which the statistics have been compiled has been designed to divide the country into the areas served by the several Post Offices in it. By this arrangement the probable course of traffic from the several parts of the district along the roads of communication can be most readily assumed.

13. The statistics of lands in parish Currency are included under both Comleroy Road and North Richmond, which, including also parts of parish Kurrajong, do not amount to more than 12,000 acres of holdings. There is, therefore, seen to be a very large part of parish Currency, which contains 17,000 acres, for which there are no returns, and which must be taken, therefore, to be still in a state of nature.

14. The statistics of Comleroy Road comprise all the settlement along that road within parishes Merroo and Currency, and some also within parish Kurrajong. There are 34 holdings carrying a population of 217 persons, aggregating 4,237 acres, of which 529 acres are under cultivation. Of this 301 acres are in orchard. The average size of holding is 125 acres. The whole of the traffic from this settlement will pass down the road through Brown's Corner. The production of fruit for 1890 has been given at 11,292 gin cases. The public school shows a register of 84 children on the roll. There is plenty of room for expansion of all kinds within this district, as a portion only of the lands have been taken up by settlers. It is now producing timber for public works. The necessary clearing and killing of bush will produce very large quantities of wood for purposes of fuel. The soil, though very suitable for fruit cultivation, is in general poorer than that of the districts further west, but the shape of the country is more gently undulating. The residents insist very strongly on the adoption of Lloyd's line, providing a station near Brown's Corner, as they claim that their district will eventually carry a large farming population, and will show a greater breadth of cultivation than any of the others, and that a station at any more distant point will be of no benefit to them. The centre of the settlement in the district is about 8 miles from Richmond.

15. The area comprised under North Richmond centres in Enfield and extends along all the roads in both parishes converging at that point. There are 49 holdings, aggregating 7,525 acres, of which 688 acres are under cultivation, carrying 397 acres of orchard. The population is 260 persons, exclusive of residents in Enfield, who may be put at 50 more. There is one property of 2,040 acres in this area and three of 600, 700, and 850 acres each, respectively. Excluding these, the average size of holding is 74 acres. Mr. Charley's 2,040 acres, being a recent purchase, has not yet been developed; but it is his intention to make the most of the favourable situation, and it may be relied on to supply an amount of produce and traffic fully proportionate to its area. The production of fruit within this district during 1890 has been given at 12,852 gin cases. The district extends both ways along the Hawkesbury and 3 miles or so inland. The greatest distance to Richmond from any of the properties cannot be more than 5 or 6 miles. The surface is undulating, without abruptness. The land is all fairly good and should, in such a situation, be utilised to the utmost. The Public School at Enfield shows a register of 74 children on the roll. The soil on some parts of this area is of the very best on the Kurrajong, but the proportion of this is not large.

16. The district under the name of Grose Vale comprises the south-west part of parish Kurrajong, including Bowen Mount and the lands down to the Grose. The number of holdings is 31, and the aggregate acreage 3,973, of which 698 acres are under cultivation. There are 643 acres in orchard. The population is 174 persons. The largest holding on the area is 700 acres, and there are 4 only from 300 to 400 acres. The average is 128 acres. The production of fruit for 1890 is given at 39,624 gin cases. There is some extent of Crown land in this area, but, as described by Mr. Henry Skuthorp, the quality of the greater part of it is inferior, mountainous, and inaccessible. The Bowen Mount Ridge, extending for 3 or 4 miles north and south, with the spurs from it, is accessible from Box Hill, and affords a large area for residential purposes, at a height of about 1,400 feet above the sea—a situation that could hardly be surpassed. The Vale of Arvoa is in the extreme south point of this district.

17. The Kurrajong district comprises 4,110 acres of holdings, of which 1 is 1,000 acres and 1 is 630 acres, in hands of 41 owners. Excluding the larger, the average size of holding is 78 acres. The area under cultivation is 620 acres, of which 477 acres are under orchard, and the production given at

11,704 gin cases. The population is 233. This district covers the hill-side at the foot of the Heights. The highest point of it is probably not more than 1,000 feet above the sea. It is traversed by the road leading to the Heights, which, from about the School-house, becomes very steep. South-westerly the extent of the district is limited by the heavily broken ground about the Gap, but to the north-east there is room for expansion down the valley of the Blue Gum Creek. The bed of the little Wheeny Creek is sunk some hundreds of feet below the level of the ridge at the Cross Roads, so there is an amphitheatre of hilly ground forming the head waters of the creek, which will probably give a very circuitous and expensive route for a line of railway designed to reach a terminus anywhere near the old stone School-house. This point is distant 8 miles from Richmond by the road, but the last 2 miles or so are on very steep hills. The register of children at the Public School at Kurrajong, to which all from the Heights also come, is 73. The whole of the land in the area covered by settlement carries very good soil. The greater part of it is very steeply inclined and rugged, and the quality is not maintained eastwards. The district is essentially suited, by its sheltered situation and mild climate at such an elevation on the south-eastern slope of the mountain, for orchard cultivation and residence. Development of such country, however, entailing very great expense in public works, and in improvement of properties, can be carried out only by slow degrees under any conditions.

18. The geological formation of the whole of the lower part of the districts described is that known as the Wianamatta shales. The Hawkesbury sandstone rocks do not appear except at the highest parts on the Heights and where the shales have been cut through by the watercourses. The soil, being all derived from these shales, is in no wise dissimilar to that found on corresponding formations anywhere else. It is a mistake to describe it as being of the highest fertility, but it is correct to say that, as found in similar situations on the same formation in the Parramatta and Dural districts, it is eminently suited to the cultivation of oranges and lemons. Patches of soil here and there are exceptionally good, the quality being probably due to admixture of decomposed vegetable matter from the abundant forest growths that covered these parts, but in general the product of these shales is a clayey soil which absorbs much labour in working, and cannot be classed very high in natural fertility for general agriculture.

19. The best parts of the country are comprised within the areas known as Grose Vale and Kurrajong; Grose Vale is a misnomer. This district lies immediately surrounding Box Hill and the School and Post Office on the South Kurrajong Road, and is separated by miles of extremely rough and comparatively worthless country from the Grose River. Kurrajong lies in the valley of Little Wheeny Creek. Eastwards of these districts, extending to the extreme limits of parish Currency, the undulations are less rugged and the soil is poorer, the good patches bearing a smaller proportion to the whole. The lower lands along the Hawkesbury are exceptionally good.

20. The statistics of Kurrajong Heights comprise the settlement that has taken place on the highest part of the country, all at an elevation of over 1,400 feet above the sea. The Post Office is at about 1,600 feet; Mr. Comrie's house at 1,870 feet; the Trigonometrical Station is 1,955 feet, and the highest point is 2,005 feet. The number of holdings is 21, aggregating 2,190 acres, of which 203 acres are cultivated exclusively in orchards, the production of which is given as 11,704 gin cases. The population is 119, but including that of the village it may be 150. One holding of 690 acres is quite in a state of nature. The actual extent of the settlement is seen to be insignificant, but the area available for small orchards and for residences is extensive. The Heights should properly be called "The Talbragga Ridge." Bell's Line of Road crosses this ridge and falls hundreds of feet on the east side. Lloyd's trial survey tunnels under it. The ridge extends for some miles north of the road and southwards 2 or 3 miles to a saddle called the "Devil's Hole," maintaining about the same elevation, namely, 1,800 or 1,900 feet above the sea. The Bowen Mount Ridge then extends south of this point for 3 or 4 miles at an elevation of about 1,400 feet. A drivable road has been cut for private use from Bowen Mount to Bell's Road along the ridges. Bowen Mount is reached at present by a very steep road from Box Hill. The whole extent of the elevated Talbragga Ridge and its spurs may be taken to be the site for the settlement on the Heights, being sufficient to carry a large population. There is a considerable quantity of Crown land on this ridge. The formation is the Hawkesbury sandstone. With regard to the advantages of this place as a sanatorium and Summer resort, a reference to Mr. Price's report, a copy of which is given in Appendix, will save further description. The climate is particularly mild, enabling cultivation of oranges and lemons alongside all kinds of English fruits. A fall of snow on the Heights is a rare occurrence, and its continuance on the ground so rare as to be fairly termed phenomenal. The rainfall is heavy occasionally, though the mean to date has been 50.50 inches only. During 1889, 58.76 inches, and during 1890, 87.16 were recorded, but during 1870 it was 111.80 inches.

21. A noticeable feature in all these statistics is the low average given as the production of orchards. This average is 52 gin cases (equivalent to 65 packing cases) per acre, or at the rate of less than one per tree. The explanation is that the cultivation in this district has been undertaken during the last 12 years only, and that a large proportion are young trees, but lately planted or not in full bearing. Taking the acreage as correct, the production within the next few years may fairly be estimated at 150,000 to 160,000 gin cases of marketable fruit, but the actual outturn from these districts during the 12 months ending June 30th, 1890, was only 66,870 cases, as given by the books of Richmond Railway Station, so there is ample room for increasing the production of the orchards.

22. The market for oranges and lemons has been for the most part in Sydney; but it seems that the produce of the Kurrajong is sent largely to Brisbane and Melbourne both by rail and by sea. This very important export trade is certainly deserving of all the support that can be given to it fairly, as the traffic of long lines of railway is benefited. Railway transport for fruit has great advantages over that by sea as so much handling and rough usage is avoided.

23. The first difficulty met with on the extension of the line beyond Richmond is the crossing of the Hawkesbury River. This presents a depression, measured on the trial survey, at the top of the high flood of 1867, of 82 chains in length, of which 60 chains covers the flat submerged land on the Richmond side, and 8 chains the extent of the flooded land on the Kurrajong bank, leaving 14 chains or 924 feet for the span of the Hawkesbury River. The highest flood occurred in June, 1867. This was measured by Mr. John Tebbutt, of Windsor, to have been 62.7 feet above the mean tidal level at South Creek, Windsor. The next highest known flood was in June, 1864, which was measured at 47.4 feet above mean tidal level at the same place. These may be taken as representing 65 and 50 feet respectively over the river bed at the proposed crossing of the railway.

24. The flood of 1867 covered the flats to a depth of 15 to nearly 30 feet. As the water from the main channel had broken over the bank at Yarramundi, there is said to have been a strong current along Cornwall's Lagoon. This occurred in 1864 and again in 1870, during the flood which is recorded by Mr. Tebbutt as having been 44·4 feet high over the mean tidal level at South Creek, or say 47 feet at the proposed railway crossing; but, though there have been two minor floods since then, the inundation of the flats has been caused only by back water from lower down the river.

25. The existing road bridge over the Hawkesbury was built over 30 years ago by a company to whom a concession was granted with rights to charge tolls. Its deck is about 10 feet above the bed of the river, but it has never been seriously damaged by floods. The piers are still in a good state of preservation, and the decking is now being renewed. The bridge at Windsor was built in the year . . . Its deck is about 14 feet above the bed of the river. It has also successfully withstood many floods.

26. The river is very sensitive. Draining a very large area of mountainous country, the accumulation of water on the lower reaches is very rapid after rains. Stoppage of traffic is therefore frequent.

27. The probable cost of constructing a bridge over the Hawkesbury at a level above all known floods, or the cost and practicability of one at any lower level, can only be considered with caution in the absence of all data. The evidence that two low-level bridges have stood securely is in favour of the presumption that a railway bridge would also be safe, but there are many other points in the matter to be considered, and I do not believe at present that, when all the conditions are taken into consideration, a railway bridge over the Hawkesbury at any level lower than above the highest flood will be found practicable.

28. One of the chief points to be decided in the design of a high-level crossing is whether the whole extent of flooded land should be bridged or only part of it. The cost of embanking would be about half that of a timber viaduct, so the saving, if one-half of the whole extent only is bridged, would amount to £8,000 or £9,000. On this point I cannot offer any opinion at present. The cost of the whole viaduct would be so great that after all this saving would be but 10 or 12 per cent. on the total.

29. Between the river and the Heights the courses of the proposed lines are governed by the positions of the natural ridges. The main roads all without exception follow the watersheds of the main drains. These watersheds are very strongly marked features. The objective point to be reached also limits the choice of routes. The direct distance between the settlement on the Heights and the crossing point on the river is but  $6\frac{1}{2}$  miles, while the vertical height to be overcome is 1,500 feet, whereas the point sought to be reached by the proposal of the Richmond League is, in a direct line,  $5\frac{1}{2}$  miles from the river, and the vertical height is but 750 feet. Lloyd's line was designed to cross the Talbragga Ridge at a certain level, and with that object in view his route was well chosen; but the summit level reached by his line was under 1,150 feet above the sea, whereas at least 1,600 feet must be attained in order to carry out Mr. Wark's views as to the service of the Heights. Lloyd's line was, in fact, in tunnel some hundreds of feet below the spot on which the settlement stands. To reach an accessible point on his line from the Heights would entail a descent of 500 or 600 feet down the Cut Rock Road, on the opposite side of the ridge.

30. The impracticability of reaching the Heights by grades and curves admissible on the standard gauge lines is shown by the adoption of the narrow gauge, steep grades, and sharp curves by Mr. Wark's advisers. The lines actually cross near Box Hill at a level of about 700 or 750 feet above the sea. The remainder of the rise to the Heights is attained by Mr. Wark's line in a length of about  $6\frac{1}{2}$  miles.

31. The point chosen by the Railway League, viz., the old School-house, can be reached on the line indicated by them (shown in green), viz., along Thompson's Ridge, by adopting a tunnel under the South Kurrajong Road, and some heavy work in the basin, and crossing of Wheeny Creek. There is information enough to hand to allow of the opinion that the gradients will certainly be flatter than 1 in 40, and the works between the river and the tunnel of a light character. The alternative lines *via* the South Kurrajong Road passing Box Hill, or *via* North Kurrajong Road (Lloyd's Line) passing Brown's Corner, both possess the advantage of rising to a higher level, but their extension to the foot of the Heights at the School-house is hardly practicable. In length all these lines will be about the same, and in point of cost and working gradient there will also be little difference.

32. As a selection among the routes is not to be made now, the question as to their relative suitability is important only in so far as it bears upon the point as to how much of the traffic of the districts to be served will be carried by the line if it is made. The greatest distance to be travelled from any holding in the district to Richmond is so short, that in fact the saving to any resident on Comleroy Road or Grose Vale will be inconsiderable, and it will be found here, as elsewhere, that a portion of the traffic of the country will, as heretofore, be actually conducted along the road in communication into the town from which the supplies are drawn. The figures supplied by the League must be discounted to provide for this contingency; but the fact is, they will not bear much of such treatment.

33. According to existing rules the rates chargeable on goods for the short distance they will be carried on the extension, are so low that there must be an enormous expansion on every line of production and consumption before any substantial sum can be realised as revenue.

34. The extreme distance will be 48 miles from Darling Harbour, Richmond being 39 miles. Deducting the rates for these mileages, the following gives the charges on the extension between the furthest points, viz., 8 miles:—

Classes.	Miscellaneous.	A.	B.	1st.	2nd.	3rd.
	d.	d.	s. d.	s. d.	s. d.	s. d.
Per ton ...	9	11	1 6	3 0	3 9	5 3

On fruit from Richmond the present charge is  $1\frac{1}{2}$ d. per gin case. From Enfield the charge would be 2d. per gin case, leaving  $\frac{1}{2}$ d. per case for the charge on the extension, and from the terminus the charge would be  $2\frac{1}{2}$ d. per gin case, leaving  $\frac{1}{2}$ d. per gin case. Taking the mean charge at  $\frac{1}{2}$ d. per gin case, on 200,000 cases, the revenue realised would be £416. This is assuming an enormous expansion on realised results. The total production of the orchards has been given at 104,171 gin cases, and it has been allowed

in

in paragraph No. 21 that 150,000 to 160,000 cases of marketable fruit may be assumed to be the production within a few years from the given area. These figures have been arrived at from the evidence of the settlers themselves. The actual quantity of fruit sent to market from Richmond Railway Station was, however, 66,870 cases during the year ending June 30th, 1890. There being no other way out of the district, this record must be taken as being indisputable, and the discrepancy may be attributed to weather or to bad season. In any case, the fact remains that there must be a very great expansion before a profit can be made on the carriage of this item alone.

35. Much reliance has been placed on the quantities of firewood that will be available. The consumption of Sydney, which has for so many years been draining the supply along the existing lines as far as Penrith and Picton, is increasing. The lands north of the Hawkesbury may be said to be as yet intact and certainly capable of supplying large quantities. For this trade, however, it seems that a migration of sawyers and carters will take place from other points, as the length of road carriage from the bush to the stations will, for a long time, be so much less on the new extension. This implies that revenue will be made on the new line at the expense of that of existing lines. The despatch of firewood from certain stations is here given to show what is actually being done. One of the largest items of import into the district will be manures, which are more or less a necessity for orchards, as the trees age. From 300 to 500lb. per acre is given as the proper quantity to be used. This would amount, on half the acreage planted, to from 135 to 225 tons per annum. See Appendix

36. The passenger traffic is a purely speculative figure, which can only be realised when the expected Summer resort has become an accomplished fact. This, under any circumstances, must be many years in attainment, and it is openly stated on the Kurrajong, that a railway to a low level will never bring it to pass. At present the total number of families resident in that part is under 70, and the population is under 400, while on the Heights there are but 25 families and 150 persons.

37. It is seen that the greater part by far of the expected profit shown in the League's estimate is from the increased traffic on the existing line between Sydney and Richmond, which will result from the anticipated expansion of all kinds that will take place on the Kurrajong. The value of this estimate can only be tested in one way, since it is admittedly all speculative. The question is, will these sums or any part of them, be revenue additional to that now being earned by the existing lines, or will it be filched from their earnings. The very arguments used in favour of the line supply the answer. It is to the superior advantages claimed for this situation over other places on the Western line, that the population and traffic is looked to. In Mr. Price's words, "It will at once rival and probably surpass all other Summer resorts." These are no grounds for the creation by the State of competition with their own lines to other places. It needs rather to be shown that a distinct want is felt by the community of a Summer resort of the kind, or that a substantial and permanent expansion in production, and the settlement of a permanent population on lands hitherto unproductive, will follow.

38. As to the want of a Summer resort, the comparison is not so very unfavourable to places on the Western line. Falconbridge, at 49 miles from Sydney, at an elevation of 1,463 feet, is at about the same distance as would be the terminus of the proposed line, at about 800 feet of elevation. The Heights are 2 miles further, up a very steep road, and from 800 to 1,200 feet higher. Mount Victoria is 77 miles from Sydney, at an elevation of 3,422 feet, and there are eight other places intervening between Falconbridge and Mount Victoria, all over 2,000 feet above the sea, and at distances from 54 to 73 miles from Sydney.

39. As to the development otherwise, the area of the country that will be directly influenced comprises 66 square miles, or 42,000 acres only. This includes a very large area in the west and south-west part of parish Kurrajong, which is practically useless for all purposes of cultivation, and can be developed but very slowly, if ever, but in which lies the greater part of the Crown lands. The area of Crown lands on the Heights is on ground so broken or precipitous that its occupation must be deferred for a long time. Though the possibilities of the district in the course of time may be unlimited, all experience goes to show that a population of 1,000 people, representing under 200 producers occupying the area given, will not develop from the land a traffic to keep a railway in work, and that a very large increase in settlement, and great subdivision of holdings, must take place before such a result can be hoped for.

40. Respecting Mr. Wark's proposal to connect with the Western line at Emu, the advantages that can be claimed for it are, that the expenditure on the crossing over the Hawkesbury is avoided and a position for a station on the Grose is obtained that will attract a tourist traffic to the Vale of Avoca, amounting, according to Mr. Wark's estimate, to 5,000 annually. A narrow gauge railway, as a State undertaking, being out of the question, it has been shown that a standard gauge line cannot be made to reach the Heights. This line will, therefore, have to be taken into the Kurrajong to a terminus on the South Kurrajong Road, near Blady Grass Hill. It cannot, at any reasonable cost, be carried to the old School-house. The natural features of the land will make this an expensive route, but there is nothing serious in the way, and the average cost per mile will not be high; but in the aggregate the extra length to be constructed from Emu will raise the grand total. This extra length is estimated to be about 6 miles.

41. This line has not yet been proposed, but the connection with Emu having been suggested and the facts brought out by this inquiry being adverse to the line from Richmond, the local interests in Kurrajong will certainly be brought to bear upon this connection, which will to all intents and purposes be of as much service to them as the extension from Richmond.

42. It is hence necessary to point out that the facts elicited by this inquiry respecting the Richmond-Kurrajong line, and the conclusions drawn from them, are equally applicable to a line from Emu or from any other point into the Kurrajong. An additional argument against the connection with Emu is that the diversion of the trade of those districts from Richmond, the terminal point on the existing line for so many years, in which all the trade has been done, will be a blow to the interests of all kinds in that place which will certainly need very strong justification before it can be sanctioned.

43. In conclusion, I would submit that the area of the country to be served in the Kurrajong districts is too small to warrant the hope that a legitimate and permanent traffic in local produce and consumption can be developed sufficient to justify the heavy expenditure in construction of a railway into it, either from Richmond or Emu. That the disabilities under which producers labour in the matter of distance from a point in the existing railway and in communicating with it are infinitesimal compared with the difficulties encountered in other parts of the country. 44.

44. One point in favour of this proposal is that it would be an extension of an existing line that can be worked without any great expense in staff or equipment, and not a branch entailing the cost of a junction station and a separate establishment and rolling stock which cannot be fully employed; but all these objections apply against the construction of a branch from Emu.

45. A large part of the traffic claimed as the produce of the district can be realised only at the expense of the revenues of the existing lines, and even this is not of a permanent character. There is no lack of timber for fuel within easy distances from Sydney. Fuel is now being taken into Melbourne from points 100 miles distant. The market price obtainable governs the distance from which it can be brought, and the influence on this price, by the sudden introduction of the large quantities necessary in order to make an appreciable revenue for the proposed line, would certainly bring within reach other areas now unused. This traffic is not of a nature that can be properly claimed as a main reliance. It should rather be treated as a contingency in support of other permanent sources of revenue.

46. It is very doubtful that the creation of a new Summer resort will result from a scheme which can only reach such a low level on the mountain. It is not clear at all that the existing townships and settlements on the Western line will not sufficiently satisfy all such demands for another generation, but there is no doubt that the construction of a line to open out a new Summer resort in competition with existing lines, and to the detriment of standing interests which have been created by the State, is quite unjustifiable.

STANLEY ALEXANDER.

P.S.—I am requested to point out that specially high rates for carriage of goods are charged on the Camden Tramway, and that the General Traffic Manager has suggested the imposition of high rates on the proposed extension of the railway into Nowra over the Shoalhaven River. The extension across the Hawkesbury into Kurrajong is a nearly parallel case, as the crossing over this river is the main difficulty to the traffic by road. The rates would be in the nature of a toll. As, however, the road bridge cannot be abolished, it would be in a still better position in competition with the railway. The object should rather be to make the railway attractive in every way.

1891.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

## THE PROPOSED RAILWAYS FOR RIVERINA.

(REPORT OF MR. STANLEY ALEXANDER.)

*Ordered by the Legislative Assembly to be printed, 26 May, 1891.*

Mr. S. Alexander to The Under Secretary for Public Works.

### PART I.

Sydney, 30 March, 1891.

THIS inquiry was instituted by direction of the Honorable the Minister for Public Works, to ascertain whether certain lines of railway, asked for by landholders and others in different parts of the tract of country known as Riverina, were such as would open up the country and be self-supporting if not remunerative. As each line is advocated in the interests of the particular district which its supporters have selected for their own personal objects, it cannot be expected that any one of them would be comprehensive enough to serve such a large extent of country.

2. The whole of Riverina is very easy country for railway construction, the scarcity of certain necessary materials and the distance from the seaboard being the only conditions tending to enhance the cost of construction above the minimum. Thus it happens, the cost of construction per mile being so nearly the same for different lines, and there being no natural difficulties in the way, a line can be projected in almost any direction across the country. The lines advocated do in fact cross each other, having for their objects the attraction of the coveted traffic to particular centres at points on the existing lines of railway, or are designed to carry the traffic in the direction considered by their promoters to be most beneficial to their own interests. It is therefore necessary to deal with the whole country at once, and not, as in ordinary cases, to consider each project on its own merits.

3. The instructions in fact did not limit this inquiry to the particular routes indicated by the promoters, nor, in taking into consideration the merits of any one route asked for, was it to be understood that the claims of that part of the country alone were to be considered.

4. A fairer field for projects for railway construction, one less trammelled by difficulties of construction or more promising as revenue producing in the future is seldom presented for consideration. Nearly the whole of the country is land that can be ploughed and will bear crops. The extent covered by natural features such as rocky hills or swamps, which must ever remain in a state of nature bears an insignificant proportion to the whole. The rainfall on the area is fairly good and over larger portions on the eastern half, which are of the finest class of cultivable land, the rainfall is exceptionally regular.

5. Extensive tracts of this country now carry a farming population who have proved the quality of the land by cultivation and have given proof of their faith in it by the prices they have paid for their farms. All the land offered for sale by the Government has been, with few exceptions, taken up at prices higher than is generally considered to be remunerative for land to be used for grazing sheep only. Much of it has been sold as "special areas."

6. A large tract of country on the south-west part of Riverina is occasionally covered by flood waters from the Murray, and is intersected by water-courses and ravines. Much of this country is covered by forests of red-gum, a timber which thrives best in the parts that are most frequently submerged, or are actually in a constant condition of saturation. This tract may comprise roughly one-fifth of the whole of Riverina. It is contained within the Edwards and Murray Rivers.

7. During conditions of flood in the Murray, the peculiar configuration of the land in the neighbourhood of Howlong, Oil-tree Lagoon, and parts of the Billabong and Urangeline Creeks occasions a complication of overflows along low hollows connecting these rivers. It happens, at long intervals of time, that the natural water-courses that are the more or less well defined drains of the high country traversed by the main line of railway between Wagga Wagga and Albury, become, by these over-flows, the recipients of the surplus waters from the Murray River itself. The extent of land so flooded is not very great on the whole, but the volume of flood-waters passing over is very considerable, and must be reckoned with in designing a railway line. Moreover, the course and extent of these floods may be taken as roughly representing the extent of what is called in this country the "plains land," as distinguished from the "forest land," or, in fact, the only part of the "plains land" in the eastern and south-eastern part of Riverina, which may be assumed to be unfit for cultivation.

8. The eastern part of the country is hilly. The summit level is at Mount Galore on the north-east, and thence the ridge follows about the boundary of counties Urana and Mitchell southwards; thence divided by the Billabong Creek, the hilly land turns westwards to Gumbargna. From Mount Galore the trend of the watershed is north-east, crossed by the Narrandera-Jerilderie railway a few miles from Narrandera, and terminating opposite Yanko. East and north of these limits, which on the whole are but a small part of Riverina, lies all the hilly land in the country; the rest is all very level. There is a block of high-lying country extending east and west through Murray Hut, Borrigan, and Saverlake; also an elevated tract of land called Clear Hills, between the Billabong and Coreen Creeks; but these do not offer any difficulties to railway construction.

9.

9. The whole of the country is divided centrally from east to west by the Billabong Creek. This water-course is crossed by the main line of railway at Culeairn. It is joined by the Cockotjedong Creek, which carries the greater part of the drainage of the north-east, after it has passed through Lake Urana, and at the same point by the Columbo Creek from the north; thence, after having passed Jerilderie, it is joined by the Yanko Creek, and, under the name of the Moulamein River, it flows into the Edwards River at Moulamein.

10. The Edwards River obtains all its water from the Murray at numerous points at and west of Tocumwal. These off-takes from the main stream all converge near Deniliquin into one main channel. West of this point all the tributaries and branches of the Edwards, and all the network of independent water-courses covering the large area of country enclosed between that river and the Murray are dependent on the Murray itself for their water. The rainfall on such an extent of country cannot feed so many drains. This tract forms the southern part of county Wakool, and the west part of county Cadell.

11. North of the Edwards River up to the Murrumbidgee the plains extend west and east from Balranald across the Narrandera-Jerilderie line. A line drawn between Morundah and Brookong; thence south-west to Gunambil, and following the course of the Billabong for about 15 miles, passing 7 or 8 miles south of Jerilderie, and then bending south-west to Tuppal, will represent nearly the boundary between the "plains" and the "forest land" in Riverina. These are the terms used in these districts to distinguish these classes of country. They indicate, not merely the land that is treeless and that which carries timber, but definitely the land that is cultivable and that which cannot be relied on to yield crops profitably. There are similar treeless patches, some of them of considerable area, scattered all through the "forest land," and a width of some extent is found along the banks of all the main water-courses. From this and other features peculiar to them their character may be described as resulting from lodgement of water. In parts, the soil on these lands cannot be inferior, if of sufficient depth, to some of the best soil in the forest land, and much of it has been proved to be capable of yielding good crops. Considerable settlement has taken place on similar land to north of Deniliquin and southwards down to Moama, but in general, though carrying good grass, the land is unsuitable for farming. So long as there remain unoccupied areas of land within the "forest" country to be offered for sale, whether by the Government or by private owners, these extensive tracts of "plains" will continue in use as sheep runs only.

12. It is noticeable throughout the central and western parts of Riverina that the best soil is found on the higher lands. The country surrounding Mount Galore, from head of the Boree Creek, extending to near Brookong, and southwards for a width of about 25 or 30 miles from the main line of railway, is mostly all of the finest quality. Some considerable areas of similar land are found in the neighbourhood of Urana, and the whole block of the Clear Hills, comprising about 30,000 acres of land, is about the best soil in the country. Similarly the whole of the high land, the centre line of which passes through Murray Hut, Berrigan, and Saverlake, is very good soil. These districts have been selected for settlement, and now carry the major part of the population who have supplied the statistics, and on whose representations this inquiry has been instituted. It is the land within these districts which, according to the professions of the pastoral holders who have secured such large areas of it, will be cut up and offered for sale in farms as soon as railway facilities render its value too high to justify its retention for grazing purposes.

13. The River Murray forms the southern border of Riverina. The following points on this border have been touched by main or branch lines of railway of the Victorian system. The most eastern point is Wodonga on the through line to Sydney, at 187 miles from Melbourne. Next, proceeding westwards down the Murray, comes Wahgunyah, at 173½ miles from Melbourne, opposite Corowa. A bridge over the Murray connects these towns. Then comes Yarrowonga; it is opposite Mulwala; a bridge connecting these towns is being built over the river. Yarrowonga is 162 miles from Melbourne. Cobram, 155 miles from Melbourne, is at a point on the Murray about 8 miles above Tocumwal. Strathmerton Railway Station, 145½ miles from Melbourne, and about 9 miles from Tocumwal, is the accessible point on the railway from that place. Echuca is 145 miles from Melbourne. The Victorian line is here continued through, along the Deniliquin and Moama Railway Company's line, 45 miles inland into New South Wales to Deniliquin, which is 190 miles from Melbourne. Koondrook is opposite Barham. It is the terminus of a short district line branching from the main line at Kerang. It is 194 miles from Melbourne. Swan Hill is 214½ miles from Melbourne. This is the most western point touched on the Murray by Victorian lines.

14. Wodonga, Wahgunyah, Yarrowonga, Strathmerton, and Echuca are the points on the Victorian lines through which the whole of the traffic of the southern and most of the western part of Riverina passes. The river having been bridged between Corowa and Wahgunyah, the bulk of the traffic from south-west Riverina crosses at that point, and a substantial bridge now being built between Mulwala and Yarrowonga will further improve the connection with Victoria. Between Tocumwal and Strathmerton the road is periodically flooded and otherwise difficult, but the river gives easy access to Echuca, and the Deniliquin and Moama line is practically an extension of the Victorian system into Riverina.

15. The first proposition for a railway for developing Riverina was made prior to 1878, and was recommended by Mr. John Whitton, late Engineer-in-Chief, in a letter dated January 10, 1878. The surveys which were made were subsequently lost in the Garden Palace fire. This route left the main line of railway at Hanging Rock, and passed through Urana and Jerilderie to Hay, with a branch from Jerilderie to Deniliquin. The line from Deniliquin to Moama was at that time in full work, having been opened for traffic on July 4th, 1876.

16. The following lines have been constructed:—Leaving the main line at Junee at 287 miles from Sydney, and traversing the north bank of the Murrumbidgee River to Hay, 454 miles from Sydney. This length of 167 miles was opened for traffic in July, 1882. The cost is given at £940,874, being an average of £5,634 per mile. From this line, at Narrandera, a branch was taken across the Murrumbidgee to Jerilderie, 412 miles from Sydney, a length of 65 miles, at a cost of £406,648, being an average per mile of £6,256. There is a line now under construction from Culeairn, on the main line, at 356 miles from Sydney, to Corowa, a length of 47 miles 40 chains, placing Corowa at a distance of 403½ miles from Sydney. The Company's railway from Deniliquin to Moama was opened for traffic on July 4th, 1876. Its length is 45 miles, and its cost is given at £162,672. This sum is inclusive of all charges. It gives an average cost per mile of £3,615. The gauge of the railway is the same as that of the Victoria lines, viz., 5 feet 3 inches. The gap thus left between Jerilderie and Deniliquin is, as surveyed in a direct line, 44½ miles.

17. The following proposals have been made for railways for the service of this country, each having been put forward by separate advocates:—

Hay to Deniliquin.—This has not been proposed for construction by Government, but by a private Company who, in the Session of 1887, failed to obtain legislative authority for its construction. The length is about 73 miles.

Jerilderie to Deniliquin.—Length, as surveyed, 44½ miles.

Jerilderie to Tocumwal, *via* Murray Hut.—Length, about 35 miles.

Jerilderie to Mulwala, *via* Berrigan.—Length, about 53 miles.

Coonang to Urana.—Length, about 16 miles.

Oil-tree Lagoon, *via* Burraja, Daysdale, and Berrigan, to Murray Hut.—Length, about 62 miles.

The Rock  
Yerong Creek } to Urana.—Length, about 48 miles.

#### THE PROPOSED RAILWAY FROM JERILDERIE TO DENILIKUIN.

18. As the country passed through by the Deniliquin-Moama railway occupies a somewhat unique position within Riverina, it is chosen first for consideration. The area within the influence of this line would also be passed through by the lines from Hay and from Jerilderie to Deniliquin. The central position of Deniliquin and its connection with the Victoria system by a railway on the same gauge, allowing of interchange of rolling stock and uninterrupted communication across the border by a permanent bridge, gives it peculiar facilities and a command of traffic.

19. The Deniliquin-Moama railway carries all the traffic, both inwards and outwards, from an extent of country including the whole of counties Townsend and Cadell, and a part of Wakool, as far as Moulamein westwards. Its terminus at Deniliquin is only 190 miles from Melbourne, while Jerilderie, the nearest point on the New South Wales lines, though 45 miles only distant from Deniliquin, is 412 miles from Sydney. See Appendix No. 42

20. By aid of reintroduction certificates, goods from Sydney taken by sea to Melbourne, and carried across Victoria, are brought into Riverina, burdened only with small incidental charges. Goods imported from Europe are taken across Victoria in bond, and pay New South Wales duty when dutiable at Moama. See Appendices Nos. 25 and 25A

21. The operations of this railway best illustrate its usefulness to the country it serves. The following are returns at Deniliquin terminus, compared with those at Hay and at Jerilderie for the twelve months ending 30th June, 1890. See Appendix No. 55:—

	Deniliquin.	Jerilderie.	Hay.
Goods outward.....	16,350 tons	2,897 tons	1,033 tons
Goods inward.....	3,742 "	2,431 "	6,579 "
Wool outward.....	23,400 bales	4,053 bales	3,456 bales

The live stock carried southward into Victoria was—336,000 sheep, and 333 head of cattle. These are stated to have been below the average. On 19th and 20th August, during the inspection, one lot of 400 head of cattle from Queensland were in process of transportation. The wool had been collected by carriers from thirty stations at distances of 50 miles north and 68 miles west of Deniliquin. The station supplies returned by the carriers from Deniliquin amounted to 585 tons. Of wheat from the neighbouring farms, the railway carried 58,817 bushels.

22. To the construction of this railway is due the whole of the agricultural and industrial development that has taken place in the country embraced by its influence. During the last few years there has been no development, on the contrary a decline has taken place. There being no limit to importation into the country by way of Victoria, but a practical bar to all export, either to Victoria or into New South Wales, no interchange of produce or manufactures can take place. The exceptions being wool and live stock, the land is naturally being devoted to the production of these commodities. Agriculture needs free communication with outside markets. Farmers cannot sell their produce to each other. A larger amount of the products of the soil have been produced than can be sold. The balance is stored, and less acreage is laid out in cultivation during the next season, the land being used for grazing, a business for which there is an unlimited market and a certain profit attainable, free of the discouragements that surround the raising of crops. Under such conditions of things it is found, as may be expected, that the small holdings are being bought up and the acreage in individual hands is being increased. The number of families resident in these districts is said to be fewer now than was the case some years ago. Grazing can only be carried on profitably on large holdings, and successfully by a class of settlers who are probably but a percentage of the number that can make a living by cultivation of small holdings. See Appendix No. 51A

23. The statistics of the settlement as now existing in the districts extending from the Murray, and comprising the whole of county Cadell and northwards into county Townsend as far as the Billabong, and eastward nearly to Tuppall, comprise a total of under 250 holdings, representing a population of about 1,250 persons, exclusive of the population of the towns and the employes on the stations. These are—Moama, 600; Mathoura, 150; Deniliquin, 2,500; and employes, say 500. Total resident population, 5,000.

The average size of the holdings is between 900 and 1,200 acres, and the total area under cultivation is under 30,000 acres, and the total held by settlers is 250,000 acres. The total yield of wheat during the season of 1889–1890 has been arrived at from compilation of various returns:— See Appendices Nos. 9, 11, 12, 13, and 10.

Wheat exported over bridge into Victoria ... ..	68,550 bushels
Wheat shipped coast-wise ... ..	687 "
Wheat—average quantity operated on at Moama mill ... ..	69,721 "
Wheat locally used in Deniliquin ... ..	29,106 "
Wheat in Moama store on 30th June, 1890 ... ..	70,833 "
Wheat held in store by farmers at their barns ... ..	50,000 "
Total bushels ... ..	288,897

Of

Of the quantity exported into Victoria, a considerable part has been returned in the form of flour bran, and pollard.

24. The operations at the port of Moama show the following imports and exports into and from Riverina, by way of Moama only:—

See Appendix  
No. 24.

Import value of all goods imported into Riverina at Moama—an average of six years ... ..	£309,541
Number of bales of wool exported at Moama—average of six years	24,764

See Appendix  
No. 15.

25. The total acreage of the Deniliquin Sheep District is 2,501,869 acres. The sheep carried on this area number 1,436,103. The whole of the wool produced from these, comprising twenty-four pastoral holdings, and also from several more distant ones, as also all the return supplies pass through Moama by the railway. During dry seasons, when the Murrumbidgee does not serve, the goods from numbers of more distant places necessarily follow the same route.

26. The following are the principal particulars regarding the towns in this part of the country passed through by the Deniliquin and Moama railway:—

See Appendix  
No. 48.

**Moama.**—Not as yet incorporated—

Number of dwelling houses ... ..	161
Population ... ..	600
Business establishments ... ..	32
Flour mill, capable of turning out 30 tons of flour weekly ... ..	1
Printing office ... ..	1
Grain store of Associated Farmers ... ..	1
Public buildings of all kinds ... ..	8

See Appendix  
No. 47.

**Mathoura.**—A township half-way between Moama and Deniliquin—

Number of dwelling-houses ... ..	27
Population ... ..	150
Business establishments ... ..	9
Flour mill ... ..	1
Saw mill ... ..	1
Public buildings of all kinds ... ..	4

See Appendix  
No. 44.

**Deniliquin.**—From the municipal return for the year ending 31st December, 1889—

Number dwelling houses ... ..	570
Population ... ..	2,500
Capital value of all property ... ..	£230,210
Receipts, exclusive of loans ... ..	£4,493

See Appendix  
No. 11

In this town are a large number of business establishments and several factories, including a flour mill and two breweries. The flour mill at present consumes from 20,000 to 30,000 bushels of wheat yearly, but can turn out 20 tons of flour weekly, and the one brewery, which malts its own barley, has trade for no more than 500 bags yearly. The duty on malt exported into Victoria is 4s. 6d. per bushel, and on barley it is 3s. per cental. The superiority of the barley grown in these and other parts of the south of Riverina has been insisted on by many witnesses, but in the lack of an outlet to a market the production is limited to the local consumption. The commercial interests of the town are suffering from the stagnation and decline of the agricultural interest in the surrounding districts.

See Appendices  
Nos. 36 to 40.

27. The value of the timber in the forests of the Murray is shown by the great use made of it on the Victorian side. Nearly the whole of the industry is conducted in that colony. There are two saw-mills near Mathoura, and one on the Murray, within New South Wales, but the greater part of their trade is in supplying log timber to Victoria. The local demand for sawn timber is small, and the duty on the border of 1s. 6d. or 2s. per hundred feet superficial prohibits export. The log timber is free. Red gum timber is cut and carried by river to Echuca from a distance of 240 miles above Moama, and from 145 miles below. There are 8 mills on the Murray owned by Victorians, having a cutting capacity of 50,000 feet superficial daily, and seven-tenths of the timber used is procured from New South Wales. The total area of the red gum forests on the Murray whence timber is brought to Echuca is 252,420 acres. The quantity of red-gum timber cut on the whole of the Murray forest reserves was, during 1889, 15,131,869 feet superficial, and the revenue derived in New South Wales from this cutting was £8,205 7s. 1d., whereas the total revenue from the forests of the whole Colony during the same year was £9,778 4s. 4d. The value of these forests is shown by these figures. It is fortunate that the red gum tree is of comparatively rapid growth, and that it especially flourishes in the land so much subject to inundation as to be of no use for any other purpose.

28. A deputation from Echuca Chamber of Commerce pointed out that a series of railway lines were projected in Victoria, commencing from Echuca, and going south-westwards through Boort and Donald to Murtoa, on the main line to Adelaide. This, entailing 157 miles of construction in Victoria, would very considerably shorten the through route to Adelaide, if the connection between Jerilderie and Deniliquin were completed. The importance of opening out the western districts of Victoria which depend for their supplies of store stock on New South Wales and the facilities given to transfer of stock by completion of these lines was insisted upon. The distance from Sydney to Adelaide by the existing route is 1,049 miles. The saving on this route, therefore, amounts to 104 miles in the through journey. Echuca is, next to Wodonga, the most important market for stock on the border. The proposed connection with Jerilderie is now of the greatest importance to the interest of Echuca.

See Appendices  
Nos. 14, 16, 17,  
20, 21, 22, 23,  
and 24.

29. The traffic on the rivers is a very important factor in the commerce of Riverina. The Edwards river is navigable during favourable seasons to 10 miles above Moulamein, and the Murrumbidgee throughout its course as far as Wagga Wagga, though traffic is not now carried so far. The import value of goods shipped at Echuca for ports on the Murrumbidgee and Edwards Rivers, an average of six years, was £67,630. The number of bales of wool landed at Echuca wharf, river-borne from the Murrumbidgee River only, an average of four years, was 56,882. The number of steamers working on the Murrumbidgee and Edwards Rivers during 1889 was 82, and of barges, 59, having an aggregate tonnage of 13,856 tons, and the value of cargoes carried was £66,957. The great importance of the port of Moama is shown by the amount of customs revenue collected there during 1889, being £13,762 7s. 1d., second only to Albury, where £28,315 6s. 10d. was collected.

30. A Victorian railway by-law, dated June 28, 1889, fixes the rebates payable on goods forwarded from Melbourne to Riverina. The operation of this rule is limited by an imaginary line drawn from Jingellic, on the Murray, westwards across Riverina, to Balranald, on the Murrumbidgee. Its exact position is defined in the by-law and shown on the attached maps. Roughly described, the rebate line crosses the main line of railway at Gerogery, passes just north of Daysdale, and about 8 miles south of Jerilderie; then, turning northwards, it passes Jerilderie about 4 miles to the west, as far as the south boundary of the river back blocks which it traverses westwards to Balranald.

31. This rule, as affecting the portion of Riverina under consideration, provides a rebate on goods forwarded from Melbourne through Echuca to any destination north of this rebate line, whether by river, rail, or team, but no rebate is allowed on goods sent through Echuca to points south of the rebate line. Goods sent to Deniliquin do not, therefore, obtain any remission of the Victorian railway rates, but on goods sent to Jerilderie or Hay, for instance, being points to the north of the line, a remission is granted. The proportion is considerable.

Melbourne to Echuca.							Freight.	Rebato.
On first-class goods...	...	...	...	...	...	...	48/6	nil.
„ second-class goods	...	...	...	...	...	...	60/6	10/6
„ third-class goods	...	...	...	...	...	...	72/6	22/6
„ fourth-class goods	...	...	...	...	...	...	84/6	34/6

32. The operation of this rule is shown by the following selected examples :—

Corrugated iron is carried from Melbourne to Deniliquin—

If for destination north of rebate line, at	...	...	...	...	...	72/6	per ton	For full details see Appendix No. 51.
It is carried from Sydney to Hay and Jerilderie at	...	...	...	...	...	80/0	„	

Fencing wire is carried from Melbourne to Deniliquin—

If for destination north of rebate line, at	...	...	...	...	...	67/3	„
It is carried from Sydney to Hay and Jerilderie	...	...	...	...	...	80/0	„

Wire netting is carried from Melbourne to Deniliquin—

If for destination north of rebate line, at	...	...	...	...	...	71/3	„
It is carried from Sydney to Hay and Jerilderie	...	...	...	...	...	66/8	„

Groceries are carried from Melbourne to Deniliquin—

If for destination north of rebate line, at	...	...	...	...	...	72/6	„
They are carried from Sydney to Hay and Jerilderie at	...	...	...	...	...	86/8	„

Tinware is carried from Melbourne to Deniliquin—

If for destination north of rebate line, at	...	...	...	...	...	83/9	„
It is carried from Sydney to Hay and Jerilderie at	...	...	...	...	...	118/3	„

Tools are carried from Melbourne to Deniliquin—

If for destination north of rebate line,	...	...	...	...	...	72/6	„
They are carried from Sydney to Hay and Jerilderie at	...	...	...	...	...	86/8	„

Agricultural Implements are carried from Melbourne to Deniliquin—

If for destination north of rebate line, at	...	...	...	...	...	83/9	„
They are carried from Sydney to Hay—Jerilderie at...	...	...	...	...	...	106/3	„

Bags are carried from Melbourne to Deniliquin—

If for destination north of rebate line, at	...	...	...	...	...	67/3	„
They are carried from Sydney to Hay—Jerilderie at...	...	...	...	...	...	130/0	„

Saddlery and Harness are carried from Melbourne to Deniliquin—

If for destination north of rebate line, at	...	...	...	...	...	76/3	„
They are carried from Sydney to Hay—Jerilderie at ..	...	...	...	...	...	98/9	„

These examples show that on a number of articles Deniliquin has now to pay very much higher rates for carriage from Melbourne than is paid at Hay or Jerilderie for carriage from Sydney.

33. The general rule under which goods are delivered at Hay or Jerilderie from Sydney is given to the "truck rates" in the "N.S.W. Railway Rate-book." By this rule, goods are carried from Sydney as all stations distant over 340 miles on the south-western or Jerilderie lines at a uniform maximum rate, so, if the line be extended to Deniliquin, the same rates will be payable to that point without any addition for the extra distance the goods are carried. The benefit to Deniliquin in this respect alone by this extension will consequently be considerable. If the rebate line be retained in its present position much of the traffic will probably be diverted from Melbourne and will come from Sydney, but an amendment of this position, so as to place Deniliquin to the north of the rebate line, would, though still further benefiting Deniliquin, certainly affect the course of the traffic considerably.

34. That the position of the rebate line is not rigidly fixed for ever must be pointed out again. The connection by railway between Jerilderie and Deniliquin will bring the southern portion of Riverina into touch with Sydney, and the only remedy applicable by Victoria in order to retain the inwards traffic into Riverina is by pushing the rebate line southwards. It may, in fact, be made concurrent with the border. To this Colony, on the other hand, the profit derivable from carrying the extra goods into Riverina over 340 miles only of her railways will be the benefit, and this will be curtailed by the necessity for carrying the goods for nothing over the extra mileage.

35. Carrying this illustration out to the farthest practicable limit the following may be given as the position into which this Colony may be forced, as regards the traffic inwards into Riverina, that is the down traffic from Sydney, by the connection between Jerilderie and Deniliquin being completed. (1) The purchase of the Company's line between Deniliquin and Moama will be a necessity. (2) Unless the competitive principle be abandoned altogether the existing railway charges and rules will still obtain, entailing the carriage of goods as far as Moama, 502 miles from Sydney, to within 146 miles of Melbourne at the same rates as are now paid for carrying them 340 miles. (3) The Victorian rebate line will certainly be pushed southwards to the border. (4) The examples given in appendix No. show that goods will be delivered in Moama at a much lower rate from Melbourne than from Sydney, and (5) The rates for the up traffic from Moama for stations in this Colony's lines for some distance from the border—as is now the rule between Albury and Junee—must be made exceptionally high in order to keep out importation from Victoria.

36. The working of the railways has given ample experience of a similar condition of things on the Great Southern Railway, but in that case the farthest distance from Sydney is 386 miles to Albury, against 502 miles to Moama. The length of line on which the up traffic is hampered by high rates is 99 miles on the former, whereas it will be 150 miles on the Moama line. The operation of the principle will therefore be more intensely felt on this district.

37. The information supplied by the business people of Moama and Deniliquin sets forth very fully the disabilities under which they labour, having a prohibitive border duty on one side and an unbridged gulf on the other, and a great deal of pains has been taken to show that the trade would be done with Sydney in a large proportion of goods were there direct communication by railway. There is proof enough, however, in the existence of the competition here and elsewhere that the railway rates are a very important factor in determining the market from which the supplies are drawn, and that the most favourable will be dealt with.

38. The papers on the subject of the extension of the line to Deniliquin show that the sole objection hitherto taken has been the dread of the competition for traffic extending along that channel into New South Wales. The minute written by Mr. Goodchap, dated 9th June, 1884, No. 7,024, puts the whole case from this point of view very clearly, but if these arguments are to be held to be conclusive of the matter, the inference to be drawn is that these border districts must either be abandoned, or be allowed to be exploited by extensions of the Victorian system of railways. The fact of the Deniliquin and Moama line having been authorised for construction would seem to be a recognition of the last of these alternatives. This experiment, having now been in operation for sixteen years, has been useful in proving that there is a limit to the development of a district under such conditions, and that the result is eminently unsatisfactory—so much so, in fact, that it is really questionable if the first alternative would not be the wisest course to adopt in such cases. The land is not now, however, virgin ground, upon which such an experiment may be tried. Interests have been created and obligations incurred which cannot be renounced.

39. That the extension of the Victorian railways into the country is not regarded as a solution of the difficulties in the southern part of Riverina is shown by the absence of any proposition of the nature along the whole border. The Deniliquin and Moama line has been a commercial success in the interests of the proprietors, and authority for a connection between Deniliquin and Hay is sought for by speculators, but experience of the past sixteen years in the country traversed by the Deniliquin and Moama line, especially of the last five years, during which the depression has been in operation most strikingly, have not induced any of the districts to move in the same direction. The reason is clearly that so long as the prohibitive customs duties obtain on the border, a connection with the markets on the other side of it gives facilities for importation only. Local production must be consumed on the spot, and be of limited quantity, and the commodities only that can be sent over the border profitably must be dealt with.

40. The trade of a district is made up of exports and imports. Given the conditions in soil, climate, and situation, necessary for the development of agriculture, it is of no importance as affecting the progress of that district whence the supplies are drawn. It has been shown by the evidence of traders in southern Riverina and in Hay that some considerable portion of their supplies are procured from Sydney by sea through Melbourne. So, even under the conditions now in force, the Sydney market does supply some portion of the wants of the country. It is contended that not only this portion, but a considerably higher percentage will be drawn from Sydney if the communication is completed, but as this does not take into consideration the certainty of a reduction in rates being brought about by alteration of the position of the rebate line, no reliance can be placed on the increase in the down traffic from Sydney into Riverina being substantial enough to materially affect the railway revenues. It is sufficient to point out that, though this down traffic does not exist now, and though it may not be brought into existence by the railway being built, yet even now the Sydney markets are drawn upon for supplies for these districts, and, as the rates will certainly be lowered, and population and progress create larger demands, this traffic may be relied on to keep pace with the advancement of the districts;—so, for the imports into Riverina, with or without the railway connection, the road for supplies is open and sure.

41. All the conditions having been proved during a long series of years to be favourable for agriculture, the one thing needful for the progress of the district is the road for exportation of produce, or there can be no production beyond local wants. So long as the border duties remain in force the sole market for the produce of Riverina will be within the Colony, and the traffic in these commodities will be over the colony's railways. This will provide a volume of up-traffic in the direction of Sydney, which is at present not in existence, but which, judging by inference from the operations in the past, may be relied on as to result from the opening of the communication.

42. The figures given in paragraph 23, showing the actual population and acreage, and the production of one staple only during the past season may be fairly taken in support of the foregoing statement. Of this total production (288,897 bushels of wheat) the figures show that 120,833 bushels were, on 30th June last, held in store, wanting a market, being in excess of local consumption and of the quantity that found a market over the border.

This surplus wheat alone represents a tonnage of over 3,000 tons, which was available for export as up traffic from the district on 30th June last,

43. Development of settlement may be expected both from sub-division of lands already alienated and from the lands that will become available in the future. The position at the end of the year 1889 was as follows for the two counties concerned—Townsend and Cadell:—

	Total area.	Total alienated.	Reserves.	Other unalienated.
	acres.	acres.	acres.	acres.
Cadell.....	563,200	293,824	119,761	149,615
Townsend .....	2,109,440	1,371,053	425,024	313,363

NOTE:—A note at foot of the return in the Statistical Register mentions that the figures in the column "other unalienated" include areas under process of alienation, and held under various forms of law, so that the total of free Crown land is considerably less than the figure given; but the actual total is not given, nor can it be obtained for this report.

Cadell is a small county on the southern border. Of the reserved land, 65,886 acres are under forest, principally of red-gum, on the Murray and Edwards rivers, and the remainder will not probably be spared, but there still remains 149,615 acres (*see note*), which will be available for settlement within a few years. On the Mathoura estate alone there are 12,000 acres of leasehold. The evidence of Mr. W. R. Virgoe, late owner of this property, which, however, in some respects, shows a much better average quality of land than obtains generally, gives the value placed upon it. He states that any land in this district that might be offered would fetch from £3 to £5 per acre now; that the whole of the 93,000 acres of freehold on the Mathoura estate was valued and sold for £5 per acre in 1837; that £7 per acre has been offered for portions, and that he is now letting land on the estate at from 4s. 8d. to 6s. per acre, in farms of from 400 to 3,000 acres.

44. County Townsend is very large; it extends north to the south boundary of the Murrumbidgee River back blocks and west to half-way between Deniliquin and Moulamein; it consists entirely of plains land. The bulk of the reserve is for water, so a considerable portion may possibly be spared, but the greater part of the county lies too far north of the proposed line to be much influenced by it. This part is, however, traversed by one of the suggested main lines of irrigation canal. The lands still unalienated, and the reserves that may be spared, would probably reach a total of 400,000 acres (*see note*, paragraph 43). Regarding the use that can be made now of this "plains" country, giving an idea of what it may become under the vivifying influence of irrigation and railway communication, the statistics that have been supplied by Mr. Porter, of Booroban, showing the settlement that has taken place in his neighbourhood, show that the necessary natural conditions are existent in the soil and climate even in that forbidding looking country, "The Old Man Plain," and that labour will make the land fruitful and capable of supporting a population. These statistics are given in full as they seem to be very interesting, as well as important.

*See Appendix No. 52.*

45. The records of the rainfall in this part of Riverina show for 16-mile gums too high a mean, as they have been taken too recently; but at Wargam the mean is 14.46 inches for eight years; at Willurah, 14.07 inches for twelve years; at Warwillah, 13.91 inches for ten years. The record rises in the Southern parts giving:—

*See Appendix No. 53.*

At Moama ... ..	16 70 inches for 10 years.
Mathoura ... ..	19.51 " 5 "
Deniliquin ... ..	17.89 " 4 "
Carnulla ... ..	10.15 " 8 "
Tuppal ... ..	17.47 " 8 "
Jerilderie ... ..	18.90 " 4 "

46. The details of the statistics of these districts has already been given in paragraph 22. The climate is not suitable for production of oats, but the barley grown has proved to be of exceptionally good quality. There is practically as much certainty of a crop of this as of wheat in the district. It is probable that considerable quantities of this cereal would be produced, as the supply of this Colony has hitherto been largely imported. In addition to the recognised townships, given in paragraph 25, there are other centres of population within the area under the influence of the existing and proposed railways which give promise of increasing. Wanganella and Carnago, both on the Billabong, are naturally situated in positions to draw traffic. There is some settlement in the neighbourhood of both, and extended over the country to the south of the Billabong. The whole of the land here is, even under existing conditions, regarded as good for cultivation, and is more or less settled.

47. With regard to the prospect of a traffic in stock, the operations of the Deniliquin and Moama line seems to show that a large portion of their revenue is derived from the transport of stock into Victoria. The transport across the border by this railway, during the twelve months ending 30th June, amounted to 336,000 sheep and 333 head of cattle. The situation of Deniliquin and Moama is peculiarly favourable with relation to the surrounding country and to Victoria, to the western districts of which there is as yet no other than a round-about access possible from this country, and from Queensland, *via* Wilcannia. The totals of stock passed over at Moama during last year, 1889, are given in Appendix. Of these, a large proportion must have been the surplus from the stations within Riverina and north of the Murrumbidgee. The supply of the western districts of Victoria has been referred to by the members of the Echuca Chamber of Commerce. A large proportion of this stock is fat, or partly so, as shown by the numbers trucked. On these very level lines this traffic is evidently remunerative. The trains on the Deniliquin and Moama line have consisted of forty-two loaded trucks of stock, amounting in weight to 400 tons, behind the locomotive. Mr. Tennant states that 300 to 350 tons can be drawn comfortably. The rates in force on the whole length of 45 miles are £1 6s. 3d. per truck for sheep, and £1 2s. 6d. per truck for cattle, against the £1 10s. per truck over a corresponding length on the lines of this Colony. From this source alone the revenue derived by the Deniliquin and Moama line for the year was £4,032 6s. 9d. The import duty into Victoria is 5s. per head for cattle, and 6d. each for sheep. The stock-market in Echuca is said to be second in importance only to that at Wodonga, and the members of the Echuca Chamber of Commerce anticipate a material increase to it on completion of the connection between the termini,

*See Appendix No. 42.*

*See Appendices Nos. 5, 6, and 7.*

Jerilderie

Jerilderie and Deniliquin. It has been stated that stock traffic is the least paying to a railway. This may be the case as an average in the Colony, but on such very level lines as in Riverina, where the rolling-stock and the staff will not probably be fully occupied, the fixed expenditure in interest on capital and wages will, in the absence of stock traffic, be debitable against other sources of revenue. This an important consideration.

48. In summarising the points that have been brought to notice in the foregoing, the subject becomes naturally divided into two parts, which separately afford room for consideration, (1) as to the need for the connection in the interests of the district dis severed from communication with the rest of the Colony, and (2) as to the general effect upon the revenues of this Colony's railways and its trade by the opening of another through connection with Victoria.

49. It is seen that there is a population of 1,250 persons in occupation of a tract of country that supports three towns, aggregating 3,250 in population. This settlement, excluding the large pastoral holdings, is located on 250 holdings, averaging 900 to 1,200 acres, having under cultivation 30,000 acres, and producing a very large surplus over consumption and the needs of the limited market available, thus proving the suitability of the soil and climate for the production of cereals. The proximity of the seaport of Victoria gives peculiar facilities for importation of supplies of all kinds, not necessarily confined to the trade of the alien colony, but also by sea from its own capital, or from Europe direct. The surrounding country is producing large numbers of live stock, the surplus of which finds a market over the border with marked benefit to the interests of both colonies. The average value of the land in the southern part of the district is nearly up to the point at which the subdivision of the large estates may be assumed to be commercially the proper course to adopt, while it is now, by reason of its geographical position, very much below the average value of land within a few miles distance across the border, though, by all accounts, in no wise inferior in quality. Of this land, in county Cadell, there will shortly be nearly 150,000 acres (*see note, paragraph 43*) available for selection; and in county Townsend the quantity may be estimated at 200,000 acres within the influence of the railway. The conditions under which this country is worked will, by the completion of communication into New South Wales, be so materially altered as reasonably to justify the assumption that the Crown lands will be materially raised in value, and the anticipation that when distributed and settled the population of the districts will rise to fully 10,000 persons, including that of the towns. The full production of the land will be available for this Colony, and form a distinct volume of up-traffic over the railway which is not now in existence, and the timber of this part of the Murray will for the first time in history be carried into its own territory.

50. With respect to the objections to the connection, it is considered that the scope of an inquiry of this kind cannot be extended to embrace the variety of questions relating to the course of traffic and general policy that go to make up the subject. The actual effect of the opening of this through line must be more or less a matter of conjecture, based upon the experience gained in the working of the main line between Sydney and Melbourne. In order that an opinion may be formed on the matter, it is obvious that a separate investigation into this working during past years should be undertaken. The facts as they have come to light have been pointed out in this report, and some opinion on the question of policy has been hazarded. No more can be done here.

51. This subject cannot be left without drawing attention to the probability that a connection by railway between Jerilderie and Deniliquin will be found in policy to entail the purchase of the Deniliquin and Moama line, as this link will then become a part of the colonial system, and be found impracticable in working, connecting, as it will, the systems of separate colonies. The Act of Incorporation provides that the line may be purchased by the Government after the expiry of twenty-one years from 3rd March, 1874 (*i.e.*, on 3rd March, 1895). A copy of the clauses relating to this is given in Appendix No. 43.

52. The conclusion at which I have arrived on the subject of connecting Jerilderie and Deniliquin by railway is, that not only the development, but the existence of the agricultural industry in this southern part of Riverina, is dependent upon this communication being made for it with the rest of this Colony. This view is borne out by the experience of the past few years, during which these industries have sensibly languished, and by the exhibition of a large surplus of grain, for which there was no market but at a ruinous reduction on value. The fact of the industry having advanced to this stage, in spite of the disabilities under which it labours, is a proof that a steady advance in all departments may be anticipated on communication with markets being made for it.

53. I believe that the working expenses of the line will be at once earned from the traffic within this Colony only to and from this district, irrespective of the intercolonial traffic, the amount of which can only be conjectured, but which in stock alone must be considerable; also, that the benefit to the revenues of the existing lines north of Jerilderie will be very marked from the new traffic that will be introduced, which will be distributed over lengths far distant from the areas in which it is produced.

54. As for the competition for the inward trade into Riverina, it must be remembered that south of Jerilderie an alteration of the conditions cannot but be beneficial to this Colony, and for the countries north of Jerilderie, that the distance from Melbourne to Jerilderie will be at least 50 miles greater than to Albury, and that between Jerilderie and the border there will be 100 miles of this Colony's railways to be travelled over.

55. With respect to the route by which the line should be taken, I believe that consideration should be given to the future of the large tract of country intervening between the Moulamein and Murrumbidgee Rivers. The time may come when conservation of water may bring into use for settlement these large areas of Crown lands, the very sale of which would construct the line. The present existence of the settlement there, shown by Mr. Porter's statistics, is a promise of the possibilities of the future. There being already some settlement along the Billabong, and between Conargo and Deniliquin, on land which is all cultivable, I would recommend the line being constructed *via* Conargo, as shown by full red line on the map, with the object of providing for a branch from that point, *via* Boorooban, to Balranald. Construction of this line cannot be contemplated for a long time, so long, in fact, as this country remains under the present conditions, but the route is one that commands the whole breadth between the rivers, and would not enter into competition with the river traffic in any way. The length to be constructed between Jerilderie and Deniliquin would be about 50 miles, instead of 45 miles by the direct route.

## PART II.

## THE PROPOSED RAILWAY FROM HAY TO DENILIKUIN.

The railway from Hay to Deniliquin has not been proposed for construction by the Government, but by a company, who have endeavoured, hitherto without success, to obtain the necessary authority from Parliament. There has, in fact, been no movement of any sort in favour of the line except by the promoters of this company. Their refusal to give any assistance to the inquiry in Hay would seem to indicate that their object is purely speculative, and not prompted by desire to benefit the country. There was no information regarding the project obtainable in Deniliquin, the interests of which would not be fully served by such a lengthy route to the metropolis and the Colony generally. The independent testimony obtained in Hay, however, supplies a basis on which an opinion may be formed on the merits of the question as a matter of policy, though as the statistics of actual and probable traffic have been withheld, being hardly procurable except as a free gift of the interested parties, the probability of such a line being a paying concern can only be inferred.

2. The returns that are available for the municipal district of Hay show as follows:—

See Appendix  
No. 46.

	1889.	1885.	1880.
Population ... ..	2,750	.....	.....
Number of dwellings ... ..	580	.....	.....
	£	£ s. d.	£ s. d.
Capital value of all property ... ..	329,335	277,850 0 0	250,721 0 0
Total receipts ... ..	4,055	4,016 13 0	3,130 17 4

3. The railway was opened to Hay in July, 1882. The distance from Sydney is 454 miles, and from Melbourne, *via* Albury and Junee, 456; but by the proposed line, *via* Echuca and Deniliquin, the distance would be reduced to 265 miles from Melbourne. The traffic at the Hay railway station has been during the years ending:—

30th June, 1889—inwards ... ..	2,190 tons.
"    outwards ... ..	8,142 "
"    wool—outwards ... ..	10,167 "
30th June, 1888—inwards ... ..	1,033 "
"    outwards ... ..	6,054 "
"    wool—outwards ... ..	3,456 "

4. The only evidence procurable regarding the traffic on the river from Hay was supplied by Mr. Whitecombe, who pointed out that the wool traffic on the railway from Hay had decreased from 7,481 bales, 1885-86, to 2,618 bales in 1889-90, while during the last season 22,479 bales had been shipped by steamer from Hay. Regarding the stock crossing the river southwards this witness gave 372,205 sheep as having passed in 1887, 533,113 in 1888, and 304,268 in 1889. This is the regular route from Queensland, *via* Wilcannia, by which large numbers of cattle travel. The permanent bridge over the river at this point makes this a point of concentration for stock.

5. The quantity of wool carried on the Murrumbidgee River, and passed through Echuca, as given by Mr. Pope, the Customs' officer at Moama, was 56,882 bales, as an average of the last four years. This quantity was collected from very long lines of river-bank, both above and below Hay. During 1889 there were trading on the Murrumbidgee River sixty-one steamers and forty-seven barges, aggregating 11,656 tonnage. Mr. Morton, of Hay, who is the Secretary to the Carriers' Union, stated that wool will this season be brought by teams to Hay from 200 miles inland northwards, from within 50 miles of the Darling, as that river being in high flood is difficult to load on, also from within 50 miles of Cobar. He pointed out that the Silverton line has diverted traffic from Hay, as also will the Cobar line when open. He gave 1,685 bales of wool as having been delivered in Hay from points north of the river during last season, and 1,320 tons of goods as having been returned from Hay by teams; also, that during the drought of 1888, large quantities of forage were passed through Hay to the surrounding districts, having been brought by rail and also by teams from the southward.

See Appendix  
No. 16.

See Appendix  
No. 17.

6. The cost of transport of greasy wool from Hay by railway to Sydney is 64s. 9d. against 74s. 3d. to Albury and 104s. 3d. to Melbourne. On the cost by river all information was refused by the steamer companies; but from other evidence it was gathered to be 20s. per ton from Hay to Echuca, exclusive of insurance, which is 14s. per ton in addition, contracts having been taken for delivery of wool in Melbourne at 50s. per ton. The rates are not fixed, being subject to modification by contract. Mr. Jenkins, of Buckenong, stated in Narrandera that his wool is delivered from above Narrandera to Melbourne by river at 70s. per ton, exclusive of insurance.

7. The freights to Hay by the New South Wales lines are governed by the "truck rate" rules before noticed. According to these, the maximum rate chargeable on goods carried to Hay is 130s. per ton, or by the 6-ton truck-load it is 86s. 4d. per ton for the three numeral classes, and 80s. per ton for galvanized iron and fencing wire. The cost of transport to Hay from Victoria is subject to the rebate rules for goods taken into Riverina. Hay is situated about 25 miles north of the rebate line. The rebates allowed by the Victorian railways on goods forwarded to Hay by river, rail, or teams through Echuca or Wodonga, are given below:—

	Melbourne to Echuca.		Melbourne to Wodonga.	
	Full rate.	Rebate.	Full rate.	Rebate.
First class .....	48/6	Nil	59/3	9/3
Second class .....	60/6	10/6	74/10	24/10
Third class .....	72/6	22/6	90/5	40/5
Fourth class .....	84/6	34/6	106/-	56/-

The operation of these allowances from Albury northwards as far as Junee, on the Great Southern Railways, is considerably modified by the special high rates for the up-traffic charged on this length, but Hay gets the full benefit of the rebate on all goods brought there from Echuca by river, and it is needful to point out with particular emphasis that if the Hay-Deniliquin line be built by a company, Hay will certainly get the full benefit of the Victorian rebate on all goods carried by it, for it is not at all likely that

that the proprietors will attempt to impose restrictive rates. The average rate for general goods from Melbourne to Hay, *via* Echuca and the river, has been quoted at 75s. 6d. per ton exclusive of insurance.

See Appendix  
No. 51.

8. The following example shows a comparison of charges on certain goods from Sydney to Hay, and from Melbourne to Deniliquin by railway, allowance being given for the Victorian rebates:—

Corrugated iron—									
Sydney to Hay	...	...	...	...	...	...	...	80/	per ton
Melbourne to Deniliquin	...	...	...	...	...	...	...	72/6	"
Fencing wire—									
Sydney to Hay	...	...	...	...	...	...	...	80/	"
Melbourne to Deniliquin	...	...	...	...	...	...	...	67/3	"
Wire netting—									
Sydney to Hay	...	...	...	...	...	...	...	66/8	"
Melbourne to Deniliquin	...	...	...	...	...	...	...	71/3	"
Groceries—									
Sydney to Hay	...	...	...	...	...	...	...	86/8	"
Melbourne to Deniliquin	...	...	...	...	...	...	...	72/6	"
Tinware—									
Sydney to Hay	...	...	...	...	...	...	...	86/8	"
Melbourne to Deniliquin	...	...	...	...	...	...	...	83/9	"
Tools—									
Sydney to Hay	...	...	...	...	...	...	...	86/8	"
Melbourne to Deniliquin	...	...	...	...	...	...	...	72/6	"
Agricultural implements—									
Sydney to Hay	...	...	...	...	...	...	...	86/8	"
Melbourne to Deniliquin	...	...	...	...	...	...	...	83/9	"
Bags—									
Sydney to Hay	...	...	...	...	...	...	...	86/8	"
Melbourne to Deniliquin	...	...	...	...	...	...	...	76/3	"

The rates are seen to be nearly the same in many of the examples, but the table of rebates given in paragraph 7 shows that on the goods passing through Wodonga the allowances are nearly twice as high as for those through Echuca. There is no certainty that the latter may not be increased nor that the existing high rates of carriage on the Deniliquin and Moama lines will not be reduced.

9. The railway from Hay to Deniliquin could be very cheaply constructed. There are no engineering difficulties, and the gradients will all be of the easiest. The necessary materials, however, for bridges, ballast, and sleepers, for forming a substantial railway are altogether wanting in the country passed through, and are not procurable in the neighbourhood of Hay, or from nearer than a long distance by railway. All will have to be brought from the southwards, and hence the cost of construction will be above the minimum. It may reasonably be assumed that the gauge of the railway, if it is built by a company, will be made the same as that of the Victorian lines, and of the Deniliquin and Moama railway, in order that the great advantage of interchange of rolling stock may be availed of. It is not to be expected that the expense attendant on a break of gauge at Deniliquin will be wittingly encountered for the small advantage that may be gained by making the railway on a narrow gauge.

See Appendix  
No. 34.

10. The traffic between Hay and Deniliquin that now is concentrated on the latter place is given by Messrs. Permewan, Wright & Co., at 23,400 bales of wool delivered in Deniliquin during last season from places at a greatest distance of 68 miles, and that 585 tons of goods had been returned to points in this country from Deniliquin. The extent of country that will be served by the proposed line, south of Murrumbidgee, will certainly be much greater than is now served by the Deniliquin and Moama line, as all the information goes to show that there are great advantages in favour of the carriage of goods by a line of rail, which is *continuous*, over that by the river. A double handling of the goods is saved, estimated at 3s. per ton. The insurance on the river is given at 14s. per ton, which is saved also. The fact of goods being now carted such long distances into Deniliquin to the railway justifies the assumption that this line would abstract a considerable portion of the traffic now taken by the river from the properties not having water frontage; and further, that the whole of the goods now shipped on steamers at Hay will, by preference, be sent by this railway. The distances by rail from Hay to Sydney and Melbourne by the several routes will be as follows:—

From Hay to Sydney	...	...	...	...	...	...	...	454 miles
From Hay to Melbourne, <i>via</i> Junee and Albury	...	...	...	...	...	...	...	456 "
From Hay to Melbourne, <i>via</i> Deniliquin and Echuca	...	...	...	...	...	...	...	265 "

See Appendix  
No. 52.

11. Statistics are given in full in an appendix of the settlement that has taken place in the neighbourhood of Boooroban (Pine Ridge) a point on the stock route 30 miles south of Hay. These have been supplied by Mr. Porter, whose letter on the subject is also given. A summary of these statistics shows the following:—

The number of holdings is 45. The total acreage secured is 29,050; and held under lease from the Crown, 66,650. These are all within 26 miles of Boooroban. Outside of this distance there are settlers whose holdings have not been given. Mr. Porter's letter is fully explanatory of the difficulties under which this part of the country is being settled, but the details are full of promise of what is possible in this country in the future. The land is all "plains" of the least inviting appearance, for the most part altogether treeless. The record of rainfall at the nearest place (16-mile Gums) covers too few years, and is therefore too high as a mean, but as the settlement and progress has been attained by aid of conservation of this rainfall it is evidently sufficient. The county is Waradgery, which extends northwards up to the Lachlan River. The state of the lands at the end of 1889 was as below:—

Total area of County Waradgery	...	...	...	...	...	...	...	1,847,160 acres
Total area alienated	...	...	...	...	...	...	...	564,645 "
Total area reserved	...	...	...	...	...	...	...	266,901 "
Total area "other unalienated"	...	...	...	...	...	...	...	1,016,415 "

See Appendix  
No. 71.

(See note to paragraph 43, Part I.)

This shows an enormous area that will in a few years be available for settlement, over which the state of affairs actually produced about Boooroban may be reproduced if the conditions are similarly favourable.

12. It seems, from the information given by the storekeepers at Hay, that the bulk of their trade is done with Melbourne. Those dealing in large parcels, or whose importations are made from Europe direct, endeavour to make their requisitions and to time the arrival of their goods in Melbourne to enable them to take advantage of the river while it is open for traffic, and to bring up during the season sufficient to last until the next river season. On the other hand, the business of the small traders is done more conveniently with Sydney, because of the speed and certainty of transit and a avoidance of the small charges, such as for customs entries and agency, which tell on the small consignments, but are not appreciable on the large ones. It seems also that much of the goods carried by the railway into Hay during the dry season has been brought round by sea from Melbourne to Sydney, being delivered there by Melbourne merchants at favourable rates. From this it is clear that if a new line of railway communication is opened with Melbourne, reducing the rail carriage to Hay from 454 to 265 miles, the alternative to the river route will immediately be this new short railway from Melbourne, and the inference is unavoidable that the route from Sydney will be unused altogether. If the traffic be not abandoned altogether, the competition by a line of 454 miles in length against one of 265 will be ruinous. It is seen that the traffic carried on the main line to and from Hay is not inconsiderable, but the figures and the information given show that the quantity fluctuates with the condition of the river. The traffic in wool especially is heavy only when the river is unfavourable. As the line to Deniliquin will do away with all uncertainty, and will carry goods at least as cheaply as the river, the traffic now done in Hay by the existing railway will most likely be all absorbed.

13. It is highly improbable that any advantage will be obtained by Hay or the countries to the north of the Murrumbidgee by connection with the agricultural lands in the southern parts of Riverina. The existing railway into Hay may be relied on to supply all requirements, but there will certainly be an advantage to all agricultural interests in those southern lands by the connection. The Jerilderie to Deniliquin line would in this respect, as opening up the whole of the colony to their products, be of very much greater benefit, but as the productions of farm and dairy about Hay are not equal to the consumption in Hay and its neighbourhood, and very far short of the requirements in dry seasons, the direct line to Deniliquin would be immediately beneficial to farmers in the south. This, however, would at once introduce a competition with the existing railway line of another form, namely, for the traffic in produce within the Colony itself.

14. It may safely be assumed that the traffic in stock southwards will supply a large part of the revenue of this line. The information given regarding this traffic on the Deniliquin and Moama line seems to afford strong evidence in favour of this. The whole of the distance between Hay and Deniliquin suffers very severely every summer, not only because of the dryness of the country, but from the large number of stock passing over it. In this respect alone, viz., for the transport of fat or saleable stock into Victoria, can this line be said to be really beneficial to the districts on the Murrumbidgee?

15. Since it appears that a sacrifice of a large part of the traffic of the existing lines, and also the institution of a new competition for traffic in farm produce within the Colony is inevitable, a question naturally arises as to whom the change will benefit. No part of the information supplied proves that the change will be productive of good to any part of the community in the districts on the Murrumbidgee, except in the way of rendering personal communication with the south easy, which is now difficult in the extreme, and of shortening the distance over which stock will have to be trucked. A connection between Jerilderie and Deniliquin will accomplish both these ends. The line will, it is believed, be one that will pay, but at the expense of other existing undertakings, and not by force of any development in the country traceable to benefits to be conferred by its construction. The development of the lands lying between the Murrumbidgee and the Billabong or Moulamein River will be considered in another part of this report. This can be effected without entailing any of the objectionable features or complications that must ensue from the line proposed between Hay and Deniliquin.

### PART III.

#### THE PROPOSED RAILWAYS

FROM JERILDERIE TO BERRIGAN AND MULWALA ;

FROM JERILDERIE TO TOCUMWAL ;

FROM OIL TREE, ON THE CULCAIRN-COROWA LINE, *VIA* DAYSDALE, TO BERRIGAN.

ALL of these proposals, having been designed for the service of the same tract of country, may conveniently be dealt with together.

2. The grounds upon which the extensions of the Narrandera-Jerilderie line base their claims for consideration, are that they connect the New South Wales system of railways with that of Victoria, opening through communication between the colonies, and developing the country *en route*. An extension of the Berrigan line to Tocumwal or Cobram, instead of to Mulwala, has not been proposed, but it is being discussed in the district, and will therefore receive consideration in this report as a possible development in the future.

3. The proposal to branch off from the Culcairn-Corowa line (now under construction) at about Oil Tree Lagoon, and to traverse the country between Daysdale and Berrigan contemplates the service of the country only. The connection with an existing line at a point so near the border is due to the position of that line and the country to be served, as Oil Tree is the nearest point to it that can be connected with. If the conclusions drawn from this investigation are just, this proposal must be credited with being the only one of all the lines proposed for this part of Riverina which would really act in developing the country and in feeding the existing system without competing with other lines or being antagonistic to their interests in any way. The objections to it that will be pointed out are considered to be fatal to its adoption, but the suggestion may be claimed to be a very good one, though the scheme has been very roughly got up and weakly supported.

4. The lengths of the several routes, suggested or possible, are approximately as follows:—

From Jerilderie to Tocumwal, along the stock route, <i>via</i> Murray Hut	...	35	miles.
From Jerilderie to Berrigan	...	25	"
From Jerilderie to Mulwala, <i>via</i> Berrigan	...	53	"
From Jerilderie, <i>via</i> Berrigan, to Tocumwal	...	43	"
From Jerilderie <i>via</i> Berrigan, to Barooga	...	43	"
From Oil Tree Lagoon, <i>via</i> Daysdale, to Murray Hut	...	62	"

5. The country served by these lines is comprised between the Billabong Creek and the Murray River. It is bounded on the east by the stock route between Urana and Corowa, and on the west by the "Plains," the limits of the forest land being at the farthest about 20 miles to the west of the stock route between Jerilderie and Tocumwal. This area includes the whole of county Denison and the southern part of county Urana.

6. The tract of country designated Clear Hills, in the parish of that name, but extending east into Gunambil, and west into Boregerry, in county Urana, lies between the Billabong and Coreen Creeks. The stock route passes north and south along the east side. The greater part of it is elevated country. The soil on this portion is a rich red loam of the highest fertility. The pastoral holdings, Gunambil and Wangamong, occupy a portion, but most of the high land has been taken up by settlers. The summary of the settlement and cultivation here given formed part of the statistics collected by the Urana railway league, in support of connecting Urana with the main line of railway at Conong, but the whole of it may also be taken credit for in support of the proposal for Oil Tree Lagoon, *via* Daysdale. They are as follows, included within the parishes of Clear Hill, Wangamong, Gunambil, and Boregerry:—

Number of holdings	...	...	...	...	...	37
Resident population (say)	...	...	...	...	...	250
Aggregate acreage of holdings	...	...	...	...	...	35,546 acres.
Aggregate acreage under crop	...	...	...	...	...	5,386 "

7. There is no township in the district, so distances can be given from no fixed point but the Clear Hills post office. This may be taken to be 16 miles from Urana, 30 miles from Jerilderie, 8 miles from Daysdale, and 34 miles from Corowa. These places, with Corowa, are the outlets for all traffic. All the wool is sent through Corowa, and the supplies are obtained from the nearest townships. The quantity of wheat sent to Jerilderie, the only possible market for this grain, the product of the harvests of 1889-90 and 1890-91, was 20,800 bushels each season, but this is only an indication of the capability of the land in production. The best of it, covering an area of about 30,000 acres, is, perhaps, unequalled in quality in Riverina. It is said that an expert has predicted a great future for this district, in the production of grapes for wine-making. The land has been settled for the most part but a few years, but many of the farms are in an advanced stage of improvement.

8. This fertile area covers the space between the Billabong and Coreen Creeks, a distance of 9 or 10 miles, and extends east and west for about 5 miles. A heavy growth of pine timber has sprung up since the days when, as pasture for stock only, the place was named Clear Hills, but all the timber of any useful size has long since been cut away, the last saw-mill having been removed from the neighbourhood about two years ago. The forest reserves on Clear Hill, amounting to some thousands of acres, will probably engage the attention of the Forest Department as being eminently suitable for conservation of pine timber. Water has been found at depths down to 190 feet in all the wells that have been sunk of a quality suitable for all purposes. In elevated ground, this is a very important feature.

9. The Clear Hills districts, lying north of the Victorian rebate line, obtain full benefit from the operation of the Victorian railway by-law on goods forwarded from Melbourne. The following are the rebates given on goods sent there through Wahgunyah:—

	Mileage rate.			Rebate.		
	£	s.	d.	£	s.	d.
First-class	2	16	0	0	6	0
Second-class	3	10	6	1	0	6
Third-class	4	5	0	1	15	0
Fourth-class	4	19	6	2	16	0

10. Southward of these districts, in county Denison, the Coreen Creek divides the waters of the Billabong from those of the Murray. Along the middle of this county, east and west, the elevated land extending from Bull Plain through Savernake, Berrigan, and Murray Hut merges north of Tuppall into the western "plains." The whole of this, excepting patches of "plains," is "forest" land, the soil being eminently suitable for cultivation of cereal crops. The distance apart between the main stock routes along the northern boundary of the county is  $37\frac{1}{2}$  miles. The traffic routes through the county are mainly the mile wide stock routes from Jerilderie to Tocumwal, and from Urana to Corowa, but the opening of the bridge over the Murray between Mulwala and Yarrowanga will bring into use the now little used routes from Jerilderie, *via* Berrigan, and from Urana, either *via* Daysdale, or by a more direct line passing through Bull Plain.

11. The centres of settlement are Daysdale, Berrigan, Tocumwal, Mulwala. The places named Murray Hut, Savernake, and Bull Plain have not yet become developed. The following, giving the agricultural settlement that has taken place, is compiled from statistics supplied by the respective centres, *viz.*, Tocumwal, Mulwala, Berrigan, and Daysdale. These statistics are given as correctly as the returns admit, distributed over the several divisions of the country being dealt with so that the present importance of each part of it may be estimated. The bulk of the settlement occupies the country between Bull Plain and Murray Hut, but there is considerable settlement to the west of the stock route, and also round about Mulwala and Tocumwal.

#### SUMMARY of Settlement in County Denison.

	Number of Holdings.	Population.	Total Acreage of Holdings.	Acreage under Crop.
From the stock route on the east along the middle of county to the extreme west, and over the whole of northern part.	138	1,026	182,255	14,036
Southern part of country about Tocumwal	36	680	22,481	2,053
"    "    about Mulwala	108	784	57,136	5,000
	282	2,390	261,872	21,089

12. This is inclusive of the population of the townships of Berrigan, Mulwala, and Tocumwal, but the actual population of the country may be set down at a percentage higher, since such returns cannot take note of the numbers of labourers and employees of all kinds all over the country. The population, in fact, may be taken to be nearly 3,000.

13. Especially noticeable in these statistics are seventy-three holdings, aggregating 12,038 acres, giving an average of 165 acres each, situated in parishes Mulwala, Boomanoomana, Taramia, and Denison. These are the special areas for which £2 to £6 per acre has been paid. This land is generally not of the best class. These settlers now all depend upon Mulwala and Yarrowanga for their supplies and for an outlet for their produce. The conditions under which farming operations can be carried on in these districts render it certain that, unless railway communication is established in the neighbourhood, the whole of these small holdings will be absorbed into the larger areas on completion of the conditions under which the land was taken up.

14. The markets for the production of these districts, excepting the wool, which is all sent to Melbourne, and such of the wheat as is sent into Victoria, chiefly in bond for gristing, and a small quantity, which may travel through Corowa round by Wodonga into New South Wales again, is Jerilderie. Very clear statements, showing the production of the different parts of this district during the past two seasons, have been supplied by Mr. Wise, of Jerilderie; the mill belonging to his firm was erected in Jerilderie in 1885, about the time that settlement became attracted to these parts. The operations of the firm for consecutive years since have been as follows:—

In 1885	...	...	...	...	...	...	310	bags of wheat.
„ 1886	...	...	...	...	...	...	7,930	„
„ 1887	...	...	...	...	...	...	9,595	„
„ 1888	...	...	...	...	...	...	18,216	„
„ 1889	...	...	...	...	...	...	11,994	„
„ 1890	...	...	...	...	...	...	26,381	„

Including 4,000 bags sent way by rail and 2,000 bags retained by farmers, the estimated production of that season was 32,380 bags, or 135,000 bushels of wheat for the season of 1889-90. Mr. Wise also estimates the yield of the same districts for the last season of 1890-91 at 40,000 bushels, and has distributed the production over the districts as follows:—

		1889-90.	1890-91.
Produced in the direction of Deniliquin and Tuppal...	...	5,000 bags.	6,000 bags.
„ „ Murray Hut and Tocumwal	...	7,000 „	8,000 „
„ „ Berrigan and Mulwala...	...	15,000 „	21,000 „
„ „ Clear Hills	...	5,000 „	5,000 „
		<u>32,000</u>	<u>40,000</u>
Bags	...	32,000	40,000
Bushels	...	135,000	167,000

These figures are exclusive of the quantities that have been sent into Deniliquin, or across the border into Victoria. From Tocumwal a shipment has lately been made to Echuca of 18,000 bushels. So the total product may fairly be set down at 200,000 bushels of wheat produced during the past season.

15. All accounts agree in the excellence of the barley produced in these parts, but the market is absolutely restricted to the requirements of the only brewery using the grain for malting purposes. This is at Deniliquin, and its consumption is about 2,000 bushels per annum only. Consignments sent to Sydney have not been profitable, as the imports from New Zealand keep the price down. The market for this grain and for oats and hay is properly in the interior of this Colony. The production of these districts in these staples can be limited only to the quantity of land available for settlement.

16. As to the land that may be opened for settlement, there is plenty of evidence that the value has risen to a price at which subdivision and sale of the large holdings would seem to be profitable, but the facts are all in support of experience in such matters that land is not parted with, except at the full price obtainable. In several cases lately £3 and £4 per acre has been given by holders of pastoral property for land thrown open for sale by Government, while of 6,080 acres offered on Barooga, only 1,920 acres realized the reserve price of £3 10s., and about 5,000 acres of inferior land below Tocumwal were sold in October last by Government at £2 to £2 5s. per acre to seven settlers.

17. For the rapid development of a country, such as is necessary in order that a railway may become self-supporting within a short time, reliance must be placed upon the Crown lands available. The *Statistical Register* for 1889 shows that in county Denison the lands alienated were 203,203 acres, and lands unalienated were 591,797 acres. Some alienations have taken place since the date of this return, but these have not been extensive. A return supplied by the Lands Department gives the following areas and distribution of reserves in county Denison:—

Water reserves	...	...	...	...	42,228	acres.
Forest reserves	...	...	...	...	20,735	„
Travelling stock	...	...	...	...	19,206	„
Other purposes	...	...	...	...	3,480	„
Total	...	...	...	...	85,649	acres.

18. The total area of the settlement, as given by the statistics collected in this county, is 261,872 acres. Mr. Sproule, in his evidence given at Berrigan, stated that he had lately sold 2,800 acres in that neighbourhood at an average of £4 3s. 9d. per acre, and that the firm (Messrs. Horsfall & Sproule) intended to dispose of 20,000 acres in parishes Mair Jimmy and Berrigan. The Tuppal Estate, comprising in all 159,373 acres of freehold land, is to be offered for sale during this month in five blocks, ranging from 8,040 to 53,337 acres. Of this, one block, containing 15,475 acres adjoining, east of the stock route at Murray Hut, and the other four blocks west of that route. Attached to this run are 18,356 acres of land held under lease from the Crown, much of which may be available, but it is situated south of the main road towards the Murray, and is mostly of inferior quality.

19.

NOTE:—The Tuppal Estate was offered in Melbourne on 17th March, but no sale was effected. The highest bid was £2 12s. 6d. per acre for Boorobanilly, 15,475 acres, at Murray Hut.

See evidence by Mr. Wise.

See Appendix No. 70.

See Appendix No. 72.

See note, paragraph 43, Part I.

19. The position of the rebate line being altogether north of county Denison, the benefits of the Victorian railway by-law relating to goods forwarded from Melbourne into this part of Riverina are confined to goods of the higher class only, and do not, therefore, affect general trade greatly.

	4th class.	Rebate.	3rd class.	Rebate.
	£ s. d.	£ s. d.	£ s. d.	£ s. d.
From Melbourne through Yarrowonga .....	4 13 6	0 10 0	.....	.....
From Melbourne through Cobram .....	4 10 0	0 6 6	.....	.....
From Melbourne through Wahgunyah .....	4 19 6	0 16 0	4 5 0	0 1 6

But, as pointed out in the paragraph relating to the rebates granted for goods through Echuca, there is no reason why the rebate line should not be made concurrent with the border, in the interests of the competition for the trade, in which case the high rebates given in the following table may be allowed :—

From Melbourne through .....	Wahgunyah.		Yarrowonga.		Cobram.	
	Rate.	Rebate.	Rate.	Rebate.	Rate.	Rebate.
	£ s. d.	£ s. d.	£ s. d.	£ s. d.	£ s. d.	£ s. d.
First class .....	2 16 0	0 6 0	2 13 4	0 3 0	2 11 3	0 1 3
Second class .....	3 10 6	1 0 0	3 6 6	0 16 6	3 4 2	0 14 2
Third class .....	4 5 0	1 15 0	4 0 0	1 10 0	3 17 1	1 7 1
Fourth class .....	4 19 6	2 9 6	4 13 0	2 3 6	4 10 0	2 0 0

See Appendix  
No. 50.

20. The towns on the New South Wales side of the border are Tocumwal and Mulwala; neither of these have been incorporated; in fact, Mulwala is but in embryo, as the bridge over the Murray, connecting it with Yarrowonga, has not been finished, but Tocumwal has risen to some importance from its position at the end of the stock route. Full details concerning it are given in Appendix supplied by the Progress Association. The communication across the river is by punt, and some extent of difficult ground, occasionally submerged by floods, has to be crossed to reach the nearest railway-station. The question as to whether the road bridge shall be built here, or opposite Cobram—some 8 miles further up the river—has been the subject of another report, which contains full descriptions of both sites.

See Appendix  
No. 63.

21. Regarding the connection with Tocumwal by a railway, either from Jerilderie direct, or *via* Berrigan, the following extract from that report is here given :—“ Nothing less than the construction of the branch line from Strathmorton to the border, opposite Tocumwal, can give that place a commanding position. From the Victorian point of view, the construction of this branch cannot be recommended on any grounds, excepting on an understanding between the Governments of the two colonies, that a junction of railways shall be made at the border, at Tocumwal. It is very improbable that Victoria will consent to an arrangement involving expenditure of a large sum of money, upon a line, which of itself bringing no additional revenue, will be in addition to expenditure already incurred in reaching the border. The interests of the town of Cobram, which has been created by that line of railway, and now number 800 inhabitants, will be inflexibly opposed to the proceeding.” The Victorian railway having already been brought to the border, at Cobram, at a point very suitable for communication with the centre of important districts in New South Wales, interests will, year by year, grow and strengthen in the vicinity in this Colony, rendering the connection with Tocumwal, either from the Victorian or from this Colony's system less and less advisable.

22. As to the advisability of connecting with the border the arguments used in favour of connecting Jerilderie and Deniliquin were not the promotion of an intercolonial traffic, which, however, will by that connection, and by the existing through line be thoroughly well carried out, but the development and service of a tract of country which has been proved in a long series of years to be capable of making a railway pay good interest and of creating two large towns, and supporting a population. The sole argument that can be advanced in favour of connecting at any of the points on the border in county Denison, rather than with Deniliquin, is that the through distance between Sydney and Melbourne will be less. The distances between these points by various routes is here given :—

<i>Via</i> Albury .....	577 miles
„ Jerilderie and Deniliquin .....	647 „
„ Jerilderie and Tocumwal .....	602 „
„ Jerilderie and Mulwala .....	629 „
„ Jerilderie, Berrigan, and Cobram .....	611 „

This advantage is proposed to be attained by the construction of a short line which will serve but a very small area in Riverina, necessitating the construction of other lines for the service of other parts of it.

23. Importance is given to the Tocumwal line from Jerilderie as being a short one. There are considerable disadvantages in this shortness. At every extension of a branch from an existing line, there is an area within 10 or 15 miles of the junction which is practically unprofitable to the branch. It has been found and reported that the difference between 10 and 28 miles of road carriage has not sufficed to attract the traffic from the established market town at the end of the long road to the railway station in the vicinity. Hence the scope of country served by the long line is greater in proportion to its mileage than that of the short line. Branches as feeders of the main system in this Colony have hardly been commenced yet, but Victoria has ample experience of the depleting effect upon her average per cent. on capital expended by what are called there “ Cock-spur ” lines.

24. A diagram is attached to this report, showing in colours the extent of country that would be served by each of the proposed lines, viz., between Jerilderie and Tocumwal, and Jerilderie and Mulwala. These areas coloured show that neither of these lines will serve a large part of county Denison nor Clear Hills, for which provision would still have to be made. A deviation at Berrigan to Barooga or Tocumwal would still further curtail the usefulness of the line. Though greater distances are benefited, 20 miles may be taken to be the range in which the influence of railway transport will be appreciably felt.

25. For the proposed line from Oil Tree, another diagram shows that the 20-mile limit covers nearly the whole of the country, the statistics of which have been under treatment, and, taken with the following points, shows good reason for the opinion given in paragraph 3, as to the good qualities of this proposal. The terminal point of this line, say at Murray Hut, entailing 62 miles of new construction, would bring that point within 425 miles from Sydney, whereas, *via* Jerilderie, it would be 432 miles; Berrigan becomes 412 miles from Sydney, or *via* Jerilderie, 437 miles. The objections to the proposal which I consider to be fatal are that though traversing good country all the way within county Denison, it passes all along the stock route southwards through poor land, which is already within the influence of the railway from Culcairn to Corowa, and which must therefore be unprofitable to one or the other. It also avoids the district of Clear Hills, and does not provide in any degree for the claims of the north-eastern parts of Riverina.

26. Daysdale is situated on the stock route between Urana and Corowa, at about 26 miles from the former place, and 26 miles from the latter. The position is of some importance, but the statistics supplied of the settlement in its vicinity show seventeen holdings aggregating 15,000 acres only, which can be separated from those of areas included within the range of other proposals, or from those that naturally belong to the Culcairn-Corowa line. The township though in existence for a very long time is very small. A return gives the quantity of wool carted down the stock route through Daysdale as 10,000 bales annually from eleven stations and selectors. The Urangeline clip is taken a more direct route. It is also stated that the local storekeepers, Messrs. M'Guinness, Prosser, & Co., brings about 400 tons of goods annually to Daysdale from Corowa. See Appendix No. 46.

27. A summary of the settlement to be served by any line leaving Jerilderie, and going southwards to the border, either at Tocumwal or Barooga, is as follows. This has been compiled, having in view the necessity that would exist for another line being taken down through the eastern part of county Denison to serve lands not accommodated by this line:— See Appendix No. 56.

Number of holdings	...	...	...	...	...	...	...	...	112

#### PART IV.

##### THE PROPOSED BRANCH LINE FROM COONONG TO URANA.

COONONG is a small station on the Narrandera-Jerilderie line at 384 miles from Sydney. The proposal to construct a branch line from this point to Urana, a distance of about 16 miles, must be dealt with separately because of its isolation from other projects. Though no extension of this line beyond Urana has as yet been suggested, it may be assumed that the interests evoked in its favour will not rest content with the line being permanently terminated at Urana. The statistics supplied in support of the line show that the bulk of the agricultural settlement lies south of the Billabong Creek in the Clear Hills district. If these be subtracted, the quantity left is found to be insignificant. See Appendix No. 67.

2. Urana owes its origin and its existence to being situated at the crossing point of the most important stock routes in this part of Riverina. It was here and flourishing before Narrandera and Jerilderie were born, and it is flourishing still. Its evil fortunes began when the projected line from the Rock was abandoned in favour of the Junee to Hay line, and continued when the branch from Narrandera to Jerilderie was made direct instead of round the east side of the lake. This was all done a long time ago, however, and now Urana proposes to remedy the matter by construction of a branch from Coonong. The continued existence of Urana in spite of its isolation is proof of the natural advantages of its position. These would have magnified its importance had the line originally projected from the Rock been built, whereas the trade of Narrandera and Jerilderie has been created by the railways alone. See Appendices Nos. 57, 58, 59, 60, and 61.

3. The stock routes from Narrandera and Wagga Wagga meet in Urana, and there diverge to Jerilderie and Corowa. The traffic along these routes is given by Mr. P. R. Brett, Stock Inspector (*Appendix No. 8*). These figures show a very large traffic. The distances are as below along these routes:—

From Urana to Narrandera	...	...	...	...	...	37 miles
From Urana to Wagga Wagga	...	...	...	...	...	68 "
From Urana to Jerilderie	...	...	...	...	...	33 "
From Urana to Corowa	...	...	...	...	...	52 "

Two pastoralists at Narrandera gave 42,000 head of fat sheep and 900 head of cattle as being sent annually to Corowa from their stations by this route.

4. The existing tracks for communications from the nearest railway stations pass over ground as bad for road construction as can be. The distance by road to Coonong is 18 miles, over perfectly level land of heavy soil, which carries the rainfall on its surface. The only road metal available is a gravel found in great abundance near Urana and round the southern shore of the lake. For lack of good material for foundation this is not a suitable stone for road making, for the peculiarly severe nature of the traffic, which is very heavy on the axles, and not of the rapid and diverse character needed for consolidation of gravel. To the difficulty of transport over this road during the winter months is attributed the necessity of procuring much of the general goods from Victoria. It seems that the road from Morundah, entailing double the cartage to Urana, has frequently to be used, because that from Coonong is impassable. The greater part of the trade of the storekeepers is done with Sydney, and given a railway all stores would be procured thence.

5. Details are given of the township of Urana and its trade in Appendices 57 to 61. There are ninety-eight buildings in the town, of which sixty-three are dwelling houses, having a population of 430 persons. The merchandise brought into the town amounts to from 717 to 772 tons annually. The public buildings include a large permanent Court-house. The site of the town is high and dry, and extensive enough to admit of very great expansion. The place being north of the Victorian rebate line obtains the full benefit of the rebate allowed on goods forwarded to it from Melbourne through Corowa, and in its trade with Sydney it has also the benefit of the truck-rate rules in force on this Colony's railways.

6. From Urana eastward to Brookong a distance of 20 miles is unbroken plains. The Butherwa Pastoral Holding adjoining contains 50,000 acres, of which 24,000 acres has been secured; but of the Crown lands left a large proportion is taken up by the stock routes. The land is all poor. On the Brookong property the Crown lands are mostly far in the north-east. North-east of Urana are some reserved Crown lands on which a high price has lately been placed. In this direction the large quantity of Crown lands on parishes Pine Ridge, Lake and Boree Creek are beyond the practicable range of the proposed railway, most of it being more accessible from the stations on the existing line. South of Urana, between Urana Creek and the Billabong, a distance of 10 miles or so, is the North Gunambil property, on which are reserves containing 5,000 or 6,000 acres of Crown land. The rest is all secured. This tract is "plains," all treeless; very good grazing land, but not of a class suitable for settlement within a very long time. North of Urana, on the Coonong property adjoining the lake, as also some part of the Crown reserve, is land of the rich red loamy character found in parts all over this end of Riverina, which can hardly be surpassed in quality. It is probable that this would all be saleable at a price high enough to justify the owner in putting it into the market; but north and eastwards to the railway line the land is all poor.

7. The route proposed for the line leaving Coonong Station approaches Lake Urana along reserve No. 1,179 between the creeks. It passes the Coonong head station within a short distance on the north. After having crossed Coonong Creek the ridges of the sand hills can be traversed leading directly into Urana along an elevated route. The Colombo and Coonong Creeks and a depression admitting flood waters from the swampy and lake country on the north-east into Lake Urana would be crossed. On the extreme north shore of the lake is an extensive deposit of coarse sand forming here the bank of the lake for a mile or so, which is admirably adapted for ballast. The quantity is practically unlimited.

8. A possible extension of this line beyond Urana would cross the Urana Creek, between the town and the lake, and keeping well to the west to avoid a tract liable to flooding, would cross the Billabong Creek, near North Gunambil head station. A reserve, No. 93, could be traversed on this route, and possibly to the south of the Billabong also reserve No. 3,109 might be taken advantage of, or the stock route might be followed if Corowa is made the objective point. This line should, however, skirt the eastern side of Clear Hills, in order to serve that district effectually, and thence be taken *via* Bull Plain direct to Mulwala. The whole of this route south of the Billabong would pass through good land, on which considerable settlement has taken place in parishes Clear Hills, Wangamong, Bull Plain, and Mulwala, whereas the extension along the stock route to Corowa cannot be supported. The distance by the route indicated from Coonong to Mulwala is about 70 miles.

9. The following list of distances give the respective positions of the two lines with relation to each other, viz., from Jerilderie and from Coonong, within county Denison:—

From Bull Plain to Murray Hut (direct) ... ..	33 miles
From Bull Plain to Berrigan (direct) ... ..	20 "
From Mulwala to Tocumwal (by road) ... ..	32 "
From Mulwala to Barooga (by road) ... ..	24 "

This shows that two lines traversing this country in a parallel southerly direction do most completely serve the whole of the agricultural area in the county as well as that of Clear Hills and Urana, and embrace all the interests that have been brought to bear upon the question, but at cost of constructing 105 miles or 113 miles of railway (depending upon the border being touched at Tocumwal or Barooga), and entailing a new junction station at Coonong and separate equipment and staff for each line, and, moreover, that within county Denison, the lines are so close together as to be really in competition.

10. Considering this line in detail, it is found that an extension beyond Urana must be contemplated either at once or in the near future. Carried as far as Urana only it would not materially assist in the development of the Clear Hills district, and if this were provided for in any other way the trade of Urana and its neighbourhood would be found to be insignificant. Of the country between Coonong and Urana the proposed line would not materially aid development or settlement. The points at which it could be reached would be at Coonong head station, within a few miles only of the junction, and at Urana. Past this again another length of 10 or 15 miles would be absolutely unproductive of revenue as far as Clear Hills; but from this point throughout its entire length down to Mulwala all is good country, capable of carrying a large population.

11. Considering how short the distance is from Coonong to Urana by road, the argument in favour of bridging this by a railway, because of the badness of existing roads and expense of making good ones, an argument that is repeatedly used in favour of railway construction, holds good merely for the through traffic from Urana, and loses sight of the necessity that will still exist for making the approaches to the stations. The construction of this or any line does not in any degree obviate the necessity for making good roads as approaches to the stations.

12. The statistics of the settlement in the neighbourhood of Urana, as supplied by the Progress Committee, comprise settlement at considerable distances away from Urana, which can only be claimed as part of the district to be served in the absence of any other scheme. However, they comprise twenty-five holdings, aggregating 39,619 acres, of which 1,000 acres are under crop. This is exclusive of the settlement of Clear Hills, but professes to take in all else within 20 miles radius. The disproportion between this sparse settlement and the size of the town of Urana, which is given as containing 430 inhabitants, is very striking.

13. The statistics of Clear Hills has been given in paragraph No. 6, Part III. It comprises thirty-seven holdings, with a population of 250, and an aggregate acreage of 35,546. The nearest point of this is fully 11 miles from Urana. The southern extension of the line to Mulwala will embrace the following, viz.:—136 holdings, aggregating 109,130 acres, and carrying a population, including that of Mulwala.

Mulwala and Coreen, of 813 persons. The sum of all these, representing the total settlement that would be served by a line from Coonong *via* Urana and Bull Plain to Mulwala is:—

Number of holdings	...	...	...	...	...	...	...	...	...	198
Total acreage	...	...	...	...	...	...	...	...	...	184,295 acres
<hr/>										
Population	...	...	...	...	...	...	...	...	...	1,109
Township Urana	...	...	...	...	...	...	...	...	...	430
"    Mulwala	...	...	...	...	...	...	...	...	...	244
"    Daysdale	...	...	...	...	...	...	...	...	...	50
<hr/>										
Total population	...	...	...	...	...	...	...	...	...	1,833

For illustration, the statistics of settlement given in paragraph 27, of Part III, that would be served by the other line southwards from Jerilderie, is given here also:—

Number of holdings	...	...	...	...	...	...	...	...	...	112
Total acreage	...	...	...	...	...	...	...	...	...	143,792 acres
<hr/>										
Population	...	...	...	...	...	...	...	...	...	857
"    Tocumwal	...	...	...	...	...	...	...	...	...	350

<hr/>										
Total population	...	...	...	...	...	...	...	...	...	1,257

NOTE.—For details of Crown reserved lands, see the Appendices to this report.

## PART V.

### THE PROPOSED BRANCH RAILWAYS FROM HANGING ROCK TO URANA AND YERONG CREEK TO URANA.

THESE proposals are treated in this place in the report, as the country traversed by them is on the extreme eastern side of Riverina, and can by description be fittingly connected with the country passed through by the other proposed lines without entailing repetition, and also because the recommendations with which this report is concluded, are partly based on the advantageous position occupied by the existing line, contiguous to an extremely fertile and fairly populous district, for a base from which to start a trunk line intersecting all the districts in this eastern part of Riverina.

See Appendixes Nos. 63, 64, and 65.

2. The line originally surveyed left the main line at Hanging Rock, passed through Urana and Jerilderie, and branched to Hay and Deniliquin. The plans of this are not now in existence. On the ground, the 3-chain road from the Rock to about 18 miles out, is the remains of the proposal. This has now become a highway for the use of the settlement that has taken place all along it, and about Green's Gunyah. The mail road in use from the Rock passes through Bullenbong and along the stock route to Urana. From Bullenbong a road branches off to Narrandera, passing north of Mount Galore. The course traversed by the surveyed line passed a little south of Brookong, but the advocates of the Rock line propose to deviate nearer to Green's Gunyah, and to traverse the stock route in order to bring the line nearer to settlers who have taken up extensive areas of land south and west of Mount Galore. The object of the Yerong Creek proposal being to traverse country much to the south of that passed through by the Rock line, a route to Urana from Yerong Creek has necessarily been proposed, that leaves Green's Gunyah some miles to the north. Hence the divergence of interests. This, however, has resulted in the compilation of statistics of a large area of country from Boree Creek down to Wallandoo, and a large amount of information.

3. The bulk of the settlement shown by the combined statistics lies between the stock route and Urangeline Creek, and extends westwards to within 5 or 6 miles of Brookong and Urangeline. South of the Urangeline Creek there is little settlement for a long way. North of the stock route in parish Galore as far as the Mount, and in parish Boree Creek, there are a very large number of settlers, but in parish Osborne the greater part of the area is still Crown land, though there are no less than forty-four settlers on the land already thrown open in special areas. The statistics of parishes Clyde and Lake have been included by the Rock railway league, but these are too far away to derive any benefit, being rather more interested in communications with the existing line from Narrandera.

4. In considering the merits of this north-west corner of Riverina, the striking features that tell in its favour are the very large areas of Crown land still available in reserves, and the good quality of the land generally. The greater part of the areas of parishes Lockhart and Osborne are Crown lands, and large areas are also in reserve in parishes Boree Creek and Lake, but Lockhart and Osborne together show a total of 35,000 acres\*, which can all be made available for settlement. Excepting some tracts of stony land on the spurs, trending down from Mount Galore, and swampy country between the Mount and Green's Gunyah, all this land is of the very highest quality. A large number of special areas have been sold within the last two years in this neighbourhood in blocks from 160 to 320 acres, at £2 to £2 10s. per acre. At this price, or even up to £3 per acre, any land thrown open on this side of Riverina would be taken up directly. Nearly the whole of the country is gently undulating and well drained. The boundary between counties Urana and Mitchell, from the water-shed of the waters of the Murrumbidgee and the Billabong on which Mount Galore is the highest point. These slopes run out in parishes Mucra, Brookong, and Hebden, into level "forest lands," merging westward in "plains." The capabilities of the whole of this country are very great. Even under existing conditions, aided by improvement to the road communications, the advancement in settlement, population, and production that will be made within the next decade will probably be greater than in any other part of New South Wales within the same period.

See Appendixes 75 and 76.

5. Regard must be had to the fact shown by the statistics, that of the areas held by the settlers, little more than one-fifteenth has as yet been cultivated, and that the distance of cartage precludes the production of things which are always saleable. The straw being of no value, the wheat is stripped, and the product results in a load of about half a ton per acre to be sent away; whereas in the form of hay the weight would be 2 tons per acre. It is universally believed that hay is a more remunerative and safer crop than wheat, provided the carriage to a railway is short. An illustration of this was given by Mr.

\* The large area of Crown land quoted for Lockhart and Osborne is not all in reserves.

W. B. Sangar at Wangamong. He holds 3,200 acres, of which he cultivates 200 acres annually. His out-turn in wool amounts to about 10 tons, whereas his agricultural produce on a fifteenth part of the area amounts to about 200 tons in weight. The capabilities of the district are very much enhanced by the high average of rainfall, which is to date at Wagga Wagga 23 inches, at Walbundry 21·81 inches, and at Yerong Creek 23·31 inches. All over the western parts of Riverina the mean is generally 6 inches lower.

6. In analysing the statistics to show what portion may be fairly taken into account as revenue-producing for a line of railway through this country, the difficulty met with is, that so much of the settlement is now actually within a reasonable distance of the existing railway line. The boundary between counties Urana and Mitchell pass north and south for about 36 miles, at a distance of 15 to 20 miles from the railway, and no settler south of the stock route can be at a greater distance from it than 30 miles.

The stations Hanging Rock, Yerong Creek, and Doodal Cooma, all serve this country. South of the Urangeline Creek there is little settlement, but north of the stock route, at a distance so far removed from the settlement on the south that no line can be devised to meet the requirements of both localities, excepting one from Wagga Wagga along the stock route, there is a quantity of Crown land and settlement of importance enough to demand to be considered in the matter.

7. The statistics have therefore been divided into three divisions according to the plan indicated above.

*North of stock route in county Urana, omitting parish Clyde.*

No. of holdings	...	...	...	...	...	...	...	...	40
Population	...	...	...	...	...	...	...	...	175

The average size of the holdings is seen to be 964 acres, but there are among them numbers from 1,500 to 6,000 acres, as the majority are small. Mr. Halliday of Brookong has expressed his intention to subdivide a large area on the eastern part of his property (Brookong), which, being all on the high land, consists of the best in these parts.

8. The traffic from these districts in agricultural produce and supplies is all carried on by the roads to the neighbouring railway stations. The Brookong wool, amounting to 3,000 bales, is taken to Sydney, but the clips from Urangeline (3,000 bales) and from Wallandoon (1,150 bales) are taken down by road to Wodonga, from which place supplies are carted back. The whole of the settlers' wool is sent through Sydney.

9. The explanation of the course adopted by Urangeline and Wallandoon is found in the high rates charged on this Colony's line, on carriage of goods from Albury northwards as far as Junee. These districts are charged special rates on goods delivered at Albury from Melbourne. In the higher classes these are favourable, but they also get the benefit of the rebate on goods destined north of the rebate line. These rates are here given.

*Victorian Railway rates—Melbourne to Albury.*

Classes.	Mileage Rate.	Special Rate.	Rebate.	Net Rate.
Agricultural	16·8	19·0	.....	19·0
Special A	21·0	23·3	.....	23·3

Special B	10·0	.....
First-class	20·2	31·0
Second-class	24·8	38·0
Third-class	33·7	52·0

10. With reference to the claims of Yerong Creek to be made the starting point of a railway into these districts, the description of the settled area, and the positions of the large reserves of Crown lands show that, though the parishes immediately adjoining Yerong Creek are, as claimed, thickly populated, and contain land of the very best quality, yet all these settlements lie more compactly in proximity to the existing railway, and are therefore better served as a whole by it than on the parishes farther north, even

as

as far as the stock route only. Parish Wallandoon, the farthest west of the existing line on which settlement to any extent has taken place, cannot in its farthest point be more than 22 or 23 miles from the line. Finlay and Ross hold but nine settlements between them, and on Urangeline one only is shown. Further there are no large blocks of reserve land such as are in the northern parishes on which a population can be looked for with complete certainty within a few years.

11. The evidence and inquiry failed to elicit any reasonable object for extending either of these lines to Urana. In a direct line from the nearest settlement in parish Hebden, Urana is distant 20 miles. The whole of this space of country is "plains" land which will probably be unproductive of revenue for generations of time. No nearer approach is made on this route to the distant settlements and Crown lands on the north, in parishes Boree Creek and Emu Plains, or Lake, sufficient to justify the line, and no new country is tapped but that which naturally belongs to the existing line from Narrandera. The need for still further extension in the future beyond Urana, has not been thought of, and the necessities of the districts upon which Urana partly depends is neglected. A further extension southwards from Urana would entail 10 or 12 miles more of unprofitable construction, making the whole length of the line over "plains" 30 miles long. As a new branch or "Cockspur," terminating at the outer limits of the settlements or beyond, at any point that may seem to give promise of development, such a line does not command enough country to give a hope of becoming self-supporting. It must be remembered that these branches can contribute to the revenue of the general system, only by developing new revenue, as a large part of their earnings throughout the range of 10 or 15 miles from the parent line is actually filched from it, and until development does begin no fresh contribution is made. The rates chargeable for the short distance cannot make up a large sum total for a great many years in such sparsely settled countries. As this branch is one that it is very desirable should be built, it is proposed to show in the conclusion to this report how it may be constructed as part of a system.

12. In the matter of construction the route along the 3-chain road from Hanging Rock present no difficulties. There is a long incline rising out of the Bullenbong Creek, which is crossed at  $8\frac{1}{2}$  miles from the Rock, rising westwards for a mile or so to the summit, after which the surface is very level, and the descent to the plains gradual from about 15 miles from the Rock. The whole of the rest of Riverina is so very level that the minor inequalities on this part of it assume more importance by comparison than they deserve. There are really no difficulties anywhere, other than places that are flooded during exceptional conditions of rainfall and Murray water, as mentioned before, and the supply of the necessary materials. There is a good gravel-pit of great extent at the Rock, from which the main line was ballasted, but all timber, except for fencing, must be brought from a distance by rail.

NOTE.—The Crown reserved lands in counties of Urana and Mitchell are given in detail in the Appendices Nos. 75 and 76.

## PART VI.

THE sum of the proposals that have been made for the service and development of this, the eastern part of Riverina, described in Parts III, IV, and V of this report may be taken to comprise construction of the following three lines. The branch line from the Culcairn-Corowa railway is excluded, and also any extension of the line from the Rock past the cultivated land towards Urana. The whole extent of each of these lines must be contemplated for immediate construction, as any section of each line cannot command enough country to be self-supporting alone.

- A. A branch from Jerilderie to the border at Barooga, passing about midway between Murray Hut and Berrigan, through Wait-a-While. Length, about 42 miles.
- B. A branch from Coonong *via* Urana, and Bull Plain to Mulwala. Length, about 70 miles.
- C. A branch from Hanging Rock to Green's Gunyah. Length, about 26 miles.

These lines are shown on plan No. 3.

2. These three lines will command the whole of the country outside the influence of the existing lines, and will give railway accommodation to existing and prospective settlement as nearly as can reasonably be provided without entering unduly into competition with the existing system, or with each other. Development of the whole country will be assured by their construction, and all the requirements of the numerous Progress Committees and Railway Leagues, with the sole exception of Tocumwal, will be amply satisfied.

3. These are the grounds upon which the first two lines, *viz.*, from Jerilderie to Barooga, and from Coonong to Mulwala, can be recommended; but the objections to them are very serious. The intercolonial traffic that will arise will introduce many complications. For instance, the traffic now carried on from and to stations on the Junee-Hay line with Victoria, *via* Albury, will be transferred to the new lines. The distances may be compared, taking Narandera as a central point on the Junee-Hay line:—

From Narrandera <i>via</i> Albury to Melbourne ... ..	350 miles.
" " " Jerilderie, Conargo and Moama, to Melbourne ...	316 "
" " " " Barooga and Cobram, "	262 "
" " " Coonong, Mulwala, and Yarrowonga "	271 "

4. The sole drawbacks to this traffic will be the breaks at the border at Barooga-Cobram and at Mulwala-Yarrowonga. These will form interruptions sufficient to enable the existing line and the line through Moama to retain all traffic to which despatch is a prime necessity, but for all else, representing stock and general goods, these lines will be in competition with existing lines and with each other, and the objectionable feature in this matter is that without this intercolonial traffic these lines cannot for a long time be self-supporting. The very design of the system should have for its object the promotion of intercolonial traffic, whereas, in the interest of the general revenues, rates will have to be imposed as a bar to this traffic.

5. Respecting the third line on this list, *viz.*, the branch from Hanging Rock: As before mentioned, it does not command sufficient extent of country to give promise of large revenue. Westward of its terminus the whole land to Urana is open plains, which will yield nothing. Southwards there is but an extent limited to a few miles in depth and width, from which traffic can reach the new line by a shorter road than to the existing line; but northwards the whole extent of country to Boree Creek will be under its influence. It will carry the wool from the Brookong shed and possibly from the Urangeline also. The district is one that will surely repay by expanding under the impulse of railway communication, but such confined areas cannot, for the space of a generation in time, carry the population and be subdivided to the extent necessary to provide the large production and consumption needed for support of a railway.

6. The main trunk line, marked on plan No. 4, commencing from the Rock, would traverse the best parts of the settled and cultivable area throughout this part of eastern and southern Riverina, and it seems to me to be free from all the objections quoted against the lines above described. In its course parallel to the border, between Bull Plain and Murray Hut, it operates, while serving the districts much better than north and south lines, in acting as a barrier between the rest of Riverina and the Victorian territory, being at every point very much nearer to Sydney than by any of the other routes. All the objectionable features of the competition for the trade of these parts will be more easily met on this line, because of the gap between it and the termini of the Victorian lines on the border, and this line cannot as the others will, introduce new features in the competition for the trade of the northern parts of Riverina and the Colony generally. Moreover, as shown by dotted lines, connections with these termini can be carried out whenever desired in the future, without disturbance to the system.

Jerilderie to  
Barooga, *via*  
Wait-a-While,  
42 miles ;  
Coonong to  
Mulwala, *via*  
Urana, 70 miles ;  
Hanging Rock to  
Green's Gunyah,  
26 miles ; total,  
138 miles.

7. The advantages in favour of this route are (1) the length to be constructed is about 100 miles between the Rock and Murray Hut, to make a complete line for fully developing the country, as compared with the sum of the other three lines, viz., 138 miles. (2) It will be worked under one system of rolling stock and staff. (3) It entails the construction of but one new junction station on the new line. (4.) All parts of it contribute to the revenue of the whole, for the traffic from the distant points will be carried over its whole length. (5.) There being but one junction with an existing line, there is but one length of new line to be constructed through country near enough to the existing line to be served by it, whereas the three other proposals, having all separate junctions, comprise three times the length subject to this disadvantage. (6.) Branches from it, as connections with the Victorian system, or with the existing lines in this Colony, can be made in the future. In fact the system is capable of expansion as the need arises.

8. The objections that may be advanced to this route, as far as can be foreseen, are,—(1.) The line would traverse an extent of 24 miles between the Urangeline and the Billabong Creeks which, though not altogether coming under the category of "plains" land, nor yet of "forest" land, is still low, flat, and in parts subject to flooding, being covered for the most part with the stiff clayey soil, common on land in similar localities all over Riverina. There are, however, several settlers on this part. Very much of the land is, again, private property, but this is an objection applicable to every line that can be projected in this country. The answer is, that no line can be devised in Riverina to avoid crossing patches of similar land, more or less extensive, and that in the aggregate, in proportion to its length, this line crosses less land of the kind than the others. (2.) It will be objected also that this line avoids Urana by 10 miles. I can only maintain that the connection of Urana to a railway cannot be done except at a heavy loss, and that however much the local interests in Urana may suffer, the interests of the settlements, existing and prospective, will not be affected adversely. Also, that by taking this line *via* Urana, and then southwards *via* Clear Hills instead of direct, a distinct robbery of traffic from the Narrandera-Jerilderie line would be perpetrated. (3.) It may be objected that this line would take away from the Narrandera-Jerilderie line the traffic of districts which now actually supply tonnage to that line. This is true, but the recommendations on this report include the connection of Jerilderie and Deniliquin, which will amply compensate for the little traffic taken away. Moreover, the existing line has proved itself to be incapable of developing the district, which, in fact, lies outside the sphere of its influence, being from 20 to 30 miles away.

STANLEY ALEXANDER.

To the Under Secretary for Public Works.

## APPENDIX.

## THE PROPOSED RAILWAYS FOR RIVERINA.

## LIST OF APPENDICES.

NO.	NO.
1. Stock exports to Victoria at Tocumwall.	40. Revenue of Forest Reserves.
2. Customs receipts at Tocumwall.	41. Red-gum forest reserves on Murray River.
3. Stock exports at Moama.	42. Returns of Deniliquin and Moama Railway.
4. Stock imports at Moama.	43. Extracts from Act of Incorporation, Deniliquin and Moama Railway.
5. Stock imports and exports at Moama.	44. Return for Deniliquin.
6. Do do do	45. Do Echuca.
7. Stock passing through Deniliquin.	46. Do Hay.
8. Stock passing through Urana.	47. Do Mathoura.
9. Wheat operated on at Moama Flour-mills.	48. Do Moama.
10. Do do Jerilderie Flour-mills.	49. Do Daysdale.
11. Wheat purchased in Deniliquin.	50. Do Tocumwal.
12. Wheat in Moama Co-operative Store.	51. Railway goods rates.
13. Wheat dispatched from Jerilderie.	51A. Customs tariff of Victoria. Extracts.
14. Wool landed at Echuca Wharf.	52. Statistics of Booroorban.
15. Wool exported from Moama.	53. Rainfall of stations in Riverina.
16. Wool brought to Echuca from Murrumbidgee.	54. State of agriculture, Murray Electorate.
17. Steamers on Edwards and Murrumbidgee Rivers.	55. Traffic returns, Hay and Jerilderie.
18. Wheat exported at Moama.	56. Bales of wool carted to Corowa past Daysdale.
19. Wheat shipped coastwise from Moama.	57. Statement by the Urana Railway League.
20. Imports and exports over the Border.	58. Return of population of Urana township.
21. Customs revenue collected.	59. Details of the town of Urana.
22. Imports at Moama.	60. Trade done by Urana merchants.
23. Exports at Moama.	61. Abstract of Urana statistics.
24. Imports at Moama.	62. Statement by the Clear Hills Railway Comm'ttee.
25. Goods re-introduced at Moama.	63. Estimated cost of line from Yerong to Urana.
25A. Do do	64. Return of traffic, Yerong Creek Station.
26. Holdings, Murray Electorate.	65. Estimate of traffic, Yerong to Urana.
27. Do do	66. Letter by Mr. Henry Holschier.
28. Area of Murray Electorate.	67. Letter by Mr. M. A. Ashton.
29. Details of Murray Electorate.	68. Statement by Jerilderie-Tocumwal Railway League.
30. Lands cultivated in Murray Electorate.	69. Letter from Mr. Dunne regarding Tocumwall Punt.
31. Leasholds in Murray Electorate.	70. Letter from Messrs. Eaton and Tewksbury on the sale of barley.
32. Yield of Wheat in Murray Valley.	71. Reserves in county Waradgery.
33. Production in Murray Electorate.	72. Do do Denison.
34. Wool handled by Messrs. Permewan, Wright, & Co.	73. Do do Townsend.
35. Timber cut on Murray Reserves.	74. Do do Cadoll.
36. Do do	75. Do do Urana.
37. Do do	76. Do do Mitchell.
38. Red-gum forest reserves on Murray River.	
39. Timber cut on Murray Reserves.	

## APPENDIX No. 1.

## Stock Exports to Victoria at Tocumwall, 1888-89.—(Supplied by the Customs Collector.)

## APPENDIX No. 9.

Moama Flour-mills, C. C. Palmer.—Particulars of Wheat operated upon.

From June 30, 1884, to June 30, 1885.....	15,982 bags.
" 1885, " 1886.....	17,385 "
" 1886, " 1887.....	20,112 "
" 1887, " 1888.....	18,512 "
" 1888, " 1889.....	13,625 "
" 1889, " 1890.....	14,825 "
Yearly average .....	16,733 "
" .....	69,721 bushels.

APPENDIX No. 10.

Jerilderie Flour-mill, Wise Bros. (Thos. Wise.)

Commenced operations in 1885 .....		310 bags.
Purchased during 1886 .....	7,990	"
" 1887 .....	9,595	"
" 1888 .....	18,216	"
" 1889 .....	11,994	bags
Purchased by other parties, 1889 .....	3,000	"
" during 1889 .....	26,381	"
" by other parties, 1890 .....	4,000	"
Remain in farmers' hands .....	2,000	"
Total for 1890 .....	32,381 bags	= 134,921 bushels.
Local consumption .....	4,500 "	= 18,570 "
Total production .....	36,881 "	= 153,491 "

Districts in which produced.

In direction of Deniliquin .....	5,000	bags.
" Tocumwall .....	7,000	"
" Berrigan and Mulwala .....	15,000	"
" Clear Hills .....	5,000	"
	<u>32,000</u>	"

Estimated production of above districts during season of 1890-91 is 40,000 to 45,000 bags of wheat.

APPENDIX No. 11.

(Supplied by A. Llewellyn.)

Quantity of wheat purchased in Deniliquin during 12 months ending June 30, 1890, exclusive of all despatched from Deniliquin ..... 7,000 bags = 29,166 bushels.

APPENDIX No. 12.

(Supplied by John Lewis, Moama.)

Number of bags of wheat remaining in Moama Farmers' Co-operative Store on June 30, 1890 ..... 17,000 bags = 70,833 bushels.

APPENDIX No. 13.

(Supplied by Station-master, Jerilderie, 27th August, 1890.)

Grain despatched from Jerilderie for 12 months ending June 30, 1890..... 7,490 bags = 27,000 bushels.

APPENDIX No. 14.

RETURN of Bales of New South Wales Wool landed at Echuca Wharf for shipment at Melbourne for the years 1884 to 1888—all river-borne—from all parts, including the Darling, Murrumbidgee, and Edwards Rivers (as far as Moulamein).

Year.	Bales.	Year.	Bales.
1884 .....	46,077	1887 .....	78,853
1885 .....	33,444	1888 .....	52,808
1886 .....	50,955	1889 .....	80,897

C. C. POPE,  
Sub-Collector.

Custom House, Moama, 6th May, 1889.

APPENDIX No. 15.

RETURN of Bales of Wool exported from Moama to Victoria via Murray Bridge for the years 1884 to 1888, inclusive, by all ways, trains, and vehicles.

Year.	Bales.	Year.	Bales.
1884 .....	23,803	1887 .....	26,487
1885 .....	23,034	1888 .....	24,690
1886 .....	24,833	1889 .....	25,647

C. C. POPE,  
Sub-Collector.

Custom House, Moama, 6th May, 1889.

APPENDIX No. 16.

RETURN of New South Wales Wool landed at Echuca Wharf from the Murrumbidgee only for shipment to Melbourne for the years 1886 to 1889.

Year.	Bales.	Year.	Bales.
1886 .....	39,437	1889 .....	48,082
1887 .....	68,646	1890 .....	70,462

C. C. POPE,  
Sub-Collector.

Custom House, Moama, 14th August, 1890.

## APPENDIX No. 17.

## PORT OF MOAMA.

RETURN showing the number of Steamers and Barges, with their aggregate tonnage, and value of cargoes, for the Murrumbidgee and Edwards Rivers, for the years 1884 to 1889.

Years.	Murrumbidgee River.				Edwards River.			
	Steamers.	Barges.	Aggregate Tonnage.	Value of Cargoes.	Steamers.	Barges.	Aggregate Tonnage.	Value of Cargoes.
1884 .....	47	36	8,934	£ 63,589	12	7	1,474	£ 3,174

## APPENDIX No. 34.

WOOL handled by Messrs. Pernewan, Wright, &amp; Co.

Dear sir, Deniliquin, 16 August, 1890.

Herewith we beg to hand you particulars of the quantity of wool from, and goods to, the various stations around Deniliquin.

This list does not contain such stations as Cobran, Mathoura, &amp;c., the wool from which goes into the railway below Deniliquin.

Yours, &c.,  
**M'COLLOCH CARRYING COMPANY LIMITED,**  
*Per JAMES SKINNER.*  
**PERMEWAN, WRIGHT, & COMPANY LIMITED,**  
*Per W. H. SUNDERLAND.*

A. LLEWELLYN, Esq.

*Summary.*

Total quantity of wool brought into Deniliquin .....	23,400 bales.
Total quantity of goods distributed from Deniliquin .....	585 tons.

## APPENDIX No. 35.

RETURN of Timber cut on the Murray Forest Reserves during the year 1887.

Red-gum exported in the log, 4,995,777 superficial feet; estimated value on the river bank, at £1 10s. per 1,000 superficial feet, £7,493 1s. 6d.
Red-gum, cut in the Colony, measured in the log, 864,450 superficial feet; estimated value of sawn timber at the mill, at 10s. per 100 superficial feet, £4,322 6s.
Pine, sawn in the Colony, measured in the log, 112,451 superficial feet; estimated value of sawn timber at the mill, at 14s. per 100 superficial feet, £787 3s.
Red Gum piles exported, 124; estimated value on river bank, £248.

Total quantity of timber cut, 5,972,678 superficial feet.

The above return gives the superficial feet of timber in the log; but as there is a loss of about one-third in sawing, it would perhaps be as well to deduct one-third of the gross log measurement for loss on timber sawn in the Colony; the estimated value of timber in the log is not affected through loss in sawing.

## APPENDIX No. 36.

## RETURN of Timber cut on the Murray Forest Reserves during the year 1888.

Red-gum exported in the log, 13,523,900 superficial feet; estimated value on the river bank, at £1 10s. per 1,000 superficial feet, £20,293 7s.

Red-gum, sawn in the Colony, measured in the log, 2,017,450 superficial feet; estimated value at the mill, £10,087 5s.

Pine, sawn in the Colony, measured in the log, 648,450 superficial feet; estimated value at the mill, at 14s. per 100 superficial feet, £4,539 3s.

Total quantity in superficial feet, 16,194,800.

The above return gives the superficial feet of timber in the log; but as there is a loss of about one-third in sawing, it would perhaps be as well to deduct one-third of the gross log measurement for loss on timber cut in the Colony; the estimated value of timber in the log is not effected through loss in sawing.

## APPENDIX No. 37.

## RETURN of Timber cut on Murray Forest Reserves during the year 1889.

Red-gum exported in the log, 13,281,019 superficial feet; estimated value on the river bank, £1 10s. per 1,000 superficial feet, £18,571 11s.

Red-gum timber sawn in the Colony, measured in the log, 1,850,850 superficial feet; estimated value at the mill, at 10s. per 100 superficial feet, £9,255.

Total quantity in superficial feet, 14,231,869.

The above return gives the superficial feet of timber in the log; but as there is a loss of about one-third in sawing, it would perhaps be as well to deduct one-third of the gross log measurement for loss on timber sawn in the Colony. The estimated value of timber in the log is not effected through loss in sawing.

## APPENDIX No. 38.

## SCHEDULE of Forest Reserves on which red-gum timber is cut and carried by water to Echuca in the log and sawn there.

Number of Reserve.	Name of Forest Reserve.	Country.	Parishes.	Number of Acres.

## APPENDIX No. 42.

RETURN taken from Statistical Register, 1889.—Deniliquin and Moama Railway.

Opened for traffic .....	July 4th, 1876
Number of miles open .....	45
Capital .....	£162,672
Revenue fund .....	£10,702
Debentures outstanding .....	£46,000
Number of passengers carried .....	16,131
Goods tonnage.....	20,535
Locomotives.....	4
Passenger carriages.....	6
Goods waggons .....	62
Gauge .....	5 ft. 3 in.

Return of Coaching and Goods Traffic supplied by Mr. D. Tennant, Secretary D. and M. Railway Co., for twelve months ending June 30th, 1890.

Revenue from coaching traffic.....	£6,105 10s. 2d.
Do Goods traffic, outward tons .....	£16,350 10s.
Do do inwards tons .....	£3,742 5s. 3d.
Wool—outward bales .....	23,339
Earnings from goods traffic .....	£11,906 17s. 9d.
Total earnings .....	£18,584 12s. 11d.

Return of Coaching and Goods Traffic at the stations Hay and Jerilderie, for twelve months ending June 30th, 1890.

	Hay.	Jerilderie.
Revenue coaching.....	£6,396 14s. 1½d.	£1,695 11s. 5d.
Goods outwards—tons .....	1,033	2,897
Do inwards—tons .....	6,579	2,431
Wool outwards—bales .....	3,456	4,053
Earnings from goods.....	£14,211 18s. 9d.	£5,776 6s. 1d.
Total earnings .....	£20,808 12s. 11d.	£7,471 17s. 8d.

## APPENDIX No. 43.

EXTRACTS from the Act incorporating the Deniliquin and Moama Railway Company, assented to 3rd March, 1874.

*Clause 181.*—It shall be lawful for the Governor at any time after the expiration of the term of twenty-one years from the passing of this Act to purchase the said railways and other works with all its hereditaments, stock, and appurtenances, upon giving to the company three calendar months' notice in writing of such intention, and upon payment of a sum equal to twenty-five years' purchase of the annual divisible profits, estimated on the average of the seven then next preceding years. Provided that if the average rate of profits for the said seven years shall be less than at the rate of fifteen pounds in the hundred, it shall be lawful for the company, if they shall be of opinion that the said rate of twenty-five years' purchase of the said average profits is an inadequate rate of purchase of such railways and other works and property, reference being had to the prospects thereof to require that it shall be left to arbitration in case of difference to determine what (if any) additional amount of purchase money shall be paid to the company. Provided also that such option of purchase shall not be exercised except with the consent of the company, while any such reduced scale of tolls, fares, and charges as aforesaid shall be in force.

*Clause 185.*—Whensoever any railway, the property of the Government of New South Wales, shall be connected with a reach any point of the line of railway authorised by this Act the company shall at their own cost, within six months after notification by the Government to the said company of the fact of such connection, adopt and maintain upon and throughout the line of railway so authorised the gauge mentioned in such notification. And if within twelve months after the delivery of such notification the company shall not have completed the works necessary in consequence of such adoption of gauge throughout their line of railway, the said railway, and all the works, stations, stock, and plant connected therewith shall be forfeited to Her Majesty.

## APPENDIX No. 44.

MUNICIPAL District of Deniliquin—Return for the year ending 4th February, 1890.

(Extracted from Return A.)

Estimated population.....	2,500
Estimated number of dwellings.....	570
Capital value of fee-simple of unimproved lands.....	.....
Estimated capital value of all property in the Municipality.....	£230,210
Receipts from ordinary rates.....	£711 4s. 2d.
Total receipts, exclusive of loans .....	£4,493 16s. 2d.
Expenditure for Public Works .....	£2,310 13s. 10d.
Total expenditure .....	£4,097 15s. 9d.
Total extent of roads and streets made .....	6 miles.
Do do unmade .....	20 miles.

## APPENDIX No. 45.

ECHUCA, 1889.

1.—Estimated number of dwellings.....	840
2.—Estimated population .....	5,470
3.—Capital value of unimproved lands .....	.....
4.—Annual value of improved lands, buildings, &c. ....	£30,000
5.—Estimated capital value of all property in the Municipality .....	£326,270
6.—Total extent of roads and streets made.....	5 miles.
7.—Do do unmade.....	45 miles.
8.—Estimated value of Municipal buildings, the property of the Council .....	£5,000
9.—Receipts from ordinary rates .....	£1,600
10.—Total receipts, exclusive of loans .....	£3,000
11.—Expenditure on Public Works .....	£2,500

## APPENDIX No. 46.

Borough or Municipal District of Hay—Return for the year ending , 1890.  
(Extract from Return A.)

Estimated population .....	2,750
Estimated number of dwellings.....	580
Capital value of fee-simple of unimproved lands .....	£44,627
Estimated capital value of all property in the Municipality.....	£329,336
Receipts from ordinary rates.....	£1,490 Os. 2d.
Total receipts, exclusive of loans .....	£4,055 8s. 5d.
Expenditure for Public Works .....	£1,878 9s.
Total expenditure .....	£4,177 19s. 10d.
Total extent of roads and streets made.....	5 miles.
Do do unmade.....	29 miles.

## APPENDIX No. 47.

PARTICULARS of the township of Mathoura.

Railway-station, D and M line.  
Police-station.  
Three hotels.  
Three general stores.  
Saw-mill.  
Blacksmith's shop.  
Post and telegraph office.  
Place of Worship in use by Anglican and Presbyterian.  
Public School; 60 on roll.  
Baker, and butcher's shop.  
Twenty-seven dwelling houses.  
Population, 150.

## APPENDIX No. 48.

PARTICULARS of the town of Moama.

161 Dwelling houses.  
Population, 600.  
Six hotels.  
Sixteen tradesmen's establishments.  
Flour mill, printing office, grain store of associated farmers.  
Railway station (D. and M. line), School of Arts, Anglican Church, public school, police-station, court-house, lock-up, post and telegraph office.

## APPENDIX No. 49.

PARTICULARS of the township of Daysdale.

Two hotels.  
Two blacksmith's shops.  
Branch of Commercial Bank.  
General store and sale-yards.  
Government stock watering tank.  
Nine buildings exclusive of the Coreen Home station.  
Population, 50.

## APPENDIX No. 50.

PARTICULARS of the township of Tocumwall.

Two banks.  
Three hotels.  
Thirteen stores and tradespeople's establishments.  
Two places of worship—Wesleyan and Roman Catholic, Mechanics Institute, post and telegraph office, police-station, court-house, public school, Collector of Customs office, resident medical man.  
Two auctioneers.  
Seventeen dwelling houses.  
Population, 300.

## APPENDIX No. 51.

COMPARISON of Goods Rates from Sydney to Hay and Jerilderie, and from Melbourne to Echuca and Deniliquin.

*New South Wales Railways.*

	£	s.	d.
From Sydney to Hay, Jerilderie, maximum per ton .....	6	10	0
Do First, Second, and Third classes, per 6 ton truck load .....	26	0	0
Do Equivalent to per ton .....	4	6	8
Do Galvanised iron and fencing wire, per truck of 6 tons .....	24	0	0
Do Equivalent to per ton .....	4	0	0

*Deniliquin to Moama Railway.*

	1st.	2nd.	3rd.	4th.
Echuca to Deniliquin .....	18/9	22/6	26/3	33/0

*Victorian Railways.*

	1st.	2nd.	3rd.	4th.
Melbourne to Echuca.....	48/6	60/6	72/6	84/6
Rebate for goods destined north of rebate line .....	Nil.	10/6	22/6	34/6
Net rate on goods destined north of rebate line.....	48/6	50/-	50/-	50/-

No rebate is allowed for goods passing through Echuca destined to points south of the rebate line within New South Wales.

*Some*

Some examples showing Railway Rates.

	North of Line.	Destination South of Line.
<b>Corrugated Iron—</b>		
Melbourne to Echuca .....	50/-	72/6
Moama to Deniliquin .....		22/6
Sydney to Hay-Jerilderie .....		80/-
Carried from Melbourne to Deniliquin—If for destination north of rebate line .....	at	72/6 per ton.
Do Do south do .....	at	95/- "
Do Sydney to Hay-Jerilderie .....	at	80/- "
<b>Fencing Wire—</b>		
Melbourne to Echuca .....	48/6	48/6
Moama to Deniliquin .....		18/9
Sydney to Hay-Jerilderie .....		80/-
Carried from Melbourne to Deniliquin—If for destination north of rebate line .....	at	67/3 per ton.
Do Do south do .....	at	80/- "
Do Sydney to Hay-Jerilderie .....	at	80/- "
<b>Wire Netting—</b>		
Melbourne to Echuca .....	37/6	37/6
Moama to Deniliquin .....		33/9
Sydney to Hay-Jerilderie .....		66/8
Carried from Melbourne to Deniliquin—If for destination north of rebate line .....	at	71/3 per ton.
Do Do south do .....	at	80/- "
Do Sydney to Hay-Jerilderie .....	at	66/8 per ton.
<b>Groceries—</b>		
Melbourne to Echuca .....	50/-	60/6
Moama to Deniliquin .....		22/6
Sydney to Hay-Jerilderie .....		86/8
Carried from Melbourne to Deniliquin—If for destination north of rebate line .....	at	72/6 per ton.
Do Do south do .....	at	83/- "
Do Sydney to Hay-Jerilderie .....	at	86/8 "
<b>Ironware—</b>		
Melbourne to Echuca .....	50/-	84/6
Moama to Deniliquin .....		33/9
Sydney to Hay-Jerilderie .....		86/8
Carried from Melbourne to Deniliquin—If for destination north of rebate line .....	at	83/9 per ton.
Do do south do .....	at	118/3 "
Carried from Sydney to Hay-Jerilderie .....	at	86/8 "
<b>Tools—</b>		
Melbourne to Echuca .....	50/-	60/6
Moama to Deniliquin .....		22/6
Sydney to Hay-Jerilderie .....		88/6
Carried from Melbourne to Deniliquin—If for destination north of rebate line .....	at	72/6 per ton.
Do do south do .....	at	83/- "
Carried from Sydney to Hay-Jerilderie .....	at	86/8 "
<b>Agricultural Implements—</b>		
Melbourne to Echuca .....	50/-	72/6
Moama to Deniliquin .....		33/9
Sydney to Hay-Jerilderie .....		86/8
Carried from Melbourne to Deniliquin—If for destination north of rebate line .....	at	83/9 per ton.
Do do south do .....	at	106/3 "
Carried from Sydney to Hay-Jerilderie .....	at	86/8 "
<b>Bags—</b>		
Melbourne to Echuca .....	48/6	48/6
Echuca to Deniliquin .....		18/9
Sydney to Hay-Jerilderie .....		130/-
Carried from Melbourne to Deniliquin—If for destination north of rebate line .....	at	67/3 per ton.
Do do south do .....	at	130/- "
Carried from Sydney to Hay-Jerilderie .....	at	130/- "
<b>Saddlery and Harness—</b>		
Melbourne to Echuca .....	50/-	72/6
Echuca to Deniliquin .....		26/3
Sydney to Hay-Jerilderie .....		86/8
Carried from Melbourne to Deniliquin—If for destination north of rebate line .....	at	76/3 per ton.
Do do south do .....	at	98/9 "
Carried from Sydney to Hay-Jerilderie .....	at	86/8 "

COMPARISON of Wool Rates from Hay and Jerilderie to Sydney and to Melbourne, via Albury, and also from Deniliquin to Melbourne, via Echuca.

<i>New South Wales Railways.</i>				
	Dumped.	Undumped.	Greasy.	Undumped Greasy Average.
From Hay to Sydney .....	71/7	83/9	64/9 per ton	74/3
„ Jerilderie to Sydney .....	74/9	83/9	64/9 „	74/3
„ Hay to Albury .....	74/9	85/-	67/3 „ average	79/8
„ Jerilderie to Albury .....		78/-	67/3 „ „	72/8

<i>Victorian Railways.</i>		
	Rates. 300 lb.	Bales. 4 cwt.
From Echuca to Melbourne—		
River borne from Murrumbidgee and tributaries, or by rail or river from north of Murrumbidgee...	29/10	22/6 per ton.
By rail or teams from north of rebate line .....	37/4	27/6 „
By rail or teams from south of rebate line .....	41/8	30/- „
From Albury to Melbourne—		
By rail or teams from north of rebate line .....	37/4	27/6 „
		average 32/5
By rail or teams from north of Murrumbidgee .....	29/10	22/6 per ton.
		average 26/2

Dumped wool is charged 3d. per bale less than above rates.

*Deniliquin and Moama Railway.*

From Deniliquin to Echuca .....	15/- per ton.
---------------------------------	---------------

Summary.

## Summary.

	Bales. 300 lb.	Bales. 4 cwt.
From Deniliquin to Melbourne—		
By rail or teams from south of rebate line .....	56/8	45/- per ton.
River borne or by rail or teams from north of Murrumbidgee.....	44/10	37/6 "
By rail or teams from north of rebate line .....	52/4	44/6 "
From Hay to Melbourne, via Albury—		
From north of rebate line .....	Average.	112/1 "
From north of Murrumbidgee .....	Average.	105/10 "
From Jerilderie to Melbourne, via Albury—		
From north of rebate line .....	Average.	105/1 "
From north of Murrumbidgee.....	Average.	198/10 "
From Hay—Jerilderie to Sydney—		
Undumped and greasy only .....	Average.	74/3 "

Regarding the cost of transport from Hay to Echuca by river, all information was refused by Mr. Brown, local agent in Hay, by order of the directors of the steamer company, but Mr. J. McCaw, who had been for some years agent of Permewan, Wright, and Co. in Hay, stated he had known the following rates to have been used, viz. :—

Steamer freight on wool from Hay to Echuca .....	20/- per ton.
Insurance for river transit .....	14/- "
Permewan, Wright, and Co. have carried wool from Hay to Melbourne by river at .....	50/- "
Do do do do Narrandera do do .....	70/- "

These last rates, subtracting rail freight from Echuca, and neglecting the insurance, which is said to be paid by the Melbourne agents, leave about 20/- per ton for the river freight alone—BETWEEN HAY AND ECHUCA.

## New South Wales Railways.—Truck Rates.

1. The maximum rate for any class of traffic (except explosives) from southern stations to stations distant over 305 miles from Sydney on the Southern, and 340 miles from Sydney on the South-western and Jerilderie Lines, is £6 10s. per ton, or if in truck loads not exceeding 6 tons, the maximum charge will be :—Galvanised iron and fencing wire, £24 per truck ; other 1st, 2nd, and 3rd class goods, £26 per truck.

## APPENDIX No. 51A.

## EXTRACTS from the Customs Tariff of Victoria, October 1, 1889.

	s.	d.
Animals—		
Bulls, cows, calves over 6 months, heifers, oxen, steers (except working bullocks in teams) .....	5	0 each.
Colts, fillies, geldings, horses, mares, not in saddle or harness .....	5	0 "
Sheep, rams, ewes, wethers or lambs .....	0	6 "
Pigs .....	2	0 "
Bacon .....	0	2 per lb.
Butter .....	0	2 "
Cheese .....	0	8 "
Fruits—Green berries, oranges, or lemons .....	0	9 per bushel.
" nct otherwise enumerated .....	1	6 "
Grain—		
Oats and barley .....	3	0 per cental.
Maize, peas, beans wheat .....	2	11 "
Barley—pearl and Scotch .....	7	6 "
Oatmeal .....	9	0 "
Maizena—Maizelour or cornflour .....	0	2 per pint or lb.
Grain or pulse of any kind, not otherwise enumerated, prepared in any way .....	5	0 per cental.
Hams .....	0	2 per lb.
Honey .....	0	2 per pint or lb.
Hops .....	0	8 per lb.
Implements—agricultural— <i>ad valorem</i> .....	20	per cent.
Jams and jellies .....	0	3 per pint or lb.
Leather (except crust or rough tanned) .....	0	6 per lb.
" manufactured— <i>ad valorem</i> .....	25	per cent.
Malt .....	4	6 per bushel.
Onions .....	20	0 per ton.
Potatoes .....	10	0 "
Sugar—the produce of sugar cane .....	3	0 per cwt.
Timber—undressed .....		free.
" boards—dressed or planed .....	1	6 per 100 ft. super.
" hardwood .....	2	0 " "
" pilings .....	0	9 per 100.
" shingles .....	0	9 per 1,000.
" spokes and felloes, in rough .....	0	6 per 100.
" staves—dressed— <i>ad valorem</i> .....	25	per cent.
Tobacco—manufactured .....	1	0 per lb.

APPENDIX No. 52.  
STATISTICS of Booroerban.

Dear Sir,

Booroerban, 30 November, 1890.

Your letter of the 16th to hand, asking for information of the settlement about here.

Unfortunately I was again away from home, which accounts for the delay in answering your letter. I have taken down on paper the particulars you require as near as I possibly can, and I think in nearly every case it is very nearly correct. As you will see, there are very few who go in for cultivation, except a little for their own use; and the reason of this is that they are too far from a market or railway to take it there. Nearly all these selectors have good land for wheat-growing, and would grow large quantities if this Hay and Deniliquin railway were made, and it would also cause a lot more settlement, as there is yet a good deal of land in the neighbourhood to be taken up. Nearly all—with about three exceptions—get their mail from this post office, and a large lot of settlers outside of those mentioned east and west, would bring their produce in if a line were made past here; but at the present state of affairs farmers cannot grow crops profitably as they are too far from market, and cannot cart their produce from 30 to 50 miles upon bad roads.

Two years ago I myself lost the sale of over £2,000 worth of chaff and hay through not being able to get it into Hay in time—the season was so bad that teams were not to be had at any price—and that same season many thousands of herding sheep died on this road, and close to this place, travelling to Victoria in search of feed, whereas had there been a railway their lives would have been saved, and I believe the same thing will happen this season, as the grasshoppers are eating every vestige of grass on this route, and tens of thousands of sheep are still coming down.

Hoping this will meet with your approval, and apologising for the delay,

I am, &amp;c,

S. PORTER.

Any other information you require of this neighbourhood I shall only be too happy to supply it as far as lies in my power.

S. Alexander, Esq.

S.P.

## APPENDIX No. 57.

STATEMENT by the Urana Railway League.

The Examiners, Public Works,—

Gentlemen,

Urana, 27 September, 1890.

We beg to lay before you the following facts and statements in support of our claim for a railway from Coonong Siding to Urana :—

## 1. Cost of construction.

The distance, 17 miles, is through a perfectly level country. There is only one small bridge required, viz., over the Colombo Creek. The line can be run along the present road, and the embankments, culverts, and metalling there can be utilized. No land need be purchased, for even in the town there are plenty of unsold Government allotments on which to erect station buildings. Half the way is fenced in on both sides.

Should it be considered advisable to bring the line by a different route, there is a reserve of 3,000 acres, extending half way across Coonong Station, and Mr. M'Caughy offered any land required at £2 per acre. Abundance of ballast can be obtained both near Coonong homestead and at Urana.

This can be made the most cheaply-constructed line in the Colony. We ask but for a light railway, and as an impression prevails in the country that this kind of line should be tried, we put forward this as a suitable opportunity for making the experiment.

## 2. Traffic.

As will be seen by the statistics laid before you by the representatives of Clear Hills, there is in that district a large number of farmers who look to the construction of this line to provide them with an outlet for their produce. In spite of having to cart their wheat from 30 to 40 miles to the nearest railway station, they have this year over 4,000 acres under crop, and are rapidly clearing their land to augment this already large area. In the event of this line being granted, they are prepared to go still more extensively into wheat growing, and others who have not yet done so will also enter into the same pursuit.

It may not be amiss to state here that wheat growing in this district is an industry that has sprung up within the last five or six years. Five years ago there was not one-fifth of the grain now produced. Selectors see clearly that the enormous development in labour-saving agricultural implements, they can now sow large areas with so little expense as with ordinary seasons and prices to make handsome profits, provided they have but the means of bringing their produce to market: also that the country must for the future look for its grain supply, not to the little paddocks of the older settled parts of the country, but to the broad plains of these distances where agriculture can be carried on in the extensive manner now prevailing in America. If, then, the increase in wheat-growing has been so great in the few years just passed, it is only fair to assume that the increase will be in a still greater ratio in the next few years, and that there will be no lack of traffic on the new lines which are being asked for by the farmers of these southern districts.

Besides the area in the Clear Hills district, there are within less than 20 miles of Urana about 1,500 acres under crop this year, and in almost every case it will be found that selectors are taking measures to increase their acreage.

### 3. Bad Roads.

The road from Coonong Siding is for a great part of the year, and particularly at shearing time, when traffic is greatest, quite impassable. To Widgiewa Siding the road is equally bad. During this winter carriers absolutely refused to bring goods from either of these sidings, and local storekeepers were obliged to get their goods consigned to Morundah, many miles more distant. The cost of putting the present road into proper repair would go far towards paying for a railway; and it should be remembered that money expended on roads is entirely lost, whereas if laid out in railways there is some revenue derived.

### 4. Irrigation.

This railway will run along the surveyed line for the proposed canal to the Urana Lake, and it will extend to the outer limit of the area proposed to be irrigated. Now, if the Government are in earnest with their irrigation scheme, and the large sums expended in elaborate surveys would seem to show that they are, the necessity for this railway cannot be gainsaid. To make irrigation profitable there must be the means of transporting the produce in the quickest time and at the cheapest rate to the market. If, then, this scheme is to be carried out, this line should be started without delay, so that by the time the canals are ready to irrigate the railway may be prepared to take away the produce.

### 5. Unsold Lands.

Close to the town are large reserves, in which are locked up some of the finest agricultural land. On Butherwah and Brookong alone there are at least 30,000 acres, which will, in the course of a few years, have to be thrown open, and the increase of value caused through having railway communication will more than suffice to pay the cost of the line.

Again: Mr. Halliday of Brookong has signified his intention of disposing of, to farmers, 35,000 acres, as soon as the irrigation scheme is started, and without doubt other landholders will follow his example.

### 6. Trade secured for Sydney.

By the construction of this line the whole trade of the district will be secured for Sydney, instead of a large portion going to Victoria, as is now the case.

### 7. Other facts.

(1.) A company has been formed to carry on a meat-freezing establishment at Narrandera. This will be the means of largely increasing the traffic to and from that town, and great numbers of sheep and cattle will be sent there from this district.

(2.) The great market for our farmers' hay and oats is the dry district of the Lower Murrumbidgee; the line to Coonong Siding will lead directly towards that district.

### Rival Routes.

Two other lines to Urana have been advocated, viz., from The Rock and from Yerong Creek. Consideration of these lines is absurd. The Rock is over 60 miles from here, and Yerong Creek nearly 60. As the settlers of these two districts are mostly within 20 miles of the main line to Albury, they should ask for a light line to feed the main one instead of an expensive branch to Urana. Why construct a railway of over 60 miles when two light feeders will serve the purpose—one 17 miles from Coonong Siding to Urana, and another 15 to 20 miles from either The Rock or Yerong Creek to the midst of the settlers in either of the localities. As already pointed out, the line to Coonong will enable farmers to despatch their produce where the market is best along the Murrumbidgee, while the other proposed lines would prevent them from so doing.

### Conclusion.

We trust, then, you will weigh well the reasons we have advanced for the construction of this line. We feel assured it will prove a paying one, and will assist the present unprofitable Jerilderie line in becoming remunerative.

With the throwing open of the reserves here, the breaking up of the large estates, and the initiation of a system of irrigation, this town will become the centre of a wealthy and thickly populated district.

Appended are reliable and carefully prepared statistics of the town and country.

We have, &c.,

Signed, on behalf of Urana Railway League,

JOHN B. MARTIN, M.B., Chairman,  
JOHN WISE, Secretary,  
G. J. STEVENS,  
P. C. BUTT.

## NOTES ON Trade done by Urana Merchants.

The following accompanied the Urana statistics:—John Scroby, coachbuilder, 24 tons; B. Carry, storekeeper, 170 tons; H. A. Hill, storekeeper, 210 tons; J. Lucas, cordial factory, 30 tons; L. Fox, hotel-keeper, 30 to 40 tons; G. Schuback, carpenter, 20 to 30 tons; C. J. Chamin, bootmaker, 5 tons; Wise Brothers, butchers, 20 to 30 tons; W. Ahkin, gardener, 10 to 15 tons; W. Dalliston, blacksmith, 30 to 40 tons; J. G. Paterson, hotel-keeper, 35 tons; E. E. Welby, hotel-keeper, 25 tons; J. M'Crabb, hotel-keeper, 30 to 40 tons; G. J. Stevens, storekeeper, 78 tons. Total, 717 to 772 tons.

## APPENDIX No. 61.

## ABSTRACT of Statistics, Town of Urana.

POPULATION, 430; merchandise, 717 to 772 tons; cattle, 250; horses, 150; area under crop, 106 acres.

District within a radius of 20 miles, but excluding Clear Hills.

Farmers.—Acreage, 39,619 acres; area under crop, 1,031 acres; produce—hay, 2,700 tons, wool, 3,152 bales; cattle, 403; horses, 319; sheep, 50,434.

Station-holders.—Acreage, 745,259 acres; area under crop, 650 acres; proposed increase, 3,000 acres; sheep, 846,503; cattle, 3,276; horses, 860; wool, 52,907 bales.

Totals for whole district (except Clear Hills farmers).—Acreage, 784,934 acres; area under crop, 1,837 acres; sheep, 896,937; cattle, 3,929; horses, 1,329; wool, 56,059 bales.

## APPENDIX No. 62.

## Clear Hills Railway Committee to the Public Works Examiners.

Gentlemen,

We respectfully submit the following reasons for urging the Government to construct the Coonong-Urana Railway, and we take leave to tender those reasons to you in conjunction with the farmers' petition hereto attached.

1. That the distance (15 miles) is entirely free from engineering difficulties, and its construction will be inexpensive owing to the level nature of the country.

2. That splendid ballast is obtainable both at Urana and half-way to Coonong siding, the convenience of which will assist to lessen the cost of construction of this line.

3. That surrounding Urana on all sides there are many thousands of acres of Crown lands suitable for settlement which, if opened to the public, would be immediately settled upon, and would make this the best paying line in the Colony if constructed.

4. That in Clear Hills district, commencing 10 miles south of Urana, there are this year at least 3,000 acres of crop and nearly 1,000 acres of fallow being prepared for next year, the returns from which must find its way to Sydney market over this line.

5. That owing to the richness of the soil the roads become boggy and unfit for traffic after a small fall of rain, compelling the farmer to dispose of his grain to his disadvantage, when the market is glutted at harvest time.

6. That under the disadvantages we labour, viz., bad roads and 40 miles of cartage, the area under cultivation in this district is yearly increasing, which points to the conclusion that if the Government provide us with proper facilities for transit of grain to Sydney, importation of grain to the Colony must shortly cease.

7. That the construction of this line of railway will greatly increase the area under cultivation, and secure to our own metropolis a lot of trade that now goes to Melbourne.

8. That this line taken in conjunction with the Corowa-Culcairn railway, and a line to Murrumbidgee or Tocumwal, will bring all the farmers who are now agitating for railway communication for one hundred and fifty (150) miles of the Murray Valley within twenty-five (25) miles of a railway. We believe that reference to a map of the Colony will show this.

9. That the construction of this line will serve the true interests of the State, of a large population, and open the Sydney market to a large community of farmers.

We are, &c.

ANTHONY HALL, President.  
FRANCIS PATEY,  
ALEXANDER MURRAY, } Vice-Presidents.

## APPENDIX No. 63.

RETURN showing estimated cost of light unfenced Line of Railway from Yerong to Urana, together with estimated Goods Traffic which such line would be called upon to carry.

*Estimated Cost Light Unfenced Line.*

Yerong to Urana, 50 miles, costing at outside price £3,000 per mile ..... £150,000

*Estimated*

*Estimated Passenger and Goods Traffic.*

Population—1,900 fares averaging, say, £1 per annum.....	£1,900
Wheat grown in line 30 miles from Yerong Station—say, 200,000 bushels or 5,360 tons at carriage rate with that grown south of Urana, say, 20s. per ton .....	5,360
Wheat grown south of Terminus, Urana—say 100,000 bushels or 2,680 tons at average carriage rate as above, at 20s. per ton .....	2,680
Wool—from 905,352 sheep as shorn along line and in district abutting on the Terminus, Urana, say, 1,620 tons at 20s. ....	1,620
Revenue derivable from market-going and travelling stock (reasonable estimate) .....	750
Revenue from goods receivable for Urana District, say, 700 tons, at 20s. per ton .....	700
Revenue from goods receivable for indyng residents along line from Young, 500 tons .....	500
<b>Total revenue .....</b>	<b>£13,510</b>

This total would give a return of 5 per cent. upon 50 miles of railway costing £5,400 per mile, and as the whole line between Yerong and Urana would traverse a level country, there cannot be the slightest probability that the cost of a light unfenced feeding line would be at any such rate.

Nor can it be urged that the estimated revenue is excessive, seeing it is based upon statistics which are undoubtedly reliable. And it must always be borne in mind that the construction of railways through agricultural areas tends immediately to immensely increase production and therefore increased revenue returns.

G. F. PLUNKETT.

## APPENDIX No. 64.

YERONG Creek Railway Station Returns for the twelve months ending 30th June, 1890.

Tonnage outwards .....	1,236 tons.
"    inwards .....	632 "
Bales Wool.....	2,741
Passengers out .....	3,461
Bags Wheat .....	12,000

G. F. PLUNKETT.

## APPENDIX No. 65.

ESTIMATE of Traffic, Yerong to Urana.

THE amount of traffic to be gained for the line from the terminus, Urana, may be gauged from the following statistical facts:—

Urana has a population of 500, and within a radius of 20 miles there are 320,000 sheep with a continually moving total through the district of 120,000, and 1,000 fat cattle, with many thousands of sheep, are annually sent to market. At Clear Hills, to the south of Urana, there are 5,000 acres of land under cultivation, which would be trebled if there was railway communication, and upon Clear Hills, Mahongu, Goonamble, and Butlema, there are over one hundred families living upon selected lands. From 500 to 700 tons of loading are brought into Urana annually, but with the railway this would be increased tenfold, as at present station-holders procure their supplies from Victoria.

G. F. PLUNKETT.

## APPENDIX No. 66.

Womboota, 14 August, 1890.

Dear Sir,

I exceedingly regret that circumstances prevented me from being present at the interview you had with the gentlemen at present in Moama for the purpose of collecting information regarding the extension of railway from Deniliquin to Jerilderie, and the more so since I could have given information perhaps not in your possession regarding land at present under cultivation of wheat, and the output of produce of the district. You may be aware when starting our grain store last year, in canvassing the district, I had careful statistics taken of the land then under cultivation and in preparation of becoming so, and proved the result to be 20,000 acres actually under crop, and about 4,500 under bare fallow and maiden fallow, within 25 miles of Moama. These statistics were taken to test the feasibility of the store, and for the correctness of same I can vouch. The result of the last year's harvest you may have a fairish idea of, but yet I doubt whether you take the same amount of interest in same as what we do; and for your guidance will inform you that the same was about 15 bushels per acre, or, otherwise, 75,000 bags of good wheat available for export. Had the spring been less moist than it was, and not lodged the crops the way they were, the result would have been fully 100,000 bags. I need not ask you to point out to these gentlemen how heavily we are handicapped through our produce being shut out of the Victorian markets, and having no communication with our own, for that I (you) now fully understand, and were it otherwise you know likewise the tremendous impetus it would give the district as a wheat-producer of the Colony. I sincerely trust that they may get a fair idea of the district, and the urgent want of direct communication with not only the Sydney but likewise the inland markets of New South Wales, for should such relief fail us I am very much afraid that it is only a question of time when sheep must again take the place of our promising rising generation upon the land here. I am certain that the disadvantages we at present are handicapped with will crush us out of the race of competition. Wishing you most heartily success in your noble endeavours to benefit the district,

I remain, &amp;c.,

HENRY HOLSCHIER,

Chairman of Farmers' Association, Womboota, N.S.W.

To Mr. John Lewis, Chairman of Railway League, Moama.

## APPENDIX No. 67.

LETTER from Mr. M. A. Ashton.

8 September, 1890.

THE principal reasons that may be advanced for the construction of the line from Hay to Deniliquin, are—

1. That it would be to the interest of the district to have facilities for trading with the nearest capital; and,
2. That it would be in the interests of the general body of taxpayers, inasmuch as it appears to me to offer the only solution of the differential rate difficulty, so far as south-western Riverina is concerned. My reason for the latter view is this: at present goods are carried from Sydney to Hay at the same rate (about) as from Sydney to Narandera, the distance being nearly 120 miles greater. This is tantamount to doing 120 miles haulage for nothing. Assuming that mileage rates are arranged on the lowest possible basis consistent with profit, this can never pay. If the Deniliquin line were made the position would at once be altered. Sydney is 454 miles from Hay, and Melbourne about 275,—a difference of 179 miles. Assuming the advantages of the Sydney and Melbourne markets to be equal, the destination of the traffic to the two capitals would be determined by distance. The point midway between Melbourne and Sydney, *via* Hay, would be about 10 miles east of Whitton. All things even, Melbourne would get all the traffic south-west of that, and Sydney all the traffic north-east. Instead of carrying 140 miles for nothing, as at present therefore, the Government would be paid full rates for half carriage to Melbourne and Sydney. Instead of reducing the returns on the Hay-Junce line therefore, the tendency of the line to Deniliquin would be to increase them, by putting an end to the differential system.

M. A. ASHTON,

Journalist, Riverina Gazette.

APPENDIX

## APPENDIX No. 68.

## STATEMENT by Jerilderie-Tocumwal Railway League.

Gentlemen,

In placing before you carefully-prepared statistics to assist you in reporting fully on the necessity or otherwise of a railway line from Jerilderie to Tocumwal, the members of the Tocumwal Railway League beg permission to urge the following reasons in its favour, and request you to lay these, with the statistics, before the Honorable the Minister for Works:—

1st. That a Crown reserve for travelling stock one mile wide extends over the whole of the proposed route, therefore no land would have to be purchased by the Government to construct the line.

2nd. That the above stock route, which is 35 miles long, contains about 22,400 acres of land, which would readily sell in special areas of 320 acres each at £4 10s. per acre, yielding a sum total of £100,000.

3rd. That an eminent engineer estimated the cost of proposed line would not exceed £1,200 per mile, the country to be traversed being level throughout, and no costly bridges or engineering work would be required, the total cost, therefore, being, say, £44,000, would leave a surplus for the Government after paying the cost of construction. The increased value put upon adjacent reserves along the line would, if desired, considerably swell this surplus.

4th. That the construction of the line would dispense with the need of a stock route.

5th. That the proposed line is within three miles of valuable and almost inexhaustible granite quarry, owned by the Government, whence ballasting, building stone, and road metal of a superior kind could be obtained, the scarcity of which has hitherto greatly retarded the progress of Government works in Riverina.

6th. That the opening up of the stock route by subdivision would induce the settlement of an estimated population of 350 souls, which alone, apart from the profit derivable by the State, should warrant its construction.

7th. That the richness of the soil renders the road unfit for traffic except in dry weather, and the cost of forming a metalled road as required would be greater than constructing a railway.

8th. That with the railway facilities for carrying our produce to market largely-increased areas would be put under crop in addition to the land along the stock route, of which alone two-thirds, or 14,000 acres, would be cultivated, with an estimated yield of 280,000 bushels of grain. It would also obviate the necessity of importing large quantities of flour as at present; a large quantity of surplus labour would be absorbed; a remunerative traffic with the metropolis and back districts would be secured, and the line would act as a valuable feeder to the Narrandera-Jerilderie line.

9th. That there are two Government wells with permanent supply of water at suitable points along the route to supply engineers and the surveyed route of the proposed Murray canal traverses many miles of the route.

10th. That in view of the present federation proposals the fact should not be lost sight of that this is the shortest alternative route from Sydney to Melbourne, and which could be used to relieve the traffic between Junee and Seymour junction in Victoria, showing duplication over that distance.

11th. That your petitioners are the holders of 378,831½ acres of land, every acre of which is adaptable for cultivation, and of which we have this year cultivated 8,098 acres, leaving an area of 370,733½ acres fit for future cultivation.

12th. The farmers on the border suffer great losses by expensive carriage over bad roads to Jerilderie, whilst heavy protective duties bar their produce going to Victorian markets. A rail connection would therefore be a great boon to this class of settlers. In support of this contention, we may state that, about two years ago, sufficient capital was subscribed at Tocumwal to float a flour milling company, but the project had to be abandoned, owing to the want of means of transit to convey flour to other Riverina towns in non-agricultural districts, whilst the Victorian protective duties, effectually barred sending it that way.

13th. That the unprofitableness of the Narrandera and Jerilderie line is attributable to the fact that it runs entirely through pastoral holdings, whilst the projected line would penetrate the heart of a rich agricultural district populated chiefly by farmers, and needing only a railway to develop its resources. The apparent result would be that the Tocumwal-Jerilderie section would not only be profitable in itself, but would increase the traffic on the already constructed lines.

14th. We would like to direct your attention to the existing conditions on the Victorian side adjacent to the Murray River. The soil in the Goulburn Valley, and the natural features of the country are precisely similar to those in this district. In other respects, such as a large uncultivated area with no outlet for produce, a sparsity of population, and no railway communication, it was, ten years ago, perhaps in a less advanced condition than the district lying between the Murray and Jerilderie is at present, but the Goulburn Valley district immediately opposite here is now the largest wheat producing area, and the railway line the most profitable one in that colony. With railway facilities and a large settled population there is good reason to believe that a similar prosperous future is in store for this district.

We have, &amp;c.,

FRANCIS MANNING,

President.

PETER A. DUNNE,

Secretary.

On behalf of the Tocumwal-Jerilderie Railway League.

To Messrs. Gilliat and Alexander, Public Works Examiners.

## APPENDIX No. 69.

LETTER from Mr. Dunne to Messrs. Gilliat and Alexander, Public Works Examiners.

Tocumwal, 24 July, 1890.

THE punt at Codram stopped working owing to floods on or about the 17th June last, and has been idle ever since. On that date the river at Tocumwal was 7 ft. 3 in.; 18th, 7 ft. 6 in.; 19th, 7 ft. 9 in.; 20th, 8 ft. 6 in.; 21st, 9 ft. 2 in.; 22nd, 10 ft.; 23rd, 10 ft. 9 in.; 24th, 11 ft. 9 in. Water from Codram should reach here in a day. The punt at Tocumwal continued to work as usual until the river reached 15 ft. 6 in. I saw bullocks and waggons cross on it when at that height. It suspended work for two days, during which the river rose to 15 ft. 9½ in. on the 8th instant. Since then it has been falling, and this morning it was 10 ft. high at Tocumwal.

PETER A. DUNNE,

River-gauge Reader.

## APPENDIX No. 70.

LETTER from Messrs. Eaton and Tewksbury on the sale of barley.

Dear Sir,

Wagga, 14 July, 1890.

Yours of 14th current, re barley, to hand. We are pleased to inform you that the barley we purchased from you has fully justified the high opinion we formed of it. For malting purposes it has proved excellent, producing far superior malt than we have ever obtained from best Victorian barley.

Should the barley you have growing at present be up to same sample, we will have no hesitation in buying.

Yours, &amp;c.,

EATON AND TEWKSBURY,

Brewers, Malters, Aerated Water and Cordial Manufacturers, Wagga Wagga Brewery.

Mr. James Roche, Tocumwal.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

PROPOSED BRANCH RAILWAY TO JAMBEROO.

(REPORT OF MR. E. B. PRICE.)

*Ordered by the Legislative Assembly to be printed, 26 May, 1891.*

Mr. E. B. Price to The Under Secretary for Public Works.

Sir,

January 2, 1891.

I have the honour to report that, according to the instructions of the Minister, I have visited and thoroughly examined the District of Jamberoo.

On the evening of my arrival I met about thirty of the farmers at a public meeting, and on the following days rode through all parts of the surrounding district, accompanied by a few of the residents.

Owing to the hilly nature of the country it is impossible to judge of its extent or capabilities, except by close examination.

I also visited the butter factories and some of the larger private dairies, and took extracts from their books.

The village of Jamberoo is about 5 miles inland from Kiama, and comprises two hotels, four stores, two tanneries, two forges, three wheelwrights, two tailors, two butchers, one bootmaker, three milliners, one saddler, one bacon-curer, two butter factories, several tinsmiths, four churches, one public school, and about forty private residences.

It is the centre of one of the best dairying districts in the Colony, a district which may be described as a basin, 6 miles in diameter, almost surrounded by mountains, which rise on the west and south to a height of over 2,000 feet, with precipitous sandstone cliffs on top, while on the north and east they gradually fall away into rolling hills a few hundred feet in height.

All the land below the sandstone cliffs is of the richest basaltic nature, capable of growing anything.

It is cut up by deep ravines with permanent springs of pure water, and is thickly populated by a thrifty and intelligent class of farmers.

An idea of the amount of settlement is best got by ascending one of the low hills near Jamberoo. From the top of one of these I counted sixty farms.

About 100 farmers are now sending milk to the Jamberoo butter factories, and, as near as I could ascertain, there are fifty others who are either too distant, or have small factories of their own, and, therefore, do not send. Some of these reside in the outlying district on top of the mountains at the Pheasant Ground.

There are also the good lands of Broger's Creek and the upper end of Kangaroo Valley which are populated and transact their business with Jamberoo.

The products of the district are at present, butter, eggs, poultry and bacon, all of which are produced in large quantities.

No crops are grown to send away, in fact little is grown except for feeding cows and poultry.

Fruit is not generally grown, though there are several large orchards containing many varieties of good fruit.

The farms are comparatively small. Taking those represented at the public meeting I found the average to be 143 acres, and the average number of cattle milked daily, 35, giving an average of 2 gallons per day each cow. It requires about 2 acres to keep one cow all the year round.

Most of the farmers send the milk to either the "Woodstock" or "Waughope" factories, and take back a proportion (not exceeding one-third) of the separated milk for rearing calves.

Under present arrangements the surplus milk is contracted for by a bacon curer, who rents the piggeries, in connection with the butter factories. At these establishments from 400 to 500 pigs are kept.

This is the weak point in the factory system, as the price obtained for the skim milk is very small, and the piggeries are a great nuisance.

Both factories are worked on strictly co-operative principles, and the profits divided monthly in proportion to the number of gallons supplied by each subscriber. Yet the return is small, varying during the past two years from 7½d. to 2½d. per gallon—the average being 5d.

It will be seen from the foregoing that the district is highly developed and in a very prosperous state, in fact there are few localities that can compare with it.

It is a pity the main line could not have come through Jamberoo; but the nature of the country rendered the cost prohibitive. The point was fully discussed when the line from Kiama to Nowra was before the Parliamentary Standing Committee on Public Works. The evidence of the officers of the Railway Construction Branch was strongly in favour of leaving Jamberoo to be served by a Branch.

Mr. Wright, District Engineer, estimated the cost of the Branch which he had just surveyed from Shellharbour Station at £30,000, and said it would be a "very easy" line to construct. For the same branch the present estimate is £50,000.

Three lines in all have been surveyed into Jamberoo at different times, use being made of portions of the old survey for the main line, except in the case of Mr. Wright's survey from Shellharbour. Unfortunately, the field-book of this survey was lost, so the estimate furnished with the other papers can only be taken as approximate, and would probably be reduced considerably by a re-survey.

Before any final decision can be arrived at as to the comparative merits of the different lines, I think both the Shellharbour and the Terragong Swamp routes should be resurveyed with a view of reducing the cost as much as possible without injuring the permanent character of the works, but bearing in mind that the line can never go more than a mile or so beyond Jamberoo, and therefore will never be used for express traffic where curves and grades become objectionable.

As laid out at present, the curves are extremely easy for a branch line.

So far, the Shellharbour line is the cheaper; but the line on the south side of the Terragong swamp would better serve the rich land.

The line direct into Kiama seems out of the question, as it entails very heavy works and does not follow the lie of the country.

The estimated cost is nearly £92,000.

When examining into the merits of any proposed work, it is necessary to consider—1st. Whether it will be of National or only local importance; 2nd. Whether it will open up an undeveloped district; and 3rd. Whether it will pay.

This branch to Jamberoo cannot be said to be of national importance, as it can never be extended beyond the mountains, neither will it develop any new district of importance.

To therefore justify its construction at present, when many other places are more urgently requiring railway communication, it must be shown that the increased traffic it will bring to the railway system will pay working expenses and interest on cost of construction. This can only be done by developing new industries, and intercepting traffic which now goes by other means of conveyance.

The principal new industries expected to be created are coal-mining and milk exportation.

With regard to coal, I examined some of the seams which crop out about 700 feet below the top of the mountains and 1,300 feet above Jamberoo.

These are from 25 to 30 feet thick, and extend for many miles.

Drives have been put in in two places, and reports obtained, which leave no doubt as to the commercial value of the coal. The distance from a seaport or railway would appear to be the only cause for the mines not being worked.

Mr. Wilkinson, Government Geologist, with whom I have had several interviews, expresses the opinion that the coal from some portions of the field is of great value and can be profitably worked.

In 1877 he personally examined the coal-seams to the west and south of Jamberoo, and reported very fully. He says the coal to the west is much better than that to the south, where it has been injured by volcanic action.

He describes the coal as being either "semi-bituminous" or "splint" and "good for steam, household, and smelting purposes."

He estimates the quantity under 13 portions, comprising 2,810 acres, at 21,100,000 tons, after allowing for waste in getting.

He also expresses the opinion that good coal extends under the whole sandstone tableland between Jamberoo and Broger's Creek, as he found good coal at the latter place.

It may therefore be taken for granted, that if a branch line is constructed to Jamberoo, private enterprise will extend it to the coal-seams, which are only 4 miles further, and large quantities of coal be sent to Illawarra Lake, when improved, or to Kiama, and to Jervis Bay—in the event of no good coal being found there.

It is impossible to estimate what the output would be; but whatever it amounts to, the railway should benefit to the extent of not less than 1s. per ton.

The export of milk will depend on the demand and the price which the milk companies can afford to pay producers. At present the Fresh Food and Ice Company get a large quantity of milk from Albion Park and the stations near Kiama, and are paying about 6d. per gallon, which is a low price; still it is double what the Jamberoo farmers get back from the butter factories at this season of the year.

In order to send milk to a distance—in summer especially—it is essential that the road carriage before reaching the railway should be short. After being cooled it is not of such consequence.

For this reason Jamberoo now sends no milk to Sydney, though the farmers immediately about Kiama send over 450 gallons per day.

As to the question of demand, I learn from the Inspector of Dairies in Sydney—an unprejudiced witness—that the demand for country milk is increasing every day, and the quality of the supply improving. It must be obvious to all who consider the question that all local dairies about Sydney must in time be closed. The value of land is becoming so great in the suburbs that little profit can be made even when double the price obtained by the country milk companies is charged.

Nearly all produce from Jamberoo, such as butter, eggs, and poultry, now goes to the "South Coast and West Camden Co-operative Co." The Company's manager informs me that he believes in a short time milk will be sent to Sydney and churned here instead of in the country, and that he is now starting experimental creameries.

Mr. Pateson, manager of the Fresh Food and Ice Company, has furnished me with a printed copy of their scale of payments to suppliers. I find the price varies from 10d. to 5d. Nothing less than 5d. has ever been paid. The average price for the year is 7d. per gallon. He says they cannot at present get sufficient milk to meet the demand. Two years ago they sold daily 2,000 gallons. Now they sell over

6,000,

6,000, although several other companies have since started. He considers that within a few years of the proposed line being opened Jamberoo could get sale for 4,000 gallons daily. He is intimately acquainted with the district and considers it the best in the colony.

The Railway Commissioners now charge 10d. per mile haulage on the milk companies vans. These hold about 110 tins on an average, equal to about 1,300 gallons.

From Jamberoo to Sydney would be charged 72 miles, which, at 10d., amounts to £3 per van.

The milk used by the two Jamberoo factories amounted last year to 1,425,791 gallons, showing an increase of 252,223 gallons over the previous twelve months.

Butter produced was 599,006 lb.; number of kegs sent to Sydney, 9,676; total weight about 363 tons, which at 24s. 6d. equals £444 freight paid to railway.

If the milk had been sent to Sydney instead of butter the carriage paid would have been £3,790.

It is therefore apparent that after a few years, the new industries of coal mining and milk exporting would go a long way towards making up the interest on the increased railway capital.

With regard to the acquisition of traffic which is at present lost to the railway, I have no power to demand the production of steam packet companies' books, and therefore cannot give an estimate of the Jamberoo traffic, which now goes by sea and will continue to do so until a railway is constructed into the heart of the Jamberoo district.

So long as producers have to pay a heavy charge for cartage over a hilly road, amounting at present to £1 per ton on some goods, so long will they continue to save a few shillings by using the steamer instead of the railway from Kiama.

The railway does not get one half of the present traffic. Much of the goods which is sent to Kiama is in reality for Jamberoo, the Kiama storekeepers acting as agents for the Jamberoo farmers.

Some idea of the steamer traffic could be got by comparing the returns from Kiama Railway Station for one month during the recent strike—when the steamers stopped running—with the previous month. This would not, however, show the full amount as the farmers kept back their orders for cattle feed as long as possible or did without.

That the steam packet companies fear the extension of the railways is shown by Mr. Keon's evidence before the Sectional Committee on the Kiama to Nowra Railway. He, as agent for the Illawarra Steam Navigation Co., requested not to be asked to produce his books, and said he believed the company would object to produce them.

It is not my intention to give any estimate of the probable increased revenue to be derived by the construction of this line as I do not believe in such estimates.

If the railway is made the entire traffic to and from over 20,000 acres of the richest land in the colony will, in all probability, pass over the railway, in addition to the output of an extensive and easily worked coal-field.

A short branch of 5 miles is difficult to work profitably, especially where the principal traffic is in goods, but where, as in this case, it is likely to do away with steamer competition and develop new industries it may become a matter of policy to construct it.

For the above reasons, and after a careful investigation of the whole question, I am of opinion that a branch should be constructed to Jamberoo; but that, as it can never be more than a branch, the cost of the line should be kept as low as is consistent with the safe working of a slow traffic.

I have, &c.,

EDWARD B. PRICE.

1891.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

PROPOSED RAILWAYS TO LUDDENHAM AND MULGOA.

(REPORT OF MR. E. B. PRICE.)

*Ordered by the Legislative Assembly to be printed, 26 May, 1891.*

Mr. E. B. Price to The Under Secretary for Public Works.

Sir,

16 February, 1891.

I have the honor to furnish the following report on the question submitted to me by the Minister.

When pursuing my investigations in connection with my recent report on the proposed alternative line to Blayney, I was struck with the large area of undeveloped agricultural land which lay in the angle between the Southern and Western railways, and stretched out as far as the Nepean. This tract of country may be referred to under its old name of the "Cowpastures."

It appeared to me then that this state of undevelopment was largely owing to the want of railway communication with the metropolis, and I therefore suggested that the construction of a branch from Liverpool was worthy of future consideration—such a line to form, as it were, a continuation of the St. Peter's to Liverpool loop-line.

The publication of this report naturally gave rise to other schemes, promoted in each case by the residents of the adjoining railway townships.

Four distinct lines have been now proposed, viz. :—

- (1.) Blacktown to Mulgoa.
- (2.) Liverpool to Luddenham and Mulgoa.
- (3.) Penrith to Mulgoa and Luddenham.
- (4.) St. Mary's to Mulgoa and Luddenham.

(1.) BLACKTOWN TO MULGOA.

This is a portion of Mr. Gipp's proposed alternative line to Blayney. He, however, did not bind himself to any particular point of connection; but doubtless selected Blacktown as being already a junction station on the Western line.

I did not meet any one at Mulgoa or Luddenham who advocated this line from Blacktown. The majority are strongly in favour of the line suggested by me in my previous report.

If there was no probability of the St. Peter's-Liverpool loop-line being constructed, something might be said in favour of Blacktown, as a point of junction, on the head of directness.

This advantage would, however, be compensated for by the line entering into competition with the existing line for at least 5 miles of its length.

I think it may be assumed that the Liverpool loop-line will be constructed before long, and then the advantage of directness will lie on the side of Liverpool as a connection.

Though possibly a little cheaper to construct, it offers much fewer advantages than the Liverpool route, and may, therefore, be dismissed from further consideration.

ST. PETER'S TO LIVERPOOL LOOP-LINE.

As the reduction of mileage between Liverpool and Sydney would add enormously to the advantage of Liverpool as a point of junction for any line into the Cow-Pastures, I thought it my duty to go over the country to be traversed by the second section of the proposed direct line to Liverpool.

I find that if the line is continued from Burwood Road it will open up a considerable area of good country, much of the land being elevated several hundred feet, and admirably suited for suburban residences.

Bankstown,

Bankstown, especially, should become one of the healthiest and most popular suburbs.

It is undecided where the line would join the existing railway at Liverpool. It may either cross George's River twice, and open up the Moorbank Estate, much of which is fairly elevated, or it may skirt round the north bend of the river, and possibly join near Cabramatta Station.

Whichever course it takes it must reduce the distance to Sydney by about 6 miles, and relieve the suburban line of the southern traffic.

My inspection confirmed my previous opinion as to the merits of this line.

## (2.) LIVERPOOL TO LUDDENHAM AND MULGOA.

I went in detail over almost the whole of districts of Cabramatta, Bringelly, Luddenham, and Mulgoa—which this line would open up—with a view of learning by actual observation the capabilities of the country.

The following is a general description of the country passed through by a line due west from Liverpool:—

For the first mile the land is poor, and covered with ti-tree scrub; the land then rises and becomes better, and when properly cultivated grows splendid fruit. Much of it, however, is of a nature which will require constant attention and manure.

As far as the Old Cow-Pasture Road the original holdings have been subdivided and sold in small farms or residential sites; many allotments are owned by Sydney business people who would doubtless build were direct railway communication established.

The country then rises into the "Puzzling Hills," as they are well called on the old maps. This range forms the watershed between the Nepean and George's Rivers, and carries the aqueduct of the Sydney Water Supply. These hills are from 200 to 300 feet in height, and are broken up in a wonderful manner forming beautiful building sites. They are generally covered with good soil. Most of the land is a fairly open forest, but some large areas were cleared and apparently cultivated in old days.

The much advertised "Hoxton Park Estate" comes in a little to the south. It does not appear to have been a success, so far as can be judged by the few inhabited cottages which still remain. It must, however, be borne in mind that much of the land is covered with a dense forest, requiring a considerable capital to clear, unless proximity to a railway enables the timber to be immediately disposed of as fuel.

After crossing the main range some beautiful open rolling grass country is seen to the north, which was once all under wheat.

No doubt constant cropping and inferior seed brought disease and in the end induced people to believe that wheat could not be grown.

I am informed that the Public School Master at Mulgoa has lately grown some perfectly sound wheat by a process of his own. I therefore see no reason why scientific farming should not cause all this country to again yield good grain crops, especially now that the land has lain idle for years.

Along Kemp's Creek is some fine orchard land on which some hardworking and intelligent settlers have lately planted gardens. Three years ago the land was dense bush, and already fair crops of very superior fruit and vegetables are being carted 15 miles to Parramatta market.

There are some very rich flats along South Creek, and nicely elevated country—here settlement is also springing up.

Except for one strip of poor ironstone country about 1 mile wide, which extends between Kemp's Creek and South Creek, all the land about here is good for fruit growing, and even this poor strip has been chosen in one instance for growing wine grapes.

The land between Badgery's Creek and the Bringelly Road is good; it is generally elevated.

Near the Bringelly Road occurs a high ridge of basalt, which has been terraced and planted with wine grapes by enterprising German settlers, who understand the value of decomposed basalt. A considerable quantity of wine is produced, which is said to be of a superior quality.

The village of Luddenham lies along the Bringelly Road; in itself it is of little importance. Near it, however, are some very large areas of cleared land, of good quality, and well elevated.

Good land extends from here all the way to the Nepean and Mulgoa, which lies rather to the north.

Settlement is rapidly springing up about Luddenham and Mulgoa, owing to the richness of the soil, the elevation of the country, and to the favourable terms offered by the owners of land who have cut up their estates into small farms.

All this country could be irrigated as easily as the area held by the Mulgoa Irrigation Company. Its elevation of course must always add to the cost of pumping, which will be very considerable.

Wonders are now being done in the way of fruit-growing without any irrigation, though certainly this is an exceptionally good year. The largest peaches and apples I have ever seen here, or in other countries, I saw growing in newly-planted orchards near Badgery's Creek, and at Mulgoa.

The present Mulgoa Irrigation scheme embraces but a small area of the country under consideration, which needs railway communication.

The larger portion of the land which it is proposed to irrigate lies within 4 miles of the Western railway, and actually crosses it at St. Mary's.

The village of Mulgoa lies at the most remote corner, and yet is only 7 miles in a direct line from Penrith.

It must be therefore understood that, though the irrigation works will produce a traffic for a railway from Liverpool, these works alone would never justify the construction of a line of such a length. It is the opening up of the intervening country which must be looked to.

Any line into Mulgoa will benefit the settlers across the Nepean, who hold land on the table-land between the Warragamba and Nepean Rivers. Some of this land in the neighbourhood of the Nepean is fairly good, and grows excellent fruit.

From the above description it will be seen that, supposing the Liverpool loop-line to have been constructed, the line from Liverpool would place in direct communication with Sydney a large area of country with a fairly rich soil, admirably suited for suburban residences and gardens.

One could hardly choose prettier building sites than those to be found amongst the hills along the Sydney water supply conduit, 20 miles from Sydney.

No steps have yet been taken to render this aqueduct available for irrigation, though the advantage of doing so was strongly urged by Mr. Clark in his report on the Prospect Scheme for water supply in 1876-77. The following is an extract:—

After calculating that an average of forty million gallons would daily have to be run to waste, he says:—

“ Situate, as the conduit will be, on or near the top of a ridge, it will command a wide extent of country on either side, and which, for a distance of many miles, is chiefly of an agricultural and pastoral character.

All that would be necessary in order to bring this quantity of water into use for irrigation, pastoral, or manufacturing purposes, would be the provision of reservoirs to contain it. For this purpose the country is especially favourable. A cursory examination of it, with a view of utilising the water otherwise to be wasted, shows that there are sites more or less suitable for ten storage reservoirs in the length of 21 miles of the conduit south of Prospect, and no doubt numerous other sites exist. Time will not permit me here to pursue this subject, but it is perfectly evident that this portion of the county of Cumberland may derive large advantages from the use of the water. Very many eligible sites for residences and homesteads exist in the district passed through. . . . I am unable to go fully into the estimate of the value of the water in an agricultural or pastoral district. It is possible, however, to estimate what a surplus quantity of twenty million gallons per day would do. It would supplement the rainfall to a extent of 12 inches per annum on 20,000 acres at a time when most required.”

I give the above fully, as it bears out in the strongest manner my previous remarks on the future possibilities of this district.

The character of the country crossed is a series of rolling ridges, with creeks between. Two of these ranges rise to a considerable elevation. There are, however, depressions—for instance, at the entrance to the Cecil Hills tunnel—through which a line could be taken without difficulty.

The ascents and descents are gradual, but owing to the peculiar nature of the hills, careful survey will be needed before any definite line can be marked out. The existing maps are very erroneous.

It may also be found advisable to add to the cost of the line in order to serve the outlying country or to extend it right into Mulgoa.

These are, however, matters for the Railway Construction Branch.

As to the cost of this branch or of other lines I refrain from offering any opinion. In my previous report—for the sake of comparison—I applied the estimate furnished to me of the Blacktown to Mulgoa line to this line, as they both run through somewhat similar country, though I stated that this line would probably be the more expensive. I also suggested the construction of only 15 miles of line, and not 17, which would be necessary to bring the line right into Mulgoa.

Nevertheless, I am now credited with estimating the cost of the whole line at £6,000 per mile.

The deputation which waited on the Minister said the line could be made for £50,000,—on what grounds I know not. My belief is that the line would be cheap at double this amount.

I wish, therefore, it to be clearly understood that the lines shown on the accompanying map, are only intended to indicate the general direction any line might possibly take.

### (3.) PENRITH TO MULGOA AND LUDDENHAM.

This line is promoted by the people of Penrith. Its length would be about 10 miles. For nearly the entire distance it would pass through good land.

I was surprised and disappointed on my late visit to find that large areas of good land in close proximity to Penrith are lying idle and only used for grazing purposes.

I had expected, and been lead to suppose, that the whole country along the road to Mulgoa was thickly populated. The reverse is the case. In fact, the poorer land near Cabramatta and Liverpool stations supports a larger population than the country in the neighbourhood of Penrith or Kingswood.

It cannot be the want of railway communication.

Further out the settlement increases, and some very nice places are met with. The country along the Mulgoa Creek is very rich, and offers beautiful building sites, which would no doubt be built upon if a railway from Penrith were constructed.

From the formation of the country, it is probable that the Nepean River once ran through where the Mulgoa Creek now flows. Some strange convulsion of nature may have caused it to turn back and hide itself among the mountains in a narrow gorge.

If the object aimed at were merely to connect the villages of Mulgoa and Luddenham with the railway and a market town, then this line would be the most direct route.

Such a line would, however, prove of little or no use to the main portion of the country it is desired to open up. Its advantages would be entirely local. It would benefit Mulgoa at the present time probably more than any other line, as it would give the small producers easy access to a considerable town, and induce settlement along the route.

Penrith even now is ceasing to be the fruit market of Mulgoa, as I find settlers sending their fruit direct to Sydney.

It was asserted to me that Mulgoa and Luddenham could never produce more fruit than Penrith could consume.

This shows a poor appreciation of the capabilities of the district on the part of the supporters of this line.

If fruit-growing on a large scale—as is contemplated by the Irrigation Company, and by numbers of settlers, who have already planted extensive orchards—is to prove remunerative in the future, when the supply becomes very great, preserving works must be established on the co-operative principle, and also exporting on a systematic scale must be had recourse to.

The amount of dried and tinned fruits now imported into the Colony is enormous, not to mention green fruit from other colonies.

There is no just reason for this, as we can grow as good fruit as any country in the world, and produce our own sugar and tin.

This

This season it has been impossible to dispose of all the oranges and grapes. In many gardens they have not been pulled. How will it, then, be when all the young orchards and vineyards come into full bearing?

It is absolutely certain that preserving and exporting on a large scale must be engaged in.

This fact is well understood by all the modern fruit-growers in these outlying districts, and they have taken the precaution to plant the superior kinds of apples and peaches.

In a few years the fact of having railway communication with a town such as Penrith will prove of little advantage to the country fruit-growers, except so far as the line would form a link in the connection with a sea-port.

It has been stated to me that the timber trade alone would make the line pay.

This will not bear investigation, as I find that if the whole of the firewood which is cut up on the south side of the railway at Kingswood came over the new line it would add only about £600 to the gross annual receipts.

It would, however, prove a great advantage to the new settlers to be saved the long drawing into Kingswood, and enable them to turn their waste timber into cash.

This question of firewood traffic applies equally to all the proposed lines. There is not much more good timber left than would supply sleepers for the line and fencing for the future subdivisions.

#### (4.) ST. MARY'S TO MULGOA AND LUDDENHAM.

Though my instructions do not tell me to report on this proposal, yet, it having been brought under my notice during my recent visit, I consider it my duty to remark briefly on it.

It is promoted by the residents of St. Mary's, and some of the settlers in Luddenham mentioned it with favour as being more direct to Sydney than the proposed line to Penrith.

This line would be about 11 miles in length, and would run for almost its entire course through the centre of the Irrigation Company's property, which is now uninhabited, except in the neighbourhood of Mulgoa and St. Mary's.

It is similar to the Penrith line, as being a local line and promoted by local interests.

Its construction would enormously enhance the value of the irrigation area.

I am given to understand that the Company would give all the land for nothing. I, however, look upon this line as one which should be constructed by the Company in their own interests, certainly as far as the Bringelly Road, say, 7 miles.

A light railway will cost them little more than a good macadamised road, such as they will have to construct to allow of access to their land.

#### CONCLUSION.

Having thus discussed separately the different proposed lines, a decision has to be arrived at as to which would in the end prove the best in the general interests.

In my opinion none of these lines would pay for some years to come.

In fact, none of the advocates except those of the Penrith line claim that they would.

They, however, all claim that the rich and beautiful country in the interior should be assisted to become something better than bush grazing land.

No line appears to me as at all likely to meet the requirements of the case except the line from Liverpool to Luddenham and Mulgoa.

Such a line would be of little use without the completion of the Liverpool loop-line.

Whether it is right to construct a line, with the object of developing an unproductive district, is not for me to decide.

It may be said that there are other parts of the country equally rich, or more so, and equally neglected; so there are, but the circumstances are not quite the same.

Its proximity to the metropolis renders this Cow-Pasture district of more than ordinary value, not only for agricultural, but for residential purposes, and with direct railway communication it must become thickly populated; but without railway communication its advance will be very slow.

As a proof of this, I find that several Sydney professional men own building sites, even at Mulgoa, and only await railway connection before commencing to build.

I have no hesitation in recommending that the line from Liverpool should be surveyed, in order that the Government may be in a position to decide whether or not the expenditure necessary to construct the line would be greater than the merits of the case will justify.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

PROPOSED RAILWAYS TO PROSPECT QUARRIES.

(REPORT BY MR. E. B. PRICE.)

*Ordered by the Legislative Assembly to be printed, 26 May, 1891.*

Mr. E. B. Price to The Under Secretary for Public Works.

SIR,

23 March, 1891.

I have the honor to report that, in accordance with the Minister's instructions, I have examined into the question of constructing a branch line to Prospect Quarries, with the object of enabling the Water and Sewerage Board to lease the Quarries on advantageous terms.

Three distinct Quarries have been opened at various points on Prospect Hill, which are still in working order.

Some confusion has arisen on account of the different situations and characters of the Quarries; I have therefore marked them A, B, and C, on accompanying plan.

The Quarry A, now in the hands of the Water and Sewerage Board, and which it is proposed to lease, is situate on the west side of the hill, rather low down, and not far from the Western Road.

The stone it contains is of a finer grain than that in the other Quarries, it is partly columnar and very similar to Kiama blue-stone.

The second Quarry (B) is the large one from which the stone pitching for the reservoir is being obtained; it is still being worked by the Harbours and Rivers Branch, and so could not be leased for some time to come.

It contains stone of a much coarser grain than either of the others, it being more of the nature of granite.

The stone is valuable for road-making and building purposes.

The Quarry, however, is difficult to work on account of the heavy head of earth and rotten stone.

The third Quarry (C) is at the south side of the hill, high up. Here the stone is in horizontal beds and of a moderately fine grain. It should be easily worked and yield better building stone than either of the others, and as good road metal.

From any of the Quarries road metal can be obtained of a very superior nature though some persons may prefer one to the other.

The supply may be looked upon as inexhaustible.

So far back as 1869 the value of Prospect Hill as a quarry was so well understood that all the correspondence relating thereto was printed by order of Parliament.

All the papers go to show that the stone was eagerly sought after in old days; in fact the Roads officers considered it superior to all others.

It may therefore be taken for granted that if railway access is given to the Quarries the output will be very great, as I see no reason why the stone could not be supplied as cheaply as that from Kiama. The short carriage should more than compensate for the extra cost of working.

The second Quarry (B) is the only one so far which has heavy head or much waste.

From the third Quarry (C) a tramway was laid some 20 years ago, which curved round the east side of the hill and joined the Western Line in the direction of Toongabbie.

At that period very little sale could be got for screenings, which are now valuable for asphalt and concrete.

The tramway was laid on the surface, with steep grades, and worked by horses, and consequently proved a failure.

The position of the Quarry, high up the hill—necessitating the use of shoots and short auxiliary tram roads—also added to the cost of working; it is therefore hardly to be wondered at that the undertaking proved a financial failure.

It appears to be an absolute necessity that whatever line is constructed should run right into the Quarry, and should have good grades, and be constructed to carry ordinary rolling stock and heavy locomotives.

The Quarry should also be worked on a systematic plan, entailing a considerable preliminary outlay.

Three lines have been proposed, viz., (1) from Fairfield and (2) Merrylands, on the Southern Railway and, from (3.) Toongabbie on the Western :—

Fairfield  
route.

(1.) The line from Fairfield would pass through Smithfield and thence to either of the Quarries B or C. It could only reach A by curving round the hill at the end of the Dam.

The promoters, however, contemplate reaching the Quarry B, now being worked by the Government.

The advantage claimed for this line is that it would serve the population at Smithfield, and between there and Fairfield.

The line could follow the general course of Prospect Creek, and would be easy to construct. The only difficulty would be the rise over the Water Supply Conduit, into the Quarry.

The length would be a little over 4 miles.

The settlement at Smithfield would appear at first sight to be an important point in favour of this route being adopted; on investigation, however, I find that the Smithfield traffic would not pay its own working expenses.

This is owing to Smithfield being less than 2 miles from Fairfield Railway Station, which already gets all its traffic, so that all increase in receipts must be derived from the carriage over an additional 2 miles of line.

Smithfield and its immediate neighbourhood contain about seventy houses. The principal industry is tanning, and there are 7 tanneries at work, one of which is a large establishment. The dressed leather sent away in February amounted to 13 tons.

The total inwards and outwards goods at Fairfield station for February was 606 tons. Of this the Stationmaster estimates that three-fourths comes to or from the Smithfield side of the line, but the greater part consisted of firewood. It would be fair, therefore, to allow that at the outside 100 tons per week would be the traffic with Smithfield and Prospect under the present conditions. 100 tons at (say) 6d. would yield £2 10s.

The passengers for February numbered 5,331, including workmen engaged at Fairfield. Not more than 4,000 would come from the Smithfield side of the railway; but as many live near to Fairfield, only about 3,000 at the outside would use the tramway from Smithfield. 750 passengers per week at 3d. would yield £9 7s. 6d.

The total income from goods and passengers would amount to £11 17s. 6d. per week, equal to £617 10s. per year.

As the distance is so short from Smithfield, unless the passenger traffic was carried out regularly with cars meeting every train the number of passengers would fall far short of 750 per week. This service could not be carried out in connection with the metal trains from Prospect Quarry, but would have to be distinct. The working expenses of one engine for fuel and wages, together with wages of conductor and cleaner, would amount to over £1,000 per annum. The line therefore would not nearly pay working expenses at present as far as Smithfield.

A considerable amount of improvement is now going on about Smithfield, so it is possible in the future that the traffic would pay for the construction of an ordinary tramway along the road from Fairfield as far as Smithfield, say 1½ mile.

Merrylands  
route.

(2.) The line from Merrylands would serve a small population living within 1½ mile of the Railway Station.

It could only reach the Quarry A by curving round the hill at the end of the Dam.

The promoters, however, prefer the Quarry C, which is the nearest to Merrylands.

One land proprietor offers to give 1½ mile of land free. His property is at Prospect, and stretches along the Water Supply Aqueduct.

This line appears to me to be altogether out of the question.

Its length would be 4½ miles, and the country crossed a series of ridges, entailing heavy works in order to get good grades.

It would certainly pass through some good land and greatly enhance its value, but this would not compensate for the disadvantages of the route in an engineering point of view.

Some well timbered land is passed through near Prospect, where sleepers could be got.

The wayside settlement is so small that little passenger traffic could be expected for some time to come.

The goods traffic would be principally firewood, and probably tiles and drainpipes from Sherwood Tile Works.

Toongabbie  
route.

(3.) The line from Toongabbie would not pass through any settlement worth mentioning, and would depend entirely on the Quarry traffic for support.

It would run direct into Quarry A, and could be extended to B and C if desired.

The line would be a very easy one to construct, as the land has a gentle fall nearly the whole way from the Quarry to Toongabbie.

Only half a mile of land need be purchased, as the remainder of the line could be laid on Government land, and along Toongabbie lane, which is very little used.

I think, however, it would be better to shorten the line by joining the Western Line at 18 miles from Sydney, instead of at Toongabbie Platform.

This would leave the line to be constructed only 2½ miles long.

Having looked carefully into all these proposals, and gone over each route twice, I have not the slightest doubt that, if the object aimed at is the development of Prospect Quarries, the Toongabbie line is the proper one to construct.

It is vastly superior to the others in length, grades, and ease of construction, and runs direct into what appears to me will ultimately prove the best Quarry, and the only one which is remote from the Water Supply Conduit.

The others closely adjoin it, and it is questionable whether it would be wise to allow of their being worked on a large scale for fear of contamination to the water supply from the numbers of men employed.

Both the other lines would have to cross the conduit to get to the Quarries.

I have no means of estimating the probable quantity of stone which would be annually supplied from the Quarries.

The demand for good road metal is practically unlimited, and will go on increasing as more land is settled on, and by-roads constructed.

Even were no line constructed to Prospect but liberal terms offered to lessees, I believe a good rental and royalty would be obtained.

When

When tenders were recently called for, the period named in the lease was much too short, and the terms were so stringent that would-be tenderers were frightened.

I met several well-to-do men who would be willing to pay a rental and a royalty of 1s. per ton, provided they got a fairly long lease which would justify their laying out capital in opening up the Quarry and purchasing plant.

I think, however, that it would be a matter of policy to construct—or at any rate undertake to construct—the railway before calling for tenders, as a very much better price would be obtained.

I have no doubt that the carriage of stone will pay a dividend on the cost of constructing the line from near Toongabbie.

The conclusions I have arrived at are:—1st. That the Prospect Quarries are a valuable property, and should have a railway constructed to them. 2nd. That the line from near Toongabbie is the best line which can be got.

I have, &c.,  
EDWARD B. PRICE.

## RAILWAYS.

(REPORT OF MR. P. SCARR ON PROPOSED LINE FROM GALONG TO BURROWA.)

---

*Ordered by the Legislative Assembly to be printed, 26 May, 1891.*

---

Mr. P. Scarr to The Under Secretary for Public Works.

Department of Public Works, Sydney, 8 December, 1890.

Proposed Railway from Galong to Burrowa.

Sir,

In accordance with your instructions I have the honor to submit the following report upon the proposed line of railway from Galong to Burrowa.      ;      ;

### Area to be served.

This will be comparatively limited, extending from Kalangan (half-way between Galong and Burrowa) on the south, to Numby and Kebyu on the north; Rye Park and Narrawa on the east, to Calabash and Douglas on the west,—an area of about 750 square miles.

Beyond these places the traffic would go southward to the Great Southern Railway, eastward to Goulburn and Gunning, northward to Cowra, and westward to Young.

It will thus be seen the existing railways practically so drain the outlying portions of the district that no traffic can be expected from distant places, as in other places where branch railways have been constructed.

No back country would be drained by this line. The district itself would have to entirely support it—that is the area I have named above.

And further, if the proposed extension to Crookwell be eventually carried out an additional slice of the traffic from the east and north-east will in all probability be filched from Burrowa.

### Nature of the Country.

I have traversed a considerable part of the Burrowa district in several directions and followed the course of the line between Galong and Burrowa.

The country through which the line passes, as well as that in the vicinity of Burrowa, is of good quality, and a large proportion fit for agriculture.

Such as is not adapted for that purpose may be called superior grazing country.

This character prevails for some miles in every direction round the town, but to the north and east the land gradually becomes more hilly, whilst to the north-east a good deal of rough broken country exists, having only a small proportion fit for agriculture, chiefly along the banks of the creeks, where some good alluvial flats exist.

### Size of Holdings.

At present the land is generally held in large estates, ranging up to 10,000, 13,000, and even 25,000 acres. These are within 20 miles of the town of Burrowa, fourteen or more estates of 5,000 acres and over, besides numerous others between 1,000 and 5,000 acres.

The average size of the holdings in the electorate is 883 acres—a high average as compared with others in the eastern division. These estates are used almost entirely for grazing purposes.

The holdings used for agricultural purposes are small and comparatively few in number.

It would appear that in years past a much larger number of selectors existed in the district, and that for some years a process of absorption of the small holdings into the large estates has been steadily going on until the result, as stated above, has been reached.

On the whole the agricultural industry throughout the district is evidently languishing, with little prospect, so far as can be seen, of a revival.

## Agriculture.

The total area cultivated in the whole of the Burrowa Electorate for the year ending 31 March, 1890, is given in the Statistical Register as 8,655 acres, being but 1·98 of the total area alienated, or 0·89 of the whole area of the electorate.

The wheat produced being 78,403 bushels, besides other produce which appears to have been only sufficient to supply local wants.

In the article flour it does not appear that the one local mill now at work has been able to compete successfully with those on the existing line of railway.

The flour produced has been used principally for home consumption.

As an agricultural district, then, Burrowa does not compare favourably with other districts having a similar climate and position.

The following table will afford an easy reference for comparison with some of these districts:—

District.	Distance from Sydney.	Proportion of Land Cultivated to Area Alienated.	Area Cultivated.	Remarks.
	Miles.		Acres.	
Carcoar .....	184	4·82	33,023	
Gundagai .....	287	4·53	35,647	
Young .....	249	6·33	57,994	
Orange .....	192	11·67	31,248	
Tumut .....	307	2·78	11,396	20 miles from rail.
Inverell .....	466	4·38	14,453	45 " "
Burrowa .....	232	1·98	8,655	16 " "

Of the sixty-two country electorates Burrowa stands forty-first on the list, both as to the proportion of land cultivated and to the average size of holdings.

These statistics will give some idea as to the position of the agricultural industry in the district at the present time.

As a source of remunerative employment to the proposed railway it affords little encouragement. And unless it can be shown that an extensive change would be likely to take place as a result of the opening of the line traffic must be looked for from some other sources.

## Prospective Increase in Agriculture.

It has been asserted that the cause of the present position of things has been brought about by the absence of railway communication with a market for produce—and that with the construction of the proposed line the present position of things would be so altered as to cause large areas of land to be placed under cultivation; either by the division of the larger estates, by sale or lease, amongst agriculturists, or by the present holders themselves cultivating on a large scale.

After careful investigation and consideration, and comparing the position of this district with others in which agriculture has been successfully carried on, I have come to the conclusion that sufficient grounds do not exist for these expectations.

As a matter of fact a large quantity of the best land in the Burrowa district lies between that town and the railway line at Binalong and Galong, and yet is not largely cultivated.

Burrowa, itself surrounded by excellent farming land, is but 16 miles from Galong and 20 from Binalong—not a sufficient distance to bar profitable cultivation entirely.

Take the case of Tumut, where maize is grown to the amount of 231,468 bushels per annum and sent by road in large quantities to Gundagai Railway Station (20 miles) for the Sydney market.

Whilst it will be found upon inquiry that in the other districts referred to above grain and other produce are carted long distances to the railway.

Only two of the railway stations of the districts quoted are nearer Sydney than Binalong and Galong.

It would not appear then that to the distance from the railway is the absence of cultivation to be attributed, but more likely to the fact that the land can be applied more profitably to sheep farming by capitalists than to agriculture by others.

And instead of the large estates being subdivided or placed under the plough, instances are not wanting to show that the reverse is taking place, even along with the existing railways.

In the Burrowa Electorate during the last few years the immense Bendinine Estate, having the Great Southern Railway running through it, has been accumulated by the aggregation of the smaller holdings and by selection.

The selectors have been bought out and farms added to the estate until now, as I am informed, it consists of considerably over 50,000 acres. A large quantity of the land being eminently adapted for agriculture.

The whole tendency throughout the Colony seems rather to be in the direction of the accumulation of large estates than the breaking up of those already existing, and there is no apparent reason why the Burrowa district should form an exception.

At the sale of the Ballyryan Estate near Burrowa twelve (12) months since, the principal purchaser was an adjoining land owner who bought largely and now uses the land entirely for grazing purposes.

Instances of landholders cultivating for market on an extensive scale are exceedingly rare throughout the colony.

Nor are cases where leasing of land for this purpose prevails numerous.

The principal exception, and almost the only one, is on the Bathurst Plains, unless it be where very rich alluvial land along river banks are used for special purposes.

I have dwelt at some length upon this question of the extension of agriculture, as a possible result of the construction of the proposed railway, as it appears to be the key to the whole question.

### Wool and other Traffic.

The district to be tapped is now heavily stocked with sheep, on many of the estates up to one and a quarter to one and a half sheep per acre, and the chief product of the district consequently is wool.

There was received from the Burrowa district at Binalong, during the year ending 30th September, 1890, 502 tons wool, and at Galong 169 tons.

Allowing for some increase in the quantity from places which now send wool to Goulburn, Cowra, and Young, yet no substantial increase can be expected in this item of freight.

The present quantity may be therefore almost taken as a fixed quantity.

The extension of the line to Crookwell would be to some extent competing with the extension to Burrowa.

### Mineral Traffic.

A good deal has been said as to the probable traffic from the mines of the district.

The principal one is the Wallah Silver Mine, 20 miles east of Burrowa.

I visited and went through the workings of this mine, and so far as can be seen and judged by one who is not an expert, there appears to be a large body of ore available.

Of its value I do not presume to offer any opinion. The shareholders, however, appear to be very sanguine as to the ultimate results of their operations.

If their expectations are realised no doubt the mine will support a considerable number of people, and produce a corresponding amount of traffic.

But so far the eventual success of the venture does not appear so well assured as to make it an important factor in the present question.

At Frogmore, 16 miles north of Burrowa, is a copper-mine at present being worked. This I did not see.

This mine was first opened some fifteen years ago, and after several attempts to work it, which for certain reasons proved failures, operations were renewed by the present owners, who are sanguine as to their prospects, which are reported to be very favourable.

So far there is not yet sufficient development to prove the ultimate success of this venture as a means of support to a large population.

### Passenger Traffic.

This is a difficult item to estimate. I have credited Burrowa with two-thirds of the total tickets issued at the two stations for the year.

### Summary.

The whole question of the prospect of the proposed line proving a financially successful undertaking must depend upon how far it would have the effect of improving the industries of the district to be tapped.

It has been shown that at present the land is held in large estates which are used as grazing farms, and that little agricultural produce is at present available for export.

No other industries exist on a scale worth bringing into consideration.

Therefore the chief product is wool; and as the land is already stocked up to, or nearly up to, its full carrying capacity, little or no increase can be expected in the quantity of wool to be produced.

To the increase in agricultural operations, then, must be looked such an increase in freight as will afford remunerative employment for the railway, unless the mines of the district are so developed in the future as to provide a means of living for a population to come in from outside.

This last probability is so uncertain as to make it unwise to at present take it into consideration.

The question then presents itself: Is there such a prospect of the district being so devoted to the pursuit of agriculture as a result of the construction of the railway that a payable traffic will arise from that source?

From no other source does it appear at present is such a traffic likely to be obtained.

The result of my inquiry leads me to the conclusion that this is not likely to come to pass.

### Conclusions.

After careful consideration, and being guided by the experience of what has taken place in other parts of the Colony, I arrived at the following conclusions:—

- 1st. That the present traffic is altogether insufficient to provide even for working expenses.
- 2nd. That the traffic would not increase sufficiently within a reasonable time to return working expenses and interest upon the cost.
- 3rd. Therefore that for years the line, if constructed, must be run at a heavy loss, even if it should ever become payable, which, from the small area to be drained by it, is very doubtful.
- 4th. Consequently, looking at the question from a commercial point of view, the railway should not be carried out.

I have, &c.,

PERCY SCARR.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

RAILWAYS.

(REPORT OF MR. STANLEY ALEXANDER, EXAMINER OF PUBLIC WORKS PROPOSALS, ON THE PROPOSED RAILWAY FROM TARAGO TO BRAIDWOOD.)

*Ordered by the Legislative Assembly to be printed, 26 May, 1891.*

Mr. Stanley Alexander to The Under Secretary for Public Works.

Sydney, 16 May, 1891.

THIS proposed railway has been designed to leave the Goulburn-Cooma branch of the main southern trunk line near the township and railway station of Tarago, at 158 miles 11 chains from Sydney. This point is 21 miles from Goulburn. The length of the proposed line, as permanently surveyed and marked on the ground, is 29 miles 11 chains, placing Braidwood at 187½ miles from Sydney. The estimated cost of constructing this is £182,058, giving an average cost per mile of £6,020.

2. Within a short distance of Tarago the proposed line passes out of the county of Argyle into the county of Murray. The boundary between the counties of Murray and St. Vincent is passed at the Shoalhaven River. This river from its source near the Big Badja mountain forms, throughout its whole length, the boundary dividing the county of St. Vincent from the counties of Murray, Argyle, and Camden. The railway line from Goulburn towards Cooma crosses the Great Dividing Range at a short distance to the south of Tarago, so this is the nearest point on that line from which a divergence can be effected in a south-easterly direction towards Braidwood. This portion of the dividing range is called the Gourcock Range. It traverses the county of Murray in a southerly direction joining and merging into the main coast range at the Big Badja mountain, between the counties of Dampier and Beresford. From that point the main coast range trends east of north to near the coast at Nowra, where it is cut through by the Shoalhaven River.

3. These main features of the country are delineated on the attached map as nearly as can be shown on the small scale to which such a map is necessarily confined. They define the boundaries of the district to be served by the proposed railway, forming the natural barriers that govern the practicable routes into and out of the country, separating it from the coast, and barring its communications with the main line of railway already constructed. This general configuration is shown clearly enough, but the minor features, which are of at least as much importance in determining the course of traffic, can only be given in words.

4. The general elevation above the sea of the tract of country enclosed between the ranges is over 2,000 feet. The Gourcock Range is sharply defined, rising some hundreds of feet above this level, and the coast range also presents a rocky edge to the plateau, covered with a heavy growth of timber, and falling with great abruptness eastward to the sea-level. Along this crest there are several eminences, the Sassafrass, Currockbilly, Budawang and Sugarloaf Mountains, which rise to very much greater elevations. The Shoalhaven River traverses the whole district from south to north, rising at an elevation of about 3,500 feet above the sea, gathering volume from the neighbouring country and deepening its channel in its progress. The position of the area drained by this river, being a depression parallel with the coast line and marked off from it by a mountain range, is peculiarly favourable to the maintainance of a moist condition of atmosphere, though as shown by the records not necessarily producing a high average of rainfall. The steepness and rocky nature of the slopes of the country drained result in very rapid accumulation of water in the lower reaches of the river, rendering its passage, even where possible between the deeply-cut banks, a matter of considerable uncertainty.

5. The coast range is cut through to the south-east of Braidwood by the watercourses named Bell's Creek, Major's Creek, and Araluen Creek, all falling through 1,200 or 1,400 feet in height, within a few miles, to the level of Araluen Valley, which is about 1,300 feet above the sea only. The combined water, after having received that of the Deua and Modong Rivers from the southwards, flowing under the name of the Moruya River to the sea past Moruya.

6. One of the outlets by road from the high land to the coast passes down from Braidwood along Bell's Creek into the Araluen Valley to Moruya, and another passes due east from Braidwood, crossing the coast range at a very high elevation near the top of the Sugarloaf Mountain. This road communicates with Nelligen on the Clyde River, within a few miles of Bateman's Bay, on water navigable for steamers, having fallen through about 3,500 feet of height within the last 15 miles. There is still another road of communication with the coast from Braidwood, viz., via Nariga to Nowra, passing over Sassafrass Mountain. It is seen from this that the district now being discussed is in direct touch by three roads, two

of which at least are in very admirable condition and very well laid out, with three important points on the coast, viz., Nowra, Bateman's Bay, and Moruya, all being centres of separate districts, and to a considerable extent representing distinct varieties of products and industries. The distances by these roads are:—

From Braidwood to Moruya, <i>via</i> Araluen	... ..	52 miles.
" " Nelligen, <i>via</i> Moruya	... ..	30 "
" " Nowra, <i>via</i> Nariga	... ..	75 "

7. The inland communications from Braidwood, though not burdened with the necessity for traversing such excessive heights as in the direction of the coast, are sufficiently difficult to form important factors in determining the courses of traffic. The dividing range, separating this district from points on the existing railway lines, is passable in several places, and in fact, communication is open for vehicles to any station on the line between Cooma and Bungendore, though by circuitous routes, principally through Parker's Gap, which is about south-west from Braidwood, and passage of stock is probably carried on freely through numerous unnamed passes leading directly to stations on the Cooma line by shorter roads than to Braidwood, though probably they are very much rougher. Stock traffic, however, cannot entirely be relied on to provide revenue for the proposed line. Little or no development in the pastoral industry can be hoped for, and, on the whole, the amelioration of the conditions under which this is now flourishing would probably be trifling, but the existence of this range of mountains, dividing this district from the existing railway line, and at a distance of 18 or 20 miles from it, for a stretch of 40 miles or so of country (measured north and south) is, in my judgment, sufficient to warrant the promoters of the proposed line in claiming the whole extent of country south of Braidwood lying between the ranges (coloured red on the map) as rightly looking to Braidwood as the centre of its trade, and depending upon communications being opened to Braidwood for development in all other directions of settlement and industry.

8. Throughout this southern part of the district the Shoalhaven River is shallow and of comparatively small volume, but north of Braidwood the crossing-places are few at any state of the river, and are hardly negotiable at all during all seasons of rain. The river has been bridged at one place only throughout its length, namely, on the main road between Tarago and Braidwood. No provision has been made by the Roads Branch for direct communication with existing railway stations, except by this bridge, from any of the parishes to the north of it on the east side of the river. On the other hand, the roads leading into the town of Braidwood from all this area of country have received considerable attention and are in very good condition. A subsidised mail coach plies between Nariga and Braidwood, affording the only means by which the railway can be reached by public conveyance. The storekeepers of Braidwood maintain business relations with the Nariga district. Though the distance to Nowra is little more than to Braidwood from Nariga, the declivity of the country and the consequent difficulty on the road, must ever very sensibly increase the cost of transport over that from Braidwood. When connected by the railway now under construction, Nowra will be 94 miles from Sydney direct, as compared with 187½ miles from Braidwood by the proposed railway *via* Tarago.

9. Though on the face of them these figures do not appear to support the inclusion of the districts surrounding Nariga in the area to be served by the proposed railway, the difference in elevation between Nariga and the coast, and the ruggedness of the intervening country, the fact that in the face of Nowra being a seaport attended on by steamers, the course of traffic is still through Braidwood, seem to afford grounds for concluding that the direct traffic in passengers only from the Nariga district will be affected by the completion of railway communication into Nowra. Between places at such a distance apart, however, the question of competition between the railway lines can hardly be worth consideration; and if, during a generation of time, the service by the sea has not sufficed to develop the resources of the table land, the interests involved in that service cannot be quoted against the institution of other means of communication. The fact that a new line of railway is being constructed along the coast would seem to show that the argument has practically been abandoned.

10. The area coloured red on the attached map is the space enclosed by the boundaries that have been described, and for which the statistics of settlement, cultivation, and population have been collected. It is submitted as fairly representing the area that will be directly influenced by the proposed railway, whence its revenue will be directly supplied, and which may, according to the promoters, be relied on to be capable of supporting a railway line at the present time, and, in the near future, of enabling it to earn a substantial revenue over and above expenses. It comprises thirty-four parishes, of which ten are in the county of Murray, two in the county of Dampier, and twenty-two in the county of St. Vincent.

11. A summary of the principal heads of the statistics gives the following:—

Appendix P.	Population of the districts... ..	3,630 persons.
	Total acreage of holdings ... ..	315,732 acres.
	Total acreage under cultivation ... ..	3,330 "

The estimated population of the townships is set down at 1,718, of which 1,380 are in Braidwood alone. These are in addition to the figures given above, which include all holders of land who are resident in the towns. The total population of the area dealt with becomes therefore 5,348, but this may fairly be increased to 6,000, as many have refused to supply details for the statistics, and there must be a considerable floating population in a mining district, which cannot be taken count of in such a census.

Appendix O.

12. The list of the parishes comprising this area shows the acreage of unalienated land in each, inclusive of all lands held under lease from the Crown, the areas of which are all included in Appendix P. The boundaries of this area are found, very conveniently so for purposes of statistics and comparison, to be nearly coincident with those of the Braidwood electorate, detailed statistics of which are annually published by the Government Statistician. From these, the details of which are given in Appendices, the following particulars are taken for comparison. They represent the statistics for the year ending March 31, 1890:—

Appendices F, G,  
H, I, J, K, L.

	The total area under crop in the electorate ... ..	4,330 acres.
	The total area alienated in holdings over 1 acre ... ..	263,933 "
	To this have to be added large areas of lands leased from the Crown and from Church and School lands, which are all included in the total quoted in paragraph No. 11 to arrive at the total acreage under occupation.	
	The total area of the electorate ... ..	904,320 acres.

Appendix O.

	According to the statistics supplied by the League the total area of holdings is..	315,732 "
	And by the calculation the area of Crown lands is...	502,299 "
	Making the total acreage of the area dealt with ... ..	818,031 "

This

This compares very well with the full area of the electorate which is not completely covered by the area coloured red on the map. Again, the total number of holdings in areas over an acre in the electorate is 563, while the total number given in the statistics is 575. These latter include a large number of small holdings of less than 1 acre, but the comparisons are decidedly in favour of the reliability of the figures that have been supplied.

13. The production of all kinds in the district is given in full detail in the statistics, but the figures in the "Statistical Register" are in a very much more convenient form. The total acreage under cultivation is given at 4,380 acres out of an aggregate of holdings of 315,732 acres; of this cultivation, 3,739 acres was in grain crop, 305 under potatoes, and 176 in orchard. Of live stock carried by these lands, there were 67,226 sheep and 30,192 horned cattle. The production of dairies was—

Butter	...	...	...	139,615 lb.
Cheese	...	...	...	14,995 "
Bacon and ham	...	...	...	85,836 "

Appendix V  
Appendix L  
Appendix J.  
Appendix H.

14. As indicative of the extent and nature of the settlement, the following figures are also useful:—

The number of places of worship	...	...	21
" public schools	...	...	32
" private schools	...	...	6
" scholars in all	...	...	1,758

Appendices B, D, and K.  
Appendices, A, L, and M.

In addition to Braidwood, there are seven distinct townships or centres of settlement. The number of electors on the existing roll is 1,554. The total weight of gold sent away by escort during 1890 was 7,619 ounces, which is probably not more than half the full quantity produced in the district during that year.

15. The town of Braidwood has but just been incorporated as a municipality, so the full details concerning it are not obtainable as yet. It contains:—

Population in the town alone	...	...	...	1,380
Number of dwelling houses	...	...	...	205
" places of worship	...	...	...	5
" schools	...	...	...	2 (410 scholars)
" public buildings and places of amusement...	...	...	...	8
" banks	...	...	...	2
" hotels	...	...	...	10
" shops	...	...	...	49
" factories and other business places	...	...	...	18

16. The distances from this centre to the principal points may most conveniently be given here:—

From Braidwood to—	From Braidwood to—
Tarago ... .. 30 miles.	Moruya ... .. 52 miles.
Bungendore ... .. 32 "	Nelligen... .. 30 "
Marulan ... .. 54 "	Araluen ... .. 17 "
Cooma ... .. 78 "	Monga ... .. 13 "
Yass ... .. 75 "	Elrington ... .. 10 "
Jemaicumbene ... .. 6 "	Nariga ... .. 25 "
Larbert ... .. 12 "	Nowra ... .. 75 "
Sergeant's Point ... .. 9 "	Reidsdale ... .. 10 "

All the roads of communication concentrating on Braidwood from these places, at least within the area under description, are exceptionally good.

17. The distribution of the settlement is exhibited in the Appendix, showing the population and acreage held in each of the parishes. The whole of this settlement is now occupied almost exclusively in the pastoral industry, the sum total of production being unequal even to the local demands for consumption in nearly every article. This is not attributable to poverty of soil or insufficient area of cultivable land, but to the certainty that any excess over local demands must be a dead loss to the producers. There are no records available in any form that can be referred to of the state of agriculture and settlement in past years during which the large mining populations of Araluen, Major's Creek, and Bell's Creek, and on the Mongarlowe River consumed all and more than could be produced; but the history of the districts about Reidsdale at the head of the Jemaicumbene Swamp, and of the lands on the west bank of the Shoalhaven River, in parishes Jinglemoney and Jineroo, supply evidence of the decadence that has taken place in this respect since the dispersment of the crowds of miners. The Reidsdale Estate was situated on an exceptionally fertile tract of land at the foot of a low range forming the western watershed of the Mongarlowe River, in parish Seymour. It was in the first instance minutely sub-divided into farms and extensively cultivated, the quality of the soil and the climatic conditions of the locality being then as now favourable to production of all manner of food supplies. The evidence shows that this settlement has all become resolved into the hands of the few whose immediate necessities did not oblige them to follow the hand to mouth occupation of existing entirely on the production of a few acres of land, and to whom the acquisition of a greater breadth of land gave the opportunity of prosecuting pastoral industries with success. A similar condition of things has caused an exodus from the lands on Jinglemoney and Jineroo, which also are of an extremely fertile character.

18. A similar belt of fertile land is found in parishes Budawang and Mongarlowe, at the foot of the Currockbilly Range. The statistics show a settlement here of forty-eight holdings, aggregating 8,687 acres, and carrying a population of 420 persons. This fertile tract is narrow, bounded by barren ground on either side. Its fertility is explained by its geological structure. It is on the Mongarlowe Gold-field which covers the whole area drained by that river and its tributaries. The alienations took place long ago before the reservations were proclaimed. The area actually under cultivation is given at 209 acres only, an extent that probably does not suffice to feed the population. Here there has been no exodus, because the conditions are favourable to the holders. The extensive areas of Crown lands in the midst of which they are placed afford ample scope for grazing cattle free of all charge, and admits of profits from stock that are hopeless from cultivation. I believe that this tract of country is capable of providing fifty more farms, and of carrying double the population now subsisting on it, without in any degree trenching on the mineral rights of the Crown.

19. Though the dispersement of the population of non-producers of food stuffs has brought about a total stagnation of the agricultural industries, extension of railway communication in the Colony generally has produced a condition of things eminently suitable to disposal of stock, and to the pastoral industry generally. The fertile lands in this district bear but a small proportion to the whole area, which is entirely a country of granite and slate, but climatic and other conditions combined with facilities for transport admit of a combination of grazing and cultivation that has produced a class of farmers whose numbers go to make up the whole of the country settlement. A considerable number of these are tenants of the Crown, or of the large freeholders, or of the Church and School lands. In parishes Percy, Boyle, and Bruce, the aggregate of the Church and School lands, all cleared, amount to 20,951 acres. The number of holdings in these parishes is given at 105, aggregating 48,387 acres, and carrying a population of 590 (these figures are probably much too low).

Appendix O.

Appendix P.

See Mr. R. Maddrell's evidence.

20. Mr. Robert Maddrell is the owner of a large estate in the vicinity of Braidwood, amounting to 30,000 acres, of which 22,000 acres are leased to tenants. "He has altogether 44 tenants. Of these, 26 are farmers, and 18 are farmers and graziers. Of the 26 farmers, their holdings average from 10 to 220 acres, and the holdings of the 18 graziers and farmers range from 26 to 6,600 acres." Two of the large portions are let to Mr. Maddrell's sons. His evidence is very much to the point on this subject. It shows the demand for land on such terms, and the certainty that the whole country might be similarly subdivided at the will of the freeholders.

21. The Araluen district occupies a unique position with relation to the table lands and to the coast. At a distance of 17 miles from Braidwood, and 35 miles from Moruya, and accessible only by the one road, it is an extensive open area at 1,200 or 1,300 feet above sea level, enclosed by lofty ranges. The Bettowind district, lying on large tributaries of the Moruya River to the west of the Araluen valley, must be coupled with it. The principal details of the statistics are here reproduced:—

	Bettowind.	Araluen.
Population ... ..	74	615
Number of holdings ... ..	12	105
Total acreage held ... ..	10,121	896
Acreage under crop ... ..	198	237

These figures are probably very nearly correct. The difference between the total acreages and the populations and the number of holdings is very striking. The average size of holding in Bettowind is 844 acres, and in Araluen between 8 and 9 acres. The total of cattle admitted to in Araluen is 1,599, being between 15 and 16 head per holding. Two owners admit to having 130 head of cattle each, and large numbers have from 20 to 50 head. The largest holdings are two of 100 and 120 acres each, and one of 60 acres. Moreover, more than one quarter of the acreage is under crop. The explanation of this state of affairs is in the large extent of common lands appertaining to Araluen, amounting to over 3,000 acres, in addition to whatever land may be of use for stock along the neighbouring ranges, for all the area enclosed by the watershed of the Araluen and its tributaries is gold-field reserve. If the figure given above is correct the common lands amount to about 50 acres per head of population, or 300 acres per holding, which is certainly a very liberal allowance as a pension to the remnants of the miners who worked the field twenty years ago. There can be no doubt that the conditions in force in those days will never be reproduced in Araluen, and that the continuance of restrictions upon such large areas of land in favour of the resident population, enabling numbers of them to engage in pastoral pursuits at the public expense, is an anomaly that should be rectified.

22. The parish of Bettowind comprises the area drained by the several tributaries of the Deua River between the Modong Creek and the Araluen. The only access to it is directly from the township of Araluen. The original selectors have nearly all been absorbed by the large holders. The country is mountainous, and the cultivable tracts in the bottoms are of small extent, but for grazing purposes the district is very highly utilized and exceedingly well qualified.

23. The present population of Araluen is the remains with their descendants of the original body of men whose operations on this farmer's field were finally crushed by the immersion of floods which culminated in 1872. Employment is still found for some portion on the works still being prosecuted, and on the extent of land cultivated, but the existence of the settlement has been due entirely to the extensive tracts available for depasture of stock. The community does not raise sufficient in any article of consumption for its own needs, being supplied from the coast, though there is a sufficiency of cultivable land, and the capacity of the soil and climate is eminently suited to many lines of cultivation. The conditions under which the gold that may be left can be obtained will require the employment of resources far beyond the power of the ordinary digger, whose occupation has now passed away, but the substitution of all other industries, conducing to permanent development of the district, can only be brought about by a radical change in the conditions under which the land is now secured.

24. The Elrington parish, comprising the creeks that form the head waters of the Araluen, viz., Major's and Bell's Creeks and the Back Creek flowing into the Shoalhaven, was of old the site on which very large quantities of gold were produced. Here, as in Araluen, a considerable population has settled, but the extent of land held is much greater. A great deal of capital has been expended on works and machinery, and the existence of rich ores has been proved in several reefs on this field, but the industry depends for success and development upon the suitability of the appliances to reduction of gold from complicated ores, and the district has no other resources in extent of fertile lands which can be relied on for development in any other more permanent directions.

Appendix O.

25. Attached is an Appendix, showing approximately as nearly as can be arrived at by scaling from the parish maps the extent of unalienated Crown lands in the area to be served by the railway. These figures include large areas that are now held under annual lease, being within the gold-field reserves and the Church and School lands, in parishes Percy, Boyle, and Bruce, amounting to 20,951 acres, also annually leased. All this land is already included in the statistics of settlement, but the extensive areas of forest reserves and the lands open for selection added to the above bring the total to the large figures shown—502,259 acres. The area of the electorate is 904,320 acres, of which 315,732 acres is given as occupied. It is almost unnecessary to point out that the mountainous country that forms the bulk of this area cannot be affected in any way by improved communications, except by being afforded an outlet for the timber. Settlement is by slow degrees penetrating into the heart of the ranges, as the bottoms of all the valleys carry good land, and some access in values would accrue, but the main reliance for revenue producing

producing purposes must be in the carriage of timber from these extensive forests, and not in increased settlement.

26. The quality of timber on these ranges cannot be too highly rated; but the extent of the trade that may result can only be inferred indirectly. As an indication of the advantages derivable from rail carriage for 30 miles of the way, the rates in force may be compared. The charge from Braidwood to Tarago by rail will be 1s. 4d. per ton for logs and girders, and 2s. per ton for sawn stuff. To this has to be added the cost of carriage from the mills to Braidwood, say about 10s. per ton, bringing the total charges as far as Tarago to 11s. 4d. or 12s. per ton. The cost of transport now by teams the whole way is about 22s. per ton. This would make a clear saving of about 10s. per ton, or about 3s. or 4s. per 100 feet superficial in favour of the mills. Note.—Hardwood is rated at 30 cubic feet or 360 feet superficial per ton. Some timbers, such as ash and plum, are lighter, but the bulk of the stuff is as stated. It seems, from information obtained in Goulburn, that prior to the opening of the main line of railway the supplies of timber were mostly drawn from the forests in the neighbourhood of Braidwood; but since that opening they have regularly been obtained from Wingello, Bundanoon, Burrawang, and other places on the Sydney side of Goulburn. The drain during this long series of years has sensibly told on these forests, and the quality of the timber obtainable has also receded. On the other hand, the quality and the class of timber available on the Gourcock and Currockbilly ranges leaves nothing to be desired; and large orders are ready, and in fact offered, but the price is necessarily limited and prohibitive. There can be no question that the saving in cost of carriage of 3s. to 4s. out of the price obtainable—viz., 13s. 6d. to 14s. 6d., delivered at Tarago, being all in favour of the district—will give an immense impetus to the timber trade, with marked benefit to the building and manufacturing industries in the adjacent parts of the Colony.

27. In other respects the magnitude of the figures given as the extent of the Crown lands cannot be quoted in favour of the construction of this line, except in relation to certain localities where the conditions under which it is retained by gold-fields regulations may be relaxed.

28. With regard to the production of dairies and orchards, any calculation based on the capabilities of the soil and climate must be subjected to extensive discounting. The question becomes resolved into a consideration, not of what the country is capable of producing, but of the use that will be made of the opportunity, and whether the district can hold its own in competition with others. For every railway proposed these items are prominently set forth in support, while the Colony's lines for hundreds of miles are in full work through lands equally suitable. Hundreds of tons of fruit are rotting on the ground or breaking down the branches of the trees here, as in many other districts; and year by year this will be repeated, until enterprise opens out a trade with other populous countries where production is not so prolific. The accessible lands of the Colony are fully capable of producing all the dairy produce required, and immense tracts of it would be so utilised if the trade were found to be remunerative. These industries are in the nature of specialities. Though they are and ever will be prosecuted with more or less success all over the country, no district, unless specially favoured by natural conditions, can aspire to become a producer for the Colony generally, but must be content to provide for its own local wants.

29. In the course of the inquiry a visit was made to the coast at Moruya and Bateman's Bay, and to Nelligen on the Clyde River. The main points of the information obtained there is detailed in the evidence. As affecting the interests of the proposed railway, the chief of these are that the bulk of the passenger traffic to Sydney from the coast, and from long distances to the south, passes by road through Moruya and Araluen to Braidwood. The steamer communication is weekly only; traffic of all kinds is maintained by sea. The productions of Moruya and the districts to the south are confined to those from dairying, traffic in stock being an unimportant item on the whole. A surplus of maize is produced, which is sent to Sydney by sea, and to Araluen and the high lands through Braidwood; and large quantities of bark are also shipped. Cultivation of wattle for bark is receiving now considerable attention on this coast and in the valley of the Moruya, whence quantities are sent through Braidwood. The whole of the flour consumed on the coast is imported from Sydney. Much of it is stated to be actually the product of the Goulburn mills, which has been travelled round the whole way. A similar anomaly is shown by the cheese and bacon from this part of the coast, finding a market in Goulburn and districts south of it, having been distributed from the Sydney emporium. Facts of this kind are very naturally reckoned on by supporters of a line to Braidwood. If they are to be explained simply by the difference in cost of carriage, then every mile of railway laid in the direction of the coast would tend to diversion of the course of this trade. Between localities so dissimilar in all conditions of soil and climate and possible industries a direct interchange of commodities suited to the wants of each would undoubtedly arise if it could be carried on profitably.

30. As factors in the matter of cost of carriage, however, there are two points that have all the weight in the speculation. The railway charges are practically fixtures, whereas the steamer rates are entirely optional with the company. A through line to the coast would, beyond all question, supplant this portion of the steamer traffic, but a line as far as Braidwood only could not compete.

31. The calculation is simple and indisputable—one item is sufficient.

*Cost of carriage of flour from Goulburn to Moruya.*

By rail from Goulburn to Sydney—special up rates ... ..	10/9 and 9/8 per ton.
By sea from Sydney to Moruya... ..	15/- 15/- „
	<hr/>
	25/9 24/8 „
	<hr/>
Say ... ..	30/- per ton all told.
By rail from Goulburn to Braidwood—Class A ... ..	5/8 per ton.
By teams from Braidwood to Moruya ... ..	60/- „
	<hr/>
	65/8 „
	<hr/>

32. The timber trade done in the districts bordering Bateman's Bay and the Clyde River is of very great extent, supplying the Colony generally with ironbark and spotted gum for all manner of works and carriage building. That this also can be profitably travelled all the way round by Sydney, instead of direct, must be demonstrated for the benefit of Braidwood folk, to whom the anomaly seemed unaccountable.

*Cost of carriage of timber from Clyde River to Goulburn.*

From Clyde River to Sydney by sea—3/6 per 100 feet, super...	...	12/8 per ton.
By rail from Sydney to Goulburn—		
Logs and girders—Class A ... ..	...	12/5 "

From Clyde River by road to Braidwood ... ..	...	40/- "
By rail Braidwood to Goulburn—		
Logs and girders—Class A ... ..	...	5/8 "
Sawn stuff—Class A + 50 % ... ..	...	8/6 "
By teams and rail <i>via</i> Braidwood—		
Logs and girders ... ..	...	45/8 "
Sawn stuff ... ..	...	48/6 "

33. The existing condition of things, as also the effect of the construction of a line to Braidwood as affecting the traffic in general goods supplied to Braidwood from Sydney, is not so easily disposed of, as the variety of articles embraces the greater part of the goods classification. It is moreover the most important matter in this connection, and the one that has been most disputed.

Appendix T.

34. It is necessary first to premise that the steamer rates are elastic. There is a "dead weight" charge and a charge by "measurement," and the discrimination between these is in the power of the steamer officials. The "dead weight" charge of 15s. per ton is much more favourable to the public than the "measurement" charge of 20s. per 40 cubic feet. The "dead weight" charges, like the railway rates, being for weight only, can be readily dealt with; but the "measurement" charges cannot in this place be compared with them at all. In the cases of crockery and furniture, for instance, the actual charge may be double or more of the rate by weight only.

35. The cartage rate in force from Nelligen to Braidwood is 40s. per ton, and 20s. per ton for the return journey. From Tarago to Braidwood the rate is 20s. per ton, and 10s. per ton for the return journey. The detailed railway goods rates are given in the Appendix quoted in margin.

36. An examination of the railway goods classification fails to show any article in the classes "Miscellaneous" and "A" that are likely to be carried from Sydney to Braidwood. The charges compare, however, as follows:—

In the miscellaneous class the railway freight from Sydney to Braidwood amounts to ... ..	...	12/7 per ton.
The steamer freight from Sydney to Nelligen is ... ..	...	15/-
The team rate from Nelligen to Braidwood is ... ..	...	40/-
	—	55/- "
Showing in favour of the railway to the extent of ... ..	...	42/5 "
In the A class the railway freight from Sydney to Braidwood amounts to ... ..	...	16/1 "
The steamer freight from Nelligen to Sydney is ... ..	...	15/-
The team rate from Nelligen to Braidwood is ... ..	...	40/-
	—	55/- "
This shows in favour of the railway by ... ..	...	38/11 "

In class B there are several articles, such as bags, woolpacks, salt, and saltpetre, which would all be dead weight.

The railway freight from Sydney to Braidwood is ... ..	...	29/7 per ton.
The steamer freight from Sydney to Nelligen is ... ..	...	15/-
The team rate from Nelligen to Braidwood ... ..	...	40/-
	—	55/- "
Showing in favour of the railway by ... ..	...	25/5 "

In the first of the numerical classes are found a number of articles of which agricultural implements, fencing wire, corrugated iron, shovels and spades, soap and sugar may be instanced—comparing the cost of transport of these:—

The railway charges from Sydney to Braidwood is ... ..	...	59/5 per ton.
The steamer charges from Sydney to Nelligen is ... ..	...	15/-
The team charge from Nelligen to Braidwood is ... ..	...	40/-
	—	55/- "

Showing 4s. 5d. per ton in favour of the steamer, but as many of these articles would certainly be charged at the measurement rate, the difference in such cases would be the other way.

In the second of the numerical classes are found a great number of articles dealt with from which the following may be selected as representative. Ale and beer in bulk, candles, furniture, iron, (bar, rod, &c.,) rope, springs, rice, tin plates, &c. The cost of transport of these as dead weight by rail:—

From Sydney to Braidwood is ... ..	...	73/8 per ton.
The steamer charge from Sydney to Nelligen is ... ..	...	15/-
The team charge from Nelligen to Braidwood ... ..	...	40/-
	—	55/- "

By measurement on the steamer this charge becomes at least 60s. per ton, and in many cases much higher in practice.

In the third of the numerical classes there is a very extensive range of articles including by far the greater portion of the stock of a country store, such as groceries, furnishing goods, drapery, ale and beer bottled, china and glassware, cutlery, corrugated iron, tea, tools, stationery, &c., &c. This class comprises such a large proportion of the total imports into Braidwood that the cost of carrying it may be taken to rule the whole, and, as so much of it would be rated by measurement, an imposition of heavy percentages

is necessary in order that a comparison may be instituted. The dead weight charges are:—

By rail from Sydney to Braidwood ... ..	102/- per ton.
The steamer from Sydney to Nelligen ... ..	15/-
The team from Nelligen to Braidwood ... ..	40/-
	55/-
By measurement on the steamer this becomes ... ..	60/-
Or with 50 % added ... ..	90/-
Or with 100 % added ... ..	120/-

37. Summing up the foregoing it is found that in class miscellaneous the charges are in favour of railway transport by 42s. 5d. per ton.

In class A they are favourable to the railway by ... .. 38/11 per ton.

In class B the advantage is in favour of the railway by ... .. 25/5 "

In the first class taking the "dead weight" and the "measurement" rates together, the charges are about equal.

In the second class the advantage is in some cases in favour of the steamer by 18s. 8d. per ton, but that for goods rated by measurement this is reduced to at most 13s. 8d. per ton, and in many instances nullified altogether.

In the third class the dead weight charges by the steamer are lower than those by the railway by 47s. per ton, but by measurement this saving is at once reduced to 42s. per ton, and in many cases it becomes nil.

38. There is a further apparent advantage in favour of the road and sea route, that all goods sent back from Braidwood to Nelligen are carried at half rates, according to the existing practice on the roads, but the productions of the district will ever be of those classes so highly favoured by the railway classification, viz., agricultural produce, shown in the last four columns and the special classes. Those rates are low enough to defy all competition.

39. This investigation shows very clearly the direction in which competition may take effect. The steamers, by simply relaxing their measurement practice, though not their written regulations, without undertaking any additional burden, may reduce their average charge enormously. That they will do so may be taken to be certain, but in the following detailed estimate of the traffic this speculation has not been taken into consideration at all. It will be seen that I have gone in detail throughout the goods classification and credited the railway with all that it may reasonably be expected to carry, bearing in mind the existence of the measurement charges on the steamers.

40. The following is my estimate of the probable operations on the proposed line for some years to come.

<i>The Estimated Goods Traffic.—Goods outwards.</i>				£	s.	d.
Miscellaneous class ... ..	100 tons	...	...	6	13	4

41. The nearest approach obtainable to the quantity of goods brought by steamers for Braidwood annually is 3,000 tons. I have estimated that the railway will carry 2,000 tons inwards. This includes of course, numbers of articles that are now brought by this route, and allows for a reasonable expansion, but it may be taken roughly to leave about 1,500 tons to be carried by the steamers still.

42. The following points only seem to need explanation. The tonnage of wool is arrived at from the total number of sheep in the electorate, 67,226, the clip of which would amount to about 150 tons, of which 100 tons has been credited.

43. The figures of the passenger traffic supplied by the Railway League are 8,756 both ways during 1890. For the following reason I do not feel justified in adopting these. Two coaches, running five days per week both ways for fifty-two weeks, carrying ten passengers each on each trip, or forty passengers daily, make up 10,400 passengers yearly as the possible total. The numbers quoted are seven-eighths of this. Again, the tickets issued at Tarago Railway Station for the year ending June 30, 1890, amounted to 4,572. This is inclusive of all traffic around Tarago, but supposing that all inwards came with through tickets, and that all travelled to and from Braidwood, the total would amount to 9,144, or not much in excess of the League's figures. I have accepted three-fourths of their total, viz., 7,800 only, and rated them at one-third first-class and two-thirds second-class, adding 1,000 more for those picked up at intermediate stations.

44. The details of the annual expenditure have been taken from the Railway Commissioners' report. I am responsible for the figures of the estimated receipts only. A comparison of these shows that the estimated annual loss entailed by the construction of this line would be £8,939, of which the loss on working expenses only would be £2,565. That the amount of receipts must be increased by 78 per cent. of the estimate before the working expenses alone are recouped, and that they must be nearly quadrupled before the line can pay its way.

45. There are yet further results that may be anticipated from the construction of this line, viz., increased revenue to the existing line (1) from carriage of the produce of the district upwards, and (2) from carriage downwards of that portion of the goods that may be diverted from the steamers. The volume of up traffic (goods outwards) has been set down at 3,070 tons, and of this it is estimated that 2,590 tons (including 1,400 tons of timber and 800 tons of farm produce) will be new traffic, which will be distributed to various points at a cost of £671. Of the down traffic (goods inwards) set down at 2,000 tons, it is estimated that 1,500 tons will be the new traffic, earning £2,645 for the existing line. The live stock may produce £500, and the coaching traffic £300. The sum of these amounts to £4,116. This reduces the estimated annual loss from £9,119 to £5,003.

46. It is necessary to point out clearly that a large portion of this sum can be earned only in the event of the steamers retaining their present charges, a disregard of their own interests that is very unlikely to be perpetrated. The details are here given.

47. The estimated value of the extra traffic along the existing railway that may result from construction of a railway to Braidwood:—

*Goods traffic.—Up traffic from Tarago.*

48. The only conclusion that can be derived from this is, as stated by the Railway Commissioners, that "there is no prospect of this line being anything but a drain upon the system for a long time." My extended examination of the country and consequent intimacy with its capacity and resources strongly inclined me in its favour; but the figures in these estimates, though merely matters of opinion, convince me that the discrepancy between the receipts and the expenditure cannot be overcome by any process of stretching in either direction.

49. The directions in which expansion can be confidently anticipated are in increase of settlement by further subdivision of the large holdings, either by sale or leasing, and on lands now under restrictions of mining regulations, and by the gradual absorption of other Crown lands now open for selection. These would add a considerable increment to the permanent population, and react upon the traffic of the railway largely. The outturn of timber might, in the course of time, double the estimated quantity, without imposing any strain upon the available supply. But the institution of arrangements for sending dead meat to market, and the probability of products of all kinds being utilised that are now wasted, introducing fresh sources of revenue, and an access to the population, cannot be speculated on in an estimate of this kind. Similarly, though enterprise may now and again give an impetus to mining operations, nothing so extensive or permanent has been proved as to justify high anticipations for the future. The Nariga part of the district on which great hopes are based is but 43 miles from Nowra, the intended terminus of the coast railway, which will place Nariga within 137 miles from Sydney, whereas *via* Braidwood it is 212 miles. In the mining interest this difference is very important, though in all other respects, as I have already stated, I consider that the Nariga district has rightly been joined to that of Braidwood for the purposes of this inquiry.

STANLEY ALEXANDER, M.I.C.E.

The Under Secretary for Public Works.

## THE PROPOSED RAILWAY FROM TARAGO TO BRAIDWOOD.

### LIST OF WITNESSES.

1. Mr. E. Smith, butcher and miner, Araluen.
2. Mr. Price, Manager, Bank of New South Wales, Araluen.
3. Mr. Grierson, manager for Messrs. Mort & Co., Bodalla.
4. Messrs. Simpson, Gannon, Emmett, senior and Emmett, junior, of Moruya.
5. Mr. Anderson, grazier, Moruya.
6. Mr. Thorpe, manager for Mr. Vider, Nelligen.
7. Mr. Webber, saw-miller, Nelligen.
8. Mr. R. J. C. Maddrell, grazier, Braidwood.
9. Mr. J. O'Brien, grazier, Braidwood.
10. Mr. E. Francis, builder and contractor, Braidwood.
11. Mr. T. Stuart, Agent for Messrs. Hassall, Roberts, and Royds, Elrington.
12. Mr. R. Geelan, stock dealer, Braidwood.
13. Mr. T. Lee, foreman, Roads and Bridges Department, Braidwood.
14. Mr. T. Farleigh, grazier, Larbert.
15. Mr. J. Musgrave, proprietor, Braidwood Dispatch.
16. Mr. P. J. Galwey, warden's clerk and mining registrar, Little River and Nariga Divisions.
17. Mr. W. J. Chapman, auctioneer, Braidwood.
18. Mr. J. Basingthwaite, grazier, Larbert.
19. Mr. W. Bridgemant, coach-builder, Braidwood.
20. Mr. J. M'Donald, storekeeper, Braidwood.
21. Mr. R. Kennedy, farmer, Reidsdale.
22. Mr. R. Hassall, grazier, Braidwood.
23. Mr. W. J. Bruce, storekeeper, Araluen.
24. Mr. W. Hennessey, miner, Major's Creek.
25. Mr. R. Maddrell, grazier, Braidwood.
26. Mr. E. Grenenger, tanner, Braidwood.
27. Mr. R. M. Higgins, storekeeper, Braidwood.
28. Mr. J. W. Bunn, grazier and census enumerator, Braidwood.
29. Mr. M. W. Lyons, farmer, Reidsdale.
30. Mr. M. Gallagher, farmer, Durran Durra.

(1.)

Araluen, 3 April, 1891.

*Mr. Edmund Smith*, butcher in Araluen, and miner, came into the valley in 1854, and has been here ever since, excepting for a trip home to England; commenced mining regularly about eight years ago; he took up the continuation of a lead of drift in unworked ground, and worked it by means of a tail-race cut in the bed-rock for 2½ miles from the commencement to where he is working now; this, with the exception of the last half-mile, is all through private land belonging to Macgregor and Co., originally the old Burnell Estate; worked this for six years, to the expiration of his lease; during last two years has worked Crown land, continuing the same race for draining the ground in the original bed of the creek; the claim has 1,400 feet frontage to the creek; during all this time he has been employing on an average of seventy men and boys and about twenty horses, for six years; and now he has twenty-five hands and six horses in work; has fully eight or ten years' work in front of him, as, in addition to the lease, he has 2 acres of purchased land on the bank adjoining, which will occupy the men for two years; there is another claim working on the private land belonging to Macgregor and Co., in Sydney; the name of this claim is the "Southern Cross," or the "Oriental" (a company of seven men); this claim was started at Christmas; it is all in unworked ground; there are hundreds of acres of unworked ground on the east side of the river, in deeper ground than was worked by the old miners, which will be worked some day; there are also other working parties in the valley; procures maize and oats both locally and from Moruya, and from Sydney; the local production of maize is not sufficient for the consumption, or, at all events, the supply is not enough, because most of the produce from the lower parts of the river is sent by sea to Sydney; always treats direct with the grower if he can manage it; when he has to procure from Sydney he gets from Tarago, because it comes cheaper; cartage from Tarago to Araluen is £1 per ton, and from Moruya is £2 10s. per ton each way; all other stores he procures from Moruya, because the sea freight is so much less than the rail freight; there is a good road to Major's Creek, 7 miles; the labour he employs at the mine is all local, all native to the place; all have some property or holding in Araluen; they are the descendants of the original miners who worked the ground, and have been employed on the same kind of mining all their lives; the tail races of the same sort as the one he has constructed have superseded the pumping engines; there are several others on private land, excepting the last half-mile of his own, which is on Crown land; machinery is not, therefore, required; there is a water-wheel belonging to a Chinese party; there are no reefs in the valley, but on the hill side on the east, near Dirty Butter Creek, a reef is being worked; and again on the spur between Major's and Araluen Creeks some shafts have been sunk, and some gold got; on the Doua River, 10 miles down, the Devil's Pinch Reef was being worked for many years; it is now idle; it dips under the river; the Sidling Reef, opposite the former, has also been abandoned; all the passenger traffic goes to and from Tarago, from as far down the coast as Bega, or beyond; originally, before the railway to Cooma was built, the traffic was by sea, but now it has been diverted to the railway; there is a regular line of coaches daily, and opposition also.

E. SMITH.

(2.)

NOTES on information supplied by Mr. W. Price, Manager of Bank of New South Wales, Araluen Branch.

Araluen, 4 April, 1891.

All trade is done with Moruya, from which the distance is 34 miles, while Braidwood is only 17 miles; there are regular carriers—one or more—on the road to Moruya, but none between Araluen and Braidwood; with regard to supplies for Araluen, it is merely a question of cost of transit, and if these could be brought from Braidwood cheaper than from Moruya, that route would certainly be adopted.

adopted; there must be 500 or 600 people on the Araluen and its neighbourhood, supplies for whom would amount to a considerable quantity; all the passenger traffic goes *via* Braidwood to Sydney; the population is of miners or their descendants; they keep large quantities of stock grazing on the common lands, and have a little cultivation and orchard, but the greater number make a living by mining, to which they have been all their lives accustomed; many go away to other mining fields, but are ever ready to return on any new find being made; there is not very much fruit produced on the whole, but the orchards are very profitable to the owners, and the cultivation is most successful; the climate and soil of the valley are eminently suited for some kinds of grapes, but apples and pears are sure to thrive very well; the difficulties to shipping in Moruya, owing to the failure of the harbour works entailing the sending of all goods to Bateman's Bay by road or by a small steamer, are very much against the route to Sydney by sea; the following are the recognized heights of certain points hereabouts:—

Irish Corner Mountain, near Reidsdale	...	...	...	3,758	feet	above	sea	level.
Top at Bell's Creek Mountain	...	...	...	2,658	"	"	"	"
Araluen	...	...	...	1,280	"	"	"	"

(3.)

NOTES on information supplied by Mr. Grierson, Manager of the Bodalla Estate (Mort & Co.).

Bodalla, 6 April, 1891.

The difficulties in shipping to Sydney have lately been represented to the Minister for Public Works by a deputation of which he was a member; produce outwards and goods inwards have to be transhipped at Bateman's Bay into a small steamer in order that it may be brought into the entrance of the Moruya River, or else everything has to be carted through Moruya, 18 miles further, to Bateman's Bay; the estate turns out, or could turn out, 500 head of fat stock annually; he has not sent any stock direct to market; has hitherto sold to dealers exclusively; some stock sold to a dealer was taken up to the rail through Cobargo, but this was in order that some other purchases might be picked up on the way; he considers that Melbourne is the proper market for fat stock from these coast districts, but this can now only be got at by sea from Eden by arrangement with Howard Smith's steamers, which will call there on being guaranteed £30 of freight; by road and rail he considers that the Braidwood route would be adopted if the railway were built to Braidwood, but he would not send any stock through Tarago; the Tasmanian steamers take 80 or 100 head of stock weekly to Tasmania from Eden; this affords some outlet for these districts; Bateman's Bay, it is said, could be readily made serviceable for shipping on to the large steamers, in which case it would certainly be largely used for the Melbourne and also for the Sydney market; dairy produce—cheese and bacon—made on this estate, is all sent to Sydney, whence it is distributed up country and goes as far or farther than Goulburn; flour, of which 2 tons per week is used on the estate, is brought from Sydney by sea; he often gets Hayes' Goulburn flour by that route; a traffic might be made between the coast and the high lands in dairy produce and wattle-bark and maize, exchanging for flour, hides, tallow, and leather manufactured in Goulburn; much of the wattle-bark sent by sea to Sydney is carried up country to the tanneries in Goulburn; the maize grown on this south coast is known to be very much superior in respect of keeping sound for a longer time than the produce of the parts north of Sydney; corn here has been kept for twelve months without becoming weevilled; the maizena factory belonging to Mort & Co., at Merimbula, can only use this southern maize as, for this purpose, the maize has to be kept throughout the year in order that a supply may always be available for the works; very large quantities of maize are sent to the high lands from the coast; the production of maize on this coast is practically limited only by the market; under the existing shipping arrangements, competition with the northern rivers in the Sydney market is impossible, and the cost of transport by road to the high lands is prohibitory; at present the use to which maize is put on the coast is for feeding pigs, which are turned into the standing crops; he has on the estate about 450 acres under this crop; one paddock of 140 acres is expected to yield 80 bushels per acre; it is flat-bottom land on the Tuross Creek, of deep alluvial soil, as good as any on the northern parts of the Colony.

(4.)

NOTES on information supplied by the following gentlemen at Moruya:—Mr. W. H. Simpson, J.P., grazier and farmer; Mr. T. H. Gannon, J.P., grazier and butcher; Mr. J. Emmett, senior, storekeeper; Mr. J. Emmett, junior, storekeeper.

Moruya, 7 April, 1891.

Mr. Simpson has known cheese of his production having been sent from Sydney as far as Queanbeyan by the railway; most of the flour used on this coast is from the Goulburn mills; an interchange of traffic between the high land and the coast would result in competition and reduction of the carting charges over the road; all the surplus maize from the coast is sent up through Araluen to Braidwood; the wattle-bark, both from the coast and from places such as Araluen, all goes by sea to Sydney, and much of it is sent up country to Goulburn; similarly with hides; it is known for a fact that hides from Moruya have gone to Goulburn tanneries; there is a certainty that the trade in flour would be done by the direct route if the railway were extended to Braidwood, and a probability that the demand on the coast would give an impetus to the production of wheat and gristing in Braidwood itself; the consumption of bagging on the coast for grain, chaff, and wattle-bark is very large; this also might be brought overland; the articles that might be sent to the high lands comprise maize, dairy produce—such as cheese and bacon—wattle-bark, and hides, which would be exchanged for the following from Goulburn and other places—flour, leather, bagging; the fruit grown on the coast is a month or more earlier than on the high land, and kinds can be produced in this climate which must ever be imported into the high lands; in these, therefore, an interchange might be effected; the rough and frequent handling to which cheese is subjected on the steamer route is very damaging; from the factories to Braidwood there would be no more than the double handling done to reach the train, whereas by the sea there are several; the surplus stock of the coast are sent to Sydney by way of Marulan, but all these would go *via* Braidwood—never to Tarago over the metalled roads; all passenger traffic now goes *via* Braidwood, and much of it from Bega also.

(5.)

(5.)

NOTES on information supplied by Mr. Anderson, of Lake View, Bergalia.

Moruya, 7 April, 1891.

These districts of the coast are devoted to dairying, and not to fattening or breeding, but still some quantity of spare fat stock are always available for market if one can be got; and many calves not required for local consumption or for dairying are always to be had; as yet the spare stock of these classes has not been numerous, as the business of exporting from the district has not been prosecuted; he does not consider that the extension of the railway to Braidwood would do much towards advancing this stock traffic; considers that there is no ground for the objection that has been quoted to the carting of cheese from the coast to the high lands; cheese has actually to go through a great number of handlings and vicissitudes now before it can reach a market by sea, and on the road to the railway it could not be more damaged than it is on the route now adopted; he is of opinion that back loading in the shape of flour would be got to the coast from Braidwood if a traffic from the coast could be instituted; many articles produced in both districts could be profitably exchanged; regarding the passenger traffic, as he himself always travels to Sydney *via* Braidwood, he considers this route to be the best; it is available every day, whereas the sea route can only be got once a week, and in point of time it is the shortest.

(6.)

NOTES on information supplied by Mr. Thorpe, manager for Mr. Vider, saw-miller and storekeeper.

Nelligen, 8 April, 1891.

He has known people to go by road all the way through to Kiama, *via* Milton and Shoalhaven, in preference to travelling to Sydney by the sea; the opening of the railway towards Cooma diverted best part of the goods and the passenger traffic from the steamers; he believes that the extension of the line to Braidwood would divert the whole of the passenger traffic from the sea route, and that much of the goods traffic also might go by the road and rail; he is now engaged in filling orders for timber wheelwright work for Goulburn; the timber for this work is spotted gum; has now an order for forty pairs of naves of ironbark and spotted gum for Goulburn, and also for spotted gum shafts; flour from Hayes' mill in Goulburn is brought here *via* Sydney; before the railway was opened to Cooma coach-builders and wheelwrights used to send teams down to this coast for timber from Queanbeyan and Cooma, but now the coast timber is all taken to Sydney by sea, and distributed thence by the railway; storekeepers goods are taken up from Nelligen to Braidwood by the road, and the teams bring back as back freight hides, leather, tallow, and sheepskins; would judge that the quantity carried up to Braidwood from Nelligen averages 30 tons per week, and that the traffic is on the increase; the maize chiefly goes up from Moruya, as the river gives facilities for transport to Sydney from the Clyde districts.

(7.)

NOTES on information supplied by Mr. Webber, saw-mill owner on Clyde River.

Nelligen, 8 April, 1891.

The quantity of goods brought to Nelligen in 1886 by the I.S.N. steamers and sent out along the Braidwood road in teams was 5,000 tons; this information was given to him by the I.S.N. Company's agent at the time, in assistance to an agitation being made for continuance of the road vote; he believes that the traffic has increased since 1886, judging by the number of teams at work now; the loads on the drays are from 2 to 4½ tons drawn by eight or ten horses; the freight paid from Nelligen to Braidwood is 60s. per ton all round; the I.S.N. Co. charge 3s. 6d. per 100 feet superficial for carriage of timber to Sydney, and the sailing vessels charge 3s. per 100; his charge at his own timber yards in Sydney for all rough building timber is 13s. per 100 feet superficial, but for selected best qualities for wheelwright and waggon work the charge is 15s. and 16s. per 100; the timber of this coast is 2s. per 100 better for wheelwright work than that from the north; spotted gum is now being used for wheels and buggy poles, and passes for American hickory; timber from his yards in Sydney is sent to all parts of the Colony and to New Zealand; his firm have ninety customers and connections in every town on the Northern and Southern lines; Cobb & Co., at Bourke, are his largest customers; timber is often sent by him direct from the mill to Braidwood, but the purchaser pays all carriage from the mill; the population of the police district of Nelligen, including all Bateman's Bay, was 701 at the last census; the passenger traffic by the road to Braidwood is considerable; there is a regular mail coach and also a private conveyance; he himself always travels to Sydney by that route; people never go by sea if they can help it; he does not believe that the steamers get fifty passengers per annum from the Bay; to persons who take their own horses to Braidwood, and go thence by coach and rail, there is a saving of 5s. in the cost of the journey to Sydney.

(8.)

Braidwood, 13 April, 1891.

*Mr. Robert J. C. Maddrell* is renting 5,500 acres of land from his father, all in the immediate vicinity of Braidwood; is a native of Braidwood; has generally from 850 to 1,000 head of bullocks on this land for fattening; turns off on an average 750 fat bullocks yearly, but has succeeded in getting away 1,250 in an exceptionally good season; these are sent to both Sydney and Melbourne, depending on the market; when sending to Sydney he trucks at Tarago, but sometimes at Marulan; Marulan is about 56 miles by the road from Braidwood; this route is adopted to save trainage; it is dependent on the state of the market which, if good, obliges the stock being trucked at the nearest point, but if low economy has to be studied; the stock have to be travelled 30 miles to Tarago, and once on the road they might as well go the other 26 miles to Marulan at a trifling extra cost; if the trucking could be done at Braidwood no travelling would be needed; he would be inclined to send stock in small quantities by railway for every weekly sale, thus getting the benefit of the average market prices; has now two applications

cations from persons who propose to slaughter cattle in Braidwood and send dead meat to Sydney market in the event of the railway being built; this climate is a suitable one for this purpose, and the quality of the beef fattened here is very highly spoken of; it has competed very well in the Sydney and Melbourne markets against that of the noted breeders; one proposer of the slaughtering arrangements is such a man as would be capable of carrying out this scheme, and he confidently believes that it will be put into practice if the railway is built; for Melbourne he principally trucks at Yass; to get there the stock have to pass Bungendore, 32 miles from Braidwood; Yass is 43 miles beyond Bungendore; this extra travelling is done to economise the cost of transporting the stock, but if the trucking could be done in Braidwood advantage could be taken of the markets, and stock might be sent only when these are favourable; there would not then be the same need for studying so closely the cost of the carriage; Braidwood would then be on a level in the matter of command of a market with other places so served by a railway line, whence stock can be trucked on the same days on which information of a good market is received; when once the stock are on the road the extra distance to be travelled is insignificant in cost; he does not cultivate now, as he can buy all produce he requires as reasonably from his father's tenantry; the land being farmed by the settlers on Budawang is all rich chocolate soil of very good quality, suitable and used for potatoes, oats, and wheat; fruit also grows very well in some of the orchards in that locality; the farms in the parishes of Budawang and Mongarlowe are very good; the land is not nearly so heavily timbered as that on the Little River or Monga; the Monga land would better repay clearing than the Budawang land; he believes that any land thrown open, even on the heavily-timbered country of Monga, would be readily taken up by settlers; there are numbers of people scattered all over the Colony connected with residents in Braidwood, people who are natives of this district who have moved to other parts; this is shown by the influx that takes place at every holiday time, such as Christmas; these are more or less desirous to return; at the time when the railway was looked upon as a certainty, a considerable number of people came to Braidwood anticipating making settlement here; a contractor named Iccley informed him that a contract for £10,000 worth of granite for Sydney could have been filled in these districts but for the cost of the transport to Tarago; he considered that the length of road between Braidwood and Tarago made all the difference in the cost of delivering the material; this man said that on the completion of the railway a considerable trade in granite would be done with Sydney, as the granite in this part is of particularly good quality; respecting the production of fruit, last season he supplied Mr. Lamb at Rooty Hill factory with 15 tons of apples, which were grown on his father's property, Bedervale, and some at Little River; he offered to continue supplying apples this year also, but Mr. Lamb did not require them, as this fruit seems to have been in plentiful supply this season; he found that the business was payable, and this gives an indication of the quality of the production as well as of its being a payable industry; he has been assured by people from Bega that fully one-third of their passenger traffic will come *via* Braidwood if a railway is built; a number do come by this route even now, but a great increase will result.

ROBT. J. C. MADDRELL.

(9.)

Braidwood, 13 April, 1891.

*Mr. James O'Brien* resides at Belle View, on the Jemaicumbene swamp; owns about 20,000 acres freehold, including conditional purchase and leasehold about 3,500 acres; these properties (freehold) are on Mount Elrington, Parker's Gap, and Karwarie; the leaseholds are on Belle View and Mount Elrington; has been in these districts 39 years; runs cattle on all these properties; at present there are about 4,000 head on them; they are capable of carrying more under improvement, but they are fully stocked now; the season is a little unfavourable; has dealt principally in fat stock for the last few years; can send away about 1,400 head of stock of all sorts annually; sends fat stock to both Sydney and to Melbourne, depending upon the market; for the Melbourne market he always trucks at Yass; to get there all stock would have to go *via* Mount Elrington and Bungendore, and Gundaroo; this distance makes about a week's driving from Mount Elrington; for the Sydney market he trucks at Tarago; this would be three days' driving from Mount Elrington; sends fat stock down to Shoalhaven and Kiama when there is a good market, because of the population, and the railway works that are going on now; did send to Cobargo a couple of times, but in that case he sold to a dealer; a grazier named Collins, at Bega, occasionally sends cattle up this way for the Sydney market when there happens to be no demand in Bega district, or for the Tasmanian market; he anticipates being able to increase his outturn of fat stock regularly year by year by carrying on improvements to his property; clearing and laying down permanent grasses; finds perennial rye grass, colt's foot and prairie grass succeed well here; has no farms let on his properties except small areas let to his own employees; bought several farms about Mount Elrington from settlers who had been resident for a long time; these had taken up their land about 1853 or 1854, and the market for their produce was in the mining camps of Araluon and Major's Creek; the dispersment of this population deprived all these farmers of their market, and left them no outlet for their produce, so they could not hold on to the land; there were about seven farms aggregating about 500 acres, for which he gave from £4 to £5 per acre all round; these were on Mount Elrington, Farrendon, and Highgate, on the west bank of the Shoalhaven River; during those times, when there was a market, he himself used to cultivate 200 acres of land at Jemaicumbene and Mount Elrington, but since the population went away he crops only what can be consumed on his own property; has had hay in his shed for years without being able to find a purchaser; he has cultivated 100 acres on Jemaicumbene, and 100 acres on the west of Shoalhaven at Highgate; on that side of the river he considers that 1,500 acres of land on his property could be found cultivable; there are 300 to 400 acres on one flat by the river near Mount Elrington; if the railway came to Braidwood he would dispatch both for Sydney and Melbourne all fat stock at Braidwood; the cattle could be brought in from the paddocks and trucked in half a day; there would not be much travelling to be done at all, whereas under the present conditions, having got them on the road it seems better to continue travelling to Yass past the station of Bungendore, as the cost of this extra piece on the journey is comparatively trifling when once the cattle are on the road; he believes that a trade in dead meat can be carried on from Braidwood, as the climate during so many months is suitable to its preservation; at the time when the railway was looked upon as a certainty about two or three years ago, he offered a price for a piece of land near the town in order to institute business in this line; he believes that it will be prosecuted if the railway is built; have been up the Little River, about 7 miles above

above Monga, and saw a fine scope of good land on one side or the other of the river; this, and for a couple of miles down, past which he has not seen, would all be capable of supporting families by farming or grazing; he considers that the Araluen reserve along Bell's Creek is very good grazing country; it would all be taken up at once if thrown open; there have been applications for it which have been disallowed; obtains his store stock from all parts; they all come to his property by road always.

JAMES O'BRIEN.

---

(10.)

Braidwood, 14 April, 1891.

*Mr. Edward Francis*, builder and contractor, has been in Braidwood for 33 years; has also been engaged in mining operations and in the timber trade and saw-milling; his saw-mills were on the Mongarlowe River, near Monga, on the Clyde Road and the Little River Road; one was transferred to the M'Cree's, about 12 years ago, and another was burnt; used to cut mountain gum, messmate, white top, plum tree, sassafras, blackwood, and mountain ash; the market for this timber extended to Goulburn, Queanbeyan, Jinendera, and Gunning; the railway opened to Goulburn in 1869, and the saw-mills in the forests north of that place, in the vicinity of the line, were opened some years after; the opening of these forests and the extension of the line southwards past Goulburn took away the market; the carting from his saw-mills to his agents timber-yards in Goulburn was 70 miles; the trade could not be continued under the strain of such a competition; the railway having been opened to Tarago 5 or 6 years ago affords some relief to the trade, but it is being carried on under great disadvantages; building timber has to be delivered in Goulburn at about 13s. per cent., and special classes for waggon and carriage work obtains 1s. or 1s. 6d. per cent. more; if from this the cost of carriage is deducted the balance left for all the operations at the mill and in the forest is enough only to give a bare subsistence to those engaged; in old times before the railway opened the price of timber in Goulburn was 16s. and 18s. per cent., which left a fair margin for the mill; if the railway was extended to Braidwood, the existing price, viz., 13s. 6d. or 14s. 6d. per cent., would also leave a good profit to the miller; the principal timbers are mountain gum and messmate, which were supplied for all ordinary purposes in building and contracts; of these the supply is unlimited; there is hardly any limit to the quantity that could be supplied; he is of opinion that a traffic in timber amounting to 500,000 feet annually can safely be reckoned on; believes that the quantity sent away even now amounts to 60,000 or 70,000 feet; there are orders in the district amounting to 40,000 feet now; an order from Mr. Ball, of Goulburn, for mountain gum for railway waggons, 25,000 feet, is now being supplied by Mr. Grant; the blackwood is on the Budawang Ranges; Mr. M'Cree himself, whose saw-mills are there, can give all particulars regarding this timber.

EDWARD FRANCIS.

---

(11.)

Braidwood, 14 April, 1891.

*Mr. Thomas Stuart*, Commissioner for Messrs. Hassall, Roberts, and Royds, at Major's Creek; has been on the creek for thirty-seven years; during this time he has been mining, grazing, and farming; and is still pursuing the same occupation; the reefs that have been worked are Dargue's, Plum's, Thomson's Blow, Kell's Reef, the United Miners, the Pipe-clay, and the Young Australian; these are on the 640 acres of Messrs. Hassall, Roberts, and Royds that has been under offer to the Major's Creek Gold-mining Co.; shafts have been sunk on all, and they have been worked down to 70 and 80 feet; in all of them the workings are down to the pyrites; the chlorination works are situated at Dargue's Reef, and the crushing plant is on the Major's Creek, with tram lines laid to both United Miners and Dargue's; about £45,000 have been spent by the Company in machinery and works; the operation now in progress is the sinking of the main shaft on Dargue's Reef, 50 feet in depth; the plant was stopped in working about December last, as negotiations were on foot to float the affair into an English company; at the time of stopping there were about seventy men employed; he is well acquainted with all these reefs, and he knows that there is any quantity of ore—especially in Dargue's and United Miners—to keep the plant constantly at work for a long series of years; the depth of the reefs is not known; there is another reef, named Rigby's, on Mr. T. Robert's property, on which a shaft 80 feet deep has been sunk to the pyrites; there is plenty of ore visible about 4 feet wide; on the Crown land, the reef is Snobb's—on the same line as United Miners; a shaft has been sunk over 100 feet; the ore is pyrites, with other minerals; this is on a lease of Mr. Blatchford's, on which a good deal of prospecting has been done on "the big hill;" also on Crown lands outside of Mr. Blatchford's there is a reef called "Rise and Shine;" a shaft has been sunk about 100 feet, and pyrites proved in a reef about 2 feet wide; then there is Stuart's lease; the shaft is down about 25 feet, proving gold and silver in quartz in a reef about 18 inches wide; there are about twenty parties comprising about 50 men at work in the creeks on the 640 acres of the Company's land; these men all pay for licenses to the Company; on the Crown land there are about 100 men at work under miner's rights; these men are constantly at work, but many of them have to depend upon rainfall for water to wash with; the whole area within the basin drained by Major's Creek down to the waterfall carries gold; the greater part of it is high above reach of water, and can only be worked during rain; on Long Flat down to the Back Creek, there are about twenty-five or thirty men at work; here, the washing is done in puddling machines near reservoirs of water; there is no one working on the Back Creek itself; the Long Flat is very nearly worked out; the ground left by the old diggers is now being worked profitably; it will last for many years, as the processes are being improved, and much poor ground is now payable; a new race has been brought in from Back Creek, which commands a good portion of the Long Flat on one side; this race is about 4 miles long; all the miners own stock in cattle, horses, and sheep, which run on the Crown lands; mostly all have their own residences, and are permanently settled; many of them cultivate, but they depend mostly upon the mining for a living, but many have produce to dispose of; he, himself, has 80 acres freehold and 40 acres leased from other persons; cultivates about 10 acres in wheat, hay, and potatoes for home consumption; some land on the Back Creek is very good; there is no market for produce; fruit is growing in every garden on Major's Creek in profusion, but there is no use for it; the locality cannot be surpassed for cultivation of apples, pears, and cherries and plums; the miners outside of the Company's land must depend upon the success of the treatment of pyrites in their

their works; if this is found payable, several more mines will soon be in operation, and the field will become populous; in view of the immense quantities of ore available, it is not too much to say that the locality of Major's Creek will carry a population of several hundred families within a few years.

THOMAS STUART.

(12.)

Braidwood, 14 April, 1891.

*Mr. Robert Geelan*, dealer in stock, has been in Braidwood for thirty-two years; owns land 24 miles from town on the Goulburn Road, 777 acres freehold, and also about 40 acres in Braidwood; keeps the stock in which he deals on his land; he puts through annually between 4,000 and 5,000 head of cattle and 13,000 and 14,000 sheep; sheep are increasing in the district; cattle breeding is carried on extensively by the smaller settlers throughout the district; his operations are confined chiefly to buying cattle in the district or in the local salcyard, and selling them in Goulburn or in other districts; in the case of sheep he mostly introduces into the district from outside; the cattle bought in Braidwood and district are chiefly stores bred in the district; these are all travelled to destination except in times of scarcity of grass; he does not deal largely in fat stock, as he could not make a profit on the work, having to travel them to the railway; he has lost money in the business; the 30 miles is three days on the road, and with the rail journey the stock lose greatly before they reach the market; his son-in-law is butchering in Braidwood; their intention is to institute a trade in dead meat to Sydney, slaughtering in Braidwood; believes that this will pay well, and that the climate here will enable this being carried on all through the year, with the aid of the freezing cars during the summer; he considers that a considerable traffic would be done by a railway line in store stock from these districts, though the cost of transport by rail is much higher than by road, yet a dealer can get so much better price for the stock after the rail journey than after the road journey that it pays him to use the rail; in case of a person sending to these districts to buy stores which he intends to fatten on his property in another district, it will not pay him to take them away by train, but it does pay a dealer who has to get as good a price as he can after the journey; believes that all the fat stock sent away from Braidwood will be trucked at this place; knowing the district well he would say that there ought to be about 6,000 head of fat cattle sent away from here annually; this he considers a fair estimate; again regarding store cattle, for the last fifteen years he has been taking these to Wagga; it costs about 5s. a head to drive them, and he is sure that they lose 5s. in condition; it is clear, therefore, that he could pay 10s. a head for the trucking; the fat sheep would certainly go away in trucks; considers that between 10,000 and 15,000 sheep (fats) annually could be sent away as a fair estimate; the store sheep are generally brought into the district; any of these sent away from here would travel by road, since this travelling does not show effect on store sheep or affect their value nearly so much as with cattle; he generally sends a couple of trucks of horses annually to Sydney for sale; he is aware that Messrs. Hassall, Madrell, and O'Brien and others send their stock to Marulan and to Yass at present by road, but he believes that all will be trucked at Braidwood, as this point is so near the properties, and a saving in men and time will be effected; one cause that prevents travelling to Tarago is that the road is all metalled, a very objectionable point for travelling stock, and also that the road is not well provided with camping reserves; it is fenced nearly the whole way, and very little feed is to be got on the road; prior to nine years ago he, on several occasions, despatched mobs of turkeys—400 and 500 in each mob—from Braidwood to Goulburn, travelling them on the road; the journey took about six days; he used to send about 500 fowls monthly at the same time; there is nothing to prevent such a traffic being renewed as it is profitable.

ROBERT GEELAN.

(13.)

Braidwood, 14 April, 1891.

*Mr. Thomas Lee*, Foreman in the Roads and Bridges Department, in charge of a gang of bridge carpenters, at work now at Warri, repairing the road bridge over the Shoalhaven River; has been in this district since 1866; employed in mining during the early part of his stay, and since then has been road and bridge contracting and farming for the last eighteen years; owns 206 acres of freehold and C.P. land in Reidsdale; has owned this land for fourteen years; cultivates wheat and potatoes, and crops, altogether about 11 acres this year; consumes all but potatoes, which are sold in Braidwood and Araluen; there is only a limited demand locally; last year he got £4 10s. per ton for potatoes wholesale; this year will have about 20 tons; might get £5 for them; gets about 8 tons per acre, but he uses mostly all new ground, lately cleared, which is covered with very heavy timber, so his crop is usually very much better than those grown on his neighbour's land; the high price last year was due to the general failure of the potato crops in these districts through wet rotting the potatoes, and this year there was a very heavy frost, about six weeks or two months ago, which cut down large areas of the crop; both last year and this year his crop has not suffered, so he reaps the benefit of the high price; this is the best crop for a farmer to grow if £3 could be got for it per ton; wheat will not pay; his soil is red, heavily timbered; it is opposite Kennedy's, under the ridge of the mountain; the land on the forest reserve adjoining him on the mountain is all very good land, heavily timbered; some of this is too mountainous, but there are many parts suitable for settlement, which would be taken up by settlers if thrown open, in spite of its being so heavily timbered; there is splendid land from the east slope of Budawang Mountain past Monga, all along the Little River to the head, and round to west of Reidsdale, and northwards again to Murgarlowe, where poor land commences; the whole of this extent of country is all forest reserve, except where it has been taken up at Monga; one or more selections were taken up at the head of Little River twenty years ago and abandoned; it is all heavily timbered, with no open places; parts are mountainous, but there are flats along the river; it would be selected if thrown open, as there is no land available for settlement; the timbers are mountain gum (the principal timber), messmate, and whitetop; is living on Bell's Creek.

THOMAS LEE.

(14.)

14 April, 1891.

*Mr. Thomas Fairley*, grazier, at Larbert, on the Shoalhaven River. "Fairleigh" is the name of his place, on the east bank of the river; owns freehold 256 acres, and leases 2,887 acres from the Crown and from the Church and School Lands; generally has from 1,500 to 2,000 sheep, and about 40 or

50 cattle for the use of the home; generally fattens 500 or 600 sheep annually, and sells to local butchers if possible, but otherwise he sends them to Homebush; trucks the sheep at Tarago; sometimes buys store sheep in the market at Braidwood, and sometimes in Goulburn; drives them to his place, but if the country was very dry he would truck them from Goulburn; all his part of the country is used more for sheep than cattle; it is all good sound sheep country, and the river flats are all of the best quality for cultivation; he cultivates for his own consumption only, but a neighbour, John Basingthwaite, cultivates from 100 to 150 acres; Larbert is 27 miles from Tarago; there is plenty of land open for selection in the neighbourhood of Larbert; some is being taken up nearly every week in conditional purchases and leases; some of it is good, and some is very indifferent; the railway at Manar would be 4 or 4½ miles from Larbert; there is a good road to it; the Shoalhaven River in the neighbourhood of Larbert and Marlow is crossable only at two fords near Larbert; these are the best fords on the river as far as he knows it, but these are impassable in extra wet weather, and from what he hears the river is not crossable throughout every ordinary winter down below Larbert for loaded teams; under such conditions the people of Narriga and Marlow will all have to pass through Larbert to reach the railway at all.

THOS. FAIRLEY.

(15.)

Braidwood, 15 April, 1891.

*Mr. John Musgrave*, proprietor of the *Braidwood Dispatch*, has been connected with this district for thirty years, and has had much experience in gold-mining and agricultural pursuits; regarding the prospects in mining matters, he is of opinion that the alluvial deposits have only been partially developed in the Araluen and Jemaicumbene districts; some years ago he held a third share in a claim on the east side of Araluen, which was very rich, and had been followed up during two years by another party below, and had given washings of from 8 to 15 oz. daily, as informed by the manager; his party found it to be very payable until a break in the lead occurred, where a watercourse had crossed it; after this the lead could not be picked up again, but he is of opinion that it is still in existence, and continues on the other side of the interruption; there is plenty of new ground in the valley, especially on the eastern side, which has not yet been worked, and which, according to the opinion of the Rev. W. B. Clarke, is probably the richest part of the ground; the cause of the abandonment of the working in the valley was a succession of floods, together with the attractions of other gold-fields, which at that time broke out and withdrew the majority of the population; has known the time when the population of Araluen was 12,000. He then ran a special service and delivered his paper to subscribers in Araluen; this was between 1865 and 1875; it was between 1870 and 1872 that the floods destroyed the workings and the population became scattered; the field was payable up to the occurrence of the floods, so the inference is that gold in quantity has been left behind—attention having been turned from the place; the desired improvement in the communications to the district would have the effect of bringing the field into notice again, causing the introduction of capital for development of the deeper ground; the large reserves, amounting to several thousand acres of common lands, in the valley are capable of affording room for a large population of miners; in addition, the area of the gold-field reserve covers the whole of the valley of the Araluen, Major's, and Bell's Creeks, and extends as far as the Jemaicumbene Creek; the valley of the Jemaicumbene Creek is auriferous from the Shoalhaven River up to Reidsdale, but on this the Church and School Lands only are Crown lands, though extending for about 6 miles on one side of the creek; there are two parties working, one on each side of the Jemaicumbene Creek, on separate leads of gold, employing about fifty hands altogether, and successfully; the Little River, or Mongarlowe River, has been very successfully worked, both in the alluvial and the reefs; the reef now being operated on is the Day Dawn; the last crushing gave 180 ounces of retorted gold for three weeks work, with a small Huntingdon mill; they are employing twenty hands; there have been a number of reefs worked on that river down to the water level, below which capital was not available for proceeding further, but which must eventually induce speculation; reefs have also been discovered on the coast side of the Currockbilly and Budawang Range, one field in that neighbourhood having now a population of 100 persons engaged on quartz reefing; the access to all these fields herein mentioned will be through Braidwood—Araluen being 17 miles only from Braidwood and 35 from Moruya; all supplies of all kinds would be brought *via* Braidwood, and fresh enterprise would be brought to bear upon the industry if the communications were improved by the extension of the line to Braidwood; he knows from personal inspection of the country that the range and the eastern slope of the Currockbilly and Budawang Range carries very good soil on gradients suitable for settlement and improvement; this is all forest reserve, covering a very extensive area, which will produce first-class timbers for ever; the Narriga gold-field is about equidistant from Tarago and Braidwood, but the road to Tarago crosses the Shoalhaven and rough intervening country, whereas the road to Braidwood avoids these difficulties; at present the greater portion of the supplies go to Narriga from Braidwood; two of the leading storekeepers have branch establishments at Narriga; a mail coach connects these places twice a week, whereas there is no direct communication with Tarago; about Narriga there is a large breadth of good, rich soil; and also further on in the district of Sassafrass; there is a good amount of settlement at both places; there is a considerable extent of Crown land heavily timbered in these districts; the production of fruit of all the English varieties is very certain in the districts about Braidwood; at present there are hundreds of tons of fruit wasting or being fed to pigs; the late varieties thrive here especially; some quantities are taken down to the coast; the climate of these districts being within the influence of the sea air is moister than that of the country farther inland; the conditions are eminently suitable to production of the later varieties of apples; the districts of Cooma, Queanbeyan, and Goulburn, not being so favourably situated are regularly supplied by hawkers from the Braidwood district; would point out that the cultivated grasses all flourish here and are permanent; clover seems to have become indigenous to the district; the butter produced here is considered to be a much better article, because of the climate, than that produced in the warmer climates; the grasses seem to be more suitable for milk giving and fattening also.

JOHN MUSGRAVE.

(16.)

Braidwood, 15 April, 1891.

*Mr. Patrick James Galwey*, Warden's Clerk and Mining Registrar for Little River and Narriga Division; resident at Little River for the last 25 years; was gold mining up to the last six or seven years in the Little River district; there are large quantities of alluvial there still unworked which would pay for ground sluicing, but the supply of water is the difficulty; during wet weather washing is still done; there are about 70 or 80 alluvial miners (Europeans), and about 45 Chinamen engaged in alluvial at the Little River; these men are permanently settled, having houses of their own and families; they make most of their living by mining, but all keep some cattle; there is a large extent of Crown land; none of the miners hold any extent of land; they usually hold the regular two-acre blocks; the men employed at the Day Dawn are not regular residents, being nearly all strangers; there is no other reef at work but the Day Dawn, excepting a prospecting claim at Swiper's place, about a mile from the Day Dawn; there are several reefs on the river which have been worked, carrying good payable gold down to the water level; this level is about 50 feet from the surface on an average in all this district; the deepest working has been down to 100 feet; the water has in every case overcome the work, and new capital is necessary to carry on; these reefs are the Homeward Bound, the Red White and Blue, the Dog's Head, Alma, and Great Britain; these are the principal reefs that have been sunk on to any depth; they all carry rich payable stone down to that level; these reefs generally strike east and north-east; none of them are north and south reefs; no such true north and south reef has been found yet; they are all on the east side of the Little River; no reefs but barren ones have been found on the west side; the bottom of the Day Dawn is fully 200 feet deeper than any sinking yet done on the river; it is 205 feet deep from the surface; it is in a hollow on Settler's Flat, which joins Fagan's Creek about a quarter mile down; the other reefs are on ground fully 100 feet higher at the surface than that at the Day Dawn; this reef has been traced only as far as seen now in the workings; the Homeward Bound has been traced to the extent of the 10-acre lease; the Red, White, and Blue and Dog's Head are supposed to be the same reef; they have been traced 300 yards between the two shafts, not beyond; none of these reefs are held by anyone at present; they could be taken up at once; they run 8 to 12 or 14 inches in width, averaging (say) 8 inches; the country rock through the Little River district is slate and sandstone, joining the granite at 3 miles from Little River on the west side; the population of the Little River district is, according to the census he has just made, exactly 760, exclusive of forty-five Chinese and two aboriginals; this district comprises the basin of the Little River, including Monga, and extending down to the confluence with the Shoalhaven; the watershed commences along the road, about 2 miles outside of Braidwood; he is of opinion that now the existence of payable gold has been proved in the Day Dawn at the depth, that the other reefs will attract attention, and he has no doubt whatever that proper management would enable them to be profitable; there is a narrow belt of very good soil running parallel with the Currockbilly and Budawong Range, at the east of the Little River, which cannot be surpassed for growth of root crops; on this land there are about twenty settlements; the land has nearly all been taken up for over twenty years; no farms have been sold out there; the quality of the potatoes is so good that a market can nearly always be found for them; now that the large mining population has been dispersed, cultivation has, to a large extent, been given up in favour of grazing; this belt of land extends from Monga, 21 miles northwards, following the range; there are settlers nearly all along it, with patches of Crown land between them; grazing is largely prosecuted, as the settlers have such large areas of Crown lands on either side of them upon which the cattle can graze, all being gold-field reserves; outside of this belt there is no land fit for settlement except for grazing purposes; at Narriga, the only work being done now is the cutting of a race from the Corang River to the Golden Terrace Company's ground, on the banks of the Shoalhaven; the Corang River comes out of the Currockbilly Range on the Western Fall; the race will be 24 miles long; there are forty men employed; sixteen miles of the race have been cut, at an expense of £10,000; the Golden Terrace is a Melbourne Company having 500 acres of special leases on the right bank of the Shoalhaven; they have not done any other work but at the race, which will not be finished for another six months; the ground is all alluvial wash; the Beasley River Company have a race partly cut a distance of 9 miles; has cost £4,000 or £5,000 at the present; this is a Sydney syndicate; the Beasley River comes from the Currockbilly Range also; the ground is alluvial; the extent is close on 300 acres; the dam that was washed away was built on the Beasley or Endric River; it was to have been 50 feet high; there has nothing been done since the wash away about three months ago; the Warden has granted six months' suspension for reconstruction of the company; nothing is now being done; lower down the Beasley River, the Primrose, a Melbourne company, have partly erected a dam, and cut a race some 7 miles in length to work at Primrose Point; the wash at this place is under the basalt; up to this nothing payable has been found, and no work is being done; the population about Narriga engaged in mining is about ninety, but the country is thickly populated, being a very old settled locality; from Narriga to Tarago is 25 miles, but to Braidwood it is 33 miles; the road to Tarago crosses the Shoalhaven at Oallen crossing; this is a tolerably good crossing; it is very subject to being stopped by floods, as rainfall up in the mountains causes floods in the Shoalhaven to rise rapidly; there is very little cultivation about Narriga; the mining works give employment to the people; the township is only a nominal affair; from Narriga to Nowra is 70 miles; the traffic from Narriga goes *via* Tarago when the river is passable; the road is very poor; very little money has been spent on it; but the Braidwood to Narriga is a very good road, on which money is being constantly spent.

P. JAMES GALWEY.

Braidwood, 15 April, 1891.

*Mr. W. J. Chapman*, auctioneer in Braidwood, has been in business here for six years; from his books he has taken the aggregate amount of stock that passed through his hands between 1st September, 1889, and 31st August, 1890, representing the sum of his transactions; it is to be noted that many lots are counted twice over, having been resold by him; these could not be separated; 7,650 head of cattle, 37,108 sheep; again, similarly for the six months from 1st September, 1890, to 28th February, 1891, the totals were—4,931 head of cattle, 32,873 sheep; his operations are chiefly in store stock, as the fat stock are usually sent direct to market by the owners, or are bought and taken away by dealers

dealers themselves; some quantity of fat cattle are sold here, but not very many; the transactions have materially increased since he commenced the business, but the difficulties in buyers coming here from other districts, having to travel by road for 30 miles from the nearest point on the railway are detrimental to the trade; with respect to the trucking of cattle at Yass and Marulan having been travelled from the neighbourhood of Braidwood, he explains that the road to these places being unmetalled and well supplied with resting places afford good travelling routes on which cattle do not suffer or lose nearly so much as on the shorter journey from Braidwood to Tarago; if the railway were extended to Braidwood there can be no doubt that all this trucking would be done here; cattle could be put into trucks on one day and be in the market at Homebush on the next without having been subjected to any of the trials of travelling by the road, and they would consequently bring better prices; he has calculated in conjunction with Mr. Geelan, that, taking the cost of driving store cattle from Braidwood to Wagga Wagga at 5s. per head, and calculating the cost of taking a full special train load of fourteen trucks from Tarago to Wagga Wagga at 8s. per head, though this represents a cost of 3s. per head by rail above the cost of travelling by road, yet the condition in which the stock would arrive in Wagga Wagga would more than repay this charge; having a good knowledge of the operations of the district in stock, he would estimate that 3,000 head of cattle would be trucked annually at Braidwood; sheep have lately been more profitable than cattle, accounting for the large increase in the sales during the last six months quoted; according to the numbers of sheep now held in the district, he would estimate that 7,500 would be trucked at Braidwood and 7,500 at Manar annually; these would all be fat sheep; in addition to the above there would be some traffic in store stock, but of this quantity he cannot venture to give an estimate; believes that 200 horses pass through his hands at the sales annually, but the traffic in these by rail would not be appreciable; as agent for owners he himself has sent away 100 bales of wool from Braidwood during the last season; this represents only two of the clips of the district.

W. J. CHAPMAN.

(18.)

Braidwood, 16 April, 1891.

*Mr. John Basingthwaite*, grazier at Larbert, owns about 800 acres freehold at that place; cultivated last year 100 acres in wheat and hay; had 70 acres of wheat, which he threshed for grain; obtained 1,500 bushels; it is good soil; sold 1,000 bushels in Braidwood to the miller, and the rest is stored; requires some for his own use, but will sell if the market rises; runs both sheep and cattle, but principally sheep at Larbert; Mr. Alex. Rirey is neighbouring his property, and runs sheep; this country generally is very suitable for cattle-grazing, but during the last few years sheep have been increasing; the crossings of the Shoalhaven at Larbert, of which there are two, are good; his property is on the left bank of the river; the Reedy Creek has to be crossed to get to Tarago; the distance from Larbert to Tarago is 20 miles, and from Manar 7 or 8 miles; he sent away by rail to Sydney during 1890, 108 tons of chaff, hay, and straw; during last year he threshed 2,160 bushels of wheat at the property on the Long Swamp, rented from W. Scott; this is about 5 miles from Manar, to the west; this wheat was sent to Goulburn from Bungendore, 12 miles away; it would have been trucked at Manar had the railway been built to that place, as the cartage would have been 5 miles only; is not now working that property; has given it up; it is now stocked by Mr. Scott; during 1890 he procured by rail from Sydney and other places 15 tons of goods; the traffic from the Little River and Nerriga goes to Braidwood, to which there is a coach road, but none to Tarago; the Shoalhaven River is a great obstacle in the direct traffic to Tarago; during wet seasons the Shoalhaven is impassable; have known the fords to be stopped for six or eight weeks; the only bridge is on the road from Tarago to Braidwood, at Wollar; it is probable that much of the Little River and Nerriga traffic would join the railway at Manar, crossing the Shoalhaven by the bridge at Wollar; not much money has been spent on the road from Nerriga to Tarago, which crosses the Shoalhaven at several places, of which Peter Roberts' is the chief one; from Larbert to go to Tarago with teams and stock people have to go through Manar; there is the old original road from Larbert to Marulan; some stock does go now to Marulan, but some also to Tarago; he himself always sends his stock to Tarago, and trucks there; believes that if the railway is built, the greater number of people, if not all, would truck their stock at Manar; has a couple of hundred sheep now ready for market which he would ship at Manar to-morrow if the line were there; has also 50 tons of hay in hand which he might send, and 50 tons of straw; this he will probably truck at Tarago, as there is little prospect of disposing of it locally; there are also on his place twenty fat bullocks, which he would send *via* Manar, but now he will have to send them to Tarago.

JOHN BASINGTHWAITE.

(19.)

Braidwood, 16 April, 1891.

*Mr. William Bridgemant*, coach-builder, has been established here five years; the chief timbers he uses are spotted gum and plum tree; obtains the former from the Clyde, and the plum tree from Monga; the spotted gum is used for all carriage works, and costs in the rough delivered in Braidwood 25s. per hundred; this is of especially good quality; the plum tree timber costs 15s. per hundred delivered; American and English ash and hickory he procures from Sydney by rail to Tarago; this is nearly all dressed as shafts, spokes, and felloes; has brought some by sea through Nelligen; the steamer makes the cheapest route, but for other business reasons he is obliged to use the rail; he has to procure all his iron and steel from Sydney; this is also for the same business reasons sometimes brought by the coast and sometimes *via* Tarago, though the sea route is the cheapest; coal, to the quantity of 10 tons, he has brought here from Sydney, but the cost of this in the carriage between Tarago and Braidwood was prohibitive, especially as it has to be bagged in order to be carried in the carts; his average tonnage of imports from Sydney amount to half a ton per week—amounting to about 25 tons per annum; his business is now confined to the district, because of the difficulty in the communications; he instances Mr. Cummins, of Wollongong, who since the railway opened to that place is extending his business to all parts of the Colony; does not use the blackwood timber; he follows coach building only, not the heavy heavy waggon work which is done by the wheelwrights.

W. BRIDGEMANT.

(20.)

Braidwood, 16 April, 1891.

*Mr. James McDonald*, storekeeper (general), has been here in business for two years, but was here between 1879 and 1884; all produce required, such as maize, oats, barley, potatoes, and such like, are procured from Sydney by rail, also salt, and timber of pine and American goods of soft description. Flour is obtained from Goulburn, but sometimes from Wagga Wagga; the major part of the flour comes from Goulburn; the local mills are stone mills, but the preference is for roller flour; Goulburn flour is dearer at Goulburn than the local flour is in Braidwood; large quantities of maize are brought up from Moruya; one, Tom Cooper, is constantly engaged in this business alone, carting it up himself; this is a wonderfully good season for maize all along the coast, and very large quantities will be sent into Sydney, which is the distributing point; the Moruya people send it to the best market, as the Braidwood people purchase in the cheapest market; no hardwoods are imported from outside; the forests in the district supply all required, of excellent quality; there are two small cheese factories at work, but quantities of bacon are produced; cheese is sometimes imported from Sydney, and direct from Bodalla, it being a better article than that produced locally; this is much better than it used to be, but there is room for improvement, which will probably be brought about by improved cultivation of the pastures; the imported article is dearer than the local; in the matter of butter, he sent away on his own account to Sydney, and along the railway lines to Hay, Wagga Wagga, and other places, 15,425 lb. during last year; this butter was all produced in the adjoining districts, some was brought up from the coast; other exports to Sydney comprise hides, skins of all kinds of wild animals, wattle bark; all these things almost invariably are sent by rail from Tarago; very rarely is anything sent by the coast, and only when there happens to a team going down to catch the steamer; during the first three months of this year, which are always quiet months of the year, he brought up from the coast *via* Nelligen 40 tons 15 cwt. 3 qr. of general goods; the aggregate for a twelve month would amount to fully 200 tons; the cartage rate from Nelligen to Braidwood is £2 per ton; this is the rate he has paid all along; occasionally he has sent down back loading to the coast, and has then given £1 per ton for it; the teams usually return empty to the coast; the cartage rate from Braidwood to Tarago is 10s. per ton as back loading, and 20s. per ton from Tarago to Braidwood; the measurement charged by the I. S. N. Co. makes up a very high rate; referring to the first paragraph of this evidence, he wishes to point out that the produce brought up from Sydney is over and above the quantity locally produced, excepting maize, which is not produced here in any quantity; the local production in produce is very often below the consumption—depending upon the season; during the last two years he has had to import wheat, barley, oats, and potatoes; has never known butter to have been imported into Braidwood from outside; the steamer freight from Sydney is 20s. per ton for dead weight, and 25s. per ton for measurement of 40 feet to the ton.

JAS. McDONALD.

Braidwood, 16 April, 1891.

*Mr. Richard Kennedy*, farmer, Reidsdale, owns 250 acres of purchased land, and leases 7,000 acres from the Crown; his father owns 350 acres adjoining; the two properties are worked as one place; last year he did not cultivate much land, because he has fully two years crop stored in his shed wanting a market; up to last year he cultivated in hay, wheat, oats, and potatoes, from 60 to 80 acres; this year potatoes are scarce, and the price will be high, but he has only 3 acres in crop which will be poor because of the dry weather and the frost of five or six weeks ago; in ordinary years when the crops are good potatoes are not saleable; his father came on to the land in 1858; since then has purchased out several of the settlers in their vicinity, and in 1871 he made a purchase of some Crown land; there used to be many more settlers in and about Reidsdale who used to cultivate very extensively; of the 600 acres now held by his father and himself, fully 400 acres have been cultivated; the market was in the Araluen and Major's Creek diggings which were then populous; since the miners became dispersed there has been no market for produce, and many of the small settlers had to sell out as they had not space enough for cattle grazing; the prices given were, for the first 100 acres, in 1858, his father gave £8 per acre; the next purchase was the Government land; the other purchases ranged from £3 10s. to £6 per acre; the whole of the Reidsdale is very good, capable of growing any crop; about four years ago Mr. Patrick Allen gave £1,000 for about 360 acres of land in this district, near his property, at the head of the Jemaicumbene swamp; his fat cattle he usually sells to dealers, who take them away to market; they do not keep sheep at Reidsdale; the back boundary of Reidsdale on the east is the boundary of the Crown land, all forest reserve; the soil generally is very good; it is heavily timbered; all the land in the valley of the Little River above Monga is very good, but it is heavily timbered; it is the pick of the land; if a railway were made to Braidwood any of this land would be taken up if thrown open, but under existing conditions he does not think any one would purchase or select there; a railway would allow of the timber being enough to pay for the land; on the reserve on Bell's Creek there are about 3,000 acres, the whole of which is good grazing land, but not fit for cultivation; on this he made application for 400 acres under non-residential clause, and the application was refused because the land is within the population area of Araluen; he and several others are renting something over 7,000 acres of this and other land in the Araluen Valley on annual lease; obtains all his stores in Braidwood from the storekeepers; makes butter and sells in Braidwood; does not make bacon, but rears a number of store pigs which are bought by the coast buyers to be fed on the maize; Mr. Donald Grant, of Reidsdale mill, has informed him that he has an order from Rogers, in Goulburn, for 30,000 feet of mountain gum weekly, which is to be delivered at Tarrago at 10s. per hundred, from which he has to pay 5s. for carriage to Tarago; has another order from Ball, of Goulburn, for timber for railway stock, to be delivered at Tarago, at 12s.; this order he is carrying out, but the former he cannot touch except when out of other work; this is also for mountain gum.

RICHARD KENNEDY.

Braidwood, 16 April, 1891.

*Mr. R. Hassall* of Bellview, of Messrs. Hassall, Roberts, and Royds, owning large properties on Araluen and Jemaicumbene; last year the firm trucked 1,400 fat cattle to Melbourne, at Yass, also about 150 fat cattle were sold to go to Shoalhaven; also about 400 were sold to local butchers and consumed in the district; the average number despatched by train may be taken at 1,400, but in a good market the property could turn out many more, and many of those sold on the spot would also be sent away; with a railway station on the spot advantage could be taken of the markets, which are always fluctuating, resulting in very much larger despatches than are now made; the product of the district would be largely enhanced, as the turn over would be more rapid; it would be more profitable to send down beasts that are not quite fat in order to get a market that happened to be good, and place fresh ones in the paddocks, then as now we are obliged to do, keep the cattle until they are prime; in addition we sent away fifty fat bullocks to Sydney from Tarago; ordinarily he has been in the habit of sending the cattle intended for Sydney *via* Marulan; would point out that no trade can be done in calves until a railway is brought nearer to the runs; and that the necessity for bringing up the calves renders the cows unserviceable for fattening or any purpose for the space of a year; calves cannot be travelled 30 miles to be trucked; they would not fetch anything after the journey, but if they could be trucked on the spot they would fetch prices in Sydney, and the cows could be fattened, and within three months be fit for the butcher; the same applies to lambs; hence with a railway as far as Braidwood the outturn from the district in stock alone would be very much greater than is now the case; in explanation of the trucking being now done at Marulan and Yass, instead of at Tarago, there is in the first place the objection of travelling stock on a macadamised road; then that to send stock 30 miles by road entails the same quantity of preparation for camping and driving as for three times or more of the same distance; the extra expense for the extra distance travelled is trifling, and there is a positive saving effected in trainage; it is his firm conviction that if the railway be extended to Braidwood all stock of the district will be trucked there; he considers that his present outturn of 1,950 fat cattle yearly would be increased by 500, if the railway is brought to Braidwood.

R. HASSALL.

Braidwood, 17 April, 1891.

*Mr. William Blackwood Bruce*, storekeeper of Araluen, has been engaged in this business for seven years consecutively, but prior to that he had kept a hotel in Araluen and a store; has been in Araluen for thirty-four years; at one time he owned 400 acres on Back Creek, in parish of Bettywynd; this he sold to Messrs. Hassell, Roberts, and Royds: obtains all his supplies for his store from Moruya; it is 35 miles from Araluen; Braidwood is 17 miles; flour, bran, and pollard he obtains now and for the last six months from Wagga Wagga, but previous to that from Goulburn, by rail through Tarago; all other supplies are brought from Sydney to Moruya; the cost of carriage is from Sydney to Moruya 20s., and from Moruya to Araluen 50s., total £3 10s. per ton in all; does not send anything from Araluen to Moruya, so these charges are exclusive of any for back loading; does not get any goods from Sydney *via* Tarago, so he cannot tell what the cost would be; procures his supplies of maize principally locally; within a radius of 20 miles there is a large quantity of maize grown but not anything like enough for the consumption; the claim horses and the horses used by business people make up a very large consumption in maize; the supplies of maize are procured mostly from Moruya, locally grown there; but at present, as has often occurred before, maize is procured from Sydney both *via* sea through Moruya and by rail and road through Tarago; it is now brought, within the last week through Tarago; he is now paying 20s. per ton for carriage of flour, bran, and pollard from Tarago to Araluen and has paid this charge during the last two years; the carrier, Tom Cooper, trading entirely on his own account in maize for the last two years is now supplying Araluen and Braidwood with maize; has within the last two or three weeks, been bringing it by rail through Tarago, probably on account of the difficulties against shipping at Moruya; three years ago he himself brought seven truck loads with maize from Sydney, which he brought through Tarago, because he found this to be cheaper than by the sea route; a considerable trade in wattle has been done in wattle bark, grown principally on the Moruya side of Araluen, amounting to more than 100 tons; this also goes both ways, but the greater part goes by Moruya; it can be taken quicker to market *via* Tarago, and the time of transport can be gauged to a day, but by the sea route the time is long and uncertain; dairy produce, such as butter, cheese, and bacon is procured in the neighbourhood and from Reidsdale, similarly with chaff and hay; some portion of the common land in Araluen West would make very good agricultural land—all is good grazing land; the passenger traffic all goes *via* Tarago; has hardly ever known any one to go by steamer; the big flood was on 11th February, 1860; there was much destruction caused; engines and works were covered over, and numbers of men were thrown out of work temporarily; but the main cause of the desertion of the gold-field is that the workable ground left still untouched is deep, requiring expenditure of capital in drainage works, and is quite beyond the power of the ordinary miner, either individually or in parties; there are large areas of land that have never been touched, because the water prevented the bottom from being reached; there are now five parties of men at work, employing a large number of men and horses which are given in the statistics; these are all working with races for draining the ground; there are three main races; the population has diminished in the last ten years; all the miners have cattle running on the common land; some hold considerable numbers and are engaged entirely in cattle grazing and dealing.

W. B. BRUCE.

Braidwood, 17 April, 1891.

*Mr. William Hennessey*, mining on Major's Creek; working on alluvial ground, washing in the creek; every flood brings down a fresh supply of gold; he is working near the Major's Creek crushing machinery; the gold is very fine mixed with black sand; has to be separated with amalgam; there is a place near the road bridge which has been yielding gold over and over again for years; this happens throughout the creek; there are about forty men who constantly find employment; and now this present rain will wash the dirt they have broken down during the dry weather and enable to make up for the time lost; the

Long

Long Flat is being worked by twenty men who obtain water from a race, the property of O'Hare, from the head of Back Creek; in Major's Creek, wherever you can bring water to bear upon it, payable gold can be washed out; during rain only can this now be done; but if a race could be worked on to the land, very large quantities of gold could be got; Mr. Forsyth's Mine at Wyanbene is now stopped, but the show was very promising, as the assays were very rich in silver; in the same neighbourhood is Krawaree and Snowball; there are about sixteen men at present working at the latter place; the approach to these places will always be through Braidwood; two applications are in by two different companies to mine on Snowball; they propose to cut a bar in the creek called the Kurrumbene Creek, which will allow of a flat being worked; this is expected to be very rich; this place will probably find employment for a number of men; Heslington's party is cutting a race on a tributary of the Kurrumbene to work alluvial; all the Wyanbene and Krawaree country is well stocked with cattle which must all travel through Braidwood; they fatten very well there.

WILLIAM HENNESSEY.

(25.)

Braidwood, 17 April, 1891.

*Mr. Robert Maddrell*, of Bedervale, near Braidwood, owning large properties in the neighbourhood; the sale of his fat bullocks on average of the past two years has been 750; the sales of last year were 650, and of the year before 850; most of these have been bought on the ground by Mr. O'Neill, and forwarded to Yass, and then by train; always hitherto he has sold on the place; has not sent a beast to market on his own account yet; a few of the cattle have been sent to Sydney; but the principal buyer, O'Neill, has sent his purchases to Melbourne; the route to Sydney has been during the past two years by Tarago, but previously it was *via* Marulan; he believes that all stock will be trucked at Braidwood, if the line is brought to this point, because the fat stock lose so much in condition in travelling by road; his property is divided thus; he has altogether 44 tenants, of those 26 are farmers, and 18 are farmers and graziers; of the 26 farmers, their holdings average from 10 to 220 acres each, and the holdings of the 18 graziers and farmers average from 26 acres to 6,600 acres; this large acreage is explained by the fact of two large portions of land being leased to his two sons; the whole of the land leased amounts to 22,000 acres, and the remaining 11,000 acres he holds on his own account, and on this he fattens stock; a good deal of the tenants' land has been cleared and farmed, but cultivation has been discontinued owing to there being no market for the produce; much of the land formerly under cultivation is now used for dairying and grazing purposes; the fact is that, during the continuance of the extensive mining operations in Araluen, Major's Creek, Bell's Paddock, and Little River, the market afforded by the assembled population induced cultivation, and the inference is that a radical improvement in the communications, bringing the districts nearer to the markets of the Colony, will again bring cultivation into practice: the land now under cultivation on his property does not amount to more than one-tenth of the area that was formerly cultivated, owing to the market for the produce having been lost; all the farms into which his property has been divided are let; in fact, if he subdivided the land that he now holds, he could put 50 more farming tenants on the estate, judging from the applications made to him for farms; in reply to his frequently urging the present tenants to cultivate more extensively, he is told that it cannot be made to pay; it seems that the employment afforded by contracting, carrying, and mining gives a more certain means of enabling the people to live and pay their rents than cultivation of the land; he certainly would subdivide his property and increase the number of tenantry, if the railway were brought to Braidwood, but not otherwise, as the rents he would obtain in that event would pay him better than the profit gained from grazing; he believes from his experience of the matter that the large land owners in this district might, as in his own case, let large areas of their land in farms; and there can be doubt but that this will be done if the railway is built, simply because it will pay better; would point that an area of 1,500 acres on the Jemaicumbene Creek is now in the hands of one tenant; formerly there were several tenants on this land, all cultivating, but owing to the markets being lost all these farms have become merged into one; on the expiry of this lease he would redivide the land into farms, if inducement offered; would point out that a run of gold has been discovered on Reedy Creek, which passes through a portion of this land on Jemaicumbene, and several applications have been made to work it, but under the conditions of the lease he is debarred from permitting the operations; the creek is 2½ miles long, on the northern side of the swamp; gold has been traced in it from its source throughout, but the water and drift sand encountered would entail the use of machinery and application of capital; he believes that a large quantity of gold is here locked up; on the expiry of the lease he will allow works to be undertaken; mention has been made to him by several influential gentlemen in Sydney as to the prospects of a dead meat industry being payable from Braidwood on the connection of that place by railway; calculations have been made, taking the present market prices for fat stock and for meat in the carcase, showing that a substantial margin is left in favour of this business; under some conditions of the market it is likely that it could not be made to pay, but such conditions are not of frequent occurrence, and are being rendered less frequent than formerly by improvement in communications and the large supplies of stock coming forward; he is in a position to say that the industry would be widely supported, both locally and in Sydney, as this climate is a particularly favourable one for its prosecution; the rail being brought to the place would enable the small holders of stock, as well as the larger ones, to dispense with the middleman, to whom some portion of the profits now go, by sending direct to the market smaller lots of stock and more frequently than is now possible, and enabling holders to take immediate advantage of the fluctuations of the markets; the stock operated on in this way would be cattle, sheep, pigs, and poultry; at present there are no calves sent to Sydney; some years ago a trade was done in them, but the distance to Tarago by road reduced the condition of the calves so much that the business had to be discontinued; it would certainly be revived, since the prices obtainable are very remunerative.

ROBT. MADDRELL.

(26.)

Braidwood, 17 April, 1891.

*Mr. Ernest Grenenger*, tanner in Braidwood, has been established here for thirty-two years. Obtains some hides in this locality, but also from Sydney, because the district cannot supply all his requirements; uses up between fifty and sixty hides weekly; the leather is sent all over the country as far

far as Hay, and to Sydney, but not on the Northern line; the Goulburn tanners only manufacture leather for their own use; there is another tannery in Braidwood; have sent leather down to the coast; but there are plenty of tanneries down there, as the water is plentiful along the coast; his bark is all procured within this district from as far as Araluen; the production is greater than the consumption locally; large quantities of bark pass through Braidwood to the rail at Tarrago from even below Araluen; the Goulburn tanneries would probably consume 100 or more cattle hides weekly each; he believes that they obtain their bark from the Crookwell direction, as most of the wattle sent from here goes to Sydney; the construction of the railway to Braidwood will enable him to enlarge his trade considerably, because his production would cost very much less as the carriage of the hides would be cheaper, and he has an unlimited market in Sydney for the leather produced; the quicker return for the money would enable him to provide more material, and possibly consume all the wattle bark which now passes through to Sydney; his total tonnage imported from Sydney was about 24 tons of raw hides, and he despatched by train and steamer about 40 tons of leather; he sends by steamer whenever he can catch a team; he pays 20s. per ton carriage to Nelligen, and the steamer freight is another 20s. per ton; carriage to Tarago is 10s. per ton, and the other way from Tarago to Braidwood is 20s. per ton; carriage from Sydney to Braidwood is from £2 to £2 10s. per ton by sea; the principal market for leather is in Sydney; there is a difference in the rail charges for manufactured and raw material, but not by sea; from Sydney to Braidwood by sea the hides would cost £3 10s. per ton, and by rail £1 14s. 8d.; but the cost of carriage of the leather by sea would be £2 per ton to Sydney, and by rail £4 6s; the leather returned is but one-third of the weight of the hides brought up; the disadvantage of the steamer route is that the steamer arrives in Sydney on Tuesday morning, on the day when the leather sales take place, and very seldom can the sale be made on that day, so that one week is lost, but if a steamer is just missed, owing to mishap or bad weather on the road 2 weeks are lost, whereas by the train no time is lost at all.

E. GRENGER.

(27.)

Braidwood, 17 April, 1891.

*Mr. R. M. Higgins*, storekeeper in Braidwood; has been in business here a little over fifteen years, but has been in the district for about thirty years; deals in general stores of all kinds; his supplies come principally *via* Nelligen; by rail some classes of goods are, however, brought very much cheaper than by steamer; the cartage from Nelligen to Braidwood is £2 and £1 for back carriage; cartage from Tarago to Braidwood is £1, and the back carriage is 10s. to 12s. per ton; the principal item produced in the district and sent away is butter, the greater part of which is sent by rail by parcel rate, which is 4s. 6d. for parcels under 80 lb., and 6s. 6d. over 80 lb. up to 100 lb; has sent 1,530 lb. during the first three months of this year, but during the winter months not so much is sent, and generally in keg by ordinary goods rates; at present he sends butter only to Sydney, though some of the traders in town do despatch to such places as Narrandera; the train here would enable him to carry on a regular trade with places along the lines not only in butter but in other lines of produce; Sydney being the only market, and one in which the prices are always lower than anywhere else, the connection by railway would enable him to deal with other markets; so much handling would be saved, and the expense in handling and carting to Tarago; there is little profit in the trade in produce; the production of produce would necessarily be very much increased, since the storekeepers can only buy a limited quantity, and the farms are capable of producing very much more than they do at present; the average quantity of goods he brings up from Nelligen is 10 to 15 tons per month; the measurement rates are charged by the steamers on all bulky articles, such as drapery, tea, furniture, and several lines in the grocery trade, boots and shoes, &c.; it is only the heavy articles that are rated at dead weight; Bodalla cheese often comes here from Sydney by rail, as the quality is superior to the local article; flour he procures from Goulburn, as the local mill is not made up of the modern appliances; the flour imported from Goulburn for Braidwood would amount to 35 to 40 tons per month, but the supply to Araluen also passes through Braidwood, making the total (say) 50 tons in all; the trade of Narriga is done through Braidwood mostly, as the direct road between Narriga and Tarago is very bad; the bark he had from Narriga had to be brought *via* Braidwood, and it is now being taken by the same route; at present there is no other way for the passenger traffic to get from Narriga except *via* Braidwood, as there is a coach on this road; bacon is largely produced here, which is all sent to Sydney, and the trade in which would be greatly fostered by the railway being built.

R. M. HIGGINS.

(28.)

Braidwood, 17 April, 1891.

*Mr. John William Bunn*, grazier, now census enumerator, has received permission from the Government Statistician to supply certain details of the population lately collected; the municipality of Braidwood, comprising 9 square miles, contains a population of 1,509 persons; in the town of Braidwood there are 1,380 persons; in 1881 the population of the town was 1,066; in Jemaicumbene the population is 242; in Major's Creek the population is 427.

J. W. BUNN.

The number of dwelling-houses in the municipality is 289 inhabited, and uninhabited 29, and 4 in process of being built.—J.W.B.

(29.)

Braidwood, 18 April, 1891.

*Mr. Mark William Lyons, J.P.*, farmer and grazier at Reidsdale, owning 600 acres freehold, acquired this by purchase, from time to time; settled in Reidsdale first about 15 or 16 years ago; in those days there were many more settlers in Reidsdale than now; the farms were too small there—of 50 and 100 acres; there was even then a considerable population in Araluen, but not so large as in former years; these formed the market, which was supplied by the small farmers in Reidsdale and elsewhere

where; when the population became dispersed, the small farms could not keep a family, and the farmer could not even find a sale for his produce; wheat only could be sold; of his own 600 acres, having between 200 and 300 acres clear and fit for the plough, he cultivates only about 20 acres; of the last crop of hay he has only been able to sell 4 tons; if there were a railway to Braidwood, the land east of Reidsdale, which is all forest reserve, would all be worth selecting for the timber alone, if it were thrown open; the land is mostly of very good quality; the land on the common, on the Bell's Creek, would all be selected if available; it is all good grazing land; it would be useful to settlers who have other land at Reidsdale, for use as grass paddocks; he turns off about forty head of fat cattle every year—always sells to dealers; it would not pay to send such small lots to Sydney to the market direct; it would pay if the railway were at Braidwood, as the cost of driving them to Tarago would be saved; pigs and poultry would also be sent away, and fat calves; the cost of carriage to Tarago is prohibitive; there must have been more than twice the number of settlers and families at Reidsdale twenty years ago than now; nearly all the farmers now there have bought up one or more settlers who have left; the last purchase he made was 100 acres at £5 per acre, five years ago; frosts are rare in summer; there was one about two months ago.

MARK WILLIAM LYONS.

---

(30.)

Braidwood, 18 April, 1891.

*Mr. Matthew Gallagher*, farmer, at M'Donell's Creek, in parish Durran Durra; owns 800 acres freehold; renting 35 acres of Church and School land; cultivating 35 acres in wheat, hay, and sometimes barley; his farm is  $7\frac{1}{2}$  miles from Braidwood and 3 miles from Larbert by going direct; grazes cattle—about 200; turns out 50 fat cattle yearly; sells to dealers, and by auction at the Braidwood sales; has never travelled his stock, nor sent to Goulburn or Sydney market. To do so would oblige him to make arrangements for driving and camping, and the profits might not pay for all this, having to be distributed over such small numbers; he is milking fifty cows daily, and selling the butter in Braidwood; is now fattening thirteen pigs; makes about 14 cwt. of bacon every year; sells that also in Braidwood; he bought about a year ago a neighbour's farm of  $223\frac{1}{2}$  acres, at £4 12s. per acre, by auction; this was rather above the general value of the land in his district; all the land about there is taken up; is paying £12 per annum for 35 acres as rent, which was fixed by auction; this is Church and School land; all his neighbours graze cattle and cultivate about the same as himself; the benefit that will be derived by him and his neighbours from the railway will be in enabling them to send their stock and produce to the markets of the Metropolis and Goulburn, and to obtain cash in payment, which they cannot do now from the storekeepers, and also to send to the markets their produce in calves, poultry, and other things which are not now saleable; has been about fifteen years in his present neighbourhood, but for the past thirty years has been in the Braidwood district; has another place at Tudor Valley, close to W. Taylor's place; this is 80 acres; and in addition has some routed land; he runs cattle there, and works it from his place in Durran Durra.

MATTHEW GALLAGHAN.

## THE PROPOSED RAILWAY FROM TARAGO TO BRAIDWOOD.

### LIST OF APPENDICES.

<p>A—Details of townships.          B—List of Places of Worship.          C—Coaching traffic between Braidwood and Tarago.          D—List of public schools. ### APPENDIX A.

#### DETAILS of Townships.

(Returns supplied by the Railway League.)

#### TOWNSHIP OF BELL'S CREEK, PARISH SEYMOUR.

Number of dwelling-houses, 11.  
 Population, 90.  
 Tradesmen's business places, 2.  
 Places of worship, 1—Union Church.  
 Public buildings—Public school and post office.

#### TOWNSHIP OF ARALUEN, PARISH ARALUEN.

Number of dwelling-houses, 121.  
 Population (including Redbank, Newtown, and Araluca West), 628.  
 Tradesmen's business places, 16.  
 Places of worship—Church of England, Roman Catholic, and Union.  
 Public buildings—Court-house, lock-up, police residence, oddfellows' hall, institute, public school, post, telegraph, and money order office.  
 Other buildings—Convent and Convent School.

#### TOWNSHIP OF JEMAUMBENE, PARISH BOYLE.

Number of dwelling-houses, 50.  
 Population, 120.  
 Tradesmen's business places, 2.  
 Places of worship, 2.  
 Places of amusement, 1.  
 Public buildings—Public school and post office.  
 Other buildings—Convent and Convent school.

#### TOWNSHIP OF NARRIGA, PARISH MEANGORA.

Number of dwelling-houses, 19.  
 Population, 126.  
 Tradesmen's places of business, 2.  
 Places of worship, 1.  
 Public buildings—Public school, post office.

#### TOWNSHIP OF BORO, PARISH BARNETT.

Number of dwelling-houses, 2.  
 Population, 18.  
 Places of worship, 1.  
 Public buildings—Public school, post office.

#### TOWN OF BRAIDWOOD.

<p>Church of England with school house and parsonage.          Roman Catholic Church with school house and presbtery.          Presbyterian Church.          Wesleyan Church.          Baptist Church.          Convent—166 scholars, 8 teachers,          Superior public school—244 scholars, master, and 4 other          teachers.          Hospital—matron and wardman.          Institute.          Court-house.          Police station and lock-up, superintendent, and 4 police.          Gaol—2 warders.          Post and telegraph office.          Pooley's line of coaches.          Maloney's line of coaches.          Bank of New South Wales.</p>	<p>Commercial Bank.          Two solicitor's offices.          Oddfellows' hall.          Skating rink.          Two coach factories.          Seven forges.          Two auction marts.          Lemonade factory.          Two tanneries.          One boot factory.          Two flour mills.          Printing office.          Ten hotels.          Forty-nine shops (27 not included in dwellings).          Two hundred and five dwellings.          Population, 1,380, within town boundary.</p>
---	--

#### TOWNSHIP OF SERGEANT'S POINT, PARISH BUDAWANG.

Number of dwellings, 12.  
 Population, 60.  
 Tradesmen's places of business, 4.  
 Places of worship, 3.  
 Public buildings—Public school, police and mining registrar's quarters, post office.  
 Places of amusement, 1.

TOWNSHIP OF ELDRINGTON (MAJOR'S CREEK), PARISH ELDRINGTON.

Number of dwellings, 80.  
 Population, 427.  
 Tradesmen's places of business, 14.  
 Places of worship, 3.  
 Public buildings—Public school and residence, police barracks and lock-up, post and telegraph office, mining registrar's office.  
 Places of amusement, 2.

Market gardens.....	15 "
Other crops .....	59 "
	<hr/>
Total area under crop.....	4,380 acres.
Permanent artificial grasses.....	104 "

## APPENDIX J.

LIVE Stock in Braidwood Electorate on March 31, 1890.

*(Statistical Register.)*

Horses .....	3,881
Sheep.....	67,226
Swine .....	1,843
Cattle (ordinary).....	26,992
Dairy cows.....	3,200

## APPENDIX K.

SCHOOLS in Braidwood Electorate during the year 1889.

*(Partly from Statistical Register.)*

Private schools—number .....	6
Number of teachers .....	18
"    scholars.....	540
Public schools—number .....	32
Number of scholars.....	1,218
Total number of scholars on register in public and private schools..	1,758

## APPENDIX L.

NUMBER of Electors on roll in Braidwood Electoral District.

At election of 1889 .....	1,609
"    for 1891-92 .....	1,554

APPENDIX M.

GOLD PRODUCTION.

Sent away by escort from Braidwood, during 1889—5,774 oz. : value, £22,110.  
 This was the largest quantity recorded during 1889 for the southern division—the next being Adelong, whence 2,804 oz., value £10,995 were sent away; and the total from the division having been 11,364 oz., value £43,875.  
 Sent away by escort from Braidwood, during 1890—7,619 oz.  
 These figures are exclusive of quantities sent by other ways than by escort. The total output of gold is probably double the quantities herein given.

APPENDIX N.

RETURN OF RAINFALL.

(Extract from Meteorological Records.)

Bedervale is the residence of R. Maddrell, Esq., a few miles from Braidwood.

APPENDIX O.

List of parishes comprised by the area to be served by the proposed railway from Tarago to Braidwood, with the area of Crown land in each.

COUNTY OF MURRAY.

Parishes.	Acres of Crown Land.
Barnet .....	10,300
Larbert .....	8,370
Fairy Meadow .....	2,270
Mulloon .....	7,010
Warri .....	14,050
Palerang .....	17,920
Jinglemoney .....	20,000
Jimeroo .....	7,760
Ollalulla .....	10,710
Oronnear .....	17,250
Krawarree .....	10,920
(11 parishes) Total .....	126,560 acres.

COUNTY OF DAMPIER.

Parishes.	Acres of Crown Lands.
Curramdene .....	17,760
Jinden .....	13,000
Wyanbene .....	20,020
(3 parishes) Total .....	50,780 acres.

COUNTY OF ST. VINCENT.

Parishes.	Acres of Crown Lands.	
Tallagandra .....	25,170	
Bendoura .....	5,250	
Bettowynd .....	15,085	
Araluen .....	17,430	
Seymour .....	Nil.	
Elrington .....	4,170	
Monga .....	23,810	
Coghill .....	1,200	
Milo .....	21,560	
Boyle .....	673	Crown land.
Percy .....	20,951	} Church and School land in the three (3) parishes—actuals.
Bruce .....		
Braidwood .....	2,120	
Budawang .....	16,400	
Mongarlowe .....	25,260	
Durrar Durra .....	3,500	
Wog Wog .....	18,460	
Marlowe .....	9,890	Summary.
Corang .....	47,370	County Murray..... 126,560 acres.
Meangora .....	19,480	County Dampier ... 50,780 "
Jerricknorra .....	11,150	County St. Vincent 325,019 "
Sassafras .....	22,290	Total ..... 502,359
Columnburra .....	13,800	
(23 parishes) Total .....	325,019 acres.	

These areas, excepting Church and School lands, have been computed by scaling from the parish maps, and they are therefore approximately correct only.—S.H.A.

APPENDIX P.

APPENDIX Q.

MINING.—A summary of the reports.  
PARISH BUDAWANG.

THERE are water races in working order extending over 60 miles in length, which will be in use when rainfall supplies the water for washing alluvial ground for gold.

On the Little River—ground sluicing for gold—

Number of men engaged .....	125
Yield of gold during 1890 .....	1,025 ounces.
Value of machinery .....	£2,500

The Day Dawn Gold-mining Company—

Quartz reef—Depth of main shaft .....	205 feet.
Yield of gold from January 1 to April 20, 1891, per month .....	120 ounces.
Cost of machinery .....	£2,000

\* Probably an error. Some holdings have been included in Durrant Durra. † The bulk of the population of these townships is given in the statistics of the districts.

NOTE.—I consider that this sum total would, by a proper census, be raised to 6,000, since a number of persons have refused to supply any details; and in a mining district there must be a considerable floating population which cannot be taken count of.

When fully opened out this mine will keep 50 men employed.

There are numerous reefs on which more or less work has been done, but of these four have been systematically worked to depths on payable gold, and have been stopped for lack of capital.

#### PARISH ARALUEN.

There are six parties at work washing alluvial, employing 84 men and 37 horses and drays. The cost of the work done in races is estimated at £10,000. The yield of gold during last year (1890) was 2,675 ounces.

#### PARISH ELRINGTON.

On Jemaicumbenc Swamp Messrs. Smith & Co. are working alluvial for gold—

Number of men employed .....	20
Cost of machinery .....	£35
Wages, &c., paid weekly .....	£50

On Major's Creek the principal works are the property of the Major's Creek Gold-mining Company comprising extensive crushing and gold-saving apparatus and chlorination works. There are seven proved reefs on the property. The work now being done is confined to sinking the main shaft to provide ore for the plant which is capable of keeping 150 men in employment. The company have spent about £45,000 on works and machinery.

In addition to the above there are four proved reefs on the same field which will be worked simultaneously with those of the Major's Creek Company.

There are now about twenty parties comprising about 50 men who are finding employment in washing gold on the Major's Creek Company's land, paying for license to the Company.

On Long Flat there are about 25 or 30 men at work on alluvial.

The alluvial mining both on Major's Creek and on Long Flat is dependent now mostly on the rainfall for supply of water, so the population actually engaged is fluctuating.

#### PARISH BOYLE.

On Jemaicumbene Creek a syndicate is working alluvial, managed by Mr. John Welsh; number of hands employed, 22.

Messrs. Bennet and Bowman are using a water race 5 miles long; cost of works, £500; number of men employed, 2.

#### PARISH SEYMOUR.

On Bell's Creek—Quartz reefing.—There are twenty-nine distinct reefs that have been proved to be auriferous and payable down to and below water level, but capital is not forthcoming for further work. Cost of machinery on the ground, £2,000; number of hands employed, a few.

#### PARISH JINGLEMONEY.

Mr. Denis M'Grath is ground sluicing for gold. A water race 9 miles long is being used, 1 man only employed.

Messrs. Bond and Payne are also ground sluicing. A water race 6 miles long is in use; number of men employed, 3.

#### PARISH BORO.

Mr. J. H. Blatchford is prospecting for silver, employing 4 men. He estimates the value of his machinery at £1,200.

#### PARISH MARLOWE.

The Horse Shoe Bend alluvial gold mine, 170 acre lease. The work in progress is directing the water of the Shoalhaven river into a race 4 miles long. The company was formed to spend £15,000, but additional ground has been taken up; number of hands employed, 30.

#### PARISH MENANGORA.

The Sandy Point and Gibraltar Gold-mining Company, 200 acre lease. A water race is being cut that will be 24 miles in length, and will cost £12,000. The machinery is valued at £8,000. Number of hands employed, 20.

The Eudrich River Gold-mining Company, 150 acre lease. Preparations are being made for ground sluicing. A dam and race 17 miles long are being constructed at a cost of £20,000. Number of hands employed, 20; cost of machinery, £10,000.

#### PARISH OALLEN.

The Golden Terrace Gold-mining Company, 525 acre lease. A water race is being cut that will be 24 miles long, and will cost £10,000. The machinery is valued at £14,000; number of men employed, 50.

#### PARISH PERCY.

Mr. Peters is using a water race 1 mile long; value of work done is £100. Number of men employed, 2.

#### PARISH JERRICKNORRA.

The Gladstone Quartz Reef Gold-mining Co., Messrs. O'Neill Bros., 10 acre lease.

Number of hands employed .....	4
Value of machinery .....	£200

There are in addition four parties of men working water races, aggregating 56 miles in length for ground sluicing for gold. £10,000 has been spent during the past year, and £20,000 will be required in addition to complete the works.

Number of hands employed .....	50
--------------------------------	----

#### PARISHES KEAWAREE AND WYANBENE.

The operations in these parishes are chiefly as yet confined to prospecting. The indications are very promising both in alluvial and in quartz-reefing, and some capital is being expended on race cutting and other preparatory works.

#### PARISH MONGA.

Messrs. M'Rae and party are ground sluicing on Warrambucca Creek. They have sunk shafts and proved the ground to be payable. Water raised by engine power is being used.

Number of men employed .....	6
Value of work done—about .....	£50
Value of machinery—about .....	£100

There are 3 other men who have been working on the same creek washing for gold for about two years past, and have been making fair wages.

### APPENDIX R.

#### SAW MILLING.—A summary of the reports.

##### PARISH SEYMOUR.

Messrs. Grant and Co. are cutting messmate, mountain ash, mountain gum, white top, and stringy bark, employing 7 men at the mill, and 2 men in carrying. The forest is very extensive and practically inexhaustible. The present output is 4,000 to 5,000 feet per week.

PARISH

PARISH MONGA.

Mr. Hugh M'Rae.—The estimated value of machinery is £2,000; employing 5 hands, and turning out 3,000 feet per week.

Mr. George M'Rae.—The estimated value of machinery is £300; employing 5 hands, and turning out 6,000 per week.

PARISH TALLAGANDA.

Mr. George Crandell is employing 6 hands, and turning out 2,000 feet weekly of mountain ash, mountain gum, messmate, and silver top. Was lately offered a contract to supply £1,000 worth delivered at Goulburn, but could not take it up as the length of carriage to Tarago would have cost too much.

PARISH OLLALULLA.

Mr. H. Thompson has been obliged to close this mill as he cannot continue to supply timber at the rates offered, owing to the length of road carriage to the railway. His machinery cost £500.

APPENDIX S.

A LETTER from C. B. Payne, Esq., late of Braidwood.

Dear Sir,

Waverley, 18 April, 1891.

I quite forgot to mention when speaking to you that when I was in business in Braidwood I sent a large quantity of butter by rail to Hay, Junee, Narranderra, Young, Cooma, and many other places, also bacon. This had to go by coach to Tarago. If the train were into Braidwood this trade would be greatly increased. The coach carriage took a lot of the profit off. If the train ran into Braidwood the carriage would be so much less, which would give the storkeepers a better chance to compete with other markets.

I am, &c.,

C. B. PAYNE.

Stanley Alexander, Esq.

APPENDIX T.

RAILWAY, Road, and Steamer Charges for transport of Goods between Sydney and Braidwood.

	Miles.	Special Classes.			Numeral Classes.			Live Stock.		Hay, in 6-ton loads.	Straw, Chaff, Fodder, in 6-ton loads.	ON UP JOURNEY.		
		Miscellaneous, in 6-ton loads.	A.	B.	1st.	2nd.	3rd.	Sheep.	Cattle.			Grain, flour, bran, pollard, potatoes, in 6-ton loads.	1st Sept. to 31st Jan.	1 Feb. to 31st Aug.

From Braidwood to Nelligen	20s. " "

BY STEAMER.

From Sydney to ports (dead weight)	16s. per ton.
" " (measurement)	20s. per ton of 40 cubic feet.

APPENDIX U.

RAILWAY Committee's Report to Stanley Alexander, Esq., Examiner of Public Works Proposals.

Sir,

We have much pleasure in handing you the statistics and other information which we have had collected, showing the present resources of the district and its further capabilities on being placed in direct railway communication with other parts of the Colony.

You will have been able to form for yourself, from your personal visits to different portions of the district, a pretty good idea of the character of the country, and its facilities for supporting a large population, and helping to promote the general welfare of the Colony.

It has been shown to you, by the evidence you have taken from the residents of the adjacent coast districts, that the proposed railway would be likely to draw a considerable amount of traffic to be distributed from Goulburn through the various Southern districts which now goes by sea to Sydney, especially as some of the harbours on the coast are becoming altogether unnavigable.

The returns of our trade from Tarago show a very material increase every year, without showing any falling off in our trade via Nelligen, nearly the whole of which will be diverted to Braidwood on the completion of the line.

It is somewhat difficult to obtain the exact figures as to the present trade via Nelligen, as the ship-owners naturally refuse to give information as to the annual tonnage. But from the number of carriers (twenty-eight in all) having teams on the several roads between Braidwood and the seaports, and from the tonnage of goods received by the business people who have sent in returns, it may be estimated at not less than 3,000 tons per annum inwards to Braidwood, and the return traffic, of which we have no account, must make a considerable addition to this.

There are no official returns procurable of the number of passengers inwards to Tarago by rail, but the coaching returns sent in to you may be accepted by you as thoroughly reliable, being taken from the books of the coach proprietors, which show the number both ways for 1890 to be 8,756, against 5,600 for the previous year, giving an increase of 3,156 passengers. This does not include passengers who travel otherwise than by the regular lines of coaches.

We may point out that our gold-mining resources, though only partially developed as yet, compare favourably with any of the gold-producing districts in the Colony. The official return of the gold won for 1890 being 7,619 ounces, the value of about £30,000; this is taken only from the Mint returns, and would be found much greater if the amount sent down privately and not by escort could be ascertained. There are extensive mining works in course of construction, which, in the aggregate, have had an expenditure upon them of, in round numbers, some £50,000, and which will require half as much more capital to complete, but which, when finished, will most probably double the gold yield as shown in the returns quoted.

As a pastoral district we have always been noted for the excellence of our fat stock and the fertility of our grasses, which is to be attributed mainly to the quality of the soil, but principally to the moisture of our climate. As a proof of our pastoral capabilities, we may point out that we help largely to supply the dairymen's requirements on the coast with springing heifers, and last year there were over 4,000 fat cattle sent from here to Melbourne, besides those which were sent to Sydney and the adjoining districts.

Our climate is eminently suited for the growths of all classes of English products, such as wheat, oats, barley, potatoes, and all kinds of vegetables and fruit. At present our farmers do little more than supply local requirements (excepting fruit, and some items in dairying, which under present conditions are sent away to other places in small quantities), but if an outside market were opened up to them, the extent of new land that would be tilled, or old tilled land recropped, would be incalculable, for as a fact, if the returns of the period between 1868 and 1870 are referred to, it will be seen that when we had a large local consumption the breadth of land under tillage in this district was surpassed by only two or three districts in the Colony. So much for our capacity for increased agricultural production.

And lastly, we can with confidence assert that our timber resources are almost untouched, and that the impenetrable forests which will be opened up by the extension of the line to Braidwood will supply timber for railway and house-building purposes for many years to come. As a matter of fact, the timber of the rivers accessible to the proposed railway terminus has been for many years past hauled for miles to the mills, thence sent by sea to Sydney, and transported by rail to different parts of the Southern Line, and a great proportion on to the Cooma Railway Line, not more than 30 miles distant from Braidwood.

Signed on behalf of the Braidwood Railway League,—  
 AUSTIN CHAPMAN,  
 Honorary Secretary.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

## TRAMWAY FROM THIRLMERE RAILWAY STATION TO VANDERVILLE, OR THE OAKS TOWNSHIP.

(REPORT OF MR. E. B. PRICE.)

*Ordered by the Legislative Assembly to be printed, 26 May, 1891.*

Mr. E. B. Price to The Under Secretary for Public Works.

Sir,

12 May, 1891.

I have the honor to submit the following report on the proposal to construct a tramway from Thirlmere Railway Station to Vanderville, or the Oaks Township.

The name "The Oaks" is also applied generally to the elevated district along the upper portion of Werriberri Creek, a district raised about 1,000 feet above sea-level, and more or less cut off by a precipitous rise from the lower country about Camden and Picton.

The soil is generally of a rich clay nature, and when drained and cultivated produces good root-crops and maize.

Some considerable orchards have lately been planted near Vanderville, where the soil is not so heavy, and is well suited for fruit.

At present very little agriculture is gone in for; but most of the country is used for dairy-farming, though in old days large areas were under wheat.

I would estimate the elevated plateau of "The Oaks" to contain about 8,000 acres of fairly good land, much of which is cleared.

Between Thirlmere and the Oaks district the soil is generally lighter and better suited for fruit culture than anything else; very little of it has been cleared. The population along the proposed route is small. The number of farmhouses is about 20, exclusive of the village of Vanderville, which consists of about 20 cottages and one store.

I should estimate the population of the entire districts which would be benefited by the construction of this line as under 1,000, while that of the immediate neighbourhood is about 200.

The outlying districts which are included are Burragorang, and the Wollondilly Valley, Cox's River, and Werombi.

The main portion of the traffic from these districts now comes through the Oaks to Picton or Camden; in fact there is no other good road.

The Wollondilly and Cox's River Valleys are very fertile, and produce heavy crops of maize. They are, however, narrow, and very inaccessible, as the road from the Oaks has to cross the Burragorang Mountain, and descend by a zig-zag track for 1,500 feet.

These facts, together with the distance (10 miles to Burragorang, and 20 miles to Cox's River), would render it very improbable that any large traffic would ever come from these valleys to a tramway terminating at Vanderville.

The present traffic is in ordinary supplies which are carted from Picton—the export trade being chiefly bacon, poultry, and eggs; a little maize is also occasionally sent away; but, as a rule, it is all used for fattening pigs, which are purchased elsewhere, and brought to the valleys for fattening.

Many of these pigs come by rail to Picton, and might possibly be brought over the tramway, though I think it would be cheaper to drive them the extra few miles.

I have little doubt that the tramway would get the major portion of the traffic from these outlying districts; but I do not think it would assist much in their development, or greatly increase their exports, as the difficulty of road carriage would still be very great.

Much of Werombi—which lies on the tableland to the north of the Oaks—is fertile, and well suited for fruit culture and dairying.

A large portion of its traffic would, doubtless, go by the tramway terminating at Vanderville. Camden would, however, still get a good deal, and, in the event of a line being ever made to Mulgoa, some would go that way.

The present trade of the Oaks and the outlying districts is done with Picton and Camden—the greater part with Picton, as it is over 300 feet higher than Camden, and on the main line. The distance from Vanderville is about 10 miles in each case.

From the map it would appear that the line to Vanderville should form an extension of the Camder tramway. The precipitous rise in the country renders it impossible to get a good grade by this route. For the same reason the line could not go from Picton.

The promoters have, therefore, chosen the easiest route, by proposing to go to Thirlmere, which is 960 feet above sea level, Picton being 549, and Camden only about 220.

As no survey had ever been made of the proposed line, I spent some time in carefully examining the country with an aneroid to satisfy myself that a line could be got. (See levels on parish map.)

It was quite evident that no road tramway could be got, but that four-fifths of the line must be constructed as an ordinary light railway.

The only difficulty is the crossing of the valley of Crocodile Creek, the rise from which to the top of the ridge along which the Picton road runs being rather sudden.

If a light railway, with rather severe grades and curves is all that is necessary, then this can be got over without much expense by a grade of 1 in 25 (or, with heavier works, 1 in 30). (See red-line on parish map herewith.)

There would be considerable difficulty in getting a line with lighter grades, and probably one of the routes shown in dotted red would have to be adopted with heavy works.

Much of the line would be easy to construct, and for about 2 miles could be laid on the public road. Sleepers and ballast could be obtained locally, and little or no land would have to be purchased.

Near Thirlmere the line would pass through Government land for 2 miles, and the promoters have promised to give nearly the whole of the remainder.

I do not, however, think that taking the line throughout it could be constructed for less than £5,000 per mile, with 1 in 30 grades and 8-chain curves.

This would give £55,000 as the cost of the whole 11 miles. The interest on this sum would, at 4 per cent., amount to £2,200 per annum, which the line should earn, exclusive of working expenses, in order to prove remunerative.

The present trade of the district, as previously stated, is in bacon, poultry, eggs, timber, and a little milk, hay, fruit, and maize, together with oxide of iron, which is sent in bags to Melbourne for gas purifying purposes and as a flux.

I do not think the present traffic would pay even working expenses, which would certainly amount to nearly £2,000 a year to keep one locomotive in steam and pay station charges and maintenance; the traffic would, therefore, have to greatly develop.

Agricultural products, for reasons previously stated, would not much increase, except from the immediate neighbourhood of the line.

Fruit-growing would, doubtless, be gone in for on a larger scale, and much of the large area of Government land in the district is well suited for the purpose, although the greater part is exceedingly poor.

The timber trade would very much increase, not so much in sleepers and valuable timber—as the quantity of workable timber is limited—as in firewood, of which there is an enormous supply.

I have no doubt that a very large trade in sawn fuel would be established soon after the opening of the line, as already considerable quantities are being carted to Picton.

In my opinion, however, the main hope of the line paying a dividend lies in the iron-ore deposits. I cannot, therefore, do better than quote from Mr. Wilkinson's report of January 30th, 1891, on the "Iron-ore deposits of New South Wales." He writes:—

"The Picton deposits are situate 8 miles from that town, which is 53 miles from Sydney, and therefore 24 miles nearer than Mittagong. They consist of brown hematite with a little magnetic, and are precisely similar in origin to those of Mittagong, having been formed at the surface by ferruginous springs; consequently they cannot be expected to extend deep below the surface\*. Taking 25 feet as the probable average depth, I have estimated that on "The Oaks," the estate of Mr. J. Mitchell, M.P., they occupy an area of 5·7 acres, containing 562,590 tons of ore, and on "The Hermitage," the adjoining estate of Mr. W. G. Hayes, 799,470 tons within an area of 8·1 acres—or, reckoned together, a total of 1,362,060 tons.

"An average sample of ore, consisting chiefly of hard compact brown hematite from the largest deposit in Mr. Mitchell's estate, yielded the following result on analysis by Mr. Mingaye, F.C.S., Analyst to the Department of Mines:—

*Brown Hematite from near Picton.*

Moisture at 100° C.	...	...	...	...	...	1·77
Combined water	...	...	...	...	...	11·88

\* \* \* \* \*

“The existence of coal near Picton has not yet been proved, but seeing that the Hawkesbury sandstone formation occurs at the surface it is probable that the Mittagong coal-seams would be found at a depth of about 700 or 800 feet. In the event of coal not proving workable the ore could be taken to Mittagong for treatment.”

From this report it would appear that much of the ore is rich enough to work were smelting works established on a large scale within reasonable distance.

The quantity available is, however, not very great, when the expense of starting such works is considered.

It is probable that works will be established on the main line or near the Mittagong coal-seams, and the ore conveyed thereto, in which case a light line to Thirlmere would pay well so long as the iron deposits held out.

The conclusions I have arrived at after spending, at different times, altogether ten days in examining the districts of the Oaks, Burratorang, Warragamba, Cox's River, Picton, and Camden are,—

- (1.) That the back districts are very much handicapped, and will develop but slowly, without better means of communication.
- (2.) That the proposed light railway to Thirlmere would be of great benefit to the elevated country in the immediate neighbourhood of the Oaks, but would prove of little real service to the outlying districts and river valleys, partly owing to the direction the line takes, whereby the traffic is drawn away from the metropolis and a seaport, and partly from the fact that it will not do away with the heavy road carriage necessary to reach its terminus at Vanderville.
- (3.) That the present traffic would hardly pay working expenses, but that after a year or two a small return might be expected, chiefly from fuel.
- (4.) That if the iron ore deposits are worked on an extensive scale the line would pay a dividend, but that such working would exhaust the deposits in about ten years.
- (5.) That the question resolves itself into one of railway policy—whether light branch lines should be constructed into outlying districts to act as feeders to the main lines, and to assist in the development of the country, even though such lines could not pay in the first instance or possibly for many years to come.
- (6.) That if the Government decide that such lines should be made that the question of a line into the Oaks district should be considered, as it is probable by the time the timber supplies and ore deposits are exhausted that the district will be sufficiently developed and populated to support a railway without these temporary resources.
- (7.) That before the route to Thirlmere is adopted the whole country should be carefully examined to see if it would not be possible to connect the Oaks with any line which may be made to Luddenham or Mulgoa.

Such a line, I am informed, was surveyed many years ago by private enterprise, as portion of the main Southern Railway.

I have, &c.,  
EDWD. B. PRICE.

# THIRD ANNUAL REPORT

OF THE

# BOARD OF WATER SUPPLY AND SEWERAGE,

BEING FOR THE YEAR

1890.

---

Presented to Parliament by Command.

---

SYDNEY : GEORGE STEPHEN CHAPMAN, ACTING GOVERNMENT PRINTER.

1891.

1891.

NEW SOUTH WALES.

BOARD OF WATER SUPPLY AND SEWERAGE.

(ANNUAL REPORT FOR 1890.)

Presented to Parliament by Command.

To the Honorable the Secretary for Public Works,—

Sir,

The Board of Water Supply and Sewerage have the honor to submit to you their third annual Report.

WATER.

1. During the past year the supply of high-level water to the city has been greatly increased, and the number of screw-down hydrants fixed, viz., 405, have materially increased the facilities for fire extinction. Over 75 miles of pipes were laid and 4,154 ball hydrants fixed; the extent of mainlaying is not so satisfactory as the previous year, which is accounted for by the continuous rainy season and also the loss of time occasioned by one of the district contractors having failed to carry out his contract and his successor being very slow.

2. During the year an accident happened to the 48-in. supply main, it is supposed through the too sudden closing of the inlet valve at Crown-street Reservoir, the effect being a ram in the pipes which fractured one of them. The Botany engines, whose fires are kept banked ready for any such emergency, were immediately started, and the supply kept going.

3. The new Worthington pumps were started on 25th March, and after the main had been thoroughly tested and made efficient, the pumps were found to work smoothly and silently. By the end of the year a 36-in. rising main was laid for these engines to pump through from Crown-street to Paddington Reservoir, but owing to the smallness of the latter reservoir the engines are not able to work to their best advantage, as they can only work for three hours at a stretch. A pair of Tangye engines were also erected temporarily to pump to Woollahra, as the old Blake engines which they replaced were thoroughly worn out; another set of Worthington engines were ordered from England to take up this duty, and eventually to pump also direct to Waverley, thus doing away with the pumping plant at Woollahra Reservoir; to enable this to be done, a 24-in. wrought-iron main was contracted for in the Colony, to be laid from Crown-street to Woollahra Reservoir; from thence it will be connected to the present 18-in. rising main to Waverley.

4. The supply to North Shore is at present through a 9-in. main laid under the harbour from Dawes' Point to Milson's Point, and is then pumped to the heights

2—A

of

of North Sydney. An accident happened to this submarine 9-in. main by a vessel letting go her anchor over it, and in getting it up again it carried away the main; this breakage was quickly repaired through the kindness of the Engineer-in-Chief for Harbours and Rivers immediately placing his staff of divers and gear at the Board's disposal, and the supply was restored before any very great inconvenience had been experienced by the inhabitants of North Sydney. The Engineer-in-Chief for Harbours and Rivers is pushing on with the erection of the engines at Ryde, and has completed laying the 24-in. supply main to Ryde, and the wrought-iron reservoirs at Ryde and Chatswood, and is laying the rising main to these reservoirs.

5. The Board had to take action with regard to the possible pollution of the catchment area near Robertson, caused by a piggery establishment, which was at once removed.

6. The "strike" which took place during the year caused some interruption to the works being carried out by the Board, and a great deal of inconvenience with regard to their coal supply, but fortunately having about 500 tons in reserve at the Botany Waterworks, no stoppage took place.

7. As the demand for high level water for the city is and has been increasing so rapidly, the Board are confirmed in their decision to erect a large reservoir, to contain at least 20,000,000 gallons at about 20 feet higher than the Paddington Reservoir. The site which has been found to be most suitable was that originally selected in the Centennial Park, between the Queen-street and Ocean-street gates. It is to be hoped that it will not be long before the required approval is given to this very necessary work. The increase of water pumped is 277,000,000 gallons over that of the previous year, and towards the end of the year more water was being pumped than was being used by gravitation.

8. A meter testing and repairing and tap testing department was found by the Board to be absolutely necessary, and one was started to work in July, and during the six months 34,335 taps were stamped, and 1,956 rejected as defective; 863 new meters were tested, 340 readjusted and tested, and 146 repaired; 826 new meters were fixed on the Board's mains during the year, making a total of 3,788 meters in use.

9. According to the returns sent in weekly from the Engineer-in-Charge at the Prospect Reservoir of the daily discharge from the reservoir to Sydney, there is a difference of about 122,000,000 gallons less than the previous year, or a difference in the daily average of about 334,000 gallons. This difference is remarkable in the face of the fact that 75 miles of new mains were laid, supplying an estimated population of nearly 20,000 people more than the previous year, and nearly 4,000 more houses connected to the sewers, and can be accounted for by only two reasons, viz., the greater rainfall of 1890 as compared with 1889, the difference being 24.26 in favour of 1890, the total amount being 1889 57.16, 1890 81.42 inches; the other reason is the control exercised by the Board over waste which in every city is a great item, this control is exercised both by the vigilance of the officers in inspection of premises and by the enforcement of the regulations insisting on all water fittings being properly tested before supplied to consumers, and water meters affixed to the supply to all buildings used for trade purposes.

10. An analysis is made by Mr. Hamlet, Government Analyst, every month, of the water which is taken from different points of supply and distribution; in all of them Mr. Hamlet characterises the quality of the water as being thoroughly satisfactory. [See Appendix.]

## LIVERPOOL.

11. After several surveys had been made of the different routes of pipe line to convey the water from the Sydney water supply canal for the supply of Liverpool, a scheme was finally adopted of making a small reservoir of about 2,000,000 gallons a few yards from the canal, close to the southern end of Cecil Hills tunnel, the canal to be tapped by a 15-in. pipe discharging into the reservoir, and thence a 9-in. supply main to be laid to Mount Misery, about  $4\frac{3}{4}$  miles, where in the future it is proposed to construct a balance reservoir to hold 1,000,000 gallons, at a height of 100 feet above the town, and distant therefrom  $1\frac{1}{2}$  miles. From Mount Misery a 6-in. pipe to be laid to and through the town.

A contract was let for conveying and distributing the trunk main pipes between the canal and Mount Misery, and was practically completed at the end of the year.

## CAMPBELLTOWN.

12. There has been a great improvement in the revenue derived from this extension, the figures are:—

Year.	Revenue.	Expenditure.		Percentage of Net Revenue on Capital.
		Loans.	Maintenance.	
	£ s. d.	£ s. d.	£ s. d.	
1889 ... ..	128 18 0	2,174 15 11	95 8 0	1.5
1890 ... ..	346 16 0	2,178 0 2	140 17 0	4.7

The above table shows a satisfactory increase in the percentage of revenue, less maintenance, on amount expended. The total amount expended from loans is £4,352 16s. 1d.

## SEWERAGE.

13. On the 30th September, 1889, the "Metropolitan Water and Sewerage Act Amendment Act" was passed by Parliament, which transferred to the Board the control of all existing sewers, as well as the main and subsidiary sewers of the new system carried out by the Minister for Public Works. The mileage of sewers varying from 6 in. to 24 in. in diameter thus transferred was over 70 miles from the City Corporation, and 13 miles from the Government.

14. During the year over  $9\frac{1}{2}$  miles of sewers were laid by the Board and at the end of the year the total length of sewers under the jurisdiction of the Board was over  $122\frac{1}{2}$  miles.

15. The area of the Sewage Farm under cultivation, which is under the superintendence of Mr. J. N. Oxley, was increased to 4 acres 3 roods, and the total amount received for the produce was £198 0s. 1d. A contract has been let for the levelling of about 10 acres, which will shortly be finished. This farm has performed the duties required of it most admirably, viz., absorption of all sewage matter discharged by the main out-fall sewer at Botany; it was never regarded or intended as an agricultural or pastoral farm, as it is simply a bed of sand. The process is as follows:—the liquids are separated from the solids on the city side of Cook's River, in a building erected for the purpose; the liquid is then syphoned under the river and used on the farm in the way of irrigation. The solids are taken over a bridge in trucks by a steam motor,

motor, and distributed on the land where it is at once dug in. This system has been in operation some four years, and even now after a crop has been taken off the sand is just as void of soil as ever. The liquid percolates through about 10 feet of sand, and a sample taken from the effluent was submitted to Mr. Hamlet, the Government Analyst, who pronounced it no worse in quality than many samples of water obtained in wells in the suburbs of Sydney, which are used for drinking purposes and the adulteration of milk.

16. According to the records of the City Council about 18,000 houses were connected with the sewers at the date of transfer of the Sewerage to the Board. During the past year, leaving out the city, there have been 3,804 houses connected by the Board.

17. A change was made by the Board in the method of issuing licenses to drainers, the previous plan of having the application endorsed by two licensed drainers was abolished, in lieu of which the applicant had to submit himself for examination to the two District Sanitary Inspectors, who tested his fitness to carry out house drainage. During the year the licenses of five drainers were cancelled, and ten others were cautioned by the Board. There have been 500 certificates issued by the Board certifying that the plumbing and sewerage work on premises has been carried out in accordance with the by-laws and regulations; and when this system becomes more generally known the public will no doubt very largely avail themselves of it, as the possession of such a certificate is an official assurance that the premises to which it may relate are in a proper sanitary condition. It is worthy of note the advantage property owners in the suburbs take of the facilities afforded them in improving the sanitary conditions of their properties. In some cases persons of small means intimated their willingness to connect their premises to the sewer, but were debarred from doing so from pecuniary circumstances, to meet such cases a scheme of doing the work on the "deferred payment system" was suggested; but on the advice of the Board's Solicitor the question had to be abandoned, as under the existing Acts the Board had no power to carry the scheme into effect.

18. The inspection of residential hotels revealed a most lamentable and, in some instances, an almost incredible state of things. Notices to place their premises in a proper sanitary condition were served, and most of them have since been remedied; and it is to be hoped that the proprietors of others will not force the Board to use the powers which they possess in the interests of public health.

19. The ventilation of the sewers has been expeditiously carried on, and the system of using Nature's forces by erecting shafts with induct cowls to throw air into the sewers and other shafts with exhaust cowls, has proved eminently satisfactory. The whole system is kept under strict observation by the Sewerage Engineer, who has daily records taken of the temperature of the various sewers. 337 of these ventilating shafts have been erected, comprising a length of 12,639 feet, and ventilating an area of 370 acres, which is more than one shaft to the acre. In connection with this, a cowl-testing station has been erected at the Board's depôt at Crown-street, which has proved of very great service in determining the most efficient cowl.

20. To the Sewerage Engineer's report is attached a diagram showing the annual death-rate from the year 1856. It may be of some satisfaction to know that the death-rate of Sydney, and also of the suburbs, compares very favourably with the

the older towns of England, and that, though 1888 was a very dry year, the death-rate was only about 17·50 per 1,000. In glancing at the table it is curious to note the effect of the rainfall on the death-rate, viz., that when the year is dry the death-rate is high, when wet there is a low death-rate. As the records in former years have not been kept with that care which is essential to their being of great value as statistics, not much credence can be placed on them; but for the last few years the table is as correct as it can be made.

#### GENERAL.

21. The working of the Water Department for the year shows an improvement on the previous year; the debit balance for the year being £1,319 15s. 7d., as against £5,718 0s. 4d. for the previous year. This debit balance is after paying maintenance and management, interest on loans expended in water supply, and after writing off for depreciation the sum of £3,421 15s. 2d. The percentage of expenses to revenue was in 1889 26·32, as against 23·82 in 1890. The percentage of revenue on capital in 1889 was 4·49, and in 1890 it was 4·57. These comparative results cannot but be highly satisfactory. The following table is a comparison of the percentage of expenses of maintenance and management to revenue with other water works companies in London, Canada, and the United States with the Sydney water supply for the year 1889:—

Southwark and Vauxhall.	Lambeth.	Toronto.	Baltimore.	Lawrence.	Salem.	Sydney.
40·39*	31·4*	40·27	46·84†	24·75†	55 0†	26·32

\* The returns of these two companies are compiled from their half-yearly balance sheet, ending 31st March, 1890, and the figures doubled.

† This percentage is working expenses to receipts, not revenue; the working expenses of Sydney to receipts was 23·65.

Adelaide, year ending 30th June, 1890—Working expenses to revenue, 21·20 per cent.

Sydney, year ending 31st December, 1890—Working expenses to revenue, 23·82 per cent.

22. The working of the Sewerage Department, after paying for maintenance and management and interest on loans, shows a credit balance of £14,773 7s. 2d. The percentage of expenses to revenue was 27·20. The percentage of revenue on capital was 6·38. As the Sewerage Department was only initiated this year the expenses would be greater, and that accounts for the percentage being higher than the water Department.

23. The Board anticipate that during the approaching year the remainder of the Nepean Water scheme, with the exception of the reservoir at Potts' Hill, and the second supply main from that locality to Crown-street, will be completed and transferred to them. This will include the whole of the canal works and pipes from Pheasant's nest to Potts' Hill, the Prospect Reservoir, the supply main to North Shore with engines, reservoirs and pumping mains, also the maintenance of the canal. The balance of the capital value of these works to be transferred will increase the debt on the Board by the amount of about £300,000, on which interest will have to be provided, besides the annual cost of maintenance of canal, which is about £5,000 per annum.

24. The Board were obliged at the latter end of the year to take some vigorous action with regard to unpaid rates. A final notice was issued to such ratepayers who had not complied with the demand on the usual rate notice paper, informing them that their rates had not been paid, and giving them warning that if not paid within seven days legal proceedings would at once be taken. 20,250 of these reminders were

were sent out, and it is satisfactory to record that 80 per cent. of them were paid within the time specified. The number of rates that remained unpaid was 4,260, representing a monetary value of £14,370 14s. 5d., for which summonses were issued and amount recovered. In every community there is always a section who will never pay moneys owing by them until made to do so, but it is to be hoped that in future it will not be necessary to resort to such extreme measures in such a number of cases.

25. To save time and cost to ratepayers situated in outlying districts having to come into the city to pay rates of small amounts, a system was tried during the year of sending an officer to attend for certain days in the week at a central Municipal Council Chamber, and receive such rates on the production of the rate notice paper. The results were not quite so satisfactory as might have been anticipated. This no doubt was owing, to some extent, to the system being novel, and not properly understood by the ratepayers. To enable this to be done the Board were greatly assisted by the Municipal Councils interested placing the free use of a room in their chambers at the disposal of the Board. All the Municipal Councils who were requested cordially assisted, with the exception of the Council of Rockdale. The above system will be tried again during the next year, when, no doubt, greater advantage will be taken of the convenience by the ratepayers interested.

26. The question of building new offices for the Board, mentioned in our last annual report as having been transferred to the Public Works Committee, was dealt with during the past year by that body, who reported on it favourably to Parliament, and a Bill was introduced and passed enabling the Board to resume the land and build new offices; the land was therefore resumed and tenders were called for the erection of the buildings; that of Mr. P. Hill was accepted for the sum of £28,900, to be completed about June, 1892.

27. The Board instituted monthly visits to the several centres of works under their control, and have made great improvements at the different depôts.

28. During the year fifty-seven meetings of the Board were held, at which the attendance was as follows :—

	Present.	Absent.
T. Rowe, President ... ..	56	1
B. Palmer, Vice-President (City Member) ... ..	56	1

Oxygen absorbed in 3 hours.	Free Oxygen.	Free Nitrogen.	Carbon Dioxide.	Degree of Aeration.	Before Boiling.	After Boiling.				
1890.																				
25 April	1519	SYDNEY WATER SUPPLY— Sample taken from fountain at No. 5 platform, Redfern Railway Station.	6.51	2.3	Traces	None	None	.08	.43	88	5.70	9.98	1.26	17	4	3.5	...	Clear greenish, yellow tint.	None	An excellent water, suitable alike for drinking, washing, and all other domestic purposes.
10 July	3	Crown-street Reservoir (sample taken on the 2nd July, 11.30 a.m.)	7.7	2.3	None	do	.05	.01	.43	88	7.1	13.14	1.32	21 1/2	5	3 1/2	Present	Clear	do	This water maintains its reputation, the analysis clearly indicating a safe, wholesome water, suitable for drinking and all other domestic purposes.
"	"	Randwick fountain (sample taken on the 2nd July, at 10.30 a.m.)	6.65	2.3	do	do	None	.06	.36	61	7.12	13.14	1.30	21 1/2	5	3 1/2	do	do	do	This analysis embodies the Wanklyn ammonia process, also the oxygen process, used in the analysis of the supply to the City of London, together with a microscopic examination. The combined results corroborate each other, and enable me to say that the water is wholesome, and suitable for drinking purposes.
12 Aug.	1742	Crown-street Reservoir	6.37	2.3	Trace	None	.04	.10	.45	92	5.57	14.05	1.23	21.80	4.0	3.0	do	do	do	There has been a gradual but perceptible improvement in the quality of the water supplied to the City of Sydney. At the present time it is equally as good as was the old Botany supply in its best days. Fully one-half of the oxygen consumed is due to the water having dissolved peaty matter from the catchment area. Making due allowance for this, the water would fall under Class II by the best English authorities— that is to say, it would be regarded as a safe and wholesome drinking water.

Sydney, 2nd February, 1891.

MELBE. GREEN,  
Accountant.

Sir,

Assessors Department, 28 January, 1881.

I have the honor to submit to the Board a report of the progress made in the work of this Branch during the year 1890.

*Rate Notices.*

During the year 155,036 rate notices were served, being an increase of 23,381 as against the number served during 1889—and this increase in the number of notices has consequently necessitated a wide additional area being traversed in order to serve them.

*New Mains and New Sewers.*

The number of properties which became liable from new mains and new sewers during the year is 7,681, and as the majority of these have been laid or constructed in parts that were not previously liable for rates, they have to a like extent increased the area of the districts controlled by the officers of this Department.

*New Assessments.*

The number of new buildings which have been erected during the year, and which on completion were assessed and rated by this Department, is 2,698. The work of assessing these new buildings has been admirably done by our own officers and given almost universal satisfaction to the public, notwithstanding that in many instances the assessments made by us have exceeded those fixed by the Municipal authorities, copies of which assessments we have just received.

*Recovery of Rates.*

The experiment made in August and September of sending a cashier to several of the suburban Council Chambers for the purpose of receiving rates did not altogether meet with the success that might have been expected, but nevertheless the opportunity given was availed of by a large number of ratepayers; and no doubt, since the Board have decided upon making another trial during the present half-year, the ratepayers will more fully realise the advantage thus offered to them and appreciate it accordingly.

That the public are becoming aware of the fact that when final notices are served stating that the rates must be paid by a certain date or proceedings will ensue, is evident by the manner in which the rates have been paid on the service of these notices. Still, in the face of this, it is noticeable that in many instances the same persons have to be summoned each year before they will pay their rates.

It is gratifying, however, that notwithstanding the increase of 11,734 additional rates having to be collected, and also the general depression experienced in all trades, to find that the amount outstanding shows a decrease of £9,995 13s. 3d. in the water rates as compared with 1889, and also a decrease of £2,909 4s. 11d. in the sewerage rates, as compared with the amount handed over to the Department by the Municipal Councils on the 1st January, 1890.

*Special Fees.*

The number of applications for the use of water for other than domestic purposes have considerably increased during the year, and the charging of a special fee for using water for gardens in lieu of having to fix a meter, has been largely availed of by the public.

HERBT. J. BEAUMONT,

Assessor.

The Secretary, Board of Water Supply and Sewerage, Sydney.

The number of premises rated and supplied with water on 31 December, 1890:—

HERBERT J. BEAUMONT,  
Assessor.

988

Water Supply and Sewerage Department,  
Sydney, 7th January, 1891.

### Third Annual Report of the Engineer for Water Supply.

I HAVE the honor to submit to the Board the Third Annual Report of work performed and projected, and of incidents and accidents that transpired during the year 1890, in the Branch under my control as Engineer for Water Supply during the year 1890.

I enclose Inspector Robertson's returns—pipes laid, hydrants fixed, and work performed by his staff of operatives; also, Mr. Fyfe's report of the performances of the pumping engines under his charge.

Another enclosure is a return of meters, taps, &c., tested, and repairs effected in the Meter Tester's Department, and a return of meters fixed during 1890 and previous years.

### Pipe-laying.

This Branch maintained a fair amount of activity throughout the year, but falls short of that of 1889, because of the reduced importance of the suburbs, which had, by the activity of former years, begun to fall away in their requirements.

The Board's decision to give a more liberal supply of high-level water to the central section of the City, and generally to improve existing supplies, kept the Board's operatives and contractors fairly active, using much material, and adding largely to the expenditure of the Board without increasing the revenue.

A large quantity of this class of work is projected, and will, it is hoped, be completed during 1891, and will materially add to the effectiveness of the supply, both for fire extinction purposes, domestic and other uses, such as giving supplies at the upper stories of lofty buildings.

### Interruption to Supplies.

On the 5th of January the supply of water from Potts' Hill suddenly ceased to flow, and news followed that the 48-inch trunk main had burst during the night at Summer Hill; at 6 a.m. operations for its repair were set in motion, a new length was inserted, and its restoration complete by 2 a.m. the next morning; meantime, in order to obviate scarcity of water, the Botany pumps were started, with such effect as to cause but little inconvenience to the public.

The fracture was considered to have been caused by the rather too sudden closing of the inlet valve at Crown-street.

On the 21st November the submarine supply main to North Shore was fractured by being dragged by the fluke of the anchor of the steamer "Bucephalus," which anchored just over the same, and swinging round drew the line of mains until a break was effected. The Harbours and Rivers Department permitted their staff of divers to effect repairs, which, for want of exact castings, was delayed till 4 p.m. of the 23rd, the district meantime suffering an interruption to supplies.

### Starting the Worthington Pumps.

The powerful pumping engines which had been in course of erection during 1889 were completed and tried on 25th March; their great power caused the 20-inch main to fracture near Moore Park gates; before allowing them to work again, the line of mains was tested up to 118 lbs., under which pressure two further fractures took place when the pumps resumed work, the working pressure being limited to 60 lbs. per square inch. At this pressure they worked throughout the year without further casualty, beyond twice blowing out one lead joint in Crown-street, which was found to be due to the form of the socket.

The Worthington pumps, after a few days of preliminary adjustment, worked smoothly, silently, and with a marked economy of coal consumption. This statement appears incompatible with the increased consumption of coal per million gallons raised, as shown by the returns, but is reconciled by the fact that up to 24th December the work was done in one-third less time than formerly through the 20-inch main, which doubles the duty on the engine; moreover, bad coal was supplied during part of the strike, and owing to the smallness of the Paddington Reservoir two stoppages and two starts are necessary daily. When the 36-inch main in Park Road was finished on the above date the economy was made apparent.

Rotative

### Rotative Engines.

When the Worthington engines were properly started, the rotative pair became disused, excepting on two occasions—viz., when a heated bearing on the Worthington engine caused a short interruption, and later in the year, while the Park Road 36-inch main was being connected to the delivery system, when this work was just completed, the defects and broken parts became so dangerous as to necessitate the rotative engines being altogether stopped. They are now disused, pending the decision of the Board as to whether they shall be repaired.

### The Blake Engines.

These engines showed such unmistakable signs of failure, and their duty of raising water to the Woollahra reservoir being indispensable, it was determined to purchase and fix in the machine-room two pairs of direct-acting Tangye engines, pending the importation and erection of the duplicate Worthington engine, to avert danger of interruption of supplies to Woollahra. The Blake engines, though greatly deteriorated, are still able to do full work, but may not last a day, and might last a month.

### Tangye Engines.

The above plant was hastily erected, and, though they took up the work of the Blakes, they showed many defects, and entailed a considerable cost in alterations and repairs, but they are now meeting requirements fairly well.

### North Shore Engines.

These are a pair of Blake duplex direct-acting, capable of raising 10,000 gallons per hour to the higher levels of North Shore.

This quantity would meet all requirements if the water were available for the engines to raise it. As is known to the Board, however, the 9-inch main across the harbor does not convey enough water to that suburb to afford a constant supply to the higher levels, which are, in consequence, subjected to intermittency.

If the permanent scheme were not so soon to be completed, a second pipe across the harbor would be laid, but the time to elapse before the permanent scheme is ready to deliver water is so short as to place that expedient out of the question.

### Woollahra Pumps.

The above plant is situate at Woollahra, and is employed raising water to Waverley Reservoir.

The spur driving-wheel of this engine was replaced by a new one during the year, the old one being repaired ready for replacement. It has performed its duty very well, and with fair economy.

### The Botany Pumping Plant.

This pumping plant is still in a fairly efficient working order, should occasion call for its use. About 11 cwt. of coal is consumed weekly to keep the engines in readiness for any sudden call. As elsewhere related, they were called into requisition during 1890.

### Consumption of Coal.

The consumption of coal for the work done is abnormal, owing to three facts, viz. :—1st., smallness of main and velocity of pumps (previously referred to); 2nd., to two stops and starts daily; 3rd., bad coal during the "strike."

### Completion of certain Works.

During the year the new building and works at Crown-street, which may be enumerated as under, were completed and put in use, viz. :—New Worthington engine, together with engine and boiler house and chimney, machine shop, valve wells for suction and delivery, valve-house for delivering and adjusting supplies to engine (in Riley-street), together with the laying of a 42-in. main thence to the engine-house, meter testers' rooms, new blacksmith's shop; the gates on depôt were renewed, and the surrounding walls and palisading renovated generally, and put in good repair.

The

The fence of pipe depôt at Newtown was repaired and the footways around it paved. Park Road depôt was formed and a gantry for lifting castings, &c., on and off drays and stacking same, was erected.

The high-level tank for the supply of a limited district of land at Ashfield, too elevated to be fed from the Prospect Scheme, was completed in November, and is now in use; its capacity is 100,000 gallons, and is circular in form, raised on brickwork walls to an elevation of 223.30 feet above H.W.M. It is filled from Woollahra by means of existing mains.

A 36-in. main, composed of the old pipes used for crossing ravines temporarily in the execution of the scheme known as "Hudson Bros." was laid from the Moore Park Gates to the Paddington Reservoir; it was completed and put in use on the 24th December, as a rising main for the present, until the new rising main is completed. The office of this pipe will be dual, viz.:—To isolate the pumping operations from the city supply mains, the fluctuations in which, being irregular, induce a dangerous tendency in the engines to "race" if not carefully watched; and, in the second place, to act temporarily as a rising main, in which capacity it enabled the pumps to raise the daily quota of 3½ million gallons in a third less time, besides reducing the pressure in the mains from 60 lb. per square inch to 38 lb., under which pressure the engines work admirably, but not with anything like their full power and economy until a more elevated reservoir is secured. When the laying of the new 36-in. rising-main from Crown-street to Paddington is completed, which was within about five weeks of completion at the end of the year, the working pressure will be further reduced to 35 lbs.; this main is designed to be used for conveying the Paddington level water to the city to meet the growing demand for high-level water in the central parts of the same and elsewhere, the distribution scheme for which has been approved by the Board, and is being carried out now.

On the 6th August the Minister for Works assented to the Board's proposal for the direct indenting, through the Agent-General, of an engine in duplication of the present Worthington, the power to be the same, but to be adapted to work at its greatest economy when raising half the quantity now being raised to Paddington to the Woollahra Reservoir, which is at double the elevation; this engine may be expected very shortly.

In order that this engine might perform its work without danger from fracture of mains, the Board called for tenders for a 24½-in. wrought-iron main, which is to be laid from the Crown-street pump along Crown and Fitzroy Streets and Moore Park Road as far as Gordon-street, whence it is considered, as the remainder of the main, although a 20-in. cast-iron, is largely freed from pressure from its elevation, it will be safe for the work.

Through this pipe, as soon as laid, it is intended to feed Woollahra by the proposed Worthington engine, and to dispense with the Tangyes.

The wrought-iron pipe contract is being executed by contract in the Colony by Messrs. G. & C. Hoskins, who were the lowest tenderers.

The first few feet of this main has been laid and connected with the delivery of engines through the Crown-street depôt, in order that the depôt might be formed to its ultimate levels.

For the same reason *the terminal* extremity of the 42-in. duplicate main from Potts Hill will be laid underground from the inlet valve well, under the stores, to Gipps-street, from which main a branch has been laid at the bottom level of reservoir and valve well to connect the 42-in. main with the Worthington pumps, so that, in the event of any interruption to the mains from the reservoir during cleansing, accident, or other reason, there should be no interruption to the pumping.

### Continuous Rains.

The rains were so heavy and continuous during the early part of the year as to incur some danger of a washaway on the Botany series of dams. As these dams were of no further service to the Board two of them, Nos. 7 and 8, were cut through to obviate their filling and carrying away.

### Great Fires.

The greatest fire on record in Sydney broke out on the premises of Messrs. Gibbs, Shallard & Co., printers, in Hosking-lane ; it obtained such a hold in that building, it being believed that it was alight at 8 p.m., and was only discovered at 2.30 a.m. on 1st October, and the buildings in the vicinity were so densely crowded, that some of the most valuable buildings in town were fired, notably Messrs. Young & Lark, the City Bank, Messrs. Bull, Price's, and many others.

The water supply in Castlereagh-street was admirable, both in pressure and quantity, until a branch main was broken by falling walls in Hosking-lane and Moore-street, which rendered the pressure of no service excepting for feeding the engines. The pressure in Pitt-street was low, but the flow in the 12-in. main was abundant for feeding the engines ; the two path mains, being 4-in. low-level, fed at one end, were of very little use ; since then these two last-named mains have been converted into high-level mains, fed both ends, by the operations of improvements which the Board had approved and only awaited completion.

Another great fire occurred at Dibbs' wharf, through a kerosene store taking fire, on 3rd December ; the flames raged for many hours, but were at last extinguished, before the whole of the kerosene cases were burnt, many thousands being saved. The water was reported to be satisfactory, though a better supply is under consideration for this locality.

The attention of the Board was brought to bear on the weak supply of high-level water to the Western suburbs by the Railway Department, the Commissioners requesting that their depôt at Eveleigh should be provided with a better means for fire extinction.

On the Department undertaking to contribute £1,200, the Board authorised a line of 15-in. mains to be laid from the 30-in. in Crown-street to Eveleigh, and a 12-in. thence to Newtown Bridge, which is about to be completed, and will very greatly improve the supply to the Western suburbs, as well as afford security against fire at the Eveleigh workshops and to all premises along its course.

### Improvements to existing supplies.

During the year, from the growing feeling that a more liberal distribution both of high and low level water must be initiated to meet the requirements of modern buildings for fire extinction and other demands, the Board approved of a very large vote for one instalment of the scheme for the centre of the city. This proposal is all but completed. Another for the general improvement of the supply to Surry Hills was passed, because the mains are both old and very small.

Three or four other localities are being prepared for early submission to the Board, all of which are but indifferently supplied now, viz., Woolloomooloo, Miller's Point neighbourhood, Pyrmont, Strawberry Hills, Darlington and parts of Chippendale, and other minor parts.

When these are completed the Board may rest satisfied that their scheme will be second to none for liberality, both as to the supplies and provision for fires.

The Board's pumping establishment will also be on a scale that the Board may justly feel proud of, but wanting the means of putting forth its full energy in the form of a capacious and more elevated reservoir than that at Paddington, which is both too low and too small for its functions. To this end it is to be hoped that the Government will concede one of the sites at Centennial Park.

In order for the full development of the capacity of the duplicate main from Pott's Hill another reservoir on the level of Crown-street will be required, but not for a few years. Meantime, the relative merits of different sites are being considered.

The Board has approved of a reticulation for the heights of Hurstville, Bexley, &c., and also of a gas engine and pumps for the same and receiving tanks ; pipes are daily expected to carry out this work ; the engine will be ready about the early days of February, and the tank will be advertised immediately.

The supply to Balmain heights has lately become most suddenly inadequate, and a scheme for its improvement is being considered.

## Botany Pumps.

## FROM WOOLLAHRA TO WAVERLEY.

1887—From April 2 to December 31,	19,317,700 gallons.	
1888—From January 1 to December 31,	61,236,931 „	181 tons.
1889—From January 1 to December 31,	80,679,780 „	197 „
1890—	85,113,600 „	228 „

## PUMPED AT NORTH SHORE.

30,420,740 gallons, 231½ tons.

## Liverpool Supply.

A contract for conveying and distributing the trunk main pipes between Mount Misery and the canal was let, and practically completed at the end of the year.

The contract for laying them will be let in January. The smaller mains and reticulating pipes for the town are about to arrive from England, and the work of laying them will proceed simultaneously with the trunk main, so that both works will be completed at the same time.

## Watson's Bay.

During the year the water was given to this district it had to be given from the Waverley reservoir at a level of 360 feet, and consequently exerts great pressure on the pipes near the sea level, causing joints, pipes, and hydrants to occasionally burst.

## Mileage of Mains Laid.

75½ miles of main were laid during the year making 214 miles since the Board's formation.

## General.

The order of the Board to substitute ball and screw hydrants for fire plugs is being carried out by the Board's operatives at a quick rate, and a saving of cost over fixing by contract; 405 screw down hydrants and 4,154 ball hydrants were inserted in City and Suburbs during the year.

The Secretary.

J. TREVOR JONES,  
Engineer for Water Supply.

Sir,

7 January, 1891.

I have the honor to submit Annual Report of work done during the year 1890:—

*Main-laying.*

During the year pipes of various sizes laid number 42,515, giving a total length of 75 miles 866 yards, making an average distance of 1 mile 795 yards per week. The mileage this year is less than that of last, owing to the continuous rainy season, which has retarded the work considerably. Great loss of time was also experienced in the early part of the year by one of the contractors failing to carry out his contract, with the result that fresh tenders had to be called for. His successor has not carried out the work as expeditiously as he might have done. It is satisfactory, however, to state that the work that has been done is of a very substantial nature.

*Main-cleaning.*

During the year the work of main-cleaning has not been carried on to such an extent as last year, owing to the Boards operatives being busily engaged on work of a more urgent nature, they having done good service during the latter portion of the year in fixing hydrants in the city and suburbs, which has been a source of great saving to the Board.

*Inspections.*

The waste water inspectors have done good service this year in detecting a number of evasions of payment of rates for stock, machinery, &c., although the number of these inspections has not been so great as last year, owing to a great part of their time having been taken up securing information of the assessor.

I cannot close this report without testifying to the very able and willing manner in which the whole of the officers and employeess under my supervision have carried out their duties.

Water Engineer.

D. C. ROBERTSON,  
Inspector.

## SUMMARY of Work done during year 1890.

Mains laid	...	...	...	42,515 pipes = 132,866 yards = 75 miles 866 yards.
„ cleaned	...	...	...	7 „ 278 „
„ removed	...	...	...	813½ „
„ repaired	...	...	...	178 „
Hydrants fixed	...	...	...	Screw-down, 405; ball, 4,154
Private works paid for by plumbers and others for inserting branches and valves	...	...	...	68

D. C. ROBERTSON,  
Inspector.

Sir,

Sir,

The Water-works, Crown-street, 7 January, 1891.

I have the honor to make the following report upon the working of all the pumping-engines, &c., during the year ended 1890.

The main engines (rotation pump) kept up the supply to Paddington reservoir till the beginning of August last, when the Worthington pumps were put on regularly, having been occasionally pumping previously, and were kept on till it was necessary to stop them for the purpose of making some pipe-connections on the 10th December, the pumping being taken up by the old rotation pumps, which was continued till the 14th December, when the defect in crank-shaft caused a fracture in fly-wheel, the work then being taken up by the Worthington pumps. I would recommend that the new crank-shaft be fitted to rotation pumps, in order that it may be in readiness to take up the pumping if required. During the year the quantity pumped to Paddington reservoir by the pumps was 992,457,890 gallons, being an increase of 149,389,740 on the previous year, and on the corresponding quarter of the year previous an increase of 41,637,970 gallons. Tangye pumps were put down to take up the work of the Blakes, which were about to be discarded. The Tangyes started in the month of August; they are limited in capacity to do the work, but were the largest procurable; they consequently have to be driven rather fast, causing great wear and tear and use of coal.

Advantage was taken to do several repairs whilst pumping at the old engine-house whilst making connections. During the year the water pumped to Woollahra reservoir was 367,108,960 gallons, being in excess of the previous year 27,945,810 gallons, and an increase in the corresponding quarter of the previous year of 1,161,300 gallons. The boilers and connections are in good working order.

The pumps at Woollahra reservoir were daily pumping to Waverley reservoir, excepting being laid up in July last for annual overhaul, boiler-flue-cleaning, &c. The engine was fitted with new mortice-wheel, and general overhaul and repairs as far as time would permit, and has since been working satisfactorily. During the year the water pumped by these pumps to Waverley reservoir was 85,113,600 gallons, being an increase of 4,433,820 gallons on the previous year. The pumps at the North Shore works have been working constantly, having pumped for the year 30,420,740 gallons, and for the quarter just ended 11,852,780 gallons, being in excess of similar quarter of the year previous 7,416,600 gallons.

The Botany pumps were worked under steam on the 6th and 7th January, owing to a fracture in the supply main from Potts Hill, and have been turned round by levers every week during the year; a boiler-fire has been kept banked and changed periodically.

I have, &c.,

J. FYFE, E.O.P.

J. Trevor Jones, Esq., Engineer for Water Supply.

To Engineer for Water Supply.

J. FYFE, E.O.P.

Sir,

Crown-street Depot, Meter-tester's Office, 2/1/91.

I have the honor to submit to you the following reports of new and old water-meters for the year ending 31st December, 1890; also the repairing of water-meters, and examining and testing all cocks and water-fittings which came into force on 1st July, 1890. To meet the importers and others that have had large stocks of inferior cocks and fittings on hand, in testing and examining, we have condemned only the very worst of them. Out of the whole number of cocks and fittings that have been passed, not 5 per cent. have been of the best quality.

I have, &c.,

W. J. ADAMS.

Engineer for Water Supply.

## WATER METERS.

Water Supply and Sewerage Department, Sydney, 5 January, 1891.

The number of Meters fixed during the Year 1890 is as under:—

Sydney and Suburbs	...	...	...	...	...	...	800
Government	...	...	...	...	...	...	26
Total	...	...	...	...	...	...	<u>826</u>

The total from the commencement stands thus:—

Taken over by Board, May 12, 1888	...	...	...	1,625
Issue to December 31, 1888	...	...	...	2,448—year's increase, 823
Do do 1889	...	...	...	3,814— do do 1,366
Do do 1890	...	...	...	4,614— do do 800
Government Bonds, May 12, 1888...	...	99	}	144— do do 45
Do increase to December 31, 1890	45	...		
				<u>4,758</u>

Number of Meters in operation, according to Meter

Readers' return, December 31, 1890	...	...	3,788 (123 Government.)
Disconnected from commencement	...	...	970
			<u>4,758</u>

The large increase in 1889 was due to the fact of it being compulsory, at that time, to affix a meter in all cases where more than two horses or cows were kept. Since that By-law has been altered many meters have been disconnected and fees paid instead. Gardens and gas engines can be supplied with water also on payment of fee, and this has affected the demand for meters. Otherwise, I hope the progress made will be considered satisfactory.

Meters for building purposes are largely used now, and disconnected, in all cases, as soon as the buildings are completed.

The number of meters which became temporarily inoperative during the year was 385; in nearly all cases they were promptly attended to, and an equitable adjustment made.

E. R. ABSELL,

Engineer for Water Supply.

Meter Clerk.

# BOARD OF WATER SUPPLY AND SEWERAGE SYDNEY

*Table shewing the Volume of Water supplied Weekly from Prospect Reservoir by Gravitation to Sydney and Suburbs during the Years 1888, 1889 and 1890, the distribution of this Water by Gravitation, and by Pumping, the Mean Shade Temperature and the Rainfall for each Week.*

(Sig. 2-)

PHOTO-LITHOGRAPHED AT THE GOVT. PRINTING OFFICE,  
SYDNEY, NEW SOUTH WALES.

## Board of Water Supply and Sewerage,

Office of Engineer for Sewerage, 5 January, 1891.

Sir,

I have the honor to submit, for the information of the Board, my report on the working of the Sewerage Branch of the Department for the year 1890.

## Transfer of Sewers, &amp;c.

The Metropolitan Water and Sewerage Act Amendment, which transferred the control of the existing city and other systems, as well as the main and subsidiary sewers of new system, carried out under the authority of the Minister for Public Works, under the powers conferred by the Principal Act 43 Vic. No. 32, to the Board, was passed by Parliament on 30th September, 1889. In pursuance of the 13th section of the Amending Act a Proclamation was made on the 18th day of December, 1889, transferring the undermentioned works from the Minister to the Board's jurisdiction, viz. :—

1. Main Northern Out-fall Sewer, from Ben Buckler, on the scaboard, to Oxford-street and Liverpool-street, with the following branches:—
  - (a) Liverpool and Kent Street Branches, and subsidiary sewers.
  - (b) South-western Branch, from Oxford-street to Prince Alfred Hospital, with subsidiary sewers.
  - (c) Western Branch, Carlton-street to Bay-street.
  - (d) Northern Branch, from Oxford-street to Castlereagh-street to Bridge-street to Macquarie-street.
  - (e) Overflow Branch, from Main Northern Out-fall to Rushcutter's Bay.
2. Main Southern Out-fall Sewer, from Sewage Farm to Nobbs-street, Surry Hills, and all subsidiary sewers flowing into same, together with all buildings, machinery, and carrier.
3. That portion of Sewage Farm now being utilized for the filtration and disposal of sewage.
4. All subsidiary sewers constructed by the Government Sewerage Department in the Boroughs of Redfern, Paddington, and Woollahra. [*Vide* Table No. 1.]
5. Stormwater ducts at the undermentioned places:—
  - Wentworth Park.
  - Pymont Bridge Road.
  - Wattle or Darling Street.
  - Baptist Estate.
  - Alexander-street, from Evelcigh Railway Yards to Copeland-street, Alexandria.
  - Park-street, Macdonaldtown.
  - Dowling-street, Redfern.
 [*Vide* Table No. 1.]

In addition to the foregoing, 72,238 lineal feet, or 13·7 miles, of subsidiary sewers, varying in size from 6-inch to 24-inch diameter, have been transferred from the Government to the Board. [*Vide* Table No. 1a.]

## City Sewers transferred.

The length of city sewers, of various sizes, transferred to the Board on the passing of the Amending Act, is 70·27 miles.

## Sewers constructed by the Board.

During the year, surveys and plans have been prepared, and contracts carried out for 50,740 lineal feet, or 9·61 miles, of sewers varying from 6 inches to 24 inches in diameter, and 3 feet by 2 feet 2 inches oviform sections; also, 2,550 feet of storm-water drains, varying from 12-inch to 5 feet 6 inch diameter. [*Vide* Table No. 2.]

## Length of Sewers under Jurisdiction of the Board.

The total length of sewers, comprising the existing and new systems now under the jurisdiction of the Board, is 122·61 miles.

## Contracts Let.

During the year, contracts to the amount of £63,586 have been let, and, with few exceptions, completed. Those unfinished are making good progress, and, in the course of a few months, I hope to see the whole of the reticulation of the immediate boroughs completed. Owing to the inclement weather which prevailed during the last year, and the quantity of subsoil water and bad ground met with, the works have not been carried on without some difficulty.

Reticulation

### Reticulation of the Suburbs.

Surveys are being made and plans prepared for the completion of the reticulation of the Boroughs of Woollahra and Waverley, and for the drainage of the following Boroughs:—Randwick, Alexandria, Macdonaldtown, Newtown, Camperdown, and Glebe. Surveys will be taken in hand early this year for reticulation of the Boroughs draining into the Western Suburbs Scheme. It is desirable that property owners should have drainage facilities without unnecessary delay, and, with this object, the surveys generally are being pushed on, so that the reticulation work can be carried out at same time as the intercepting ducts.

The unsatisfactory manner in which land has been subdivided in some of the suburbs by the omission of accommodation lanes between building blocks, and disregard of drainage levels, renders the work of reticulation somewhat difficult. It is to be regretted that a responsible authority has not jurisdiction over the subdivision of land intended for residential areas.

### New Sewers within the City boundary.

The general character of the buildings in the business centres of the City is undergoing a marked change, and the question of basement accommodation is becoming one of great importance.

The extent of basement accommodation is at present limited by the levels of the existing sewers; the system being on what is termed the "combined," *i.e.*, conveying storm-water as well as sewage, renders basements connected thereto liable to flooding during heavy rainfalls, as the sewers are at such times surcharged and working under considerable pressure.

To meet the growing requirements and to afford the greatest facilities for drainage on sound sanitary principles, the Board has wisely determined to initiate a new system of sewers on modern lines within the city. The sewers will be connected direct with branches of the main Bondi outfall and laid at greater depths than existing ducts. The existing house drains will be disconnected from the old and connected with the new sewers, and provision will be made for thoroughly aerating the public sewer and ventilating the branch drains according to the by-laws of the Board. Surveys and levels have been taken with this object, for sewers in the principal business thoroughfares, *viz.*, George, Pitt, Market, and King Streets, and plans will be ready for contract this month.

### Relief Sewers to Existing System.

With the view of relieving the main outfall sewers, discharging at Fort Macquarie and Blackwattle Bay, during heavy rainfalls the question of constructing overflow sewers has been inquired into, and the necessary levels are being obtained. The construction of the ducts alluded to will be of great service in the low-lying areas, by preventing flooding of cellars and basements by the surcharge water from old sewers.

### Condition of Existing Sewers, City.

In July last I instructed the Assistant Engineer and City Sanitary Inspector to examine some of the main sewers of the city system, and the result of such inspection showed that they were in anything but a satisfactory condition, so much so that it is a matter of surprise that they did not collapse in places. On several sections the invert had entirely disappeared, and sides considerably damaged, on others the arch showed signs of weakness.

The Board instructed that the defective sewer should be put in good condition, and the work was taken in hand at once; up to the 31st December last very good progress had been made. The following sewers have been dealt with:—

		Invert. Feet, super.	Arch. Feet, super.	Pointing. Feet, super.
Northern section	... { Young-street	... 1,435	24	7,424
	... { Phillip-street	... 420	...	1,715
South-western section	... Hay-street	... 1,648	...	21,350
		<u>3,503</u>	<u>24</u>	<u>30,489</u>

The cost of this work up to date, including labour and materials, is £571 2s. 9d.

During the year a few subsidiary sewers were blocked through street *detritus* and other gully matter. These were cleaned and repaired by the maintenance men. In cleaning the sewers the defective condition was clearly seen; the joints in many places were broken, and the jointing material had entirely disappeared. In such a state the liquid sewage, instead of being carried off, finds its way through the open joints into surrounding soil, and the solid matter collects in the pipes, and finally causes a stoppage.

The

The foregoing applies to the older sections of subsidiary sewers. Those of later date are constructed on modern lines, and are more easily maintained. The cost of maintenance, however, could be considerably reduced if street gullies were disconnected from them.

The carrying out of the low-level system—*i.e.*, for areas lying between the 40-foot contour and high-water mark which cannot be drained by gravitation into intercepting branches—will afford an opportunity of improving the condition of the sewers before referred to, by constructing new and much smaller ducts for house sewage and roof drainage only, leaving the existing ducts for storm-water disposal. The result will be economy in maintenance and greater facilities for ventilating and aerating the sewers.

During the year the sewer in Pitt-street, south of Bathurst-street, became surcharged on one occasion, and on examining the locality it was found that the storm-water was not distributed as it should have been, the drainage from one zone being carried into the sewer of another, instead of into its own duct. This has been rectified, and the storm-water has now been so distributed that each duct carries off the drainage of the zone through which it passes.

### Outlets of Sewers draining into the Harbour.

The various outlets of sewers discharging into the harbour have been attended to. The large duct through Wentworth Park has been kept clear of silt, and no complaints have been made in connection with same. Through the courtesy of the Engineer for Harbours and Rivers, two outfalls have been dredged, and great improvement has been effected thereby, *viz.*, at Woolloomooloo Bay and King-street. At the latter place the sewer has been extended, and now discharges at end of jetty below low water. A report was received from the Health Board in connection with the insanitary condition of King-street Wharf, and steps were taken by the Board and City Council to remedy the evil. The remedial work is now in hands, and will be shortly completed.

An inspection of the eastern section of the city system, discharging into Woolloomooloo Bay, showed that the sewers in the vicinity of the outfall were silted up to such an extent as to reduce the discharging capacity fully 50 per cent., the sewers had not been cleaned for three years previous to the Board assuming control. The Board directed that they should be attended to, and the work was taken in hand at once, the Harbours and Rivers Department having kindly placed a punt for receiving the sludge at my disposal, also providing towage to reclamation works now being carried out by them.

### OUTFALL AND SUBURBAN SEWERS.

#### Condition of the Main Northern and Southern Outfall Sewers, new system, and Suburban Subsidiary Sewers.

The Sanitary Inspector in charge of the suburban district reports that during the year 673 cubic yards of silt were removed from the Bondi outfall and branches, and 893 cubic yards from the Botany outfall. The silt principally consisted of road *detritus* and other gully matter; owing to the gullies, connected to the branches discharging into the intercepting sewer, not being provided with gratings, large substances are carried into the main duct, which considerably assists in the deposit of silt.

He further reports that five (5) stoppages occurred in the branch sewers; these were in connection with the Paddington and Woollahra sections, and are attributed to carelessness of the contractor's men in allowing hardened cement and pieces of timber to pass into the pipes; the stoppages were removed by the maintenance men.

The hydrants laid down by the Water Department for flushing purposes have been useful in keeping sewers clean and free from deposit.

The various penstocks and gas-checks have been examined weekly, kept well oiled, and are in good working order.

During the year all the manholes in Bourke-street main sewer, in the Borough of Waterloo, have been altered from side-chambered ventilators to direct ones; this admits of the sewer being examined without disturbing the surface of the road, and facilitates overhead ventilation.

A thorough inspection of the two main outfalls and branches show that they are in good condition.

When the storm-water sewers proposed to be carried out by the City Council on the southern watershed are completed, the amount of silt which will have to be dealt with in the southern outfall will be reduced to a minimum; it is to be hoped that this important work will not be delayed, as the subsidiary sewers on the lower levels are seriously interfered with at the time when they are required to work freely, by the quantity of storm water discharged into the main duct.

### Storm-water Sewers.

The storm-water sewers at Rushcutter's Bay, Dowling-street, Baptist Estate, and Alexandria have efficiently served the purpose for which they were carried out. Sewage

### Sewage Farm.

The manager of the sewage farm, Mr. J. N. Oxley, reports that the area under cultivation is 4 acres 3 roods, and the crops produced to 31st December, 1890, were 23,500 cabbages, 11 tons turnips, 39 tons lucerne, 5'8 tons sorghum; the total amount received for same being £198 0s. 1d.

The amount of sludge dredged from precipitating chambers at Inlet House was 1,565 cubic yards, in addition to which 50 cubic yards was obtained from filter beds; the whole of the sludge was used on the irrigation beds in growing the above crops.

The quantity of lime used in Inlet House during the year was 21½ tons.

The whole of the screens, travelling gear, grabs, valves, &c., are in good working order. The locomotive is in good running order, the only repairs required during the year being new brasses.

The manager further reports that there is a standing crop, available for purchase, the value of which he estimates at £50.

### Extension of Cultivation Areas.

A contract has been let for levelling and preparing additional irrigation areas; this is making good progress. Plans are nearly completed for an extension of filtering tanks on the Botany Bay side of farm; also for a subsoil drain which will admit of more rapid filtration of water in the tanks.

### Analysis of Effluent Water.

Analysis of the effluent water have been made by Mr. Hamlet, Government Analytical Chemist, with favourable results. The analysis clearly demonstrates the suitability of the site and soil for purifying the city sewage by land filtration. The character and density of the crops raised from the soil, which is raw sand, is ample evidence of the value of liquid sewage when properly applied. Details of analysis by Mr. Hamlet are shown in Appendix marked A.

### House Sanitation (City).

The by-laws under which all premises in the City or Suburbs were to be drained were gazetted on the 30th day of December, 1889.

The number of houses which were connected to the public sewers at the date of transfer of the city system to the control of the Board was, according to the records of the City Council, 18,000.

### House Connections.

During the year the house connections carried out under the Board's by-laws were:—City, 961; Borough of Redfern, 1,047; Borough of Waterloo, 201; Borough of Woollahra, 486; and Borough of Paddington, 2,070. Total, 4,765.

With reference to the number given for the City, a large percentage was for a reconstruction of the house system according to the by-laws.

### Drainage Plans.

In connection with the work of house drainage, 2,184 plans or diagrams were prepared, representing 4,765 houses, and the amount of fees returned to accountant for same was £1,027.

### Unassessed Properties.

A considerable amount of work was done by an officer of this branch, with one from the assessors, in making an inspection of all hitherto unassessed property in the City, which resulted in additional revenue to the amount of nearly £2,372 being obtained.

### Defective Drainage.

The City Sanitary Inspector, Mr. Rhodes, reports having served 345 notices to alter and repair defective drainage. Out of the number, 101 owners complied with the Board's demands; the remainder must be further dealt with, as provided by the by-laws.

The reports of the Inspector of examinations of existing drainage in the City show that the best localities and first-class dwellings are not exempt from the effects of bad drainage and imperfect sanitary arrangements; in many cases the state of the drains, &c., were absolutely dangerous to the occupants.

The Suburban Sanitary Inspector, Mr. McKenzie, reports having served 57 notices to alter defective drainage, out of which 25 have complied with the Board's demands; the remainder will, he states, be attended to when a new sewer is laid by the Department.

Licensed

### Licensed Drainers.

During the year it was found necessary to cancel the licenses of five drainers, and ten others were cautioned by the Board. The system of issuing certificates as to work being carried out according to the by-laws has operated very well during the year; the public are now availing themselves of the protection afforded them by the Board.

Taking the rate of progress made in the year, it is within the bounds of possibility that the immediate suburbs will be in a thorough sanitary state in the course of a few years, and the "cesspits" and "pan" system, with their attendant abominations, will be things of the past.

### Sanitary Plumbing.

In this section of the Department it was considered advisable by the Board that the plumbers, who practically had the lives of their clients in their hands, should prove their fitness to undertake such important work as sanitary plumbing, and with the view of testing the capabilities of the licensed plumbers in sanitary work, the Board ordered that before licenses should be issued it would be necessary for them to undergo an examination in the practical and theoretical branches of the trade. This rule was, however, modified to meet cases where old-established firms had held licenses for years. The limit was restricted to a five years tenure of license, and all plumbers who had not held licenses for that period were called upon to pass an examination, the examination consisting of bench work, sanitary fittings, and hot-water supply by diagrams. The results of examination for the past year are, viz. :—

PLUMBERS HOLDING LICENSES					PLUMBERS ATTENDING				
<i>(a) Under five years.</i>					<i>(b) For the first time.</i>				
Number attended	...	...	...	57	Number attended	...	...	...	73
Passed	...	...	...	23	Passed	...	...	...	42
Failed	...	...	...	34	Failed	...	...	...	31

In *(a)* division, of the number of candidates only 40·35 % passed; in *(b)* division, 57·53 % passed the examination. Examinations are held quarterly, and the fact of a candidate failing at an examination does not bar him from presenting himself again; the object of the Board being to improve the status of the plumber, as well as assuring the public that plumbers licensed by them are capable of undertaking the work entrusted to them. During the past year one plumber's license was cancelled, and five were cautioned by the Board.

The Inspector of Sanitary Plumbing, Mr. Clarke, reports that during the year he served 310 notices to alter defective sanitary fittings. Of the number, 123 properties have been altered in accordance with the by-laws. Others are in progress, and some will have to be dealt with as provided for in the Board's by-laws.

### Inspection of Residential Hotels.

The Inspector has examined twenty-nine residential hotels, and reported on the sanitary condition of same. The reports have at various times been brought before the Board, and the proprietors have been requested to comply with the requirements of the Act.

The reports generally disclose a most unsatisfactory state of things in connection with the sanitary fittings of the hotels inspected. In some instances the proprietors have taken action to remedy the defects pointed out. In others it will be necessary, in the interests of public health, to take measures to enforce the law. Of the many instances of defective sanitary fittings, the following will convey an idea of the sanitation of some of our leading hotels. In one case the top and sides of an indoor water-closet trap was perforated by sewer gas. The closet was situated within 10 feet of the principal dining-room. The soil-pipe was unventilated, and received the exhaust steam from serving-room. In another case the joints of the soil-pipe, which was inside the building, were open, and in several places where it had been cut to clear stoppages the workmen had neglected to close the openings. In another instance the soil-pipe was so badly constructed that the joints were fully 2 inches apart, allowing the soil to flow over the place, and, finally, on to the pathway.

Of the various private residences and office chambers examined, the following examination notes will illustrate the dangerous state of internal fittings, viz. :—In one dwelling the bath waste was found discharging into the soil-pipe; the discharges from latter choked the waste from bath, and on two occasions the Inspector found the faecal discharges from the closet in the bath. In several dwellings the soil-pipes, fixed inside, were found to be perforated by sewer gas.

In two buildings, used as offices and work-rooms, the soil and rain-water pipes were connected together, and the hopper heads of down spouts finished close under a window. The "trap" of a closet in one instance had no seal, and was broken on top.

The

The foregoing cases clearly show the necessity for a radical change being made in connection with the sanitary fittings of premises, both public and private, in this city. The danger to health is intensified by the fact that not only are the majority of house-drains not ventilated, but they are connected with an unventilated system without the intervention of a "disconnecting trap." I might here mention that instances have been brought under my notice by the inspectors, of sewers laid under dwellings which were completely stopped by faecal and other matter, the joints being quite open, and in places the pipes were broken. It is obvious, under such conditions, that dwellings could not be otherwise than unhealthy, the sewers, instead of contributing to the healthiness of the premises, became the vehicle of disease by conveying sewer gas into the dwelling.

The carrying out of the by-laws in the earlier part of the year was not effected without considerable trouble and friction, but it is gratifying to be able to report that the medical profession, architects, and general public, are becoming alive to the importance of sanitation. Many buildings, both public and private, have had the house drainage and sanitary fittings entirely reconstructed, without compulsory action of the part of the Board.

The process of reconstruction in the City must necessarily be gradual, as any other course would tend to cause an undue disturbance in the labour market, and be detrimental to the public interests. It would be impossible for even the large number of plumbers licensed by the Board to meet the demands in a reasonable time, considering the amount of work carried out in the suburbs.

### Sanitary and Plumbing Certificates.

The Inspector further reports that 500 certificates were issued to plumbers, that their work was carried out according to by-laws. Many of the jobs were of considerable magnitude and first-class workmanship, and reflected great credit on the plumbers who carried them out.

The Department has been greatly assisted, in dealing with defective drainage in the City, by the City Corporation, through Mr. Seymour, Chief Inspector of Nuisances. Fully eighty cases of defective drainage were reported by that officer, and action was taken by the Board to have same rectified. The reports showed that numerous instances existed where premises were connected with the public sewers without any proper means of flushing.

### Ventilation of Public Sewers.

This important question has been inquired into, in connection with the new system, for some years past. By direction of the late Engineer-in-Chief for Government Sewerage Department, Mr. W. C. Bennett, M. Inst. C.E., exhaustive observations were made in the main outfalls on the movement of air currents in the sewers. The result of such observations clearly showed that the previously accepted rule of air currents travelling in a contrary direction to the sewage flow would not hold good under all conditions. On quick grades it was found that the air current travelled in the direction of the flow; on others, easier grades, it was also found that the wind exercised considerable influence on the direction of the current. Observations have been made at Wimbledon, England, by Mr. Santo Crimp, A.M.I.C.E., with like results. After the completion of the main outfalls and admission of the city sewage complaints were made of the bad smells emitted at certain times from the open ventilating shafts in the roadway. In order to afford relief to the localities affected permission was sought from owners of properties to erect ventilating shafts against their buildings—the Government not having legislative power to attach same to properties—in each case the permit was granted without demur. Permission was also granted by Messrs. Alderson and Sons and the Poudrette and Ammonia Company to connect the branch sewers in vicinity of the works to their chimney stacks. The work was carried out in April, 1889, and the shafts and sewers have been under almost daily observation since. The result has been highly satisfactory, no complaints having since been made.

Tests were also made at various shafts where the old City system was intercepted with test-papers, prepared by steeping sheets of filter-paper in a newly-made solution of 10 per cent. of acetate of lead, and placed in shafts while slightly moist. After exposure, the papers were submitted to the Government Analyst (Mr. Hamlet, F.I.C., F.C.S.), who reported in one case that the test indicated an amount of hydrogen sulphide decidedly dangerous to health. Mr. Hamlet also fixed a scale by which the results could be determined whether the sewer air under test was dangerous to health or not.

When

When the amended Act passed, the Minister or Board were granted powers to attach shafts for ventilation of sewers to buildings, and in the early part of the year the Board instructed that plans be prepared for ventilating the public sewers. The work was taken in hand, and some preliminary tests were made as to the condition of the air in the sewers.

The first section operated upon was the Borough of Darlington and that portion of Borough of Redfern known as Golden Grove, having a population of nearly 10,000. The reticulation of the Darlington Borough and part of Golden Grove was carried out by the local Councils, the former being totally unventilated. Prior to the erection of the shafts, Mr. Dempsey, the officer appointed to supervise this branch of sanitary work, carried out exhaustive tests, in order to ascertain the condition of the sewers to be operated upon as regards "sewer gas." The results verified my previous opinion with regard to one section, viz., Darlington Borough. It was found that hydrogen sulphide was present in a form dangerous to health. During the erection of the shafts, the men employed were often compelled to stop work, being attacked by vomiting and modified forms of tonsillitis, or sewer-air throat, the Inspector also being a sufferer. On one occasion one of the men had to be removed in a semi-unconscious state. The foregoing is of importance, to show the condition of the sewers prior to being systematically ventilated and aerated.

Three months after the erection of ventilating shafts, a marked improvement was noticed in the sewers. The open ventilators, which used previously to emit noxious smells, were changed into fresh-air inducts, through which fresh air was drawn into the sewers to supply the place of the vitiated air drawn out by the exhaust-shafts. A marked decrease in the humidity of the air in the sewers is also noticeable, the range being from 98° at the inception of the work to the mean atmospheric conditions as recorded at the Observatory. This is verified by the reports from the District Sanitary Inspector, who states that since the sewers were ventilated the manholes have become dry, whereas previously they were wet.

#### Surface Air-feeds, not satisfactory.

Observations were made with the view of testing the efficiency of the open gratings of manholes as air-feeds to exhaust shafts. The result was extremely unsatisfactory. It was found that owing to the spaces between the bars of gratings becoming choked with horse manure, road *detritus*, &c., the quantity of air which passed through was small. It was apparent that the gratings could not be depended upon as adjuncts to ventilation, unless at a high cost for maintenance.

#### Overhead Air-feeds.

In lieu of the gratings specially made and tested, induct cowls were attached to shafts at certain points, and the air was thrown into the sewer, by means of the cowls, with a volume equal to 40 per cent of the prevailing wind velocity. This result has been deduced from carefully-made tests with anemometers and Observatory records.

This system of crating the sewers has been tried in England with success. A small installation was tried at Chelsea by Mr. Strachan, A.M.I.C.E. By adopting the system, which is a combination of the "plenum" and "vacuum" systems, purer air is obtained for crating the sewers, and considerable saving is effected in cost of maintenance.

#### Mean Temperature of Sewers.

Observations have been made during the year on the temperature of the sewers. The depth adopted is 10 feet below the surface, and the site precludes the possibility of returns being influenced by conditions other than connected with ordinary sewage.

On the diagram, marked Appendix B, is shown the result of last year's observations, the mean temperatures of each month being shown, as well as external temperature and humidity of the atmosphere.

Daily observations are being taken of the temperatures at different depths, with the view of determining the aids required for efficient ventilation at all times of the year.

In order to treat that portion of Redfern and Darlington draining into the City system separately for ventilation, the flow of sewer gas from the City system was cut off at Cleveland-street by a special chamber with gas check, and shafts were conducted from same over the roofs of houses on either side. It is worthy of note that in this particular locality, where the openings were sources of continual complaints, the conditions have so much altered that, on inquiries being made at intervals, the same favourable reply is received. The air exhausted from the sewer at the above point is, on the average, 48,000 cubic feet

feet in twenty-four hours. In Darlington, by the aid of 13 induct and 35 exhaust shafts, in the average about 39,000 cubic feet of fresh air per hour is passed into and exhausted from the system. The sewers are literally air-swept by means of the shafts, and thoroughly oxydized. That this accords with the true principle of ventilation of sewers, viz., to have the foul air constantly replaced by the admission of fresh air. The sewers should have a constant current often passing through them, as well as the sewage being in constant motion. In properly constructed sewers there should not be any resting place for either—motion, not stagnation, should be the object aimed at.

In the report on the drainage of Melbourne, by Mr. Mausergh, M. Inst. C.E., he states, *inter alia*, in referring to what is termed the "Harrington" system, that "with such circulation it is practically impossible that any offence can arise, and I am of opinion that power should be taken in the Metropolitan Board Bill to erect ventilators of this or other approved type on private property, of course under proper and reasonable regulations, to prevent offence and disfigurement. Arrangements should also be made to utilize the furnaces and high shafts of works factories, tramway stations, &c., to assist the ventilation of the public sewers."

The results of the system adopted in Redfern and Darlington can be summarised as follows:—Thorough oxydation of the sewer air, reduction of humidity, and consequent prevention of fungoid growth in sides of sewers, between maximum and minimum flow, economy in maintenance, and reducing the water required for flushing to a minimum.

### WORKS IN PROGRESS.

#### For erecting Shafts.

The contractors for erection and manufacture of ventilating shafts are making good progress with their different portions of the work. The district under operation comprises that part of the city draining into Lacrozia Valley on the north, and Bourke-street on the south, Paddington and eastern portion of Redfern. The total length of sewers ventilated during the year is 76,770 lineal feet, comprising an area of 370 acres, details of same are shown on Table V.

Plans and data are in course of preparation for ventilating the branch sewers in Boroughs of Paddington (Eastern and Southern portion), Woollahra, Waterloo, and portions of the city.

The main outfall sewer to Bondi will be dealt early this year. Drawings and calculations are being made as to the necessary requirements.

#### Cowl Testing Station.

In order to test the efficiency of the number of cowls submitted for approval the Board approved of a station being established at Crown-street Reservoir for that purpose.

The method of testing has received the approval of the persons most interested, by the manufacturers, it being thoroughly impartial, at the same time exhaustive.

The station is nearly of same altitude above sea level as Government Observatory, so that the daily meteorological records taken at the latter place are used in connection with the testing work. The testing was carried out by means of 4-inch vertical shafts, each fitted with anemometer chambers. These were attached to a light framing made of wrought-iron piping. The cowls for testing were placed in the shafts and allowed to remain for 24 hours; the anemometers were read every morning at 9 a.m., the cowls were then changed over, and allowed another 24 hours run; the mean of the two readings being taken as the result of the trial in each case. By this arrangement the cowls were placed on equal footing. The cowls which gave the best results were then tested against each other by connecting the two shafts by a  $\perp$  piece. The different results are now being collated, and will shortly be ready.

The above tests were made more for house-drain ventilation, and to ascertain the efficiency of the test cowls in a long draught, as would be required in public sewer ventilation; two lengths of pipes, 250 feet each, were laid and connected with upright shafts fitted with anemometer chambers. This test amply demonstrated that some cowls may be very efficient in short draughts, as house ventilation, but are practically useless for long lengths, such as would be required in public sewer ventilation. Forty cowls have been tested at the station, and I will be in a position shortly to tabulate the different cowls according to merit for public information. I should mention that establishing the station has caused a healthy spirit of rivalry to spring up between manufacturers, the object aimed at being to have the most efficient cowl at moderate cost. Great improvement has been effected in "induct" cowls, and the results of same are being collated, and will form valuable data for dealing with the ventilation question.

I wish to record my thanks for the courtesy and kindness shown by the Government Astronomer, H. C. Russell, Esq., B.A., C.M.G., in supplying me with valuable meteorological data, which has contributed largely to the working out of the results of observations made during the year in connection with public ventilation.

## Annual Death-rate.

The diagram marked Appendix C shows the annual death-rate of the city and suburbs from 1856 to 1889, kindly supplied by the Government Statistician, J. A. Coghlan, Esq., A.M. Inst. C.E.; also death-rate from latest returns of the principal Australian and English cities. It will be seen that the death-rate of the suburbs has been higher than that of the city from 1885 to 1889. The latter compares favourably with the healthiest of the English towns, but is higher than that of Adelaide for a single year. The mean death-rate, however, is given by Government Statistician as—Sydney, 19.1; Adelaide, 19.1. The comparatively high death-rate of the city and suburbs can be accounted for by reference to the latest edition of the *Wealth and Progress of New South Wales*. The Government Statistician shows that for 1889 the proportion of deaths of children under 5 years of age per 1,000 of mean population was—city, 63.42; suburbs, 61.06. Persons over 5 years of age—city, 10.25; suburbs, 9.30. The returns show that during the year 1889 epidemics of whooping cough and dysentery occurred, which might account for so high an infantile mortality.

The return will be useful for future comparison with regard to the extension of the new sewerage system to the suburbs and gradual reconstruction of the old city system.

I have, &c.,

J. M. SMAIL, M. Inst. C.E.,

Engineer for Sewerage.

The Secretary.

W. D. CAMPBELL,  
Assistant Engineer.

10th January, 1891.

The following are the rates and charges for water and sewerage :—

WATER RATES.

1. The following rates and charges are those which the owners and occupiers of houses, tenements, and lands shall pay in respect of water supplied by the Board, that is to say :—

*(For water supplied for domestic purposes otherwise than by measure.)*

- (I.) On every house, tenement, or land of twenty pounds assessed annual value and under, ten shillings per annum.
- (II.) On every house, tenement, or land above the assessed annual value of twenty pounds, a rate of sixpence for each pound sterling on the amount of the valuation up to three hundred pounds inclusive; fivepence for each pound on the amount of the valuation in excess of three hundred pounds up to seven hundred pounds; fourpence for each pound on the amount of the valuation in excess of seven hundred pounds up to one thousand pounds; threepence for each pound on the amount of the valuation in excess of one thousand pounds up to four thousand pounds; and twopence for each pound on the amount of the valuation in excess of four thousand pounds.
- (III.) Vacant lands of the assessed value of sixty pounds and over shall be subject to a rate of twopence for each pound sterling on the amount of the valuation.
- (IV.) The like rates as those abovementioned shall be charged on all lands, tenements, and hereditaments not included in any valuation by the Municipal Council of the City of Sydney or Redfern, or of any Borough or Municipal District, and on all lands for the time being valued by the said Municipal Council of the City of Sydney or Redfern, or by such Borough or Municipal District, at a sum less than the true value thereof.

*(For water supplied by measure.)*

- (V.) The charge for water supplied from stand-pipes shall be one shilling and sixpence per 1,000 gallons.
- (VI.) The charge for water supplied from the mains by measure shall be one shilling and sixpence per 1,000 gallons.
- (VII.) The charge for water supplied to shipping will be one shilling and sixpence per 1,000 gallons. Her Majesty's Navy will be supplied free of charge.

*(For water for other than domestic purposes otherwise than by measure.)*

- (VIII.) The charge for water-troughs shall be twenty shillings per annum each.
- (IX.) The charge for gas-engines shall be five shillings per annum for each engine of two-horse power and under, and for every additional horse power beyond two-horse power an additional charge of one shilling per annum for each horse power.
- (X.) The charge for steam engines shall be one pound per annum up to three-horse power. No steam engine of more than three-horse power shall be supplied with water unless through meter.
- (XI.) The charge for organs and such like shall be two pounds per annum up to one-half horse power. No organ or such like instrument of more than one-half horse power shall be supplied with water unless through meter.
- (XII.) The charge for water used in the process of photography or any like process shall be two pounds per annum in each case.
- (XIII.) The charge for water used in the business of cleansing tripe shall be ten shillings per annum in each case.
- (XIV.) The charge for water used for tiring purposes shall be ten shillings per annum in each case.
- (XV.) The charge for water used for ventilators and refrigerators shall be—For trade purposes, two pounds per annum; and for private purposes, one pound per annum in each case.
- (XVI.) The charge for water used for dentists' lathes shall be one pound per annum in each case.
- (XVII.) The charge for water used for the business of a laundry shall be ten shillings per annum. This shall only apply in cases where not more than three persons are employed.

The Board reserve to themselves the right of insisting upon a meter being fixed at any time, notwithstanding the fact that the special fee may have been paid.

2. Assessed rates shall be paid half-yearly in advance, whether a meter is used or not. In the case when a meter is used, the meter account will be rendered only when it is in excess of the assessment. Cheques and post office orders will be received in payment of rates; but if the cheque tendered by any person as payment for rates due is dishonoured, the Board may cut off his service, and proceed for the recovery of the amount by warrant for distress or otherwise. Cheques and post office orders must be crossed in favour of the Board.

3. The minimum charge for water, whether supplied through meter or otherwise, for domestic purposes and for purposes other than domestic, is the assessed annual rate. If the water is supplied by meter, and the meter account exceeds the assessment (calculated at the rate of one shilling and sixpence per 1,000 gallons), then such excess shall be charged in addition to the assessment.

4. One meter may be allowed to supply several tenements when such tenements are occupied by one person or firm as a place of business or abode, and the meter account will be credited with the assessments of all such tenements. One service only will be allowed under these conditions, upon which the meter will be fixed, and all the water for such tenements must pass through such meter. Where peculiar circumstances entail a departure from the above, and two services are absolutely necessary, then there shall be a meter on each service pipe.

5. The Board may supply water for building purposes at the rate of five shillings per room, or by meter at one shilling and sixpence per 1,000 gallons; and the minimum charge by meter shall be ten shillings and sixpence for each work, which charge must be paid in advance. The Board may supply water for plastering rooms at two shillings and sixpence per room, and for the building of washhouses, water-closets, coppers, and chimneys, at five shillings each. The Board may supply water for the making and mixing of concrete for foundations of wooden blocks, stone cubes, or other form of permanent roadway or pavement, at the rate of one pound ten shillings per 1,000 square yards, by superficial measurement of road surface; and for all other concrete, brickwork, or masonry, at the rate of threepence per cubic yard, as measured on the work.

6. Any person who maintains horses or cows may be supplied with water, without meter, from the domestic service for the sum of five shillings per annum for each animal, in addition to the assessed annual rate of the premises on which such animal is maintained or supplied with water.

7. All lands or premises on which any one or more head of horses or cattle shall be kept or maintained, whether such lands or premises are actually supplied with water from any main water-pipe of the Board, or are otherwise rateable or not, shall be liable to an extra rate or charge (beyond and in addition to the assessed annual rate of the premises) of five shillings per head for each head of horses or cattle kept or maintained on such lands or premises.

8. The Board may supply water for gardens (and for such purpose may permit a hose and standpipe to be used) without meter, at the rate of ten shillings per annum for every 750 square feet superficial area, or part thereof, in addition to the assessed annual rate of the premises to which such garden belongs or is attached.

9. The Board may permit a supply of water for water-fountains or waterfalls of a size, construction, and form, and in a position previously approved by the Board, without meter, from the domestic service, for the sum of five shillings per annum for each such fountain or waterfall, in addition to the assessed annual rate of the premises on which such fountain or waterfall is maintained.

#### SEWERAGE RATES.

The following rates and charges are those which the owners and occupiers of houses, tenements, and lands shall pay in respect of sewerage, that is to say:—

- (I.) On every house, tenement, or land of seventeen pounds assessed annual value and under, ten shillings per annum.
- (II.) On every house, tenement, or land above the assessed annual value of seventeen pounds, a rate of sevenpence for each pound sterling on the amount of the valuation.
- (III.) Vacant lands of the assessed annual value of forty pounds and over shall be subject to a rate of threepence for each pound sterling on the amount of the valuation.

#### DESCRIPTION OF SYDNEY WATER WORKS AT END OF 1890.

The supply of water is taken from the Nepean River, and two of its tributaries, the Cordeaux and Cataract Rivers, having a catchment area of 354 square miles; across the Nepean River is thrown a concrete dam 10 feet high, which is designed to divert the stream only, and lift it to level of crown of tunnel; the water is then taken by a tunnel  $4\frac{1}{2}$  miles in length to the Cataract River; a masonry dam is thrown across this river just below the outlet of the tunnel from the Nepean, and is thence conveyed by a tunnel for about  $1\frac{3}{4}$  mile, and then a series of open canals and tunnels, making a total distance from the source of about  $40\frac{1}{2}$  miles to the Prospect Reservoir; there are  $11\frac{3}{4}$  miles of tunnels, and about  $28\frac{1}{2}$  miles of open canal from the catchment to the Prospect Reservoir.

##### *Prospect Reservoir.*

This reservoir covers an area, when full, of 1,261 acres, and has a capacity of 10,812,313,000 gallons.

The dam is earth with a clay puddle core, and is 7,300 feet long, maximum height 84 feet, with slopes of 3 to 1 on the water side, and  $2\frac{1}{2}$  to 1, and two 15-foot berms on the outer side, and is 30 feet wide on the top; the water face is covered with heavy bluestone pitching; when quite full there will be 6,744,343,000 gallons available by gravitation.

The water is drawn off from the reservoir through a valve tower into pipes placed in a brick tunnel, carried outside and round the northern end of embankment, and is discharged through controlling valves into a basin, from which it then proceeds by an open canal for 5 miles to the Pipe Head Basin, situated  $16\frac{1}{2}$  miles from Sydney, and is then conveyed by a wrought-iron pipe 6 feet in diameter to Potts' Hill, a distance of 5 miles, where the screening tank is placed, the water has to percolate through copper gauze screens of 840 mesh to the inch, and then proceeds through a 48-inch cast-iron pipe to Leichhardt, where it is reduced to 42-inch to Crown-street Reservoir. At Lewisham a 48-inch branch is taken off to supply Petersham Reservoir.

##### *Crown-street Reservoir.*

Crown-street Reservoir top water level is 141 feet above high-water mark, and is built of brick, and contains 3,250,000 gallons. At this place is situated the main pumping plant, consisting of a compound high-duty Worthington engine capable of raising 500,000 gallons per hour to Paddington with very great economy: it was designed to work against a head of 100 feet, but with the last main recently laid it only has a pressure of 80 feet to work against, while pumping into the present reservoir at Paddington. The pumps are larger than are necessary for the present supply, and owing to the small storage capacity at Paddington the engine is not being worked to its greatest advantage, as it can only be worked for about three hours at a time.

Three 142-h.p. Babcock and Wilcox boilers.

Two Tangye duplex pumps (non-compound) capable of delivering 105,000 gallons per hour to Woollahra Reservoir; the duty of these pumps is very low, and they are only for temporary use.

*Paddington Reservoir.*

Paddington Reservoir top water level, of which is 214 feet above high-water mark or 73 feet above Crown street, is built of brick, and contains 2,000,000 gallons, and is supplied by a 36-inch cast-iron main from Crown-street pumps, and distributes the water through a 24-inch cast-iron main, *via* Begg-street, and a 36-inch, *via* Park Road.

*Woollahra Reservoir.*

Woollahra Reservoir top water level of which is 282 feet above high water mark or 141 feet above Crown-street, is built of brick and contains 1,000,000 gallons, and is supplied by a cast-iron main from Crown-street, part of which is 30-inch and part 20-inch diameter, and distributes the water through a 20-inch main.

At this Reservoir is an engine which pumps the water to Waverley, through an 18-inch cast-iron pipe, a distance of 1 mile. The engine is a geared rotative Tangye engine fitted with Meyers "cut off" slide valve.

*Waverley Reservoir.*

Waverley Reservoir top water level is 360 feet above the high-water mark, and 73 feet above Woollahra, is built of brick-work, and contains 1,087,000 gallons; it distributes the water through a 15-inch main.

*Petersham Reservoir.*

This reservoir is built of brick and contains 2,157,000 gallons, the top water level is 166 feet above high-water mark, and receives its supply by gravitation through a 48-inch cast-iron main, which branches off the 48-inch main at Lewisham, and distributes the water through two 18-inch outlets.

*North Sydney.*

North Sydney is supplied from the Paddington Reservoir by a 9-inch cast-iron main, which is laid under the harbour from Dawes' Point to Milson's Point, and serves the low level by gravitation. A pumping station is situated at 125 feet above high-water mark, which contains a pair of Blake duplex direct acting pumps, capable of forcing 10,000 gallons per hour through a 6-inch rising main up to two 20,000 gallons elevated wrought-iron tanks, situated at St. Thomas' Church, the top water level being about 325 feet above the high-water mark. From these tanks the high levels are supplied.

The scheme for the supply by gravitation from Potts' Hill to Ryde, and thence by pumping to Chatswood, is very nearly completed, and will command the whole of northern shores of the Parramatta River and Port Jackson. When this extension is finished the present mode of supplying North Sydney will be disused.

*Campbelltown.*

Campbelltown is supplied direct from the main canal by gravitation, a 6-inch pipe from the canal at 16 miles 40 chains being laid to the town, a distance of 2½ miles, and the reticulation consisting chiefly of 4-inch mains.

*Granville.*

Granville is supplied by gravitation through a 15-inch main laid along Woodville Road, a distance of 2½ miles, from the 72-inch wrought-iron trunk main.

*Ashfield.*

A part of Ashfield is too elevated to receive a supply by gravitation from Potts' Hill level, therefore, the loftier parts are supplied from the Woollahra Reservoir by the Petersham trunk main, which is isolated thrice per week from the reticulation and charged with Woollahra water which, it conveys to a 100,000-gallon tank of wrought-iron erected on a brick circular support, at an elevation of 223 feet above high-water mark.

## SEWAGE PURIFICATION.

(REPORT TO THE HONORABLE THE MINISTER FOR PUBLIC WORKS UPON THE QUESTIONS OF SEWAGE PURIFICATION AND SEWER VENTILATION NOW IN USE IN GREAT BRITAIN, BY GEORGE H. STAYTON, M. INST. C.E.)

*Ordered by the Legislative Assembly to be printed, 26 May, 1891.*

Sir,

In accordance with the instructions which I received from you prior to my departure for Europe, in July, 1889, I have the honor to submit the following Report and accompanying plans, being the result of various inspections of works and inquiries into the questions of sewage purification as now practiced in Great Britain.

During my prolonged absence from this country, I inspected the sewerage arrangements of the following cities and towns in Great Britain, viz:—London, Birmingham, Manchester, Salford, Glasgow, Edinburgh, Brighton, Eastbourne, Portsmouth, Plymouth, Bristol, Southampton, Ryde, Folkestone, Bournemouth, Coventry, Croydon, Acton, Tunbridge Wells, Reigate, Norwood, Wimbledon, Kingston-on-Thames, Dorking, Edmonton, Llandudno, Knutsford, and other places. I also inspected various sanitary works and arrangements, and procured much valuable information, at the same time making myself acquainted with the administration of works of water supply, sewerage, and sanitation generally.

While in London I had frequent opportunities of conversing with Sir Robert Rawlinson, K.C.B., who for many years was Engineer-in-Chief to the Local Government Board; Professor Robinson, M. Inst. C.E.; Mr. Alexander Binnie, M. Inst. C.E., the Engineer to the London County Council, and many of the leading sanitary engineers of the day. I also attended an important discussion on the sewage question at the Royal Society of Arts.

Of the various systems of sewage discharge or purification in use in the before-mentioned cities and towns, nine have a direct discharge into the sea, four have adopted broad irrigation, six have adopted precipitation alone, and six use precipitation combined with irrigation or earth filtration for the effluent. Manchester is about to adopt precipitation on a large scale, and Glasgow is contemplating the adoption of irrigation and the establishment of a sewage farm of some 4,500 acres in extent. The purification of sewage by electrical treatment, which created such a *furor* in the scientific world two years ago, does not appear to have made great headway, as beyond certain limited experiments at London, Salford, and Bradford (now discontinued), no practical demonstration has been effected on an important scale or for any lengthy period.

It may be convenient to divide the processes chiefly adopted into four divisions, viz:—

1. Purification by Land (Irrigation).
2. Chemical Purification (Precipitation).
3. Precipitation combined with land filtration.
4. Purification by Land (Intermittent—downward filtration).

As practical examples of the above-named processes, I have selected the following places for the purpose of this Report. I venture to think that the information which has thus been obtained cannot fail to be of interest and real service to the Department over which you preside, which must obviously have an intimate acquaintance with the question under consideration.

The cities and towns referred to in the following remarks under the first classification are Croydon, Edinburgh, Edmonton, and Berlin; the places under the second heading are London, Acton, Kingston-on-Thames, and Salford; those under the third class are Birmingham, Coventry, and Dorking; and under the fourth class the Wimbledon works are referred to. I have also described the electrical system as tried at Crossness, Salford, and Bradford; and have briefly referred to the "Amines" process, which I saw on trial at Wimbledon in 1889, in company with Sir Saul Samuel, K.C.M.G., the Agent-General for this Colony.

In discussing the merits of the various systems, it must be understood that no one system can be laid down as a hard and fast rule. The local conditions of every place requiring sewage disposal must be taken into consideration. Although my instructions were to report fully upon *three only* of the most successful systems in operation in Great Britain, it will be seen that I have dealt with several other towns and systems; indeed, it became necessary to see a number of places before I could determine which, in my opinion, were the most successful systems in use.

I had, however, no difficulty in arriving at the conclusion that the best arranged and managed sewage farms are those of Croydon and Birmingham, and that the three most successful systems of sewage purification by precipitation which I saw are the "International" process, the "A.B.C." process, and the "Coventry" system. I have, therefore, fully described the works and processes in each of these instances, and have procured, and herewith submit, twelve plans and sections of various works and arrangements for sewage purification.

SEWAGE

## SEWAGE IRRIGATION.

Sewage irrigation has been pursued for ages in the ancient Eastern Cities of Europe, and it has been carried on in England and Scotland for a sufficient length of time to show that it is a cheap and effective mode of treating sewage, where land is obtainable at agricultural prices, and where the sewage can flow to the land by gravitation. In discussing the question with Sir Robert Rawlinson, he said that "town sewage, in which there is the largest mixture of human excreta and the least mixture of solid detritus, is the richest in manurial properties, and its disposal will cost the least when applied to land in broad irrigation." He also contended that "crude sewage put on the land while it is fresh, and without storage, is the best system; that chemicals alone will not destroy the salts, but that land will do so." He further said, "Do not drain clay soil or a sandy soil for the purpose of sewage irrigation, as the land cracks under those conditions or becomes so opened that unpurified sewage passes through and creates a nuisance."

There are some thirty or more places in England where sewage irrigation has been in use for a number of years with more or less satisfactory results, as at Banbury, Barking, Bedford, Birmingham, Blackburn, Cheltenham, Chorley, Croydon, Edinburgh, Doncaster, Harrogate, Leamington, Merthyr Tydvil, Oxford, Rugby, Tunbridge Wells, Warwick, West Derby, Wolverhampton, and Wrexham. Paris has appropriated land for sewage irrigation for some years at Gennevilliers and some other places to the extent of 12,350 acres. Steam-pumping power is used, and the river Seine is crossed. The Municipality is so satisfied with this work that the late engineer is to have a statue erected to his memory.

## Croydon Sewage Farms.

The Croydon Sewage Farm is well known to all sanitarians as one of the most successful instances where broad irrigation has been adopted. The Beddington Farm has been established since 1860. It now contains 550 acres and serves a population of 75,000 persons. The South Norwood Farm, which I also visited in May last, has an area of about 100 acres.

The capital outlay incurred in the main sewerage and outfall works, the acquisition of land for the sewage farms, and the erection of buildings thereon, has amounted to £375,000; and the management of the farms is a matter requiring considerable skill and experience. The sewage gravitates to the farms, only a very small amount of pumping being necessary. The subsoil of the Beddington Farm is sandy and gravelly, that at Norwood being a stiff clay. At neither farm is there any subsoil drainage. The Croydon sewage passes through "extractors," but the Norwood sewage is received on the farm in a filter-house, in which there are regulating tanks with galvanized iron gratings, and which intercept a large portion of the grosser matters in the sewage. The tanks are worked alternately and are cleared out by an arrangement with buckets like a dredger. From these tanks the crude sewage, without any further treatment, flows on to the land by open carriers, which are so arranged as to wet the surface gradually. The sewage frequently passes three times over the land before it reaches the river, and the effluent on the occasion of my visit was clear and odourless. For the small amount of pumping at the South Norwood Farm, an "Atkinson's" Cycle gas-engine and a "Waller's" pump are provided.

The lithographed plan accompanying this Report [*vide* Appendix, Drawing A] shows the arrangements of the carriers on the farms. The land on the Beddington Farm, owing to the excellent management, has remained sweet for a period of over thirty years; but there is little doubt that had the management been inefficient it would not have remained so for many months.

The working expenditure of the Beddington Farm for 1889 amounted to £1,091, and for 1890 to £4,244. These amounts do not include any provision for interest or repayment of capital outlay. The receipts for 1889 amounted to £1,403, and for 1890 to £3,505.

The South Norwood expenditure for 1889 was £1,263, and for 1890 £1,480; the receipts being £955 for the former, and £916 for the latter year.

The following statement shows the particulars of the sums received under the various items, and gives some idea as to the value of the crops realized in 1889 and 1890, viz. :—

The accounts show that the charges for rates and taxes on the two farms amount to about £800 per annum, which sums are included in the before-mentioned expenditure. The Croydon Corporation do not now keep any stock on the farms, but they derive a considerable income from what is called "summering"

"summering" cattle—that is, allowing animals to graze on different parts of the farm. The charge for cattle is from 1s. 6d. to 2s., and for horses 4s. per week. Rye-grass is the principal crop grown; but, as will be seen, mangolds, potatoes, cabbages, turnips, celery, &c., are also raised to a large extent. The whole of the grass, except what is required for the farm horses, is sold to dairy-keepers in the neighbourhood and finds a good market.

The Beddington Farm has a considerable number of good residences in its vicinity, and one side of South Norwood Farm abuts upon a populous suburb of the metropolis.

### Edinburgh Sewage Farm.

The Craightenny Sewage Farm has been carried on for over 200 years, and the sewage of Edinburgh has been successfully utilized thereon for irrigating the grass land. I was particularly struck with the simplicity of the manner in which the crude sewage is applied to the land, without even straining, the open water courses and ditches being utilized in a great measure to convey the sewage to the land, which is done entirely by gravitation.

The City Council merely deliver the sewage at the farm, and the lessee, who has a long term, sells the luxuriant crops of grass to dairymen and others. He has an admittedly valuable concession, out of which I learn that fortunes have been amassed. The authorities are endeavouring to arrange with him for the construction of improved conduits and carriers; but I understand that the lessee is so suspicious that any alterations may prejudice his profits, that at present they have not been able to come to terms.

The farm is in the suburbs of Edinburgh, and it has been so often alluded to in reports presented to the Department of Public Works, that I scarcely think it necessary to make more than a passing reference to it. I had an interview with Dr. Littlejohn, the well known Medical Officer of Health at Edinburgh, and he informed me that he had never been able to ascertain that the operations at the farm had caused sickness to the local residents. During the time of the cholera visitation many years since, a number of houses which are in the midst of the farm were at that time supplied with drinking water from wells, and some sickness occurred; but since the city water supply has been laid on to these premises and the wells closed, the occupants of the houses have enjoyed ordinary health, clearly showing that sewage-farm operations may be safely carried on in the vicinity of dwelling-houses.

### Edmonton Sewage Farm.

The sewage of Edmonton and Southgate, on the north side of London, is discharged upon a farm of some 200 acres in extent. The dry-weather flow from a population of 40,000 persons is about one and a half million gallons per day.

Until quite recently the lime process was used, followed up by irrigation, at an annual cost of £2,000. In consequence of the great expense thus incurred, the Engineer discontinued the use of lime, and reverted to broad irrigation only, by which the annual cost was reduced to £750, and a good effluent obtained.

The whole of the sewage is pumped into concrete settling tanks, which have been built above the surface of the ground, the tanks commanding the entire farm. The buildings and works have been constructed very economically. The engines are 70-horse power, and consume 2 lb. of coal per I.H.P. The sewage is pumped to a height of about 26 feet. The sludge from the tanks is conveyed by gravitation to the lower parts of the farm through a 2-foot cast-iron main.

There are some 40 or 50 acres of watercress beds, for which the growers pay the Local Board an annual rent of £12 per acre. The crops sold from the farm realise over £1,000 per annum.

### Berlin Sewage Farm.

At Berlin the sewage of the city is lifted by steam-power to a height of 130 feet, at a cost of £12,000 per annum. Upwards of 2,000 acres of land have been purchased at a cost of £400,000, and this land is laid out and cultivated under sewage. Berlin is the first large continental city where sewage irrigation has been recently adopted on a gigantic scale. When the drainage works are completed, not a particle of sewage will find its way into the river that flows through the city. The area of Berlin comprises 24 square miles, with a length of streets equal to 233 English miles. Its population now amounts to one and a half millions, it having increased during the last few years at the rate of  $3\frac{1}{2}$  per cent. per annum. The river Spree flows through the town, and divides it into the northern and southern city, the land rising on either side of the Spree. At an average water-level, the Spree discharges about 1,500 cubic feet per second, but carries as much as 5,700 cubic feet in flood time. The annual rainfall amounts to a little over 23 inches on an average, but the city is subject to very heavy thunderstorms. Berlin is divided into twelve separate drainage systems, called "radial systems," seven lying north and five south of the Spree. Each system is entirely independent of the other, and the name "radial system" was, no doubt, given them, as all sewers radiate from the circumference of the system towards the centre of it, where the pumping station is situated. From here the sewage is forced through large pumping mains on to the farm. These radial systems vary in size from about 556 acres to 2,130 acres, and average about 1,150 acres, with a population, in those districts that are entirely built upon, of nearly 200,000. Only the storm-overflow sewers have a direct connection with the river, and the city authorities have to obtain the sanction of the Government to all such connections. The systems north of the river have their farms on that side, and the farms for the southern radial systems are on the south side, so that, practically speaking, no sewage finds its way across the Spree. The farms to the north are about 6 miles distant from the heart of the city, and those in the south about 12 miles. The total acreage of all the farms has now reached 16,477 acres, or about 26 square miles, out of which total about 7,900 were, at the end of 1887, specially prepared for irrigation, and every year more land is dealt with in this way. The total dry-weather sewage flow in twenty-four hours amounts to about 27,000,000 gallons, equal to about  $21\frac{1}{2}$  gallons of sewage per head, the water supply only amounting to 14 gallons. To pump 1,000 gallons of drinking water into the city costs about 7-49d.; to convey the same quantity to the pumping station, to force it from there on to the farm, and to purify it there, costs another 7-52d. The health of the

the labourers on the farms is very good, and the death-rate was only eleven per 1,000 during the last year; and it is rather a remarkable fact that, although there was a severe epidemic of typhoid during the first months of 1888 in the city, yet no case of disease occurred on any of the farms. The effluent from the farms goes into little streams in places not wider than 10 feet, and that from the northern farms joins the Spree above Berlin. No complaints are now made respecting the condition of the streams, and the chemical analysis during the last year has given satisfactory results. The authorities of Berlin have spent £2,794,196 in sewage works, and £1,149,206 in sewage disposal works, or a total of £3,943,402 in the two undertakings. The income from the farms amounted, during the last year, to £95,027, the expenditure to £86,570, leaving a surplus of £8,457, which is equal to one-seventh part of the total amount repayable for capital and interest. The cost of the sewage disposal is, therefore, about 10d. per head of the population.

### PRECIPITATION.

It is now generally admitted that sewage is not purified by chemicals, but only clarified; and that the sludge separated by precipitation, in itself, has no commercial value, wet or dry. The only purification of sewage with which I am acquainted (says Sir Robert Rawlinson) is when it is used in broad irrigation on a light porous soil, in summer weather; when the entire volume of water disappears in absorption and evaporation, the soil and the sun having effectually purified it. This, and this alone, is sewage purification.

The system of sewage disposal by precipitation has certainly been adopted in England to a very considerable extent during the past six or seven years. The principle consists in the addition of certain chemicals to the sewage, which causes the suspended matters to subside and to precipitate a great part of the organic matter in solution. Settling tanks are provided for this purpose. After the clarified liquid is drawn off, there remains the sludge at the bottom of the tanks for subsequent disposal.

The lime process, which up to a few years since was considered sufficient to clarify sewage, is now very generally condemned. It consisted in the use of fresh lime reduced to a fine powder, made into milk of lime, and introduced into and thoroughly mixed with the crude sewage. For many years this process was in operation; but where the effluent was discharged into a river or watercourse it gave most unsatisfactory results, and it will be readily understood that where 10 to 12 grains of lime were used for every gallon of sewage, it greatly increased the bulk of sludge which required to be dealt with. It is, however, in use in a more or less modified manner at Birmingham, Sheffield, Chiswick, Ealing, Leeds, and other places; but it has been abandoned at Coventry, Wimbledon, Dorking, Hendon, Salford, Reigate, Edmonton, and other towns; in fact, the Borough Engineer of Salford informed me that they found lime utterly useless at their works as a satisfactory purifier of sewage.

The other precipitation processes in use in the most modern arrangements for the purification of sewage are the "International" System, the "A.B.C." process, and the "Sulphate of Alumina and Lime" process followed up by irrigation, as in use at Coventry. There is also the "Lime and Iron" process which has been adopted for the London sewage at the outfalls at Barking and Crossness.

### The London Sewage Outfall Works.

London has now expended some £7,000,000 sterling upon main sewerage and outfall works. The County Council have practically completed the new works at the Barking and Crossness outfalls, and have commenced to purify the sewage of the metropolis upon the process which was recommended by their chemist and several eminent men some three years ago. A large number of tanks, each 1,000 feet by 31 feet, covering an area of 11 acres in all, have been constructed at the outfalls, and I had an opportunity of inspecting these works in November last. The cost of the works, machinery, ships and plant is about £1,000,000 sterling. It is intended to use lime and proto-sulphate of iron to clarify the sewage. These chemicals will be added to the sewage in the proportion of 4 grains of lime and 1 grain of iron to each gallon of sewage, the treated sewage being allowed to settle, and the effluent drained off to the river Thames at certain states of the tide. In hot weather, permanganate of potash will be further added to deodorize the effluent. The daily volume of sewage is nearly 200,000,000 gallons, and the sludge is estimated at the enormous quantity of 3,000 tons per day, or over 1,000,000 tons per annum. It is to be pumped into steamers, which have been specially built for that purpose, each vessel holding 1,000 tons of sludge, and taken out to sea 12 miles beyond the "Nore," and deposited over an area of 20 miles of water. The Council have recently ordered another sludge-ship to be built at a cost of £28,000.

At the time of my inspection, only about 15,000,000 gallons per day were being so treated. This volume produced about 2,000 tons of drained sludge per week. It costs about 6d. per ton to pump the sludge from the tanks to the steamers and dispose of it. It is anticipated that to treat 70,000,000 gallons per day at Crossness will cost from 18s. to £1 per million gallons, irrespective of the disposal of the sludge.

The authorities find that it will be cheaper to take the sludge out to sea than to press it into cakes by means of filter presses. They estimated, after making exhaustive experiments, that the total cost of pressing would amount to about 4s. 6d. per ton; the item for filter cloths alone amounting to no less than 1s. 1d. per ton. After allowing the sludge to drain off for sixteen hours, its moisture was found to have been reduced to 41 per cent. The Council therefore decided that it is more economical to take it to sea without further treatment.

### The International System.

The International system of sewage purification has been adopted at Acton, Hendon, Southall, Swinton, and Finchley. It is being largely adopted in Lancashire, at populous places like Hyde, Sale, Pendlebury, Radcliffe, Bury, and Turton, and the Local Government Board has sanctioned its use at Tottenham, Sutton, Crompton, and Royton. I learn on high authority that the process is likely to be adopted at Salford on a very extensive scale, in which case there is little doubt that the numerous towns which now drain into the river Irwell will also adopt the International system during the present year, in consequence of the action which will be taken by the Manchester Ship Canal Company to compel these authorities to discharge a satisfactory effluent into the canal waters. In

In the report of the Royal Commission on the London Sewage Discharge in November, 1884, precipitation and deodorization followed by filtration were recommended. Scientists and sanitarians subsequently discovered means to effectively and economically attain these objects, and in 1887 the International Company was established to carry them out.

The system was first adopted at Acton, where the sewage works are situated upon the boundary of the metropolis. The process has been in use since July, 1887, and it is carried out in two stages, viz. :—

1. By precipitating and deodorising the sewage in settling tanks by the aid of a magnetic precipitant and deodorant called "ferozone."
2. By passing the partly purified sewage-effluent from the settling tanks through "polarite" filter beds, which arrest any solids remaining in suspension, and oxidise and render innocuous any putrescible matters held in solution.

I learn from the Company's pamphlets that "ferozone" is the trade name of the material so successfully used in deodorising sewage and precipitating the solids therefrom. It is a cheap preparation, containing salts of iron and alumina, acknowledged to be the best and most powerful precipitants and deodorants for sewage purification. It is rich in ferrous iron, alumina, magnesia, and magnetic oxide of iron, in a very spongy and absorbent condition. By virtue of its soluble iron, alumina, and magnesia salts, it soon causes subsidence of the suspended solids. The iron oxide being porous and magnetic, parts with its polarised oxygen and thereby helps to disinfect and deodorise the sewage and sludge. It attacks the molecular constitution of that portion of the organic matters in solution which cannot be removed by precipitation in the settling tanks. It so alters the constitution of these putrescible matters that further oxidation thereof by filtration through polarite becomes certain and under complete control at all times. The sludge precipitated is said to be richer in ammonia than that produced by the lime process, and is therefore of considerable value as a fertiliser.

"Polarite" is the name of the material used for filtering and further purifying the ferozoned sewage water. The Company state that "it is a specially prepared rustless and magnetic oxide of iron, insoluble in water, non-poisonous and practically everlasting; that it is very hard, porous, and absorbent; and that it is the only permanent oxidiser sufficiently cheap and durable for practical use in filter beds on a large scale for the purification of sewage effluent. It is a powerful deodoriser and decoloriser by virtue of the polarised oxygen contained within its microscopic pores. Although it consists chiefly of iron it does not rust and is therefore much superior to spongy iron. It supplies a long felt want for sanitary purposes, and is cheap enough to bring it into general use where good drinking water or a satisfactory sewage effluent is required. The polarite filter-beds at the Acton Sewage Works are now as good and effective, after continuous use for over three years, as when they were laid down."

Both these materials are manufactured from natural deposits which are found in the anthracite coal formation in South Wales. The London price of the polarite is £4 per ton, and of the ferozone £2 per ton.

It appears that the company are now purifying the sewage of a population of 11,000 persons by passing the tank effluent through polarite filter beds having an area of one-ninth of an acre only, and are obtaining much better results than when the sewage was put over a large quantity of land.

In carrying out the process of purification at Acton, where the sewage works had not been originally constructed to carry out the polarite process; the sewage, on reaching the outfall works, is run through strainers to arrest the floating solids, such as corks, rags, &c., and it then flows through a floating trough, in which there are a series of baffling plates to thoroughly incorporate the ferozone with the sewage, into a settling tank, the floor of which inclines towards the centre so that a gutter may convey the sludge to the outlet valve. Before entering the tank, which has a capacity of 130,000 gallons, and of which there are three, side by side, the crude sewage receives a dose of the ferozone, which costs about one farthing for every 1,000 gallons of sewage treated. This can be added automatically by placing baskets of ferozone in the flowing sewage, or by using "Beloe's" patent automatic sewage-mixing machine. In places where the sewage does not flow by gravitation, but has to be pumped, and steam-power is therefore available, the ferozone may be ground with water or sewage in a small edge-runner mill and added automatically to the crude sewage in a liquid state. This is done at Acton, but the company desire it to be distinctly understood that no mechanical power is necessary for adding and mixing the ferozone. The flow of sewage into the tanks is effected by means of a floating inlet board, and the flow through the tanks is not continuous. Quiescent tanks are better for precipitation purposes, whatever kind of precipitant be used. When a tank is full its contents are left standing for about two hours, so that the ferozone may have time to act thoroughly. As towns differ in the quality of their sewage, the needful period of quiescence will vary in different places. The ferozone causes deodorization and precipitation to take place in the sewage, and a considerable part of the albumenoids in solution congregate and are precipitated with the solids. The supernatant sewage-water thus clarified is then drawn off by means of floating outlets with scum-shields attached, and run through polarite filter-beds, which are said to produce a higher degree of purification at less cost than can be obtained by any other known process.

The polarite filter-beds consist of 6 inches of broken stone, in which 4-inch agricultural drain-pipes are embedded, 3 inches of gravel, 6 inches of sand, 12 inches of polarite and sand mixed in equal proportions, and at the top a layer of 9 inches of fine sand, making a total depth of 3 feet of filtering material. Polarite filters purify tank effluents which have been treated with ferozone at the rate of 1,000 gallons per square yard in twenty-four hours. They give better results than those frequently produced by land filtration, and at less cost and without nuisance. Land-filters pass about 1½ gallon per square yard in twenty-four hours. It is therefore asserted that 1 acre of polarite filter-bed will do as effective work as 666 acres of land.

The polarite filter-bed only requires a few hours rest occasionally for aeration and for cleansing the surface sand, which is done automatically at a nominal cost. The polarite does not require to be removed or replaced, hence it is better to lay down several small beds rather than one or two large ones, so that they may rest a few hours alternately for aeration and cleansing.

After the needful time has elapsed for precipitation of the solids in the ferozone tank, the supernatant sewage-water is drawn off through a floating arm, surrounded by a floating sill to prevent any solid matters from passing into it. It flows from the tank through an iron pipe to the polarite beds for filtration.

tion. After passing through the polarite, the effluent is neither acid nor alkaline. It will not decompose in hot seasons, but remains inodorous, non-putrescible, clear, and tasteless. The higher forms of green aquatic vegetation thrive in it. It will not kill fish, but rather help to purify a river by discharging into it water free from any tendency to undergo secondary decomposition. I can personally testify that the effluent is tasteless, having drunk a tumbler of it as it came out of the tanks at the Acton works.

The sludge deposited in the settling tanks having been deodorised by ferozone, is comparatively inoffensive—unlike that produced by lime and other processes. The quantity, too, is less, being only about one-half that produced by the lime process; hence it is rich in manurial value, and requires less labour and machinery to treat it. In many places it may be drained into sludge-pits, covered by a light roof and arranged so as to send the surface liquor back to the tanks for further ferozone treatment. The sludge can then be mixed with house refuse and street sweepings, and sold to farmers. In large works it is probably better to press it by improved sludge-pressing machinery. The pressed ferozone sludge will dry spontaneously if placed under cover, and can be easily and cheaply ground to powder. In this state it can be kept, without nuisance, in a dry store until the season comes round for selling it as a fertiliser. The sewage manure produced by the International process is shown by analysis to contain nitrogen equal to from 1 to 2 per cent. of ammonia, according to the quality of the sewage, besides phosphates. At Acton it is sold in a fine powder at 30s. per ton, whereas at some sewage works, where lime is the precipitant, the sludge actually costs over 4s. per ton to press.

The International Company claim that their system is better adapted for the purification of sewage than any other known process, because—

- (1.) It is more effective and less costly than any other system.
- (2.) Existing sewage-works could generally be utilised, the cost of acquiring additional land avoided, and capital thereby saved.
- (3.) Purification would be effected to an extent which fulfils all the requirements of the "Rivers' Pollution and Thames Conservancy Acts."

That the International process of precipitation, deodorisation, and filtration meets the requirements of sanitarians is established beyond doubt by the actual experience of the sanitary authorities who are using it, and by the reports of such well-known authorities as Professor Sir Henry Roscoe, M.P., F.R.S., Dr. Dupre, F.R.S., Professor Frankland, F.R.S., Dr. Chancellor, State Director, Board of Health, Baltimore, U.S., Professor Robinson, M. Inst. C.E., Mr. Baldwin Latham, M. Inst. C.E., and many other eminent engineers and scientists who have examined the process and testified in its favour.

I visited the sewage works at Salford, where the sewage of a population of 250,000 persons is discharged. The Borough Engineer, Mr. Arthur Jacob, M. Inst. C.E., expressed satisfaction with the experiments which his Corporation have carried out themselves with the International Company's process, and Dr. Carter Bell (the Borough Analyst) has certified that "the effluent was a first-class one, and that many well-waters in the country were not so good." The result of the analysis of Sir Henry Roscoe of the sewage treated by the Company's process gives remarkably good results. In the report of the Medical Officer of Health to the Corporation of Leicester, who have adopted the treatment by ferozone, it is stated that fish lived for weeks in the effluent, and that portions of it were kept for weeks at a temperature of 90 degrees Fahrenheit and did not decompose, but remained perfectly clear and inoffensive. A polarite filter would act automatically night and day, and independently of the weather. Dr. Angell, analyst to the Borough of Southampton, in explaining the action of the ferozone as a precipitant and deodorant, stated "that its effect was to render the sludge more valuable. The polarite was an extremely porous substance, containing excluded oxygen, or oxygen in its most active form. This was the agent that effected the ultimate purification of sewage. The process was used largely in this country, in India, Malta, and some of the Colonies, for the purification of water. The filters made of polarite were, humanly speaking, indestructible, the polarite not requiring renewal for many years. This was on account of the polarite being absolutely insoluble, and never rusting as spongy iron did. The polarite in use at Acton had been examined and found to be entirely unchanged."

The following abstract from a report by Professor Frankland (one of Her Majesty's Commissioners to inquire into the pollution of rivers) to Major Tulloch, R.E., the Chief Engineering Inspector of the Local Government Board, on the results of his investigation of the process as carried out at Acton, is of such importance that I give it at length:—

"The results show that the raw sewage contained a very large proportion of highly-polluting suspended matter, and an unusually large amount of foul organic matter in solution; and further, that the effluents from the subsidence tank and filter were derived from sewage of about equal polluting powers as regards dissolved organic matter. In the subsidence tank the suspended matter was reduced from 240.80 parts per 100,000 of raw sewage to 5.92 parts per 100,000 of tank effluent, whilst the effluent from the filter was free from suspended matter. It was clear and transparent. This is a satisfactory result. The effect upon the dissolved organic matter in the subsidence tank is very remarkable, its amount being reduced to little more than one-tenth of that present in the original sewage. In its subsequent passage through the filter, the dissolved organic matter is still further reduced to nearly one-sixteenth of that present in the original sewage. It is now in a state of purity greatly exceeding that prescribed by the standards of the Rivers' Pollution Commissioners. No chemical process of purifying sewage has ever, in my experience, approached this efficiency; and if the results obtained at Acton can be accomplished in other places, a most important advance will be made in the purification of the sewage of towns. I need scarcely add that the effluent from the filter is not only clear but inodorous and inoffensive. It is of course not fit for dietetic purposes; but it may be admitted in large volumes into running water without creating any nuisance."

I should state that Dr. Frankland's investigation was made, unknown to the Company, for Major Tulloch, and not for or at the request of the International Company.

In an account of the Acton Works, Mr. G. H. Underwood, Chairman of the Gorton Sewage Committee, states that the ferozone acts with great rapidity both as a disinfectant and a precipitant. It runs into the sewage in a creamy state. The sewage is from a water-closet system, and the odour is most offensive; but immediately the ferozone comes into contact with it, deodorization appears to follow, and the

the sewage appears to be full of a flocculent precipitate, which immediately begins to subside upon entering the tanks. This he attributes to the decomposition of a ferro-aluminous salt in the ferozone; and as it falls, it carries with it much insoluble organic matter held in suspension, and, unlike the use of lime, it fixes all the ammonia in place of evolving it, thus reducing the nuisance to a minimum. From his observation, the ferozone appears to be the most economical of any product used for sewage purposes. It is calculated that eight grains per gallon is sufficient to effect the desired object.

Mr. Underwood proceeds—"As all sewage treatment must be of a chemical nature, this ferozone appears the best agent for the purpose I have met with, as well as the most economical. Precipitation of the sludge is quicker by this process than by the lime process, for in about three hours the precipitation is perfect. The clear liquor—the effluent from the tanks—is then run upon a filter capable of filtering 1,000 gallons per square yard in twenty-four hours. This filter is the "Eureka" of sewage purification. The passage of the tank effluent through the filter produces a wonderful change. You see it flow from the filter bed in a pure sparkling state, perfectly free from matter in suspension and from any odour. It contains no trace of sulphureted hydrogen or free sulphide. It is neutral, contains a quantity of soluble chlorides and sulphates, and is bright and sparkling—enough so to tempt one to drink. The mysterious part of the Acton Works is this filter. Its power is hidden and secret, and the result marvellous. You have on its surface a dark unsightly fluid, and, flowing from it, a beautiful pellucid stream. This magical transformation is owing to the use of a natural ore called 'polarite.' It is highly magnetic, and is microscopically porous. Though an iron compound, it does not rust or oxidise whilst in use. The soluble organic matter of the tank effluent is putrescible; but when it is passed through the polarite filter, this soluble matter is consumed (oxidised) by the oxygen contained in the pores or cells of the polarite, and the effluent becomes almost free from soluble organic matter, and is in a fit state to run into the river. It is said that this polarite gives up some of its oxygen of composition, and possesses the power of recuperation, and that to ensure this effectually the filter is allowed to cease work at intervals. It is also said that this filter is indestructible, that the polarite never requires renewing, and that a rest of a few hours revives its peculiar action. This would appear true of the Acton filter, as it is as energetic in its action as when first used. It is the best system of sewage purification that I have seen."

Professor Robinson, M. Inst. C.E., the eminent sanitary engineer, in a recent report, says:—"Since my inspection of the sewage works at Acton, in 1887 and 1888, for the purpose of observing the process of the International Company, I have again visited the work, and found that the 'polarite' filter continued its purifying effect upon the effluent water from the tanks in which the sewage had been previously treated by the ferozone, the precipitating material employed in this process. During this month I have inspected the Sewage Outfall Works of the Hendon Local Board, which the International Company has now the sole management of, in consequence of the lime and land process, which had been in operation there before, not proving satisfactory. A population of 10,500 contributes to the sewage, which arrived at the tanks on the occasion of my visit in an exceedingly foul condition. I am informed that the Board acquired 40 acres of land, of which 21 are occupied by the works, and about 6 are laid out as an earth filter, consisting of 12 inches of alluvial soil laid over 18 inches of burnt ballast, the whole underdrained by 4-inch drain pipes. The remainder of the land was not laid out, although used at times for sewage treatment. Before the Company undertook the management of the Outfall Works, the system employed was that of precipitating by lime (about 16 grains per gallon, or 1 ton per 1,000,000 gallons), and passing the effluent through the earth beds. On the works being taken over by the Company, the lime process was abandoned, and their precipitant, 'ferozone,' was employed instead. They also discontinued the use of the earth and ballast filter-beds, and laid out a small area (525 yards) into two 'polarite' filters, consisting of 6 in. of polarite mixed with 6 in. of sand above it and 6 in. of sand beneath it, with underdrains laid in ballast. With this small filtering area as an adjunct to the precipitation works, the effluent produced is very satisfactory, and confirms the favourable opinion I had formed of the process as I had seen it at Acton. The sludge is smaller in bulk than in the processes employing lime as the chief precipitant, and it is free from the enfeebling action which is produced through the presence of lime in large quantities in sludge, from a manurial point of view. I consider the effect produced by this small filter of 525 yards is very remarkable, and the fact that it accomplishes a purification which the large area previously employed failed to do, indicates a great advance in dealing with sewage, especially on limited outfall areas."

I venture to submit, therefore, that the foregoing opinions are emphatically in favour of the international system. It is certainly a strong recommendation that not only do the Local Government Board and many of the leading sanitary engineers approve the process, but the various sanitary authorities who have adopted it are decidedly impressed by the results which have been achieved. No doubt there have been many failures in the attempts hitherto made to treat sewage by precipitation only, and for several reasons. Improper chemicals have been used; the tank effluents have not been properly purified by filtration; and many of the chemical processes have been promoted by companies who hoped to make money of the materials extracted from the sewage. Although beautifully clear effluents were produced, the financial part of the process did not succeed, and, when the work had to be carried on at a loss, it soon came to an end. Chemical science has made great strides during the last few years, and it would appear that, in the question of sewage treatment, the introduction of the precipitant and deodorant above referred to is a decided advance.

When I visited the works at Acton, in August last, I had an opportunity to see and examine the entire process. I saw the manner in which the foul sewage was deodorised before it entered the tanks, how it passed into the polarite filter-beds, and not only saw the purified effluent as it came away, but, as I have previously stated, drank a tumbler of it. At the time of my visit there was not the slightest suspicion of any foul smell, and, although the works are in a populous district, I could not learn that any complaint had been made as to the manner in which the operations are carried on.

The quantity of ferozone used per million gallons of sewage varies from 7 to 10 cwt., according to the nature of the sewage treated—whether it is in a state of decomposition, or whether it is delivered at the sewage works in a fresh condition. In various instances the ferozone has been successfully used as a sewage deodorant during the summer months, without the use of polarite filters, and with beneficial results. At Leicester, some 9,000,000 gallons are so treated daily, and at several towns, asylums, and public institutions the sewage is thus deodorised before being used for irrigation.

Polarite

Polarite beds for filtering the ferozoned sewage water, cost in England from £2 5s. to £3 per square yard, including brick or concrete construction and all materials as well as the polarite. Six beds of 200 yards each are sufficient for purifying 1,000,000 gallons per 24 hours, the only cost being interest on construction, and a small sum (calculated at 4s. per 1,000,000 gallons), for cleansing the surface sand of the filter beds. This can be done automatically. The polarite beds do not require changing or removing, a slight rest only of a few hours occasionally being all that is needed to effect revivification. The engineer's estimate for altering and adapting the sewage tanks at Salford, and constructing polarite beds for 10,000,000 gallons of sewage per day, amounted to £17,000; and the working expenses, including 912 tons of ferrozene, were estimated at £3,840 per annum.

Accompanying this Report are plans and sections (*vide* Appendix, Drawing B) of the most modern works in England in course of construction for the international sewage process; also, a sketch plan (Drawing C) of the Acton sewage works and section of the polarite filter beds, and plan and sections (Drawing D) illustrating an ideal arrangement for this system of sewage purification, together with sketch plan (Drawing E) of an arrangement suitable for a small town or public institution. The first named plans have recently been designed for a town near London, and for a prospective population of 25,000 persons. The engineer for these works states, that it would be an advantage to place a light corrugated iron roof over the tanks, as he did at Southall, in Middlesex.

I venture to submit that for such a district as North Sydney or other suburban or country towns where land is not easily available for irrigation or earth filtration, the process is obviously worthy of every consideration; and, supported by the before-mentioned professional opinions and experiences, I have every confidence in asserting that if such works were well designed, and the process properly looked after, the result would certainly give satisfaction.

### The "A. B. C." Process.

The "A. B. C." process of sewage purification is in operation at Kingston-on-Thames, Aylesbury, and Wellington College. The process has been in use at Aylesbury since 1882, and at Kingston-on-Thames since June, 1889. It has also been satisfactorily working at Wellington College for some time. These three places may be said to be representative ones, and demonstrate the efficacy of the process for a large town, for a small one, and for a public institution.

I inspected the works and process at Kingston-on-Thames, in September last, with the Chairman of the Drainage Committee of that Borough, and with Mr. W. C. Sillar, the Managing Director of the Native Guano Company, who carry on the process of purification at these works under an agreement with the Kingston Corporation. The works are situated within a few hundred yards of the market place, and there are houses and mansions in close proximity. There is also a newly formed promenade with ornamental gardens along the river front of the works. It may, therefore, be said that the process at Kingston is subjected to a very severe test as regards the questions of nuisance and annoyance.

It is generally admitted that the Company have fought an exceedingly hard battle for many years in their endeavours to get their precipitation system adopted. The process has produced one of the best effluents of any chemical system which does not employ filtration in aid of chemicals. The expense is a serious consideration, and it can only be justified on the assumption that the dried sludge or native-guano manufactured therefrom realises the price of £3 10s per ton, which it is stated to be worth.

It is claimed for the "A. B. C." process that it successfully fulfils the demands of the sewage purification problem, and:—

1. That the effluent water is sufficiently purified to be admissible into any river within the requirements of the Rivers' Pollution Prevention Act, and without injury to fish.
2. That this is effected without nuisance.
3. That the materials used do not injure or destroy the manurial qualities of the sewage, which are consequently preserved for agricultural use, in a dry, portable, and inoffensive form.

Accompanying this Report will be found plans and sections of the works and buildings (*vide* Appendix, Drawings F, G, and H), together with a small lithographed plan (Drawing I) illustrating various arrangements.

The site of the works is about 800 feet in length and 250 feet in breadth. The approach is by a gateway, near which are the offices, and a tramway winding up an incline for the conveyance of coals and the guano produced. The existing main sewer of the town is intercepted, and the Kingston sewage, on reaching the works, passes into the screening chamber and through a grating which intercepts coarse matter likely to choke or injure the pumps, and thence through a culvert to a pump well 25 feet deep by 14 feet in diameter under the main building, where it receives the "B C" or deodorizing and purifying mixture. The sewage thus partially treated is raised about 12 feet into the main building by centrifugal pumps, of which there are three, each driven by a 15-horse power engine, and capable of lifting 1,650 gallons per minute. The pumps discharge into a meter chamber, where the sewage is measured and the quantity registered. On leaving the meter the sewage flows along an open channel to the settling tanks, receiving on its way the precipitating agents. These pumps are driven by three "Willan's" triple expansion central valve engines, coupled direct to the pump spindles, and mounted on the same bed-plate.

The main building is built of yellow stocks and red bricks, with stone dressings, and presents a very sightly river frontage. The end views are also simple and neat. The chimney stack is done away with, being replaced by a block of flues like those of an ordinary residence. In this building are also placed, near to the sump well, the steam engines for driving the shafting and working the mixing and other machinery. These engines are also of the latest "Willan's" type, and will be each capable of indicating 40-horse power. Close by, also, on a raised floor, are the mills which mix the clay and charcoal. This mixture is ejected into the conduit, and acts chemically upon the organic matter of the sewage. Further on are the alum mixers, the alum mixture flowing along a saw-toothed gutter at right angles to the conduit and running over it into the sewage stream in drops and rills.

The chemically-treated sewage still flows on in the conduit until it reaches the settling tanks, which are eight in number, or may rather be described as two sets of four tanks. The conduit flows past all these, the sewage being admitted by sluices into one or more, or any, as may be required. The tanks are each 85 feet long by 50 feet broad, and 6 feet average working depth, holding 150,000 gallons, or 1,200,000 gallons

gallons in the aggregate, and are partially divided in the middle longitudinally by a wall, about three-quarters the distance of the entire length. The tanks are deeper at the near ends and shallower at their rears, so that the tendency of the sludge deposited is to gravitate towards the front wall, whilst the dividing wall tends to cause the fluid portion to circulate round into the second half of the tank, giving it more time to settle before the surplus water runs off by a trumpet-mouthed vertical pipe, secured to the wall. Attached also to the same front wall of each tank is a jointed pipe, to which a floating valve is attached for draining off the remainder of the water, nearly to the surface of the sludge beneath. The water so drawn off is conveyed by an iron pipe to the same place of discharge as the effluent which constantly flows off from the trumpet-mouthed pipes.

The treated sewage thus flows in a continuous stream through the tanks, precipitating as it flows, and passes clear, bright, and odourless into a covered channel, discharging into the Thames. The tanks are cleaned periodically, the deposit or "sludge" being pumped into the sludge-well by a "Tangye-Holman" double-action pump, at the rate of 500 gallons per minute. Another jointed pipe in the same wall can be let down into a sump-hole and the sludge drawn into four sludge vessels, or accumulators, by the creation of a vacuum, and it is then forced by air pressure, at 100 lb. on the square inch, into filter presses on the first floor of the building, from which it is removed in hard cakes. There are two "Scott's" air-pumps and eleven of the Native Guano Company's filter presses. To prevent these accumulators from becoming too full, a floating ball is raised by the inflowing sludge until it closes the air passage, when the exhaust, of course, ceases. The air at three or four atmospheres of pressure is then turned on, and the contents of the accumulators are forced up to the first floor of the building, and there into mechanical presses, which express the fluid and mould the solid residue into cakes. The expressed water runs back to the sump-well, and the pressed cakes are dried in a Borwick's drying cylinder (with fan and condensing apparatus attached), ground into powder, bagged, and sold to farmers and gardeners as native guano, at £3 10s. per ton.

To prevent any escape of foul emanations in this operation, the reek from the revolving cylinder is forced off by a fan, and carried by iron pipes first to a closed chamber, in which it is subjected to the absorbing action of water spray amid layers of brushwood. It then passes on in stoneware pipes to a cooling tank placed at the top of the building; thence again by pipes to a second chamber, and finally passes into the external atmosphere by a flue in the boiler-stack. The condensed fluid flows from the pipes to the drain.

The Surbiton sewage is separately received and screened, and is pumped by centrifugal pumps through a meter into the Kingston pump well. There are three pumps, each driven by an 8-horse power engine, and capable of lifting 750 gallons per minute.

The boilers are of the locomotive multitubular type, working at a pressure of 150 lb. per square inch—one of 80-horse power, and two of 60-horse power each.

Two mortar mills are used for grinding the chemicals, which are then mixed in vats and discharged into the pump well; and there are two vats for dissolving the precipitating agents. A small centrifugal pump supplies water from the river for the boilers, mixing the chemicals, &c.

The upper floors of the main building are devoted to the storage of this material. Welsh coal is burnt to avoid smoke and its annoyances. The effluent is discharged from the works down a brick slope into an open trough, where it can be sampled and examined. From this spot the effluent flows in a covered-way to the limit of the property into the down stream of the River Thames.

At the present time the sewage being treated is that of Kingston and Surbiton, having a population of nearly 40,000 persons. In a short time Hampton Wick will also send its sewage over the railway bridge to these works by one of Shone's ejectors. The works are constructed for an average of 45 gallons of sewage per head per day, and their capacity could be easily increased if fully developed for double the before-mentioned population.

In the report of Dr. Tidy and Professor Dewar, F.R.S., on the experiments carried out by them at the Aylesbury works for the purpose of determining the conditions and efficiency of the "A B C" process, they briefly gave a description of the *modus operandi* of the process as follows:—"The sewage is delivered at the works into a small oblong space, about 4 feet wide by 6 feet long, paved with bricks. Across this space, and about 1 yard from the sewer mouth, a wooden V shaped trough is placed, into which the 'B C' mixture is run, even distribution into the sewage being effected by means of numerous notches cut on the side of the trough. By this means the sewage is completely and immediately deodorised, no escape of offensive odours from the sewage into the surrounding air taking place. The entire works are, in our experience, free from any objectionable smell whatsoever."

"After being mixed with the "B C" mixture, the sewage passes through an iron grid for the purpose of catching paper, straw, and similar floating materials. It then passes along a brick-paved channel for about 12 feet, the channel afterwards narrowing to 2 feet in width. Here the alum solution flows in from a wooden trough in the same manner as we have described in the case of the "B C" mixture. The alum, it will be noted, is added some short time after the "B C" mixture. The addition of the precipitating ingredients separately, we are informed, is found to afford better results than when they are run in together."

"The treated sewage flows along the channel for about 40 yards, in order to facilitate mixture before it is allowed to run into the first subsiding tank. There are three subsiding tanks, each holding 42,000 gallons, through which the treated sewage successively flows before finally passing through a fourth and last tank, which is about double the size of the other three. On leaving the tanks the effluent, now practically free from suspended matter (as will be seen from the tables), and devoid of smell, passes for several hundred yards along an open brick channel, before finally discharging itself into the brook."

"The materials used for the precipitation of the sewage matters are clay, carbon, blood, and alum, and they are manipulated as follows:—"Weighed quantities of the clay and carbon are ground together in a mill with a certain small proportion of blood and some water. When thoroughly incorporated, the mixture is run into a reservoir placed beneath the mill, where a considerable proportion of the heavier clay particles subside, whilst the lighter particles of clay and carbon are added to the sewage as above described. The sulphate of alumina is dissolved in a separate tank, and is run directly from this into the sewage. The solution of alum used was found to contain, on an average, from 1 to 2 per cent. of sulphate."

The investigation of Dr. Tidy and Professor Dewar extended over a period of three months, and in order to arrive at a satisfactory conclusion, systematic and continuous experimental observations were needed, and accordingly consecutive half-hourly samples of sewage and effluent were taken for twenty-four hours, on separate occasions, and subjected to chemical examination, the results being, in their opinion, satisfactory.

The report they submit establishes the following facts:—

1. That the "A B C" process produces a clear effluent, free from suspended matter and devoid of smell.
2. That the effluent is uniform, notwithstanding the very varied nature and concentration of the sewage.
3. That, as the strength of the sewage increases, the precipitation is more complete.
4. That the process removes over 80 per cent. of the total oxidizable organic matter.
5. That it precipitates 60 per cent. of the organic matter in solution, and of the residue left in the effluent, at least two-thirds are non-albuminous, and therefore of a nature less liable to putrefactive and other changes.
6. That the process is carried on without nuisance, the sewage being immediately and completely deodorised and the entire works free from any objectionable smell.
7. That it produces a manure containing an average of 3.8 per cent. of ammonia, calculated on the perfectly dry manure, or if with 20 per cent. of water, 3 per cent. of available ammonia, and also 5 per cent. of phosphates, reckoned as tricalcic phosphate of lime.

I ascertained that the Kingston works and buildings involved an expenditure of £26,000. Of the 20 acres of land originally required by the Corporation, only 3 acres have been used for the works and buildings.

The terms on which the Company purify the sewage are equivalent to a rate of 3d. in the £ per annum; or, taking into consideration the interest on the capital outlay, it amounts to a 5½d. rate. The Company find that the cost of manual labour is very great, amounting to some £40 per week for wages, coals, and chemicals. Measures are therefore now being taken by the Corporation to so modify the arrangements of the process as to dispense with a considerable amount of the manual labour.

At the inauguration of the works a very distinguished company of scientific and professional men were present, and on a day when the heat was almost tropical, the eminent men and experts who were present very closely criticised the process. Mr. Thomas Hawksley, M. Inst., C.E., F.R.S., who has had more than forty years experience in sewage disposal, told the company "that Kingston-on-Thames was getting its sewage purified at a cost of only one-third of what many other towns had to pay. He had very much faith in the ultimate results of the system, and was very agreeably surprised at the perfection of the arrangements. He had seen the raw sewage as it had approached the works, and had seen the effluent as it left them. The change in the condition of the water, which at the commencement was black and disagreeable, and in too many respects an objectionable fluid, was remarkable, for it was turned out of these works a smell-less and wholly unobjectionable water."

The Medical Officer of Health to the Kingston Corporation in his annual report stated that he had visited the works, and walked around the neighbourhood on frequent occasions, and had questioned a good many people living in the vicinity, and concluded by saying, "I can vouch for the completely unobjectionable nature of the process. There is neither smell nor anything else which would indicate to a stranger passing by that sewage was being dealt with at the spot, and I certainly consider that Kingston has pioneered the way for other towns labouring under similar sewage difficulties."

The Aylesbury Local Board also expressed their entire satisfaction at the success of the process, and the authorities of Wellington College were equally emphatic as to the satisfactory results of the system. Mr. Baldwin Latham, M. Inst. C.E., has also testified to the great success of the process since 1878, and knew of none so satisfactory.

Since the Native Guano Company first commenced the process, they have sold more than 10,000 tons of native guano for the sum of £34,335. They have received an immense number of testimonials from farmers and gardeners, showing the valuable results of its practical application in the farm and the garden.

I certainly was greatly impressed with the process and the completeness of the works. Doubtless the working cost of the system will be reduced before long. I can testify that I saw the foul sewage enter the works, that the operations were carried on without the smallest annoyance, and that the degree of purification of the effluent which was discharged into the Thames was such, that numbers of fish were present in the river at the outlet, and anglers were busily engaged close by. It must not be lost sight of that in this, as in all successful processes, the sewage must come straight from the main sewer to the works, and be treated before there is time for decomposition to set in. In the *London Daily Telegraph* of 10th November, 1890, in a report of the rejoicings at Kingston-on-Thames, on the occasion of the opening of the Pleasure Gardens, Sir Whittaker Ellis, Bart., M.P., asserted that "the event would be highly interesting to all municipal authorities. They had, in the first place, solved one of the greatest problems of the day, and shown that the current belief that the sewage of towns must be taken a long distance away for purification was entirely a mistake. In Kingston it had been proved that the treatment and disposal of sewage could be performed in the midst of a crowded population, although in other places the great difficulty had been to find a spot which was right away from everybody. In the second place, they had provided a magnificent garden, having 1,000 feet of frontage to the Surrey bank of the river, which in a few years would be one of the most charming spots in England."

### Salford Sewage Works.

At the time of my inspection in September last, I found that crude sewage was being discharged from these works into the river Irwell, at a point where it joins and forms part of the Manchester Ship Canal. The sewage was black and turbid, and created an abominable stench. Some years since the Corporation incurred an outlay of £100,000 in providing a series of tanks, together with powerful engines to raise the sewage from the low-level sewer into the tanks, a lift of 48 feet; and for some years these  
works

works have been in operation, the lime process being used. During the past year the Corporation have been carrying on a series of experiments with various precipitation systems, and with the electrical process hereinafter referred to. Since these experiments were concluded, the Corporation deemed it advisable to revert to the lime process, the consequence is that crude sewage is discharged into the river for the time being, and its condition is certainly the most unsatisfactory of any I saw in England. In addition to Salford there are a number of small towns draining into the Irwell; but the whole of these places will be immediately required to satisfactorily purify their sewage, prior to the completion of the Ship Canal.

The result of the experiments is being awaited with much interest, and doubtless the system selected by the Salford Corporation will be followed by most of the other authorities referred to.

### Birmingham Sewage Farm.

The Birmingham Outfall Works and Sewage Farm are upon a somewhat extensive scale. When I visited them I had interviews with the City Engineer and the farm manager, from whom I obtained much interesting information.

It appears that the Birmingham, Tame, and Rea District Drainage Board is formed by eleven constituent authorities, viz., the City of Birmingham, the Borough of Sutton-Coldfield, and the Local Government Districts of Aston Manor, Balsall Heath, Smethwick, Saltley, Harborne, and Handsworth; also, the contributory places of King's Norton, Aston, and Perry Barr. The total area of the drainage district is 47,275 acres. The population is estimated at 650,000 persons, and the ratable value at £2,450,000.

Practically, the whole of the sewage of the Drainage District, amounting to 20,000,000 gallons per day, dry-weather flow, flows by gravitation to the outfall works. Only a very small area requires its sewage lifted by pumping, the cost of such pumping being £104 per annum.

The method of treating the sewage as now carried on is as follows:—

The sewage, on arriving near the liming sheds at the upper end of the works, is mixed with lime, 11 tons 6 cwt. being used every twenty-four hours, both to neutralise the acids (present to an unusual extent in Birmingham sewage), and also to assist precipitation. The sewage then passes through the large or roughing tanks, where the grosser impurities are precipitated, and from thence it is conveyed by the main conduit to the land and disposed of by ordinary irrigation. The sixteen small tanks which were required at one time for completing the precipitation process are still used under certain circumstances, and are a valuable auxiliary when the rainfall has increased the normal quantity of sewage.

The sludge from the tanks is raised by bucket dredgers and pumps into elevated movable wooden carriers, and flows into beds formed in the land at Saltley at the western end of the farm. The sludge contains about 90 per cent. of water as it comes from the tanks, but after lying on the ground for about fourteen days, much of this water drains away or is evaporated, leaving the sludge in a layer about 10 inches thick and of a consistency that admits of its being trenched into the land. Crops are then planted, and after a time the sludge becomes pulverised and capable of being irrigated. Forty-five and a half acres were required for the sludge last year, and the same land may receive a coating of sludge every two or three years.

The sewage is conveyed to the land by means of a conduit 8 feet in diameter, and about 2½ miles long, capable of discharging 38,000,000 gallons per day when running half full, or double that quantity when running full, the fall being 2 feet per mile. This conduit commences at the outlet end of the large tanks at Saltley, and terminates at Tyburn, valves being placed at suitable intervals for discharging the sewage on the land passed through. Below Tyburn a conduit 3 feet 6 inches in diameter has been constructed, which is sufficient for the remainder of the farm. The sewage is drawn from these conduits into open brick carriers, which again discharge into secondary carriers of earth, and thence into the flooding carriers.

The total area of the farm is 1,227 acres. The nature of the land is very favourable for the purification of sewage, the surface of the land (after levelling) being even, and the natural level such as to admit of the irrigation of the whole by gravitation, with the exception of about 100 acres. The subsoil is gravel and sand, varying from 6 feet to 10 feet in thickness. The land is drained to a minimum depth of 4 feet 6 inches, but in many cases, owing to the level nature of some of the land, a greater depth has been found necessary at the lower end of the drains. The subsoil drainage consists of 3-inch and 4-inch agricultural drain-pipes, placed half a chain apart, and discharging into main drains of 9, 12, 15, and 18 inch stoneware socket pipes, which in turn discharge into the outfall channels.

The total cost of the land and works up to the present has been £410,033; the rent of the leasehold land is at the rate of £4 per acre; and the cost of the freehold, including timber, buildings, mill-rights, tenants' compensation, law charges, &c., amounted to £152 per acre.

The quantity of mud arrested in the large tanks last year was 129,783 cubic yards, and in the small tanks 16,685 yards; the total being 146,468 yards as against 147,952 yards the previous year. Of this quantity, 142,710 yards were raised by the elevators and dug into the land, 45½ acres being used for this purpose, whilst the remaining 3,758 yards were removed by the steam crane, thirty loads being sold, and the rest applied to the Tyburn lands. About 1 acre of land is thus required for the sludge per week.

The following details as to the lime used, the crops grown, milk sold, live stock disposed of, &c., are practical instances of what can be produced on a properly organised sewage farm.

The quantity of lime used for precipitation purposes was 4,013 tons, or an average of 11 tons 1 cwt. 2 qrs. per day, as against 4,123 tons, or an average of 11 tons 6 cwt. per day, the preceding year. The material costs 12s. 9d. per ton delivered at the works.

Forty acres of wheat were grown, producing 30 bushels per acre and 30 cwt. straw; 70 acres of oats, 56 bushels per acre, and 25 cwt. straw; 9 acres of peas, part picked for market and the remainder consumed by the stock; 90 acres of mangolds, weighing 2,970 tons, or an average of 33 tons per acre; 56 acres of Swedes—those grown at Tyburn yielded 20 tons and at Saltley 15 tons per acre; 28 acres kohlrabi, 23 tons per acre.

Sixty-eight acres potatoes produced about 8 tons per acre; 156 acres cabbages, viz., 58 acres, maiden, 71½ savoy, 22 drumhead, and 4½ acres red; 2 acres onions, 8 carrots, 6 kidney beans, 5 celerly, 5½ cauliflower, 10 parsnips, 6 Brussel sprouts, 8 curled greens, and 1 lettuce.

The total proceeds from the vegetable and other crops amounted to £5,984 5s. 4d.

One

One hundred and ten acres rye-grass; of this, 52 acres were grown at Saltley, which produced 943 tons, or an average of 20 tons per acre. Of this quantity, 343 tons were sold at an average price of 14s. 5d. per ton, realising £251 15s.; 104 tons were made into ensilage, and the remainder consumed by the farm stock. The remaining 58 acres were grown at Tyburn, and produced 1,856 tons, or an average of 32 tons per acre; 54 tons were sold, realising £53 13s. 9d., 40 tons were made into ensilage, and the remainder consumed by the farm stock. Two hundred acres of grass were mown, which produced about 350 tons of hay, 16 acres vetches, 10 rape, 12 lucerne, and 14½ acres of rye.

The yield of milk for the year was 133,787 gallons, realising £4,092; as against 130,628 gallons, realising £3,868 3s. 9d. the previous year. The yearly average per cow exceeded 850 gallons.

#### SUMMARY OF ANNUAL INCOME AND EXPENDITURE.

		<i>Expenditure.</i>		£	s.	d.

			Total	£ 20,538	6	6

The works and operations have so far satisfied the complaints from the riparian owners, and have stopped various law suits. The City Engineer states that since the opening out of the irrigation land, the expenses at the outfall works have undergone some reduction, and there is every prospect, not only of a further reduction in the future, but also of a gradual increase in the receipts from the irrigation land, as the demand for the farm produce is developed; but bearing in mind the large initial outlay in purchase of land and the construction of the works, and the annual working expenses in disposing of so large a volume of sewage, it is not to be expected that assistance from the rates can be dispensed with until, in the somewhat distant future, the large annual sum now required for interest and repayment of loans shall cease. It should, however, be remembered in dealing with sewage farm accounts, that after all, the great item on the credit side of the balance-sheet (although it is one that cannot be represented by a money value) is the satisfactory disposal of the sewage.

There are still some 36,000 pans or pails in the city for the reception of excreta. The latter is mixed with ashes at various wharfs, and treated in "dryers." The house refuse is burned in Fryer's four-celled destructors, thereby reducing the refuse to one-sixth of its original bulk. The collection of ashes and fecal matter costs £45,000 per annum, less £10,000 for the sale of the manure so produced. At the recent annual meeting of the National Society of Medical Officers of Health, which was held in Birmingham, the "pan" system was severely condemned, but the water-carriage system was highly approved by the various speakers.

Accompanying this Report will be found a Plan (*Vide* Appendix, Drawing J) of the sewage farm, main conduits, and sewage carriers; also, the dimensions and capacity of the nineteen tanks, showing the general arrangements which have been adopted, and which are managed in a highly efficient manner.

The effluent was beautifully clear when I saw it leaving the farm. It falls over white glazed bricks into the river Tame, and had attained a high degree of purification.

#### Coventry Sewage Works.

After many years experience of the lime process, which failed to give a satisfactory effluent, and caused the principal landowners to be at variance with the Corporation on account of the pollution of the river, the City Council entered into an arrangement with the Rivers' Purification Association to treat the sewage under their alumina and lime system, when new outfall works and tanks were constructed at a cost of £14,000, plans of which I procured. The population of the city is 50,000, and the nature of the sewage to be treated, of which the daily volume is upwards of 2,000,000 gallons, is exceptionally foul, in consequence of the large amount of discharge from the dye-works, and other manufacturing refuse, which finds its way into the main sewers.

The Company carried on the works for several years for a subsidy of £2,000 per annum, but did so at a loss; and when a re-arrangement of the terms became necessary, it was decided that the Corporation should carry on the operation themselves. This they now do at a cost of about £3,200 per annum.

The quantity of alumina actually used is from 5½ to 7 grains per gallon, according to the varying qualities of the sewage to be treated. The alumina consists of shale treated with sulphuric acid, the price paid by the Corporation for the alumina being about £2 13s. per ton. The manager of the works informed me that about half-a-ton per day would be required for the ordinary sewage of a town having a population of 25,000 persons.

The

The effluent from the subsiding tanks is conducted to a filtration area, or to the irrigation area as the case may be, and as it finally issues into the river it contains only 0·061 of albuminoid ammonia per 100,000 gallons, or 3·60 per cent. of its original proportion, a very striking result. It has been asserted that during the holiday seasons at Coventry, when manufacturing refuse is absent from the sewage, that the amount of chemicals necessary to purify the sewage is only about two-thirds of that which is requisite when the dyes and other manufacturing refuse are present. The Corporation annually dispose of some 4,000 or 5,000 tons of dried sludge to farmers and gardeners, for which they receive 1s. per ton.

I can testify that the effluent I examined in long test tubes appeared to be perfectly pure and bright, and that it was entirely free from odour. Indeed, chemical analysis has proved that the effect of this double system is to secure an effluent of a very high quality.

### Dorking Sewage Works.

The Dorking Sewage Works are quite modern, having been completed only a short time before my visit to England. They are well designed and the works are so conveniently arranged that I procured a copy of the plan and sections to accompany this Report (*vide* Appendix, Drawings K and L).

The Dorking district is in the County of Surrey, and contains a population of about 7,000 persons. The outfall works are situated about 1 mile from the centre of the town, and the sewage flows there by gravitation. The sewers are on the "separate" system, but the total exclusion of rain-water from roofs and yards caused considerable trouble to the working of the house-drains and pipe-drains at first. This has now been remedied by admitting part of such rainfall.

The volume of sewage is about 100,000 gallons per day. It is discharged into the straining tanks, passing from thence into an automatic-mixing machine, where lime is added, and beyond which a wooden trough is filled with cakes of alum, over which the sewage passes on its way to a series of four settling tanks. Each tank contains about 50,000 gallons and is provided with a galvanized iron wire cage, 3 feet square, where any foreign matter escaping from the first straining tank is arrested.

The effluent rises over the weir of the first tank and follows a channel leading to the second, and so on until it has reached the fourth tank, at which point it discharges into conduits leading to rye-grass and osier beds.

By means of the sluice gates, the settling tanks may be used separately or altogether, and upon other sluices being opened, the effluent is drawn off through floating arms to within 18 inches of the floor of each tank. In emptying a tank, the contents flow upon the beds, covering about 2½ acres, upon which a prolific crop of osiers is growing. The ordinary overflow of the effluent is discharged upon the rye-grass beds which are about 3½ acres in extent, or it may be poured upon the osier beds at pleasure.

Around all these beds are open-jointed drains, varying from 9 to 15 inches in diameter, and about 8 feet deep, all converging at one inspection chamber, where the effluent runs over a marble weir in a white brick basin, and from thence into the River Mole.

After the effluent is drawn off to within 18 inches of the bottom of each tank, there remains the residuum sludge, which finds its way by gravitation into the wells, flowing through a 12-inch drain underneath the tanks.

By means of a 6-inch "Invincible" centrifugal steam pump, the contents (6,000 gallons) of the wells are raised, in less than an hour, to receptacles constructed above the roadway, and from thence the sludge gravitates to the rams and is forced into the presses.

The sludge rams, of which there are two, are constructed, as is the whole of the machinery, so that all may easily be taken to pieces and examined at any time. The steam-engine in the press-house is made to drive the air-compressor, and is well balanced to prevent vibration, and the air-receiver itself forms a substantial foundation. An automatic gear is fixed to regulate the supply of steam in proportion to the amount of air required for pressing. The filter presses, which are in duplicate, are constructed to stand a great many tons pressure between the plates, and the labour of opening and closing is accomplished by mechanical means, which is an important advantage in the manipulation of sewage sludge.

The method of working this apparatus is exceedingly simple. The sludge passes by gravitation direct from the high-level receptacles into the rams, and when these are full the inlet valve is shut off and the compressed air supply turned on, which immediately acts upon the mass of sludge and drives it with enormous force into the filter press. The press is composed of a series of plates placed vertically and resting by means of lugs on two horizontal shafts, upon which they easily slide. At one end of the shaft a strong frame is fixed to support them and withstand the great power exerted during the operation; at the other end is a heavy movable frame which, by means of the same accumulated air-pressure for filtering, is forced and brought to bear on the whole set of (twenty-five) plates in each press. Therefore, when the press is closed, there is a series of vertical chambers, with filter-cloths on either side, forming a filtering area equal to the size (2 feet square) and number of the plates in the press.

The sludge is made to pass through the centre of the fixed end and into these chambers, where the separation of the solid particles from water takes place. The liquid, or water, runs through the filtering surface and flows out by openings at the lower edge of the plates into a trough and finally to the wells. The pressure is kept on till the liquid ceases to flow, indicating that the press is full of solid matter, weighing 8½ cwt. Ninety pressure gives the best results. The hand-wheels are then loosened, and the end frame is moved by a piston acted upon by compressed air, and the plates are separated one from another by sliding along the horizontal shafts.

The cakes of solid sewage are allowed to fall into the waggon underneath, and the press is again closed automatically. Pressed sludge has realised 10s. per ton at the works, but it is all taken away now at 5s. per ton.

The cost of the works was as follows, viz. :—

Land (11 acres) ... ..	£4,200	0	0
Formation of beds, roads, paths, and fencing ... ..	3,100	0	0
Buildings ... ..	1,200	0	0
Tanks ... ..	2,000	0	0
Machinery ... ..	1,000	0	0
Total ... ..	£11,500	0	0

Two men are regularly engaged at the outfall works, their wages being 26s. and 18s. weekly. Additional labour is occasionally required on the beds. Pressing is carried on daily, except Saturdays. I procured drawings and full particulars of the filter-press machinery and arrangements.]

The subsoil on the lower plateau (osier beds) may be described as follows:—The first layer met with is a stratum of light vegetable earth, about 1 foot in thickness. The greater part of the remainder is composed of sandy loam, becoming more stiff and clayey towards the bottom. Near and underneath the cross barrow-path, however, is found the commencement of a stratum of gray gault; between this and the sandy loam is found a thin layer of gravel, containing a small amount of water.

The upper plateau (rye-grass beds) contains a similar layer of vegetable earth on the surface to that on the lower plateau. The bed of gravel becomes thicker and contains more water. The light gray gault which lies below the gravel on the lower beds is hardly touched upon, but the blue gault is cut into and becomes more tenacious towards the settling-tanks.

I observed the nature of the effluent which was discharged into the river, and as it flowed out through the glazed white-brick bottom of the open man-hole, it appeared to be perfectly clear and purified.

#### INTERMITTENT-DOWNWARD FILTRATION.

The intermittent-downward system of sewage purification is another process of land filtration. It necessitates a very much smaller area of land than is required for broad irrigation. This system was originally brought forward by Mr. Bailey-Denton, and it necessitates a special preparation of land, to enable it to purify a larger quantity of sewage than it would naturally be capable of doing. Where suitable gravelly and sandy subsoil exists, a system of drains 6 to 8 feet deep and 2 or 3 yards apart is required; or plots may be made up of burnt ballast or other loose material or soil, the surface being arranged in ridges or furrows, along which the sewage flows, vegetables and plants being grown thereon.

Among the first places at which the process was carried out were Merthyr and Kendal. From the experience gained at a number of small towns it would appear that the sewage of at least 500 persons per acre may be dealt with in this way. Even where broad irrigation is adopted, it is frequently the case that a few acres are laid out for filtration, so as to provide a safety-valve in case of necessity.

The sewage farm at Wimbledon, consisting of 47 acres of stiff clay and serving a population of 25,000 persons, was laid out and under-drained as a filtration area somewhat on this principle, but it failed miserably, and in consequence of the fouled discharge, an injunction was obtained against the local authorities, who, under skilful management very soon wrought a wonderful change. The old drains were filled up with clay, and the sewage after clarification by different chemicals, was allowed to flow over the surface of the land only. This it does three or four times, before reaching the outlet culvert leading to the river.

I am not acquainted with any new feature in this system of sewage purification, and I think it may be asserted that the process is not making any particular advance in England.

#### THE ELECTRICAL TREATMENT OF SEWAGE.

Since the question of the electrical treatment of sewage was before the Department of Public Works, and was subsequently inquired into and considered by the Parliamentary Standing Committee on Public Works in 1888 and 1889, I think it cannot be said that the results obtained by the experiments which were conducted at the London Sewage Outfall Works at Crossness, or more recently at Salford and Bradford, have materially tended to advance the process in the eyes of scientists and sanitarians.

The principles of the electrical treatment were described by Professor Threlfall in his report and evidence in 1889. Since then some modifications have been made, and a description of the details will be observed in the remarks which follow. The Electrical Purification Association (Limited), which has been formed in London to work Webster's Electrical process for the purification of sewage, states that "the success of the laboratory experiments was such that Mr. Webster asked for and obtained permission to set up plant at Crossness, near the southern outfall of the Metropolitan sewage into the Thames, for the purposes of demonstrating on a practical scale the advantages of the process. A few gentlemen asked to join him in bearing the expenditure, to which he agreed, and the association was then formed for the purpose of making the necessary experiments as to the best mechanical and other arrangements for carrying out the process on a working scale, with a view to bringing it before the attention of public bodies, as the solution of the sewage problem." After the experiments were carried out at Crossness, the association asserted "that the question had been finally settled," and further that it had conclusively proved that cast-iron plates of the commonest quality employed as electrodes give the best results. They added that the process is very simple, inasmuch as for treating sewage or impure water, the fluid is allowed to flow through suitably constructed channels containing iron plates set longitudinally, the alternate plates being connected respectively with the positive and negative terminals of a dynamo. The sewage or other impure liquid in its passage through these channels becomes entirely split up by the electric action. The matters in suspension in sewage and part of the organic matter are not only removed by precipitation, but the soluble organic matter is oxidised and burnt up by the nascent oxygen and chlorine oxides evolved, and this oxidation may be carried to any extent, according to the amount of purification required.

On visiting the Crossness outfall works in September and November last, I found that the experimental works had been abandoned, and that the temporary buildings and other plant erected had not been removed, but were left standing. It appears that the electrical treatment of sewage did not exceed 36,000 gallons per day, instead of 1,000,000 gallons as stated beforehand; nor for a longer period than eighteen days. I was also informed by the Superintendent that in July, 1889 (usually the hottest of summer months in England), the effluent from the electrical process had not only an offensive scum on the surface, but that it smelt badly; so much so, in fact, that the London County Council were obliged to disuse it for the boilers.

In December, 1889, the analytical chemist to the County Council (Mr. Dibdin) reported at length on the results obtained. By his courtesy I was allowed to see the report, together with the reply of the Electrical Purification Association thereto; but, as the documents are still before the Drainage Committee of the London County Council, they must be considered as privileged. I am therefore unable to quote from them.

Sir

Sir Henry Roscoe, F.R.S., M.P., reported on the experiments in October, 1889, as follows, viz. :—

“The reduction of organic matter in solution is the crucial test of the value of a purifying agent, for unless the organic matter is reduced the effluent will putrefy and rapidly become offensive. I have not observed in any of the unfiltered effluents from this process which I have examined, any signs of putrefaction, but on the contrary, a tendency to oxidise. The absence of sulphuretted hydrogen in samples of unfiltered effluent which have been kept for about six weeks in stoppered bottles is also a fact of importance. The settled sewage was not in this condition, as it rapidly underwent putrefaction, even when in contact with air, in two or three days. The effluents as collected from the tanks were found to contain a small amount of iron in solution in the ferrous state, and on exposure to air ferric hydrate was precipitated. In order to remove this iron, it was arranged to pass the effluent from the precipitating tank over and through a filter of sand, and by this means oxidation and precipitation of the soluble ferrous salt was brought about, and effluents were obtained, free from iron, of bright appearance, but in no degree chemically purer, as regards organic matter, than in the unfiltered effluent. The results of this chemical investigation show that the chief advantages of this system of purification are:—(1.) The active agent, hydrated ferrous oxide, is prepared within the sewage itself as a flocculent precipitate. (It is scarcely necessary to add that the inorganic salts in solution are not increased, as in the case where chemicals in solution are added to the sewage.) Not only does it act as a mechanical precipitant, but it possesses the property of combining chemically with some of the soluble organic matter and carrying it down in an insoluble form. (2.) Hydrated ferrous oxide is a deodoriser. (3.) By this process the soluble organic matter is reduced to a condition favourable to the further and complete purification by natural agencies. (4.) The effluent is not liable to secondary putrefaction.”

Mr. Alfred B. Fletcher, F.C.S., Inspector under the Rivers Pollution Act, also reported in November, 1889, as follows, viz. :—

“At Crossness, near the southern outfall of the metropolitan sewage into the Thames, an experimental plant has been erected for showing the working of the above process. An arrangement is made for drawing from the main culvert a portion of the sewage as it arrives from the metropolis. This is caused to flow through a wooden shoot measuring 18 inches in breadth internally and 2 feet in depth. The length is 400 feet, and leads to a tank 3 feet 4 inches deep, capable of holding 25,000 gallons. The long wooden shoot is filled with wrought-iron plates  $\frac{1}{2}$  inch thick and 1 inch apart. These are connected alternately with the positive and negative conductors from an electric generator driven by a steam-engine. Samples of the raw sewage as it entered the long shoot were taken every 10 minutes, and also samples of the sewage after having passed between the iron plates in the long trough. A portion of the samples thus collected was taken as an average both of the raw and of the treated sewage. A sample of the upper portion of the treated sewage was taken from the tank after it had been filled and had been allowed to subside during two hours, also a sample after three hours' settling. A portion of this treated sewage was allowed to filter through a bed of sand about 6 inches deep, and a specimen of the clarified liquor was taken. These various samples, brought away in stoppered bottles, were submitted to chemical analysis. Of these it should be said that as all the analyses could not be commenced immediately, it is probable that the determination of ammonia may have been somewhat affected by the changes which take place rapidly in sewage. It was noticed that while the raw sewage filters very slowly, so that 500 c.c. required 96 hours to pass through a paper filter, the electrically treated sewage settled well and filtered rapidly. Samples of the raw sewage having but little smell when fresh, stank strongly on the third day. The treated samples, however, had no smell originally, and remained sweet, without putrefactive change. The treatment causes a reduction in the oxidisable matter in the sewage varying from 60 to 80 per cent. The practical result of the process is a very rapid and complete clarification of the sewage which enables the sludge to separate freely. After the treated sewage has been allowed to settle for two hours, the effluent may be passed through a filter of sand, &c., and discharged bright in appearance, and free from offensive smell. In producing this result two agencies are at work, there is the action of electrolysis and the formation of an hydrated oxide of iron. It is not possible perhaps to define the exact action, but as the formation of an iron oxide is part of it, it seemed desirable to ascertain whether the simple addition of a salt of iron, with lime sufficient to neutralise the acid of the salt, would produce results similar to those attained by Webster's process. There was a difficulty in carrying out these experiments fully, owing to the impossibility of obtaining fresh samples of raw sewage identical with those which had been treated by Webster's process. That which had been kept for a few days was no longer available. In order to make these experiments, samples of fresh raw sewage were taken at Crossness, at intervals of one hour during the day. As much as 10 grains of different salts of iron were added per gallon, plus 15.7 grains of lime in some cases, and 125 grains of lime in another, and the treated sewage was allowed to settle twenty-four hours; the results obtained were not nearly so good as by the electrical method. The result of my examination of this process has been to convince me of its efficiency in clarifying sewage, of removing smell, and in preventing putrefaction of the effluent. I am of opinion that such an effluent as I saw at Crossness can be discharged into a river, or, after passing through a thin layer of sand, even into a stream without causing any nuisance.”

The Electrical Purification Association further state, that “after submitting Webster's process to the severest tests, they have proved that by its means sewage is effectually purified, clarified, the smell removed, and secondary putrefaction prevented, the bulk of sludge being reduced to a minimum. That these results cannot be obtained by chemical precipitation is now an established fact generally admitted. Doubts have been expressed as to cost, but it may be unhesitatingly affirmed that for dealing with sewage, there exists no other known process which will bear comparison with the electrical treatment, either for simplicity or for economy, assuming of course that efficiency be a consideration. The necessary plant consists of electrolytic channels, containing the iron plates, the copper conductors and measuring instruments, dynamos, engines, and boilers. Thirty effective horse-power should be provided for treating one million gallons of sewage in twenty-four hours (representing a town of 30,000 inhabitants), assuming that about 450 tons of iron are laid down. This is estimated as ten years' supply, the iron consumed having been ascertained to be about 45 tons per million gallons per annum. But as the amount of iron laid down is in inverse proportion to the horse-power required, these two factors can be varied to suit the special requirements of each case. It should, however, be borne in mind that the larger the quantity of iron laid down, the longer it will last, and the cheaper it will be in the long run. For one million gallons of sewage in twenty-four hours, the cost of above plant (not including iron) would be about £2,000; this would

would allow for three engines and dynamos (direct driving) and two boilers, any two engines and dynamos and one boiler being capable of doing the full load. For dealing with larger quantities of sewage, the cost of plant is proportionately less; for instance, for ten million gallons, the cost of electrolytic channels, dynamos, engines, and boilers, would be about £10,000. With modern machinery, the coal consumption may be taken as not exceeding 2 lb. per indicated horse-power. The annual cost of maintenance would comprise only coal, iron consumed, and labour. Two shifts of two men each would suffice for one million gallons. To this must be added interest on capital and depreciation of machinery. For ten million gallons the coal and iron consumed would be in proportion to the amount of sewage treated, but the labour required would but little exceed that for one million gallons, two shifts of three men each being sufficient."

Notwithstanding what the Association say, I have good reason to believe that the result of the electrical trials at Crossness does not appear to have been satisfactory to the late Metropolitan Board of Works, or to the London County Council and their advisers, otherwise the experiments would probably not have been abandoned. The length of durability of the iron electrodes is altogether too problematical to justify any considerable outlay in what can only be regarded as a costly experiment.

The *Sanitary Record* of February, 1890, refers to the question, and states that "some interesting facts and figures as to the electrical treatment of sewage at the Crossness pumping station are brought to light in the report of Mr. Dibdin, the chemist, and Mr. Shoolbred, the electrician, made at the request of the London County Council. Mr. Dibdin sets forth the details of each experiment and the results of the analyses, as well as a full description of the plant employed. Mr. Dibdin finds the process is capable of removing practically the whole of the matters in suspension, and an average of 22 per cent. of the oxidisable organic matters in solution, at a cost of £1 15s. per million gallons of sewage, or £102,200 per annum for the whole of the daily flow of the London sewage, exclusive of labour, interest of capital, wear and tear, &c., and the cost of disposing of the sludge. The most important point to ascertain in this process, after the consumption of coal, seems to be the loss of iron in the plates used, as the electrodes, by the passage of the electric current through them, and the experiments so far made, afford no reliable data."

At the Annual Congress of the British Medical Association held at Birmingham last year, a discussion took place on the electrical treatment of sewage, and I noted that the Medical Officer of Health for Bradford, in describing the electrical process, said that it reduced the putrescent and noxious qualities of the sewage dealt with by 70 per cent., and the Bradford experiments showed that no living organisms were found in the effluent. The only objection to the system was its costliness, certainly not its efficiency. Dr. Bostock Hill said he feared that there was enough iron left in the effluent to discolour the streams into which it flowed, by the formation of sulphide of iron. Was it true, he asked, that the cost of the electrical process increased as it went on? Dr. Carpenter expressed dissatisfaction with the results of the trials, and while he desired to see further experiments of the process, he attached great importance to the working of sewage farms, such as that of Birmingham. The President said the effluent of the electrical process was unsatisfactory, whereas at the Birmingham farm the effluent was purer than the stream it ran into.

Since I left London, Mr. Webster submitted a paper on the system to the Chemical Society, in December last, in which he dealt more particularly with the Salford experiments. The quantity of sewage to be dealt with at Salford is 10,000,000 gallons per day, and for this it was calculated that 400 indicated horse-power would be requisite. He estimated that the annual cost of running the process would be £2,500—with an additional sum of £2,500 for the deterioration of 5,000 tons of iron electrodes. If a clear effluent were necessary, a further charge of £1,200 to £1,500 per annum would have to be met. Mr. Webster said that the practice now consists of passing the sewage through a brick channel, containing a large number of iron electrodes connected in parallel; the cast-iron plates being from  $\frac{1}{2}$  inch to 1 inch thick and 6 feet long, placed in a shoot 18 inches deep, 2 feet wide, and 200 feet long. It is also stated that a period of three hours is required for subsidence. The Salford estimate was taken for a consumption of 2 lb. of coal per indicated horse-power, the price of coal being estimated at 10s. per ton. During the discussion which followed, Mr. Webster's figures were attacked, and it was asserted that the full cost of the treatment would be from £21,000 to £24,000 per annum, or four times as much as the estimate Mr. Webster had given. The *Electrician*, in an article on the paper, stated that "the question suffered from the absence of actual figures relating both to treatment and cost, owing to the delay in the publication of the official report on the experiments at Salford. But while the subject is one of vital importance to the country, the question of cost must remain as the leading factor in any comparison with other systems." The article proceeded to say, that "the figures given by the author need some further explanation. It is not clear how 400 indicated horse-power can be generated, continuously we presume, for £2,500 per annum. Taking the volts at 1.8, this 400 horse-power for ten million gallons corresponds fairly well with .37 ampere-hour per gallon, and is equivalent to 6,600 kilowatt-hours per day. At  $1\frac{1}{2}$ d. per kilowatt, this amounts to about £41 per day. One penny per horse-power hour, as suggested in the discussion, comes to £40 per day, or £14,600 per annum. It is very remarkable that if an attempt be made to imitate an electrolytic action by chemical decomposition, the action is not so great. It has been shown that a certain quantity of chlorine given off by the decomposition of common salt by an acid is not so efficient as the same quantity produced by electrolysis. Similarly, attempts have been made to treat sewage by the salts of iron which Mr. Webster's process produces, but the results are not so good."

In a further criticism of the question, the writer stated that having witnessed the Salford experiments he was particularly struck by the extreme simplicity of the International Company's plant as compared with that required by the Electrical Company. On the one hand a sluice, into which "Ferozone" was automatically fed and mixed with the flowing sewage, precipitating tanks, and polarite filters; on the other, engines and boilers, dynamos and copper leads to the electrolytic conduit and sand filters. The writer estimated that the cost of producing the required electrical energy alone, under the conditions stated, to be something like £9,000 per annum. Also that the consumption of iron at the rate of 3 grains per gallon claimed by the Company (1 grain only per gallon was the basis of the 1888 calculations) would make the cost, at £4 per ton, amount to £2,500 per annum. He further contended that "the most important point is that the plates could not be used up to the last grain, because, as they got thinner, the electrical resistance of the conduit would be much increased, and not only would more power be required, but

but the state of things would be aggravated by some of the more liquid sewage flowing past, owing to the increased space between the plates, without being properly treated. Further, that as cast iron at £4 per ton cannot be relied on as being very homogeneous in its texture, it is not unreasonable to suppose that the plates would not wear uniformly, but would tend to wear in holes. Thus it would appear that another item, frequency of renewals, has been overlooked."

In November last the Electrical Purification Association furnished me with an estimate of the cost of treating sewage by the electrical process at various places, that for Salford being as follows, viz.:—For capital expenditure.—Engines, dynamos, boilers, electric channels, copper connections, and iron plates (at £4 per ton) to be £31,000. For annual expenditure.—Including coal, labour, iron consumed, and maintenance, £5,250.

I am of opinion that the annual cost of treating the Salford Sewage, 10,000,000 gallons per day, by the electrical process may fairly be put at nearly £20,000, inclusive of the cost of power, iron, renewals and supervision. The coals are taken at the current rates of 18s. per ton, and not 10s., as stated in Mr. Webster's paper. It must also be borne in mind that a very extensive series of tanks are already in existence, and interest on their cost is not included in the calculation. Taking these figures as fairly correct, it would show that the cost of treatment would be nearly £6 per 1,000,000 gallons. When the question was before the Parliamentary Works Committee in December, 1888, and July, 1889, the evidence shows that I estimated the cost of such treatment at £7 13s. 9d. for 1,000,000 gallons, or £4 7s. 5d. for 20,000,000 gallons per day, as against Mr. Webster's 13s. and Professor Trelfall's £1 per 1,000,000 gallons.

The official report of Salford experiments will be very interesting. The Engineer has promised to furnish me with a copy when it is issued. As far as I could gather, there is a strong impression amongst engineers in England that the inventor is a clever enthusiast, but that he has not succeeded in demonstrating that the process can be carried out in a thoroughly practical, convenient, and economical manner. It certainly appears to be much more costly, as regards original outlay and continuous expense, than the International or "Polarite" system for instance, neither does it appear to do such sound work.

### The "Amines" Process.

In September, 1889, I witnessed a demonstration of the "Amines" process at Wimbledon, in the presence of an influential and representative company. The sewage works and farm are situated on the outskirts of Wimbledon, and the promoters of the new process having obtained the sanction of the Wimbledon Local Board, carried on their experiments for several months. The materials employed are certain organic bases which are found in the chemical group of "Amines" (ammonia compounds) in combination with lime. The effect which is claimed for this process is that the effluent therefrom is sterile as regards the presence of living organisms, as the re-agent which is formed by the chemicals is completely destructive to organic life. At the trial of the process, "herring brine" mixed with milk of lime was used, and it evolves a soluble gaseous reagent, having a briny odour. This when applied to the sewage is said to produce a rapid deodorisation and deposition of flocculent matter. Dr. Klein, F.R.S., has examined the process, and confirms the sterilising of the effluent which is claimed.

Compared with the most expensive summer treatment at the Wimbledon works, where clarification is not effected under one and a half hours, the "Amines" process occupies less than half that time, and the promoters maintain that, instead of having to pay £4 10s. to £5 per million gallons for the summer treatment of sewage by chemicals alone, the cost by their process would not be more than £2 10s. to £3, according to the magnitude of the volume. The inventors also claimed that as the process admits of the sludge being dried on land, thereby reducing its bulk, a considerable expense is saved.

I must say that I was not particularly impressed with the value of the process, neither were the majority of the engineers and scientists who were present on the occasion. The day was in every way favourable for such an experiment, the temperature of the atmosphere being high; there was no question, however, that the smells experienced were anything but pleasant. Indeed, Professor Robinson remarked to me that, "instead of the smell of the 'briny ocean' which we had been led to expect, what we actually experienced was more like a sniff from a somewhat neglected railway-station lavatory."

The fact that the treatment of sewage under this process depends so largely upon the use of "herring brine" is in itself sufficient to prevent its adoption to any considerable extent. Apart from this, such a large quantity of lime was used that the bulk of sewage sludge would be greatly increased. I understand that the experiments were continued for some few weeks, but I have heard nothing more of the process for over a year. My impression is that it has ended in a "fizzle."

### SEWER VENTILATION.

I inspected the arrangements for sewer ventilation in several of the metropolitan districts, and in Croydon, Eastbourne, Southsea, Bournemouth, Dorking, and other towns. It is now generally recognised in England that the means hitherto resorted to for permitting sewer gases to escape by street gratings alone are frequently thoroughly insanitary; and, in many cases where such gratings have been retained, it was done with a view to converting them into down-take shafts as inlets for fresh air.

The Sanitary Committee of the late Metropolitan Board of Works, after ascertaining what measures had been taken for sewer ventilation in the principal cities and towns of the United Kingdom, and in the various districts of the metropolis, reported that any system of sewer ventilation can only be successful to the extent that it is in accordance with natural laws.

### Various Systems of Ventilation.

The three practical methods of ventilating sewers are:—(1) By open ventilators at the surface of the carriage-ways; (2) by shafts without heat; (3) by shafts in which heat is the motive power. Surface ventilators, as at present existing, are more or less a serious cause of nuisance. Shafts, without heat, is a method of ventilating sewers coming much into use, notwithstanding that householders sometimes object to pipes being placed against their houses. The shaft has practically the same effect on a sewer as an open surface grating, and if pipes are placed in proper position above the roofs, they are not

of such danger as surface ventilation; if placed in improper position, however, the danger is greater. It is not surprising, therefore, that it is still debated in some quarters whether upcast pipes carried up to the tops of houses are best, and whether they are really free from the danger of bringing foul air into the upper windows. On the other hand, it must be remembered that, as a rule, the sewer gases would be so diluted with air as to be comparatively harmless. It is clear, however, that such ventilators can be used in aid of existing sewers with advantage. Cowls and other contrivances to "exhaust" or "extract" air from sewers have been found to be useless, and little faith can be placed in them. Shafts, with heat, give benefit within 50 or 60 yards only of the shaft, and entail an enormous expenditure in first cost and maintenance. Where sewers can be connected to tall chimney-stacks, as in manufacturing districts, the benefits are equal to the expense incurred. The system of utilising street lamp-posts as ventilating shafts, with gas to burn and exhaust the sewer-gas, even if desirable, is scarcely practicable, by reason of the cost of maintenance. The London County Council, however, have recently closed an open ventilator in the carriage-way of the Chelsea Embankment, on account of the offensive smells which emanated from the main sewer at that spot, and have carried up a pipe inside the nearest lamp-post, in which there is an arrangement by which a gas jet is constantly at work purifying more or less of the sewer gas as it rises. This has stopped the cause of complaint, but as the Council have not extended the system, they do not apparently consider this means of ventilation very efficacious, or probably it has been found too expensive.

### Shaft Ventilators.

The before-mentioned Committee recorded their opinion that the existing system of ventilating sewers, by means of shafts leading to gratings in the centre of carriage-ways, has not proved satisfactory, and has been the cause of much complaint. They have further expressed the opinion that one of the best means of remedying such complaints is in the erection of pipe ventilators by the side of buildings, in the immediate locality of the shafts complained of.

It is somewhat disappointing that, after thirteen years' consideration, the metropolitan authorities have found no better remedy than simply transferring sewer-gas from the street level to the tops of the adjacent houses. If it is proposed merely to substitute "upcast" shafts, it must be remembered that they have very little or no power of themselves to produce ventilation, but are only extensions of the sewer to enable offensive gases to be discharged at a higher level. It must be borne in mind that the efficiency of a shaft is in proportion to the square root of its height. Taking, for instance, the area of the better form of London sewer ventilating-grating, which is about 90 square inches, and assuming an existing shaft to be 25 feet in height, it would theoretically require a sectional area of 45 inches to do the same amount of work at a height of 75 feet. The Committee finally decided that pipe ventilators of large section, and constructed with bends, but without angles, can be used with great advantage in addition to, and not in substitution for, surface ventilators, wherever the consent of owners and occupiers can be obtained to such ventilators being fixed. They therefore recommended that the sewers of the metropolis should be improved by altering the construction of many of the surface ventilators, and by carrying up large pipe ventilators wherever practicable.

In the West-end metropolitan districts, the authorities are providing iron shafts to a large extent, and in Kensington they endeavour to arrange with the builders of new houses and premises to build large ventilating flues, for sewer ventilation, alongside the chimneys wherever practicable, that is, when the outlets can be satisfactorily placed.

### Vertical Shafts.

Cast-iron vertical ventilating shafts have been erected at Portsmouth, Eastbourne, Croydon, Bournemouth, Dorking, and many other places, in lieu of open gratings in the streets. The practice is becoming general for local authorities to pass by-laws and regulations as to this mode of ventilating sewers and house drains, including "disconnection" for the latter.

At Croydon, which is a populous borough, the Corporation have erected about 500 iron shafts in lieu of street gratings, having in each case previously obtained the consent of the property owners. When requested, the Corporation agreed to pay compensation to the extent of 5s. in each case; but, out of the whole number, only *ten* owners have asked for this. In all cases the Corporation undertake to remove the shaft and to restore all damage within twenty-four hours of the receipt of a notice objecting to the existence of such shafts. The engineer considers that the best form of shaft is an 8 in. x 6 in. cast-iron pipe, and that the next best is a 6 in. or 8 in. circular iron pipe.

At Sydenham, Lewisham, Beckenham, Bournemouth, and other towns, the authorities have, in numerous instances, closed the street gratings and erected a number of "combined ventilating columns and street lamps" instead, each column being fitted with a revolving cowl and a door for testing the current with an anemometer. The columns are 16 feet in height, and, as will be seen by the accompanying sketch, are somewhat ornamental. The cost, including the sewer connection, averages about £10 each.

### Harrington's Patent System.

The London County Council subsequently directed their attention to a system which combines "upcast and downcast" shafts, and which is known as "Harrington's patent," and which I constructed in Jubilee Place, Chelsea, in 1884. According to the official reports which have been made, the system has acted with the very best results, and it costs nothing to maintain. The use of "cowls" has been very largely considered in connection with pipe ventilation. It has been claimed for exhaust ventilators and other special contrivances intended to be placed at the top of ventilating pipes, that the wind so acts upon such appliances as to *exhaust* the air from the pipes to which they are attached, but the almost invariable experience has been that they are useless. The Chelsea system consists of cowls to *force* the air into the sewers. The result of the tests at Chelsea proved that the gaseous contents of the sewer were changed every 31½ minutes during forty-four days, by the force of the wind on a self-acting cowl. The method in which the shafts are erected at the sides of houses, resembling brickwork or stone-work,

work, is certainly worthy of note; as, instead of being an eyesore, like ordinary shafts, they present a somewhat pleasing feature, and have given every satisfaction. The sewer was formerly ventilated by open gratings in the centre of the carriage-way, but these gratings, from which offensive smells frequently issued and caused complaint, are now closed. I certainly consider that this system of ventilation, embracing, as it does, the sound principles of "isolation" and "downcast and upcast" shafts is exceedingly simple and effective, and that it ventilates the sewer thoroughly and without offence to anyone.

### Ford and Wright's Patent System.

I examined the new system of sewer ventilation which is in use at Portsmouth, on the low-level main sewer at Southsea, under the superintendence of the inventors, Messrs. Ford and Wright. The invention consists in the provision, at or near the top of the sewer or drain, of a "special air passage" in conjunction with a "downcast" and an "upcast" shaft and a current of fresh external air, which can be induced by a proper arrangement of shafts, or the current of fresh air can be secured at very little cost by a finely divided jet of water, supplied from the nearest water-main, and arranged in the downcast shaft, which is connected with the air passage. The water, after having induced the air-current, can, with great advantage to the cleanliness of a sewer, be utilised for flushing by means of automatic flush-tanks arranged in, or adjoining, the man-holes. The inventors submit:—

- (1.) That the great advantages secured are that the present imperfect system of permitting foul gases from sewers to discharge at road surfaces can be abandoned, and that existing surface ventilators as foul air outlets can be closed, some of them being used as "downtake" shafts for fresh air. The "uptake" shafts for the diluted sewer air may be of iron or other material, carried up the fronts or backs of adjoining buildings, or other places adapted for the purpose.
- (2.) That fresh atmospheric air is continually forced through the air passage, which is made to act as a fresh-air distributor all along the sewer, and mixes the fresh air with the ascending sewer gases at each break formed in the air passage.
- (3.) That as the current of air travels in a separate passage from the sewage flowing along the sewer, the friction of the water on the air current in the air passage is obviated, and the air current is easily brought under absolute control as to its direction.
- (4.) That the system of sectional ventilation of sewers is easily carried out by simply partitioning the air passage and the sewer, the latter by floating valves or other means above the sewage flow, into such sections as are required to be separately ventilated.

In a recent report to the Drainage Committee of Portsmouth, the Borough Engineer described the nature of the galvanised steel tubes and other fittings as fixed in the 4-feet sewer experimented upon. He also stated that when he took his first records in February last the atmosphere was very still and hazy, and the anemometer in the uptake remained perfectly still, showing that no air was passing out of the sewer. But almost immediately that the water in the downtake was turned on, the anemometer commenced to revolve at the rate of 105 revolutions per minute; which, according to the calculation, gave over 2,700 cubic feet of air per hour passing out of the sewer. Taking the actual capacity of the air space in that section of the sewer—with 18 inches of sewage running through it—at 3,500 cubic feet, it is obvious that the sewer gas would not be allowed to stagnate. The Engineer further stated that before completing his observations and after the water-spray in the downtake had been turned off, a breeze sprang up, which caused the anemometer to revolve rapidly and showed that a strong current of air was passing through the sewer without the aid of the water-spray. He further made very satisfactory tests with smoke rockets, and came to the conclusion that when the atmosphere is heavy and still, this method of sewer ventilation is advantageous, inasmuch as the water-spray induces a current of air to pass into the sewer, the gratings of which would otherwise be acting as outlets for foul air.

I procured full details and records of the experiments which had been continued from January to August last year, also drawings illustrating the arrangements. When I inspected the working of the system and tested its efficiency by means of anemometers, I was greatly struck with the advantages it possesses, and am of opinion that a trial of the system by the Department of Public Works would be found not only satisfactory, but would demonstrate that the system is infinitely superior to the method of ventilation now in operation in Sydney. The records show that the consumption of water as registered by the water meter, amounted to an average of 525 gallons per day, the cost of which was about 3d.; and that for every cubic foot of water consumed, over 1,400 cubic feet of fresh air was passed into the sewer. Also that on no single occasion did the system fail, notwithstanding the force or direction of the wind nor the atmospheric conditions which prevailed. Even in the calmest weather, the air in the sewer was changed on the average 35 times in 24 hours.

In conclusion, permit me to express a hope that the information which I have thus been enabled to procure and place before you, will be of practical use to your Department, more especially in connection with the great works of Sewerage which you have to carry out in this country.

## NEW SOUTH WALES.

## METROPOLITAN WATER AND SEWERAGE ACT.

(PROCLAMATION AND NOTIFICATION OF THE TRANSFER OF THE HARRINGTON BRANCH SEWER TO THE BOARD OF WATER SUPPLY AND SEWERAGE.)

Presented to Parliament, pursuant to Acts 43 Vic. No. 32 and 53 Vic. No. 16.

NEW SOUTH WALES, } Proclamation by His Excellency The Right Honourable VICTOR ALBERT GEORGE,  
to wit. } EARL OF JERSEY, a Member of Her Majesty's Most Honorable Privy Council,  
(L.S.) } Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint  
JERSEY, } George, Governor and Commander-in-Chief of the Colony of New South Wales  
Governor. } and its Dependencies.

IN pursuance of the provisions of the "Metropolitan Water and Sewerage Act Amendment Act of 1889," I, VICTOR ALBERT GEORGE, EARL OF JERSEY, Governor aforesaid, do hereby proclaim and declare that the provisions of the 13th section of the "Metropolitan Water and Sewerage Act Amendment Act of 1889" aforesaid, shall, from the date hereof, come into force in respect of the work hereinafter mentioned, which has been reported complete to me by the Minister for Public Works:—

The Harrington-street Branch Sewer, which commences in Moore-street near its junction with Castlereagh-street, and extends in a westerly direction along Moore-street into George-street; thence along George-street and under private property to Harrington-street, and terminating in Argyle-street,—being a total length of 62·14 chains.

Given under my hand and Seal, at Government House, Sydney, this sixth day of March, in the year of our Lord one thousand eight hundred and ninety-one, and in the fifty-fourth year of Her Majesty's reign.

By His Excellency's command,  
W. McMILLAN.

GOD SAVE THE QUEEN!

Department of Public Works, Sydney, 17th March, 1891.

## NOTIFICATION OF TRANSFER OF WORKS UNDER METROPOLITAN WATER AND SEWERAGE ACT AMENDMENT ACT OF 1889.

It is hereby notified, for public information, that, pursuant to the provisions of the abovementioned Act, the portions of work constructed under the authority of the Minister for Public Works, hereinafter described, are hereby transferred to the Board of Water Supply and Sewerage.

BRUCE SMITH.

## DESCRIPTION OF WORK TRANSFERRED.

THE Harrington-street Branch Sewer, which commences in Moore-street near its junction with Castlereagh-street, and extends in a westerly direction along Moore-street into George-street; thence along George-street and under private property to Harrington-street, and terminating in Argyle-street,—being a total length of 62·14 chains.

## NEW SOUTH WALES.

**PUBLIC WORKS ACT OF 1888.**(RESUMPTION OF LAND IN CONNECTION WITH THE SUPPLY OF WATER TO THE TOWN OF LIVERPOOL,  
PARISH OF CABRAMATTA, COUNTY OF CUMBERLAND.)

Presented to Parliament, pursuant to Act 51 Vic. No. 37.

**NOTIFICATION OF RESUMPTION OF LAND UNDER  
THE "PUBLIC WORKS ACT OF 1888," 51 VICTORIA  
No. 37.**

NEW SOUTH WALES, } Proclamation by His Excellency The  
to wit. } Right Honourable VICTOR ALBERT  
GEORGE, EARL OF JERSEY, a Member  
(L.S.) } of Her Majesty's Most Honourable  
Privy Council, Knight Grand Cross  
of the Most Distinguished Order of  
Saint Michael and Saint George,  
JERSEY, } Governor and Commander-in-Chief of  
Governor. } the Colony of New South Wales and  
its Dependencies.

WHEREAS the Minister for Public Works of the said Colony is desirous of acquiring the land described in the Schedule at the foot hereof, for the purpose of a certain Public Work, that is to say, the Supply of Water to the town of Liverpool, in the said Colony: And whereas it is estimated that the cost of completing such work will not exceed the sum of twenty thousand pounds: And whereas the land described in the said Schedule is in my opinion required for carrying out the said work: Now, therefore, I, VICTOR ALBERT GEORGE, EARL OF JERSEY, the Governor aforesaid, with the advice of the Executive Council, in pursuance of the "Public Works Act of 1888," do hereby direct that the said work shall be carried out under the "Public Works Act of 1888," by the Minister for Public Works aforesaid, who, in respect of the said work, shall be deemed to be the Constraining Authority: And in further pursuance of the said Act, I do hereby direct that the land described in the Schedule hereto shall be acquired and taken for the purpose aforesaid, under the "Lands for Public Purposes Acquisition Act," and I do declare by this notification, to be published in the Government Gazette and in one or more newspapers published or circulated in the Police District wherein is situated the said land, that the said land described in the said Schedule has been resumed for the public purpose hereinbefore expressed, that is to say, for and in connection with the Supply of Water to the town of Liverpool, in the said Colony, to the intent that upon the publication of this notification in the Gazette, the said land described in the said Schedule hereto shall forthwith be vested in the said Constructing Authority, on behalf of Her Majesty, for the purposes of the

said Public Works Act of 1888, for an estate in fee simple in possession, freed and discharged from all trusts, obligations, estates, interests, contracts, charges, rates, rights-of-way, or other easements whatsoever; and to the intent that the legal estate therein, together with all powers incident thereto or conferred by that Act, shall be vested in such Authority as a trustee: And I declare that the following is the Schedule of land hereinbefore referred to:—

**SCHEDULE.**

All that piece or parcel of land situate in the parish of Cabramatta, county of Cumberland, and Colony of New South Wales: Commencing at an angle in the eastern boundary of the Sydney Water Supply Canal Reserve, being a point bearing south 89 degrees 46 minutes 30 seconds east 5½ chains and 95·6 links and north 5 degrees 50 minutes east 18 chains 78 links from the south-west corner of John Wylde's portion of land containing 2,000 acres; and bounded thence on the south-west by a line bearing south 43 degrees 15 minutes east 1 chain 4 links; thence on the south-east by a line bearing north 44 degrees 45 minutes east 9 chains 12 links; thence on the north-east by a line bearing north 45 degrees 15 minutes west 12 chains 97 links; thence on the north-west by a line bearing south 81 degrees 42 minutes west 4 chains 92 links to the eastern boundary of the Canal Reserve; and thence on the west by that boundary, being lines bearing south 15 degrees 41 minutes east 2 chains 90 links, south 21 degrees 22 minutes east 1 chain 59 links, south 32 degrees 46 minutes east 1 chain 59 links, south 33 degrees 29 minutes east 6 chains 47 links, and south 9 degrees 35 minutes east 3 chains 60 links, to the point of commencement,—containing 10 acres, and said to be in the possession of the Trustees of Sir John Wylde, and occupation of J R. Firth.

In witness whereof I have hereunto set my Hand, and caused the Great Seal of the Colony to be hereto affixed, at Government House, Sydney, this second day of April, in the year of our Lord one thousand eight hundred and ninety-one, and in the fifty-fourth year of Her Majesty's Reign.

By His Excellency's Command,

BRUCE SMITH.

GOD SAVE THE QUEEN!

## NEW SOUTH WALES.

## PUBLIC WORKS ACT OF 1888.

(RESUMPTION OF LAND IN CONNECTION WITH THE ERECTION OF OFFICES FOR THE ACCOMMODATION OF THE BOARD OF WATER SUPPLY AND SEWERAGE, CITY OF SYDNEY, PARISH OF ST. LAWRENCE, COUNTY OF CUMBERLAND.)

Presented to Parliament, pursuant to Act 51 Vic. No. 37.

NEW SOUTH WALES, } Proclamation by His Excellency Sir  
to wit. } ALFRED STEPHEN, Knight Grand Cross  
of the Most Distinguished Order of  
(L.S.) Saint Michael and Saint George, a  
ALFRED STEPHEN, Companion of the Most Honourable  
*Lieutenant-Governor,* Order of the Bath, Lieutenant-Governor,  
*Administering* of the Colony of New South Wales and  
*the Government.* its Dependencies.

WHEREAS the construction of a certain Public Work, that is to say, the erection of Offices for the accommodation of the Board of Water Supply and Sewerage, has been duly authorised under the provisions of the "Board of Water Supply and Sewerage Offices Erection Act of 1890": And whereas the lands described in Schedule A hereto are necessary and required for the purpose of the said authorised work: Now, therefore, I, the Lieutenant-Governor aforesaid, with the advice of the Executive Council of the said Colony, under and by virtue of the powers and authority vested in me by the Public Works Act of 1888, hereby direct that the said lands shall be acquired for the purpose aforesaid under the provisions of the said last-mentioned Act:—

## SCHEDULE A.

All that piece or parcel of land, situate in the City of Sydney, parish of St. Lawrence, county of Cumberland, and Colony of New South Wales: Commencing at the intersection of the north side of Wilmott-street with the west side of Pitt-street; and bounded thence on the east by Pitt-street bearing northerly 72 feet; thence on the north by a line bearing westerly 81 feet 5½ inches to Stewart-lane; thence on the west by that lane bearing southerly in all 72 feet 2½ inches to its intersection with Wilmott-street; and thence on the south by Wilmott-street bearing easterly 83 feet 8¼ inches, to the point of commencement,—containing 22 perches, and said to be in possession of Donald Manson.

Given under my Hand and the Seal of the said Colony, at Government House, Sydney, this fifth day of January, in the year of our Lord one thousand eight hundred and ninety-one, and in the fifty-fourth year of Her Majesty's Reign.

By His Excellency's Command,

BRUCE SMITH.

GOD SAVE THE QUEEN!

150—

NOTIFICATION OF RESUMPTION OF LAND UNDER THE PUBLIC WORKS ACT OF 1888, 51 VICTORIA No. 37

NEW SOUTH WALES, } Proclamation by His Excellency The  
to wit. } Right Honourable VICTOR ALBERT  
GEORGE, EARL OF JERSEY, a Member  
of Her Majesty's Most Honourable  
(L.S.) Privy Council, Knight Grand Cross  
of the Most Distinguished Order of  
JERSEY, Saint Michael and Saint George,  
*Governor.* Governor and Commander-in-Chief  
of the Colony of New South Wales and  
its Dependencies.

WHEREAS by an Act of the Parliament of the said Colony, 54 Victoria No. 22, intituled the "Board of Water Supply and Sewerage Offices Erection Act of 1890," it is enacted that the Public Work more particularly described in the Schedule thereto should be carried out by the Secretary for Public Works or the Member of the Executive Council for the time being charged with the duties of the said Minister, and such Minister or Member should for the purposes of that Act and the Public Works Act of 1888, be deemed and taken to be the Constructing Authority authorised to enter into contracts, and to exercise all powers, do all acts and things, and be responsible in respect of all obligations and liabilities which could be done or incurred by a Constructing Authority under or pursuant to that Act, or the said Public Works Act, so far as might be necessary for the carrying out of the work thereby sanctioned: And whereas the land described in the Schedule hereto is required for the purpose of erecting thereon the public work authorised to be carried out under the said Act 54 Victoria No. 22, that is to say, Offices for the accommodation of the Board of Water Supply and Sewerage: And whereas by a Proclamation dated the fifth day of January last, and under the Hand of His Excellency the Lieutenant-Governor administering the Government of the said Colony, and the Seal of the said Colony, it is directed that the said land should be acquired for the purpose aforesaid under the provisions of the said "Public Works Act of 1888": Now, therefore, I VICTOR ALBERT GEORGE, EARL OF JERSEY, the Governor aforesaid, with the advice of the Executive Council, in pursuance of the provisions of the said last mentioned Act, do hereby direct that the land described in the Schedule hereto, which in my opinion is required for the said authorised work, shall be acquired and taken under the "Lands for Public Purposes Acquisition Act." And I do declare by this notification, to be published in the Government Gazette and in one or more newspapers published or circulated in the Police District wherein is situated the said land, that the said land described in the said Schedule hereto has been resumed for the public purpose hereinbefore expressed, that is to say, for the purpose of the

erection thereon of Offices for the accommodation of the Board of Water Supply and Sewerage, to the intent that upon the publication of this notification in the Gazette, the land described in the said Schedule hereto shall forthwith be vested in the said Minister as the Constructing Authority, on behalf of Her Majesty, for the purposes of the said Act, for an estate in fee simple in possession, freed and discharged from all trusts, obligations, estates, interests, contracts, charges, rates, rights-of-way, or other easements whatsoever, and to the intent that the legal estate therein, together with all powers incident thereto so conferred by that Act, shall be vested in such Authority as a Trustee. And I declare that the following is the Schedule of land hereinbefore referred to:—

SCHEDULE.

All that piece or parcel of land, situate in the City of Sydney, parish of St. Lawrence, county of Cumberland, and Colony of New South Wales: Commencing at the intersection of the north side of Wilmott-street with the west side of Pitt-street; and bounded thence on the east by Pitt-street bearing northerly 72 feet; thence on the north by a line bearing westerly 81 feet 5½

inches to Stewart-lane; thence on the west by that lane bearing southerly in all 72 feet 2½ inches to its intersection with Wilmott-street; and thence on the south by Wilmott-street bearing easterly 83 feet 8¼ inches, to the point of commencement,—containing 22 perches, and said to be in the possession of Donald Manson.

NOTE.—This notification is in correction of that published in the Government Gazette, No. 26, of the 13th January, 1891.

Given under my Hand and the Seal of the said Colony, at Government House, Sydney, this seventeenth day of March, in the year of our Lord one thousand eight hundred and ninety-one, and in the fifty-fourth year of Her Majesty's Reign.

By His Excellency's Command,

BRUCE SMITH,

GOD SAVE THE QUEEN!

1891.

## NEW SOUTH WALES.

## LANDS FOR PUBLIC PURPOSES ACQUISITION ACT.

(RESUMPTION OF LAND IN CONNECTION WITH THE SUPPLY OF WATER TO THE TOWN OF HILLGROVE,  
PARISH OF METZ, COUNTY OF SANDON.)

Presented to Parliament pursuant, to Act 44 Vic. No. 16, sec. 6.

NOTIFICATION OF RESUMPTION OF LAND UNDER  
44 VICTORIA No. 16.

NEW SOUTH WALES, } By His Excellency The Right Honour-  
to wit. } able VICTOR ALBERT GEORGE, MARQUESS OF  
JERSEY, a Member of Her Majesty's  
(L.S.) } Most Honourable Privy Council, Knight  
Grand Cross of the Most Distinguished  
Order of Saint Michael and Saint  
George, Governor and Commander-  
in-Chief of the Colony of New South  
Wales and its Dependencies.

WHEREAS I, the Governor of the said Colony, with the advice of the Executive Council of the said Colony, have duly sanctioned the carrying out of certain works for and in connection with the supply of water to the town of Hillgrove, for and towards the completion of which said works public funds are available: And whereas the lands hereinafter described are required for the construction of the said works: Now, I, the Governor aforesaid, with the advice of the Executive Council of the said Colony, in pursuance of the powers in this behalf given to or vested in me by the "Lands for Public Purposes Acquisition Act," do, by this notification, published in the Gazette, and in a newspaper, that is to say, in the "Hillgrove Guardian," circulated in the Police District wherein the said land is situated, declare that the lands hereinafter described have been resumed for the public purposes hereinafter mentioned, that is to say, for and in connection with the supply of water to the town of Hillgrove, to the intent that, upon the publication of this notification in the Gazette, the legal estate in the said lands shall forthwith be vested in the Minister for Public Works and his successors, on behalf of Her Majesty, for the purpose of the said last-mentioned Act, for an estate of inheritance in fee simple in possession, freed and discharged from all trusts, obligations, estate, interests, contracts, charges, rates, rights-of-way, or other easements whatsoever; and to the intent, further, that the legal estate therein, together with all powers incident thereto, or conferred by the said Act, shall be vested in the said Minister as a trustee, with the powers stated in the said last-mentioned Act: And I declare that the following are the descriptions of the land hereinbefore referred to, that is to say:—

1st. All that piece or parcel of land situate in the parish of Metz, county of Sandon, and Colony of New South Wales, being

portion 169, containing 40 acres, and said to be in the possession and occupation of William Rischhoff.

2nd. All that piece or parcel of land situate in the parish of Metz, county of Sandon, and Colony of New South Wales, being water reserve 1,436, containing 39 acres 1 rood, exclusive of a road 1 chain 50 links wide passing through the said portion in a south-easterly direction.

3rd. All that piece or parcel of land situate in the parish of Metz, county of Sandon, and Colony of New South Wales, being portion 23, containing 60 acres, and said to be in the possession and occupation of Richard Hargrave.

4th. All that piece or parcel of land situate in the parish of Metz, county of Sandon, and Colony of New South Wales, being part of portion 15: Commencing at the south-east corner of portion 28; and bounded thence by its south boundary bearing west 24 chains 49 links; thence by part of the west boundary of portion 15 bearing south 10 chains; thence by a line parallel to the south boundary of portion 28 bearing east 24 chains 49 links; thence by part of the east boundary of portion 15 bearing north 10 chains, to the point of commencement, containing 24 acres 2 roods, and said to be in the possession and occupation of R. Hargrave.

5th. All that piece or parcel of land situate in the parish of Metz, county of Sandon, and Colony of New South Wales, being part of portion 17: Commencing on the east boundary of the aforesaid portion 17, at a point bearing north and distant 10 chains from the south-east corner of the aforesaid portion 17; and bounded thence by a line bearing west 8 chains; thence by a line bearing north 5 chain; thence by a line bearing east 8 chains; thence by the east boundary of portion 17 aforesaid bearing south 5 chains, to the point of commencement, containing 4 acres, and said to be in the possession and occupation of R. Hargrave.

In witness whereof, I have hereunto set my Hand, and caused the Great Seal of the Colony to be hereto affixed, at Government House, Sydney, this seventeenth day of February, in the year of our Lord one thousand eight hundred and ninety-one, and in the fifty-fourth year of Her Majesty's Reign.

By His Excellency's Command,

BRUCE SMITH.

## NEW SOUTH WALES.

## LANDS FOR PUBLIC PURPOSES ACQUISITION ACT.

(RESUMPTION OF LAND IN CONNECTION WITH THE SUPPLY OF WATER TO THE WESTERN SUBURBS OF SYDNEY AND DISTRICTS NORTH OF THE PARRAMATTA RIVER, PARISH OF HUNTER'S HILL, COUNTY OF CUMBERLAND.)

Presented to Parliament, pursuant to Act 44 Vic. No. 16, sec. 6.

NOTIFICATION OF RESUMPTION OF LAND UNDER  
41 VICTORIA No. 16.

NEW SOUTH WALES, } By His Excellency Sir ALFRED STEPHEN,  
to wit. } Knight Grand Cross of the Most Dis-  
(LS) } tinguished Order of Saint Michael and  
ALFRED STEPHEN, Saint George, a Companion of the  
Lieutenant-Governor, Most Honourable Order of the Bath,  
Administering Lieutenant-Governor of the Colony of  
the Government. New South Wales and its Dependencies.

WHEREAS I, the Lieutenant-Governor aforesaid, with the advice of the Executive Council of the said Colony, have duly sanctioned the carrying out of certain works for and in connection with the supply of water to the western suburbs of Sydney and districts north of the Parramatta River, for and towards the completion of which said works public funds are available under the provisions of the "Appropriation Act of 1887;" and whereas the land hereinafter described is required for the construction of the said works: Now I, the Lieutenant-Governor of the said Colony, with the advice of the Executive Council of the said Colony, in pursuance of the powers in this behalf given to or vested in me by the "Lands for Public Purposes Acquisition Act," do, by this notification published in the Gazette, and in a newspaper, that is to say, in the "Sydney Morning Herald," circulated in the Police District wherein the said land is situated, declare that the land hereinafter described has been resumed for the public purposes hereinafter mentioned, that is to say, for and in connection with the supply of water to the said western suburbs of Sydney and districts north of the Parramatta River, to the intent that upon the publication of this notification in the Gazette, the legal estate in the said land shall forthwith be vested in the Minister for Public Works and his successors, on behalf of Her Majesty, for the purpose of the said last-mentioned Act, for an estate of inheritance in fee-simple in possession, freed and discharged from all trusts, obligations,

estate, interests, contracts, charges, rates, rights-of-way, or other encumbrances whatsoever; and to the intent, further, that the legal estate therein, together with all powers incident thereto or conferred by the said Act, shall be vested in the said Minister as a Trustee, with the powers stated in the said last-mentioned Act: And I declare that the following is the description of the land hereinbefore referred to, that is to say:—

All that piece or parcel of land situated in the parish of Hunter's Hill, county of Cumberland, being part of a grant of 55 acres to Archibald Morrison and also part of lots 3 and 6 of a subdivision of the said grant: Commencing on the southern side of a road one chain wide at a point bearing easterly and distant 3 chains 58 links from the north-western corner of the said grant; and bounded thence on the north by the said southern side of a road bearing easterly 30 links; thence on the east by other part of the said grant bearing southerly 10 chains 91 links to the north-eastern corner of a lane 30 links wide; thence on the south by the northern extremity of that lane bearing westerly 30 links to the eastern boundary of lot 5 of the said subdivision; thence on the west by lots 5 and 2 bearing northerly 10 chains 91 links, to the point of commencement,—containing 1 rood 12½ perches or thereabouts and said to be in the possession and occupation of the Trustees of the estate of the late Hon. James Squire Farnell.

In witness whereof I have hereunto set my Hand, and caused the Great Seal of the Colony to be hereto affixed, at Government House, Sydney, this third day of January, in the year of our Lord one thousand eight hundred and ninety-one, and in the fifty-fourth year of Her Majesty's Reign.

By His Excellency's Command,

BRUCE SMITH.

GOD SAVE THE QUEEN!

## NEW SOUTH WALES.

## PUBLIC WORKS ACT OF 1888.

(RESUMPTION OF LAND IN CONNECTION WITH THE SUPPLY OF WATER TO THE TOWN OF COBAR,  
PARISH OF COBAR, COUNTY OF ROBINSON.)

Presented to Parliament, pursuant to Act 51 Vic. No. 37.

NOTIFICATION OF RESUMPTION OF LAND UNDER  
THE "PUBLIC WORKS ACT OF 1888," 51 VICTORIA  
No. 37.

NEW SOUTH WALES, } Proclamation by His Excellency The  
to wit. } Right Honourable VICTOR ALBERT  
GEORGE, EARL OF JERSEY, a Member  
(L.S.) of Her Majesty's Most Honourable  
Privy Council, Knight Grand Cross  
of the Most Distinguished Order of  
Saint Michael and Saint George,  
JERSEY, Governor and Commander-in-Chief of  
Governor. the Colony of New South Wales and  
its Dependencies.

WHEREAS the Minister for Public Works of the said Colony is desirous of acquiring the land described in the Schedule at the foot hereof, for the purpose of a certain Public Work, that is to say, the Supply of Water to the Town of Cobar, in the said Colony: And whereas it is estimated that the cost of completing such work will not exceed the sum of twenty thousand pounds: And whereas the lands described in the said Schedule are in my opinion required for carrying out the said work: Now, therefore, I, VICTOR ALBERT GEORGE, EARL OF JERSEY, the Governor aforesaid, with the advice of the Executive Council, in pursuance of the "Public Works Act of 1888," do hereby direct that the said work shall be carried out under the "Public Works Act of 1888," by the Minister for Public Works aforesaid, who, in respect of the said work, shall be deemed to be the Constructing Authority: And in further pursuance of the said Act, I do hereby direct that the lands described in the Schedule hereto shall be acquired and taken for the purpose aforesaid, under the "Lands for Public Purposes Acquisition Act," and I do declare by this notification, to be published in the Government Gazette and in one or more newspapers published or circulated in the Police District wherein are situated the said lands, that the said lands described in the said Schedule have been resumed for the public purpose hereinbefore expressed, that is to say, for and in connection with the Water Supply to the Town of Cobar, in the said Colony, to the intent that upon the publication of this notification in the Gazette, the said lands described in the said Schedule hereto shall forthwith be vested in the said Constructing Authority, on behalf of Her Majesty, for the purposes of the said Public Works Act of 1888, for an estate in fee simple in possession, freed and discharged from all trusts, obligations, estates, interests, contracts, charges, rates, rights-of-way, or other easements whatsoever; and to the intent that the legal estate therein, together with all powers incident

thereto or conferred by that Act, shall be vested in such Authority as a trustee: And I declare that the following is the Schedule of lands hereinbefore referred to:—

## SCHEDULE.

All that piece or parcel of land situate in the parish of Cobar county of Robinson, and Colony of New South Wales, being part of portions 59 and 60: Commencing on the east boundary of portion 60, at a point distant 9 chains  $75\frac{7}{10}$  links from its south-east corner; and bounded thence on the south-east by lines bearing south 70 degrees 33 minutes west 9 chains  $46\frac{4}{10}$  links and south 73 degrees 55 minutes west 11 chains  $56\frac{7}{10}$  links; thence on the south by a line bearing west 3 chains  $27\frac{1}{10}$  links; on the south-west by the north-eastern boundary of a road bearing north 44 degrees 50 minutes west 32 links; on the north by a line bearing east 3 chains  $46\frac{7}{10}$  links; on the north-west by lines bearing north 73 degrees 55 minutes east 11 chains  $52\frac{8}{10}$  links and north 70 degrees 33 minutes east 9 chains 54 links; on the east by the east boundary of portion 60 aforesaid bearing south  $24\frac{1}{10}$  links, to the point of commencement,—containing 2 roods  $8\frac{1}{10}$  perches and said to be in the possession and occupation of the Great Cobar Copper-mining Co. and the North Cobar Copper-mining Co.

All that piece or parcel of land situate in the parish, county, and Colony aforesaid, being part of portions 69 and 70: Commencing on the north boundary of portion 70, at a point distant 4 chains  $41\frac{8}{10}$  links from its north-east corner; and bounded thence on the south-east by a line bearing south 27 degrees 16 minutes west 43 chains  $10\frac{2}{10}$  links; on the east by a line bearing south 4 chains  $75\frac{3}{10}$  links; on the south by the south boundary of portion 69 bearing west  $22\frac{2}{10}$  links; on the west by a line bearing north 4 chains  $80\frac{8}{10}$  links; on the north-west by a line bearing north 27 degrees 16 minutes east 43 chains  $15\frac{7}{10}$  links; and on the north by the north boundary of portion 70 bearing east  $25\frac{9}{10}$  links, to the point of commencement,—containing 1 acre and  $14\frac{7}{10}$  perches and said to be in the possession and occupation of the Crown.

In witness whereof, I have hereunto set my Hand, and caused the Great Seal of the Colony to be hereto affixed, at Government House, Sydney, this fourteenth day of April, in the year of our Lord one thousand eight hundred and ninety-one, and in the fifty-fourth year of Her Majesty's Reign.

By His Excellency's Command,

BRUCE SMITH.

GOD SAVE THE QUEEN!

**LANDS FOR PUBLIC PURPOSES ACQUISITION ACT.**  
(RESUMPTION OF LAND IN CONNECTION WITH THE SUPPLY OF WATER TO THE DISTRICT OF  
HURSTVILLE, PARISH OF ST. GEORGE, COUNTY OF CUMBERLAND.)

Presented to Parliament, pursuant to Act 44 Vic. No. 16, sec. 6.

NOTIFICATION OF RESUMPTION OF LAND UNDER  
44 VICTORIA No. 16.

NEW SOUTH WALES, } By His Excellency The Right Honour-  
to wit. } able VICTOR ALBERT GEORGE, EARL OF  
(L.S.) } JERSEY, a Member of Her Majesty's  
Most Honourable Privy Council, Knight  
Grand Cross of the Most Distinguished  
Order of Saint Michael and Saint  
Jersey, } George, Governor and Commander-  
Governor. } in-Chief of the Colony of New South  
Wales and its Dependencies.

WHEREAS I, the Governor of the said Colony, with the advice of the Executive Council of the said Colony, have duly sanctioned the carrying out of certain works for and in connection with the supply of water to the district of Hurstville, for and towards the completion of which said works public funds are available: And whereas the land hereinafter described is required for the construction of the said works: Now, I, the Governor aforesaid, with the advice of the Executive Council of the said Colony, in pursuance of the powers in this behalf given to or vested in me by the "Lands for Public Purposes Acquisition Act," do by this notification, published in the Gazette, and in a newspaper, that is to say, in the "Daily Telegraph," circulated in the Police District wherein the said land is situated, declare that the land hereinafter described has been resumed for the public purposes hereinafter mentioned, that is to say, for and in connection with the supply of water to the district of Hurstville, to the intent that, upon the publication of this notification in the Gazette, the legal estate in the said land shall forthwith be vested in the Minister for Public Works and his successors, on behalf of Her Majesty, for the purpose of the said last-mentioned Act, for an estate of inheritance in fee simple in possession, freed and discharged from all trusts, obligations, estate, interests, contracts, charges, rates, rights-of-way, or other encumbrances whatsoever; and to the intent, further, that the legal estate therein, together with

all powers incident thereto or conferred by the said Act, shall be vested in the said Minister as a trustee with the powers stated in the said last-mentioned Act: And I declare that the following is the description of the land hereinbefore referred to, that is to say:—

All that piece or parcel of land situate at Conneli's Bush, in the parish of St. George, county of Cumberland, and Colony of New South Wales, containing 2 acres 2 roods or thereabouts: Commencing on the north-eastern side of a road 1 chain wide, at the south-western corner of G. Parkes' 3 acres 1 rood 6 perches; and bounded thence on the south-west by that road bearing south-easterly 2 chains 50 links; on the south-east by a line bearing north-easterly 10 chains to M. Byron's 6 acres; on the north-east by part of that land bearing north-westerly 2 chains 50 links to E. Sweeney's 15 acres; and on the north-west by part of that land and G. Parkes' 3 acres 1 rood 6 perches aforesaid, in all bearing south-westerly 10 chains, to the point of commencement,—being part of lot O on a plan deposited in the Land Titles Office, Sydney, numbered 53, and also part of 1,605 acres delineated in the public map of the said parish, deposited in the office of the Surveyor General, originally granted to Robert Townson by Crown grant dated the 1st day of January, 1810; and which piece or parcel of land is said to be in the possession of Andrew Menzies.

In witness whereof I have hereunto set my Hand, and caused the Great Seal of the Colony to be hereto affixed, at Government House, Sydney, this ninth day of March, in the year of our Lord one thousand eight hundred and ninety-one, and in the fifty-fourth year of Her Majesty's Reign.

By His Excellency's Command,

BRUCE SMITH.

GOD SAVE THE QUEEN!

WHEREAS I, the Governor of the said Colony, with the advice of the Executive Council of the said Colony, have duly sanctioned the carrying out of certain works for and in connection with the Sewerage of the towns of Wallsend and Plattsburg, for and towards the completion of which said works public funds are available: And whereas the lands hereinafter described are required for the construction of the said works: Now, I, the Governor aforesaid, with the advice of the Executive Council of the said Colony, in pursuance of the powers in this behalf given to or vested in me by the "Lands for Public Purposes Acquisition Act," do, by this notification, published in the Gazette, and in a newspaper, that is to say, in the "Newcastle Herald," circulated in the Police District wherein the said lands are situated, declare that the lands hereinafter described have been resumed for the public purpose hereinafter mentioned, that is to say, for and in connection with the sewerage of the said towns of Wallsend and Plattsburg, to the intent that upon the publication of this notification in the Gazette, the legal estate in the said lands shall forthwith be vested in the Minister for Public Works and his successors, on behalf of Her Majesty, for the purpose of the said last-mentioned Act, for an estate of inheritance in fee simple in possession, freed and discharged from all trusts, obligations, estate, interests, contracts, charges, rates, rights-of-way, or other easements whatsoever; and to the intent further that the legal estate therein, together with all powers incident thereto or conferred by the said Act, shall be vested in the said Minister as a Trustee, with the powers stated in the said last-mentioned Act: And I declare that the following are the descriptions of the lands hereinbefore referred to, that is to say:—

1st. All that piece or parcel of land situate in the parish of Kahlabah, county of Northumberland, and Colony of New South Wales, being part of the Wallsend Coal Company's property: Commencing at the south-eastern corner of allot-

ment 7 of section BA of the town of Plattsburg; and bounded thence by a curved line of 4 chains 52 links radius, 1 chain 89 links; thence by a line bearing 159 degrees 35 minutes 7 chains 82 links; thence by the northern boundary of Kemp-street bearing 232 degrees 1 chain 5 links; thence by a line bearing 339 degrees 35 minutes 8 chains 14 links; thence by a curved line of 5 chains 52 links radius, 2 chains 31 links; thence by the southern boundary of allotments 8 and 7 of section BA of the town of Plattsburg bearing 93 degrees 31 minutes 1 chain, to the point of commencement,—containing 1 acre and 1 perch, and said to be in the possession of the Wallsend Coal Company.

2nd. All that piece or parcel of land situate in the parish of Hexham, county of Northumberland, and Colony of New South Wales, being allotments 8 of section BA, 6 of section A1, and 6 of section A of the town of Plattsburg,—containing 1 rood and 11 perches, and said to be in the possession of the Council of Plattsburg.

3rd. All that piece or parcel of land situate in the parish of Hexham, county of Northumberland, and Colony of New South Wales, being allotment 7 of section BA of the town of Plattsburg,—containing 15 perches, and said to be in the possession of the Trustees of the Baptist Church.

4th. All that piece or parcel of land situate in the parish of Hexham, county of Northumberland, and Colony of New South Wales, being allotment 5 of section A1 of the town of Plattsburg, containing 19 perches, and said to be in the possession of C. Nichols.

5th. All that piece or parcel of land situate in the parish of Hexham, county of Northumberland, and Colony of New South Wales, being allotment 7 of section A of the town of Plattsburg, containing 15 perches, and said to be in the possession of S. Hall.

6th. All that piece or parcel of land situate in the parish of Hexham, county of Northumberland, and Colony of New South Wales, being part of allotment 8 of section A of the town of Plattsburg: Commencing at the south-western corner of the aforesaid allotment; and bounded thence by its western boundary bearing 26 degrees 41 minutes 70 links; thence by a line bearing 186 degrees 46 minutes 74 links; thence by the northern boundary of Council-street bearing 295 degrees 32 minutes 25 links, to the point of commencement,—containing 13 perches, and said to be in the possession of H. Wicken.

7th. All that piece or parcel of land situate in the parish of Hexham, county of Northumberland, and Colony of New South Wales, being part of C. B. Ranclaud's property: Commencing on the boundary-line dividing the properties of C. B. Ranclaud

and J. W. Brooks, at a point bearing 2 degrees 53 minutes and distant 2 chains 77 links from the intersection of the northern boundary of Charles-street with the western boundary of a lane; and bounded thence by lines bearing 2 degrees 25 minutes 12 chains 97 links, 309 degrees 2 minutes 1 chain 52 links, 182 degrees 25 minutes 10 chains 21 links; thence by a curved line of 2 chains 36 links radius, 3 chains 87 links; thence by lines bearing 276 degrees 19 minutes 6 chains 95 links, 181 degrees 58 minutes 1 chain 6 links, 96 degrees 19 minutes 10 chains 69 links, to the point of commencement,—containing 2 acres 2 roods 39 perches, and said to be in the possession of C. B. Ranclaud.

8th. All that piece or parcel of land situate in the parish of Hexham, county of Northumberland, and Colony of New South Wales: Commencing at the intersection of the northern boundary of Charles-street with the western boundary of a lane; and bounded thence by the said boundary of lane bearing 2 degrees 53 minutes 2 chains 77 links; thence by lines bearing 276 degrees 19 minutes 50 links, 182 degrees 53 minutes 2 chains 79 links; thence by the northern boundary of Charles-street bearing 93 degrees 30 minutes 50 links, to the point of commencement,—containing 22 perches, and said to be in the possession of Messrs. House and Abel.

9th. All that piece or parcel of land situate in the parish of Hexham, county of Northumberland, and Colony of New South Wales: Commencing at the intersection of the southern boundary of Charles-street with the western boundary of a lane; and bounded thence by the said boundary of lane bearing 182 degrees 53 minutes 2 chains 11 links; thence by the north-western boundary of John-street bearing 233 degrees 20 minutes 55 links; thence by a line bearing 2 degrees 53 minutes 2 chains 53 links; thence by the southern boundary of Charles-street bearing 93 degrees 30 minutes 50 links, to the point of commencement,—containing 18 perches, and said to be in the possession of E. Evans.

10th. All that piece or parcel of land situate in the parish of Hexham, county of Northumberland, and Colony of New South Wales, being part of the Wallsend and Plattsburg Gas Company's property: Commencing on the northern boundary of Kemp-street, at a point bearing 52 degrees and distant 46 links from the south-western corner of the Wallsend and Plattsburg Gas Company's property; and bounded thence by the said boundary of Kemp-street bearing 52 degrees 43 links; thence by a curved line of 6 chains 7 links radius, 2 chains 3 links; thence by the southern boundary of John-street bearing 233 degrees 20 minutes 11 links; thence by a line

bearing 181 degrees 39 minutes 1 chain 47 links; thence by a curved line of 5 chains 73 links radius, 76 links, to the point of commencement,—containing 10 perches, and said to be in the possession of the Wallsend and Plattsburg Gas Company.

11th. All that piece or parcel of land situate in the parish of Hexham, county of Northumberland, and Colony of New South Wales, being part of J. W. Brooks' property: Commencing at the intersection of the dividing lines of the properties of J. W. Brooks and C. B. Ranclaud; and bounded thence by a line bearing 2 degrees 25 minutes 91 links; thence by a curved line of 7 chains 72 links radius, 2 chains 14 links; thence by another curved line of 6 chains 50 links radius, 1 chain 81 links; thence by a line bearing 2 degrees 25 minutes 1 chain; thence by the southern boundary of the Co-operative Coal Company's railway bearing 304 degrees 1 chain 43 links; thence by a line bearing 182 degrees 25 minutes 1 chain 75 links; thence by a curved line of 7 chains 72 links radius, 2 chains 14 links; thence by another curved line of 6 chains 50 links radius, 1 chain 81 links; thence by a line bearing 129 degrees 2 minutes 1 chain 52 links, to the point of commencement,—containing 2 roods 30 perches, and said to be in the possession of J. W. Brooks.

12th. All that piece or parcel of land situate in the parish of Hexham, county of Northumberland, and Colony of New South Wales, being part of C. B. Ranclaud's property: Commencing on the northern side of Nelson-street, at a point bearing 26 degrees 41 minutes and distant 1 chain from the north-eastern corner of allotment 7 of section A of the town of Plattsburg; and bounded thence by a line bearing 26 degrees 41 minutes 70 links; thence by a curved line of 2 chains 89 links radius, 3 chains 10 links; thence by lines bearing 1 degree 58 minutes 70 links, 290 degrees 83 links; thence by a curved line of 3 chains 87 links radius, 3 chains 41 links; thence by a line bearing 206 degrees 41 minutes 80 links; thence by the northern boundary of Nelson-street bearing 115 degrees 32 minutes 1 chain, to the point of commencement,—containing 1 rood 31 perches, and said to be in the possession of C. B. Ranclaud.

In witness whereof, I have hereunto set my Hand, and caused the Great Seal of the Colony to be hereto affixed, at Government House, Sydney, this ninth day of February, in the year of our Lord one thousand eight hundred and ninety-one, and in the fifty-fourth year of Her Majesty's Reign.

By His Excellency's Command,

BRUCE SMITH.

GOD SAVE THE QUEEN!

## NEW SOUTH WALES.

## PUBLIC WORKS ACT OF 1888.

(RESUMPTION OF LAND IN CONNECTION WITH A NEW ROAD FROM LITHGOW TO THE HERMITAGE, PARISHES OF MARANGAROO AND LETT, COUNTY OF COOK.)

Presented to Parliament, pursuant to Act 51 Vic. No. 37.

## NOTIFICATION OF RESUMPTION OF LAND UNDER THE "PUBLIC WORKS ACT OF 1888," 51 VICTORIA No. 37.

NEW SOUTH WALES, } Proclamation by His Excellency The  
to wit. } Right Honourable VICTOR ALBERT  
 } GEORGE, EARL OF JERSEY, a Member  
 } of Her Majesty's Most Honourable  
(L.S.) } Privy Council, Knight Grand Cross  
 } of the Most Distinguished Order of  
JERSEY, } Saint Michael and Saint George,  
Governor. } Governor and Commander-in-Chief of  
 } the Colony of New South Wales and  
 } its Dependencies.

WHEREAS the Minister for Public Works of the said Colony is desirous of acquiring the lands described in the Schedule at the foot hereof, for the purpose of a certain Public Work, that is to say, a new Road from Lithgow to The Hermitage, in the said Colony: And whereas it is estimated that the cost of completing such work will not exceed the sum of twenty thousand pounds: And whereas the lands described in the said Schedule are in my opinion required for carrying out the said work: Now, therefore, I, VICTOR ALBERT GEORGE, EARL OF JERSEY, the Governor aforesaid, with the advice of the Executive Council, in the pursuance of the "Public Works Act of 1888," do hereby direct that the said work shall be carried out under the "Public Works Act of 1888," by the Minister for Public Works aforesaid, who, in respect of the said work, shall be deemed to be the Constructing Authority: And in further pursuance of the said Act, I do hereby direct that the lands described in the Schedule hereto shall be acquired and taken for the purpose aforesaid, under the "Lands for Public Purposes Acquisition Act," and I do declare by this notification, to be published in the Government Gazette and in one or more newspapers published or circulated in the Police District wherein are situated the said lands, that the said lands described in the said Schedule have been resumed for the public purpose hereinbefore expressed, that is to say, for and in connection with a new Road from Lithgow to The Hermitage, in the said Colony, to the intent that upon the publication of this notification in the Gazette, the said lands described in the said Schedule hereto shall forthwith be vested in the said Constructing Authority, on behalf of Her Majesty, for the purposes of the said Public Works Act of 1888, for an estate in fee simple in possession, freed and discharged from all trusts, obligations, estates, interests, contracts, charges, rates, rights-of-way, or other easements whatsoever; and to the intent that the legal estate therein, together with all powers incident thereto or conferred by that Act, shall be vested in such Authority as a trustee: And I declare that the following is the Schedule of lands hereinbefore referred to:—

## SCHEDULE.

1st. All that piece or parcel of land situate in the parish of Marangaroo, county of Cook, and Colony of New South Wales: Commencing at a point bearing north 57 minutes east 13 chains and 43 links from the south-west corner of portion 6; and

bounded on the north by a line bearing north 30 degrees 53 minutes east 5 chains and 14 links; thence north 69 degrees 33 minutes east 6 chains and 10 links; thence south 82 degrees 3 minutes east 13 chains and 20 links; thence south 65 degrees 15 minutes east 6 chains and 64 links; thence south 69 degrees 37 minutes east 2 chains and 96 links; thence south 78 degrees 40 minutes east 3 chains and 14 links; thence on the east by a line bearing south 29 degrees 19 minutes east 1 chain and 17 links; on the south by lines bearing north 78 degrees 40 minutes west 3 chains 86 links; thence north 69 degrees 37 minutes west 3 chains and 4 links; thence north 65 degrees 15 minutes west 6 chains and 54 links; thence north 82 degrees 3 minutes west 12 chains and 80 links; thence south 69 degrees 33 minutes west 5 chains and 50 links; thence south 30 degrees 53 minutes west 6 chains and 52 links, to the west boundary of aforesaid portion 6; and on the west by that boundary bearing north 57 minutes east 2 chains, to the point of commencement,—containing 3 acres 3 roods and 3 perches, said to be in the possession of T. S. Mort and R. Pitt.

2nd. All that piece or parcel of land situate in the parish of Lett, county of Cook, and Colony of New South Wales: Commencing at the north-west corner of portion 53 on parish map; and bounded on the east by part of the west boundary of that portion being a line bearing south 57 minutes west 18 chains and 38 links; thence on the south by a line bearing north 57 degrees 50 minutes west 1 chain and 17 links; thence on the west by a line bearing north 57 minutes east 17 chains and 70 links to Farmer's Creek; and on the north by that creek upwards, to the point of commencement,—containing 1 acre 3 roods 8 perches, and said to be in the possession of A. Brown.

3rd. All that piece or parcel of land situate in the town of Lithgow, parish of Lett, county of Cook, and Colony of New South Wales: Commencing at a point bearing south 59 degrees 6 minutes 30 seconds west 1 chain 22½ links from the junction of the north-western boundary of Main-street with the south-western boundary of Station-street; and bounded on the north-east by a line bearing north 31 degrees 19 minutes west 2 chains and 35 links to a lane; thence on the north-west by said lane south 65 degrees 26 minutes west 70 links; on the south-west by a line bearing south 29 degrees 53 minutes east 2 chains and 42 links to Main-street; and on the south-east by that street bearing north 59 degrees 6 minutes 30 seconds east, to the point of commencement,—containing 27·8 perches, owner and occupier unknown.

4th. All that piece or parcel of land situate in the parish of Lett, county of Cook, and Colony of New South Wales: Commencing at a point south 57 minutes west and 17 chains 20 links from the north-west corner of portion 53 on parish map; and bounded on the north-east by a line bearing south 57 degrees 50 minutes east 5 chains and 2 links; again on the north-east by a line bearing south 57 degrees 18 minutes east 3 chains and 13 links; again on the north-east by a line bearing south 31 degrees 55 minutes east 1 chain and 47 links to the railway fence; on the south-east by the said railway fence bearing south 67 degrees 16 minutes west 1 chain and 4

links; on the south-west by a line bearing north 31 degrees 55 minutes west 1 chain and 13 links; again on the south-west by a line bearing north 57 degrees 18 minutes west 2 chains and 87 links; again on the south-west by a line bearing north 57 degrees 50 minutes west 4 chains and 37 links to the west boundary of said portion 53; thence on the west by that boundary bearing north 57 minutes east 1 chain and 18 links, to the point of commencement,—containing 3 roods 24 perches and said to be in the possession of Eskbank Iron Company.

5th. All that piece or parcel of land situate in the parish of Marangaroo, county of Cook, and Colony of New South Wales: Commencing at the south-west corner of portion 6 on parish map; and bounded on the east by the west boundary of that portion being a line bearing north 57 minutes east 13 chains and 43 links; on the north-west by a line bearing south

30 degrees 53 minutes west 1 chain 99 links; on the west by a line bearing south 57 minutes west 11 chains and 85 links to Farmer's Creek; and on the south by that creek upwards, to the point of commencement,—containing 1 acre 24 perches and said to be in the possession of A. Brown.

Given under my Hand and Seal of the said Colony, at Government House, Sydney, this second day of April, in the year of our Lord one thousand eight hundred and ninety-one, and in the fifty-fourth year of Her Majesty's Reign.

By His Excellency's Command,

BRUCE SMITH.

GOD SAVE THE QUEEN!

## NEW SOUTH WALES.

## PUBLIC WORKS ACT OF 1888.

(RESUMPTION OF LAND IN CONNECTION WITH THE WIDENING OF RICKETTY-STREET, ST. PETERS, PARISHES OF PETERSHAM AND BOTANY, COUNTY OF CUMBERLAND.)

Presented to Parliament, pursuant to Act 51 Vic. No. 37.

## NOTIFICATION OF RESUMPTION OF LAND UNDER THE "PUBLIC WORKS ACT OF 1888," 51 VICTORIA NO. 37.

NEW SOUTH WALES, } Proclamation by His Excellency The  
to wit. { Right Honourable VICTOR ALBERT  
GEORGE, EARL OF JERSEY, a Member  
(U.S.) of Her Majesty's Most Honourable  
Privy Council, Knight Grand Cross  
of the Most Distinguished Order of  
Saint Michael and Saint George,  
JERSEY, Governor and Commander-in-Chief of  
Governor. the Colony of New South Wales and  
its Dependencies.

WHEREAS the Minister for Public Works of the said Colony is desirous of acquiring the lands described in the Schedule at the foot hereof, for the purpose of a certain Public Work, that is to say, the widening of Ricketty-street, St. Peters, in the said Colony: And whereas it is estimated that the cost of completing such work will not exceed the sum of twenty thousand pounds: And whereas the lands described in the said Schedule are in my opinion required for carrying out the said work: Now, therefore, I, VICTOR ALBERT GEORGE, EARL OF JERSEY, the Governor aforesaid, with the advice of the Executive Council, in pursuance of the "Public Works Act of 1888," do hereby direct that the said work shall be carried out under the "Public Works Act of 1888," by the Minister for Public Works aforesaid, who, in respect of the said work, shall be deemed to be the Constructing Authority: And in further pursuance of the said Act, I do hereby direct that the lands described in the Schedule hereto shall be acquired and taken for the purpose aforesaid, under the "Lands for Public Purposes Acquisition Act," and I do declare by this notification, to be published in the Government Gazette and in one or more newspapers published or circulated in the Police District wherein is situated the said lands, that the said lands described in the said Schedule have been resumed for the public purpose hereinbefore expressed, that is to say, for and in connection with the widening of Ricketty-street, St. Peters, in the said Colony, to the intent that upon the publication of this notification in the Gazette, the said lands described in the said Schedule hereto shall forthwith be vested in the said Constructing Authority, on behalf of Her Majesty, for the purposes of the said Public Works Act of 1888, for an estate in fee simple in possession, freed and discharged from all trusts, obligations, estates, interests, contracts, charges, rates, rights-of-way, or other easements whatsoever; and to the intent that the legal estate therein, together with all powers incident thereto or conferred by that Act, shall be vested in such Authority as a trustee: And I declare that the following is the Schedule of lands hereinbefore referred to:—

## SCHEDULE.

1st. All that piece or parcel of land, situate in the parish of Petersham, county of Cumberland, and Colony of New South Wales: Commencing at the intersection of Ricketty-street, St.

Peters, with the Cook's River Road; and bounded on the north-west by that road bearing north 52 degrees 38 minutes east 59 links; on the north-east by a line bearing south 46 degrees 35 minutes east 15 chains 17 links to land owned by D. Cooper; on the south-east by that land bearing south 37 degrees 45 minutes west 50 links to Ricketty-street; and on the south-west by that street bearing north 46 degrees 35 minutes west 15 chains 30 links, to the point of commencement,—containing 3 roods 1·8 perches, and said to be in the possession of Mrs. Burns.

2nd. All that piece or parcel of land, situate in the parish of Petersham, county of Cumberland, and Colony of New South Wales: Commencing at a point bearing south 46 degrees 35 minutes east and distant 15 chains 30 links from the north-eastern intersection of Cook's River Road with Ricketty-street; and bounded on the north-west by land owned by Mrs. Burns, being a line bearing north 37 degrees 45 minutes east 50 links; on the north-east by a line bearing south 46 degrees 5 minutes east 12 chains 87 links to land resumed by the Government; on the south-east by that land, being a line bearing south 24 degrees 8 minutes west 50 links to Ricketty-street; and on the south-west by that street bearing north 46 degrees 5 minutes west 13 chains, to the point of commencement,—containing 2 roods 23·4 perches, and said to be in the possession of D. Cooper.

3rd. All that piece or parcel of land, situate in the parish of Botany, county of Cumberland, and Colony of New South Wales: Commencing at the intersection of Ricketty-street with Kent Road; and bounded on the south by Ricketty-street bearing north 85 degrees 5 minutes west 5 chains 33 links; thence north 82 degrees 39 minutes west 13 chains 84 links; thence north 78 degrees 21 minutes west 76 links to land resumed by the Government; on the west by the said land, being a line bearing north 24 degrees east 52 links; on the north by lines bearing south 78 degrees 21 minutes east 63 links, south 82 degrees 39 minutes east 13 chains 82 links, and south 85 degrees 5 minutes east 5 chains 30 links to Kent Road; and on the east by that road bearing south 18 degrees 23 minutes east 50 links, to the point of commencement,—containing 3 roods 38 perches and said to be in the possession of S. Keep.

In witness whereof I have herunto set my Hand, and caused the Great Seal of the Colony to be hereto affixed, at Government House, Sydney, this second day of April, in the year of our Lord one thousand eight hundred and ninety-one, and in the fifty-fourth year of Her Majesty's Reign.

By His Excellency's Command,

BRUCE SMITH.

## NEW SOUTH WALES.

## PUBLIC WORKS ACT OF 1888.

(RESUMPTION OF LAND IN CONNECTION WITH A BRIDGE OVER BECKETT'S CREEK, NEAR GRANVILLE, PARISH OF ST. JOHN, COUNTY OF CUMBERLAND.)

Presented to Parliament, pursuant to Act 51 Vic. No. 37.

## NOTIFICATION OF RESUMPTION OF LAND UNDER THE "PUBLIC WORKS ACT OF 1888."

NEW SOUTH WALES, } Proclamation by His Excellency The  
to wit. } Right Honourable VICTOR ALBERT  
(L.S.) } GEORGE, EARL OF JERSEY, a Member  
of Her Majesty's Most Honourable  
Privy Council, Knight Grand Cross  
of the Most Distinguished Order of  
Saint Michael and Saint George,  
JERSEY, } Governor and Commander-in-Chief of  
Governor. } the Colony of New South Wales and  
its Dependencies.

WHEREAS the Minister for Public Works of the said Colony is desirous of acquiring the land described in the Schedule at the foot hereof for the purpose of a certain Public Work, that is to say, a Bridge over Beckett's Creek, near Granville, in the said Colony, and the approaches thereto: And whereas it is estimated that the cost of completing such work will not exceed the sum of twenty thousand pounds: And whereas the land described in the said Schedule is, in my opinion, required for carrying out the said work: Now, therefore, I VICTOR ALBERT GEORGE, EARL OF JERSEY, the Governor aforesaid, with the advice of the Executive Council, in pursuance of the "Public Works Act of 1888," do hereby direct that the said work shall be carried out under the "Public Works Act of 1888," by the Minister for Public Works aforesaid, who, in respect of the said work shall be deemed to be the Constructing Authority; and in further pursuance of the said Act, I do hereby direct that the land described in the Schedule hereto shall be acquired and taken for the purpose aforesaid under the "Lands for Public Purposes Acquisition Act": And I do declare by this notification, to be published in the Government Gazette and in one or more newspapers published or circulated in the Police District wherein is situated the said land, that the said land described in the said Schedule has been resumed for the public purposes hereinbefore expressed, that is to say, the construction of a Bridge over Beckett's Creek, near Granville, in the said Colony and approaches thereto, to the intent that upon the publication of this notification in the Gazette, the said land described in

the said Schedule hereto shall forthwith be vested in the said Constructing Authority on behalf of Her Majesty for the purposes of the said Act, for an estate in fee simple in possession, freed and discharged from all trusts, obligations, estates, interests, contracts, charges, rates, rights-of-way, or other easements whatsoever, and to the intent that the legal estate therein, together with all powers incident thereto so conferred by that Act, shall be vested in such authority as a Trustee: And I declare that the following is the Schedule of land hereinbefore referred to:—

## SCHEDULE.

All that piece or parcel of land, situate in the parish of St. John, county of Cumberland, and Colony of New South Wales, being a part of lot 10 of section 1 in the original subdivision of Sir Henry Parkes' land, containing 8 perches: Commencing at a point on the southern side of Beckett's Creek at its intersection with the Sydney Road 80 feet wide; and bounded thence on the west by that road bearing south 8 degrees 23 minutes east 107 feet 6 inches to a corner of that road; thence on the south again by that road bearing south 63 degrees 27 minutes 32 seconds east 50 feet; thence on part of the east by a line bearing north 47 degrees 8 minutes west 36 feet 9 inches; thence on the remainder of the east by a line bearing north 8 degrees 28 minutes west 107 feet 6 inches to Beckett's Creek aforesaid; thence on the north by that creek upwards 18 feet to the point of commencement; and which parcel of land is said to be in the possession of William Cock.

In witness whereof, I have hereunto set my Hand, and caused the Great Seal of the Colony to be hereto affixed, at Government House, Sydney, this sixth day of April, in the year of our Lord one thousand eight hundred and ninety-one, and in the fifty-fourth year of Her Majesty's Reign.

By His Excellency's Command,

BRUCE SMITH.

GOD SAVE THE QUEEN

1891.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

## PROPOSED BRIDGE OVER THE RIVER MURRAY AT TOCUMWAL.

(REPORT OF MR. STANLEY ALEXANDER.)

*Ordered by the Legislative Assembly to be printed, 26 May, 1891.*

## Mr. S. Alexander to The Under Secretary for Public Works.

Sydney, 31 March, 1891.

TOCUMWAL occupies a high position at the extreme north end of an extensive bend in the River Murray. The main line of road that skirts the river from its upper waters diverges from it here north-west along the Tuppal Creek to Deniliquin, 45 miles distant. Mulwala is 32 miles to the east, and Jerilderie 35 miles to the north. A travelling stock route a mile wide from Jerilderie meets the river at Tocumwal. This is a very important route, being the central of three of the principal routes for travelling stock from New South Wales into Victoria.

2. The township of Cobram is in Victoria, about 8½ miles in a direct line south-east from Tocumwal. It is situated on the south bank of the river Murray. It is the terminus of the railway line at 155 miles from Melbourne, through Mangalore up the Goulburn valley. This direction is straight for Tocumwal. The railway survey was carried to the border opposite the town of Tocumwal, but a deviation was eventually decided upon taking the line due east to Cobram. This line was opened for traffic in October, 1888. The railway terminus is over a mile from the river bank, and a resumption of land 4 chains wide has been made to a point suitable for crossing.

3. The course of the river and lagoons is shown very imperfectly on the maps of both colonies, so the exact position of the various places with relation to one another can hardly be accurately defined.

4. The site selected for the village of Barooga, on the New South Wales side of the Murray, is on water reserve No. 108—area about 1000 acres. This is a good elevated site, level and suitable in every way, on the bank of the Bullinginya lagoon. This lagoon and the bend between it and the Murray is forest reserve No. 3215, of 2560 acres, called the Barooga State Forest.

5. The Bullinginya lagoon opposite the village site has two branches. The middle one of these is the larger. They join at about opposite the boundary fence of reserve No. 108, at a quarter of a mile or so from where the track enters the lagoon. Water was seen flowing in this lagoon while the level of the river at Tocumwal was at 9 feet. According to a rough section shown by Mr. McFarland the bed of this middle arm is 22 feet 7 inches below the ground surface at a peg on the right bank at Barooga village. Mr. F. R. Mahoney, Engineer to the Yarrowonga shire, states in his evidence, that he believes that a deck level for a bridge over these lagoons of 22 feet above the bed of the middle arm will be raised above all floods, and that he has ascertained that level to be 2 feet 10 inches above the high flood mark of 1889, as shown at Cobram, and that he is designing for Mr. McFarland, a bridge, 11 chains in length, which he considers will suffice to bridge both lagoons, and be a permanent crossing under all conditions of flood.

5a. The track now in use across the lagoons and over the land intervening between them and the Cobram punt, winds considerably between the Barooga village site, where it strikes the lagoon and the north bank of the Murray. It then follows this north bank right up to the punt. Depressions in this bank, by which flood water passed over into the lagoons, have been filled in by the proprietors of the punt. The greater part of this north bank, as now levelled, is stated by Mr. McFarland to be above the level of all but such extraordinary floods as those of 1867, 1870, and 1878; but Mr. Mahoney said that he had not yet confirmed this by levelling. The general character of the surface of the land west of the track between the Bullinginya lagoon and the river is tolerably level, though intersected by shallow water-courses formed by the overflow from the Murray, and gradually falling away in level from the river bank over which the track passes. Mr. McFarland gives the measured distance from the north bank of the Murray at the punt to the point on the bank of the lagoon where the fence of reserve No. 108 meets the lagoon at 40 chains, and from the same point on the Murray to the point on the bank of the lagoon at which he would commence his bridge at a little over 60 chains. The distance along the track was measured to be 64 chains.

6. A Mr. Hulbard proposed at one time to place a punt on the Murray nearer to Cobram, at the head of a long straight reach of the river, but he could not obtain the necessary authority. The banks here are very high and well defined, and quite out of reach of any floods, but the access to this punt from the New South Wales side could only have been along the right bank of the river past the existing punt site, and along the existing track to Barooga village. The Barooga private property adjoins west of reserve No. 108. Over this there is no right of way, even if a practicable track across the lagoons could be formed.

7. The Murray River, opposite Cobram, is confined to well defined banks. It spreads out over the Bullinginya lagoon and the intervening land only, but does not overflow those limits. Some miles down the river on the Victorian side an overflow takes place, forming the Koonoomoo lagoon, and farther west again a number of extensive overflows from the Sheep-wash Creek. Still farther on the Dairy Creek flows out of a lagoon and the three or more heads of the Sapling Creek and the Jump-up Creek also leave the river. The water from these over-flows covers nearly the whole of the country west of Cobram and north of the railway line, and to some extent to the south of the line also. The railway embankment has been raised above all flood level, but the openings left in it have not been sufficient to allow of the flood water passing across freely, though the embankment does not appear to have been breached anywhere. The flood was all over the Yarroweyah township, and surrounded the principal buildings. Some of the low parts of Cobram township were also invaded.

8. On the New South Wales side the flood passes out of the river limits at about a mile and a half west of the Barooga homestead, near the irrigation works, and passes over a considerable extent of country generally as a shallow overflow, around Tocumwal. The general effect of this extensive flooding on the New South Wales, and more especially on the Victorian lands is, however, insignificant, being no more, in fact, than would be caused temporarily by excessively prolonged rainfall.

9. There is, it seems from this, an extensive dispersment of flood waters, to the relief of the main channel of the river, taking effect some distance below Cobram, and the inference is that the rise of floods must be greater within the confined limits of the channel opposite Cobram, or the velocity of discharge must be considerably higher than at Tocumwal.

10. The highest recorded flood at Tocumwal was registered at 17 feet 9½ inches on the gauge on September 16th, 1889. The heights of all preceding floods are known only by tradition, as a gauge had not been fixed when they occurred, but they are said to have been a few inches higher only. The record shows that this flood, 1889, endured for some time, as the water remained over 16 feet on the gauge from September 3rd to 30th, and above 17 feet from the 4th to the 25th.

11. It has been stated that the Sheep-wash and Sapling Creeks commence to flow only when the water in the river has risen to 15 feet 3 inches on the gauge at Tocumwal, but even so the condition of things during September 1889 and November 1890 would seem to show that considerable areas of the country on the south side of the river were under water for the greater part of the month.

12. During the high floods the whole of the south bank of the Murray opposite Tocumwal is submerged. The Sapling and Jump-up Creeks, which intersect the land enclosed by the river, result from several overflows over the river bank that take place within the first mile and a-half measured in a straight line immediately above Tocumwal, a considerable extent of the river bank between these over-flows is said to have been out of water during the flood of 1889. The Bouchier's property boundary has been laid out taking the contour line of the southern edge of the flood water so formed, but the Zig-Zag form of this boundary is also said to have been adopted to exclude all red-gum timber growth. South of this boundary Mr. R. Bouchier says that 500 acres of land are quite above all flood level. They have been in occupation of this land since before the flood of 1878, so he can speak with authority on the matter.

13. A narrow winding ribbon of water called Dairy Creek traverses the Bouchier's land from east to west communicating just on the Geodetic line, the boundary road between the parishes Yarrowonga and Strathmerton, and of the shires Yarrowonga and Numurkah, with a wide "depression" shown on the maps. This "depression" is one of the serious obstacles to traffic during times of flood. It communicates within a mile and a-half of the Geodetic line with the Ulupna Creek, near the point at which this creek is joined by the Sapling Creek. The Dairy Creek takes its rise in an overflow from a lagoon on the Murray. It is there dammed and provided with a rough gate by the Bouchier's in order to retain the water in the creek.

14. The Sheep-wash Creek is formed by the confluence of numerous overflows from the Murray, not shown on the map, as the whole of a very large blank area therein is forest reserve. Somewhere about the Geodetic line the Creek bed becomes well defined. It also flows into the Ulupna Creek. A considerable extent of land on both sides of the Sheep-wash Creek is low, and swept by floods.

15. Commencing from the Tocumwal punt the road to Strathmerton now in use crosses the Sapling Creek below the confluence of the several overflows by which it is formed. The creek is here as a wide hollow only. The track then passes west along Bouchier's boundary as far as the Geodetic line of road. This road is then followed southwards across the "depression" and then crosses a piece of land which is known to be above the level of all floods, and enters upon the waters of Sheep-wash Creek. This Creek was securely bridged above flood level some years ago by the Numurkah Shire Council. The road passes through about a quarter of a mile of flood, approaching it from the north, and fully a mile on the south of the Creek. The greater part of this flood will be found to be shallow, but there are numerous hollows in which the current will be flowing, as the surface of the ground is evidently falling westwards. The evidence of current is also shown by the deposits of timber all over this open ground which have every sign of having been drifted there. The north boundary of Mr. Copes' land is out of all flood, and from this point to Strathmerton (a distance of 5 miles) the road is formed and safe at all times. Some flood waters pass across it in places, but these have been provided for, and the country all along is generally high. The whole of it is in occupation and much of it cultivated.

16. This is in fact correct of all land on the Victorian side of the Murray, in this neighbourhood. Every part of it, excepting only a few leaseholds and the forest reserves of red-gum timber, has been taken up in small holdings, on which non-residents are in a minority. Some portions of this country being within the reach of the lower floods are not fit for cultivation, not only because of their frequent submergence, but from the character of the soil; but such areas bear but a small portion of the whole tract outside of the reserves which is within the reach of very high floods. Over such level land a few inches of rise of flood covers a very large area with water.

17. The track from Tocumwal to Yarroweyah and Cobram follows the route described above to the Bouchier's boundary, crossing this land by a formed road, shown on the map, and entering on the open forest reserve. The numerous water courses forming the heads of the Sheep-wash Creek here cover a large area with flood water annually, and form an obstacle to road making, which will probably not be overcome for a very long time, but outside the limits of the reserves the shallow water encountered presents no difficulty.

18. The surveyed line of railway from Strathmerton to the river opposite Tocumwal is shown approximately on the map. The real difficulties on the route are the crossing of the Sheepwash Creek and its overflows, and on the length between the Bouchier's high land and the river. The floodwater crossed between Strathmerton, and the Sheep-wash creek water is comparatively unimportant shallow overflow. According to the information available, the cost of constructing this length of 9 miles was estimated by the Victorian department at £60,000. In the face of the fact that the line has already been built to Cobram, and that this length will probably be reported on the Victorian Public Works Committee, an opinion as to the sufficiency of that sum is not called for in this report, but as the construction of this length seems to have been taken to have an important bearing on the bridge question, the following assumptions as to the reasons that may have led to the deviation of the line to Cobram may be ventured.

19. Of the whole of the 9 miles, the line would cross fully 3 miles of water between Strath-Merton and the Bouchier's high land and 1½ miles from that land to the river. Though, as shown, this would not necessarily be very expensive to construct, yet the excision of such a large tract of country leaves but a small hope that the remainder may be productive of sufficient revenue. This of itself would be enough to stop the construction of the line at Strathmerton, pending a decision as to the point at which the river is to be crossed, but for continuing the line to another point on the border, another sufficient reason may be found in the fact of there being but a small area of dry land available, viz., on the Bouchier's property, for a terminal township. This site is isolated by floods, and would entail great expense, in the long run, in making and maintaining approaches from the adjoining country.

20. For the present inquiry the question of the practicability of the roads from Tocumwal to the existing railway is of more importance than that of the cost of the railway branch, since a decision on the lines within Riverina has yet to be formed. On this matter, inspection of the country and the facts elicited in evidence show that floods in the Murray, caused by melting of snow on the mountains, raise the surface to a height sufficient to fill the overflow channels, and maintain them in a flowing condition annually. That the addition of a heavy rainfall or abnormally warm weather raising the surface a few more inches very materially adds to the strength and volume of the overflowing water, and inundates extensive tracts of country. Four occurrences of the maximum floods have been known, viz., during 1867, 1870, 1878, and 1889; but minor floods, rising to within a few inches of these, have been very frequent, sometimes being caused by rainfall only. The condition of things on the road during the periodical floods is that the passage of sheep from Tocumwal over 3½ miles of it is impossible, and traffic of any sort at such times is difficult; that during the continuance of many of the minor floods, which are of almost annual or bi-annual occurrence, the regular road is impassable, the track followed being on sufferance across Mr. Bouchier's land; and that, during the occasional extraordinary floods, all traffic is stopped.

21. It appears that the remedy for this state of things is in the hands of the Shire councils. Of the road to Strathmerton, about 1½ miles is in the Yarrawonga Shire, and the rest in the Numurkah Shire. The whole of the road to Yarroweyah and Cobram is in the Yarrawonga Shire. A redistribution of the ridings in the Numurkah Shire is being agitated, in order to bring about better representation in the Council of the interests of the northern part of the Shire, the construction of this road to Tocumwal being one of the objects to be attained; but, as some part of it is in the Yarrawonga Shire\*, it seems that considerable difficulties lie in the way of the whole work being carried out. It may be added that a road from Tocumwal to Strathmerton can be made at no great cost, so as to be *passable* in all conditions of flood, but to make one high and dry above flood-level could only be done at a cost beyond the resources of the Shire.

22. The township of Tocumwal has been in existence for a very long time, the punt having been at work since the year 1862. The stock route to this place has also been in use from an early date. Eastward up the river the next crossing-place is at Mulwala, 32 miles distant, where a bridge is being built. East of this again is Corrowa, 24 miles distant. Westwards of Tocumwal the Tuppal Creek and the broken ground south of it cuts off all access to the river as far as Moama. The only route into Victoria is *via* Deniliquin. This place is 45 miles from Tocumwal. The population of Tocumwal is given at 357, the number of dwellings being 56. It has grown up alongside the only crossing-place on the river available for a large extent of country, and has become the centre of trade. This country would by now have become overspread with farms and populous had the land been available. The pastoral properties surrounding Tocumwal are Belubla on the west, the Murray run, and the Barooga on the east. North-eastward there is a large property, Tuppal, of 159,295 acres of freehold land, which is shortly to be sold in five blocks, ranging from 8,040 to 53,337 acres in each. There is a considerable area of Crown land on this property,† but the sum total in the whole district is but a small proportion. Development must be looked to from subdivision of properties, and all experience goes to show that expansion of an agricultural community depending on such conditions is not a rapid process.

The operations at the port of Tocumwal are given in the following figures:—

	1888.	1889.	1890.
Cattle ... ..	1,276	1,189	1,312
Horses ... ..	36	11	34
Sheep ... ..	194,908	32,213	72,609
Wool (bales) ... ..	2,686	3,754	3,974
Duty collected ... ..	£1,756	£2,009	£1,778
Value, imports ... ..	£20,602	£29,601	£22,380
„ exports ... ..	£106,371	£89,939	£83,494

This return includes shipments made some miles down the river at the Belubla wool-shed, amounting to about 1,800 bales. During 1889, about 3,600 bales, and during 1890, 3,472 bales were shipped to Echuca; so the quantity carried to the railway through Tocumwal is but a small proportion of the whole. The very large number of sheep that were crossed over in 1888 was owing to the dry season during which stock were sent over to grass in Victoria.

23. The trade of the place is carried on in communication with the railway stations at Yarroweyah and Strathmerton, and with Echuca by the river. There is no constant service, but during the wool season, and for timber, steamers traverse the river and are freely used whenever available, and they carry by far, the greater portion of the wool dispatched. The difficulties on the road to the railway at Strathmerton during the wool season are the obstacles to the free use of the rail, though Melbourne is 10 miles nearer to

\* See Appendix K.

† This property was offered for sale in Melbourne on March 19, but no sales were effected.

to Strathmerton than Echuca, and the steamer carriage 20s. per ton, and the insurance 7s. 6d. to 10s. per hundred pounds are additional to the rail charges from Echuca. As an instance, the Tuppal wool, 2,500 bales, has been regularly taken 30 miles to Deniliquin, which is 201 miles from Melbourne, at a cost of about 1s. per ton per mile for road carriage, whereas, Tocumwal is distant 15 miles and Strathmerton 25½ miles from the shed, and 145 miles from Melbourne. Were the roads of even quality, the cost by the several routes should be approximately as follows:—

From Tuppal <i>via</i> Deniliquin ... ..	75s. per ton.
"    " <i>via</i> Strathmerton ... ..	60s.    "
"    "    Tocumwal and Echuca ... ..	65s.    "

Wool taken from Echuca enjoys special rates not granted at Cobram or Strathmerton. It will be noticed in the evidence that the difficulty of crossing by the punt is given as the reason for adopting the expensive route.

24. Importations into Tocumwal for consumption in the town and district (irrespective of what may be brought in by the settlers themselves) amount to about 150 tons per annum from the railway, and about 80 tons per annum by the river. The latter tonnage consists chiefly of flour, bran, and pollard, the return of wheat sold in bond to Echuca millers from Tocumwal and Moana.

25. The crossing place over the river at Barooga is 8 miles up the river from Tocumwal. This has been chosen as the village site, as being opposite Cobram, not for accommodation of neighbouring settlement, for of this there is none for 15 miles back from the river, nor for many miles along the road either way, excepting the run homesteads. The township of Berrigan, around which settlement has taken place, is 19 miles distant. The land lately sold at Barooga is 15 miles due north from the site, and the block, which is next to be offered, adjoins it, extending back along the Berrigan road for about 15 miles\*. As the place has no history, and there are no statistics of settlement or production, excepting those of the runs, the interests to be served by adoption of this as a crossing place must be sought for outside of the immediate neighbourhood.

26. The township of Cobram owes its origin to the site having been made the terminus of the railway, so it dates from about 1888 only. It has, however, within this space of time become considerable. The return gives the number of dwellings at 147. The population taken at the usual average would be 735, or say under 800. The whole country surrounding it is taken up in farm holdings. There are two trains daily to and from Melbourne carrying a good traffic, though perhaps not as yet enough to justify such a service. The town is well laid out, and for the most part solidly built. Its rapid rise is attributable perhaps to speculation on its advantageous position on the border, rather than to the commercial importance of the surrounding country, which is exceptionally well served by railway lines, but it is nevertheless a fact, and its future may be safely predicted. Postal communication has not, as yet, been opened across the border from Cobram. The centres of trade in these districts are, Yarrowonga, 22 miles distant up the river, and Numurkah, 22 miles on the railway line towards Melbourne. Echuca is 52 miles away in a direct line. The terminus of a branch line at Katamatite is 12 miles due south from Cobram.

27. As to the practicability and probable cost of bridging the Murray River between Cobram and Barooga there is no information other than that collected by Mr. M'Farland for his own guidance, which, however, he has made no secret of. Over and above the cost of the bridge proper, there is a tract of land from 40 to 60 chains in extent to be overcome in some way. The site spanned by the lesser of these must certainly be bridged throughout, but on the line proposed by Mr. M'Farland a proper instrumental survey may lead to adoption of his suggestion—viz., to bridge the lagoons only at a cost of about £3,000 or £4,000 and to embank the rest. These schemes differ so greatly in cost as to justify the expense of an investigation and also, in case of a bridge over the whole being decided upon, that of an examination of a site lower down crossing the river at the head of a long straight reach where the banks are high and well defined. The whole cost of this approach to the main bridge over the Murray must be borne by New South Wales.

28. The punt at Cobram is the property of a company. It is worked under an annual license granted by Victoria, and a Customs license by both colonies. There is a regulation scale of charges which, however, is not fully exacted. These punts are very profitable concerns. At Tocumwal the annual takings have amounted to from £500 to £700. The average of the last three years gives 96,577 sheep as having crossed there at 25s. per thousand. This traffic alone realised over £120 yearly. The whole of the profits belong to the proprietor. The traffic will certainly keep pace with expansion on both sides of the river and improvements in the communications. At Cobram, however, the punt may be said to have worked for a few months only, as the lagoons were impassable during half of last year. The operations for 1890 were as follows:—

Exports, total value ... ..	£1,020
Imports " " ... ..	3,007
Duty Collected ... ..	335

A small portion of this traffic was for Berrigan, and the rest for the Barooga station. As pointed out by Mr. M'Farland these figures give no test of the importance of this crossing place. His own wool could not be passed over last season, and traffic will not be brought from a distance to an uncertain crossing.

29. The statistics supplied by Tocumwal and Berrigan in support of their railway proposals give the whole of the settlement that has taken place in this part of Riverina. Dividing them as best possible, it is found that on the west side of the stock route from Jerilderie to Tocumwal there are forty-one farms aggregating 57,993 acres. Here also are four of the sub-divisions of the Tuppal estate comprising severally 8,040, 48,090, 34,352, and 53,337 acres, some part of which may possibly, now that the property has been broken up as a whole, become settled. In addition there are on this side of the stock route about 20,000 acres of Crown lands of all kinds, a large part of which will be available for settlement. The areas of many of the holdings are large, the average of the whole being 1,407 acres, so a further sub-division of the large ones may be anticipated. The Belubla run of 23,000 acres, but all purchased land, fronts on the river below Tocumwal. The land on this property is generally of an inferior quality, but north of this the whole extent of country is good agricultural land for 10 or 15 miles west of the stock route where the "plains" commence. The distance from Tocumwal to Strathmerton is 11 miles, and to Cobram over the proposed crossing *via* Barooga would be 13½ miles.

30.

\* See appendix M for details of reserves.

30. East of the stock route, extending about half way to Berrigan and from the extreme north, within 7 or 8 miles of Jerilderie, down to Tocumwal, the number of holdings is 33 aggregating 38,226 acres. One of the subdivisions of the Tuppal estate comprising 15,475 acres lies surrounding Murray Hut. This is Booraboonilly, referred to in the evidence as being one that will probably be settled by farmers. The Crown lands available are unimportant in extent. The Murray run lies immediately around Tocumwal. (The sale of the Tuppal estate is reported to have been a failure. For the Booraboonilly portion £2 12s. 6d. per acre was the highest bid. The whole property was withdrawn from sale.)

31. These two divisions of the country, extending along both sides of the stock route from Jerilderie comprise the whole area to which Tocumwal is the centre of the trade. The aggregate of existing settlement is 74 farms covering 96,219 acres, and carrying a population, including that of Tocumwal, of about 1,000 persons. Great extension of settlement may be anticipated within a few years on the large tracts of land now being brought into the market and an increase in population from further subdivision of the farm holdings. The whole of this area has hitherto drawn their supplies from Tocumwal and for all communications to or from Victoria the route will ever be *via* Tocumwal to the great majority of settlers in these districts.

32. The statistics supplied by Berrigan cover the country from half way to Murray Hut 6 miles to the East, northwards 6 or 7 miles towards the Billabong and eastwards 14 or 15 miles to Savernake, and for 5 or 6 miles southward. From this point to the Murray there is no settlement on the direct line to Cobram. The statistics comprise 51 farms aggregating 77,316 acres occupied by a population of 448 persons including those in the township of Berrigan. This place, however, is but newly established and is, without connections or communications, practically isolated. A portion of the acreage given lies so far to the east as hardly to be included as having any interest in the location of the bridge under enquiry, as the crossing at Mulwala is already open to them, but the district as a whole is very important, and its future progress is dependent upon the communications to it.

33. It occupies a high back-bone of country dividing the Bilbalong waters from those of the Murray, extending from Bull Plain through Savernake, Berrigan and Murray Hut, and north of Tuppal, merging into the "Plains land." A portion only of this extent of country is covered by the Berrigan statistics, given above. This tract, comprising a considerable part of the acreage included in the Tocumwal statistics, represents the best stretch of good land in this part of Riverina and the large areas that are now proposed to be brought into the market. From the Berrigan district the outlet for produce is through Jerilderie and the road for supplies through Corrowa and Jerilderie, but the bridge being built at Mulwala will open another route from Victoria.

34. All the available land has been taken up by farmers to whom now communications are of the utmost importance. The distances from Berrigan are:—

To Jerilderie ... ..	25 miles
„ Mulwala ... ..	28 „
„ Yarrawonga ... ..	30 „
„ Corrowa ... ..	60 „
„ Barooga ... ..	19 „
„ Cobram ... ..	21 „
„ Tocumwal ... ..	20 to 25 „

(The doubt as to this last distance seems insoluble, there being no regular road. The direct distance is only 17 miles). The plan attached shows the positions of the district described with relation to the proposed crossing places over the River Murray and the railways in Victoria. The land soon to be brought into the market is also approximately shown.

35. A review of the whole of these particulars shows that a bridge spanning the river between Barooga and Cobram will not be inconvenient to the settlement along the stock route between Jerilderie and Tocumwal, since the extra distance to be travelled thence to a railway is but 2½ miles, and the road is, and probably ever will be, greatly superior to the road to Strathmerton; and, in comparing the positions of the two sites with relation to the neighbouring country in Riverina, that the Barooga-Cobram site serves a larger extent of country. Taking Murray Hut and Berrigan, 13 miles apart, as about the centres of the important routes and of the settlement, the distances to the accessible points on the Victorian railway are:—

From Murray Hut to Strathmerton ... ..	25 miles.
„ „ „ Cobram ... ..	27½ „
„ Berrigan to Strathmerton ... ..	31 to 36 „
„ „ „ Cobram ... ..	21 „

Since Yarrawonga *via* Mulwala is but 30 miles from Berrigan, an access to Strathmerton, which is from 31 to 36 miles away, can be of no service to the Berrigan district.

36. Nothing less than the construction of the branch line from Strathmerton to the border opposite Tocumwal can give that place a commanding position. From the Victorian point of view the construction of this branch cannot be recommended on any grounds, except, on an understanding between the Governments of both colonies that a junction of railways shall be made at the border at Tocumwal. It is very improbable that Victoria will consent to an arrangement involving expenditure of a large sum of money upon a length of line that of itself can bring no additional revenue and will be in addition to expenditure already incurred in reaching the border. The interests involved in the town of Cobram, which have been created by the railway, will be inflexibly opposed to the branch to Tocumwal.

37. The enquiry into the subject of railways for development of Riverina, now reported on, has led to recommendation of a trunk line traversing this part of the country parallel with the border and does not include branches to the border being undertaken in the near future. Adoption of this principle will delay for many years consideration of the question as to whether the branch line from Strathmerton shall be built or not, but in the mean time the necessities of the traffic across the river will be increasing in urgency.

38. Intimacy with the subject convinces me that the interests at stake on the adoption of Tocumwal as the site for the bridge, as also for the connecting point for the railway systems, are those of the property holders and business people of Numurkah and Tocumwal, and not of the agricultural population.

population and users of the road. The interests at stake in Tocumwal are vastly more dependent upon the railway being taken that way than upon the road bridge being built there, for even if it is built at Cobram, Tocumwal will not cease to be on the route for all the country to the north and west and the centre of its trade.

39. The present size and importance of Tocumwal are quite inconsiderable in view of the future of the country in one corner of which it is situated. There is room for many towns, and another town at Barooga will not necessarily mean ruin to Tocumwal, but the interests of the districts should not be subordinated to the claims of Tocumwal to being made the headquarters of trade.

40. On the Victorian side the towns of Yarrowonga, Cobram and Numurkah, aggregating 3,500 to 4,000 inhabitants are but 22 miles apart, and in the country between them there are in addition four other townships, viz.:—Katunga, Katamatite, Strathmerton and Yarroweyah. A township has been laid out at Barooga, and a punt has been authorised and is at work connecting with Cobram; if these preliminaries are followed up by sale of the township lands, the first steps will have been taken in creation of interests on this site which will rapidly grow in power, whether the river be bridged here or not.

## LANDS FOR PUBLIC PURPOSES ACQUISITION ACT.

(RESUMPTION OF LAND IN CONNECTION WITH THE ESTABLISHMENT AND CONSTRUCTION OF A PUBLIC CEMETERY AT BOWRAL, PARISH OF MITTAGONG, COUNTY OF CAMDEN.)

Presented to Parliament, pursuant to Act 44 Vic. No. 16, sec. 6.

NOTIFICATION OF RESUMPTION OF LAND UNDER  
44 VICTORIA No. 16.

NEW SOUTH WALES, } By His Excellency The Right Honour-  
to wit. } able VICTOR ALBERT GEORGE, EARL OF  
(L.S.) } JERSEY, a Member of Her Majesty's  
Most Honourable Privy Council, Knight  
Grand Cross of the Most Distinguished  
Order of Saint Michael and Saint  
George, Governor and Commander-  
in-Chief of the Colony of New South  
Wales and its Dependencies.

WHEREAS I, the Governor of the said Colony, with the advice of the Executive Council of the said Colony, have duly sanctioned the carrying out of certain works for and in connection with the establishment and construction of a General Cemetery at Bowral, for and towards the completion of which said works public funds are available; and whereas the land hereinafter described is required for the construction of the said works: Now I, the Governor aforesaid, with the advice of the Executive Council of the said Colony, in pursuance of the powers in this behalf given to or vested in me by the "Lands for Public Purposes Acquisition Act," do by this notification, published in the Gazette, and in a newspaper, that is to say, in the "Bowral Free Press," circulated in the Police District wherein the said land is situated, declare that the land hereinafter described has been resumed for the public purpose hereinafter mentioned, that is to say, for and in connection with the establishment and construction of a General Cemetery at Bowral, to the intent that, upon the publication of this notification in the Gazette, the legal estate in the said land shall forthwith be vested in the Minister for Public Works and his successors, on behalf of Her Majesty, for the purpose of the said last-mentioned Act, for an estate of inheritance in fee simple in possession, freed and dis-

charged from all trusts, obligations, estates, interest, contracts charges, rates, rights-of-way, or other easements whatsoever; and to the intent, further, that the legal estate therein, together with all powers incident thereto or conferred by the said Act, shall be vested in the said Minister as a trustee with the powers stated in the said last-mentioned Act. And I declare that the following is the description of the land hereinbefore referred to, that is to say:—

All that piece or parcel of land situate at Bowral, parish of Mittagong, county of Camden, and Colony of New South Wales: Commencing at a point bearing north 47 degrees 4 minutes west and distant 7 chains 93 links from the intersection of the south western side of the road from Bowral to Kangaloon with the northern side of the road from Burradoo to Kangaloon, said intersection being a point on the south boundary line of J. N. Oxley and H. M. Oxley's grant of 4,200 acres; and bounded thence on the south by a line bearing west 14 chains 50 links; on the west by a line bearing north 8 chains 46 links; on the north by a line bearing east 9 chains 16 links to the south-western side of the road from Bowral to Kangaloon first mentioned; and thence by part of that side of that road, being a line bearing south 32 degrees 16 minutes east 10 chains, to the point of commencement,—containing 10 acres, and said to be in the possession of Edward Carter.

In witness whereof I have hereunto set my Hand, and caused the Great Seal of the Colony to be hereto affixed, at Government House, Sydney, this twentieth day of February, in the year of our Lord one thousand eight hundred and ninety-one, and in the fifty-fourth year of Her Majesty's Reign.

By His Excellency's Command,  
BRUCE SMITH.

GOD SAVE THE QUEEN!

## NEW SOUTH WALES.

## LANDS FOR PUBLIC PURPOSES ACQUISITION ACT.

(RESUMPTION OF LAND IN CONNECTION WITH THE ESTABLISHMENT AND CONSTRUCTION OF A PUBLIC CEMETERY AT TERALBA, PARISH OF TERALBA, COUNTY OF NORTHUMBERLAND.)

Presented to Parliament, pursuant to Act 44 Vic. No. 16, sec. 6.

NOTIFICATION OF RESUMPTION OF LAND UNDER  
44 VICTORIA No. 16.

NEW SOUTH WALES, } By His Excellency The Right Honour-  
to wit. } able VICTOR ALBERT GEORGE, EARL OF  
JERSEY, a Member of Her Majesty's  
(L.S.) Most Honourable Privy Council, Knight  
Grand Cross of the Most Distinguished  
JERSEY, Order of Saint Michael and Saint  
Governor. George, Governor and Commander-in-  
Chief of the Colony of New South  
Wales and its Dependencies.

WHEREAS I, the Governor of the said Colony, with the advice of the Executive Council of the said Colony, have duly sanctioned the carrying out of certain works for and in connection with the establishment and construction of a General Cemetery at Teralba, for and towards the completion of which said works public funds are available; and whereas the land hereinafter described is required for the construction of the said works: Now I, the Governor aforesaid, with the advice of the Executive Council of the said Colony, in pursuance of the powers in this behalf given to or vested in me by the "Lands for Public Purposes Acquisition Act," do, by this notification published in the Gazette, and in a newspaper, that is to say, in the "Newcastle Morning Herald," circulated in the Police District wherein the said land is situated, declare that the land hereinafter described has been resumed for the public purpose hereinafter mentioned, that is to say, for and in connection with the establishment and construction of a General Cemetery at Teralba, to the intent that upon the publication of this notification in the Gazette, the legal estate in the said land shall forthwith be vested in the Minister for Public Works and his successors, on behalf of Her Majesty, for the purpose of the said last-mentioned Act, for an estate of inheritance in fee-simple in possession, freed and discharged from all trusts, obligations, estates, interest, contracts, charges, rates, rights-of-way, or other easements whatsoever, and to the intent further that the legal estate therein, together with all powers incident thereto or conferred by the said Act, shall be vested in the said

Minister as a trustee, with the powers stated in the said last-mentioned Act: And I declare that the following is the description of the land hereinbefore referred to, that is to say:—

All that piece or parcel of land situate in the parish of Teralba, county of Northumberland, and Colony of New South Wales, containing 20 acres and 3½ perches: Commencing on the eastern boundary of portion 13, A. L. Donaldson's 305 acres, at a point bearing south 14 minutes east and 1 chain distant from its north-east corner; and bounded thence on the west by part of the eastern boundary of that portion bearing south 14 minutes east 14 chains 15 links; thence on the south by a line bearing north 89 degrees 46 minutes east 14 chains 15 links; thence on the east by a line bearing north 14 minutes west 14 chains 15 links; and thence on the north by a line bearing south 89 degrees 46 minutes west 14 chains 15 links, to the point of commencement, and said to be in the possession of John Black.

NOTE.—The description in the above notification is in correction of that in the notification published in the Government Gazette No. 714, of the 12th December, 1890. The corrections are as follows:—The 5th line, as it appeared in the Gazette above referred to, read "bearing south 14 degrees east and 1 chain distant from its north," but instead of which now reads "bearing south 14 minutes east and 1 chain distant from its north." Also, the 7th line, as it appeared in the Gazette above referred to, read "eastern boundary of that portion bearing south 14 degrees east," but instead of which now reads "eastern boundary of that portion bearing south 14 minutes east." ¶

In witness whereof, I have hereunto set my Hand, and caused the Great Seal of the Colony to be hereto affixed, at Government House, Sydney, this fourth day of March, in the year of our Lord one thousand eight hundred and ninety-one, and in the fifty-fourth year of Her Majesty's Reign.

By His Excellency's Command,  
BRUCE SMITH.

**EARLY CLOSING OF SHOPS.**  
 (PETITION FROM CERTAIN HOUSEHOLDERS AND OTHERS.)

—  
*Received by the Legislative Assembly, 27 May, 1891.*  
 —

To the Honorable the Speaker and the Honorable the Members of the Legislative Assembly of New South Wales, in Parliament assembled.

The Petition of the undersigned Householders and others,—

HUMBLY SHOWETH :—

That your Petitioners, believing that the closing of drapers, grocers, mercers, butchers, and other shops, should be regulated by Act of Parliament, which would supply a public want without detriment to the public welfare, humbly pray for the passing into law of a measure to give effect thereto.

And your Petitioners, as in duty bound, will ever pray.

[*Here follow 2,600 signatures.*]

**IMMIGRATION.**

(REPORT FROM AGENT FOR.)

Presented to Parliament by Command.

The Agent for Immigration to The Principal Under Secretary.

Sir,

Immigration Office, Sydney, 25 February, 1891.

I have the honor to submit, for the information of the Colonial Secretary, my Report on Immigration for the year ending 31st December, 1890.

Operations under the Regulations have been confined to the nominations of wives and their children by husbands, being residents in the Colony, who have obtained certificates of good character from either a clergyman or a Magistrate.

Of the total of 376 immigrants who arrived during the year all were nominated in the Colony; none were selected by the Agent-General.

They consisted of 187 individuals above 12 years of age, and of 189 under 12 years of age.

No births nor deaths occurred during the voyage.

The appendices herewith annexed give full detailed information relative to immigration during the past year:—

- A.—General Statistical Information.
- B.—Nationality of Immigrants.
- C.—Educational Attainments.
- D.—Religious Persuasions.
- E.—Distribution into Country Districts.

I have, &amp;c.,

GEORGE F. WISE,

Agent for Immigration.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

**MACLEAY RIVER.**

(REPORT BY SIR JOHN COODE, K.C.M.G., ON ENTRANCE TO)

*Ordered by the Legislative Assembly to be printed, 26 May, 1891.*

Sir John Coode to The Secretary for Public Works.

Sir,

Westminster Chambers, 9, Victoria-street, London, S.W., 18 December, 1890.

Having carefully considered the several plans and documents relating to the Macleay River Entrance, prepared in accordance with the memoranda framed by me when in the Colony, I have now the honor to submit my report thereon, with especial reference to the works which I have to recommend for its improvement.

I should here remark that the results of the survey and investigation, embodied in the plans, sections, diagrams, and descriptive notes, upon which this report and the accompanying drawings are based, have been obtained and prepared by Captain Howard in a very skilful and complete manner, enabling me to fully comprehend the physical conditions of the case, and to devise, with confidence, the works for the improvement of the entrance which I now put forward for adoption.

Captain Howard has prepared for my information a description of the Macleay from Belgrave Falls (where the tidal influence ends) about 43 miles above the entrance to the sea, wherein he touches on all the salient features of the river, the condition of its banks, the general character of the wharfage, and the navigable depths available, and also the particulars of the townships. It will not, therefore, be necessary that I should add anything by way of description, except in connection with the entrance and its channels, inasmuch as I append to this Report a copy of Captain Howard's memorandum, from which full details of the present condition of the Macleay throughout the length of its tidal compartment can be ascertained and referred to. Description of river.

This Report is accompanied by two drawings. No. 1 is a plan of the river, at a scale of 2 inches to the statute mile from Bungay Creek, just above Belgrave Falls, to the sea; it shows also the coast-line from the North Head, near the entrance of the Macleay, around to the southward of Korogoro Point. For that length of the river between Rainbow Reach and North Head, this plan has been compiled from the special survey made by Captain Howard in 1887, the remaining portions having been taken from parish maps supplied to me by the Harbours and Rivers Department of the Colony. Drawings.

Drawing No. 2, prepared from Captain Howard's special survey of 1887, shows in full detail, and in a convenient form, the results then obtained for the purpose of my study and investigation, to which reference has been made above. This drawing has been plotted to a scale of 500 feet to an inch, and shows that portion of the river which calls for treatment in connection with the improvement of the entrance, and also the coast-line from North Head to South-west Rocks, together with the soundings, borings, and other observations, which were taken with a view to the consideration of alternative sites, viz., for an entrance near its present position, just to the south-west of the North Head, as compared with a possible site involving a channel of considerably-reduced length, which channel would pass to the northward of Ruddor's Hill, and the range of rocks adjacent thereto, discharging into the sea near the South-west Rocks.

The river in its present state, and under the most favourable conditions, cannot be considered as navigable for craft drawing over 9 feet—in fact, vessels of 8 feet draught have to wait for high-water to get up to Kempsey, about 32 miles from the entrance. Available depth in the river.

Captain Howard remarks that the Macleay Bar may be regarded as a smooth one, compared with other bars on the coast of New South Wales. During strong south winds it is frequently smooth on the bar when a high sea is running in the offing. It is only when the wind gets round to south-east that the sea breaks heavily on the bar. With west winds, Captain Howard has seen the bar free of breakers for some days continuously, during both flood and ebb. Entrance and bar.

The position of the entrance varies considerably, dependent upon the force and direction of the sea, and the existence of more or less "fresh" in the river. There is still an old beacon, rather more than a mile to the southward of the North Head, which marks the site of a former channel. It has also been stated that since 1864 channels have been formed in several positions between the North Head and a point distant nearly 2 statute miles to the southward thereof. It is important to note that the entrance has been much deeper and more constant in direction when the channel has been either under or near to the North Head than in any other position.

Under existing conditions, the fluctuations which occur in the entrance necessitate the frequent changing of the leading-marks. Towards the end of 1887, during a period of three months, these marks were moved northward nearly 1,000 feet.

In a memorandum, dated September, 1889, Captain Howard states that the entrance was, at that date, about a quarter of a mile to the northward of its position during the survey of 1887, which last-named position is that indicated on the accompanying drawings. He also observes that it seemed then only to require time (probably not more than two or three years), or the occurrence of a heavy flood, to sweep away the North Spit and bring the fairway out under the North Head, somewhat on the line which it occupied in 1864, or practically in the position which I have selected as the best site and aspect for the improved entrance, shown on the accompanying drawings.

Under the present untrained condition of the entrance, the depth on the bar fluctuates considerably. In September, 1887, during Captain Howard's stay in the locality, there was a good bar, having a depth over it of 10 feet at low-water of spring tides, with a straight run in. About a month later, in consequence of the occurrence of heavy north-east winds, this depth was reduced to 3 feet 6 inches at low water, or 8 feet at high water.

During freshes, discoloured water can be seen to trend around to the northward, well outside the bar; it has also been observed that wreckage from Trial Bay, or South-west Rocks, is deposited on the beach close to the North Head, or on the sands northward thereof. These circumstances point to the existence of a northerly eddy, shoreward of the constant south-going current which sets along the coast outside the capes. This eddy is an important feature as affecting the direction and aspect of an improved entrance, which clearly should conform with this northerly set, and thus have a slight "bias" in the same direction, rather than point directly seaward at a right angle to the shore-line.

At the time of my visit, Pilot Jamieson informed me that the least depth available at ordinary high water was 5 feet, but that these unfavourable conditions only existed for two or three days concurrently; the greatest depth he had experienced was 14 to 15 feet at high water over a month's duration, but only after the occurrence of a fresh. The average depth on the bar generally was from 8 to 9 feet at high water.

The sources of the Macleay run through a very broken country, consequently the river is subject to sudden freshes of short duration.

The information with reference to floods is very contradictory. That which occurred in March, 1875, appears to have been the highest on record, when at Gladstone Wharf the flood then rose 14 feet 6 inches, or thereabouts, above ordinary high-water level. Such works of improvement as may be undertaken with a view to fix the entrance, and the channels adjacent thereto, cannot fail to exercise a beneficial effect on the discharge of the flood-waters. I do not propose to consider further, in this Report, the effects of flooding, or the mitigation thereof, beyond the influence of the entrance works above referred to—in fact, the data available here are not sufficient to enable me fully to enter upon this matter, neither is it clear that inconvenience and loss have been thereby occasioned to an extent that would justify the construction of works having for their special object the prevention of flooding in the upper reaches, more particularly in view of the pressing need of expenditure on the river entrance. Having regard to the presence of such immense masses of easily-moved sand, works for the effectual treatment of the bar and entrance must of necessity be of considerable magnitude, and entail proportionate outlay.

Before describing the works for the improvement of the entrance which appear to me to be best adapted to meet the requirements of the case, it is desirable that I should here refer, in general terms, to the four possible projects which I have deemed it right to consider, and to some extent work out, in connection with this investigation. They are marked Nos. 1, 2, 3, and 4 respectively, on drawing No. 1, upon referring to which it will be seen that proposal No. 1 contemplates the formation and fixing of the entrance close to the North Head, about half a mile northward of the fairway surveyed in 1887, and shown on the accompanying drawings. The position and aspect of the entrance as contemplated under this proposal, taken in conjunction with the extent and character of the moles and training-works as designed and shown in red, would ensure, *with certainty*, the attainment of satisfactory results, as to the provision and maintenance of a sufficient navigable depth, and would also provide for the free discharge of all the flood-waters of the district. Moreover, as before stated, experience has shown that when the entrance fairway has hitherto been in about the position of No. 1, the depth over the bar has been greater for a longer period than at any other site. Again, the North Head, or thereabouts, having regard to the northerly drift of the sand, would appear to be a specially advantageous position for the entrance to the Macleay, because sand passing the entrance would readily travel unimpeded to the northward, along the length of coast embayed between the North Head and Scott's Head.

Entrance No. 2 would also provide for the discharge of the whole of the flood-waters of the district; but, in consequence of the northerly drift of the sand, there is an element of uncertainty associated with this design, from which No. 1 is free, as regards the lengths of the sea moles, which would be eventually required for the maintenance of the requisite depth, having regard to the accumulations which would inevitably occur to the southward of the South Mole. Moreover, the diversion of a river of this magnitude, from its existing course into a new channel such as that leading to No. 2 entrance, would be a work attended with much difficulty. Again, the extent and cost of the works required, including the formation of the new channel from the moles to the point where it would join the river to the westward of Shark Island, would be fully equal to that of project No. 1.

Each of the projects 3 and 4 contemplates the formation of an entrance near the South-west Rocks. Either of those positions would be partially sheltered by Lager's Point, but each is associated with the grave defect of not providing for the discharge of the whole of the drainage from the district, inasmuch as the considerable volume of water now passing through Clybucca Creek, including also that which flows into the latter from the Macleay during floods, as described by Captain Howard, could not, unless at very great cost, be diverted through the new fairway. Further, bearing in mind the excavation and dredging of the new channel, it is not improbable that the cost of either of these undertakings would be fully as great as that of No. 1.

Line No. 4 has been set out on the ground, and carefully bored and examined. In the position indicated on drawing No. 1 a sufficient depth would be available over the rock surface on this line, but the curves of the channel would of necessity be inconveniently sharp, and the works generally partake of an experimental character.

For the reasons above given, I entertain an undoubted preference for project No. 1, which, as I have before stated, is associated with no element of uncertainty as to the production of satisfactory results. Moreover, to ensure the maximum scouring effect, it is of the utmost importance that the whole of the discharge, including that contributed by the Clybucca Creek, should pass seawards through one entrance, which would be impracticable if either of the partially-sheltered projects Nos. 3 and 4 was adopted.

*Proposed*

Floods and freshes.

Alternative projects.

*Proposed Works.*

The works which appear to me to be best adapted to fulfil the requirements of the case are those coloured red on drawing No. 2; they may be briefly described as follows:—

This work would commence at the north-west angle of the South Spit, and extend therefrom in a north and easterly direction for a length of 4,000 feet. The termination in the first instance is indicated on the plan by the letter X; hereafter, when funds are available, it is proposed to extend this Breakwater 500 feet, making its total length 4,500 feet, as shown. It would consist throughout of a rubble mound, the inner portion, as far as practicable—probably for a length of 2,500 feet—being formed as an “end-and-side” tipped embankment, the remainder being deposited from a temporary stage.

This work would commence on the southern face of the North Head, and extend therefrom in a south and easterly direction for a length of 1,000 feet, terminating, in the first instance, at the point marked Y, and forming, with the South Breakwater, an entrance of 700 feet in width at low water. It is believed that this width will be sufficiently restricted to produce the requisite scour necessary for the maintenance of a navigable depth of about 12 feet at low water, or 16 feet 6 inches at high water of ordinary spring tide, the latter being equal to the navigation (allowing for “scend,” or undulation) of vessels drawing say 12 feet.

The lines of the moles have been so arranged that the proposed width of entrance, viz., 700 feet, may be varied by modifying the curve of the North Breakwater, should experience show, during progress, that an alteration is necessary with a view either to increase the scour, or, conversely, to prevent a throttle in the discharge of the flood-waters.

Like the South Breakwater, this mole would consist of a rubble mound, but in this case it will be advisable to deposit the stone from a stage throughout the entire length of the work.

Although it is probable that the improved entrance, with the moles carried to the points X and Y respectively, would meet all the requirements of the navigation for a considerable period, the changes which would be produced thereby, in the configuration and disposition of the existing sandbanks, might possibly render an extension desirable, when each mole should be simultaneously and equally prolonged, say 500 feet, thus rendering the total length of the North Mole 1,500 feet.

With a South Mole of 4,500 feet and a North Mole of 1,500 feet there can be no question as to the entirely satisfactory character of the results produced, nor as to the permanent maintenance of a navigable depth of from 12 feet to 15 feet at low water.

To obviate the escape of water through the old channel between Shark and Fisherman's Islands, and at the same time to prevent the river from breaking through the Sandspit during floods, and thus outflanking the new entrance, I propose, on the right or eastern side of the channel, to form a turn-water training-bank for a length of 11,000 feet, commencing to the north-west of Shark Island, and terminating opposite the coal-store of the Clarence and Richmond Steam-boat Company. The formation of this bank would render the breaking through of the Sandspit during floods, or the formation of subsidiary channels, an impossibility, thus ensuring the fixing of the entrance in the position shown, and the utilisation to the utmost extent of the scour produced by the flood discharges.

The proposed bank would consist of rubble deposited from barges, the top being 8 feet in width, and at the level of high-water spring tides.

It is very important that the old channel which skirts the west side of Shark Island should be effectually closed. I have, therefore, shown a training-bank of 5,600 feet in length to effect this object, and at the same time to guide the current into its proper course, viz., to the western bank of the river near the outfall of Clybucca Creek. The construction of the work would correspond in character with that of the bank proposed at Fisherman's Reach.

Leading-lights would be provided for the new entrance as shown on drawing No. 2. The lower reaches would also be effectually buoyed.

The effect of the currents passing in and out through the new fairway, unaided by the West Training-bank, would be to create a channel on about the line shown on the plans; the sand accumulating to the north-west of the said channel would assist to some extent in training these currents. During floods and gales, and in the absence of the training-bank, disturbance of this sand would inevitably arise, causing consequent fluctuations, but not to a very serious extent, in the depth of the channel.

Were the funds available for the execution of the West Training-bank, the work might with advantage be carried out simultaneously with the execution of the sea-moles, but, looking at the large outlay required on the more important structures, the execution of this bank could, if desired, remain in abeyance for a time, without material prejudice to the success of the undertaking.

As will be seen from drawing No. 2, the bank would be 7,000 feet in length, the seaward end being 300 feet distant from the river slope of the North Breakwater, thus forming a wave-trap, or spending-beach, of a valuable character. The bank should be of rubble stone, the outer portion being 4 feet above high water of spring tides, and 10 feet wide, whilst the inner length would be of the width and at the level described for the other training-banks.

*First instalment of the works.*

South Breakwater, 4,000 feet in length ... ..	£133,000
North Breakwater, 1,000 feet in length ... ..	48,700
Training-bank at Fisherman's Reach, 11,000 feet in length ... ..	62,800
Training-bank at Shark Island, 5,600 feet in length ... ..	21,800
Buoying and Lighting Channel ... ..	2,000
<b>Total expenditure for first instalment of works ... ..</b>	<b>£268,300</b>

*Extension works required to complete design as before described.*

West Training-bank at entrance, 7,000 feet in length ... ..	£48,400
South Breakwater, additional length, 500 feet ... ..	39,000
North Breakwater, additional length, 500 feet ... ..	27,000
<b>Cost of extension works ... ..</b>	<b>£114,400</b>

The

The foregoing estimates are based upon what are believed to be liberal rates, and they cover contingencies and engineering charges.

**Order of procedure.** The South Breakwater should first be proceeded with until reaching the point X. The construction of the North Breakwater should then be taken in hand, and simultaneously therewith the training-bank at Fisherman's Reach, to be followed by the bank at the south end of Shark Island.

**Materials.** There would appear to be an abundant supply of material for the work at the North Head and in vicinity thereof, and at Rudder's Hill and the adjacent ridges. Before finally determining on the works, these sites should be carefully examined, and the precise character of the material available fully investigated.

**Borings on site of entrance.** No borings have been made on the site of the proposed entrance. It is more than probable that rock does not exist within the proposed fairway at a depth which would interfere with the navigation. This question, however, should be definitely set at rest, by fully boring the site, more especially along the line of proposed channel, before arrangements are made for the execution of the works.

**Conclusion.** It may possibly be considered that the sum required for the completion of the first instalment of the works, viz., £268,300, is altogether disproportionate to the extent and character of the trade carried on at present in connection with the Macleay. I have no means of judging of this point, nor does it, in fact, fall within my province to do so; I may, however, state, very emphatically, that works of a more limited character and extent than those contemplated under this expenditure would not suffice to fix the entrance and to train the currents under the unfavourable conditions which prevail at the Macleay. As previously pointed out, to render the undertaking complete, the extension works are desirable, and until funds are available for their execution the small fluctuations in depth in the entrance channel, which will in all probability be experienced, must be borne with.

I have indicated by red dotted lines on the plans the approximate line of a future deep-water channel, but of course do not now contemplate any expenditure on dredging or artificial deepening, the means for which will not, I presume, be available, in view of the large outlay required on the structures herein described. The training and guiding of the currents by the proposed banks at Fisherman's Reach and the south end of Shark Island cannot, however, fail to produce very beneficial effects, although the 12 feet navigation, for which the entrance is adapted, as described, cannot be fully utilised until the improved scour has been aided to some extent by dredging. To what extent, however, the proposed aid will be required it is impossible now to predict.

I have, &c.,  
JNO. COODE.

## NEW SOUTH WALES HARBOURS AND RIVERS.

### MACLEAY RIVER.

#### General description of the Macleay River, by Captain Howard, R.N.

*Appendix to Sir John Coode's Report, dated 18th December, 1890.*

The Macleay River entrance is (1888) about  $\frac{1}{2}$  mile south of a smooth grassy headland, which lies north-west (mag.) 6 sea miles from Laggors Point, the outer extreme of Trial Bay.

This headland, known as the North Head, is a rocky peninsula, joined to the mainland by a low sandy isthmus 500 feet across, and covered with Banksia scrub. The headland, which is 1,000 feet in extent east and west, and 800 feet north and south, is precipitous on its three sides facing the sea, and 140 feet above low water near its south-eastern corner, where the old signal-staff, in use when the channel was immediately south of the head, still stands.

Southward from the head is a flat of drift-sand about 1,000 feet wide, known as North Spit, which extends to the present channel, the centre of which is 3,000 feet south from the old signal-staff.

Near the south-west corner of the head the north-east wind has heaped up a quantity of sand in a pyramidal form, the apex of which is 60 feet above low water. This sand-drift is a good mark for making out the North Head from seaward, showing like a white triangle against the dark cliffs of the head.

Westward of the North Head the sandy shore curves round to a small rocky point, the extreme of a narrow rocky ridge which runs eastward from Yarrahapini Hill. This point, known locally as Razorback, is 1,200 feet west-south-west (true) from the nearest part of North Head.

What was formerly the river channel is now a pool of quiet water between the North Spit and the western shore, the action of the tidal streams having thrown up sandbanks westward from the south end of North Spit, leaving only a narrow winding boat-channel, nearly dry at low water.

I have not been supplied with a plan showing the soundings obtained during former surveys, but have been informed that the old fairway was close past Razorback Point; from thence straight across to North Head, and along its southern side; that in this portion of the channel there were no outlying rocks, and after freshes a depth of 20 feet at low water, over a sandy bottom. There is, however, one pinnacle rock about 100 feet east of the end of shelving rocks at Razorback Point. This rock is very small, and at low-water springs its summit is within a few inches of the surface. The pilot informed me that it is quite isolated, very steep too, and that there are no rocks whatever outside it above a depth of 20 feet at low-water; also, that he has sounded all round it, and obtained 25 feet at low water. In the event of this rock being in the way of a fixed channel it could easily be removed.

The pilot-station, with the houses of the pilot and his crew, are on the flat between Razorback and the North Head. Attached to the pilot's house is the Post and Telegraph Office. A few hundred feet westward the land rises to the thickly-timbered spurs of Yarrahapini.

At the river entrance the distance between the high water of the North and South Spits is nearly 2,000 feet, but a sandspit projects northward from the South Spit, which contracts the navigable entrance to a width of 300 feet, and depth of 22 feet. Further out, where the navigable water is broader, the depth becomes uneven, with from 8 $\frac{1}{2}$  to 10 feet at low water, right to the bar, which is 3,000 feet outside the point of North Spit. The bottom throughout this space is very uneven, in ridges like waves.

Outside the bar the water deepens to over 30 feet very quickly.

The

The South Spit is the northern end of the long narrow tongue of land separating the Macleay River from the sea. Its outer side is one gradual curve to South-west Rocks, Trial Bay, a distance of nearly 6 English miles. The South Spit is about 1,200 feet wide near the entrance, but further up the river the tongue of land gets very narrow, and in several places is under 200 feet from high-water inside to the sea. For nearly a mile from the entrance the spit is drift-sand and low hummocks nearly bare, but above Stewart's Point thick vegetation commences.

Stewart's Point is a sandy point, projecting slightly from the western shore. It is the first stopping-place inside the river for sea-going vessels. There are two saw-mills, a Post and Telegraph Office, a good Government wharf, and a number of weatherboard houses at Stewart's Point. This place was the head-quarters of numerous fishing-boats: here the fish netted in the river were packed in ice, and sent by steamer to Sydney, but during the stay of the survey party this industry seemed to fail, and most of the fishermen left the river.

The Stewart's Point Government wharf is 9,000 feet south of Razorback Point; the foreshore between these places is a steep sandy bank or cliff about 20 feet above low water, inside which the land is flat, or in slightly-undulating ridges parallel to the coast, and covered with thick scrub, or, where cleared, with fern. From abreast the entrance southwards for nearly 3,000 feet the sea at high water dashes against the foot of this bank, a considerable quantity of which, with the timber growing at its edge, was washed down whilst the survey was in progress.

The river at Stewart's Point is 1,400 feet wide, and from 8 to 12 feet deep, over a clear sandy bottom, the fairway channel being well on the eastern side. Above Stewart's Point the river trends about south by east  $\frac{1}{4}$  east (true), the western shore being low and swampy, with a growth of thick mangroves, and fronted with extensive sand and mud flats. The eastern shore is a nearly-straight sandy beach; the narrow strip of land inside being covered with thick scrub.

The Clarence and Richmond Steamship Company, whose steamers run to the Macleay River, have a coal-store on the north-east end of a mangrove island, 7,000 feet above and on the same side as Stewart's Point. Directly opposite this store, on the eastern side of the river, is the hull of a small iron steamer—I believe, the "Atlas."

All soundings above the coal-store on the plan are reduced to low water at No. 2 tide-gauge, or 8 inches above low water at the entrance.

Above the coal-store 4,600 feet is Fisherman's Island, of low alluvial soil, and covered with swamp oak and grass. The greater part of the island, which is 800 feet east and west, and 1,500 feet north and south, is awash at high water. Here the sea-reach of the Macleay may be said to end, the river forking round Fisherman's Island, and the much larger Shark Island.

Until quite lately the ship channel was round the east side of Fisherman's Island, and along the north side of Shark Island, till close under the bank on the west side of the river; but a cutting has now been dredged westward of Fisherman's Island, and more in a direct line up and down the stream.

This cutting is about 5,000 feet in length, and was said to be 60 feet wide, but according to our soundings was of very irregular width and depth.

After the soundings shown on the plan were obtained, the dredge was again working here, cutting off some of the corners. The depth in the cutting was from 7 to 10 feet at low water, and the bottom very uneven. The Dredge-master was working entirely by eye, having no plan of the proposed work or of the river. The sea-going steamers rarely passed through without grounding, either in the cutting or on the shoals formed in the river northward of the coal-store, where the silt from the cutting was deposited. As the cutting is on a curve, there are two sets of leading-marks—one over on the eastern side, near wreck of "Atlas," for entering or leaving the northern end; and the other on western bank above the cutting for the southern end.

The southern end of the cutting is near the south-west end of the old channel, and at certain times of tide, when the flood streams from each channel meet, an eddy is formed, which, I believe, will leave a deposit of sand across the end of the cutting.

The former ship channel between Fisherman and Shark Islands is said to be gradually shoaling up. There are leading-beacons on the eastern shore to lead through it; but the deepest water is well to the northward of the leading-line. The ruling depth in the channel is  $5\frac{1}{2}$  feet at low-water springs.

Shark Island is about 1 land mile in extent east and west near its north end, and  $2\frac{1}{2}$  miles north and south, tapering off gradually to a sharp point at its southern end. The north end is either covered with mangroves or extensive grass or swamp oak flats, and no part of it is more than a few feet above high-water mark. The middle portion of the island along the western side is occupied by several farmers, and is said to grow very good maize crops.

The channel north-west of Shark Island is about 800 feet wide, and from 8 to 18 feet deep at low water above the cutting.

The western shore of the river is a sandy bank or cliff from 12 to 20 feet high, with flat sandy land thickly timbered behind. This country is marked on the parish maps as a reserve, but there are several families living on it, and it has lately been surveyed. From abreast Fisherman's Island, southward for 10,000 feet, the western shore continues of the same character to the mouth of the Clybucca Creek, a large opening over 700 feet wide at its mouth and opening out inside to a large lagoon. The Clybucca Creek runs into the eastern side of this lagoon. For about 4 miles from its mouth the Clybucca Creek is about 200 feet wide, and from 10 to 15 feet deep, with low swampy land on its eastern side, and thick forest of gum-trees on its western side. Its course is nearly parallel to the Macleay River, and, according to the parish maps, after a length of 12 miles, it ends in large swamps.

I am informed that during floods a large quantity of water makes its way across from the Macleay River, and down the Clybucca Creek. A portion of this creek is included in the area marked by Sir John Coode for survey, but could not be done in the time allowed.

Northward of the mouth of Clybucca Creek the Macleay is contracted by two islands, both thickly wooded, low, and of alluvial soil. The fairway is between them and Shark Island, and above them, close over to the western bank, it is in places not more than 200 feet wide, with from  $8\frac{1}{2}$  to 20 feet water.

Southward of the two above-mentioned islands is a large sand and mud bank, which dries at low water, and extends nearly across the river, which is here 2,000 feet wide. The ship channel is round the western end of this bank. A cutting has been dredged along its southern side across to Shark Island, in an east-south-east (true) direction for about 3,000 feet.

This

This cutting has a depth of from 12 to 7½ feet at low water. The fairway through is marked by leading-beacons at each end.

Towards the close of the survey the sea-going steamers were continually grounding here, the marks leading too close to the southern side of the channel, which is gradually shoaling.

I may here remark that although most of the dredged channels in this river appear to be cut across, yet the tidal streams set fair up and down them.

At the south end of Shark Island, looking up, the river presents a pleasing aspect; the grassy and wooded slopes of Rudder's Hill appear quite close to the shore, and both banks in Rainbow Reach are cleared, cultivated, and studded with farm buildings.

The channel eastward of Shark Island is narrow, and was at one time the outer part of Spencer's Creek, Shark Island being, twenty-five years back, a peninsula.

I am informed that a Mr. Salmon, seeing that the isthmus near Rudder's Hill was low and narrow, made a small cutting through it to admit his boats to the main river. The times of high and low water in the creek being earlier than in the river, caused a great scour in this opening, and now, in 1888, it is 1,800 feet wide, and what twenty-five years ago was dry land is now the middle of the ship channel, with 15 to 17 feet at low water.

The channel on the east side of Shark Island is of the average width of 700 feet; it is full of shoals, and only navigable by boats, some parts of it being less than 1 foot deep at low-water springs.

I am informed that this channel was at one time navigated by schooners, but having been constantly used as a depositing-place for the silt dredged from the main channel, is now nearly blocked up. The sides of the channel are generally fronted with belts of thick mangrove, and the Shark Island side densely wooded with large timber. On the eastern side there are four shallow inlets running to within a short distance of the sea-beach, giving the impression that at some time the river has run through them into the sea. The southern of these inlets which I call here South-west Creek starts from the eastern channel of Macleay River, at a point 5,000 feet below the southern point of Shark Island; it is 9,000 feet in length, and from 200 to 500 feet broad, running through swamps; its banks are mostly belts of thick mangroves, except in two places, where the points of rocky spurs of Rudder's Hill come to the water's edge.

This creek during the survey flowed into the sea, but it has not always done so. The first time I saw it, in the year 1885, the water of the creek did not reach high water on the sea-beach by 300 or 400 feet, but since then, in March, 1887, I am informed, the creek and surrounding swamps being full of flood-water, a gutter was dug through to the sea-beach to run it off, and this quickly became a wide gap forming a good entrance. In September, 1887, it was over 200 feet wide, and 2 to 3 feet deep at low-water springs, and although during the survey it once or twice nearly silted up, it never entirely did so, and was wider in July, 1888, than during the preceding summer.

A cutting through the mangroves was made about twenty years back, 1,000 feet inside the entrance; this at the time was 200 feet long and 10 feet wide, with a depth of 18 inches; it is now 30 feet wide, and over 5 feet deep at low-water springs. In September, 1887, the tidal stream rushed through this place at the rate of 4 to 5 knots per hour.

At the western end of South-west Creek two small islands have formed outside the entrance, and, with the shoals surrounding them, nearly block the creek, which can only be entered between three-quarter flood and one-quarter ebb. The water in the creek at low-water springs is from 3 feet at the western end to 2 feet at the eastern above low-water springs outside.

South-west Rocks Point is a double rocky head, east of South-west Creek, the bar of which is at its extreme north-west point. It rises to a height of 6½ feet above low water, and is grassy, with open *Banksia* scrub. This point is a favourite camping-ground for the Macleay River farmers, who, with their families, camp here from Christmas to the end of January. There must have been nearly 200 people camped here in January, 1888.

There are only two houses at South-west Rocks Point—one a two-story stone house, the other a weatherboard cottage. The stone used in building, a soft freestone, was obtained from the summit of the wooded ridge, a short distance southward of the point. The rock cropping out at the point is either conglomerate or a hard slaty rock of a blue colour.

The South-west Rocks are a cluster of large granite boulders lying about 400 feet east of the Point, and mostly surrounded by shelving rocks; awash in patches at low water.

The largest and most eastern is 15 feet above low-water springs, and can be reached by wading at low-water springs in fine weather.

The water deepens quickly outside these rocks, the 5-fathom line being only from 400 to 500 feet north of them, over a clear sandy bottom. Westward of South-west Rocks Point the 5-fathom line is from 1,200 to 1,500 feet off the low-water line.

Only one detached rocky patch was discovered, the least water on it being 21 feet; it lies north of the western side of the Point about 700 feet, and can be seen from the shore in very fine clear weather only.

As the surrounding sea has been closely watched from the Point for many years by fishermen and others, and the above is the only rocky patch that has ever been seen off it to seaward, it is fair to suppose that no other outlying patches exist.

Eastward of South-west Rocks is the beach of Trial Bay, extending round to the Labour Prison, at Lager's Point.

On a small knoll near the north-east extreme of the Point is an obelisk to the memory of a number of people drowned from wrecks on South-west Rocks and on the Point during easterly gales.

The ridge of the South-west Rocks Point extends in a southerly direction until it meets one of the spurs of Rudder's Hill; it is about 1,200 feet wide of thick forest, the land on each side being a grassy swamp.

The only boring-tool with the survey party was a 16-foot pricker, and with this I one day took some probings off the two rocky points jutting into south-west creek. The pricker went down easily to its end, through sand and ooze, without coming to rock. Mr. Pilot Jamison, however, made a statement to me that "there is granite under all the swamps between South-west Creek and Macleay River." He says, "I have seen it and felt it when using sounding-pole."

All the land about South-west Creek inside the line of sand hummocks is under water during heavy freshes in the river, or after a high spring tide. Most of it is covered with grass, and there are extensive forests of swamp oak, which in places grow to a great height. A great number of the trees appeared to be dying, or were already dead, in July, 1888.

Rudder's

Rudder's Hill, on the east bank of the Macleay, is a grassy hill, thickly timbered near its summit, which is 248 feet above low water. The summit is about 2,000 feet from the river, and from thence it runs nearly level to the south-eastward, along the right bank of Spencer's Creek, and gradually falls to the northward towards South-west Creek. The soil of the hill seems poor and stony, but there is a flat of alluvial soil of a sandy nature between the west side of the hill and Macleay River; this flat is for the most part a swamp, part grassy and part covered with thick forest of ti-tree, swamp-oak, and mangrove. Along the river-bank the land is higher, and cultivated with maize and vegetables.

The foot of the slope of Rudder's Hill facing west, right round to South-west Creek, was evidently at one time the coast-line of a bay or estuary, the rock with which it is lined being in places covered with oyster and other shells.

The bottom of the river, generally about Shark Island, is soft dark sand and ooze, but abreast the entrance to South-west Creek it is hard and full of shells.

Southward of the south point of Shark Island the main river was surveyed for 11,000 feet, to where it curves round to the eastward in Rainbow Reach. The average width of this part of the river is from 1,000 to 800 feet, with a depth of from 9 to 17 feet in the straight reach, and as much as 25 feet rounding the bight of Rainbow Reach.

The left bank of the river in this reach is cultivated nearly to the water's edge. The bank itself is perpendicular, and in the bights, or where steep, is continually falling away. The land on the point in Rainbow Reach is at the same time encroaching.

Spencer's Creek runs into the river on the eastern side, southward of Rudder's Hill. It is at present about 300 feet wide at its mouth, but gets wider inside, and after a course of about 18,000 feet joins the main river again at Pelican Island. The tidal water that flows into Spencer's Creek, however, runs into a large lagoon 18,000 feet above the lower entrance. This lagoon is filled by the flood-tide from both ends of the creek at the same time, and during the ebb is emptied in the same manner. There is a range of low stony hills running along the east side of Spencer's Creek and the lagoon, apparently a continuation of Rudder's Hill range.

The land between Spencer's Creek and the Macleay is an alluvial flat, and where not swamp all under maize cultivation.

There is a depth of 8 to 10 feet water at the lower end of Spencer's Creek, but where it widens out it becomes much shallower. The flat-bottomed steam-droghers, however, ascend the creek as far as the bridge, 10,500 feet from its mouth. Between the lagoon and the Pelican Island end of Spencer's Creek there is not more than 6 inches water at low-water springs.

Pelican Island divides the river  $11\frac{1}{2}$  English miles from the entrance. It is a low alluvial island, densely wooded, especially at the upper end. This island is set apart for the use of the Aborigines, who have cleared a considerable area, and cultivate maize. The island is about 3,500 feet long, north and south, of oval shape, and its greatest breadth is 1,300 feet.

Just below Pelican Island, on the right bank of the river, is a Government wharf, known on the river as Pelican Island or Robertson's Wharf. There is a punt and a ferry across the river a short distance above the wharf. All sea-borne heavy goods for the prison or Trial Bay breakwater works are landed on this wharf and taken overland to Trial Bay.

During the survey a quantity of rails which had been landed caused it to droop, and nearly brought the wharf bodily down. The jetty at Trial Bay is useless as a landing-place.

The fairway is along the west side of Pelican Island, and after passing it there is a shoal water of not more than 7 feet at low water turning into Long Reach. The channel east of Pelican Island is only used by boats, being blocked by shoals about its upper end.

Long Reach runs in a south-westerly direction for  $3\frac{1}{2}$  miles, with an average width of 1,000 feet. The middle of the reach broadens to 1,300 or 1,400 feet, and the centre is occupied by a shoal, dry in places at low water.

The fairway is on the right side of the river until after passing the above shoal, where a cutting has been dredged across to the left bank, the least water in which is 7 feet at low-water springs. This cutting is marked by leading-beacons at each end.

There is a Government wharf on the left or western side of Long Reach, about  $2\frac{1}{2}$  miles above Pelican Island.

The shores of Long Reach are cleared and cultivated from end to end, and present a pleasing appearance, with numerous farm-houses along the banks.

During floods the water flows over the western bank, which is low in places, and finds its way into the Clybucca Creek.

Above Long Reach the river gets narrow for a time, and takes a winding southerly course to Kinchela Creek, which joins the river from the south-eastward, about 2 miles above Long Reach.

The soundings in these narrow reaches are from 16 to 25 feet in the fairway, or centre of river, over a dark sandy or oozy bottom.

Half-a-mile down the river from Kinchela Creek, and on the right bank, is Kinchela Government wharf, and a quarter of a mile further down, on the left bank, is Summer Island Government wharf. The horse-punt and ferry is midway between these wharves. The Government township of Kinchela is on a point 1 mile below the creek. Apparently, very little of this township is in private hands, and is at present occupied by Aborigines.

The houses are mostly along the river-bank, towards and close to the creek.

Kinchela Creek, after a very winding course of 9 miles, ends in extensive swamps, southward of Korogoro Head. Its banks are under cultivation of maize, and it is navigated by steam-droghers for about 5 or 6 miles. There is a punt and ferry across the creek, near its mouth.

The banks of Kinchela Creek gradually decrease in height as it is ascended, and in time of flood the water runs up the creek from the river, and spreads over the swamps.

An extensive shoal lies off the upper side of the entrance to Kinchela Creek, the entrance fairway being close round the lower point. A cutting has been dredged through the tail of the above shoal for the navigation of the main river. It is marked by sets of leading-beacons above and below, on the right bank. The least water on the leading-line is  $7\frac{1}{2}$  feet at low-water springs.

There is a small Government wharf, locally known as Ross's Wharf, about 500 feet below the creek.

Above

Above Kinchela Creek the river bends gradually to the westward for nearly 2 miles, with an average width of 1,000 feet, and depth of water in the fairway of  $9\frac{1}{2}$  to 23 feet. It then sweeps round in a southerly reach to the mouth of the Belmore River.

In the bend are the two Fatorini Islands, which extend along 4,000 feet of the channel.

These islands are thickly wooded at their southern ends, the northern portions being cultivated and occupied by the Aborigines.

There is a Government wharf on the right bank of the river, 4,000 feet above Kinchela Creek, locally known as Partridge's. The "Teredo navalis" is very destructive to timber in the brackish water of the Macleay River, and at the time of our survey this wharf was very shaky through some of the unsheathed piles being nearly eaten through.

The town of Gladstone is on the right bank of the Macleay and Belmore Rivers, and the mouth of the latter. This is a Government township, with Court-house, post and telegraph office, &c., and is 22 land miles from the entrance. There is a Government wharf here, and punt and ferry across the Belmore, about  $\frac{1}{2}$  mile up that river.

The Belmore River is more often called the Darkwater Creek, its first name. It runs in a southerly direction, and its first reach is directly in line with the Macleay River. After a winding course of about 12 miles, it ends in swamps near the coast. It is navigated by steam-droghers a long way up.

Like Kinchela Creek, the banks of Belmore River, which are about 15 feet above low water at Gladstone, gradually decrease in height as the river is ascended, until they are level with the surrounding country.

In floods the stream sets up this river.

At Gladstone the Macleay River takes a very sharp turn north-west round a peninsula, on which is the private township of Smithtown.

The Smithtown Government wharf, on the left bank of the river, is nearly three-quarters of a mile below Gladstone wharf, and immediately above it is a punt and ferry across the Macleay.

At Smithtown is the first station (telegraph) above Stewart's Point.

The fairway is between Fatorini Islands and the left bank. The channel is narrow, but deep, until south of the northern island, when, for nearly 1,200 feet, there is a flat with only  $7\frac{1}{2}$  feet at low water in places; the depth then gradually increases till off Gladstone Wharf there is a depth of 34 feet in mid-stream, with a dark sandy bottom.

Passing the North Fatorini Island, the lead showed a bottom of soft yellow clay for a few casts, and the same bottom was observed off Partridge's Wharf.

Above Gladstone the river trends about north-west for  $2\frac{1}{2}$  miles to Seven Oaks bend, with deep water throughout.

There is a Government wharf on the left bank of the river, about half a mile below the bend, called Seven Oaks Wharf.

The width of the river between Smithtown and Gladstone wharves is from 600 to 400 feet, but above Gladstone it widens again to 700 or 800 feet. I may here remark that the widths above the limit of our survey are estimates by eye. The parish maps are not to be trusted, and no two of them agree. They are marked only "approximately correct."

At Seven Oaks bend the river turns sharply round to about south by west, and then runs in one long reach, curving westward for 4 miles to the town of Frederickton.

At the Seven Oaks bend great changes have taken place; the concave left bank is continually washing away, and the opposite point growing out. I am informed that what is now the ship channel was once dry land.

The bank is low about the middle of the bend, and during floods great quantities of water flow over it and strike across the low swampy ground to the Clybueca Creek.

Just above Seven Oaks bend is a shoal in mid-channel nearly awash at very low tides. A cutting has been dredged through the shoal water surrounding it, the fairway being on its west side, and marked by a buoy and leading-beacons at each end. The least water in this cutting is 8 feet,  $\frac{1}{2}$  mile above the buoy.

On the peninsula between Seven Oaks and Smithtown, the flat country is relieved by two or three rocky mounds, apparently from 30 to 50 feet high, grassy, and about  $\frac{1}{2}$  mile inland. These rise abruptly from the plain.

The reach between Seven Oaks and Frederickton is about 1,000 feet wide; the western bank is fronted with a weedy shoal nearly the whole way, and the fairway on the eastern side has from 11 to 14 feet water, with a dark sandy and oozy bottom. There is a channel for small craft east of the shoal at Seven Oaks, leading close round the point.

Frederickton is a conspicuous town on the left bank of the river, immediately below Christmas Creek, a narrow stream which runs a long distance into the hilly country, but is apparently not navigable.

A spur of the hills coming down to the river at Frederickton, and a number of buildings being on its slopes, the town shows to more advantage than those built on the alluvial banks below. As seen from the river, the most conspicuous places are the churches and cemetery.

Here houses of brick may be seen, those lower down the river being all of wood, with the exception of one or two at Seven Oaks and Gladstone. There is a saw-mill at Frederickton, which, however, was not working when we left. A short distance below the creek is the Government wharf, and another opposite on the right bank. Close to the wharf, and below it, is the usual punt and ferry.

From Frederickton the Macleay River runs in one curving reach to Kempsey, a distance of 4 miles in a south-south-west direction.

Kempsey is the principal town on the Macleay River; nearly all the Government officials reside and have their offices there, and the public buildings are large and numerous.

The town is very much scattered, the Government townships of East and West Kempsey being on opposite sides of the river, nearly north and south of each other. The principal business is done at Central Kempsey, a private township on the left bank of the river. There is a good Government wharf at Central Kempsey, and another on the opposite side of the river; a punt and ferry cross just above the wharves.

The Central Kempsey Government wharf is the terminus of the Clarence and Richmond S. S. Co.'s steamers, which, plying weekly, carry the larger portion of the produce of the district to Sydney.

The

The Central Kempsey Government wharf is 32 land miles from the entrance. The river-bank above the wharf is about 20 feet above low water. At West Kempsey the land is much higher, and some parts must be nearly 100 feet above the water. The right bank of the river is also very high and steep to between East Kempsey wharf and the Government township, which is a mile further up the river. The Macleay River here takes a wide bend to the westward and north-west.

Between Frederickton and Kempsey the fairway is close to the left bank for  $2\frac{1}{2}$  miles, the opposite side having shoal water stretching a long way into the river. The soundings vary from 8 feet off the mouth of Christmas Creek to 30 feet,  $1\frac{1}{2}$  mile above it, with a dark sandy bottom.

Within a mile and a half of Kempsey wharf the fairway has been dredged across to the right bank, and then between two wooded islets, which have been formed by floods, and lie near the right bank, between  $\frac{1}{2}$  mile and 1 mile below Kempsey wharf. The channel is then cut between the upper islet and the right bank close in shore, and is about 70 feet wide.

The cuttings are marked by sets of leading-beacons at each end, and a red buoy in mid-stream. A vessel coming up the river steers on the lower line until abreast the red buoy, and then turning sharply westward gets on the upper line of beacons, which leads between the islets mentioned above. The ruling depth in these cuttings is 8 feet, and I should imagine they would silt up partially after every heavy fresh.

Above the islets the water deepens quickly, and above the Government wharves under the high steep bank on the right side of the river, there is as much as 52 feet water over a dark sandy bottom.

There is another wooded islet near the right bank, 2,000 above Kempsey wharf, and a set of leading-beacons for a crossing immediately below it. The least water on the line of beacons is 6 feet.

West Kempsey Government wharf is on the left bank below the rounding point, and about  $\frac{1}{4}$  mile above Kempsey wharf. During the time of our survey the approach to this wharf was silted up, and boats could not reach it or float alongside at low-water.

About 900 feet above West Kempsey wharf is a slip for hauling up the hopper punts used with the Government dredge. The dredge herself is constantly at work on the different cuttings and approaches to wharves. There is a Government dry dock at East Kempsey, about 700 feet below East Kempsey wharf. This dock is intended to take in the dredge for repairs, and has been in use for that purpose. It is merely a trench dug in the bank here, from 40 to 50 feet high, and with a very steep slope from the surface of ground to the bottom of the dock. The boiler and pump are fixed on the slope about half-way up. Every flood fills the dock to high-water mark with silt; and at the time I saw it (March, 1888) a considerable portion of the soil on the lower side loosened by heavy rains had fallen into the dock, leaving a perpendicular side, and more seemed likely to follow.

The Euroka Creek (only navigable by boats for a short distance) enters the river on its right side  $1\frac{1}{2}$  mile above Kempsey wharf, and runs nearly parallel with the river for  $\frac{1}{2}$  mile. On the point made by the creek entering the river is a Government wharf, and just above it a punt and ferry across the Macleay to West Kempsey.

About  $\frac{1}{2}$  mile north-west of the above ferry is a shoal patch covered with weeds, in the centre of the channel. Of the leading-beacons at one time in position to mark the fairway between this shoal and the left bank, only one remained in June, 1888. The least water passing this shoal was 9 feet.

Greenhill's Government wharf, at the end of the north-westerly reach before mentioned, is  $3\frac{1}{2}$  miles above Kempsey wharf, on the left or northern bank of the river. This bank is very high and steep, the slope being thickly covered with scrub. The opposite side is low, gradually rising to a well-cultivated plain. There is a punt and ferry immediately above Greenhill's wharf.

The river at Greenhill's is about 400 feet wide, and the depth in the reach between Euroka Creek and Greenhills from 9 to 25 feet.

Above Greenhill's the river curves round to the southward. A little more than half-a-mile above the wharf is a dredged crossing, with only 6 feet water on it, marked by leading-beacons on each side. Abreast the upper beacon on the left side of the river is the first large shingle-bank. It is now covered with vegetation. From here upwards the river is much encumbered by shingle, which forms large banks on either side, sometimes covered with vegetation. These banks are all liable to change their form and position during floods or heavy freshes, and most of the soundings were over a shingle bottom.

One and a quarter miles above Greenhill's Wharf, on the left side of the river, on a high, steep bank, is the hamlet of Warneton.

The fairway crosses again to the left side of the river, and there is as much as 30 feet of water under Warneton.

Still, on the left bank of the river, three-quarters of a mile above Warneton, at a place where the land slopes gradually to the river, is another Government wharf, with only enough water alongside it to allow droghers to lie there.

The river here has entirely lost its alluvial character. The banks are high on both sides, and in places rocky, and the points all shingles and boulders.

Just above the last-mentioned Government wharf, on the right or east side of the river, is a rocky, isolated hill, its cliffy side towering over the river, and 50 feet of water over a rocky bottom abreast of it. The river here takes a sharp turn to the westward, and about a mile above the rocky hill occur the first rapids, locally called falls.

Navigation by droghers drawing 4 feet ends a quarter of a mile below the rapids, or 39 miles above the entrance. A vessel drawing 6 feet can come as far, taking the bad places at high water.

The rapids are formed by banks of shingle, which nearly block up the river; at high-water a light boat will float over them, but within 2 miles are four others, known as the Belgrave Falls, each only a few inches in height. Above these, or 43 miles from the entrance, tidal influence ceases.

The river was seen by the surveyor for only a few miles above Belgrave Falls, as far as Yarravale. It continued to be of the same character.

The Upper Macleay is not yet properly charted, the Government plans only showing portions of the river here and there. The country through which it runs, however, looks very wild and broken, as viewed from the Macleay Valley.

The Macleay River cannot be deemed navigable for vessels of over 9 feet draught, and drawing 8 feet would have to wait for high water to get up to Kempsey. The Company's steamers sometimes load up to  $8\frac{1}{2}$  feet draught, but part of the cargo is put on board at Stewart's Point, below all the cuttings.

Sometimes, in very fine weather, when the bar has shoaled up to 8 feet, at high water the tender goes outside and discharges her cargo into the Sydney steamer in the open sea.

The Macleay River produces a large quantity of maize, but during the survey its price was so little

little that not much was exported. A quantity of hardwood timber, sawn and in logs, is also exported. There is no pine or cedar on the river. At one time a quantity of sugar-cane was grown, and there are still several old-fashioned mills to be seen; but this industry died out, and the only crop seen was at Smithtown. It appeared to be doing well until the winter frosts completely killed it.

The ranges north and west of the Macleay are reported to be rich in gold, silver, lead, and other metals, and numerous prospecting parties have been exploring them lately, but nothing very valuable appears to have been discovered.

The metal-bearing country is too much broken to contain continuous payable reefs. The ores are found in small veins and pockets, and contain a great mixture of metals.

Early in 1888 the greater part of the grassy North Head was pegged out in gold claims, traces of that metal having been found there.

A small quantity of gold has also been obtained from the sides of Smoky Cape peaks on the coast.

#### *Entrance and Bar.*

The entrance to the Macleay River was close round the south side of the North Head, as shown on Mr. Baron's plan, dated November, 1861, until the heavy flood of August, 1864. This flood came down during a heavy east-south-east gale.

My informant states that a great quantity of land on each side of the river had just been cleared, the timber lying on the ground till the flood swept it away down the river.

On reaching the bar all this timber was met by the heavy breakers outside and forced back, until such a mass had accumulated that the entrance was completely blocked, and the river broke through the narrow neck of land between itself and the sea in several places, whilst the old entrance quickly sanded up. One of the new channels was about 10,000 feet above the old entrance, and above Stewart's Point.

At various times since the channel into the river has shifted north and south, but has never gone back to its former site under the North Head.

A shipmaster of one of the trading schooners informed me that in July, 1876, being at anchor on the north side of Stewart's Point during an easterly gale, the sea broke through the sand abreast his vessel, and the flood-water quickly scoured a deep channel, so that the heavy sea came right into the river and broke over his vessel, obliging him to weigh and run up stream.

There is still an old beacon on the outer part of South Spit marking the edge of the former channel, which must have been over half-a-mile southward of the present one.

I am informed that the bar was much deeper and more permanent in direction when the channel was under the headland.

Now the leading-marks have to be shifted nearly every spring tide; and during the last three months of the year 1887 were moved nearly 1,000 feet northward of their position in September of that year. During these months there was a good opportunity of observing the action of the wind and sea on the formation of the spits and bar. In September there was a good bar with 10 feet at low-water springs, and a straight run in. The Pilot informed me that the bar had not altered since March, 1887, when there was a heavy fresh in the river. Early in October some heavy north-east winds occurred, the effect of which was to alter the shape of the North Spit, which began to form across the bar outside the extreme of the South Spit. By the middle of December, the strong north-east winds had brought so much sand across the entrance that there was for some time only 8 feet at high water over the bar, North Spit then quite overlapping the South Spit, the fairway being from the southward, in a north-westerly direction until inside the break; and two sets of leading-beacons being necessary for entering. This state of things lasted until a strong fresh broke through the North Spit, and the fairway was nearly, as in September, 1887, viz., straight out. Afterwards the bar altered continually. Several days strong north-east winds, shoaling up the depth of water 2 or 3 feet, and westerly winds, deepening it.

During the winter, the Pilot informed me that at one time a channel seemed likely to form in the old position under the Head, the sea coming in and making a gutter in the sand to within 30 feet of the inside water. If it had once broken through there was every probability of a deep channel being scoured out, as the water was high, and the river in fresh at the time.

The Macleay bar may be considered in comparison with others on this coast as a smooth one. It is in a large bight, and sheltered from the southward round to south-east by Trial Bay and Smoky Cape. During strong south winds it is frequently smooth on the bar when a high sea is running in the offing. It is only when the wind gets round to south-east that the bar breaks heavily. In moderate north-east winds there is little break during the flood stream, and with continued west winds I have seen the bar free of breakers for days on both ebb and flow.

The wreck of the "Agnes Irving," an iron steamer, has been lying in 11 feet of water outside the South Spit, and over a cable's length south of the fairway, since December, 1879. It is partially sanded up with 9 to 11 feet at low water inside the hull, but amidships some ironwork stands above the sand, and one piece has a depth of only 5½ feet over it. A spar buoy was placed outside this wreck in October, 1887, but it was repeatedly washed away, and sometimes found miles up the river.

No perceptible current was observed immediately outside the soundings obtained, but the flood stream was observed to set towards the entrance from either side.

During freshes the discoloured water could be seen when well outside the bar to trend round to the northward and inshore.

The Pilot informs me that all wreckage from Trial Bay or South-west Rocks is deposited on the beach, either close to North Head or along the beaches north of it, which would seem to indicate a northerly eddy inside the constant southerly current which sets along the coast outside the Capes.

#### *Of Floods and Freshes.*

The Macleay River having its sources in the New England Range, 80 or 90 miles inland, runs through very broken country for the first part of its course, and is joined by many mountain creeks, consequently it is subject to sudden freshes of short duration.

Very heavy rains along the coast do not affect the river much, and I am informed that the only floods known have been during gales between south-east and north-east, when the rain clouds, being driven inland against the mountain barrier, discharge their contents there, and fill up the numerous creeks which feed the river.

All information regarding floods was very contradictory; the river-banks and all landmarks of the old times seem to have changed or have been removed. The buildings on the lower part of the river being all of

of timber have decayed, or been swept away and replaced by others. I was given no time to make inquiries above Kempsey, but at Central Kempsey I was shown a flood-mark said to have been levelled to by a surveyor, and 25 feet above the ordinary high water. This was in the flood of 1875; the mark has since been built over.

The best information as to frequency and duration of floods and freshes was obtained from some old diaries kept by Mr. Croad, of Smithtown, who kindly allowed extracts to be made. He appears to have noted down all freshes of consequence.

Unfortunately, his house, which was a chain from the river-bank, was pulled down some years since, and his later journals mislaid or lost. The following extracts extend over a period of fifteen years:—

- 1863.
- 26 January ... River rose 4 feet.  
 27 January ... River bank high (14 feet above datum).  
 28 January ... River falling.  
 14 February ... River rising; wind south-east to north-east, very strong.  
 15 February ... River running over bank.  
 16 February ... River over sleepers of house.  
 17 February ... River falling, but still bank high.  
 18 February ... River fell 3 feet.  
 19 February ... River falling fast; ten men drowned up river.  
 3 April ... River bank high; southerly gale.
- 1864.
- 10 February ... River rising; wind south, heavy rain.  
 11 February ... River rising; wind south-east, heavy rain.  
 12 February ... At 10 a. m. over banks, and soon after falling.  
 1 March ... River rising; strong north-east wind and heavy rain.  
 2 March ... River bank high.  
 3 March ... River bank high all day.  
 4 March ... Fresh abated slowly till 12th March, when river was not yet at ordinary level.  
 19 March ... River rising again; strong southerly winds and heavy rains. The river was again very high on 30th and 31st March.  
 2 May ... Strong fresh in river; wind south-east.  
 3 May ... Strong fresh in river; wind strong.  
 4 May ... Fresh abating.  
 4 June ... River running bank high; south-east wind strong.  
 20 June ... A high fresh in river.  
 14 July ... Heavy rain and gale from north-east; river rising fast.  
 15 July ... River over banks at 8 a. m., and still rising at 9 p. m.; wind north-east to south-west.  
 16 July ... 1 p. m., river falling slowly.  
 20 July ... River still falling; wind north-west.  
 6 August ... Continuous heavy rain.  
 7 August ... Continuous heavy rain.  
 8 August ... Heavy rain; east-south-east gale all night and day.  
 9 August ... Flood over sleepers of house; strong south-east gale.  
 10 August ... Eight inches of water in house (17 feet above datum).  
 11 August ... Water falling; light south-west wind.  
 13 August ... Water had fallen 2 feet.
- 1866.
- 13 July ... River in fresh over bank; strong south-east gale.  
 14 July ... River in fresh over bank; strong south-east gale.
- 1867.
- 11 April ... River rising; strong north-east wind.  
 24 April ... River rising; strong north-east wind shifting to east.  
 25 April ... River up to stump (16½ feet above datum).  
 26 April ... River falling; strong south-east wind.  
 27 April ... River falling; strong south-east wind.  
 28 April ... River rising.  
 29 April ... River rising; over bank.  
 30 April ... River falling.
- 1869.
- 19 March ... River rising, in strong south-east gale.  
 19 April ... River rising, in strong south-east gale.
- 1870.
- 9 March ... River rising; strong north-east wind.  
 10 March ... River falling.  
 13 March ... River rising; heavy rain and south-east gale.  
 14 March ... River rising; heavy rain and south-east gale.  
 15 March ... River rising; heavy rain and south-east gale.  
 16 March ... River rising; heavy rain and south-east gale.  
 17 March ... River rising; heavy rain; wind south.  
 18 March ... River bank high.  
 19 March ... River bank high; gale from south.  
 20 March ... Black Sunday. River running over banks; all sugar torn up by roots and corn submerged.  
 21 March ... River over banks; fine north-east wind.  
 22 March ... River slowly falling; fine north-west wind. The water continued to fall and reached ordinary level on 27th March.  
 12 May ... River rising; wind north-east to south-east. 1872.

1872.  
22 December ... River rose 6 feet ; wind south-south-west, with rain.
1873.  
25 February ... River bank high ; south-east gale.  
26 February ... River bank high ; falling.  
15 June ... River rising ; wind east, with rain.  
16 June ... River rising ; gale from north-east.  
17 June ... River bank high at 7 a.m. ; north-east gale. After that the flood-water fell slowly till the 20th, with fine weather and west winds.  
29 December ... Fresh in river ; heavy gale from north-east, with rain.  
30 December ... River rising ; heavy gale from south-east.  
31 December ... River falling.
1874.  
27 January ... River rising ; south-east gale and heavy rain.  
28 January ... River rising ; south-east gale and heavy rain.  
29 January ... River rising ; south-east gale and heavy rain.  
30 January ... River rising ; south-east gale and heavy rain.  
31 January ... River falling.
1875.  
25 February ... River rising ; strong south-east and rain.  
26 February ... River rising ; strong south-east and rain.  
27 February ... River rising ; strong south-east and rain.  
28 February ... Flood water in house ; south-east gale, blowing barn, outhouses, and trees down. This is the most disastrous flood known on river.  
1 March ... Water 18 inches in house (18 feet above datum) ; south-east gale still blowing.  
2 March ... Flood water slowly falling ; south-east gale.  
3 March ... Flood water slowly falling ; north-east showers. The river continued to fall till the 7th March, with north-easterly weather.
1876.  
11 April ... Heavy rain and south-south-east wind till 14th.  
14 April ... River rising fast.  
26 June ... River rising ; strong south-east wind.  
27 June ... River falling.  
14 July ... Heavy rain : south-east gale.  
15 July ... River rising ; easterly gale.  
16 July ... River rising ; easterly gale ; heavy rain, ended 7 p.m.  
17 July ... River up to top of bank ; south-westerly wind.  
18 July ... River falling ; south-east gale.  
19 July ... River rising ; south-west gale.  
20 July ... River falling slowly ; south-west gale.  
21 July ... River falling slowly ; south-west gale.  
22 July ... River falling slowly ; south-west gale.  
23 July ... River falling slowly ; less wind
1877.  
21 December ... Very heavy rain and hail south-east ; strong fresh in river.
1878.  
7 February ... River up 8 feet ; north-east wind.  
9 February ... River falling.  
16 February ... River rising ; south-east gale.  
17 February ... River up 8 feet ; south-east gale.

From the above date the books containing the entries were not to be found.

During the survey the river was in fresh more or less from the 26th December, 1887, to the end of April, 1888.

Early in January, 1888, the flood-water was over the Government wharf (about 6 feet rise) for some days at Smithtown, and frequently afterwards 1 or 2 feet above ordinary level, but nothing that could be called a flood took place.

No rainfall has been noted at the Macleay Heads, the nearest meteorological station being West Kempsey, where the rainfall has been registered since 1882. The average for five years has been a fall of 37·75 inches, which would be about two-thirds of the rainfall at the Heads.

I was unable to obtain any information as to the winds during the last ten years, and any records from West Kempsey would fail to show how the winds blew at the entrance.

On February 8th, 1888, a strong north-east wind was blowing at the entrance and some distance up the river ; at Kempsey it was calm till about 1 p.m., when a very heavy rain squall came from the westward. This met the north-east wind at Seven Oaks, and from thence to Kinchela Creek caused a cyclone, which levelled all crops along the river banks, tore up trees, barns, &c., and unroofed or otherwise damaged most of the houses at Smithtown.

The works on the Macleay River carried out by the Harbours and Rivers Department are the Government wharves, dry dock, and dredged cuttings, and I doubt the existence of any plans of these works. I am informed that a breakwater is to be run from Logger's Point across Trial Bay by prison labour, but the plans have not been made public. A large quantity of rails, trucks, &c., for this work was landed at Pelican Island wharf during the survey.

With regard to materials, prices, &c., there has been a Resident Engineer of the Harbours and Rivers Department at Trial Bay for many years who can best furnish that information.

COMMANDER F. HOWARD, R.N.,  
Hydrographical Surveyor,  
Harbours and Rivers Branch,  
Department of Public Works.

## NEW SOUTH WALES.

NEW ZEALAND AND SOUTH SEAS EXHIBITION, 1889-90.  
(REPORT OF THE COMMISSIONER FOR NEW SOUTH WALES.)

Presented to Parliament by Command.

New Zealand and South Seas Exhibition, held at Dunedin, 1889-90.—Report of  
Oscar Meyer, Esq., Commissioner for New South Wales.

To His Excellency the Right Honorable CHARLES ROBERT, BARON CARRINGTON, a Member of Her Majesty's Most Honorable Privy Council, Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies.

MAY IT PLEASE YOUR EXCELLENCY,—

In accordance with the terms of the Commission issued to me on the 5th August, 1889 (*Appendix A*), in which I was authorised to report my proceedings in connection with the Exhibition held at Dunedin, I have the honor to submit for your Excellency's consideration, the following statement as to the steps taken by me in the performance of such duties. The experiment, tried in this case for the first time, of confiding an Exhibition to the charge of a single representative, threw upon myself, as the sole Commissioner, the entire responsibility of the success or failure of the undertaking; and, conscious of a sincere desire that the Colony should sustain no loss through error or deficiency on my part, I have devoted myself to the work with all the energy I possess, and, as I trust, not without a satisfactory result.

The enterprise which ultimately grew into the New Zealand and South Seas Exhibition, was originally suggested by a private citizen of Dunedin, who deemed it a fitting mode of celebrating the Jubilee of the Colony. Somewhat coldly received at first, the project secured, after a time, the support of some of the leading capitalists in that city; and, with such a guarantee of success, was finally taken up with considerable enthusiasm throughout New Zealand, and especially in the southern provinces of the Middle Island. As there appeared at the time little prospect of obtaining aid from the Government in any shape, the promoters resolved to form a Company to carry out the proposed work, not as a matter of profitable commercial speculation, but as a patriotic undertaking for the general benefit. No difficulty was experienced in obtaining the stipulated amount of capital necessary for the successful working out of the scheme; and the Government, seeing the energy displayed by the shareholders, and the readiness with which they risked capital to the extent of over £15,000, at length consented to assist with a grant of £10,000. At this stage, other countries and colonies were invited to take part in the Exhibition, and to join in making such a display of their respective products, natural and manufactured, as would bring their resources and capabilities distinctly into notice. Responses were received from New South Wales, Victoria, and South Australia, which were the only colonies from which Commissioners were appointed by their respective Governments.

Out of a large number of sites offered for the erection of the Exhibition buildings, the Executive chose a level piece of ground containing about 12½ acres, and situated in a part of the city easy of access from all quarters, and as nearly central as the distribution of population would allow. It is a significant fact that this site had but a few years previously formed portion of an unreclaimed area covered at high water by the sea; and, irrespective of other considerations, there was a singular appropriateness in utilising it for the purposes of an Exhibition that would supply evidence of the industrial progress of the Colony.

As, for the most part, the buildings were designed to be of a temporary character only, they were chiefly constructed of wood and iron. In shape they consisted of an irregular four-sided figure about 1,100 ft. in length and 400 ft. in width, of which the two longer sides only were parallel, and having transverse bays connecting those sides and octagonal spaces at the angles and in the middle of the longer sides. A broad passage, "The Avenue of Nations," passed through each side of the quadrilateral, having on either hand bays for the display of exhibits. On the western side of the block were located the Victorian and New South Wales Courts; a portion of the northern was occupied by the exhibits of British contributors; and the remainder was allotted to the various provinces and districts of New Zealand and the South Sea Islands. In the transverse bays were placed Art Galleries, the New South Wales mineral collection, Victorian exhibits, French, German, and other foreign exhibits, and machinery.

In preparing the New South Wales Court for the reception of exhibits, some difficulties had to be encountered, arising chiefly from the peculiar shape of the space allotted for the purpose. After determining the exact positions in which the several classes of exhibits should be placed, the arrangement and decoration of the Court were rapidly proceeded with, and the most strenuous efforts were made to ensure the completion of all these works prior to the day set apart for the opening of the Exhibition. In connection with this subject, I cannot forbear to remark that the unanimous verdict of the press and of visitors places the Court first in order of merit on these grounds. Some apprehension was felt as to the possible non-arrival of exhibits in time for display by the opening day. Irregularity of communication by steamer between Sydney and Dunedin, and the almost total impossibility of shipping direct to the latter port, precluded any precise calculation of the dates of arrival. Anxiety was particularly felt on account of the large quantity and great variety of mineral exhibits expected, and it was foreseen that the landing and arrangement of these would require all the time at our disposal, even when the men employed were working twelve and thirteen hours a day. Still greater cause for anxiety was occasioned with regard to the paintings sent by the Art Society of Sydney. In the absence of sufficient means of direct communication with Dunedin, these paintings were forwarded by way of Melbourne, and it was feared that even then they might not arrive until after the opening day. Although the vessel did not enter the port till late on the day preceding the opening, and the pictures could not be obtained until night, arrangements were made in advance for their reception, and by next morning all were properly hung in their places in the Art Gallery. Fortunately, all other exhibits, with few and inconsiderable exceptions, arrived in time, and were displayed in the places assigned to them prior to the appointed day.

The ceremony of opening the Exhibition took place on the day selected for the purpose, 26th November, 1889, His Excellency the Earl of Onslow, Governor of the Colony, having, at the request of the Executive, been present to perform the office of declaring the building open to the public. Extensive preparations had been made with a view to render the ceremony impressive, and the exertions of the Executive to that end were cordially seconded by the public. In the main the example set at the Centennial Exhibition in Melbourne was followed. Outside of the building there was military display, followed by processions of Friendly and Trade Societies and Fire Brigades. Within, a large audience consisting of leading citizens, official persons connected with the Exhibition, and ladies, were assembled in the Concert Hall to witness the proceedings, and to hear from the Governor the declaration that the Exhibition was formally opened. After prayer by the President of the Exhibition a "Song of Praise" was performed by a choir and orchestra, and the President having addressed the Governor in a speech that contained many interesting particulars, His Excellency replied, eliciting warm applause from the audience. Having then made the official announcement as to the opening of the Exhibition, His Excellency was conducted through the different courts, and was pleased to speak in complimentary terms of the appearance of that belonging to New South Wales. The whole ceremony was most successfully managed, and appeared to give universal satisfaction.

There can be no doubt that the general arrangement of the building was judicious, and such as would enable visitors to note the principal exhibits to the greatest advantage. A continuous avenue passing round the entire building, and of moderate width, was perhaps the form best adapted to assist spectators in making a close examination of the object displayed on their right hand and on their left, while none could be overlooked by persons who cared to exercise their powers of observation. In the transverse bays a similar arrangement was adopted; and among the advantages gained thereby not the least was the fact that mineral exhibits belonging to New South Wales were open to inspection from two broad avenues.

Before describing the exhibits displayed in the New South Wales Court, it may be desirable to note a few brief remarks upon those supplied by other colonies and countries; for the limitation placed upon the articles eligible for exhibition in my instructions requires that the position of New South Wales in the competition should be defined; and this will probably best be effected by a comparison of exhibits, or by the contrast which would naturally be suggested to an intelligent observer. It will readily be admitted that, in New Zealand, the Exhibition, as a mode of celebrating the Jubilee of the foundation of the Colony, would be regarded in a different light from that in which it would be viewed elsewhere. *There* it seemed to be an essential part of the programme that steps should be taken to evince the progress made by the colony in all the arts of civilized life during the fifty years of its existence; and as a consequence exhibits exemplifying that progress would not only be welcome, but would be considered necessary. Hence such exhibits as are produced in what are frequently termed domestic manufactures, those, namely, intended for home consumption in contradistinction to those designed for export, and of which boots and shoes, clothing, furniture, vehicles, and articles of daily consumption are familiar examples, were provided for in the schedule of classification, and were supplied in considerable numbers. They fully answered the purpose intended, and showed that, in all such manufactures, New Zealand is fully abreast of the other colonies, notwithstanding its brief period of existence. But no such necessity lay upon the other colonies which desired to show such goods only as would form the material for an export trade. Even in this design, the fiscal system of New Zealand gives little encouragement to producers in other colonies, except in a few articles upon which the customs duty is not distinctly prohibitive. The resolution of the Government of New South Wales, to restrict the exhibits from that Colony, mainly, to minerals, timbers, wines, and wools, was therefore fully in accord with the spirit of the Exhibition itself, and with all the surroundings of the case, although the effect was to limit in appearance the number of exhibits belonging to the various classes of manufacture carried on in New South Wales. That this Colony suffered, however, from the absence of such exhibits there is no evidence to show, while there is abundant proof that the restrictions above mentioned have led to a high degree of success in making widely known the most important natural products of New South Wales.

Omitting the exhibits in the Armament Court as not specially distinctive of New Zealand, it may be remarked, in the first place, that not only each provincial district, but, in some instances, each county, had secured for itself a separate bay. As a consequence, while it was easy to ascertain, so far as the exhibits shown were concerned, what the products of such districts were, some difficulty would be felt in forming a general idea of the resources of the country as a whole, and of the comparative value of different districts with respect to any special product. This was shown most pointedly in the case of minerals; for, though there was an excellent collection of ores, and similar products shown by the Government in a separate bay, there were others scattered among the exhibits of the various districts where

where they were to a considerable extent unnoticed in the crowd of miscellaneous articles. Had all these been collected into one spot, together with those exhibited by the Government, a display would have resulted that, in some respects, would have challenged comparison with that contained in the New South Wales Mineral Court.

Among the articles which may be considered to be characteristic of New Zealand, and of which specimens are not generally produced in other colonies, it may be said that the Auckland Court showed limestone, building stone, and antimony ore; Kauri timber, flax, rope, twine, and matting; leather, and boots and shoes, and Kauri gum. From Hawkes' Bay, the most noteworthy exhibits were specimens of timbers, agricultural produce (including hops), beers, wines, and spirits. Portland cement, woollen manufactures, flax, wool, beers, and preserved meats were furnished by the Wellington district; coal was sent from Nelson; wheat from Wanganui; and flax, beers, and preserved meats from Marlborough. From the great mineral region lying on the west coast of the Middle Island, a collection of minerals was shown that included gold in sand and in quartz, coal of various qualities, and greenstone. Timbers and ferns, chalybeate water, and New Zealand wines were also sent from that province. Though not so fully represented as regards its special products as might have been expected, the large agricultural and pastoral district of Canterbury appeared to considerable advantage. Its principal exhibits were lignite coal, pottery, timbers and articles made therefrom, grass seeds, barley and malt, hams and bacon, flour and oatmeal, wines and beers, agricultural implements, and wools. Otago supplied pottery, lime and cement, textile fabrics (principally from the Mossiel Woollen Company and the Rosslyn Worsted and Woollen Mills), timbers and articles constructed thereof, flax, ropes and cordage, vegetable and grass seeds, beers, cheese, bacon, hams, and lard, preserved meats, flour, maize, rye, and oatmeal, biscuits and confectionery, leather, and agricultural machinery. In separate bays, under the names of the counties or towns from which they were supplied, were also shown gold, antimony, cinnabar, coal and lignite, manganese, lime and cement, wheat, oats, flour, oatmeal, flax, linsced and grass seeds, hams, bacon, butter and cheese, timbers, beers, fruits, wools, and textile fabrics. From the district of Southland the following exhibits were received:—Building stones, tin ore, coal lignite, fire-clay, kaolin, pottery, timbers, flax, oats, wheat, barley, grass seeds, turnips, potatoes, beers, cheese, bacon, hams, lard, canned fish, biscuits, and agricultural implements. From the foregoing detail a fairly correct estimate of the resources of New Zealand, as at present developed, may be formed. The Mineral Court, however, arranged by the direction of Sir James Hector, shows that there are other resources not as yet fully availed of, but nevertheless likely at no distant period to be turned to useful account. Among the specimens of minerals shown were arsenic, copper, gold, iron, lead, silver, tin and zinc, asbestos, chalk, jasper, graphite, barytes, sulphur, and marble. Coal of different kinds was also shown in great variety. In the Early History, the Natural History, and Fisheries Courts, the New Zealand Government have shown collections, not only intrinsically interesting, but of great value and utility to all who desire to understand the true history of the country and of its former possessors. The anthropological collection includes contributions from various of the island groups in the South Seas.

It appears to have occurred to the Exhibition Executive that the display would be incomplete in the absence of exhibits showing the progress made in the schools conducted under the educational system of the colony. Accordingly a large number of articles was obtained from different schools, and shown in an Educational Court. These were generally of a very creditable character, and with few exceptions, were obviously genuine. So far as bookwork, drawing, and needlework can attest the efficiency of the instruction given in schools, these exhibits bear most favourable witness. "In the hope that such a display would prove of great educative benefit and pleasure to the people at large, and be the means of fostering and encouraging a desire for art and artistic study among the younger members of the population," the Executive undertook to display in a brick building, specially erected for the purpose, a collection of engravings, lithographs, and pictures, examples of the work of artists of standing, British, foreign, and colonial. Of this collection, it may be said, in general terms, that it was not only adapted to be of service to the art student, but that it was of equal value in enabling the general public to discern the excellent in art from that which is merely false and pretentious.

On the whole, the New Zealand Courts were calculated to impress the visitor with the idea that the country itself possesses vast natural wealth in the fertility of its soil, in its indigenous timbers, and in its varied mineral products. Not less decided would be the conviction that the people are gifted with energy and enterprise to avail themselves of the treasures within their reach, while the educational system established throughout the land is a guarantee that nothing will be wanting to the due development of its capabilities through lack of knowledge. In its relation to other colonies, New Zealand would also be in a position by means of these exhibits to show that it is capable of meeting many wants and supplying many articles of commercial value with advantage to both producer and consumer. The intercourse which would be developed by intimate commercial exchange would doubtless tend to benefit both parties, in other than merely material points of view.

The Victorian Court under the charge of a Commission appointed by the Government of that colony, was situated next to that of New South Wales and in a line therewith. With the exception of the exhibits supplied by different departments of the Government, inconsiderable in number and consequence, all the goods displayed in the Court belonged to private individuals. Most of these exhibits may be included under the designation of manufactures. Among these the following appeared to be deserving of special mention, by reason either of their intrinsic importance or of their excellent qualities:—Glassware, pottery, furniture, textile fabrics, carriages, boats, and machinery. In addition to these, there were a few exhibits of agricultural produce, including wheat, maize, oats, peas, beans, barley, and hops. Wines were largely represented, there being thirty-five exhibitors in this class, and a few samples of beer were also shown. Biscuits and jams with allied products were exhibited, but in small quantities; but leather, boots, and shoes, and saddlery were represented by fifteen exhibitors. A few exhibits of wool, though of excellent quality, very inadequately represented this important branch of Victorian productive industry. Some agricultural machinery completes the list of exhibits of the economical classes shown by private persons. Among the Government exhibits of those classes may be mentioned a mineral collection, carpalogical specimens and fibres, and wine. In the Educational section, including Art, were a collection of specimens from the Educational Department, Melbourne; copies of the Victorian Year Book by the Government Statist; maps from the Survey and Mines Departments; a large collection of paintings in  
oil

oil and water colours by various artists, resident in Victoria; and photographs. A special gallery within the Victorian Court was devoted to the exhibition of a loan collection of paintings by artists of eminence, including 167 separate pictures. This added greatly to the attractions of the Victorian Court.

Although represented by a Commissioner, South Australia displayed but few exhibits, and of these only the wines require special notice. A large number of different kinds of wine were shown by twelve growers, including all who had succeeded in establishing a reputation for the high quality of their products. Judging from the number and class of awards obtained from the jurors, these wines must, on the whole, have been of superior quality and in excellent condition. Another characteristic industry of the colony was also represented, but to no great extent—the manufacture of currants, raisins, dried fruits, preserved fruits, jams, and olive oil, which bids fair, at no distant date, to become an important branch of production in South Australia, as, in fact, it might be in most of the other Australian Colonies.

To British exhibitors, represented by Mr. Arthur Day, space was allotted in the northern side of the building. Other British exhibits were shown in another portion of the building, the separation having been caused by the fact that the British Government had not appointed a Commissioner, and that, in consequence, each exhibitor had to arrange as he best could for the display of his goods. The natural result of this lack of arrangement was that a visitor would find it difficult to discover some of the exhibits, and that the impression which a large collection is calculated to produce was to a considerable extent lost. The great bulk of these exhibits consisted of manufactured goods in various branches of industry. An exception to this was Sutton and Sons' display of seeds, which was of great value in an educational as well as in an economic sense. A duplicate of this exhibit would form a most useful feature in the museum of an Agricultural College. This remark applies with especial force to the case containing a collection of cereals and pulse. Exhibits of candles, soaps, oils, pickles, sauces, coffee, cocoa, chocolate, condiments, and medicaments were displayed in ornamental show cases judiciously arranged in the Court; and specimens of woollen cloths from the west of England afforded an excellent opportunity for making comparisons with the best samples of the same class of goods produced in the New Zealand factories. It need scarcely be remarked that the specimens of British manufacture exhibited were all of the high class usually found in such articles.

American and foreign exhibitors were accommodated with space in the transverse avenue leading from the octagonal area between the Victorian and New South Wales Courts to the similar area in the New Zealand Courts. Among their exhibits one of the most conspicuous was that of the Messrs. Cameron—tobacco in various forms, including the growing plant. An interesting exhibit was also shown of tobacco from Fiji. Agricultural machinery from American makers occupied a considerable space. With the exception of French wines, Indian and Ceylon teas, statuary and pianos, the remainder of the exhibits in this Court were of a miscellaneous character, difficult to classify. As a representation of national resources or industries, they were wholly inadequate, and in this sense were probably the least effective portion of the whole exhibition. In the same avenue exhibits from France were shown under the direction of Mons. V. Laruelle, representative agent. Excepting wines and spirits, of which there were numerous specimens, the French exhibits were, generally speaking, not examples of great staple manufactures, but rather of those works in which delicate taste, excellent workmanship, and high finish enable the French to excel other nations. Such, for example, were the different specimens of glassware shown in this Court, the porcelain exhibits, ladies' and children's dresses and shoes, jewellery, and even the toys and trinkets. Although characteristically French, however, such exhibits could not be considered as properly representative of the great French industries; and it may indeed be doubted whether the majority of the exhibitors had any definite motive in displaying their goods beyond the hope of profit from immediate sales in the building.

Adverting now to the New South Wales Court, it may be mentioned that it commenced at the octagonal space in the middle of the western side of the building. The whole octagon was divided between New South Wales and Victoria; and the portion allotted to this Colony was occupied by the exhibits of the *Sydney Morning Herald*, being handsomely fitted up for the display of Messrs. Fairfax & Sons' specimens of typography and engraving. Adjoining this, were the office of the Commissioner and the Reception Room, in which it has been the custom to receive visitors to the Court, especially such as came from New South Wales. There is reason to believe that the existence of such a convenience has been highly appreciated by a large number of persons who had spent time in inspecting exhibits. Next to the Reception Room on the same side of the main avenue, was a fernery in which specimens of ferns of various genera were planted, and which afforded relief to the spectator when fatigued with long continued close examination of the goods displayed in the Court. Passing a small bay in which the exhibits of the *Bulletin* Newspaper Company were shown, comprising files of that paper and humorous drawings and cartoons by leading artists in that branch, the next division of space was occupied by an Art Gallery in which was hung a valuable collection of paintings by members of the Art Society of New South Wales, and which has attracted a large amount of attention. Natural History specimens prepared by the experts of the Australian Museum in Sydney came next; and in the same bay were shown cases containing coins of various ages and different countries exhibited by Mr. A. A. Simpson, of Tumut. In close contiguity was the space set apart for the representation of the Jenolan Caves which, from the first, formed a highly popular portion of our exhibits and was visited by many thousands of persons. By means of paintings and photographs and the aid of powerful lenses, the artist, Mr. W. J. Wilson, of Sydney, whom I employed for the purpose, succeeded in producing a more effective representation than had been previously exhibited of these magnificent caves; and competent judges who had personally visited these natural wonders have borne witness to the truthfulness of the reproduction. By the local press equally favourable testimony was given to the vividness and apparent truth to nature of the scenes exhibited. In an adjoining bay there were shown exhibits of scientific instruments, constructed by Mr. Wiesener, of Sydney. These instruments, made in the Colony of New South Wales, and in many instances of original design, attracted attention, not only on account of their obvious utility, but also because of their merits in point of workmanship, and of their cheapness. On these grounds they obtained a first-class award. Some very superior samples of horse-shoes were placed in the same bay, and were also honoured with a similar award. Specimens of compressed leather and samples of preserved fish were likewise exhibited in this bay, both being pronounced excellent of their kind.

Crossing the main avenue at this point, the New South Wales wine bar next presented itself. Originally included by the Exhibition Executive in their programme, the installation of colonial wine bars was at once adopted as part of their policy by the Commissioners from the other Australian Colonies; and

after

after some consideration, I resolved to follow the same course. The reason which influenced me in arriving at this decision was principally the desirableness of making known in New Zealand the existence of the numerous varieties of high-class wines produced in New South Wales, and, if possible, of creating a taste that might ultimately lead to a constant demand for these beverages. At the same time it appeared to me that, under careful management, this could be effected without trenching upon the funds granted by the Government for the purposes of the Exhibition; and all the subsidiary arrangements were accordingly made with a due regard to this consideration. The bar itself was constructed on a novel principle, the external portion being formed of representations of vines intertwined and covered with foliage, and it was thus relieved of the character of a mere wine-shop. From the time of the opening of the bar it has continued to pay all the expenses incurred; the making of a profit upon sales was not contemplated. Although less numerous than could have been wished, the wine exhibits were fairly representative of the several wine-producing districts; and a considerable proportion possessed great merit, a fact duly recognised by the judges, as will be seen from the subsequent statements as to the awards.

It may be mentioned here, however, that, in proportion to the number of exhibitors, the wines of New South Wales secured a larger number of the higher classes of awards than any other colony. The following table shows the proportion of awards of the higher classes to each exhibitor:—

Colony.	Proportion of the 1st and 2nd class Awards gained by each Colony.		
	1st class.	2nd class.	Total.
New South Wales .....	3.00	1.04	4.04
Victoria .....	0.93	0.71	1.64
South Australia .....	1.03	1.00	2.03

Proceeding northward from the wine-bar, and on the same side of the main avenue, the bay was reached in which wool exhibits and cocoa-nut matting were shown. In the class of wools, also, it were much to be desired that a more fully representative collection of samples had been procured; but the lateness of the period at which it was decided to take part in this Exhibition precluded the possibility of effectually canvassing many important wool-growing districts in New South Wales. It is gratifying to know, however, that the samples which came to hand were of excellent quality, and that, besides various other awards of the highest class, the International Grand Champion Prize for Wool was secured by a New South Wales exhibit, that of the Collaroy Company. The wool shown by Messrs. Traill Brothers also received a high encomium from the judges, who pronounced it to be the finest spinning wool shown in the Exhibition.

The mats and matting from Darlinghurst Gaol are admittedly of high class, both as regards material and workmanship.

The exhibits from the Technological Museum, forwarded by the Curator, Mr. J. H. Maiden, were both interesting and instructive, and they have secured much careful scrutiny on the part of the public and favourable comment from the press. They included an educational collection of wools, each specimen being accurately labelled and described so as to present means of comparison with regard to all essential qualities of wool; and also a series of samples of colonial wools to illustrate the different stages of clothing manufacture. This was followed by a collection of barks useful for tanning, and comprised, besides those in actual use, those not hitherto employed for the purpose. Such a collection, properly studied, should prove of great value in countries where the raw materials of leather are so abundant as in Australia and New Zealand, and where the leather industry must eventually become one of the highest importance. As the Curator properly points out, "many of these barks are but little known, and are shown for two reasons: A bark is usually the most easily observed, and often the most characteristic portion of a tree. Examination of these will bring about a more intelligent interest in our forest wealth. Also much ignorance prevails in regard to the economic value of our commonest species. This is partly accounted for by the fact that our wealth of indigenous vegetable products is so great that only those most readily converted into money are known." To a considerable extent the foregoing remarks apply to the "Collection of Fibres and Fibre-barks from Indigenous Australian Plants," for while those of great excellence are scarce, fibres of less value are abundant, and are likely in the future to be extensively used for economic purposes. Although the next exhibit, instructive as it may be, was perhaps more curious than useful, the "Indigenous Australian Vegetable Products chiefly used as food by the Aborigines," might be found to include specimens that hereafter would prove to be of some utility. So, with regard to the "Indigenous Vegetable Substances reputed to possess Medicinal Properties," it is not improbable that new curative agents of great value may be discovered among these plants, a consideration that invested the collection with much interest. Next followed a collection of "Australian Gums, Resins, and Kinols," and another of "Insect Galls," both of which possess scientific interest as well as affording the promise of future economic value. The list of exhibits from the Technological Museum closes with a "Collection of Exhibits to illustrate the utilisation of some of the most useful timbers of New South Wales." Attention is called by the Curator to the fact that "these timbers have not been worked into their present forms at random. The timbers are actually used, for the purposes shown, within the Colony of New South Wales." It will be evident that the whole of this series of exhibits were worthy of careful study, both on account of their bearing upon productive industries, and also the admirable manner in which they have been selected and displayed. That such was the opinion of the jurors is evident from the high award adjudged to them by the Exhibition authorities.

A loan Collection of Works of Art, consisting of oil paintings, statuary, and bronzes, occupied the adjoining bay. The paintings, for the most part, were by old masters, and afforded visitors a profitable opportunity of comparing their style and treatment with those adopted by living artists, as shown in the pictures displayed in the Art Gallery on the opposite side of the main avenue. This collection has proved highly attractive, though being non-competitive, it did not come within the purview of the jurors in the Art section.

The exhibits from the Government Printing Office, Sydney, including specimens of printing, bookbinding, and photographs, are so well known for their high qualities as to need but brief mention in this report; and it may suffice to state that, while they have secured from the general public a large amount of attention, they have also obtained from the jurors an award of the first-class.

Occupying

Occupying a rectangular space 12,000 feet in area, and possessing frontages to both the main and transverse avenues, the position of our Mineral Court was not surpassed by any in the building, and the facilities for observing in detail the great variety of specimens contained within its bounds were absolutely unrestricted. Trophies of copper and tin were erected on the frontage to the main avenue; gold and gems were placed at the intersection of the two avenues; timbers were effectively displayed on the line of the transverse avenue; the various mineral specimens were arranged in parallel rows, with wide gangways between, so as to admit of close inspection on every side; the samples of coal occupied the eastern portion of the bay; and the whole display was bounded on that side by a wool trophy of great size and ornamental appearance. In the arrangement of the Mineral Court I was ably assisted by Mr. J. E. Carne, Curator of the Geological Museum in Sydney, who, at my request, was spared for the purpose, by the Honorable the Minister for Mines, from his immediate duties. Besides the ordinary labels attached to exhibits for the purpose of technical description, it seemed to me that some more striking means of directing attention to exhibits individually might be devised; and accordingly, banners variously coloured and with appropriate lettering were affixed to the principal specimens. Still further, to relieve the somewhat sombre and uninteresting appearance presented to the ordinary visitor by so large a collection of mineral ores, boards painted in different colours, and inscribed with the names of the chief mining localities in New South Wales, were suspended at some height above the various gangways, so that, while easily read, they in no way interfered with the general view of the whole Court. Special arrangements were made for the lighting of the Court at night, in order that the exhibits might be as effectively displayed then as by day. Thus arranged and decorated, the Court presented an appearance so light and attractive that great numbers of visitors, for whom mineral exhibits would of themselves possess no interest, paused in their circuit round the building to read and examine, while practical miners found themselves at once directed to the specimens they wished to inspect, and provided with information as to locality, specific character, and value, ready at hand. As regards the general effect of this display of mineral wealth, a few points are deserving of special notice. In the first place, there can be no doubt as to the deep impression created in the minds of visitors generally by this evidence of the value and variety of the natural resources of New South Wales. It was obvious that a country possessed of such wealth must occupy a high position among the family of nations, notwithstanding temporary checks and reverses arising from unpropitious seasons or other drawbacks to general prosperity. Secondly, some practical benefit has resulted from the examination of the mineral specimens by miners and other persons interested in mining pursuits. By comparison of geological conditions, methods of working, and difficulties in the treatment of ores, an impulse has been given to mining in New Zealand, and new processes may hereafter be elaborated that will prove advantageous to both colonies. In support of these opinions, the various articles upon the Exhibition contained in the different issues of the local journals may be referred to, the views expressed in them being those of writers free from bias in favour of any particular colony or country. If the timbers shown in the New South Wales Court attracted less attention than the minerals, the fact may be explained from the abundance and value of the indigenous timbers produced in New Zealand, which, in some cases possess the same qualities, and are useful for the same purposes, as those found in New South Wales. In the latter colony, however, the varieties are more numerous, and consequently it is easier to find timbers more exactly suited for special needs. It is unnecessary to institute comparisons with regard to the exhibits displayed by different colonies and countries, and it is with no such intention that I allude to the fact that, looking upon the mineral exhibits as constituting the chief feature of our Court, the inference is obvious that it was also unique as respects the whole Exhibition. Owing mainly to this fact, the New South Wales Court has throughout borne a character wholly distinct from that of any other, and was in reality the outcome of a conception of the objects of an Exhibition entirely different from that ordinarily entertained. This difference was speedily recognised by the public, and was, without doubt, one source of the popularity of the New South Wales Court.

In the important matter of judging exhibits, great difficulties had to be encountered in the selection of jurors to represent the interests of New South Wales. This was especially the case with regard to mineral exhibits. In view of the supreme importance of this class, it seemed imperatively necessary that a thorough expert should be chosen for this duty, and accordingly the Honorable the Minister for Mines was appealed to for the assistance of one of the officers of his Department. As none of these could be spared at the time, recourse was had to geologists and mining experts resident in New Zealand. Even these, however, were found to be in some way so engaged that they were unable to render the assistance required, though ultimately I was fortunate enough to secure, on the recommendation of Professor Ulrich, the services of Mr. Donald Henderson, a gentleman well qualified for the task. On the whole, the awards of the jurors have been received with favour as justly indicating the merits of the exhibits judged; and, in cases of appeal against the decision of jurors, the result has been held to be satisfactory. A complete list of awards to New South Wales exhibitors is appended to this Report (*Appendix B*), but a summary may be usefully given here to show the extent to which the excellence of New South Wales exhibits was recognised:—

Summary of Awards to New South Wales Exhibitors.						
First-class Award with Special Mention	...	...	...	...	...	1
First-class Awards	...	...	...	...	...	106
Second-class	..	...	...	...	...	24
Third-class	..	...	...	...	...	9
Highly Commended	...	...	...	...	...	6
Total of Awards						146

From this statement, it appears that, of the total number of awards to New South Wales Exhibitors, 73 per cent. were of the highest class, 16 per cent. of the second class, 6 per cent. of the third class, and the remainder belonged to the class of "highly commended."

In order to provide for the due care of the exhibits and the proper keeping of the Court, seven attendants were appointed from among the persons previously employed in the fitting up of the Court and the arrangement of the exhibits. Being on this account, well acquainted with the different exhibits, they were able to perform all the necessary work of sweeping, dusting, and polishing, and thus to preserve everything in a fit state to meet the public scrutiny. They were also required to keep guard over the valuable specimens of minerals which might prove tempting to the dishonest, and also over the works of art which might easily be injured by careless or mischievous visitors. As, for these purposes, it was necessary

necessary that their right to interfere for the protection of exhibits should be easily recognisable, they were provided with a distinctive dress which, while thoroughly plain and simple, was sufficiently marked to indicate their position. I am glad to be able to report that the duties assigned to these attendants were effectively discharged, and that neither loss nor damage occurred through any lack of vigilance on their part. The expense of their uniform was consequently well bestowed in providing for the safety and preservation of the exhibits. In justice to the visiting public, it should be explicitly stated that the order and decorum generally observed were most noteworthy, and that no trouble was occasioned through misconduct of any kind. Better order, or greater self-respect I have never seen maintained in any other Exhibition in which I have taken part. Even on gala days, when the attendance was largest and the visitors of a more mixed character than usual, nothing occurred to call for interference on the part of the persons in charge of the Court.

The Exhibition was closed on the 19th April, 1890. Intimation had previously been received of the decision of the Government that New South Wales should be represented at the International Exhibition of Mining and Metallurgy to be held in London in the month of July following; and I was instructed to forward the minerals shown in our Court to that city for exhibition. In view of the necessity for using the utmost expedition in order that these exhibits might be despatched in time to reach their destination prior to the opening of that Exhibition, such preparations were made in advance that within four days from the closing of the Dunedin Exhibition, all the goods in the Court were repacked and ready for shipment. The mineral exhibits, packed in cases, were forwarded to Lyttleton for shipment by the steamship "Doric," which left that port for London on 1st May. The remainder were despatched to Sydney by the Union Steamship Company's vessels by which they had been brought to Dunedin.

It is satisfactory to be able to place on record the fact that all the exhibits, amounting to 300 tons, arrived at the Exhibition in excellent order and returned in the like condition, and that no serious claims have occurred for loss or damage to exhibits. Adequate insurances, it should be mentioned, were effected upon all exhibits in transit, through the United Insurance Company of Sydney.

A statement of receipts and disbursements on account of the New South Wales Court at the Exhibition is appended to this report (*Appendix C*), and shows that the total amount expended was £9,377 Os. 6d.

I cannot more fittingly close this report than by stating my conviction that the hope expressed by His Excellency Lord Onslow, in his reply to the President's address at the opening of the Exhibition, has been abundantly fulfilled. On that occasion His Excellency said,—“I join with you, sir, in the expression of a hope that this gathering may be instructive and beneficial, both to ourselves and to those who are entering into competition with us; that we may find it the means of interchange of thought as well as of merchandise; that it will give us the opportunity of dispelling all jealousies which rival enterprise may engender, and enable us to cultivate those friendly sentiments and that mutual esteem which alone can bring peace and goodwill among the nations of the earth.”

I have the honor to be,  
Your Excellency's most obedient servant,  
OSCAR MEYER,  
Commissioner.

## APPENDIX A.

### Commission.

VICTORIA, by the Grace of God, of the United Kingdom of Great Britain and Ireland, Queen, Defender of the Faith, and so forth,—

To our trusty and well-beloved—  
OSCAR MEYER, Esquire,—

Greeting:—

WHEREAS an International Exhibition is to be held in the City of Dunedin, in Our Colony of New Zealand, in the year one thousand eight hundred and eighty-nine: And whereas it has been represented to Us that it is desirable that a Commissioner should be appointed to devise and carry out the details necessary for the collection and transmission to Dunedin of all articles the produce or manufacture of Our Colony of New South Wales, intended for exposition at the said International Exhibition, for their due display thereat, and for their subsequent disposal or careful return to their owners: Now know ye that We, reposing especial trust and confidence in your knowledge, integrity, and ability, do by these presents authorise and appoint you to be such Commissioner accordingly: And We do authorise you to duly report your proceedings from time to time to Our Governor of Our said Colony of New South Wales, until the business of this Commission shall have been brought to a conclusion: And We do also empower you to expend the moneys appropriated or to be appropriated by the Parliament of Our said Colony of New South Wales in this regard, in the payment of the expenses of the representation of Our said Colony at the said Exhibition.

In testimony whereof, We have caused these Our Letters to be made Patent, and the Great Seal of Our said Colony of New South Wales to be hereunto affixed.

Witness, Our Right Trusty and Well-beloved Councillor, CHARLES ROBERT, BARON CARRINGTON, Knight Grand Cross of Our Most Distinguished Order of Saint Michael and Saint George, Our Governor and Commander-in-Chief of Our Colony of New South Wales and its Dependencies, at Government House, Sydney, in New South Wales aforesaid, this fifth day of August, in the fifty-third Year of Our Reign, and in the year of Our Lord one thousand eight hundred and eighty-nine.

[L.S.] CARRINGTON.  
By His Excellency's Command,  
HENRY PARKES.

ENTERED on record by me, in REGISTER OF PATENTS, No. 13, pages 409-10, this sixth day of August, one thousand eight hundred and eighty-nine.

For the Colonial Secretary and Registrar of Records,  
CRITCHETT WALKER,  
Principal Under Secretary.

## NEW SOUTH WALES.

**PUBLIC WORKS ACT OF 1888.**

(RESUMPTION OF LAND FOR POST AND TELEGRAPH OFFICE AT RANDWICK, PARISH OF ALEXANDRIA, COUNTY OF CUMBERLAND.)

Presented to Parliament, pursuant to Act 51 Vic. No. 37.

**NOTIFICATION OF RESUMPTION OF LAND UNDER THE "PUBLIC WORKS ACT OF 1888," 51 VICTORIA No. 37.**

NEW SOUTH WALES, } Proclamation by His Excellency The  
to wit. } Right Honourable VICTOR ALBERT  
GEORGE, EARL OF JERSEY, a Member  
(L.S.) } of Her Majesty's Most Honourable  
Privy Council, Knight Grand Cross  
of the Most Distinguished Order of  
JERSEY, } Saint Michael and Saint George,  
Governor. } Governor and Commander-in-Chief of  
the Colony of New South Wales and  
its Dependencies.

WHEREAS the Minister for Public Works of the said Colony is desirous of acquiring the land described in the Schedule at the foot hereof for the purpose of a certain Public Work, that is to say, a Post and Telegraph Office at Randwick, in the said Colony: And whereas it is estimated that the cost of completing such work will not exceed the sum of twenty thousand pounds: And whereas the land described in the said Schedule is, in my opinion, required for carrying out the said work: Now, therefore, I, VICTOR ALBERT GEORGE, EARL OF JERSEY, the Governor aforesaid, with the advice of the Executive Council, in pursuance of the "Public Works Act of 1888," do hereby direct that the said work shall be carried out under the "Public Works Act of 1888," by the Minister for Public Works aforesaid, in respect of the said work shall be deemed to be the Constructing Authority; and in further pursuance of the said Act, I do hereby direct that the land described in the Schedule hereto shall be acquired and taken for the purpose aforesaid under the "Lands for Public Purposes Acquisition Act": And I do declare by this notification, to be published in the Government Gazette and in one or more newspapers published or circulated in the Police District wherein is situated the said land, that the said land described in the said Schedule has been resumed for the public purpose hereinbefore expressed, that is to say, the erection of a Post and Telegraph Office at Randwick, to the intent that upon the publication of this notification in the Gazette, the said land described in the said Schedule hereto shall forthwith be vested in the said Constructing Authority on behalf of Her Majesty,

for the purposes of the said Public Works Act of 1888, for an estate in fee simple in possession, freed and discharged from all trusts, obligations, estates, interests, contracts, charges, rates, rights-of-way, or other easements whatsoever, and to the intent that the legal estate therein, together with all powers incident thereto or conferred by that Act, shall be vested in such Authority as a trustee: And I do declare that the following is the Schedule of land hereinbefore referred to:—

## SCHEDULE.

All that piece or parcel of land containing by admeasurement 2 roods, be the same more or less, situate in the county of Cumberland, parish of Alexandria, at Randwick, near Coogee: Commencing at the intersection of Allison Road, one chain wide, with the Frenchman's Road, at a point distant one chain north from the north-east corner of S. Hebblewhite's 5 acres 1 rood 39 perches; and bounded thence on the south by Allison Road, bearing west 1 chain 81 links, dividing it from part of that land; on the west by a line dividing it from part of 3 acres 3 roods 37 perches granted for Church of England Burial Ground bearing north 2 chains 77 links; on the north-east by the south-west boundary line of the 2 roods granted for Church of England Parsonage bearing east 71 degrees 30 minutes south 2 chains 70 links to the Frenchman's Road aforesaid; and on the south-east by that road south-westerly 1 chain 91 links to its intersection with Allison Road aforesaid, advertised in the Government notice dated 4th March, 1858; and which piece or parcel of land is said to be in the possession of the Trustees of the Church of England.

In witness whereof, I have hereunto set my Hand, and caused the Great Seal of the Colony to be hereto affixed, at Government House, Sydney, this second day of April, in the year of our Lord one thousand eight hundred and ninety-one, and in the fifty-fourth year of Her Majesty's Reign.

By His Excellency's Command,

BRUCE SMITH.

GOD SAVE THE QUEEN!

1891.

## NEW SOUTH WALES.

## RABBIT ACT OF 1890.

(REGULATIONS.)

Presented to Parliament, pursuant to Act 54 Vic. No. 29, sec. 49.

Department of Lands,  
Sydney, 10th February, 1891.

### RABBIT ACT OF 1890.

It is hereby notified, for public information, that His Excellency the Governor, with the advice of the Executive Council, has, in pursuance of the "Rabbit Act of 1890," made the Regulations hereinafter set forth, for the purpose of carrying into effect the objects of the said Act.

JAMES N. BRUNKER,

#### REGULATIONS MADE IN PURSUANCE OF THE "RABBIT ACT OF 1890."

1. In these Regulations the expression "the Act" means the "Rabbit Act of 1890"; "the Form," with a number added means the Form of that number appended to these Regulations; expressions defined in the Act have the same meaning in these Regulations unless the context otherwise requires.

2. Whenever by the Act or these Regulations, any application, notice, document, or communication is directed to be sent or forwarded to the Minister, the same shall be addressed to the Under Secretary for Lands, who shall have authority to correspond with all persons and otherwise act under the direction of the Minister.

3. The Rules and the Regulations made for the purposes of the Crown Lands Acts shall, as far as possible, be applied in all proceedings before the Land Court or a Board under this Act, except that any notice given under or for the purposes of the Act shall be given in manner directed by the 43rd section of the Act. Forms provided for the purposes of the Crown Lands Acts shall be used for the purposes of the Act if no special form is provided in these Regulations, and shall be altered as may be necessary.

4. Any reference by the Minister to the Land Court of the decision or report of a Board, in any case, shall be made by giving a written notice thereof to the Registrar of the Land Court within two months from the date of the receipt of such decision or report; and when any such reference is made, the Minister, or some authorised officer on his behalf, shall forward to the Registrar all papers connected with the case.

5. Inspectors appointed under the Act shall in all respects be subject to the authority of the Minister, and shall be authorised agents of the Minister for the purpose of destroying the rabbits on any public lands.

6. In any case in which an Inspector becomes aware of the commission of an offence under the 28th section of the Act it shall be his duty to prosecute the offender.

7. Any Inspector, or person authorised by an Inspector, shall, upon laying poison on any public lands, exhibit, in a prominent position near the place where such poison has been laid, a notice cautioning the public as to the laying of such poison.

8. Rabbit-proof fences shall conform to the following requirements:—

- (i) The posts shall be thoroughly substantial, and of durable material, not less than 4 feet 8 inches long, and shall, where practicable, be firmly set in the ground to a depth of not less than 22 inches.
- (ii) The wire netting shall be securely fastened to the posts and rails, or posts and wires with staples, or staples and binding wires as may be necessary, and shall be sunk to a depth of not less than 6 inches perpendicularly, in the ground.
- (iii) The fence and netting shall be sufficiently rigid to stand all ordinary wear and tear.
- (iv) The Minister, before approving of the erection of any rabbit-proof fence, in respect of which he will be liable as a contributory or otherwise, may insist upon any further requirements which he may deem to be reasonably necessary or expedient.
- (v) All gateways or gates shall be such as are in the opinion of the Board thoroughly rabbit-proof.

9. Applications to the Minister for his approval of the inclusion of any public lands within a proposed group shall be made in the Form 1, and with any such application shall be furnished a plan of the whole of the lands proposed to be grouped, showing the position of the proposed ring-fence, and also the position of any other public lands in the immediate neighbourhood of the group. With such plan shall also be furnished particulars of the lands within the proposed ring-fence, distinguishing those which will, and those which will not, form part of the group.

10. Applications to the Minister for his approval of the erection of a rabbit-proof fence, in respect of which he will become liable as a contributory, shall be made in Form 2, and with such application shall be furnished a plan showing the position of the proposed fence.

11. In any case in which the Minister grants permission to a person in any city, town, or village to keep live rabbits in any cage or similar enclosure, a license in the Form 3 shall be issued upon payment of a fee of ten shillings. Every such license shall be in force for such period as may be determined, and shall not be transferable, and shall be subject to all such reasonable conditions as the Minister may think fit to insert therein, and may at any time be withdrawn. No person shall be deemed to have the permission of the Minister to keep rabbits, unless he is the holder of such license as aforesaid.

12. A special permit entitling the holder thereof to kill or capture any such natural enemy of the rabbit, as may be specified in such permit, may upon application be issued by the Minister. A permit shall be in force for such period as may be determined, and shall not be transferable, and shall be subject to all such reasonable conditions as the Minister may think fit to insert therein, and may at any time be withdrawn.

13. Applications to the Board to apportion the amounts payable by the respective owners within a group shall be in Form 4, and shall be forwarded or delivered to the Chairman of such Board.

14. Applications to the Board—

- (i) To assess the amount payable as a contribution by any person or group under the 20th or 25th section of the Act;
- (ii) For permission to detach a holding from a group;
- (iii) For its authorisation of the subdivision of a group;
- (iv) For permission to carry a rabbit-proof fence across a road, travelling stock reserve or route, or any public lands, and for a dispensation (if any sought) from the erection of any required rabbit-proof gate;
- (v) For the settlement of any dispute in reference to the erection or maintenance and repair of a rabbit-proof fence;
- (vi) For an extension of time for the erection of a rabbit-proof fence;
- (vii) For obtaining the sanction of the Board to any proposed variation from the statutory requirements as to a rabbit-proof fence;
- (viii) As to any other matter in which it is desired that the Board take action;—

shall be made on Form 5, and shall be forwarded or delivered to the Chairman of such Board.

15. When the Minister is the moving party in any proceeding within the last two regulations, the proceeding before the Board may be originated by a reference by the Minister to the Board.

16. At the Head Office of the Board a register shall be kept for each Land Board District of all holdings within the same, upon which any moneys have become charged in accordance with the provisions of the Act, and in such register shall be specified the date of the order or declaration in virtue of which such moneys have become charged, and the respective persons by whom and to whom such moneys are payable. Upon the production of a receipt, signed by the person to whom such moneys are payable, and attested by a Justice of the Peace or Commissioner for Affidavits, an entry that such charge has been satisfied wholly or in part, as the case may require, shall be made, and the correctness of such entry shall be certified to by the Chairman or some person authorised by him in that behalf. With such register shall be kept an index, in alphabetical order, of the names of the persons originally liable to pay any moneys charged as aforesaid.

17. Any person may search the said register and index upon payment of a search fee of two shillings and sixpence; and the Chairman, if so required, shall upon payment of the like fee furnish a certified copy of any entry therein.

18. Notice by the owner of a holding, which consists wholly or in part of Crown Lands held under occupation license or annual lease, that he intends to make such holding rabbit-proof, or that it is intended to include such lands within a group, shall be given to the Chairman of the Board in the Form 6, and the particulars required by such Form shall also be furnished therewith. Copies of every such notice shall, on the receipt thereof, be exhibited outside the Head Office of the Board and at the office of the Land Agent of the District.

19. Notice that the intention to make any such holding as aforesaid rabbit-proof, or to include any such lands as aforesaid within a group, has been abandoned, shall be given to the Chairman on Form 7, and copies of such notice shall in like manner be exhibited.

20. The appointment of the Secretary of any group shall be made by an instrument in the Form 8. A copy of such instrument shall be filed with the Chairman of the Board.

**Form 1.**

Rabbit Act of 1890: Regulation No. 9.

*Application to the Minister for the inclusion of Public Lands within a proposed Group.*

I, [name in full] hereby apply that the Minister for Lands will approve of the inclusion of the Public Lands described in the First Schedule hereto within a group proposed to be formed, which group will include the lands described in the Second Schedule hereto.

With this application are forwarded the plan and particulars required by the Regulations.

Dated this            day of            189 .

(Signature.)  
(Address and nearest Post Town.)
