 1292. In the face of that, how would you expect to draw the trade, now going to Melbourne, to Condobolin? The roads immediately around Coan Downs, and the surrounding stations, are sometimes impassable. I remember the Coan Downs wool lying in the shed for two months. I told the owner that if he would give it to me I would manage to have it taken to Parkes, but he insisted on it going to Melbourne.
 1293. I suppose they considered the cost of conveying it from their station to Parkes? I could have delivered it at Parkes at the same cost as they would take it to Hay.
 1294. Would that remark apply now? It would if the same weather existed.
 1295. You heard the railway rates quoted by Mr. Lohan? Yes.
 1296. Do you think it would be possible to reduce them? I do not.
 1297. Then all the Committee can expect to look for, if the line is extended to Condobolin, is the trade already in existence, and the surplus consequent upon increased agricultural production? What about further settlement?
 1298. Can you tell the Committee how further settlement is to take place immediately? All the lands immediately along the line, and for hundreds of miles from the line, are available for settlement when the leases fall in.
 1299. But they do not fall in for five years; therefore, if the railway were constructed within twelve months, you would have to wait for four years until you could deal with those lands? Yes; but there is an unlimited supply of mallee between Euabalong and Mount Hope. I think the Government could give the people those lands to grow wheat upon.
 1300. But are they not held under lease? I do not think so. I think they have been thrown up for some years.

Mr. Arthur Edgar Newton, Resident Engineer for Roads, Forbes, sworn, and examined:—

- Mr. A. E. Newton.** 1301. *Mr. Molesworth.*] Will you tell the Committee what roads are under your immediate charge in this district? Two roads from here to Condobolin—one *via* Trundle, and one *via* Burrawang—the one along which the proposed line goes.
23 Mar., 1895. 1302. Have you anything to do with the roads from Forbes to Condobolin? Yes; there are two others—one on each side of the river and following the river.
 1303. Are only the scheduled roads under your supervision? Yes; except with regard to special grants. If any money is expended upon them, of course, we expend it, and sometimes we report upon them.
 1304. In point of fact, then, there are four principal roads in this district which are under your care between here and Condobolin? Yes. 1305.

1305. Will you describe how the road *via* Trundle goes;—does it go almost direct? No; it is common with the direct road for about 12 miles. Mr. A. E.
Newton.
1306. And then turns off in a north-westerly direction? Yes.
1307. Does it make for Trundle direct from there? No; it strikes another road between Trundle and Bogan Gate, and it is common with that. That is an unclassified road. 23 Mar., 1895.
1308. When it strikes that road, does the continuation of it to Trundle come under the scheduled roads? That part of the road is classified, because it is part of the road to Condobolin. It is a crooked road.
1309. Leaving Trundle on the way to Condobolin, will you describe the direction of the road? That is also a very crooked road; nothing has been done upon it; we are only just opening it up. It was only classified a year ago. It is a 3-chain road, and is rendered very crooked on account of the alienation of the land.
1310. When you require roads, do you not take them through the various selections under some Act of Parliament? We can; but that work is done by the Lands Department, unless it is a very rough mountainous road. The Works Department do not usually deal with it before survey.
1311. Will you describe the features of the country between here and Trundle? It is a red soil, box, and pine country, slightly undulating.
1312. Are there no steep ridges in that direction? There is the Gunningbland Range to be crossed, and Treeweke's Gap. There is Gunning Gap, near Forbes, and the gap at the Bogan Gate, and Treeweke's Gap, all in the same range. There are only a few gaps in this range in which it would be possible to obtain a railway grade.
1313. Would the railway have to follow the direction of the road, to a certain extent, in order to meet those gaps in the ranges? Yes; except that, perhaps, it might go straighter.
1314. But it would have to utilise those gaps the same as the road does now? It would have to utilise Treeweke's Gap to go to Trundle.
1315. What will be the distance from Trundle to Parkes? About 33 miles through Treeweke's Gap.
1316. Do you reckon that there are any heavy engineering works over those ranges? From the road point of view, it is much better than the direct line.
1317. In what respect? It is higher, and a very sound country for roads; in fact, we have made it the main road to Condobolin.
1318. On the ground that it is sounder ground? Yes—that is, we have reduced the vote on the direct line, and raised it on his.
1319. How much has been spent on the road between Parkes and Trundle? When we expend the available means we shall have expended £2,000.
1320. During what period? It has been scheduled about eighteen months. We have only a half-year's vote for this year.
1321. Is that a special vote for the purpose of making the road, or is it looked upon as an annual grant? It is an annual grant. I am speaking of the scheduled road, *via* Trundle, to Condobolin.
1322. But you say nothing has been done between Trundle and Condobolin up to the present time? No. Contracts have been called to open it up.
1323. But the amount you specify has been spent on the road between Parkes and Trundle? Yes.
1324. You say you view the road to Trundle as a better road than that to Bogan Gate;—is the grade better or steeper on that road than on the Trundle road? The grades are favourable to a road. We can put in a much steeper grade than would be allowable on a railway line.
1325. What is about the steepest grade you care to put on a road of this description? If we had a bad hill to go up we put a grade of 1 in 12, but there is nothing like that required through here.
1326. What is the steepest grade on that road at the present time? I do not think there is anything more than 1 in 20 anywhere.
1327. And that you look upon as a very good grade for a road? Very fair for undulating country.
1328. I suppose you have no idea as to what the ruling grade would be for a railway over that road? No.
1329. But the grade would necessarily be higher than the grade on the direct route *via* the Bogan Gate? Yes.
1330. Considerably so? Yes. There would be a great deal of difference—one is almost flat and the other is undulating.
1331. Then you are of opinion that the cost of constructing a railway line from Parkes to Trundle would be more than the cost of contracting one from Parkes *via* Bogan Gate? I think so.
1332. Then the projected line is undoubtedly the one which will be the most cheaply constructed? Yes.
1333. Do you know anything of the country between Bogan Gate and Condobolin? Yes; I have a general knowledge of it.
1334. Have you traversed that part of the country where the line is likely to go? No; I have not. I have been on parts of it here and there just behind Burrawang.
1335. Does it touch any of the flooded country at the Condobolin end, or when it reaches a point near the Lachlan? I think it has been swung round the flooded country, I think it is clear.
1336. Can you give the Committee the exact distances by road from Parkes to Condobolin, in a direct line, and from Parkes to Condobolin, *via* Trundle? The distance from Parkes, *via* Trundle, is 70 miles.
1337. Is that the measured distance? It is scaled.
1338. And the direct route? About 66 miles.
1339. Do we understand then, that there is only a difference of 4 miles between the two routes? That is all.
1340. That is by the road? Yes; the road is very crooked.
1341. I suppose you know that the railway measurement for the proposed line is only 60 $\frac{1}{2}$ miles? Yes; but the railway surveyors have gone nearly direct, and the road and stock routes swing away to the south.
1342. What are the features of the road from Condobolin to Forbes? The road follows the river.
1343. There are two roads? Yes, they are much the same; except that one is better than the other. They are the same with regard to the soil—it is black soil. The road on the southern bank is the better one.
1344. Do you mean that it is shorter or firmer? It is slightly shorter, and it is a sounder road—not so much of what we call glue-pot, and not so much flooded country along it.

Mr. A. E. Newton. 1345. What amount has been expended on those two roads, respectively, since they have been classified? That is on the south of the river. From Forbes to Condobolin, on the north side, the amount has been £8,300.

1346. That is a total since 1885 of £17,000? Yes.

1347. Will you describe the character of the country, stating whether it is hilly, flat, or subject to inundation? It is flat, and subject to inundation here and there.

1348. At which end most particularly? At the Condobolin end.

1349. And when it is flooded, can you tell us what extent of country is liable to inundation? I cannot say. The water escapes to Lake Cowal, and covers thousands of acres. It works its way back again to the Lower Lachlan.

1350. Do I understand you to say that a line from Forbes to Condobolin would be subject to inundation? Yes; a line following the direction of the river would.

1351. And, therefore, more expensive to construct? Yes.

1352. It would be almost impossible to construct what is known as a surface line? Quite impossible.

1353. And, therefore, would be more expensive? Yes.

1354. But on the direct route, which avoids the flooded country, there would be no difficulty in constructing a surface line—that is, the proposed line? I think it could be done.

1355. Then it will avoid all the flooded country? I think so. Of course, without a survey, I could not say whether it could be further improved upon. It might be further improved upon by taking it a little further to the north, after crossing the gap at Bogan Gate.

1356. Do you mean on the west or east of Bogan Gate? To the north of Bogan Gate.

1357. In the direction of Trundle? Yes; it leans towards the south now.

1358. How much further north would you propose to take it? You would have to have a survey to tell that, to see whether you could get through the range. There is the Black Range there.

1359. There is the Black Range to the north of the proposed line, in the vicinity of Bogan Gate? Yes, further on, more towards Burrawang, on the Condobolin side.

1360. You say there is a range which would have to be reckoned with in bringing it further north? I think so. You might escape it.

1361. Knowing the roads, and the nature of the country, do you care to express an opinion as to whether the proposed route to Condobolin, *via* Bogan Gate, is the better one upon which to build a railway, or would you suggest a deviation one way or the other? Do you mean from an engineering point of view or as regards the settlement?

1362. I would rather you viewed the matter in a general way in the best interests of all concerned; I want you to look at it from the view of the general extension of our railway system, the accommodation, as far as possible, of the greatest number, and to bear in mind the cost of extra haulage for all time, if a longer line is built? Of course it would only be a few miles if it were turned further north.

1363. How much further north? I cannot say how far you would have to go. Still the line is not straight. Probably it would not make 3 or 4 miles difference in the length, but I think, if the railway is built with a view to its ultimate extension, you should take it as direct as possible.

1364. But, in advocating going a little further north, what objects would you propose to serve? The thicker settlement to meet the local interest.

1365. With a view of getting a little nearer to Trundle? Yes.

1366. That you look upon as the most thickly settled district? Yes; the more you go north the closer you go to the present settled country.

1367. But later on there may be a much larger settlement than there is at present in the direction of Bogan Gate, when the Crown lands are thrown open? Yes; but still the line might be equally as direct as at present, if it were sent further north.

1368. Then, I understand you think, if the line were taken a little further north, the distance would not be very materially increased and the people in the vicinity of Trundle would be better served? I think so. Of course, I cannot say whether it is possible to get a line through there, but I think it would be worth trying.

1369. Do you know how much further north it would be possible to get without reaching the ranges you speak of? No; I cannot say. Of course, they are not directly opposite Bogan Gate. They are more towards Burrawang, and I think the line passes Burrawang 3 or 4 miles further north. You would possibly have to go 6 or 7 miles to strike the ranges there.

1370. You are aware that climbing the ranges, although they may not be very steep, would be more expensive than running the surface line proposed? Certainly.

1371. And if it is an expensive project the line may not be undertaken? No.

1372. Then, I glean from your evidence that if the line could be taken a little further north without increasing seriously the engineering difficulties, you would recommend it, on the score of meeting the requirements of the population? Yes; the present settlement, instead of waiting for future settlement.

1373. *Mr. Gormly.*] The line which is called the direct line from Parkes to Condobolin is very crooked? Yes.

1374. To a great extent it follows the travelling stock route? Yes; pretty well all the way.

1375. But there are some portions about Burrawang where it is not a stock route? Yes; here and there there are narrow strips.

1376. And the most suitable land for the construction of a road has not been laid out there? No; I think it was never selected at all.

1377. And the best land has not been selected for the construction of a road? No; about the worst.

1378. And it goes considerably to the south, and, therefore, in some cases comes under the influence of flood-waters? Yes.

1379. Whilst if it were kept further north it would escape those flood-waters? Yes; but the country would not be so sound as *via* Trundle.

1380. Do you know sufficiently about the country to say, that if you had the selection of what might be called a direct route from Bogan Gate to Condobolin, you would not find it necessary to make the detour *via* Trundle? I think I should make the detour, not round by Trundle township, but going away north. I should take it through the red country all the way.

Mr. A. E.
Newton.
23 Mar., 1895.

1381. Have you followed the surveyed railway line? No; but I have noted it on the parish map.
1382. Therefore, you are not in a position to state definitely whether a line free from floods has been selected or not? I have inspected the most critical points, where you are likely to meet floods, and I know where the line is located.
1383. What points are they? Near Condobolin. Borambil is one place.
1384. But have you inspected the exact position laid out for the line? No.
1385. Therefore, you do not know whether a line free from flood has been selected or not? From my general knowledge, I know it has.
1386. But you have not exact knowledge? It is pretty exact. I know where the road is, and I have scaled the difference between the road and the railway.
1387. Then you know the extent of the flooded country? Pretty well.
1388. And you think the projected railway is located outside? Yes.
1389. By inspecting the maps you can locate the flooded country? Yes.
1390. And, in your opinion, the route goes outside the flooded country? Yes.
1391. *Mr. Chanter.* Road-formation in this district is carried out, I presume? Yes.
1392. Have you carried out any earthworks without metalling them? Yes, in places.
1393. What depth of formation in the centre, and what width of road, do you consider necessary to carry ordinary road traffic? We do not put in the earth with that object. It is to get above flood-waters or soakage; but, if it is for soakage, we often have 18 inches in the centre, and above that depends on the height of the floods.
1394. What is the width of your formation? About 30 feet.
1395. Is that from channel to channel? No; from the embankments.
1396. Supposing you were going through a swamp, or something of that kind, where it was necessary to raise the road a little, you would have drains on each side? We should have drains away from the formation in that case—a raised road and drains away.
1397. And what width of formation would you have in that instance? Thirty feet.
1398. And what would be the average depth? According to the height of the waters.
1399. It is proposed on this line to lay a formation a width of 18 feet, and a depth of only 6 inches, and to lay the sleepers on these without any ballast;—do you think a line constructed on that principle in that country, where it is low, and in some places is liable to inundation, sufficiently stable to carry a railway line? I think that would altogether depend on the draining of it, and making it free from water.
1400. The trend of your evidence is, that you would go north of the proposed line, from a road point of view, in order to get sounder country? Yes.
1401. Where you have unsound country, and it is necessary for you to make up the roads, it would be necessary for you to make the embankment higher in order to give greater solidity? Yes.
1402. Therefore, the constructing of a surface line on the route proposed would necessitate a greater depth of soil forming the embankment than would be the case if it were taken further north? It might not, because our road is a very low one. The railway has higher ground.
1403. I want to know whether an embankment of 6 inches of soil, sleepered, and without ballast, would be sufficient to carry railway freight? That is really a railway question. I have not studied the matter. From a road point of view, it is quite a different question.
1404. It is not a question of grade at all—it is simply a question of solidity? Yes.
1405. Supposing you had to construct a road on the surface in level country such as that, and you wanted a formation of 9 inches in the centre, or 9 inches altogether, with a width of 18 feet, with two side-drains to carry off the water, what value, per chain, would you place upon the work? It would depend upon the amount of cubic yards of earth there were in it.
1406. This would run about a cubic yard to the lineal yard? If scoops were used, we should pay about 8d. a cubic yard.
1407. What would that be per chain? About 15s.
1408. Could that kind of formation be done for £1 a chain;—what has been the average price you have paid for a formation of that character? The last was done by scoops at, I think, from 7d. to 8d. per cubic yard.
1409. Are you satisfied that the earthwork could be constructed for £1 a chain with scoops, or any other appliances? I think so.
1410. One reason I have for asking you this question is, that the earthworks in connection with railway construction have, in the past, cost three times what they ought to cost, judging from the amount of money spent in your Department for earthwork. If it were estimated that the earthworks alone would amount to £250 a mile, do you not think it would be very much in excess of what the work could really be done for? I could not say, because, in the first place, you do not know where they are getting the earth from. If you can plough the earth out easily on each side, and use scoops, it ought to be done for 8d. a cubic yard. That is 14s. or 15s. a chain.
1411. If you were to call for tenders for that class of work in the district, would you have any difficulty in obtaining them? None whatever.
1412. Have any of the contractors working under your supervision used what is called the American grader in forming earthworks? No.
1413. It has not become known to them? No.
1414. Have you any knowledge of them yourself? No; I have seen descriptions of them.
1415. What provision is there for obtaining ballast, should it be required at any future time along the proposed line from Parkes to Condobolin? I think it can easily be obtained within a reasonable distance.
1416. From what point? You could get it at Burrawang and at Gunningbland—in fact, all the way to Bogan Gate.
1417. That is between Bogan Gate and Condobolin? You could get it between Bogan Gate and here.
1418. At several places along the line ballast can be obtained if necessary? Yes.
1419. How much freehold land will the proposed line run through? I could not answer that question, but, having seen the parish map, I think it would run through a good deal.
1420. Would that be near to Parkes, or near to Condobolin? All along the line.
1421. Could that be avoided in any way by any detour to the north or south, to take the line through Crown lands, instead of through freehold lands? I think not. I think it would strike selections in any case.
- 1422.

- Mr. A. E. 1422. Have you, in this district, within a recent period, completed any roads—that is, formed and metalled them? Yes.
- 23 Mar., 1895. 1423. What is about the average cost per mile? That again depends on how far the stone is away; but with regard to these two lines, I should think the direct route to Condobolin would average about £1,200 a mile.
1424. That is, to form and metal them? Yes; and I think, *via* Trundle, the average would be about £1,000 a mile.
1425. If the line is constructed as proposed, or detoured in any other direction, would it relieve your Department of any outlay on roads; if so, how much? We would probably be able to reduce the expenditure on the road *via* Trundle; it would take all the heavy traffic off that road.
1426. What is the nearest scheduled road running parallel to the proposed line? Parkes to Condobolin.
1427. Then there would be no necessity for that road? Yes; it would be required, even if the railway were constructed. It is a stock route.
1428. It would not relieve the Department, then? Not on that road, but we only spend very little upon it. We only just keep it open. It is a travelling-stock route.
1429. I thought the stock route went in a northerly direction from Bogan Gate to Trundle? That is another one.
1430. There is one running parallel, then? Yes.
1431. How near to the proposed line? The railway crosses it here and there. At Burrawang I suppose it is about 4 miles away.
1432. Does the stock route run right through from Parkes to Condobolin? Yes.
1433. What is its width? An average of half a mile. It is narrower in some places. In some places it is only the width of a road.
1434. And does it go along country as sound as that along which the proposed line of railway would go? No; it goes through bad country—it goes to the south.
1435. Then it would not be possible to take the line along the stock route and avoid the freeholds. I suppose you would not care to give an opinion as to which would be the most beneficial line to construct, from all points of view? No; there are so many limitations. First, there is the price; probably if you went further north you could not construct it at the price proposed. Then there is the ultimate extension to be considered. It is rather a difficult question, but I should think, if you could put it a little further north, nearer to close settlement, without increasing the distance, it would be a better line.
1436. And the further north you went the foundation of the line will be sounder? The question of expense crops up again there.
1437. Taking all these things into consideration, what is your candid opinion as to the line;—should it go direct, or as nearly direct as possible, or detoured in any other direction? If it is built without any regard to cost, I should, after passing Bogan Gate, swing it further north—that is, all things being equal, and if the line is suitable.
1438. If you take the line to Bogan Gate, as shown on the map, you will see a curve to the south, and then there is a more northerly curve running to a point not far distant from Condobolin, and again a curve to the south;—if that line were curved immediately from Bogan Gate for 2 or 3 miles, and then run as straight as it is possible to take it to Condobolin, would it materially increase the distance? Not materially, I think. Of course, the curve at the other end is rendered necessary by the floods.
1439. If the curve is made at Bogan Gate, and then the line is taken straight, it would still avoid the floods? Yes.
1440. And it would not interfere with the different nature of the country as regards grade, unless you went a considerable distance north? I cannot say that. That would require inspection.
1441. Have you heard any expressions of opinion from any of the residents with regard to this proposal? Yes.
1442. What is the general opinion? Of course the Trundle people want it through their land, and the Condobolin people want it to go direct.
1443. Have you heard any expressions of opinion from people residing south of the creek down to the Lachlan? No. The squatters there have runs, and they would be just as well pleased if the railway kept away from them.
1444. Then, as a matter of fact, the people towards the Lachlan and about Forbes are rather apathetic about the matter? There is not much farming settlement on the Lachlan between Forbes and Condobolin.
1445. Do you think there ever will be close settlement there? I think it is very likely in the future, especially if they could adopt any suitable irrigation scheme.
1446. Is the land suitable for other than pastoral purposes? A certain amount of it is subject to flood, and that which is not flooded is first-class land.
1447. Then you would expect to see an increase of settlement in that locality if the land were made available for selection? Yes.

Mr. Walter Bland Brown, Crown Lands Agent, Parkes, sworn, and examined:—

- Mr. Chairman.] 1448. How long have you been here? Only a few days—a little over a fortnight; and out of W.B. Brown. that time I have been away a week at Forbes and Trundle.
- 23 Mar., 1895. 1449. Who was your predecessor? Mr. Watt.
1450. Where is he now? I believe he is about Sydney.
1451. Has he left the Service? No.
1452. Was he here any length of time? About eight months.
1453. Who was here before him? Mr. Kingsmill.
1454. Can you give us any information as to the land under free selection or conditional purchase? I cannot do so now. I was given to understand this morning that I would not be called, and I am not prepared to give any information at present.

Mr. Robert Murphy, police constable, Parkes, sworn, and examined:—

1455. *Chairman.*] Have you been here long? Seven years next September.
 1456. The Police Department here is charged with the collection of certain statistics? Yes; every year during the month of January. Mr. R. Murphy.
23 Mar., 1895.
 1457. Were those statistics collected last January? Yes.
 1458. Can you tell us the number of people who were on the electoral roll of Parkes at the beginning of the year? No; but the population of the Parkes division for Ashburnham electorate for 1895 was 6,990.
 1459. Can you tell us how that compared with the previous twelve months? A considerable increase. There has been an increase actually in the Parkes division since 1894 of 660 all told.
 1460. What other information have you? There are 667 holdings in the Parkes police district.
 1461. *Mr. Gormly.*] All over 1 acre? Yes; there are 169,635 acres of freehold land including conditional purchases. There are 337,094 acres of Crown land, conditional lease, and some annual leases. Under cultivation last year there was a total of 8,422 acres in the Parkes police division. Under cultivation for grain alone there were 5,342 acres. The yield was 68,079 bushels. The number of horses was 2,726; cattle, 6,363; sheep, 310,934.
 1462. *Chairman.*] I notice that Mr. Cusack, in 1890, gave the return of sheep as 46,736 in the Parkes district—that will show a considerable decrease? I can explain that. Since then there has been a great portion of this district cut off from Parkes. There has been a police station formed at Trundle, which takes in the whole of that country as far north and west of Bogan Gate as Burra Burra and Mogambogie and that country.
 1463. Consequently, the statistics of that district are not included in the Parkes district? No; no further than the Bogan Gate. The district includes a radius of from 22 to 25 miles.
 1464. That return, of course, would include a considerable area to the east of Parkes? Yes; about 16 miles, I suppose.
 1465. With regard to the portion of land to the west, north-west, and south-west of Parkes, which your return embraces, has there been an increase or decrease of late years? An increase. Since I came to the district the whole of that country has been taken up.
 1466. With regard to the yield of wheat, does it not strike you that the return is rather a low one? It does. In many instances the crops were total failures. They were destroyed by wallabies, and, in some instances, the wet would get upon the grain and spoil it, and it would never come to a head.
 1467. These things then have tended to cut down the average crop? Yes.
 1468. Do you think the district is in a prosperous condition at the present time? I do.
 1469. Have you noticed a marked improvement during the last four or five years with regard to agriculture and population and the stability of the people? Yes.
 1470. You must have come in contact with a number of people living on the route of the proposed railway? Yes; I have travelled the whole of the country for six years, and I have collected the whole of the returns of the Trundle portion of the Parkes district until last year, when it was cut off.
 1471. Are the people of such a character as to be likely to stay;—are they permanent residents? I think they are.
 1472. They are a good class of residents? Yes; making a home for themselves and families. Some of them, of course, have to struggle a bit. They had not much capital to start with, and found it hard. Others, who had enough capital to go on with and to put their land in fair condition, are doing well.
 1473. *Mr. Molesworth.*] In giving your estimate of the quantity of Crown lands in the district, you say you include the conditional leases and conditional purchases? I gave the conditional purchases separately.
 1474. Did you include the conditional leases with the Crown lands? Yes; under the heading of Crown lands.
 1475. Because the Lands Department did not reckon them as Crown lands? We had agricultural schedules served out to us from the Government Printing Office, and the Crown leases were included in the Crown lands. The conditional lease that goes with the conditional purchases; these are included in the return under the heading of Crown lands.
 1476. *Mr. Chanter.*] You have only included as freehold lands the lands obtained in fee-simple? All alienated lands or lands in course of alienation, and all other lands are classed as Crown lands.

MONDAY, 25 MARCH, 1895.

[*The Sectional Committee met at the "Bogan Gate Hotel," Bogan Gate, at 3 p.m.*]

Present:

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

JOHN MOORE CHANTER, Esq.		JAMES GORMLY, Esq.
EDMUND WILLIAM MOLESWORTH, Esq.		

The Sectional Committee further considered the proposed Railway from Parkes to Condobolin.

Mr. William Todd, sawyer, Bogan Gate, sworn, and examined:—

1477. *Chairman.*] How long have you been in this district? I have been managing the saw-mills here for Mr. W. Todd. fifteen years, and I have a selection.
 1478. Can you tell us what serviceable trees there are within a reasonable distance of the projected line of railway, and in what quantity? There is ironbark, and there is a certain amount of of sound small box. 25 Mar., 1895.
 1479. Is there considerable quantity of ironbark? Not a considerable quantity, but I think there is sufficient for a railway from Parkes to Condobolin.
 1480. What woods do you grow? Pine, principally.
 1481. Does that find a local market principally? Yes.
 1482. Have you had any transactions in railwaysleepers? Yes; I was on the Murrumbidgee amongst the railway sleepers when the Hay line was being constructed.

Mr. W. Todd. 1483. Can you give us any idea what sleepers could be supplied along the proposed line of railway, and at what price per sleeper—I do not mean squared sleepers, but half-round sleepers? I should say about 25 Mar., 1895. 3s. to 4s. a sleeper, but I have not had any experience in sleepers, except on the Murrumbidgee.

1484. And that is a good many years ago? Yes.

1485. Then you have not gone into the question of the price of sleepers on the line at all? No.

1486. And there are big trees which would supply sleepers? Yes; there is fairly good ironbark here.

1487. Within what distance of the direct line from Parkes to Condobolin? Within from 3 to 7 miles of the present surveyed route.

1488. And, I suppose, it is all level country? It is undulating country. Where the ironbark grows it is ridgy country.

1489. Is there much timber-splitting in the district? There has not been a great deal out here, because it has not been required.

1490. What about the box timber;—is that suitable, in your opinion, for railway sleepers? I think the box timber is much superior to the ironbark.

1491. Would that become as expensive as ironbark? I think it would, because you cannot get it in quantities like the ironbark. There are sound box trees in the forests here and there.

1492. Are you the only saw-mill proprietor in this locality? Mr. West is the proprietor. I am simply managing for him. There is another saw-mill about 10 miles away, but I do not think they cut for the public as a rule—it is more of a private mill.

1493. Do you send much timber into Parkes? Yes; we have sent a great quantity.

1494. Can you give us any idea of the quantity in a year or six months? The last twelve or eighteen months, it has fallen off considerably, but when we had the mill at Gunningbland, we sent about 18,000 or 20,000 feet a week for about eighteen months. During the last eighteen months or two years, we have not averaged more than 7,000 or 8,000 a week.

1495. How is it that it has fallen off? I can only attribute it to the depression, which exists all over the country.

1496. What would be the rate of carriage of that timber into Parkes by team? We are paying 2s. for 100 feet now. That is a very cheap rate.

1497. How far do you call it from here to Parkes by road? Twenty-three and a quarter miles.

1498. What did you pay in good times for carriage? Two shillings per 100 feet from the other mill, which is 12 miles from Parkes, and we have paid as much as 4s. to Forbes.

1499. What would you pay in good times from here? Three shillings to 3s. 6d.

1500. But carriage, generally speaking, is very cheap in this district? It is very cheap now; in fact, we are making nothing out of it. They have been carrying wheat for 30 miles to my knowledge.

1501. How can they do that when there is so little feed on the road? They have the teams, and they must do something.

1502. To what do you attribute the depression in this district? It is very hard to say. There seems to be depression not only in this district, but all over the colonies.

1503. Does much traffic pass this hotel between Condobolin and Parkes? Since the line was opened to Parkes there has been more traffic than previously, because it used to go from Borenore and Forbes and that way.

1504. What would be the character of the goods sent along the line? All sorts of provisions and general merchandise.

1505. That would be outwards to Condobolin? Yes.

1506. How about going back? A good deal of copper has gone this way from Mount Hope to Parkes.

1507. Do you know whether grain in any quantity has been sent from Condobolin to Parkes? Yes; a good deal of grain has gone through this year, but this is the first year.

1508. I suppose that is accounted for by the low rate of carriage and the people wanting to utilise their teams? Yes; that and the construction of the railway to Parkes. It is as near to send it to Parkes as to Forbes.

1509. Can you say which is the favourite route from Condobolin for produce to Parkes or Forbes? This is.

1510. All along? Yes; that is, since the line was open to Parkes. Before that it used to go up the river and through to Cowra or Borenore.

1511. We heard the opinion expressed the other day that the bulk of it still went by way of Forbes, because of that road having, as it were, been the recognised road all along, and they stick to it because it is the old recognised road.

1512. Do you bear out that idea? I cannot say I do, because I have been here a good deal and have seen a lot of that traffic going this way.

1513. You have no detailed account of the tonnage which has passed? No.

1514. But it has been considerable? Yes; since the line opened to Parkes.

1515. Approaching this hotel the line skirts away a little under the hill to the south of the driving road, so as to keep close under a slight hill;—do you know whether that portion of the road over which it is intended to take a railway suffers at any time from flood, close under the hill? No; I do not think so. If there is any portion suffers from flood at all, it is along the creek near the hotel.

1516. That is the creek going from here towards Condobolin? Yes; there is no flood-water of any consequence. The only thing which makes it appear to be flood-water is that there is a big dam, and as the water flows up to it it banks down and goes down in a day or two.

1517. Is there any quantity of water about here which would injure a railway line laid pretty close to the surface? I am quite confident there is not.

1518. *Mr. Gormly.*] Is there any considerable number of young, sound box trees which might be cut up the centre for sleepers? There is not a considerable number, but there are sound box trees all through the forest.

1519. About 9 or 10 inches in diameter? Yes.

1520. Could they be sawn in the centre so as to be left half round? It depends upon what the size of the sleepers are to be.

1521. About 9 or 10 inches in diameter;—could many be got, and if they could be got, could they be cut up the centre for sleepers? Yes.

1522.

1522. Could they be procured cheaply? There is not a sufficient quantity to enable them to be procured Mr. W. Todd. any cheaper than ironbark. I do not think there would be any difficulty in getting ironbark, because from the Gunningbland Range right through to Condobolin there is ironbark all the way. 25 Mar., 1895.
1523. Have you gone along the surveyed route of railway from here to Condobolin? No, I have not; but I have been in proximity to it.
1524. You know the country moderately well on each side? Yes; principally on the north side.
1525. And you have been up and down the line in the winter months, when there has been a considerable amount of rain? I have been through the country within a few miles of the line.
1526. And if moderately high land is selected for the line, do you think there will be any danger of flooding? No.
1527. Gunningbland Creek runs pretty high at times? Not high enough to stop traffic.
1528. Do you know where the Gunningbland starts? It only comes out of the ridges at the head of the Gunningbland Station—not far away.
1529. And it is not likely to stay up many days in succession? No.
1530. How often is it that it is not running? I have seen it not running for months.
1531. Then there would be no danger of flooding the line;—excepting in heavy extraordinary rain it would not run over the banks? I do not think so.
1532. *Mr. Molesworth.*] Is there any ironbark available which could be cut 1 foot square for timber openings on the line, and what length? I have known ironbark to be obtained here 24 feet long.
1533. And you think that class of timber is still available? Yes.
1534. *Chairman.*] As an observer of the district, can you say whether grain growing has increased or decreased during the last few years? It has increased greatly.
1535. And until this general depression do you think that is a fairly remunerative occupation? I think it could be made to pay well enough at about 3s. a bushel; but at the present price there is nothing in it.
1536. Could you say what rate of carriage selectors or growers of grain could afford to pay the Railway Department to take their produce along the line of railway, say, for 20 miles? I think they could afford to pay what they are now paying to road teams, that is 1s. a bag.
1537. That would be 3d. a bushel? Yes.
1538. That would be for 20 miles? No, for more than that, because the principal wheat carried has come from about 30 miles to Parkes.
1539. Then they could pay about 3d. a bushel for a carriage of 25 to 30 miles? Yes.
1540. Is there any other information with which you can supply the Committee? The bridge near the hotel was constructed only recently. It is all ironbark; it was got within 3 miles from here. I do not think there was any difficulty in getting it.
1541. Have you noticed whether the stock in the district is increasing or decreasing? The number has increased during the last six or seven years. The Trundle paddock, when I got here, contained 96,000 acres, and they tell me they only ran 6,000 or 7,000 sheep in it then. I can quite understand that, because there were no improvements.
1542. What distance do you call it from here to Trundle? About 13 miles.
1543. Is that by the road? Yes.
1544. *Mr. Gormly.*] There is a travelling-stock route? Yes, a mile wide.
1545. *Chairman.*] What is the carrying capacity of the land about here? I think improved land will carry about a sheep to the acre.

TUESDAY, 26 MARCH, 1895.

[*The Sectional Committee met at the "Trundle Hotel," Trundle, at 9 a.m.*]

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

JOHN MOORE CHANTER, Esq.		JAMES GORMLY, Esq.
		EDMUND WILLIAM MOLESWORTH, Esq.

The Sectional Committee further considered the proposed Railway from Parkes to Condobolin.

Mr. James Pike, pastoralist, Gobondry, sworn, and examined:—

1546. *Chairman.*] Where do you reside? At Gobondry.
1547. What distance from Trundle? About 14 miles.
1548. How long have you been in the district? Ten years.
1549. Did you come as an original selector or purchaser? No; I bought into the district before the Act of 1884 came into force.
1550. What is the extent of your holding? Sixteen thousand acres, at that time; it is 8,000 acres leasehold at the present time.
1551. And what freehold? Eighty acres.
1552. Do you carry on the business of a grazier altogether, or do you combine agriculture with it? A little agriculture, not a great deal of it. I have been cultivating up to the present year about 50 acres for my own use.
1553. Where do you send your wool and produce to? To Sydney *via* Parkes.
1554. What distance by road are you from Parkes? About 47 miles.
1555. Will you give the Committee your views as to the proposed line of railway, and as to the route you think it should take? It is my opinion that the line should be taken *via* Trundle, for the reason that there are no engineering difficulties whatever. It could be cheaply constructed, as timber, stone, and everything else required for railway purposes—ironbark and box—are accessible to the line in several places. It goes through the centre of the population between Parkes and Condobolin, and there is a large population out north which it would serve; and unless the railway comes *via* Trundle, their business will go to Parkes instead, and the Bogan Gate line will not serve them. The country, especially north of the proposed line, and along the line, is suitable for the growth of all kinds of cereals—grain of any kind, fruit-trees

Mr. J. Pike.

26 Mar., 1895.

Mr. J. Pike. fruit-trees and vegetables, grapes, or any other kind of produce;—they grow to greater perfection here than I have seen in any place in the Colony. There is a population, extending 30 miles out north, which will only be served by a detour to Trundle. As to grain-growing, I believe it will give as good results as most parts of the Colony. I, myself, have grown wheat for seven years, up to 23 bushels to the acre. In one dry year, with 9 inches of rain throughout the year, I obtained 9 bushels of wheat. My average rainfall for ten years is over 26 inches.

1556. If you look at the Government map, you will see that the line, as projected to Condobolin, is a very direct one; whereas a line by way of Trundle would give a very considerable elbow. We are given to understand that you have some proposal for a line to go in the direction of Trundle? Yes; we have a plan of the line which goes in the direction of Trundle, and which, according to it, will only make the detour about 5 miles. We think that that line will be more cheaply constructed on account of the nature of the ground. We think the extra distance will be made up by the cheapness of construction.

1557. Starting at Parkes, will you tell us to what places it would go? From Parkes it goes through a quantity of selections; but it is my opinion that those selections, with a very small detour, could be missed altogether.

1558. For how many miles from Parkes does it pass through those selections? About 12 miles; but I think those holdings could be avoided by coming as far as Brolgan Tank, on the present surveyed line to Condobolin; and, branching from there, it will come through Gunningblad and Blowclear leasehold to within 8 or 10 miles from Trundle, and through a continuation of selections from Trundle to Condobolin.

1559. I suppose those selections mostly owe balances? Yes; the land through those selections will be of no cost to the Government, as the gentlemen owning them are prepared to give it free of charge. That will be shown to you to-day by the person who has collected their signatures.

1560. With regard to the engineering difficulties of constructing that line, say, from Parkes to Trundle—what is your opinion concerning them? The greatest engineering difficulty would be at a place passing through Treweeke's Gap. The report of Mr. Stawell, a Government official, is to the effect that the grade there would not be more than from 1 in 80 to 1 in 100. We think that is the greatest difficulty on the line.

1561. From your own knowledge of that part of your proposed line, how does it compare with the line from Parkes to Bogan Gate? It will run through dry country, whereas I believe a portion of the Bogan Gate line will run through flooded country. That is, the line from Bogan Gate to Condobolin. The line is much the same from Parkes to Trundle as from Parkes to Bogan Gate, except for this gap, and the country is much the same.

1562. Excepting that portion, where the gap is shown on the map, is the country between Parkes and Trundle and between Parkes and Bogan Gate very much of the same character? Yes.

1563. And one presents no more engineering difficulties than the other? If anything, I believe the engineering difficulties on the route, excepting at the point I have mentioned, will be found to be less.

1564. As far as we have heard since we have been here, it is not so much the desire to serve the Trundle people that the Trundle people are so anxious about the line—they are more anxious to serve people out to the north? North and west, because that will be the population which will be served by it. There is no doubt that Trundle and all along the line will be served; but the population out there is so far west, and so far away from the railway, that the Bogan Gate line will not serve them. It will suit them better, 10 miles north of Trundle, to go direct to Parkes than to Bogan Gate, so that Bogan Gate will miss all business 8 or 10 miles north of Trundle.

1565. What, in your opinion, is a fair distance to expect a grower of grain to cart his produce to a railway station, so as to make it fairly remunerative? Twenty miles. A grower should not be required to go more than one day in and one day out.

1566. How long has that been your opinion? For some years.

1567. I asked that question because when the Molong to Parkes railway was constructed several witnesses from this locality, living 30 to 40 miles distance from the proposed railway to Parkes, gave evidence that it would pay them well to cart their produce in that distance. Now the position seems to have altered? I have not altered. I am of opinion that 20 miles is sufficient for any farmer to cart his produce. It may pay him to cart a little longer distance, but we cannot expect to get a line within 20 miles of every farmer; therefore, they may be satisfied to cart 30 or 35 miles. I know that a large quantity of wheat comes past me from Melrose, which is 90 and 110 miles. They are carting to Parkes at the present time, but I do not think it will pay anyone to do so at present prices. They are bound to do it when they have no nearer transit for their produce.

1568. But all these selectors and agriculturists who are that distance from the railway took up the land with their eyes open, did they not? No doubt; but they took it up with the prospect of a railway coming in that direction. It was always mooted here, as far as I can remember, that a railway would be sent down the Lachlan and right through the Colony. They were in hopes that at some time a railway would come within reasonable distance of them.

1569. During your residence in this district you must have observed what its progress or otherwise has been? Progress has been very large in the district, although the suspension of financial institutions has caused things to go down. The selectors have come in and made the place. The place was nothing before they came.

1570. Selection has gone on very largely? Very largely; the whole of the land available in the district has been taken up. It was the first centre in which the whole of the land was absorbed in the district. It was the first place to start selection on the very first day after the coming into operation of the Act of 1884, and from that hour it continued until every acre has gone. Were the leaseholds now thrown open, it would be one of the first places in the Colony which would be all taken up;—the land is of such good quality, and the people are so much in favour of it.

1571. When the Parkes railway was under consideration a great deal of evidence was tendered as to the probable increase of agriculture in the Parkes and Trundle district, has that taken place? It has, to a great extent; the distance of carriage has been a drawback. There are people in the district who have 200 and 300 acres under cultivation; they are prepared to put 1,000 acres under cultivation; and we have within a few miles of Trundle up to 800 acres under cultivation. It is quite a common thing to see from 100 to 300-acre paddocks. They are prepared to double and treble the amount, if they can get facilities to take their produce away.

1572. What is the rate of cartage from Trundle to Parkes at the present time? It varies according to the Mr. J. Pike. season of the year—from £1 to £1 10s. a ton.

1573. Do you get as much as £1 in a bad season like this? Yes; I have known it go farther for £1. 26 Mar., 1895. It has been taken 15 and 18 miles beyond Trundle for £1, this year. The wool season cheapened it.

1574. When Mr. Gilliat was here, there was one fact which was emphasised in his report, which I would like to ask you about;—one of the witnesses gave evidence to this effect: "Money is made so easily out of grass that many people prefer the smaller returns, in order to avoid the hard work necessary in farming." Is that the state of affairs in this district? It was so at that time; but it is not so now, times have changed. There is very little made out of grass. There is more made out of wheat for 2s. and 2s. 3d. a bushel than out of sheep, so that they would prefer now to go in for cultivation. Wool, which is now 5d. was then 9d. and 10d., which made a great difference in their returns.

1575. What is the carrying power of this country for sheep? I should put it, all through, in all seasons, at one sheep to 2 acres—that is when improved.

1576. What have you got for instance on your place? This is a fairly dry season, and I have over that on it.

1577. But you think a fair average would be a sheep to 2 acres? I think so—I think $1\frac{1}{2}$. I have had one sheep to an acre and a half, and it has carried them well. But taking one season with another, I think a fair average, when improved, would be about one sheep to 2 acres.

1578. We have heard the opinion pretty freely expressed that the stock here are suffering, not so much from want of feed as from want of water;—what efforts have been made in the direction of tank construction here? Water, to my knowledge, is distributed well through the district. I know of no part of this district which, at present, although there has been little rain for five months, is in any way short of water, except Fifield, which is outside the pastoralists' district. The pastoralists are well supplied with water from tanks and dams. I have known of no difficulty with water for some years. Formerly there used to be difficulty when water was not so plentiful.

1579. What would be a fair amount of money for a man to invest in a tank? The most useful tanks are from 3,000 to 4,000 yards; but their extent should be in accordance with the quantity of land to be supplied. I think a 2,000-yard tank will supply a selection with a fair water catch. In some cases the water catch may be so small as to necessitate 1,000 yards more being required.

1580. For a 640-acre selection? No; 2,500 acres. I have a tank of 2,300 yards which is watering 4,000 acres, and has been doing so year after year, but the catches are exceptionally good.

1581. What extent of area do you think it is necessary for a man with a family to hold here in order to live upon it; that is, supposing he works himself? 2,000 to 3,000 acres is sufficient to enable him to live fairly well.

1582. That would be if he combined the two occupations of grazing and farming? And if the prices were good 640 acres would be sufficient if he put it under cultivation. If the prices were not good, I think a man could get a fair living by combining the two industries.

1583. Do you not think that the advance of this district from an agricultural point of view has been induced rather by the low price of wool and sheep than by the peculiar qualities of the district for agriculture? No; the people of the district have been farmers, most of them, all their lives, and they naturally adhere to farming, and the fact of the land being of such quality has induced them to go in for it more than has the low price of stock and wool.

1584. Then you think that this is really a permanent agricultural district? I do; and it will be one of the leading agricultural districts of the Colony eventually.

1585. *Mr. Chanter.*] You have informed the Chairman that the average rainfall of the district is 26 inches? My average rainfall. I can show you each year's fall.

1586. What radius does your district take from Trundle? Fourteen miles north-west. I produce each monthly statement.

1587. This is taken from 1885 to 1894, giving an average of 26·82 inches? Yes.

1588. Is the gauge taken by yourself? Yes; it is a purchased gauge. I purchased it from Lassetter and Co.

1589. Is it one approved by the Government Astronomer, Mr. Russell? I expect so.

1590. You give the rainfall in 1888 as 9 inches 22 points? Yes.

1591. I understood you to say you grew wheat that year;—what was the result? Nine bushels to the acre.

1592. And for the other years? I have had as high as 23 bushels and 18 to 20 bushels.

1593. How is the rainfall distributed? Some years it is very impartially distributed. It falls at the end of the year or the beginning of the year sometimes. That is one drawback to the district, the rain occasionally not being distributed through the year.

1594. In what months do you usually get the heaviest falls of rain? We have had them in all months. We have had them in February, January and December, but as a rule April, May, and June are the heaviest months.

1595. Then, from your experience in this district, you are perfectly satisfied as to the result of the growth of cereals? Yes.

1596. You say a railway can be made to Condobolin via Trundle, traversing the route of the proposed line for a distance of 12 miles, and then branching off? Yes.

1597. Where would you propose it to branch to? Direct to Trundle, passing by Brolgan Tank.

1598. Have you traversed the country between that and Trundle? Yes.

1599. On the proposed line? Near to it.

1600. How near? Sometimes I have been within a mile on either side.

1601. Do you know the country between here and Bogan Gate? Yes.

1602. How does the country between the 12-mile point on the Parkes line compare with that between Bogan Gate and Trundle in regard to its natural features? I think they are in favour of that line. The quality of the country is better, and the levels, I think, would be much the same.

1603. The soil is better? Yes; a great portion of it is better than the country between here and Bogan Gate.

1604. And the levels? They would be much the same, if anything in favour of the line from Brolgan Tank.

- Mr. J. Pike. 1605. What length across this range through the Gap would be required to be traversed before you got upon country fairly level again? Not more than half a mile.
- 26 Mar., 1895. 1606. I understand you to say that some of the witnesses will give evidence to the effect that all the private holders of land along that route are prepared to grant their land free of cost to the Government for the purposes of a railway? Yes.
1607. Have you been on the Burrawang run along the route of the proposed line? I have been across it, but not along the route of the proposed line.
1608. Then you do not know the nature of the land? The land in any place where I have been about the line is much similar to a lot of the back land, but all inside is of a different nature altogether, and, I believe, thoroughly unfit for small settlement on account of it being a hard stiff clay.
1609. In 1892 a gentleman, who was then the district surveyor, gave evidence before Mr. Gilliat to the effect that if that land were made available for selection the whole of it could be profitably occupied in special areas? I am strongly of opinion that very little of the land at Burrawang is suitable for special areas. What little there is may be just along the line, but south of the line I believe there is very little. The greater portion of it is unfit for special areas.
1610. Then, in your opinion, the land there would not be suitable for special areas? No; the greater portion of the land would not be suitable for special areas.
1611. If the line is constructed in the direction in which you wish it to go, or anywhere near to it, are you, or any other gentleman present, in a position to state whether the farmers would be willing to pay a local rate of carriage? The question has not cropped up, and I have not had an opportunity of ascertaining. Speaking for myself, I might state that if the line went sufficiently near to me to give me an advantage I would not mind taxing myself on that account.
1612. It is not a tax upon the land? No; but I would not mind taxing myself by paying extra haulage, believing the line will be a benefit to the district.
1613. What was the character of your country when you took it up? It was a very rough piece of country, and it is now. The range of the dividing waters between the Lachlan and the Bogan runs through the centre, and causes a portion of my country to be rough.
1614. Is it broken and stony? It is broken and hilly, but the land outside the hills is of good quality.
1615. What improvements have you effected upon it? I have ringbarked a great portion, and I have 10,000 acres subdivided. I have also scrubbed out a portion of it.
1616. What proportion of the whole? It has always been scrubbed, but a portion of the scrub has grown up again, so that I have not more than 4,000 acres of fairly well scrubbed land.
1617. Supposing the whole of your land were scrubbed and cleaned, how many sheep would it carry? Taking in the hills and rocks, which are not of good quality, I think it would carry a sheep to 2 acres.
1618. I understand you are carrying that now? I am carrying rather less, but I can carry a sheep to 2 acres in any season. Having a portion of rough country I must make an allowance for it. My country, on account of the hills, is a little inferior to some of it.
1619. Then your country would not be a fair specimen of the average of the district? No.
1620. When the land is ringbarked, scrubbed, and cleared up, and after it has had time to grass for two or three years, with a rainfall such as you have described, what then do you think it would carry? If properly cleared up it would carry a sheep to the acre all the year round; but I am referring to the ordinary way of clearing scrub. There are one or two gentlemen who have lands cleared close to the proposed line, and I will guarantee that even if there are nine months out of twelve of drought, it will carry one sheep to the acre.
1621. Do you know anything of the country between here and Condobolin? I speak of the country between here and Condobolin.
1622. Have you traversed that country yourself? I have traversed all parts of it—perhaps not exactly the whole of the way in which the line goes, but on both sides of it.
1623. What is the character of the country? Nearly all level; very slightly undulating from here to Condobolin.
1624. How does that compare with the country between Parkes and Bogan Gate? It is far superior, so far as the construction of a line is concerned.
1625. Is it more level? Yes; and there are only one or two small waterways of any note upon it.
1626. *Mr. Molesworth.*] I see you have exhibited a plan, drawn by some local person, showing the line which you would wish to make marked upon it? Yes.
1627. Has that line been drawn by a surveyor? By a draughtsman in the Survey Office.
1628. But not by a draughtsman who has been over the country? No.
1629. Therefore, the line marked upon that plan is drawn without any regard to the features of the country—it is only a suggested route? It is a suggested route founded on the report of Mr. Stawell, who said that the line should pass from Parkes to Treweeke's Gap, from Treweeke's Gap to Trundle, and then on to Condobolin.
1630. Then no surveyor has been over the proposed route? No.
1631. And you do not know anything about any levels in that direction? No.
1632. In other words, it is simply a suggested route? Yes.
1633. Do you think there is anything on your suggested route to interfere with the construction of what is known as a pioneer line? No, excepting Treweeke's Gap; and I think that can be overcome.
1634. I suppose you are aware that anything which will give a greater grade than 1 in 100 will not come within the term "pioneer" line? Excepting at that point, I do not think there is any portion of the line which will not give a grade of 1 in 100. I am of opinion that it can be constructed as a pioneer line.
1635. With the deviation you require? Yes.
1636. How far is your property from the proposed line? It is outside the 20 miles area.
1637. Then if a line were drawn up 4 or 5 miles nearer Trundle, you would be from 14 to 16 miles away? Yes.
1638. You have stated that evidence would be tendered to show that land through which your proposed line would traverse would be given without cost to the Crown? Yes.
1639. In that agreement will they be bound to do so? Those who signed it promised to sign a document to the Government to that effect.

Mr. Patrick James Clara, store manager, Trundle, sworn, and examined:—

1640. *Chairman.*] You are the secretary of the Trundle Railway League? Yes. Mr.
P. J. Clara.
1641. You have prepared some statement for the Committee? Yes; I have compiled some statistics. They refer to the alienated land, freehold and rented, Crown lands, total area under cultivation, area 26 Mar., 1895. under wheat for grain, total yield of wheat, and approximate number of bales of wool.
1642. In the Trundle district? Yes. (*Vide Appendix*).
1643. Where has the bulk of the produce of the district gone to? To Parkes.
1644. *Mr. Chanter.*] How is the freehold land made up—in large or small holdings? Principally in small holdings. I have only four large holdings specified. The largest holding is Burra Burra.
1645. What size is that? 107,000 acres of Crown land.
1646. How do you class rented lands—are they rented from private individuals, or from the Crown? I class them rented from private individuals.
1647. Are you in a position to inform the Committee what rental is being paid for these lands? No.
1648. In what position are the 455,000 acres of Crown lands within the district at present? They are held principally under lease.
1649. What proportion of them would be available for selection at the present time? From Parkes *via* Trundle to Condobolin, the Crown lands would be about 286,000 acres.
1650. At present available? Yes. The leaseholds comprises Blowclear, Broowey Plains, Treffs, Carlisle, Murrumbogie, Gobondry, Burra Burra, and Melrose Plains.
1651. You know that the leaseholds have been extended to the maximum of five years? Yes.
1652. So that, except some special legislation takes place, no settlement can be effected on the Crown lands? I may state that the area of Crown lands is embodied in the leasehold lands. Mr. Stanley would give more direct evidence on that point.
1653. Can he separate those on the leasehold lands from those on the resumed area? Yes.
1654. In describing cultivated lands—4,360 acres—you only gave the Committee their products in the shape of cereals? Yes.
1655. What other class of products is produced besides wheat? Oats, barley, lucerne, grapes, and fruit.
1656. Have you averaged the wheat yield, per acre, for the past two or three years? No; I have only been in the district a little over two years. I might state that the basis of population is 1,100 within the radius to which I have referred.
1657. Is this a separate police district from Parkes? It is included in the Parkes district.
1658. But not for statistical purposes? No; there is a defined district.
1659. How far towards Parkes from Trundle does this statistical district extend? Twelve or 14 miles.
1660. Do you know anything of the country between Parkes and Trundle? I have traversed the road two or three times.
1661. How near would that be to the proposed line? It would be very close. I think we might say it would run parallel.
1662. Then you have the opportunity of judging of the features of the country the line would traverse from the road? Yes.
1663. You heard the previous witness say that it was proposed to traverse that line direct in a westerly direction? Yes.
1664. What is your opinion of the natural features, and of the grading of that country, compared with the country along the whole of the line from Parkes to Bogan Gate? I think the grades would be very similar; in fact, I consider that the least obstacles, with the exception of Treweeke's Gap, would be found from Parkes to Trundle.
1665. You will notice that on the Gunningbland Range there are two gaps—one at Bogan Gate and the other at Treweeke's? Yes.
1666. How do those two gaps compare with each other? I have not been through the Gap. There is a natural gap, I think, on the north-west side of the present road—that is going from Trundle to Parkes. The other gap I have gone through—that is the Gunningbland Gap; but there is another gap in another place which I have not been through.
1667. That is considerably further north than Treweeke's Gap? Three-quarters of a mile—whether it is north or south I could not say.
1668. Do you know anything of the country between Trundle and Condobolin? I have been along the road, and about 8 miles on the proposed route.
1669. What is the character of the country? Splendid country; much better than between Trundle and Parkes. It seems to be a splendid class of country.
1670. What engineering difficulties would present themselves? None, with the exception of one water-way. It is undulating country all the way.
1671. What is the nature of this waterway;—would it require any expensive bridging? No; it would require no very expensive bridging. It is the Yarrabundi Creek, which, I believe, will have to be crossed in any case, even on the other route.
1672. As a store manager, you must have a good deal of knowledge as to the position of the settlers already on the land here;—do you think they are a class of settlers who have come here determined to stay? Yes; and especially those settlers who are to the north and north-west. If you go over the country you will find that the improvements upon the settlements are of a substantial nature, and there is every indication of those at present working on the holdings intending to stay. I consider it would be best, in the interests of the country, for this to be an intermediate station, for the simple reason that the selectors and others lie to the north-west and extend as far as Bullock Creek.
1673. If a line is not constructed to Trundle, but is constructed as proposed by the Government, *via* Bogan Gate, would those people north of Trundle and north-west continue to grow produce, or would they graze? I do not think they would advance in the growing of produce.
1674. Do you think it would be possible to produce wheat and cart it to a railway station at a profit, any distance beyond 20 miles? I consider it could be carted within a radius of 30 miles.
1675. How long would it take a farmer to carry a load of wheat 30 miles and return to his farm? Three days. He might do it in two. It all depends upon the road. If he went on the Condobolin road in winter-time he would never get there.
1676. Do you think he would continue, with the present low prices, to produce wheat if he had to be away from home three days in a week with a load? No, I do not.

- Mr. J. Clara. 1677. You are of opinion, then, that if railway facilities are given agricultural facilities will largely increase? I am.
- 26 Mar., 1895. 1678. And that it is more profitable to those who are settled to produce cereals and other produce than stock? That is in addition to stock. Principally the holdings are large, but there are men prepared to go in for 1,000 acres of crop at the present time, provided a railway comes in the vicinity of Trundle.
1679. *Chairman.*] You are a store manager? Yes.
1680. Does the bulk of the goods for Trundle, and the area you have comprised in your return, come from Parkes to Trundle? Yes.
1681. Can you give the Committee any idea of the tonnage which comes? No. I have not prepared the tonnage, with the exception of what came to Trundle and to Fifield.
1682. *Mr. Chanter.*] What position is Fifield from here? Twenty-five miles north-west. Mr. Metcalfe, storekeeper at Fifield, has, during the last twelve months, received 120 tons; Mrs. Moloney, of Trundle, has received 95 tons; Mr. Burger, of Trundle, has received 30 tons. I do not know how many tons Mr. Moore, of Fifield, has received, but, altogether, I should say that 400 tons have been received by the four storekeepers.
1683. Would that be the bulk of the tonnage? No; because there are all the holdings to this side of Woodland, Murrumbogie, and Troff's, and others.
1684. Can you give us any idea of what the total tonnage would be? Probably 500 or 600 tons.
1685. And what would be the average rate per ton paid for cartage? The average rate through would be £1 per ton. Carriage, however, has been as low as 13s. per ton from Parkes.
1686. *Mr. Molesworth.*] If the line were constructed, would not the Melrose Plains tap it at a nearer point than Trundle? No. The owner states he would come to Trundle. He says that all his produce in the shape of wool and wheat would come here, and what he would receive would come through Trundle.
1687. You included in your statistics some settlers 35 miles to the north of Trundle? Yes.
1688. If they had to come so far, would they not be likely to go all the way to Parkes, instead of intercepting the line here? No; they would prefer to come here. There would be farmers even further away who would come into Trundle. In winter time, or any time in wet weather, they cannot possibly get across the Bogan to get in towards Narromine. It is black soil of a peculiar nature, and in flood time they cannot travel.
1689. Would not many of them come right into Parkes rather than to Trundle? It would be a greater distance to Parkes.
1690. What is the additional distance? I am not prepared to state, but according to the lay of the country it would be considerably greater. The class of country they would have to travel between there and Parkes includes the Broomey Plains.
1691. What reason have you to suppose that the people living that distance to the north would come to Trundle? I have their own statements.
1692. *Chairman.*] With regard to your goods;—supposing the line were constructed on the direct route from Parkes to Condobolin, would you, as a store manager, have your goods brought by train to an intermediate point by Bogan Gate, and then cart it here, or would you cart it direct from Parkes? I am not prepared to state. Being the manager, it would all depend on what my employer would do.
1693. You do not finance the business then? No.
1694. Have you any other document to hand in? I have a document showing the signatures of those who are prepared to give their land free to the State for the purpose of railway construction. It is as follows:—

Trundle, 2 February, 1895.

WE, the undersigned selectors, residing between Parkes and Condobolin, are fully prepared to give our land free for the purpose of railway construction from Parkes, via Trundle, to Condobolin:—

G. Simmons, Grassdale, selector.	Geo. Shipard, Derrawang.
W. Berry, Woodview, selector.	Alfred Bassett, Derrawang, Condobolin.
L. Simmons, Grassdale, selector.	Henry Bassett, Derrawang, Condobolin.
L. O'Brien, Yarrabundi, selector.	Thomas Dunne, Derrawang, selector.
John O'Brien, Yarrabundi, selector.	Robert Aitken, selector.
Thomas O'Brien, Yarrabundi, selector.	Margarey Morgan, Condobolin, selector.
John Quade, Avondale, selector.	J. D. Williamson, Yarrabundi, selector.
Thomas Quade, Belview, selector.	James W. Currie, East Derrawang, selector.
Frederick Farmell, Spring Creek, selector.	M. Kerin, Eden Valley, selector.
Edward Derham, Condobolin, selector.	Alfred Fell, Trundle, selector.
Horace Leighton, Condobolin, selector.	Walter Francis, Trundle, selector.
John Baxter, farmer, Derrawang.	Christopher Francis, Trundle, selector.
W. Grey-Innes, farmer, Derrawang.	Thomas West, Blowclear, selector.

1695. Do these people extend along either side of Trundle, or are they chiefly between Trundle and Condobolin? Between Trundle and Condobolin, and between Trundle and Parkes.
1696. Do they embrace the bulk of the selections the line would go through? Yes. These people extend about 10 or 11 miles on the proposed line towards Parkes, and the full distance from here to Condobolin.
1697. Do you know whether these people would require the railway authorities to fence if they went through their holdings? That I am not prepared to say.
1698. I suppose you could state that, in all probability, they would? They might do so.
1699. "Free" means, I suppose, free of all claims—severance as well as the actual taking of the land? Yes. I may say there has been one refusal on the Condobolin side—Mr. Dawson; but if our proposed route is approved of, he is prepared to give the land, but that is an indirect statement.
1700. Is there any other documentary evidence you wish to give in? No. Perhaps I may not be out of place in referring to the evidence of Mr. Harper before the General Committee a few days ago. According to the *Western Champion* of 22nd March, 1895, Mr. Harper, the Goods Superintendent, Department of Railways, referring to the traffic on the line, said:—

He anticipated that the traffic on the line would be 2,000 tons of goods, at an average of 3d. per ton per mile, £1,500; 1,000 tons, at 2d. per mile, £500; from intermediate points, practically about Trundle district, at 2d. per ton per mile, £55.

I have already stated that the amount received by the stores alone is 300 tons, without taking into consideration the amount received by pastoralists and others.

1701.

1701. *Chairman.*] Does that apply to the outward traffic? The inward traffic to Trundle. Then Mr. P. J. Clara, Harper goes on to say:—

He estimated that 5,000 tons of wool would be carried from Condobolin, giving, at 2d. per ton per mile for the whole distance, 10s. per ton. 26 Mar., 1895.

We have 867 tons to leave this district alone—that is, inside the boundaries I have specified, whereas, out on the other side—Woodlands—on account of the nature of the country, the produce would come direct to Trundle, which would increase the amount of revenue. Mr. Harper also states:—

The Commissioners' estimate of the cost showed an annual loss of £2,000, but it was possible in the near future that this would be made up by the wheat traffic, and the development of the mining resources.

I might state that since Mr. Gilliat's inquiry was made in 1892, Fifield has sprung into existence, and you will have evidence to-day from Mr. Metcalfe as to its mining resources. They have increased considerably. As far as wheat production is concerned, it would increase tenfold if the railway came to Trundle. That shows that there would be a considerable increase of revenue over and above Mr. Harper's estimate.

1702. Is there any coaching traffic between Trundle and surrounding districts? There is a coach from Dandaloo. They go through this way. It is the main road, and there will be a large passenger traffic if there is a railway.

1703. Why did Cobb & Co. give up running? They had a line of coaches running to Trundle from Dandaloo, and they were bought out at a satisfactory price by Mr. Clifford, one of the drivers.

1704. And does he run the coach now? Yes.

1705. Have you any other documentary evidence? I produce a copy of a report, dated 28th December, 1892, signed by Mr. J. M. Stawell, dealing with a proposed trial survey from Parkes to Condobolin, via Trundle, as follows:—

Department of Public Works, Railway Construction Branch,
Supervising Engineer's Office, Parkes, 28 December, 1892.

EXTENSION, PARKES TO CONDOBOLIN.

Subject:—Proposed Trial Survey via Trundle.

Memorandum to the Engineer-in-Chief.

In accordance with instructions received in memo. 92-1,468, I have examined the route from Parkes to Condobolin, via Trundle, and have to report as follows:—

Route.—The proposed survey would leave the Molong-Forbes line at about 267 miles 10 chains, and running in a north-west direction would cross the Gunningbland Range (the boundary of counties Ashburnham and Cunningham) at Treweeke's Gap, continuing in the same direction to Trundle. It would then take a south-west course, passing some distance to the north of the Black Range and to the south of Derrawang, striking the surveyed line via the Bogan Gate, about 4 miles from Condobolin. Between Parkes and Trundle there are two alternate routes, one crossing the range about a mile to the north of Treweeke's Gap and the other about the same distance to the south. The route via Treweeke's Gap is the most direct, but one of the other might give better grades.

Grades.—A ruling grade of 1 in 80, and possibly 1 in 100, could be obtained with very light work.

Water-ways.—There are no large creeks to cross. The water-ways on the whole would be small.

Distance.—The total estimated distance is 67 miles.

General.—The country passed through may be described as gently undulating. In places there are ridges, but these can be easily dealt with, and in most cases avoided altogether. The last 20 miles would be almost flat. The timber along the line is useless, except for fencing. There is a fair amount of settlement on the route, the country for the most part being held by large selectors.

J. M. STAWELL.

Mr. Joseph T. R. Stanley, police constable, Trundle, sworn, and examined:—

1706. *Chairman.*] How long have you been here? Thirteen months.

Mr. J. T. R.
Stanley.

1707. What statistics are you charged with the collection of in this district? Collecting the freehold areas, the holders of conditional leases, and the stock and crop of the district. The statement handed in by Mr. Clara contains the area in which I have to collect the statistics. 26 Mar., 1895.

1708. Did you supply those statistics? Yes.

1709. Are they correct? Yes.

1710. What about the population of the district? The population of the area within which I collected the statistics is over 1,000.

1711. Where does the bulk of it lie, as regards Trundle? To the north—that is Fifield, and from here out to Bullock Creek.

1712. I suppose you have a general knowledge of the district? Yes; I have been all over the area in question.

1713. As far as your observation goes, what is its character as regards its occupancy? Very good.

1714. Agricultural or pastoral? Agricultural. I have had considerable experience in travelling about the country, and I consider that nearly the whole of it is fit for agriculture. I do not suppose you would find more than 1 acre of the total which is not fit for cultivation, and particularly to the north. The land itself is very scrubby in many places; at the same time, it is exceptionally good.

Mr. Henry Alfred Croft, farmer and grazier, Trundle, sworn, and examined:—

1715. *Mr. Molesworth.*] How long have you resided in this district? Thirteen years.

Mr.
H. A. Croft.

1716. Are you an original settler? Yes, I selected.

26 Mar., 1895.

1717. What occupation do you carry on in conjunction with grazing? Agriculture.

1718. What quantity of land had you under crop last year? 280 acres.

1719. What was your yield per acre? It varied; about two bags to the acre.

1720. That is an exceptionally low yield? It is; but it is made up in this way that it was not put in until July.

1721. And you had an exceptionally dry season? Yes.

1722. You gave evidence five years ago in connection with the proposed line of railway from Molong to Parkes to Forbes—you were then only a grazier? Yes.

1723. How long is it since you took to agriculture? The last three years.

1724. Is the result sufficiently satisfactory to justify you to continue to grow wheat? Yes.

1725. Notwithstanding that you had such a poor yield last year? Yes.

1726.

- Mr. H. A. Croft. 1726. I presume that you have to carry all your grain to Parkes? Yes.
 1727. What is the distance from your farm? Thirty-two miles.
 26 Mar., 1895. 1728. What is the greatest distance you think it would pay a grower of wheat to carry his grain to a railway station? I do not think they could possibly do it over 20 miles, for the simple reason that even at 20 miles a farmer could only take two loads a week, and he would then require a very strong team. If he cultivated anything like 200 acres it would take him a considerable time to cart his produce in. He could not possibly do it unless he engaged carriers.
 1729. And yet you have been carting your wheat for a distance of over 30 miles? Yes.
 1730. Do you feel that you are doing so at a profit? No; there is no margin left.
 1731. If the prices were better the extra distance would not be felt? No, not so much; but in the present state of the wool market people are compelled to go in for agriculture as well as grazing in order to make things pay at all. You must combine the two.
 1732. Have you increased the quantity of land under cultivation since you gave your last evidence? Yes; I had 1,280 acres of holding then, and I now have 3,300 acres. Last year I had 280 acres under crop, and this year I am preparing 400 acres.
 1733. Then you believe that with a fair season you could grow wheat profitably? Yes; with facilities for market.
 1734. Do you think the same opinion prevails amongst the settlers generally? Yes.
 1735. Do you believe this is likely to be a permanent wheat-growing district? Yes.
 1736. Have you been over the proposed deviation suggested by the Trundle League? Yes; every bit of it.
 1737. Do you know what are the features of the country? Yes.
 1738. Will you briefly explain them? The land is similar to that from Bogan Gate. The only obstacle at all is Treweeke's Gap. On the south side of it, for about a mile, there is what is called the Old Mile-Post track, which used to go from Bogan Gate to Parkes. There is a considerable stock reserve which runs through Blowclear West, and goes on to the Bogan. The line would come through the leasehold part of Blowclear West estate.
 1739. How far do you anticipate it would traverse the direct line before it broke off to go Treweeke's Gap? As far as I can understand it, the line will go somewhere near Brogian Tank—that is the Government tank.
 1740. What distance is that from Parkes? Twelve miles. It would branch off there, and then come through Crown land in the back portion of the Gunningbland estate, and through Blowclear.
 1741. What would it go through after that point? Through alienated land.
 1742. Are you equally well acquainted with the country between Trundle and Condobolin? Yes.
 1743. And you know fairly well where the line would run? Yes.
 1744. Do you know of any difficulties to overcome there, in the shape of ranges? None whatever.
 1745. How would you avoid the Black Range? That is on the south-west side.
 1746. Is the Black Range west, north, or south of Condobolin? It is east of Condobolin.
 1747. And how far away from your projected line? It would be 3 or 4 miles north.
 1748. You keep south of it? No; we keep north of it.
 1749. The Government line goes to the south side of it? Yes.
 1750. And you propose to go to the other side? Yes.
 1751. And in doing so do you escape anything in the shape of serious grades? Yes.
 1752. Have you had any professional surveyor to estimate the grades for you? No; we have only the report of Mr. Stawell.
 1753. And he made what is really called an inspection? He made an examination.
 1754. And took no levels? I think he did.
 1755. Going back to Treweeke's Gap—what do you believe is the difficulty in regard to the grade there;—what grade do you think you are likely to get? I do not think it will be more than 1 in 80.
 1756. Are you aware that anything worse than 1 in 100 will bring the line outside the range of a pioneer line? I was not aware of it until to-day. There are two gaps—one on the south and one on the north. On the north there is one about a mile and a half from Treweeke's. Then there is one on the south, which the Old Mile-Post track goes along, which is almost level. In going through it, you would hardly discern that there was a gap at all.
 1757. Do you know anything of the line from Parkes to Condobolin and from Bogan Gate to Condobolin in particular? Yes.
 1758. Will you tell us what are the features of the country? The features of the country are similar from Parkes to Bogan Gate, and from 4 miles below Bogan Gate towards Condobolin. Then you get into flooded country—that is, it is level, and the water lies there for some considerable time. I know it is an impossibility, in wet seasons, for stock to travel here.
 1759. What area of land is covered by the flood-waters? It is pretty nearly all alike.
 1760. Would it cover a mile of country? More; you could not get round it.
 1761. You will notice from the plan that the line, when it reaches Condobolin, takes a sudden jump to the northward? Yes.
 1762. The evidence we have had is to the effect that the object of that is to avoid the flooded country, and it is stated that by making that bend the line will avoid it;—do you think it will do so by going that additional mile or so? No. They may miss the main part of the flooded country, but still it is all wet country.
 1763. Supposing the line, instead of being bent, as it is, towards Condobolin, were bent towards Trundle from Bogan Gate, and then run straight to Condobolin, what class of country would it pass through? You would have to go through the Black Range, and it would be all rough country.
 1764. There would be no object served, then, in deviating the line in that direction, with a view to coming as near to Trundle as possible? No.
 1765. You must either go south or north of the Black Range? Yes.
 1766. Supposing it was thought desirable to afterwards connect Trundle, would a branch line from Bogan Gate to Trundle, going northward, be a line which would eventually pay? I think it would be a very expensive line.
 1767. Where would the expense of the line come in? Coming from Bogan Gate here you must have observed that there is a range which you have to go over. That is a continuation of the Black Range. It

It is inferior country coming along there, and it bluffs out on the boundary of Blowclear West.

Mr.
H. A. Croft.

1768. You think there is a difficulty between Bogan Gate and Trundie? Yes.

26 Mar., 1895.

1769. *Chairman.*] Your holding is 3,300 acres? Yes; and I combine grazing with farming.

1770. Will you tell the Committee to what extent you think you would be a customer to a railway by sending goods to it, and possibly by having stores conveyed to you? I can only give you an estimate in regard to this year, because this is the only year in which I have had any amount of cultivation. I have been increasing during the last three years, and this year I have paid for over 50 tons' carriage of wheat from my holding to Parkes.

1771. At an average of how much a ton? Twelve shillings.

1772. Have you carted yourself? No; I have employed. I have also sent 12 tons of wool at £1 a ton, and have had about 3 tons of back carriage of supplies at £1 a ton. That is independent of what I got locally.

1773. How is it you have to pay £1 a ton for back carriage? It is only this year that I have sent in wheat at all to the market at Parkes, and the usual carriage to Trundie is £1 a ton, and up to 25s. and 30s. a ton. Unless you take the opportunity of getting back carriage when you are loading in, you have to pay much more for it.

1774. When you were examined in February, 1890, you gave this evidence:—

How far are you from Parkes? Thirty-two miles.

Is that not too great a distance over which to cart grain to a railway? No. Usually, the settlers consider that if they are within 20 miles of a railway, and can make one day's stage with a load of wheat, they are all right. This line would be within 32 miles of us.

You then said that the railway to Parkes would not be too far for you to cart your produce to it? At that time agricultural produce was at a much better price than it is now, and that is why matters have altered considerably. At the present time prices are very low, and I altered my opinion because it cannot be done at the price. But if we were to get 3s. to 4s. a bushel, as we did then, we could afford to cart 32 miles.

1775. Supposing the railway is constructed direct from Parkes to Condobolin, what would you do with your produce?—supposing there was a station near Bogan Gate, would you carry your produce there and send it to Parkes and Sydney by railway, or would you still continue to cart direct to Parkes? It all depends upon the carriage.

1776. According to the present railway rates—unless special rates were imposed for this line, the extra tonnage from Parkes to Condobolin would only be about 9d. a ton for grain, so that from Bogan Gate to Parkes it would be much less. Therefore, it would certainly pay you better to cart to Bogan Gate than to Parkes; it is nearer from here to Bogan Gate than to Parkes? It is 13 miles from Bogan Gate to here, and I suppose the platform will be a mile or a mile and a half further on.

1777. And how many miles is it from your place to Parkes? Thirty-two miles.

1778. Then, if it is only 9d. a ton from Bogan Gate to Parkes, surely the difference would be worth saving, would it not? The carriers, probably, would not consider it too far to carry the produce for nearly the same money. When once they get their waggons loaded it does not make much difference to them.

1779. On the other hand, you made a statement a short time ago about the one day's journey? You could not go to Parkes and back in a day.

1780. You could go to Bogan Gate? No; not with a load—it means about 30 miles.

1781. What teams do they use here? Horses and bullocks.

1782. A horse team could do it, but a bullock team could not? They could only do the trip—they could not come back again. By the time they took the wheat there, waited their turn, unloaded, and got back again, it would be two days.

1783. *Mr. Chanter.*] You gave the result of your crop as two bags to the acre? That is on an average. Some yielded according to the time at which it was put in. Some which was sown in April yielded five bags to the acres, and some which was sown in May yielded four bags. It ran down to one bag.

1784. Did you sow any in April? Yes.

1785. What was the result? Five bags.

1786. Did you sow any in May? Yes; and the result was four bags.

1787. Your experience is that if you sow late you cannot expect to get a crop? No.

1788. If you had sown the whole of your crop in May you would have had considerably more tonnage for the railway? Yes.

1789. And judging from your own experience you would not be inclined to repeat the mistake by selling late? I would not sow again after the end of May. I was one of a deputation which waited on the then Secretary for Public Works, Mr. Lyne, on the opening of the Forbes railway. Mr. Lyne himself favoured the only line which was down the Lachlan River—that was from Forbes to Condobolin—but he promised the deputation, which went from Trundie and Condobolin, that he would send one of the best engineers in the Department to examine the Trundie route, and if the report were favourable he would order a survey. Some time elapsed, and we wrote to the Department again on the matter, and that is why we got Mr. Stawell's report. He had examined the route some time in 1892.

Mr. John O'Brien, farmer and grazier, near Trundie, sworn, and examined:—

1790. *Chairman.*] Where do you reside? Between here and Condobolin—about 10 miles from here, and 30 miles from Condobolin.

Mr.
J. O'Brien.
26 Mar., 1895.

1791. *Mr. Chanter.*] What is the extent of your holding? We hold about 20,000 acres altogether—several brothers work together.

1792. To what do you devote the land principally? Sheep and cattle.

1793. What is the character of the land? Level alluvial land.

1794. Suitable for agricultural purposes? Yes, every acre of it.

1795. What returns do you get from the sheep? We consider it will carry about one sheep to the acre if it is highly improved.

1796. Was it originally timbered? Yes; with pine, scrub, and box.

1797. What is the nature of the improvements? Fencing, ringbarking, scrubbing, clearing, and tank-sinking.

- Mr.
J. O'Brien. 1798. Had you to make much provision for water supply? We had a creek running through it, and we had to dam it up.
- 26 Mar., 1895. 1799. How many sheep do you carry? About 22,000 on an average.
1800. What amount of wool do you send away in a year? Three hundred and twenty bales, or 65 tons.
1801. Do you send any skins away? Yes; about a ton in a year.
1802. And tallow? No.
1803. How do you dispose of your fat stock? We send them to Homebush.
1804. How many trucks? About twenty a year. At the present time we do not send so many, because it is so far to take them to the market. We would send far more if the line were running through the property, or close to it.
1805. The whole of your land is suitable for agriculture? Yes.
1806. Why do you not produce cereals? We do; we go in for agriculture to a certain extent.
1807. To what extent? Last year we had about 400 acres under wheat and oats.
1808. What was the return from the wheat? Nearly three bags to the acre—12 bushels.
1809. Was that sown at the proper time? No; it was a late sowing. Some of it was sown in June and July. The late crops, we find from experience, are a total failure, and we do not intend to repeat the mistake.
1810. Had you any sown early? No; it was all late, but, judging from the returns in the district, we expect to get 16 bushels to the acre at least.
1811. How did the oats turn out? We cut that off for hay.
1812. About how many tons of hay? We had about 30 tons.
1813. From how many acres? Fifteen acres, or 2 tons to the acre.
1814. I suppose the Committee can assume that the cultivated land being so small in proportion to the whole of the holding is in consequence of the distance you are from the nearest railway town? Yes. We would go in more extensively if the railway were more convenient, and if prices rose at all.
1815. How far is your holding situated from the direct line, *via* Bogan Gate? Three or 4 miles.
1816. And if the line were taken *via* Trundle, how far would it be away? I think it would run through.
1817. Then, in either case, the line, if constructed, would be of benefit to you? Yes.
1818. Then, if the line is constructed, what do you and your brothers propose to do in the way of increase of agriculture? If prices were high next year, we would go in more largely. At present we intend to put in what we did last year.
1819. You do not propose to increase your agriculture at present? Not this year.
1820. If the line were constructed, would you increase it? I think so.
1821. Very materially? Yes; very likely.
1822. Is your country of a level character? Yes.
1823. What class of machinery do you use? Harvesting machines, ploughs, reapers and binders.
1824. Do you know the nature of the country between Trundle and Condobolin? Yes.
1825. Will you describe it? It is mostly level country. The only place the railway would have to cross would be Yarrabundi Creek.
1826. Would there be any engineering difficulty about that? No; only a simple bridge one chain wide.
1827. What is the depth of the creek? Ten feet. If the line went to the south of the Derrawang Mountains, I do not think there would be any difficulty at all.
1828. Do you think it is possible to get a line with a grade of not more than 1 in 100 feet? I am sure of it.
1829. Is the character of the soil between Trundle and Condobolin similar to the soil you hold yourselves? Yes; it is chocolate soil, heavily timbered.
1830. Do you think, in the event of the line being constructed, agriculture would increase towards the Condobolin end? Yes.
1831. Do you know anything of the country along the direct route from Parkes to Condobolin, *via* Bogan Gate? Yes.
1832. What is the character of that country as compared with the assumed deviation? For 8 miles from Bogan Gate towards Condobolin it is agricultural land, but the remainder I consider more suitable for pasturage. It consists of open country, with a soil which would not be very suitable for wheat. Belts of red ground come in through it, but not to a great extent.
1833. I suppose your experience is that plain country is not so suitable for agriculture as timbered country? Not wet swampy lands.
1834. Have you ever seen that country flooded? Yes; I have seen a great deal of flood on the Condobolin route.
1835. Would it be towards Condobolin or Parkes? The river floods to the north of the Burrawang Station, and, in my opinion, it would come right up to the railway line at a point due north of that station, and then on the Condobolin side, for 4 or 5 miles, it would be flooded as well.
1836. If you will look at the map you will see that at the Condobolin end there is a considerable elbow, the object of which is to avoid the flooded country? In my opinion that would completely avoid the flooded portion at the Condobolin end.
1837. Take the Bogan Gate, where it comes through the gap, do you think that line would touch any of the overflow? I think it would, at a point due north of Burrawang Station.
1838. What is the greatest flood you have seen there? I think the greatest flood I ever saw there came over the railway line.
1839. When was that? About four years ago. We had 8 inches of rain at one time.
1840. Then the flooded waters extended a long distance? Yes; the Yarrabundi Creek was flooded half a mile wide in several places.
1841. What is the character of the country along the line of route from Parkes to Condobolin? It is similar country to what we occupy at present.
1842. Is it good country? Yes; most of it.
1843. It has been stated by a Government officer that a close settlement of special area settlement could be made upon the land to the north, with a limited area of 640 acres;—do you think a close settlement of 640 acres of land could be obtained there? I would not like to take up land on that condition. I do not think I could make a living out of it.

1844. Your experience is, that you would require more than 640 acres? Yes.

1845. Then to induce permanent settlement there the area would have to be increased? Yes; by another 640 acres at least.

1846. What distance from the railway line do you consider you can profitably produce wheat and cart it? It largely depends upon the price of carriage. This year the carriers carried from Trundle to Parkes for 1s. a bag. They drew our wheat 42 miles. It makes little difference when the produce is on the waggon to take it an extra 10 miles.

1847. If you could get your wheat carried for the same price, would you continue to grow? Yes; I think 20 miles carriage is sufficient for any man who wishes to make agriculture pay.

1848. Then you think, if the railway is constructed in the district, landholders for 20 miles from the railway will continue to produce? Yes.

1849. Do you think they would increase their productions? Yes.

1850. Do you think the increase will be so great as to return a sufficient revenue to the State to pay interest upon the cost of construction? I could not say. What would the interest be?

1851. This being a pioneer line, it has to be constructed, if at all, at a cost of about £2,000 per mile, and the interest upon that would be $3\frac{1}{2}$ per cent. The total cost of the line will be about £127,000. The interest and working expenses will amount to about £9,000 a year, and the revenue to about £7,000? There would be an annual loss of £2,000.

1852. Do you think the productions of the district will increase sufficiently to justify Parliament in believing that if the line were constructed in a short time it would return a revenue of £9,000 a year? I am sure the revenue would increase. It might increase the first year by £2,000, but I think it would within five years.

1853. If a line were taken through your property, would you be prepared to tender to the Crown the necessary amount of land for construction? Yes, willingly; free of all cost, unless it very materially damaged an improvement.

1854. Would you make no claim unless it went across a tank or building? No; we have all signed a bond to that effect. I took the bond down to Condobolin, and got every one to sign it, with only one dissentient.

1855. As a grazier and farmer, and one so situated that whichever way the line goes you must be benefited, which route do you think the railway from Parkes to Condobolin should take? I think it would very largely benefit the district as a whole by coming to Trundle. I think the Government would be justified in making the deviation to Trundle.

1856. Do you think a line could be constructed to or near Trundle, and then on to Condobolin, as cheaply as it could be constructed from Parkes to Condobolin direct? I think so. I think the cost of the cutting over Treweeke's Gap would be compensated by you not having to construct along the flooded country.

1857. Do you know Treweeke's Gap? Yes.

1858. What length of cutting would have to be made there? I am under the impression that a gap could be found in the hill by making a slight deviation. It is rather steep where we cross on the road, but I am informed that there are points with a far lighter grade.

1859. Then you do not look upon this matter as one of great difficulty? Not at all.

1860. Chairman.] You understand that by extending the line by way of Trundle you would involve an extra distance of 6 or 7 miles? Yes.

1861. Which would be an additional expense of £12,000 or £14,000? Yes.

1862. What about the extra revenue to be obtained in this district to benefit the State for that extra expenditure? It would tell in the future settlement. At the present time the line runs right through to Burrawang leasehold. The selectors would be right on the line. That is not settled, and is not likely to be settled for many years. There is a lot of leases lying on the Troffs and Murrumbogie, and if the line is taken further north it will materially add to its value. It will bring those on the Troffs and Carlisle Station within 10 or 12 miles of the line, and will enhance the value of that land considerably.

1863. Why does it seem so necessary to come right up to Trundle? The township of Trundle is already formed, and there is permanent water here at the dam.

1864. Supposing the line went a few miles north of the projected route, would the country be of a character over which a railway could be constructed? No; it would strike the Black Range.

1865. It must either go as proposed, then, from Parkes to Condobolin direct, or make a big arch to escape the Black Range? Yes. If the line were to come within 4 miles of Trundle, and were then arched round, it could be done in that way.

1866. What kind of a range is the Black Range? It is a rough mountain; you could not get over it.

1867. Therefore, the line must be where it is, or must come to Trundle, or within 2 or 3 miles of it? Yes.

1868. That is to get over engineering difficulties? Yes. There is a lot of ironbark and stone for ballast upon this road too.

Mr. Llewellyn Simmons, farmer and grazier, near Trundle, sworn, and examined:—

1869. Chairman.] Where do you reside? Between Trundle and Condobolin, about 11 miles from Trundle.

Mr.
L. Simmons.
26 Mar., 1895.

1870. Mr. Molesworth.] What is the extent of your holding? My brother and I are partners; we have 5,000 acres.

1871. I understand it is situated exactly on the suggested line from Trundle to Condobolin? I think so.

1872. What distance are you from Condobolin? About 26 miles.

1873. What would be your nearest point of connection with the proposed railway? About 12 miles.

1874. Will you give your views as to the nature of the country between Trundle and Condobolin? I have traversed most of the country. It is red, deep soil, and almost level. It is slightly undulating, and the only difficulty is the Yarrabundi, a small creek which runs from the north to the south-west, which would have to be crossed by the Bogan Gate line, and it would be much larger down there than it is here, on account of other creeks coming into it.

1875. And there would be no range to cross? No; the Black Range would lie 3 miles away to the south.

1876. What quantity have you had under cultivation this year? Fifteen acres.

1877. Is your land suitable for agriculture? It is.

1878. The greater bulk of it? Yes; it is all level and suitable for agriculture.

1879. Why have you not adopted agriculture? On account of the low prices. We consider we are too far from a market; the cartage would be too high.

1880.

- Mr. L. Simmons.** 1880. But if the line were constructed within fairly easy access, would you feel disposed to put your land under crop? Yes; I think we should try 200 or 300 acres for a start.
- 26 Mar., 1895. 1881. What would you propose to grow? Wheat principally, and hay and oats.
1882. Did you grow any wheat last year? Yes; we cut it for hay. We got about 30 cwt. to the acre.
1883. Why did you do that? We had not machinery for a small quantity. We therefore converted it into hay for our own use.
1884. With reference to the Yarrabundi Creek, which you propose to cross, is there any wide spread of it? No; it has good high banks.
1885. Could a railway line be built up to within easy distance of the banks of the creek? Yes.
1886. What kind of a bridge would be necessary? Ordinary timber.
1887. And it could be built sufficiently strong to carry a goods train over it? Yes; it is not a broken creek. The banks are not open.
1888. But are they not liable to break away in flood-time? I think not; they have not done so hitherto.
1889. Then you do not think that there would be any great expenditure in approaches to the bridges? No.
1890. What would be the width of the span? About 1½ chains.
1891. Is there plenty of timber in the locality, suitable for sleepers and bridge work? Yes; at a little distance—within 3 or 4 miles.
1892. What timber is there there? Ironbark.
1893. Is there an abundant supply in that district? Yes.
1894. Have you gone in for cultivation other than the wheaten hay? Yes; oaten hay.
1895. With what result? The same as with the wheaten hay, but it was sown late.
1896. Was the season favourable or unfavourable? It was a fair season.
1897. How far do you consider you could convey the produce from your station to a railway station successfully? At the present prices, I do not think it would pay to carry wheat over 20 miles, although they do so.
1898. Your holding is close to the north-western boundary of the Burrawang leasehold? Yes; we join the Murrumbogie and the Troffs.
1899. You are south of Murrumbogie, and slightly north of Burrawang Holding? Yes; on the northern portion of Burrawang Holding, on the west of the Troffs, and south of Murrumbogie.
1900. What was your product of wool last year? About seventy bales.
1901. Did that find its way into Parkes Station? Yes.
1902. Did you send any other produce away? No; only a few sheepskins.
1903. How many sheep are you grazing? At present we have 4,100, but we have run on an average 6,500 for six years.
1904. How many sheep to the acre will that be? We have 5,000 acres grazing 6,500 sheep. We have had as many as 8,000 upon it during the two years we have been there.
1905. Is that a fair average stocking for your run? Yes.
1906. Which you intend to maintain? Yes.
1907. *Chairman.*] You are one of the gentlemen who are willing to give the land if the railway is built? Yes.

Mr. Henry Hollibone, estate manager, Trundle, sworn, and examined:—

- Mr. H. Hollibone.** 1908. *Chairman.*] What are you? I am managing an estate for Mr. H. V. Foy.
1909. What is the name of it? Mordialloc.
1910. What is the extent of it? 5,160 acres.
- 26 Mar., 1895. 1911. What area is under cultivation? Last year 700 acres were under cultivation.
1912. That is one of the largest cultivations in the district? I think it is. The balance is stocked with sheep and large stock.
1913. Can you give us an idea of the quantity of sheep upon it? 3,500 at present, and fifty head of cattle, sixty horses, and fifty pigs.
1914. Where is the estate situated? Nearly north of Trundle.
1915. How many miles away? Five miles north-east of Trundle.
1916. How many miles is that from the projected line of railway, *via* Bogan Gate? About 20 miles.
1917. Will you give us such information as you can of the producing qualities of the 700 acres under your control? I have an account of it. First of all I had 141 acres of Calcutta oats, which averaged 40 bushels to the acre; then I had 3 acres of Algerian oats, which averaged 60 bushels to the acre; then I had 17 acres of English barley, which averaged 25 bushels to the acre. The wheat I have in two lots. The old ground, 70 acres, which was cultivated last year, and was sown in April, averaged 24 bushels to the acre. The new ground, 400 acres under wheat, averaged 8 bushels to the acre. That was not sown until May and June. It was a late crop, and was a failure.
1918. Is that an indication, generally, that late crops do not answer here? They do not. There were 69 acres of oaten hay, which averaged 30 cwt. to the acre, and 140 tons of straw—that is, from the oats—which were threshed.
1919. Are these good returns? Yes; excepting the late crops.
1920. Is that a fair average, do you think, to the district? It is about an average, I think, for crops sown in April and May, last year.
1921. Has not this been rather a dry season? It was very dry in the spring when we should have had rain. The crops would have been much better if we had had rain earlier in the season.
1922. To where did the bulk of that produce go? To Sydney.
1923. Carted to Parkes, and then by train to Sydney? Yes.
1924. Supposing the line of railway were constructed, as projected, nearly direct from Parkes to Condobolin, to where would you send your produce, which you require to go to Sydney? I might almost as well send it to Parkes. I could not get it taken in any cheaper 20 miles than 30 miles.
1925. You are quite certain about that? Yes. When it is on the team it might as well go into Parkes. I have over 100 tons of hay at present, and cannot find a market for it. I sent 6 tons to Sydney market last year, but there was nothing to be made out of it. I have to pay almost the same freight from here to Parkes, as from Parkes to Sydney. It is the cartage which handicaps the grower.
1926. What did you get for it? It would not sell, and I sent it to Mr. Foy in Sydney for training purposes.

1927. How long have you been here? Eight years.
 1928. What kind of country is it for carting stuff in wet weather? It is not very good; it is heavy.
 1929. The carrying of sheep to the acre seems to be low here as compared with some other parts;—is there any reason for it? They are all breeding ewes, and are to lamb next month. There will be over 5,000 to shear. The place is not stocked.
 1930. What do you say the land could carry to the acre? A sheep to the acre very well.
 1931. In what condition is the bulk of your land;—is it rung or cleared? It is rung and scrubbed.
 1932. Is there any appearance of rust in this district? I never saw any sign of rust in this district.
 1933. Mr. Chanter.] What class of wheat is sown? Purple straw is the most suitable for this climate.
 1934. How many permanent hands have you on the estate? About five; that is the average for the twelve months. Last year I had thirty hands clearing. I have 1,000 acres cleared for crop this year.
 1935. If the railway were brought within a distance which would suit your estate, do you think the amount of agriculture would be increased? Yes; my intentions were to cultivate 1,000 acres next year, to put it under crop and sow lucerne, then to clear another 1,000 acres and so on, until we had it all sown with lucerne, and then to fatten sheep and truck them; but without a railway I could not manage it.
 1936. Does lucerne grow well? Yes; it will run seven or eight sheep to the acre.
 1937. Chairman.] Have you much knowledge of the farms surrounding your place? Yes; a good deal.
 1938. How are they carried on—in an advanced style of agriculture or a primitive style? Some are, and some are not.
 1939. According to their means? Yes.

Mr.
H. Hollibone.
26 Mar., 1895.

- Mr. Francis William Gibson, farmer and grazier, Trundle, sworn, and examined:—
 1940. Chairman.] Where is your holding? It is situated 10 miles to the north-north-east from here.
 1941. What is its extent? In conjunction with my brother I have 5,200 acres.
 1942. Mr. Chanter.] How long have you been in the district? Six years.
 1943. In what condition was the land when you selected it? Pretty rough, heavily timbered country, and scrubby.
 1944. What class of timber was growing? Box, pine, and oak, and varieties of scrub.
 1945. What is the cost of ringbarking and scrubbing? On an average about 2s. an acre. That is the first cost, but it requires doing again after a year or two.
 1946. What stock would it keep when you got it into its natural state? About one sheep to 8 or 10 acres.
 1947. What does it keep now? We are carrying a sheep to the acre now.
 1948. Do you think that, for grazing purposes, it has reached its maximum position? It will improve further, I think.
 1949. Do you cultivate any of your land? Yes; last year we had 190 acres under wheat.
 1950. What was the result? It averaged 17 bushels.
 1951. In what month did you sow? In different months, some early and some late, from the beginning of April till the end of June.
 1952. What was your experience of that sown in April compared with that sown in June? The early sowing was good, and the later sowing was bad. I had some of over seven bags to the acre, and the other went down to two bags.
 1953. You would not sow late again? I would. There is a chance of getting a crop, and it acts as a fallow.
 1954. You originally lived in the Berrigan district? Yes; adjacent to it.
 1955. What is the character of the country here, in comparison with that at Berrigan, from an agricultural and grazing point of view combined? I think it is equally as good, if not better; when it is in the same state of improvement. Of course it is not improved as Berrigan is at present, but the soil is as good, and the rainfall is better. My experience is, that here we can grow as good crops, and carry more stock than there.
 1956. Do you think, if railway facilities are given to the residents of this district, agriculture will increase largely? I think so.
 1957. Is it in consequence of the distance from the railway at present, that there is so little agriculture entered into? Yes; there are lots who would go in for it, but they are kept back by the distance from the railway.
 1958. Do you know the nature of the country between Parkes and Condobolin proper? No; but I have touched portions of it here and there.
 1959. You do not know that portion from Bogan Gate to Condobolin? No.
 1960. Do you know the country from Trundle to Condobolin? Generally speaking, I do. I have not followed the route, but I have a fair idea of the quality of the land.
 1961. Do you know the country between Trundle and Parkes? Yes.
 1962. Do you know the country starting from a point 12 miles west of Parkes, and then going through Treweek's Gap? Yes; I know it.
 1963. How does that country compare with the country which has been described to the Committee this morning? It is very similar—good agricultural land.
 1964. How does it compare in the matter of levels? I think, if anything, it is the more level of the two, with the exception of Treweek's Gap.
 1965. How does it compare with Bogan Gate and Trundle? It is very similar; there are no big creeks, no heavy hills, and no heavy gradients.
 1966. Do you think the Crown would be justified in constructing a line to cost £150,000;—would they get a return, on the completion of the line, of £9,000 or £10,000 per annum, to cover interest and working expenses? I think they would.
 1967. This line would not affect your land? No; I lie away to the north of it.
 1968. Then, on the whole, you favour the line coming to Trundle, and then on to Condobolin? Yes; it would benefit a large population, and would go through good land all the way, and, with the exception of Treweek's Gap, it is all fairly level.
 1969. Do you know the Crown lands of Burrawang leasehold? No.

Mr.
F. W. Gibson.
26 Mar., 1895.

Mr. F. W. Gibson. 1970. Presuming the land is similar there to what you hold yourself, do you consider a permanent settlement of selectors could be placed upon it, by restricting the area to 640 acres and charging 1s. per acre for it? It might be placed there. It all depends upon the quality of the land.
26 Mar., 1895.

1971. I am presuming that the land would be equally as good as your own;—do you think that a permanent settlement could be established there under the special area system? I think it would be some time before it is taken up.

1972. If it were taken up, do you think the people would remain there? They might.

1973. Do you think, under the existing conditions, and the low price of produce, settlement will continue in this district if selectors have to pay more than £1 an acre, by deferred payments, on their land? I do not think so. I think £1 an acre is too much in these times.

1974. You are of opinion, then, that the special area system will not result in the establishment of a permanent set of collectors on the soil? Of course it all depends on the price of the land and the amount they are allowed to take up.

1975. It cannot be less than 30s. an acre by law? I think 640 acres is not enough.

1976. And it cannot be more than 640 acres by law? That is only my opinion, of course.

1977. I ask you this question as one who has had considerable experience, because it has been stated that a permanent settlement can be established upon those Crown lands under the special area system? It is possible they could. At the same time there are Crown lands to the north as well as at Burrawang. There is almost an equal amount of Crown lands to the north.

1978. How far to the north? Starting within 3 miles of Trundle. There is all the Troffs country and Murrumbogie.

1979. Within 20 miles of Trundle? Yes.

1980. I suppose you would have no objection, if the line were brought to or near Trundle, to consent to pay a local rate? No; I would only be too pleased to do it, until it was shown that the line would pay.

Mr. Thomas Carey, grazier, near Trundle, sworn, and examined:—

Mr. T. Carey, 1981. *Mr. Molesworth.]* What distance are you from Trundle? Fifteen miles north.

1982. What is the extent of your holding? In conjunction with my brother, 7,000 acres.

26 Mar., 1895. 1983. To what use do you put it? Grazing only.

1984. To where do you send the products of your station? To Parkes.

1985. Is your ground not suited for agriculture? Grass, pretty well all of it.

1986. What is the reason you do not care to go in for agriculture? It is too far from the railway. We are 44 or 45 miles from Parkes.

1987. How far do you think it would suit you to convey your wheat? I would not care about carting more than 20 miles.

1988. Do you know much of the country between Parkes and Condobolin *via* Trundle? No; but I have travelled between here and Parkes.

1989. Have you any additional evidence to give, with regard to the future of the country, to what has already been given? No; only I think the line should be constructed very cheaply. I have had a little experience in railway embankment work, and I think this line, on account of the nature of the ground, could be made very cheaply, as far as the embankments are concerned. It would require very little ballast, and I think the sleepers could be got within 20 miles of the line.

1990. In a deviation *via* Trundle would there be any embankments of a serious character to provide for? No.

1991. What would be the highest? I think the highest would run from 1 foot to 10 inches.

1992. Would there be much of that? That would be about the highest, unless there were some little creeks.

1993. Would that frequently occur? No; it is a light line which would require practically no embankments. Of course, where the soil is deep an embankment of about a foot might be made.

1994. What is the extent of the wool you sent from Parkes station last season? Over 108 bales—about 16 tons.

1995. Supposing the lines projected by the Government were constructed, would it bring you within easier access of railway communication? It would be about 30 miles from our place.

1996. How far are you now from Parkes? Forty-four miles.

1997. You would save a distance of 14 miles? Yes; but that would not be worth considering. I think we should still go to Parkes.

1998. Do you know anything about Treweek's Gap? I do not think that is any consequence, from what I remember of railway embankments. Any embankments I had to do with were on the level plain country between Jerilderie and Narrandera.

1999. Do you think, if you could come within 20 miles of the railway, you would be induced to go in for agriculture? Yes.

2000. What would you be likely to grow? 400 or 500 acres at least—probably double.

2001. What would you put in? Wheat for a few seasons, with a view to eventually laying it down with lucerne.

2002. How far north of Trundle does the close settlement exist? It runs 30 miles or more north of Trundle. It is all selected with the exception of two small leaseholds of 15,000 or 20,000 acres.

2003. Then you think it would be an advantage to yourself and others north of Trundle if the line were deviated in that direction? Yes; I am certain there would be a considerable acreage under cultivation—thousands of acres. I know two of my neighbours who would put in 500 or 600 acres.

2004. *Chairman.]* When the railway from Molong to Parkes was under consideration, the general tendency of the evidence was to the effect that, if that line was constructed, agriculture would be much more largely gone in for. Has that been the case since 1890, when you gave evidence? Yes; there has been more cultivation gone in for, but nothing to what it would be if there were a line here.

2005. You are from Victoria? Yes.

2006. Have you found coming here advantageous to you? Yes; the land here is much better. It will carry a double number of stock, and it seems to be far superior for cultivation.

Mr. William H. Cannon, grazier, Bullock Creek, sworn, and examined:—

2007. *Chairman.*] Where do you reside? About 25 miles north from here, on Bullock Creek
 2008. Is there much settlement around you? Yes, pretty well; 2,560-acre selections.
 2009. How many selectors are there around you? Thirty or forty.
 2010. What is your holding? 10,000 acres; there are four brothers.
 2011. How do you use your land? For grazing principally.
 2012. What stock have you upon it? Sheep and cattle.
 2013. How many sheep? 10,000.
 2014. How many cattle? Twenty-five to thirty.
 2015. Have you gone in for agriculture? Not there; we only go in for 25 or 30 acres for our own use.
 2016. What are the capabilities of the district as regards agriculture? For wheat, from 18 to 20 bushels per acre.
 2017. Do you think the soil well suited for agriculture? It is well adapted for it.
 2018. Have you any disposition to change your land from grazing to agriculture? Yes; we are prepared to sow 1,000 acres there. We have a good deal ready for agriculture now, and about £500 worth of implements, all new.
 2019. How far are you from Narramine Station? About 54 miles.
 2020. Have you ever worked this out: Take 1,000 acres and use it for sheep-farming, and take 1,000 acres and use it for grain-growing; with average seasons, and a fair price for both products, how would it work out? I have never worked it out, but I have an idea there would be a vast difference between the two in favour of agriculture.
 2021. Supposing wheat were 2s. 6d. a bushel? There would be 18 bushels to the acre, and one sheep to the acre. You would not get more than 2s. 6d. to 3s. for your wool.
 2022. So that the advantage would be in favour of agriculture? Yes.
 2023. What inducement do you want to make you go in for agriculture; you have your land already, regardless of any railway? We want railway communication. With the low prices ruling, and the distance of carriage, it does not pay. For the last three years we have been cropping 500 acres at Wollondillon.
 2024. How has the distance affected you? The Narramine Station is 32 miles from Wollondillon, and the place where I reside is 54 miles.
 2025. Thirty-two miles is not a great distance to carry produce? But that country is not as well adapted to growing wheat as Bullock Creek. It is heavy myall country. It is not nearly so productive, and not so easy to work—in fact, you cannot work it.
 2026. Opinions seem to vary very much about carriage; one witness tells us that if he once gets his load upon the dray, an extra 10 or 15 miles is nothing? A lot of carriers have told me that.
 2027. It seems very strange? We have paid for the carriage of 30 tons this last season to Narramine, and when the wool was finished, and we started the wheat, the carriers said they would just as soon take ours 32 miles as take others which were 8 or 10 miles nearer.
 2028. What did you pay from Narramine? One shilling a bag for the wheat. Nine bags of wheat were reckoned as a ton—that is 9s. a ton—and the wool 30s. The teams were idle at that time, and they would just as soon carry it as do nothing.
 2029. Your land is carrying a sheep to the acre now;—is that a fair average for a droughty season? No, we shall have to reduce that very much. If we have three or four months' dry weather we shall have to reduce. I have been six years in this district, and during that time we have carried 10,000 sheep.
 2030. You would have to cart your produce 25 miles at least if the railway came to Trundle? Yes, according to the way I go at present; but I might get a few miles shorter. We would be quite willing to crop 1,000 acres if we had a railway to Trundle.
 2031. What about paying special rates if the railway were extended; would you be disposed to pay a little more for your produce? I think we would be satisfied to pay a little more.
 2032. How do you get on for water? We have dams and tanks. We have 9 miles frontage to the Bullock Creek, and there are three large dams in it.
 2033. Have you gone in for lucerne cultivation? We have very little, but we intend to go in more extensively for it.
 2034. With water, I suppose you could grow it? Yes, we could irrigate it; but it will grow without water, although not quite so well.
 2035. Have you been farming in this country all the time? No; I have been all my life farming in Victoria. I was sixteen years about Rochester and Goulburn Valley, and a few years about Berrigan.
 2036. What distance were you from railway communication there? The first year we were 40 miles, the next year 20 miles, and the third year 6 miles.
 2037. And that ended in your clearing out;—the nearer the railway came the worse you found it? There is no chance of clearing out here. I like the country too well.
 2038. Why did you clear out of Victoria? Because I got larger and cheaper territory here. The holdings were small in Victoria—300 acres—and land was dear at that time.
 2039. Do you know the country about Berrigan? Yes; I lived near there.
 2040. How does the country which you are occupying compare with the Berrigan country for agriculture? I think this is better adapted for wheat-growing. It is a deeper and richer soil, easier worked, and there is a better rainfall. The rainfall is 4 or 5 inches better, and as I say the soil is deeper, and the deeper the soil the better the country is adapted for growing wheat.
 2041. Is there anything else you would like to state to the Committee? I would urge the construction of the line *via* Trundle for the following reasons:—1st. A greater number of landholders would derive benefit by it, and thereby encourage them to cultivate and work land that is now almost valueless. 2nd. The land within a radius of 30 miles north of Trundle is specially adapted for wheat-growing, besides being capable of producing almost any other cereal. I can speak from experience that potatoes have been produced here equal in yield and quality to those obtained in the potato-growing districts of Victoria. Having been for the past twenty years following farming and grazing pursuits in Victoria and New South Wales, I can assure you there are thousands of acres of resumed land in this district equal to the famous Goulburn Valley land, Victoria, and it is not being selected because of its being too far from a railway. 3rd. Another most important industry could be promoted, namely, dairy produce. We have over 100 head

Mr. W. H.
Cannon,

26 Mar., 1895.

- Mr. W. H. Cannon. head of superior cows which are at present only rearing their calves, whereas their milk could be utilised in making butter and cheese, if we had a convenient way of disposing of the produce. We intended going in extensively for cultivation, and with that object in view purchased upwards of £500 worth of implements and machinery. At present we find that after paying carting such a distance, and the low prices, we are not compensated for the trouble of putting in the crop. Now, if we had a railway at a convenient distance we could cultivate 1,000 acres, and make a profit even at low prices; and my neighbours are also prepared to cultivate largely. There are 60,000 acres of leasehold land on the Burra pastoral holding. There is also a large quantity of leasehold land on Jumble Plains and Melrose Plains, and other adjacent runs, which will be all open for selection at the expiration of lease. There are about 60,000 acres of available resumed land within 25 miles from here, as good as any of the land sold for £14 to £15 in the Goulburn Valley. About 7,000 acres were selected a couple of weeks ago.
- 26 Mar., 1895. 2042. Can you tell us what area of holdings is necessary for a man, so that he and his family, combining a little farming with sheep raising, may subsist upon it? He could not do it on less than a full lot of 2,560 acres.
2043. *Mr. Chanter.*] If a railway line were brought to Trundle, do you think this 70,000 acres of land upon the resumed area would be selected? It is a matter of general conversation amongst the people, and those who can select, that they wish the railway were here, as they have their eye upon it. I have heard a gentleman say that every acre, excepting a few hills, will be taken up within a fortnight.
2044. When does the leasehold portion expire? In about five years.
2045. Then, your opinion is that this 70,000 acres available for selection, being on the resumed portion, is only remaining unselected in consequence of there being no railway communication? Yes; it is exactly in the centre, between Parkes and Forbes and the Narramine railway. It is 50 or 60 miles from any railway.
2046. From your knowledge of the area is it fit for settlement? Yes; the biggest part is—there is some beautiful country. I desire to state that the principal part of the produce from the Bogan River would come to the Trundle railway station, not because it would be nearer, but on account of this being a far better road. There are a lot of rivers, creeks, and bad, heavy country going towards Narramine, and nearly all the principal part of the produce would come from Wallanbillan this way.

Mr. Thomas Loby, grazier, Bullock Creek, sworn, and examined:—

- Mr. T. Loby. 2047. *Chairman.*] Where do reside? At Bullock Creek, about 27 miles to the north from here.
- 26 Mar., 1895. 2048. *Mr. Molesworth.*] You are a neighbour of Mr. Cannon, the last witness? Yes.
2049. What is the extent of your holding? About 5,000 acres.
2050. Is it stocked principally with sheep? Sheep and cattle.
2051. How many? Five thousand sheep, and fifty head of cattle, and twenty head of horses.
2052. I suppose you send your wool to the Sydney market? Yes; by way of Narramine.
2053. Are you nearer to Narramine than to Parkes? Yes.
2054. Is there much difference? Yes; a difference of 15 miles in favour of Narramine.
2055. What quantity of wool did you send away last season? Nine tons.
2056. Is your land suitable for agriculture? Yes, all of it.
2057. Why have you not adopted agriculture? The carriage is too far.
2058. If a line were constructed to Trundle, do you think you would be induced to go in for cultivation? Yes, and my family too.
2059. What would you feel disposed to cultivate? Over 600 acres between us, principally wheat and oats. When I first went to Bullock Creek, I sowed some English barley, and obtained about 70 bushels to the acre. Since then I have been growing wheat, and have obtained from 25 to 30 bushels to the acre. I have grown it principally for hay and private use.
2060. Do you think it would pay you to cart your produce to a station at Trundle? I am sure it would.
2061. A distance of 27 miles would not be an effective barrier? No; it saves 30 miles on the trip. If we had the railway at Trundle, I would cart all my produce to Trundle.
2062. And you believe you would be induced to lay down large quantities of land in cereals? Yes; we grow two crops of potatoes there in a year, and it is as good a country as any I have ever been in for wheat.
2063. How many tons of potatoes do you get to the acre? Five or six.
2064. Do you market any of it? No, it is only for private use.
2065. Have you no local market for any of your produce? No. Fifield is the only place which has cropped up, and I have never been there.
2066. Where is Fifield? Twenty-five miles from my place, in a south-westerly direction.
2067. Is there a large population there? There was, but many have left lately. It has only been opened a couple of years. It is a mining centre; there is not much business doing owing to the want of water.
2068. If they had water business would revive? Yes; there is shallow ground there which is spoken of very highly.
2069. If the line were constructed to Trundle, it would be of value to you and your immediate neighbours? Yes; it is 45 miles to Narramine, and 60 miles from Parkes.
2070. *Chairman.*] You heard the evidence of Mr. Cannon? A portion of it.
2071. Do you agree with what you heard? Yes.

Mr. Evan Jones, farmer and grazier, Bullock Creek, sworn, and examined:—

- Mr. E. Jones. 2072. *Chairman.*] Where do you reside? Three miles east of Bullock Creek.
- 26 Mar., 1895. 2073. *Mr. Chanter.*] How far is that from Trundle? Twenty-five to 26 miles north.
- 2073½. What is the size of your holding? Between myself and the children it is 7,000 acres.
2074. How many children have you? Two. There are three selections—one for each child, and one for myself.
2075. What condition was the land in when you took it up? Green timber, and plenty of scrub.

2076. What have you done in the way of improvements? We have fenced it in, put tanks upon it, and we have rung it all once; but a lot of it wants scrubbing again. Mr. E. Jones.
2077. You have scrubbed it? Not all of it.
2078. How many sheep to the acre would it carry when you took it up? About one sheep to 3 acres.
2079. How many will it carry now? About one sheep to the acre.
2080. You have about 7,000 acres altogether? Yes.
2081. Have you cultivated any of it? Yes; about 10 acres for our own consumption.
2082. What do you grow upon it? Wheat, oats, and potatoes.
2083. How much wheat did you get to the acre? We never threshed any, because we had no market to take it to; but it was as fine a crop as any man could wish to look at.
2084. How many bushels do you think it would give? From 35 to 40.
2085. What about the oats? A good crop of oats. If threshed and properly handled it would give from 40 to 50 bushels to the acre.
2086. Have you grown potatoes? Not to any extent; only for our own use.
2087. Did you keep account of the number of bags you got to the acre? We had only a small piece, a chain square, from which we obtained an average of seven bags per acre.
2088. I suppose your reason for not growing more than you required for your own consumption was because you were too far from the railway? We have no outlet for our produce—we have no market. I have, lying idle, a plant with which I could grow 200 or 300 acres of crops; but the margin between profit and loss is so small that the cartage absorbs the lot.
2089. If a line of railway were constructed to Trundle, would you not go in for agriculture? My position is this: The plant would be at work, and although the profits would not be much, I should not be on the losing side. Wheat is so cheap, compared with what it used to be, that everything is cut very fine.
2090. At what do you value your agricultural plant? About £200.
2091. With the labour strength you have, and the machinery you have, what acreage could you put under crop? Between 200 and 300 acres.
2092. Would you be prepared to utilise the machinery? That is just what I am waiting for.
2093. And if you could reach a railway station as near as Trundle, you would utilise your machinery, and produce from it? Yes.
2094. What profit do you get per acre from grazing sheep? From 1s. 9d. to 2s.
2095. Is that the net profit? Yes.
2096. Supposing you used your land for wheat, how much profit would you get from it? From 12s. 6d. to 15s.
2097. Then it would be to your interests to go in for wheat-growing? Yes.
2098. The only drawback now is the distance you have to cart it? The cartage more than eats the profit.
2099. You are an experienced farmer? I have been farming since 1856.
2100. You were farming in one of the best districts in New South Wales? Yes, and in one of the best districts in Victoria, too.
2101. How do you compare the land you have now with what you had before? I consider that what I have now is better than what I had before. It is better land for agriculture and better land for grazing. The soil is of a different character. The one was a heavy clay, and a terrible rainfall must come before there would be any good results, whereas half the amount of rain would do here. In addition to that, there is more rainfall here than there was there.
2102. Then, on the whole, you consider that the property you hold here is, for agricultural purposes, superior to that which you held before? More than double.
2103. Supposing the price of produce remains at 2s. a bushel, and the railway line goes to Trundle, would you still continue to grow wheat? We would; we would grow it for a double purpose. We would grow it to clear the land and lay it down in lucerne, which we could not do as things are now, because our nearest railway is Narramine, which is 55 miles away, and Parkes is 60 miles away. Trundle lies about 26 miles from us, and we have a terrible advantage in 50 miles saving on a trip.
2104. Is your land of a similar character to that around Trundle? Something similar. There are thousands of acres between here and where I live fit for agriculture.
2105. There is a similarity in the soil? All scrub land is somewhat similar, except on patches. There are a few stony patches and some gravelly stuff.
2106. If the railway is constructed how much tonnage would you, under the circumstances you have explained to the Committee, be prepared to supply to the railway? My railway bills have been paid at Narramine during the last five years, and they have amounted to over £200 a year.
2107. What tonnage would you be prepared to send to Sydney? A considerable amount.
2108. How many bales of wool did you send last year? Only fifty-five last year, whereas there should have been sixty-five; but this part of the country, between here and Bullock Creek, is very scrubby, and the greatest drawback in this locality is the wild dogs, which kill the sheep. I think there is a lot of two-legged dogs amongst them. I consider my loss last year was over ten bales of wool.
2109. Because of the dogs? Yes.
2110. What do you do with your fat stock? We sell them on the ground.
2111. Did you send any to Sydney? We did not send any from here, because if we had we should very likely have had to send a cheque to release them.
2112. I suppose that would be a sufficient check upon you sending them? Yes.
2113. Then we may assume that as far as your contribution to the railway is concerned, you will go in for agriculture to the extent of 200 acres, and the produce, which you have been in the habit of sending to Narramine, would be sent to Trundle instead? Decidedly.
2114. Would you like to make a statement to the Committee giving any other information you may possess? I would not be surprised to bring 1,000 bags of wheat to Trundle.
2115. That is, you would endeavour to do so? I do not think I am far out in my calculation when I say there would have been 1,000 bags of wheat off 200 acres. I am quite confident of the country. The rainfall is quite sufficient to grow almost any kind of vegetable, and, if the railway comes by way of Trundle, it will give us all encouragement to go to work, because we shall be able to make a trip in three days instead of in eight or ten days.

26 Mar., 1895.

Mr. E. Jones. 2116. Will you compare, for the information of the Committee, the two roads—the road from your property to Trundle, and the road from your property to Narramine—that is, from a cartage point of view;—
26 Mar., 1895. which is the better route of the two upon which to cart produce? The one is 53 miles, and the other is 25 or 26 miles, and the land on both sides in wet weather is very bad. The greatest difficulty on the Narramine is got over, and that is the bridge over the Bogan. At the same time the distance remains all the same. The distance is double to Narramine. We are bound to come to Trundle and save 50 miles a trip. 2117. Then, as far as the road is concerned, it would be infinitely to your interests to come to Trundle instead of to Narramine? Decidedly.

Mr. Arthur Clifton, grazier, Rosewood, sworn, and examined:—

- Mr. A. Clifton.** 2118. *Chairman.*] Where do you reside? At Rosewood.
 2119. Between Trundle and Bullock Creek? Yes.
26 Mar., 1895. 2120. How far are you from Trundle? Twenty-two miles north of Trundle.
 2121. *Mr. Gormly.*] What business do you carry on? Principally grazing.
 2122. Are you engaged in any other business? Farming.
 2123. What is the area of your holding? 5,000 acres.
 2124. Do you keep sheep? Yes.
 2125. Where do you send your wool? To Sydney *via* Parkes.
 2126. Have you cleared any of your land? Only about 2½ acres for my own use.
 2127. If the railway were constructed, would you be likely to go in for agriculture? Yes.
 2128. Is your land heavily timbered—would it be easily cleared? Some of it is pretty heavy, some of it is open.
 2129. Fit for agriculture? Yes.
 2130. Sufficiently level to cultivate? Yes.
 2131. Have you had any experience of agriculture in other districts? Yes.
 2132. Do you believe your land, and that in the district, is suitable for agriculture? Yes; it is far in advance of what I had on the Murray.
 2133. Have any of your neighbours kept a rain-gauge? No.
 2134. What part of the year does the rain usually fall? Christmas, generally, is the heaviest time, and the spring of the year.
 2135. At what other times do you get rain? Last year we had rain from the beginning of autumn right on to September, which was the last heavy fall we had.
 2136. *Mr. Chanter.*] Was your holding in a natural state when you selected it? Yes.
 2137. What would it carry then? One sheep to 8 acres.
 2138. How long have you been there? Five years.
 2139. Have you ring-barked? Yes.
 2140. What is its present carrying capability? Over one sheep to the acre.
 2141. Does it carry them well? Yes; and there are twenty head of cattle, and twenty-five horses.
 2142. If the proposed line is constructed to Trundle, would you be prepared to go in for agriculture? Yes.
 2143. To what extent? 200 or 300 acres.
 2144. If you found it more profitable than grazing would you increase it? Most likely I would.
 2145. You would be 22 miles distant from the railway? Yes.
 2146. You have heard the evidence given by witnesses as to the net profit from sheep? Yes, 3s.
 2147. Do you agree with that? Yes.
 2148. You have also heard the evidence given as to the profit from wheat? Yes.
 2149. If railway facilities were afforded, would you feel inclined with others to go largely into agriculture? I would not care to go too largely into it. I have done a good bit of it, and have never made much out of it. I would go in principally for lucerne.
 2150. That is with the view of getting more stock? Yes.
 2151. But you are prepared to give the produce from 200 acres to this line? Yes.
 2152. Where do you send your produce now? Parkes.
 2153. And it goes to Sydney? Yes; this is the only year I have sent to Parkes. It used to go to Narramine across to Bogan.
 2154. How many tons of wool did you send this year? Fourteen.
 2155. Have you sent any stock to Sydney? Not yet.
 2156. Do you propose to continue sending your wool *via* Parkes? Yes, at present.
 • 2157. So that the extent of your contribution to the line would be your 14 tons of wool, and whatever you could produce from 200 acres of land? Yes.
 2158. *Mr. Gormly.*] Have you any working horses or agricultural implements to enable you to go in for agriculture, if the line were constructed, within the next twelve months? Yes.
 2159. Have you draught stock, horses, &c.? Yes.

Mr. George Hutton, grazier, The Troffs, near Trundle, sworn, and examined:—

- Mr. G. Hutton.** 2160. *Chairman.*] Where do you reside? At the Troffs, 8 miles north-west of Trundle.
26 Mar., 1895. 2161. How long have you been carrying on grazing? About twelve years next May.
 2162. I believe you could give the Committee reliable information as to the rainfall? Yes; I have kept the records since 1883. When I came to the district the first question I asked was: What is the average rainfall? They gave it to me as an average of 18 inches from 1874 to 1882; but they did not leave me the records. From 1883 to the present time I have kept the record myself. Supposing they were right in their average of 18 inches, the average from 1874 to 1894 has been 21.9 inches.
 2163. You have had experience, during the twelve years you have been here, of sheep-raising;—will you tell us what your ideas are as to the carrying powers of this country? When we first came here, with the country in its unimproved condition, taking it in fairly good seasons, I reckoned, on an average, that it was 6 acres to a sheep. With ringing and dividing into small paddocks, I daresay you could carry, on a great portion of the country, a sheep to the acre. On our own country, where we have large paddocks, we always reckon about one sheep to 1½ acres. That would not be in bad seasons. 2164.

2164. That would be in good seasons? In average good seasons.
 2165. Where do you send your wool? To Parkes.
 2166. Do you know the projected line from Parkes to Condobolin, *via* Bogan Gate; if that line were constructed would you send your wool straight to Parkes or to the nearest point at which you would intercept this line? It would depend on what the carriage was between the nearest point and Parkes. It would make a difference to me of 20 miles if it were sent to Bogan Gate.
 2167. It would take 20 miles off your distance by waggon? Yes; but some people have told me that when once the load is on 10 or 20 miles does not make much difference.
 2168. You have had considerable experience as a grazier here and in Queensland? I have been connected with it about twenty-five years.
 2169. Is that your experience with regard to carriage? Yes; 10, 15, or 20 miles makes very little difference. It is the handling which is the main point.
 2170. Especially if there is plenty of feed along the road? Yes.
 2171. Have you taken any interest in the construction of this railway? I have helped my district as much as I could.
 2172. What is the nature of your holdings? 64,000 acres of Crown lands and 960 acres of freehold.
 2173. How long is that 64,000 acres secured? We shall have five years after next June.
 2174. Is your country suitable for agriculture? Parts of it. A good deal of the southern half; but a great deal which looks good for agriculture has very little depth of soil really. Where the homestead is it is nice open plain, but 18 inches down we come to gravel, and it wants a lot of rain to keep anything growing there. I had a cultivation paddock close to the homestead, but had to give it up.
 2175. Is that exception as far as this district is concerned? It is only a small patch of limestone which runs across it. I do not think it goes anywhere else.
 2176. The evidence has been unanimous as to this being a kind of Eden, that your remark comes somewhat as a surprise? It is only a little flaw; the moment you get off it you get upon good agricultural country.
 2177. Then this is only a strip across the run? Yes.
 2178. Do your views, as regards the agricultural properties of the country, agree with those of the bulk of the witnesses? Yes.
 2179. I suppose, looking at the matter from a selfish point of view, you would rather not see the country split up so small? Undoubtedly.
 2180. Nevertheless, you think the country is suitable for agricultural purposes? Yes.
 2181. Have you gone in for any agriculture on any good land? We have some now, but it is rather stiff soil.
 2182. Have you gone in for growing produce? Only a little hay.
 2183. Have you found it necessary here to go in for the storage of hay or feed? Yes; we always try to keep a little.
 2184. Hay or natural grasses? I have stored natural grasses.
 2185. Was it a success? It was in bad seasons, and it was very difficult to get. It became too dry, as a rule, before we got it. The horses ate it readily enough, but I do not think there was much sustenance in it; I think we cut it too late. In cutting natural grasses for hay you ought to cut them when in flower.
 2186. Have you gone in for lucerne-growing? No.
 2187. Have you gone in for ensilage? No; I have seen pieces of lucerne growing in several places, and it always seems to do well.
 2188. Although the country appears to be somewhat of a dry character, have you ever had to send your stock away for feed? No; I could not have sent them because there was no water.
 2189. You could not travel them? No.
 2190. In other inquiries of this character, I have heard witnesses say, that a railway would be a great advantage in dry seasons to starving stock. Do you think the proposed railway would be of any advantage in that direction? Undoubtedly, if you could get a place to which to take the stock. Droughts are not usually general.

Mr. Charles Metcalfe, storekeeper, Fifield, *via* Trundle, sworn, and examined:—

2191. *Chairman.* Where is Fifield? Twenty miles north-west of Trundle.
 2192. What population is there? About 300.
 2193. I what direction do the stores and other requirements for Fifield go? From Parkes *via* Trundle.
 2194. I suppose you have considerable communication with the residents of your immediate neighbourhood? Yes; with the miners.
 2195. Have you any extensive knowledge of the people living outside the mining area—I mean the agriculturists and pastoralists? I have a good general knowledge of the whole of the district. I have been in the district about ten years as a selector.
 2196. And your business relations bring you in contact with a number of the residents? Yes.
 2197. Do you find the population of the district increasing in number? The mining population has increased within the last two years. Two years ago there was no mining population at all. Now there are 300 hundred on Fifield alone, and fifty or a hundred in the surrounding districts prospecting.
 2198. Is it gold-mining? Gold and platinum. Tin has been found there, and worked to a small extent; but owing to want of experienced men, and want of water it was never made anything of.
 2199. Is Fifield well supplied with water? It has a good supply for domestic purposes, but for mine-workings there is no supply.
 2200. Are you suffering from the scarcity of water? There has been no dirt washed for four months.
 2201. I suppose a good portion of the agricultural and grazing settlement has taken place in this district since you came to Fifield? Since I first came to the district.
 2202. Within the last ten years? Yes; Fifield has only been in existence two years. I have been in the district itself ten years.
 2203. And the population has increased? Yes; I was one of the first selectors in the district.
 2204. Do you still hold the land you selected? Yes.
 2205. What use have you made of it? Principally for grazing purposes.
 2206. What extent of land have you? In my family there are 15,000 acres. We work it as one holding.

Mr.
G. Hutton.
26 Mar., 1895

Mr.
C. Metcalfe.
26 Mar., 1895

- Mr.
C. Metcalfe. 2207. And you have been in other districts before coming here? I came from Cookardinia.
 2208. Does this district compare favourably with that for grazing? I think it is equally as good.
 26 Mar., 1895. 2209. Have you a knowledge of agriculture in other districts? I was connected with farming in that district—produce buying—and I have an idea of what the land was there. I spent some little time on the Hawkesbury, and that is the only district I have ever known which I consider is much better than this. I know the country from Wagga Wagga through Grenfell, Young and Forbes, Molong and Parkes, and I think this is equally as good as any I have seen.
 2210. Is the settlement in this district likely to be permanent? Yes.
 2211. Have any of the holders any inclination to sell their holdings or go to other districts? No; as far I can see, they seem to be trying their best to make homes for themselves.
 2212. Do they seem to be successful? Yes, as far as the present condition of things will allow them. They are trying their best, and if they can get a reasonable market I think they will succeed.
 2213. Are the holders removing the scrub and making permanent houses and fences? Yes. Every time I ride over the district I find fresh improvements of all descriptions.
 2214. Do they seem to be of a substantial and lasting character? Yes.
 2215. Is there much difficulty in keeping the scrub in check? Yes, you want time and money to keep it down. After two years it gets a start again.
 2216. If the land were devoted to agriculture, would it be a cheap mode of keeping the scrub in check? In the long run it would, I think.
 2217. Do you think it would be effectual? I think it would.
 2218. It has been stated by a number of witnesses that lucerne has been sown in the district. Have you any knowledge of the growth of lucerne in any other district? Only on the Hawkesbury River.
 2219. Have you seen any of the lucerne paddocks cut for hay? No.
 2220. It has only been used for grazing? Yes.
 2221. Do you know how the lucerne is treated in other districts? In the Hawkesbury district they generally cut it for hay.
 2222. Then lucerne growing here is only in the experimental stage? As far as my experience goes, I think it will prove to be a permanent thing.
 2223. It grows well in dry weather? Yes; during the hot weather.
 2224. During the hot weather and during the winter? Yes.
 2225. Have you a mild winter here? From what I have seen of it, it does not grow well in the winter. Our winters are very severe.
 2226. Have you heavy frosts? Yes.
 2227. When do they commence? About May, June, July, and August are the heaviest winter months.
 2228. Have you any other information with which you would like to supply the Committee? I can give you some information as to the mining resources of Fifield, and its future prospects. Some two years ago an agitation was set on foot for an extension of the railway line from Parkes to Condobolin, via Trundle, and a trial survey was asked for. At that time the settlement in the district was purely agricultural or pastoral; but since the discovery of gold to the north-west of Trundle, about two years ago, this district has come prominently before the public as a mineral-producing field, and bids fairly to become one of the largest mining centres of the Colony. Fifield, a mining township situated 18 or 20 miles to the north-west of Trundle, is the centre of a very large auriferous and plantiniferous area. Stanniferous deposits of considerable extent have also been discovered. This large mineral field embraces the pastoral holdings of Burra Burra, Melrose Plains, Carlisle, and Murrumbogie, in the immediate vicinity of Fifield, and extends to the Bogan River on the north, and Nymagee on the north-west. All the country on the above-mentioned holdings is most highly suitable for agricultural and pastoral purposes, being of an undulating nature, and no rough hilly country is met with. The soil over this area varies considerably, but is generally found to be of a very rich nature. Fruit-trees of all varieties, as well as grain and vegetables, grow most luxuriantly wherever they have been planted, as anyone visiting the above-named homesteads may testify. At present the population of Fifield and immediate surroundings is about 300. There are thirty-six alluvial claims working, as well as a considerable amount of prospecting going on. The amount of gold produced last year was about 1,000 oz., with 850 oz. of platinum. These returns would have been greatly increased, but owing to the lead running through private property, the miners could not get on to the ground until the latter end of the year. During the last three months no washings have taken place, owing to the scarcity of water. About 1,850 loads of wash-dirt have been brought to the surface, and according to results obtained should yield about 650 oz. of platinum, and 325 oz. of gold. Platinum-mining is, practically speaking, a new industry to the Australian mining world, and should become a permanent source of wealth to the Colony. Several other deposits of gold have lately been brought to light in various parts of the district. At Lightning Creek, 15 miles to the north, on Melrose Plains, 14 miles west, and on Carlisle, 9 miles south-west of Fifield, gold in more or less payable quantities has been found; but just at present, owing to the scarcity of water, no practical work can be done. On Melrose Plains, also, a reef has been opened up showing gold freely, but as there is no machinery on the ground nothing can be done with it at present. The whole country is highly auriferous, and on Burra Burra, 12 miles north-west of Fifield, considerable deposits of tin exist, which will undoubtedly be worked in the near future. This settlement of Fifield, with its vast mineral resources scarcely yet touched with a pick, and its wide area of rich agricultural land, which will shortly be thrown open to the farmer, has before it a most prosperous future, and it now behoves us to look ahead and provide for our future wants. The proposed line of railway from Parkes to Condobolin, via the Bogan Gate, would pass too far to the south to be of any practical service to this district. On the other hand the proposed line via Trundle would pass within 12 miles of Fifield, and would be of great benefit in opening up the resources, both mineral and agricultural, of this promising district. 1,000 oz. of gold, and 850 oz. of platinum, were produced in four or five months.
 2229. If there is a good water supply, are the mineral resources likely to be thoroughly developed? Yes, that is what is keeping the place back at present. There are three other places in the locality and they cannot get on until they get water.
 2230. You have had conversations with settlers in the district, as to their intentions to increase their holdings for agricultural purposes, if the railway is constructed within reasonable distance of them? Yes. They say that if they can get a railway or a market near to them they will go in for it.

2231. Are many clearing the land for agriculture? Yes, I could mention a dozen.
 2232. Are the roads in the winter months in a bad state? Generally they are.
 2233. Is it difficult to send heavy loads from the different districts to the railway station? It is.
 2234. I suppose that on some of the travelling-stock routes there is a scarcity of feed at times? There is. I have done a good deal of droving, and I have found the roads very short of feed at times.
 2235. Is there any other general information with which you can supply the Committee? I have had 120 tons of goods carted to Fifield within the last twelve months.
 2236. From where? From Parkes. Then there is Mr. Moore, another storekeeper.
 2237. Does he do as much business as you? No. He estimates his cartage at 5 tons per month.

Mr.
C. Metcalfe.
26 Mar., 1895.

- Mr. Henry Hollibone, estate manager, Trundle, sworn, and further examined:—
 2238. *Chairman.*] You are well acquainted with the country to the north of the projected line of railway? Yes.
 2239. Between Trundle and the projected line? Yes.
 2240. Will you give the Committee the benefit of your knowledge of the country as regards its character for railway construction, and also, as regards the land which will be available for selections, sooner or later, on the Burrawang Run? A great deal of the Crown lands of Burrawang is too wet for agricultural purposes. All the country north of the Government line, on the west of the Black Range, is agricultural land; but all east of the Black Range is wet lime country—that is on both sides of the proposed line.
 2241. How far would that extend? From the Black Range back close to Bogan Gate, a distance of 15 miles.
 2242. Do you know sufficient of the country to be able to make the general statement that it is unfit for agriculture? Yes; I have travelled over it for the last eight years continually, and it is not fit for agricultural purposes, excepting little spots here and there.
 2243. In what way is it deficient? It is low-lying and wet. Most of it is a sort of black clayey land—myall swampy country.
 2244. How would it answer for the purposes of railway construction? Not at all. I should think there would have to be an embankment made through that country.
 2245. You think a surface line could not be laid without danger from floods? I am sure it could not—not until you crossed Yarrabundi.
 2246. Does that objection, as regards railway construction, apply to the portion which is marked for the railway line? Yes; it touches it below the Bogan Gate, and runs with it right to the Yarrabundi Creek and the Black Range.
 2247. Do you say that that is local stagnant water? Yes. There are no river floods; but it comes from the rises and creeks from the back country.
 2248. Would not box-drains, at intervals, provide for any damage to the line? I do not know that the floods would be great, but the country is low.
 2249. What depth of flood have you seen there? About 2 feet.
 2250. As much as that? Yes; all the swamps are 18 inches or 2 feet, and in some places more.
 2251. Do you undertake to say that you have sometimes seen the route of the proposed Government line, running through Burrawang Station to the east of the Black Range, flooded to a depth of 2 feet? Yes.
 2252. To what extent on either side of the Government line? Four miles on the north side, and 7 or 8 miles on the south side.
 2253. How far do you think that would extend along the line? About 15 miles. I should say it was 15 miles from the Black Range to Bogan Gate.
 2254. When did you last see it in that condition? Two years ago.
 2255. Is that state of things exceptional? It is not flooded every winter. The last five winters have been very wet. There is a clear road from Bogan Gate to Condobolin, and that road is impassable three out of the twelve months. Even the mails have had to come here in order to get to Parkes, instead of keeping to the surveyed clear road.
 2256. How far is that road from the projected railway line? It crosses the projected line just below the Bogan Gate, and is on the side of it all the way to Condobolin.
 2257. The railway line is on the south of the road? No, the road is on the south of the line.
 2258. Is not the railway line placed sufficiently north to escape that flooding which occurs on the road? No. It spreads out before it gets to where the proposed line is for a distance of 3 or 4 miles.
 2259. And you have seen it 2 feet under water? Yes, in the swamps—the low wet swamps.
 2260. *Mr. Chanter.*] What is the character of the country south of the projected line? It is plain country—wet plains and myall country.
 2261. Suitable for dairying? It is not bad grazing land. Parts of it are suitable for dairying, but not for agricultural purposes.
 2262. What is the description of the land from the Black Range towards Condobolin? First-class agricultural land with the exception of little stony ridges every few miles.
 2263. Are they there to any extent? No; they are only belts of stone which run through the country.
 2264. If a line were made by way of Trundle to Condobolin, how far would settlers be from that line? I think the nearest point would be 1½ to 2 miles.
 2265. That is, west of the Black Range? Yes.
 2266. And they would be as well served by a line from Trundle to Condobolin as by one from Condobolin to Parkes? Yes; the only difference is that the line might split up the country the other way, but they would be only within 1½ miles of the nearest point this way.

Mr.
H. Hollibone.
26 Mar., 1895.

- Mr. John Doyle Williamson, farmer, near Condobolin, sworn, and examined:—
 2267. *Mr. Molesworth.*] Where do you reside? In the parish of Byong, between here and Condobolin.
 2268. What distance from Trundle? Fifteen miles.
 2269. In what direction? West.
 2270. How far are you from Condobolin? Twenty-five miles.
 2271. How far are you in a direct line from the proposed railway line? It is about 6 or 7 miles south of me.
 2272.

Mr. J. D.
Williamson.
26 Mar., 1895.

- Mr. J. D. 2272. And the projected line, if it came through Trundle, would run through your property? Yes.
 Williamson. 2273. Do you cultivate as well as graze? Yes.
 2274. What quantity have you had under cultivation this season? I gave it up. I had 50 acres ready, but I gave it up.
 2275. What hindered you from carrying it on? The distance from market communication.
 2276. Do you know the country upon the surveyed line of railway? I have seen the greater portion of it—that is, from the Bogan Gate to Condobolin.
 2277. What is it like? From the Bogan Gate it is not very good until it gets north of Burrawang, about 28 or 30 miles from Condobolin, and from there to Condobolin it is good agricultural land.
 2278. Is this country liable to flood? No; it swamps in places when the creek flows down.
 2279. Have you ever seen any portion of the line between Bogan Gate and Condobolin under water? Yes.
 2280. To what extent? Enough to stop the mails.
 2281. Can you say what area was under water? No; it is flowing water, and it branches out in creeks.
 2282. Can you say how far on either side of the line it extended? I know the Sydney mails have to come out to my place in the winter time.
 2283. When did you last see the road in a bad condition like that? Last winter.
 2284. And cannot you give an idea as the extent of the water lodged there? No; I never travelled through it. Where I have seen it extended 2 or 3 miles wide, and lower down it opens out.
 2285. Did you see it 2 or 3 miles wide in the vicinity of the proposed line? Below the line, but it backs up over the line.
 2286. Have you seen the deviation at the Condobolin end of the line with the view of avoiding that? No.
 2287. If the line has been brought up a mile or two to the north, would it avoid that flooded country? Yes; but there are more places than that where there is a flood.
 2288. Will you describe where? About the Yarrabundi Creek, 28 miles from Condobolin, and 16 or 18 miles from Bogan Gate.
 2289. And that is the most difficult point? Yes.
 2290. And you think that can be avoided by the line being brought a little further northward? They could avoid the flood, but they would have to build a culvert all the same.
 2291. For what width? Where the present line crosses it would have to be a wide one—half a mile, I think, on piles. It is low, swampy country.
 2292. You think, if the line is brought by Trundle, the whole of this flooded country will be avoided? Yes.
 2293. And you do not think there is any other means of successfully avoiding it? No.

Mr. John McFadden, post and telegraph master, Trundle, sworn, and examined:—

- Mr. J. McFadden. 2294. *Chairman.*] How long have you been here? Two and a half years.
 2295. Have you any figures to show the character of the business done here? I have made a rough calculation. The receipts from telegraph business in 1892 amounted to about £58 12s. 7d.; for 1893, to £83 13s. 2d.; for 1894, to £85 18s. 3d.
 26 Mar., 1895. 2296. What about the postal returns? I could not make them up for previous years; but for 1894 the postage stamps sold amounted to £291 11s. 9d.
 2297. Are you able to say whether that was an increase? Yes; a considerable increase on previous years; but during the latter part of 1894 the pre-payment for telegrams by stamps was brought into existence. That accounts for some of the increase; but previous to that I noticed a big increase in the sale of stamps.
 2298. Do you do any business in money orders? The commission on money orders for 1894 was £8 7s. 6d. The letters posted in December, 1891, were 476; December, 1892, 741; December, 1893, 1,142. The letters received per week are about 800.
 2299. That is about the average? Yes.
 2300-1. And that shows an increase? Yes; about twice the number there used to be.

WEDNESDAY, 27 MARCH, 1895.

[The Sectional Committee met at the "Royal Hotel," Condobolin, at 8:30 p.m.]

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

JOHN MOORE CHANTER, Esq.		JAMES GORMLY, Esq.
		EDMUND WILLIAM MOLESWORTH, Esq.

The Sectional Committee further considered the proposed Railway from Parkes to Condobolin.

Mr. Edward Barton Thornbury, surveyor, Railway Construction Branch, Department of Public Works, sworn, and examined:—

- Mr. E. B. 2302-3. *Chairman.*] How long have you been in the Railway Department? Since 1881.
 Thornbury. 2304. Were you engaged in railway work before that? Yes.
 2305. Where? On the Continent, Hungary, Switzerland, and four years in South Africa.
 27 Mar., 1895. 2306. At present you are engaged on the survey of the line under consideration from Bogan Gate to Condobolin? Yes.
 2307. Will you describe the character of the line between those two points, commencing at wherever you have started your work? Starting from the Bogan Gate, the country is very flat as far as I have gone. I have been through 20 miles. It is flat for 15 miles, and I have explored the other 5 miles.
 2308. Would that bring you right on to Condobolin? There are about 4 miles which I have not been through.

2309. What is the character of the whole of the country which you have surveyed? I think it will be Mr. E. B. Thornbury.
a very light line, with very easy gradients.
2310. What will be the highest gradient which you think would be necessary? I do not think there need 27 Mar., 1895.
be any steeper than 1 in 100.
2311. It would be the exception, I suppose, for the grades to be even as high as 1 in 100? Yes.
2312. The greater part of the line would be nominally level? You might say level. Of course, there is
a fall all the way to Condobolin.
2313. What holdings have you passed through? Starting from Bogan Gate, the holdings I have passed
through, so far, have been the leasehold portion of the Burrawang Run, and a few purchased portions
about $2\frac{1}{2}$ miles in width.
2314. Whereabouts are the purchased portions? Nearly opposite Burrawang Station.
2315. Is that held by various holders? No, all by Mr. Edols. It is part of Edols' purchased land.
2316. With regard to the rest of the line, what is the tenure of the land it passes through, so far as
you know? The line will follow the travelling-stock route for the greater part of the distance. There
may be only a few properties, close to the township here, to resume for station purposes.
2317. So that, with the exception of a small portion of Edols' purchased land, and some property close to
Condobolin, it really is all purchased land? Yes.
2318. We want you, in view of statements which have been made by other witnesses, to tell us the
nature of the country through which the direct line is proposed to be taken, so far as its liability to
flooding is concerned? The only part where it is liable to be flooded at all, is where the creeks are—the
Yarrabundi and the Gunningbland Creeks for instance.
2319. Where is Gunningbland Creek? About 4 miles west of Bogan Gate. That country is liable to
flood-waters; the country is so flat, and there is no defined channel, and it runs out all over the country
there.
2320. What length of country there would have to be dealt with by embankments, or by the line being
placed on piers? It is not easy to say how far the water spreads out in that country. It is so seldom
that there is a flood that the grasses, which generally show flooded ground, are not so distinct. It is so
rare that the ground is flooded that the grasses are not different from what they are on the driest ground.
It is hard to say how far the flood does run out, but it is not deep—never more than a foot, I think.
2321. At this particular portion of the Gunningbland Creek to which you refer, what height would the
line have to be raised to avoid damage by flood? The least height, I think, would be about 3 feet. An
ordinary timber opening requires at least 3 feet to get in good construction.
2322. Do I understand you to say that if the line, even at Gunningbland Creek, were raised 3 feet, with
occasional openings, that would be sufficient to prevent any damage by floods? I think so.
2323. Can you tell us what length of line at this particular place will have to be raised about 3 feet?
Not more than a quarter of a mile. The line could be altered a little there, perhaps, and taken down
to a more defined channel of the creek, and then the opening would not be so great. The channel of
the creek is not more than a chain wide anywhere.
2324. Do you know any portion of the direct line which you have traversed where it would have to be
embanked 3 or 4 feet high for one continuous distance of 4 miles? No; I know of no portion that I
have been over; and the only part which has not been explored is hilly country, which is still less liable
to flood.
2325. Can you tell us of any other part of the line which would require similar treatment? It might
require similar treatment at the crossing of Yarrabundi Creek.
2326. Where is that located? Between 18 and 19 miles west from Bogan Gate.
2327. What height do you think the line would have to be raised there? I have not seen a section of it,
and I have not been able to hear how much the creek does overflow there. I followed the course of the
creek, and the defined channel is suddenly lost, and the creek seems to spread out there over a flat. I
think a channel could be cut for it, which would drain the ground.
2328. What extent would that flood be? I do not think it could be much; it simply spreads over the
ground.
2329. For want of a channel to run into? Yes; and there being so little fall in the ground.
2330. Would an embankment of 3 feet be sufficient there? Quite.
2331. And about what length would that require to be embanked? It would depend a good deal upon
the fall, and the grades of the ground. Of course, we would run it out as soon as possible, not making it
longer than was necessary; but the channel of the Yarrabundi Creek is not more than a chain wide in
places, and I think 5 or 6 chains would be sufficient opening to allow for the creek.
2332. How would you cross that opening? On trestles.
2333. Is that work of an expensive character? No; it would not be expensive, because it would be so
low. There would be very little bracing required.
2334. Is there any other part of the line, which you know of, which would have to be treated in this way?
No; I do not think there is any other part. Those are the only two creeks. Then there would be the box
culverts and drains to let the water through from the upper side.
- 2335-6. It is proposed that this shall be a pioneer line at a cost of about £2,000 a mile;—would the
extra work required to get over the two creeks you have mentioned be of such an expensive character
as to materially add to that average rate of £2,000 a mile? I do not think so. There would be so much
line which I think could be done under £2,000, that it would make up for the more expensive portion.
2337. With regard to the other part of the line, will you describe the character of the country which it
will pass over? The surface generally is good hard ground, and there is no swampy country right to
Condobolin; but at about 23 miles from the Bogan Gate the line enters the travelling stock route.
2338. Is that good hard ground? Yes; a deviation of the road has been proposed near the Burrawang
Gate, and the line will keep above that deviation.
2339. *Mr. Chanter.]* That is to the north of the Burrawang Gate? Yes.
2340. *Chairman.]* Is that the deviation which is marked upon the map;—there is a considerable deviation
to the north, approaching Condobolin? Yes.
2341. What is the object of that deviation? To get out of the present marked road, which runs through
flooded ground.
2342. As far as your work is concerned, you have kept sufficiently to the north to avoid flooded country?
Yes.

Mr. E. B. 2343. There is some country we have passed over—a kind of broken clay—is that the ground you have to treat as flooded country? No; I was referring to the country where the back waters from the creek and the river come up to the road. That is outside the boundary of the Burrawang Run.

27 Mar., 1895. 2344. What are your ideas as to the formation of what is called a pioneer line;—what would be the character of the line? I should say that where the ground is firm, and not liable to get boggy in wet weather, the earth thrown up sufficiently to level it to a grade would be sufficient to bear the sleepers. The sleepers would be closer together than where the line is ballasted, and a cheaper kind of sleeper could be used.

2345. What kind of sleeper would you suggest? I should think the use of half-round sleepers might be allowed.

2346. Have you made any inquiries as to what would be the probable cost of those sleepers? No; but I have heard that there is plenty of ironbark on the adjacent ridges from which sufficient sleepers could be obtained for a line. A red gum could be obtained from the river.

2347. On a surface line of this kind, however slight the earthworks thrown up, they must have the effect of stopping surface-water flowing in one direction or the other? Yes.

2348. Do you mean that this slight embankment is to have the effect of throwing the water right back again, or is it to be allowed to pass under the line, at intervals, by means of box drains? There would be a side ditch on the upper side of the line, and this, of course, would collect all the water, and the gradient of the side ditch would follow the gradient of the line, according to the surface of the ground, and at convenient points there would be a box culvert, and the water on the upper side of the line would be thrown to the lower ground.

2349. At what intervals would these cross drains have to be made? If the ground changed from a slight fall in one direction to a slight rise in the opposite direction, you would have to put the box culvert in at the break; but, taking it all through, I think 15 chains distance would be quite often enough. At some parts nearer the creek, where, perhaps, more water would come into the side drains, there might be a few closer together.

2350. Do you think the country is one in which the Government could fairly experiment with a surface line of railway? It is one of the best districts I have seen in which the experiment could be tried.

2351. Have you examined the country between Trundle and Condobolin? No.

2352. *Mr. Gormly.*] You stated that the water about 2 miles from Gunningbland would not be more than a foot deep at any time? Yes.

2353. That would be over an extent of about a quarter of a mile of country? Not quite as much as that. It would certainly not be more than a quarter of a mile.

2354. From that portion, about 2 miles from Bogan Gate, would the country be fairly dry until you come to the 13 or 14 mile peg near Burrawang Station? Yes.

2355. Would the greatest portion of it be dry? Yes.

2356. Would that portion require box culverts of any size, 15 chains or so apart? Yes; because there is rising ground above—from the hills to the north.

2357. Would the box-culverts require to be of any considerable size? No; 2 feet. If it were thought that more water would come through at certain points, they might be doubled.

2358. They would not be actual culverts, but box-drains? Yes.

2359. Would there be many other large waterways required in that distance? No.

2360. Then the waterways required for this line would be inconsiderable? Yes; the only two creeks are the Gunningbland and Yarrabundi.

2361. What size culverts would be required over the Gunningbland Creek—what width of opening and what height? I think the cheapest construction of that kind is a 10-feet opening.

2362. How many 10-feet openings would you require? If it were to clear flooded ground, I think 5 chains would be sufficient.

2363. And about what elevation? About 3 feet.

2364. That would carry off the waters where the line crosses the Gunningbland Creek? Yes.

2365. And there would be no other waterways of any other size, except the box drains, until you come between the 18 and 19 mile peg? No.

2366. That would be over the Yarrabundi Creek? Yes.

2367. Would that require more openings than the Gunningbland Creek? I think it would require about the same.

2368. And there would be no other similar waterways towards Condobolin? No.

2369. There would only be the ordinary box-drains? Yes. There might be some of them on this broken ground near to Condobolin.

2370. But not equal to the others? No; they would be of lesser size.

2371. Then the line you have surveyed and explored would not be expensive, so far as the construction of waterways was concerned? No.

2372. What height of embankment would be required at the Gunningbland Creek? The bank would run up to the height of the culvert—about 3 feet at the highest.

2373. And about 3 feet at the highest point at the 18 or 19 mile peg? Yes.

2374. What would be the entire length of the 3-feet embankments on the whole of the line from Bogan Gate to Condobolin; would they amount to 1 mile? It is not easy to say without a section. I should say approximately they would not be more than that.

2375. You would not think it would require 2 miles? I do not think it would exceed 1 mile.

2376. Is the line heavy or lightly timbered? It is mostly lightly timbered. The timber has all been ringbarked. In some parts there is none at all.

2377. It would be a cheap line to clear of timber? Very cheap.

2378. Can you tell the Committee of any other extra cost of labour in constructing this line;—those would be the only difficulties of construction over an ordinary surface line? Yes.

2379. That would be the only extra cost of construction over a surface line? Yes.

2380. *Mr. Chanter.*] You think that at Gunningbland Creek, 5 chains of waterway, with 10-feet openings, will be sufficient to carry off the flood-waters? Yes.

2381. Can you say what the cost would be? I think first-class work, with trestles, runs to £3 a foot, but that would be for high trestles. I think it could be done for less than £3 a foot.

Mr. E. B.
Thornbury.
27 Mar., 1895.

2382. It would roughly amount to what? About £1,000.
2383. What value would you place upon the earthworks? I have had no experience in this country as to the cost of earthworks. Of course, where scoops and graders can be used it lessens the cost a good deal. I have had to do with sub-contracting, and of course I have let sub-contracts as cheaply as I could get a man to take them. I have let them at 1s. a cubic yard. Of course the contractor found the tools in that instance.
2384. It would take how many yards to the lineal yard to raise it 3 feet? That would be 6 yards to the lineal yard.
2385. And calculating it at 1s. a yard, it would amount to how much per chain? £6 per chain.
2386. Then, for a length of 15 chains it would be about £90 or £100? I believe the cost of the Government contracts is more than 1s. a yard.
2387. But you would take into consideration the depressed times, and the low price at which this class of work is being undertaken now? Yes.
2388. Are graders and scoops used in connection with the existing price of 1s. a yard? It would be a good price that for a good contract.
2389. Then you have no doubt it would be taken at that price, and would not exceed it? I think so.
2390. Then this length of 20 chains extra work at the Gunningbland Creek would amount to about £1,100? Yes.
2391. Would the same principle apply to the Yarrabundi Creek? Yes; I think they are very similar.
2392. Would there be as much earthwork there as at Gunningbland? I think the same.
2393. That would be about £2,200 extra on this work? Yes.
2394. If there were no creeks at either of these places, and the line had to be raised only 6 inches as proposed, what would be the cost of the earthworks and the side drains over the best portion of the country which you have gone over? I should think £150 to £120 per mile.
2395. You would say, then, about £100 for half a mile at the creeks? Yes.
2396. That would leave an excessive cost, owing to the two trestle bridges having to be built and raised earthworks having to be made, of about £2,100? Yes.
2397. I understand you to say that there is no other place along the route which would require other than the ordinary earthworks? Ordinary earthworks and box drains.
2398. So that, if these waterways had not to be accounted for or bridged, the work could be done on the whole distance for £2,100? Yes; as far as the earthworks go.
2399. I am presuming that there were no creeks—that you had country practically the same from one end to the other? Yes.
2400. So that, in comparison with a line in any other direction, where there were no creeks to take into consideration, the line would only cost £2,100 more on the whole distance, in consequence of those two creeks, which would be spread over a distance of 60 miles? Yes.
2401. So that the difference in regard to cost would hardly be appreciable? Yes; I think so.
2402. Did you observe, coming along the road to-day near to Condobolin, some earthworks in progress of construction? Yes.
2403. Do you think a raised road of that description would be sufficient to carry the line the whole of the distance, except at the places you have described? I think so.
2404. If evidence can be adduced as to the cost of earthworks, it would be fair to assume that the cost on the proposed line would not exceed it? Yes; but of course there is the carriage of tools and materials from Sydney. The local councils have their own tools.
2405. Is it not the practice of the local councils simply to let a work, and for the contractors to provide tools? Yes.
2406. So that, in letting earthworks of this kind, it would be fair to assume that the greater the work the less the cost in proportion? Yes.
2407. In reply to the Chairman you said you had had a good deal of experience, and you had no doubt whatever that, with the two bridges provided for as you have described, the rest of the road for its whole length is eminently suitable for a surface line—that is, for laying the sleepers on a bed of 6 inches of raised earthworks? Yes.
2408. You have not seen the country to the north—that is, taking a direct line from Condobolin to Trundle? No.
2409. You do not know whether any creeks or waterways would have to be provided for there? I do not know the country at all.
2410. Have you seen the country south of the proposed line, towards the Lachlan River? In parts. I have seen it over towards the Forbes Road. I travelled on the Forbes road.
2411. And how does that country compare with the line of route we are now discussing, and as far north of it as you have seen? So much of the land is subject to very deep floods that it would, of course, be a much more expensive line.
2412. Do you think there is as much room for close settlement on the south side of the line as on the north? I think so. There is excellent land along the creeks.
2413. Would the creeks require any great expenditure by the Roads Department, in order to bridge them for the purpose of making roads from various points to the railway station? It would be an expensive item if there were many of them; but there are a few good places where bridges could be provided. One bridge could be provided at Mulguthries, on the Bomboggan Creek.
2414. Would that give provision to the settlers already on the south side for crossing the line? Yes; but I think, especially in the wet weather, there would be so much flooded ground to cross that they would prefer going to Forbes direct, if they had to take produce.
2415. Would the character of the country you have seen there lead you to believe that it is intersected so much by creeks, and so on, that the selectors would confine themselves more to pastoral than to agricultural pursuits? I could not say. I have not had evidence about the flooding of the ground there. Most of the land is taken up by the Burrawang Run. They have the greater part of the frontage to the creeks.
2416. There are not many settlers on that portion of the land? No.
2417. And there is no Crown land available there, at present, for settlement, other than that under lease? No; I think all the land has been taken up. There are a few selectors within 10 miles of Condobolin?

Mr. E. B. Thornbury. 2418. The line to those settlers, whether it went direct to Parkes *via* Bogan Gate or *via* Trundle, would be practically the same in length? Yes.

27 Mar., 1895. 2419. So that it would not affect the question? No.

2420. Evidence has been given to show that, for about 15 miles west of Bogan Gate, the route of the proposed line has been flooded for 4 miles on each side. In going through this country, was there anything to indicate to you that there had been a flood of that character? No; I am certain it could not be.

2421. If there had been such a flood, it would leave the evidence behind it? I am sure it would.

2422. In prosecuting your survey you have not noticed any evidence of such a flood? No.

2423. Nor have you noticed any evidences of any flood other than from the waters overflowing the Gunningbland and Yarrabundi Creeks? Yes.

2424. There was nothing there to lead you to suppose that any of the Lachlan waters came to that part? No; the Lachlan water does not come anywhere near the line, except where it backs into the Goobang Creek, about 8 miles from Condobolin, and that we are avoiding by keeping on high ground.

2425. Then you think the statement made is, to say the least of it, an exaggerated one? It is, certainly.

2426. Are there any depressions in the proposed line which will require more than average filling? There are a few. It is hard to see them now though, as the ground is so hard and dry.

2427. You have not made an actual survey of the line—that is to take the levels, so as to know exactly what the depressions would be? For 18 miles I have, but not right through.

2428. So that you are not in a position to say at present what filling would be required to keep a level grade? There are a few places where we meet with gilgai holes, which we cannot avoid. They spread all over the country, and whether you went a few chains more to the north or south, you would be bound to hit one or two of them.

2429. Are they very extensive? No; there is one belt I know of, and that is near to Burrawang Station. It is a long belt which comes right down from the mountains across the track of the line.

2430. About what length is it? The width of this belt, where the line crosses it, is about 30 chains, but, of course, there are only three or four gilgai holes which will be touched in that length.

2431. Practically, that would mean very little more than the ordinary earthworks required? Very little more.

2432. *Mr. Molesworth.*] Coming back to the flooded water question, will you tell us the widest extent to which you think the spread of flood waters would occur at any point on either side of the line? It would be hard for me to say, unless I saw the flood, because there are no indications.

2433. But judging from the indications you have seen, and the character of the country? The water runs from north to south, and, of course, if there were very heavy rains on this flat ground, there would be a continual running of water as long as the rain was falling.

2434. What would be the widest spread of any waters in a wet season which you would have to embank? Not more than half a mile over the whole of the line.

2435. Do you think that, with the provision you propose to make for escaping the flood waters, the line will be fairly free from inundation at any point? I think so.

2436. Supposing, by any excess of flood waters, the line should be slightly submerged, would it suffer any serious damage on such a level country? No; it could easily be made up. There is no fear of the water washing holes in the ground.

2437. How long, after the rain ceased, do you think it would take for the water to get away from any point at which the line might be affected? At some parts there is more slope in the ground, and it would run away very quickly, but at other points it might lie for a little.

2438. For the most part it would all be away in four hours after the rain had ceased? It might lie on the ground for two or three days, but it would not injure the line in any way, because the line would be protected a good deal by the side drains. The water would be caught in the side drains and carried in the box culverts to the lower side, so that it could not do much damage to the line.

2439. How long do you expect it to be before you quite finish your survey of this portion of the line? Three or four months.

2440. Ready for the work to be commenced as soon thereafter as may be convenient? Yes.

2441. How many miles are there which you have not actually surveyed? I was over the ground in connection with the line from Forbes, and this new line, except that it follows the travelling stock route, and avoids property as much as possible, is identical, as far as the section goes, with the old line.

2442. I understand from you that that portion of the line, which you have not been over this time, you have been over on a previous occasion, in connection with the survey from Forbes? Yes.

2443. And the slight alteration will not affect the section in any shape or form? No.

2444. *Chairman.*] The line as projected is estimated to be a little over 60 miles in length? Yes.

2445. As far as you can see at present, is that length likely to be exceeded to any considerable extent by any deviations which you may have to make? Very little, if at all. You might say it would be almost the same from Bogan Gate to here.

2446. You do not see any probability of any alteration? Hardly any. The length could be hardly increased.

2447. From an engineer's point of view, would a line running from Forbes to Condobolin be a very much more expensive line to construct than the one you are now surveying? No; the portions from the Bogan Gate, with an equal length on the Forbes line, would be almost identical.

2448. Is not that liable to flooded country? There is the same kind of flooded country at the Goobang Creek, where the creek spreads out over the flats, so that that would be about the same as the crossing of the Gunningbland Creek.

2449. But I am speaking of a line which has been mentioned considerably to the south of the Bogan Gate line—more towards the Lachlan River—the direct line from Forbes to Condobolin? Yes.

2450. How does that compare, from an engineering point of view, with the line you are now dealing with? It is a flatter line right through than the line from Parkes.

2451. But is it not more liable to floods from the Lachlan waters? I do not think it is. No part of it is sufficiently near to the Lachlan to be flooded. In fact, there is no part on the whole of this line which is liable to flood from the Lachlan water.

2452. Not even the direct line of railway from Forbes to Condobolin? No, not from the Lachlan. The only floods are from the creeks. It crosses the same creeks—the Goobang, the Gunningbland, and the Yarrabundi, and it would be subject to the same floods as the line from Parkes.

2453.

2453. To a greater or less extent? To a slightly greater extent, because the lines, where they cross these creeks, are not far apart, and the amount of water to be met with would be about the same on each. Mr. E. B.
Thornbury.
2454. You will see on the wall-map a dotted line, starting from Forbes, and going in a north-westerly direction until it meets the direct line from Parkes to Condobolin;—what is the character of the country along that dotted line? It is very flat throughout.
2455. And not liable to flood from the river? No, not from the Lachlan.
2456. You know that part of the country? Yes.
2457. You say it is quite suitable for agricultural settlement? I think so; there are some very good agricultural farms on the Goobang Creek.
2458. And the line is so marked out as to avoid the flooded part of the country? Yes.
2459. You gave an estimate of prices to Mr. Chanter, but I suppose that that does not come within your part of the departmental work? No.
2460. And those prices, although they may be approximate, may not be actually correct? I do not wish them to be taken as professionally correct.
2461. *Mr. Gormly.*] I suppose you do not know what would be the cost of the 5-chain culverts? I think between £2 and £3 a foot.
2462. Do you think they could be done for less? I think that is the price.
2463. Did you ever see culverts 3 feet high let at that price? No; I have had no practice in connection with them in this country, and I am rather hazy about the cost.
2464. Seeing that it is a very dry country between Parkes and Condobolin, would the railway people be able to get water for their engines on the line? I think they could get water near Gunningbland Gap, and water could be got at Condobolin.
2465. Sufficient water could be obtained on the line? Yes, near these creeks, by a dam or tank.
2466. *Mr. Molesworth.*] Can you tell us, as you surveyed the line from Forbes to Condobolin, what would be the mileage of that line? It is about 55 miles ~~as~~ against 60 from Parkes.
2467. Then there would be a saving of 5 miles in point of distance, so far as railway construction is concerned, by taking the Forbes route? Yes.

THURSDAY, 28 MARCH, 1895.

[*The Sectional Committee met at the "Royal Hotel," Condobolin, at 10 a.m.*]

Present:—

THE HON. WILLIAM JOSEPH TRICKETT, Esq. (CHAIRMAN).	
JOHN MOORE CHANTER, Esq.	JAMES GORMLY, Esq.
EDMUND WILLIAM MOLESWORTH, Esq.	

The Sectional Committee further considered the proposed Railway from Parkes to Condobolin.

Mr. David Henry Tasker, Mayor of Condobolin, sworn, and examined:—

2468. *Chairman.*] How long has Condobolin been incorporated? About five years. Mr.
2469. You hand in a statement giving the total holdings in the municipality and their various designations, showing there are 244 erections in the place, and a total amount of rates per annum of £494 5s. 10d.? Yes. The list of the premises in the municipality is as follows:— D. H. Tasker.
28 Mar., 1895.

Residences	157	Schools	2
Shops.....	34	Churches	3
Offices	10	Brewery.....	1
Blacksmiths' shops	6	Cordial manufactory	1
Hotels	9	Auction marts	2
Halls	6	Flour mill.....	1
Butchers' shops	3	Saw mill	1
Produce stores	4		
Banks.....	2		244
Billiard room	1		

Total amount of rates per annum, £494 5s. 10d.; estimated capital value of all ratable property in the municipality, £57,140; estimated population in municipality, 1,200; estimated population in police district, 2,800 to 3,000.

2470. How long have you been a resident of the district? Eighteen years.
2471. Will you give the Committee some idea of the progress of the district during that time, both as regards the town and its surroundings? When I came here eighteen years ago there was not a brick building in the town. It was a very small place—in fact, it was in the time of the bark roofs. Since then it has grown considerably up to the time of the bank suspensions about two years ago, since when it has been at a standstill. There are, as you may see, many brick buildings in the place, and had it not been for the bank suspensions, I have no doubt that the town would be much larger than it now is.
2472. Was there so much money held by the people of the district, deposited in the banks which suspended, that the locality was caused to stagnate? No doubt there was a great amount. A great many farmers came here from Victoria and took up the land. They had money, and expended a great part of it in improving their land, and when they wanted more money to go on with the banks would not advance.
2473. Was the progress of the district more marked during the few years preceding the bank suspensions, or has it been gradual during the whole of the eighteen years? No; about two years previous to the bank suspensions it was very marked.
2474. How do you account for that? By the land being thrown open for selection; that brought a great influx of selectors.
2475. Do you think the opening of the railway to Parkes had anything to do with advancing this part of the country? I cannot say that the extension to Parkes had a great deal to do with it, the distance being so great.
2476. Where do you get your goods from, and to where does the produce from this district go? Prior to the railway coming to Parkes and Forbes, Cowra was our railway station. 2477.

Mr. 2477. How far is that? 120 miles. Still it made little difference in the carriage from Condobolin to Parkes, and Condobolin to Cowra. We could get goods landed here from Cowra within a trifle of what we could get them landed here from Parkes.

D. H. Tasker. 2478. How do you account for that? The back road to Parkes being dry, teamsters did not care to travel over it. They would sooner travel the river road.

2479. The water is better along the river road? Yes.

2480. Is much produce sent at present to Parkes from or near Condobolin? This season there has been a great deal of wheat sent, but wheat only. It would not pay to send anything but wheat, the carriage to Parkes being so great.

2481. What do they pay for carriage from here to Parkes? I have heard it being taken at 12s. 6d. a ton.

2482. That is 60 miles? Yes; but you cannot always get carriage at that price. They are almost famine rates, and the people cannot live at it. They come from Parkes and Forbes with the back loading, and that is taken into consideration.

2483. Does the bulk of the stores for Condobolin and surrounding districts come by way of Parkes? From Forbes, I think. The teamsters are travelling the river route on account of the grass and water.

2484. Although it is a longer distance? I think it is shorter to Forbes. The carriage road is a little shorter, but I have known of instances where the carrier would rather load from here to Parkes, around by Forbes, than go direct to Parkes.

2485. That is to a large extent accounted for, because of that being the old road. People follow the old roads very often? No, not only that, but the grass and water are in that direction.

2486. What inducement could you hold out to Parliament to continue the line of railway to Condobolin? I think this would be a great trucking station, and that the district would be a great wheat-producing district, because if the farmers had a railway, they would always be sure of a market in Sydney. Now it is almost useless to grow wheat. They grow it and cart it to Parkes and Forbes, and the carriage takes all the gilt off. If they had a railway here they could put the produce on the train and send it to Sydney at once.

2487. Do you think that would be done even if the present low rate for wheat were maintained? Yes; and any amount of it would be grown.

2488. You think it would be grown even at present prices? Yes.

2489. Would the farmer make anything out of it? He would grow it in the expectation of making more, but it would pay him even at the present price. I have been told by practical farmers that even with present prices, if there were railway communication growing wheat would pay them.

2490. We were told by Wright, Heaton, & Co.'s manager in Parkes that, according to the railway book, the extra freight from Parkes to Condobolin would only be about 9d. per ton for grain, do you think the farmers around Condobolin would be sufficiently patriotic to pay a special rate for their grain, seeing that it is only 9d. per ton, and they are now paying 12s. 6d. for cartage;—do you think they would be inclined to pay a special rate for that extra distance? I could not say. I have not heard any expression of opinion on the matter,

2491. Is the chief product in this district grain or wool? Both; but chiefly wool at present.

2492. What large estates are there within range of Condobolin which would be likely to send their wool by the railway to Parkes, and thence to Sydney? I should say the stations within 50 miles south and 90 miles west; and, taking in Melrose Plains, about 45 miles north. As you get further over that way you get near the Trangie line. Up the river on the other side, I should say they would come within a distance of 20 miles from Boggandillon. Anything above that would go to Forbes.

2493. You told us just now that a lot of stuff went to Cowra Station? That was prior to the railway being opened to Parkes and Forbes.

2494. You say some wool would come a distance of 100 miles? About 90 miles westward.

2495. Would that be some of the wool which goes now to the Cowra Station? No; I think that that wool at present goes to Carrathool.

2496. What kind of country is this for carting to a railway station? Very good.

2497. Can the country generally be travelled over? Yes; unless it is flood-time, which does not very often happen. When you get away back it is boggy in winter time.

2498. You carry on business as a produce merchant? Yes.

2499. Can you give us any information as to the quantity of grain which has passed through your hands in twelve months, and been sent from here to Parkes? I have not sent any to Parkes. I sell it locally.

2500. Have you traversed the roads between here and Parkes very often? No; only twice. We generally go Forbes way, up the river.

2501. Can you give the Committee any evidence as to that portion of the country between Parkes and Condobolin;—can you say whether it has ever been flooded, and that teams have been delayed in consequence? I know it has never been flooded, because the flood-waters do not get out that far. I have not been on the road for many years, but I am quite confident it does not get flooded.

2502. Do you think there would be any difficulty in getting across Gunningbland Creek with a railway? I do not think Gunningbland Creek would interfere much with it.

2503. Do you think the statement that the line would be flooded about 4 miles on either side of it at that point would be correct? I should think it was incorrect.

Mr. Arthur James, Inspector of Stock, Condobolin, sworn, and examined:—

Mr. A. James. 2504. *Mr. Chanter.*] What is the extent of your district? A little over 5,000,000 acres.

2505. How many miles, taking Condobolin as the centre, does it extend? Seventy-five or 80 miles, 28 Mar., 1895. excepting towards Forbes, where I only go about 25 miles.

2506. Can you give the Committee the number of stock depastured within that district at present? Yes; 5,536 horses, 11,336 head of cattle, and 1,837,408 sheep.

2507. What proportion of the 5,536 horses are marketed? 1,150.

2508. Where do they generally find a market? Forbes and Wagga Wagga.

2509. What proportion of them would go along the railway line to the Sydney market? About 500.

2510. I presume the stock from your district goes to Sydney? Some of it.

2511. It does not go to Melbourne? No; the cattle went last year to Sydney. Mr. A. James.
2512. How many went to Melbourne last season? None; they went to the other markets—Goulburn, Wagga Wagga, and Forbes. 28 Mar., 1895.
2513. Then the railway would be benefited by the stock;—they would be travelled to Wagga Wagga and Forbes, and that would be their destination? Yes.
2514. What about the sheep? I should say the cast of fat sheep in the district would be about 80,000.
2515. And how are they disposed of? Last year about 32,092 were sent to Sydney, trucked at Forbes.
2516. I suppose that would be an average return of the number of sheep? Yes.
2517. Can you tell the Committee where the balance were sent to? 17,294 went to Melbourne, and about 28,900 to Goulburn. The 17,294 which went to Melbourne were travelled to Melbourne.
2518. And they would not touch our railway at all? No.
2519. How did the 28,900 go to Goulburn? Partly by rail, trucked at Forbes. There were 76,353 sent to Condobolin from Forbes by road. It is probable they would go by train if there were one; and 51,403 came from Forbes into the Condobolin district.
2520. They would be stores? Yes.
2521. Do you know what proportion of those stores would have benefited the railway, if there had been one? I cannot tell—they went into other districts.
2522. When they leave your district you have no further knowledge of their destination? No.
2523. Is it more profitable for the growers in your district to send sheep to Melbourne, and pay the duty of 2s. a head, than to travel the extra distance to the existing lines? These sheep belonged to Mr. Blythe, of Wyalong, and he told me he did not gain very much out of the transaction.
2524. Did he gain sufficient to induce him to continue sending? I do not think so.
2525. How would it affect him if a line were made to Condobolin? His wool would not come here at all.
2526. Where would it go? To Temora.
2527. What proportion of the 17,000 sheep which went to Melbourne belonged to Mr. Blythe? I think the whole lot of them.
2528. As far as the Condobolin extension is concerned then, it would be immaterial whether he sent them to Melbourne or not? Yes.
2529. If he did not send to Melbourne, he would send them to Temora? Yes.
2530. Will you describe the character of the country in your district, the nature of the improvements upon the various holdings, the carrying capabilities of the soil from a stock point of view. Can you give us in the first place, the names of the various stations and their areas in your district? Yes; I can supply a return.
2531. In preparing this return, will you place an asterisk or some other mark against those stations which, in your opinion, would, in the event of the railway being constructed to Condobolin, use it? Yes; I can tell you a few stations which would not use the railway at all.
2532. You might name them? There is Orange Plains.
2533. What distance is Orange Plains from Condobolin? Over 75 miles.
2534. What station would they use? Nyngan. Then there is Boggadilloon.
2535. Where is that? It is 10 miles on the way to Forbes. Then there is Woodlands.
2536. Where is that located? Close to Orange Plains. Then there is Back Creek, situated to the south-east.
2537. Distant how far from Condobolin? About 80 miles. Then there is the Overflow, Lake Cowal, and Wyalong. They would not come here, they would go to Temora. Then there is Merringreen and Yalgogrin. They would go to Temora. Then there is Malonga, and Nanarabhan. They would not come here. I think they would go to Whitton on the Hay line. Then there is Billabong, which would go to Young.
2538. Your profession entails a large amount of travelling? Yes.
2539. What is the nature of the country, how has it been improved, and what is its present carrying capacity for stock purposes. I will ask you to describe that area of country from which, in your opinion, the producers would forward their stock to Condobolin if the line were constructed? The whole of the district carries about one sheep to 4 acres. Of course there are other places, such as river frontages, which would carry more.
2540. Is it high or low land? High land and some low—some is liable to be flooded.
2541. The flooded country is good pastoral land? Yes.
2542. Would it carry as much stock as the unflooded land? It would carry more.
2543. I suppose a good deal of the flooded country is used in conjunction with the back country when the floods are off? Yes.
2544. Does it comprise plain open country or timbered country? Some of it is plain, and some is timbered. The greater portion is timbered.
2545. Is the soil in this country rich or otherwise? It is fairly good red soil, timbered with gum.
2546. That is principally on the low country, is it not? Yes.
2547. What is the high country timbered with? Box and pine.
2548. Are the trees in the timbered country ringbarked? Yes.
2549. Has the small scrub been removed? Yes.
2550. Is it capable of still further improvement, to improve the carrying capacity? Yes.
2551. Is there any disposition on the part of the owners to further improve it? They talk about waiting to see new the Land Act.
2552. Most of the leases were to have fallen in July next, but they have been extended for a further term of five years? Yes.
2553. And they are now waiting to see what becomes of the Land Bill? Yes.
2554. There is a disposition, however, on their part to improve the country? Yes; by erecting rabbit-proof fences.
2555. Is yours a good stock district? It is about Condobolin.
2556. What about when it gets away from there? A portion is affected with anthrax.
2557. Which portion? South of the river.
2558. That is on the low-lying country? Yes.
2559. Do you find it on the higher land? No; it is perfectly healthy and sound. There are only a few stations which are affected with anthrax.
- 2560.

- Mr. A. James. 2560. Is there any other disease amongst cattle or sheep in your district? No; a little pleuro-pneumonia breaks out occasionally, which I attribute to Queensland cattle travelling through.
- 28 Mar., 1895. 2561. Do the stock-owners inoculate their cattle? Yes.
2562. Is it compulsory? No; they do it to protect themselves.
2563. I suppose there are some selectors amongst those who forward you returns of stock? Yes.
2564. Do they hold good land? Yes.
2565. At present, I suppose, they are principally grazing? Yes.
2566. How have they improved their holdings in comparison to the large holdings? In about the same proportion. They have complied with the Act.
2567. That is, they have fenced and made tanks where necessary? Yes.
2568. Do they carry more stock in proportion to the area they hold than the larger holdings? I should say about the same.
2569. Do any of them cultivate? Some of them do.
2570. Have they good crops? Very good.
2571. And the land is capable of producing wheat? Yes.
2572. Do you think the land is likely to run out, that is, to grow lesser quantities after a continuance of cropping? No; I do not think so.
2573. Do you think that they would produce more wheat if a line were constructed to Condobolin? I think they would, but I do not know it as a matter of fact.
2574. *Mr. Gormly.* To what particular stations does your district extend on the south side of the river? To Narraden, Lake Cargellico, Bygalorie, and Woowey.
2575. Woowey is 115 miles from Whitton railway station? Yes.
2576. It is 45 miles from here to Woowey? Yes.
2577. They are sending their wool now to Whitton? Yes.
2578. That is 110 or 115 miles from Woowey? Yes.
2579. Would the Woowey people be likely to send their wool 45 miles to Condobolin if the line were constructed? Yes.
2580. More likely than to send it to Whitton? Yes.
2581. I suppose they can cross the Lachlan at the bridge? Yes.
2582. Is there a fairly good road from there to Condobolin? Yes.
2583. Then they would have as short a distance to Condobolin and a fairly good road? Yes.
2584. Equally as good as the other? The other is very bad.
2585. Would the Bygalorie wool be likely to come here instead of to Whitton? Yes.
2586. What distance on the north side does your district extend? It goes to the overflow.
2587. Does it go to Coan Downs? No.
2588. Is there any considerable amount of mallee in the north-west? There is mallee in the direction of Mount Hope.
2589. What extent of your district is covered with mallee? I have not travelled very much over it.
2590. But you know mallee does exist? Yes.
2591. What particular stations are on the boundary of your stock district from the Lachlan River northward? North Condobolin, Carlisle, Burra Burra, and Jumble Plains.
2592. I want the north-west boundary down the river, starting on the north bank? Moabla, Palistan, and Eremeran.
2593. Do those stations carry as large proportions of stock per acre as those on the eastern boundary of the district? No.
2594. Then the country to the north-west does not carry as much stock per acre as the country to the east? No.
2595. Is that to be attributed to the overgrowth of scrub, such as mallee, or to the climate? I think it is more to the climate.
2596. Is it to be attributed to both? The soil is not very good.
2597. It is not such a productive country? No.
2598. Is that country as productive as the country about Condobolin? No.
2599. Is that owing to the drier climate, or to the country being more densely covered with timber? I think the climate is very much drier.
2600. Can you give the Committee an idea as to the proportion of stock which that portion of your district carries, compared with that immediately above Condobolin—does it carry two-thirds less or one-third less. I suppose you know the area of the stations, and the number of stock upon each? Yes.
2601. You have stated that this land carries one sheep to 4 acres? Yes.
2602. Do the stations you have referred to carry one sheep to 4 acres, or one sheep to 5 or 6 acres? Palistan does not; Moabla does.
2603. What number of acres does it take to carry a sheep on the Palistan? It has not been stocked for some time.
2604. The stations referred to would probably send their wool and stock to Condobolin? Yes.
2605. Are you of opinion that they would not have a large quantity of wool and stock in proportion to their holdings to send? No, they would not.
2606. With regard to the country fronting the Lachlan, where you cross the Humbug Creek—is that heavy carrying country? Yes.
2607. Does it carry a large number of stock? Yes.
2608. Does it fatten them well? Yes; it is a productive country.
2609. Would those stock be likely to come here if the line were constructed? Yes.
2610. Would they come from Wollongoff? Probably.
2611. And the country north of there? Yes.
2612. Would they come from Bygalorie? Yes.
2613. Is that heavy carrying country? Yes.
2614. Is there a large number of stock on the Melby blocks? No; it is not a heavy carrying country.
2615. Is it more covered with scrub? Yes, there is scrub upon it.
2616. The river frontages opposite to Condobolin, and for a considerable distance further down, are very wide? Yes.

2617. Is the frontage country heavy carrying country? Yes.
 2618. And produces a great number of fat stock? Yes.
 2619. Would those stock be likely to come to Condobolin? Yes.
 2620. There is a large portion of this district which is of a very fattening character? Yes.
 2621. And produces a large number of fat stock? Yes.
 2622. And a great proportion of those fat stock, to within 20 or 30 miles on the south-west, and north of Condobolin, would be likely to come to Condobolin if they were to be sent to market by train? Yes.
 2623. They would not be likely to go to any other railway station? No.

Mr. A. James,
 28 Mar., 1895.

Mr. William Silas Bellamy, Postmaster, Condobolin, sworn, and examined:—

2624. *Mr. Molesworth.*] How long have you been a resident of this district? I have been at Condobolin two years, but I have been at Hillston and down the river for about twenty years. Mr. W. S. Bellamy.
 2625. Have you had sufficient experience of those places to be able to form an opinion as to whether there has been any growth or otherwise of the district? The district is increasing, as far as correspondence is concerned. The stamps sold last year amounted to £150; the letters posted last year numbered 166,800; the newspapers, 34,984. The parcel-post was only in force last year, and about 4,800 parcels were sent, of an average weight of 5 lb. From Forbes we have a daily mail, except on Sundays; from Euabalong, four mails per week; Hungary—that is Wollongoff—one mail per week; Beena, one; Trundle, two; Nangeribone and Melrose, one. There are fifteen mails despatched per week and fifteen received. 28 Mar., 1895.
 2626. Have you any information in regard to the business done in the Money Order Department? Yes; I hand in the following comparative statement:—

	1892.	
Orders issued	£5,082 17 7
Commission on same	£41 19 0
Savings Bank deposits	£1,444 0 0
Money Orders paid	£882 14 2
Savings Bank withdrawals	£759 3 10
Cash received for telegrams transmitted	£427 15 4
Letters actually posted at Condobolin	117,516
Papers actually posted at Condobolin	17,676
	1893.	
Money Orders issued	£4,212 12 5
Commission on same	£46 12 0
Savings Bank deposits	£3,762 6 9
Money Orders paid	£1,171 10 0
Savings Bank withdrawals	£1,780 18 7
Cash received for telegrams transmitted	£472 8 8
Letters actually posted at Condobolin	142,524
Papers actually posted at Condobolin	26,460
	1894.	
Money Orders issued	£5,190 6 8
Commission on same	£50 1 6
Savings Bank deposits	£3,910 4 0
Orders paid	£1,286 10 0
Savings Bank withdrawals	£1,672 5 0
Postal notes sold at Condobolin during the year 1894	£499 5 6

Total rainfall at Condobolin for the year 1894—2,710 points.

2627. To what do you attribute the increase in the Savings Bank deposits;—do people prefer the Savings Bank, or is the increase due to the natural growth of the district? The people prefer to invest in the Savings Bank.
 2628. Have you noticed any growth of the town during your period of residence? Yes, it has increased considerably.
 2629. Do you find that the work with which you are entrusted is also increasing in all its branches? Yes.
 2630. Do you think that the growth is a natural one, and likely to continue, or has it been spasmodic? I think the town will improve by people taking up land.
 2631. Do you look upon the settlers as *bond fide*? Yes.
 2632. They have not taken up land with the view of eventually disposing of it? No; I look upon most of the selectors around here as men who have come to make a living.
 2633. Are they men who are improving their holdings? As far as I know.
 2634. Do you find there is a disposition to cultivate or graze? On places handy to the town they are growing wheat.
 2635. I suppose for the main part the residents of the town are favourable to the construction of the line? Yes.
 2636. Speaking as a citizen of Condobolin, which do you think will be the most acceptable line to the people—the direct line to Parkes *via* Bogan Gate, or a detour by way of Trundle? The direct line *via* Bogan Gate.
 2637. I suppose on account of its directness and less haulage? Yes.
 2638. You do not think there would be any special advantage to Condobolin to connect with a locality such as Trundle? I could not express an opinion.
 2639. Do you know anything of the character of the country between here and Parkes *via* Bogan Gate? No; I know the road to Forbes. During the two years I have been here the road has been impassable for six months at a time, and the coach could not travel along it; the flood-waters were over the fences in many places. We used to make the coach travel out *via* Burrawang.
 2640. When you found the Forbes line flooding in that way, what did you do with regard to the carriage of mails? We had to send them *via* Burrawang. 2641.

- Mr. W. S. 2641. Did you not send some of your mails during the bad weather *via* Trundle? No; they could avoid the flood-water by going *via* Burrawang, and then turning in towards the river.
 Bellamy.
 2642. You say you have spent a portion of your life at Hillston? Yes.
 28 Mar., 1895. 2643. How long were you there? Ten years.
 2644. Did you hold a similar position there as you hold here? Yes.
 2645. What class of country is there about Hillston, so far as settlement is concerned? On the south side of the river it is all red timbered soil. On the north side, between the Lachlan and Marrobee, and the Marrobee and Willandra, it is all open cotton-bush and salt-bush country.
 2646. Is a large portion of it suitable for settlement? All the south portion.
 2647. What quantity would be suitable for settlement? All the country, until you get upon the plains near Carrathool.
 2648. *Mr. Gormly.*] They could not send wheat from there to Condobolin? No.
 2649. *Mr. Molesworth.*] How far distant from Condobolin do you think the settlers from the west or in the direction of Hillston would be likely to use the Condobolin Station? They would not come here at all. By the new line it is only 60 or 70 miles to Carrathool.
 2650. How far east of Hillston would be likely to utilise Condobolin? Not below Euabalong. The Cargellico people might come here.

Mr. Humphrey William Grey-Innes, farmer and selector, Condobolin, sworn, and examined:—

- Mr. H. W. 2651. *Chairman.*] Where are you located? Two miles from Condobolin. I have been a resident of the Grey-Innes. district for twenty-two years.
 28 Mar., 1895. 2652. You were formerly Mayor of Condobolin? Yes.
 2653. Can you give the Committee any information to show that the projected line would not only be a benefit to Condobolin, but to the country? I have always advocated a direct line *via* Bogan Gate. One reason is that it is practically level country. It does not pass through any flooded land, and it passes through an immense quantity of Crown lands—220,000 acres at Burrawang alone. In connection with a former inquiry held here, the evidence of the District Surveyor was to the effect that it was all suitable for special areas.
 2654. You were formerly, I think, in favour of the Trundle diversion? I wrote in the press strongly advocating the other route as against Trundle.
 2655. Did not Mr. Gilliat interview you in 1892? Yes; I gave evidence at the inquiry.
 2656. Mr. Gilliat in his minute states:—
 Mr. H. W. Grey-Innes, Mayor of Condobolin, considers the line by Trundle best suited for the interests of Condobolin.
 Is that correct? It is not. It is quite different. I was president of the railway league, and was supporting the direct line.
 2657. Then if your name has been attached to that statement it is an error? Yes, decidedly.
 2658. Do you know the line as shown on the wall-map from Parkes to Condobolin, going by way of Bogan Gate? I know it well.
 2659. Will you explain what is the character of the country along that line, as regards its liability to being flooded? There is a small portion near Bogan Gate, and I have never seen it deeper, in the heaviest floods, than about 1 foot—that is right on the line.
 2660. What extent would it be? About 15 miles. It never was more than a foot deep.
 2661. Would that foot deep extend for 15 miles? It is patchy here and there. In some places there may be two or three watercourses breaking out from the Billabong Creek where it might be a little deeper, but very little.
 2662. But was it a continuous length of water 15 miles in extent and 1 foot deep along the line? Yes; I went almost from Burrawang to Bogan Gate, and it was a foot deep that length.
 2663. When was that? Four or five years ago. I was met by people who told me I would not be able to get there, but I did get there. I went along the road, and the road is a little to the south-east of the line, and that is the only place where water breaks over, and it is very slight.
 2664. On the whole line is that the only bad part? Yes.
 2665. And that, you say, even there is about a foot deep? Not more.
 2666. And where you travelled is a little to the south-east of the projected line? Yes.
 2667. Which would not be so deep? It would not be so deep, because the ground is higher as you go to the west.
 2668. Does the ground become very soft when it gets that water upon it? No; not upon that portion of it. That is only in the pine country. That is principally yarran country, and is not boggy at all. It has a better bottom.
 2669. With an embankment 1 foot high, and then the sleepers and rails upon them, would there be any difficulty in constructing a line over that country, even with such a heavy rain as you describe? Not the slightest, and that was an exceptionally wet season.
 2670. Can you state the actual year when that occurred? It is four or five years ago.
 2671. Do you know the country through which the Trundle people wish the line to be taken? I know the road between here and Trundle.
 2672. How does that compare with the road you have described which gets the water over it in heavy rains? There is one creek to cross between here and there, and there are two or three steep ridges to cut through.
 2673. Would it be as easy a line to construct as the direct line? I should think not. Mr. Stawell, who was inspecting the Parkes line, came through that way, and gave it as his opinion that it would not be as easy. He thought there would be two or three pretty heavy cuttings between Trundle and Condobolin.
 2674. What is the range which runs along there? Two or three steep ridges.
 2675. Which would take the water away from the creek;—on a surface railway there would have to be cuttings? Yes.
 2676. Would they be of any extent? Yes; one would be a cutting of about 2 miles.
 2677. That would be to get a 1 in 100 grade? I think so.
 2678. Have you been cultivating in this district for many years? I was cultivating for about ten years.

2679. Do you still do so? I have not done any this last year. I have been going in for laying down lucerne. Mr. H. W. Grey-Innes.
2680. Is that a success? Yes, so far.
2681. Do you irrigate? No, I have only tanks; I have no water frontage.
2682. Why did you give up growing grain? Because the price was so low, and there was practically no market without railway communication.
2683. It would not pay to send it to Sydney by carriage and train? No; we are practically in the hands of one firm here for a market.
2684. We have heard to-day that the carriage is very cheap at present, being as low as 12s. 6d.? That would be 4d. a bushel from here to Parkes, and you would get 2s. 2d. in Parkes, and they are giving 1s. 10d. here.
2685. Do you work on your farm yourself? Yes.
2686. What would be the lowest price at which you could grow grain? With railway carriage 2s. a bushel would pay in this district, because the land is good. I have close on 370 acres of splendid land near to the town, suitable for agriculture, which I would put in wheat if I had a means of getting it away.
2687. What is the average yield here? Some 16 to 18 bushels.
2688. Do you consider that very good? It will pay.
2689. Do you try any other growth except grain? I have grown hay, and I saw last year some exceptionally good crops of oats. But oats, as a rule, are not so safe to grow as wheat in this district.
2690. Is the district liable to rust at all? No.
2691. What is the extent of your holding? About 1,468 acres.
2692. To what extent would you be a customer to a railway if it were constructed? About twenty-two bales of wool a year, and I would go in for wheat-growing.
2693. What quantity of sheep have you? At present, 1,500. I had 3,000 last year.
2694. I suppose your holding is well improved? Yes.
2695. What can you carry? About one sheep to the acre.
2696. What do you get out of an acre when you run sheep upon it? About 2s. at present prices.
2697. What would be the ordinary price? Between 2s. and 3s.
2698. With the average yield of wheat which you have described, what would you be able to get? I reckon if I got 10s. an acre it would pay better to grow wheat than wool.
2699. And that would be a low estimate? Yes.
2700. Is labour abundant in this part of the country? Yes; I have had men coming to me lately offering to work for their tucker. I think I have had to do with more selectors in this district, as far as making out their applications, and so on, is concerned, than anyone else, and I can speak as to their *bona-fides*. I believe the majority of the selectors in the district are *bona-fide* men. They have proved that wheat will pay if there is a market, and it appears to me that if they get a railway they will continue to work their land; and if they do not get one it is a question whether they can live. They have proved that the land will grow wheat, and grow it at a little cost. The stump-jumping implements break up the land now at very little cost.
2701. What would you say would be a reasonable holding for a man to make a living upon, if he worked it himself along with his family? In agriculture a man could do well enough on 640 acres with a market. I think the fairest system would be this, to have a sliding scale, and give the man who is closer to a railway and to a market a limited area of land, and increase the area to those who are a distance away.
2702. Where do you get your water from? I have tanks.
2703. What does a tank cost for a holding such as yours? They are very cheap now. You can get some for about 9d. a yard. Mine is about 1,800 yards in extent.
2704. Do you know of any quantity of wheat which has had to remain in the district because it could not be taken to a market? There are advertisements in the papers calling for tenders for the conveyance of wheat to Parkes at the present time.
2705. Would you be prepared to pay a special rate of carriage from here to Parkes? That opens up a broad question. My idea is that if a district wishes to have a railway it should be prepared to agree to pay a small rate, between the difference of the working expenses and interest on the cost of construction, until it became self-supporting. If that system were adopted we should have less unremunerative railways.
2706. Do you think there are many in this district who hold that opinion? I think so.
2707. Is there anything else you would like to state? I think, from my past experience of the district, Condobolin would be an important trucking station in the event of the railway being constructed. There is a large quantity of stock fattened in this district; in fact, it is essentially a fattening country on the south side of the river.
2708. How would a line from Forbes to Condobolin suit the Condobolin people? I opposed that on the ground that it would be more expensive on account of the flooded country and the bridging, and also that for all time we would have to pay the extra haulage round by Forbes, whereas we should go direct to Parkes. There is a good deal of flooded country coming out from Forbes, and there would be expensive bridges to construct.
2709. Then you think Parkes would be the best place to connect with? There is also the advantage of having 300,000 acres of Crown lands to pass through which would be readily taken up.
2710. You, as a practical farmer, are of opinion that the Burrawang leasehold portion, when available, would be readily taken up? Yes; and that part of the country which the line passes through is much more suitable for agriculture than the river frontage. We find that the red soil is far better for wheat-growing. It is more liable to rust near the river, it is so wet. That sort of country holds the moisture.
2711. With regard to the farmers generally, are their holdings similar to or larger than your own? The majority have 2,560 acres.
2712. Do they all combine agriculture with grazing? A great many of them have done so latterly, and they would do much more if they had railway communication. A great many are men with families, who do their own work. I know that at Melrose, 50 miles away, several of them put in large areas of wheat. At first they sold a good deal of their wheat for poisoning rabbits, but now they use the pollard instead.
2713. In many portions of New South Wales the tendency is rather for agriculture to develop into sheep-farming, than for sheep-farming to develop into agriculture;—is that the case in this district? No.

28 Mar., 1895.

- Mr. H. W. Grey-Innes.** 2714. Your observation has been that the people go in more for agriculture? Yes.
 2715. On account of the suitability of the district, and better results? Yes; you can make 10s. an acre by agriculture, and you cannot make more than 2s. by wool-growing.
 28 Mar., 1895. 2716. *Mr. Chanter.*] Replying to the Chairman, you alluded to Mr. Gilliat's report and the district surveyor's report as to the suitability of the Crown lands at Burrawang for special areas;—do you think, under existing circumstances, any farmer, no matter how industrious he may be, can make a living out of a special area of 640 acres? I am totally opposed to special areas, except within population areas around towns. I do not believe in special areas excepting around towns.
 2717. You stated that at present the net profit from a sheep is 2s. per acre? Yes; that is on a fairly good holding when it is improved.
 2718. Then a holding of 2,560 acres would give a net profit of £256? Yes.
 2719. One-half of that—1s. an acre—would have to be paid to the Crown for rental? Yes.
 2720. That would leave the selector on a full block £120 per annum with which to maintain his family, and to pay for the cost of fencing and other improvements? Yes.
 2721. Does not that go to show that it would be absolutely useless to get a close settlement on a special area in any part of the country districts where the carriage is so great? I think 640 acres close to a railway are worth 2,560 acres back. You can make money out of all sorts of things close to a railway, such as a few lambs, for instance, and so on.
 2722. Take any part of the locality between Condobolin and Parkes,—do you think it is possible to maintain a close settlement along that line of railway on 640 acres of land? I think a man could make a fair living from it; it is splendid land.
 2723. What revenue would he derive from it? If he went in for agriculture, combined with sheep-farming or dairying, he should make a better living from it than a man would on 2,560 acres 60 miles back from here.
 2724. Supposing he put one-half of it—320 acres—under wheat; that would give him £160 a year revenue from wheat? Yes.
 2725. With regard to grazing. He could not keep more than 320 sheep on the balance; he would have to keep horses and cows? In country like that he could do so if it were cut up into small paddocks, and you can keep two sheep to the acre in that country.
 2726. Would that be by growing lucerne? No.
 2727. Roughly speaking, what revenue do you think a farmer could make out of 640 acres of land? £150 a year.
 2728. Do you think that would be sufficient to maintain him and his family, and to pay the Crown? I am estimating that his family would be maintained by the produce of the land.
 2729. That is so far as food is concerned? Yes.
 2730. But there is a considerable amount of cost for clothing? That depends upon the tariff we are going to get.
 2731. Practically, he would receive £200 a year in cash from his farm? Yes.
 2732. What about the stock? He could send a few fat sheep away if he had a market. If he were near to a railway he could utilise his straw and everything; nothing would be wasted.
 2733. Would another £50 a year cover that? Yes.
 2734. That would be £250 a year? Yes; and it would not cost him more than £100 a year.
 2735. He would have to pay to the Crown £48 a year rental? Yes.
 2736. Your opinion is that along this proposed line of railway a man can get a living, and make a profit out of 640 acres of land? Yes.
 2737. Evidence has been given to the effect that a close settlement can be provided for on this line of special areas. The minimum price for special areas is 30s. per acre, and the maximum quantity of land is 640 acres. I want to obtain your opinion as a practical farmer. What you wish to convey is that a lesser area of land would suffice to give a man an opportunity of making a living, but at a reduced price? Yes.
 2738. So that it would be an ordinary selection, only with a limitation of area? Yes.
 2739. Then you think it would be wise, where a railway runs, to take into consideration the limitation of area? Yes.
 2740. And to only make it special in that sense, and not to increase the price? Yes.
 2741. It is estimated that the capital cost of the proposed line will be £140,000, and the interest on the capital and working expenses will be £9,000 a year. Do you think that those who would be served by the line would be patriotic enough to enter into a bond with the Railway Commissioners to agree to pay what is termed a local rate—that is an increase on the ordinary railway rate—which I am told would be 9d. from Condobolin to Parkes? Yes.
 2742. You have stated that the selectors in the district are *bona-fide* men? The majority of them are. I could put my fingers on all who are not.
 2743. If the depressed times continue, and the railway is not constructed, what will be their position? They could not maintain their holdings—they would have to abandon them.
 2744. You look upon them as good settlers? The very best of settlers—men with families who do their own work, and who are anxious to make a home. They are not speculators.
 2745. In your opinion the only hope they have of retaining their land is the construction of a line of railway. Their holdings, large as they are—2,560 acres—do not give them sufficient profit out of grazing alone to enable them to make a living? They do not.
 2746. *Mr. Gormly.*] What is your opinion as to the area of land in different directions from Condobolin, which will be suitable for settlement when the leases fall in;—take the country west and north from Euabalong—what extent of country is there suitable for settlement and selection? When you get 30 miles from here you come to the western division; but inside that division there is a good deal suitable for settlement.
 2747. Euabalong is 42 miles away? Yes, it is 12 miles from the boundary.
 2748. What extent of country along the division, between the central and western divisions, is suitable for settlement? There is an immense quantity at Melrose alone.
 2749. Is all that suitable for settlement? It is splendid land, the pick of the run, and nearly the whole of the resumed area has been taken up.

MINUTES OF EVIDENCE--RAILWAY FROM PARKES TO CONDOBOLIN.

75

2750. What is your opinion with regard to the land immediately adjoining the Western Division;—is it suitable for homestead leasing? A good deal of it has been taken up as homestead leases. Mr. H. W. Grey-Innes.
2751. You are aware that the homestead lessee can devote his land to agriculture if he chooses? Yes. 28 Mar., 1895.
2752. And he would hold his land probably at a cheaper rate? Yes; on part of Eremean Station there is a good deal of land which has been taken up as homestead leases.
2753. Are you of opinion, from your experience of this district, that agriculture might be carried on in that direction? I think so.
2754. And that the produce would be likely to come to Condobolin? Yes; it would have no other outlet at present. It could not go to Carrathool, Hay, or Whitton. About Euabalong there is a good deal of grain grown. One man had 1,000 bags this year.
2755. There is a good deal of lightly timbered country there which could be easily cleared? Yes.
2756. And you are of opinion that agriculture, if the railway is extended to Condobolin, might extend in that direction? It would extend about Cargellico and Euabalong.
2757. Are the residents of this portion of the Colony and further west towards the boundary of the Western Division, troubled much with rabbits? Most of them are netted. They also go in for poisoning, but outside that they are very bad. The smaller the holdings the better.
2758. If settlement were to extend there it would check the spread of rabbits? Yes.
2759. If the land were devoted to agriculture the holdings would get smaller? Yes.
2760. Then you are of opinion that there is a large extent of country which the Committee have not seen—that is, to the west, north, and north-west—which is suitable for settlement? Yes.
2761. You are of opinion that there is a large extent of land suitable for settlement around Condobolin? Yes; and I believe that with a good system of water conservation the produce would be increased at least sixfold. That has been proved by Mr. Gatenby, between here and Forbes. It has been proved that you can cut six crops of lucerne in a year.
2762. The creeks of the Lachlan could be dammed easily and cheaply? Yes.

Mr. Robert Clark, farmer and selector, Melrose, sworn, and examined:—

2763. Chairman.] Where is your selection? At Melrose and Palestan. Mr. R. Clark.
2764. How far is that from Condobolin? Forty miles.
2765. You are a member of the Central Farmers' Association? Yes; I am the secretary of it.
2766. Mr. Molesworth.] How long have you been a resident of this district? Four years. 28 Mar., 1895.
2767. What part of the country were you in before? Coolamon.
2768. What is the size of your holding? Myself and brother have two full blocks of 5,000 acres.
2769. To what use do you put it? To agriculture and sheep-raising.
2770. What quantity of land have you under crop? About 100 acres.
2771. What do you grow? Principally wheat and oats.
2772. Where do you find a market for them? Principally at Nymagee. It is only this year I have had any area under crop.*
2773. What is the distance to Nymagee from your place? About 50 miles.
2774. Then you would be about 10 miles nearer to Condobolin if the line were constructed to it? Yes.
2775. Do you favour the construction of the line according to the proposed route? Yes.
2776. How far out in your direction would the settlers be likely to utilise the Condobolin railway station? About 90 miles out—principally from the west and north-west.
2777. What would be the principal products? At present the principal product is wool, but if there were a railway I think it would be principally wheat.
2778. I understand you have a statement to make to the Committee? A number of selectors are likely to utilise the railway if constructed. The number of settlers on the portion of Melrose which I represent is fifty-six. There are some on the southern side, whose names I have obtained, who would utilise the railway. There are fifty-six on Melrose and eight on the adjoining station. The holdings are 144,860 acres. The area under cultivation at the present time is 1,524 acres. The result is 24,329 bushels of grain, an average per acre of 15 bushels 57 lb. I hand in the following list, showing the names of the selectors, population, area cultivated, and the yield:—

Names of selectors.	Popula- tion.	Area selected.	Culti- vation.	Bushels	Remarks.	Names of selectors.	Popula- tion.	Area selected.	Culti- vation.	Bushels	Remarks.
Morrows.....	3	6,500	40	756		Davidson	5	5,000	Grazier.
Gavell.....	5	10,000	Grazier.	Anderson	2	1,000	40	450	
Austin.....	10	6,500	120	2,016		Deaves	13	2,560	120	2,100	
Breen.....	3	640	60	1,260		Polyblank ...	1	2,560	12	252	
Chant.....	3	2,560	40	672		Kerley	17	7,000	76	1,205	
MacGregor.....	6	2,560	35	400		Faulkly	12	12,800	3	50	Mostly graziers.
Brown.....	6	3,000	90	1,080		Kerr	1	2,560	Grazier.
Mackenzie.....	3	1,600	Gardening.	Boxsell	6	10,000	4	84	
Baxter.....	2	900	Grazier.	McGorman	2	2,560	13	189	
Gibberson.....	1	800	Grazier.	Simmonds	1	2,560	Grazier.
Bowkett.....	10	2,560	60	960		Clark.....	3	5,000	97	2,030	
O'Donoghue	7	1,300	20	340		Carnes	8	2,560	60	1,350	
Durning.....	1	2,560	6	96		O'Brien	1	1,280	Grazier.
Sweeney.....	1	2,560	47	705		Barnes	16	7,000	31	596	
Bell.....	8	1,280	52	...		Draper & Miller	2	1,900	Newselectors.
Payne.....	7	2,560	50	850		Menzies Bros.	7	12,500	12	600	Oats only.
Pengilly.....	11	2,560	150	1,880		Richards	1	2,560	20	420	
Tremayne.....	4	2,560	21	264		Keating	5	1,500	Grazier.
Milledge.....	6	2,560	70	1,050		Seymour	1	2,560	New selector.
O'Halloran.....	2	1,280	115	1,764		Total	214	144,860	1,524	24,329	

Average per acre under cultivation = 15 bushels 57 lb.
Number of selectors on Melrose = 56 and 8 adjoining.

2779.

* NOTE (on revision):—I may state there is only a limited demand for produce at Nymagee; about 400 bags supplied it this year.

- Mr. R. Clark.** 2779. I understand that besides the selectors, whom you say you represent, there are a number nearer still to Condobolin who would be likely to use the railway? Yes; principally at Moabla.
- 28 Mar., 1895.** 2780. Can you give any idea as to the number of acres likely to be put under crop if the extension were completed within a reasonable time? I am quite certain all the selectors would go in largely for agriculture, if they had the convenience of a railway. The chances are they would cultivate 200 or 300 acres or more.
2781. And you believe it would become a large wheat-growing district? Yes; one of the largest in New South Wales.
2782. Is it well adapted for agriculture? Yes; it is equal if not superior to the Coolamon country. I have been on the Murray, Victoria, and I find it is equal to that.
2783. Had you any trouble with rust in your locality? A little made its appearance this year, but it did not affect us. It is dry soil, and it is not liable to rust.
2784. In what month did the rust appear? In September.
2785. Do you attribute it to any special cause? It had been a very wet spring and it then turned dry.
2786. Do you think the excessive wet at the beginning of the growth affected it? Yes.
2787. What quantity of wool is produced in the district you represent? I have not gathered the statistics in regard to wool, because the selectors are for the most part new upon the land and have not got it improved. The land will carry one sheep to the acre if properly improved.
2788. Is there any prospect of getting minerals in that direction? Yes; I think there is a great chance. We have all sorts out there—gold, silver, and copper.
2789. Are the mines in active operation? No; there is very little doing apart from fossicking.
2790. Is the rainfall sufficient to enable you to cultivate wheat satisfactorily? Yes; it has been over 22 inches for a number of years. I heard a statement just now about the Palestan country. A portion of my land is on Palestan, and I heard Mr. James say it is one of the poor carrying stations in his district. That is not because the land is inferior, but because it has not been improved. There is very little of the land which has been scrubbed, and there is very little water upon it. There is only one tank, in fact, on the whole of the station. The gentleman who owns the station says it will be equal to the land he has at Trundle if he improves it, and he is going in largely for improving it now.
2791. Then the failure of Palestan to carry more stock is simply from the fact that it is not improved? Yes.
2792. Is there any likelihood of any stock being sent from your district to be sent by rail to the metropolitan market? Yes; a considerable amount.
2793. What would it consist of? Principally fat sheep for market.
2794. Do you think the prospects surrounding the extension of the line from Parkes to Condobolin are essentially good? Yes. I may state that the future of the district depends on the railway to Condobolin, for without it it is impossible for us to pay our rent and live on the land. We cannot make a living by grazing alone, and with the present prices for grain it is impossible for us to grow it. It is 40 miles to Condobolin, and the carriage to Forbes or Parkes is 100 miles.
2795. Do you think the farmers in your direction would pay a local rate between Parkes and Condobolin until such time as the line paid working expenses? I do not think they would object. Speaking for myself, I would not object.
2796. What do you pay at present for the carriage of any grain you produce to a market? Sometimes 2s. per bag; at other times we have to pay more.
2797. That would be from Melrose to where? From Melrose to Parkes, about 100 miles.
2798. What would be the carriage from Melrose to Condobolin? I have to pay 1s. 6d. per bag or 13s. 6d. a ton; that is for a distance of 40 miles.
2799. The railway book rate from Parkes to Condobolin would only be about 9d. a ton—I suppose you would willingly pay more than that? Yes.
2800. What is about a paying rate for the production of grain? I think we could make grain pay at 2s. even at the distance I am from a market—40 miles—because the country is easily cleared, and we have a fairly good average.
2801. Do you go in much for sheep-farming? The country is not properly improved yet; but I intend to go in for it as much as I can.

Mr. Archibald Brown, farmer and grazier, Melrose, sworn, and examined:—

- Mr. Brown.** 2802. *Mr. Gormly.]* Where were you living before you came here? At the Rock, near Wagga Wagga.
- 2803.** How long have you been here? About four years.
- 2804.** You are well acquainted with your immediate neighbourhood? Yes.
- 2805.** The country is lightly timbered? Yes.
2806. Is there much scrub upon it? In places it is densely scrubbed.
2807. The land is easy to cultivate? Yes. Some of it is clay, and other parts sandy loam.
2808. Are you reasonably supplied with water? Yes; there are good catches.
2809. But you have to make large tanks? From 1,000 to 2,000 yards. There is no scarcity of water at present.
2810. The residents have enough for domestic use and for their stock? Yes.
2811. Is there a strong inclination on the part of the holders in your district to devote their land to agriculture? Yes; they are all going in for it.
2812. Are you satisfied that it is a grazing and agricultural district? It is a better agricultural district than the one I came from. The land is more easily cleared.
2813. Have you seen some of the land cultivated? I have 100 acres under crop myself; 40 acres I stripped for wheat. The first year I cut mine for hay; the next year I got 20 bushels to the acre.
2814. You can cultivate moderately cheaply, owing to the land being fairly level? Yes.
2815. Is that an advantage in agriculture? Yes.
2816. What implement do you use for harvesting your grain? The stripper.
2817. Do you find any number of persons who wish to acquire land in your district? Two selectors have taken up land within the past three weeks; others are waiting until the new Land Bill comes into force.
2818. Is there any quantity of land available for settlement in your neighbourhood? Odd blocks; but the pick is taken.

2819. If the lands now held as reserves and leaseholds were available, would persons settle in the Mr. A. Brown district? I think so.
2820. Is there any considerable number of persons who seem to have an inclination to settle? I could 28 Mar., 1895. not say.
2821. Do many go round to inspect the country, and make inquiries? Not during the past year, owing to the dull times.
2822. I suppose they can tell by the charts that the land is not available to any extent? Yes.
2823. Is there any other district in your neighbourhood, where settlement has taken place to any extent, which a railway to Condobolin would serve? It would serve all between there and Condobolin. Walker's Hill is outside Melrose, but it would be benefited, and then there is Nangebone.
2824. Are there any settlers there? I do not think there are any there. I should like to say a few words with regard to Palestan. I was there a few days ago, and the owner of the station told me he considered the country equal to that around Trundie, and that he was improving 5,000 acres by getting it ringbarked and scrubbed at 1s. an acre.
2825. Then his holding is overrun with scrub? Yes.
2826. And will not carry many stock? No.
2827. Are the settlers in your neighbourhood removing the scrub and timber? Yes.
2828. Have you used your land for grazing? Yes.
2829. What will it carry? When properly improved it will carry a little over a sheep to the acre.
2830. Do stock do well there? Yes.
2831. Are they liable to any disease? No.
2832. Do they get reasonable feed? Yes.
2833. Do you find grass-seeds which get into the wool troublesome on any of that country? Not where the land is properly stocked—only in odd places. Where the land is reasonably stocked after a few years the grass seems to change.

Mr. Horace Leighton, farmer, near Condobolin, sworn, and examined:—

2834. Chairman.] Where do you reside? Seven miles to the east of Condobolin.
2835. Mr. Chanter.] What is the extent of your holding? 2,560 acres.
2836. How long have you held it? Six and a half years.
2837. Did you take it up for selection? Yes.
2838. What improvements have you effected upon it? I rung and scrubbed it, I sank two tanks and a well, and put up a dwelling-house with other buildings, and fenced it all in. It is all ringbarked, but I have 1,000 acres of mallee, and as fast as you cut it down it springs up again.
2839. What is the character of the soil in the mallee? The very best for cultivation.
2840. Suitable for agriculture? Yes.
2841. How many acres have you under cultivation? 250.
2842. Is that situated in the portion of the mallee you have described? Part of it.
2843. What was the result of your cultivation? The wheat gave 20 bushels to the acre, and the hay 1½ tons.
2844. Where do you dispose of your produce? I have all my hay on hand yet. I have sold 500 bags of wheat to the mill at Condobolin.
2845. Do you expect to get a sale later on? No; they do not care to buy other than first-class samples, and the wheat I have on hand yet is a little pinched, on account of the richness of the soil, which dries up too quick.
2846. What are your prospects for disposing of the hay? There is no prospect about here.
2847. Have you sent any of your produce to Parkes or Forbes? No, only my wool. I send that to Parkes every year.
2848. What price did you get for the wheat you sold? One shilling and 10d. a bushel.
2849. And you say you cannot get any sale for the balance? No, they will not set a price upon it.
2850. What would be the cost to take it to Parkes? Twelve shillings a ton.
2851. If you cannot get a sale for it here you will have to send it to Parkes? No; I will feed my own stock upon it.
2852. I am speaking of the wheat, and not of the hay? The wheat too.
2853. What stock do you keep? 1,000 sheep, twelve draught horses, and two light saddle and harness horses, and a few cattle.
2854. What will that portion of your holding which you have improved by ringbarking carry? One sheep to the acre.
2855. Will the mallee portion, when improved, have equal carrying capabilities? Yes; but it will take several years. I should crop it first.
2856. How much wool did you have this year? Three tons.
2857. Where did it go? To Parkes.
2858. How far is your holding from Condobolin? About 7 miles.
2859. Would the railway, if constructed, induce you to increase your cultivation? Yes; I have to keep a plough going to keep the scrub down. There are so many different scrubs which the sheep will not eat. I have 170 acres ploughed to keep the young scrub from coming.
2860. About what acreage, under those circumstances, with railway communication, would you have? Myself and family could have about 500 acres a year.
2861. And how many bags per acre would you expect to get? Four bags, or 15 bushels, at the least.
2862. That would be 2,000 bags of wheat? Yes.
2863. Then you would be prepared to supply the railway with over 200 tons? Yes.
2864. Do you grow fruit? Yes.
2865. Do you find it profitable? I have never sold any yet. I use it for home consumption, but the fruit does remarkably well.
2866. If you had railway communication, would you be induced to grow it for market? Yes; I have had lots of raisins this year.
2867. Do you know the district pretty well? Yes.

Mr.
H. Leighton.

28 Mar., 1895.

- Mr. H. Leighton. 2868. Do you know what your neighbours would be disposed to do if the railway were constructed;— would they increase their agricultural area? I have not seen any of them to inquire.
2869. Do you think they can make a living and retain their land under existing circumstances? Yes; if they have a market.
2870. But what if there is no railway at all? It would be of no good then.
2871. Then if the railway were constructed you think it would be to their interests to produce cereals and other produce from the land which they are now grazing? Yes; because agriculture will keep it clean, and sheep will not.
2872. Is there a considerable area around you suitable for agriculture? Yes; all of it.
2873. Are the holders industrious, permanent settlers? Yes.
2874. Men who came with the object of making a home? Yes; like myself.
2875. It is costing your neighbours about 12s. 6d. a ton to carry their wheat to Parkes? Yes.
2876. Would you be inclined to agree to pay a higher rate of carriage from Parkes to Condobolin than 9d. a ton, or what is termed a local rate? Yes; if I could get the stuff away when I wanted to.
2877. Would you be agreeable to sign a bond to the Railway Commissioners to pay what is termed a local rate? Yes.
2878. That would be nothing in comparison to what you are paying now, but still it would be higher than the through rate? Yes.
2879. Do you think your neighbours would do the same? Yes.
2880. Do you think, under the circumstances of a local rate, and the prospects as to the development of traffic, Parliament would be warranted in approving of the construction of a line from Parkes to Condobolin? I do.
2881. Do you approve of the direct line from Condobolin to Parkes, or the line from Condobolin to Forbes, or of the line from Condobolin to Parkes via Trundle? I think the direct line via Bogan Gate is the best.
2882. Do you know Bogan Gate? Yes.
2883. Have you ever noticed the condition of the country there after a very heavy rainfall? Yes; I was through there last winter, up to Parkes and back again. It was very wet for two days, but the water drained off very quickly.
2884. How far would that extend from the Gunningland Creek, where the line crosses? I do not think there was more than 5 miles of very bad country there.
2885. Did you travel along the road? Yes.
2886. But the line would be considerably to the north? It would be better still to keep away from the water. I kept up a little towards Trundle coming back, and I found it was not so wet there.
2887. What was the average depth where you went? The deepest was 18 inches.
2888. What would be the average depth? Eight or 10 inches.
2889. Was the ground solid or boggy? Very boggy. I got through it with trouble with a buggy. There had been an extra heavy rainfall.
2890. Last season you had one of the heaviest rainfalls on record? Yes.
2891. If the railway were built up with an embankment a foot high, and sleepers 9 inches thick were laid on the top, and two tide drains were constructed to collect the water, with proper outlets, could a train travel over it? Yes; but there would have to be several culverts, because water comes from Trundle way very heavily.
2892. If 4 or 5 chains of waterway were constructed on each side of the creek, would not embankments, such as I have described, be sufficient to safely carry a line with a fair load? Yes; I think it would take all the water away.
2893. Was the rainfall last season as heavy as any which has preceded it? Yes.
2894. Is it not possible for a person to ride along a piece of country which would be low and flooded, and perhaps half a mile or a mile away find it perfectly dry and outside the reach of flood? Yes.
2895. Then, if the deviation shown on the plan is so much further north towards Trundle, would it not decrease the danger from flooding? The more you went towards Trundle the more the water would decrease.
2896. You are not in a position to say then that the line does not run upon reasonably dry ground? Reasonably dry ground.
2897. It is only when it gets more south, towards the creek itself, that the water would lie? Yes.
2898. Do you know anything of the Crown lands at Burrawang? No.
2899. Then you do not know the nature of the country? I know it is low.
2900. Do you think it is possible, even with the railway constructed, for a close and permanent settlement of farmers to be retained if the area is limited to 640 acres along the line? I do not know. You must keep stock as well as farm. I do not think I could get a living on 640 acres.
2901. And you assume that if you could not get a living no one else could? I think not.
2902. What would it be a fair legitimate area of land to allow a selector close to a railway line? About 1,000 acres of good land.
2903. You do not share the opinion that the Crown land on the line of route should be taken up and permanently settled by special areas of 640 acres, at a cost of 30s. an acre? I do not. I do not think a man could live upon it.
2904. You think the area should not be less than 1,000 acres, and the price not more than what? £1 is sufficient.
2905. If the Crown lands are made available on the conditions you have described, and with the land already settled in the hands of selectors at present, you are satisfied that this line of railway would, by producers consenting to a local rate, immediately pay, and, by the development of the district pay still better, so that the local rate could be removed? Yes.
2906. And you approve of the construction of the line? Yes.

Mr. Robert Officer, manager of Condobolin Station, sworn, and examined:—

2907. *Chairman.*] What are you? Manager for the Union Mortgage and Agency Co., at Condobolin Station. Mr.
R. Officer.
2908. *Mr. Molesworth.*] How long have you been in this district? Ten years. 28 Mar., 1895
2909. Is your station within easy distance of the town? It surrounds it.
2910. What is the size of it? Originally it was 120,000 acres. We have about 80,000 acres left now; we use about 60,000 acres.
2911. Is it all leasehold, or is some portion of it freehold? There are 20,000 acres of secured lands, and the others are leasehold and occupation licenses.
2912. Do you carry nothing but sheep on the station? Just now we carry only sheep, and sufficient horses and cattle to work it.
2913. Do you cultivate any portion of the land? Not now; but two or three years ago we cultivated 200 or 300 acres.
2914. Was there any special reason for giving it up? Over-production in the district, and no market outside.
2915. In the event of the railway being constructed, will there be any inducement to again cultivate? Yes; as manager I should advocate going into cultivation largely.
2916. What do you mean by "largely"? Up to 3,000 acres annually, with a view to putting it down in lucerne after a crop or two had been taken off.
2917. Have you any record as to the rainfall in the district? Yes; the average for the last twenty years is 20 inches.
2918. What was the largest, and what was the lowest rainfall? Fourteen and a half inches was, I think, the lowest, and 31½ inches the highest.
2919. Do you consider the average sufficiently good for the growth of cereals? Yes.
2920. Is the district eminently adapted for growing wheat? Yes.
2921. What is the lowest price at which it would pay, if the railway were constructed, to grow wheat in this district? Two shillings—going into it largely.
2922. Where do you send the product of your station to? At present to Sydney, via Forbes.
2923. It consists, I suppose, principally of wool and fat stock? Wool; no fat stock.
2924. Would you feel inclined to send fat stock if the railway were constructed? Eventually we would; but the country is not fattening country. It has all, originally, been pine scrub country.
2925. Have you noticed any improvement in the growth of this district since you have been here? Very marked.
2926. Has it been a regular steady progress? Yes. About the time I came here there was what you might call a rush for land. Settlers came in great numbers from Wagga, and the progress since that has been steady.
2927. Has there been any great settlement since the railway was opened to Parkes? No.
2928. Do you think there would be an increased settlement if the line were extended here? Yes.
2929. And lands would be thrown open eventually for settlement? Yes.
2930. Can you give an estimate of the quantity likely to be thrown open for selection? When I came to this station there were 120,000 acres, which were supposed to carry 30,000 sheep. I spent money upon it, and made it carry one sheep to the acre, whereas before it only carried one sheep to 4 acres, and then even it had been improved.
2931. That seems to be the average capacity of the land all through? Properly improved with natural grasses, it will carry a sheep to the acre.
2932. Does the proposed railway run through any portion of your land? Not secured land.
2933. I understand you have some proposal to make to the Committee? Yes. The owners have authorised me to offer 10 acres of land as a gift to the Commissioners for a railway station, provided that they use it for that purpose.
2934. What distance from the town is the land you propose to offer? It is really closer to the town than the proposed site.
2935. How far would it be from the centre of the town, taking the post-office as a centre? Less than three-quarters of a mile, and following the road.
2936. Do you think there is room for the growth of the town in that direction? The town must go that way.
2937. There is no opportunity for it to go in the other direction? The country is unsuitable for building.
2938. Is this on the higher land of the town? It is lower land near the proposed site, offered for a railway station, but on perfectly high dry land.
2939. Is it sufficiently level for station purposes? Yes; it is almost dead level.
2940. Supposing 10 acres is not sufficient, would it be possible to get more at a fair valuation? Yes.
2941. Without any trouble about compensation, excepting what might be fair and reasonable? Yes; as the representative of the company, I might say we would do all we can to encourage putting the station there. We recognise that it will add value to the adjoining land.
2942. You make this statement on the authority of the owners of the station? Yes; I have a telegram in my pocket authorising me to make the offer. It is a free gift, provided it is used for railway-station purposes.
2943. Do you know anything of the proposed line between here and Bogan Gate? Yes; I have travelled over most of it.
2944. Have you travelled over the pegged line? I did not travel over it with a view to forming an opinion as to the line, but I have travelled all along the line to within 10 miles on this side of Bogan Gate.
2945. Will you give the Committee the benefit of your knowledge as to the liability of the country to floods, especially on the route of the proposed line of railway? I came along it last July, in the middle of one of the wettest winters we have had, and there was nothing along the road to stop an ordinary pair of horses and buggy. With drainage, I do not think there is half a mile of country over which there would be any difficulty in forming a line.
2946. It has been stated in evidence elsewhere, that the line at the Condobolin end would be liable to flooding a little distance from here—between here and Burrawang—and that the waters would extend from 6 to 10 miles in the locality of the Goobang Creek? There is no difficulty from flood-water on the whole of the line which could not be got over with drainage. 2947.

- Mr.
R. Officer. 2947. I suppose you are aware that the engineers of the Department have lifted the line at the Condobolin end with the view of escaping this doubtful country? Yes.
- 28 Mar., 1895. 2948. Do you think a line brought up in that way will escape the possibility of flooding? There is no flood-water over the marked route—nothing but rain-water.
2949. And the effects of rain would easily be met by the ordinary lifting of the line 2 or 3 feet from the surface? Where the bend is shown on the map, I do not think you would need to lift it 6 inches. It is right out of the reach of the flood-water, with a gravelly soil.
2950. How high do you think it would be necessary to raise the line to keep it out of the reach of flood-waters at Gunningland Creek? I think 3 feet high would escape any flood-water.
2951. And for what distance? I could not say.
2952. Could you give a margin? I should say at the outside half a mile.
2953. You see that the proposed route is a direct line from Parkes to Condobolin; but there is an alternative survey to Forbes, and strong pressure has been brought to bear in favour of it going through Trundle;—which do you think would be the best line from a national point of view? From Parkes *via* Bogan Gate, from a national point of view, and with a view to the interests of the district.
2954. And with a view to further extension, you think that will be the better line? Yes.
2955. Do you know the country in the vicinity of Trundle? I know the country close to Trundle.
2956. We have evidence to show that it is thickly settled upon, and that the heavier part of the settlement takes place north of Trundle;—notwithstanding that, do you still think the direct line is the better one to follow? I think it is. I think Trundle is a better settled district, and contains a more substantial class of men than any other portion of the district. At the same time I do not think it is sufficient to warrant a detour to that extent.
2957. Do you think the lands in the neighbourhood of the railway, when thrown open to the public, will be settled upon? Yes.
2958. And are they suitable for farming and agriculture? Every inch, except one or two portions near the Gap, where the line comes through.
2959. What quantity of tonnage would you be likely to supply the railway with at Condobolin? From 100 to 150 tons per annum.
2960. Is that both ways? Yes; the ordinary carriage from Sydney will be rock-salt and wool-packs principally.
2961. No ordinary supplies? No; we get them in the town.
2962. Does that include the trucking of any stock? No; that would be extra. We have not proved that our country is fattening country yet, and until that is done, I do not think it would be fair to make an estimate.
2963. Do you think the railway would be likely to be used as an outlet for stock, supposing there was a drought here, and you wished to move the stock elsewhere? Most decidedly. It would be of value to get stock to the mountains, and people would send stock away which are not really prime fat, whereas if there were no railway we would not risk sending them.
2964. I suppose you know that there would be a loss on the line at the outset of £2,000 per annum? Yes.
2965. Do you think there would be any objection on the part of the proprietors of your station, and others, to pay a local rate between Condobolin and Parkes, until the line became self-supporting? I do not understand the position we would be in.
2966. Where extensions have been made in new districts, it has been customary to charge a local rate upon the local line—that rate is a little higher than the ordinary rate for that piece of line? I believe the owners would be perfectly willing to enter into any fair arrangement of that description.
2967. Do you think the construction of the line would lead to a sufficient volume of traffic to make it self-supporting? I believe it would.
2968. And to remove the liability of £2,000 a year? Yes.
2969. Are there any prospects for mining in this locality? Yes; during the last six or seven years I have spent nearly £1,000 myself in prospecting here, and I believe that as soon as we get practical experts here it will be found there is a large reefing field.
2970. Do you think the opening of the line will induce the experts to come? I think so; and it will enable us to send away trial crushings, and prove stone which is lying idle.
2971. Do you think there are any other minerals worth developing here? There is copper; but I do not think it is in sufficient quantities.
2972. Altogether, you look on the prospects of the proposed line as being good? I do. I think it is a line which will pay as soon as any of the light lines in the Colony.
2973. You are aware it is intended to construct it as a pioneer or cheap line? Yes.
2974. With no gradient exceeding 1 in 100? Yes.
2975. From your knowledge of the country, do you think that would be a sufficient permanent way to carry the traffic from Condobolin for some years to come? I think, if we got such a line, it would not be long before the Commissioners were justified in making a stronger and more permanent one.
2976. The railway authorities inform us that the line would be sufficiently strong to carry everything run on the main line, with the exception of the heavy engines? In that case I should think it would be quite sufficient.
2977. You have no doubt whatever as to the freedom of the line from flood? I am perfectly satisfied there are no engineering difficulties on account of flood at all.
2978. I might mention that the speed upon the line would be limited to 15 or 20 miles an hour;—I suppose that would be sufficient to commence with? I think so. Of course the passenger traffic is a mere secondary consideration, and for goods that speed is quite sufficient.
2979. I suppose the line would induce passenger traffic too? Undoubtedly.
2980. On the whole, you are thoroughly prepared to recommend the construction of the line, believing it would pay before very long? I can honestly say I feel satisfied it will pay, and that it will be a surprise to the Commissioners when they get it going.
2981. *Chairman,* Do I understand you to say you have had no experts here to inquire into the mining question? We have had experts, but not practical men—men who would come and look at the field and form an opinion without doing any work.

2982. Government officials? Yes, once or twice. I think you will be interested to know that, on the Melrose Road, 3 miles from the town, if you take a dish of dust off the road and wash it, you can get colours of gold almost anywhere. I have had rough reef stone assayed which has shown a little gold, and it has given a return of 67 ounces to the ton. The assayer has said it was reef stone, and had come no distance. I have spent a good deal of money trying to find where the reef is. I have not found it, but I blame the man I have employed more than the country.

Mr.
R. Officer.
28 Mar., 1895.

2983. Is the country similar to that around Parkes from which gold is obtained? Something of the same kind, but this is a different rock.

2984. What possibility do you see of further development? The difficulty here has been, that when stone has been obtained, men have not cared to go to the expense of sending it to Parkes to be tried. If we had a railway, samples which are now left in the field would be tried.

2985. Are there any number of fossickers or prospectors about? There is a new field down the river which has taken most of them away. I do not think there are more than half-a-dozen on it.

2986. Are they earning a living on it? No; there has been no payable gold obtained.

2987. So far there is no payable gold? Not close to the town. I believe there is a payable reef at Cugong about 30 miles down the river, which would come to Euabalong if the railway to Condobolin were constructed.

Mr. Thomas Francis Mooney, grazier, near Condobolin, sworn, and examined:—

2988. Chairman.] Where do you reside? About 18 miles south of Condobolin.

Mr.
T. F. Mooney.
28 Mar., 1895.

2989. Mr. Gormly.] You live on the south side of the river? Yes.

2990. Have you been there many years? Twenty-one years next July.

2991. What station are you on? Borambil.

2992. Are there many other small landowners around you? Yes.

2993. How many? Fifteen or twenty, within 10 miles.

2994. If the railway were constructed, would Condobolin be the nearest point of communication you would have with Sydney? Yes.

2995. Would you and your neighbours send your produce here? Yes.

2996. Is any agriculture carried on in your neighbourhood? There is some, but not so much on the south side of the river as on the north.

2997. Is that owing to the distance you are from Condobolin? The carriage has something to do with it.

2998. Is there a fair road during the whole of the year? At times there is, and at other times it is very bad.

2999. Are you cut off by floods at any time? Very seldom; but the roads get into a bad state.

3000. I suppose your neighbours keep sheep? Yes.

3001. Where do you send your wool to? To Sydney by way of Forbes.

3002. What distance are you from Forbes? Nearly 60 miles. I have two small places—one on the river, and one further back, and I am living further back from the river.

3003. What are the possibilities of population in your neighbourhood? I think the population is bound to increase after a time.

3004. It is not increasing now? It cannot, because there is no land available.

3005. Are any of the landholders in the neighbourhood leaving? Very few.

3006. Are some leaving? I know of one on the south side.

3007. Have some of the selectors at Bygalorie abandoned their holdings? Only one that I know of.

3008. Can you tell us the reason why? Chiefly on account of anthrax.

3009. It has been rather prevalent in that district? Just in that neighbourhood.

3010. Is there any amount of fat stock produced in that neighbourhood? Yes.

3011. What market is it sent to? Forbes is the market for 25 miles around where I am.

3012. There is no considerable extent of population for a radius of 20 miles around you? The whole of the leasehold area, excepting the reserves, is taken up.

3013. What quantity of wool do you produce? At present I have 19,000 sheep on the run. Last year I sold 10,000 to Mr. Richards, of Riverstone.

3014. Then you would send the wool of 19,000 sheep, if the railway were constructed, to Condobolin? Yes; I shear on the river 12 miles east towards Forbes. But with the bad state of the road to Forbes I would have to send to Condobolin.

3015. You shear 12 miles up the river? Yes.

3016. But it would suit you to send the wool to Condobolin? Yes.

3017. Chairman.] What price do you generally pay for carriage? Last year we had it delivered in Forbes from my place for 25s., but it varies sometimes to £3. To Cowra it used to be £3, and £3 5s., but last year, labour being cheap, it was very low—lower than I have ever seen it.

3018. Would you be prepared to pay a slightly increased special rate for carriage on the railway? If it were made too high I would have to utilise the road.

Mr. James Dawson, farmer and grazier, near Condobolin, sworn, and examined:—

3019. Chairman.] Where do you reside? About 12 miles south of Condobolin.

Mr.
Jas. Dawson.
28 Mar., 1895.

3020. Do you remember giving evidence in 1892 to Mr. Gilliat? Yes.

3021. Is what you stated then substantially correct now? Yes; I could not alter that.

3022. You said on that occasion that agriculture would be likely to largely increase? Yes.

3023. Has agriculture in that district increased since the railway was extended to Parkes? It has, a great deal.

3024. That is amongst people within a reasonable distance of the railway? Yes.

3025. What reason have you for thinking it would still further increase if the railway came to Condobolin? Simply because it would give facilities to get to market. As it is, we are confined to the mill in Condobolin.

3026. You cultivated in 1892 about 200 acres out of 14,000? Yes.

3027. Have you increased that cultivation area since? No.

- Mr.** 3028. Why not? It has rather decreased, because as cultivation increased the market became overdone.
Jas. Dawson. The mill could not dispose of it here, and it would not pay to send it to Forbes or other places.
28 Mar., 1895. I see that during the thirteen years up to 1892 your average yield was about 13½ bushels to the acre? Yes.
3030. Has it increased since then? Yes; last year. It was a better average last year.
3031. That seems to have been the experience of the district generally? Yes.
3032. Have you been improving the soil, or what? I think we have had better average seasons—a better rainfall.
3033. Do you look upon the district as eminently suited for agriculture? I do.
3034. Have you had experience in other parts of the Colony of farming? I lived in the Albury neighbourhood ten years.
3035. How does this place compare with that from a farming point of view? Favourably.
3036. What about fruit-growing in this district? It is very good, but it requires irrigation to be successful.
3037. In your former evidence you referred to the valley of the Lachlan, as far as Hillston, being what you considered one of the best wheat-growing districts in the Colony. That would be, I suppose, away from any land likely to be affected by rust? I think so still. There is no land subject to rust, unless by floods.
3038. Do you look upon those parts, between here and the Lachlan, south of the proposed line, as good wheat-growing country? I do not think the flooded plains would be as good, because it would be subject to rust.
3039. Taking the portion of country between the Government line and the Lachlan River, and taking the portion between the Government line and Trundle, which do you think would be likely to produce the largest body of settlers? There is very good land on both sides. There is a good deal on the southern side of the proposed line which is not subject to floods.
3040. You look upon that which runs through Burrawang as being all good for agricultural purposes? Yes.
3041. How do you send your wool to market? By teams to Forbes.
3042. Seeing that you are 10 miles south from Condobolin, where would you send it if a line were constructed to Condobolin? To Condobolin. I would be satisfied to be within 10 miles of a railway.
3043. In addition to that, the road to Forbes is bad? Yes; a very bad road.
3044. What quantity do you send to the railway in a year? Last year I sent about 50 tons of wool.
3045. Did you send anything else? No.
3046. What quantity of sheep have you on your 14,000 acres? I shore 13,500, but since giving that evidence I have purchased another place, and I shall probably shear about 21,000 this year.
3047. What do you pay for the carriage of your wool from your holding to Forbes? I gave £5 5s. last year for the through trip to Sydney.
3048. A carrier's agent took it through, I suppose? Yes.
3049. Do you know what the proportion of cost would be from your place to Forbes? About £1 17s. per ton, I think.
3050. According to the railway book, if the line were extended from Parkes to Condobolin, the freight for greasy wool would be 6s. 6d., and for scoured wool 8s. 6d. per ton. Seeing that you pay so much more now, would you be prepared to pay a little over the book rates if the railway were constructed, until it became remunerative? Certainly, I would.
3051. This is a kind of country upon which, notwithstanding its apparent dryness, stock seem to do well? Yes; they have always done well when they had plenty of water in summer.
3052. Have you gone in for fat stock? Yes.
3053. How have you succeeded with them? The difficulty is in getting to market; it does not pay to start with a small lot.
3054. With regard to small holders on from 1,000 to 2,560 acres,—one witness has stated that if the railway were close to their holdings there would be many small items of profit which they could occasionally make, if they could now and then send a few beasts to market;—do you think that that would be likely to be availed of by the small holders to increase their profits? I think it would; although, as a rule, I do not think very small holdings are profitable when they are so far away from a market.
3055. One witness says he thinks 640 acres close to a railway would be a fair holding upon which to make a living? It might do for a single man, but not for a family.
3056. These special areas are supposed to cost 30s. an acre;—do you think a man can afford to pay that for a holding of that character? I think a good deal of judgment is required in laying out special areas. There is a great deal in the classification of the land.
3057. They would have to be picked localities for a man to pay 30s. an acre for? Yes.

Mr. John Dawson, farmer and grazier, Derrawang, sworn, and examined:—

- Mr.** 3058. *Chairman.*] How far is Derrawang from Parkes and Condobolin? Fourteen miles north-east from Condobolin, and I think 55 miles from Parkes.
Jno. Dawson.
28 Mar., 1895. 3059. *Mr. Chanter.*] Your holding at Derrawang is 7,680 acres? Yes.
3060. How near would the proposed line pass your property? Some 6 miles.
3061. How long have you been here? Eight years.
3062. In 1892 you had 130 acres under cultivation? Yes.
3063. Have you increased it? Yes, to 200 acres or more.
3064. Your average crop, then, was 20 bushels per acre? Yes.
3065. What has been the average since 1892? I think it has fallen a little. Some of the ground has been cropped more frequently. I should say that 16 or 18 bushels is the present average.
3066. Since you gave your last evidence wheat has fallen very much in price? Yes.
3067. Would you be prepared, if a market were opened to you, to further increase your area of wheat? Yes.
3068. Would you find it more profitable, being so near to a railway station? I do not say I should; but I could get rid of produce, and at present I cannot.

3069. What is your experience in regard to the profits from stock and cropping ;—which would give the greatest return per acre with railway facilities at hand ? I think they would be nearly equal. Mr. Jno. Dawson.
3070. You put the average crop at 18 bushels per acre ;—how much would it cost you to produce that ? 28 Mar., 1895.
I do not know—I have not employed much labour. I think agriculture would give greater returns than grazing.
3071. Providing you had a market accessible for your produce, would it not be to your interests to largely increase the area under cultivation ? At the present prices it would not.
3072. I presume you have not increased your area to any considerable extent, because of the carriage ? Yes.
3073. If the line is made that difficulty will be removed ? We shall produce considerably more.
3074. You have had experience at Albury, and in South Australia ;—will you compare this district, for the purposes of close settlement and production, with the Albury district, with the district with which you have had experience in South Australia ? I think that this district will favourably compare with either.
3075. Is it equal to those districts ? I think it is superior. The land is much richer than at Albury.
3076. What district in South Australia were you in ? Near the city and the hill country.
3077. That was not considered one of the most favourable parts for production ? No ; it was more suitable for grazing.
3078. Then you think this is a superior agricultural district to Albury ? I do.
3079. And the production from this district would be greater ? Yes.
3080. What route do you think the line should take, taking into consideration first of all the natural features of the country, then the fact that it must not exceed a cost of £2,000 per mile, and then considering the necessity of its serving the greatest number of people ? I have always advocated the Bogan Gate line, and I still think it is the most suitable for all purposes.
3081. Will you give your reasons why ? It is more direct. It passes equally between the river and the settled country to the north of Trundle and that neighbourhood, and it is the shortest line.
3082. When you gave your evidence before Mr. Gilliat in 1892 you held a different opinion ; is that so ? I am not very certain about that.
3083. In your evidence you then said, "The line *via* Trundle is the best, as it avoids flood-water" ? Yes.
3084. You do not hold that opinion now ? Not at present.
3085. Will you tell the Committee what reasons you have for now giving your opinion in favour of the railway *via* Bogan Gate ? Since then I have become better acquainted with the country, and I understand that the route is much shorter by the direct line. It would save haulage, and would serve people who might settle upon the country when the leases were opened.
3086. You said then, as one of your reasons why the line should go by Trundle, that it avoided flood-water ;—will you give your personal experience of the flooded state of the country about Gunningblad Creek in the vicinity of Bogan Gate ? I was under the impression then that the line would be flooded ; but I find on better personal acquaintance with the country that it is not flooded.
3087. Your evidence on that occasion, then, was not founded on actual knowledge of the flooded state of the country ? No ; only from what I had learned from other people. Since then I have become better acquainted with the country.
3088. Have you traversed it since then ? Yes ; two or three times.
3089. Were you along this line during the last winter ? No.
3090. Were you along it in the winter of 1893 ? No ; I have not been along it in winter time.
3091. Then you have not seen it since you gave your evidence to Mr. Gilliat ? I have seen it, but not in the rainy season.
3092. Then your evidence, as to the flooded character of that district, is from hearsay, and not from actual knowledge ? More so than really personal knowledge.
3093. How many sheep do you keep ? Nearly 10,000.
3094. Where do you send your wool to at present ? Usually to Forbes.
3095. How much do you send ? About 24 tons.
3096. Do you truck any live stock ? I have stock to send at present ; but it is difficult to send it owing to the distance to the railway.
3097. Is that because you have not a sufficient number at one time to take away ? I have a sufficient number ; but the difficulty is to keep them in condition between here and Forbes or Parkes.
3098. If you had facilities, how many trucks per annum would you be able to send ? I could load thirty trucks.
3099. Would there be any other kind of produce, such as hides and skins, which you would be able to send ? The usual year's work of a station would be sent by rail.
3100. Can you tell how many tons that would be ? It would not make a great tonnage.
3101. Four or five tons ? Hardly that.
3102. And your wheat or cereal production would depend a great deal on the price you could obtain at Condobolin or Sydney ? It would be regulated very much by that.
3103. Failing your getting a better price at Condobolin, it would be sent to Sydney ? Yes.
3104. About how many bags of wheat would you be able to contribute to the railway each year ? Eight hundred.
3105. Can you state, from the conversations you have had with neighbouring settlers, what they would be prepared to do in the way of increasing agriculture ? I can say they would all increase their agriculture if the railway were constructed ; and their properties would, in every way, be better developed.
3106. In consequence of the extra facilities they would have to get to market ? Yes ; they would send away everything they produced.
3107. Would you enter into a bond with others to pay what is termed a local rate until the line became self-supporting ? Certainly.
3108. Do you think there would be any difficulty in getting your neighbours to enter into a similar bond ? I do not think there would be any objection whatever on their part.
3109. On the whole, you are of opinion that Parliament would be warranted in authorising the construction of this line, inasmuch as the people themselves would assist it by paying a reasonable local rate ? Yes.

Mr. Richard Whitehead, manager of Borambil Station, near Condobolin, sworn, and examined:—

- Mr. R. Whitehead. 3110. *Chairman.*] Where is Borambil? It is situated 10 miles from Condobolin, up the river on both sides.
 3111. *Mr. Molesworth.*] How long have you been a resident of the locality? Eight years.
 28 Mar., 1895. 3112. What is the size of your holding? 80,000 acres.
 3113. Do you depasture sheep principally? Yes, and farming.
 3114. How much land had you under cultivation during last year? For the last two years I have stopped farming; I found it did not pay. I have gone in for lucerne and hay instead.
 3115. What was the cause of your abandoning agriculture? I saw there were so many farming, and it was not paying them.
 3116. Why did it not pay? Because they could not get rid of it in the district.
 3117. The local market was over-supplied, and you had no means of getting it to a central market? Yes; I can buy it cheaper now; I bought oats the other day at 1s. 6d.
 3118. Would that state of things be altered if the railway were constructed to Condobolin? Yes.
 3119. Would you be prepared to put a quantity of land under cultivation? Yes; I would go in more for cultivation.
 3120. To what extent? 200 or 300 acres.
 3121. By way of experiment? Yes.
 3122. If it succeeded you would increase the quantity? Yes.
 3123. What would you grow? Principally wheat and oats for the metropolitan market.
 3124. At what point would you connect with the proposed railway? Condobolin.
 3125. What wool or other produce would you have for a railway? Last year's clip was 1,300 bales.
 3126. What does that amount to in tonnage? 230 tons.
 3127. You have heard other witnesses examined with regard to a local rate;—do you feel disposed to fall in with an arrangement of that kind? Certainly.
 3128. You would have no difficulty in entering into a bond with others with a view to making the line self-supporting? No.
 3129. Do you think the railway would become remunerative in a short time? I am sure it would. People would have more encouragement to extend their operations. The difficulty for years has been the want of a market.
 3130. Would you be likely to patronise the railway in order to send away fat stock? Yes; I do now.
 3131. Do you find a difficulty in driving such a distance to the railway at Forbes? Yes; it is a barrier.
 3132. But if the railway were closer to your door, it would be greatly to your advantage for the removal of stock? Yes.
 3133. How many trucks of stock in the course of a year would you be likely to send? About 100 trucks of sheep.
 3134. Would you be likely to utilise the railway, in the event of dry seasons, if you were moving your stock from one part of the country to the other? Yes.
 3135. You think that the line might be utilised in a bad season to remove stock from a dry to a wet district? Yes.
 3136. Do you know the route of the proposed railway? I know what is called the direct line *via* Bogan Gate.
 3137. Have you been over the country where the line is pegged out? Yes.
 3138. Can you give any information with regard to the liability of that particular part to flooding? I do not think there would be anything serious. I think it would be much better than going by Trundle.
 3139. You do not think the flood-waters would be a serious barrier? No.
 3140. What would be the greatest depth of water at any time in the vicinity of Gunningbland Creek? That is the worst place, and I have not seen it in flood.
 3141. Judging from the appearance of the country, can you give any idea as to its depth? I suppose in the creek itself there might be 10 feet, but I do not suppose in the approaches there will be more than 3 feet on the flats.
 3142. Then, if the creek were spanned by an ordinary timber bridge, and the approaches were built up 3 feet, with a drain on either side, the line, you think, would be fairly free from water? Yes.
 3143. There is an elbow in the line approaching Condobolin with the view of escaping the flooded country? That is on North Borambil.
 3144. Do you think, by making that bend, the line will escape the flooded country at that point? Yes; that is the way the teams go now to avoid the flood-water.
 3145. Even in flood times, do you think there will be any force of water to damage the line? There is no force of water there at all.
 3146. How long does it remain on the land before it subsides? About a fortnight at the outside. It is only in high floods that water gets there at all.
 3147. Then it is not a regular, but an extraordinary thing for water to reach that height? Yes.
 3148. And probably it would not occur once in three or four years? No; it did occur the last two years, but that was exceptional.
 3149. I suppose you are aware that there is a strong effort to induce the Government to take the line by Trundle; there is also an alternative route surveyed from Forbes;—will you give the Committee your opinion as to which is the most suitable line to construct in the best interests of the country? The direct line *via* Bogan Gate.
 3150. For what reason? It is good farming land all the way, and it will give a greater scope to people on each side of it.
 3151. Are you aware that the Crown lands on the Burrawang Station will not be available for settlement for five years? Yes.
 3152. Are you of opinion that when they fall in those lands will be eagerly settled upon? Yes.
 3153. You think they are suitable for agriculture and grazing farms? Yes; I do not think you could get better land anywhere.
 3154. Is it all suitable for wheat-growing as well as carrying stock? Yes.
 3155. Are you of opinion that, before the line has been constructed many years, it will become payable? Yes; a long way better than some lines.
 3156. You are perfectly satisfied that the line is one which could be cheaply constructed, and that it would become remunerative in a very short time? Yes.

Mr. Thomas Watson, storekeeper, Condobolin, sworn, and examined:—

3157. *Mr. Gormly.*] How long have you been in Condobolin? Five and a quarter years. Mr. T. Watson.
 3158. Are you well acquainted with the capabilities of the district? I know the town pretty well, but not much outside it. 28 Mar., 1895.
 3159. What quantity of goods do you get annually to Condobolin? I can tell you what I have paid in carriage since I have been here—about £8,000.
 3160. In five and a quarter years? Yes.
 3161. Is the amount you paid for carriage greater now than it has been for some years? I pay less for carriage than I did.
 3162. You mean that you keep a less quantity of goods? Yes; since the bank failures.
 3163. You get your goods from Sydney? Yes; *via* Forbes.
 3164. Then your experience is that the consumption of goods which go through your hands is less now than it was some time ago? Yes; less than it was two years ago.
 3165. Do you attribute that to the decrease of population, or is your trade going into the hands of some other person? No; I attribute it to the banks closing, and people who ordered goods some years ago do not order them now.
 3166. I suppose some of the goods you get by the train include wire and galvanized iron, and other things which would be used for the improvements of lands? Yes.
 3167. Has the falling off in that class of goods been more than on other classes? I think the falling off has been principally in goods for improvements.
 3168. I suppose the land-owners have less purchasing power owing to the reconstruction of the banks? Yes.
 3169. Have you seen any indication of business improving within the last six months? No.
 3170. Do you see any indication of improvement immediately taking place? No.
 3171. Then the purchasing power of the people is not likely to be increased, unless the productions become greater? The purchasing power of the district might be greater if people could get rid of their stuff; but they cannot do it.
 3172. I suppose the reduction in the value of stock, wool, and grain, has caused a restriction in business? Yes.
 3173. If the producers had an opportunity of sending their produce to market, cheaper than they do at present, would that be likely to increase trade in the district? I certainly think it would do so.
 3174. *Chairman.*] The district seems to have got a check at the time of the bank suspensions? Yes.
 3175. From the time you came here to the time of the bank suspensions, was business progressing? It was much better before the banks reconstructed.
 3176. Did it improve from year to year? It did; but when the banks reconstructed people had not the money to spend, and as a matter of course, business collapsed accordingly.
 3177. Do you get your carriage taken by Wright, Heaton, & Co., or by carriers? Sometimes by carriers, and sometimes by Wright, Heaton, & Co.; I do not confine myself to anybody.

Mr. Matthew Bolton, storekeeper, Condobolin, sworn, and examined:—

3178. *Chairman.*] How long have you been here? Since 1879. Mr. M. Bolton.
 3179. Are you one of the principal storekeepers here? Yes.
 3180. How do you find business? Very dull—duller than ever it has been since I have been here.
 3181. What is the reason of that? General depression, and having no market for the sale of anything. Until last month there was no getting any money for wheat or anything else. 28 Mar., 1895.
 3182. Having been in the district for some time, can you say whether it has been an increasing agricultural district? In 1884, there was no wheat grown in the district at all.
 3183. And since then it has been developed? It has gone up to 23,000 bags this year.
 3184. Can you give any particulars of what you pay for tonnage inwards and outwards? I have paid £4,726 for carriage in the last five years—that is from Sydney right through. Out of that the flour is local. There has been no flour included in that for the last three years. In 1884, there was not 100 acres under cultivation for wheat.
 3185. How many storekeepers are there in Condobolin? Seven.
 3186. Would their businesses be as extensive as yours and Mr. Watson's? No; they have only been here the last two or three years.
 3187. Still they are all getting a living? They are all living.
 3188. You cannot separate the particulars of your freight—you cannot say what you pay for it from here to Forbes? No.
 3189. Do you get paid for your goods pretty well? Pretty well, I think.
 3190. Is the population a constant, or a changing one? When I came here in 1879, there were sixteen houses only in the town, and on this side of the road there was nothing but the lock-up and Simmons's hotel.
 3191. Are the settlers around Condobolin of a permanent character? We have a very good class of settlers here. I think the town has increased rapidly in sixteen years.
 3192. Would you be inclined to pay a special railway rate for your goods from Parkes to Condobolin? That would depend on whether we could carry at a lower price the other way. The competition is so great that we cannot afford to pay extra.
 3193. The comparison is so great, that if you pay three times what you are likely to be called upon to pay to the railway, it would not approach the cost of the team-carriage? Carriers are taking goods down now at £1 a ton.
 3194. I do not think the special rate would amount to more than 3s. or 4s.? We should patronise whichever carriage is the lowest.
 3195. You would go to the cheapest market? Certainly.

Mr. Alexander Thomas Healey, grazier, Condobolin, sworn, and examined:—

- Mr. A. T. Healey. 3196. *Mr. Molesworth.*] How long have you been in the district? Fourteen years.
 3197. How far is your holding from here? Thirty-five miles westerly on the north side of the river.
 3198. Are you nearer Euabalong than Condobolin? Yes; within 8 miles of Euabalong.
 28 Mar., 1895. 3199. What is the size of your holding? 120,000 acres.
 3200. What do you depasture? Principally sheep and a few cattle.
 3201. How many sheep did you shear last year? 52,000.
 3202. What was the result in wool? Last year I had 817 bales, or 152 tons 6 cwt.
 3203. What railway station did you send it to? Mostly to Forbes—10 tons went to Cowra, and 20 tons to Whitton. It used to go to Cowra until this year.
 3204. Would the whole of your produce be likely to come to Condobolin, if the railway were constructed? Yes; until there was a nearer one.
 3205. What have you under cultivation? About 50 acres.
 3206. If the line were constructed to Condobolin, would you be induced to go in for agriculture? Not at present prices.
 3207. Would you be willing to fall in with an arrangement to pay a local rate on the line? It would depend on what the local rate was. If it were the cheapest I should adopt it.
 3208. Have you any knowledge as to the extent to which this line would be fed from your district;—are there any surrounding stations which would be likely to utilise it? Yes; there are a number of them.
 3209. Can you name them? There is Eremeran.
 3210. What is its capacity? I know they have sent 1,500 bales from there.
 3211. Are there any large stations which are likely to utilise the railway? Yes; there is Wooyeo, and other large stations, about twenty-four in my neighbourhood which would utilise the Condobolin Station.
 3212. What is the capacity of Wooyeo? About 40,000 sheep.
 3213. How much wool would they give? Seven hundred bales.
 3214. Would you be likely to utilise the railway for stock purposes? I could not say; I have never done so. The distance, of course, makes the difference. If it were handy I would send a truck away when I could.
 3215. Would it not pay to bring stock a distance of 38 miles to Condobolin? Yes.
 3216. You think there is a possibility of utilising the line even for the conveyance of stock? Yes.
 3217. From your knowledge of the capabilities of the district, and the produce of wool, are you of opinion that, within a short time, the traffic would increase sufficiently to make the line a remunerative one? I do not say it would increase very much. I do not think, for instance, it would double the quantity.
 3218. According to the official report, the line would be opened and worked at a loss of £2,000 per annum;—do you think there would be a sufficient increase of business to make up that deficiency in a short space of time? I should think so. That is not very much loss, seeing that I am, myself, paying £1,500 a year in carriage;—that is for wool carriage and return.
 3219. Have you any other information which you would like to supply the Committee? In the last three years I have had 220 tons of stuff down from Sydney, and it has cost me £1,251 19s. 6d. That is the back loading from Sydney. The total I have paid in carriage in three years, both ways, is over £4,000.
 3220. That includes both road and rail traffic? Yes.
 3221. You are not in a position to separate them? No; of course, a good deal of it has gone to Cowra.
 3222. Will you give us the benefit of your opinion as to which route the line should go? I think the Trundle route is altogether out of the question.
 3223. If you went from Condobolin to Parkes, you would have 21 miles less carriage than if you went to Forbes? From the little I know of the country, I should be in favour of the Parkes line. It would be less costly, and more outside the flooded country.
 3224. *Chairman.*] Although you do not go in for agriculture yourself, is there much agriculture around your holding? Agriculture there is just in its infancy. It is only within the last two years that there has been any wheat-growing.
 3225. Is the country suitable for it? Very suitable. Around me last year there must have been 3,000 or 4,000 bags of wheat grown. One holder near to me told me he had 1,500 bags, and that it averaged 20 bushels to the acre.
 3226. Is the land there valuable for selection and wheat-growing, or is it all taken up? It is mostly Crown land. There is plenty available.
 3227. At once? There are resumed areas there unimproved.
 3228. Is that likely to be taken up? I do not think so, in the present state of things.
 3229. Not even if the railway were to come to Condobolin? Not a great deal of it.
 3230. Do you think there are sufficient farmers in the district? Yes; to supply all local requirements.
 3231. Has your experience shown you that selectors have left the district? No, but they are in a very bad state for want of capital.
 3232. Has that been a recent development? Yes; more so in the last two years.
 3233. Up to then they were fairly prosperous? Yes; the carriage is a big item against them.

Mr. John May, station manager, Condobolin, sworn, and examined:—

- Mr. J. May. 3234. *Chairman.*] You are the manager of Mr. George Lee's South Condobolin Station? Yes.
 3235. *Mr. Gormly.*] What stock do you keep on the station? About 38,000 sheep and from 500 to 600 head of cattle.
 3236. Do you send your wool to Forbes? It went to Parkes the last two years.
 3237. Do you produce many fat stock? All our surplus stock are sent away as fats, both sheep and cattle.
 3238. Yours is a good fattening station? Yes.
 3239. It has a good deal of frontage to the Lachlan, I think? About 7 miles.
 3240. And the frontage land extends a long distance back? Yes.
 3241. It is intersected by overflows from the Lachlan? Yes; for 7 miles back.
 3242. And all that country between the river and those creeks is fattening? Yes.
 3243. Therefore, you are able to send a good deal of fat stock away? Yes.

3244. How many fat cattle do you send away yearly? About 300 this year, and I have sent 5,000 sheep Mr. J. May. away this year.
 3245. Were they trucked from Forbes? No; from Bathurst. Mr. Lee lives at Bathurst, and they go 28 Mar., 1895. into the receiving paddocks there.
 3246. You could not state positively, then, that if the line were constructed, you would truck from here to Sydney? I think Mr. Lee would.
 3247. Still you could not speak with any certainty upon that point, as you do not truck from Forbes now? I could not.
 3248. It would only be surmised? Yes.
 3249. Can you give the Committee any information as to the increase of the population or resources of the district within the last few years? I think in the last few years the products of the district have increased very largely. I have never heard of so much wheat being grown as last year.
 3250. But on your holdings you would not be likely to devote any land to cultivation? No; a good deal of it is suitable for fruit. There is good agricultural land out back of run.
 3251. But that would be a considerable distance from the railway if constructed? Yes; and they would have to cross the flooded country.
 3252. Have you heard Mr. Lee say he would be likely to devote any land to agriculture if the line were brought here? No.
 3253. How many years have you been here? Twenty-seven.
 3254. Are you well acquainted with the country from here to Parkes, and from here to Forbes? I am well acquainted with it from here to Forbes, but not to Parkes. I have been as far as Burrawang.
 3255. Have you been on the back road at any time outside the floods? No.
 3256. Do you know whether the proposed line passes the flooded land? I think it goes outside it—unless it is at Burrawang.
 3257. Would that flooding be to any extent? No; last winter it was very wet, and I heard the carrier say it was very swampy at Burrawang.
 3258. Have you kept a rain gauge? Yes.
 3259. What has been the average? For the last ten years, nearly 24 inches. I have kept a gauge since 1882, and the average altogether during that period has been 22 inches.

Mr. John Kane, farmer, Condobolin, sworn, and examined:—

3260. Chairman.] Where do you reside? Within 3 miles west of Condobolin. Mr. J. Kane.
 3261. To what extent are you a farmer? My holding is 1,280 acres. Seven years ago I selected another block further down, and sold it last year, and bought this place nearer to Condobolin; therefore I have 28 Mar., 1895. nothing under crop this year.
 3262. Was it an improved holding when you bought it? Yes; there were 65 acres of it tilled. I and my brothers, ten years ago, selected 10,000 acres near the river, and went in largely for agriculture. We had about 900 acres under crop, and when the banks closed we were compelled to sell, having about 300 tons of stuff which we could not dispose of. As soon as Wyalong broke out we disposed of it, and I bought this place near Condobolin.
 3263. What became of the 300 tons of produce? I sent it to Wyalong. I paid £2 a ton carriage, and the expenses came to about £3 a ton, and I got £6 a ton for it.
 3264. What did you give for your present holding? £610. Part of it is conditional lease, and the other conditional purchase.
 3265. How much is conditional lease? 320 acres.
 3266. How much is paid upon that? 6s. an acre.
 3267. To what extent has it improved? It is all fenced with a wire fence and with a drop fence.
 3268. Is it paddocked? It was subdivided, but not with good fences—only brush fencing.
 3269. Are there any residences upon it? Yes; there is a cottage upon it and a stable.
 3270. What stock have you upon it? Twenty-five horses, fifty-six cattle.
 3271. Any sheep? No.
 3272. To what use do you intend to devote the holding? To both agriculture and sheep. I should have got sheep by now, but last year a fire broke out and burnt all the grass. But for the late rains I should have had no grass at all.
 3273. How do you regard this as a farming country? There is a good future for it. I have been a farmer all my life. I have been in two parts of Victoria. Before coming here I was a large producer near Tocumwal for twelve years. It is one of the best grain-growing parts of Victoria, and this is equally good, if not better.
 3274. Do you know the Berrigan district? Yes.
 3275. How does this compare as an agricultural district with that? Equally as good, if not better, for this country has a good bottom mixed with limestone. You could not beat it in the colonies for malt barley. We thought of entering into an engagement here with the brewer to supply him at a reduced price, but he would not undertake to put up a malt-house. We undertook to supply him at 10s. a bag, and he was paying 10s. a bushel for it.
 3276. Do you think you will be able to make a good living off this small holding? Yes, if I have direct transit for my productions; but at present the freight is too much.
 3277. If there was a considerable reduction in the wagon carriage you believe you could make it pay? Yes.
 3278. What do you think should be the selling price of wheat to leave you with a margin of profit? That depends on the return. I think the return since we came here has been favourable. There has been an average of 15 to 20 bushels, and sometimes more.
 3279. What price would remunerate you? About 10s. a bag, or 2s. 6d. a bushel, or even less, if you could send it away at rates cheaper than those existing at present.
 3280. When did you buy your holding? About six months ago.
 3281. Things were not particularly bright then? No.
 3282. Notwithstanding all the depression you saw around you, you still had sufficient confidence in the district to put your money in this land, with a view of making a profitable holding of it? Yes.

Mr. J. Kane. 3283. Is there anything else you have to state? The railway is the only the thing which the settlers are looking to for relief. A great many are waiting for it. I know of good agricultural land now in the market for 4s. an acre.

3284. *Mr. Chanter.*] Is that conditional purchase and conditional lease land? Yes.

3285. *Chairman.*] Supposing a railway were constructed to Condobolin would you be inclined to go in extensively for agriculture? Yes.

3286. To what extent? I would go in for 500 or 600 acres. The last consignment, sent from where I was, was 3,000 bags to Melbourne.

3287. We were told in Parkes that the freight per ton for grain, from Condobolin to Parkes by railway, would be about 9d.; that is, according to the ordinary freight;—would you be prepared, if the line were extended, to pay a little over that amount until the line paid its way? Certainly. Of course there would be a big margin then compared with the present rates.

3288. Do you think you would be able to pay 2s. 6d. a ton for that distance? Yes; certainly.

3289. That would be very much less than you are paying now for road carriage? Yes.

3290. Do you belong to any farmers' association? Yes; to the Condobolin Farmers' Association.

3291. Has the special-rate question been discussed by them? No.

Mr. John Bell, farmer, Melrose, sworn, and examined:—

Mr. J. Bell. 3292. *Chairman.*] Where do you reside? Between here and Nymagee, 39 miles north.

28 Mar., 1895. 3293. *Mr. Molesworth.*] How long have you been in that locality? Fifteen years.

3294. What is the size of your holding? 1,960 acres.

3295. How do you utilise it? Wheat-growing and dairying.

3296. What quantity of wheat did you raise during the past year? About 50 acres. It is not threshed yet, and I have not sent it to market.

3297. Where do you propose to market it? I am thinking of sending it to Nymagee in the shape of chaff.

3298. Is that on account of the length of carriage? Yes.

3299. Supposing the line were extended from Parkes to Condobolin, would you be likely to use it? Yes.

3300. Would Condobolin be near enough for you to send wheat to it? Yes.

3301. How long would it take a team to bring a load of wheat from that distance and return? Three days.

3302. Do you know anything of the country over the proposed line between Parkes and Condobolin? I have been that way, but not since it was surveyed. It was six or seven years ago since I was there.

3303. Have you seen it in wet weather? Yes; I have seen the old road on the north of Burrawang.

3304. Was much of the country under water at that time? No.

3305. What depth of water was there then on any part of the road? None at all at that time—it was only boggy. I have never seen it under water.

3306. I suppose you have heard of the rival routes in connection with this railway? Yes; I think the direct route is the best.

3307. Why? It seems to be shorter. I think it would be an easier constructed line.

3308. You prefer it to the line going *via* Forbes? Yes.

3309. Are there many people living in your direction who would be likely to utilise the line? Yes; there are about 200 inhabitants at Melrose.

3310. Young and old? Yes.

3311. How many holdings are there? About seventy.

3312. Do you think there would be more freight for the railway at Condobolin than there is at Parkes? Twice as much I should think.

3313. It would lead to a larger growth of cereals? Yes.

3314. And a large quantity of wool from that direction would necessarily come to Condobolin? Yes; the Eremeran wool, and the wool around there would come.

3315. How far from Condobolin would the wool be brought in that direction? About 55 miles, or close on 60.

3316. Have you any knowledge as to whether any stock would be likely to come from that direction? I have not.

3317. Do you think the distance is too great for stock? It is not a good fattening country. The fattening country is more to the south.

3318. Then you would welcome the construction of a line from Parkes to Condobolin, as a means of helping you to develop your farm, and you believe a large number of your neighbours would be equally glad? Yes.

3319. Do you think they would be likely to pay a local rate until the line were made remunerative? Yes; it would be much cheaper than carrying as we do now.

3320. And you believe the construction of the line would soon lead to it becoming remunerative? Yes.

3321. *Chairman.*] What about the rainfall where you live? For the last eight years it has been 22 inches and 12 points.

3322. Do you keep a gauge? Yes; I keep the Government gauge, and send the information to Mr. Russell.

Mr. George Miller Gavell, selector, Melrose, sworn, and examined:—

Mr. G. M. Gavell. 3323. *Mr. Chanter.*] How long have you been in this district? Four and a half years.

28 Mar., 1895. 3324. What are you? A selector residing at Melrose. I hold 2,560 acres there. I am also interested in land on the south of the river, 6 miles down the Lachlan, beyond Condobolin. That is a pastoral holding, principally conditional purchase land.

3325. What is the extent of the holding south of the river? About 15,000 acres.

3326. In addition to that, you have a selection on Melrose? Yes.

3327. The 15,000 acres was originally conditionally purchased land, and purchased land? Yes; the major portion of it.

3328. Do you devote that to grazing purposes? Almost exclusively. I cultivate in a small way.

3329. As one who has had experience here, and in Victoria, I should like you to make a statement in regard to the proposed railway, and to give us your opinion as to the present state of settlement, and as to how far it would be developed by the construction of a line to Condobolin? In the light of my past experience, I look upon this district as capable of sustaining a very large population—an agricultural and grazing population especially. I would combine the two callings. As a wheat-grower of twenty years' standing in the southern parts of Victoria, and also in the northern areas, as well as near Kerang, in the south-western portion of this Colony, together with the experience I have had here, experimenting as an agriculturist, I am prepared to state, that the land in the Lachlan Valley is superior for wheat-growing and horticultural purposes, and also for artificial grasses, lucerne especially. I have experimented in an agricultural way on the South Gulga Holdings in growing wheat and oats. Two years I put off a small section of a paddock, which, I was credibly informed, had been under crops, almost continuously, for the last twenty years; and I obtained, as the result of cultivation, something like 60 bushels of oats to the acre. The following year I allowed a portion to ripen, and the result was that it exceeded 30 bushels of wheat to the acre, of a very fine, well-developed grain. I look upon the red straw variety as one capable of giving a splendid class of flour. Much of this country near Condobolin is of a limestone formation—in its original state too rich for wheat-growing purposes. But after having yielded a crop or two of oats or barley, or something of that kind, the wheat plant grows to perfection, as well as I ever knew it, and I have come in contact with wheat-growing in all parts of Victoria. I have also obtained wheats from South Australia, and have obtained the opinion of experts with regard to their malting qualities. I look upon this district as a very superior agricultural district, from a wheat and oat growing point of view. The country, on the other side of the river, for 30 miles away from the river, is very superior for wheat-growing purposes. As a fruit-grower, I have experimented on a small scale on the Gulga Holding. I have planted a variety of trees, and several varieties do well, especially the apricot, peach, nectarine, and early varieties of apples. I have only been there four years, and the plantation is only about three years old. Oranges appear with me to do specially well, and I believe, if the ground were well prepared and fairly treated, and the trees supported in the earlier stages with a little water to start them, they would do very well. My small orchard has received no water this year, and the trees promise admirably.

Mr.
G. M. Gavell.
28 Mar., 1895.

3330. As a practical agricultural expert, you have no hesitation whatever in asserting that this district is capable of producing cereals and fruits, equal to those of the famed districts in the more northern or south-western portions of the Colony, or in the best parts of Victoria? Equal to any of the northern areas of Victoria—those are the wheat-growing portions.

3331. What is your opinion as to the class of selectors around this district? I certainly look upon them as *bona-fide* selectors.

3332. Do you consider that, in the event of the construction of a line of railway, self-interest alone would induce them to increase their agricultural areas very largely? There are many selectors who, in my opinion, hold a sufficient area for agricultural purposes at present, and I think it hopeless to expect that they can stop on the land unless they have facilities to transport their produce.

3333. The ordinary selector is compelled by force of circumstances to go in for grazing, because the cost of carriage is so large as almost to swallow up the amount he receives for his cereals;—if that state of things continues, how long will they be able to retain their holdings? It will be impossible for them to do so as graziers. I am taking the majority of cases. There may be some exceptional cases, where the men who are entirely out of debt may possibly hold on.

3334. We have had evidence from selectors who have taken up selections of 2,560 acres, now distant from the nearest railway 90 or 100 miles; can they continue to make a living out of 2,560 acres by grazing alone? My practical experience tells me that they cannot. It is impossible for them to do it.

3335. You think self-interest alone will induce them or compel them to go in for the more laborious occupation of wheat-producing if railway facilities are offered to them? I am satisfied of it.

3336. What do you think would be a fair radius, taking a terminal point at Condobolin, for agriculturists to produce wheat? I should think west from Condobolin we should expect to get wheat grown within 30 miles; east, because of the Forbes terminus, probably not so far—say 20 miles, owing to the bad condition of the road; and north-west, probably 35 or 40 miles. I know of many of the Melrose people who have sent their wheat to Forbes, and others to Parkes.

3337. Have the results been satisfactory? There was no choice. I am not prepared to say the results were satisfactory.

3338. You know the cost of production, and the minimum price at which wheat can be produced, so as to leave a margin for profit sufficient to sustain life? I went into a calculation with the view of growing wheat on the Melrose Holding, and I found, under existing circumstances, I was forced to graze, and do the best I could. I am prepared to grow wheat at 1s. 6d. a bushel, and to make it pay better than grazing; but I find it is impossible for me to expect, under existing circumstances, to obtain it on the ground. Therefore, I believe, bad as grazing is, it would pay better than growing wheat. My experience leads me to the conclusion that I could fairly expect, for a decade of years, 4 bags per acre, and with that result I could make wheat, at 1s. 6d., a bushel on the ground, pay perhaps rather better than grazing at present.

3339. Then, if railway facilities were offered to you, you would be prepared to enter into agricultural pursuits largely? Yes. There are no inducements to most men to put under crop more than 30 or 40 acres. That involves the consideration of machinery. The price of that machinery, with a small area, would not make it so payable as with a larger area. As a man who has learnt the best method of agriculture in the northern districts, I have come to the conclusion that it is necessary for a farmer to have his land prepared for crop, so that it can be sown within a fortnight or three weeks. Therefore, he would require a larger area. He would have to have 200 acres to deal with whilst 200 acres were growing.

3340. Will you tell the Committee the period at which cereals should be sown here, in order to give a fair average return? In May; earlier if possible. I have noticed a serious drawback to late sowings in this district.

3341. In addition to early sowings, you consider you would get greater results if you kept your land in a state of fallow? Yes.

3342. Ready to sow when the rainfall and climatic conditions required it? Yes.

3343. Where do you dispose of your stock at present? Some I sell on the ground, and others I forward to Sydney. On one occasion, owing to the state of the road, I send a draft of sheep to Melbourne.

Mr. G. M. Gavell. 3344. Can you state the approximate tonnage of wool and other produce, which, in the event of the railway being constructed, you would send to Sydney? My average tonnage of wool amounts to a fraction over 26 tons a year.

28 Mar. 1895. 3345. Would you be prepared to dispose of your fat stock by sending them to the Sydney market? We should send them to Sydney, if we could do better there. If the Melbourne market were better, we should avail ourselves of it, but the principal portion of our stuff has gone to Sydney.

3346. It has been asserted that a great deal of the produce of the district is now trending Melbourne-wards, and if that state of things were to continue, it would not justify Parliament in constructing a line here;—what would be your interests if the line were constructed—would you have any interests which would induce you to send your stock or produce to Melbourne? I do not think I would. My wool has gone to Melbourne, *via* Sydney. Last year I sold on the station and sent away—that is between the shearings of 1893 and 1894—between 5,000 and 6,000 sheep in wool; and on one occasion, owing to the flooded state of the river, I sent 2,000 sheep to the Melbourne market.

3347. That would be in consequence of the flooded nature of the country which prevented you travelling sheep? Yes.

3348. If, by any arrangement, federation were to take place between the colonies, or between Victoria and New South Wales, what would be the position of the stock producers of this district, in regard to the markets of Sydney or Melbourne? They would go to Sydney decidedly. I am satisfied there is sufficient territory south and west of this nearer Victoria, to fill up the Melbourne market; but Sydney would be our best market.

3349. Would not this also be taken into consideration—that having a terminal point of railway at Condobolin, and having fat stock here, you would be able to put them on the market in good condition rather than having to travel them a considerable distance? That would be an important consideration.

3350. Sufficient to give you an increase of value on account of the prime quality of the stock sent away? I may remark that, as settlement becomes more intense, that consideration will become larger and larger.

3351. Your own interests, then, would, at all times, be to use the line if constructed? Yes; we should have, in fact, no other outlet to Sydney.

3352. Geographically and commercially you look upon yourselves as being more connected with Sydney both for the present and all time, than with Victoria? I am quite satisfied I should not have sent anything to Melbourne had there been a railway from here to Sydney.

3353. There is a large area of Crown lands along the proposed line. It has been stated that a settlement under the special areas system of 640 acres, with a minimum limit of price at 30s. an acre can be made there. Do you think it possible, even though close to the line, for permanent settlers to maintain and retain that land for all time at that price, and with that limitation of area? I decidedly do not think they could maintain a position as agriculturists on that limited area.

3354. Then if any attempt were made to lead off in that direction, it would only ultimately result in some of the settlers buying others out, or they would be compelled, by force of circumstances, to sell out? They would have to sell out.

3355. And you think it would be a wise provision to make the areas larger? Yes; and to make it an essential condition that the right class of people should be placed on the land, and to reduce the minimum price.

3356. Would you, as a producer, be willing to enter with others into a bond to pay what is termed a special or local rate between Parkes and Condobolin, until the increased development of the district warranted the Railway Commissioners in placing you in the same position as they have placed those upon what are termed the main lines? I am perfectly willing, upon the principle that I would get my stuff carted cheaper than I do at present.

3357. Do you think this country is suitable for what is termed a surface line of railway? Quite suitable. I am satisfied that you could construct a cheap and inexpensive line, probably without ballast at all.

3358. And upon a slightly raised formation? Yes; I might draw your attention to the line from Kondrook to Kerang in Victoria. It is not fenced, it is very lightly ballasted, and carries a sufficient weight for the main lines to receive. Mr. Munro, the contractor, gave me to understand that that line would be constructed very much under £2,000 a mile, had it not been for the construction of two very important bridges; as it was, it was constructed under £2,000 a mile.

3359. Have you travelled between Condobolin and Parkes during the winter months? Yes. I am perfectly satisfied a railway line should be so constructed.

3360. Is there anything to indicate to you any engineering difficulties owing to floods? Nothing whatever. What water there is is the result of the overflow from the river. It is stagnant, and there is no scour.

3361. *Mr. Gormly.*] Do you know that from your personal observation? Yes. I am speaking now with regard to a particular point of the line on North Borambil.

3362. But you have not followed the railway pegs? No.

3363. Because the engineers say they have gone outside the water? I am quite satisfied if they went north.

3364. But you do not know that they have not gone north? No.

3365. *Mr. Chanter.*] Do you know Bogan Gate and Gunningland Creek? Yes.

3366. Taking ordinary or extraordinary seasons, when that creek naturally overflows from the catchment of the higher areas, what extent of country on each side do you think it would cover, and to what depth? I have not visited the country when the flood has been up. I travelled between Parkes and Condobolin last year when the floods were high, and there was nothing then.

3367. Which would be most conducive to the best interests of the district as a whole—to take the shorter length of line from Condobolin to Forbes, or the greater length from Condobolin to Parkes—which would the residents prefer in their own interests? I am not prepared to say, but my impression is there would be heavy engineering difficulties on a railway from Forbes to Condobolin. I look upon it as altogether out of the question to construct a light line between Forbes and Condobolin.

Mr. Allan Henry Morrow, farmer and grazier, Melrose, sworn, and examined :—

3368. *Chairman.*] What extent of holding have you? 3,760 acres. Mr.
A. H. Morrow.
 3369. How is it used? Forty acres of agriculture; but I would use a lot more if the railway were constructed. 28 Mar., 1895.
 3370. Is the land suitable for agriculture? Yes; it is as good as any I ever saw for wheat-growing.
 3371. How much stock have you? 1,400 sheep.
 3372. Where do you send your wool? To Trangie.
 3373. How many miles is that? Ninety.
 3374. What do you pay for carriage? I generally cart my own produce.
 3375. How long does it take you to go to and from Trangie? Three weeks with each load, by bullock team.
 3376. How long would it take you to bring your produce into Condobolin if the railway were constructed? Four days.
 3377. Then there is no doubt that the railway would be a great advantage to you? Yes.
 3378. Why do you not take it on a little further, to Parkes or Forbes? The Parkes road is too bad. The teams did travel along there once, but they were half starved. There was neither grass nor water to be had.
 3379. Supposing you came from Melrose to Condobolin, how would you get on then? There is plenty of grass and Government tanks on the road, and there is the river in the town.
 3380. How long have you been at Melrose? Four years.
 3381. Where did you come from? Temora.
 3382. Had you a farm there? Yes. I was growing wheat there for eight years.
 3383. Did you sell out? Yes.
 3384. Is this a better district for agriculture? I have a larger area here.
 3385. What area had you at Temora? 640 acres.
 3386. And, although you were close to a railway line, you found your holding was too small for you to continue wheat-growing? Yes.
 3387. How would that apply to country you are now in as regards area;—would 640 acres of land, such as you now have, be enough for a man to live upon out there? No; it would not. He would starve upon it. He could not live on less than 2,000 acres.
 3388. What tonnage do you think you would send to the railway if it were constructed to Condobolin? I would go in strongly for wheat-growing, because I have been brought up to it all my life. I believe I would put in from 400 to 500 acres.
 3389. Is the land easy to plough? Yes; the easiest I ever worked. I have over 3,000 acres of nice level country which could be ploughed.
 3390. Did you take this up as selected land? I selected it myself.
 3391. Have you fenced it? Yes; principally with wire-netting. It is rung and scrubbed, and permanently watered.
 3392. Supposing a railway is not constructed, do you think you are likely to go down? I am afraid I will, and a lot more with me too. I do not see how we can possibly make a living, unless we have some means of getting our stuff away. In a dry summer we could not carry our wheat to Parkes, because there would be neither grass nor water.
 3393. Would you be prepared to pay a slightly increased special rate of carriage on a railway if constructed? Yes.

Mr. William John Arthur Pengilly, farmer and grazier, Melrose, sworn, and examined :—

3394. *Mr. Molesworth.*] How far are you from Condobolin? Forty-two miles. Mr. W. J. A.
Pengilly.
 3395. What is the size of your holding? 2,560 acres.
 3396. What are you using it for? Wheat-growing and grazing.
 3397. How many acres had you under crop last season? About 150.
 3398. What were your products in the shape of wheat? 1,880 bushels.
 3399. What did you do with it? Most of it went to Parkes, and some to Sydney.
 3400. Did you find it pay you to send it to Parkes? We had no other market.
 3401. Did it leave you a margin of profit? It cost 2s. a bag carting it to Parkes, and I think the average we got in Parkes was 2s. 2d. a bushel.
 3402. Did it leave sufficient margin to enable you to grow wheat another year? Yes; but it would pay a great deal better if we had a railway into Condobolin.
 3403. You do not consider carting a distance of 42 miles anything serious? No.
 3404. Do you intend to increase your cultivation? To 200 or 300 acres or more.
 3405. Would you be prepared to join with others in paying a special rate on the proposed line? Yes; it will be better to do that than cart the wheat to Parkes.
 3406. Would many of your neighbours utilise the railway? There are some selectors 7 or 8 miles on the other side who would come into Condobolin. They are doing so now.
 3407. From how far out to Condobolin would the Melrose farmers be likely to bring in their produce? Fifty miles at the least.
 3408. Do you think the opening of the railway to Condobolin would give an impetus to farming in the locality? I do. I believe there would be fully three times as much under cultivation.
 3409. Do you think the estimated loss on the railway would, in a short time, be recouped? I do.
 3410. Do you consider the rainfall of the district sufficient for wheat-growing? I do.
 3411. Would a line via Trundle, or direct to Condobolin, suit you and your neighbours best? I think the direct line would. It would be the shortest and most easily constructed. I may say I was farming seventeen or eighteen years in the Yarrawonga district, Victoria, and I think that this land is even better than that for agriculture.
 3412. All you want is access to market? Yes.
 3413. *Mr. Chantre.*] The Yarrawonga district was looked upon as one of the best for wheat-growing in Victoria? Yes; and I consider that most of this district is as good, if not better, than that.

Mr. Peter Kerr, farmer and grazier, Melrose, sworn, and examined:—

Mr. P. Kerr. 3414. *Mr. Gormly.]* You have heard some of the witnesses give their evidence? Yes.

3415. Have you anything to add to what they have stated? No.

28 Mar., 1895. 3416. Do you confirm what they have said? Yes.

3417. Is there anything new you can state in regard to this inquiry? I have cut crops for hay, more north-west than the other witnesses. I have cut the heaviest crop of hay I ever saw there.

3418. You are of opinion that a large extent of agricultural land exists in that neighbourhood? Yes.

3419. Are you a practical agriculturist? Yes; I have been brought up to farming, and I came here with the intention of farming; but when I got here I found that with the distance to market it would not pay. Therefore, I went in for grazing instead of farming.

3420. What distance is your place from Condobolin? Fifty miles.

3421. Would you be prepared to send agricultural produce that distance to a railway? Yes.

3422. At present prices? Yes; the prices are low, but labour is cheap, and the cost of carriage is low.

3423. Is your land capable of being cleared cheaply? Yes.

3424. Would the cultivation of the land assist to keep the scrub upon it in check? Yes.

3425. Are you in any way apprehensive that you will have to store water on your farm for a time of excessive drought? No; I do not think there is any likelihood of that.

3426. Are the tanks easily filled? Yes; they are up to 6 inches from the top now.

3427. What is the extent of your holding? 2,560 acres.

3428. What quantity of stock have you upon it? 1,450 sheep.

3429. If you improve the land more, would it carry more stock? Yes.

3430. What quantity? A little over one sheep to the acre.

Mr. John Colin White, Council Clerk, Condobolin, sworn, and examined:—

Mr. 3431. *Chairman.]* How long have you been in the district? Twenty-one years.

J. C. White. 3432. Are you thoroughly conversant with it? I know every holding in it, personally. The following are the boundaries of the district within which all wool grown will come to Condobolin when a railway is established:—Commencing at the south-west boundary of the Wooyeo holding on south bank of Lachlan River, and running east along southern boundary of Wooyeo to west boundary of Youngara Plains; thence east along southern boundaries of Youngara Plains, Merringreen, Bolygamy, and Youngee Plain; thence north along eastern boundaries of Youngee Plain, Ungarie, Woolongough, Euglo, and Moonbia, through Bogandillon to river; thence north across river to north-eastern boundary of Murrumbogie; thence west along northern boundaries of Murrumbogie, Carlisle, Melrose Block D, and Melrose; thence south-east through Nangeribone to western boundary of Eremeran; thence south along western boundary of Eremeran, eastern boundaries of Wircilliba, Bedooba, and Thule; thence east along southern boundaries of Coan Downs and Mount Hope; thence north along eastern boundary of Mount Hope; thence east along southern boundaries of Roto North-east and Gunilguldrie, across Lachlan River to point of commencement. Estimated to carry at present 3,000,000 sheep. The following is a list of stations embraced within the boundaries of the foregoing wool district:—South side—Wooyeo, Youngara Creek, Youngee Plain, Wargambegal, Dundoo Hills, Bygolvrie, Moulmein, Wardry, Back Wardry, Brotheroney, Mickabil, Milby, West Milby, Bena, Galgo South, Galgo, South Condobolin, Borambil, Euglo, Bolygamy, Ungarie, Woolongough, Merringreen, Moonbia, Kookaburragong, Bogandillon, and Four Bob. North side—Murrumbogie, Carlisle, Melrose Plains, Melrose, Bornavert, Mowabla, Kiacaturo, Palesthan, Booberoi, Euabalang, Euabalang North, Errchendery, North Wooyeo, Murrin, Eremeran, Wircilliba, Tara, Nangeribone, Overflow, Coan Downs, Mount Hope, Morthumbli, Boirthambli, Bedooba, Roto North-east, Gunilguldrie, Condobolin North.

3433. What is the estimated number of sheep upon those stations? Three million.

3434. And reckoning 5 lb. of wool per head, that means 6,696 tons 8 cwt.? Yes.

3435. And you think that quantity of wool would find its way to Condobolin? I think so.

3436. What is the furthest distance of any of the stations you have mentioned from Condobolin? Sixty or 70 miles. Mount Hope, possibly, is further.

3437. How far would that be? Over 80 miles.

3438. In what direction? Almost due west—a little south of west.

3439. Where does the Mount Hope mining produce go to now? To the Murrumbidgee, I think, across a long stretch of dry country.

3440. None of the minerals come this way? I have seen some pass through here, but that was some time ago.

3441. We had evidence, this morning, from Mr. Officer, as to certain operations going on about Condobolin. He gave evidence to the effect that capitalists were employing men prospecting;—was that carried on to any great extent? Not to any great extent; a lot of men have been prospecting, but they make a poor living at it.

3442. Do you know whether any Government official has been to report on the district? Yes.

3443. What was the effect of their report? Generally favourably. I was managing a station 40 miles south from here, and I have had experience in Victoria. I have seen better crops grown here eighteen years ago than I have ever seen growing in the crack districts of Victoria.

3444. What has been the rate of progress of the district for the last ten years? My experience in Condobolin is only during the last four years. I have been in the country most of my time. During the last four years it progressed very quickly, until the bank suspensions. I am certain that, if the railway line is built, it will progress faster than ever.

3445. How does the borough stand with regard to finances? Very favourably.

3446. Are you in debt? We are free from debt. I was talking to the manager of the flour-mill, and he tells me he has 12,000 bags in the mill at present. Loaded teams are coming to the mill every day; they can scarcely unload them fast enough.

3447. Did he tell you how much wheat he ground a year? No; most people who know about the subject think that the copper from Mount Hope would come here, and the traffic from Mount Allan gold-mine, if there was a railway.

3448. Where is Mount Allan? Ten miles north of Mount Hope.

3449. Is there a fairly good road from Mount Allan and Mount Hope? Yes; I may say that there is a large extent of country in this district which has been allowed to be over-run with scrub, and it is comparatively useless; but it is some of the best land in New South Wales for carrying stock. Mr. J. C. White.
28 Mar., 1895.

3450. *Mr. Gormly.*] Have you a personal knowledge of the fact that the runs you have enumerated depasture 3,000,000 of sheep? I have a personal knowledge of what every run in the district carries.

3451. I suppose all the wool from these sheep does not at present go to Forbes? No; some goes to Young and Whitton.

3452. But you think the extension to Condobolin would cause it to come here? Yes.

3453. But still, with regard to some stations, you are doubtful whether it would come here? There is doubt in a few cases.

3454. They would be equally as near to other stations? They would; but this is the better road.

3455. Some might go to Whitton? Possibly.

3456. Some might go to Young? I do not think so. The whole of the wool on the south side of the river would come here, and the wool on some of the stations outside the boundaries I have mentioned—Uabbab, for instance—would come here.

3457. Uabbab is 150 miles from Hay? It would not go to Hay. It goes to Whitton, and Condobolin is nearer to Whitton. It is only 70 miles from here. There are several smaller stations which I have left out of the list.

3458. *Mr. Chanter.*] Where would the Hillston produce go? Some to Whitton and some to Hay.

Police-sergeant Thomas Muldoon, Condobolin, sworn, and examined:—

3459. *Chairman.*] Can you give us any information as to the agricultural returns of the district? Yes; Police-sergt. the freehold land is set down as 123,339 acres in the Condobolin patrol district; rented land, 4,107 acres; T. Muldoon.
28 Mar., 1895. Crown lands, 525,604 acres; under cultivation, 5,266 acres; under wheat, 4,364 acres; total yield of wheat, 59,347 bushels. That would include an area of, say, about 100 miles by 50 miles.

3460. *Mr. Chanter.*] What would be the greatest extent from Condobolin? Westward it would be about 80 miles; 22 miles to the east, and 50 miles to the north. In the county of Gipps, on the south side of the river, the freehold land is 117,073 acres; rented from other owners, 3,140 acres.

3461. *Chairman.*] Is it rented from graziers or what? Principally; and from big selectors.

3462. *Mr. Chanter.*] Does one selector rent from another, or from the large land-holders? The large land-holders principally rent to persons who have no land at all.

3463. *Chairman.*] Those would be very small holdings then? Yes; the Crown lands on the south side of the county of Gipps, would be 90,119 acres—that is within my patrol district.

3464. *Mr. Chanter.*] What do those Crown lands embrace;—Crown lands under lease, occupation license, travelling-stock routes or reserves? It only means the Crown lands open to selection—not the leasehold or travelling-stock route.

3465. Then the 90,000 acres of Crown land would be upon the resumed areas of run available for selection? Yes.

3466. A colleague of yours at Trundle, in giving evidence, embraced within the denomination of Crown lands, the conditional leases—have you done the same? Yes.

3467. *Mr. Gormly.*] But you caused the printed forms to be distributed to the different holders, and they filled them up? Yes.

3468. As they thought proper? Yes.

3469. *Chairman.*] Can you tell us the number of persons on the electoral roll? In the Condobolin electorate there are 2,375 electors.

3470. Does that take in more than the land you have indicated? Yes; vastly more. Within the divisions which, to my knowledge, would use the proposed railway, there would be a population on the electoral roll of 1,460.

3471. Do you know what the population is in the divisions which would use the railway? The only average I could strike would be by multiplying the numbers in the division by three; I think it would be a fair average.

3472. Can you say whether agricultural settlement has increased in the district? When I came here thirteen years ago, there was scarcely any settlement. The great increase of settlement has taken place since the Land Act of 1884.

3473. Did the increase continue until the check caused by the bank suspensions two years ago? Yes; wonderfully.

3474. You will know nearly all the selectors in your patrol district? Yes.

3475. Are they a good stamp of permanent residents? I consider them superior to those of any other district I have been in. They are a very respectable class of settlers. They are industrious men, and they have brought a good deal of money into the district from other colonies,—they are principally Victorian settlers.

Mr. James Miller, Crown Lands Agent and Clerk of Petty Sessions, Condobolin, sworn, and examined:—

3476. *Chairman.*] How long have you been here? About a month. I was previously at Temora.

Mr.
J. Miller.

3477. Can you tell us whether the payments are made regularly? Yes; the payments of the conditional purchase instalments are coming in fairly well now, despite the bad times.

3478. How much have you received in fees since you have been here? About £2,500. During the last two days, and to-morrow and the day after, I dare say I shall receive £2,000 each day. Some of these are first payments, and some of them are the annual instalments; but they are generally the annual instalments. 28 Mar., 1895.

3479. *Mr. Chanter.*] Are there any applications for fresh conditional purchases? Yes; there have only been two conditional purchases taken up and two conditional leases since I have been here. About 2,500 acres have been taken up since I have been here.

3480. Are there any special area landowners in the district? No; there have been no applications for special areas since I have been here.

3481. Were there many selections prior to 1884? Yes; there are some dating back to 1866.

**Mr.
J. Miller.** 3482. Were they transferred under the Act of 1888 for the purpose of paying the balances? There is hardly anyone left now who has not brought his selections under the 1884 Act, for the purpose of paying the balances.

28 Mar., 1895. 3483. Are the leased rentals paid locally? Yes; and they are paid regularly, too. They are paying the leased rentals very well.

3484. What other moneys do you receive? I receive the mining revenue, and the collections as Clerk of Petty Sessions, and a pretty large amount for sheep assessment.

3485. *Mr. Chanter.*] How are these amounts paid;—are many of them paid through agents? The majority of the conditional purchase instalments and the conditional lease rents are invariably paid through banking institutions, whether the parties holding them are actually mortgaged or not, because it is more convenient as a rule.

3486. Your books would show any transactions by mortgage? Yes; every action.

FRIDAY, 29 MARCH, 1895.

[*The Sectional Committee met at Burrawang Station, at 3 p.m.*]

Present:—

The Hon. WILLIAM JOSEPH TRICKETT (CHAIRMAN).
JOHN MOORE CHANTER, Esq. | JAMES GORMLY, Esq.
EDMUND WILLIAM MOLESWORTH, Esq.

The Sectional Committee further considered the proposed Railway from Parkes to Condobolin.

Mr. Frank Alleyn Edols, grazier, Burrawang Station, sworn, and examined:—

**Mr.
F. A. Edols.** 3487. *Chairman.*] You are a grazier, living at Burrawang Run? Yes.

29 Mar., 1895. 3488. And you are one of the proprietors of Burrawang? My father is the sole proprietor; I am his eldest son.

3489. What is the area of the run? 200,000 acres of leasehold, and 100,000 of freehold, including conditional purchase.

3490. What stock have you upon it at the present time? About 220,000 sheep, 250 horses, and 1,200 cattle.

3491. What machinery and plant have you on the run? Very little just now. We have an engine at work, and another which works at the shearing shed.

3492. One of these is used, I suppose, for irrigation? Yes.

3493. I suppose you have a large plant in the shape of waggons, ploughs, and so on? Yes; and we have a big steam plant which we do not use—two large engines, and a large plough and scoop.

3494. What were they used for? For sinking tanks and dams. They are no longer used for that purpose.

3495. They have done their work? Yes.

3496. You have not gone in for agriculture at all on the run? No, except to the extent of a small amount of hay for the use of the run.

3497. What was the yield per acre of hay? About 2 tons.

3498. I suppose the run was of far greater extent before the Land Act of 1884? Yes.

3499. What was the acreage then? I should say about 500,000 acres. That was before we sold any of the back country.

3500. Since the Land Act of 1884, what has been the result as regards selection? We leased all our resumed area.

3501. It was a class of country which was readily taken up for smaller holdings? Yes.

3502. Have these small holdings been a success? I do not think many of them have made much.

3503. But have the holders remained on the land which they took up? A good many of them wanted to sell out. I think those who came here with money have done fairly well.

3504. But has not your experience shown that it is a country which is suitable for agricultural holdings? I think the back country is more suitable than the river country.

3505. I am speaking of the portion which was thrown open. Was not a large portion taken up in small holdings by a good class of settlers? Yes.

3506. Can you tell us the extent of the holdings which these men took up? I could not. 2,560 acres is the largest.

3507. I thought you might be able to give us some information, as to what holding it would be necessary for a man to have to live upon comfortably, with his family, combining agriculture and sheep farming? I think, if a man had a fair start, he could make a living out of 2,560 acres.

3508. You know that under the present law 640 acres are set apart as a special area at 30s. an acre, to be taken up in special districts for the purpose of selection;—do you think these special areas should be made available for settlers in the district;—do you think a man could live on the 640 acres? I hardly think so.

3509. Do you view the proposal to construct a railway from Parkes to Condobolin favourably, or otherwise? Favourably.

3510. Although, possibly, in five years it may be the means of reducing your holding, yet you think it would be a good thing for the district generally? Yes.

3511. The Burrawang Run is a very old sheep run? Yes.

3512. Mr. Edols was not the original holder? No; he bought in April, 1873. The Hon. J. G. Francis, and his partner, Mr. Martin, owned it five years before that, and I know that Dr. Youl owned it prior to that.

3513. At the time Mr. Edols and his partner became possessors of the run, did they increase the area? No; it has never been increased, it has been made less ever since.

3514. Until the selection under the Act of 1884 took place, it was the same size as when Mr. Edols purchased it? No; because we sold Gobondry.

3515. What did that take out of it? About 1,600 acres. Then we owned the Moonbie and the Island, which was sold out.

3516.

3516. What would be the total area taken out by those two sales? I do not know what there is in Moonbi, but I think that it is 10,000 or 12,000 acres, and the Island is about 2,000 acres. Mr.
F. A. Edols.
 3517. You know the route of the direct line from Parkes to Condobolin? Yes. 29 Mar., 1895.
 3518. What will be your nearest point to it? About 1½ miles.
 3519. How far would your woolshed be from the line as projected? About 12 miles. It is about 10 miles from here to the woolshed.
 3520. How far is that point from Parkes? About 42 miles.
 3521. If the line were constructed, would you avail yourself of a railway station, located about 12 miles from here? I could not answer that question. My father would have to decide that.
 3522. Is it likely you would carry your wool from here to Parkes, a distance of 42 miles, when you could carry it 12 miles to a railway station, and put it direct on the trucks? But we send our wool from the shed to Forbes, and that is 25 miles. Of course, from the woolshed to the nearest point on the line would be only 12 miles; but we would have 20 miles extra carriage the other way. Still, my private opinion is, that it would suit us very well to have a siding here.
 3523. Is not the road from here to Forbes rather a bad one to travel on? It is at times, when it is wet; but still, there are far worse roads. There is no really rotten back country to go through.
 3524. I believe your last wool-clip went to Melbourne? Yes.
 3525. *Mr. Gormly.*] Did you send it by way of Sydney? Yes.
 3526. *Chairman.*] What do you pay for your carriage of the wool from your sheep-shed into Forbes? About 17s. 6d. a ton.
 3527. The extra tonnage for greasy wool from Parkes to Condobolin, according to the present railway book, would be 6s. 6d. for greasy and 8s. 6d. for scoured wool;—would it not suit you better to pay that, and to cart it for 12 miles, than to carry it the whole distance into Forbes and to pay 17s. 6d.? Yes.
 3528. Do you send your wool in by your own carriers or by Wright, Heaton & Co.? By Wright, Heaton & Co.
 3529. They take it at a contract price for the season? Yes.
 3530. You say you are favourable to the construction of a line; would the owners of Burrawang be likely to offer any assistance in the way of giving it a little extra carriage? I could not say that. I am not in a position to say it.
 3531. You are not in a position to give any positive assurance that, if the line were constructed, you would use it? No. We have thought so little about the railway that we have scarcely talked about it.
 3532. How many tons of wool do you send away in a year? We had close upon 5,000 bales last year, amounting to about 850 tons. That was a very big clip.
 3533. Would the average clip be very much less than that? Yes; the average would be 700 or 800 tons.
 3534. How long have you been in the district? Since 1874.
 3535. You know pretty well the proposed route from Parkes to Condobolin? Yes.
 3536. What is your opinion in regard to any portion of the line being flooded? There is only one part of it likely to be, at a paddock called Buckley's paddock.
 3537. Where is that? Directly north from the homestead, crossing the Yarrabundi Creek. The deepest part of it is about a foot, except in the bed of the creek; but the flooded ground does not cover the grass, and the water stays such a short time that it does no harm.
 3538. How far would that be north from where we are now? About 2½ miles.
 3539. Is there any fear, as far as you know, of a surface line of railway being injured there by floods? No.
 3540. Have you traversed it after there has been heavy rain? Yes; I have been all through it after sheep in flood-time.
 3541. What depth of water was there, as a rule? About a foot.
 3542. It has been stated that for a length of 15 miles there would be water from 1 foot to 3 feet deep? That is altogether wrong—they have made a mistake.
 3543. At any rate that is not your experience? No, it is not.
 3544. Is it very boggy kind of country when it gets wet? No, except in the pines; the pines are in ridges. It is not so boggy where the water is, as it is out of the water.
 3545. Do you think there would be any fear of a surface line of railway being damaged by any water you have seen? No; I certainly think it would not.
 3546. You think it could be constructed so that the water would drain away? Yes.
 3547. There is no rapid rush of water likely to interfere with the line? No.
 3548. I see you have gone in for dam-work a great deal? Yes.
 3549. Does the earthwork when heaped up consolidate well? Yes.
 3550. Have you had any contract work done, in the shape of earthworks, about 1 or 2 feet high? We have had several tanks sunk lately.
 3551. What does it cost you for tank-work? Eightpence a yard.
 3551½. That is rather a high price? It is for cleaning out.
 3552. But supposing you are getting a new tank altogether? It would be less then—I think about 6d.
 3553. You have a large portion of land which, in about five years, will be available for selection? Yes, according to the present law.
 3554. To what extent? About 200,000 acres.
 3555. Do you think the bulk of that land is suitable for agriculture? I have had very little experience in agriculture. I do not think they would make much out of the agricultural land here.
 3556. Not even if there was a railway to give them a market to Sydney? The seasons are very uncertain here. Sometimes you might get a good crop, after a good season. I do not know how they would fare with a dry season like the present.

Mr. Charles Pluis, sheep overseer, Burrawang Station, sworn, and examined:—

3557. *Mr. Chanter.*] How long have you been in the employ of the proprietors of the Burrawang Run? Mr. C. Pluis.
 About 20 years.
 3558. Your engagements compel you to traverse this country at all seasons of the year? Yes. 29 Mar., 1895.
 3559. Do you know the projected line of railway between Parkes and Condobolin? Yes.
 3560. What is the nature of the country in exceptionally wet seasons? The water lies a little in wet weather, but there is no flood-water.
 3561. There is no back water from any creeks? No. 3562.

- Mr. C. Pluis. 3562. Does the Yarrabundi Creek overflow much? It is shallow water. It is very seldom there is any water at all there, and it is seldom more than a foot deep.
 29 Mar., 1895. 3563. Do you think a surface line of railway would be out of reach of flood-waters in this district for all time? It would.
 3564. Have you had any experience of Gunningbland Creek at Bogan Gate? Not much; but I know it well enough.
 3565. Have you been there in wet seasons when the creek has been overflowing? Yes.
 3566. How far would the overflow waters extend? To where the line crosses. It would not be very wide at all.
 3567. How far on each side of the Gunningbland Creek would the water spread? Not more than 300 yards.
 3568. What would be the depth of water? Very shallow—about a foot.
 3569. Do you know the intervening country between the Gunningbland Creek and the Yarrabundi? Yes; that is all good country.
 3570. Are there any depressions there, where water would lodge, which would require any filling-up? No.
 3571. A raised bank of 12 inches, with sleepers and rails above it, would bring the line beyond the possibility of flood? Yes.
 3572. Do you know the country between the Yarrabundi Creek and Condobolin, as far as the boundary of Burrawang extends? Yes.
 3573. Are there any difficulties in the way of water to contend with there? Not until you get right to the western boundary of the run, then there is a drop of water there.
 3574. Does the water extend any distance north? No.
 3575. Then, if the line is taken considerably north of the western boundary gates it would clear all flood-waters? Yes.
 3576. The creek is called the Goobang? Yes.
 3577. Do you know the country from that point to Condobolin? No; but it is all dry, as far as I know.
 3578. In your opinion, with the exception of the Gunningbland Creek and Yarrabundi Creek, the line would traverse good sound country? Yes.
 3579. What is the description of the soil throughout that route? It is mostly red soil.
 3580. Is it timbered? Yes.
 3581. In your opinion it is good sound country? Yes.
 3582. And, with the exceptions which have been named—the creeks—there is nothing to prevent what is termed a surface line of railway being constructed? No.

Mr. Harry Ingles, Burrawang Station, sworn, and examined:—

- Mr. H. Ingles. 3583. *Mr. Molesworth.* How long have you been a resident of this district? Over twenty years.
 3584. Your occupation takes you over the whole of the district? Yes.
 29 Mar., 1895. 3585. Do you know the route of the proposed railway? Yes.
 3586. Can you give us your opinion as to the flood-waters upon it? Yes.
 3587. Where are we likely to meet with flood-waters? I do not see that there can be any flood-water at all on the proposed route.
 3588. Coming from Parkes the line will cross the Gunningbland Creek? Yes.
 3589. Is there any great spread of surface-water on either side of that point in flood time? No.
 3590. About how far do you think the waters overflow the Gunningbland at the point where the line crosses the creek, about a mile south of Bogan Gate? I should think it would be almost out of it.
 3591. You think the surface-water would spread a very short distance indeed?
 3592. Then there is the Yarrabundi Creek to cross? Yes.
 3593. Is that liable to overflow at that particular point? It does overflow.
 3594. Have you seen this country at its worst in time of flood? Yes.
 3595. How far do you think the overflow waters would spread over the line on either side? I do not think they spread far at all. It is not very deep in any part of it.
 3596. How far do you think they would spread on either side of the creek? About a quarter of a mile.
 3597. What would be the greatest depth in the worst flood? Two feet.
 3598. Do you think a surface line of railway would be free from flood-waters? I think it would.
 3599. Does the water lie on the ground after the rain ceases? No.
 3600. What is your experience regarding the flood-waters approaching the western boundary of Burrawang run? It is rather bad there.
 3601. The line will be taken $1\frac{1}{2}$ miles north of that point with a view of escaping the flood-waters there; do you think it will be on sufficiently high ground to escape them? I think so.
 3602. Then you have no hesitation in saying that, with the precautions the Railway Construction Branch take, there is no fear of flood-water on the line? No.
 3603. What is the nature of the soil on either side of the line? All good grazing and agricultural land.
 3604. Where the line will cross the creek ordinary timber bridges will be constructed; the earthworks will be built up about 3 feet on either side of the crossing to meet the approaches to the bridge; do you think that will be a sufficient height to place the line for all time out of the reach of flood-water? Yes.

SATURDAY, 30 MARCH, 1895.

[The Sectional Committee met at the Council Chambers, Forbes, at 2:30 p.m.]

Present:

The Hon. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

JOHN MOORE CHANTER, Esq.	JAMES GORMLY, Esq.
EDMUND WILLIAM MOLESWORTH, Esq.	

The Sectional Committee further considered the proposed Railway from Parkes to Condobolin.

Mr. William Thomas, Mayor of Forbes, sworn, and examined:—

3605. *Chairman.*] How long have you occupied the position of mayor and alderman? Fifteen or 16 years.

Mr.
W. Thomas.

3606. How long has Forbes been incorporated? About 25 years.

30 Mar., 1895.

3607. Have you any information to give to the Committee as to which would be the better route along which to take the line of railway, from Parkes to Condobolin, or from Forbes to Condobolin? I may state that in Forbes we do not know the Bogan Gate and Trundle country very much, but we think a line branching from here would be more beneficial to the largest number of people. It would travel along the bank of the river, and would serve both the north and the south side. The traffic on the railway at the present time to Forbes has, I think, been great since it has been established. We are carrying stock, wool, and passengers. Of course if the line branches from Parkes towards Trundle or Bogan Gate, they will get the business which this line has had. There is no doubt that the largest population will be along the banks of the Lachlan River. People are more likely to settle there than by Trundle and the back country. There are a good many reserves on the river at present, and that prevents people from settling, but once the reserves are broken up, every inch of land near the line will be taken up. I have no hesitation in saying that we shall have a large population along the river before many years are over our heads. That is the reason, we think, the line should extend from Forbes to Condobolin, rather than from Parkes—on the ground that it will serve a larger number of people. I believe the distance is a little longer going round to Forbes, but it is only a few miles.

3608. You admit that the distance from Forbes to Condobolin would be greater than from Parkes to Condobolin? Yes.*

3609. The haulage, at any rate, would be greater if the goods are to come to Forbes, and then go on to Condobolin? Yes.

3610. You see the dotted line on the wall-map from Forbes to Condobolin, and the direct line from Parkes to Condobolin? Yes.

3611. That is a long way removed from the Lachlan River, but that is the line which is the most direct from Forbes to Condobolin? Yes.

3612. If the Government were to construct a line from Forbes to Condobolin by the route indicated on the map, would not that be a very long way from the Lachlan River to benefit the people on the south side? Some parts of it.

3613. I want to know whether, if the line went from Forbes to Condobolin, it should go as northerly as it is marked on the plan, or whether, in your opinion, it should go near the Lachlan River? You cannot get it on the banks of the river exactly.

3614. The wall-map takes it about 10 miles from the Lachlan River? Yes.

3615. Would that be close enough to the Lachlan River to catch the trade you speak of? I think so, because the land within 10 miles of the river is good, and you can grow anything. It is likely to cause a large settlement in time.

3616. What is the character of the country you indicate;—what is it suitable for? I think it will grow anything.

3617. Is it liable to be flooded? Some parts of it; but I think the line could be got away from the flooded land. From what I hear, I think the line can be carried on dry ground beyond floodmark from here to Condobolin without any trouble.

3618. What effect has the extension of the railway to Forbes had as regards Forbes itself and the surrounding districts;—has it been beneficial or otherwise? It is hard to say, because the country has been in a bad state all over, and things have not been more prosperous since the railway was built. I do not consider it is the fault of the railway, because other places which had a railway before us have suffered in the same way.

3619. Is there much wheat-growing land within an area of 20 miles of Forbes? Yes; there is a good deal.

3620. We have been told at other places that if the railway is extended wheat-growing will be indulged in to a tremendous extent;—do you think, since the line has been extended to Forbes, people have gone in more largely for agriculture? There is no doubt they have done so. They have been growing more wheat since the railway was built.

3621. Mr. Reymond, in giving evidence before Mr. Gilliat, said, "Money is made so easily out of grass that many people prefer the smaller returns to avoid the hard work necessary in farming";—has that been your experience in regard to the progress of farming round about Forbes? Sheep, as a rule, pay better than wheat, and that is the reason, I suppose, they have gone in for grass.

3622. Do you think the railway extension to Forbes has had the effect of increasing agricultural occupation? It certainly has. More wheat has been grown since the railway came here. I did not grow any wheat at all myself before the railway came, but last year I had 200 acres under crop, which averaged 20 bushels to the acre.

3623. Has the population increased or decreased since you have had the railway to Forbes? It has increased.

Mr.

* NOTE (on revision):—Forbes is nearer to Condobolin than Parkes; but to take the distance from Sydney to Condobolin I believe it is a little shorter via Parkes than via Forbes.

Mr. William Gibson Dowling, sheep inspector for the Sheep District of Forbes, sworn, and examined:—

Mr. W. G. Dowling. 3624. *Mr. Gormly.*] What is the amount of stock in the district between Forbes and Condobolin? On the northern side of the river, between here and Condobolin, there will be Bogabigal Station, with 92,000 sheep; Carrawobitty, 40,000; Burrawang, 250,000; and Borambil—on that side of the river—about 60,000. All those, except Borambil, are in my district.

30 Mar., 1895. 3625. Will you enumerate the stations on the opposite side? Wowingragong, 8,000 sheep; Newpark, 8,000—that is, bordering directly on the river; Walla Walla, 12,000; Jemalong, 60,000; Waroo, 60,000; Geeron, 25,000; Cadow, 50,000.

3626. What distance is Cadow from Condobolin? About 25 miles.

3627. Would the Cadow wool, if the railway were constructed to Condobolin, be likely to come to Condobolin or to Forbes? To Forbes, I think. It is a bad road on the other side.

3628. Is there any mode of crossing the river, from the south side to the north, which wool and stock would be likely to use in getting to a line from Parkes to Condobolin, or from Forbes to Condobolin? At present there is no bridge between here and Condobolin, except at Borambil.

3629. There is no mode of sending them when the creeks and the rivers are up? No.

3630. You think the traffic from those stations, on the south side, would still come to Forbes if a railway were constructed to Condobolin? Yes.

3631. There is a reasonably good road and bridges over the creeks on the south side of the river? Fairly good, except in exceptionally bad weather.

3632. And there is a good bridge crossing the river at Forbes? Yes—two; an iron one and a wooden one.

3633. Is the stock increasing or decreasing in this district? It is increasing.

3634. Is that to be attributed to good seasons or to the holdings being improved? To both.

3635. You have a knowledge of the small stock-owners, as well as the large ones? Yes.

3636. Are the small stock-owners increasing in the district? Yes; there is an increase from last year of about eighty men on good sized selections.

3637. You have a general knowledge as to the progress the district is making in agricultural and pastoral pursuits? Yes.

3638. Have the agricultural resources of the district increased within the last two years? Yes.

3639. Materially? Yes.

3640. Is there an inclination on the part of the land-owners to devote portions of land to agriculture? Yes.

3641. To any great extent? To a large extent—on the share system.

3642. That is even in connection with the large holdings? Yes.

3643. Can you say whether there is a greater quantity of land being prepared for agriculture for the coming season, than there was last year? Yes, there is a great deal; but not much can be done until the rain comes.

3644. Notwithstanding low prices, there is still an inclination on the part of farmers to cultivate their land? I think so. The land is adapted for growing, and they get a larger return.

3645. Have you a considerable knowledge of the improvements made in other districts? No.

3646. How long have you been in this district? About 11 years; I have travelled over every acre of it.

3647. Are you of opinion, from your observation, that your district is suitable for agriculture? Yes; nearly every acre of it.

3648. And you think that the land-owners, both large and small, have an inclination to cultivate land? Yes.

3649. Do you consider the construction of a line from Parkes to Condobolin, or from Forbes to Condobolin, would be of material advantage to agriculturists or pastoralists living in proximity to it? I think it would materially assist them.

3650. Have you travelled over the surveyed line from Forbes to the point at which it reaches the proposed line from Parkes? Yes; over every acre of the country.

3651. Is it a country along which a railway could be constructed cheaply? I think so.

3652. Is there any extent of flooded country? No; excepting where the line comes near the mountains, and there is a bit of a swamp there.

3653. What width? About a mile.

3654. Have you any general statement to make, in regard to the construction of a line between Forbes and Condobolin? I do not think a line from Forbes and Condobolin would catch much of the stock traffic, because I think they would still truck at Forbes. They follow the valley of the Lachlan.

3655. There is a good travelling stock route up the river, I suppose? Yes; on both sides. It is a stock reserve; the whole length a mile wide, and in some places 40 chains. I produce a list of the stock which has travelled along the routes from Parkes to Condobolin, and from Forbes to Condobolin since 1887:—

Year.	Forbes—Condobolin.		Parkes—Condobolin in part, on a turning off at the Dandalee Junction to Forbes.	
	Sheep.	Cattle.	Sheep.	Cattle.
1887	86,171	1,242	150,207	9,754
1888	217,261	1,663	146,005	8,043
1889	276,653	13,456	109,929	2,995
1890	314,116	2,333	259,816	1,538
1891	365,904	2,127	193,558	9,927
1892	317,925	1,439	135,528	400
1893	197,239	1,858	138,394	60
1894	328,549	3,200	101,374	152
Total	2,103,818	27,318	1,234,511	32,869

Number of stock trucked at Forbes—Condobolin to Forbes Road, 1894:—Sheep, 52,470; Cattle, 989.
Trucking at Forbes:—Horses, 5; cattle, 2,295; calves, 101; sheep, 123,731.

Mr. Joseph Bernard Reymond, miller, Forbes, sworn, and examined:—

3656. Mr. Chanter.] You are a miller at Forbes? I am a miller, farmer, timber merchant, and fruit-grower.

Mr. J. B.
Reymond.

3657. How long have you resided in the district? Since 1862.

3658. Would you like to make a statement with regard to the proposal before the Committee? I think the railway should be extended from Forbes to Condobolin, instead of from Parkes. The reason I have for this opinion is this: If you look at the matter only for the present, it may seem hard on the people down the river to have to come to Forbes, and then to travel 20 miles to Parkes, instead of going direct to Parkes. A railway, however, is not a matter for the present, but for all time. If you look at the map, you will see that between Carcoar, Orange, Molong, Parkes, Forbes, Grenfell, and Young, there is a big scope of country, as good as any in the Colony. I doubt whether you could get 50 miles of country as good as the land between here and Cowra. I do not think that part of the Colony will be left long without a railway. When that railway comes, people will have to go from Forbes to Parkes to get to Condobolin, so that the extra distance will be reversed, not for a few years, as it would be now if the line were constructed from Condobolin to Forbes, but for all time. There is no doubt that land on the river is more productive, consequently more valuable, and will keep a larger population than the land out back. Any one with experience of the Colony knows that. Then, the railway, if it goes from Parkes to Condobolin, will be where the population will be the smallest. Those who have any experience of what the land can produce on the river will tell you that 10 acres will keep a family there—that is where water can be had; and all the way up and down the river water can be had by sinking from 30 to 40 feet. I would not like to say how many acres it would take out back to keep a family, because irrigation is out of the question, and when the bad seasons come the man with only a small holding will find himself starving, whilst the man on his 10 acres on the river, can always make a living. At the present time there is a population settled away from the river. The reason for that is that they could not get the land on the river to select. They would not have left land on the river if they had been able to get it, but it was not open to selection, and they had to go back. But there will be land on the river for selection, and the population will come to it—to the good land. The great objection to a line near the river is that the land is all held in large holdings. When it is shown that agriculture will pay, the man with a large piece of land will be as eager to cultivate as the man with a small piece. I think, if you take all these matters into consideration, you will arrive at the same conclusion as myself, that the line should be kept as close to the river as possible; that the extension should start from Forbes, because at some future date there would be a line from Cowra, and instead of it being a straight line going down the river, when it reaches Forbes, it will have to go round to Parkes. The map shows a piece of country left without railway communication, and it is, as I have stated, as good a 60 miles of country as any I ever saw. That part cannot be left without a railway for a very long time, and when it is constructed and comes to Forbes the mistake will be seen that the people, instead of being able to travel straight down, will have to go north to go west again. Agriculture is progressing every year. When the inquiry in regard to the construction of the line from Molong to Parkes was being held, I had to give evidence. I think it was a good deal later in the season than now, and I told the Committee the quantity of wheat we had about that date. We considered it was about the end of the season, but at that date we had about 49,000 bushels of wheat. Some of that had come from Parkes, I think. This year we have not had anything from Parkes, but up to date, buying from our own neighbourhood, we have taken in 66,000 bushels—that is, an increase of nearly 20,000 bushels—and the season is not far advanced yet; there is some wheat yet in the farmers' hands, but I cannot say how much. Some comes every month of the year until the new crop comes in. That shows there has been an increase in the production of wheat. There has been cultivation in other ways. Orchards and vineyards have been planted. There is some talk too, of going in for the cultivation of tobacco.

3659. Is the character of the country you have described between Forbes and Condobolin sufficiently level to admit of the construction of a pioneer line, at a cost not exceeding £2,000 a mile? I believe such a line could be constructed.

3660. Do you think such a line, to cost £127,000, would immediately, or within the near future, pay the interest upon the capital account and working expenses? I am not well enough up in railway matters to answer that question.

3661. As a commercial man, if you were going to construct a line, would you not first ascertain whether it would pay? Certainly.

3662. In giving evidence before Mr. Gilliat in 1892, you made a statement to the effect that money was made so easily out of grass that many people preferred the smaller returns in order to avoid the hard work necessary in farming? That was true then. It is not true now, because the price of wool has gone down so much that the farmers have found out that they must work wool with wheat. I was speaking to a man with a holding of 2,560 acres some time ago, and I said to him, "The price is down to 2s., and it is not likely to be any higher for some time to come. Will you give up farming altogether, or will you still keep growing wheat?" He said, "I will keep growing wheat as long as I can get 2s. a bushel, and I will clear land, and put in all I can work with my own family. I cannot see how I could pay for labour at the present prices, but I can put in 200 acres with the labour I have in my own family, and when my cheque for wool comes in I find it is too small, but the cheque coming in for wheat after it makes the two ends meet." In 1892 the price of stock and wool was so much higher than it is now that they could do without growing wheat. Now, stock and wool have gone down to such a low price that they find, in order to make the two ends meet, they must go in for cultivation, and they have actually done so.

3663. Is it not a fact that, whilst the price of stock and wool has depreciated, the price of wheat has also depreciated very seriously? Yes; but they find that two small amounts make a pretty good one. If they had only one small amount they would be short of the other.

3664. What distance from a railway station upon the proposed or any other line do you consider people can continue to occupy land and grow wheat and sell it for 2s. a bushel? They ought to be able to send it to the nearest railway station for 1d. a bushel. If they have to pay more than that the handicap is too big.

3665. How far would the carriage at 1d. a bushel extend from a railway station? Four pence a bushel brings it from Condobolin now, and one-fourth of that would be 15 miles.

30 Mar., 1895.

- Mr. J. B. 3666. Is it within the memory of the oldest inhabitants of Forbes that carriage has been so low? Wheat was never so low, and labour was never so low.
3667. If grain is carried from Condobolin to Forbes, a distance of 60 miles, for 12s. 6d. a ton, how long will a teamster keep his teams together? Well, we cannot load all the teams which want to load just now.
3668. I understand these are exceptional prices? They are certainly lower than I have ever known them to be.
3669. Presuming the producer carts his own grain, his labour is worth something to him, although he does not pay money out of his pocket for it? If he can go to a railway station with his produce and come back in one day, I would not think it was too much of a handicap upon him. About 15 miles would be a good day's work. If it takes two days it is worse.
3670. Would you consider 20 miles too far from a railway station for him? I would not, but beyond that it would be.
3671. You see the direct line marked on the map, starting from Parkes, and terminating at Condobolin? Yes.
3672. That takes in a radius of 20 miles on each side of the line; within that radius it is expected produce will be carted if the line is constructed;—do you think agriculturists can continue to produce wheat within that radius, cart it 20 miles, and sell for 2s. a bushel? Yes; they will do it. The man who was telling me that you can do nothing better than grow wheat is 25 miles from Forbes, and he told me he would not only grow it, but he would have more under cultivation, until he had just as much as he could cultivate with his own family.
3673. Then your opinion is that agriculture has increased, consequent upon the depreciation of the value of live stock? Yes.
3674. Can you supply the Committee with any information as to the stock-carrying capabilities of any of the small holdings in the district? I cannot say anything about Parkes, but round the Forbes district, where the land has been improved, one sheep to the acre is not over-stocking. I know of a place of 640 acres on the river which has kept a few working horses and a few head of cattle, and never less than 1,200 sheep.
3675. About what profit can that holder get from each sheep? I can tell you that he pays his rent for that holding.
3676. But sometimes people pay more rent than the land is valued at? Well, if he paid more than the land is worth, he would have given it up long ago. I understand he pays £75 a year, and he has never had less than 1,200 sheep.
3677. That is about 2s. 6d. an acre? A little under; that is on the river.
3678. Is he grazing alone? He grows wheat too.
3679. How much? About 60 acres.
3680. What return would he get from the wheat? Two shillings a bushel.
3681. How many bags would he get from the 60 acres? I cannot tell what he got last season, because he has not sold it yet. I think last year he had four bags to the acre, or 240 bags, which would give a return at 10s. a bag, of £120. He hires no labour.
3682. What return would he get from a sheep to the acre? Two shillings and sixpence in wool, and increase.
3683. I mean calculating the wool and the increase, and any fats or lambs which he might sell. This is a pertinent matter, and one upon which the Committee wish to be satisfied, as to whether these holdings will be used for agricultural purposes, or still retained for pastoral purposes? I think they could not pay for pastoral purposes only. This man has some milch cows. I do not know whether he makes butter. At shearing time, I think the family earn money at something else.
3684. Is his land cleared? No.
3685. What would it cost to clear it? About 30s. an acre. We used to pay £3, but it is done for less now.
3686. Is there any great area of land now being prepared for cultivation in this district? I would not say a great area, but there is some.
3687. About what percentage of increase? Ten per cent.
3688. Is there a disposition on the part of the holders to still further increase? They seem to be doing it. They are clearing ground.
3689. How many crops can be taken off this land? I have taken thirty crops off a paddock.
3690. Continuously? Yes; since 1866.
3691. Was it a change of crop? Wheat, and wheat, and a change to wheat again.
3692. Was it a continuous crop of wheat? Yes.
3693. What was the average yield? The land is on the river, and it is very good, and we have had as high as 45 bushels to the acre, and as low as 7. Until two or three years ago, I reckon our average was 20 bushels, but for the last two or three years, the yield has been less.
3694. Would you put the average at 20 bushels, taking one season with another? Yes; until the last four or five years.
3695. Have you any information with regard to the rainfall in this district during any past period? I think our average is 20 inches.
3696. And that is sufficient for the growth of cereals? Yes; if it comes at the right time.
3697. Is it evenly distributed over the year? Not always; if it were, we should always have good crops. Sometimes we do not get it at the end of September, and the beginning of October. That is when we want it. If we miss the rain, then we miss a good crop.
3698. Do you know whether the landholders of this district, or any other district in which the railway may be constructed, are prepared to meet the Railway Commissioners by paying a local rate sufficient to make the line pay its working expenses? That is more than I can tell.
3699. Would you be prepared to do it? We have the railway here now. It would be for the people between here and Condobolin to say.
3700. But I presume it is to the interests of Forbes, Condobolin, and other towns to see to the development of the district? I believe that if the extension is from Parkes the people would rather pay a tax to stop it altogether than to pay one to help it on.
3701. If the line of railway is constructed from one point to another, from which do you think it would get its greatest returns—by going through a settled or an unsettled district? By going where there is good land—land which is likely to keep a large population.

3702. How many of the holders of freehold land between here and Condobolin would be prepared to produce wheat from that land? That is a question I cannot answer. Mr. J. B. Reymond.
3703. But you, as a miller, do business largely with these people? We get wheat from down the river, but I do not know whether all the people who own land are growing wheat. 30 Mar., 1895.
3704. The Crown lands there are not available for selection, and cannot be made available until the leases terminate—those leases do not terminate for five years? But five years is a very short length of time when you are thinking of a line of railway.
3705. But it means, at the rate of £2,000 a year, a loss of £10,000 in that period? If you construct a line which will pay for hundreds of years the first loss of £10,000 will be a mere trifle.
3706. From whom do you expect to get the wheat production on the southern portion of the line? From all the small holders who are on the line.
3707. You are not in a position to say as to what they would be prepared to do if the line were constructed from Forbes, or from any other place? The only way to find out would be to get a meeting of them.
3708. If your opinion is a correct one, and there is more settlement south of the line, the Committee would require to know whether those settlers would be prepared to use the railway if it were constructed? The only way to find that out would be to canvass those people.
3709. Do you think it would be a benefit to them if the line were taken to Condobolin, no matter where it were taken from, so long as it went 60 or 70 miles further west? I do believe it would benefit them. It would benefit the Condobolin wheat-growers very much, because when 4d. a bushel is taken off the low price of wheat now very little is left.
3710. What is the local price now? It costs 4d. or nearly 5d. a bushel to send it from here now, and I believe 6d. would take it from Condobolin if there was a line there.
3711. Forbes at present is on the through-rate system to Sydney? Yes.
3712. If the extension is made at all, the producers using it would have to pay a higher rate between the point of departure and the terminal point, for the time being? If the Commissioners charged as much as the producers could get their stuff brought up by carriage, the railway would be of no benefit at all.
3713. The through rate from Forbes to Condobolin would be about 9d. per ton. The producers could afford to pay the Commissioners four or five times that amount, and then save money. Could they pay a special rate of 2s. 6d. or 3s. for a few years until the district was sufficiently developed? That would be a saving to them of 9s. a ton. They would agree to pay 3s. instead of 12s. 6d., there is not the slightest doubt about that.
3714. You say that, in your opinion, the line should start from Forbes and go to Condobolin. Can you say where the traffic would come from, and of what nature it would be, to recoup the working expenses, £9,000 a year? The traffic would, as near as possible, be the same to Forbes as it would be to Parkes.
3715. Can you indicate where it would come from? From Carrawobity, Goodgery, and Budgerabong.
3716. We have had evidence from the witness who preceded you to the effect that stock for a considerable distance north-west and west of Forbes will continue to be travelled into Forbes along the river, whether a line is made or not? I believe that is true.
3717. That being the case, if the line gets any traffic from between Forbes and Condobolin, to the north, it will not get it from agriculturists? Yes; except the seasons are so bad that stock cannot be travelled.
3718. The Committee are informed that the worse the season is the more necessity will there be for them to travel along the river? If there were no grass they would rather truck them than allow them to starve.
3719. Does it ever happen that on the Lachlan stock are in that condition? I remember having seen it somewhere about 1882 or 1883.
3720. If the line were taken a little further north, would it not be more beneficial to stock, because the stock would certainly be worse off for grass and water on the back country than they would on the river frontages? No doubt they would.
3721. Recognising that stock in good seasons will still travel to Forbes, what guarantee would Parliament have that if the line were constructed to Forbes it would get any intermediate supplies? What applies to the line from Parkes will apply to the line from Forbes.
3722. The difference is here: All those north of the line from Parkes have indicated clearly that they are prepared to supply the railway, if constructed, with so many tons of live stock, wool, &c. The Committee wish to ascertain, if the line is taken from Forbes to Condobolin, what amount of traffic would be expected upon it? That is a question I cannot answer. The only thing to do is to give a certain time for statistics to be collected.
3723. What would you consider a reasonable time? Three weeks or a month.
3724. What amount of wheat passed through your hands in 1894, and during the present year, either retained here for grinding purposes, or forwarded to any other place? In 1894, 48,000 bushels; in 1895, up to date, 66,000 bushels. That shows a considerable increase.
3725. And the price this year has decreased considerably? Yes; the price this year is the lowest known.
3726. Is there anything further you wish to state? I hope, when the line is decided upon, that people will think of the future—think of that line which should come down from Cowra and have a straight run down the river.
-
- Mr. William Kinglick Garnsey, stock and station agent, Forbes, sworn, and examined:—
3727. *Mr. Molesworth.*] How long have you been a resident of this district? Twelve years. Mr. W. K. Garnsey.
3728. And during that period you have had considerable transactions in stock and stations? Yes.
3729. You are fairly acquainted with most of the stations served by the Forbes railway? Yes.
3730. You gave evidence before Mr. Gilliat with reference to the proposal to construct a line from Parkes to Condobolin, via Bogan Gate? Yes. 30 Mar., 1895.
3731. Do you still hold the opinions you expressed then in reference to the construction of that line? I do.
3732. Will you give the Committee the benefit of any information with regard to the construction of the proposed line;—which, in your opinion, is the best route? I think the best route will be to keep on the good land.
3733. Where do you think that is? Within 20 miles of each side of the Lachlan River.

- Mr W. E. Garpsey. 3734. Where would you, then, propose to locate the line with a view to connecting with Condobolin? I would start from Forbes, and join the proposed line north of Burrawang.
- 30 Mar., 1895. 3735. You are of opinion that, by doing this, the best land would be likely to be brought within access of the railway? Yes.
3736. Are you aware that the majority of the land on that route is held in fee-simple? Yes.
3737. And that there is little or no Crown land available? I think there is a good deal of it available. You have this to consider—that the other side of the river is equally as good as the north side for 20 miles. That 20 miles would be served by a railway running as near as possible to the river.
3738. Is there any great settlement on the south side of the Lachlan River on that line? Not within 30 miles, but there are plenty of provisions for making settlement in the future.
3739. The trend of the evidence, so far, has been to show that, even with regard to the direct line as marked on the map, the bulk of the settlement has taken place to the north, in the direction of Trundie? That is the land which is thrown open.
3740. Still, as a matter of fact, you admit there is a greater settlement north of that proposed line than to the south of it? There is just now. I do not pretend to know what you can do here in growing wheat, but I know that the value of the land within 20 miles, on each side of the river, is three times the amount of the value of the land on the north side of the proposed line from Parkes to Condobolin.
3741. What do you base your calculation upon? Upon being able to put the water upon it.
3742. You consider any land within reasonable access of the Lachlan is more valuable than land at a greater distance from it, because it is within reach of irrigation? At the lowest estimate it is worth three times as much. You can obtain three times the quantity of stock and produce if the land is irrigated.
3743. Has there been any effort in the direction of irrigation in that locality? Yes; Mr. Gatenby, of Jemalong, has an irrigated farm.
3744. To what extent? 500 acres.
3745. Is it under cultivation? Yes; principally lucerne. He grows grain there, and corn.
3746. I presume the lucerne is for herbage? For grazing.
3747. Is it for hay? He has 3,000 or 4,000 tons of hay there, I should think.
3748. What does he propose doing with it? It is for feeding in hard times.
3749. He is keeping it simply for his own stock? He may market it later on.
3750. What is the character of the holdings at the present time on the route from Forbes to Condobolin? Pretty large.
3751. Principally sheep stations? Yes.
3752. What extent of agriculture is carried on in that direction? I could not say there is very much.
3753. The settlement, so far as the smaller holdings are concerned, is more than 20 miles south of the Lachlan? Yes.
3754. In the direction of Lake Cowal? Yes, and beyond it; and it is all good wheat-land out there.
3755. What advance has been made in this district in the last few years? Unfortunately, we have been suffering under difficulties. We have not had much opportunity of advancing as much as we expected we should from the construction of the railway, because we have had financial depression, and there has been a low price in stock.
3756. What stock passes through your hands every year? Something like 250,000.
3757. Where does it go to? Principally to the cold climates.
3758. Does it travel by road or rail? From 15 to 20 per cent. by rail. The rest travels by road.
3759. What quantity of stock have you sent by rail during the last twelve months? From February 2, 1894, to February 5, 1895, we have trucked 29,513 sheep, and 563 cattle.
3760. Where has it principally gone from? From Forbes. Fully 75 per cent. of the stock of the district is trucked from Forbes, and goes from Forbes to Molong.
3761. What is the object of it going to Molong? It goes on to Sydney.
3762. With regard to the construction of the line of railway, which you suggest should be from Forbes to Condobolin, have you taken into consideration what is best in the interests of the general extension of the railway system, or have you dealt with the matter as a local one? I look at it from a general point of view. I think it would benefit the whole of the country more to keep it on the good land.
3763. How would it benefit Condobolin, if it has to pay upwards of 20 miles extra haulage? We cannot help that. We have to do it ourselves.
3764. But you refer to the best interests of the whole of the community, and not of Forbes alone;—how will it be in the best interests of Condobolin for the railway to come to Forbes instead of to Parkes? If a private individual were constructing the line, he would keep on the good land, no matter how far he went out of its course, because it is the good land that would pay.
3765. Do you know the character of the country between Bogan Gate and Parkes? Yes.
3766. Do you think it inferior in quality to land near the river-banks? For grazing.
3767. But what about the growth of cereals? I do not profess to know.
3768. You think the land on the river-banks is the best for grazing? Yes.
3769. Do you consider the lands better than those at Bogan Gate, for the growth of cereals? Yes; I believe for all general purposes they are three times as good.
3770. What is the character of the soil on the river-lands? Rich chocolate soil.
3771. Does it continue the whole length of the line? Yes; from here to Condobolin.
3772. You are acquainted with the route from here to Condobolin? Yes.
3773. Do you know whether there is any flooded country which the line would have to cross? I believe it would have to contend with flooded country.
3774. Do you think a pioneer line, not to cost more than £2,000 a mile, could be constructed direct from Forbes to Condobolin? Not for the money.
3775. At what point would you expect to meet the flood-waters? There would be flood-water in the Gap, on both sides of the range, and there would be very little beyond that.
3776. To what extent do you think these flood-waters would reach in flood time? Four or 5 miles.
3777. And a line built there would have to be on a raised embankment? Yes.
3778. What height? Four or 5 feet.
3779. What would be the greatest depth of the flood-water at that point? It is rarely more than 5 feet in the deepest part.

3780. Notwithstanding that the line would have to face that difficulty, you are still of opinion that, in the best interests of railway extension generally, it should be connected with Forbes? I might mention that if a line were constructed from Forbes, you would get a lot of stock from the Bland country. The Bland country is in the direction of Lake Cowal.

Mr. W. K.
Garnsey.
30 Mar., 1895.

3781. *Chairman.*] Can you tell the Committee what part of the country sends its stock to Melbourne? From the head of the Bland.

3782. How far do they send it to a railway station? Forty-five miles.

Mr. Luke Kingsmill, Postmaster, Forbes, sworn, and examined:—

3783. *Chairman.*] Have you any statistics showing the extent of your business during the last year? Yes.

Mr. L.
Kingsmill.

	Stamps for Month.	Average Stamps for Year.	Postal Notes for Month.	Average Postal Notes for Year.	30 Mar., 1895.
November, 1893	£ s. d.	£ s. d.	£ s. d.	£ s. d.	
241 0 0	{	3,112 0 0	60 19 5	{

January, 1894	262 0 0	{	40 16 0	{	
November, 1894	253 0 0	{	111 8 5	{	
December, 1894	273 0 0	{	83 6 3	{	1,115 9 8
January, 1895	269 0 0	{	84 2 7	{	

I have been asked to make a statement with reference to the mails. If a line of railway is constructed from Parkes to Condobolin, *via* Bogan Gate, there will still have to be a mail contract for the carriage of mails from Forbes to Condobolin. There is a fairly large population between here and Condobolin along the river.

3784. How long have you been here? Four and a half years.

3785. Has the business of the post office been progressing all that time? Yes; very largely so.

3786. *Mr. Chanter.*] How many mails are there coming into Forbes? The following statement will show:—Mails arriving at the Forbes post office—Sydney, daily; Young, daily; Bathurst, daily; Grenfell, daily; Orange, daily; T.P.O., daily; Parkes, daily; Molong, daily; Eugowra, daily; Temora, daily; Tichbourne, daily; Melbourne, daily; Condobolin, daily; Budgerabong, Carrawobity, Waroo, Wamboyne, Marsden, Trundle, Dandaloo, Bogan Gate, Cowra, Goolagong, Tomanbil; besides nineteen private bags.

Mr. Thomas Edols, proprietor of Burrawang Station, sworn, and examined:—

3787. *Chairman.*] You are the owner of Burrawang Run? Yes.

Mr.
T. Edols.

3788. Do you know the proposed line of railway from Parkes to Condobolin—the direct line which passes through your run? Yes.

30 Mar., 1895.

3789. Will you give the Committee your opinion as to the desirability or otherwise of constructing that railway, looking at it as a line likely to bring in a good revenue to the Government? In my opinion it ought to come to Forbes—for this reason: I look upon it that before long you will have a line to Forbes, and Grenfell, and Young. In my opinion that ought to be the first move of the railway. There ought to be a line going from Dubbo, Parkes, Forbes, Grenfell, and Young. It is a pretty straight line, and I think it will be a paying one. As for grazing and cultivation, I do not think anything of cultivation.

3790. That is round about the proposed line? Well, anywhere. You have only to go from here to Young, and you will see there land which has been cultivated, which is growing now nothing but thistles. The land of one of the biggest farmers is in the hands of the banks—in fact, they have collared it.

3791. How do you account for the whole of the northern part of your run, known as the Trundle paddock, having been so eagerly taken up, and being largely under wheat at the present time? Because they are ignorant of the acreage capabilities.

3792. The evidence is, that the land up there is very suitable for wheat-growing, and produces splendid crops? So it may for a year or two, but we want to see something permanent.

3793. Have you ever indulged in agriculture yourself? Yes, I have, and it nearly had the last shilling I owned.

3794. Where was that? Within 3 miles of Geelong, and my first crop averaged 60 bushels to the acre. I sold the wheat for 9s. or 10s. a bushel, and then I went right away down. Had I not had a brother, who started me grazing on the Wimmera, I would not have had a shilling this day. I was told by a man not long ago that on the Wimmera, from Dimboola to a portion which is 25 miles away, there is nothing but wild oats; and down this way, at Grenfell and Young, you see nothing but thistles.

3795. Is that in places where cultivation used to take place? That is where they have been cultivating for some time. I give you my idea of it, and you can go there and see it for yourselves.

3796. Could you give your own experience in that respect, with regard to land near your own run? We have never grown anything there but for hay.

3797. Have any selectors been there growing crops, who have abandoned their agricultural portions in the way you indicate? No, there are not many; but you can look all round this country, and see there is any amount of land which you would say was fit for cultivation, and what are they doing with it now? Nothing but letting it lie.

3798. The proposed line from Parkes to Condobolin would go through about 3 miles of the freehold portion of your run? About that.

3799. Are you sufficiently favourable to a line being constructed there, as to give any part of that land, or all of it, to the railway purposes? We would make an exchange.

3800. You would be willing to do what was reasonable in the way of an exchange if the line were constructed? Yes.

3801. Taking the matter away from its paying aspects, are you otherwise opposed to a line of railway being made as indicated on the plan? No; but I should like it to go where it will be of benefit to the district

Mr.
T. Edols. district at large, and it is for other people to say which way it would go. Very likely, if I were to say one thing or other, I should make a lot of enemies, and I do not wish to do that. It is a matter of indifference to us which way it goes.
30 Mar., 1895.

3802. If the line went in the direction I have mentioned, would you use it for sending your wool and stock to Sydney? I almost doubt that, because I think it would be a better road to come into Forbes than it would be to send it to the Bogan Gate. In a wet season that ground would be very boggy, but if it were a dry season very probably we would send it. It is doubtful, you know.

3803. We had evidence from your son yesterday that the railway line would be about 12 miles from your wool-shed? Yes.

3804. In fair weather, would not that be better than taking it down to Forbes? Yes, in fair weather; but the chances at that time of the year are that it would not be fair weather. Last year we could not send a lot of wool a mile on the track.

3805. Could you send it to Forbes in bad weather? Yes; we had to do it, and we did it. We had the option of two roads—the river road and the road *via* the Gap.

3806. What is your experience of that country, in regard to floods, about Bogan Gate? I think it is out of the way of floods.

3807. It is not flooded to such an extent as to prevent a light line of railway, with about a foot of earth-works, being built there, and not being interfered with? I do not think it.

3808. There is no width of water there? No.

3809. It is mostly surface water, which gets away in a few days? Yes; there may be a rush of water at the creek itself.

3810. How many permanent hands are there on your estate? From seventy to a hundred.

3811. Supposing the line were constructed on the surveyed route from Forbes to Condobolin, do you think there are any flood-waters there which would interfere with it? No.

3812. One is about as easy as the other, I suppose? I do not think there is much difference. The Goobang Creek comes down, and there is a little flood there at times.

3813. You have always been able to travel the country in the worst of times? Yes; when the big floods are on, all the roads are stopped, no matter where it is.

3814. If this line of railway were constructed from Parkes to Condobolin, would you be inclined to give up your leasehold portion at once, or would you give up the benefit of the five years which you have at present? I think we should stick to the five years.

3815. Supposing you had the alternative of holding the half for ten years, and parting with the other half, or having the whole for five years, have you considered which you would adopt? There is another reservation. If we got compensation for improvements, that might be thought of.

3816. With compensation, you might think of it? Yes.

Mr. John R. Nield, Station-Master, Forbes, sworn, and examined:—

Mr.
J. R. Nield. 3817. *Chairman.*] You hand in a statement of the traffic and revenue, for the year 1894, for the Forbes railway station? Yes; the following are the particulars:—

30 Mar., 1895. FORBES.—Statement of Traffic and Revenue for the year 1894.

Year.	Goods Traffic.			Live-stock Traffic.										Wool.		Coaching.		
	Inwards.	Outwards.	Revenue.	Inwards.					Outwards.					Revenue.	Bales-In-wards.	Bales-Out-wards.	No. of Passen-gers.	Amount.
				Horses.	Cattle.	Calves.	Sheep.	Pigs.	Horses.	Cattle.	Calves.	Sheep.	Pigs.					
1894	Tons cwt.gr. 3,551 19 3	Tons cwt.gr. 5,574 13 3	£ s. d. 15,413 17 3	56	13	..	1,670	..	5	2,295	101	123,731	67	£ s. d. 220 18 6	31	25,195	4,377	£ s. d. 4,487 13 1

Mr. Daniel McKeown, Council Clerk, Forbes, sworn, and examined:—

Mr.
D. McKeown. 3818. *Mr. Gormly.*] Are you prepared to place any information before the Committee? Yes. The ratable properties within the Forbes municipality in 1888 numbered 900; this year they number 1,300—an increase of 45 per cent. The estimated capital value of improved and unimproved properties within the municipality for 1894 was £441,000. The population numbered 3,700; there are 730 dwellings; the rates amount to £2,400 per annum. The total revenue is £3,100.

3819. Have you any general knowledge as to the desirability of constructing a line of railway from Parkes to Condobolin, or do you know a more suitable line? I am of opinion, of course, that the line should be constructed from Forbes to Condobolin, for the reason that at some future time a line will eventually have to be made from Cowra.

3820. Do you know anything of the land in the district? I know there is a large population settled on the banks of the Lachlan River. I have been over the land on the river banks. On each side it is very productive.

3821. Can you say whether it is capable of being used for agriculture? Yes; it produces all kinds of cereals in quantities.

3822. Which would be sufficient to serve a railway? Certainly. There is no doubt that, at some future time, there will be a large population.

3823. Can you give a comparison of the land within 10 or 20 miles from the river, and the land further removed from the river? I have not been in the back part of the country for a number of years, but I know the land on the river frontage to be much superior to any at the back for agriculture or grazing. I merely speak from personal observation.

Mr. Alfred Baldock, storekeeper, Forbes, sworn, and examined:—

3824. *Mr. Molesworth.*] How long have you been in this locality? Thirty years.
3825. Always in Forbes? Yes.

Mr.
A. Baldock.

30 Mar., 1895.

3826. Have you had an opportunity of judging as to the progress the district has made during the past five years? I have had ample opportunity of judging.

3827. What is your opinion with regard to the progress of the district during that period? I think it progressed very rapidly up to a recent date.

3828. In what respect has that progress been made? In general settlement and productions. The latter are becoming more varied every year, and people are erecting better houses than they used to do.

3829. Do you know the character of the country over which the proposed line from Parkes to Condobolin, *via* Bogan Gate, will go? I have been about half way between Parkes and Condobolin.

3830. How far west from Bogan Gate have you been on that road? As far as the Burrawang Run—not quite so far as the homestead.

3831. Have you been over the country there? Yes; more particularly over the Trundle country.

3832. And have you also been over the country through which the proposed line from Parkes to Condobolin will pass? Yes; a portion of it.

3833. Which land do you think is best suited for agricultural or grazing holdings? I think the river land is the best for the general purposes of production. For instance, we are establishing a butter factory here. The thing is almost complete as regards the initiation. We have to collect the application money on 100 shares, and the company will be registered. With the knowledge I have of the uncertainty of seasons in this district, irrigation will become a thing of the future. In fact, it will be the only thing which people can depend upon, where they have to feed stock and grow produce. We have cycles of dry and wet seasons, and there have been times when the people out back have had to bring their stock into the river country for drinking water. Taking into consideration the fruit-growing industry, the dairy industry, and farming, on what I call a proper basis, I think the safer place for the railway is on the river. My impression is that, in twenty-five years' time, for every man making a living out back you will find ten making a living on the river. The evidence which guides me to a material extent in coming to this conclusion that the river land is the best is the experience of the people upon it. You will never find a man who can get near water who will settle from it. My experience is that at one time the squatters would not take the land at the back. All the time there was river land available it was fought for.

3834. I suppose the squatters would not take it because they wanted water for their stock; but do not the farmers in the Trundle district need all their requirements, in regard to water, by the construction of their own tanks? Yes; but they do not last very long in seasons such as we are likely to get.

3835. Are you in a position to say that the Trundle tanks are not admirable? I know the Government tank at Trundle has been dry prior to settlement.

3836. I am referring to private tanks? Any I have seen are liable to get dry.

3837. Have you seen them dry? Not in my experience.

3838. Do you know, as a matter of fact, that any of the private tanks, sunk on the lands north of the proposed line, have gone dry? No, because there has been a course of good seasons ever since the people went there, but I do know the Government tank went dry.

3839. You do not know that it was because of faulty construction that it went dry? I do not.

3840. Do you know whether, during the present dry season, any of the private tanks have gone dry? No; but the weather has not been so particularly dry that I would expect that result to follow.

3841. You think they are liable to go dry? Yes; but I have no knowledge that they have yet done so.

3842. Beyond the fact that you think the river frontages are the most suitable for agriculture and grazing generally, have you any other reason to adduce as to why the line should go through Forbes? I think it will be more central to strike the line at Forbes than at Parkes, because it will form a connecting link with the cross-country line. Persons wishing to go to Melbourne or direct to Cowra in the future would have a better opportunity of doing it than if they had to go to Parkes and come back here.

3843. Why should we consider the mode of transit to Melbourne before we consider the best means of transit to Sydney? It may happen that the federal city will be at Albury, and they might all want to go there.

3844. Which would be the nearest, from Forbes to Sydney, *via* Parkes, or from Forbes to Sydney, *via* Grenfell and Young? It would be nearer *via* Parkes.

3845. And yet you favour the connecting point being with Young? My idea is that if any second railway were constructed from here it should go through Cowra.

3846. Would it be any nearer to Sydney *via* Cowra than *via* Parkes? I think it would be about the same.

3847. What object would be served by going *via* Cowra, instead of *via* Parkes, if the distances are the same? We have 60 miles of river frontages, which are practically without a railway on both sides, and I think in the public interest a line should go through Cowra and Canowindra, following the rich lands of the Lachlan to Cowra. That is an undoubted necessity in the public interest, and I think it would be nearer for the Condobolin people, and all the people, who have to come to the end of the line, to come through Forbes and Cowra on to Sydney. Then there is this question of going south. If people require to go to Melbourne, or to send their stock to a southern market, they have the option of doing it.

3848. To do that, the better way would be for them to connect with Young, *via* Grenfell;—there is a surveyed line in that direction, but there is not one in the direction you indicate, *via* Cowra, showing that it is not in the mind of the Government of the day to connect at Cowra? That is so.

3849. The question is: Is the line, as suggested by the Government, from Parkes to Bogan Gate, and to Condobolin, the most suitable in the interests of the district generally, and in the interests of the railway system of the Colony, or is the line *via* Forbes the most suitable? If you regard the claims of the river, you must admit that a line from Parkes to Bogan Gate is a wrong one. If the arguments which are adduced in favour of the extension from Parkes to Condobolin hold good—that is, that the line should go where the selectors are, and probably through the leasehold country—I contend that it ought to go to Trundle. Nothing, however, justifies any Government in taking the line from the river.

3850. Then your opinion is that the line should connect at Forbes, and not at Parkes, notwithstanding that that would necessitate an extra haulage for over 20 miles for all time? Yes; and the next best line, in my mind, would be the line *via* Trundle.

Mr. Samuel Sydney Smith, proprietor of the *Forbes and Parkes Gazette*, Forbes, sworn, and examined:—

Mr.
S. S. Smith. 3851. *Chairman.*] What are you? Proprietor of the *Forbes and Parkes Gazette*.

3852. You have kept a gauge of the rainfall from 1890 to 1895? Yes; it is as follows:—

30 Mar., 1895.

Rainfall at Forbes, New South Wales.

Year.	January.	February.	March.	April.	May.	June.	July.	August.	Sept.	Oct.	Nov.	Dec.	Total.
1890	41	531	655	67	293	297	277	160	231	278	85	106	30-21
1891	739	102	23	334	28	609	296	287	202	123	174	96	29-93
1892	202	5	67	44	268	135	262	174	501	347	91	331	24-27
1893	95	42	451	305	374	190	163	108	109	121	275	147	23-80
1894	566	195	509	394	92	178	192	226	196	102	42	212	29-04
1895	311	54

Mean for five years, 27 inches 16 points.

3853. Is there anything else you would like to state? I may say I have been up and down the river country. The country is very flat, and there is no current. It is not that the river overflows its banks, but it goes out in little billabongs, and will run 8 or 10 miles back. It is all dead water.

Mr. Thomas Kennedy, Surveyor, Railway Construction Branch, Department of Public Works, sworn, and examined:—

Mr.
T. Kennedy. 3854. *Chairman.*] Will you make a statement in regard to the line which you have surveyed? Commencing from the existing line, at 267 miles 30 chains—that is 30 chains beyond the present station at

30 Mar., 1895. Parkes—it has been found necessary to start at this point, in order to avoid some rough hills which would come in the direct line. These hills are skirted by 12-chain curves. A low range is crossed at about $1\frac{1}{2}$ miles from Parkes. It is a small range, dividing Cook's Creek from the immediate drainage of Parkes. From there a gradual descent is made for about 3 miles, on a grade of 1 in 100. It has been necessary, to maintain this grade of 1 in 100, to put in a considerable amount of curvature at this point, necessitating the use of about four or five sharp curves. There has been an advantage also in doing this, as it moves the line further to the south, and so avoids the resumption of property which otherwise would occur in running a straight line. After getting off the falling gradient of 1 in 100, no difficulties are experienced in getting a surface line from there right away until the town of Condobolin is met. I may mention that the only difficulty to contend with on the line is the waterway. After leaving the descending gradient near Parkes the first is met at $277\frac{1}{2}$ miles—Cook's Creek.

3855. *Mr. Gormly.*] What waterway do you think will be necessary? I could not say exactly, but it will be inexpensive work. There will be no bridge work.

3856. Extending about how many feet? I should say the flood-water in the centre of the creek would not be more than 6 or 7 feet deep, because the banks, where we cross it at Cook's Creek, are well defined, and the water is contained almost between the banks. There would not be more than 40 or 60 feet of an opening there. After crossing Cook's Creek the line takes advantage of the northern boundary of John Bell's selection, and runs parallel with that boundary, which divides Bell's selection from the Nelungaleo Run, thereby avoiding any unnecessary severance. From 281 miles, a bend in the line is made slightly to the south, in order to avoid resumption of property, and taking advantage of the travelling-stock route. This stock route is followed down to the crossing at Bogan Gate, and thence the line bends slightly to the south again, and at about 293 miles it crosses the Gunningland Creek.

3857. You have gone into a detailed statement of the survey you have already made, where it terminated;—are you past that point? No; Bogan Gate is where I end my survey. But I also explored the country from Bogan Gate to Condobolin.

3858. What sort of a survey did you make? A trial survey.

3859. You have made a trial survey from the point at which you started to Bogan Gate? Not quite to Bogan Gate.

3860. To within what distance? To within 5 miles.

3861. Has any other surveyor made a survey of the line you have explored? Mr. Thornbury is at present engaged in running a survey from Bogan Gate, and he has completed the survey some distance beyond Burrawang Station.

3862. Have you explored the line which Mr. Thornbury has surveyed? Yes; I explored it with Mr. Burge, the principal engineer, for trial surveys.

3863. Have you anything to do with the work Mr. Thornbury is carrying out? Nothing at all.

3864. And you have no directions to give to him? No; I have only to do with my own length.

3865. Have you explored to where Mr. Thornbury's work crosses Gunningland Creek? Yes.

3866. The Committee wish you to describe how it is intended to cross Gunningland Creek, what work you think is necessary to make the line safe crossing that creek, and the approaches to it. You have heard Mr. Thornbury's evidence? Yes.

3867. Will you go over the same ground and give your opinion as to what works will be necessary? I can say nothing as to what work they are going to put in.

3868. From your general knowledge of making surveys, and seeing work carried out after survey, you have an idea as to how much work should be constructed? I think, as far as I can see from travelling up and down that creek, that the flood-water would not be more than a quarter of a mile wide where it is crossed by our line—that is where it crosses Gunningland Creek. From my general knowledge of the drainage of creeks and openings, I should say that 5 chains of open way would be ample to carry off all the flood-water coming down that creek.

3869. What height will the line have to be elevated over these waterways in order to make it perfectly safe? I should say the line will have to be elevated an average of from 4 to 5 feet. That would leave it, perhaps, $2\frac{1}{2}$ feet above the highest flood ever known.

3870. At what height would that embankment require to approach the culvert or bridge? It would be a gradual embankment, commencing from almost nothing up to the height of the trestle work.

3871. Would that bring it from nothing to a level of about 4 or 5 feet? Yes.

3872. And that embankment, including the culvert, would only be about a quarter of a mile? I think so. I have not taken the levels, and they have not been worked out.

3873. But you think, in making this statement, you are on the safe side in regard to the works which would be required? Most likely they would not require to be so large. I have walked over nearly all the country to the north of the Gunningbland Creek, and I am of opinion that none of the line is flooded, with the exception of the crossing of Gunningbland Creek. After crossing Gunningbland Creek no flood-water is met with. It is all pine and box forest, perfectly sound and free from flood. The next waterway which would be met with would be about 307 miles, where the Yarrabundi Creek is crossed. This creek does not drain quite as much area as the Gunningbland, but I think, from the flat nature of the country, it would require almost the same openings—that is, that the channel is not so well defined where we cross it. At $315\frac{1}{2}$ miles, the line strikes the travelling-stock route, and follows that down to 310 miles. At this point, an alteration in the road has been lately made, to avoid the overflow from the Lachlan River, which used to come over the main road.

Mr.
T. Kennedy,
30 Mar., 1895.

3874. The proposed survey has been shifted further north? Yes; to run parallel with the amended traffic road, which has been made to avoid the flood-waters. It follows that amended road, and then again comes on to the original road, at about 322 miles. It follows that down to the town of Condobolin.

3875. Is there any elevation, or incline, going into the town of Condobolin? It is not finally decided where the Condobolin station will be.

3876. Can the town be approached without any steep incline, and with the usual grade of 1 in 100? Nothing worse than 1 in 100 will be used. I may mention that, at 324 miles, there may be a few inches of flood-water—water coming over the road—but I think that it will not be over 1 foot.

3877. Over what extent of country? There would be only about a mile of it, which would occur when there were very high floods on the Lachlan.

3878. And not likely to go over an ordinary railway embankment? Not if it is raised 1 foot high over the ordinary level of the road; and the raising of the embankment would be better than putting the line further to the north, and severing some properties which are well improved, and some of which are under cultivation.

3879. Have you explored the line from Parkes to Condobolin more than once? Yes; I have been over it, I should say, four or five times—not directly over each portion of it, but altogether I have been over it that number of times.

3880. You have explored it more than once? Yes.

3881. At different times? Yes.

3882. Have you gone over it in company with Mr. Deane? No; with Mr. Burge; from Parkes to Bogan Gate with Mr. Deane.

3883. There was an interval between each exploration? After the first general exploration, we are always exploring until the matter is finally settled.

3884. To see if you can find a better route? Yes; we explore until the line is finally settled, in order to see whether any better line exists.

3885. You have become well acquainted with the route, owing to the frequency with which you have been over it? Yes; I have been over it now five or six times.

3886. And you have explored the country a considerable distance on each side? Yes; I have been five or six miles on either side.

3887. Have you made a survey from Parkes towards Bogan Gate? Yes.

3888. How long have you been engaged on that survey? I have been actually at work, in the field, surveying for two months.

3889. And you have had to skirt some hills? Yes.

3890. The hills necessitated your going over the country several times, probably, in order to get a more suitable route? I ran about 25 miles of preliminary line, in order to get the pick of 5 miles before I got a suitable line.

3891. In the trial survey you have made, you have long straight stretches? Yes; after getting over the difficulty just after leaving Parkes.

3892. What were the straight stretches you got on that line? I had one straight of 6 miles; another of about 5 miles.

3893. Were there any other considerable straight stretches? After that we followed the travelling stock route, and we had to bend when that bent.

3894. But they are very slight? Yes; they would hardly be noticed.

3895. Do the curves you have referred to increase the length of line to any great extent? They only increase it, so as to be able to get a gradient of 1 in 100.

3896. But would the increased distance be anything considerable;—would it amount to a mile? No.

3897. Or half a mile? I should say about 45 or 50 chains over the original line.

3898. Could those curves be dispensed with by making slight cuttings? If you take the curves out, you shorten the distance.

3899. But could they be dispensed with by making slight cuttings? Yes; they could be reduced.

3900. What would be the depth of these cuttings? I could not say, without an actual inspection.

3901. Can you speak approximately? If I put a cutting in 6 or 7 feet, I could shorten the line about 10 chains.

3902. It would take a considerable amount of cutting to make any considerable difference in the length? Yes.

3903. Therefore, you do not think it desirable to dispense with the curves? No.

3904. There would not be a corresponding advantage by the reduction of the distance? No.

3905. I suppose you know the direct road from Parkes to Trundle? I know the main road from Parkes to Trundle.

3906. Have you been over the whole or the greater portion of that road? I have been over the greater portion.

3907. About what portion have you not seen, or travelled over? From about 12 miles from Parkes to about 20 miles from Parkes—that means 8 miles.

3908. Have you seen any of that distance from elevations on both sides? Yes; from both sides. I have seen the ridge which intervenes between that distance.

3909.

- Mr. Kennedy. 3909. And from where your inspection has ceased? Yes; between Parkes and Trundle.
3910. Then you have travelled over, or seen, the entire distance from Trundle to Parkes? Yes.
- 30 Mar., 1895. 3911. Have you been able, from any elevation, to see the general height and direction of the different hills and ridges which intervened between the portions you inspected? Yes; I could see the ridge running at right angles to the line.
3912. And were you able to judge the elevation of the ridges and hills? I could tell the elevation of those I have been on, but not of those I have seen at a distance.
3913. Could you tell whether they were as high as the ones you explored? They appeared to be as high as the ones I was on.
3914. You state that your trial survey has shown that you can get a surface line from Parkes to Bogan Gate, with a grade of 1 in 100—that is the entire distance over the portion, in regard to which you made a trial survey? Yes.
3915. And your exploration and observation have shown that the same class of line, at a grade of 1 in 100, can be run on to Condobolin? Yes; I think there would, perhaps, be only one or two short grades of 1 in 100 after leaving Bogan Gate on to Condobolin; then it is almost flat.
3916. Upon the other portion, then, there would be a less grade? Yes; much less.
3917. Did any of your explorations extend in the direction of the main road to Trundle? No; they all trended towards the south.
3918. So that you made no actual trial surveys, or explorations, on the direct road from Parkes to Trundle? No.
3919. I suppose you used certain instruments in making explorations? Yes.
3920. Will they give you the approximate height of the elevations, without taking the actual levels? Yes; they will give you a good idea.
3921. Will the instruments you use for exploring enable you to approximately fix the elevation of the different rises? Yes; you can tell very well what the rises are.
3922. And you can take sights with your instruments from one distance to another? You can tell what the grade will be by using an instrument called the clinometer—that is, if you can get an open view.
3923. Have you used those instruments on the cleared road between Parkes and Trundle? I have.
3924. Did those instruments show that a surface line could be got on the grades you observed? No, it could not, according to the grades shown by the clinometer.
3925. Do you think the instruments you used would enable you to come accurately to that conclusion? Yes.
3926. Have you observed any gaps or depressions in the hills which would enable you to cross those hills, without making cuttings, at a grade of 1 in 100? I think a cutting would be required on almost all the ridges crossed.
3927. Did you make a special inspection of that portion of the road called Treweeke's Gap? Yes.
3928. What conclusion did your inspection and observations lead you to, in reference to crossing the Gunningbland Hill, at a point known as Treweeke's Gap? It showed a rise from the plain country of 100 feet in about a mile, and the grade of 1 in 100 gives a rise of 52 feet, so that to run straight up to the Gap would require a cutting of 50 feet; but this could be avoided by contouring the country, and very likely the cutting would not exceed 25 to 30 feet.
3929. Would that cause any considerable curving? It would require an additional length. Curves would be required to get additional lengths to reduce the cuttings.
3930. Would it be necessary to make any embankment beside that cutting to cross that hill? The earth-work which comes out of the cutting is filled in the embankment at the foot of the hills.
3931. Did you make any considerable inspection of the Gunningbland Range, which would enable you to judge whether any lower gap than Treweeke's Gap might be found, upon which you might put a line? I made an inspection about a mile to the north, and found that it was 25 feet higher.
- 3931½. Did you get the opinion of any resident in that neighbourhood in regard to the lowest gap existing on that hill? This gap was shown to me by an old resident.
3932. What was his name? Mr. Treweeke.
3933. Has he been in the neighbourhood long? Twenty years.
3934. Is he the owner of a station or property in that neighbourhood? Yes; he owns the property adjoining the Gap.
3935. Extending nearly to the top of the range? Yes.
3936. And the gap he pointed out to you as being the lowest on the hill showed, from your observation, that it was 25 feet higher than Treweeke's Gap? Yes.
3937. I suppose that the greater height of the gap, pointed out by Mr. Treweeke, is caused to some extent by a general rise to the north? Yes; the whole of the country rises to the north.
3938. Even if the hill were level on the top, still, the general rise to the north would cause an extra elevation? Yes.
3939. Was that the reason this portion of the hill was shown to be 25 feet higher than Treweeke's Gap? The ridge rises higher as you go north.
3940. What class of country did you find in your inspection from Treweeke's Gap on to Trundle? It was slightly undulating country, and to get a surface line it would be necessary to put in a good deal of curvature.
3941. And do you think it would be necessary to make any cuttings? I think they could be avoided by putting in a considerable amount of curvature from Treweeke's Gap to Trundle.
3942. You think there was no continuous range to cross? I think it could be avoided. The grade did not seem of any great difficulty from Treweeke's Gap to Trundle.
3943. Are you prepared, from your observations, to state whether a line from Parkes to Trundle would be of a much more expensive character than a line from Parkes to Bogan Gate? Yes. From Parkes to Trundle there are at least three or four good-sized ridges to cross, which it would be necessary to have cuttings at—that is, to make grades of 1 in 100.
3944. Have you any general knowledge of country similar to that, and do you know what a railway constructed over it would be likely to cost?—I ask you this question in order to see whether you can give a moderately accurate opinion as to the cost of the line from Parkes to Trundle, in comparison with the line from Parkes to Bogan Gate? It would be much similar country to that between Cootamundra and Temora.

3945. Would it be likely to cost double the amount? If a line from Parkes to Bogan Gate were likely to cost £2,000, would one from Parkes to Treweeke's Gap be likely to cost £3,000 or £4,000? I could not say. Mr. T. Kennedy.

3946. But you are prepared to say it would cost more than a line from Parkes to Bogan Gate? I should think the earthworks would be as heavy as those on the Cootamundra and Temora line. 30 Mar., 1895.

3947. Have you any knowledge as to what the earthworks on that line cost? I surveyed the original line, and I know the general character of the country almost resembles that which I went over.

3948. Can you give any information as to what the earthworks on that particular line cost? I do not know. It seems to me to be a similar class of country.

3949. But you are of opinion that the cuttings and earthworks from Parkes to Treweeke's Gap would be equal to those on the Cootamundra and Temora line? Yes.

3950. Would that be to get over the hill on each side, or on one side alone? It would be to get over the hill at Treweeke's Gap.

3951. What do you know of the surveyed line from Forbes to the point at which it joins the proposed line from Parkes to Condobolin? I have been over the country. I surveyed the boundaries on that portion and walked over the line. I surveyed the portions of land which the line intersects, and connected the different surveyed blocks with the line.

3952. You located the line on the surveyed blocks? Yes.

3953. On the whole of the distance? Nearly the whole.

3954. Therefore, you have had the opportunity of becoming well acquainted with that country? Yes.

3955. What is the character of the country on leaving Forbes;—is it similar to that between Forbes and Parkes, or similar to that between Parkes and Bogan Gate? It is similar country to that on the Parkes to Bogan Gate and Condobolin line.

3956. For what distance? Nearly the whole distance. The only difficulty would be at the crossing of the Goobang Creek. I should say there would be as much water coming down the Goobang Creek as down the Gunningbland and Yarrabundi Creeks together.

3957. Could that creek be crossed by works which would cost as much as the two crossings which you have mentioned in connection with the two different creeks on the other line? I think so. I think the flood-water would be equal to the two put together.

3958. Would the culverts, bridges, and embankments be expensive? Not more expensive than the two crossings combined. I may say that the line from Forbes would have to cross the Gunningbland and Yarrabundi as well as Goobang.

3959. Will there be a greater expense in making works to cross those creeks upon the line from Forbes than upon the line from Parkes? There would be a greater expense crossing the Gunningbland, because it would cross it 4 or 5 miles lower down, where there would be more flood-water.

3960. Would the crossing of the Yarrabundi Creek be the same? It would be the same crossing. The lines are common after passing the Burrawang homestead.

3961. Would it be necessary to cross the Yarrabundi Creek before it was connected with the Parkes line? They would connect 2 miles before crossing the Yarrabundi Creek.

3962. Then it would only be necessary to have works if that line were constructed to cross the Goobang and Gunningbland, because they would connect before they came to Yarrabundi? Yes; but each line would be a separate line.

3963. It would cross the Yarrabundi before it was connected with the other line? No; after.

3964. It would be necessary, then, to have a crossing there? Yes; the same crossing as on the Parkes line.

3965. And that would be at about the same cost as on the Parkes to Condobolin line? Yes.

3966. Could a line from Forbes be constructed as a surface line and without cuttings? Yes; with very little cutting. There would be two little cuttings, 3 or 4 feet deep, just out of Forbes.

3967. Therefore, the line could be constructed at about the same cost, with the exception of the crossing at Goobang Creek? Yes; about the same, with this exception: from Forbes, almost the whole of the way to Burrawang, you would go through alienated land, and on the other line you would only have about 7 miles to resume.

3968. In the whole of the distance from Parkes to Condobolin? Yes.

3969. In going from Parkes to Condobolin, what quantity of freehold land would the line go through? About 2 miles.

3970. And the other miles would be through conditionally purchased land? Yes.

3971. Would it be wholly conditional purchase, or conditional purchase and conditional lease? Some conditional lease and some conditional purchase.

3972. You have stated that the line from Forbes to the intersection of the Parkes-Condobolin line would go through private lands;—would they be freehold or conditionally-purchased lands? Some freehold, and some conditionally-purchased—about an equal number of each.

3973. How many miles of freehold land would there be? Altogether there would be about 21 miles of resumptions, and I should say 13 would be freehold land. The first 5 miles from Forbes run along the main road.

3974. If a line were constructed from Forbes, would it intersect the proposed line from Parkes to Condobolin, before it went through those 2 miles of freehold land? Yes, just before reaching them.

3975. Then it would go through the 2 miles of freehold land, as well as the 13 miles of private land besides? No, I included that; it is only a rough estimate. It is not taken out from scale.

3976. Is there anything else to which you wish to refer? Mr. Burge and I made a very careful examination of the first 12 miles of the Trundle line, and found considerable difficulty in getting grades of 1 in 100. He abandoned that piece of the line, and explored another to the south, which is where the present line is marked out, and it was very much better than the line which would run along the Trundle Road.

3977. Has any trial survey been made from Parkes to Trundle? No; but the original trial survey from Parkes to Condobolin was run parallel, about $1\frac{1}{2}$ mile south of the Trundle Road, and this is the line which it was proposed by the Trundle Railway League, should go direct on to Trundle.

3978. But no trial survey has been made by way of Treweeke's Gap to Trundle? Not that I am aware of.

3979. If there had been one you would be likely to know of it? I would.

3980. I suppose you have seen Mr. Gilliat's report? I did not read it.

3981. Have you seen a tracing he shows in that report? No. 3982.

- Mr.** 3982. You see that the tracing shows a proposed line to Condobolin *via* Trundle? Yes.
T. Kennedy. 3983. Does that run perfectly straight from the point of commencement to Trundle, and from Trundle to Condobolin? Yes.
~~30 Mar., 1895.~~ 3984. Would a line be likely to run as straight as that if an exploration were made for a more suitable route? No.
3985. You think, then, that anyone can put a ruler on a piece of paper and draw such a line? You could not run a line like that—it might cost £10,000 a mile.
3986. And the person who drew the line might not know whether he could get over the difficulties in the way or not? No; he might not be able to get a line at all without some of them.
3987. What is your opinion, then, with regard to that plan of Mr. Gilliat's? The line has only been sketched straight in order to give a general indication of the direction and the distance.
3988. Have you any knowledge as to whether Mr. Gilliat inspected that country in such a way as to enable him to judge as to whether the line could be constructed at a reasonable cost? I could not say.
3989. You have been engaged in surveys in these districts for a number of years? Yes.
3990. And you have had some knowledge of the surveys which have been carried on? Yes; I have seen plans and sections of them all.
3991. Are you of opinion that the line sketched by Mr. Gilliat is merely an imaginary one to show the distance from one particular point to another, irrespective of any engineering difficulties which may be met with? It is not meant as a line laid down. It is drawn simply as a comparison.
3992. To get from one point to another? Yes.
3993. Irrespective of what difficulties there might be in the way? Yes.
3994. [Chairman.] The proposed line from Parkes to Condobolin is estimated at 60 miles 30 chains? Yes.
3995. What do you estimate the distance of the line from Forbes to Condobolin as indicated on the plan? About 57 miles.
3996. What would be the distance of such a diversion as that shown by way of Trundle, going right up to the township of Trundle;—what would be the length of that line? I could not say. It could not be ascertained without finding out how much curvature would be necessary to get the best line; but I think it would be a considerable distance over the straight line between Parkes and Trundle and Trundle and Condobolin; and I think the perfectly straight line was about 4 miles longer than that estimated *via* Bogan Gate.
3997. From your examination of the country between Parkes and Trundle, could you say whether or not a surface line of railway could be run over that country? It could not, with grades of 1 in 100.
3998. From your knowledge of the country between the direct line and Trundle, do you know of any middle course which might be adopted, by a diversion in the direction of Trundle, northward, of about 4 or 5 miles which would help the Trundle people? I do not think you could get up 4 or 5 miles without coming in contact with the range known as the Black Range.
3999. So that if that line were contemplated at all—I mean if it were intended to serve the Trundle people specially—you think it would have to go pretty well all the way to Trundle for that diversion? I think so.
4000. [Mr. Molesworth.] Having examined all the routes, or having a general knowledge of the two routes, other than the direct one, will you give the Committee your opinion which is the best for laying down what is known as a pioneer line? From Parkes *via* Bogan Gate to Condobolin would be cheaper, I think, than any line which could be constructed.
4001. With reference to the question, by the Chairman, as to making a northerly deviation with a view of reaching the Trundle people, is it possible, without altering the grades, or seriously increasing the length of the line, to draw the railway nearer to Trundle without meeting serious engineering difficulties? I could not see any way in which it could be done without encountering serious difficulties in connection with the Black Range, which intervenes between Trundle and the proposed line.
4002. With regard to the extension, from Forbes to Condobolin, you said there would be certain cuttings required immediately on leaving Forbes? Yes.
4003. For what distance would they be required? There would be only one or two cuttings up to 3 or 4 feet deep out of Forbes.
4004. Inexpensive cuttings? Yes.
4005. And the only other serious difficulty you have to face on the Forbes line is the water of the Goobang Creek? The only difference in the cost of construction between the Forbes-Condobolin and the Parkes-Condobolin lines would be the crossing of Goobang Creek.
4006. You are satisfied that a line from Forbes to Burrawang would go through a large amount of alienated land? Yes.
4007. You are satisfied your estimate of 21 miles is a reasonable one? I think it goes through alienated land as far as that.
4008. And you are equally satisfied there will only be 7 miles of alienated land through which the direct line would have to pass? Approximately.
4009. You have pretty well described, in detail, the contour of the country between Parkes and Treeweek's Gap. Starting out from Parkes, you say there would be required a considerable number of curves? Yes.
4010. Can you tell the Committee the greatest angle of any of those curves? Not without a survey. The curves are generally put in to save cuttings.
4011. They would not be very sharp? I think they would have to be 12-chain curves.
4012. You say a line of railway could be taken from Parkes to Trundle, if a cutting of 25 feet were made;—how far along the present surveyed line from Parkes would that line follow? It would leave Parkes directly at the station, and branch off from there in a more northerly direction than the proposed line *via* Bogan Gate, almost running parallel with the main road for about 12 miles.
4013. Can you state, approximately, about what length of cutting would be required to cross that gap, or depression, which you estimate to be about 25 feet deep? I should say it would be about 10 chains long.
4014. If a cutting were made there 25 feet deep, a distance of about 10 chains, would you have any engineering difficulties to contend with between that point and Trundle? No; I could get a surface line from Treeweek's Gap to Trundle without any great difficulty.

4015. Then, with the exception of this cutting, 10 chains in length and 25 feet deep, you could get a surface line from Parkes to Trundle? No; from Treweeke's Gap to Parkes the country is undulating, and I could not get a surface line from Parkes to Treweeke's Gap. Mr. T. Kennedy.
30 Mar., 1895.

4016. Without cuttings? There would be slight cuttings all the way along the line. It would not be a surface line.

4017. What depths would those cuttings be? It would be impossible to tell; but I think there would be cuttings from 5 to 10 feet deep. On the original line laid down we did not expect to reduce the earth-works, but only the grades.

4018. Can you state what length of cutting would be required to go through the hills between Treweeke's Gap and Parkes, and the average depth? I could not say without more minute exploration and survey; but on the original survey between Parkes and Condobolin, which would be common to the line *via* Trundle, they had cuttings of 20 feet, with 1 in 50 grades. In this case it would be necessary to use 1 in 100 grades, and it is doubtful whether those cuttings could be reduced after putting 1 in 100 grades in place of 1 in 50 grades.

4019. I understand you to say that for 20 miles you can only describe the country as similar, for the construction of a line from Parkes, to that between Temora and Cootamundra? Yes.

4020. But having crossed the range at Treweeke's Gap you would have no difficulty in getting a surface line from that point to Trundle? No, with slight curvature.

4021. Have you made any inspection of the line from Trundle to Condobolin? No; but the line from Condobolin back towards Trundle would be almost common with the line as at present proposed—that is, by Bogan Gate, for 9 or 10 miles.

4022. Then there would be no engineering difficulties to contend with there? I could not say, from 10 miles to the east from Condobolin to Trundle, what the country is like.

4023. Would there be any creeks to cross on that route? Only the heads of Yarrabundi Creek, where it branches out into small water-courses. I think the creeks would be smaller on the whole line from Parkes to Trundle and Condobolin than on any of the other lines.

4024. Then a line of railway from Parkes to Condobolin, *via* Trundle, would cross only the heads of the creeks? That is all.

4025. It would not require extensive bridging? No.

4026. Can you give the Committee any information as to whether a surface line could be obtained from what is termed Bogan Gate to Trundle direct north? I think a branch line could be made from Bogan Gate to Trundle with 1 in 100 grades on the surface.

4027. A surface line throughout? Yes.

4028. That would comply with the conditions of a pioneer line? I would not like to speak positively on the point, but I think it could be done.

4029. You have a knowledge of the suitability of soils for agricultural or pastoral purposes? Yes.

4030. Is the soil between Parkes and Bogan Gate suitable for close settlement, for agricultural pursuits? It is all agricultural land with the exception of that which is flooded from the Goobang Creek.

4031. Does that apply to the land north of Trundle, or in a north-easterly direction? Yes; it is all good land.

4032. Is the soil to the south of the proposed line towards the Lachlan River equally good for agricultural purposes? It is mostly flooded, and low-lying country, more fitted for grazing than for agriculture.

4033. [Chairman.] In your experience of this country, you must have noticed whether there is sufficient timber in the vicinity of the three suggested lines, for railway sleepers? I saw on Treweeke's Gap iron-bark which would be suitable for sleepers.

4034. In what quantity? There seemed to be plenty of timber suitable for sleepers.

4035. And have you seen any at any other place? Occasional ironbarks along the main road between Parkes, and what is called Brolgan Tank.

4036. And from your observations you think there would be no difficulty in getting suitable timber in the locality whatever line is selected? Yes; I think ironbark timber could be procured on almost all the ranges.

MONDAY, 1 APRIL, 1895.

[The Sectional Committee met at the Council Chambers, Forbes, at 10:15 a.m.]

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

JOHN MOORE CHANTEE, Esq. | **JAMES GORMLY, Esq.**

EDMUND WILLIAM MOLESWORTH, Esq.

The Sectional Committee further considered the proposed Railway from Parkes to Condobolin.

Mr. John Smith, manager for Wright, Heaton, & Co., Forbes, sworn, and examined:—

4037. [Chairman.] How long have you been here? About fifteen months.

4038. You know the amount of goods which go through the hands of your firm, inwards and outwards? Yes.

4039. You know the proposed line of railway from Parkes to Condobolin, as indicated on the map? Yes.

4040. And also the surveyed line from Forbes to Condobolin? Yes.

4041. What we want information upon is this—the quantity of goods which would be likely to feed a line connecting Forbes with Condobolin. Give us, in the first instance, the properties or localities, which you think would bring their goods to that line, instead of bringing them direct into Forbes? There is not much between Burrawang and here, which would come by rail.

4042. It would go chiefly into Forbes by road? Yes.

4043. Can you tell us of any properties, west of Barrawang, which would be likely to send to the railway line? No; I do not know very much about the Parkes district. There are various squatters on the route; but at present they take their goods into Parkes.

Mr. J. Smith.

1 April, 1895.

Mr. J. Smith. 4044. If a line of railway were constructed to Parkes or Forbes, I suppose they would avail themselves of either line? On the other side of Burrawang, the western side, they would; but there is very little traffic there.

4045. What becomes of the bulk of the goods between here and Burrawang—does it come to Parkes or Forbes? It comes to Forbes, and from here to Burrawang.

4046. All of it? All of it.

4047. Can you tell us what quantity of goods, in a year, comes to the Forbes railway station from between here and Burrawang? About 200 tons;—that is the inward goods coming in by rail.

4048. The goods which come to Forbes, and go out to various places between here and Burrawang? Yes.

4049. Can you tell us the quantity of goods which come into Forbes in twelve months? In 1894, there were 6,000 bales of wool.

4050. What about grain? This is the first year they have brought it in. Up to the present they have brought in 500 bags of wheat, but there is still a lot to come in yet.

4051. Is there any other produce, in material quantity, which comes in? Not that I know of.

4052. Do you have anything to do with live stock? No.

4053. What does the tonnage from Sydney or the main line into Forbes, and which is sent out to the stations, chiefly consist of? Supplies.

4054. During 1894, was much wire or other articles required for improving stations sent out? Not for the northern side of the river, but there was to the southern side—not between here and Condobolin.

4055. Have you noticed whether there has been a large importation of agricultural implements—ploughs, harrows, &c.—since the railway was opened to Forbes? There has.

4056. Do you include that in the 200 tons you have mentioned? Yes.

4057. Has the bulk of the ploughs and harrows gone north or south of the river? In nearly every instance to the north of the river.

4058. Does that indicate that agriculture is carried on more in that direction than about the river? I should think so.

4059. Do you know much about the river country between here and Condobolin? Only on the south side.

4060. Is that used chiefly for farming or for grazing? Mostly for grazing.

4061. What arguments have been used, in favour of the connection of Parkes with Condobolin, whether by way of Forbes or direct;—has it been said that a great amount of agriculture would be entered upon all along the line, and within 20 or 30 miles of it;—have you heard expressions of opinion in that direction? Yes.

4062. From people holding land which is chiefly used for running sheep? I have heard some of them mention it.

4063. The small holders? Yes; they have said they would go in for it, but at present the prices are not very tempting.

4064. Is there a ready market for the wheat which is brought into Forbes? They sell it very easily. The local mills consume a great deal of it, and what is not taken by the mills is trucked to Sydney. A good deal goes to Sydney.

4065. Is there any quantity of grain of any kind, so far as you know, stored about Forbes for the want of a market? No; there is nothing stored at all, except at the mill.

4066. Can you give us any idea of the rate of carriage for the goods you have mentioned—that is, wool and grain—allotting it out in distance of 10 to 30 miles? We could average the wool at about 6d. per ton per mile.

4067. That is the average, but what distance would that cover? Up to 60 miles.

4068. Supposing the distance were only 20 to 30 miles—could you give us an idea of what the carriage would be then? Fifteen shillings a ton.

4069. Can you give similar information with regard to grain carriage? At present grain is being brought from Condobolin to Forbes for 10s. a ton.

4070. Is not that an extremely low rate? Yes; it is very low.

4071. Would that be done by people who grow the stuff themselves, and use their own waggons? No; ordinary teamsters.

4072. You can charter teamsters to do it at that price? Yes.

4073. What would the rate for return loading from here to Condobolin, for store goods, be? £1 a ton.

4074. We understand that the Condobolin to Forbes road is very largely used in preference to the road to Parkes? Yes.

4075. Why is that? Because there is more grass and water. It is a better road to travel—it is a harder road. Even in the middle of winter they come this way in preference to Parkes.

4076. It is a more improved road, too? Yes. Some traffic went to Parkes last year, but it was put down to the flooded state of the river road, but the real cause was on account of the washaway near Condobolin. It was impossible to cross it with the teams. You could not get into Condobolin from this side.

4077. How far, do you think, it is likely producers of grain and wool would convey their goods to a line of railway, in preference to sending it direct by road by carriers? I think a line constructed from Forbes to Condobolin on the northern side of the river would take all the wool.

4078. That would be for a distance out, I suppose, of about 10 miles? And even further than that—all along the line. I do not think we should be bothered by the teams, if a line were constructed from here to Condobolin.

4079. The owner of Burrawang Station stated on Saturday that he would still cart into Forbes in fair weather; do you think he would do so, in preference to striking the railway at a distance of 12 miles from his wool-shed? I am inclined to think he would, if he had to cart the wool 12 miles.

4080. If he had to cart it for 12 miles, you think he would continue right on to Forbes? I think there is a possibility of him doing so.

4081. Have you talked the matter over at all with carriers? Yes.

4082. Have you ever heard the growers say they would be prepared to pay a special rate of carriage on the railway? No.

4083. Your colleague, in Parkes, thinks that 9d. a ton will be the extra freight from Condobolin to Parkes for grain? That is what it would be from here.

4084. The rate for greasy wool will be about 6s. 6d. extra, and for scoured wool 8s. 6d.? Yes.

4085. You say there are about 200 tons of goods which came from Sydney, and that direction, to Forbes Mr. J. Smith. by the railway last year? Yes; that is for places between here and Burrawang.
4086. That does not include the town goods at all? No.
4087. That would be for goods going beyond? Yes.
4088. Of goods going as far west as Burrawang, you say there would be about 200 tons? Yes.
4089. Can you state generally whether goods go beyond Burrawang, in the direction of Condobolin, chiefly from Forbes or from Parkes? Most of the Condobolin goods come here. About 600 tons came from the town of Condobolin and district last year.
4090. Do you know how much came from Euabalong? I include Euabalong.
4091. Does that include the Melrose tonnage? We have not had any Melrose goods in—they go to Parkes.
4092. Is there anything else you can tell us? 7,000 bales of wool came from the Condobolin district to Forbes last year. We expect to have considerably more than that this year.
4093. That would be the only product which came from the Condobolin district? Yes; about 1,500 bags of wheat have come from there since the beginning of January.
4094. Any quantity of hay or chaff? No.
4095. It is too far, I suppose, for that? Yes; they send a lot of chaff from Condobolin to Wyalong.
4096. There seems to be a great deal of fruit grown about this place;—does much of that come to Forbes, in order to be sent to Sydney? Not much, I think.
4097. I suppose your firm does not have the handling of it? Yes, we do.
4098. What quantity of fruit-cases do you think you carry? Only a few lots of cases come up.
4099. I suppose the producers send their own fruit away? Yes.

Mr. Arthur Sharp, District Surveyor, Forbes, sworn, and examined:—

4100. *Mr. Chanter.*] How long have you been in the district? Eighteen years. Mr. A. Sharp.
1 April, 1895
4101. You gave evidence before Mr. Gilliat in 1892? Yes.
4102. You then stated that the best extension of the railway, in the general interests of the district, would be that from Parkes to Condobolin via Bogan Gate? Yes.
4103. Has anything transpired since then to lead you to alter your opinion? Yes; I have considered the matter over since then, and I have altered my opinion. That opinion was hurriedly arrived at.
4104. Will you make a statement to the Committee, giving your views as to the proposed line from Parkes to Condobolin, and the alternative route from Forbes to Condobolin? There is no doubt that the line from Parkes to Condobolin would go through level and good country for wheat-growing, but it is very doubtful whether a railway would pay for wheat-growing, as the rates are so low. If a railway will pay carrying wheat at the present rates, then we are robbed right and left in the rates we have to pay for ordinary goods. The settlement of Trundle is as dense now as it ever will be. There is one family of four or five brothers owning 20,000 acres.
4105. What is the name of that family? O'Brien.
4106. But they are situated between Trundle and Condobolin? Yes; to the south-west of Trundle, principally.
4107. Is there not a considerable settlement at Trundle, and north of Trundle? It is not a dense settlement by any means. There are large areas of 2,500 acres or more.
4108. How far distant are the O'Briens from Trundle? About 10 miles. The Berrys are about 7 miles south-west, and they have 10,000 acres amongst them.
4109. How far does your district extend to the north of Trundle? To Dandaloo, about 70 miles.
4110. Will you describe the settlement directly north of Bogan Gate through Trundle? There are a good many selectors in the locality, but they all have large areas. Some of them sold out. There are no small areas there—they could not live upon them. There is nothing less than 2,560 acres.
4111. You stated to Mr. Gilliat that the land to the north of Trundle was inferior to that to the south of Trundle? Yes.
4112. Is it inferior from an agricultural or a grazing point of view? From both.
4113. Is the country north of Trundle timbered country? Yes; heavily timbered and scrubbed.
4114. If the timber and scrub were removed, what would be the value, compared with the land on the south? It would not be equal to it. There is not the same depth of soil on the north. You get to the gravelly bottom sooner.
4115. How far distant from Trundle north could you locate the agricultural soil? They can grow crops, but I do not think that they could grow many, 20 miles or more north; but the country is very dry, and the rainfall is precarious.
4116. We had evidence at Trundle from selectors living 30 and 35 miles away, who said they were prepared to go largely into wheat-growing if a line were constructed in that direction;—in your opinion, would the land 35 miles north of Trundle be suitable for agricultural purposes? It would in a good season, and for a few crops, but the crops would be very risky.
4117. You say that from your own knowledge of the capabilities of the district? Yes.
4118. What is the character of the country between Trundle and Condobolin, taking a direct line between the two points? Very fair country. Some of it is inferior, but some is very good, about Derrawang; for instance, 14 or 15 miles from Condobolin it is splendid agricultural country.
4119. Taking the south of the proposed line from Parkes to Condobolin, how does the character of the country and the soil compare with that north? For some distance out it would not be agricultural country—it is too clayey. On parts of the river it is very good.
4120. How far would the good country extend from the river? An average of about a mile.
4121. Then the land north of a mile would be more suited for pasturage? Patches of it are very good for agriculture.
4122. Would there be any considerable extent in those patches;—what proportion would they bear to the whole? About one-tenth, I should think.
4123. Will you describe the country south of the surveyed line from Forbes to Condobolin, taking a distance of 20 miles from the line;—how would that be suitable for settlement? There is not a great deal of the river land left, but out back, I should think, a man would require 1,280 acres to live upon.
4124. The land along the river proper is mostly freehold? A great proportion of it.

Mr. A. Sharp. 4125. Do you know whether there is any disposition on the part of the landholders to go in for agricultural pursuits? I could not say. One or them, Mr. Grattenby, 20 miles from here on the south side, goes in extensively for lucerne-growing. He has something like 1,000 acres.

4126. Is that lucerne grown for feed or cut for hay? He cuts it for hay.

4127. Does he find a market for it here? What he does not sell he has been storing up for a time, in order to feed his stock upon it.

4128. Who is that freehold land, principally, held by, to the north of the Lachlan River? Mr. Edols, principally.

4129. About what proportion of that freehold land would be held by selectors, if any? About 6,000 acres.

4130. And the balance would be included within the Burrawang estate? Yes.

4131. You stated when you gave evidence on a previous occasion that along the route there would be 238,000 acres of Crown land? Yes.

4132. You then gave it as your opinion that that land would be suitable for special areas. In the light of further experience, do you still hold that opinion? No; I think they would require more than 640 acres. They would require 1,280 acres.

4133. Do you think 1,280 acres there would be sufficient to live upon? Yes.

4134. Do you think anyone taking that land could afford to pay more than £1 per acre for it? Yes.

4135. What price? Twenty-five shillings.

4136. You are aware that since you gave evidence before there has been a considerable depreciation in the value of live stock and cereals? Yes; that is the reason why I think the larger area is required.

4137. And that will have to be taken into consideration? Yes.

4138. The line would pass through certain freeholds between Parkes and Condobolin, and the same remark might also apply to a line from Forbes to Condobolin? Yes.

4139. Would there be any difficulty in making exchanges of those portions of the land which the line would pass through for other portions? I think not. There is an exchange proposal, which is not gazetted yet, in which all the scattered portions are given up, and consolidated by taking the small blocks in the centre.

4140. That is on the Burrawang estate? Yes.

4141. A line from Forbes to Condobolin would pass through small holdings? Yes, it would go through some small holdings.

4142. Could you inform the Committee if any arrangement could be made, if the line were taken in that direction, for those persons to receive compensation in land on some of the Crown lands, in order to obviate the necessity of paying for resumptions? I do not think so. There is no Crown lands which could be given. It is all alienated.

4143. Would the cost of resumption of these lands be very heavy? I do not think so, because all between the line and the road could be resumed, and severance would be avoided.

4144. In what locality would the Crown lands which would require an exchange for freehold lands be situated;—would they be near to or distant from the line, or would the owner of Burrawang be taking lands close to the line in exchange for outlying lands, or *vice versa*? Close to the line, but not upon it.

4145. What portions do they propose to surrender? Some scattered blocks north of the line, and they will take in exchange land on the south of the line.

4146. Would not that release for settlement a considerable area north of the line, and consolidate the settlement more north and south? It will leave no alienated land on the north at all.

4147. Exactly; and that land will be made available ultimately for the purposes of selection, so that the small settlement would be north of the proposed line, and not south of it? No; you would not have very close settlement there.

4148. I am presuming, from evidence given by Mr. Edols, that, as far as he is individually concerned, he would not be a customer to the line except on very extraordinary occasions? He would only be 13 miles from Bogan Gate.

4149. He tells the Committee he would still carry his wool to Forbes, except in bad weather; he also gave evidence to the effect that the land was not fit for agricultural purposes, and that any man who settled there for that purpose would only ruin himself? Mr. Edols has that opinion about all that country.

4150. If that exchange is to be effected, and the settlement is to take place north, and more Crown lands are to be made available, and the owners of Burrawang do not use the railway, would you still consider it advisable to take the line direct from Parkes to Condobolin *via* Bogan Gate, or take it through the settlement? It would remove one objection if they sent their wool to Forbes. Otherwise it would be an unproductive line, as Burrawang helps it a lot.

4151. We have evidence from Mr. Edols and the gentleman in charge of the Forbes stock district to the effect that if the line is constructed the stock will still continue to come to Forbes. That being the case, and the proposed line not being far distant north of the stock route, would it be wise to construct it there, or take it on further, north or south, as the case might be? I suppose the stock would still come up the river.

4152. The estimated cost of this length of line is £127,000, and the annual revenue required to pay interest on the capital account and working expenses is close on £10,000 a year. If the Burrawang produce is not sent along the line, and no other produce is sent along it east of Burrawang, what prospect is there of the line paying anything like the amount required? I do not think it would pay, because wheat is carried for next to nothing.

4153. It is expected that, in the event of the line being constructed, special rates will be charged along the section from Parkes to Condobolin, or from Forbes to Condobolin? What will the special rate be?

4154. The present rate for greasy wool over that distance is 6s. 6d. a ton, and the rate for wheat would be about 9d. a ton. Perhaps it might be doubled in both cases for that section. If that were so, would it deter the selectors along the river from using the line, and would they cart produce or drive their stock to Forbes in order to get the advantage of the through rate? I think they would cart their wheat to Forbes when the road was dry.

4155. Are there any Crown lands available for selection within 20 miles of the proposed line from Parkes? Yes; but it is so poor that no one will take it up. It is not suitable.

4156. If the line were taken from Forbes, as the starting-point to Condobolin, what Crown lands would be available for selection within a radius of 20 miles? There would be a little of inferior country to the north.

4157.

4157. But what lands would be available for selection south? Nothing at all.
 4158. Will you enumerate the pastoral holdings along the river, taking the line from Forbes, and then dealing with the line from Parkes; also state their position, the extent and tenure of the leaseholds, and the character of the various reserves? I could not tell you from memory.
 4159. Give an approximate estimate, and you can subsequently send in a detailed statement, which will be added as an appendix to your evidence? The line itself would pass through Bocabigal.
 4160. How is that situated? Within 3 or 4 miles from Forbes to the west.
 4161. What is the leasehold area? About 3,000 acres.
 4162. What is the extended tenure, if any? An extension of five years was granted, which will terminate in 1900. The next would be Gunning.
 4163. What is its extent? 3,000 acres.
 4164. And the tenure? It is extended for five years.
 4165. And the next? Burrawang, with a leasehold area of 206,000 acres. That is also extended to five years.
 4166. What joins it on the west? Borambil.
 4167. What is the extent of that leasehold? On the north side of the river there will be about 6,000 acres, and considerably more on the south side.
 4168. Can you total it? I think about 30,000 acres on the south, and about 6,000 acres on the north.
 4169. Has an extended tenure been given for that leasehold? Yes; of five years.
 4170. What pastoral property joins that on the west? Condobolin town comes on the west. To the north of Condobolin there is the Condobolin Station of 42,000 acres of Crown land.
 4171. And does the same principle of extended tenure apply to it? Yes.
 4172. Can you indicate the areas, as nearly as possible, included within the reserve along the route you have spoken of, and the character of the reserve? There is one large reserve which includes the inferior country on the Gunning Mountain, and the rest consists of stock reserves. I suppose there would be 15,000 acres altogether.
 4173. Are the whole of these reserves required for the purposes for which they were reserved, or could not some of the land be released for settlement? Not all required.
 4174. Is there any extent of water reserves there? Yes; there are several water reserves.
 4175. Are there any more there than are absolutely required? Yes; considerably more.
 4176. Is the land situated on those reserves suitable for settlement? Yes.
 4177. What is the nature of the reserves on the south side of the river? They are all water reserves, excepting small camping reserves at intervals.
 4178. If a line were constructed from Parkes to Condobolin, or from Forbes to Condobolin, could not the greater proportion of travelling-stock routes be reduced to 5-chain roads? I do not think so. These 5-chain roads are impassable in wet weather.
 4179. Would it not be safe to assume that the stock, a considerable distance west and south of Condobolin, would be trucked to Condobolin in preference to being driven? Fat stock would, but not stores.
 4180. Then, in your opinion, the stock routes along the river should be kept intact? Pretty much as they are now—not much reduced.
 4181. What has been the nature of the settlement during your long residence in the district;—have the original selectors remained on the land, or have they transferred? In very few cases prior to 1885 have the original selectors remained on the land.
 4182. What have they done with their land? They have sold out to the lessees.
 4183. Have the lessees been the principal purchasers? Yes; in almost every instance.
 4184. Can you form any opinion as to the reasons which induced them to sell out;—did they sell out for speculative purposes, or were they controlled by circumstances of an unfortunate character? They sold out for speculation. In most places they got enormous prices. £2 an acre has been given for conditional purchases, and conditional leases.
 4185. Would those prices be given by the pastoral lessees? Yes; this was three years ago.
 4186. What is the latest sale or transfer of which you are aware? There has been no sale for a long time. The squatters will not buy now.
 4187. Do you think the pastoral tenants will not buy, or that the settlers remaining are of a different class from those who have preceded them? If they were disposed, the squatters could buy a great many of them. But take the resumed area at Burrawang—the lessee has no land out there—it is all selections.
 4188. Do you believe, if any more land were made available for selection there, its ultimate destination would be to be transferred to the station? I do not think so. When the land is thrown open, if they sell out there, they will not be able to get other places. In former times they could go on the next run, and get as much as they wanted.
 4189. The Committee have been informed that it is possible to purchase some of these selections of 2,560 acres at 5s. or 6s. an acre? I believe it is.
 4190. And these lands have been fenced and otherwise improved to comply with the conditions of the law? Yes; not about here, but down the river.
 4191. We have been informed that this applied more particularly to Forbes? I do not think so, unless it is a very bad selection.
 4192. In any case, if that were so, it would not recoup anyone for speculative purposes? No.
 4193. Because that would be absolutely less than the value of their money and labour put upon the ground? Yes; but three or four years ago they used to get 20s. and 30s.
 4194. Could you compare any of the selections on the river frontage, north or south, with that back, say, about Trundle;—what is the comparative value? I would sooner have 640 acres on the river, than three or four times the amount at Trundle.
 4195. Have any of the lands on the river been sold out? No; not for a long time.
 4196. Then those which have been sold have been back lands? Yes; but not very far back.
 4197. What has been about the price of the river land;—have any of the river lands been sold by selectors? I cannot recollect any.
 4198. I suppose, as a matter of fact, it has come within your knowledge, that many of those so-called selectors were not *bona fide* men? A good many of them, but still many of them were.
 4199. Would not the lessees in this district do, as lessees in other districts have been doing, employ dummies? Yes; no doubt.
 4200.

Mr. A. Sharp. 4200. In your opinion the land on the river, and in its vicinity, is more suited to close settlement than the back lands? Yes; because of the water. Within a few miles of the river, as far as Goobang Creek, you can get an unlimited supply of water by sinking.

4201. It is more suitable, then, principally on account of the water, and not because of the soil? No; the soil is very good, Trundie way, if they had the water.

4202. In your evidence, given before Mr. Gilliat in 1892, you stated:—

The demand for land in the district is so great that if the leaseholds were thrown open, the whole of the Crown lands on Burrawang and Gunningland leaseholds would be taken up as special areas within eighteen months or two years at the outside.

If the lands were made available now, do you think that would still apply? No; there is not the same demand at all now as then.

4203. Then the depreciation in the value of produce has had a deterrent effect? Yes.

4204. And the land would only be taken now, if made available in larger areas, and that at a reduced price? Yes.

4205. And, judging from your own experience, you would recommend that course? I would.

4206. That is, with the object, not only of inducing settlement, but retaining it? Yes.

4207. What proportion of land on the river, or that in the vicinity of the river, is under cultivation compared with that held purely for pastoral purposes? There is not much cultivation on the river. There are some gardens.

4208. Is the soil of the same character all along the river between Forbes and Condobolin? It is better in some places than in others.

4209. Where is the greatest area of land suitable for the growth of cereals? I think the land is higher on the south side, because the water goes out towards Lake Cowal, and leaves a large area inside.

4210. Have you had any conversation with any pastoralists in regard to the Land Bill now before Parliament? Yes.

4211. Would they be prepared to come within the provisions of that Bill, to surrender one half? Those I have spoken to would only be too glad to do it.

4212. That would release a large area of land to be made available for settlement at once? Yes; it would release 100,000 acres on Burrawang alone.

4213. But the owner of Burrawang is very pronounced as to the conditions upon which he would release the land; if the land were taken from him he would have to be paid for improvements, and everything else at once; otherwise he expressed the opinion that he would hold the land until 1900? He could not go against the law.

4214. At present it would seem to the Committee, from the reply given by Mr. Edols, that unless the matter were made compulsory, the runholders would not surrender; they would retain the land for five years;—if that is to be the case—if no land is to be released for five years, taking the present settlement into consideration, either between Parkes and Condobolin or between Forbes and Condobolin, do you think Parliament would be justified in authorising the construction of a line of railway along the present settlement? No; not from either place.

4215. Where do you think the ultimate close settlement of this district will be;—on the river, or back from the river? I think on the river.

4216. Taking that view of the case, you would recommend the construction of the line as near to the river as possible? Yes.

4217. Because you think the permanent settlement will ultimately trend in that direction? Yes.

4218. Notwithstanding that a line constructed along that country would, in consequence of its broken character, be more expensive than a line constructed on higher or more level country? I do not think it would be much more expensive.

4219. You are aware that it is proposed to construct a pioneer or surface line; the average depth of earthworks laid upon the surface would not exceed 6 inches, except where depressions were met with; upon this earthwork sleepers would be placed, and then the rails, without ballast;—would the river country be as suitable for the construction of a line of that character as the country further north? With the exception of crossing Goobang Creek, I think it would.

4220. Would the crossing at Goobang Creek necessitate any expensive structure in the shape of a bridge? There would have to be an embankment of a quarter of a mile, and a bridge about 30 feet long over the creek.

4221. What depth of embankment would be required to bring it up to the level of a bridge? Four feet, I think.

4222. What length? About a quarter of a mile.

4223. With that exception, would the country be suitable for a surface line of railway? Just as suitable as the other, in my opinion. It is hard, level country.

4224. Having had extended experience, and taking into consideration the existing depression all over the Colony, and the depreciation in the value of produce, you now change your opinion in regard to the adaptation of this particular country for special areas? Yes.

4225. And you are now of opinion that the area should be extended to 1,280 acres, and the price reduced, and a maximum fixed of not more than 25s. an acre? Yes; the area of Crown lands within 15 miles of the river on either side, between Forbes and Condobolin, is about 450,000 acres.

4226. That includes reserves of all denominations? Yes. I may also state that across the river, within $1\frac{1}{2}$ mile of Forbes, there are 1,500 acres which were taken up in special areas at from £4 to £7 per acre.

4227. Whom were they taken up by? Principally by persons having business in the town as a suburban home.

4228. Then they are adjuncts to their present businesses? Yes.

4229. Do you find they are better improved in comparison with the other lands? Yes; they are very well improved. Some are under lucerne, and most of the others are all cultivated.

4230. Then your opinion is that the experiment of allowing townspeople to have an opportunity of taking up those lands has been beneficial? Most successful.

4231. Are they residential or not? They are all residential.

4232. Is there any extent of Crown lands still available to further develop that close settlement? No; it is all gone.

Mr. Thomas Tozer, orchardist, Forbes, sworn, and examined :—

4233. *Mr. Molesworth.]* How long have you been a resident of this district? Thirty-one years.
 4234. What has been your principal occupation during that time? Orcharding and vegetable growing.
 4235. What is the extent of your holding? Eighteen acres and a half.
 4236. Is it all laid out as an orchard? Yes; except that there are 5 acres of cultivation paddock.
 4237. Have you had an income from that sufficient to maintain yourself and family during the past years? Yes.
 4238. Do you depend upon the rainfall, or do you irrigate? I irrigate when necessary.
 4239. You have all the appliances? Yes.
 4240. So that when dry weather comes on you can water the land by a process of irrigation? Yes.
 4241. Do you find the culture of fruit in this district fairly successful? Yes.
 4242. What do you estimate the average cost per acre per annum for irrigation? I have not kept a record.
 4243. After you have the plant established, is the amount inconsiderable? It is very little.
 4244. What would be the value of a plant suitable for irrigating a small quantity of land like yours? A little over £600.
 4245. Would that plant be capable of irrigating a very much larger quantity of land? Yes; double the quantity.
 4246. And you find irrigation is eminently satisfactory here? Yes.
 4247. How often do you irrigate your land? Not very often—it depends on the weather.
 4248. How often would you irrigate it in dry weather? We have only irrigated three times all the summer, and more than half the land has not been irrigated at all. It is only the peaches we go in for irrigating; we do not trouble so much about the apples and the pears.
 4249. What interval elapses between each irrigation? Two months between each time.
 4250. For how long do you let the water run? A few hours.
 4251. How much can you irrigate in a day? About 2 acres.
 4252. Have you a ready market for your produce? Yes; for most of it. It would not pay me to send it away.
 4253. Do you generally irrigate your land by means of long channels? Yes.
 4254. Then you run them off into subdivisions wherever required? Yes; I open trenches with the plough. One man attends to it, and directs the water in such direction as I desire.
 4255. Have you a bountiful supply from the river? Yes.
 4256. You have never known your irrigation plant to be idle from want of water in the river? Only once—when I first got it.
 4257. How long is that since? About twelve years ago, before we got the weir put up.
 4258. Since the weir has been constructed, you have had no scarcity of water? No; we would have no scarcity for three years even if we had no rain.
 4259. Judging from your experience in irrigation work, do you think it could be profitably carried out on a larger scale along the river bank? Yes.
 4260. Could it be made useful for agriculture? Yes.
 4261. And for grazing lands as well? Yes.
 4262. Are there many others who have an irrigation plant besides yourself? Mr. Reymond, Mr. Gatenby, and Mr. Farren.
 4263. Have they had to construct weirs to retain sufficient water for pumping? Not that I am aware of.
 4264. Are their holdings used for a similar purpose to yours? No; more for grazing. Mr. Reymond grows a great deal of fruit, too, under irrigation.
 4265. He grows grapes and makes wine? Yes.
 4266. Have you done any fruit drying? No.
 4267. You simply depend on the green fruit? Yes.
 4268. We have heard that fruit grown under the irrigation process will not keep—have you had any experience with regard to that? It is a great mistake.
 4269. You believe that fruit grown under irrigation will last as long as fruit grown from natural purposes? Yes; if watered when necessary, and not overdone.
 4270. Then, your opinion is that, unless it is overdone, there is no fear of injuring the keeping power of the fruit? No; and it will keep better than fruit sodden with rain.
 4271. Have you suffered from over-watering at any time? No.
 4272. Is your fruit always marketable and sound? Yes.
 4273. Will it compare favourably with fruit grown in other parts of the district? I think I beat them all.
 4274. Whether the fruit is grown under the irrigation process or under the natural rainfall? Yes.
 4275. Have you exhibited any of your fruit at public shows? Yes.
 4276. Have you obtained prizes? Yes.
 4277. Against all competitors? Yes.
 4278. Have you ever been beaten at any of the shows? Very seldom.
 4279. Have you obtained fairly satisfactory market prices for your goods? Yes; it pays me better to sell it in the district than to send it away.
 4280. Then, if you had not a local market, you do not think your returns would be so satisfactory? No.
 4281. Have you many competitors in the local market? Yes.
 4282. But still you are always able to hold your own? Yes.
 4283. Do you attribute that to the quality of the fruit? Yes.
 4284. And you think the quality of the fruit is maintained by your system of irrigation? Yes.
 4285. How many hands do you employ upon your orchard? Three men, and sometimes four.
 4286. When irrigation is required, those hands attend to that part of the business as well? Yes; it takes one man to drive the engine, another to look after the water, and another to fetch wood.
 4287. The men who do that are, at other times, employed about the ordinary orchard work? Yes.
 4288. Besides the hired labour, do any of the members of your family assist you? No. I might mention that if we did not irrigate some seasons here the fruit would not be worth eating, and we could not sell it.

Mr. T. Tozer.
 1 April, 1895.

Mr. F. Tozer. 4289. Will you state the wholesale prices you obtain per case for some of your leading lines? Peaches have been running all the season at 8s. a case, and apples and pears at 5s. and 6s. a case. For plums we generally get the same price per case.

1 April, 1895. 4290. Have you any idea what your returns are per acre? No.

4291. *Chairman.*] You have taken a prize for your farm;—what was it? The first prize for the best orchard in the Colony over 12 acres.

4292. When was it awarded? In 1890, in Sydney.

4293. That was a national prize of £50, was it not? Yes.

4294. Would you like to say what value you put upon your holding? I have been offered £6,000 for it.

Mr. Frederick Thomas Cheeseman, general land agent, Forbes, sworn, and examined:—

Mr. F. T. Cheeseman. 4295. *Mr. Gormly.*] Have you had many inquiries for land from persons who have wished to settle within the district within the last four or five years? Yes; and I am constantly getting inquiries from the southern part of the Colony, and from Victoria and South Australia.

1 April, 1895. 4296. Have many persons settled in the district since you have been here? Yes; I think I was the first to advertise in the Victorian papers that lands were open to selection, and 300 or 400 persons came over here in consequence.

4297. When did you advertise? In 1887.

4298. And many persons have consulted you, and have settled in the district in consequence of your advertisement? Yes.

4299. Are there many persons now settled in the district? Yes; towards the Bogan River and Trundle, on the southern side of the river, and on Melrose.

4300. You sometimes meet a number of those persons in business transactions? Yes.

4301. Are they satisfied with their holdings? None of them are satisfied with less than 2,560 acres. Some of them who came over with a considerable amount of money—£1,000 and upwards—have not been able to make a very good living, and they are at the present time wishing to borrow money.

4302. Have many of those persons consulted you as to the probability of selling their holdings? A large number.

4303. They wish now to sell their holdings? Yes.

4304. Because they cannot make a fair profit? Yes.

4305. Is that the reason they wish to sell? It is either the fact that they cannot make a fair profit, or that they have not sufficient money to carry on.

4306. I suppose it is very difficult to get at a reasonable rate, on conditional purchase or conditional leases? It is almost impossible.

4307. And many of those holders have not command of sufficient money to make the necessary improvements which would render their holdings productive? No.

4308. And a number of them would sell their holdings if they could get a buyer? I have them offered as low as 5s. an acre.

4309. That would include the conditional lease? I know of one or two selectors who, after they had done their five years residence upon them, and put improvements to the value of £1,000 upon them, sold at 5s. an acre.

4310. To what extent? 2,560 acres.

4311. Then they lost upon them, in addition to losing the value of their time? Yes.

4312. Where was that land situated? Towards the Bogan. I can show you one holding which I have under offer at the present time. It is 10,000 acres. I was offered it for 10s. an acre about three weeks ago.

4313. That would include the conditional lease? Yes. When I could not get a buyer at 10s. an acre the seller said he would take 8s.

4314. I suppose that, to a great extent, is attributable to the low price of stock, wool, and grain? Yes; to the general depression.

4315. Is it attributed to any extent to the want of railway communication? Some of them do complain that it makes a difference.

4316. Have the conditions of residence been fulfilled? Yes.

4317. And the necessary improvements made? Yes.

4318. And a certificate of conformity obtained? Yes. The man to whom I have referred has 3,000 acres in Riverina, and I think he has laid out £4,000 or £5,000 on his property here.

4319. If railway communication were extended to where persons have taken up land, would it materially relieve them or enable them to still hold their land? In some instances I think it would enable them to hold, but in a good number of instances I am afraid it would not. I am afraid the want of water has a good deal to do with it.

4320. I will ask you to refer more particularly to the lands which would be served by a railway from Forbes to Condobolin, or from Parkes to Condobolin direct, or from Parkes to Condobolin, *via* Trundle. Which portions of those lands are considered the most valuable—the river lands or the back lands towards Trundle, or further west towards Bogan Gate? There was a sale about a month ago of land about 21 miles from Forbes, and about 4 miles south of the suggested line from Forbes to Condobolin, and 4 miles from the river. 1,100 acres were sold at £2 an acre, and 640 acres almost adjoining it, at 30s. an acre. That was bought by an independent person—not by the station.

4321. Would that be a better price than that which was asked for the lands you have indicated where there were 10,000 acres? Yes.

4322. Would it be double the value? Fully.

4323. Is that an indication of the value of land in proximity to the land you have just referred to? I think so. I think the river lands are more valuable.

4324. For grazing or agricultural purposes? I think this land was bought for grazing purposes; but I think the greater portion of the river lands are even more valuable for agriculture than the further back land.

4325. For a variety of forms of agriculture? For wheat-growing, I should say.

4326. Have you any experience of the carrying capacity of lands in or about the river, and those in the back country;—will the river lands carry a larger amount of stock per acre? Yes.

4327. To what extent? I should imagine the river lands, in all seasons, would average about a sheep and a half to 2 acres, and the back lands a sheep to 4 or 5 acres. Mr. F. T. Cheeseman.
4328. Do you refer to the back lands as improved or unimproved land? Some of the back lands would take 12 acres unimproved to feed a sheep; but striking an average all through I should say one sheep to 4 acres. The reason of that is the difference in the rainfall. 1 April, 1895.
4329. Are you well acquainted with land on the south side of the river? Yes.
4330. Is there a larger extent of good agricultural and pastoral land there? Yes.
4331. About what distance will the flood-waters extend back from the river in different places—in the creeks or branches? On the south side the flood-waters sometimes go across the swamp and as far as Lake Cowal, and on the north side they are sometimes as far north as the Goobang Creek.
4332. But those waters do not cover the whole of the land embraced within that distance? No.
4333. The water only goes in creeks? It follows large swamps.
4334. And is a large amount of the land within that area free from inundation? Yes.
4335. Is that land of a good character? Yes.
4336. For agriculture? A certain proportion of it would be. Mr. Sharp said about one-tenth. I should put it higher than that, and say fully one-fourth.
4337. And that would be suitable for grazing and agriculture? Yes.
4338. Have you seen the crops in the various portions of the district—on the river lands and the lands in proximity to the river, and also in the back country? I have not seen so many crops on the river lands as slightly back from the river. Mr. Gatenby irrigates a good deal, and I have seen his lucerne crops, which were magnificent.
4339. What is the reason the river lands are not cultivated;—is it because most of the river lands are held in large holdings? I think that is the reason.
4340. The river lands are held by large owners? On the northern side they are held principally by Mr. Edols, and in addition there is a large travelling-stock reserve which fronts the river.
4341. From your observations in going over the district, and from the way in which the present holders utilise the lands, are you of opinion that if the river lands were occupied by small holders, a fair proportion would be devoted to agriculture? I think so.
4342. And that opinion is given upon personal observation in travelling over the district? Yes.
4343. And from seeing the crops of holders who had cultivated their land? Yes.
4344. You are of opinion that the river lands are of the greatest saleable value? Yes.
4345. To what extent over the back lands? I can only estimate it in one way. I have had men coming here from Victoria, and the southern parts of the Colony, and they have offered me £100 commission if I could get them a block of land fronting the river.
4346. Was anything like that amount of commission offered for obtaining a block of back land? No; about £10 would be the highest for that. Not one man, but pretty well hundreds have written to me offering the same thing.
4347. Is there any further information which you can supply as regards the extension of the line from Parkes to Condobolin direct, from Parkes to Condobolin, via Trundle, or from Forbes to Condobolin? So far as the extension by way of Trundle is concerned, I do not think there is any other land, excepting that which has already been selected, which has been greatly benefited by the line going in that direction instead of Bogan Gate.
4348. Are you of opinion that when the lands shown on the plan as untinted, in proximity to the direct line from Parkes to Condobolin, are made available for settlement, there will be immediate applications for them as ordinary conditional purchases, or in areas of less than 2,560 acres? Personally I think, for the benefit of the Colony generally and the district especially, it would be a great pity to throw open any blocks less than 1,280 acres.
4349. Anything less than that would not be sufficient for a family to make a living on? No.
4350. Are you of opinion that any land made available for settlement in that direction would be immediately applied for? I think it would be all settled within twelve or eighteen months.
4351. You state that land in the immediate neighbourhood of the proposed line is offered for sale at a less price than it would cost the present holders? Yes; I do not understand the reason. I have several times attempted to point out to selectors that they can buy cheaper than they can select, but still they have the craze, and go in for selection.
4352. Would not that be attributable to the low payment at first? It might be.
4353. They would only have to pay a deposit and a year's rent in advance for a conditional lease? Yes; I think that would be the reason.
4354. Chairman.] Seeing that a line from Forbes to Condobolin would go through a lot of freehold land, could you name an average price per acre which the Government would have to put upon it? About 30s. an acre.
-
- Mr. James Wilson Taylor, Crown Lands Agent, Forbes, sworn, and examined:—
4355. Mr. Chanter.] How long have you been here? Eight years.
4356. Have you any information with which you can supply the Committee? Yes. The following is a statement showing the areas of conditionally-purchased and conditionally-leased lands selected and leased since 1884 in the Land District of Forbes, within 5 miles of the Lachlan River from Forbes, to within 20 miles of Condobolin:—Conditionally-purchased land—No. of selections, 240; area, 37,847 acres. Conditionally-leased land—No. of leases, 116; area, 44,336 acres. With very few exceptions these selections and leases are held by the original holders. Mr. J. W. Taylor.
1 April, 1895.
4357. Have you had any considerable number of transfers? I have had a number.
4358. Has there been any considerable number during the last five years? Not since 1884.
4359. What has been the number of transfers in the district within the last few years—during the period of the severe depression? I think about fifty each year.
4360. Have they been absolute transfers, or transfers by way of mortgage? About half and half.
4361. Do you consider the selectors of whom you have a knowledge a fair class of men? A very good class.
4362. Are the rentals paid regularly? Yes.
4363. Have any applications been made for an extension of time? Very few. 4364.

- Mr. J. W. Taylor. 4364. Are there any special area selections in your district? Yes.
1 April, 1895. 4365. What price was put upon the land by them? From £1 10s. to £8 an acre.
4366. Where would the land at that place be situated? North of Forbes.
4367. How far distant from the town? A mile and a half.
4368. What area? Four or five acres.
4369. Is that the only class which has been taken up? No; there are some blocks of 160 acres further on.
4370. What was the price put upon them? Thirty shillings an acre.
4371. How long has that been held? Seven years.
4372. Have the instalments been regularly paid? Yes.
4373. Have you any knowledge of the holders? I know them all.
4374. What are they doing with the land? Growing cereals and fruit.
4375. And are they making a living from 160 acres? They all are, I think. I do not think there is one of them which is mortgaged.
4376. Is this specially favoured land? It is close on the river.
4377. Then in your opinion the settlers in your district at present are men who will be permanent if they have facilities to get their produce to market? They are sure to be, I think.

* 367 tons, approximately.

The approximate number of sheep would be, according to number of bales of wool, 400,000.

The estimated population numbers 1,100.

The above statistics are taken from within a radius of 12 miles east, 14 miles north-east, 30 miles north, 35 miles north-west, 10 miles west, and 7 miles south from Trundie.

B.

[To Evidence of Mr. A. James.]

STOCKOWNERS AND STOCK IN THE DISTRICT OF CONDOBOLIN.

Sir,

I have the honor to forward you herewith a list giving the names, addresses, acreage, number of stock possessed by the stockowners in the Condobolin sheep district possessing 2,560 acres or more, and the distance of the several places from Condobolin.

This return was asked for by the Sectional Committee while recently at Condobolin.

The asterisk opposite the names indicates that in my opinion these persons would not make use of the proposed Forbes to Condobolin or Parkes to Condobolin Railway.

I have, &c.,

A. JAMES,

Inspector of Stock.

The Secretary, Public Works Committee, Sydney.

ALPHABETICAL List of Stockowners, with their addresses, and number of stock, in the Sheep District of Condobolin for Year 1894.

Names of owners in alphabetical order.	Name of run or holding.	Nearest post town.	Acreage.	No. of horses.	No. of cattle.	No. of sheep.	Distance from Condobolin.

[To Evidence of Mr. A. Sharp.]

PASTORAL HOLDINGS ALONG THE PROPOSED RAILWAY ROUTE.

3 April, 1895.

Sir,
In accordance with the request of the Sectional Committee, I have the honor to forward two schedules giving names and areas of pastoral holdings along the proposed route.

I am, &c.,

ARTHUR SHARP,
District Surveyor.

The Secretary, Public Works Committee, Sydney.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

PARKES TO CONDOBOLIN RAILWAY BILL.

(MESSAGE No. 69.)

Ordered by the Legislative Assembly to be printed, 20 June, 1895.

FREDK. M. DARLEY,
Lieutenant-Governor.

Message No. 69.

In accordance with the provisions contained in the 54th section of the Constitution Act, the Lieutenant-Governor recommends for the consideration of the Legislative Assembly the expediency of making provision to meet the requisite expenses in connection with a Bill to sanction the construction of a Line of Railway from Parkes to Condobolin.

Government House,

PLAN I.—General Plan.

PLAN II.—Showing Lands that may be affected by the proposed railway.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

RAILWAY FROM TEMORA TO WYALONG.

REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the present Session of Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, and the Public Works (Committees' Remuneration) Act of 1889, 53 Vic. No. 11, to whom was referred the duty of considering and reporting upon the expediency of constructing a line of railway from Temora to Wyalong, have, after due inquiry, resolved that it is not expedient the proposed line should be constructed; and in accordance with the provision of sub-section IV, of clause 13, of the Public Works Act, report their resolution to the Legislative Assembly:—

1. The proposed railway was under inquiry by a previous Committee ^{Inquiry into} in April and May, 1894, and at the end of that inquiry it was resolved that a ^{the proposed} decision as to whether the railway ought or ought not to be constructed should be ^{railway by a} ^{previous} ^{Committee.} deferred for six months, in order that at the end of that time the importance or otherwise of Wyalong as a gold-field and a district of settled population might be determined with more certainty than was then possible. The evidence obtained in this first inquiry did not indicate a likelihood of much increase in the yield of gold from the field or in population. Until further development should take place, 1,500 persons, it was represented, would be all the population the field would support, and without further development, this number would be reduced. In the opinion of the Government Geologist the prospects of the field were favorable, but as a greater depth than that at which work was then carried on was attained, mining operations, he stated, would be more difficult and expensive. The Sectional Committee appointed in the course of the former inquiry felt justified in recommending the construction of the line, if it were regarded as a section of a main line to the Lachlan at Hillston, *via* Cargellico. The question of ultimate extension to the Lachlan should, they considered, first be decided, as, unless it should be the settled policy of the country to extend the Cootamundra-Temora branch to the Lachlan, there was not sufficient evidence to justify the immediate construction of the line to Wyalong.

2. Commencing at the termination of the Cootamundra to Temora railway, ^{Description of} ^{the railway.} the route of the proposed line proceeds chiefly alongside or on the main road to Barmedman, and thence still close to or upon the road to Wyalong, a distance of 331 miles from Sydney and 40 miles from Temora. By following the road or keeping alongside of it the railway would go almost wholly through Crown lands. Very little fencing would be provided, and only about a quarter of the line ballasted; the absence of ballast being compensated for by additional sleepers. The rails would be 60 lb. steel rails, and the speed of the trains not more than 20 miles an hour. Station buildings are proposed for Barmedman and Wyalong, and a waiting-shed for Reefton.

3. The estimated total cost of the railway as stated in the evidence given ^{Estimated} ^{cost.} before the last Committee was £104,430, or £2,707 per mile, exclusive of land and compensation. In the present inquiry it is given as £92,000 or £2,300 per mile, exclusive of land compensation and survey expenses. The reduction is due to alterations in the estimates for earthworks, permanent-way materials, and ballast.

Railway Commissioners' report.

4. When the railway was under the consideration of the last Committee, the Railway Commissioners were not favourable to its immediate construction, and in their report they recommended that the proposal should be deferred for six months, or until such time as there could be no reasonable doubt as to the future of Wyalong. Their estimate of traffic from the railway indicated an annual deficiency of £4,150. They now state that the experience of the gold-field and its requirements during the twelve months which have passed since the date of their last report has "not indicated anything to warrant a change of opinion as to the probable result of the extension of the line." Population, they point out, has fallen off, and the output of gold for the twelve months ending 15th March last, the date of the latest information before the Commissioners, was not such as to show the existence of a large field or to give evidence of extensive working. The road being in fair order and the cost of carriage and of conveying passengers low, there does not appear to them to be "any great disability consequent on the want of railway communication." Further, they say that the line would appear to a very large extent to affect local interests only, as in their opinion the course of traffic from the outlying districts would be better served by an extension in a direction other than Wyalong. They consider that the present requirements and those of the near future of the gold-field are, under existing circumstances, reasonably met, and that the probable results from the railway would not warrant them in recommending that it be constructed. In their estimate of cost attached to the line, the Commissioners calculate the interest on the capital expenditure at 4 per cent. If the calculation were based on interest at $3\frac{1}{2}$ per cent. the estimated annual loss would be reduced to £3,970.

Witnesses examined.

5. The Committee examined a number of witnesses in Sydney, and then by means of a Sectional Committee obtained evidence at Barmedman, Wyalong, and Cootamundra. The Under Secretary for Public Works explained the reasons for the second reference of the line to the Committee, and produced reports from the Gold-fields Warden at Wyalong, and the Chief Inspector of Mines, upon the progress of mining operations on the Wyalong Gold-field. The Engineer-in-Chief for Railway Construction gave details of the route, and of the works intended to be carried out in connection with the railway, and his evidence was supplemented by a surveyor in his department who was employed in the survey of the route. The Secretary to the Railway Commissioners and the Railway Goods Superintendent were examined with regard to the Commissioners' report and the prospects of traffic. The Principal Assistant Engineer for Roads and Bridges gave evidence respecting the road between Temora and Wyalong, and the cost of so improving it as to meet the requirements of traffic in the event of the railway not being constructed. From the Acting Chief Draftsman of the Department of Lands was obtained a map, giving particulars of all lands within an area of 20 miles on either side of the route, and evidence explanatory of the map. The Chief Engineer for Water Conservation was questioned on the subject of water supply; and the Rev. J. M. Curran, Lecturer in Geology in connection with the Technical Education Branch of the Department of Public Instruction, and Mr. C. L. Garland, were examined with reference to the progress in the past, the present condition, and the probable prospects of Wyalong as a gold-field and a place for the maintenance of a settled population. The witnesses who appeared before the Sectional Committee were representative of the gold-field and its district, and they attended after ample publicity, by advertisements and paragraphs in the local press, of the intention of the Sectional Committee to visit Wyalong, and of their desire to hear anyone who had anything to say relevant and important to the subject of inquiry.

Principal points in the inquiry.

6. Bearing in mind the reasons why, when the proposed railway was under the consideration of a previous Committee, a recommendation was made that a decision with regard to its construction should be deferred, it has appeared to the Committee necessary in the present inquiry to consider specially the progress of Wyalong since the date of the last inquiry, the present condition of the place, and its probable future. The route, estimated cost, and method of constructing the railway are matters of importance, and in the present inquiry have been submitted in a more favourable light, alterations made since the proposed work was last under consideration reducing the estimated cost by £407 a mile.

7. Since the date when the railway was last under consideration Wyalong has made progress and become a township of fairly creditable buildings and business activity. The manager of the Bank of New South Wales at Wyalong, according to his evidence before the Sectional Committee, has received at his bank 13,000 oz. of gold, and in addition to this evidence points to the fact that a large quantity of ore from the field has been treated at Barmedman and other places. Land selection, the Railway Goods Superintendent found, has taken place to a limited extent only, and the area under crop has not been materially increased. The Sectional Committee in their report express the opinion that the operations which appeared to them to have been carried on in connection with the gold-field during the interval which had elapsed since the field was previously visited by a Sectional Committee were encouraging, but state that at present the field is practically at a standstill pending a supply of water for battery purposes. A large quantity of ore, variously estimated at from 5,000 to 15,000 tons, is at grass awaiting treatment. The claims showing gold number 130, and of these seventy are regarded as payable.

8. The probable future of Wyalong as a gold-field is shown prominently in the evidence given by the Rev. J. M. Curran who spent nearly two months of the present year in the Wyalong district, thoroughly examining the gold-field with a view to reporting upon it to the Department of Mines. The future population of Wyalong will probably be found depending upon the amount of permanent mining and settlement on the land in the district for the purposes of agriculture, or for agriculture combined with pastoral pursuits. For this the land is not unsuitable, although the rainfall of the district is limited. At present most of the land is in the hands of Crown lessees, and may not be thrown open for selection for some years, but when it shall become available to selectors there can be little doubt it will be taken up and some of it cultivated.

9. In addition to what has already been said as opposed to the construction of the line, there is the important circumstance that, should the railway be made to Wyalong, it will in all probability not be extended. From the fact that the Railway Commissioners and the Government approve of the district of the Lachlan being served by a railway through Condobolin from Parkes, a line which the Committee have had under inquiry and passed, the railway from Temora to Wyalong cannot be regarded as a portion of a line to the Lachlan River at Cargellico or Hillston.

10. The Sectional Committee, as will be seen from their report, were unable from the evidence before them, and from what they saw of the gold-field and the district, to recommend the construction of the railway, but they express the opinion that action should be taken to place the worst portions of the road in good repair, so that no special disadvantage may be suffered by an enterprising community. They give the following reasons for the conclusion at which they came:—

- (1) That the population of Wyalong alone does not justify such an expenditure;
- (2) That the successful development of the field depends largely upon a permanent water supply which, at present, is not in existence;
- (3) That the policy of the Government with regard to the leasehold areas in its vicinity has not yet been disclosed;
- (4) That the Parkes-Condobolin line having been approved by the Committee, an extension, *via* Wyalong, can no longer be regarded as a line to tap the western country.

11. The Committee have decided that it is not expedient the proposed railway should be carried out. In their opinion there is at the present time no justification for its construction. The prospects of traffic on the proposed line are not sufficiently encouraging, and those of the future of Wyalong not such as to lead them to conclude that the line should be built in anticipation of what may be the condition of the gold-field and district some years hence. The resolution arrived at by the Committee, passed on the 26th inst., is as follows:—

"That, in the opinion of the Committee, it is not expedient that the proposed Railway from Temora to Wyalong, as referred to the Committee by the Legislative Assembly, be carried out."

THOS. EWING,
Chairman.

JAMES GORMLY, Esq.
EDMUND WILLIAM MOLESWORTH, Esq.

The Committee proceeded to consider the proposed Railway from Temora to Wyalong.

Joseph Barling, Esq., Under Secretary, Department of Public Works, sworn, and examined:—

1. *Chairman.]* You propose to make some statement to the Committee with regard to the railway under consideration? Yes. I do not think I need trouble you with many remarks upon the subject as it has been before the Committee on a previous occasion. The work was first referred to the Committee on 29th March, 1894, in these terms:—

J. Barling,
Esq.
17 May, 1895.

To report upon the expediency of constructing a line of railway from Temora to Wyalong.

The inquiry was entered into on the 9th April, and the following resolution was come to:—

That, in the opinion of the Committee, it is expedient that the decision upon the proposed railway from Temora to Wyalong, as referred to the Committee by the Legislative Assembly, be deferred for six months.

I may mention that the estimate which I put before you on that occasion was for 40 miles of railway at £110,000. Mr. Deane, however, gave you a revised estimate, which brought it down to £104,430, or at the rate of £2,707 per mile. The Committee having come to the resolution referred to, of course the matter remained in abeyance for some considerable time. Difficulties then arose with regard to the question of the road, and representations were made to the Department as to the necessity of constructing a better road to the gold-fields. I will briefly refer to the papers in regard to that matter:—

Question of constructing a road or railway between Temora and Wyalong.

In November last the Under Secretary asked what sum would be necessary to put the Temora-Wyalong Road in fair order, as under the most favourable circumstances it could hardly be possible for the railway to be constructed for some years, and while this may be considered a good reason for postponing the carrying out of any large road work until the railway question is settled, he thought it hardly held good against putting the road in fair order.

The matter was referred to Mr. Hanna, who was of opinion that to provide for an ordinary winter—and assuming the railway would be constructed—that a sum of £4,000 would be sufficient to keep the road open for traffic during 1895.

Mr. Principal Assistant-Engineer Scarr, however, considered that before even the modified demand made by Mr. Hanna, viz., £4,000, is conceded, consideration should be given to the question of constructing a railway, as he is of opinion that the only expenditure of any magnitude that can be of real service in country of such a boggy nature—and to carry the heavy traffic on this road—will be the construction (*i.e.*, metalling), of the most substantial kind. If this work were carried out at once, it would be at least two years, with the most attentive maintenance, before it could possibly be consolidated, and during process of consolidation would require considerable expenditure in labour and material, whereas, Mr. Scarr states, a railway could be constructed in the locality as quickly and probably as cheaply as a metalled road.

The Commissioner for Roads is also of opinion “that nothing short of complete construction should be undertaken, and in conference with the Minister on the 11th January last, suggested the construction of a light line of railway, as he explained that the Department would be throwing money away unless it went to the expense of making a first-class road, which would probably cost as much or more than a light line of railway.”

The Under Secretary then asked Mr. Deane, whether, in the light of the experience he has gained from his visit to America and Europe, he could suggest a less expensive line than that previously proposed by him.

In reply, Mr. Deane now estimates that the cost of the railway can be reduced by £400 per mile, making the total cost stand at £92,000, or £2,300 per mile.

The approximate cost of constructing a road is £60,100.

The estimated cost of the railway given to the Public Works Committee by Mr. Deane was £104,430, or £2,707 per mile, whereas the Railway Commissioners were of opinion it would cost £85,000; and taking their estimate, the annual interest at 4 per cent. would be £3,400 and cost of working £3,550. The annual revenue they considered would not exceed £2,800, leaving an annual deficiency of £4,150.

When this proposal was referred to the Public Works Committee in May last, they considered it expedient that the decision upon the railway should be deferred for six months. The time expired on the 28th November, 1894.

Submitted for instructions.—J.B., 19/2/95. Ask the Department of Mines to obtain report as quickly as possible as to what developments have taken place at Wyalong since the report of the Public Works Committee, so that it may be determined whether there is sufficient justification for again submitting the matter to Parliament.—J.H.Y., 20/2/95. Minute sent to the Under Secretary for Mines, 20/2/95. In a month, if no reply received before, 21/2/95. Prepare resolution for reference to Public Works Committee, 26/2/95.—J.H.Y.

J. Barling, Esq. 2. Is the cost of the land included in that estimate of £2,300 per mile? No; it is exclusive of land.
17 May, 1895. 3. *Mr. Hoskins.*] It was stated when the line was previously under the consideration of the Committee that the distance would be 38 miles? Yes; but we have had some deviations. I do not think I could state it at exactly 40 miles. We have a surveyor on the ground, and he is now making some slight deviations, so that we think it safer to put it down at 40 miles. Several deviations have been made, and we get a better result. Owing to the constant demands made upon the Department for the repairing of the roads, and the answers given to the Department by the engineering officers that nothing could be done unless a substantial road were made, it brought forward the question prominently before the Minister as to whether the time had not come to again submit the railway to the Committee—in other words to submit the proposal to them to enable them to complete the report, as recommended by a previous Committee. In order to obtain further information on the subject I was instructed to communicate with the Mines Department, as to any further information which they could give relating to the development of the field in the meantime. I was furnished with two reports, one from Mr. Slee, the Chief Inspector of Mines, and the other from Mr. Clarke, the Warden. The Warden's report is dated March 8th, 1895. Mr. Slee's report is dated March 15th, 1895. Mr. Clarke's report is as follows:—

Mr. Warden Clarke to the Under Secretary for Mines and Agriculture.

Sir,

Warden's Court, Wyalong, 8 March, 1895.

In accordance with the instructions contained in your blank cover of the 28th ultimo, respecting the developments of the Wyalong Gold-field since the report of the Parliamentary Standing Committee of Public Works regarding the proposed extension of the railway to Wyalong; I have the honor to report that although the population is not so large as it then was, there is still a more settled population of about 5,000 within a radius of about 5 miles of Wyalong. At Yalgogrin, about 30 miles distant, but in this district, there are about 200 miners, and there are a great many at Riley's Lookout, which is about 20 miles away but not in my district. At Reefton there are about 200 people, chiefly miners. Reefton is about 33 miles from Wyalong and about 11 from Barmedman.

I think the permanency of the field has been assured, and that the present and expected developments will be sufficient to provide for the existing population, and if the present aspirations are eventually realised the population will steadily increase. The development has been greatly retarded owing to the difficulty in procuring a good water supply, but in time this will be overcome. The Rev. J. M. Curran, geologist, who has recently visited this field, is assured that the field has "come to stay," and that further developments may be expected. He is also of opinion that alluvial will be found, probably between the Pine Ridge and Barmedman.

The yield of gold to date from Wyalong has been 11,768 ounces from 7,328 tons, but some of the small returns are not included in this. I estimate the value of gold won at about £46,000.

Three hundred and eighty-four allotments for residence and business areas have been conditionally registered in the Government town, and the town has been rapidly built upon. The population at West Wyalong is greater, and the buildings are quite as numerous; but I cannot give the number of allotments as they have not been registered, as this locality has been reserved from occupation under miners' rights and business licenses.

Five hundred and sixty quartz claims have been applied for and conditionally registered, 431 have applied for survey, and 120 have been surveyed. Four claims have lodged applications to be converted into leases.

I will now give the particulars of some of the deepest shafts:—

"Currajong," 110 feet; reef about 18 inches; crushing from that level 37 tons; yield, 2½ oz. per ton.

"White Reef," 150 feet; reef averages about a foot; driven 210 feet at that level; crushing 213 tons; yield 2 oz. per ton; just on the water.

"Welcome Stranger," 115 feet; reef averages about a foot; went 6½ oz. to the ton; 105 tons crushed.

"Hidden Treasure," 210 feet; driven 15 feet north and south at the 200-feet level; the reef runs from 8 to 12 inches; now crushing and on to the water.

"Three Star," 180 feet; driven 57 feet; reef about 2 feet; 207 tons crushed for 1½ oz. per ton; water makes about 1,200 gallons per day.

"Two Up," 180 feet, but working at 150; 19 tons went 2 oz. per ton; this claim is also troubled with water.

"Dodger," 148 feet; reef about 8 inches; just on the water; crushing from 120 feet, 53 tons, for 1 oz. 15 dwt.

"Star of Peace," 135 feet; reef about a foot; 105 tons went 1 oz. 16 dwt. per ton.

"Golden Fleece," 160 feet; reef averages about 116 inches; stone taken from 80 to 116 feet; 122 tons, which yielded about 1 oz. per ton.

Doyle and party, Pine Ridge, 124 feet; reef about 3 feet; crushings from surface to levels, 53 tons for from 2 to 3 oz. No. 1, south of Doyle's, 146 feet on reef, Keegan and party, 87 feet, and have had the reef from the surface.

No. 2, Hannah and party, about 90 feet, with reef; yielded, between 2 and 3 oz. per ton.

No. 3, Foot and party, 136 feet, with reef; 40 tons yielded 1 oz. 15 dwt. per ton.

At Yalgogrin there are sixteen claims and leases. The deepest shaft is 80 feet, and the reef 2 to 3 feet wide. The last crushing was 1 oz. 5 dwt. from 30 tons. Altogether 300 tons have been treated for an average yield of 1 oz. 9 dwt.

From Reefton 429 tons have yielded 799 oz., and the value is £3,056 3s. 6d.

From Barmedman, and crushed at Barmedman, 314 tons yielded 91 oz.

Fresh discoveries are being made in all directions, and I am satisfied that the field will last for some years, and that far better results will be obtained when the machinery is improved, as a quantity of the quartz, more especially at a depth, requires improved treatment.

I have, &c.,

WILLIAM CLARKE,

Warden.

The second report is from Chief Inspector Slee, and is as follows:—

The Chief Inspector of Mines to the Under Secretary for Mines and Agriculture.

Department of Mines and Agriculture, Sydney, 15 March, 1895.

Further report on the Wyalong Gold-field in connection with the Wyalong Railway.

FEW, if any, new developments have taken place in mining operations on the Wyalong gold-field since the 28th May, 1894, the date on which the Parliamentary Standing Committee on Public Works visited the Wyalong gold-field.

The population is less at present than it was in May, 1894. By the Police Returns the population within a radius of 5 miles was, on the 31st December, 1894, given as 3,825 males and 390 females, or a total of 4,215. Owing to the scarcity of water and the non-discoveries of fresh auriferous deposits the population has still further decreased since the beginning of this year.

In my evidence given before the Parliamentary Standing Committee on Public Works I stated that I thought the Wyalong gold-field would support a population from 1,500 to 2,000 for years to come, and my last visit to Wyalong in the beginning of February of this year has strengthened that belief.

So far nothing has been done on the Wyalong gold-field to prove the permanency of the reefs after the hard rock has been reached, and as this is also the water level mine owners have so far contented themselves to work their mines on the shallower levels above the hard rock where the auriferous quartz can be more easily and cheaply obtained. Other gold discoveries may also be looked forward to between Wyalong and Barmedman and Temora and Barmedman.

W. H. J. SLEE,

Chief Inspector of Mines.

With regard to the cost of road-making, I gave my figures at £69,100—the figures put before you on the last occasion. That is what it would cost to make a first-class metalled road. Since then some discoveries have been made as to road gravel and metal, and we are able, therefore, to somewhat reduce that estimate. The Chairman, perhaps, is aware that instructions were sent to our road officer to go carefully over the whole of the district and to report upon various aspects of the case, amongst which was the question as to the

the facilities for making good roads. The officer's name is Mr. G. S. Mullen, and I have a rather long report which he has sent in in pursuance of his instructions. I should like to hand it in, inasmuch as it gives information not only as to road matters but other subjects, such as the character of the soil, and so on. [Vide Appendix.] Amongst other things, he refers to the fertility of the soil, its capacity for supporting an agricultural population, and the character of the timber. He points out that there is good ironbark timber there and good grey-box timber, which would do for sleepers. Then he points out that there is good gravel, and in some parts of the road good metal for making roads. He puts down the distance from Temora to Barmedman as 22 miles. To make a good gravel road he estimates it will cost £13,165 10s. I have made an allowance for what we have spent on account of the road there already. We have spent on the road from Temora to Barmedman £3,245 16s., and from Barmedman to Wyalong, where only a narrow track has been cleared, £472, a total of £3,717 16s. We have allowed for that in the estimate I have just given. We suppose we shall require £13,165 10s. from Temora to Barmedman; and from Barmedman to Wyalong—17 miles—Mr. Mullen has estimated that we shall require £10,845, or a total of £24,010 10s.

J. Barling,
Esq.
17 May, 1895.

4. *Mr. Chanter.*] Is that for a gravelled road continuously? Yes, and it will include draining and some culverts and so on.

5. *Chairman.*] You were asked when before the previous Committee the following question:—

We have the estimate of £69,000 for one work against £110,000 for the other;—are we to understand that it is intended to carry on the work? It all depends, of course, upon the developments which take place.

Does it not strike you as a remarkable alteration of the whole view of the case? I think I can anticipate what you are going to state. It is a remarkable change in one sense, but we are aware of the existence of material now of which we were not aware then.

6. But ought not the Department to know exactly where the material is? They did not know. It was practically a new district at that time. We found out that there was material there of which we did not know at the first. There were gravel ridges some distance off the road, and I do not believe the road, from what I can understand, has been put in the best place by any means.

7. You do not think the road as originally laid out was in the best place? I think it is very doubtful. The road in many parts could have had a better location. If it had followed some of the ridges we should have had a much better road, and it was here where the gravel was found, and, as far as I can make out, our officers were unaware of its existence. The Chairman has referred to the great discrepancy between the former estimate of £69,100 and the present estimate of £24,010. I have had a talk with Mr. Scarr on this subject, because the discrepancy is patent to everyone. Mr. Scarr, however, still maintains the accuracy of the first estimate, £69,100. He says that in making up the smaller estimate Mr. Mullen has not provided for sufficient gravel on the road to meet the heavy traffic. We made a road with gravel last year, but Mr. Scarr says it was very soon completely cut up. It is a very weak road indeed. Mr. Mullen has given $1\frac{1}{2}$ cubic yard of gravel to the lineal yard of road. Mr. Scarr says that there ought at least to be 2 cubic yards of gravel. He speaks from experience, and states that the gravelled road, which was made with presumably $1\frac{1}{2}$ cubic yard of gravel to the lineal yard of road, was completely torn up by the traffic. He states that in order to meet the traffic we ought to make a good metal road, which will cost £69,100, but taking into account what we have spent that amount will be brought down to £64,112.

8. *Mr. Chanter.*] Do I understand that Mr. Scarr does not recommend a gravelled, but a metalled road? Yes, because we can get metal; but in some parts of the road we may still stick to gravel. If I recollect rightly the metal is to be found more on the other side of Barmedman.

9. *Mr. Davies.*] The only explanation for the great discrepancy between the two estimates is the fact that one officer recommends only a small proportion of gravel and the other a larger proportion? Yes. I have now, I think, stated sufficient to show the causes which have led to the work being again referred to the Committee. The Minister determined to refer the matter again to the Committee with the view of their completing their report, and on the 7th March, 1895, the project was referred in these terms:—

That the Parliamentary Standing Committee on Public Works having reported on the 28th May, 1894, "that in the opinion of the Committee it is expedient that the decision upon the proposed railway from Temora to Wyalong, as referred to the Committee by the Legislative Assembly, be deferred for six months," and such period having expired, the question be now referred again to the said Committee for report.

I have given you the last revised estimate, and now I will read you the report I have received from the Railway Commissioners, which is dated the 15th May, 1895:—

Proposed Extension of the Cootamundra-Temora Railway to Wyalong.

Sir, Government Railways of New South Wales, Secretary's Office, Sydney, 15 May, 1895.

In reply to your letter of the 14th instant, requesting a further report from the Railway Commissioners as to the proposed extension of the railway line from Temora to Wyalong, for the information of the Secretary for Public Works, I am directed by the Railway Commissioners to state that little can be added to the information conveyed by my letter of the 11th May, 1894—copy attached. Twelve months experience of the gold-field and its requirements have not indicated anything to warrant a change of opinion as to the probable result of the extension of the line.

The population was at that date estimated at 5,000, and at the present time it does not equal that number; and the output of gold for the twelve months ending 15th March last—the date of the latest information before the Commissioners—was 7,328 oz., which does not indicate a large field, or evidence of extensive working.

The Public Works Department have placed the worst portions of the road in fair order, and the cost of carriage between Temora and Wyalong is as low as 15s. per ton, passenger fares being equally reasonable, and there does not appear to be any great disability consequent on the want of railway communication.

The question of the extension moreover would appear to a very large extent to affect local interests only, as the course of traffic from the outlying districts would, it is thought, be better served by the extension of a line in another direction than *via* Wyalong.

The present requirements and those of the near future of the gold-field are reasonably met, and the probable results would not, in the Commissioners' opinion, warrant their recommending that the line be undertaken.

I have, &c.,

H. McLACHLAN,
Secretary.

The Under Secretary, Department of Public Works.

Proposed Extension of the Cootamundra-Temora Branch Line to Wyalong.

Sir, Office of the Railway Commissioners of New South Wales, Sydney, 11 May, 1894.

In reply to your letter of the 29th March, I am directed by the Railway Commissioners to inform you, for the information of the Secretary for Public Works, that they have, at the earliest possible moment (having regard to other pressing matters of business), inspected the proposed extension from Temora to Wyalong.

It

J. Barling,
Esq. It is estimated that the line should, if constructed as a pioneer line as described by the Commissioners in a paper dated the 10th October, 1892, and referred to in their annual report for the year ending June, 1891 (copies attached), be made, and all necessary accommodation provided, at a cost of £85,000.

17 May, 1895. The estimated annual cost would, under these circumstances, be—

Interest on estimated cost of construction at 4 per cent.	£3,400
Estimated cost of working—	
Traffic expenses	£800
Permanent Way expenses	2,000
Locomotive do	750
	3,550
	£6,950

As regards the probable revenue, really nothing definite can be stated. In railway construction the proposal from a traffic point of view is unique, as the future entirely depends upon the permanency of the gold-field at Wyalong, which it is understood is the basis of the extension. There is country adapted for agricultural purposes around Wyalong and en route thereto, but there is no present necessity for providing it with railway communication while there are large areas suitable for the purpose contiguous to existing railway lines available.

The present population of Wyalong (about 5,000) cannot be accepted as any indication of the future. Everything there at the present may be said to be in an abnormal condition, as was the case at Peak Hill, where it is understood there were, when the field was first discovered, 12,000 people, the present population being 1,500. However, basing the estimate of traffic on the assumption that there will be a permanent settlement at Wyalong to the extent that now exists at Temora—about 1,800—the value of the annual revenue will not exceed £2,800.

In view of the great uncertainty of the future of Wyalong the Railway Commissioners recommend that the proposed extension of the Cootamundra-Temora Branch Line be deferred for six months, or until such time as there can be no reasonable doubt as to the future of the place.

I am to add that the Commissioners have ascertained that both passengers and goods are being carried at reasonable rates between Temora and Wyalong, and therefore no hardship would be consequent upon the postponement suggested.

I have, &c.,

The Under Secretary, Department of Works.

H. McLACHLAN, Secretary.

We have put the road in fair order for a time, but it must be remembered we have had a very dry season, and when the rain comes it will be in anything but fair order. I have been looking at the Railway Commissioners' previous report. They estimated the interest on capital at 4 per cent. I think, as the money market is coming down so much, that we may fairly put it down at $3\frac{1}{2}$ per cent. That would make £92,000, at $3\frac{1}{2}$ per cent., £3,220. The traffic expenses, permanent way expenses, and locomotive expenses would be £3,550, which would mean for interest and expenses £6,670. The revenue which the Railway Commissioners then estimated would be the annual revenue would not exceed £2,800, which would mean a loss, as far as the railway returns are concerned, of £3,970.

10. In their last report to the Committee the Commissioners based their calculation upon a population of 5,000. In the report of the proceedings in connection with a previous reference, they based their calculation upon a population of 1,800? Yes, it was 1,800.

11. In the statement you have just read it is stated that the estimated population twelve months ago was 5,000, and to-day it is 5,000? Yes.

12. There is a very wide distinction? I think they were estimating the floating population. I imagine that what they meant was this, that although there is a population of 5,000 now, they do not suppose the field will support such a population—that when it comes down to its permanent level it will support a population of about 1,800.

13. In the estimates you have furnished you have left out the probable cost of the lands which may be required for the railway? Yes.

14. Can you furnish the Committee with any particulars in regard to that matter? Not at present. I think it was you who asked me that question on a previous occasion, and it was pointed out that the line would go the whole of the way through Crown lands, but I believe owing to some deviations we are making there will be a small amount of resumption required, but not much.

15. You do not know the nature of the deviations? No; they are not quite finished.

WEDNESDAY, 22 MAY, 1895.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERT.

JAMES HAYES, Esq.

The Hon. WILLIAM JOSEPH TRICKETT.

ROBERT HENRY LEVIEU, Esq.

The Hon. JAMES HOSKINS.

JOHN MOORE CHANTER, Esq.

The Hon. JOHN DAVIES, C.M.G.

CHARLES ALFRED LEE, Esq.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

JAMES GORMLY, Esq.

EDMUND WILLIAM MOLESWORTH, Esq.

The Committee further considered the proposed Railway from Temora to Wyalong.

Joseph Barling, Esq., Under Secretary of Public Works, sworn, and further examined:—

J. Barling, Esq. 16. Chairman.] You have a statement to make with regard to the Railway Commissioners? Yes. You will remember when I was here last week you asked me to communicate with the Railway Commissioners again, with a view to their giving a revised estimate. I wrote to the Railway Commissioners, and this is the letter I received in reply:—

Sir,

I have to acknowledge your letter of yesterday's date with reference to a difference between the cost stated in the Commissioners' minute of the 11th May, 1894, and the Engineer-in-Chief's present estimate, in regard to the Temora-Wyalong Railway.

I am directed to say that the sum named by the Commissioners in their original minute was only given as the approximate cost, and it is now noted that the result of the detailed survey gives the estimate more correctly as £92,000 in place of £85,000.

In regard to the annual interest, the difference between 4 per cent. on £85,000 and $3\frac{1}{2}$ per cent. on £92,000 would only come to £180, which is a small sum and so apparent that it does not require a formal report from the Commissioners, it having already been brought under the notice of the Committee.

I have, &c.,

H. McLACHLAN,
Secretary.

The Under Secretary, Department of Public Works.

Seen.—J.H.Y., 21/5/95. The Secretary to the Committee.—J.B., 22/5/95.

You

You will notice that I gave the revised statement myself. This is merely a confirmation of it by J. Barling, Esq. for the Railway Commissioners. You also asked me to refer again to the road authorities the estimate for the road. This I have done, and Mr. Scarr has just put a statement into my hands. You will remember that I gave Mr. Mullen's estimate of the total cost of a gravelled road at £24,010 10s. Mr. Scarr has now carefully gone through the matter. I explained when I was here last that Mr. Scarr thought that Mr. Mullen did not allow sufficient depth of gravel. Mr. Scarr has increased Mr. Mullen's $1\frac{1}{2}$ yard to 2 yards, and that brings the total amount to £32,409. He has also carefully revised the cost of a first-class metal road. I stated that cost when I was here last to be £69,100; in fact I was quoting from figures which were made up when the previous Committee sat on the question. Mr. Scarr has now revised the whole estimate, and has brought the cost for a first-class metal road down to £45,943.

17. The original Departmental estimate was £69,000. You say now it is £46,000. There must be some special reason for that? Yes; but Mr. Scarr will give you information on that point.

18. *Mr. Chanter.*] What is Mr. Scarr's estimate for a gravel road? £32,409; that is changing the $1\frac{1}{2}$ cubic yard per lineal yard of road to 2 yards.

19. *Mr. Hoskins.*] Is that the estimated cost of the road the whole distance from Temora to Wyalong? Yes; 39 miles.

20. But a portion of the road has been formed, drained, and metalled? Yes; repairs have been made between Temora and Barmedman, and the road has been formed, at any rate a small portion of the way between Barmedman and Wyalong.

21. Has the expense incurred in making that portion of the road to be added or deducted from the estimate? I have only had the estimate a few minutes. Mr. Scarr will give you all the necessary information.

22. *Chairman.*] Is there anything else you wish to state? Yes; there is one matter to which I wish to refer, and that is in regard to the value of the land resumptions. Mr. Thompson, our land valuer, has not yet returned. Therefore, I have had no opportunity of communicating with him. Furthermore, it is hardly of any use doing so, until all the deviations have been finally settled. These, of course, will be determined shortly, and then I will give the necessary instructions for the valuations to be made. I put in the following estimate for a gravelled road and a first-class metalled road:—

TEMORA TO WYALONG RAILWAY QUESTION—COST OF ROAD.

Gravelled road.

Length, Temora to Barmedman—22 miles.		£
Clearing (completed throughout).		
Formation, 1s. per lineal yard, £88 per mile		1,936
Draining, 8d. per lineal yard, £59 per mile		1,298
Gravelling, $1\frac{1}{2}$ cubic yard per lineal yard, road, 2,640 cubic yards per mile at 3s. (say), £396 per mile		8,712
Culverts or causeways, 5 per mile, at £12—£60 per mile		1,320
 Total for 22 miles at £603		 £13,266

<i>Add $\frac{1}{2}$ cubic yard gravel per lineal yard of road to be put on either during construction, making a total of 2 cubic yards per lineal yard, or as maintenance material almost immediately after completion—$\frac{1}{2}$ cubic yard at 3s.—£132 per mile</i>		£2,904
 Total at 2 cubic yards gravel per yard of road		 £16,170

Length, Barmedman to Wyalong—17 miles.		£
Clearing 17 miles, at £44 per mile		748
Formation, 1s. per lineal yard £88 per mile		1,496

		Henry

Henry Deane, Esq., Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and examined:—

- H. Deane,
Esq.
22 May, 1895.
23. *Chairman.*] Have you been over the route of the proposed line of railway? Yes.
 24. Do you know it fairly well in detail? Yes.
 25. Have you definitely decided on the position of the line? Yes; I made some deviations from the original line. In going over the line last March I decided that it would be necessary to make four deviations, all, except the last one, comparatively unimportant, and mere matters of detail. The first deviation is at 299 miles; it is on a railway reserve.
 26. How many miles is that from Temora? Eight miles. All I do there is just to curve the line a little way from the road. The object is to avoid cutting into the road, which, I think, might be dangerous to ordinary traffic. It is only a small detail. The next is also a detail for the purpose of getting a better station in Barmedman. I have deviated the line somewhat there, so as to have the station ground on the Temora side of Barmedman instead of down in the hollow beyond. I was not satisfied with the site formerly proposed for the station ground. It was too much in the hollow, and the approaches would have been costly. There would be some filling and metalling; and now by altering the line somewhat at the southern end the station will be on dry ground. At 309 miles the line deviates to the right, so as to get on to the hill—on to the high ground at Barmedman. Just before getting to the township it crosses the road, and passes through the allotments on the left-hand side of the town, which are Crown property. I thought the best site for a station was, naturally, up there on the high ground. Therefore, I have had the line deviated so as to provide a sufficient straight there, with small earth-works. The third deviation is at Kangaroo Hill.
 27. How far is that from Barmedman? It is only a short distance out of Barmedman.
 28. *Mr. Humphery.*] Is the first proposed station near an inn? The first proposed station was at Barmedman, but there has been a village formed at or near Reefton where, if the line is constructed, it will be necessary to have a stopping place.
 29. *Chairman.*] Where is Reefton? About 12 miles from Temora. The third deviation is one as to the desirability of which there may be some little doubt. It is a question whether we should cut into the hill, keeping on the road, or go on to private property, and get a surface line. I have made an estimate of the cost of going along the road and making a deepish cutting, and fencing the other portion of the road off, which, of course, would be necessary in order to make it safe; and I have compared it with the cost of going upon private property, and resuming the land, and doing the extra fencing there; or of making cattle-stops if we adopt them; and I find the cheapest way, and I think the best way, will be to make the detour there; but that is a matter which can be gone into later on.
 30. You will make a severance there of about how many acres? Under 15 acres, I think. I think the best plan would be to resume the land; it would be just as cheap.
 31. It is unimproved land? I think there is cultivation on some of it, and it is all suitable for cultivation.
 32. How wide is the road? Three chains.
 33. And otherwise the line is as it was previously submitted? So far, up to that point; but further on I propose a more important deviation.
 34. That is the fourth deviation, then? I am going to describe the fourth deviation now. It will be seen on the parish map that at about 318½ miles from Sydney the line diverges from the road, proceeds in a straight line to Temora, and turns to the left on the southern side of the Government township. I propose now—and I have had the line marked out, and I have not the slightest doubt but that it is the proper thing to do—to deviate the line so as to go along the road or close by it, and, instead of turning off to the left, and making the station ground on the southern side of Wyalong, to keep on the road and make a station at the police paddock. It is not shown on the parish map, but it is shown on the tracing which I will put in.
 35. Is that north-west or north-east of Wyalong? North-east. It will go on the eastern side of the township instead of turning to the southward. It will have this advantage—besides the advantage of being near the public road, that any extension of the line in the case of the alteration will not have to pass through a series of claims which are now being worked to the west of the Government town.
 36. *Mr. Humphery.*] You might distinguish between the two towns—one is called Wyalong and the other is called Wyalong West? Yes; I am speaking now about Wyalong, the Government township.
 37. It is about 1 mile nearer Barmedman? Yes.
 38. *Chairman.*] All your references so far have been to the Government township of Wyalong? Yes; but if the line marked in red were continued towards Lake Cargellico it would have to cross the line of reef. It would have to cross a lot of claims which would be difficult to deal with. By going the way the line is being marked out now on the eastern side of the Government township of Wyalong, we can keep to the road, and of course keep full possession of the ground, and from that point we can either rejoin the dotted line shown on the wall map, or else a line which has been suggested can be taken to Wollongough and Bygalorie on the way to Cargellico, so that by adopting the line I now mention we shall be in a better position to get away from Wyalong in either direction.
 39. *Mr. Humphery.*] Therefore you propose to follow the main road from Barmedman to Wyalong? Yes; I propose, along part of the way, just to keep outside the main road.
 40. Will the railway be absolutely on the road in any place? Yes, most of the way, and elsewhere I propose to go alongside of it.
 41. Is it all Crown lands? Yes.
 42. You follow the main road from Temora to Barmedman with the exception of the deviation at the crossing of the creek? Yes.
 43. With the exception of that deviation on the Temora side of Barmedman, it is on the main road? Yes.
 44. *Mr. Roberts.*] Has the survey you speak of been made since the question of the construction of the line was before the previous Committee? Yes; it has been made since I was over the line myself.
 45. You have been over it? Yes; it is in consequence of that I had the alterations made.
 46. What will be the total length of the line now, according to the re-survey? I am taking it as 40 miles.
 47. What is the estimated cost per mile? I reckon the cost per mile at £2,300. That is a reduction.
 48. Is that a reduction on the previous estimate when the question was before the last Committee? Yes; the previous estimate was £2,707 3s. 8d. per mile.

49. What has led you to make the reduced estimate;—in what way will the expenditure be kept down? The estimate is lowered, I may say, principally in three items. The earth-works are less by £43 a mile. You will remember that when the line was first submitted the survey was not complete, so that it really was desirable to be on the safe side; but now I consider the earth-works can be done, including the station earth-works, at £260 per mile. The permanent-way materials are reduced from £896 per mile to £645 per mile. The reduction there is due almost entirely to a reduction in the cost of the materials. In submitting the estimate last year I put a foot-note to this effect—that if the quotation for rails lately received can be made use of, the estimate can be reduced by £150 per mile. The estimate has been reduced by more than that—by about £250 per mile. I have assumed, in this new estimate, that the freight for railway materials will not cost more than 1d. per ton per mile, which is the usual rate we have arranged with the Railway Commissioners. I have no doubt that the Railway Commissioners would agree to carry the material at the same rate. Of course, if they showed that more ought to be paid, the estimate would have to be increased in proportion, but I do not think there need be any increase on that item. I know that the Railway Commissioners have approved—Mr. Eddy approved before he went away—of carrying railway materials generally at 1d. per ton per mile.

H. Deane,
Esq.
22 May, 1895.

50. The total amount for the construction of the line I understand, is, £92,000? Yes. The other item in which a saving can be effected is in the ballast. I have put in more sleepers and less ballast.

51. Will that account for the difference between the last estimate and the present? Yes; that will account for the difference fully.

52. So that since the question was before the last Committee we may say that there has been a clear saving of £400 per mile? Yes; I have a detailed estimate with me which I will hand in:—

REVISED ESTIMATE, TEMORA TO WYALONG.

Length, 40 miles. Exclusive of land compensation and survey expenses.

22 May, 1895.
£260

Earth-works					
Box drains and timber bridges					154
Crossings and cattle stops					26
Permanent-way—					
Materials—					
Rails, 60-lb.	tons.	£	s.	d.	
Rails, 60-lb.	94·3 at £4 10s.	424	7	0	
Fish-plates....	3·25 at £6 12s.	21	9	0

Water supply		3,000			75
Fencing		500			13
Engineering and supervision.....		5,160			129
Contingencies		5,160			120
Total..	£92,000	Average per mile.....			£2,300

H. DEANE,
Engineer-in-Chief.

53. Is there plenty of timber which would be suitable for sleepers on the line? Yes; there is a good deal of ironbark in the neighbourhood—the same as was used for the Temora extension, and the Commissioners have now contracts for the delivery of this same timber at Temora. I think at present there is plenty of it.

54. Are there any creeks of any size to be met with on the line? The most important creek is the Barnedman Creek.

55. Would an ordinary culvert do to get over that? Yes.

56. No expensive bridges would be required? No; only the cheaper waterways—timber openings.

57. I notice that the line from Cootamundra to Temora was a much more costly one than this would be;—is the character of the country different? Yes; it is not so even from Cootamundra to Temora.

58. In other words, that was not a pioneer line? No, it was not intended to be. It is a line of better construction, and is kept higher than this will be.

59. This will be on more level country? Yes; on the whole it is more level country.

60. What will be the grade of the line? One in 100.

61. Will it be necessary to use ballast on certain portions? I propose to use ballast. I have taken one quarter of the line as requiring ballast.

62. What description of rail do you propose to use? 60-lb. steel-rails.

63. That is the same as you propose to use on the line between Parkes and Condobolin? Yes; and it is the same as is used between Cootamundra and Temora.

64. Would the same engines be able to run from Temora to Wyalong as run from Cootamundra to Temora? Yes.

65. What speed do you expect will be run? I would limit it to 20 miles an hour. The trains frequently run faster on the Temora line, but I think the speed ought to be limited to 20 miles an hour on a line of this character.

66. Do you contemplate fencing the line? No; I have only allowed £500 for what fencing may be required.

67-8. Having been over the proposed line, you think it is one which can be easily constructed;—there are no difficulties in the way? No; I could construct it for £2,300 a mile.

H. Deane, Esq. 69. Can you tell the Committee why this line should cost £2,300 a mile, whilst the Parkes to Condobolin line is only to cost £2,100 a mile;—is it owing to the country being more elevated; again the Jerilderie to Berrigan line is only to cost £2,000 a mile? From Jerilderie to Berrigan it is quite an exceptional piece of country. That, I am afraid, will not serve as a guide to other lines.

22 May, 1895. 70. Perhaps we can compare the estimate for the Parkes to Condobolin line with this? I think one reason for the difference in cost is the difference in the length of the line. Some of the items of cost are for terminal expenses, which should be divided in the case of Parkes-Condobolin over 60 miles of line, and in this case over 40 miles of line. The bulk of the difference is in the stations, also in the supervision.

71. Do you see at present any way to reduce your estimate to £2,100 per mile? I do not think it would be desirable to reduce it. In this case I have made the earthworks lower than on the Parkes to Condobolin line, although I have put a little more down to box-drains and timber bridges. On the Parkes to Condobolin line the earthworks and culverts come to £420. In this case I have only reckoned £414. The fencing is also a little cheaper on this line, and so are the crossings and cattle stops, naturally, because we go along the road.

72. The permanent-way materials cost £15 per mile more? The reason of that is that they have to be brought a little longer distance. The ballasting and sleepers come to a little more on this line. I have taken the ballast at 3s. 6d., as against 3s. on the Condobolin line. It will be more costly. The sleepers on this line I have taken at 3s., as against 2s. 6d. on the Parkes to Condobolin line. My impression in connection with the Parkes to Condobolin line is that the trees in the neighbourhood are better and larger than they are here; therefore easier to get. With regard to the other items of expenditure, it means, in the case of the Condobolin line, dividing them over a long length of line, so that naturally they would, in the case of a line only two-thirds of the length, amount to 50 per cent. more—in the proportion of 3 to 2.

73. But still, do you not think £200 a mile extra seems rather an extravagant estimate? No; I do not think so.

74. How long would it take to construct the line? I think fifteen months would be sufficient.

75. *Mr. Gormly.*] Where do you propose to have your water supply from the line? I should have the end water supply at Wyalong, and there would be an intermediate supply either at the Barmedman creek—on this side of Barmedman—or at Reshton. There is a proposition to provide a Government tank there, I believe, and if one is made we should arrange to get water from there. That is a detail which, of course, must be settled later on.

76. Have you gone into the details of the water supply to enable you to estimate what is the cost? I have put down for water supply £3,000.

77. Does the survey show the number of moderately large-sized culverts which will be required on the line? Yes; they will be mostly very small.

78. There will be only one creek—Barmedman—to cross? That is really the only marked creek.

79. The others, I suppose, will be only little gullies? Scarcely that. Between Barmedman and Wyalong we pass a gilgai swamp. I have not the slightest doubt that we should require a good many timber openings there to get rid of the water. I believe a good deal of water passes the route of the line there in the wet season.

80. Does the survey show that there will be any considerable cuttings on the line? The worst cutting will be at Barmedman.

81. What depth will it be? Not more than 7 or 8 feet.

82. Then the line practically will be mostly surface line? Yes.

83. I suppose the ballast you require would be easy to obtain? I have put down more for ballast than on the Condobolin line, because there are ridges there from which we can get it. You do not see it going along this line at all. There are only indications of a sort of ironstone gravel and quartz gravel.

84. *Mr. Chanter.*] I understood you to say there would be no difficulty in getting iron-bark sleepers? I think not.

85. In close proximity to the line? Yes.

86. Does not that indicate the barren character of country which the line would pass through? No; it indicates the neighbourhood of ridges.

87. Is there any extent of this ironbark country? It is in narrow streaks.

88. You have travelled over the route from Temora to Wyalong? Yes.

89. You did not make any deviation? No.

90. Do you know what is the nature of the country within 20 miles of each side of the line? I know from the maps that there is a great deal of settlement beyond Wyalong.

91. North of Wyalong? Yes.

92. What is the nature of the settlement between Temora and Wyalong? The amount of land taken up is shown on the plan.

93. Does the portion tinted blue show conditionally purchased land? Yes.

94. What was your impression in passing through there—that the land is occupied by small settlers, or in large stations? I do not know that I could give you any trustworthy information on that point.

95. But you did not see much settlement yourself? No.

96. Then it is fair to presume it is not there? It might, of course, be back from the road.

97. I notice from the evidence given before the previous Committee that the railway authorities have no means of arriving at what revenue can be obtained from the line. It is perfectly clear from that that there can be no great settlement between Temora and Wyalong; otherwise they would have been able to form that as a base of revenue? Yes.

98. What class of sleepers do you propose to use on the line? Round-topped ones.

99. Will they be much cheaper than the rectangular sleepers? Yes, I think they would be cheaper. I think they ought to be from 9d. to 1s. cheaper.

100. That would be a consideration? Yes.

101. *Mr. Hoskins.*] Do you think they would last as long? They would last just as long. The timber is the same, only the sap-wood is not cleared off.

102. *Mr. Chanter.*] You only propose to ballast the line in places? That is all. I have allowed for one quarter. I should ballast it where it is soft, in passing over the black soil and gilgai country, and I should ballast it in the station-yards.

103. And where the land is not ballasted the sleepers will be increased in number per mile? Yes; I have allowed 2,500 sleepers per mile.

104. What is the character of the ballast you would obtain,—gravel or metal? There would probably be a variety. I have not myself hunted about to see, but I presume it would be somewhat similar to what we had on the Temora line. A good deal of it was a slatey-looking stone, intensely hard. It would show a black streak if you tried to scratch it with your knife, showing that it was silicious, and there was some quartz gravel which would be very good for the purpose. H. Deane Esq.
22 May, 1895.
105. You have said that this will be almost a surface line? Yes.
106. What is the greatest depth of cutting? About 7 or 8 feet in Barmedman.
107. Would there be any number of cuttings passing through ridges along the whole of the route? No; it would be very nearly a surface line. There was a cutting about 8 miles from Temora, which I mentioned, where I propose to make a deviation round, so as to avoid having the cutting on the road, and the same a Kangaroo Hill, 3 miles beyond Barmedman. I propose to deviate round that. However, if it turns out that it is better to stick to the road, we shall have a cutting there of 8 feet at least.
108. I suppose you do not deal with the policy of the continuation of the line to any other part? No.
109. Therefore, you are not in a position to give any answer to any question as to the policy of its continuation to Cargellico? No.
110. I notice you have put down the sum of £5,000 or £125 per mile for the cost of station buildings? Yes.
111. How many station buildings will there be between Temora and Wyalong? There would only be a station building at Barmedman, and a small waiting-shed at Reefton.
112. And a terminal station at Wyalong? Yes. At the terminal station of course there would be a number of requirements.
113. Do you not think that that amount could be considerably reduced? I could not say, because it depends entirely on what the Railway Commissioners may require. I base the estimate on the Railway Commissioners' information, and I should not like to say it could be done for less.
114. What class of buildings is it proposed to construct? They would only be wooden. In connection with the Parkes to Condobolin line, I gave the details of all the stations, I think.
115. But this estimate is in excess per mile? Yes; per mile, but not in the total cost. In the total cost it is a good deal less.
116. But there were more stations on the Condobolin line than are proposed in this? Yes; but it is the terminal station which makes all the difference.
117. You propose to utilise the existing station at Temora? Yes.
118. There would be no increase there? No.
119. Then, as a matter of fact, until you know absolutely the class of buildings which the Commissioners require, you are not in a position to say whether the amount can be reduced or not? It is a fair amount if the usual terminal arrangements are carried out. From the estimate I submitted last year, it will be seen that the sum of £4,440 was put down for the same item. I have simply made that sum up to £5,000.
120. That is an increase? Yes; in view of probable increases in sidings, stations, or platforms. The Railway Commissioners said then that they only required a station at Barmedman and at Wyalong. I was discussing the matter with Mr. Harper only a few days ago, when it was decided that in the event of the line being constructed it will be necessary to have a stopping-place at Reefton and possibly one other.
121. Would not ordinary platforms do at these intermediate stations? Yes; but still they would cost something. The difference between the previous estimate and the present one is £520; that does not allow for very much being done.
122. If no consideration is to be given to any future extension from Wyalong to Cargellico would not a much less costly style of building be suitable from Temora to Wyalong? You soon run into £5,000. If you remember, the Committee were rather surprised at the amount put down for accommodation at Bogan Gate on the Condobolin line. I think about £1,900 is to be spent there.
123. That was the most costly station building on the line? Yes; but it was not so much as was proposed to be spent at the terminus—about £5,000—so that you see this is very much less.
124. What will be the character of the earthworks on this line in comparison with the earthworks on the line from Jerilderie to Berrigan? The line is more undulating, and there will be more hollows to fill up and more little knobs to cut through.
125. That accounts for the increase in earthworks on this line? Yes; and there would be more earthworks at the Barmedman station. The first item of earthworks includes the station earthworks. There will be more at the Barmedman station than on either of the other lines that have been considered, because it is on the top of a hill, and we should undoubtedly have to run into cutting at one end.
126. You propose to lay sleepers similar to those which are to be laid on the line between Jerilderie and Berrigan? Yes.
127. The only difference being that in this case they are to be of ironbark as against red gum in the other case? Yes.
128. Your estimate, if I recollect aright, was 2s. 6d. for the sleepers on that line? No; I think not. It may have been originally, but I think I altered it to 3s. On the Parkes to Condobolin line, the estimate is 2s. 6d.
129. Why should the sleepers cost more on the line from Temora to Wyalong than on the line from Parkes to Condobolin, when they can be obtained locally? They will be obtained locally on the Parkes to Condobolin line. They are in the ridges there. I believe we can get them for 2s. 6d. on the Parkes to Condobolin line, although it may be rather a tight price, but on this line the trees seem to me to be smaller. They will be more difficult to get.
130. But would not a smaller tree be more suitable for this class of ground? They would require more splitting. The sleeper-cutter would have to go over more ground, and do more cutting.
131. At what distance could the sleepers be obtained from the line? The edge of the ironbark touches the line at one spot between Temora and Barmedman, and I came through some ironbark between Wollongough and Wyalong. They exist in many of the low ridges about there. I think they would all be obtained within 8 or 10 miles of the line.

THURSDAY, 23 MAY, 1895.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN.)

The Hon. FREDERICK THOMAS HUMPHERY.
 The Hon. WILLIAM JOSEPH TRICKETT.
 The Hon. JAMES HOSKINS.
 The Hon. JOHN DAVIES, C.M.G.
 The Hon. CHARLES JAMES ROBERTS, C.M.G.

JAMES HAYES, Esq.
 JOHN MOORE CHANTER, Esq.
 CHARLES ALFRED LEE, Esq.
 JAMES GOEMLY, Esq.
 EDMUND WILLIAM MOLESWORTH, Esq.

The Committee further considered the proposed Railway from Temora to Wyalong.

Henry Deane, Esq., Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

- H. Deane, Esq. 132. *Mr. Chanter.*] Do you wish to make any statement before I ask you any further questions? I want to point out to the Committee that on page 4 of the minutes of evidence on the Parkes to Condobolin line there is a list of distances which will be of use; but somehow or other two errors have crept in. The distance from Sydney to Cargellico via Wyalong is 400 miles instead of 330½ miles, and from Sydney to Euabalong it is 416 miles. Another matter which I wish to mention is, that the rails for the Wyalong line would have to be ordered. I mentioned, in connection with the inquiry as to the Parkes-Condobolin line, that we had rails for that line, but we have not enough rails for this. They will nearly all be absorbed by the Moree and Condobolin lines. There may be a few miles to spare, but not enough.
- 23 May, 1895.
133. *Mr. Davies.*] Would the 60 lb. steel rails proposed for this line be a portion of the rails purchased by the Government last year at a very low price—£3 or £4 a ton? Rails for 150 miles of road were ordered. Sixty-five miles would be required for the Moree line and over 60 miles for the Parkes-Condobolin line.
134. What price do you estimate you will have to pay for the steel rails you will require? I do not suppose we shall have to pay anything more than we pay now.
135. Was not the price to which I have referred a remarkably low one? It was very low, but I believe prices have not materially increased.
136. Was it not the lowest price at which you had ever purchased rails? Yes.
137. Have you any assurance that you will be able to get a supply necessary for the construction of the line at as low a price? You could never have any assurance of that kind. It depends on the market, which is always fluctuating.
138. I think it is an important matter, affecting your estimate. If you have not the rails in stock you do not know what they will cost? No.
139. *Mr. Chanter.*] What average depth of formation do you propose on the line? The average depth of formation, taking all hollows into consideration, will be about 9 inches or 1 foot.
140. Under the sleepers? Yes.
141. And what depth of ballast will be used where required? Where ballast is put in I shall put 5 inches under the sleepers.
142. For what distance would the line follow the road? Pretty well all the way.
143. Will not that necessitate fencing along the whole distance? Not more than it would on the Berrigan or any other line.
144. Do you think the character of the country, so far as traffic is concerned, is similar to that of the Berrigan country? There is very much more traffic on this road than on the Berrigan road.
145. I understand it is a 3-chain road? Yes. I do not consider 3 chains is enough for a road and a railway; but it was settled that 3 chains was enough.
146. In giving evidence on the line from Jerilderie to Berrigan, you gave it as your opinion that not less than 4 chains was sufficient? Yes.
147. You do not propose to resume any land in this case? No, except where we deviate from the road, which is only in a few places.
148. When the line is constructed what space of roadway will be left for the ordinary vehicular traffic? About 2 chains. A good deal of the road has been formed and metalled—some miles of it; I could not say how much—between Temora and Barmedman.
149. Is that formation in the centre of the road, or on one side? It is in the centre of the road.
150. Would not that bring the traffic dangerously close to the railway? Very close—a great deal too close in my opinion.
151. That being the case, do you not think that it would be almost absolutely necessary for the safety of the general public that the line should be fenced? I think it would be better to keep the traffic further away, even if it were fenced.
152. You could not do that without shifting the railway? No.
153. The macadamised portion of the road being in the centre would bring the road traffic almost alongside the railway? Yes, it would.
154. That would be dangerous, would it not? I think it would be very objectionable.
155. It would be far cheaper to run a line of fencing than for the Works Department to construct the road further away from the line? I do not know that it would quite meet the case, either, because the road would be very close up to the fence under any circumstances. The road might be dangerous on that account.
156. Your estimate for fencing is £500? Yes; that does not include fencing for the whole distance even on one side.
157. What proportion of the whole distance? Taking the fencing at £50 per mile, that would mean 10 miles on one side or the other.
158. How many miles will the train run along the road where there is no fencing? The estimate for fencing is put down at a lump sum, more than as a complete and accurate calculation of what will be required. It is impossible at this stage to deal with actual requirements. A great deal of the £500 would be required where we have stations, because station yards of any size would have to be fenced in.
159. That does not take into consideration any portion of this road, but it only applies to station-buildings or crossings? No, it does not; except in places where, perhaps, the road-fence might have to be renewed. I think there would probably be some places like that.
- 160.

160. By how much would the cost be increased, if the line, where it runs along the road, were wholly fenced? I should think about £1,700. H. Deane, Esq.
161. You estimate the rails at £4 10s. per ton, and the previous estimate, I think, was about £6 a ton? Yes, it was. 23 May, 1895
162. It is a considerable reduction? Yes.
163. Have you any reason to doubt that the rails can now be obtained at £4 10s. a ton? I think we can get them at that price; but it does not follow that we can get them in six months' time or a year, if there was a sudden spurt in the iron or steel rail trade. In times when prices are rising you can never tell from month to month what you will get them for.
164. But taking the chances of a rise into consideration, you base your estimate on the opinion that they can be obtained at that price? Yes, at the present moment.
165. That would mean a considerable reduction in the cost of the line compared with the last estimate of £6? Yes.
166. The sum of £3,000 is put down for water supply; on what part of the line is that supply to be made? There will be a terminal supply at Wyalong, and there will have to be an intermediate supply somewhere or other—by damming up the Barmedman Creek; or else it will be obtained at Reefton, where the Government propose to make a water supply, and will supply the Department.
167. What description of supply is proposed for Wyalong—a surface tank? There are Government tanks at Wyalong. There is a tank on the north-east side of the town called Carter's tank. That is an alienated block. Arrangements have been made to resume that. The Government have another tank alongside, of a capacity of 10,000 cubic yards. There is also a tank now in process of construction near the south-west corner. I have had it shown on the map.
168. *Chairman.*] How far to the west? It is close to the new settlement—on the south-west corner of West Wyalong.
169. *Mr. Chanter.*] What distance would that be from the station at Wyalong? It would be a couple of miles or more. The most suitable tank for water supply would be the new tank next to Carter's.
170. What is the total cubic capacity of the tanks? I think Carter's is about 3,000 cubic yards, but the new one is 10,000 cubic yards.
171. What about the one to the west? That is of nearly the same capacity, I believe.
172. The three would be what are termed surface tanks—not fed by any rivers or creeks, but by the ordinary catchments? Yes.
173. So that the supply would depend entirely on the local rainfall? Yes; in the first instance.
174. Is there any water there at present? I do not think so.
175. *Mr. Humphery.*] Not in Carter's tank? I think there is very little left there. There is none in the new tank.
176. *Mr. Chanter.*] Is there any in the tank to the west of the station? No; that is under construction. I might say that the information I am giving you now I obtained from Mr. McKinney, and the Committee will be able to obtain more details from him.
177. Then it is proposed to take over these tanks for railway purposes? No, not for railway purposes. The Government are making these tanks. They have these tanks.
178. And how do the Railway Department propose to pay the Government—would it be an annual charge; I notice that the water supply is put down at a lump sum? Yes; I put down a lump sum on the supposition that we should have to put a pump and a small tank at Wyalong, and a line of pipes along which to conduct the water. This tank or dam is not sufficiently high above the railway to get a gravitation scheme.
179. These tanks, I understand, are being, or have been, constructed by the Works Department? No.
180. By the Railway Department? No; by the Mines Department.
181. Would not they be required to be compensated for the tanks if they were taken wholly for railway purposes? I would not take them wholly. If we could get the water from them, and pay so much per 1,000 gallons, that would be the best arrangement.
182. So that there would be an annual charge? Yes; there would be an annual charge in any case. There would be the cost of pumping, and interest on money expended.
183. Are you in a position to give an approximate estimate of the annual cost? I do not think so; but I should think that the Railway Commissioners' estimate of expenditure would include it. They make an estimate, including locomotive charges, and under locomotive charges and expenses, the cost of water, no doubt, would be included.
184. I suppose the cost would be somewhat similar to that charged by municipalities when they supply the Railway Department with water? It might be made on a similar basis.
185. Taking everything into consideration, can you see your way clear, contingent with proper safety in working the line, to reduce the cost of construction below £2,300 per mile? No; I would not recommend any further reduction.
186. Could anything be saved anywhere to meet this extra charge of £1,700, which would be required to fence that portion of the road where the line would run in dangerous proximity to the traffic on the road? I do not think it could.
187. If that portion of the line were fenced the cost would be increased by £1,700? Yes. The only thing that I can see is that if we get the prices to hold, the amount put down for contingencies, £5,160, might cover it.
188. *Mr. Hayes.*] You estimate £3,000 as the cost of the water supply for the line? Yes.
189. That is for watering stations? Yes.
190. Is not that rather a large amount? No; it is a very small one.
191. You propose to take the water from tanks? Yes; but you would have to lay the pipes, and you would have to build an engine-tank at the stations.
192. You would not use the Government tanks? No; that is too far away.
193. Is there no site in the vicinity of the proposed terminus at Wyalong suitable for the erection of a tank? No; there is no site. I believe the Water Conservation Branch have thoroughly examined the country for the purpose.
194. The cost of excavating a 10,000-yard tank would not be more than £500? You mean, I suppose, that if we were to excavate a tank closer to the line, we could save money by it.

H. Deane, Esq. 195. Yes? That is, of course, providing you can get the ground and the catchment. There is no possibility of it.

23 May, 1895. 196. There would be at Barmedman? At Barmedman I should make it at the creek. I should simply dam up the creek. That could be done very well.

197. When you gave evidence here, a year ago, as to the cost of rails, you estimated them at £896 per mile;—that would be permanent-way and fastenings? Yes.

198. There is a foot-note to your evidence to the effect that if the quotation for rails lately received were made use of, the estimate could be reduced by £150 per mile? Yes.

199. You now estimate the cost to be £251 per mile less? Yes; the reason is this: the rails are cheaper and I have put down the freight lower than I did then. I have put down the freight at 1d. per ton per mile, for which the Railway Commissioners have invariably carried the material.

200. You formerly estimated the cost of carrying the rails at 2d. per ton per mile? Yes.

201. That makes a difference of £100 per mile? Yes, something over £100 per mile.

202. The reduced estimate which you have made on the item of sleepers and ballast is caused by using more sleepers and less ballast? Yes.

203. And you save £156 per mile by that? Yes.

204. The road upon which you propose to take the line is 3 chains wide? Yes.

205. You do not think that is sufficient for a road and a railway? Well, I do not like it.

206. Take the case of an ordinary road metalled by the Department;—I suppose you are aware that it is only 18 feet wide? If it is metalled it is right enough; but it is where it is not metalled that the difficulty comes in, and it also comes in when stock are travelling—they would have a tendency to run over the line and do damage.

207. But there would be no risk whatever in taking the railway along a road 3 chains wide, as far as interfering with ordinary traffic is concerned? Except with stock.

208. The ordinary traffic would not interfere with it at all? It would not be interfered with; but in the matter of the ordinary traffic the point is this: that where the road is not formed and metalled, and the ground is not very hard, the traffic goes all over the place. One portion gets cut, up and then they have to try another portion, and so on, so that where there is a large amount of traffic, and the ground is not hard or the road metalled, a wide strip is required.

209. But if the railway is constructed will it not practically take away the whole of the heavy traffic from the road? It would, I should think.

210. Then, practically, there would be only light traffic over it? Yes.

211. And as the road would then be 1½ chain wide—100 feet—would not that be ample? Yes; so it has been decided, I think.

212. *Mr. Lee.*] Can you give the Committee any idea of the area of freehold land, if any, which will have to be resumed on the route? There is no freehold land.

213. The amended survey passes entirely through Crown lands? With the exception of a little deviation at Kangaroo Hill, just beyond Barmedman.

214. Is that freehold land? It looks like a 40-acre selection on the map.

215. And a survey will pass through one corner? Yes.

216. Necessitating a resumption of about how much? Of a few acres.

217. With that exception, all the rest is Crown lands? Yes.

218. The Book of Reference prepared in 1894 would apply to that amended survey with that one exception? Yes.

219. But some of the town allotments of Barmedman and Wyalong, although Crown lands, might be in occupation? I do not think any town allotments are in occupation.

220. If they are, there will be very few of them? Yes.

221. Since you gave evidence before the Committee in 1894 you have had the opportunity of visiting the United States of America, and of seeing the cheap branch railways which have been constructed there? Yes.

222. Since your return to the Colony have you applied that principle as far as you could to the proposed line before us? Yes.

223. Have you gone into this particular matter with a view of cheapening the cost, knowing that it is, to a certain extent, a pioneer line? Yes.

224. And the estimate before us is as low, in your opinion, as is justifiable? Yes.

225. With reference to the position of things in 1894 and now;—in 1894, when you gave your evidence, there was no proposal before us for the extension of the line from Parkes to Condobolin? No.

226. Since then the Committee has dealt with that proposal, and has recommended the extension of the line from Parkes to Condobolin? Yes.

227. In view of the fact of that line having been approved of, and supposing that the extension from Temora to Wyalong were approved of, to what part of the western country would you expect to further extend the line? I do not know whether I ought to express any opinion on that point.

228. If the question touches on the policy which ought to be determined by the Railway Commissioners, I will not press it further, but I ask you in a broad sense, under the impression that you naturally are an important factor in the opening up of the country, and in pointing out in which direction railway extension would be possible? In view of the fact that the Committee have recommended the construction of a line from Parkes to Condobolin, thus tapping the Lachlan district, I should consider that if the line were extended from Temora to Wyalong it should stop there—that no attempt should be made to extend it further on.

229. Am I correct in inferring, from your answer, that if any further extension were made into the western country, it should be by the extension of the line beyond Condobolin? Yes.

230. And that in the case of an extension to Wyalong, that place should be the terminus? That is the general impression I formed. Of course, it is not part of my duty to report on matters of that kind.

231. One thing about which we shall want to know if an extension in the future is necessary, is as to the point to which it should be taken;—it is apparently impossible, in view of the character of the country, to make an extension from Condobolin, and also from Wyalong? It would be very unnecessary.

232. Then, in your opinion, the Committee, in dealing with the line, are dealing with it simply as an extension to Wyalong? That is what I think.

233. And not as a section of an intersecting or national line? No.
 234. Purely a local line? Yes.
 235. *Mr. Molesworth.*] Will you tell the Committee whether the features of the country along the proposed line are nearly similar to those on the Parkes to Condobolin line? It is a different looking country from that.
 236. I mean so far as the surface ground is concerned? I do not think you can compare the two very well. Here you are bound to a particular direction. You follow the road, and the line is really more undulating than the Parkes to Condobolin line. At the same time, the levels of the ground and the gradients of the road are such that we can get a surface-line nearly all the way without departing from the road.
 237. Is that the reason of it being more costly than the Parkes to Condobolin estimate? I do not think it is more costly.
 238. The Parkes to Condobolin estimate was only £2,100 per mile? Yes; but I have explained that that was not due to earthworks.
 239. What is it principally due to? The earthworks are £40 per mile less. The increase in cost is chiefly due to work connected with stations. In this case you have all these charges to divide by 40, whereas on the Condobolin line you have to divide them by 60. The shorter mileage gives a large average in the cost of station buildings. There are station buildings, sidings, metalling the station yards, turntable, weighbridges, and water supply.
 240. *Chairman.*] What do they amount to altogether? To £392 per mile, and on the Condobolin line they only amount to £228.
 241. How many creek crossings have you? The chief is the Barmedman Creek. There is a creek just outside Temora—the Trigalong Creek. Then there is a small creek, which I think is a branch of the Barmedman Creek—the Mandama Creek. I find that it will be necessary to provide a good deal of opening on the gulgai patch, before you get to Wyalong. I know that a good deal of water sometimes runs across the gulgai country although it may appear to be still. During the construction of the Narrabri line a washaway occurred where the road went over some gulgai country, showing that there was really a very large body of water crossing there; and I expect in this place water will have to be contended with. Therefore, I have put down a considerable length of openings as waterways.
 242. What will be the height of your bridge over the Barmedman Creek? I should think about 10 or 12 feet.
 243. Is it a running creek? It was not running when I was there.
 244. You have recently visited the locality? Yes.
 245. Can you give us any idea as to the extent of settlement along the proposed line? No; I do not think I could give you much information about that. I attended chiefly to the engineering question.
 246. *Mr. Lee.*] Between the points 309 miles and 313½ miles, there appears to be a great bow in the line—that is up to the boundary of the township of Barmedman? I think I explained that yesterday.
 247. The road then goes pretty well straight from the 309 miles point to Barmedman? If we followed the road we should have to go down, then up, and down again, and then up into Barmedman. By keeping to the right you get good ground and an even grade into Barmedman.
 248. *Mr. Davies.*] Is the country between Cootamundra and Temora similar to the country which lies beyond Temora and Wyalong? No; the country between Temora and Wyalong is, on the whole, flatter than the other.
 249. Much more level than between Temora and Cootamundra? A good deal more level I should think, because we have been obliged to go in for heavier earthworks on the Cootamundra to Temora line.
 250. What was your estimate for earthworks on the Cootamundra to Temora line, per mile? If I remember rightly, the earthworks were about £600 per mile.
 251. And your estimate for earthworks on this line is £260? Yes.
 252. And your previous estimate when before the Committee was £303? Yes; I have reduced it.
 253. What was your gross estimate for the construction of the line from Cootamundra to Temora? It was about £3,650 per mile.
 254. Did not the Committee fix the sum at £3,300? Yes.
 255. And the line cost £3,900 per mile? I know that it cost more than my estimate, because there was a good deal extra done in the shape of junction arrangements.
 256. But the Committee, in that instance, in recommending the line, fixed the cost of construction, after having taken your evidence and that of others, at £3,300 per mile? Yes.
 257. And we find the total cost was £3,900 per mile? Yes.
 258. A long way in excess of your own estimate? It is less than 10 per cent. in excess of my estimate, but it included a lot of extras which were found necessary afterwards, which the Railway Commissioners asked for, such as the junction arrangements, &c.
 259. If the Temora railway cost £3,900 per mile, are you still of opinion that you will be able to construct this line for £2,300 per mile? Yes.
 260. There is no possibility of going beyond that sum? I am sure it can be done for that. I did not cut my estimate down on that line. I did not submit anything less than £3,650. I never said I could do it for £3,300.
 261. But you do say you can construct this line for £2,300? Yes.
 262. But when this line was previously before the Committee for inquiry, you submitted an estimate very much larger than that which you submit now—£2,707 3s. 8d. per mile? Yes.
 263. Then you have reduced the cost of the proposed line to £2,300 per mile? Yes.
 264. What was the cost of your rails per mile in your original estimate? About £6 a ton, or a little over.
 265. Then you base your reduction in the estimate of the proposed line on a reduction in the price of rails to £4 10s. a ton, being a reduction of some 30s. a ton? Yes.
 266. Your calculation, I understand, is based upon the fact that rails were purchased at low rates some short time ago? Yes.
 267. But you are not certain you will be able to get 60-lb. steel rails at £4 10s. a ton? It is a proper price at the present moment. If prices were to go up, of course it would not be done.
 268. But is there any certainty that there will not be a rise in prices? There never can be any certainty about that.

H. Deane,
Esq.
23 May, 1895.

- H. Deane, Esq. 269. Have you ever known rails to be so cheap as those purchased by the Government a short time ago? I do not believe they have.
- 23 May, 1895. 270. That price covered the landing and all charges? Yes.
271. Then, to the £4 10s. per ton, you have to add the cost of carriage to the proposed line? Yes.
272. That is a matter of freight? Yes.
273. You make it £132 a mile? Yes; £132 18s. 6d.
274. Is that a less sum than that which you calculated on a previous occasion would be the cost of carriage? I have generally taken the freight at 1d. per ton per mile. In the case of the Berrigan line it was a little under that. There was a special arrangement with the Railway Commissioners.
275. It is only within the last year or eighteen months that you have taken it at 1d. a ton? We have had a good deal of permanent-way materials carried at that charge.
276. Was not the uniform charge of the Commissioners 2d. a ton? Yes, it was the rate in the rate-book; but still we have had it carried for 1d.
277. But that was the charge that was always made against the Construction Department? Not always, because the Railway Commissioners have not always charged 2d.
278. Did I understand you to state that your former estimate was based on the cost of carriage at 2d. a ton? Without looking up the details I think it was.
279. You also calculated that you would get the rails and all the necessary fish-plates, bolts, spikes, and so on, carried at the rate of 1d. per ton? Yes.
280. Then the calculation for your earth-works being £260 per mile, will that, in your judgment, be sufficient to cover all possible charges on the whole length of the line? Yes.
281. Can you say whether the country is a wet or a dry country? Generally speaking it is rather dry; but there are some wet places in it.
282. But you have made a provision of £154 per mile for box drains and timber bridges? Yes.
283. What number of box-drains have you provided for? I think it would be necessary to put in about four to each mile.
284. They are a very inexpensive kind of provision for drainage? Yes; they cost about £20 each.
285. What opening will there be in them? Three feet. Of course, there will be the bridge over the larger creeks, and there will be the openings in the gulgai country which I mentioned a little time ago.
286. You provide then for rails, fish-plates, bolts, spikes, and freight, making a total of £644 7s. 6d. per mile? Yes; I have taken that at £645.
287. I see you put down an estimate of 3s. per sleeper? Yes.
288. How does that price compare with your former price? The same.
289. So that there will be no reduction under the heading of labour? Oh, yes; there is less ballast.
290. What difference is there between the present estimate and the original estimate for ballast? I have taken one quarter of the distance for the ballast, and cut out the rest.
291. You only intend, then, to use ballast on certain portions of the line? Yes.
292. What saving will that effect as compared with your former estimate? That makes a saving of £156 per mile.
293. Does that include the metalling of station yards? No, that is extra.
294. The metalling of station-yards will be an additional sum of £125 a mile? No; I put down metalling and various expenses of station-yards at £1,750, and station-buildings, &c., £5,000, making £125 a mile.
295. What will be the character of the ballast you propose to use in the station-yards and along the line at different parts? I should get whatever I could. I might get ironstone-gravel or quartz-gravel. It would probably be one or other of those.
296. During your visit to the country, did you see any suitable ballast? No, not immediately on the line; it is only from a knowledge of the character of the country, and the ridges we go through.
297. What was the general character of the ballast you saw;—was it ironstone you saw? There was ironstone-gravel and quartz-gravel. On the Temora line we used a jointy kind of stone which looked rather like a hard shale, but which was really flinty in character.
298. Would that make good ballast? Very good.
299. What number of station-buildings would you have on the proposed line? The principal station-buildings, of course, would be at the terminus. Then there would be Barmedman to provide for, and Reefton, or the village of Trungley. There would be a waiting-shed there.
300. Would the buildings be of brick or wood? Wood.
301. You estimate that the putting up of those buildings will cost £5,000;—would there be any occasion for so a large a sum as that to be spent? I put it down under the heading of buildings, &c.; but there would be goods-sheds, platforms, cattle and sheep yards, coal-stages, wool-banks, and a number of things which are included in that item. They really are not all buildings. I have added “&c.” in order to include the whole group of station construction charges.
302. You have put down £3,000 for water supply, or at the rate of £75 per mile? Yes.
303. You have already answered some questions put to you by Mr. Chanter with reference to providing the water supply? Yes.
304. Did I understand you to say that the Water Conservation Department would provide the necessary water supply for the railway line? No, that would have to be decided; but it is possible we might get the water and pay for it at so much per 1,000 gallons, or we might have to put down pumps and pipes and erect a station tank.
305. Would the £3,000 which you have put down for water supply be sufficient for that purpose? It is not too much. I think it will do.
306. Would it not be necessary to have an engine and a man constantly pumping to keep the tank supplied with water for the supply of the locomotives? The man pumping, of course, would be a traffic charge.
307. It would not be in your Department? No; but I should have to provide the pump and the pipes and the overhead tank.
308. Would that be included in the £3,000? Yes; the probability is that we should want nearly £2,000 at Wyalong, and the balance somewhere else.
309. When visiting the district, did you not see that it was a very dry country, and that there was a great absence of water and no wells? It is not a bad country for tanks. There are some very good tanks.

310. The people have absolutely to depend on catching the rainfall for their supply? Yes.
 311. There is no other provision? No
 312. Is there a good supply of water at Temora? A very bad supply there at present.
 313. It is a very important matter, so far as the traffic is concerned, for the locomotives to get a supply of water? When the rain does come there will be a good supply after that. New tanks are being made.
 314. You mean that it is a good country for holding water if you can catch it? Yes.
 315. There is an item of £5,160, or £129 a mile, for engineering supervision;—is that the usual provision made by your Department? I have been looking that matter up, and I find that engineering supervision and office charges, taking the average of lines, have amounted to about 6 per cent. on the cost of the lines.
 316. The gross total you have estimated for the construction of this line—£2,300 a mile—would be absolutely within that sum? It would not be outside the cost of construction.
 317. There is no margin of 10 per cent.? I do not anticipate it will be at all necessary to go outside that sum.
 318. You believe that the whole of the line could be constructed well within that sum? Yes.
 319. That is, the water supply, permanent way, and everything necessary for a fairly good road? Yes; if I had instructions to prepare for the construction of this line, I should, if I had my own way, have everything ready, and the stations all fixed before calling for tenders.
 320. Have you determined on the site of the stations? Roughly.
 321. Do you know anything about the reservation of the land by the Lands Department along the line of railway;—there is a reservation of a mile on each side? It has been done. It was done in the case of the old line which went from Temora through Barmedman to Hillston direct. I am not aware of anything more being done than that, and I do not think it is necessary.
 322. When the first returns were made with regard to the extension of the line from Temora to Wyalong, was not some action taken by the Department of Lands to reserve a mile on the then surveyed line? That I do not remember.
 323. How far is Wyalong from Condobolin? Fifty-one miles—that is, straight across.
 324. How far is Cargellico from Condobolin? Condobolin to Euabalong is 35½ miles, and Euabalong to Cargellico is 15 miles; so that that would make 50½ miles.
 325. How far is Wyalong from Cargellico? About 69 miles—that is, by the surveyed route. It is more than that by the road.
 326. What is the distance from Wyalong to Forbes? Sixty miles; that is evidently on an absolutely straight line, because it is more than that distance from Wyalong via Condobolin.
 327. What is the distance from Cargellico to Hillston? Fifty-one miles.
 328. That is the surveyed line, is it not? Yes.
 329. How far is it from Hillston to Condobolin, on the north side of the river? About 100 miles.
 330. [Chairman.] How far is it from Hillston, going due north, to where you would intercept the dotted line, on the Parkes to Condobolin wall map, which would appear to be an extension of the Parkes-Condobolin line going west, up to the Willandra Billabong? About 30 miles.
 331. Therefore, the Parkes-Condobolin line, being projected westward, would pass within 30 miles of the line from Wyalong to Hillston, if one were constructed? Yes.
 332. [Mr. Hoskins.] Which will be the nearest to Hillston—the Condobolin or the Wyalong line? From Condobolin to Hillston it is about 100 miles; and from Wyalong to Hillston, via Cargellico, it is about 120 miles.
 333. But if you turn off at Barmedman you would get there in 100 miles? You would save about 10 miles.
 334. There is a difference, then, in the two roads of about 20 miles? I know the difference between the Cargellico Road and the Barmedman Road is only 10 miles. It is in consequence of the winding about that you have to adopt.
 335. You say that to extend the line from Hillston to Condobolin you would require 20 miles less railway than to go to Hillston via Lake Cargellico? Yes.
 336. What do you regard as the best route from Wyalong to Hillston;—is the Cargellico route the best? Yes.
 337. Do you prefer it to the Barmedman route? Yes.

TUESDAY, 28 MAY, 1895.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHREY.	JAMES HAYES, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	ROBERT HENRY LEVIEN, Esq.
The Hon. JAMES HOSKINS.	JOHN MOORE CHANTER, Esq.
The Hon. JOHN DAVIES, C.M.G.	CHARLES ALFRED LEE, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	JAMES GORMLY, Esq.
EDMUND WILLIAM MOLESWORTH, Esq.	

The Committee further considered the proposed Railway from Temora to Wyalong.

Hugh McLachlan, Esq., Secretary to the Railway Commissioners, sworn, and examined:—

338. [Mr. Hoskins.] You remember the Committee having had before it some months ago a proposal for the construction of a railway from Temora to Wyalong? Yes.
 339. The Committee recommended that no further steps towards the construction of the line should be taken, at all events for six months, until the Commissioners had ascertained whether the traffic on the existing line to Temora had increased, and whether there was a probability of the Wyalong gold-field being a permanent one? Yes.
 340. Has the traffic on the Cootamundra to Temora railway largely increased during the last six months? No.
 341. How many trains a week did the Department run on that line prior to the last six months? At first we ran on every alternate day; now we run a daily train.

H.
McLachlan,
Esq.
28 May, 1895.

H.
McLachlan,
Esq.
28 May, 1895.

342. Why did you alter it from a tri-weekly train to a daily one? The traffic was almost sufficient to warrant it. It was a great public convenience, and we could do it without a great additional cost.

343. Have the increased receipts on that line justified your increasing the accommodation for the public?

There has been no increase in the traffic; but the traffic in itself almost warrants the convenience being given. Again, there has been no great additional expense. The only additional expense has been in the locomotive branch.

344. Practically, you state that no appreciable additional profit has accrued to the Department in consequence of the running of the daily train? No appreciable profit. Of course, we may earn a little more, but contrasted with a year ago there has been no increase in the traffic. If we did not run a daily train we might not earn so much.

345. Has the traffic in agricultural produce from the district increased? Not to any great extent. I may state that I made an informal inquiry at the Agricultural Department as to whether there had been any increase in the grain production of the district for the year, and I understand from them there has been no increase.

346. Has the traffic in wool increased on that line for the year? No; I think not. I will give you an instance of the traffic. In April, 1894, the sectional earnings of the Cootamundra to Temora line came to £803; for the last month they came to £764. In the month of March—of course that month was slightly exceptional, being shortly after the gold-field opened, when, perhaps, there was extra material going up—we earned on that line £1,039. In March of this year we earned £848, showing that there has been no increase on the branch. That would indicate to a large extent that there has been no increased production or population at Wyalong.

347. Then what you have stated shows that the actual traffic on the line has decreased? It is very much the same. There has been no increase, but a decrease.

348. From £1,049 to £838? Yes; that is the comparison between March, 1894, and March, 1895.

349. That is rather a serious decrease? Yes, the month of March, 1894, might have been an exceptional month, owing to the opening of the gold-field.

350. Has the passenger traffic increased? No; not for those months. In March, 1894, we earned £616 for coaching, as against £523 for last March.

351. I suppose the Commissioners for Railways have made inquiries as to whether the permanent settlement of the district, exclusive of the gold-field district, is increasing;—can you say whether such inquiry has been made, and whether the population of the settlement has increased? Mr. Harper went to the district in March last, and I gather from him there has been no increase in the settled population.

352. I gather that the Railway Commissioners do not view with any favour, at present, the proposal to construct a railway from Temora to Wyalong? No; that is their report, which I daresay has been placed before the Committee.

353. And that report is based on their experience of working the existing line from Cootamundra to Temora? Quite; and the information gathered from the field outside it.

354. I gather that the Railway Commissioners do not consider that, prospectively, there is any probability of a large increase in the traffic between Cootamundra and Temora? No.

355. Mr. Humphrey.] Have you the returns of the Cootamundra to Temora railway for last year? I could give them to you. I may state that, taking the earnings for the nineteen months during which the Cootamundra to Temora line has been opened, the total earnings have been £16,323, and the working expenses £6,976. The interest on the cost of construction, at 4 per cent., would come to £12,381; total, £19,857, as against £16,323, leaving a loss of £3,034. That will work out 3 per cent.

356. How long before the discovery of the Wyalong gold-field was the Cootamundra to Temora line opened? The line was opened in September, 1893. The Wyalong gold-field was opened about February; but, as evidence to show that the gold-field has not had such a wonderful effect on the line, I may state that in October or November, 1893, before the gold-fields were thought of, the sectional earnings on the Temora line were £1,132 and £1,161. For October and November, 1894, the earnings were £1,088 and £1,212; so that it shows that Wyalong is not having such a wonderful effect on the traffic. Of course, October and November, 1893, were exceptional months, because we understand a considerable quantity of grain had been held back for the opening of the line.

357. Mr. Trickett.] Have the Commissioners taken into consideration the question of the further extension of the line beyond Wyalong? Yes; it is referred to in their report as follows:—

The question of the extension, moreover, would appear to a very large extent to affect local interests only, as the course of traffic from the outlying districts would, it is thought, be better served by the extension of the line in another direction than via Wyalong.

358. You refer there to the Parkes-Condobolin line? Yes.

359. Then it would be merely a local line, as far as you can see at present? Yes; because the Commissioners have already recommended an extension in another direction, to tap the back country.

360. When the line was before the Committee on the previous occasion it was estimated, in round numbers, to cost £110,000? Yes.

361. Now it is estimated to cost £92,000? Yes.

362. Do you think that is a sufficient reduction to induce the construction of the line? No; because the Commissioners had even a lower figure than that in their minds.

363. You thought it could be constructed for about £85,000? Yes.

364. Is there any reason at all which you can advance which would in any way justify the construction of the line at present? No; The Commissioners' reasons are the other way. They think it ought to stand over.

365. When the proposal was before us on a previous occasion you then stated that it could stand over; and seeing that the traffic has not developed, you think it is judicious that it should still stand over? Yes; the Commissioners do not recommend it.

366. Mr. Davies.] You have stated that one of the reasons why the Commissioners do not recommend the construction of the line is the fact that another line has been recommended to tap the country towards Hillston by way of Condobolin? That is a reason to show that there would be nothing more than local traffic, and the local traffic would not be sufficient to warrant the line being undertaken.

367. I think, on the previous occasion, the Railway Commissioners, through you, based the calculation of the revenue to be derived from the railway, if constructed, upon a population of some 1,500 people? A fixed population.

368. Similar to that at Temora? Yes.

369.

H.
McLachlan,
Esq.

28 May, 1895.

369. Have you seen any reason to alter your opinion and your calculations by reason of the fact that here are 5,000 permanent residents on the gold-field, and in the district of Wyalong? The Commissioners do not think it will carry that number. I believe the population of the district at the present time is not above 2,500.

370. But if we have evidence from the Mines Department that the population is 5,000, what then;—would that Department be better informed than the Railway Commissioners? Our officer, Mr. Harper, was on the spot and obtained information there. Of course our estimate of traffic is based to a large extent on what is actually going forward at the present time for the population.

371. Mr. Harper made a recent visit to the field? Yes; he was there in March.

372. Has he not seen fit to alter his calculations as to the possible revenue to be derived from traffic and freight? No; he went into the figures he submitted twelve months ago, and if anything he found that those figures were above rather than under the mark.

373. When you were before the Committee previously you showed that the railway between Cootamundra and Temora had paid working expenses and about $3\frac{1}{2}$ per cent. on the capital cost? Yes.

374. If the statement you have made to-day is borne out by facts which have come under your observation during the last six months the earnings on that line are somewhat less than what they have been previously? The average earnings for the year would not exceed about 3 per cent. I think I mentioned when I was here before that the line was opened at a time when all the fat months of the year came in—September to March. Our light months are from March to September.

375. You regard, then, the additional earnings at that time as being caused by the rush to the goldfield as well as to the keeping back of the large quantity of produce? Yes; to a large extent. Of course it was a local traffic on the line.

376. From the goldfield, then, there has not been any large accession of passenger traffic? No.

377. And there has been a falling-off in the freight? There has been a falling-off.

378. In view of those facts, do I understand you to say the Commissioners do not recommend the line? Yes.

379. Those are the facts which have come under the observation of the Commissioners during the last few months? Yes.

380. Then the Commissioners practically have not altered their opinion as to the evidence you gave when before us on a previous occasion? No.

381. Has Mr. Harper furnished the Commissioners with a Report? The Commissioners had him before them before they made their report. They practically had all his information.

382. One of the strong reasons why the Commissioners do not recommend the line is that a line which will serve the country and tap most of the trade, which now finds its way to Victoria, can be constructed by way of Condobolin? Yes; and the line in itself otherwise would not pay.

383. *Mr. Lee.]* Were the trains running tri-weekly or daily in March, 1894? They were then run three times a week.

384. In March, 1895, were they running daily? Yes.

385. You say that, notwithstanding that they had a daily service in 1895, the earnings were less than in March, 1894, when there was a tri-weekly service? Yes.

386. You have given the loss on the Temora line for the first nineteen months at £3,034? Yes; it comes to about £1,920 a year.

387. I notice by the Report of the Commissioners that the estimated loss upon the contemplated extension to Wyalong would be £3,970 per annum? I do not recollect the exact figure; it was under £4,000.

388. Adding that to the annual loss on the Temora line, it would bring the total loss to about £5,980 a year? Yes.

389. Do you see any prospect of this traffic overhauling the annual loss on the existing line, or the extension of that line? I do not see any prospective traffic for the Temora to Wyalong line by the extension.

390. Is there any particular interest other than that of mining likely to be developed, which would bring an increase? Not that I could learn. I have not been in the district myself, and would not venture an opinion.

391. You know that the Commissioners have recently recommended the construction of the line from Parkes to Condobolin? Yes.

392. And it has been dealt with by the Committee? Yes.

393. If the line were constructed to Wyalong, and any further extension were made, would it not be as a competitor of the Condobolin extension? Yes; they would both drain the same country.

394. So that one extension into that country will be ample for all requirements, and that one is the one which has been recommended by the Commissioners to Condobolin? Yes.

395. The extension to Wyalong they do not recommend? No.

396. *Mr. Molesworth.]* Do I understand that the Commissioners are unfavourable to the construction of what you might call spurs or short branches? When there is no prospect of them paying or adding some benefit to the railways.

397. Unless they can see a prospect of their almost immediately paying expenses? Yes; and helping the main line. They laid down certain lines in this report. If lines will pay working expenses and assist the main lines they will be prepared to recommend them, but every circumstance is taken and considered on its merits.

398. Their calculations with regard to the earnings and expenses of the line are purely with regard to the branch itself? They are with regard to the Cootamundra to Temora branch.

399. There is no allowance made for a traffic brought to the main line? No.

400. But as a matter of fact there is some additional traffic brought to the main line? Yes.

401. Can you give any idea of the extent of it? No; it has never been separated.

402. You do not anticipate that the traffic to the main line would compensate for the loss on the branch line? Not on the Wyalong line.

403. *Mr. Chanter.]* The answers you have given to the questions put to you show that in nearly all the Departments of the Cootamundra to Temora line the earnings this year have decreased compared with last year? Yes; in coaching and goods.

H.
McLachlan,
Esq.
28 May, 1895.

404. Can you inform us how the revenue derived from the line compares with the estimated revenue of the Railway Commissioners when the construction was originally proposed? So far as I can recollect, they did not give an estimate of the revenue on the Cootamundra to Temora branch. They said that the line was a unique one and that they would prefer not to give a direct estimate as to the traffic.

405. Are you in a position to say whether the revenue derived from the line is satisfactory to the Commissioners? Yes; they are very pleased with the earnings on the Cootamundra to Temora section.

406. Is there any prospect of those earnings being increased? They are paying 3 per cent. now, which is a very fair return, in addition to helping the main line with new traffic.

407. They anticipate a yearly loss on the extension to Wyalong of £3,970? Yes, about £4,000.

408. *Mr. Davies.*] That is based on a 4 per cent. interest on the capital cost? Yes. The Commissioners' estimate was based on a sum which is a little lower than the construction estimate. If you take the construction estimate at 3½ per cent., it nearly equalises the Commissioners' estimate of 4 per cent.

409. *Mr. Chanter.*] But the Commissioners' present estimate for the line is £92,000? That is the construction estimate.

410. Against the original estimate of £110,000? Yes.

411. The reduction of ½ per cent. would not mean a serious reduction? No; one would equalise the other.

412. You are quite satisfied that the Commissioners, in dealing with the proposed extension from Temora to Wyalong, do not intend to take into consideration any further extension from Wyalong to Carragellico? No.

413. They propose to tap that country by an extension from Condobolin? Yes.

414. *Mr. Hayes.*] Does the whole of the district traffic to Wyalong at present travel on the Temora line? Yes; practically the whole.

415. All traffic going out in that direction goes via Temora? I think it does at present.

416. And you do not anticipate any increase of traffic on the Temora line, if the Wyalong extension is carried out? I do not think there would be any increase in traffic—that is, from the information I can gather.

417. You have no idea what proportion of goods and passenger traffic belonging to Wyalong proper goes over that line? I would prefer that Mr. Harper gave that evidence.

418. *Mr. Roberts.*] Have the Commissioners considered the desirableness of extending the line from Temora to Barmedman? No.

419. Could you give any opinion as to whether the extension from Temora to Barmedman, without going on to Wyalong, would be likely to pay? No, it has not been looked at. They only considered it as submitted to them—Temora to Wyalong.

420. Have they not considered the question of constructing the line from Barmedman to Hillaton? No.

421. *Mr. Gormly.*] I suppose two sets of trains are required to run between Cootamundra and Temora? One set does.

422. Does a train go from Cootamundra to Temora and back again the same day? Yes.

423. Then the present sets of trains between Cootamundra and Temora could not go on to Wyalong and back? No. Of course, we have not considered. The working has not been considered, but I think you would want an independent set of men working.

424. And probably the present rolling-stock would not do? Yes; the rolling-stock would do. The same trucks would be taken on at once.

425. What is the reason the Commissioners estimate 4 per cent. on the capital invested? That was estimated twelve months ago or more. Our securities were not bringing such a high figure, and that was considered a fair price to pay, especially as the money with which the Temora line was constructed was raised at a somewhat higher rate than probably could be got now if money were borrowed.

426. Can you explain the reason why the population at Temora, and the traffic of the district, were considered sufficient to justify the extension of the line from Cootamundra and Temora, especially in view of the fact that the Wyalong gold-fields had not then been opened? The circumstances were favourable when the line was opened. It was opened in the best portion of the year.

427. You have no reason to think the population about Temora and district has increased since that time? No.

428. Therefore, there must be an additional population to be served now by the line from Temora to Cootamundra? I do not think there has been any great growth.

429. I am including the population of Wyalong? Of course Wyalong must help the line to some extent.

430. *Mr. Levien.*] Have you read the Rev. J. M. Curran's opinion about the Wyalong district? No.

431. Do you know he has a very strong opinion that the field is a permanent one? Yes; but still it is not likely to employ sufficient population or to give sufficient traffic to warrant a railway being specially constructed to it.

432. But supposing it is a permanent field, of which there are very few in this Colony, would it not support a bigger population than it does to-day? There has not been a growth for twelve months, and it is not likely there is going to be a rush there, which will warrant the continuance for many years of any increased population. The opinion seems to be that it will support its present population, but that it is not likely to have an increased population; and the present population locally would not justify a railway being constructed to the place.

433. But if it is a large permanent field, it is more likely to give employment to an increased population? They have had sufficient knowledge, I think, of the working, to show what it is likely to be. It will support a certain population, but not one big enough to justify a railway being made to the place.

434. The estimated annual cost of the line from Cootamundra to Temora was £14,497? Yes.

435. What do you propose this line should cost? I have not the figures by me, but it is based on a low figure, and upon the experience of the working of the Temora and other lines.

436. But labour is cheaper now? As a matter of fact, the Commissioners' estimate of the construction was somewhat lower than the engineer's estimate.

437. The cost of the construction of the Cootamundra to Temora line at 3½ per cent. is £7,000? Yes.

438. How long has the line been opened? Nineteen months.

439. You have just stated that the interest on that line amounts to £12,000 odd? That is for nineteen months.

440. How do you account for the discrepancy;—the interest on the cost of construction at $3\frac{1}{2}$ per cent. is £7,000; yet it only has been opened for nineteen months, and it is £12,000? The discrepancy is very slight. One set of figures is for twelve months, and the other for nineteen months. At £7,000 a year it would come to £11,100, instead of £12,000. But, as a matter of fact, the one is calculated at 4 per cent. and the other at $3\frac{1}{2}$ per cent., so that there is really no discrepancy. H.
McLachlan,
Esq.

28 May, 1895.

441. But you will admit, I suppose, that if the population has increased at Wyalong, and the field is a permanent one, as the Rev. J. M. Curran says it is, there will be more probability of the line paying if constructed? I do not think it would be wise to make the railway upon the opinion of an expert. I think it would be better to have actual facts before us before making it. Of course, it is admitted that it is a permanent field to some extent, but not sufficient to make a railway pay if constructed.

Percy Scarr, Esq., M.I.C.E., Principal Assistant Engineer, Roads and Bridges Branch, Department of Public Works, sworn, and examined:—

442. *Mr. Trickett.*] You know the road from Temora to Wyalong? Only as far as Barmedman.

P. Scarr, Esq.,
M.I.C.E.

443. For what distance? Twenty-two miles.

444. When did you visit that road? Two and a half years ago, before the Wyalong diggings broke out.

28 May, 1895.

445. But you are thoroughly acquainted with the character of the road? I cannot say that I am. I was only over it once. My purpose in travelling over it was to see the road works, and what had been done, and what was required on the road at that time.

446. Was it a flat or a hilly country? It was a flat and undulating country. There were low undulating hills and flats in other places.

447. I suppose they would not exceed 50 and 100 feet in height? I think not.

448. And all easy rises to the hills? Yes.

449. I suppose it is what you would characterise as a pretty level road? Yes.

450. There would be no difficulty in road-making there;—no cuttings required? No.

451. What kind of soil was it? My recollection of it is that the hills were of the usual red soil, which we find in that country, and the flats were of black soil, swampy in places.

452. Mr. Barling, in giving evidence the other day, stated that he had had a conversation with you on the subject of the traffic on the road, and as to the great discrepancy of the former estimate of constructing a new road with the present one—the former estimate was put down at £69,100 and the present estimate is put down at £24,010;—will you inform the Committee what was the reason of this great discrepancy? In the first place we did not know the exact mileage at the time the first estimate was given, and we set it down at 45 miles. Since then we have found that it is only 39 miles. Again, at that time we did not know what materials were to be had for road-making. We assumed that we would have to get metal which was estimated to cost at first 8s. to 12s. a cubic yard. Since then we have found that metal between Barmedman and Wyalong can be got for 5s. a cubic yard.

453. That is gravel? No, not gravel. The estimate you have of £24,000 is for a light gravel road, with gravel at 8s. a cubic yard.

454. Was the original estimate for a metal road right through? Yes; the estimate of £24,000 was a rough estimate, made in a hurry on the day Mr. Barling gave his evidence, for a light gravel road.

455. Have you had any reason to alter that? Yes. I understand Mr. Barling has handed in a more complete estimate, which I gave him, fixing the cost of the gravel road at £30,909 exclusive of any supervision.

456. I understand you to say that the calculation that the road could be made for £24,010 was only a rough one? A rough calculation for a light gravel road at $1\frac{1}{2}$ cubic yard to the lineal yard of road.

457. Would that be a sufficient road? No, not for any heavy traffic.

458. What was the object of making a computation for a road which apparently was quite valueless? That was made, I think, whilst we had Mr. Mullens' report in hand, and he had made his calculation at $1\frac{1}{2}$ cubic yard to the running yard.

459. It was very misleading to the Committee, because it has fixed the amount of £24,010 in their mind, which appears to be entirely valueless? If you will refer to Mr. Barling's evidence, on page 5, you can arrive very quickly at the cost of the road at $1\frac{1}{2}$ cubic yard to the running yard, by adding together the items £13,266 and £12,121. That will give you the amended estimate for the $1\frac{1}{2}$ cubic yard to the running yard of gravel.

460. But you are of opinion that that would be only waste of money? For any traffic such as has been stated to be going to Wyalong lately. I might go further than that and express the opinion that you could not construct any gravel road to carry the traffic which was going to Wyalong at the time the diggings were in full swing.

461. *Mr. Hoskins.*] Is not a gravel road a weak road for any traffic? Yes; I say no gravel road would stand the traffic.

462. *Mr. Trickett.*] Then we may consider that estimate is entirely put aside by the figures you have supplied, and which are shown on page 5 of the evidence? Yes.

463. What does your estimate for a good gravel road from Temora to Wyalong amount to? Including supervision, £32,409—that is estimating £1,500 as the cost of supervision.

464. And what is the estimate for a first-class metal road? £45,943.

465. For the class of traffic likely to go along that comparatively level road, which I suppose in wet weather is subject to a good deal of cutting up, what kind of road would you, as a responsible officer of the Department, recommend to be made? The metal road undoubtedly.

466. Give the reasons why a metal road will be the better of the two? In the first place, assuming that there is a traffic such as you would have to a prosperous gold-field—as Wyalong was, say, twelve months ago—I do not think any gravel road can be constructed to carry the traffic. It does not matter how much gravel you put on, you could not keep a good surface on the road with heavy traffic.

467. The traffic is bound to go through it? Yes.

468. That would not happen with a metal road? Only to a limited extent. I might add that with the present width of tyres— $4\frac{1}{2}$ inches—it seems almost impossible to construct a metal road to carry the loads which are put on the waggons.

469. What would be the comparative lives of a gravel and a metal road, under circumstances similar to those which would be found between Temora and Wyalong? That is a question which it is hard to answer.

if

P. Scarr, Esq., If you left a metal road to itself, and did not do anything towards its maintenance, it would be destroyed
 M.I.C.E. in a very short time, under anything like a heavy traffic.

28 May, 1895. 470. That being so, which would require the least repair—a gravel road or a metal road? A metalled road, most certainly.

471. Can you say to what extent—25 or 50 per cent.? I can only repeat what I said just now—that is, that if you expended £30,000 in making a gravel road, you would never have a good road. It would not matter what maintenance you carried out upon it, you would never have it good on that heavy traffic. A gravel road is only suitable for light vehicles and comparatively light loads.

472. Would there be any stone sides to the road, or would it be one in regard to which vehicles could cut on and off as they liked? There would be no stone sides—that is, border sides.

473. Then vehicles could go on and off as they liked? Yes.

474. Does not that injure the roads very much? It breaks down the sides.

475. I suppose the expense of making a road with border-stones would be very large indeed? Yes, you could not do it there; you could not get suitable stone.

476. In going over the country one observes that the roads are terribly cut into by the teams. When drivers see a chance they go off the road and plough along the sides, along the natural surface, and then come back again here and there. Does not that injure the road very much? Yes; we always have trouble to keep the teams from cutting into the sides of the roads. In order to prevent it, logs and boughs are put down to keep them in the centre.

477. Apart from any question of railway construction, you would strongly recommend the making of the metal road if the question were one of road-making? That is if the traffic is to be heavy.

478. And in your opinion a metal road could be constructed for about £46,000? Yes.

479. There is a considerable difference between £46,000 and £69,000, which was the former estimate of the probable cost of the road; will you explain how the difference occurs? In the first place, there is the difference of 6 miles at nearly £1,500 per mile. That comes to £9,000. In the first estimate there was rather a liberal allowance for culverts. We found we should not require so many culverts, and not such large culverts as were anticipated. Then, also, there were only 17 miles of road to clear instead of 45. Again, in the first estimate I allowed for a drain on each side of the road, and that has not been included in the second estimate, because on re-consideration it was not thought it would be necessary. That would amount to about £1,600 or £1,700.

480. Of what do you construct the culverts? Of wood.

481. You have allowed for five culverts to the mile. Do you think that is sufficient? Yes; I should like to mention that the first estimate was very hurriedly prepared without proper information. We had no information about that part of the country beyond Barmedman at all. We were not constructing or dealing with any roads at that time at all.

482. Mr. Barling, in giving his evidence, was asked:—

Do I understand that Mr. Scarr does not recommend a gravelled, but a metalled road? Yes, because we can get metal; but in some parts of the road we may still stick to gravel. If I recollect rightly the metal is to be found more on the other side of Wyalong.

Do you agree with that? I would never recommend the use of the gravel on that road, if the traffic is to be as heavy as it may be expected to be to the gold-fields.

483. Therefore, you do not agree with that recommendation? No, not entirely.

484. Where would you get the metal from for the construction of the road? Judging from Mr. Mullens' report, there seems to be very little metal to be had between Temora and Barmedman; but it is more plentiful between Barmedman and Wyalong. I take it, that it will be obtained out of the hills very close to the road. That is in view of the price he names.

485. Is the price he mentions, 5s. a cubic yard, a reasonable one? Yes.

486. In the country, or in town? In the country.

487. Do you know the cost of metal in town? I could not tell you. I have very little to do with metal contracts in Sydney.

488. But 5s. a yard is a reasonable rate in the country districts? Yes.

489. What size would that be broken to? Three inches.

490. You allow 1s. per lineal yard, for formation? Yes.

491. Do you put any ballast upon the road? No.

492. You simply put the metal down? Yes.

493. What thickness? For the $1\frac{1}{2}$ yard, it will be 9 inches.

494. Is that a sufficient thickness for a first-class road? Yes.

495. That is the thickest you put on anywhere? It is very rarely we put it on thicker, unless it is on an embankment or approaches to bridges. Sometimes it is put on a little thicker there, or ballast is used underneath the metal.

496. What do you use for blinding a road of this character? The stuff at the side, as a rule. On that road I do not know there is any better stuff to be had.

497. And then the traffic really makes the road? Yes; and then the question of maintenance comes in. Men have to be employed continually to rake it in, and after a time additional metal has to be supplied to make up the surface.

498. I suppose the idea of rolling country roads would be too expensive altogether? We have found it so. We had rollers in different parts of the country, but we found the cost of moving them about for the short lengths we were constructing, was too great.

499. Do you not think, in connection with a long length of road like this, that if the road were properly consolidated by means of rollers, it would save very much in the way of subsequent repairs? Undoubtedly it would assist in the consolidation of the road, and where we are constructing any long lengths it would be advisable to get rollers.

500. Have you allowed for that in this instance? No.

501. Would that be a heavy item in a road of this kind? It would be only a comparatively small item on a large job like this.

502. You could not tell us, approximately, what it would cost;—it has always appeared to me that allowing the traffic to make these roads is a very weak point, because the metal gets disarranged and into a groove at once? Yes; exactly.

503. In making a road of this kind would not you recommend that it should be rolled? Yes. P. Scarr, Esq., M.I.C.E.
504. If this were to be a road in place of a railway—for that is really what it means—would you not recommend that it should be thoroughly consolidated by means of rollers? Yes. 28 May, 1895.
505. Could you tell us how much more that would cost? I could not at present.
506. Do you think it would run into £500 or £1,000? You might put it down at between those amounts.
507. One of the reasons put before the Committee in favour of the construction of the railway is the large expenditure involved in the formation of a road;—we want to know what it would cost to make one of the best roads for the country;—you think the rolling would not exceed £1,000? I should think not; but we do so little of road rolling that I am not able to say exactly.
508. Of course the cost of maintaining the road after it has been constructed has to be considered? Yes.
509. You allow 1s. per lineal yard for the formation? Yes.
510. Explain what you mean by forming a road of this kind? That is, cutting a water-table on each side and throwing the stuff into the centre, and rounding it up to the proper shape and proper convexity, 27 feet wide.
511. Is this a cleared road? It is cleared from Temora to Barmedman.
512. All the way? Yes; and it is only partially cleared from there to Wyalong.
513. Are there any stumps of trees on the road from Temora to Barmedman? No; it is thoroughly cleared, I understand.
514. Do the tree-stumps and trees still remain on the road from Barmedman to Wyalong? It has been cleared in a sort of way—in some places half a chain wide and in others three-quarters wide. The clearing is not of great value there. I think the cost of clearing is stated at £44 a mile.
515. What would you allow per mile yearly for the maintenance of the road? For the first two years I do not think the maintenance would cost less than £90 to £100 a mile.
516. For 39 miles that would be about £3,500? Yes; that is for labour and material.
517. After that, it would be more expensive? No; because at the end of two years you would have the road fairly well consolidated. There would then be not so much labour or material required.
518. What do you think it would cost per mile after that to keep it in order? About £60 a mile. I am almost always assuming that there will be a heavy traffic upon it.
519. After the first two years it would cost about £60 a mile, or in round numbers, £2,340 a year? Yes, to maintain the road properly.
520. That is reckoning for a heavy dray traffic? Yes.
521. Would this road come under the classification of a first-class road in the Government schedule of roads? Under those circumstances it would.
522. It would be considered a first-class road, and of course it would be a first-class price? Yes.
523. In the yearly votes for the maintenance of roads a lump sum is put down under the heading of "Road votes"? There is a lump sum which is made up of the items for each particular road on the schedule.
524. The officers supply to the head of the Department a total amount, based on a certain calculation? Roughly, on a mileage classification basis.
525. What do you generally allow for a road of this character? The classes run roughly in this way: A first-class road, £50; second-class, £40; third-class, £30; fourth-class, £20; fifth-class, £15; sixth-class, £10; and the seventh-class, £7.
526. Then how is it that this road will cost from £90 to £100 per mile for the first two years? Well, if the road had to be maintained in proper order the money would have to be found for it. Of course, sometimes we get special grants to supplement the road votes.
527. Does not the £50, which is generally allowed for first-class roads, keep them in first-class order? We never get an opportunity of constructing a road right out from one end to the other. We get, say, £50 a mile, and we have to do the best we can with it. We may do a mile or two of metal this year, and a mile or two the next year; but we have scarcely ever had the opportunity of constructing a road from end to end. I do not know of any single case.
528. Can you point, in the history of road-making in this Colony, to where there has been a length of road of 39 miles, in an outlying district like this, made from end to end? No; it has never been done in this Colony. The nearest approach to it was the completion of the Mudgee road, about sixteen or seventeen years ago, when £22,000 was voted in a lump sum to complete the metalling of the road throughout from Wallerawang to Mudgee.
529. And then they built the railway immediately afterwards? Yes.
530. Would you like to say whether it is absolutely necessary that the road to Wyalong should be metalled all the way;—are there any parts of it along which they could get heavy traffic all the year? I could not say from my own knowledge; but I am informed that in the winter-time, with the traffic which was on it last year, you can hardly pick out any bad spots,—that one place was as bad as the other.
531. But there is one particularly bad spot? Yes; at a place called Donkin's Lane. That is worse perhaps than some of the others; but our officers informed me that the road was bad from one end to the other.
532. And if there is going to be heavy traffic there, to a large and central population, it would be necessary to make a road such as you have indicated? Yes, sooner or later. No doubt we could get the traffic along without carrying out all that work at once.
533. You stated a short time ago that country roads suffer fearfully, and the revenue in proportion, by reason of the narrow tyres on the waggons— $4\frac{1}{2}$ inches? Yes, I think that is the usual width.
534. Is that a matter of general complaint? It has been complained of ever since I have had to do with roads—for the last 30 years.
535. Have you ever made representations in the direction of getting some law to widen the tyres? The officers have done it ever since I can remember. Representations have been made by the Department ever since I came into it.
536. Do you know of any law in any of the adjacent colonies regulating the width of tyres? I do not think there is any such law in Victoria or Queensland.
537. I have heard of one in South Australia. I think I have heard of that.
538. Would not such a law be very desirable? Yes; and it would be an advantage to the carriers themselves, I think.
539. What is the latest report you have had as to this road? The report from Mr. Mullens, sent in in the early part of April.

- P. Starr, Esq., 540. Is 18 feet a sufficient width for a road where there is likely to be a considerable traffic both ways?
- M.I.C.E. Yes; that is the width we have always constructed the main roads and all others.
- 28 May, 1895. 541. Do you find the gravel or metal in this kind of soil sink in very much? One of the difficulties is that the foundation is so yielding. It takes a long time to consolidate.
542. Have the Department ever considered the desirability of brushing it? That is done sometimes in very soft, swampy places—on what we call rotten ground—but it is not used generally.
543. It is proposed, if a line of railway is constructed along this road, that it will be what is called a surface railway, with the sleepers placed on the surface, with little or no ballast; the sleepers are to be placed on the soil, which is scooped up from the drains on either side;—do you think sleepers so bedded in that scooped up material would be likely to sink in with heavy locomotives going over them? I would rather not give an opinion on that subject, because I have had nothing to do with railways for thirty years. The practice now is quite different from what it was then.
544. But seeing that you put down the brushing under metal in bad places, and seeing that the metal sinks considerably, would it not be a saving of expense if the whole of the roads were made in that way? I do not think it would be desirable in all places. The result of experience has not shown that. It is only in swampy rotten ground that we use it. In some instances, in the black soil, it has been used rather frequently and has been found to be a mistake. The objection to it arises a good deal from the want of proper material. If we could get ti-tree, or such material as that, no doubt it would be a good thing, but that is not available in many places, and the ordinary scrub in the bush is not suitable. The sticks are too crooked, and too large as compared with the leafy portions.
545. How about pine scrub? Fine pine scrub would do very well, but that grows where there has not been much road-making done, and where there is really no road material.
546. How is the repair of the roads carried out—by contract or by day labour? By day labour, as far as the straightening and raking in of the metal is concerned, but the metal is supplied by contract.
547. Would this length of road be under the supervision of one road officer or more? It is under one at the present time.
548. Mr. Davies.] Does Mr. Mullens, the local road superintendent, include in his estimate the longer distance you spoke of? No, he took the 39 miles.
549. What portion of your estimate differs from that of Mr. Mullens for a gravel road? It is chiefly in the quantities. Mr. Mullens, in his estimate, allowed for only 1 cubic yard to the yard run, and I have allowed for $1\frac{1}{2}$ cubic yard.
550. What is the meaning of this:—
- | | |
|--|----------|
| Total at 2 cubic yards gravel per yard of road | £16,170? |
|--|----------|
- If you refer to the first portion of the estimate you will see that I say:—
- | | |
|--|---------|
| Add $\frac{1}{2}$ cubic yard gravel per lineal yard of road to be put on either during construction, making a total of 2 cubic yards per lineal yard, or as maintenance material almost immediately after completion— $\frac{1}{2}$ cubic yard at 3s.—£132 per mile..... | £2,904. |
|--|---------|
551. Would that apply to the whole length of the road? Yes.
552. In what other particulars does your estimate vary from that of Mr. Mullens, for a gravel road? It does not vary in the detailed prices, but in the quantities to be used.
553. You have the same estimate as Mr. Mullens for clearing? Yes; that is in the latter estimate—not in the first estimate.
554. I want to know how the discrepancy between his estimate of £24,000, and yours of £32,000, occurs? You will find that the £24,000 is not made up by Mr. Mullens, but by me from his prices and quantities; but as I explained a short time ago, that estimate of £24,000 was made up rather hurriedly, and the estimate which we give in now is £32,409, which includes supervision, and which was not included in the estimate of £24,000. The cost of supervision is £1,500. The estimate for £32,000 is a more carefully got-up one than the estimate for £24,000, and contains the additional quantity.
555. I understand you prepared the estimate of £32,000 yourself? Yes.
556. The other was a hurried estimate prepared by you upon information supplied in a hurried manner by Mr. Mullens? Yes.
557. And which you regard as unreliable? His information is quite correct.
558. But his estimate is unreliable? Yes.
559. You state that you would not recommend a road for that district—even a gravel road—at a cost of £32,000? No; I would not recommend a gravel road under any circumstances with that traffic.
560. Supposing a railway is constructed between Temora and Wyalong, what annual saving, including the capital cost of the road, will be effected by your Department? If the railway is not constructed I take it that we should have to construct a road of some sort or other, or rather we should have to construct the worst portions of the road almost immediately. In fact, there will be a large expenditure. The whole of that expenditure will be saved by a railway.
561. What proportion of the road will have to be constructed in the event of a railway not being constructed, and what will be the probable annual cost of maintaining the road so as to carry the traffic? That is a matter for the consideration of the Minister as to what money should be granted for the road, but if the traffic is to be kept up there, I think we should want £3,000 or £4,000 a year for it.
562. Then there will be an annual saving of £4,000 a year to your Department if the railway is constructed? Exactly.
563. Would it be fair to credit the railway with £4,000 a year, as a saving to your Department if it were constructed? Yes; I think so.
564. There is no direct revenue derived from your roads? No revenue whatever.
565. But there would be a revenue derived from the railway? Exactly; although there might be a total loss upon it.
566. We will take the other estimate you have for a metal road. Who supplied you originally with the estimate of £69,000? I made that estimate up.
567. Upon information from the same officer? No; I was going on general lines then. We had little or no information then. The only thing I ascertained was that we could probably get metal at an average of 8s. a cubic yard throughout, and upon that, the estimate was made up, principally.
568. It was not upon information supplied by the local officer? No.

569. You now, after careful examination of all the circumstances and prices, come to the conclusion that P. Scarr, Esq., it can be done for £46,000? Yes; that is keeping in mind that it is 6 miles shorter than we took it to be at the time. M.I.C.E.
28 May, 1895.
570. That is one item which makes up for the difference between the £69,000 and the £46,000? Yes.
571. In the absence of a railway, would you recommend the construction of a road from Temora to Wyalong, a distance of 39 miles, of metal instead of gravel? Yes.
572. Even if it cost £46,000? Yes.
573. Would it be necessary to construct that road in the absence of a railway? I should not recommend that £46,000 be given at once to construct it; but that we should proceed on the usual lines and obtain £50 a mile for the road year by year. That is the usual course all through the colony.
574. And how many years will it take you to complete that road? Fifteen or 20.
575. Then when you got to the end of it you would have to start again? Unless it had been properly maintained. Maintenance would have to be taken out of the £50 a year. You start with the road with no work upon it. You take £2,000 a year. We do 3 miles the first year. The next year we want some of the annual grant of £2,000 to keep up that 3 miles.
576. Then you would go on for fifteen or twenty years constructing the road? Yes; doing the worst portions.
577. Supposing you spent £46,000 on a new metal road, would it effect a larger saving to your Department than would the construction of a gravel road of £32,000? The saving, of course, would be in the lesser cost of maintenance. After a little time we should have a good road, whereas if you constructed a gravel road you would never have a good road.
578. Would there be a difference of £5,000 a year to the Department if you were to construct a metal road, for its maintenance and capital cost on construction? No; because the construction and maintenance of a metal road would only be from £3,000 to £4,000 a year.
579. It would be absolutely less than a gravel road? The cost of maintenance of a metal road would be less than the cost of maintenance of the gravel road.
580. But there would be a difference in the capital cost? Yes, a difference of £13,000.
581. Then there would be a saving of at least £4,000 a year to the Department if the railway were constructed, and it would give greater facilities for the carriage of produce and other traffic, than would a road? So far as I can see.
582. That would be the position of affairs? Yes; that is assuming that the railway were a paying concern.
583. *Mr. Lee.*] Is the road from Temora to Wyalong a scheduled road? It is at the present time.
584. Has your Department placed the worst portions of that road in fair order? No.
585. If any other branch of a public Department has stated that the Works Department has placed the worst portions of the road in fair order, is it correct? It is certainly not correct, because we have made very little expenditure on the road.
586. But is the road at the present time in such order as to carry the ordinary traffic? I understand it is during the present dry weather.
587. And if there is a heavy rainfall you anticipate it will be cut up? Yes; as bad as it was before.
588. How much money have you spent on this road? I think about £3,425.
589. Is that since the discovery of the gold-fields? No; that expenditure has been going on for some years between Temora and Barmedman.
590. But has there been any special vote since the discovery of Wyalong? A special vote of £500 between Barmedman and Wyalong.
591. Is that the only one? I think so. There might have been a small vote of £50 or £100 for a special purpose there.
592. But no large amount? No.
593. And the small grants have been for particular spots? Yes.
594. So far as the road is concerned, then, if it be made at all it will have to be made properly from end to end? Yes.
595. And so long as the weather remains fine the road may be passable for traffic? Yes.
596. *Mr. Molesworth.*] In the event of a railway being constructed, what kind of road will require to be maintained from Temora to Wyalong? I take it that there will be very little road required unless it is here and there for approaches to the railway stations.
597. But would not a road be required to be maintained for vehicular traffic? Some little expenditure will be necessary to keep the road open.
598. What do you think will be a reasonable expenditure? £400 or £500 a year would be quite sufficient.
599. Supposing the railway is not constructed, what class of road will be required to meet the requirements of the traffic? I think £50 per mile per annum should be given.
600. Do you think an expenditure of that kind, without a large sum to put the road in order, would be sufficient? I think under our present arrangements it would suffice, because we never get more than £50 a mile for any road. That is the maximum, unless the Minister chooses to give special grants for special purposes.

WEDNESDAY, 29 MAY, 1895.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	JAMES HAYES, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	ROBERT HENRY LEVIEU, Esq.
The Hon. JAMES HOSKINS.	JOHN MOORE CHANTER, Esq.
The Hon. JOHN DAVIES, C.M.G.	CHARLES ALFRED LEE, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	JAMES GORMLY, Esq.
EDMUND WILLIAM MOLESWORTH, Esq.	

The Committee further considered the proposed Railway from Temora to Wyalong.

Percy Scarr, Esq., M.I.C.E., Principal Assistant Engineer, Roads and Bridges Branch, Department of Public Works, sworn, and further examined:—

- P. Scarr, Esq., 601. *Mr. Chanter.*] Will you tell the Committee what would be the annual cost of maintaining a road, if M.I.C.E. it were made right through from Temora to Wyalong? For the first two years about £90 to £100 per mile. I stated that yesterday.
- 29 May, 1895. 602. But yesterday, were you not dealing with the construction of a part of the road and not the whole? It will make very little difference. The rate per mile will be about the same whether the whole or the part is constructed.
603. Would there be very much difference in the cost of maintenance if the road were constructed of gravel or metal? A very great deal of difference.
604. Which would be the least costly? The metal road would be the least costly to maintain.
605. Although it would be more costly to construct in the first place, it would be less costly to maintain afterwards? Yes.
606. What class of gravel is to be found in the neighbourhood? I could not say. Mr. Mullens has not stated that in his report.
607. However, there is a class of gravel which would make a first-class road? I think it is ironstone gravel along that part of the country, and in some cases it makes a very good road.
608. And it is a very fine gravel? Yes, usually.
609. It could not be compared to the gravel used in the Moama district—the screened gravel from the Bendigo mines? A different sort of thing altogether, I think.
610. A small pebbly gravel? Yes; ironstone gravel usually is.
611. As far as your knowledge goes, there would be no other class of gravel in the locality? Not so far as we have any information.
612. And that is of a crumbly nature in comparison with the quartz gravel? It is not usually soft.
613. The reason I ask this question is because the quartz gravel taken from those mines has made as fine a class of road as possible? Under a certain class of traffic.
614. A heavy traffic? The tailings from the mines at Bendigo can hardly be called gravel.
615. It is classed as screened gravel? Yes; but it is really quartz boulders.
616. Would there be any chance of getting that class of gravel from the mines at Wyalong? I could not say. I have no information on that point.
617. If you got that kind of gravel, would it not be possible to materially lessen the cost of the road? Possibly; but I have not heard that there is any quartz of that kind.
618. In the Parkes district, the roads are made from the so-called metal from the mines at a very cheap rate? Yes, from the tailings.
619. Would it not be possible to decrease the cost of this road if that class of covering were used? I do not think so, because the cost of gravel on the Wyalong Road would be 3s. to 3s. 6d. per cubic yard.
620. And the metal 5s. 6d. per cubic yard? Yes.
621. What would be the cost of laying down a corduroy base of pine, wattle, or box saplings? That depends upon the nature of the timber there, independent of whether there is any pine there.
622. Can you obtain that information? There is some information in Mr. Mullens' report as to timber for bridge purposes, but I do not recollect any information about pine for corduroying. He says there is some very good ironbark to be had there.
623. I notice that the clearing is set down at £4 per mile;—what width of road do you clear? A chain usually.
624. That is wholly cleared? Yes, stumped.
625. Is it burnt or placed on the side of the road? Burnt usually.
626. Is the timber between Temora and Wyalong of a heavy description? I have not been beyond Barmedman.
627. How does that country compare with the Riverina, Berrigan, and Moama country? My recollection of it is that it is more heavily timbered, and that there are more large trees in it.
628. Very much heavier? I should say there is a good deal of difference.
629. The reason I ask this question is because in what I conceive to be similar country the municipal bodies are getting their roads cleared at less than half the cost you estimate? I could not speak about that.
630. The farmers and others who are clearing for cropping purposes think it excessive to pay £2 10s. per acre—your estimate is really about £5 per acre;—would it not be possible to reduce that very considerably? I do not think £5 is a very excessive estimate for clearing down there.
631. With regard to the formation, what is the estimate of 1s. per lineal yard based upon;—is it based upon work of a similar description previously carried out and paid for? Yes.
632. Is it not possible to reduce that? It might be. It might be that when tenders were called they would be under that amount, but not very materially.
633. You are aware that in many parts inland they are using what are termed the American graders? I know there are such machines, but I am not aware that they have been very generally used. We have not used them.
634. Some of the municipalities have used them with marked effect, and have decreased the cost? Yes; the reports are very favourable to the machines.
- 635.

635. Evidence was given in connection with the Berrigan to Jerilderie line that the cost of the formation P. Scarr, Esq., of the roads there was about $2\frac{1}{2}$ d. per yard, as against 1s.? Quite so. If the testimonials furnished to us by the owners of that machine, Carroll & Co., are correct, it would reduce the cost at least 50 per cent., but we have not yet had an opportunity of trying it. We are arranging for a trial next month near Sydney, in order that we can see what the machine is really worth.

636. For the first two years the maintenance would cost about £90 or £100 per mile? Yes.

637. After that period what would be the average cost of maintaining the road? About £60.

638. That would be a charge for all time? Yes; that is to maintain the road in good order, with a good surface upon it.

639. I take it that you do not see your way clear to materially decrease the amount of your estimate for this road? No; the principal item is the metal. If the items of formation and clearing were reduced by one-half it would not amount to much. One item is £748 and the other £1,496, so that there is not room for very material reduction in the estimate there.

640. Mr. Hayes.] Is not the clearing and formation always done by open tender? That is our practice.

641. The cost of that work has been reduced of late years? It has been reduced very materially during the last two or three years, since the depression commenced.

642. When Mr. Mullens went over the road did he have instructions from you to see whether a better and sounder road could not be found? Yes. In his report he does not indicate that there is much chance of a better route.

643. Not by means of some deviation? Some small deviation, but it would not amount to very much. The Temora to Barmedman road is already fixed. The road is cleared, and his report is that it could not be materially improved, and beyond that, with the exception of one place, I think no material alteration could be made.

644. You could not alter it so as to get sounder ground? Not to any great extent.

645. Looking at the present population of Wyalong, do you think it is sufficiently large to justify the construction of a metal road? Throughout?

646. Yes? Certainly not. I do not think there is any chance of a metal road being constructed right through—not at one motion.

647. What class of road do you usually form where there are similar populations in other parts of the country? They have to wait until a road can be formed and metallised by degrees, in the same way that all the main roads have been constructed. They have been done mile by mile, as the money was available.

648. Have you been over this road yourself? Only as far as Barmedman. Wyalong was not in existence when I was out there.

649. I suppose the character of the country is about the same? So I understand.

650. Is it a fair road in summer? It is reported to be in very good order now, but that, I take it, is owing to the dry weather.

651. What is your experience on other soft roads when heavy traffic occurs, and the roads become puddled up;—does not that, as a rule, make the roads much sounder afterwards? I do not think they ever get so bad again as they do the first time they are puddled up.

652. They form a hard crust? Not that exactly. The ground seems to get into firmer consistency—more solid.

653. If a railway is not constructed, will a large expenditure on a road to Wyalong be required? I think not. I should not recommend any unusual expenditure upon it.

654. Mr. Gormly.] Has Mr. Mullens sent a sample of the gravel? No.

655. Does his report contain any information as to whether stone for metal would be found near the line? Yes; he gives full information on that point.

656. Would the stone be found close to the line over the whole distance? Between Temora and Barmedman the stone is not so plentiful. There it would cost 8s. per cubic yard. From Barmedman to Wyalong it would cost 5s. per cubic yard. In view of those prices, I take it that the stone between Temora and Barmedman is somewhat distant from the proposed line, whilst beyond there it is fairly close.

657. Is Mr. Mullens an officer of experience? He has had a good deal of experience, and he is a very capable man.

658. Mr. Hoskins.] In the event of a railway not being made between Temora and Wyalong, and we determined to construct a road, what amount per mile will be allotted from the Road Vote per annum for making it and keeping it in repair? Under present circumstances I should not recommend more than £30 or £40 per mile. Certainly not more than £50.

659. Mr. Humphery.] Can you say how much was expended upon the road between Cootamundra and Temora before the railway was constructed? Not without going through the books.

660. Do you know what the condition of that road was? Very bad at times.

661. How much was allowed for the maintenance of that road? There was a pretty heavy grant at one time, about £50 per mile, but I could not be sure of that without referring to the papers.

662. Chairman.] What is the amount the Department votes on a first-class road? Fifty pounds per mile.

663. You mention £40 as being a reasonable amount to spend on the road? At the present time I think that would be quite sufficient under the circumstances.

664. Is it your view that the importance of Wyalong does not entitle it to connection with Temora by what is known departmentally as a first-class road? I think not at present, as far as we can see.

665. Therefore, your branch of the Public Service would not recommend the expenditure of £45,000 to build a road? Certainly not.

666. It is not justified in the interests of the country? I think not.

John Harper, Esq., Goods Superintendent, Department of Railways, sworn, and examined:—

667. Chairman.] Are you acquainted with the route of the railway under consideration, and the country it is intended to develop? Yes. J. Harper, Esq.

668. You recently made an inspection of the country, and will be able to give the Committee the most recent information? Yes. 29 May, 1895.

669. Mr. Humphery.] Do you remember the evidence you gave when before the Committee in May, 1894, on this line? I have a general recollection.

J. Harper, Esq. 670. Has the result of your recent visit to the district led you to alter the views you then expressed? I expressed a number then upon different subjects, but so far as the permanence of the goldfield is concerned, I am in no better position to answer that question to-day than I was then.

29 May, 1895. 671. I refer chiefly to the question of traffic? Yes; that is, with the known lines of traffic which are on the surface.

672. When did you make your inspection? On the 15th of March last.

673. Did you report to the Commissioners the result of your inspection? Yes.

674. When? On 15th May.

675. Have you a copy of the report with you? Yes; I have it with me, and will read it to the Committee:

Proposed Temora to Wyalong Railway.

New South Wales Government Railways, Goods Superintendent's Office, Sydney, 15 May, 1895.
In April of last year when reporting on this projected extension it was pointed out by me that the character of the population was of such a character that it was impossible to give anything like a reliable estimate based on the then existing conditions. I consequently prepared an estimate founded on an assumed permanent population of 1,800 as far as supplies and passenger traffic were concerned, and credited the line with the possible carriage of known quantities of wool in the district. During the interim between the date of that report, and the end of December of that year instructions were given to have the traffic carefully watched for the purpose of arriving at a closer estimate of its value. On 7th February, Superintendent Day furnished me with the attached report, which was supplemented by a return of wool coming from the district concerned furnished by the station-master, Temora. The return given by Mr. Day represents about 1,500 tons of goods per annum. An estimate of 1,700 tons was given in my previous report. The wool return gives 4,716 bales, but as some selectors' wool has not been taken into account, and several clips not included which would have been influenced by the construction of the proposed line, I think this may be safely increased to 8,000 bales. In my estimate 10,000 bales were allowed, but it was distinctly stated that this included all that were likely to be carried, and possibly more. Early in March last I again visited the district. There had been extensive developments of mining properties since the line was inspected by the Commissioners, and eight batteries had been erected. The official estimate of population was 4,000. The total production of gold during the twelve months the field had been open was 7,328 oz. I mention the latter fact as illustrating the limited character of the earnings of the field. It is true that owing to want of water a great deal of ore remained unoperated upon, but this probably did not exceed the quantity from which the gold had been extracted. Selection had taken place to a limited extent only, and the area under crop had not been materially increased, so that the estimate for carriage of wheat remains practically unaffected. Action had been taken by the Roads Department to improve some of the worst portions of the track, and the rate for carriage had consequently been materially reduced, ranging to 15s. per ton from Temora to Wyalong. The whole of the circumstances which came under my observation were such that although the population is at present larger than that upon which my estimate was based, I do not feel justified in increasing it, especially having in view the improved conditions of the road, and the possibility of the extension to Condobolin affecting the volume of wool and other traffic. I therefore submit my estimate of April last, as being the extreme amount I expect the line to return as matters are at present.

676. Is it your opinion that in the event of the line being constructed to Wyalong it should be extended to Hillston? No.

677. What are your reasons? I think I have previously expressed the opinion that the best extension of a line to Hillston would be by the Lachlan, through Condobolin.

678. That is an extension of a line which has already been dealt with by the Committee? Yes.

679. Then you would regard the proposed line simply as an extension from Temora to serve Wyalong only? Yes.

680. And regarding it in that light you think it would be an unprofitable line? My opinion is that it will not realise more than I estimate—probably less.

681. That is making a full allowance for the probable population? No; I simply allow for what is on the surface. Of course it is very hard for me to say what is below the surface. As my report indicates, during the twelve months which elapsed between my previous visit and the time of my last visit 7,000 oz. of gold have been produced. Arguing from that, if a population of 4,000, which is the officially estimated population, were able to subsist on a production of 7,000 oz. of gold, all I can say is that it must have subsisted very poorly, or a lot of money must have come into the field for the purpose of keeping the population there.

682. Do I understand that your opinion is that the future population of Wyalong must necessarily depend upon a further development of the field? Yes; decidedly.

683. And that pending that development, it will not be wise to construct the extension? That is my view.

684. Did you travel between Temora and the Lachlan in March last? Yes.

685. What was the condition of the road between Temora and Barmedman? It was rough in places—rough probably 3 or 4 miles between Reefton to Barmedman. Outside that it was a good country road, and there was no difficulty in travelling about 7 miles an hour in a buggy.

686. And between Barmedman and Wyalong? There was no difficulty in travelling at the same rate. I may mention that I left Barmedman by moonlight at 3 o'clock, and arrived at Temora at a quarter to 6 in the morning.

687. Have you travelled the road during wet weather? Yes.

688. Can you speak as to the general condition of the road? It was a very good back country road in dry weather. The big gilgai holes have been remedied by means of a corduroy road made over them.

689. As the result of a recent expenditure of £500 by the Roads Branch? Yes. There are several other gilgai holes which require the same treatment. There are one or two places which are exceedingly soft, but there is also a lot of comparatively sound ground, which would not require any special treatment.

690. Have you formed any opinion as to what would be the cost of making a road practicable for traffic? I should think that if one-fourth of the road were improved it would be a good carrying road during wet weather.

691. Improved in what way? I cannot indicate to you how it should be improved, but it could be improved upon its present condition. I may say that the corduroying which has been done has been most effectual on the worst parts of the road.

692. Is a portion of the road out of Temora towards Barmedman metalled? Yes.

693. For how many miles? I should say 7 or 8 miles at least.

694. What is the condition of that portion of the road at the present time? It was very good when I drove over.

695. Is it good enough for the present traffic? Yes. The evidence of that is the fact that the traffic is being carried as low as 15s. per ton for 40 miles.

696. Chairman.] You state that the carriers charge 15s. per ton? Yes.

697.

697. For doing that service, what would the railway charge? My estimate, I think, is 13s. Of course you would have to strike an average practically, because there is a certain class of traffic that I have estimated at 13s. per ton, and some at 6s. 6d. per ton, so that, probably, 10s. per ton would be a fair average rate.

J. Harper,
Esq.
29 May, 1895.

698. Therefore, if a railway were in existence, it would mean a saving of 5s. per ton on goods going to Wyalong? No; we should simply deliver at the railway terminus, and accept at the railway terminus. The people who are carrying now would carry from store to store. You would probably have to add 2s. 6d. per ton at each end for cartage to and from the railway station.

699. The rates you mention are those you propose to charge on the railway? Yes. I may mention a matter which is often lost sight of, but it is one we feel very keenly in connection with the present road competition, and that is the fact that teams haul up alongside the stores, and deliver and receive their goods. It means all round a difference of 5s. per ton. We will suppose, for instance, that Dalton Bros., of Sydney, are sending goods to Orange, as they do frequently by teams. The teams go up alongside of their stores, and are loaded. They save 2s. 6d. a ton cartage to the Darling Harbour station at this end. They deliver to Dalton Bros.' store at Orange. They save 2s. 6d. per ton cartage between the railway station and their stores, so that you require to add that to the railway rate.

700. Then that 5s. on the Temora to Wyalong line would make the railway rate equal to the road rate? About the same.

701. Are we justified in believing that a railway from Temora to Wyalong would not save the people much? It would probably during the winter months, but under the conditions which obtained when I was there, I am satisfied they would not save much.

702. You say it would not be any great saving to the people? No.

703. *Mr. Humphery.*] You mentioned that one class of goods will be carried at 6s. 6d. per ton? Yes; by us.

704. And the other at 13s.? Yes.

705. Would the class of goods you propose to carry at 6s. 6d. be carried by teamsters at 15s.? No; the probabilities are that the railway would be left to carry that class of goods.

706. You did not refer to that class of goods when you replied to the Chairman? No; I was striking an average between the two. It often happens that in making up teamster's load, they have to put in what we call low-grade traffic—that is, in order to complete a load they will have to put some traffic for which they would have to pay 6s. 6d. per ton if carried by rail; but the bulk of it would be carried by us.

707. If you got a class of goods for which you would receive 6s. 6d. per ton carriage, you would conduct that traffic at a loss? Yes; practically. If the railway were constructed the profitable proportion of the traffic would go to the teamsters, and the unprofitable portion to the railways. That is what we have reason to expect.

708. Therefore, when you estimate the returns at £2,674, including the traffic for which you would get 13s. per ton, it is quite probable a large portion of that would not go to the railway? It is quite probable it might not come to us.

709. Are you quite satisfied that you have made an ample estimate of the earnings of the railway when you put them down at £2,764? Yes, I am satisfied.

710. That is based upon the probable population, unless further developments take place? Yes.

711. *Mr. Davies.*] Can you give the Committee a statement showing the return of traffic on the Temora-Cootamundra line, and comparing the months of September, October, November, December, 1893, with the corresponding months of 1894? I could give you a comparative statement so far as wool is concerned.

712. You have the gross traffic? The position was this, so far as the gross traffic is concerned. Inwards to Temora, which would of course imply supplies sent to Wyalong and elsewhere, the tonnage in May was 744 tons; in June, 718 tons; in July, 507 tons; in August, 496 tons; in September, 486 tons; in October, 531 tons; in November, 539 tons; in December, 518 tons; in January, 383 tons; in February, 494 tons; in March, 520 tons, and in April, 542 tons. I might explain that that is entirely misleading. When I was through that district they were obtaining chaff from all round the district. They were obtaining chaff from the Hay line and other places. As a matter of fact all the local chaff had been exhausted, and large supplies of chaff and forage were coming into Temora for the purpose of taking it to Wyalong. Of course that is a class of freight upon which practically there is no profit at all.

713. You have stated that trade has fallen off? Yes.

714. And the only reason you assign is that the gold-field has not been so reproductive as was anticipated? Yes.

715. When you were before the Committee on a previous occasion I think you and the Commissioners based your calculations on a basis of population of 1,600 or 1,700 persons? Yes.

716. You are aware that there is now a population of 5,000? Four thousand is the official estimate.

717. Who gave you that estimate? The officer in charge of the police at Wyalong.

718. Take a population of 4,000 as against 1,700—do you see any reason to alter your opinion? None whatever.

719. Would not the larger population of 4,000 as against 1,700 give you a better result in the shape of passenger traffic? I might point out that my estimate of the passenger traffic was not absolutely based upon a population of 1,800. It allowed for a floating population such as would be incidental to a field of that character, and, in my opinion, it is too high an estimate for a population of 1,800.

720. That is to say, your former estimate is too high for a population of 1,800? Yes.

721. And in view of the population being more than double your estimate on a previous occasion, do you see any reason to alter your opinion? None whatever. I have a return of the passenger traffic at Temora. The total passenger traffic at Temora for the twelve months ending April this year, which embraces all the earlier period of the rush, from May up to April was 5,200. My estimate was 2,000 for Wyalong.

722. How do you obtain that result? You have to deal with a population in the Temora district of over 2,000, and must anticipate a large amount of local traffic there which must be deducted from the total for the purpose of showing the quantity which went to Wyalong.

723. But would not those numbers be a much larger proportion than what you anticipated when you first made your estimate? No.

- J. Harper, Esq. 724. You based your calculation upon a population equal to that which existed at Temora? Yes; the field started in April, but it probably continued attracting passengers three or four months afterwards.
- 29 May, 1895. The total passenger traffic from the beginning of May, 1894, until April of this year was 5,200.
725. That is just twelve months? Yes; I have credited the Wyalong line with 2,000 passengers.
726. Then you take 3,200 for Temora? Yes; and as being incidental to the rush, which is now practically over.
727. Can you tell what has been the proportion of people travelling between the points you have mentioned? No; it would be impossible to tell that.
728. You think 2,000 passengers travelling between Sydney and Wyalong would be a fair estimate for a population of 5,000? No; I do not say for 5,000.
729. Say 4,000? No; I do not deal with them as 4,000 people. My estimate is based upon a permanent population of 1,800; but I am speaking now of facts which relate to a population which is at present there of 4,000, and I am well within the estimate when I say that with a population of 1,800 there will be 2,000 travellers. Our experience is this: that with a population supposed to be 4,000 we have had 5,200 people travelling to Temora.
730. At Temora, the population is estimated at about 1,800? Yes.
731. And you have given Temora, with a small population of 1,800, credit for 3,200 passengers? No; I have given them credit in my estimate for only 2,000.
732. Where do you get the other 3,000 from? As arising out of the population which I do not regard as permanent.
733. You give that number then to Wyalong? No; I quote these figures to show what the passenger traffic has been to Temora? My estimate, which I have laid before the Committee, is based upon an assumed population of 1,800.
734. That is the assumed population of Wyalong? Yes; but I say that with the population, which is known to us, of 4,000 at Wyalong, and with all the incidents connected with the new rush, the passenger traffic has been 5,200.
735. Taking that as a basis, would it, in your opinion, be sufficient to warrant the construction of a line of railway from Temora to Wyalong? No.
736. Would the district itself as a wool-growing and wheat-producing district warrant the construction of a line 40 miles long from Temora to Wyalong? I do not consider it would.
737. Does the fact of the Committee having recommended the construction of a line from Parkes to Condobolin strongly influence the opinion of the Commissioners against a recommendation for the construction of this line? It is hard for me to say what the opinion of the Commissioners may be.
738. You have stated in your report that the construction of the Parkes-Condobolin line will serve a large portion of the country which would be served if the Wyalong line were constructed? Yes.
739. And that is a strong factor in your objection to the construction of a line almost parallel to another? Yes.
740. In the absence of the extension of the railway from Parkes to Condobolin, would you hold the same opinion as you do now against the construction of a line from Temora to Wyalong? I think I would. I would hope that the country would consider the whole question before it committed itself to the construction of a line which would only partially serve the country.
741. Would you regard an extension from Wyalong to Hillston as preferable to an extension from Condobolin to Hillston? No, I would not; I would consider the river route would be the better one to follow.
742. *Mr. Lee.*] I understand that you have personally visited the district? Yes.
743. And I presume in the formation of your estimate of revenue, you have given the district the same fair play as you have given every other district? I have endeavoured to do so.
744. And the revised estimate you now submit has the additional security of some six or seven months actual traffic on the railway to Temora? Yes.
745. And notwithstanding that, only a slight difference can be made in your estimate of April last? Yes; if anything I think it should be reduced, especially in view of the action of the Public Works Committee.
746. At all events, after twelve months, you are now in a position to speak with more definiteness than you were when you made your first estimate? Yes; I may state our local officers at Temora have watched the traffic to and from the district with a view to ascertaining its volume.
747. I presume you have made fair allowance for traffic that might reasonably be expected to come to the line outside the Wyalong traffic proper? Yes.
748. That is wool and station produce? Yes.
749. Do you think the construction of the Condobolin line would attract any of that traffic? Yes; I fancy about 2,000 bales of wool which I estimated in connection with the Wyalong line would go into Condobolin.
750. Then your estimate will stand to be reduced to that extent? Yes; to the extent of about 400 tons of wool. It would reduce the estimate by about £200. Of course, there would be returns supplied, which I have not estimated, which would come in.
751. That is an item you feel pretty sure about? Yes.
752. And it is quite possible that there may be other items which you cannot estimate at present, which would go over the Condobolin line? I would regard them as rival railways to a certain extent outside the immediate district of Wyalong.
753. You have also had the benefit of seeing the result of a year's work on the Wyalong gold-fields? Yes.
754. What has been the result there—an increased or a decreased population? It has been practically stationary. If anything, I think a decrease. I think to the extent of about 1,000.
755. I presume that during that time the heavy materials incidental to the forming of batteries have been imported to the field? Yes.
756. Do you think the field is of such a character that there is still a larger development to take place, thus necessitating the importation of heavy goods and machinery? That, of course, I cannot say, but at the time of my visit a number of batteries were idle, and they say they were short of water, and probably they were idle on that account. There were eight batteries on the field altogether, and I think only three of them were employed at the time I was there, but I think that was largely due to the want of water, because there was plenty of stone at grass.

757. Are we to understand that the uncertainty of the water supply will always operate against the district? That I cannot say. J. Harper,
Esq.
758. It happened to be a dry season when you were there? Yes.
759. Do you think we could take the traffic which has passed over the line from Cootamundra to Temora as a guide to what would go to Wyalong? No.
760. But would not all the Wyalong traffic go to Temora? Yes; but the district between Cootamundra and Temora is a much better district than that between Temora and Wyalong.
761. Before the outbreak of the gold-field there was, comparatively speaking, good traffic from Cootamundra to Temora? Yes.
762. And, notwithstanding the opening of the gold-fields, the traffic has not perceptibly increased? No.
763. So that there must have been a leakage between Temora and Cootamundra, because that line had the advantage of the Wyalong traffic? I do not quite follow you.
764. According to the information we have from your Department the railway traffic has not largely increased between Cootamundra and Temora during the last twelve months. During that time the line has had the benefit of the Wyalong rush, and yet the revenue has not increased very much. Therefore, there must have been a leakage between Cootamundra and Temora? You can scarcely get a comparison. The railway to Temora was opened in September, 1893, and the gold-fields were opened in April. During the months of March, April, May, and June, there was a large influx of population to Wyalong. A very large number of people who are there now were carried, and they have not been carried subsequently. The machinery which was carried to Wyalong was carried in that period.
765. Your Department appear to view the proposed extension as one to a gold-field only? That is all.
766. I presume the Department view that as a dangerous experiment? We think so, because if the field were to collapse the railway would be left there, ending in nothing and nowhere.
767. Then you feel quite incapable of showing a sufficient return to justify the construction of the line, even under present conditions? Yes.
768. Supposing we take it for granted that we should get the wool and the freight from the various stations, and treble the passenger traffic to and from Temora and Wyalong, how would that affect your estimate? If you got treble the passenger traffic you would practically treble the goods traffic. You would require, therefore, to add the traffic which would be carried owing to the increased population.
769. What would you consider to be a fair estimate, under those circumstances? Supposing you were to treble the population, you would increase the goods traffic by about £2,000, because, leaving out woolpacks and ordinary station supplies, you must reckon on the supplies the ordinary population would consume.
770. Admitting that it is possible for the field to treble its population, which would be a very large increase, and admitting that that would bring at least £2,000 more revenue to the railway, that revenue, then, would amount to a total of £4,764 19s., as against the estimated interest on cost of construction and working expenses of £6,950, or an annual loss of £2,186? Yes.
771. So that, in short, the gold-field will have to treble its production, and it will have to treble its population and trade, and even then it will show a loss of over £2,000? Yes; as far as figures show.
772. Do you know how the railway from Cootamundra to Temora is paying at the present time? It is paying more than working expenses, but not interest.
773. At the time that line was constructed the question of extending the line from Parkes to Condobolin was not under consideration? No; but the line from Molong to Parkes was under the consideration of the Public Works Committee about five years ago. I remember giving evidence in connection with the Cobar line down the Lachlan.
774. Having in view at that time the probable extension to Condobolin, upon what line of policy was the railway from Cootamundra to Temora constructed? I do not know.
775. What was supposed to be the probable extension of that line? I think there was an idea of its probable extension to Hillston.
776. Then you cannot find sufficient traffic to justify you recommending the construction of the line? No.
777. *Mr. Molesworth.*] I understand you have been over the proposed route of the proposed line two or three times? Yes.
778. And you are thoroughly acquainted with the locality? Yes.
779. You know exactly what traffic would be likely to be drawn to the line? Yes; we know that from our books and from a reasonable knowledge of the district.
780. Would a line from Temora to Wyalong tap any traffic which is not enjoyed by the present railway? No. As a matter of fact I have given the line credit for one or two stations which last year sent their produce to Hay and down the river. They took advantage of the lower competitive rates on the south-west line. I may also say, that the proprietor of Bygalorie told me the other day that assuming the two railways were constructed he would prefer to send his wool to Condobolin.
781. And that is also one of the stations you have credited to Wyalong? Yes. Again I credited Uabba station to Wyalong, which is very doubtful. It is probable it will go down the river the same as Merri Merrigal and Naradham.
782. Then you do not think there is any material traffic which will be lost to the railway if the line to Wyalong is not constructed? No. I have included in my estimate Euglo, and all the selectors upon it. As a matter of fact their distance is rather in favour of Condobolin.
783. Is there sufficient population in the Wyalong district to justify their being served by a railway in the hope of future settlement? I have expressed the opinion in my report that there is not.
784. You stated just now that there would probably be no further extension of the line, if constructed to Wyalong, in consequence of the Condobolin line serving the Lachlan district? Yes. The distance to Hillston would be shorter by the Condobolin route from Sydney.
785. Will you give the Committee the figures? The distance from Sydney by way of Parkes and Hillston would be 429 miles. To Hillston by way of Wyalong it would be 448 miles, a difference of 19 miles. The distance to Cargellico by way of Parkes would be 381 miles, and by way of Wyalong 400 miles.
786. Then Cargellico would be better served from Condobolin? Yes; by a difference of 19 miles.
787. Supposing Parliament declined to sanction the construction of a railway from Parkes to Condobolin, do you think the Railway Commissioners would then favour an extension from Wyalong in the direction of Hillston? I do not think they would be so shifty in their policy. I fancy they would go for what they considered the best line in the interest of the country.

J. Harper, Esq. 788. Supposing Parliament refused to sanction the construction of the line referred to, would not the Commissioners attempt to recommend an alternative route by way of Wyalong? It is scarcely for the Commissioners to dictate the railway policy to a Government. It is for them to express an opinion.
 29 May, 1895.

789. Coming to the question of the natural features of the country, which line would be most satisfactory to construct? The Condobolin line.

790. You think the features of the country from Condobolin to Hillston are better than from Wyalong to Hillston? Yes, a line down the Lachlan would best serve the general interests of the country.

791. *Chairman.*] In other words, if the traffic is going to Victoria, you would complete the Wyalong to Hillston line. If going to Sydney, you would build the other line? No; I should say in any case build the shorter line, for the purpose of bringing the produce to market, and I think there are more possibilities in the district of Condobolin than there are in the district of Wyalong—that is, outside the gold-field.

792. *Mr. Molesworth.*] Then I understand that even if the construction of a line from Parkes to Condobolin were not sanctioned it would in no way improve the position of the proposed Wyalong extension? Not a bit.

793. *Mr. Chanter.*] In giving your evidence before the Committee last year, you stated that the district was only comparatively well settled? Yes.

794. Now you have made a more recent visit? Yes; if you will read the evidence you will find that Mr. Hoskins asked me this question:—

I suppose you have, on many occasions, travelled between Cootamundra and Temora? Yes.

Is that country pretty well settled? Only comparatively well settled—there is not much population there.

795. Can you tell the Committee the character of the settlement between Temora and Wyalong? There is absolutely none except mining. There are about half a dozen selectors on the road.

796. Have they been there any length of time? Five or six years, I think.

797. What is the character of the country for agricultural purposes between Temora and Wyalong? Some of the soil is good; the only thing is that they suffer from a dearth of rain.

798. What is the rainfall? Eighteen inches, I think, is the most favourable record. As you go north-west it falls off. Barmedman is about a central point, and a seven years' record shows 18 inches there.

799. You say the land is comparatively suitable for agricultural settlement? Yes; when I say comparatively suitable, I mean this—there is no doubt there is a lot of good mallee land, the question is whether, under existing conditions, that is suitable land—whether people will be anxious to go upon it.

800. Do you know how the land between Temora and Wyalong is held? In the district of Barmedman, which extends 24 miles west, 15 miles in the Wyalong direction, 10 miles towards Temora, and 14 miles towards Young, there are 2,386 acres under cultivation, of which 1,494 were under wheat last year, and the grain production was 9,376 bushels.

801. *Chairman.*] You have an area of 28 miles by 25 miles? Yes.

802. Out of that there is an area of 2 miles each way under crop, and there were 137,000 sheep carried in addition? I might explain that a good deal of this cultivation lies to the north-east of Barmedman, and would find its way into Temora under any circumstances.

803. *Mr. Chanter.*] According to the plan, it would appear that the line goes through leasehold;—can you tell us how many pastoral leaseholds it runs through? I think there are about four.

804. In travelling from Temora to Wyalong, did you take any particular notice of the description of timber? Yes.

805. How does that country compare with the Berrigan district? It is entirely different. There is a different class of timber altogether.

806. Is it more heavily timbered? Yes, with scrub.

807. But not with large timber? There is some large timber. There is some ironbark there, but it is a different class of timber altogether.

808. I am speaking more particularly of the route itself? Yes; I should imagine it would take twice as much to clear it, as it would in the Berrigan district.

809. In the estimate given for the cost of construction you do not detail the cost of clearing the track? No.

810. What track would have to be cleared? I should think 3 chains would be ample.

811. How much per acre do you think it should cost to clear the land? I do not know. I need hardly tell you that the conditions of labour vary so much that an estimate obtained, say, three months ago would have to be varied to-day by reason of the different conditions.

812. Did you take any notice of the class of stone which could be used for the road and ballasting purposes? Yes.

813. Is it a good class? I think so. I think it would make a good road.

814. Is it contiguous to the proposed line? Yes; in several places where I broke off into the bush I met with ironstone and gravel ridges.

815. Then with the exception of two or three selectors there is practically no settlement between Temora and Wyalong? No.

816. Do you see any prospect of any increase of settlement? I do not under existing conditions.

817. And, if the lands held under pastoral lease, are to be held for another five years, there can be no increase of settlement? No; I will give you an idea of what has been paid for some of the leasehold areas there. On Upper Wyalong No. 3—Mr. Amos has paid 1d. an acre for 19,000 acres. Upper Wyalong No. 2 for 18,000 acres 1½d.

818. *Chairman.*] At what would a similar area of land near Temora be rated;—of course it would depend on the class of country near Temora? There is one station—Mimosa—between Temora and Cootamundra, for which the Bank of New South Wales have paid 3½d. an acre.

819. *Mr. Chanter.*] When previously before the Committee you were asked:—

If the line were extended to Wyalong, would it attract wool which now goes to Carrathool and Whitten, and thence down the Murrumbidgee to Echuca and so to Melbourne? I do not think so.

—Are you still of that opinion? Yes.

820. You were also asked:—

Are you of opinion that if the Temora line were extended to Hillston via Lake Cargellico, the wool from the district you have just mentioned would make use of that extension instead of going into Victoria? No; I think that the bulk of it would still go down the river.

If

If a line of railway is extended from Parkes to Condobolin, and thence on to Hillston, would it not have the same effect? I do not think it was ever contemplated to use that as a main line of railway. The idea, I think, was to have a branch to Hillston and to continue along the Willandra Billabong to the Darling at some future time. J. Harper,
Esq.
29 May, 1895.

821. According to the wall map, the Commissioners' idea was to carry it from Condobolin, Cargellico, and Hillston, and thence on to Menindie? That was never the Commissioners idea. The idea was to come down to Uabalong from Condobolin, and then to have an extension down to Hillston, and running the line along the Willandra Billabong.

822. Would it have any different effect, as far as obtaining the produce of that district is concerned, whether you carried the line from Condobolin to Hillston, or from Wyalong to Hillston? Yes; it would have a great effect, because there are a number of stations, which if intercepted by a railway along the Lachlan would probably send their produce to Sydney. At present it is sent to Hay or Carrathool to go by river.

823. Then the only way of intercepting that traffic would be to extend the line *via* Condobolin? Yes.

824. I gather, that with the view of an ultimate extension into the Lachlan country, you do not favour the line from Temora to Wyalong, and thence on to Hillston? No.

825. But you do favour an extension *via* Condobolin? Yes. I would not say that at the present time I favour an extension from Condobolin. I would not say the time has arrived for that.

826. But if an extension is made, in your opinion it should go by way of Condobolin rather than by way of Wyalong? Yes, and down the river.

827. Then your estimate of the probable traffic from Wyalong shows that traffic to be entirely a local traffic? I have included the traffic from Uabba.

828. What distance is that from Hillston? Eighty or 90 miles, and it is very doubtful whether it would come in.

829. From your knowledge and research then you are of opinion that the construction of this line would not be justified at present. That is my opinion.

830. *Mr. Hayes.*] When before the Committee on a previous occasion you estimated the goods and coaching traffic at £2,764? Yes.

831. You also stated that you had included the traffic from stations right out on the Lachlan? Yes.

832. Do you consider that the amount of traffic you then estimated would not be realised? I do not. I consider especially, if the Condobolin line is constructed, that it will not be realised. I think it is exceedingly doubtful whether the traffic of two of the stations would come in.

833. You anticipate, then, that the estimate you have made would not be realised? Yes.

834. Is it a very full estimate? Yes.

835. You also stated that you did not make any allowance for teamsters interfering with the traffic? Yes. Of course, circumstances have entirely altered since then. I found when I went up there this time that team carriage had been reduced by 50 per cent.

836. That will also interfere with your former estimate to a considerable extent, and reduce it? Yes.

837. *Mr. Roberts.*] We have it in evidence that about twelve months ago, within 5 miles of Wyalong, there was a population of about 5,000 people? Yes.

838. Will you explain why you form your estimate for 1894 upon a basis of population of 1,800? If you read my report on page 3 of the Minutes of Evidence on the railway from Temora to Wyalong, you will find it will explain the whole matter. I regarded it as a floating population, which could not be used as a basis of an estimate for a railway. At that time it could not be regarded as a permanent population. The then existing population of Temora was taken as the basis of a field equal to that at Wyalong.

839. Is it a fact that since you have made that estimate the population has fallen to 4,000? Yes; 4,000 is the official estimate.

840. And that appears to justify to some extent the estimate you formed last year? Yes; especially taken in conjunction with what I have given as to the yield of gold from the field, which does not indicate that a population of 4,000 people could be sustained upon it.

841. But if there are 4,000 people there now, it is hard for me to understand why you should only reckon for 1,800? For the simple reason that we have seen so many of these gold-fields come and go.

842. You base your estimate on previous experience? Yes.

843. Is not the population of Temora 1,800? Yes.

844. Would it not be fair to assume that if a railway fairly paid to Temora, with a population of 1,800, one would be likely to pay to Wyalong with a similar population? No. The districts are entirely different.

845. Is it more fertile about Temora? Yes; there is a greater rainfall. There is more agriculture going on. The land is more suitable for cropping, and it has the advantage of being closer to market.

846. Is there any population about Barmedman? Yes; there is a population of 250 in Barmedman itself.

847. Assuming that the Committee could not recommend the extension from Temora to Wyalong, would there be any justification in recommending a continuation of the line from Temora to Barmedman, seeing that it is already at Temora? No. I should think the Committee would be better justified in going to Wyalong than to Barmedman.

848. In other words, there would be no advantage whatever in going to Barmedman? None whatever.

THURSDAY, 30 MAY, 1895.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERTY.
 The Hon. WILLIAM JOSEPH TRICKETT.
 The Hon. JAMES HOSKINS.
 The Hon. JOHN DAVIES, C.M.G.
 The Hon. CHARLES JAMES ROBERTS, C.M.G.

JAMES HAYES, Esq.
 JOHN MOORE CHANTER, Esq.
 CHARLES ALFRED LEE, Esq.
 JAMES GORMLY, Esq.
 EDMUND WILLIAM MOLESWORTH, Esq.

The Committee further considered the proposed Railway from Temora to Wyalong.

Rev. John Milne Curran, Lecturer in Geology, Technical Education Branch, Department of Public Instruction, sworn, and examined:—

Rev. J. M. Curran.] You hold a semi-official position in connection with the Department of Public Instruction? Yes; an official position. I am Lecturer in Geology to the Technical Education Branch.

(30 May, 1895.) 850. Which position takes you to all parts of the country, and enables you to form a definite opinion with regard to their mineral resources? Very often.

851. Do you know the Wyalong country? Yes; I spent six weeks or close on two months in the district this year. I visited Temora, Wyalong, Reefton, Barmedman, Yalgogrin, and surrounding districts. I have been over the country from Temora to Wyalong too. I returned from there on Monday last.

852. Do you know the country going in a northerly direction from Wyalong across the Lachlan, towards Euabalong? Yes; I came down there from the Cobar side some years ago. I think I know its resources pretty well. I worked down from Cobar to Condobolin, through Euabalong, many times years ago—in fact it was an old travelling route of mine.

853. And you know the country intimately? Yes; pretty well.

854. Mr. Davies.] You have made several visits to Wyalong? Yes; more than one.

855. What is your opinion as to the permanency of the field? I consider the field is permanent, inasmuch as the word permanent applies to any gold-field. It is not a thing which is to end next year or the year after, but if you mean by permanent that the field is to go on developing, and the population is to be added to, I cannot agree with you. I think there are as many people in Wyalong now as there ever will be.

856. Then you regard the present population as large as it is likely to be? Yes; with the mineral resources I know of.

857. With the mineral resources at present in sight? Yes.

858. Do you regard it as a poor man's field? Certainly not. So far it has been, and it will be for the next twelve months, but after that some of the greatest questions dealing with the winning of gold will have to be dealt with.

859. Do you know the total amount of gold that has been raised? I cannot go into that question now. I think I should be in a position in a day or two to give a fairly accurate figure as to what has come from there.

860. Have you furnished a report to the Department? It is in preparation now. It is complete except as to some analyses of minerals and rocks.

861. I suppose you have learnt that about £40,000 worth of gold has been raised? Yes; I have heard so.

862. Do you regard that as a fair index of a permanent field, taking into consideration the number of miners employed in connection with the various reefs? No; I should not take that as an index of a permanent field. At the same time I do regard Wyalong as a permanent field.

863. Will you give the reasons why you have come to that conclusion? So far, the gold has been won from reefs in contradistinction to alluvial gold, which works out very rapidly. There has been no alluvial gold won there so far. The gold which has been got we know has been won from the reefs; it is not gold which has been transferred there. More than that, the gold has every appearance of having been derived from pyrites, which we find *in situ* at the lower level. The quality of the gold which has been won differs in no way from the quality which remains in the ground in exploratory shafts and drives which have not been touched. The character of the stone near the surface is in keeping with the character of that at the greatest depth which has been touched, excepting that one is oxidised and the other is in its natural condition.

864. Do you find the reefs growing in richness as you get to greater depths? On the contrary, quite the other way. In addition to what we might conclude from examining the rocks, we know for a fact that the gold is not getting richer. More than that, in eighteen months' time very different methods will have to be resorted to to get the gold, provided work goes on continuously.

865. To extract the gold? Yes.

866. What is the general character of the quartz reef? Up to a depth of 150 to 190 feet the gold occurs as what we call free gold mixed with sulphides. Below that depth there is very little free gold, as far as our knowledge up to date goes; but there is gold combined with pyrites, both iron and arsenical.

867. Take the greatest depth of claim at Wyalong;—what would be the width of the reef, and what would it be likely to yield per ton? I do not think I could answer both sides of the question with one reply. So far, the stone crushed has to my own knowledge yielded on an average 2 oz. to the ton.

868. That is taking the whole field? Yes; that is naturally the richer ore. In a certain sense there is what we might call surface concentration there. Some thousands of feet of country have been removed, and as the country has been removed a good deal of the gold has dropped back into the reefs, because wherever water will go gold will go.

869. As the claims follow the reef down, they become troubled with water? It is a fortunate trouble. They have struck water on every deep shaft on the field, which I consider a fortunate thing.

870. And they will not be able to work the claims without some appliances for pumping? Certainly not. That is one of the reasons why I have said I do not consider it a poor man's field. Below 200 feet it will require capital to develop it. Certainly there was never a field so easily worked up to the present time, and, I may add, so badly worked. They have taken out the reef simply with a pick and shovel. The surrounding rock is so decomposed that it can be dug out.

871. What are the walls? Of granite on Wyalong proper, sometimes slate, and often diorite on parts of the field. Rev.
J. M. Curran.
872. What is the greatest width? I should explain with regard to the greatest width, that I saw no reef on the field that runs horizontally and vertically at a definite width. In slate country we find reefs run through, practically north and south, and run at an equal width; but in Wyalong the walls come together both horizontally and vertically, so that a man may have 200 feet of reef showing on the surface, but he cannot count on 200 feet of gold-bearing stone falling there. There is a lot of dead ground between the two points, where the reef will make, and the same principle holds with regard to depth. 30 May, 1895.
873. Does the fact of the country being granite make it improbable that the reefs will continue? Certainly not. There is no reason why the reefs should not occur in granite, and be permanent. I may mention that Charters Towers is a gold-field which has a reputation, which seems to be going to last, and reefs occur there in granite.
874. Have you ever visited Charters Towers? No.
875. Is the country similar to that at Wyalong? Without visiting we know the character of the rocks. It is not at all unlike it.
876. I gather, then, that you are hopeful of a rich permanent field being established at Wyalong? I would rather leave out the word "rich." I have every hope of a permanent field—that is, mining will continue there for many years to come—but that it will be a rich field, I have no evidence before me to show.
877. Are you of opinion that it is likely to be a payable field? Decidedly.
878. A payable permanent field? A payable field, say, until such time as mining under such conditions as an ounce of gold per ton in pyrites would cease to pay.
879. Then you are of opinion that at least an ounce to the ton would be realised? Yes.
880. And as they get to greater depths that will be maintained? We see no reason why the gold will not go to a depth. On the contrary, recent indications, up to the day before I left the field, all pointed in that direction. I saw some stone taken from below the water level, which is an important point to consider, and it was exceedingly well mineralised.
881. What level would that be? Over 200 feet.
882. Was that from the "Three-star" Claim? No; it is quite close to the Welcome Stranger,—on the Welcome Stranger line of reef. The stone is splendidly mineralised. It contains galena, which is considered a favourable sign for the occurrence of gold in a quartz reef; also, carbonates of lead, carbonates of zinc, carbonates of copper, and free gold alongside, not in the pyrites. The specimen is rather a unique one, and has gone to the Technical Museum.
883. And you regard those indications as a safe sign? Decidedly.
884. How do you regard the reefs at Barmedman? I am not in a position to speak so unreservedly about Barmedman. There is no active mining going on there. We could not get underground, and had to take everything on hearsay, which is not a thing to depend upon.
885. You are not in a position to express an opinion about Barmedman? No; but in trying to get at an estimate of what Barmedman was worth, I had occasion to find out what gold was sent from there through the banks, which is something to depend upon, and that is decidedly encouraging. Up to the day on which they stopped work there was gold coming from Barmedman. The water came in and caused the stoppage.
886. Do you know the total amount sent? I made no note of it, but it was sent continuously while operations were going on.
887. What area of auriferous country will there be on the Wyalong gold-field? If a man told me he had discovered a payable reef in a tract of country about Wyalong, say, 20 miles long by 15 miles wide, I should have no reason at all to doubt him. I should say it was quite possible; but from my own observations I think the paying reefs are confined to a very much narrower strip of country. I should think that 3 miles by 1½ mile, would cover all the good things there.
888. What number of miners would be sustained by a field of that extent? I do not consider the miners can maintain themselves at all there very shortly. The field will have to be worked by companies, and of course companies will work much more economically than will small parties of men.
889. That is to say, capital will be required to erect pumping-plant, &c. Decidedly; I do not think there is any prospect of the population being added to. On the contrary I think it will be the other way, even though the field should continue a remunerative one.
890. You do not think it is likely there will be a large increase of population? I do not; I do not see anything to justify it.
891. Are you in a position to express an opinion as to the condition of the road from Temora to Wyalong? The road was very good when I came along it, although I have not been there in wet weather. It was quite dry—in fact, too dry.
892. Was there much traffic upon it? Yes, there was a good deal of traffic. We passed eight or ten teams coming or going.
893. I understand that Reefton is included in your opinion as to the character of the field? No; it is a separate field with separate conditions, about 11 miles from Temora.
894. Is it a different character of country? Very different.
895. What is the character of the reefs there? The reefs there are really more like the reefs we are accustomed to—they are good quartz reefs in slate country.
896. Are they wide reefs? Yes; some of them are very promising. One or two of the crushings have been very good so far.
897. What has been the average? I do not think I should be far out if I say 2 oz. to the ton.
898. Then the average is quite as good as that at Wyalong? Yes, but the field is not so extensive.
899. What extent of auriferous country is there there? Not more than three quarters of a mile. I do not think there is payable gold all along the reef. Perhaps there will be five good properties.
900. Is the land that was available all taken up? Yes.
901. And it is being worked at the present time? Yes, in a desultory sort of way.
902. You have already stated that you do not think it is likely that the population will be increased? No; I think there are quite enough people at Reefton, even for a better thing than the Reefton people have got.
903. The same remark applies to Wyalong? Yes.

Rev. 904. Is there anything further you wish to state, with reference to the Wyalong gold-fields, including
 J. M. Curran. Reefton and any other portion of the district, which will contribute to a settled population? I think
 the country about Yalgogrin will contribute to a settled population.
 30 May, 1895.

905. How far is that from Wyalong? About 30 miles to the south.

906. Has gold been discovered there? Yes.

907. Are many miners at work there? I saw about forty or fifty men there making a living.

908. What is the character of the country there? Slate and granite. It is rather promising country. There is a crushing-mill there.

909. Has any alluvial been discovered there? No.

910. Taking all these different centres of auriferous country, you are still of opinion that they are not more than sufficient to maintain the present population? Yes; that is my opinion.

911. Unless some fresh discoveries are made, it would not be wise to base a calculation upon any greater population than that which is centred there at the present time? Not from a mining standpoint. Of course, I know nothing about what the throwing open of land may do in settling a place. As a gold-field, I think there are a great number of people working properties which are absolutely useless. They are hoping for better things and better times, which I do not think will come to them. They hope that new discoveries will be made which will absorb those people who are not getting a living at the present time.

912. Have you anything further to add with reference to the field? I have been giving a good deal of attention to the water supply there. From the start I committed myself to the opinion that there would be no difficulty about water.

913. Water for domestic purposes? No; the water is very mineralised—in fact, extraordinarily so.

914. You mean for batteries? Yes; it is first-class water for battery purposes, although very strongly mineralised.

915. Would it not affect the boilers? Certainly; it could not be used in boilers without special precautions. It could be condensed, of course. I am quite satisfied they will never be short of water for battery purposes, and when the tanks once get filled they will not be short of water for domestic purposes.

916. And you believe, as they get to a greater depth, they will get more water in the claims? All the shafts that have gone below water now cannot cope with that water. At Cox's battery in particular they put on a small pump, but cannot make any impression on the water.

917. Is that likely to apply to most of the claims? Yes; to most of them, not to all.

918. How are they going to work those claims, then? A mining pump can almost cope with any water supply.

919. I notice that Mr. Warden Clarke, in giving particulars of some of the deepest shafts, says:—

Three star, 180 feet; driven 57 feet; reef, about 2 feet; 207 tons crushed for 1 ounce per ton; water makes about 1,200 gallons per day.

920. What claim did you refer to as making water so fast that they could not cope with it with a small pump? It was a shaft put down for water at Cox's.

921. *Mr. Trickett.*] You say you do not regard this as a poor man's field? Not in the future. So far it has been pre-eminently so.

922-3. At the present depth the material which they have to deal with is comparatively soft? I suppose they never had such a combination of favourable circumstances in the Colony before. As they go down they will get to the hard granite, and the process of treating the granite quartz will be of an expensive character.

924. Do you think the chlorination process will be necessary? We have made experiments on that head. We have tried chlorine and cyanide. We find there is no reason at all why chlorinating in open vats will not meet all requirements.

925. Will that process be necessary to deal with the gold at a deep depth? Yes.

926. Is not that about the most expensive process to extract the gold? No. In any of the conditions that may apply to Wyalong, it certainly is an expensive process, and I suppose it will cost £2 10s. a ton to treat it. £3, I daresay, will be the charge made by the people who will erect works to treat the ore.

927. And what is the cost of the amalgamation process? The present price is 17s. 6d. a ton; 15s. for large lots.

928. Then the expensive cost of treating is rather a handicap to the gold-field? When you look at it in the light in which it will be shown by and bye, I do not think so, because they will not have to treat every ton of stone in that way. They crush about 20 tons. They get all the free gold they can in the mill. The blankettings and concentrates will have all the difficult material, and the 20 tons will be reduced to about 2 tons, so that out of 20 they will only have to treat 2 tons practically, by chlorination. So far the difficult ore relative to the free ore would be 1 per cent.

929. During the time you were there, did you notice whether miners were leaving the ground or coming to it in any numbers? It would be hard to say they were coming to it. They certainly were not coming to it.

930. Were they going? I can hardly say they were going away. The men were leaving properties considered of no value, and trying others. There is plenty of ground there still. I do not think many were leaving the field; but I am certain very few were going to it.

931. What area do you think would cover the present discoveries at Wyalong? That is a very difficult question to answer. If I were asked whether all the good mines were close to Wyalong, I could answer easily. All the good mines close to Wyalong township, I should say, would be within an area of 3 miles by 2. All the good mines are certainly within 1 mile of the mining camp at Wyalong.

932. *Chairman.*] Still from the formation of the country, if, in 20 miles by 15, you were informed there were good discoveries, would you have any reason to doubt it? No; it is country where reef-gold may be found anywhere.

933. *Mr. Trickett.*] Does the same character of country extend as far as Cargellico to your knowledge? No, not the same character of country; but I may say I have had rather encouraging samples of stones sent in from a number of places out in that direction.

934. *Chairman.*] In the direction of Cargellico? Yes; the owners of the properties do not seem to care about encouraging prospectors. They send in the stone themselves, but they do not want it to be made public.

935. *Mr. Trickett.*] But persistent prospecting would be required for this country to ascertain its character ;—it is not easily prospected ? I should think Wyalong would never have been discovered if it had not been for an accident. I think no men would have ever started to prospect for gold there. In fact, one of the methods of prospecting there in the early days was very primitive. They simply took a pick and drove it into the ground anywhere, and whenever they felt anything hard they thought it was a reef, and very often they were perfectly correct.

Rev.
J. M. Curran.
30 May, 1895.

936. I understand that the character of the field is such that the seams thin out as you go down, and make again at intervals—it is patchy ? Yes ; both horizontally and vertically.

937. But do they vary ? I have seen gold cross a reef 3 feet wide.

938. And you have seen one as small as how much ? Threads. I have known it thin out to nothing horizontally.

939. What distance would that be ? I found payable gold in one claim I know something about for 30 feet. It thinned out from 3 feet to nothing in a length of 30 feet. The walls came together—there was no reef. You follow the joint, and the reef makes again. I may say the miners do not consider it a hopeless case when they lose a reef there. As long as they have a joint they think they will be able to pick it up again, and so they do.

940. It is a field, then, which nothing but persistent and patient work will make permanent and payable ? Yes ; it is very different from the slate country we have in Victoria and parts of this Colony.

941. Where they have 100 feet of reef showing on the surface they can give an estimate of what there is 100 or 200 feet deep ? Yes.

942. So far as your observations have gone you see no reason why down to 200 feet the reef should not be fairly consistent and remunerative ? Yes ; under the conditions I have mentioned—that we must allow for walls meeting horizontally and walls meeting vertically, so I daresay half the reef of every area will be what we call dead country.

943. How many batteries are there at Wyalong at the present time ? There were four in full swing when I was there, and a prospecting battery, and a thirty-head battery was being erected, with all the latest appliances for gold saving.

944. We had evidence from Mr. Pittman, twelve months ago, that there were three batteries then erected ;—is it not rather a slow development of crushing-plant to have only four batteries now ? It is indeed, considering how easy the stone is got; but in explanation of that, I might say that there are more people employed mining there, who have not been mining before, than I have ever seen in other parts. They are men who have left other positions and who have taken to mining.

945. Did you see many claims lying idle ? I did not see any mine where work was suspended. But it will strike anyone going to Wyalong that when four men form a party and work for twelve months and bring so very little stone to the surface, it is a shocking state of affairs.

946. Almost indicating that the land was largely taken up for speculative purposes ? I would hardly say that, because I happen to know some of these parties, and they seem bewildered. They do not know what to do ; the conditions are so different to what they have been accustomed to. Many of them have never been accustomed to any of the conditions of mining, and because they cannot see gold in every stone they take out they become frightened. I think they have a shrewd idea that they will not be able to work the claims themselves by and bye, and they cannot send the stuff to a crushing-mill as at present. Under all the circumstances I should think many of them would be very glad indeed to sell out.

947. With regard to the mines which are being vigorously worked, is there much stone at grass, or is it all pretty well crushed ? No ; there is stone waiting all over the field for machinery. It is waiting everywhere to be crushed, and it is a stone which I consider will do very well ; so that the next twelve months of Wyalong, I think, will be its most prosperous time if they get water.

948. Did you examine any stone at grass ? Yes ; we brought half a ton to Sydney. It was selected from all over the field. It was collected from various parts of the fields as specimens for the Museum.

949. Are the batteries fully employed ? Yes ; they are doing all they can.

950. Then I suppose it is really want of capital which has kept back the erection of further batteries ? I hardly think so. I think the difficulty has been water. There is plenty of capital forthcoming, in fact ; I know of people now waiting to put up mills there, but water is the difficulty, or it has been in the past. This thirty-head mill is going up, and that will soon run through a lot of stone. I do not think many people will be waiting for crushing if they have, say, 2 inches of rain next month.

951. Is a company putting up this mill ? No ; it is the property of Nicholas and Reymond, from Forbes. They have had mills on the fields in the western districts for many years.

952. Do you think this is a field on which a miner, with ordinary experience, would be able to get a fair living if he could get his stuff crushed at one of the local batteries ? Certainly ; there is no question that a number of people there have made money as it is, and by far the greater number have stone at the surface good enough to sell or crush. They are merely waiting for it to be treated. But you must remember they have taken twelve months to get it.

953. Then you think that the reason certain people are not doing so well is because of their want of experience in mining ? Decidedly. It has come to my knowledge that people there have left properties which are very good. I might state that the Technical College agreed that I should take down an assay plant and an assistant, and, in many instances, we were able to assure the people that the stone they were throwing away was really worth an ounce of gold.

954. Do you think a distance of 39 miles from a railway is an excessive or inconvenient distance for a gold-field, as regards the carriage of gold from it, and material and food to it ? I do not see how it could hurt it very much to be 39 miles from a railway.

955. Especially if a fair road were constructed ? I cannot see how it could hurt the field in any way. The stone must be treated on the field. It takes $1\frac{1}{2}$ oz. of gold to send it to Sydney and treat it here.

956. That distance then would not be a great detriment to the place as a gold-field ? I do not think a railway would either make the place or the absence of one mar it.

957. *Mr. Lee.*] When did you visit the place first ? Early in February this year.

958. When was the discovery first made ? About eighteen months ago. I would not be sure on that point, but it is certainly under two years.

959. Were you there between February and your last visit ? Yes ; I remained there for three weeks for that time, and I remained there for three weeks part of last month and this month.

- Rev. 960. Those were your only two visits? Yes.
- J. M. Curran. 961. What was the population when you first visited it? I do not think the population has altered; it is about the same.
- 30 May, 1895. 962. You spent several weeks there on each occasion, therefore you were in a position to see everything connected with the field and its commercial requirements? Yes.
963. Did it occur to you that the ordinary necessities of the people were fairly met by the distribution of supplies? I really think it is as cheap to live there as in Sydney.
964. That is to say, they have no difficulty in getting their supplies from the various stores on the spot? I never heard of any difficulty.
965. Did you take particular notice of the route between Temora and Wyalong? Yes.
966. In what condition would you consider it for an ordinary bush road? For an ordinary bush road of course it is capital.
967. Was it able to carry the ordinary dray traffic? When I saw it, certainly it was. It was carrying teams.
968. Do you think the development of the field is being retarded in consequence of the people not being able to get machinery there quick enough by the ordinary dray traffic? Certainly not; two days cannot make any difference.
969. Do you think the present means of communication sufficient to supply the field with machinery and everything else required? I cannot say I felt or noticed the absence of anything.
970. Was the present means of communication a cause of complaint? I never heard any influential person there saying that the railway was wanted. I heard people say that the fact of Wyalong having been discovered should alter the designs of whatever Department or authority has the constructing of lines, and that now that Wyalong exists the line should go from there to Cargellico.
971. But, so far as you were able to judge, the residents of Wyalong were suffering no disability for the want of a railway? I never noticed anything of that kind.
972. And, as a matter of fact, if the railway were built to-morrow it would not increase the development of the mines? I cannot say that it will.
973. Is the town of Wyalong permanently or temporarily built? There was nothing really permanent, so far as I could see. I think there is only one brick store built.
974. It is chiefly a mining town? Yes, in every sense of the word.
975. And it differs very little, I suppose, from other mining townships at the same stage? It differs in no way; but it is a little more comfortable than most fields.
976. You know Peak Hill? Yes.
977. What is the distance from Peak Hill to the nearest railway station? I do not think the Parkes line was opened when I had anything to do with it. Dubbo used to be the nearest, and that was 42 miles away.
978. About the same distance as Wyalong from Temora? Yes.
979. Was there not a large population at Peak Hill? Yes.
980. And large machinery erected? Yes.
981. That was all carted over the ordinary road? Yes.
982. And that field, like most others, has diminished in numbers? We could always see that Peak Hill would diminish quicker than Wyalong. Wyalong is better than Peak Hill.
983. As a matter of fact, the prospects at Peak Hill have not been sufficient to maintain the population? No.
984. Is it not the history of nearly every gold-field in the Colony, that at their early stages they attract a large population? Yes; there is more gold to be got at the beginning.
985. And as the field proceeds in development the population fines itself down—in other words, it is a case of the survival of the fittest? Nearly always.
986. The field of Wyalong, with its present fair prospect, I presume, has no conditions different to what we have had in other fields in the Colony;—there must come a period in its history when it must be worked out? Yes; but all the same, the conditions are very different from any other gold-field I ever saw. I never saw a gold-field before where you could stand in the centre of the camp and see payable properties so plentiful around you, say, within a distance of 1 mile.
987. Was not that supposed to be the case at Gulgong and Hill End? No, certainly not. Hill End was problematical, because there it was hoped to strike shoots; but at Wyalong they have actually got them.
988. But they found very rich deposits? Yes; and they were hoping to find others which they did not, and they had no surface indications of those deposits.
989. Is it not a fact that after a few years the number of paying claims in connection with any gold-field thins down? Decidedly.
990. And the population gradually decreases? Invariably.
991. There may be some mines which will work for many years, but the majority gradually thin out? Certainly.
992. Under those circumstances, if a railway were built to Wyalong at the present time, what would be its prospects of paying, say, five years hence? Five years hence, as far as I can inform the Committee, a great number of the properties will be amalgamated. People trying to work small areas of ground will find it necessary to amalgamate with those alongside of them, and after five years time I should say, that if there are five companies getting payable gold in Wyalong they will be very fortunate.
993. That would mean a decrease of population? Yes; that would mean a population certainly not what they have now.
994. In your many travels I suppose you have satisfied yourself with the important part mining has played in the settlement of this country? Yes.
995. Many of our inland towns are due almost entirely to those discoveries? Yes.
996. Do you think the conditions are such in the vicinity of Wyalong that there is likely to be a town of any permanent importance springing up? Yes; there will always be a mining town in Wyalong. It will be a more important place, say, than Peak Hill, and certainly more important from a mining standpoint than Gulgong is to-day—we do not know what it is going to be to-morrow—and quite as important a mining town as, say, Drake.

997. Is there, in your opinion, land of quality sufficient to induce such an amount of settlement round there as would go to support the town? I can speak from experience as to the quality of the land. *J. M. Curran.* Rev.
There is certainly no better. The land at Wyalong is ideal land. The rainfall, I fear, is the trouble *30 May, 1895.*

I do not think they have as good a rainfall as they have at Temora, but I think the soil is very much better. It is undulating soil; it is partly alluvial and partly decomposed granite.

998. And you think it is probable that it might happen there, as everywhere else, that the miners after making a little rise would take up land, settle upon it, and make the nucleus of a fair town? The land will be taken up when thrown open.

999. You are aware that mining townships very soon die out unless there is something at the back of them? Yes.

1000. There must be land to carry population? Yes.

1001. Do you think that is likely to happen in this case? I do; it is very good land about Wyalong. Anyone who has been in the back country for a length of time will know that the Wyalong country will all be taken up.

1002. And for some years there is a prospect of a fair population earning sufficient to keep them? Yes; there are decidedly encouraging prospects.

1003. *Mr. Molesworth.*] I understood you to say that in some of the shafts where they have gone below 200 feet there is a great inflow of water? Yes.

1004. And that water might be largely utilised for mining purposes? Yes; from the experiments we have conducted so far, we find that it is first class for mining purposes, exclusive of boiler use, of course. It does not hurt tables, or interfere with mercury, and it does not prevent the gold from amalgamating.

1005. Do you think that quantity would be sufficient and permanent? Yes.

1006. For all the mining purposes of the field? Yes; that is my opinion.

1007. I understand you to say it would not be capable of being used for domestic purposes? No; we are making an analysis and we have almost completed it, and we find it is unfit for drinking purposes.

1008. Is there no treatment by which it could be rendered fit for domestic purposes? No. I presume you refer to the fact that some hard waters can be rendered soft. This is a mineralised water absolutely.

1009. And it cannot be treated so as to render it fit for domestic purposes? This is so mineralised that it could not without being distilled.

1010. How, then, do you expect the permanent water supply is to be obtained for domestic purposes? Well, if it all came to all, water could be condensed; there is plenty of wood, and it is cheap. I believe, however, that country will hold water very well. The tanks have only been excavated a few months, and there has been no heavy rain. My experience in Cobar and Bourke leads me to believe that when the tanks are once filled they will not go dry for many years.

1011. Then the people will have to depend on the tanks for their future water supply? Yes.

1012. Did you notice whether there was any prospect of minerals, other than gold, being discovered in payable quantities? No; on the contrary I do not think there is any prospect of other minerals. I look upon this purely as a gold-field.

1013. *Mr. Chanter.*] You think the field can only be retained by the investment of capital and incorporation of the present claims? That is my opinion.

1014. That will materially lessen the number of hands employed to develop the mines? Yes.

1015. And must seriously decrease the population as compared with the present population? It will decrease it, but I hardly think seriously. Of course I am always making allowances for new discoveries.

1016. I understand from you that when the water-line has been struck no attempt has been made to develop the reef below it? Practically none.

1017. Would it require very costly machinery to draw the water from the mines in order to develop the reefs below? I do not think it would require exceptional machinery. Ordinary pumping appliances would do.

1018. I suppose it would be so costly as to put it out of the power of the present proprietors to obtain it? Yes; they do not grant leases there, but simply claims. It is a "four men's" ground, and it is out of the question that four miners can put a pumping machine to draw water 200 feet.

1019. Have you had anything to guide you in arriving at the conclusion that the reef is likely to penetrate to a considerable depth below the water-line, or is there any geological formation to prevent it. There is nothing to prevent it. There is only one rock, and that is granite. The reefs fill fissures in the granite, which we have every reason to believe go down to great depths.

1020. The greater the depth the greater the probability of an inflow of water? I do not think that at a great depth there will be more water to contend with than there is at 250 or 300 feet. I think a great deal of the water is really surface water, although it is very much mineralised. It is not flowing water underground.

1021. At about what average depth from the surface is the water struck? 200, 210, and 220 feet.

1022. And there would be sufficient water from the mines to treat the ores? Yes; I committed myself to that opinion when no water had been struck there.

1023. Mr. Warden Clarke states that you recently visited the field and expressed the opinion that "it had come to stay"? Yes; those were the words I used.

1024. I also take it that you were then of opinion that alluvial would be found;—did I not understand you to say a short time ago that there were no alluvial indications? I could hardly hope for any alluvial. In one instance I recommended people to try for it, and before they had tried for two days we saw it was out of the question.

1025. Then the statement that you were of opinion that alluvial would be found is not quite correct? It is not.

1026. You travelled along the road in dry weather? Yes; only in dry weather.

1027. Was the character of the soil such as to induce you to believe that after a heavy fall of rain it would become impassable? I think if the road is used as it has been, and is being, it will take a good deal of rain to render it impassable.

1028. Would a road formed of earth and light gravel carry the ordinary traffic? I should think so; although I know very little about roads.

1029. You think the soil is suitable for settlement for agricultural purposes? Decidedly; there is no question about that.

1030.

- Rev.* 1030. And there is a desire on the part of the present inhabitants to obtain land? Yes; a good many people are waiting for land.
- 30 May, 1895. 1031. Have you noticed, in travelling through that country, that those who hold the land as freehold or conditional purchase land, are putting it to agricultural purposes? No; there is no agriculture around Wyalong. The nearest agriculture I saw was near Reefton.
1032. It would be a fair assumption that if the remaining Crown lands were occupied, the occupiers would not desire to use them for agricultural purposes? I hardly think so, because the people who would take up land now would be more inclined to go in for agriculture than the present holders.
1033. But is there not a number of selectors in the vicinity of Wyalong? There was no object for them to go in for agriculture. A selector living a long way from Temora had no object to gain by putting in a crop, because he had no market for it.
1034. But would not the existence of a township at Wyalong induce them to do so? But Wyalong did not exist. The present holders have only had one season since Wyalong was discovered in which to put in a crop, and that season has not been a good one.
1035. You did not notice any indications of land being prepared for cropping? No; but I heard on various sides that people would put in crops as soon as they got rain. It would have been out of the question to put in a crop anywhere about Wyalong up to a month ago. They were starting to plough as I came down last week.
1036. On the whole, you see no prospect of the mining population increasing in the future? No.
1037. But it must, for the reasons you have given, to a certain extent decrease? Yes; although more gold may come from it. Even though the population may decrease, we may get more gold.
1038. *Mr. Hayes.*] But would not that be due to a better system of mining being carried on? No; the system which has been carried on, if they had only had water, would have given more gold. There is nothing wrong with the system of mining there; but an uncertainty has possessed the miners. I could count thirty parties who have never been on a gold-field before.
1039. If the field were in the hands of experienced miners they could get through more work, and naturally get more gold? On condition that the batteries could go ahead and take the stone, these men could supply the batteries if they could take the stone.
1040. Can you give any estimate as to what number of working miners can be fairly employed on the field as it now exists? I think there are more men on the field now than employment can be found for.
1041. In looking to the future of Wyalong where do you think the extension of the gold-field will take place—in the direction of Yalgogrin? Yes.
1042. The prospects are in that direction? Yes. There is a place called Fifield between Cargellico and Wyalong, where they get gold and platinum and other minerals which are sent to us constantly, and which are very promising.
1043. What distance from Wyalong? About 60 miles. There are about 200 miners there.
1044. Your examination was practically confined to mining around Wyalong, Yalgogrin, and Reefton? Yes, and Barmedman and Temora.
1045. And you think there is a prospect of new discoveries being made in the future between 20 and 25 miles of Wyalong? Yes.
1046. And that may to a large extent keep the present population employed? Yes, that is much as I could hope it would do. They will be very fortunate if they do keep the present population going, because I know of so many mines which must be abandoned.
1047. There has really been no alluvial mine discovered there yet? No.
1048. And you think there is no prospect of one? No.
1049. Have you examined along the range between Wyalong and Yalgogrin? Yes; I have been along it.
1050. Has that been examined for alluvial to any large extent? No; all the same, the prospects are not encouraging there.
1051. *Mr. Roberts.*] What is the average yield of gold per ton at Wyalong? Close on 2 oz.
1052. That is irrespective of picked stone? Yes, taking the stone all through.
1053. Would not that pay very well for the investment of capital? It would if it would last, but we do not expect it to.
1054. Why not? For the reason I have already referred to—that for the first 70 and 100 feet there is what I call surface concentration. The richest stone is near the surface invariably, and even if there is as much gold in the stone below it will cost more to get it. It will cost more to mine it, and more to save it when you do mine it.
1055. Is not proper machinery there to deal with the stone? So far the machinery there is quite suitable for any ores they have sent to the mill. I may say I saw a parcel of stone there which would yield about 20 oz. to the ton from arsenical pyrites.
1056. Does there appear to be any lack of capital there for the proper developments of the reef? Yes; at the same time there is no prospect of capital coming. I have known investors come there, and directly they find a small area they will not touch it. An English investor came there to buy some properties for those whom he represented, but when he found he could not have a lease granted to him, or that it would take twelve months to put it through, he went somewhere else.
1057. Is not that owing to a defect in the mining law? They will not grant leases there. It is not a defect in the sense of an oversight. I do not think the Department of Mines mean to grant leases there.
1058. Does that prevent the introduction of capital into the district? In that one instance it has prevented it.
1059. I gather that you do not think there will be much improvement in Wyalong in the near future? Not in the number of people.
1060. Are you aware of any new capital being about to be invested in the district by way of mining? No.
1061. *Mr. Gormly.*] Can you give an opinion as to whether the reefs are likely to go any considerable depth below the water level? One's opinion does not go for much. I believe the reefs are just as permanent below as above.
1062. And likely to go a considerable depth? Yes.
1063. *Mr. Humphery.*] When you were at Wyalong how many claims were on payable gold? Between sixty and seventy. "Payable gold" is such a wide term that one person would call gold payable which another

another person would not. I have seen places which would give payable gold on the surface, but I could not advise anyone that it would continue. If you went round the claims and numbered those who had payable stone at grass in quantities of over 5 or 10 tons, I should think it would run close up to 100 claims. Rev. J. M. Curran.
30 May, 1895.

1064. Assuming there to be about 100, how many men would be employed on each shaft, on an average? Four and eight, as a rule.

1065. Taking the average at six, there would be employment for about 600 men on what might be regarded as payable gold? Yes; that would be very close to my estimate.

1066. You have spoken of reefs in the immediate vicinity of the camp? Yes; there are six lines of reef.

1067. Do they run parallel? Yes, pretty well.

1068. Those are the reefs, I presume, which would come within the area described as 3 miles by 1½ mile? Yes.

1069. Beyond that area, how many shafts within 8 or 10 miles of the camp would be upon payable gold? Not more than seven or eight.

1070. And employing about how many men? About forty.

1071. Would the gold be more expensive to win after reaching a depth of 200 feet? Yes.

1072. Did you examine any deep shafts? Yes; I examined Gorman's, which was close on 200 feet.

1073. Did you examine Neill's? Yes; but they have not got that distance down yet.

1074. Was Gorman's the deepest? The deepest was the shaft put down for water away from the reefs.

Hugh Giffen McKinney, Esq., Chief Engineer, Water Conservation Branch, Department of Mines, sworn, and examined:—

1075. *Mr. Lee.*] Have you any knowledge of the country from Temora to Wyalong? I know it pretty well. H. G. McKinney, Esq.

1076. Have you been to Wyalong since it became a gold-field? Yes, several times.

1077. Have you been carrying out any works there for the conservation of water? Yes; on a comparatively small scale. We have constructed two tanks, and have resumed some others, which we have been fitting up. 30 May, 1895.

1078. Are they sufficient to furnish the residents with water for domestic use? They are, under existing conditions.

1079. Has it not been very dry for some months? Yes.

1080. And they have carried a sufficient supply for domestic use? Yes.

1081. You do not profess to find water for mining purposes? No.

1082. Have you in contemplation the erection of any further works? Nothing has been proposed yet.

1083. Does your Department look upon the population of the field as such for which provision must be made in the shape of water? We did; but the evidence we have is to the effect that the population is rather too great for the existing conditions of the field. That is the opinion of Mr. Slee, and he should know pretty well the value of the mines.

1084. But you designed the tanks and constructed them? They are only ordinary tanks.

1085. What did they cost? One of them about £500, and the other £400. They are ordinary excavations.

1086. Have they been found to give a sufficient supply of water during the last four or five months, when it has been very dry? Yes. The supply did not run short, although the strain was very severe.

1087. Then, I presume, you do not contemplate adding to those works? There is nothing at present to justify further works.

1088. Have you any work in hand at present for the extension of those tanks? Nothing, except fencing them in, and making some drains, and matters of that kind.

1089. But not to make any more tanks? There is nothing contemplated at present.

1090. Is there any demand from the people for more tanks? There has been an agitation there for some time, but, as a matter of fact, they did not make the best use of the supply they have got. In several cases the tanks were contaminated by the people; in fact, they allowed cattle to go into them, and in some cases they used the tanks for baths.

1091. What view is taken by the Department as to the future? We consider that the arrangements are sufficient for the domestic supply, but we have made no attempt to meet other requirements.

1092. That is so far as the quantity of the water is concerned, but has not the quality been very bad? I do not think so.

1093. Has there not been a lot of typhoid there? The water has undoubtedly been bad at the White Tank, but we found it impossible to keep the people from contaminating it. A very strong report was given by Dr. Ashburton Thompson, in the early days of the field, about the way the water was contaminated. It was so bad that he recommended that that tank should be filled up.

1094. What did you do? We proposed filling it up, but immediately an agitation against that was started, and the people said they were determined they would not have that tank interfered with.

1095. Have you taken any steps to cleanse the tank? Yes; some time ago it was cleaned out, and the Government contributed half the cost of doing it.

1096. Will not the tanks be liable to be contaminated in the future? We have been fencing them in, and have two caretakers there to try and prevent them being contaminated.

1097. The fencing would only keep the cattle away? We are putting up wire netting too.

1098. How do you consider the contamination of the water took place? One of the most recently resumed tanks there was one called Bolte's. On the last occasion I was there I found it was full. The water up to that time had been in good condition. It was full up to the brim, and would have been a valuable supply, but when I was going to it with one of the Wyalong Progress Committee we were asked a question whether we were going to make any attempt to stop people bathing in it. I suggested then to the members of the Progress Committee that it would be a good thing if the Progress Committee would try to do something. At that time that tank was only partly fenced in. I was told that the people there made a practice of going to the tank and bathing in it and occasionally swimming their horses in it.

1099. Could that water be contaminated by drainage from the surface of any portion of the town? No; the only tank in any serious danger of being contaminated is the White Tank. In fact it is the only one which is seriously contaminated.

- H. G. McKioney, Esq. 1100. Are you quite satisfied that is the only source from which contamination can come? No doubt, to a certain extent, as population increases, they would become liable to contamination.
- 30 May, 1895. 1101. Is there any means by which you could give the people a better supply? The only good source I know of which would be likely to be utilised is Lake Cowal and that is a long distance away. I scarcely think the population on the ground would justify the pumping of water from there.
1102. How far is it from Wyalong? Twenty-five or 27 miles.
1103. Are we to understand that so far as the present population is concerned the present water supply is considered to be sufficient? Yes; for domestic purposes.
1104. Have you conserved the water in sufficient quantities for the field? I think so.
1105. Is there any other source of supply from creeks or waterways? No.
1106. They have to depend entirely on the water from the tanks? Yes.
1107. That being so, it will not be necessary to build a railway to convey water to the field? No.
1108. Take a radius of 20 miles from Wyalong—Is the country well watered or badly watered? Naturally it is badly watered.
1109. If there is any large settlement there in the future, the settlers will have to depend on the surface water, which they may conserve? Yes; there may possibly be some soakages which they may get a moderate supply from.
1110. But are there any permanent creeks there? No.
1111. There is no permanent water nearer than Lake Cowal? No.
1112. What is the supply like at Barmedman? They have some springs near there. I believe they were sufficient to carry them through a long drought, but the supply from them is comparatively small? I think it is sufficient to carry Barmedman through a difficulty, but it would not be sufficient for Wyalong.
1113. Are there no permanent creeks at Barmedman? I do not think there is any permanent flow. They have some small permanent springs.
1114. Are there any wells there? I am not quite sure. I know they have good supplies of mineralised water there.
1115. There is nothing permanent then about Barmedman? They have a very good supply of water there of an inferior quality in one of the shafts. It is mineralised more or less.
1116. Is the supply the result of surface water, or is it spring water? It is not surface water.
1117. Is it not a fact that they have also obtained spring water by sinking on the reefs at Wyalong? They did obtain water in moderate quantities.
1118. Would not that go to prove that there is great possibility of obtaining water anywhere by sinking for it? It is quite possible they may obtain water. So far as I have heard, there was no water of good quality obtained in that way.
1119. But water sufficient for railway purposes? I think that is quite possible.
1120. For instance, if a railway is made to Wyalong, how are they going to get their water supply? If there is a railway made, they can conserve the water in tanks. There are good catchments in many places.
1121. Or they could sink for it? Yes.
1122. *Mr. Hayes.*] The water supply you have at present is tanks at Wyalong? Yes.
1123. Are the people settled upon the drainage areas which supply the tanks? There is a large number settled upon the "White Tank."
1124. There is no water in the new tanks you are putting up? No. On those tanks there is practically no settlement on the catchment areas.
1125. Has any provision been made to reserve the catchment areas? Yes; we have had reserves made on each of them.
1126. And you think the supplies at those tanks will not be polluted? I think so; we find great difficulty in keeping the people off the catchment areas.
1127. *Mr. Gormly.*] Have you examined the dividing range? No.
1128. Have you any information which will lead you to believe that there are suitable gullies for making tanks and dams near the range? I believe there are.
1129. If an excavation were made there, could a considerable amount of water be brought down by pipes to Wyalong? There could; but I did not hear of any place where a large expenditure would be justified. I did not hear of any large catchment area, where any good supply could be conserved, which would justify the laying of a line of pipes to Wyalong.
1130. Was much of the country explored for the purpose of finding a suitable catchment for forming a tank? Only within 4 or 5 miles of the town.
1131. If water was conserved in the gullies a distance up, would it be likely to be pure and suitable for domestic purposes? Yes.
1132. Better than the present source of supply? Yes.
1133. Have you explored the country about Barmedman Creek? No; we had an exploration made in the neighbourhood of Trungle.
1134. Is there a suitable place there for a tank? Yes; we selected one specially to supply Reefton, and we kept possible railway and travelling stock requirements in view.
1135. Could a sufficient quantity be conserved to supply Wyalong if it were found that the levels would bring it down by gravitation? I am very doubtful about that. The evidence we have rather goes to show that there would not be sufficient.
1136. What is the depth of the tank you have made at Wyalong? Eighteen feet.
1137. How much per yard does it cost to make them? The contract price for one was 10d. or 11d.; in the other place the contractor failed to finish his contract, and we had to finish it by day labour.

FRIDAY, 31 MAY, 1895.

Present:

THOMAS THOMSON EWING, Esq. (CHAIRMAN.)

The Hon. FREDERICK THOMAS HUMPHREY.	JAMES HAYES, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	ROBERT HENRY LEVIEU, Esq.
The Hon. JAMES HOSKINS.	JOHN MOORE CHANTER, Esq.
The Hon. JOHN DAVIES, C.M.G.	CHARLES ALFRED LEE, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	JAMES GORMLY, Esq.

EDMUND WILLIAM MOLESWORTH, Esq.

The Committee further considered the proposed Railway from Temora to Wyalong.

Hugh Giffen McKinney, Esq., Chief Engineer, Water Conservation Branch, Department of Mines, sworn,
and further examined:1138. *Mr. Davies.*] How many thousand gallons of water will the dam, which has been constructed at Wyalong, hold? The White Tank, West Wyalong, has a capacity of 3,100 cubic yards. That is the one which Dr. Ashburton Thompson recommended should be filled up.H. G.
McKinney,
Esq.

1139. Is that now full? No, but some water was put in by the recent rains.

31 May, 1895.

1140. Is it used for domestic purposes? I believe it is still.

1141. How many gallons does it hold when full? Something over 500,000.

1142. Is the capacity of the dam the same to-day as when it was first excavated? Yes; if anything it is greater, because it was cleared a few months ago.

1143. What proportion of that 500,000 gallons of water is in the dam at the present time? I do not think there is more than one-fourth or one-fifth of that quantity.

1144. For what length of time would that supply the population of West Wyalong? I could not be sure of that, because I do not know that a separate statement of the population of West Wyalong has been made out, but I think it may be taken at 1,200 or 1,400 people. At 10 gallons per head per day that would mean that there would only be about a month's supply for the population.

1145. How far is the site of the dam from the surveyed line of railway? I am not quite sure. I fancy the dam at West Wyalong is the place where the gold-field first started.

1146. You have not made provision in that tank for supplying the railway with water for their engines? No; the requirements of the railway were not taken into account in any figures we have put down.

1147. Then you would not regard the supply, even for 1,400 people, as adequate? Certainly not, in that tank.

1148. Does your Department contemplate making any better provision for supplying the district of West Wyalong? They have lately completed a large new tank of 1,200 yards, within 1½ miles of West Wyalong.

1149. Is that nearer to the surveyed railway line? It is somewhat nearer.

1150. Is the White Tank the one which was contaminated by the residents swimming their horses and bathing? No; but it is the one Dr. Ashburton Thompson recommended should be filled up.

1151. Did you take any steps to fill it up? The question was raised; but as soon as it became known in Wyalong the people protested.

1152. What action did you then take? The mining warden attempted to keep the people off the catchment area, but on account of the camp being so close to the tank that was practically impossible. The fact is, the position of the tank for that township is entirely unsuitable, and without going to a great deal of expense I think it would be practically impossible to keep it from being contaminated.

1153. Has there been any drain cut around the banks to prevent the drainage from the surface into the tank, other than the rainwater? I do not think there has. Not unless it has been done by the people themselves, and I do not think that probable.

1154. What did the clearing out of the tank cost? I think the contribution of the Department was not more than £30.

1155. Has Dr. Ashburton Thompson reported upon the character and nature of the water since the tank was cleared out? No.

1156. What area of catchment would there be to supply the tank, and what would be the fall? I cannot say precisely. A complete survey of the catchment area has not been made. The fall too is very slight. There is a gentle fall from three sides of the tank, and also from the township itself.

1157. It is sufficient for the water to flow towards the tank? Yes.

1158. Have the necessary precautions been taken to prevent water becoming polluted outside this catchment area? Yes; we purposely selected a site 1½ miles away from West Wyalong. We also got places which were thought not likely to be much interfered with by prospectors. We have also reserved a piece of land, so as to be in a position to protect it.

1159. That would give, if full, a four months' supply for the population of 1,200 or 1,600 people? About that.

1160. What was the cost of that tank? About £500.

1161. But in making the tank you had no idea of supplying the railway locomotives? No.

1162. What other tanks have you put up? The only other one we have actually constructed is about a mile from the Government township of Wyalong.

1163. Is that near the railway line? Yes; within ¼ of a mile of it.

1164. What is its capacity? 10,000 cubic yards.

1165. Would there be sufficient provision there for supplying locomotives with water? We did not take that into account.

1166. Have the Department of Railway Construction communicated with your Department with a view to making provision for water supply for engines? No; they made inquiry as to what we have done about the construction of tanks and the resumption of new ones. They have not made any arrangement, but I think they assume that they will be able to make use of that tank I spoke of near the Government township. There is an old tank besides that with a capacity of nearly 2,000 cubic yards.

1167. Do you believe the Railway Department will make use of the new tank in the township? I think that is the intention. From the way Mr. Deane spoke to me about it, I understood he had some idea of doing so.

- H. G.
McKinney,
Esq.
1168. Would it not be necessary to enlarge the carrying capacity of the tanks if they are to supply the railway engines? I am not in a position to speak, because I am not sure of the extent of their demands. Our provision is simply for the domestic purposes of Wyalong.
- 31 May, 1895. 1169. *Mr. Gormly.*] The tanks may not fill for several months? That is quite possible.
1170. What is the batter of your tanks? The two we have made are $1\frac{1}{2}$ to 1.
1171. Therefore they expose a considerable surface? Yes, pretty considerable.
1172. And the evaporation in the summer months would be considerable? Yes, undoubtedly.
1173. What is the depth? Eighteen feet.
1174. Have you estimated what the evaporation of such a tank would be in four of the summer months? I have made no experiments.
1175. What quantity might evaporate if the water were not used during the four of the hottest summer months;—would it be one-third of the quantity? No, I do not think so. I think the evaporation in that period would not be more than 3 feet at the outside.
1176. *Mr. Hoskins.*] Have the Water Conservation Department inspected the district of Wyalong with a view to ascertaining whether there is a possibility of obtaining artesian water? Yes; we have had inspections on our own behalf, and we have also got the geological reports.
1177. What is the nature of them? They are altogether averse to the idea of artesian water being obtained anywhere in the neighbourhood.
1178. Have any bores been put down? I have heard of none.
1179. What would be the cost of putting down a bore 500 feet? If no lining were required it might be put down at £200 or £300.*
1180. I believe artesian water has been found in this Colony in places where there is no cretaceous formation of rock—that is, in unlikely places? Yes.
1181. Looking at the number of persons who would probably be congregated at Wyalong for some years, and the fact that the climate is dry, do you think that the Conservation Department would not be justified in recommending the Government in putting down an artesian bore in the most likely place they thought fit? They would not be justified in putting it down anywhere within a good number of miles of Wyalong—not within 8 or 10 miles at all events—and probably not within 20 miles. The country is intersected in all directions by quartz-reefs, and the formation of the country is about as unfavourable for finding anything in the way of artesian water as it possibly could be.
1182. I suppose you know that some of the claim-holders at Wyalong have struck water when they have gone to a depth of 200 feet? Yes.
1183. Do you not think, seeing that the residents of Wyalong will have to be dependent on the rainfall, that it would be advisable for the Department to sink a deep well through that water—which they say is mineralised—and might they not find below that strata of water better water suitable for drinking? The only sinking I think worth while doing in the neighbourhood of Wyalong would be in places where there is good reason to believe there are deep soakages. There must be valley lines there which are more or less filled up, and it would be worth while sinking on some of those. I made inquiries about them, and I found there were places where there seemed to be a considerable natural soakage within a few miles of Wyalong, but I do not think by any deep sinking anything would be found, because you come to granite and other igneous rocks.
1184. Have you recommended that sinking should be made in the places you speak of? No; for this reason, that it was not contemplated to spend more than a moderate sum on water supply; and it seemed to me, at all events for a time, that the cheapest way was to put down the tanks.
1185. But in the event of there not being any rain there for months—perhaps half a year—even though you may have tanks, there may be no water, and the people may have to abandon the place? Of course there is a risk if there is a very long drought.
1186. Do you not think, in view of the physical features of the country, it would be advisable to have one or two deep wells sunk on the soakages you speak of? I think it would be advisable. It is surprising the people have not done it for themselves yet.
1187. How far are those soakages from the centres of population at Wyalong? I think the nearest place which seemed a good one to sink at was 4 or 5 miles away.
1188. Do you believe the water in those soakages would be mineralised? There would be quite a possibility that water not mineralised would be found.
1189. Do you think it would be advisable to recommend the Minister to incur some expenditure with the view of ascertaining whether such water cannot be obtained? The only reason I did not recommend that was because I was under the belief that the tanks we had would be sufficient for the water supply of the existing population. But if there is any risk in regard to the supply, I certainly should be disposed to recommend it. Personally, I did not think there was any such risk.
1190. Considering that the last rainfall was very limited, do you not think it is worth while to take the matter into serious consideration? I think the matter is well worth considering.
1191. *Mr. Gormly.*] Have you known of artesian water being got in granite formation? No; not in solid granite.
1192. Have you seen artesian water procured in such a country as Wyalong? No.
1193. Would the soakages you refer to be soakages from the surface? Yes.
1194. And if that went through mineral country would the water be likely to be mineralised? Yes; but what I thought possible was that in the natural valley lines, which in the course of time will gradually be filled up, we may find places where there is shingle or sand at the bottom, and the water may be working its way in that under the ground.
1195. In fact you would have to go down to a drift before you got permanent water? That would be the best formation to get it in, and it would be more likely to be pure.
1196. Is there a probability of a drift being found at some considerable depth from Wyalong? I think there is within a moderate distance.
1197. Although Wyalong is on level country, still it is at a considerable elevation over the valleys of the rivers? Yes, from Lake Cowal to Wyalong it rises about 130 feet.
1198. Then there may be a probability at 200 or 300 feet of getting water? Possibly; but I do not think it is likely any large quantity will be obtained.

1199.

* NOTE (on revision):—This would be the approximate outlay if a plant were on the ground.

1199. Have you taken into consideration whether a cheap gravitation scheme can be got from the Yeo Yeo Creek? No. H. G. McKinney, Esq.
1200. Do you know what is the fall of the Yeo Yeo Creek? No.
1201. But a scheme could be carried out by tapping the creek high up? Yes, but I am afraid it would be necessary to go a very long distance from Wyalong. 31 May, 1895.
1202. And therefore it would be impossible? Yes.
1203. Mr. Hayes.] Are there any surface indications at Wyalong of any of the valleys being filled up? There are one or two places where, in depressions, the grass keeps much greener than in other places round about, and remains boggy longer. The only instance I saw of water being tapped in that way was on a very small scale during a rainy time, and we found that there was an undoubted underground flow in that case.
1204. Are not those indications caused by the rock coming near the surface? It is simply a matter of the soil being very porous, and the water getting down on the higher ground and getting into what are really continuous drifts and flowing into them, instead of on the surface.
1205. Are you aware that several attempts were made in Wyalong some time ago to find water? No.
1206. Did you make inquiries? I asked about wells around Wyalong and could not ascertain that there were any.
1207. Mr. Chanter.] What is the average rainfall of the Wyalong district? Something over 20 inches, but I could not say exactly.
1208. What is the aggregate capacity of the three tanks? Something over 4,000,000 gallons.
1209. That would give a supply to the present population of the field for how long? Reckoning the population at 5,000 it would mean eighty days, reckoning 10 gallons per head per day—but the whole field does not draw from those tanks. There are nine tanks altogether for the field to depend upon. We have constructed two, and the Government by resumption or otherwise has acquired seven others.
1210. Mr. Deane states that, in the event of the railway being constructed, the supplies for the locomotives would be taken from your large tanks? That is the one, no doubt, near the Government township.
1211. Would any arrangements be made by the Railway Department with your Department for payment for use of the water? I think so. In a number of other cases the Railway Department has made an arrangement not with our Branch but with the Harbours and Rivers Branch. If the Railway Commissioners obtained a supply they pay according to the quantity they received.
1212. Do you think it is possible your tanks could supply the population of Wyalong and the railway locomotives? I think it is quite probable they would, because as a matter of fact the people are beginning to draw on other sources of supply. We make a charge for the water taken from the tanks, and we know there are at least two private tanks from which the people are drawing. In some cases they are using the water from the shafts. We know, too, that in several cases they have large underground tanks.
1213. Is there any disposition on the part of the residents to construct private tanks? Several of them have good underground tanks. There are two instances of open tanks that I know of.
1214. Do the owners sell the water? They were selling it before the rain came.
1215. You state that part of the supply might be yielded by the water in the mines? I know that on the pine ridge near the Government township they have water which is not very good, but still they consider it quite fit for use. I think they struck it first at 60 or 80 feet.
1216. And that would be a surface soakage? It is, I believe.
1217. The Rev. J. M. Curran has stated that the water in the mines is altogether too highly mineralised to be used for domestic purposes unless condensed? I believe that is so.
1218. Then in your opinion the supply cannot be increased except by the excavation of more surface tanks and the sinking of wells in some of the soakages 5 miles distant? That is the simplest and least expensive way of doing it. Of course a permanent supply could be brought from Lake Cowal, but that would be an expensive matter.
1219. Too expensive to undertake for a limited population? I fancy so. I have been told that some of the people there contemplated doing it as a private enterprise.
1220. What distance is Lake Cowal from Wyalong? Twenty-two or 25 miles.
1221. What is the elevation of Wyalong over Lake Cowal? Over 100 feet.
1222. It would require expensive machinery to force the water up that elevation? Yes.
1223. Have your Department received any applications recently from the residents of the field for increased water supply? No.
1224. Then it is to be presumed that the people are satisfied with present prospects? They have not lately made any statement to the contrary.
1225. Do you know the features of the country between Wyalong and Yeo Yeo Creek? I cannot say I do.
1226. Then you do not know whether a supply could be obtained from there? I could not say whether it could be obtained by gravitation or not. I believe it could be obtained from there, but it would be at a heavy expense.
1227. Do you know the elevation of Wyalong over the nearest point of the Yeo Yeo Creek? No; but I should imagine it would be considerably above the nearest part of the creek.
1228. I suppose your Department have done all they deemed necessary up to the present? Yes; all that is required to meet existing demands. There has been no attempt at a comprehensive supply. The whole object was to avoid expensive works on a field which we regarded as being on its trial.
1229. What would be the cost of a test bore 500 feet? It would be difficult to say. I fancy contractors would be inclined to ask for high rates, on account of the prospect of going into solid ground at a moderate depth.*
1230. Mr. Hoskins.] What is the superficial size of Lake Cowal? It is a very large sheet of water about 15 miles by 4 miles.
1231. Has it a good depth? Only at one end; the greater part of it is liable to go dry. A minute was lately sent to me to go into the question as to whether the lake could not be drained and the land converted into a labour settlement.
1232. Is the water good and suitable for drinking? Yes; it is not mineralised. It can all be drained except the south-eastern end.

Arthur

* Note (on revision) :—I have made inquiry about this matter from an experienced contractor for artesian boring. This contractor informed me that in view of (1) the expense of taking the necessary plant to the ground (2) the improbability that further boring would be done, and (3) the practical certainty of meeting with very hard rock at no great depth, he would not care to put down such a bore for less than £2 per foot.

Arthur James Stopps, Esq., Acting Chief Draftsman, Department of Lands, sworn, and examined:—

A. J. Stopps, Esq. 1233. *Chairman.*] You produce a map of the county of Gipps, which has been prepared under your directions? Yes.

31 May, 1895. 1234. *Mr. Molesworth.*] I suppose the colourings on that map are the same as are usually used to characterise the different holdings? Yes. The red colour represents the freehold land; the blue represents the conditionally purchased land, and conditionally leased land. The reserved lands are indicated by a green tint. The gold-field reserved from conditional purchase is shown by green hatching. The white portions indicate Crown lands held under pastoral lease or occupation license.

1235. What is the area of the Crown lands within a radius of 20 miles of the proposed line? 435,590 acres.

1236. How much alienated land is there? Freehold, 115,910 acres; conditionally purchased and conditionally leased land, 445,950 acres; the reserves are 269,240 acres.

1237. Does that include the mineral reserves? It includes everything.

1238. According to your plans, I think there are no alienated lands interfered with by the proposed line? I think no alienated lands are interfered with. The few private lands which exist on the line of railway are not separated or intersected by it.

1239. Does the line run along the public road, or alone the travelling-stock routes? For the greater part of the way it does. It is quite possible it might go through a smaller area of land under occupation; but the map does not show that clearly.

1240. Can you localise the proposed deviation at Kangaroo Hill? Yes; it would go through a conditional purchase of 40 acres.

1241. With the exception of that deviation, you are satisfied that the line would not pass through any alienated land? Yes.

1242. *Mr. Chanter.*] Did you say that the Crown lands adjoining the railway line were not under lease? It will just pass through one or two holdings of leasehold.

1243. What pastoral holdings does the line run through? Through a part of Barmedman leasehold area, Wyalong, and Mandama.

1244. *Mr. Davies.*] Has a reserve been made within a certain radius of the proposed railway of a mile on each side? No.

1245. Is it usual to make reservations of that character? When we are solicited to do so; but it is not general to make applications of the kind. They have been made, and the reservations have been made accordingly.

TUESDAY, 4 JUNE, 1895.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHREY.

JAMES HAYES, Esq.

The Hon. WILLIAM JOSEPH TRICKETT.

ROBERT HENRY LEVIEEN, Esq.

The Hon. JAMES HOSKINS.

JOHN MOORE CHANTER, Esq.

The Hon. JOHN DAVIES, C.M.G.

CHARLES ALFRED LEE, Esq.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

JAMES GORMLY, Esq.

EDMUND WILLIAM MOLESWORTH, Esq.

The Committee further considered the proposed Railway from Temora to Wyalong.

Charles Launcelot Garland, Esq., sworn, and examined:—

C. L. Garland, Esq. 1246. *Chairman.*] What are you? An investor.

1247. Have you a knowledge of the mineral resources of Wyalong? Yes; a fair knowledge.

4 June, 1895. 1248. And of Barmedman? Not so much of Barmedman.

1249. Your evidence will be primarily in regard to Wyalong? Yes.

1250. Would you like to make a statement? My knowledge of Wyalong has been acquired chiefly through my association with Mr. Climo's chlorination plant in Sydney. I think it was Mr. Climo who first gave information to the miners of Wyalong, who were crushing at the local batteries, which led them to believe they were losing a large portion of their gold. As a result of that information they have sent a great number of parcels of stone to Mr. Climo's chlorination works at Darling Harbour for treatment, and we have found that through the stone being of peculiar character, ordinary crushing, and amalgamation with quicksilver, could not possibly save the gold; so that the results which have been published of Wyalong, giving an average, I think, of something like 2 oz. to the ton of ore treated locally, does not by any means represent the richness of the field. I take it that the question of the value of the field will come into consideration with you gentlemen, who are to decide about a railway going there. We found, at our works, where we made an assay of everything that came in, that the tailings from the various batteries were carrying almost as much gold as the crushings at the local batteries produced, and in order to lay the facts before the Committee, I have carefully taken out from our books the assays of samples of tailings that have been sent from the field. I find that of forty-five bulk samples, the average is 2 oz. 2 dwt. 18 gr., which gives a value of £9 1s. a ton, which is now being practically wasted.

1251. *Mr. Molesworth.*] That is the tailings—not the original crushings? Yes. That is after treatment at the local batteries.

1252. *Mr. Gormly.*] What do you mean by bulk parcels? We have asked the miners who have had crushings, in every instance to take a fair average.

1253. What is the bulk from which you have obtained your results? They may have been 50 tons or 100 ton piles.

1254. *Mr. Lee.*] Have you treated tailings in bulk? Yes; but these figures represent samples sent from the field. We have treated tailings in 5-ton and 10-ton lots, and have extracted 4 oz. of gold to the ton from them.

1255. *Chairman.*] Do you wish to make a statement with regard to the various operations? Yes. When we ask a miner for a bulk sample of his tailings, he goes through his pile and takes an average of it.

Then

Then he sends us a sample. It may be a 10-lb. lot or a 10-oz. lot. We assay that, and then estimate the value per ton, and we buy upon that estimate after verification by re-sampling. Forty-five samples have averaged 2 oz. 18 dwt. 2 gr.; and value, £9 1s. per ton. I should like to mention that there is a lot of gold going away at Wyalong in the "slimes"—that is, in the very fine suspended matter in the water. The water is very thick there. We have only had, so far, three samples of the "slimes" from Wyalong, and those three samples averaged 3 oz. 2 dwt. 2 gr., or a total value of £12 8s. 4d. per ton. As the result of those assays we have had bulk samples of tailings and of blanketings sent to our works. I have taken from our books all our assays of tailings and also of rough blanketings, and the blanketings, I need hardly say, average very much higher. I have a list of thirty-six samples of blanketings from different mines at Wyalong, and they run from something under 1 oz. to 20 oz. to the ton; but the average of the thirty-six samples is 5 oz. 13 dwt. 21 gr., and the money value is £22 15s. 6d. per ton. Those, I need hardly say, are waste products from the local batteries. In addition to that, I have a list of sixteen bulk samples which have been absolutely treated at the works—that is, we have bought them on the assay value. They run from 1-ton to 20-ton lots. The average of those samples of bulk lots was 5 oz. 5 dwt. 7 gr. That would seem to bear out very approximately the value of the tailings and the value of the crude ore; because the average of the batteries on the field is a little over 2 oz., and the average of the tailings is another 2 oz. That would mean a little over 4 oz.; but our average is 5 oz. 5 dwt. 7 gr.

C. L. Garland,
Esq.
4 June, 1895.

1256. *Mr. Lee.*] That is bulk stone? Yes; that is a total value of £21 1s. 3d. per ton. Then we have also had a large number of bulk samples of ore for assay, where miners wanted information as to whether their ore was worth sending to Sydney for treatment or not. Those samples run all the way from about 8 dwt. 4 gr.—that is the lowest I have, and there are twenty-seven different samples—to 41 oz. 1 dwt. 20 gr. The average of the twenty-seven samples is 8 oz. 4 dwt. 5 gr., and the total value per ton is £32 16s. 10d. Hitherto I have only been dealing with what we term oxidised ores—that is, ores existing above what is supposed to be the water-level of the field, and there can be no doubt that at Wyalong, in a country composed of granite, when once the water-level is reached, the country will become hard and composed; it will become an ordinary granite country, and the nature of the veins there will totally change—or rather the nature of most of the veins. Most of the veins are composed largely of oxide of iron on the surface, right down to the water-level; and from the water-level down, no doubt, that oxide will change into a sulphide of iron—in other words, pyrites ore will come in. But the oxidised ores themselves are difficult to treat, inasmuch as the oxide coats the gold, and when it comes into contact with the quicksilver, with which it is supposed to amalgamate, the coating of oxide of iron prevents it from amalgamating, and it passes on into the tailings. But those particles of gold which are free from the coating of oxide of iron amalgamate immediately, and are caught in the quicksilver, and are recovered; but when the water-level is reached, and the upper levels have been worked out, a very different proposition will present itself. The batteries will not be able to cope with stone of that character, although they are probably saving nearly 50 per cent. of the gold in that ore now; but when it becomes a dense sulphide, quicksilver will sicken at the sight of it, so that some new method of treatment will have to obtain at Wyalong, just the same as it has had to obtain at Mount Morgan, where chlorinating is carried on exclusively. There it was found that with oxide of iron, quicksilver amalgamation could not save the gold. Now they chlorinate 6,000 or 7,000 tons of ore a month there, and Wyalong is just one of those fields which will require that system of treatment. In connection with the works with which I am associated, we have made several visits to the field, and have inspected the mine, and we are quite satisfied that there is ample scope, for a start, for a chlorinating plant to work 50 tons a day. That will represent the largest public chlorinating plant in Australia. We purpose going on with that plant at once—in fact, the contracts are already let.

1257. *Mr. Trickett.*] Is it a larger plant than the one at Mount Morgan? It is the largest public chlorinating plant. The plant at Mount Morgan is a private one, and treats something like 2,000 tons a week. With this plant for a start, we propose to treat 50 tons a day of the ore, crude from the mines, and any concentrates which may be made by the batteries, and any tailings which may contain sufficient gold for chlorination. I should like to tell you that we have not gone into this matter hurriedly. Mr. Climo, who is operating our works, is a chlorinator of thirty years' practical experience. He has visited the field, and is thoroughly satisfied that there is ample work for a plant of that kind for many years to come. Mr. Walter Sully, a gentleman who has put a large amount of capital into the enterprise, who is one of the oldest miners in Australasia, who was one of the pioneers of the Thames gold-field, and also the late chairman of the Broken Hill Proprietary Board, also visited the field with us, and he is perfectly satisfied with regard to its future,—so much so, that he is prepared to put something like £8,000 into this plant to carry it to a success. As I have already stated, he is a man of great mining experience, so that in recommending the construction of this line, I may say we are prepared to put our own capital and energy into the field. I presume, however, that what the Committee would be chiefly interested in inquiring, is, as to what amount of revenue, if the line is constructed, would be derived from a work of this character. I have made out a careful estimate of the quantities of supplies which these works would require. In the case of chlorination, we crush the ore dry, and then subject it to a chloridizing roast in a large revolving furnace. The furnace we shall use up there will be a cylindrical wrought-iron one, brick-lined, 40 feet long by 6 feet in the clear, and we calculate it will roast about 50 tons per day of ordinary Wyalong ore. In roasting this ore we shall use about 8 per cent. of salt—that is, about 4 tons of salt per day. We shall also manufacture chlorine gas and dissolve the gold in the ore, or render the gold soluble in water; and in manufacturing this we should use large quantities of sulphuric acid and manganese. All these supplies will have to be got from Sydney, and will have to travel over the railway. We shall use annually, if we are running at our full capacity, 1,440 tons of salt,—that is, for chloridizing the ore. Then in the manufacture of chlorine gas we shall also use salt; and we shall use about 180 tons of salt a year in manufacturing the chlorine, and about 72 tons of sulphuric acid, which makes a total of 1,672 tons of carriage.

1258. *Mr. Davies.*] What about your fuel? We shall use wood obtained locally. In addition to that we shall have to use coke in the assay plant, and various chemicals in a small way, and there may be a certain amount of carriage in the shape of repairs. Salt, however, will represent the chief item of carriage. In connection with this work we propose to have a thorough analytical department. Our present idea is to make Wyalong the metallurgical centre for the whole of that part of the country. By the process we should adopt we could treat any class of gold-ore, no matter how refractory, which requires solvent treatment. We do not propose to go in for smelting works, but to treat any ore which is suitable for solvent

C. L. Garland; solvent methods, so that these works would obviate the Government erecting a plant in a locality like that for public treatment. It will be a thoroughly comprehensive plant, and we shall be able to buy any kind of gold ore which may be in the market.

4 June, 1895.

1259. What is the total amount of capital proposed to be invested? We are getting our materials very cheaply; I think it will run us into between £8,000 and £10,000. If we were to erect the plant new—that is to buy new engines and boilers—it would run us in to a much larger sum than that; but we can get second-hand power very much cheaper than we can get it new. The most attractive feature about the assays we have had from there is that the mineralised ore—that is the pyrites ore, which is coming in at the lower levels still carries gold. I think there was some question about the mines being valuable or otherwise at a depth.

1260. *Mr. Lee.*] That is as to their future permanency? Well, we are quite satisfied on that score, or we would not venture to put up a plant of this kind, because at present we should have to compete with the local batteries for all the oxidised ore, and no doubt if they could crush for 15s. a ton, and we charge £3 a ton, they could afford to lose a good deal of gold, and still give better returns than we could. We are, however, looking to the future of the field. Wherever a mine has come down to the water level, and has got ore below that level, we have found that the ore has been a thorough base pyrites ore which the batteries could not touch at all, and wherever we could get samples of that we have had them sent down from the various mines. I am going to give you certain figures—I am not going to say that those figures will be equalled, or anything like equalled by future results; it may be an accident that all the sulphide ore we have got from there happens to be much richer than the average of that above the water-level; but it shows that gold is going down—that when the water-level is reached and the pyrites comes in, the gold is still in that ore. We have only been able to get six samples from there, and they assay as follows:—33 oz. 9 dwt. 16 gr.; 13 oz. 14 dwt. 9 gr.; 5 oz. 14 dwt. 8 gr.; 138 oz. 6 dwt. 20 gr.; 30 oz. 18 dwt. 14 gr.; and 32 oz. 14 dwt. 23 gr.—an average of 40 oz. 16 dwt. 11 gr.;—and the value per ton is £163 5s. 10d. Those figures are phenomenal, and I do not suppose for a moment that the sulphide ore is going to average more than the oxidised ore. It may be that these samples happened to be obtained when sinking in a shoot of ore, and that they have got it particularly rich just below the water-level; but this is sufficient to satisfy us that the gold carries down below the water-level, and that is what we are chiefly going upon in constructing this plant—to treat such ores as those. I do not think there is any more information I can give you in regard to the returns. They have been carefully compiled, and taken indiscriminately from our books.

1261. *Chairman.*] Do you think the railway must look for its returns to the supplies going to Wyalong. There will not be much carriage from Wyalong to Sydney? Not at present, but judging from the nature of the country I should think it would be a country which a gold-field would ultimately settle. I have seen gold-fields in New South Wales settled in parts of territory which were not nearly so good as Wyalong, and settled permanently. It appears to me that the soil is very rich and very good, and that it simply requires the miner, as a pioneer, to open a country like that to permanently settle it.

1262. You do not expect any great body of stone to go from Wyalong? I do not think when once we have started works of the character I have described on the field—works which will be suited for the most modern treatment of refractory ores—that there will be much ore going from the field; but I expect we shall have to largely increase the capacity of the plant, and that the supplies I have mentioned will probably be doubled before long.

1263. *Mr. Chanter.*] You have had considerable experience in regard to the Wyalong field? Not in regard to the field. I have only visited it twice, but I carefully inspected it both times I was there.

1263½. You have given evidence in regard to the extracting of gold by means of the present appliances on the field, and also in regard to the amount of gold wasted or lost? Yes.

1264. Did you obtain those samples yourself, or were they forwarded to you by mine owners? They were forwarded to us by mine owners.

1265. Then you have no positive guarantee that they were fair samples of the bulk? No, beyond this: that the mine-owners have written us asking us for advice with a view to sending their ore for treatment. We have told them how to proceed to take samples and to be careful to take bulk samples, otherwise it would not pay them to pay the freight down and our charges; and whenever they have sent stone to us we have been able to give them returns equal to the samples.

1266. Where are your chlorinating works situated? At 25, Matthew-street, Darling Harbour. I may state that these works erected by us in Sydney are small works capable of doing only 12 or 14 tons of ore per week; but the idea of erecting them was to take samples from mines where refractory ore occurred in any part of the country, and by treating those samples and giving the returns to induce the owners to put up plant, adopting the methods which we are using, and training men to send out to those plants to operate them.

1267. What is the cost per ton to the mine owners of Wyalong to send the tailings to your works? We charge them £4 per ton and we pay them for 90 per cent. of the fire assay of the ore for gold.

1268. Do you pay the carriage from the field? No; they pay it. It costs them about £6 a ton.

1269. Would that cover the carriage? It would cover the carriage, but it would not cover bagging.

1270. What would be the entire cost, including your charges, to the miner, in forwarding the tailings to your works at Darling Harbour? About £6 per ton.

1271. Then, according to your estimate that there are over 2 oz. to the ton of tailings, that would leave them a clear profit of about £2 a ton? Yes; the estimate I have given is the average of all the assays we have made.

1272. Have you had any large quantities of tailings sent for treatment? No; but we have had concentrates—that is, blanketing. We have had, I think, fully half a dozen bulk samples, running from 3 or 4 tons up to 10 or 12 tons.

1273. In the event of your proprietary not establishing these works at Wyalong, what would the mine owners do with the tailings? Since they have ascertained their values they are carting the tailings away from the local batteries and stacking them on their own mines in a hope of future treatment—in the hope of some plant going up there suitable for the treatment of the tailings.

1274. In the event of your plant being established there, what length of time would be occupied before you were in a position to treat the ore? We are trying to get the plant established within four months. I think it will probably be about five months before we shall be in full operation.

1275. And you would still keep the works at Darling Harbour? Yes; those are more than fully C. L. Garland, occupied now. In fact, we are refusing ore almost daily from different parts of the country, in order to try to do the best we can for the Wyalong mines.

1276. The carriage, as far as the railway is concerned, you estimated at about 1,690 tons per annum? ^{4 June, 1895.}

That would be about what we would require in full work at Wyalong.

1277. How many hands would you employ in your works? Very few, in view of the capacity of the plant. In order to do what we propose to do, and what we have agreed to do—that is, to treat the ore there as cheaply as in any part of Australia—that is £3 a ton for chlorinating—it is necessary for us to design all the labour-saving machinery we can. We are cutting out all labour as far as it is possible for us to do so. We do everything, as far as we can, automatically.

1278. Then the traffic to the railway, consequent on the establishment of your works, would be particularly in regard to the carriage of goods for those works? Yes; and stores and supplies.

1279. If your works are established there, would the mine-owners treat the tailings as at present, or would they send the ore altogether for treatment? They would send crude ore direct from the mines. They have now undertaken to do so.

1280. And would your plant—treating about 50 tons a day—be sufficiently large to treat the ore coming from the various mines at Wyalong? I do not think so. I hope we shall have to double that plant. It is a big enterprise to go into, and we have to compete with the batteries which are crushing there for 15s. a ton, and which may crush for 12s. 6d. a ton, so that we do not want to establish a plant which will be too big for the amount of stuff which we should get.

1281. Then the success of your chlorinating works would mean the stoppage of the batteries at present in existence? Not necessarily. There will always be low-grade mines on every field. For instance, a mine which will average half an ounce of gold per ton and where they have a large body of stone. That half an ounce would not pay our charge for chlorinating; it is only worth about £2, and our charge is £3—that stuff might go to a battery, and if they only save 50 per cent. it might pay them very well.

1282. But would not the same loss of gold apply to the tailings in that case as in the other? No; there would not be so much to lose. If there was 50 per cent. loss in half an ounce, that would leave one quarter of an ounce in the tailings, which would mean about £1 per ton.

1283. You have spoken of stuff obtained from under the water-level, it appears to give extraordinary results;—how far below the water-level was it taken from? You mean how far below the water-level does the pyrites come in? Generally speaking, it is at the point of the water-level in the mine. Above that the ore is of a more oxidised nature, which gradually changes into the sulphide when it reaches the water-level.

1284. Were those samples taken by yourself, or forwarded to you as in the case of the tailings? It was all forwarded.

1285. Were they taken from one or a number of mines? From different mines on the field.

1286. Can you state what mines they were sent from? I have not a list with me, but I could name a few of them from memory.

1287. The value per ton, according to the results obtained by you, in that case would be considerably over £100 sterling? Only with the sulphide ore; but we have not treated any of the sulphide ore except by assaying.

1288. I am speaking of the ore treated from under the water-level? Those are assays. They are only assays.

1289. *Chairman.*] Not much ore has been raised from under the water-level? No; they have only just touched the water-level. The moment they touch it they stop, because they have no facilities for pumping, and they have plenty of oxidized ore overhead to work at; but in these cases we have been able to get samples from the water-level of the dense sulphide.

1290. The base of the country under the water-level is considerably harder than that at the surface? Yes, much harder.

1291. Would it be likely that at this particular portion there would be a greater concentration of gold underneath? It is quite possible that at the junction of the level there may have been some concentration of gold; but at the same time it must be remembered that the whole of that ore was once of the same composition as it is under the water-level—it was of dense sulphide, and it is only by changes through the oxygen operating on the higher levels that the ore has become oxidised.

1292. Would there be any excess of cost in treating the sulphide ores under the water-level compared with that of treating the oxide ores above the water-level? In chlorination?

1293. Yes? Only to us.

1294. Would it not necessitate a corresponding charge in your treatment? No; we have undertaken to do it for a certain price all through. The cost to us would be greater.

1295. Much greater? Not much. There would be a greater cost for roasting and for leaching out the basic salts; but the cost would not be so great that it would necessitate an extra charge to them. I might say that both zinc, blend, copper, and arsenic occur in the sulphide ore below the water-level, making it very difficult for battery treatment.

1296. Have you any data to go upon as to the probable results of gold-bearing stone being found at any considerable depth below water-level? Nothing beyond this—that the veins appear to be continuous and strong; and there is no geological reason why, in a granite country, whether decomposed granite or otherwise, the lode should not continue in depth and carry gold.

1297. We have had evidence already from a scientist, that the lodes or veins at Wyalong are not continuous—that there is a considerable break, and an absolute loss even with a distance of 30 feet, both horizontally and vertically? That is so. That is the case in all granite country. The lodes are lenticular, that is, they make and break; but the channel is there, and where you can open a very narrow vein of ore you follow it, and it widens out again into a bunch of ore. They find that in the upper levels, all through the mines, and that phenomena will be found as far down as they go on these lodes; but then they take the average of the vein. They have to take the thin portions with the thick portions. That is so, not only in granite country, but in many other classes of country.

1298. The evidence tendered by those who are responsible for their statements is to the effect that the surface area of the gold-field of Wyalong is rather limited—about 3 miles by 1½ mile;—does that correspond with your opinion? No. That was about the extent of it the first time I went to Wyalong; but on the last occasion I went out a number of miles and found that they were developing the reefs in

every

C. L. Garland, every direction, that the field was extending very largely, and that there was a good deal of prospecting going on outside that area. Even inside that area new reefs have been found.

4 June, 1895. 1299. Were those reefs of a similar character, as regards richness, to the others? Yes.

1300. The following question was asked of the Rev. J. M. Curran:—

What area do you think would cover the present discoveries at Wyalong? That is a very difficult question to answer. If I were asked whether all the good mines were close to Wyalong, I could answer easily. All the good mines close to Wyalong township, I should say, would be within an area of 3 miles by 2. All the good mines are certainly within 1 mile of the mining camp at Wyalong.

? That is so; but there is such an excess of surface soil that it is difficult to prospect. As the miners go out they are opening up new veins, and I should not be surprised to see Wyalong a very extensive field after a few years.

1301. *Mr. Chanter.*] The character of the country between the surface and the water-level is very soft? Yes, exceedingly soft; very easily worked.

1302. And can be operated upon by ordinary labour? Yes; without explosives.

1303. But, judging from your own evidence confirmed by that of others, it will be a much more costly matter to mine under the water-level because of the nature of the country? Yes; it will be much more expensive.

1304. Then it is safe to presume it can only be worked by companies with a certain amount of capital at command? Not necessarily. I have seen mines worked by miners in a country very much harder than is likely to be got at Wyalong.

1305. It has been stated that it will be necessary, in view of the cost of working below water-level, to amalgamate the present companies? Yes; I should think better results would be got by the amalgamation of various companies and sinking main shafts, with pumping and winding plants.

1306. Would not that have the effect of reducing the population on the gold-field? No; that would rather have the effect of increasing the population.

1307. In what manner? Because if main shafts were sunk and levels opened out on mines like these they would be able to employ a greater number of men than they do at the present time. There would be room for many more men to work in a mine which was properly opened out with levels and machinery.

1308. You have a pretty good knowledge of agricultural country? Fair; I do not know very much about it.

1309. You expressed the opinion a short time back that the soil in the locality of Wyalong was insufficiently fertile to induce miners to settle there continuously for other purposes than mining? The soil itself, as far as I could judge, is excellent, but I am doubtful about the rainfall being sufficient. I have no doubt that if that country could be irrigated it would grow anything.

1310. Is there not sufficient rainfall for the growth of wheat? The rainfall is pretty uncertain. I do not know exactly what it is, but judging by the scarcity of water for mining purposes, I should think the rainfall would be rather too precarious for agriculture.

1311. Is there any other class of settlement between Temora and Wyalong than a mining settlement? From the road very little is observable. I did not go off the road to any extent to see what the settlement was about there, but I should hardly think the country is thickly settled.

1312. Do you think the population at Wyalong is likely to increase or to decrease? I think it is more likely to increase than to decrease—I am speaking of the permanent population, not an ordinary one; I think the permanent population will be more likely to increase than to decrease.

1313. What number do you think the mining field at Wyalong will sustain permanently? It is a difficult question to answer.

1314. At present there is about a population of over 4,000? I think it could sustain a bigger population than that. I have no doubt that there will be an immediate increase in the population if the miners get their ore crushed, because many of the mines working now are simply shepherding. They have large piles of ore at grass, and there is no earthly prospect of getting it treated. They argue in this way—that it is no use expending labour to take the ore out of the ground when there is no prospect of getting any return for it.

1315. Would your works require a large supply of water? Not so large as a battery treating the same quantity of ore. We crush dry.

1316. You are aware that the water supply is the severest drawback to the field? Yes, we use less water than an ordinary battery. We are now taking out a 12,000 yards surface tank.

1317. Would it be possible for you to use the mineralised water from any of the mines? We could use the mineralised water for some purposes, but not for others. We could not use it in boilers, but we could use it for leaching ore—that is for washing the gold out when once the gold is soluble, but we prefer the fresh water.

1318. How many permanent hands will your works employ? Probably, directly in connection with the works—I do not include timber-getters or fire-wood men—about twenty.

1319. What will be the cost to your proprietary of the carriage of the 1,690 tons from Sydney to Wyalong, if a railway is constructed? I cannot say; I do not know what the rate is.

1320. Salt, is carried, I believe, at a specially low rate? I am making inquiries about the matter, and I have not yet received the information.

1321. Could you supply the Committee with that information later on—as to what your company would be prepared to pay the Railway Commissioners for the carriage of your goods? Yes; that could easily be ascertained by adding to the rate to Temora, the mileage rate between Temora and Wyalong. I suppose they will charge about the same rate per mile. I think the present rate for machinery an excessive and disastrous rate to all enterprise in the country. The rate to Temora is something like £4 10s. per ton from Sydney. It will cost us something like £650 for freight alone to get our machinery on the field.

1322. The carriage from Temora to Wyalong by road, at present, is about 15s. It is about 25s.

1323. Is 25s. per ton a special price for machinery? No; 25s. is about the ordinary cost for carriage. It runs from £1 to £3 a ton according to the nature and character of the road.

1324. You are speaking of the team carriage? Yes.

1325. But we have received evidence to the effect that the teams carry all classes of goods at one rate per ton, and therein lies the difference between railway and team carriage? They carry all at the same price; but according to the character of the road the freight varies from £1 to £3 per ton. If the road is very bad they charge as high as £3.

1326. You are taking an average of the whole of the year? No; at the present time the roads are C. L. Garland, pretty good, and the carriage now is 25s.

1327. That is rather different from the evidence we have received on that head? I obtained that information, to-day, from Wright, Heaton & Co. I was making inquiries as to what they would charge to take our stuff from Temora to Wyalong, and they said it could not be done for less than 25s.

1328. Are your opinions of the prospects of the field such as to lead you to believe it will be a permanent field? I think so.

1329. And that it will sustain as great a population or greater than at present? Yes.

1330. And that the prospect of the continuance of rich gold-yielding ore underneath the water level is very good? Yes; I think the ore will be very good under the water level, but it will be more difficult to treat.

1331. And that the soil in the locality is suitable for settlement, contingent upon the water being supplied by irrigation or otherwise? Yes.

1332. Then I need scarcely ask you, from your replies to those questions, whether you are of opinion that Parliament would be thoroughly warranted in recommending the construction of the line? I think it would. I think that Wyalong, as a gold-field, is the most promising for permanency and extent of any I have seen in the Australasian colonies. I may say that I never knew a field except the Thames, in New Zealand, where there were so many mines of payable gold within so small an area; and I have every reason to believe that if ever the Government were warranted in building a line to any mineral field in New South Wales, Wyalong is that field.

1333. You are aware that under the law at present, Parliament has to take into consideration the fact that a line should not be constructed unless there is reasonable evidence adduced to show that it will pay working expenses and interest on the cost of construction? I was not aware of that.

1334. Taking into consideration the probable cost of the line—£2,300 a mile—would the population of Wyalong, and the carriage of goods to and from Wyalong, be sufficient to pay working expenses and interest on the cost of construction? A great deal depends in answering a question of that kind as to the policy of running a line of that character—I mean of operating it. No doubt the people of Wyalong would like two or three trains a day on the line if they could get them. In that case the working expenses would be infinitely greater than the line would earn—at any rate in its earlier stages; but if it were run on purely commercial principles—that is, if it were worked cheaply, I think it would pay more than would cover the interest on the cost of construction. But, unfortunately, in most of these cases the people clamour for so many trains a day, and for expensive platforms and stations, and the result is that a loss is shown which is prejudicial to the extension of railway lines. If they ran this line as they do some in America, without platforms or stations as all these pioneer lines should be run—I have no doubt it would pay very well.

1335. This is called a pioneer line. We have evidence before us from the Secretary to the Railway Commissioners that an increased cost between a daily train and running a train three times a week is not very material, as the staff has to be paid all the same; that applies between Temora and Cootamundra, and it would also apply to Wyalong;—in order to contribute to the paying capacity of this line would your company be prepared to pay a special rate for the carriage of your goods between Temora and Wyalong—higher than the rates on the line from Temora to Sydney? I could not say without consultation with the other members of the company.

1336. Can you express an opinion as to whether you think they would? Individually I would just be as pleased in the interests of this enterprise that there should be no line constructed to Wyalong, for this reason, that the handicap of heavy road freight charges is all in our favour. If the railway were constructed the Wyalong mine-owners would have the choice of any plant in Australia—in other words, they could escape the 25s. per ton of road carriage, and get their ore to Sydney at a very low rate. So far as our enterprise is concerned, it would suit us much better if the line were not constructed, because it would practically pay the miners infinitely better to treat their ore on the field than to take their stuff to Wallaroo, the Clyde Works, or any other works which they would have access to if they had a line. I am not advocating the construction of the line in the interests of our works at all but in the public interest.

1337. *Mr. Gormly.*] The Rev. J. M. Curran was asked this question:—

Do you find the reefs growing in richness as you get to greater depths? On the contrary, quite the other way. In addition to what we might conclude from examining the rocks, we know for a fact that the gold is not getting richer. More than that, in eighteen months' time very different methods will have to be resorted to to get the gold, provided work goes on continuously from this time to that.

Are you of opinion that the quartz will be equally rich under the water-level? There is no reason why it should not be—possibly richer. What Father Curran says regarding the difficulty of extracting the gold is perfectly true. It will require a different method. That is why these works will be established. But there is no reason why the gold should not be equally as rich. In fact, when I was on the field Father Curran himself made an assay of pyrites ore from under the water-level, and the assay, if I remember rightly, was 13 oz. to the ton.

1338. What was the size of the parcels of ore which your company had assayed from below the water-level? Any samples we have had from below the water-level have been only assay samples.

1339. About what size? If they got out a ton or half a ton of ore they would thoroughly mix it up, take a sample out of it, and send it to us for assay. We have not treated any stuff from below the water-level at Wyalong—in fact, they are not mining stuff from below the water-level. It would be absolutely useless, because they could not get it treated.

1340. Would you require any large quantity of fuel? Yes; we should use large quantities of firewood.

1341. Would that employ many persons? Yes; it would employ a great number of men.

1342. I suppose when in Wyalong you examined the timber for the purpose of seeing whether fuel could be procured? Yes.

1343. And that would be one of the reasons why your work should be carried out successfully? Yes.

1344. Did you find that fuel was plentiful? Yes; otherwise we would not be able to chlorinate at the price I have mentioned.

1345. Is it a suitable class of timber for fuel? Yes.

1346. What class of timber would you be likely to use? Generally white box.

1347. Would mallee be suitable? I do not know much about the qualities of mallee, but anything which would generate steam or which would have good heating properties would do for us.

- C. L. Garland, 1348. You would want solid wood which would give out a large quantity of heat? Yes.
 Esq. 1349. Can you estimate the number of men the works would employ procuring firewood? We should probably use 30 tons a day of firewood.
- 4 June, 1895. 1350. That, I suppose, would employ several men in procuring and carrying the timber? Yes.
 1351. I suppose you have had a good deal of experience on the different gold-fields? Yes.
 1352. And you have seen permanent settlements established around gold-fields or where gold-fields existed? Yes; almost invariably.
 1353. Have you had a knowledge of such districts as Parkes since gold was discovered there? I know nothing of its early history.
 1354. For how many years have you known it? Only for the last ten or twelve years.
 1355. Did you find the population of that district increase? Yes.
 1356. From your knowledge of quartz reefs more particularly, have you seen many fields which had as great a show of permanency as the Wyalong field? I do not know of one field.
 1357. You do not know of one field which has such a show of maintaining a population as this? No; I do not know of one field.
 1358. Is that because of the number of reefs which exist and the depths they are likely to go? Yes; the number and the area over which auriferous veins extend. I know a field where there is one main line of reef—a larger reef—but where only two or three mines could possibly operate; but in Wyalong, within a rifle-shot of the centre of the town, there are no less than six main lines of reef, and they are discovering others almost weekly.
 1359. Have you made gold-mining your chief occupation for a number of years? Since I was 15 years of age.
 1360. I suppose you have given particular study to the development of gold-fields in order to carry on your business? Yes; from the first.
 1361. And in consequence of the company with which you are connected being about to establish the works you have referred to, you have given the Wyalong field your attention? Yes; we gave the field particular attention before we conceived the idea of starting these works, and it is the only field in the colony I know of where such works are warranted.
 1362. You say you have visited Wyalong on two occasions? Yes.
 1363. Did you give the gold-mining country about Wyalong particular attention? Yes; I visited every mine of any importance which was opened up.
 1364. And carefully inspected them as far as you could? I went down a number of the typical mines, but not all the mines; but to one who has had experience of that class of country a visit to one mine is practically a visit to the lot. They are all of a similar character.
 1365. Are they of such a similar character that the field might be a very extensive one? Yes; as far as I can judge that particular class of decomposed granite country extends for many miles around Wyalong, particularly north, and I anticipate seeing some great developments north of Wyalong.
 1366. The Committee have been told that it was difficult to discover the indications of gold in that country, that it was only by removing the surface that the reefs were likely to be found;—did you find that to be a case from your observation? Yes; that is so. There is very little to indicate the presence of reefs, and the only way the country can be prospected successfully is by sinking shafts and cross-cutting at some considerable depth below the surface.
 1367. There is a clay formation over the reefs? Yes, usually.
 1368. Therefore excavations have to be made to find the reefs? Yes.
 1369. Have you any knowledge of the finds about Yalgogrin or any of the places where gold has been found in the neighbourhood of Wyalong? I did not visit Yalgogrin, but Pine Ridge is a very promising field. That is several miles out of Wyalong; but from all I can learn from Yalgogrin, and judging from the crushings there, it appears to be a field of considerable importance.
 1370. Is there a need of a permanent water supply in Wyalong? I think in time, as tanks get sunk there upon a large scale and once they are thoroughly full, the community can fairly depend on the catchment area; but there would be no doubt that the field would receive very great assistance if any such a scheme as the bringing of water from an adjacent lake could be carried out.
 1371. From Lake Cowal? Yes.
 1372. From your knowledge of other gold-fields have you found that, when there was a number of people about those fields for some time, the country became so hardened that water would run quicker into the tanks than it would before the population centred there? Yes; it is almost invariably the case. The ground absorbs so rapidly without settlement and population.
 1373. Therefore, a smaller rainfall would fill the tanks? Yes.
 1374. Do you think such a thing as that is likely to occur at Wyalong? I should judge so, and I should also think that at a certain depth the mines would develop considerable quantities of water which would be useful for many purposes.
 1375. Do you think it would pay to condense the heavily mineralised water from the low levels for the purpose of a local supply? I do not think that would be necessary. I think there would always be a sufficient quantity of water for domestic and steaming purposes.
 1376. It would be of service to the Committee if you would state, in your own words, whether there is a certainty of your company establishing these works at Wyalong? There can be no doubt about our establishing the works, inasmuch as we have entered into agreements with the chief mine-owners there. We have entered into signed contracts to treat their ore, and the work of construction is already going on. Our tank is now being excavated, and we have imported one of our machines from San Francisco. The other two will be here within three weeks. The engines and boilers will be sent up next week.
 1377. To Wyalong? Yes; we are absolutely committed for the scheme.
 1378. And you look upon it as a certainty that the works will be established? Yes.
 1379. Have you any reason at all to think that anything may occur to prevent the works being established? Nothing that I can by any possibility think of.
 1380. Then you look upon the establishment of these works as a certainty? Yes; we are fully committed to it.
 1381. And you have entered into contracts with the mine-owners to crush stone, and you have procured a portion of the plant for the works? Yes; we made an offer to-day for an engine and boiler, and portion

portion of the plant is now lying in Sydney Harbour waiting for the duties to come off. It is a plant C. L. Garland, which we could not possibly get in the Colony. The duty would simply be a tax on the industry, because the patent rights are held in the United States, and it is machinery which has never been introduced into this country before, so that the question of the local industry does not come in.

4 June, 1895.

1382. You have stated that you are in communication with Wright, Heaton & Co., as to their charges for conveying goods from Temora to Wyalong? Yes.

1383. Of a portion of your plant? No, the whole of it.

1384. Then you are entering into communication with carrying agents for the purpose of getting the plant carried from Temora? Yes. We are getting contracts from each of the carrying agents to ascertain the lowest price for which we can get it to the field.

1385. Is any of the plant likely to go within a short time? Yes, the plant will go forward at once.

1386. And that which you have in bond will be ultimately sent up? Yes. We have two other machines also coming. If the tariff is not removed there will be a tax on those three machines alone of £100.

1387. *Mr. Roberts.*] What period elapsed between your first and second visit to Wyalong? About four months.

1388. When were you last there? About four weeks ago.

1389. Did you see any great change in the state of mining affairs generally on the occasion of your second visit? Yes; in the development of the mines at the lower levels. We were so satisfied with the development of the mines at the lower levels that we felt that we were justified in going into this enterprise.

1390. When you speak of the lower levels, what depth do you mean? The water level there comes in from 160 to 180 feet. The majority of the mines on my first visit had not touched the water; but on my last visit many of the mines had gone down to the water where the dense sulphide ore came in, and it was through the developments at the lower levels, showing that the reefs continue down, that we were settled on the idea of building the works.

1391. Were you impressed with the idea that Wyalong would be a permanent field? Yes; we are fully satisfied on that score.

1392. Did you go up with the object of reporting for your brother directors as to the probabilities of the permanency of the field? We all visited the field with the determination of making a thorough inspection to ascertain whether we would be warranted in spending the money on the plant.

1393. Who else went besides yourself? Mr. Climo, a very old mining-man and a metallurgist, and Mr. Walter Sully, Broken Hill, our partner, who is finding the chief amount of money, and myself. We made an inspection of nearly every mine on the field.

1394. Are we to understand that you were so favorably impressed with the prospects of Wyalong that you determined on purchasing machinery to the value of £10,000, and placing it at Wyalong forthwith? Our machinery will not cost us that amount, but we are so satisfied with the prospects of the permanency of the place, that we felt justified in starting works which before we get any returns from them at all will probably stand us in £10,000.

1395. Is it a crushing machinery? Crushing, roasting, and chlorinating.

1396. And treating the peculiar ores found at Wyalong? Yes; for instance, we have a contract out now for the ironworks of the furnace, which alone amounts to £580. It is being done in Sydney. It is a wrought-iron revolving furnace. It has been three weeks in course of construction.

1397. Has the field at Wyalong been developed as fully as you would expect or is it suffering from the want of capital? The amount of development work done at Wyalong exceeds that of any other fields I have ever visited in the limited time there has been since the discovery of gold there; but the reason is that most of the country is remarkably soft, being all decomposed and easily worked. A couple of men could drive, probably 12 feet, in a shift, if they liked to work, and that does not occur in many fields, so that the development has been very great, but not nearly so great as it would have been had there been facilities for the treatment of the ore when it was found.

1398. Am I right in assuming that there is a great want of pumping machinery there to deal with the water? The necessity of dealing with anything under the water-level has not yet occurred, inasmuch as the oxidised ores have been very rich and easily got, and the surface levels are not by any means worked out; I suppose the miners think "that sufficient unto the day is the evil thereof." They have taken out the ore they can get easiest and which is more amenable to treatment, but ultimately the proposition of dealing with the ores under water will have to be tackled, and it will require pumping and winding machinery.

1399. Are you aware that the population of Wyalong has decreased to the extent of 1,000 during the last twelve months? I am not aware of it, but I should not be at all surprised at that, inasmuch as it is the case of every gold-field; I know of no exception.

1399½. Do you anticipate further decrease? No; I think there is more prospect of a further increase than a decrease.

1400. On what ground? To every new rush large numbers of men go, who are not in any way qualified to prospect, and who are merely camp followers—if I may use such an expression—and when the country is pegged out, and the field does not extend to their expectation, and matters become dull, they invariably leave. The practical men who remain who settle to hard work gradually develop, and if the field is any good at all they soon prove it, in which case other men who are competent and practical are attracted to it, and further prospecting of a legitimate character goes on. I think you will find that has been the history of nearly every field in the colonies.

1401. Do you think the interest of Wyalong is suffering for the want of a railway? I cannot say that that is the case to any great extent. The construction of a railway would mean this advantage, that the cost of developing the field would be very much less; but not only that, the chances of the capitalist putting in the necessary money to develop the field as it should be developed would be greater.

1402. Is there not a good road from Temora to Wyalong;—there is no difficulty in reaching Wyalong? There is no difficulty in reaching Wyalong just now. The road happens to be good just now; but there are times when it becomes almost impassable, and the coach takes two days to do the 40 miles.

1403. *Chairman.*] That is in wet weather? Yes.

1404. *Mr. Roberts.*] Are there any difficulties in getting supplies to Wyalong? There have been in the past. I hardly think there will be in the future—I mean in regard to provisions; but it might happen within the next week that all our machinery might be stuck up, if rain should fall.

1405. The carriage from Temora to Wyalong is very reasonable, is it not? Very reasonable when the roads are good.

1406.

C. L. Garland, 1406. Have you any knowledge of the mines about Barmedman? No, I did not inspect any of the mines Esq. about there; but they have a very good history, and below a certain level—although I am given to understand the gold carried down—there has been no work done because of the lack of pumping machinery.

4 June, 1895. 1407. Do the reefs increase in richness the lower you go? So far as we can ascertain from making a great number of assays of stone from Wyalong that apparently is the case

1408. Have you had samples from below the water-level? Yes; the six samples to which I referred, averaging 40 oz. 16 dwt. 11 gr., are from below the water-level. I do not, however, put that forward as being anything like an average below the water-level. The probability is that it would not be a bit richer below the water-level than above it.

1409. But it was the richness of ores below the water-level which so favourably impressed you, and decided you in going in for the purchase of £10,000 worth of plant? Yes; that is what finally decided us. It would not be worth our while putting up a plant like that if the gold at Wyalong did not continue below the water-level.

1410. And you feel satisfied it will prove a remunerative investment? I think so.

1411. *Mr. Humphery.*] Have you any idea how many tons of payable stone are at grass at the present time awaiting treatment? As far as I could tell from inspecting all the piles of the chief mines, there would be about 3,000 tons of stone at grass when I was there.

1412. Stone which would be worth treatment? Yes; of payable stone, but numbers of the mines are not raising stone for the very simple reason that it costs money to get the stone out, and there would not be the slightest chance of getting the money back, inasmuch as the stuff cannot be treated.

1413. Do you think that presently the claims can be worked without assistance in the way of capital? No doubt of it. Many of the claims can be worked without any capital whatever, although machinery is required.

1414. Can they be worked at depths below 200 feet? It is very difficult with whip or whim below 200 feet. After that it becomes economy to equip a shaft with winding engines and drums, and then if water becomes at all plentiful it can easily be raised; but I do not think there will be any water at Wyalong which will beat the miners. There will never be a heavy influx of water in those mines.

1415. I suppose you were referring a short time ago to the Fiery Cross Mine at Barmedman? Yes.

1416. Can you say why operations were not proceeded with there after the water came in? The water is very much heavier at Barmedman than it is ever likely to be at Wyalong.

1417. Was any attempt made to provide machinery there? I believe they did put, not pumping machinery, but machinery to bail tanks with. I do not think they ever had a proper pump in the mines there. They had some difficulty in beating the water there and when they did beat it they had no capital to go on with.

1418. Was not that regarded as a very good claim? Yes; the history of the claim shows it to have contained very good ore right down.

1419. Was not that claim abandoned solely on account of want of capital to deal with the water? I understand that the first owners of it divided their money as they got it until they got to the water-level, and there was a necessity for machinery, when they could go no farther. The mine was idle for some years, and subsequently a small syndicate of Victorian capitalists was formed and they put in just enough to keep the water down. Then they had no further funds, and the men were not paid, and the mine closed down again. Since then nothing has been done.

1420. Do you think it is probable that that will be the history of many mines at Wyalong? I think there will never be the same water difficulty.

1421. Will you explain why there would not be a similar difficulty at Wyalong? It is a different nature of country.

1422. *Chairman.*] It is only an inference—you infer the water is worse at Barmedman than at Wyalong? Yes. I do not know of any place in granite country, especially in flat country such as that in the vicinity of Wyalong, where there has been any serious water difficulty in mines.

1423. Is the stone at Wyalong of a different description to that at Barmedman? Yes; as far as I could judge.

1424. *Mr. Trickett.*] I suppose you do not propose to treat all the stuff with the plant you propose to put up, as it comes straight from the mine? Yes; what we claim is this: That in the Wyalong ore there is more going away in slime, in suspension, and in tailings, than would cover the balance between the cost of crushing in the ordinary way by quicksilver-amalgamation, and chlorinating, and it would pay the miners better to pay £3 a ton, and get 90 per cent. of their gold, than to pay 15s. a ton, and get under 50 per cent. of their gold.

1425. The chlorination process is a very expensive one—it is about four times as expensive as the amalgamation process? Probably, according to local circumstances.

1426. Then, if by adopting the amalgamation process in the first instance you can get a lot of gold out, and treat the remainder by the chlorination process, is it not a waste of money to treat the whole lot with the chlorination process? Yes; if you can do that. But there are certain classes of ore which will not yield up their gold to ordinary crushing and quicksilver-amalgamation. That class of ore pays better if you extract the whole of the gold in the one operation. In ordinary crushing there is the cost of crushing. In chlorination there is only the cost of crushing up to that stage. I mean that it is cheaper to take an ore which will not yield up its gold to ordinary quicksilver-amalgamation; it is cheaper to take it crude from the mines and to chlorinate it direct, because you get in one operation that in which otherwise you have to employ two to get.

1427. I asked you that question because when I was examining the Rev. J. M. Curran on this phase of the question, I asked him if the expensive cost of treating by the chlorination process is a handicap to the gold-field, and his reply was—

When you look at it in the light in which it will be shown by-and-bye, I do not think so, because they will not have to treat every ton of stone in that way. They crush about 20 tons. They get all the free gold they can in the mill. The blankettins and concentrates will have all the difficult material, and the 20 tons will be reduced to about 2 tons, so that out of 20 they will only have to treat 2 tons practically, by chlorination. So far the difficult ore relative to the free ore would be 1 per cent.

? That is so in some ores.

1428. But he is speaking particularly of the ores at the Wyalong gold-fields? He is speaking without that intimate knowledge of the ore which we have been enabled to acquire by actual treatment of the stone

stone in bulk. Always in an ore like that a lot of slime goes away in suspension, and the slimes, we have C. L. Garland, Esq., tested, as I have pointed out, carry an average of £12 8s. 4d. per ton in value—that is 3 oz. 3 dwt. 2 gr. The Rev. Father Curran evidently does not take that into consideration. By ordinary crushing these 4 June, 1895. slimes are irrevocably lost, and it is only the washed tailings which are got, or the blanketing. We have always found the slimes assay as rich, in many instances, as blanketing, and the gold which is fine and held in suspension like that is the very first gold which gives itself up to chlorination. The finer the particle the quicker it is rendered soluble by chlorine gas. That gold is always recovered. The only chance of losing gold in chlorinating is where the particles are so coarse that the chlorine gas will not resolve them into chlorides and render them soluble in water.

1429. The principal part of your treatment will be in reducing everything to a fine powder? Yes; we lose nothing, beyond that gold which is locked up in particles of silica that the chlorine gas cannot get at to dissolve it, and the recovery of that is governed by the fineness of our crushing. What we have undertaken to do in our agreements at Wyalong is to pay the miners 90 per cent. of the fire assay of their ore, so that whether we extract that percentage or not we should have to carry out that contract.

1430-1. We were told that a great difficulty in the development of this field, with regard to the erection of machinery, is the want of water, so that if that difficulty does exist how do you make out that there is going to be a large development of the gold-field. You cannot have any of those expensive processes in running machinery without a good supply of water, and that is what has kept the erection of batteries and so on back. How is that difficulty to be got over? On every field in the interior of New South Wales that same difficulty has cropped up, and in every case it has been overcome. I think, with Wyalong, it is only a question of the conservation of water which will overcome the difficulty. At Broken Hill the same difficulty occurred, but the mines were good, and that warranted the pumping of water from the Acacia dams, and subsequently the completion of the Stephen's Creek scheme, which is giving an enormous supply. If Wyalong is a permanent field there is no doubt there will be enterprise and capital forthcoming to bring water from the lake some 20 miles away. But apart from that I do not think that difficulty is a permanent one. When sufficiently large tanks are sunk, and where there are good catchment areas, the water difficulty will be overcome.

1432. And they can use the water over and over again? Yes; in most instances.

1433. I suppose you will not, after a little time at any rate, regard Wyalong as a poor man's gold-field? If the field develops and extends—and there is no reason why it should not, judging from the nature of the country for many miles—there is no reason to suppose that miners will not be able to make a very good thing, wherever they get payable gold in the stone down to water-level—that is, down to 150 or 180 feet. Very often claims have turned out thousands and thousands of pounds worth of stuff down to that level, and if the miners are far-seeing enough to put by a portion of their profits resulting from the development of the cheaper ground, there is no reason why the mines should not continue to be worked by parties of miners. Unfortunately, they do not always do that.

1434. There is no doubt it is an expensive matter working when you get to the granite? Yes; the word granite would seem to indicate hardness, but granite country is not difficult mining country to work. There are far worse formations to work than granite. Granite is not very difficult to bore, and it shoots well. For instance, trap rock and other classes of rock are very much more expensive to work. Even below the water it will not be a very expensive country to work; it will require explosives.

1435. Then if there is ample crushing plant there it will still be a remunerative field to work the lower depths and have the stone crushed by your process? I think so.

1436. *Mr. Davies.*] You have stated that you know the claim known as the Fiery Cross at Barmedman? I have seen it and I know of it from hearsay, but I have not been down it.

1437. Have you ever examined the workings? No.

1438. Do you know if the walls following the reef are of the same character as those at Wyalong? I do not think they are. I think it is a different class of country.

1439. Do you know what gold was raised at Temora? No, not from memory, but I know there must have been a large quantity of alluvial gold raised there. It appeared to me that there was a large mineral belt of country running from Temora North, and the occurrence of a gold-field of equal richness to Wyalong would not surprise me.

1440. *Chairman.*] You mean between Wyalong and the Lachlan? Yes, running right north. It seems to me to be all auriferous country. It may be that some of the reefs are poor, but there will, no doubt, be payable reefs found all through that country. It has, however, been very little prospected, and Wyalong to-day, but for the fact that the whole of the country is decomposed would not have been of any importance whatever. It has only been because the country has been so easy to develop that its richness has been shown. I have a peculiar specimen here which shows the ore in all stages of decomposition. There is sulphide right in the middle of the stone and gradually extending outwards until the oxide of iron is shown. No doubt that piece of stone was at one time a dense sulphide, and as water-level is reached, so that stone remains in its original form.

1441. That is a refractory ore? Yes; it is called refractory.

1442. Do you know of any quartz-reef or any deposit of gold similar to that at Wyalong? No. I may say that I saw more gold showing in the paddocks of stone at Wyalong, visible to the naked eye, in the last two days I spent examining them than I have ever seen before; that is, more gold was visible in the paddock of the stone at grass, and it extended over a bigger area.

1443. It is usual to find gold practically in ironstone? The miners always look upon ironstone as being a good indication of gold. An old expression among miners is "the iron rides a good horse." Generally where you find ironstone in association with quartz you find gold. At Mount Morgan itself it was the same.

1444. Have you seen any in our own Colony? No; I do not know of any field in New South Wales where the ironstone predominates.

1445. And at present, down to the water-level, it is decomposed iron and granite? Oxidized siliceous iron in a decomposed granite formation.

1446. Then you do not anticipate that the same trouble will occur at Wyalong as the miners get to a lower level as occurred at Fiery Cross at Barmedman? No; I do not think there will ever be a heavy influx of water; nothing that cannot be beaten by small water pumping plants.

1447. Are you of opinion that the stone will carry as much gold? I think so.

- C. L. Garland, Esq. 1448. You are aware that at Fiery Cross? No; I do not know that the gold became poorer.
 4 June, 1895. 1449. I do not mean to say poorer in its commercial value, but the quantity was much smaller? Probably the batteries could not extract as much. Nearly all the mines in New South Wales have got poorer at the water-level for this reason: that by the ordinary methods of amalgamation the miners could not extract the same number of ounces or pennyweights per ton, but it does not follow by any means that the gold was not in the stone.
 1450. But if they spent £20,000 in putting up plant and crushing appliances, would you concede that they had the best plant possible at the time? Yes; but it is only within late years that there has been any development of the science of dissolving the gold out of ores. Up to very recently all our chief mines have depended upon mechanical appliances for recovering gold. At that time probably the battery was the best machine they knew for extending the gold.
 1451. Have you seen the plant at Barmedman? It is a very good battery, but not at all suitable to the treatment of complex ore.
 1452. You think it is not of a sufficiently modern character to save the gold? For a battery it is a good one, and would save as much as any other battery; but when the ore becomes full of sulphur the battery will not save the gold. It requires a different process.
 1453. That is in consequence of the character of the ore itself? Yes.
 1454. But you and your partners have no misgiving as to a permanent field at Wyalong? No misgiving whatever, otherwise we would not go into it.
 1455. You believe in a short time you will have to double your appliances? Probably, and I believe that within five months we shall be at work.
 1456. It is stated that fully 1,500 or 1,600 persons are engaged in different occupations on the field? Yes; I should think so.
 1457. And you have stated that the number is likely to increase? Yes.
 1458. Mr. Lee.] Do you see any prospect of the population of Wyalong doubling or trebling itself within the next few years? I believe that with the erection of the plant we propose to put up, and the returns which that plant will give, public attention will be drawn to Wyalong, and there will be a large influx of capital with a view to purchasing the mines right out and amalgamating and developing them on a large scale. I do not know of any field in New South Wales where the average richness of the ore is as great as at Wyalong, and that must tell when the gold is extracted.
 1459. Under those conditions you think that there is a probability of the population increasing instead of decreasing? Yes; I think so. It is more likely to increase than to decrease. I do not anticipate any decrease in the population.

WEDNESDAY, 5 JUNE, 1895.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHREY.	JAMES HAYES, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	ROBERT HENRY LEVIEEN, Esq.
The Hon. JAMES HOSKINS.	JOHN MOOKE CHANTER, Esq.
The Hon. JOHN DAVIES, C.M.G.	CHARLES ALFRED LEE, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	JAMES GORMLY, Esq.
EDMUND WILLIAM MOLESWORTH, Esq.	

The Committee further considered the proposed Railway from Temora to Wyalong.

Thomas Kennedy, Esq., surveyor, Railway Construction Branch, Department of Public Works, sworn, and examined:—

- T. Kennedy, Esq. 1460. Chairman.] Do you know the country between Temora and Wyalong? Yes.
 5 June, 1895. 1461. Have you made a survey of it? I made a survey of about 9 or 10 miles on the Temora side to Barmedman, just opposite the new diggings, known as Trungley, or Reefton.
 1462. You know the route all the way through? Yes; I have been over it.
 1463. Are you prepared to express a definite opinion about it from an engineering standpoint? I can only say it is an easy piece of country over which to construct a line.
 1464. The only portion of the country about which you are able to speak in detail is the 10 miles which you have just particularised? Yes.
 1465. But you have a general knowledge of the whole of the line? Yes.
 1466. When were you there? In 1894.
 1467. You have not been there since? No. I was there along with the Sectional Committee in connection with the previous inquiry.
 1468. I suppose you have not seen the deviations to which Mr. Deane has referred? I do not know anything about those deviations.
 1469. Mr. Hayes.] Do you know the line all through from Temora to Wyalong? Yes.
 1470. Are there any engineering difficulties on the road? No; it would be very easy country.
 1471. What is the ruling grade? I think 1 in 100 is the ruling grade.
 1471½. And there would be no difficulty in constructing a line with that grade? No.
 1472. Then, practically, it is a surface line of railway? Yes.
 1473. Mr. Gormly.] What do you think would be the deepest cutting upon the line? I could not say, because some alterations are being made, but the cuttings would not be very great.
 1474. We are told that it will be necessary to make some cuttings a little beyond Barmedman;—do you know anything about that matter, and whether there is a deviation there or not? I could not speak positively about that.
 1475. The line has been re-surveyed since you were over it? Mr. Deane has made some amendments in the survey.
 1476. Mr. Humphrey.] What provision can be made for a water supply for railway purposes? I do not know anything about that. There is no permanent water as far as I know of on the line. I think tanks would have to be made, and the water stored in them.

1477.

1477. Is that the case at Barmedman? There is a good underground supply there, but I do not know T. Kennedy, whether it would be suitable for use on engines. It may be brackish, or it may contain minerals.
1478. *Mr. Trickett.*] I understand that it is proposed to take the line between Temora and Barmedman to a large extent on the main road? Yes.
1479. That is a road 3 chains in width? Yes.
1480. Do you think, if a railway line were taken out of that, ample roadway would be left for travelling stock and other traffic? I think 2 chains would be quite enough for travelling stock. Besides, there is a good deal of Crown land along the line, which would enable the road to be widened out if necessary.
1481. When you went from Temora to Barmedman, was the road metalled and formed? Small pieces of it—patches where the road had been very bad.
1482. Was that in the middle or on the sides of the road? It was more to the northern side. The line would just touch on the edge of some of the metal, or very close to it.
1483. I suppose that a line of railway along a road of that character would be kept well to one side or other of the road? Yes; on one side altogether.
1484. And in making a road of that character would you fence it, and also have a fence between the railway line, and the portion of the road which would be used for ordinary traffic;—would not that be necessary? I could not say what it is intended to do.
1485. But would not that be almost necessary. It would not do to have a railway tearing along a main road, alongside ordinary horse traffic, and mobs of travelling cattle;—do not you think that would be rather dangerous? I could not speak with any certainty about the matter.
1486. Is the portion of the country which you surveyed, country upon which a railway could be easily constructed? Yes, it is very easy country.
1487. Is it of a similar character to that over which we recently travelled in your company between Parkes and Condobolin? Yes, it is very much after that class of country.
1488. Then a surface line of railway similar to that which is recommended to be constructed between Parkes and Condobolin would do between Temora and Wyalong? I think it will be very nearly a surface line.
1489. Have you formed any opinion as to what you think this line of railway could be constructed for at per mile on that portion which you surveyed? No; we have nothing to do with the estimates.
1490. As far as you say, when you were surveying the line, could the gravel and metal used on the road be utilised for railway purposes? I think the railway would resume about half the metalled road where the small portions were gravelled or metalled.
1491. The half running the length of the road? Yes.
1492. The railway would absolutely go upon part of the metalled road? Yes. It is not very long. I do not know the exact length it is metalled. I do not know the details of the part where it is metalled. I only just staked the line out, but I do not think it would interfere with any great length of metalling.
1493. Do you know of any railway line in the country which has been constructed any length along an ordinary road? No, I do not.
1494. If this line of railway were formed along the portion of the road with which you are acquainted, and in view of the fact that there will be a large wagon and dray traffic, do you not think there would have to be a road formed for the purposes of that kind of traffic as well;—they could not travel on the soft surface very well in bad weather? They are travelling now on the soft surface. Light traffic would be all right, I think.
1495. You think then that the traffic would become light, because the bulk of the heavy traffic would go by train? I think so.
1496. Then you do not think the country would have to be put to the expense of a railway and a road as well? I should not think so.
1497. Have you the particulars of your survey of the portion of the line you refer to? No; they have all been sent in and plotted upon plans.
1498. Would the culverts and waterways on the particular portion of the line which you surveyed be of an extensive character? I could not say what waterways would be constructed. There is one creek, called Mandama Creek, which we crossed.
1499. Is that in the length you dealt with? Yes.
1500. Would that be an expensive creek to cross? No; not very expensive. The quantities for the crossing of that creek have been taken out, but I do not know what they are.
1501. In your report upon this railway, did you recommend the number of culverts or causeways per mile which, in your opinion, would be necessary? No; an officer was sent up specially to do that.
1502. Would you like to say whether five culverts per mile would be sufficient to drain this character of country? I think five culverts per mile would be quite sufficient.
1503. I understand you have not made any detailed estimate of the probable cost? No; that does not come in our work at all.
1504. *Mr. Davies.*] Following up Mr. Trickett's question with reference to stock travelling along the route of the proposed line, I wish to ask you whether, during the time you were engaged in the survey, you observed any large number of stock travelling on the road between the two points on which you were engaged? No; I did not notice anything. I do not think there were any travelling at all. It was winter time when I was there, and I did not notice.
1505. How long were you engaged on the survey? Three months.
1506. And during that time you saw very little stock on the road? Very little. I saw a very little stock—milching cows and so on, for local consumption, going up to Wyalong, and that was all.
1507. You do not apprehend any difficulty, in the event of the railway being constructed, from stock travelling on the road alongside the railway? I think the stock would get accustomed to the railway.
1508. You do not apprehend any difficulty or trouble? I do not think there would be any. I did not see much stock coming down.
1509. Did you see any stock coming down? No; it was all going for local consumption.
1510. Had you anything to do with the last deviation of the line from the original survey? No; I had nothing to do with the last deviation.
1511. What were the points which you surveyed? About 10 miles on the Temora side of Barmedman to Barmedman?

- T. Kennedy, 1512. You have had nothing to do with the deviation which has been made since? No.
 Esq. 1513. And as far as your survey between those two points is concerned, you say there are no engineering difficulties in the way of the construction of a cheap line of railway? No; it is practically level country.
- 5 June, 1895. 1514. Mr. Molesworth.] Are we to understand that a great portion of the line is proposed to be taken along the 3-chain road? It was. I do not know what the amendments are now.
 1515. When you had to do with the survey, however, the intention was to take a portion of it along the 3-chain road? Yes, as far as they could.
 1516. Is there much fencing along that road, or is it open country? It is mostly all fenced; from Temora to Barmedman it is fenced.
 1517. On both sides? Yes; and from Barmedman to Wyalong it was practically unfenced.
 1518. Is the proposed line staked out? It was permanently staked, but it has been altered.
 1519. Who staked it out? I did the portion to which I have already referred.
 1520. Who did the remainder? Mr. Cumming and Mr. Powell.
 1521. Did the officer now on the line have anything to do with the permanent staking in the first instance? No; he did the trial survey from Barmedman to Wyalong.
 1522. Is there any flooded country to be provided for in connection with the construction of the proposed line? No; there is no flooded country.
 1523. No flooded country at all? No; there is only surface water and rainfall.
 1524. To what extent? Nothing of any importance.
 1525. Nothing to interfere with the construction of the line? No.
 1526. And nothing to prevent it being made a surface line? No.
 1527. Mr. Chanter.] Do you know the whole length of the line? Yes; I have been over it.
 1528. What is the character of the timber along the route? Generally box and pine.
 1529. How does it compare with the timber along the proposed line from Parkes to Condobolin? I think it is very much similar timber country.
 1530. Is it any heavier or denser than the country from Parkes to Condobolin? I think it is about the same.
 1531. Did you take any particular notice of what they term gravel in that district;—do you know what class of gravel it is? Yes; you get good ballast about 3 miles on the Temora side of Barmedman.
 1532. That would be a kind of metal, would it not? Yes; I think it is hard sandstone.
 1533. We have it in evidence that there is a gravel called ironstone gravel;—did you notice any of that along the survey? I did not notice any.
 1534. It would not be in your length, I suppose? No.
 1535. Is the character of the country between Barmedman and Wyalong more stony than that between Barmedman and Temora? Yes; I think it is a little.
 1536. Were there any creeks to cross in your length? The Mandama Creek was the only one.
 1537. Is that of an extensive character? No; not very extensive.
 1538. Did you make any observation when you were in the vicinity of Yeo Yeo Creek, as to the probabilities of a water supply being obtained from there for Wyalong? Yeo Yeo Creek is between Coatumundra and Temora.
 1539. Did you see it? No.
 1540. The timber, you say, is similar to that on the road from Parkes to Condobolin, and, in your opinion, is not any denser? No; it is about the same. You come into the mallee around Wyalong.
 1541. Is there much extent of that? I could not say exactly.
 1542. There is not a great proportion in comparison to the box and pine? No.
 1543. How does the character of the soil compare with that between Parkes and Condobolin? I think it is slightly better between Parkes and Condobolin.
 1544. Not impregnated with so much stone? Not so much stone, and the soil is heavier, and of a better quality.
 1545. More suitable for agricultural purposes? Yes.
 1546. Are there any settlers farming in the district at present, or were there any when you made your survey? Yes; there are settlers just outside Barmedman, a few of them growing wheat.
 1547. Do they seem to be fairly well settled? I only drove through the farm. They seemed to have their places well cultivated.
 1548. Do you think the proposed line should be constructed as cheaply as the one proposed to be constructed between Parkes and Condobolin? I could not say what the estimate is at all, because we never have anything to do with the estimates.
 1549. But judging from the features of the country? I should say the earthworks would not be any heavier on the one than on the other—about a similar class of line.
 1550. What is the greatest cutting on this line? I could not say, because the line has been altered since I was there.

THURSDAY, 20 JUNE, 1895.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHREY.	JAMES HAYES, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	ROBERT HENRY LEVIEU, Esq.
The Hon. JAMES HOSKINS.	JOHN MOORE CHANTER, Esq.
The Hon. JOHN DAVIES, C.M.G.	CHARLES ALFRED LEE, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	JAMES GORMLY, Esq.
EDMUND WILLIAM MOLESWORTH, Esq.	

The Committee further considered the proposed Railway from Temora to Wyalong.

Arthur James Stopps, Esq., Acting Chief Draftsman, Department of Lands, sworn, and further examined:—

1551. *Chairman.*] Your Department is surveying special areas near Barmedman;—can you give the Committee any information in regard to them? About 3,686 acres of land were surveyed with a view to their being made special areas.

1552. Adjacent to Barmedman? Yes.

1553. What areas have you cut them into? I think the maximum area is 160 acres.

1554. What amount did you place on them as purchase money? The proposed price will be 30s. an acre; but it has not been definitely settled what is to be done with these areas as yet. I may say that it is proposed to create a population area of about 13,600 acres around Barmedman, and those lands which have been measured will come within that population area, and in all probability they will be made special areas subject to the residential condition; but that has not been decided as yet. The probability is that that is what will be done with them.

1555. That is the Departmental idea? Yes. There are two other special areas proposed, which lie to the south of Barmedman.

1556. How far to the south? Quite close to the suburban boundary of Barmedman. These are portions that were measured for auction sale; but they are now made up into two special areas.

1557. Of what extent? One embraces 123 acres and the other 118 acres; but they will be open to be taken up in areas of about 30 acres maximum, minimum 15 acres, approximately.

1558. Is there anything further that you have to say about Barmedman? That is all the surveying that has been done in that neighbourhood.

1559. Has the Department come to any conclusion with regard to the resumption of any leasehold areas about Wyalong? I am not aware of any proposed resumptions.

1560. And, as far as the Department is concerned, these lands will be held by pastoralists for another five years, under present occupation? With the exception of three areas.

1561. What are they? These will expire next month. One of them is Youngee Plain, comprising 12,700 acres. That lies to the north-west of Wyalong.

1562. How far from the township? From 10 to 15 miles. And there is West Brand Plains, an area of 5,915 acres. That is on the north-east of Barmedman.

1563. How far from Barmedman? It will be from 12 to 20 miles from Barmedman. Then there are Back Creek and Nobby's Lagoon to the north of Barmedman. Back Creek and Nobby's Lagoon are from 5 to 18 miles north of Barmedman.

1564. What is the area? 22,285 acres. These are the only three leasehold areas that run out this year.

1565. Then during the next five years there will be only 50,000 acres available within 20 miles of the proposed line? That is so.

1566. Do you know anything about the character of the country there? It is described by the surveyor as being of rather a poor character—clay soil, fitter for pastoral than for agricultural pursuits.

1567. These areas are regarded as only being suitable for grazing purposes? More suitable for grazing than for agricultural purposes. That is what the surveyor says.

1568. *Mr. Gormly.*] Has the *Gazette* notice been issued for proclaiming this land? No; it is now under submission to the Minister. I have here some information which Mr. Chanter asked for. I find that 159 conditional purchases, containing 52,045 acres, have been transferred to the pastoral lessees.

1569. In what district? Within the area presumed to be affected by the proposed railway.

1570. What proportion is that of the area taken up? It is very nearly half. I was going to give particulars in regard to the conditional purchases which have been transferred to other persons and the number of conditional leases that have been transferred to pastoral lessees. There are 43 conditional leases which have been transferred to pastoral lessees, embracing 32,000 acres, and 191 conditional purchases, embracing 60,967 acres, have been transferred to other owners, and 124 conditional leases, embracing 93,000 acres.

1571. Have you the number of conditional leases taken up? The total of those would give the number within that area.

1572. You did not tell us the number of conditional leases taken up, but only the number transferred? I have not got that. I have got only those which have been transferred. I have also particulars of the holdings that would be affected by the railway. The line will pass through those holdings.

1573. *Mr. Chanter.*] What are the names and the areas of those holdings? There is the Billabong holding, 41,874 acres; the Upper Wyalong, 19,809 acres; the Barmedman holding, 29,311 acres; the Mandamah holding, 21,000 acres; Temora holding, 18,462 acres.

1574. Can you inform the Committee when those leases expire? The leases of Billabong holding, the Upper Wyalong holding, the Barmedman holding, and the Mandamah holding terminate in the year 1900. The Temora holding is under preferential occupation license only.

1575. Will you hand in a list of all the holdings to which you have referred? Yes. [Vide Appendix.]

20 June, 1895.

Hugh Giffen McKinney, Esq., Chief Engineer, Water Conservation Branch, Department of Mines, sworn,
and further examined:—

- H. G. 1576. *Chairman.*] You gave some evidence, the other day, in reference to the White Tank, near West Wyalong? Yes.
 Esq. 1577. Have you seen that tank? Not for the last five or six months.
 20 June, 1895. 1578. Have you had officials up there for some time? Yes, whilst two new tanks were being constructed.
 1579. Do you know the state of the White Tank at present? Yes; I have got reports within the last few days about all the tanks.
 1580. What is the state of that tank? It is said to be dry at present.
 1581. And clean? I assume that it is clean from the fact that it was cleaned out six weeks or two months ago; it ought to be clean.
 1582. Do you know the state of the West Wyalong tank? Only from that report. I got a report stating that there was no water in it; and I know that we got a certificate some time ago that it had been cleaned out by the West Wyalong people, who sent in their account.
 1583. Who furnished the certificate? Two members of the West Wyalong Progress Committee.
 1584. Who vouched for it? One of the officers up there.
 1585. One of your officers vouched for it, that it was cleaned out and in proper order? He said that there had been 3 feet of silt cleared out of it.
 1586. Did he say it was sufficiently cleared? Yes, I understood so; but I have had a report since then stating that the rains which occurred some time ago had put some water into the tank, and I suppose it carried in some rubbish. The report may be quite correct notwithstanding what you say about it now.
 1587. Do you know where the drainage into the West Wyalong tank comes from? The drainage of the township goes into it to a certain extent.
 1588. Well, the drainage of a township like that, with so large a population—do you regard it as satisfactory that it should go into the tank? It is certainly unsatisfactory. But supposing we proposed to close the tank we should have indignation meetings on the subject at once.
 1589. You are at the head of the Water Conservation Branch? Properly speaking that is not my work, but that place was made over to us as a special matter, and even then the idea was merely to make such arrangements as would carry things on up there for a time. There was no idea of constructing large works.*
 1590. Are you in charge of the water supply at Wyalong at present? Yes.
 1591. And you say that the drainage of the town finds its way into the White Tank? The drainage of West Wyalong.
 1592. Still you allow it to remain as the water supply of that place? We did all we could to stop people from getting water from it, but we could not.
 1593. But what must happen to West Wyalong people if this goes on? It is natural to suppose that they will have an outbreak of fever; but I do not know of any Act under which you can stop them from taking water from the tank. When I was there I spoke to them about the water being bad, and they said it was not so bad as we thought, and they objected to it being interfered with.
 1594. Is it one's duty to stand by and see the sewage of a place washed into a tank and permit the people to use the water? I think that if we tried to get them into proper sanitary habits we should have an uphill task.
 1595. You pay for cleaning out a tank which, when filled again, must be a fever-bed;—does it not strike you that that is about the position? It is; but the people do not admit that. They deny that there is any danger from the water, and they object most strongly to the tank being interfered with.
 1596. Did the Government resume the tank? They did not formally resume it.
 1597. Who owns the tank now? It really belongs to the station on which it is situated.
 1598. Who put a fence round it? The people of West Wyalong.
 1599. You stated in your evidence that you believed that no animals could get to it? There is no wire netting round it. Dogs were not kept out. They put a fence round it to keep the cattle out.
 1600. Would you be surprised to learn that it is only a high top rail fence, and that cattle can get through? It was not so when I was there. But I know that the people of Wyalong have a habit of knocking down fences for the convenience of cattle. I might mention that Dr. Ashburton Thompson was up there, and gave a report on the state of affairs at Wyalong.
 1601. *Mr. Davies.*] Under what Act have you constructed tanks? It is really under the Public Works Act. Any resumption that we do is under that Act.
 1602. On what authority have you gone and constructed tanks and taken the control of tanks? Simply under Ministerial authority.
 1603. How did you become possessed of the White Tank? As a matter of fact, we have not formally taken possession of it. The people of West Wyalong took possession of it.
 1604. Did Dr. Thompson call the attention of the Minister and your Department to the terrible and disgraceful state in which that tank was? Yes, he did.
 1605. Did you not then give instructions to have the tank filled up? No; the question was raised as to the filling up of the tank, but it was not sanctioned. When the information went abroad about the proposal to fill up the tank, the people of Wyalong protested against it.
 1606. Is that the reason why you stopped? So I understand.
 1607. Do you think that the White Tank is properly situated, when there are 150 cesspits within a short distance draining into it whenever there is a fall of rain;—is it a proper place from which to supply people with water? Decidedly not; but we have really no authority to fill up the tank.
 1608. Have you authority to make representations to the Government as to the serious consequences that must arise from having a tank to supply people with water for domestic purposes from a polluted source? When Dr. Thompson's report came in about the state of the tank, originally I supported his recommendation that the tank should be filled up, but I think it was decided that we had no authority to take this action.
 1609. Had you an officer from your Department there? There was Mr. Wade up there.
 1610. How long? He has been there at different periods. I suppose that altogether the time that he was up there would be about two months.

1611.

* NOTE (on revision):—What is intended to be conveyed is, that as head of the Water Conservation Branch, I have, properly speaking, nothing to do with water supply to towns. A vote of £5,000 to assist unincorporated towns in providing themselves with water was granted, and from this Wyalong has received the largest share.

1611. Is he a highly-salaried officer? He is an assistant engineer of some twelve or thirteen years' standing. H. G. McKinney, Esq.
1612. What salary does he receive? About £370 a year.
1613. He was there about two months? Yes.
1614. And the cost of a new tank is about £500? Yes.
1615. Did you include the salaries of the officers in that sum? No.
1616. So that the tank actually cost a good deal more money? Certainly.
1617. Has Mr. Wade at any time made representations to you as the head of the Department as to the serious consequences that must follow the want of a proper water supply, independent of the tank which has already been built by him? I got a report from him quite recently about the extent to which the water supply is failing through the long drought.
1618. Has he made any report about the filthy state of the White Tank? He knew that we were aware of the condition of the White Tank, and that population had settled in a position in which they should not have settled.
1619. I want to know whether your officer of high standing who has been in the district about two months, and who must have seen the filthy state of the tank and the cesspits all round it draining into the tank, about 150 cesspits, whether he has ever called your attention to the terrible consequences that may arise from such a state of things as the inhabitants using such filthy water in a populous place like Wyalong? I believe he has mentioned the matter, but we already had the information in regard to it, and the difficulty was to know what to do.
1620. If he has given you a report as to the filthy state of the tank and the sacrifice of life that might arise from using the water—what action have you taken? Since the time when I endeavoured to get the tank filled up, all we have done was to go on providing better water for the people; but they insist on taking water from that tank.
1621. Have you any report as to the probability of the water now available for domestic purposes not lasting more than three or four weeks? I have a report that it may not last more than six weeks at the present rate of consumption.
1622. What will you do in view of a report of that kind? I have recommended that another tank be resumed about a mile and a half east of Bartley's tank. That is about $4\frac{1}{2}$ miles from the town of Wyalong.
1623. Have you made a report to the Minister on the importance of this matter? I have.
1624. And has the Minister acted upon your recommendation? He has not taken action on it yet.
1625. Do you know how serious it is for a population of 4,000 or 5,000 to be practically without water? Yes, I do; and I recommended that the price of the water should be raised in order to cause economy in the use of it. The quantity of water used is nothing compared to what has been wasted. Whole tanks of water have been wasted at that place.
1626. What have you been charging for the water? Sixpence per 100 gallons.
1627. Those who take the water have to cart it several miles? Yes.
1628. In the event of there being no rain for the next four or five weeks, there will be a great scarcity of water? This is really the first time that we have had such a state of things. It is the first time that there has been any apprehension of a scarcity of water at Wyalong.
1629. You are aware that there has not been half an inch of rain there for the last four or five months? I am aware that there has been a very protracted drought.
1630. The conservation of water comes within your Department? Water supply to towns is not what it is intended for. In a good number of cases small water supplies are not dealt with by me at all. We have been dealing with small towns not constituted as municipalities.
1631. What does the Water Conservation Department do? We are building locks and weirs. There is to be a lock at Bourke and a weir at Warren. We are getting out plans for several works.
1632. You only deal with rivers? Principally with rivers.
1633. *Mr. Hoskins.*] Do you know that the Rev. Mr. Curran has given his opinion to the Committee that if a powerful pumping engine were placed in some of the claims where mineralised water is got, by continual pumping they might get better water? I have not heard that he has given that opinion.
1634. Will you place yourself in communication with Father Curran about it? I will. The reports which have reached the Mines Department about the underground water there are unfavourable.
1635. Mr. Curran believes that if powerful pumps were put down in those claims and the water pumped up for a considerable time it would eventually become more suitable for consumption? I will look into that matter at once.
1636. *Mr. Lee.*] You say that you have suggested that another tank be resumed? Yes.
1637. What distance will that be from West Wyalong? It is a long way from West Wyalong, about 7 miles.
1638. What will be the area of that tank? I could not say. There is about 2,900 cubic yards of water in it; that would be about 400,000 odd gallons.
1639. What would the Department have to pay for that if they resumed it? I think the compensation in a case of that kind is merely the actual cost of excavation.
1640. What would be the cost of that tank? Not more than 1s. a yard. It may be a 5,000 yards tank; that would be £250.
1641. How long would the present supply of 400,000 gallons last, if that was the only water supply for Wyalong? If that was the only water supply for 5,000 people it would last a very short time.
1642. About a fortnight? Something like that.
1643. In the event of that tank failing have you anything else to fall back upon? There is a small quantity being obtained at present from shafts.
1644. I want to see whether your Department is alive to the fact that there is a large population there threatened with a water famine. You have taken the precaution to utilise the existing water within seven or ten miles of the place, but if that fails either the people must famish or leave;—have you taken things by the forelock, and made arrangements for a reliable and safe supply to be obtained? I have not taken up the question of any large scheme.
1645. You have taken up no scheme whatever? There was no expenditure contemplated except what would be sufficient to provide a domestic supply for that field, and, as a matter of fact, the supply there, if it had been properly used, would have kept the people going for a long time to come, but the water has been scandalously wasted.

H. G.
McKinney,
Esq.
20 June, 1895.

1646. You have it under your control have you not, your officer, Mr. Wade, visiting the place? We really have not had it under our control. The whole question of the water supply for Wyalong has not been taken up as a single question. It was intended to provide merely for the immediate wants of the place, with the idea of handing over the maintenance to local trustees, and getting it off our hands.

1647. What I want to elicit now is this: Are you alive to the fact that there is a large population there on the verge of a water famine? I am quite aware that the circumstances have become serious.

1648. What steps, if any, have been taken to avoid it—you say, practically, none? There has been nothing except the matter of taking up another tank.

1649. You have already given us the cost of the tank;—would it not be cheaper and more satisfactory to spend £250 or £300 in putting down a large well and condensing water from it? If we could depend upon getting a good supply of water.

1650. But with a Department like yours, with all appliances, is it not imperative to try whether it can be done? I suppose under present circumstances something must be done.

1651. When was your officer there last? About ten days or a fortnight ago.

1652. That was Mr. Wade? Yes.

1653. Did he report to you then or subsequently that the question of providing a suitable water supply is one of great urgency? From the reports that were coming down about the state of the tank—

1654. Has he reported that to you? I asked him specially to report it.

1655. That shows that, to some extent, he was alive to the position of affairs, and had brought it under the notice of the Department? Yes.

1656. Has the Department taken any steps to secure a supply? That was the first step I took to find out what water was actually available in the neighbourhood, and I ascertained that the only large tank that was available was one near Bartley's.

1657. *Mr. Humphery.*] When were any steps taken to provide a water supply for Wyalong? Since the new tanks were put under construction is about five or six months, it would be in November or December.

1658. Had anything been done before that? Nothing, except the resumption of tanks.

1659. Did Mr. Richmond, surveyor, make any representations to the Government as to the site he had selected for a tank, and the catchment area, and the provision that could be made at a very slight cost? I do not recollect such a suggestion from Mr. Richmond.

1660. Was it not Mr. Richmond who surveyed the town of Wyalong? Yes.

1661. Are you aware that he selected the site for a tank previous to 1894? No.

1662. Are you not aware that the Sectional Committee that visited Wyalong when the matter was previously under inquiry made representations to the Department as to the necessity for making immediate provision for the population? I was not aware of it.

1663. If you will listen to these questions and answers, perhaps you can say whether he brought the matter under your notice. I will quote from the examination of Mr. Richmond on the occasion I have referred to:—

Have you made any recommendations as to the commencement of the tank? Not yet. I suppose it would not be less than 10,000 yards.

What quantity of water would that hold? 1,500,000 gallons.

Do you think that that would be a sufficient supply for the town? I should think so, because the people would not depend entirely upon it; they would have their own supplies as well.

Have you discovered any other place within a reasonable distance of the town which you think would be suitable for water conservation? Yes; there are good catchments in all directions—that is, good catchments for this country.

So that if it is ascertained that the supply to which you have referred is insufficient, there will be no difficulty in obtaining a further supply? No; another tank further on, of about 13,000 yards capacity, is a good one.

Then he goes on to speak about the provision that was in contemplation. That was twelve months ago. Can you tell me why no action was taken until four or five months ago? I know it was only then that we got the sanction to construct the new tank.

1664. Do you know of any reason why immediate action was not taken? I fancy the reason must have been that it was considered that the tanks then in existence were sufficient to carry the place on. We had a report from Mr. Slee, chief inspector of mines, that the population of the field twelve or eighteen months ago was three times as great as the field could support. I think he said it could support a population of about 1,200. He considered the population of the field was likely to decrease rapidly. To the best of my recollection, up to the latter part of last year, the idea was that the tanks then in existence were sufficient for the requirements of the place.

1665. Had the Government sold all the land in the new township, or nearly the whole of it? I think there is a considerable part which was not sold.

1666. Was not all the land that was offered sold? There was a certain quantity; but I think it was not nearly all sold.

1667. The evidence here is different. Had the tank been made in May, 1894, would there not now have been ample provision for the population? Yes; there were some good rains just after May, 1894.

1668. There would have been ample provision? Yes.

1669. And that provision has not been made owing to a report from Mr. Slee, that in his opinion the population on the field at that time would not be maintained? That weighed very considerably with us. Mr. Slee's opinion was that the field was greatly overdone, and that there was nothing to justify such a population as there was in that neighbourhood.

1670. *Chairman.*] Has Mr. Slee altered his opinion? I do not know.

1671. *Mr. Gormly.*] Have you taken levels in and about Wyalong? No; the railway levels have been run up to Wyalong.

1672. You have not taken the levels to see whether or not water could be brought to Wyalong by gravitation? No.

1673. *Mr. Molesworth.*] I understand that the tanks which the Government now possess at Wyalong are not under your special control? They are.

1674. Have you not a caretaker in charge of them? We have two caretakers there.

1675. And are they not able to prevent people from polluting the tank? I believe they are not. I got a report in the other day stating that a number of men had camped on the catchment area of one of the tanks that contains water, and I have sent word that the warden is to be communicated with, and asked to turn those people off the catchment area.

1676. Are not the tanks fenced in? They are.

1677.

1677. We are told that the fences consist of only a high top rail? As regards the White Tank it has not been taken over by the Government.*

H. G.
McKinney,
Esq.

1678. Whose property is it at present? I believe it belongs to the station. The Government have not paid any compensation for it.

20 June, 1895.

1679. Is it not practically Government property? I do not think so.

1680. Are you not really utilising it for the domestic supply of Wyalong? No; we do not recognise it. People take the water, but they take it on their own responsibility. We have no caretaker at the White Tank, and we do not recognise that it is part of the water supply, but the people refuse to give it up.

1681. Is there no means by which your Department can obtain the control of the tank and prevent the pollution of it? Not that I know of.

1682. *Chairman.*] As regards the water supply, the question of the supply by gravitation and the question of tanks, then as to pumping as suggested by Rev. J. M. Curran to secure a less mineralised supply of water, the question of condensing, and the unsuitability of the White Tank,—you have gathered all these points? Yes.

1683. And you will see the Minister on the subject as soon as you can. I will see him on the subject.

TUESDAY, 25 JUNE, 1895.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHREY.
The Hon. WILLIAM JOSEPH TRICKETT.
The Hon. JAMES HOSKINS.
The Hon. JOHN DAVIES, C.M.G.
The Hon. CHARLES JAMES ROBERTS, C.M.G.

JAMES HAYES, Esq.
ROBERT HENRY LEVIEEN, Esq.
JOHN MOORE CHANTER, Esq.
CHARLES ALFRED LEE, Esq.
JAMES GORMLY, Esq.

EDMUND WILLIAM MOLESWORTH, Esq.

The Committee further considered the proposed Railway from Temora to Wyalong.

Percy Scarr, Esq., M.I.C.E., Principal Assistant Engineer, Roads and Bridges Branch, Department of Public Works, sworn, and further examined:—

1684. *Chairman.*] You have had an opportunity of seeing the notes of the evidence given by your local P. Scarr, Esq., M.I.C.E. officer at Temora in connection with the road from Temora to Wyalong? Yes.

1685. Are you seized of the points? Yes, pretty well.

1686. Will you explain to the Committee the difference between your estimate and that of the local officer? In looking over the evidence the first thing that struck me was that Mr. Gordon appeared to have very little information on the subject; that he did not appear to be very conversant with the subject. I would point out that he estimates the gravel at 1s. 11d. per cubic yard. Mr. Davies asked: "What did you give per yard for the mullock which is called gravel now lying on the road?" His answer was, "From 1s. 11d. to 2s." Then Mr. Davies said, "It consists of slate and dirt. Is that the best stuff that you can get in that district?" Mr. Gordon answered "That is all we can get there." He said that the price was from 1s. 11d. to 2s. per cubic yard for metal; then he goes further, and puts down the cost of metal at 3s. 9d., not distinguishing the sections of the road between Temora and Barmedman and between Barmedman and Wyalong. We have Mr. Mullens' report that the metal is very much more difficult to get and scarcer on the length between Temora and Barmedman than it is between Barmedman and Wyalong. Mr. Gordon makes no difference in that respect. In this later report he put the metal down right through at 5s., so that he evidently has seen reason to alter his estimate of the cost of metal, which is a most important item. In another portion of his evidence Mr. Gordon says that the stone that they can get is not of the best quality, but very inferior; and yet, at the same time, I observe that he only provides about 1½ cubic yard of metal for the yard run. Anyone having any knowledge of road-making would admit that 1½ cubic yard to the yard run of such inferior stone would not make anything like a good road.

25 June, 1895.

1687. *Mr. Hoskins.*] How wide would the metal road be? Eighteen feet.

1688. *Mr. Humphery.*] What would be the thickness? One and a quarter cubic yard would give about 8 inches of metal.

1689. *Chairman.*] With regard to the gravel, do you absolutely dismiss the idea of making the road with it? I do. I want to point out that Mr. Gordon, after expending a good deal of money in what he calls graveling the road with slate and mullock, as it is described here, admitted that he has given up any idea of doing any more work with any stuff of the kind. From his evidence it does not appear that he has any metalling at all, as far as I can see. This estimate of his, first at 3s. 9d. per cubic yard, and afterwards at 5s., is opposed to the information that we have from Mr. Mullens. I think that Mr. Gordon has under-estimated the cost of the work that he proposes to do, and that he is really not talking of making a first-class road, so that I have no reason to go back on the estimate that I gave before.

1690. As head of the Department, do you approve of such work as he proposes to carry out? No; certainly not.

1691. *Mr. Hoskins.*] What kind of stone is it? It is described by Mr. Gordon to be very inferior.

1692. *Mr. Gormly.*] Does not slate break up very quickly? Slate should not be put upon a road under any circumstances.

1693. *Chairman.*] It struck us that your officer does not know where the material is for road-making? That is clear from his evidence. I wish you to understand that in making this estimate, I was estimating for a first-class metallled road. Mr. Gordon and I seem to have been talking of two different things.

1694. You still adhere to your figures? Yes; with the exception that I am afraid, from the evidence of Mr. Gordon, that I have rather under-estimated the cost than otherwise.

1695. *Mr. Davies.*] The cost will be £45,000? £46,000.

1696. *Mr. Hayes.*] In giving evidence before, you stated that an expenditure on the road for maintenance of from £25 to £30 a mile would be sufficient for the traffic to Wyalong? No; I do not think I said that.

1697.

* NOTE (on revision):—The information contained in this question is not correct except as regards the White Tank.

P. Scarr, Esq., 1697. You would not advocate a metalled road for the traffic of Wyalong? I think what I said was that
 M.I.C.E. I would not advocate departing from the usual custom of the Department to grant so much per annum,
 25 June, 1895. and that I put that down at about £40.

1698. Would that expenditure of £40 a mile be ample? I think so. I would not advise any departure from the present practice.

1699. You think that that amount would be ample? I cannot say what the future requirements of the traffic may be, but it is sufficient for the present.

1700. *Mr. Davies.*] In the absence of a railway to Wyalong, would you recommend that a special vote be granted to put the road in a fair state of repair for ordinary traffic, say a vote of a couple of thousand pounds? I do not think so. Of course I am speaking rather in the dark. I have not been over the road myself, and I have not seen what Wyalong is.

1701. For a district like Wyalong, with a population of 4,000 or 5,000 people, a population that is likely to grow, and has very bad means of communication by road, would not your Department be bound to make better provision than there is for the traffic? As far as my own opinion goes, I would not recommend any special expenditure on the road, unless I saw it myself, or some reliable officer of the Department saw it, and made a special report upon it.

1702. With your present knowledge, you would not recommend a special expenditure of a couple of thousand pounds on the road? Not without further inquiry.

1703. *Mr. Chanter.*] This road between Temora and Wyalong is just on a par with other roads in that part of the Colony, is it not? I do not know of any difference.

1704. There is no part of that district that has continuous metalled roads made up to the point of settlement? No.

1705. Is it not usual for the Department to expend their funds in improving the road in the worst places? Yes.

1706. And you leave the natural features of the country to form the roads as nearly as possible? Yes. Take the case of the Temora and Cootamundra road, the circumstances of which are the same. The gold-field sprang up suddenly, but no special steps were taken to construct the road.

1707. I notice that in a communication from Mr. Gordon, which was before the Committee to-day, he gives an estimate for the forming and brushing of the road. Why is there any necessity for brushing and forming in that part of the Colony when it is not done in any other part? It is not commonly done, but it is done in some places.

1708. Is it not the usual practice in forming roads in loose soil to make them in summer? Well, we do it when we can get the money. It is often the trouble that we get the money in the middle of winter.

1709. Would it not be well to delay the works until the soil is dry? It would be very much better, no doubt.

1710. From your knowledge of the character of the country, obtained from your reports, do you not think that the ground there is sufficiently firm to carry loading when it is dry? Yes; I think so, and I may say that I am not in favour of brushing as a rule. It is only where we can get very good material, such as ti-tree or small pine brush that I would recommend it. I saw it done at Inverell, in the black soil of that district, and it was not a success, owing to the unsuitable nature of the material.

1711. The soil is a loose loam? Yes.

1712. It is soil of a similar class all through that country? We have not made use extensively of that brushing in any part of the country.

1713. When you form a road for the purpose of bearing a loading of metal, must not special provision be made for drainage wherever you cross a depression? Yes; by culverts or stone causeways.

1714. Without that provision your metal would sink if water were allowed to accumulate? Yes; it would keep the embankment always soft.

1715. Is there any reason why this expense in brushing on the road between Temora and Wyalong should be incurred? Not that I know of.

1716. Nothing special has been brought under your notice? This is the first that I have heard of it.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.
Railway from Temora to Wyalong.

APPENDIX.

A.

[*To Evidence of J. Barling, Esq.*]

EXTRACT FROM REPORT OF MR. G. S. MULLENS, ROADS OFFICER, DEPARTMENT OF PUBLIC WORKS.
Temora via Wyalong to Cargellico.

1.—As to nature of country traversed by proposed line.

From Temora to Barmedman, 22 miles; general character of soil is of red chocolate formation suitable for agriculture; on road Barmedman to Wyalong, 17 miles, is for 10 miles not so good, being of a more clayey nature. Thence to Wyalong is more sandy and well adapted for agricultural purposes. At and around Wyalong a considerable amount of mallee country is met with; this is, however, good soil, and if cleared with a roller at a small cost, say, 7s. per acre, would give good returns if cultivated. To the north-west of Wyalong a better class of country exists, and this extends to about head of Humbug Creek; all down the right side of the creek the soil is of a dark heavy nature, being mostly covered with Myall and Belah timber. From the Humbug westerly to range forming boundary between counties of Gipps and Dowling very good red chocolate soil is met with. After crossing the range, which is of basalt formation, the resumed area of Wheeo Run is entered, and the line here strikes through an inferior description of spinifex and mallee country; this runs in belts extending some 5 miles north of line, and south on to Malonga some 14 miles, and to within 12 to 15 miles of Lake Cargellico, where good agricultural land extends to edge of flooded land round lake.

The country traversed by the road in use, Wyalong to Cargellico, via Ungarie and Bygalorie, and which is distant from railway survey in parts, north, 8 miles, is generally of a better class than that followed by the line; this especially refers to that portion through Wheeo resumed area, which entirely avoids the mallee country, and crosses excellent red chocolate soil covered, however, in parts with dense pine scrub.

The timber met with between Temora and Wyalong is chiefly grey box (this must not be confounded with another species of box-tree with broad, bright-green leaves, commonly called "Bimbil," an inferior quality of timber) and is classed as to durability and strength almost with ironbark. It is suitable for building purposes and railway sleepers when used half-round, but is not adapted for bridge-building purposes, the trees scarcely attaining a growth sufficient to square.

From Wyalong to Cargellico timber is mostly Bimbil and pine with, in parts, a thick undergrowth of hop-bush, currawong, broom bush, and pine scrub.

Ironbark, in about lengths up to 10 or 12 feet, can be procured that can square 12 inches, and would be suitable for sleepers or trestle-work in building timber openings in railway construction. This can be had within easy distance of proposed railway from Temora for about 60 miles of its length.

2.—Amount of Settlement generally, &c.

From Temora to Barmedman the country is fairly well settled. Between Barmedman and Wyalong it is mostly Crown lands, leasehold areas, and sparsely settled on. About Wyalong only, settlement is of a mining character. Small areas of the best land had been picked out before opening of goldfields. All down the Humbug Creek is sparsely settled along the proposed line, the general trend of settlement being north of line. From Humbug to Cargellico scarcely any settlement exists, the land being principally held by station-holders along route in leasehold areas with small portion of secured land. Within a radius of a few miles of Lake Cargellico a considerable settlement of small farmers has taken place and mostly all available land has been taken up.

The country generally is all suitable for settlement of an agricultural nature, with exception certainly of the mallee lands on Wheeo Run, which has even been abandoned by the lessees, now some three years.

3.—Suitability for Road Traffic, &c.

Between Temora and Barmedman present road is most suitable, and no other line can be got to suit purposes of traffic. It is almost a direct line. The distance is 22 miles, the road is 3 chains wide, and the greater part is fenced. Here the surveyed line, to within 4 miles of Barmedman, runs inside the road 50 feet from its eastern boundary—the railway requires 66 feet space in all—and present road-works which are centred 100 feet from eastern boundary will not be interfered with. This applies for a distance of 8 miles from Temora (297 miles 21 chains per railway survey), at which point the telegraph line, which has hitherto been running through paddocks to north of road, turns in and takes centre of road. From here to Barmedman the clearing and other road works are situated between telegraph line and eastern boundary of road, centred 56 feet from that boundary, and are encroached upon by the railway survey to within 4 miles of Barmedman as follows:—

	£ s. d.
From 297 miles 21 chains to 309 miles—say 11 miles 50 chains in all—127 chains gravel construction, including clearing and drain.....	@ £7 889 0 0
2 causeways	@ £12 24 0 0
803 chains clearing, 1 chain wide.....	@ 6s. 240 18 0

Estimated value..... £1,153 18 0

This road is cleared throughout 1 chain wide. The estimated value of existing works, including those encroached upon, is as follows:—

	£ s. d.
369 chains gravel, including clearing and drain.....	@ £7 2,553 0 0
25 chains forming	@ £3 8s. 85 0 0
1,366 chains clearing, 1 chain wide.....	@ 6s. 409 16 0
14 causeways	@ £12 168 0 0

Estimated value..... £3,245 16 0

With this expenditure on present line any question of deviation would be inadvisable even if feasible, which in this case is not. Along this 22 miles good gravel can be obtained at an easy distance at a cost of about 3s. per cubic yard.

Between Barmedman and Wyalong the railway survey takes almost a direct line—the road being to eastward of railway,—at furthest point they are about half a mile apart. At about halfway between Barmedman and Wyalong, road as at present exists runs through about a mile of gilgai holes; and by a deviation of existing road to alongside surveyed line, a less amount of bad country would be crossed. The gilgai holes on existing road have now, however, been corduroyed for a distance of 53 chains, thus rendering the worst part of the road trafficable.

I have also examined another road used by the coaches last winter, more to east of present road, leaving it at about 7 miles from Barmedman, and re-joining at about 12 miles, running through Christie's station, "Wyalong No. 2" Run. This avoids the gilgai holes, and traverses better country generally for purposes of a road; but has the disadvantage of increasing the length of the present road (which is 17 miles) by about 2 miles, whilst that mentioned as running along proposed railway would decrease original length by about $\frac{1}{4}$ mile.

Metal and gravel can be procured along greater part of this road, but not easily. Metal might be set down at 5s. per cub. yd., and gravel 3s. 6d. for a fair average. Good material can be procured at Kangaroo Hill, close to Barmedman, along the Ironbark ridge through Christie's, and at the Piney Hill, 15 miles from Barmedman.

4. Whether roads may not be taken along Railway line.

Road Temora to Wyalong covered under last heading.—From Wyalong to Cargellico; railway distance 70 miles. Present road via Ungarie and Bygalorie and south end of Lake Cargellico, 80 miles, which can be reduced by 6 miles when proposed bridge at Junction Yards, Lake Cargellico, is erected. This road could be conveniently taken along railway for 18 miles without incurring any severance to its intersection with the Marsden to Wagga stock route near Murringreen Waterhole. From this point on for about 16 miles to the range forming boundary between counties of Gipps and Dowling, the country has been mostly selected, and it would not be possible to place the road alongside the rail without severance of property: thence into Cargellico there would be no difficulty in placing the road alongside the railway.

I should here state that on account of the natural facilities, roadmaking on present line of road will be less expensive than that along railway, as good gravel hills are crossed at frequent intervals, and cost of gravel per cub. yd. is estimated at 3s., whilst that on railway route would probably average 4s.

5. Whether private estates would be seriously severed.

The only private estates that would be seriously affected are along the 16 miles referred to above where severance takes place, and would principally be Murringreen and Tonangara Creek holdings. No other estates would be severed to any serious extent by proposed railway.

6. Present trend of traffic, &c.

To Wyalong and thence into Temora, the present trend of traffic is from Ungarie and the country N. and N. E. up as far as Lake Cowal. In the event of the proposed railway being constructed the greater portion of this traffic would possibly be diverted via Ungarie, along the Wagga stock route to its intersection with the proposed railway. A small amount of traffic also comes from Cargellico to find a market at Wyalong, and as before mentioned, the road from Cargellico to the Gipps Dowling boundary can be directed to run parallel with railway with no serious inconvenience to present traffic.

7. Information as to past expenditure, &c.

Taking road Temora to Barmedman first, the past expenditure, as per page 3, is estimated at a value of £3,245 16s. Gravel is here easily obtainable, and the cost of completing this road throughout, which is cleared 1 chain wide, and will require draining in parts on both sides, is set down at £485 12s. per mile, or £6 14s. per chain, and is as follows:—

1,391 chains gravel formation, at £6 14s.....	£9,319 14 0
50 causeways, at £12.....	600 0 0
	<hr/>
Cost of completion	£9,919 14 0
Works completed, as per page 3.....	3,245 16 0
	<hr/>
Total cost.....	£13,165 10 0

From Barmedman to Wyalong the clearing is but 33 feet wide, and is through country heavily timbered with grey box, belah, and pine, so much so that in parts the trees interlace overhead and completely shadow the road; moreover, the clearing in parts is not very straight, and I have allowed for $\frac{1}{2}$ chain clearing throughout. Material is not so easily obtained, and cost of completed road is estimated at £8 3s. per chain.

Cost of present improvements is estimated at:—

17 miles clearing, $\frac{1}{2}$ chain wide, at £16 per mile.....	£272 0 0
53 chains corduroy, at £3 17s.....	200 0 0
	<hr/>
	£472 0 0

Cost of completed road:—

17 miles construction, at £652 13s.....	£10,845 0 0
	<hr/>
	13,165 10 0

Total estimated cost Temora to Wyalong	£24,010 10 0
--	--------------

A1.

MEMO. re ESTIMATE OF COST OF ROAD-WORKS.

1. *Temora to Barmedman*.—The clearing of this road is completed 1 chain wide. Cost of finished works is estimated at £6 14s. per chain, or £530 per mile, made up as follows:—

Gravel, 3s. per cub. yd., 1½ yards to lin. yd.	£0 4 6
Forming, per lin. yd.....	0 1 0
Drains	0 0 8
	<hr/>
Per lin. yd.....	£0 6 2
Per chain.....	6 14 0

2. *Barmedman to Wyalong*.—Clearing is but 33 feet wide and not very straight. Have allowed for an average of $\frac{1}{2}$ chain clearing. Cost of finished works is estimated at £8 3s. per chain, or £652 13s. per mile.

	s. d.
Gravel, 1½ cub. to lin. yd., 5s. 3d.—metal, 5s.	5 3
Forming	1 0
Drain.....	0 8
Clearing	0 6
	<hr/>
Per lineal yard	7 5

[To Evidence of Rev. J. M. Curran.]

WATER SUPPLY FOR WYALONG.

Sir,

I am of opinion that it is useless to bore for artesian water at any point within 20 miles of Wyalong. The water-bearing strata, either cretaceous or triassic, are not there to give the supply. I am of opinion that the supply of water under Wyalong is practically inexhaustible, but that this water is mineralised (sulphates and chlorides of potassium and soda), so as to be unfit for domestic uses. It would be worth while having the opinion of an expert as to whether this water may not become fresh on pumping on a large scale.

20 June, 1895.

J. MILNE CURRAN.

The Secretary, Public Works Committee.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

SECTIONAL COMMITTEE.

RAILWAY FROM TEMORA TO WYALONG.

REPORT.

THE Sectional Committee appointed on the 5th June, 1895 to inspect, take evidence, and report on the proposed railway from Temora to Wyalong have the honor to report to the Parliamentary Standing Committee on Public Works—

That the Committee (with the exception of Mr. Levien) left Sydney by train at 9 p.m. on Friday, 14th June, and arrived at Temora at 10:30 the following morning. Accompanied by Mr. Gillett, Surveyor, Construction Branch, Railway Department, they immediately continued their journey by special coach to Barmedman which was reached at 2:30 p.m. The Committee opened their inquiry the same evening at Barmedman, left for Wyalong on the following day, and reached their destination at 1 p.m. On Monday, 17th June, the Committee met in the Court-house, Wyalong, when witnesses resident in the district were examined. Subsequently the Committee visited and inspected the White Tank, the tanks recently excavated by the Water Conservation Department, and several of the principal mines. At 8 a.m., on Tuesday, 18th June, the Committee commenced their return journey, and proceeded as far as Cootamundra, which was reached at 8 p.m., and where the evidence of the Resident Engineer for Roads was taken.

The main point the Committee had to decide was whether there had been sufficient improvement in connection with the mining field at Wyalong to justify the proposed expenditure, and therefore it is necessary to point out the difference between the state of things obtaining in April of last year and those in existence now.

Matters with regard to agriculture or pastoral occupation have undergone little change. It is therefore not necessary to devote any special attention to those industries. Some operations will probably be in existence at Barmedman shortly which will revive the mining trade there, but at present these are in an initial stage, and the Committee are unable to form an opinion as to any important developments in that vicinity. Wyalong, as it was on 24th April, 1894, will be found fully described in the report of the Committee visiting the district in that year. It is now apparent that its stability and importance fairly bear out the hopes therein expressed. The surveyed Government township of Wyalong shows evidence of improvement, but the business centre of the field is Wyalong West. There the progress has been satisfactory, there being a considerable number of fairly creditable buildings and an active commercial life apparent.

Since the previous Sectional Committee's report, the Parliamentary Standing Committee on Public Works having approved of the line from Parkes to Condobolin, any likelihood of immediate extension *via* Wyalong towards the Lachlan is removed. Therefore, instead of Wyalong being on a line from Temora passing out to tap the portion of the western district, crossing the Lachlan at Hillston, it becomes a terminal station.

Although the Committee travelled on the road from Temora to Wyalong under exceptional circumstances, it being in especially good order from the continuous fine weather, there was abundant evidence of the enormous amount of labour sometimes entailed from its extremely unsatisfactory condition. In places the road had

been

been torn up by the traffic to such an extent as to present the appearance of a ploughed field, and with heavy traffic and a recurrence of a like wet season unless with considerable expenditure, a similar state of things will again obtain. It does not, however, appear probable that the road in the immediate future will be called upon to carry such heavy traffic as was in existence last winter, as the stone which was at that time sent to Barmedman battery, will now, by the presence of batteries in Wyalong, be locally treated, and further, the erection in the near future of chlorination works on the field will render it unnecessary to send away the concentrates to outside works for treatment.

The cost of transit appears to the Committee to have been very much under-estimated by the officer of the Railway Department. It is true that at present with the dearth of employment and extremely satisfactory condition of the roads loading has been taken from Wyalong to Temora for 15s. a ton; but the prevailing rate is considerably higher. Further, with a recurrence of a similar season to that of last winter as much as £4 to £5 a ton might be charged. After full inquiries it appears to the Committee that not less than 30s. a ton would be a reasonable rate of carriage to pay.

The evidence of the local officer of the Roads Department is virtually to the effect that placing the class of gravel obtainable in the district upon the road is tantamount to a waste of public money, an opinion with which the Committee fully agree, having had an opportunity of inspecting some of the gravel on the road which was of a most inferior character. In country of this kind in wet weather even the best gravel could not carry a heavy load. The gravel which is available would simply disappear under the pressure of fairly heavy traffic. The expenditure on a metalled road estimated by the Department in the first instance as being £69,000 and subsequently reduced to £46,000, is now estimated by the local officer of the Department as being about £23,000. He is also of opinion that an expenditure of £10,000 would give ample means of access to Wyalong, and meet all present public requirements, and that the expenditure usually allowed on first class roads—£50 a mile—would be sufficient to maintain the road in fair order.

The location of the line appears to the Committee to be satisfactory, both from an engineering standpoint and its contiguity to the main road. The deviations suggested by the Department during the present inquiry are decided improvements, avoiding as they do elevations which would necessitate increased earthworks. The work can apparently be readily carried out well within the Departmental estimate.

The immediate future of Wyalong primarily depends, not upon the construction of the railway, but upon a permanent supply of water. The field at present is practically at a standstill pending a supply for battery purposes. The amount of ore at grass is variously estimated at from 5,000 to 15,000 tons. Possibly the mean of these two amounts would be a reasonable figure. The satisfactory yield obtained from local crushings and from the concentrates sent away for treatment, leads to the opinion that the stone now at grass will prove of equal value.

From the evidence it will be observed that 130 claims are on gold, of which seventy are regarded as payable. Until water is obtained there can be no extensive operations to deal with the ore at present at grass, or the large quantities which are being daily raised. The only provision made by the Government has been the excavation of a tank at Wyalong, and also one at Wyalong West, for domestic purposes. At present they are empty, and will remain so until Wyalong is visited by a considerable rainfall.

The question of water supply for domestic purposes comes incidentally into the matter of the inquiry, in that it is not possible for a large population as will probably be supported by the field to exist without suitable arrangements being made in that direction. The Committee regret that the Water Conservation Department is not apparently able to furnish them with definite information with reference to the best means of obtaining such supply. The tank referred to in the evidence, known as the White Tank, lies immediately adjacent to the settlement of West Wyalong. The country is very flat, and it did not appear at all sure to the Committee that the drainage from West Wyalong in a heavy fall of rain would not find its way in large quantities into the tank. If this be

be so immediate action should be taken to fill it up. A few miles to the south lies the range dividing the watersheds of the Lachlan and the Murrumbidgee, where it might be possible to obtain a suitable catchment area, and thus give the field an efficient supply for all purposes by means of gravitation. Information was placed before the Committee suggesting various supplies from other localities. These are imperative matters and should be immediately inquired into, but in the absence of definite information the Committee are unable to express an opinion. They would urge that immediate steps be taken to make those full explorations which would enable a suitable project to be matured; or a scheme by which the abundant supply of water, although mineralised, lying under the field, might be utilised is also worthy of consideration. It is possible that a scheme to effect a satisfactory result might be designed which would meet the wants of the place, and also prove highly remunerative.

From a previous paragraph it will be seen that there is every probability of a fairly extensive gold-field. Operations, during the interval which has elapsed since the visit of the last Sectional Committee, have been of an encouraging nature.

The land immediately around Wyalong has been reserved. Outside this area any suitable land for settlement has already passed out of the hands of the Crown, or is already leased to pastoralists for a further period of five years. Until these leases expire, or until it becomes the policy of the Government to throw these areas open, it is impossible that there can be any great increase of small holdings. Situated as these lands are, some forty miles from a railway depot, at the price of produce at present obtaining, it is not probable that they will be taken up for agricultural pursuits. But if a railway were constructed to Wyalong, and these lands were thrown open, it appears probable that wheat might be profitably grown in its vicinity. It is, therefore, apparent that the question of resumption of portions of the pastoral leases has a very close bearing upon the construction of a line to this locality.

The Committee are of opinion that the expenditure upon the road from Temora to Wyalong has been remarkably small; in fact, between Barmedman and Wyalong, with the exception of some 50 chains of corduroy and clearing, the road is in a state of nature, notwithstanding that it has been the chief access at times for a population of about 8,000 people.

The Sectional Committee are unable to recommend the immediate construction of a line of railway for the following reasons:—

- (1) That the population of Wyalong alone does not justify such an expenditure;
- (2) That the successful development of the field depends largely upon a permanent water supply which, at present, is not in existence;
- (3) That the policy of the Government with regard to the leasehold areas in its vicinity has not yet been disclosed;
- (4) That the Parkes-Condobolin line having been approved by the Committee, an extension *via* Wyalong can no longer be regarded as a line to tap the western country.

Still, the Sectional Committee are of opinion that immediate action should be taken to place the worst portions of the road in good repair, so that no special disadvantage will be suffered by an enterprising mining community. In the construction of the road, care should be taken that the worst parts should receive earliest attention—the present dry weather being especially suitable for having the work cheaply and expeditiously done—and as far as possible, the permanent work should fit in with the eventual scheme of development should the railway be constructed.

The question of land resumption and severance in connection with the line being of such a nominal character, requires no special comment.

THOS. EWING,
Chairman.

June 20, 1895.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

RAILWAY FROM TEMORA TO WYALONG.

[TAKEN BEFORE THE SECTIONAL COMMITTEE.]

SATURDAY, 15 JUNE, 1895.

[*The Sectional Committee met at the "Barmedman Hotel," Barmedman, at 3:45 p.m."*]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. JOHN DAVIES, C.M.G. | The Hon. CHARLES JAMES ROBERTS, C.M.G.
CHARLES ALFRED LEE, Esq.

The Sectional Committee proceeded to consider the proposed Railway from Temora to Wyalong.

Mr. Lachlan Robertson, grazier, Barmedman, sworn, and examined:—

1. *Chairman.*] Does your holding surround Barmedman? Yes.
2. What distance is your home from here? Three miles. I hold most of the land around here under *L. Robertson.* occupation license—about 1,000 acres.
3. What other holding have you? About 29,000 acres of leased and about 12,000 acres of purchased *15 June, 1895.* land.
4. What do you pay for your leasehold land? I could not tell you from memory.
5. Could you forward us the information? Yes, although it could be easily found out in Sydney.
6. Do you approve of the construction of a railway through here to Wyalong? Yes.
7. Of what use would it be to you? It would not be of much use to me; but I think the district wants it.
8. What would the railway carry? Fat stock. I am sending fat stock to-day for Temora.
9. What else would it carry? It would carry wheat. There is no doubt at all that this is one of the best districts in the Colony for growing wheat.
10. What amount of wheat is grown here? It is not a question as to what is grown here; but what can be grown here.
11. Then your contention is that the land is sufficiently good, but there are no means of communication? Yes.
12. Would any wool go by the railway? The wool from round here went last year to Temora. I had to cart mine to Temora last year. Personally, I do not consider that 20 miles from a railway is a great distance; but if we have winters like that of last year, we cannot travel.
13. You believe, then, that the district is capable of development, but that in bad weather the road will not carry traffic? Yes; I consider that we have one of the best districts in New South Wales.
14. But you cannot offer any great inducement for the construction of a line, so far as immediate traffic is concerned? Not unless we get selectors.
15. When does your lease run out? In five years from now.
16. Selectors, therefore, cannot come for five years? No.
17. Unless the Minister exercises his power under the new Bill? If he does not there will be no land right through my run for the next five years; but when I say that, I think I am, to a certain extent, speaking against my own interests. Should the Government at any time resume that land, I have another way of looking at the matter, and that is that I am allowed 10s. for the rest.
18. If the Government resumes one half, do you believe it will be taken up? A good deal of it would.
19. What portion? Adjacent to the line on both sides. It is good agricultural land.
20. What does it cost to clear the ordinary box country we came through? That is in its natural state. Last year it cost me to get 60 acres ploughed and cleared £1 an acre. It had been ringbarked for a number of years.
21. It was ringbarked country? Yes.
22. What would green forest cost to clear? I reckon that if a man went into it at once to clear it it would cost about £2 per acre. If a man selected and the country was rung, in a couple of years the trees would be burnt off easily.
23. Time would do most of the work, you think? Yes.
24. *Mr. Roberts.*] Is there any difficulty now in getting produce taken from Temora by team? Not this year. There was last year—the road was almost impassable.
25. You are referring particularly to the winter time? Yes. Of course, in summer-time the road is dry enough. I knew the Nine-mile Forest in the western districts of Victoria about thirty years ago. I have seen twenty-eight teams capsized there. There is also what is called the Black Forest. These are supposed to be the two worst spots in Victoria, and I honestly believe that the road here is as bad as any road which ever existed in Victoria.
26. What is the rate per ton for carriage between here and Temora? About £1 now.

Mr. L. Robertson. 27. I think I am right in saying it is only 15s. to Wyalong—in fact, I heard this morning that it was 12s. 6d.;—would that surprise you? Nothing would surprise me, because the people are so poor that they are only too glad to get 1s. if they can. I have told you, however, what I am paying at the present moment. I got a ton and a half of wire out the other day and it cost £1 per ton.

15 June, 1895.
28. *Chairman.*] That was a small load? Yes; but this man was supposed to cart my wool in, and he does it cheaper.

29. *Mr. Roberts.*] Had you any back carriage for him from here to Temora? No; but during shearing-time I load my wool at £1 a ton to Temora railway station.

30. Do you not think that Barmedan is within a fair distance of railway communication? Yes, I think so.

31. Then on what grounds would you strongly recommend the construction of the railway? On account of the rise of Wyalong.

32. You know Wyalong? Yes, well.

33. Is the population there increasing or decreasing? I think it is decreasing. There is no water there for crushing purposes; the men cannot work in consequence, and they are bound to go away somewhere. That reduces the population to a certain extent. If they had water there these people would come back again.

34. Then operations are delayed on account of the want of pumping machinery? For want of water.

35. Is it not a fact that in many instances they have already struck water, and it is the want of pumping machinery to get rid of the water which causes the difference? I do not think so. The water they have struck is not fit for use in an engine. It is the want of fresh water that keeps them back at the present time. I came from there the other day.

36. On what grounds do you believe there would be sufficient traffic to give a revenue to a railway if constructed from Temora to Wyalong? You would catch all the wool from beyond Wyalong. Instead of going to Narrandera it would come here. You would get a certain amount of population from Victoria. I only came from there five or six weeks ago, and I know there are a number of people there who are anxious to take up land in New South Wales and go farming, provided they have a means of getting their produce to market.

37. Do you think they would be attracted to the district around Wyalong? Yes, and around here. I have been told that Mr. Morris' partner had a letter from a number of farmers in Victoria asking whether there was good land about here.

38. Do you not think that the want of water will probably prevent settlement? Of course, they will miss that at the first; but there is no selector who cannot supply himself with any amount of water in this part of the country. I have one tank of a little less than 3,000 yards. It was put down twelve years ago, and it has never been dry but once. A 3,000 yards tank is not a very large one, but it keeps my stock going as well. I had about 10,000 sheep watering at the tank the year it went dry.

39. Then it is more in the interests of the people of Wyalong than of the people of Barmedan that you recommend the construction of the line? For the good of the district in general.

40. When you refer to this district you mean the district between Temora and Wyalong? Yes.

41. Is there much settlement any distance from Barmedan? There is a good deal of settlement about here.

42. About how many settlers are there within a radius of 5 miles? There must have been fully 18,000 acres taken out of my run.

43. For wheat-growing? Yes; for wheat-growing and grazing.

44. How many bushels of wheat to the acre do you get? The year before last I reckoned I had about 56 acres in. I suppose I had 30 bushels to the acre. Last year was a poor year, and I had 16 bushels. The year before that I had 20 bushels.

45. Would not all these selectors of whom you speak be within 20 miles of Temora? Not at all. All the land about here is selected, excepting the gold-fields reserve, and, of course, if they select at all, they must go further back.

46. Have you heard from your neighbours any expressions favourable to the construction of the railway;—are the people here generally favourable to its construction? That I will not say. I will leave other people to pass their own opinions upon it. I am only giving you my individual opinion.

47. Then you believe that if the railway were constructed, a large number of people would soon settle upon the soil, provided land were available for them? I think so.

48. *Mr. Davies.*] Did I understand you to say that your run, including your freehold, was 28,000 acres? The leasehold is 29,000 and a few hundred acres, and the freehold, including selections, is about 12,000 acres.

49. Making 41,000 acres? Yes.

50. What is the carrying capacity of your run? I think at the present time, which is a bad year, there are about 29,000 sheep upon it. I might state that the purchased land is well improved.

51. The 29,000 sheep are on the 41,000 acres of land? No; I have an occupation license of 10,000 or 11,000 acres besides that.

52. Making 50,000 acres? Yes.

53. What quantity of wool did you send last year to Temora? Something like 500 bales.

54. That goes at present to Temora by road? Yes.

55. And if the railway were constructed it would go by rail from Barmedan? Yes.

56. What stock do you usually send from here to Temora during the year? As a rule, I sell them on the station, but last year I must have sent 3,000 or 4,000 sheep down.

57. By rail? Yes; I think I sent 60 tons of wool from Temora to Sydney last year.

58. And the carriage of that by road cost you £1 a ton? Yes.

59. Are there any other large graziers who send wool from this district? Yes, Mr. Franks and Mr. Carter.

60. Do they send it by road to Temora? Yes.

61. You mentioned, in reply to Mr. Roberts, that a large quantity of wool went by rail to Narrandera? I believe so.

62. How far is that from Barmedan? It is a long way back from here.

63. Would it not be nearer for the wool to go by way of Narrandera, than for it to come to Barmedan? Yes; but if you constructed the line to Wyalong, I reckon it would be nearer to come to Wyalong.

64. What is the distance of the stations you are thinking of to Narrandera? I am not clear on that point. Mr.
L. Robertson.
65. You think, then, that the wool would come by way of Wyalong? That is my impression.
66. But there is no certainty about it? No. 15 June, 1895.
67. Would it be any nearer to go by way of Wyalong than to go by way of Narrandera to Sydney? A lot of people between Narrandera and Wyalong and Hillston, send their wool the other way, and I have no doubt that they would come this way.
68. Would a railway to Condobolin take a large share of the traffic you speak of? I do not think so.
69. I mean from Hillston and about there? I reckon it is like going round the world to go that way in order to get to Sydney.
70. But is not Hillston much nearer to Condobolin than to Wyalong? I am not posted up in the matter.
71. You do not know the distance? I do not.
72. Being an old resident, I thought you would be able to tell us every inch of the country? No.
73. Then you do not know the distance between Condobolin and Hillston? No.
74. And you do not know the distance between Wyalong and Hillston? No.
75. You are expressing an opinion, as an old resident of the district, and a large property-holder, in favour of the construction of a cheap line of railway to serve the district, and develop its resources? Yes.
76. And you have stated the grounds upon which you base your support of the line? Yes.
77. Do you believe, with the scanty rainfall you have in this district, there would be any large amount of settlement for agricultural purposes? I think so.
78. Your rainfall is about 18 inches, is it not? Yes; for growing wheat we do not require such a lot of rain.
79. But would a district like this, although it may be rich in its resources, give agriculturists who might take to growing wheat anything like a fair prospect of making the industry a success without a reasonable rainfall? I think so. I think, taking an average, that we can grow, at any rate, 16 bushels to the acre, and that is a lot more than they grow north of Adelaide.
80. But your district is regarded as a dry district? Yes, it is dry. A district with an average of 18 inches of rain is a dry district. But one peculiarity about wheat is that it does not require a lot of rain to make it grow.
81. Then you would not advocate the construction of a line of railway simply for the purposes of a gold-field? No.
82. I suppose the traffic on the line to Wyalong, if constructed, would consist of passengers and supplies going to the field? Yes.
83. That would be the only business done with the railway? Yes.
84. Are you able to express an opinion as to whether the field is likely to be a permanent one? No; I would not venture an opinion on that point. I might state, however, that I have been upon most of the gold-fields in the Colonies and I reckon that this is one of the best I have seen; but whether it is going to be permanent is more than I or anyone else can tell. The mines are improving as they go down, and that is not a bad sign..
85. Have you very much difficulty in getting your produce to market by road in wet seasons? I cannot say that I ever had.
86. Then you do not regard 20 miles as an unreasonable distance from a railway? Certainly not. I am not agitating to get a railway here for my own benefit.
87. I am only asking you, as an old resident, to express your opinion; I do not suppose you are actuated by any other than the highest of motives;—do you regard the service of a railway system within a distance of 20 miles as a reasonable service? I think it is a reasonable service.
88. You stated, in reply to Mr. Roberts, that you believed that, if a railway were constructed, a larger amount of settlement would take place? Yes.
89. That is, settlement in the shape of agriculturists and small farmers? Yes.
90. *Mr. Lee.*] Is your run in the Central Division? Yes.
91. I think you have already stated that you held it under leasehold and occupation license? Yes.
92. That has not been available for selection for some time? Not since 1885.
93. There appears to be very little selection between Temora and here;—how do you account for that? I think most of the country worth selecting between here and Temora has been selected long ago.
94. But would all the forest land which we saw when travelling from Temora to Barmedman, have been taken up had it been available? No doubt the best of it would. There is some land between here and Temora which would not be worth taking up.
95. Then you think the best parts have already been secured? Yes.
96. If the railway were here now, the only traffic which would be sent from here, at present, would be the wool in the wool season, and the small quantity of wheat which is raised? Yes.
97. Then you are building your evidence upon the fact that, with a railway here, and a portion of your run resumed, there would be a small settlement which would thus create a traffic. Yes.
98. But at present there is not sufficient for a railway? The way in which I look at it, is this: if we do not get a railway we are entitled to a road.
99. But at present there is not sufficient traffic from Barmedman to pay the expenses of a railway? No; but until we get a railway we shall not have any more settlement.
100. As one of the chief residents here, and as one who has a great deal of freight to send in a certain season of the year, are you not exercised more as to proper means of communication with Temora, rather than as to the absolute want of a railway from here to Temora; for instance, if you had a good metalled road to Temora, and could depend upon it at all times, would you not be satisfied? I would be quite satisfied with that.
101. Do you think, considering the scarcity of metal, and the difficult nature of the country for road-making, there is a possibility of building a cheap line to cost about the same as a road? Yes, that is my idea. I do not think it would cost the Government any more for a light line of railway from Temora to Wyalong than it would for a metalled road. Further than that, the Government get some return from a railway, and nothing from a road, although they have to maintain it for nothing.
102. If Wyalong continues to be a good paying gold-field, or if a permanent settlement takes place, the traffic must necessarily pass through Barmedman to Temora? Yes. 103.

Mr. Robertson. 103. Consequently, then, the people will be as much interested in a good road between Barmedman and Temora as they would in one between Barmedman and Wyalong? Yes.

15 June, 1895. 104. And whatever the views of residents of Barmedman may be, the remark will apply with equal or greater force at Wyalong? Yes.

105. Then, in your opinion, if there was a good road which could be depended upon, the question of railway communication to Barmedman would not be so urgent? No.

106. Is mining here flourishing, or is it going down? It has gone down a great deal, but I think that is owing to want of capital. I believe there will be some good gold obtained here yet.

107. Is there not a large mining reserve in the vicinity? Yes.

108. Does it not debar settlement? No doubt, to a great extent.

109. There are some 50,000 acres of reserves? Yes; but a lot of it has been cut up lately into special-area blocks.

110. Then, has it been taken up? It has not been gazetted yet.

111. Is the land in the vicinity of this township, within a radius of 8 miles, suitable for agricultural settlement? Yes; I think so.

112. Where would you locate the best land suitable for agricultural purposes? The best land I know of is along both sides of the line from here to Wyalong.

113. Is it better than that from here to Temora? Equally good, if not better.

114. Is that land on your run? A lot of it is.

115. If that were resumed under the new Crown Lands Act, do you think there would be a reasonable prospect of it being taken up and settled upon? As far as I can learn, a number of people in this town have received letters from their friends in Victoria inquiring about land. I cannot go further than that.

116. But you will understand the way in which it will probably be offered to the public—not as a freehold, but under a system of homestead selections, or perpetual rent;—do you think it would be accepted under those terms? I do not think so.

117. Inasmuch as the country through which the contemplated line would run is in the Central Division, and if any resumptions were made in this locality under the new Act, and they were thrown open under a system of homestead settlement, do you think that that settlement will arise in the same way as it has done around new gold-fields in the past, and thus form the nucleus of a town? I do not see why it should not.

118. Even under a system of leasehold? Even under a system of leasehold. People are always very anxious to get close to a town.

119. At all events, as far as Barmedman is concerned, the freight which would be available for a railway would be prospective? That is all.

120. In the event of resumptions taking place under the Act, it must necessarily be two years at least before there could be any increase in the production here? It would be all that.

121. At least two years? Yes.

122. Even if the land were taken up? Yes; even if the land were taken up to-morrow.

123. *Chairman.*] You tell us you have been here for twenty years? Twenty-two years.

124. How many years out of those twenty-two years has the season been so dry that the wheat crop would have failed, caused by the dryness? I could not say.

125. Have you no idea? No.

126. Do you think they have often failed? No, not very often. For the first four years I was here, I was not interested in the matter. With regard to the subsequent eighteen years, I might state that for five years out of that period the crop, I think, would have been a failure from dryness of the seasons. Roughly speaking I might state that every fourth year they would be a total failure from dryness.

Mr. Henry Beecroft Copeland, Crown Lands Agent and Clerk of Petty Sessions, Barmedman, sworn, and examined:—

Mr. H. B. Copeland. 127. *Chairman.*] Did you give evidence before the previous Committee? Yes.

128. Has anything happened since which has caused you to alter your opinions with regard to the proposed railway? No.

15 June, 1895. 129. *Mr. Davies.*] You state you have no reason to alter your opinions in regard to the railway? No.

130. Have any developments taken place within the last twelve months which would go to strengthen the evidence you gave before the previous Committee in favour of the proposed line from Temora to Wyalong? Yes; since the last inquiry was held the new Land Act has been passed, which, I suppose, will enable between 60,000 and 70,000 acres of land to be thrown open between here and Wyalong. That in itself is, in my opinion, very good ground in favour of a railway. There is no necessity for a railway unless the land is thrown open.

131. Would that, in your opinion, be the means of increasing the settlement of the district? Yes.

132. In your capacity as Crown Lands Agent, have you had applications within the last twelve months for any large amount of land? Not personal applications. I have seen letters during the last few weeks—since the passing of the new Act—addressed to an agent in the town, making inquiries about land.

133. No inquiries have been made to you direct? Not within the last twelve months. When I first came here, as I mentioned in my previous evidence, several people spoke to me about it.

134. For what purpose would the land be taken up? For farming and grazing.

135. Are you of opinion that if the land were thrown open for settlement, a large proportion of 60,000 acres would be taken up? Yes.

136. What is the general character of the land which will be available? Good.

137. Suitable for grazing and agriculture? Yes.

138. Is there much land under cultivation in the district? Yes, a fair amount.

139. What acreage? I could not say; it is increasing.

140. Can you tell what proportion of increase there has been within the last twelve months? No.

141. Has the population of Barmedman increased? No.

142. What has been the proportion of decrease since you last give evidence? I could hardly say.

143. Approximately? I believe the population when I came here was about 400. I should not think it is 300 now.

Mr. H. B.
Copeland.

15 June, 1895.

144. You think there is a decrease of nearly 100 permanent residents? Yes.
145. To what do you attribute the decrease? To the opening up of the gold-fields at Wyalong.
146. Then the people who have left your portion of the district have gone to Wyalong? Yes.
147. So that the district itself has not lost settled population? No.
148. It has simply been a change from here to Wyalong? Yes.
149. Do you know anything of the mines at Barmedman? There is one mine, the Fiery Cross, which is not working at present, but I believe it will be working in a short time. The people who have it now are starting to float it. If they succeed a lot of people will be employed. There is another small mine about $1\frac{1}{2}$ miles out of the town which was sold the other day to some Sydney people for £300. They have brought a battery and intend to crush the stone out of the mine and treat the tailings.
150. Do you know of any claim in the Barmedman district which is paying at the present time? There is only one mine working.
151. Then the gold-fields, practically, are abandoned as far as Barmedman is concerned, except in the two instances you have just mentioned? Yes.
152. Do you know of any prospect of any fresh developments in connection with the gold-fields at Barmedman? No; with the exception of the re-working of the Fiery Cross, and I have no doubt when that gets to work there will be a lot of prospecting about Barmedman in the hope of taking up the Fiery Cross lead.
153. You do not know of anything beyond the possibility of fresh settlement by opening up the lands which is likely to increase the population? No.
154. Do you know of any good reason why a railway should be constructed from Temora to Wyalong other than the reasons assigned in your previous evidence? No.
155. You have no stronger evidence to give? No.
156. Would the trade and traffic between Barmedman and Temora warrant the expenditure necessary for the construction of a railway, especially in view of the fact that the population at present is a shrinking population? I do not take the population of Barmedman into consideration at all, but the population of the outside districts. There is a big district which would derive a great amount of benefit from a railway.
157. What would be the business which would pay working expenses and cost of construction? The carriage of wheat, stock, and wool.
158. But all the wheat and stock in the district at the present time would not pay the interest and working expenses? It might not at present; but if people could get rid of their produce they would go in for larger cultivation.
159. Then, in the event of the land being taken up for settlement, how long would it be before the results of that settlement were available;—how long would it be before the settlers would be able to send stock to market? Fully five years.
160. So that there would not be likely to be any large addition of trade or traffic for five years? No.
161. Even if the land were taken up tomorrow? Perhaps in five years. They would have to clear the land; and I daresay it would be pretty well on for five years by the time it was cleared and ready for the plough.
162. Do you regard the distance from Barmedman to Temora as an unreasonable one for railway communication? Not exactly from Barmedman to Temora, but from the outlying districts to Temora.
163. What radius would you take? All the produce is grown to the west of the town. The settled country is to the west; and all the country to the east is within the leasehold areas.
164. How far would the settled portions be from Temora? You could go from here west, I suppose, 20 miles.
165. From Barmedman? Yes.
166. [Chairman.] What is west from Barmedman? I mean out Kildary way and Boddigah.
167. How much below Hillston would a line west strike the Lachlan? I could not say.
168. [Mr. Davies.] You state that it is about 20 miles from Barmedman to the settled portions of the district? Yes; it is settled 20 miles out.
169. So that would make it 40 miles to Temora? Not exactly, because they could go direct from there to Temora. I think there is a main road that way.
170. A shorter distance? No, it will be 30 miles from here.
171. That, in your opinion, would be rather a long distance? Too long.
172. Are you in a position to express an opinion as to the permanency of the Wyalong gold-fields? No; I do not know much about mining, but from what I have seen I should imagine there would be a very big field there.
173. The settlement during the time the diggings were in full swing at Temora, was, I believe, much larger than it has ever been at Wyalong? Of course Temora was an alluvial field.
174. But a large number of people were employed there? Yes; when Wyalong first broke out there were 6,000 or 7,000 people there, but the number has fallen away lately.
175. In the event of the Wyalong field being worked out, as has been the case at Temora, do you think a settled population would be left in the district? Yes; if they had a railway I think there would be a fair-sized town there.
176. Something after the same proportions as Temora? Yes.
177. What would sustain the district in the event of the gold-fields failing? Agricultural pursuits.
178. You are aware that the district is recognised as a dry one, the rainfall being very small and precarious? The average rainfall of this district is nearly 23 inches.
179. Where did you obtain that information from? From Mr. Richmond, the staff surveyor. He collected the information. I do not know whether it was for the Department or for his own purposes. All the squatters round about have been keeping a record for a number of years, and he told me the average was 23 inches.
180. If we have sworn testimony that the rainfall is only from 17 to 18 inches, which is most likely to be right? I cannot say. I have nothing to go upon beyond his words.
181. The district, however, is regarded as a very dry one? Yes.
182. In view of the deficiency in the rainfall, do you think the district would be a successful agricultural growing district? I believe in South Australia they have less rainfall, and do very well with wheat.

Mr. H. B. Copeland. 183. But do you think this district would be successful with so small a rainfall? I do not see why it should not. We have splendid soil. Of course the rainfall is rather precarious, but we have had very good seasons, until the present one, for a number of years.

15 June, 1895. 184. Then, I understand you are of opinion that in the event of the gold-fields not proving permanent, a settled population would remain and take up agricultural pursuits and grazing, providing the lands were thrown open? Yes.

185. Do you think that population and settlement would be sufficient to pay the interest on the cost of construction, and the working expenses of a railway between Temora and Wyalong? Of course it might not pay working expenses for some time, but there is the land. My idea is that unless you throw open the land there is no need for a railway; but if the railway were opened, even if it were run at a small loss, it would benefit an enormous number of people.

186. Do you regard the road between Temora and Barmedman and Wyalong as a fairly good one? No; I do not.

187. Supposing the road were made fairly passable for traffic between Temora and Barmedman, and Barmedman and Wyalong, would not that be sufficient in the absence of a railway? No.

188. You believe, then, that a railway is absolutely necessary for the development of the district? I do.

189. Mr. Lee.] Can you tell the Committee what acreage of selections, if any, has been taken up since you gave evidence in 1894? I suppose there must have been about 10,000 acres; but I could not say with certainty.

190. How would it be taken up—as conditional purchase, or conditional purchase and conditional lease? Both.

191. Have you had an opportunity of ascertaining what the produce of wheat has been this year? No.

192. Have you had an opportunity of finding out whether there has been a larger area placed under crop since you gave your evidence last? Only from what I have heard from farmers themselves. They seem to be gradually increasing the area.

193. What is done with the wheat grown here? It is sent to Temora to be ground or sold. Some of it has been ground, but not very much. Most of it has been sold.

194. About the time they were carting their wheat to market, was the road in fair order? The road has been in good order since November. The last rain was in October.

195. As a rule, is it not about the months of December, January, February, and March, that the road from here to Temora is pretty good? Yes.

196. Those are the dry months, as a rule? Yes.

197. And those are the months the farmers want to use it most? Yes.

198. And those are the months in which the wool finds its way to market? Rather earlier than that. Shearing here is over by October. The wool comes in from out west and from north about October.

199. Would it be safe to assume that during the summer months the main road from here to Temora, as a rule, is in trafficable condition? Yes.

200. And when it is really bad is generally in the winter months? Yes.

200 $\frac{1}{2}$. Particularly if they happen to be wet? Yes.

201. Then, I believe, the road is very bad? It is horrible.

202. In view of the slight progress in this district in the way of settlement, if the road were made trafficable during the months it is required to carry the heavy traffic, would it not suit all the requirements of the district for some time to come? No doubt for some time to come.

203. Is the cost of the carriage of wheat from here to Temora held to be a detriment to the production of wheat? The farmers say that to take wheat from around Barmedman the carriage is not so bad, but when it gets away from there the carriage takes all the profit away from it.

204. I am speaking now of land within a fair radius of Barmedman—say, from 6 to 8 miles? I dare say that within a radius of that distance from here the carriage would not be excessive.

205. They could afford to carry their wheat to market at Temora over an ordinary road? Yes.

206. In the event of any land in the Central Division of this district being thrown open under the new Act, it would necessarily be some years before the produce of the district increased so largely that you would require a railway to convey it to market? Yes.

207. And at the present time, so far as Barmedman is concerned, there is no pressing necessity to extend the railway from Temora? No.

208. Since you gave your evidence last there has, I believe, been considerable development in the gold-fields at Wyalong? Yes.

209. And that is looked upon in this part of the country as a great centre of attraction? Yes.

210. Whatever may pass to and from the field has necessarily to pass through Barmedman? Not all of it.

211. Is there some other track? Yes; they come from Grenfell and Forbes.

212. But would not the dray traffic find its way there? Yes; but a lot of produce comes through Grenfell and Forbes.

213. What is the distance from Forbes to Wyalong? Fully 50 miles.

214. Not very much further than it is from Temora to Wyalong? Not very much.

215. Is it a better road? I do not know.

216. I suppose the produce finds its way from there, because there is so much more grown in the neighbourhood of Parkes and Forbes? Yes.

217. And they go there to find a market? Yes.

218. Consequently, there is a fair amount of passenger traffic that way? I do not think there is much passenger traffic that way; I think that comes this way, unless it is the miners travelling to and fro. A great number of people come from Forbes way and settle there.

219. If the same conditions of supply were maintained in the Forbes and Parkes district, and a line were constructed by this track to Wyalong, the construction of that line would not necessarily bring the produce traffic round that way? No; the produce for that part of the country would still go that way.

220. Owing to the distance? Yes.

221. And it is within an easy cartage distance, 50 miles? Yes.

222. Therefore, there would always be a competitor to the railway even if it were made there? Of course there would be a competitor to a certain extent.

223. Do you know much of the character of the land between here and Wyalong and above Wyalong? I believe it is very good.
224. What do you mean by very good? It is good wheat-growing and grazing country.
225. Equal to the land between here and Temora? I think even better.
226. There is a large proportion of vacant land between here and Temora? No; there is only one run—that is Mandamah, about 3 miles from here. The rest of the land in my land district, which extends to about 6 miles from Temora, is nearly all selected.
227. But not brought under cultivation? They are all pretty well new selections.
228. Does the cultivation portion lie back from the road? That I could not say. The cultivation, I think, is further inland.
229. Are many of the 10,000 acres, which you have spoken of, within the area? No; they are scattered all over the district.
230. Is the land so held under pastoral lease and occupation license between here and Wyalong of such a character that it could be resumed under the new Act? Yes.
231. And if that were done, do you think there is a reasonable possibility of it being taken up? I believe so.
232. But would not the fact of this part of the country being so dry and absolutely without surface water debar small settlement? I do not think so. People have been selecting here for years.
233. Would it not discourage agriculture? I do not see for what else they could take it up. They take it up now for agriculture.
234. But they appear to turn so little of it to that account? You have to take into consideration the fact that the selections are very young. The people have not had time to go into cultivation; they have to clear the land first.
235. But do you think cultivation a possibility here so as to compete with the richer lands closer to the markets, such as the lands about Temora, Gundagai, and that locality;—do you think you could ever produce wheat here, and compete with those districts? Perhaps people close to the towns have a greater advantage; but still they can grow wheat here and do fairly well in reasonable seasons.
236. They have the advantage of better land and better rainfall in those districts? I do not know about better land.
237. Would you consider land in the vicinity of Cootamundra better than land in the vicinity of Barmedman? I could not speak about the land at Cootamundra, but I believe the land about here is very good—it is very suitable for wheat-growing.
238. I take it that you intend to convey the idea that the apparently permanent settlement at Wyalong is an important factor to their having a railway? Yes.
239. If there were no Wyalong, I suppose there would be no agitation for an extension of the railway to Barmedman? Yes, there would; I believe before I came here, there was a very strong agitation for an extension to Barmedman.
240. And the opening of Wyalong has increased the desire to have the line here? Not through Barmedman—I refer to the townspeople. Of course, it does not affect the selectors to any great extent.
241. So far as you are able to judge from an official point of view, there are stronger considerations existing now for an extension of the line than there were when you gave evidence in 1894? Yes.
242. You are clear about that? Yes; I look at it from this point of view—that all this land is now available, or can be made available for selection, and a railway, of course, will offer greater inducements to people to take it up.
243. You are fortified in your opinion by several reasons;—one is the passing of a Land Act since you last gave evidence, the further development of the mining field at Wyalong, the area of land which can be resumed in this district, and the desire of people to get that land to settle upon? Yes.
244. Are we correct in assuming that that is the actual state of affairs at the present time? Yes.
245. And, under those conditions, you have no hesitation in giving favourable evidence for the extension of the line? No.
246. *Mr. Roberts.*] Have you ever been to Wyalong? Yes, on several occasions.
247. When were you there last? On Tuesday and Wednesday of this week.
248. Are you of opinion that the Wyalong field is likely to be a permanent one? Yes.
249. Do you think that the population there is becoming more settled than it was? Yes.
250. You do not think it is likely to decrease? It has decreased for some time; but I put that down to the fact that they have been unable to crush the stone, and the men have been starved out. They have had to go away to earn money.
251. Is it for the want of capital that they have left Wyalong? Yes; they have expended what capital they had waiting for crushings. They have had to leave in order to work elsewhere to obtain more money.
252. Have you heard of any new capital being introduced there, or being about to be introduced there? There is a new crushing plant just started—Climo's—which will give a very big result, judging from the crushings they have had in Sydney. He is putting up a plant which will put through 50 tons a day.
253. Is that the plant referred to in the evidence of Mr. Garland, in Sydney? Yes.
254. And it is the satisfactory prospects of the field that has led Mr. Garland and his friends to introduce this new plant? Yes.
255. And it is owing to the improved prospects of Wyalong that you yourself have formed the opinion that it will be desirable to construct a railway? Yes. I may mention that when I was at Wyalong on Tuesday I had a sale of land—it was 5 acres of town land, $\frac{1}{4}$ -acre blocks, they average £22 per acre—that is in the surveyed town of Wyalong.
256. What area of land was sold? Only one 5-acre section in ten lots.
257. How long has elapsed since you had a sale there previously? That was the first sale.
258. Is there any land around Wyalong, at present devoted to agriculture? There are selections to the north of Wyalong, and a few to the south-west,—that is close to the town; I think the selections to the north will be somewhere about 3 to 8 miles.
259. Is there any wheat being grown there now? I do not think they have grown wheat; they have grown hay.
260. Has the progress of Wyalong been retarded for the want of money to put up pumping machinery to deal with the water? No.

Mr. H. B.
Copeland.
15 June, 1895.

8^r
Mr. H. B.
Copeland.

261. In your official position I imagine you are well acquainted with the people of the Barmedman district? Yes.

15 June, 1895. 262. Can you tell the Committee whether there is any anxiety on the part of the people in this district for the construction of a railway? Some of the selectors who have been in the office have been talking about it.

263. Do they complain of the difficulty in getting their produce to Temora? Yes; they say if they had a railway here it would be much cheaper, and they would get a fair profit.

264. But is not carriage from here to Temora very reasonable? It is, at the present time.

265. Do you know what the carriage is? I know that there has been carriage from Temora to Wyalong at 15s. per ton.

266. How much would it be to Barmedman? I think the average between Temora and Barmedman is £1. One man pays £1, all round, winter and summer. I dare say the average would be about that. At present it is much higher on account of the rise in produce.

267. But is it not a fact that the carriage from Temora to Wyalong is 15s. per ton? That was when there was a big rush of carriers, and they were forced to take the stuff. I know it has been down as low as that, but it is a starvation price. I think the average price to Wyalong is somewhere about 30s.

268. Do you look upon 30s. as a fair rate? Yes.

269. And I understand you to say that the present rate is about £1? No; one storekeeper was paying £1 all the year through; but it is higher now since the rise in the price of produce.

270. In forming your opinion that the railway should be constructed, have you gone into any calculation as to the amount of produce which would be carried, and also, the number of passengers;—in fact as to the probable revenue of the line? No.

271. You have merely formed your opinion upon the fact that you think this is a fine wheat-growing district and that there is a large mining population, and that you think this part of the Colony ought to be served in the same way as other parts similar to it? Yes.

272. In other words, you merely recommend the railway on general grounds? Yes. There will be a loss of close upon £3,000 a year on the railway from Parkes to Condobolin. I do not think there will be the same loss here. When Wyalong gets a fair start—that is, when the people get their tanks full, there will be far more money turned out there than in Parkes or Condobolin.

273. In view of the fact that railways have been constructed, do you not think it would be wise to give the matter grave consideration before constructing similar lines? I think the Government ought to be quite content, if they make a loss on a railway, to get rid of the land and to settle people upon it.

274. Without regard to the probable revenue to be received from the railway? Under present circumstances the revenue would be very slight, but if you could settle people on 50,000 acres of land, there must in years to come be a very big return.

275. Looking at it from that point of view, do you think that the people of the district surrounding Barmedman and Wyalong are justly entitled to a railway? Yes.

276. And that it would tend to the settlement of a large population upon the land? Yes.

277. Mr. Lee.] Can you tell the Committee whether the revenue has increased since the 21st March, 1894? Yes, it has.

278. Have there been many transfers of land during the same period either by way of mortgage or sale? Yes; mostly in mortgage. I might mention that since I last gave evidence a gold-field has broken out at Reefton, about 7 miles from here. There have been fair prospects there, but they are suffering from the same difficulty as Wyalong. They have stopped crushing from want of water. There is a battery there, and there must be a population of 200 people.

279. Chairman.] Are the people here growing enough stuff for local requirements;—where does the fodder used about Barmedman and Wyalong come from? Usually it is locally grown.

280. Is it locally grown at present? Yes, I think so.

281. It has not been imported here? No; I do not think it has.

282. Mr. Lee.] You do not grow maize here? No.

283. Chairman.] What do the carriers feed their teams on? Usually on oats, or wheat and chaff.

284. Mr. Davies.] Is the chaff brought from Cootamundra by rail? I could not say with certainty, but I have seen large loads of chaff come from Temora.

285. Chairman.] And where has it gone to? To Wyalong.

286. Looking at the map supplied by the Survey Office—starting from Wyalong and coming to Barmedman—you will see that the whole of the line passes either through land held under lease or through reserve? Yes.

287. That is a correct description? Yes.

288. Passing from Barmedman you will notice that the first 4 miles pass either over the Common or to the south of the Common, through a reserve? Yes.

289. Therefore, there is no settlement adjacent to it? No.

290. The next 4 miles appear to be settled partially on the western side of the line and fully on the eastern side of the line? Yes.

291. The residue of the western portion of the line being reserved? Yes.

292. Then for the next 6 miles it passes through reserves except where it touches one portion—apparently portion 15? Yes.

293. Where are the lands which you believe will be available for settlement and which will furnish supplies for the railway if taken up? A considerable area between Barmedman and Wyalong is held under leasehold. There is a limited area along the line in the form of reserves, between Barmedman and Temora, and a considerable extent of land on the Mandamah Run is available, and also some land towards the east. I put in the following return showing the agricultural statistics for Barmedman for the year ending December, 1894, as collected by the police:—

Number of occupiers.	Total area of land held.	Total area under cultivation.	Area under wheat for grain.	Total yield of wheat for grain.	Total number of sheep as per Returns to C.P.S.
82	173,101 acres	2,407½ acres.....	1,520½ acres.....	9,316½ bushels...	140,722.

Mr. Denis Byrne, farmer and grazier, Barmedman, sworn, and examined:—

294. *Chairman.*] How long have you been here? About four years.
 295. Where did you come from? From Albury.
 296. *Mr. Lee.*] How many acres of land do you hold? 2,560 acres.
 297. What area have you under cultivation this year? 150 acres.
 298. That is 10 acres more than you had in the year before? Yes.
 299. Did you grow wheat during last year? Yes.
 300. What was your yield per acre? Between 16 and 17 bushels.
 301. Where is your selection? About 7½ miles almost due west from here.
 302. What did you do with your crop? I stripped it for grain.
 303. What did you do with the grain? It is stored at Cootamundra awaiting an advance in price.
 304. You gave evidence before the Sectional Committee on the question of the construction of a railway about a year ago? Yes.
 305. I suppose you remember pretty well the evidence you gave on that occasion? I gave a general statement as to what I knew existed at that time.
 306. You were in favour of the extension of the railway then? I am of the same opinion still.
 307. You have had no reason to alter your opinion? Not the slightest; if anything my opinion is stronger, in view of the increased areas which people could put under cultivation if they had the means of getting produce away. Local markets cannot be depended upon for any length of time.
 308. The produce of the district would depend upon the quantity of land thrown open? Yes.
 309. What do you estimate it costs you to cart your wheat from here to Temora? I had some wheat carted from Temora at £1 per ton. That was seed wheat. In harvest time it will cost about 15s. per ton.
 310. There are about nine bags to the ton? Yes.
 311. That is about 1s. 8d. a bag, or 5d. a bushel? Yes.
 312. What is the railway carriage from Temora to Cootamundra? It is a very slight fraction compared with the carriage from here to Temora. The carriage to Sydney will be about the same as it will cost me from my place to Temora, about 4d. I can send it from Temora to Sydney for less than I can land it from my place at the Temora station.
 313. I suppose it will not cost you more than 7s. 6d. a ton from Temora to Cootamundra? I should not think it would.
 314. That will be 2½d. a bushel or 7½d. a bushel from your farm to Cootamundra? Yes.
 315. Cootamundra, I suppose, is your best market? Yes; considering that we have no mills out here.
 316. *Chairman.*] Is there a mill at Temora? There was a mill, but it did not make good flour, and it was burnt down lately.
 317. *Mr. Lee.*] Have you been able to make a living out of your land, sell your wheat at recent prices, and pay the rate you have stated for carriage? Yes. I cannot say that it has been better than grazing, but you are forced to make a living out of something. There are two ways to make it—out of grazing or farming.
 318. And of the two farming pays the better? I believe it does.
 319. But you are hopeful that times will improve and prices get better? I suppose they will.
 320. You have not been many years in this district? No.
 321. Where were you before coming here? On this side of Albury.
 322. How long have you been here? Practically only three seasons.
 323. You have not experienced a dry season yet? Not until the present one.
 324. So that your farming, as far as you are concerned, has been under somewhat favourable conditions? I have made a mistake. The first season I was here was almost similar to the present one, with this exception—that the drought broke up a few weeks earlier.
 325. That was your first year and you did not do much cultivation? No; although I had about 10 acres in which yielded a good return of hay.
 326. What do you think of the prospects of the district from an agricultural point of view? I think they are good—very much better than any other district I have been in.
 327. Do you think that the rainfall is sufficient? Yes, I do; it is quite sufficient for wheat-growing.
 328. What particular advantage would accrue to this district if the railway were extended to Barmedman? Of course the farmers would have increased facilities for getting their crops away at the cheaper rate. It would also induce settlement if any of the Crown lands were made available.
 329. Are you of opinion that there is, from the cultivation of station produce sufficient freight in the district at the present time to pay the ordinary expences of working the railway if extended here? I do not think there would be, just about this locality at present. We always think it would give an impetus to it.
 330. You are of opinion the railway will cause more settlement, hence more freight? Yes, if the land becomes available.
 331. Would you regard an extension to Barmedman as being sufficient for all purposes, or do you think, in order to give you a proper outlet, there should be an extension to Wyalong? I do not think it will affect the farmers about here; I think Sydney is our real market. The supply of Wyalong would be almost taken from a few farmers, if they went in for it properly.
 332. You look to the larger markets? Yes; we look to the head market.
 333. That is where you must necessarily go if there is any large quantity of produce raised in the district? Yes.
 334. Of course, you have of necessity been compelled to use the road from here to Temora? Yes.
 335. In all weathers? Yes.
 336. At times, I believe, that road has been almost impassable? No one who has not seen it could imagine what it has been.
 337. Are there any large deposits of metal along the road, which could be obtained for the purpose of making a road? Not that I am aware of, except at one place. About 8 miles from here is the only real supply of metal I know of, and it is not of a good description.
 338. Then, one of your chief objects in advocating the line, is to obtain a more certain communication, and a cheaper rate of freight? Yes.
 339. And at present it costs about 15s. a ton to Temora? That will be a reasonable rate.

Mr. D. Byrne.
15 June, 1895.

Mr. D. Byrne. 340. But with a railway rate of 5s. per ton, you would be able to make so much more profit, and have a more reliable means of communication, which would enable you to take advantage of any rise there might be in the market? Yes; another thing I might point out which would be an advantage is this:—Supposing I had wheat, and was compelled to send it away and sell it, if I held it to the best time for selling, it would cost from 15s. a ton to cart it; whereas I could have it stored at a railway station and carted any time it suited me.

341. Your harvest is generally in a dry season? Yes.

342. And the better prices generally prevail in the winter months of the year? Yes; and carriage is much higher owing to the bad state of the roads.

343. In the event of the lands being thrown open in the vicinity, where do you think the settlement would take place? This is a peculiarly situated place. In order to see the good farming land here you require to go off the main road. The principal amount of the good farming land lies to the west. There are patches of good land about here; but for a large and unbroken extent of good land, there is nothing like going over the range.

344. And those who settle on that land would of necessity have to send their property to Barmedman? Yes; that is the nearest point—15 to 18 miles from here.

345. Is any of that country cultivated at the present time? Some of the settlers have from 150 to 180 acres in this year, and some more than that; that is, taking all the country west of Broken Dam. I suppose that for anywhere east of that, Temora is the railway station.

346. In your opinion, has this district progressed or gone back within the last twelve months? It has certainly progressed as far as improvements are concerned. I might also state that very few people, if any, have sold out.

347. Is the land squarely held in this district—that is, by the *bona fide* settler? Yes, as a rule, it is very honestly held.

348. *Mr. Roberts.*] In your opinion, is there a sufficient area of land under cultivation around this district to warrant the construction of a railway? No, I do not believe there is at present.

349. But you think if a line were constructed settlement would speedily follow? I believe it would.

350. Do you base that opinion on the fact that you consider the land well suited for the production of wheat? I believe it is very well suited, not only for the production of wheat, but for the production of first-class chaff.

351. And you think that the district would rapidly progress if it had railway communication? I think it would be a very great help. I might mention, with reference to the question of freight, that I forgot to state that in the case of chaff it would cost me, at present, about two and a half times as much to land it at my place at the Temora railway station as it would to land it in Sydney.

352. What would it cost to take it from here to Temora? Not less than 25s. a ton. I could get it carried from there to Sydney for about 10s. a ton.

353. Then what leads you to the conclusion that the railway ought to be constructed here is, that instead of paying 15s. a ton for the carriage of your wheat from here to Temora you would only pay about 2s. 6d.? Yes; that would be a help to farmers, no doubt.

354. Are you acquainted with Wyalong? I am acquainted with the district.

355. You have been there? Yes; and far beyond it too.

356. Can you form any opinion as to the mining operations now being carried on there, or as to the permanency of the field? No; I have never had anything to do with mining, but it has a good reputation.

357. *Chairman.*] What distance might a farmer be from a railway station and be able to profitably occupy his land? Of course, a great advantage accrues to farmers if they can go from home, deliver a load, and return the same day. The limit of a day's run is about 12 miles. A farmer can travel 12 miles in a day, deliver his load, and return.

358. What would be the limit? I consider a district is well served which is within 15 miles of a railway—that is, from an agriculturist's standpoint.

359. *Mr. Davies.*] What would it cost per acre to clear the ordinary land about here—taking your own holding as an example? Fifteen shillings to £1 an acre.

360. Is it similar land to that between here and Temora? No; it is not so heavily timbered. You have not seen the agricultural land coming from Temora to Barmedman. The best agricultural land is miles west of here.

361. Is the good land you speak of scrubby land? Yes, pine scrub.

362. And in a green state it is very easily cleared? Yes, pine is easy to get rid of.

363. And you average it at about 15s. an acre? Yes, it could be done for that.

364. What would it cost per acre to plough that land, sow it, provide seed, strip the crop and bag it? It would cost 8s. an acre to plough, sow, and harrow, without providing the seed.

365. What would it cost you for seed per acre? About 3s.

366. What would it cost you for bags and stripping? About 8s. per acre.

367. Would you be surprised to learn that all this has been done in the Berrigan district for 10s. an acre? Yes, I would be very much surprised. If I had to do it myself I could not do it.

368. If you have to pay 19s. for this work, and have to sell your wheat at 1s. 9d. a bushel, what profit can you have? One shilling and ninepence a bushel is not a fair average. People who sell at that rate are forced to sell.

369. Could you afford to grow it at that price if this work cost you 19s. per acre, and it cost you £1 per ton for cartage? No; I would not care to do it.

370. Do you think it would leave you any return whatever? Not without very favourable crops. It would not take in the ordinary average crop.

371. Would you with wheat at 1s. 9d. a bushel just make wages? Yes; that is, if I had a fair average crop.

372. And you state your average crop to be 16½ bushels? Yes.

373. *Chairman.*] Is anything over 1s. 9d. a bushel profit? I should think so; I would grow for 2s. a bushel.

374. *Mr. Davies.*] If you had a railway to carry it at lower rates you would have so much more profit? Yes.

Mr. Edward O'Donnell, farmer, Barmedman, sworn and examined:—

375. *Chairman.*] Where do you reside? Two and a half miles west of Barmedman.
376. How long have you been here? Close on eight years.
377. *Mr. Roberts.*] What is the size of your holding? 1,672 acres.
378. How much is under cultivation? I have not gone in for cultivation extensively, because I consider, not being close to a railway line, it would not pay.
379. How far are you from Temora? About 25 miles.
380. Do you not produce anything? The year before last I had a crop of wheat in.
381. Where did you send it? To Temora.
382. You combine farming with grazing? Yes.
383. How many sheep have you? I shore 2,000 last year.
384. Did you send the wool to Temora? Yes.
385. Have you found any difficulty in getting the wool taken by teams? I use my own teams.
386. Are you favourable to the construction of the proposed line? I am.
387. Upon what grounds? Because we could get our produce away cheaper, and we could get our supplies cheaper.
388. Do you think the construction of a railway would lead to a large amount of land being taken up for agricultural purposes? Yes; for instance, I am putting 100 acres of ground under crop this year myself, and if there were a railway I might put 300 acres under crop.
389. It is owing to the want of railway communication that you have not gone in for the production of wheat to any large extent? Yes.
390. You look upon the land as good for wheat-growing? I do; I think it is as good wheat land as any in the Colony.
391. Do you not think that wheat-growing at the present time would pay you better than grazing? I do not know. There is very little in either.
392. How many sheep can you carry to the acre? I could not tell you in a season like this. In a good season this country would carry two sheep to the acre.
393. You do not look upon the present as a good season? No; it is about the worst I have seen since I have been here, during a period of eight years.
394. Have you gone into figures at all as to the probable revenue derived to the State if the railway were constructed? No.
395. You have not considered the question of freight or passenger traffic? No.
396. You merely take the broad view that if a railway were constructed larger settlement would take place, population would increase, and a large amount of freight would go to the railway—much larger than goes at the present time? I am certain of it, because there would be a great deal more land under cultivation.
397. Have you any knowledge of Wyalong? A little.
398. Do you know anything about mining? I have been down a hole or two in my time.
399. But you are not in a position to form an opinion as to the permanency of Wyalong as a gold-field? From what I have seen of it I think it is there to stay.
400. Do you think the present population of Wyalong likely to increase or decrease? I could not say about that. I do not think it will decrease, because if they can get water the batteries will give a great deal more work.
401. Have you any personal interest in mining? I have, at Wyalong.
402. Do you hold an interest in a claim there? Yes.
403. Are you getting good returns on the capital you have invested? Yes; I have come out all right.
404. And you look upon Wyalong as a permanent field, and you think there will always be a large population there? Yes.
405. Somewhat similar to Temora? I think it will be a better place than ever Temora was.
406. In what way? There will always be more work and more population. The mining operations there will be more extensive.
407. Then, on the ground that you consider Wyalong to be a permanent gold-field, and that if a railway were opened a large amount of settlement would take place, you think a railway would in the near future pay for its construction? I do not know whether it would pay just now, but it would eventually.
408. *Mr. Davies.*] Did you give evidence at the previous inquiry? No.
409. Were you summoned to give evidence? No.
410. Have you experienced any difficulty in the transit of your wool to Temora? No; simply because I have my own teams.
411. But has the road been good? No; it has been very bad at times.
412. Then have you experienced difficulty in sending your wool to Temora by reason of the bad road? Yes.
413. At what period of the year do you find the road so bad? In the spring of the year; and September, October, and November—sometimes all the winter through.
414. Is the road regarded as a fairly good road in dry weather? It is; but it is the worst road I ever saw in wet weather. I never saw anything to equal it.
415. How many miles are you from Temora? About 25.
416. What would you regard as a fair railway service for a farmer or grazier? 12 or 15 miles.
417. You would not regard a distance of 20 miles from a railway as a fair service? 20 would be better than 50. I think a fair and reasonable distance would be 12 or 15 miles. Anything over 15 miles involves an extra loss in carriage.
418. I suppose you sometimes send stock to market? No.
419. But all your wool at present goes to Temora? Yes.
420. So that the railway already has that traffic from Temora? Certainly.
421. What new traffic would be brought to the railway service, if the proposed line were constructed, other than the earnings between Barmedman and Temora? New freight would be created by the increase in agricultural products.
422. Do you think any large quantity of land would be brought under cultivation? I do.
423. If the land is thrown open under the new Act, will much land be taken up for the purposes of settlement? A great deal will be taken up.

Mr.
E. O'Donnell.
15 June, 1895.

- Mr. O'Donnell.* 424. And that land will be likely to be taken under cultivation? Yes.
E. O'Donnell. 425. How many years would it be before you got any return from land taken up now? It would be a couple of years before it could be got into order.
15 June, 1895. 426. So that there would be no additional traffic or carriage for a couple of years? Yes, there would, because people are settled now.
427. But, supposing the land were thrown open next week, and it were taken up, it would be a couple of years before there could be any return? If the land were taken up next week there could be a crop in next year if the farmers wished.
428. Could they clear the land and have it sown by that time? Certainly.
429. How much of that could be done? It would depend upon how much money you had to spend upon it. If I had money and could let 100 acres by contract I could get it cropped in three months.
430. What would it cost you per acre? That depends on the character of the country. I gave 25s. and 35s. an acre for my place.
431. Is any of the land you speak of as likely to be taken up for settlement similar to the land between this and Temora? There is a lot better land than that.
432. But is there any like it;—you could not clear that land for £5 an acre? Yes, you could.
433. Could you clear the heavily-timbered forest land for that amount? Yes.
434. Can you tell me of any similar country heavily-timbered like that which has been cleared for less than £5 an acre? I never knew £5 an acre to be given.
435. Can you tell me of any portion of the district similar to that which is being cleared? No, I cannot.
436. What would be the lowest for which land of that character could be stumped and cleared—I mean the heavily-timbered land between here and Temora? I have never seen any land like that cleared about here.
437. What do you think that land could be cleared and stumped for? £4 an acre.
438. *Chairman.*] That is green forest land? Yes.
439. *Mr. Davies.*] Did you take up your land for selection? Yes; conditional purchase and lease, under the Act of 1884.
440. You have not put a large portion of your land under crop? No.
441. You consider wool-growing pays better? I consider wheat-growing will not pay at all, when you have to cart your produce so far to market.
442. Do you confine yourself absolutely to wool-growing? No; the year before last I had 70 acres under cultivation.
443. And you had not any under cultivation last season? No.
444. I suppose you got a pretty good price for the produce of the 70 acres? I sent it to Temora and got it ground into flour, and I took it to Wyalong and sold it.
445. Did you get a good price for your wheat at that time? Yes.
446. A much better price than you would have got last season? Yes.
447. And notwithstanding the fact that you had a good price for your flour, you did not put any in last year? No.
448. And you have not anything this year, so far? I have over 50 acres sown at the present time. I am putting 100 acres under crop this year.
449. Can you tell the Committee how the railway is to be made to pay interest on the capital cost and working expenses? I cannot.

Mr. Thomas Joseph Kenny, station manager, Wyalong, sworn, and examined:—

- Mr. T. J. Kenny.* 450. *Chairman.*] What station do you manage? Prior to three months ago, I managed Wyalong No. 3.
T. J. Kenny. 451. *Mr. Davies.*] Were you examined by the previous Committee? No.
15 June, 1895. 452. How long have you been in the district? Over twenty years off and on.
453. Where is Wyalong No. 3 station? Six miles from here. I am now renting a selection about 1 mile from the town.
454. An agricultural selection? Agriculture and grazing.
455. Of what extent? 1,200 acres.
456. What number of acres have you under cultivation? I intend to put in between 30 and 40 acres if we get some rain.
457. Was the selection under cultivation previously? Part of it—I think about 15 or 20 acres.
458. From whom do you hold it? From the Bank.
459. Who was the original holder? Mr. Cassin.
460. And he only had 15 or 20 acres under cultivation? I imagine so by the look of it.
461. Can you state any reasons why a railway should be constructed between Temora and Wyalong? I know it is a splendid agricultural country.
462. Although fairly good soil, is it not recognised as a very dry country? It was, but I think the rainfall is getting better.
463. What is the average rainfall? I have been taking it for the last fourteen years for the Government, and, I think it is something like from 18 to 20 inches.
464. Do you regard that as a reasonable rainfall for an agricultural district? Yes.
465. What is the least you ever saw? Ten inches.
466. And what was the most? About 29 inches.
467. Do you regard the district as an extremely dry one? It is dry, but not extremely dry.
468. Are you of opinion that agricultural pursuits could be followed here profitably? Yes; with a railway.
469. Not without it? No; I do not think so.
470. What number of sheep have you on the leasehold you have taken up? I think there have been 2,000 on it.
471. Can you give any other reason besides the one you have assigned, in favour of the construction of a line between Temora and Wyalong? I think the population would be increased very much by it.
472. Are you aware that the population here has decreased during the last year? That is owing to the people going to Wyalong.
473. We have evidence that the population is one-fourth less than it was a year ago? I should not think so.

474. Whereas it was 400, it is now 300? No doubt a good many people have gone from here to Wyalong. Again, there are people in Wyalong who have their families here, perhaps. Mr. T. J. Kenny.
475. As a station manager, what would you regard as a fair and reasonable service for station property? About 15 miles—that is about a day's stage in and out. 15 June, 1895.
476. Would you regard 20 miles as a reasonable distance? No; it is rather far, and it breaks the day.
477. You have no strong reasons to assign why a railway should be constructed? I think it is a strong reason that the land is so good, and is lying waste.
478. Would not that apply to every part of the Colony of New South Wales? Not so much as to this. This is the best agricultural land I have ever been on. I have seen as good crops of hay here as in any part of the Colony.
479. It would not require a railway to carry the gold from Wyalong? It may in the future.
480. Are you aware of the amount of gold raised from Wyalong since it has been open? No.
481. Would you regard the sum of £40,000 for gold in twelve or fifteen months, as a fair return from a field like Wyalong? You have to consider the hardships they have had to go through for water, machinery, &c. It is hard to say what amount of gold is now waiting to be taken out of the stone.
482. Do you think that the value of the gold which has been raised would be a justification for the Government spending £100,000 upon a railway? I should not think so.
483. I suppose there would not be much freight from the gold-fields? I think there would be a freight. I think Wyalong, in the future, will command a large population; so will the whole of the district, as it is of a very auriferous nature.
484. Do you regard Wyalong as likely to be a settled town? Yes.
485. Even should the gold run out? Yes.
486. How would it then be supported? By agriculture.
487. Then you believe the agricultural and pastoral interests would be sufficient to maintain and sustain a railway, eventually? Yes; I think it would increase the population, and would be the means of forming a large town, independent of the gold-fields.
488. Do you think the Government would be justified in constructing a railway between Temora and Wyalong showing a deficiency at the start of £4,150 a year? I do not know about the figures; but if any country is worthy of a line at all the Wyalong country is worthy of one. The advantage of a line from here to Wyalong is in what would accrue from beyond Wyalong. There is good country on the other side.
489. If that factor has been taken into account in connection with the estimate of the earnings of the line, do you not think it would be better to wait and see the result of settlement upon the lands when thrown open? I do not think so.
490. You are aware that 60,000 acres will be available for settlement under the new Act? Yes.
491. Do you think it will be taken up without a railway? Not all of it.
492. You do not think it would be better to wait and see the result? No; I think it would be better to have the railway first. I think the people would follow.
493. Have you any reason to assign as to why, in your opinion, the railway should be constructed? I can only refer to the good nature of the country. I do not agree with Mr. O'Donnell in his price for clearing the country at £4 an acre; it can be done for 30s. an acre.

MONDAY, 17 JUNE, 1895.

[The Sectional Committee met at the Court-house, Wyalong, at 10 a.m.]

Present: —

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. JOHN DAVIES, C.M.G. | The Hon. CHARLES JAMES ROBERTS, C.M.G.
CHARLES ALFRED LEE, Esq.

The Committee further considered the proposed Railway from Temora to Wyalong.

Mr. Cecil Septimus Gillett, surveyor, Railway Construction Branch, Department of Public Works, sworn, and examined:—

494. *Chairman.*] You are at present engaged in surveying the line from Temora to Wyalong? Yes. Mr. 495. Of what portion of the line have you an intimate knowledge? Between Barmedman and Wyalong. C. S. Gillett. 496. Have you any information at all with regard to the Temora to Barmedman portion? Only in reference to one deviation. With the exception of that deviation, I did not survey the portion between 17 June, 1895. Temora and Barmedman myself.
497. Therefore, the information you have is limited to one deviation between Barmedman and Temora, and the line from Barmedman to Wyalong? Yes.
498. *Mr. Davies.*] Did you complete the whole of the survey from Barmedman to Wyalong? Yes.
499. And you subsequently made some deviations of the original survey? Yes.
500. In what direction are those deviations made? The first was at Barmedman, to obtain a better station site. Just before entering the town of Barmedman those deviations are placed. The second one is at what is called the Kangaroo Hill, to avoid the hill in order to get a surface grade. The third one starts at from 3 to 4 miles beyond that, and follows the road up to Wyalong township.
501. The deviations you speak of are off the road? Yes.
502. Will they lengthen the line between these two points? Slightly.
503. To what extent? It will make a difference of about 9 chains, I suppose. It is very small indeed.
504. And the deviation you speak of is to avoid a cutting? Yes.
505. Will you now have almost level country for the line? Yes; it will be a surface grade all the way, you might say, with the exception of the cutting at the Barmedman railway station.
506. Where did you intend the original site for the station at Barmedman, in your first survey, to be? Just on this side of the township. It was altered on account of it being such low-lying ground.
507. The object of the deviation at the site of the station, then, was simply to have higher land? Yes.
508. Free from flood? Yes.

- Mr.
C. S. Gillett.** 509. Will the deviation be a means of economising the expenditure for earthworks? Yes.
- 17 June, 1895. 510. You know something of the estimated cost of constructing the line? I think Mr. Deane has put it down at £2,300 a mile.
511. Do you remember what the original cost was in connection with the previous survey? No.
512. You made the first survey? Yes.
513. Are you aware that Mr. Deane has reduced the cost from £2,700 to £2,300 per mile? I heard there had been a reduction.
514. Have you seen Mr. Deane's estimate in detail as to the cost of the proposed line? No.
515. Then, you are not in a position to express an opinion as to whether the estimate for earthworks, box-drains, timber bridges and crossing, necessary for the construction of the line, is correct? No; I should not like to do so.
516. Is there abundance of timber for sleepers in the district? Yes.
517. Then sleepers could be procured for a reasonable price? Yes.
518. And the line could be readily constructed along the last survey? Yes.
519. Without any extensive earthworks and without any expensive provision for drainage? Yes.
520. Could any quantity of ballast be procured? Yes; there would be no difficulty in obtaining ballast.
521. How long have you been employed altogether on the first and second surveys? A little over twelve months.
522. During that time, have you had an opportunity of seeing the condition and character of the road between Barmedman and Wyalong? Yes.
523. What has been the general character of the road? Very bad in the winter time.
524. Has there been a difficulty in teams travelling? Yes.
525. Is the country of that character that when you have heavy rains the road is rotten? The road is almost impassable in heavy rain.
526. And great difficulty has been experienced by teamsters travelling along the road? Yes.
527. You say there is abundance of ballast in the district for the purposes of the line? Yes; I think there will be no difficulty in getting ballast.
528. Would there be any difficulty in providing the necessary ballast for road-making? No; I do not think there would. I think they could get the ballast, but in some instances it may be long drawing.
529. In coming through from Barmedman to Wyalong we saw heaps of what was supposed to be ballast along the road? Yes.
530. Would you regard that as fit ballast for road-making? The material did not appear to me to be good, and I would not use it if I could obtain better, but the question has never been officially under my notice.
531. How far distant from the surveyed line would the ballast you speak of as being fit for road-making and a railway be? Between Barmedman and Wyalong they could get some very good ballast—about 8 miles on this side of Barmedman, about a quarter of a mile from the road.
532. Nearly midway? Yes.
533. And there would be abundance of it? Yes; I think they could get ample there.
534. Are you in a position to tell the Committee the cost of the supposed ballast we saw on the road? No.
535. I suppose you would not regard it as ballast? No.
536. Could ballast be found on other portions of the line between here and Barmedman independent of the position you speak of about 8 miles from Barmedman? I think good ballast could be obtained on the pine ridge about 3 miles before you get into Wyalong.
537. That is to say, that about 8 miles from Barmedman and 3 miles from Wyalong you could get abundance of ballast for road-making or for ballasting a line of railway? Yes.
538. In view of the fact of material for road-making being so easily accessible, would it be a costly process to make a good road between Barmedman and Wyalong? The ballast I speak of consists of large reefs—an enormous body of stone which would have to be excavated and broken.
539. It would practically be hard metal? Yes.
540. Would that, in your judgment, be sufficient to carry heavy traffic upon the road? Yes, if it were broken up.
541. During the twelve months you have been in the district you have noticed a great deal of difficulty experienced to people in travelling between Barmedman and Wyalong by reason of the bad state of the road in wet weather? Yes.
542. Is the road fairly good just now? Yes.
543. Is that in consequence of the dry season? Yes.
544. Has there been any strong expression of opinion on the part of residents of the district—storekeepers and miners—in favour of the extension of a line from Temora to Wyalong? Yes; I have heard people on the other side of Wyalong express a strong opinion about it.
545. Does that feeling seem to be of a general character? I do not think it is unanimous.
546. It is a divided opinion? Yes.
547. It is not an unanimous opinion in favour of the construction of a line from Temora to Wyalong? No, it is not unanimous.
548. There is a diversity of opinion? Yes.
549. Would the majority of the people be satisfied with a good road instead of a railway? Some are of opinion that a road would suit better than a railway, and some prefer a railway.
550. There is simply a diversity of opinion? Yes.
551. *Mr. Lee.*] Does the proposed line pass through purchased property between Barmedman and Wyalong? Only in one case, and that is at the Kangaroo Hill. That is the only place where it passes through alienated ground.
552. What is the character of that holding? It is conditional purchase.
553. And for the remainder of the distance it would pass through a pastoral holding? Yes.
554. Is that under occupation or pastoral lease? Pastoral lease.
555. Therefore, under the ordinary operation of the Land Act, it will not be available for some years? I do not suppose it will. I do not know exactly how the Land Act stands with regard to that.
556. At all events, you now confirm the statement made by the Engineer-in-Chief, that the line will pass almost from end to end without going through purchased land? Yes.

557. Therefore, the cost of resuming land, and severance, will be practically nil? Yes.
558. Have you inquired into the question of the water supply in the vicinity of Wyalong for railway purposes? The idea of Mr. Deane was, I think, to obtain the water for the engines from a tank not far from the hospital. It has, I believe, lately been excavated. I also think he had an idea of putting a tank on the Barmedman Creek. Mr. C. S. Gillett.
17 June, 1895.
559. Is the tank which you speak of at Wyalong a Government tank? Yes.
560. How long has it been finished? Only lately, I think.
561. What is its capacity? I do not know.
562. Is there any water in it? No.
563. Will not the conservation of water in sufficient quantities for railway purposes always be a matter of difficulty here? I suppose, if they once got their tanks full, the water would last a long time unless we had another dry season.
564. How long have you been in this part of the country? About twelve months.
565. Is it a country which is subject at times to severe drought? I believe it is.
566. In the event of the water supply failing altogether, what position would the people be in? They would have to carry the water from Temora or Cootamundra.
567. Then at best the water supply here can be but an intermittent supply? Yes.
568. Where have you located the site for the railway station at Wyalong? Down on the main road within the police reserve. It is on the main road to Wollongough.
569. How far from Wyalong proper? It would be actually on the boundary.
570. How far from the Court-house? About 25 to 30 chains.
571. Can you give the Committee any reason for terminating the line there? The idea was, that in the event of the line being extended to Hillston, or to Lake Cargellico, it could be continued on through Wollongough, straight along the road, and along the travelling stock reserve.
572. But in view of a line to tap the western country having been approved of, would that cause you to somewhat alter your opinion as to the location of the station site? To get to the previous station site which was selected, on the southern boundary of the town, the line would go for some distance through claims, and over claims which are being worked at present.
573. What was the reason for not terminating the line at West Wyalong? It is impossible to get down through the claims.
574. If you took the line to West Wyalong you would have to pass through the centre of the mining field? Yes.
575. Was that an important factor with you in deciding to terminate at Wyalong? Yes.
576. And you think the station will be sufficiently close to the town for all purposes? Yes.
577. *Mr. Roberts.*] How wide is the road between Barmedman and Wyalong? Three chains.
578. Does the line follow the road all the way? Yes; with the exception of the deviation at Kangaroo Hill.
579. Does the line go around Kangaroo Hill to avoid a cutting? Yes.
580. Does not that increase the distance to be traversed? It only makes a difference of 1 chain.
581. In the event of the line being constructed, what space would be left for ordinary traffic along the road? Where the line is actually on the road it only takes up 1 chain; and of course on the second deviation from Barmedman north, the whole of the distance up to Wyalong, the line is off the road altogether. A 3-chain strip is taken alongside the road.
582. Why did you leave the road in that case;—do you save some little distance? No; but it is all Crown land, and Mr. Dean considered it better to keep the line off the road where it is Crown land.
583. How many stations have you provided for on the portion of the line which you surveyed—between Barmedman and Wyalong? There are none.
584. Have you provided for any platforms? No, I do not think so. Of course I am not certain as to what Mr. Deane has done with regard to them.
585. I understand, then, that the only places at which stations are provided for are Barmedman and Wyalong? Yes.

Mr. Frederick Needl, miner, Wyalong, sworn, and examined:—

586. *Chairman.*] How long have you been in Wyalong and district? I came here last August twelve months.
587. Where from? From Golden Valley, Victoria. 17 June, 1895.
588. Your knowledge of this district, therefore, is limited to twelve or eighteen months? Nearly two years..
589. *Mr. Lee.*] Did you give evidence before a Sectional Committee about a year ago? No.
590. Are you the owner or part owner of the selection upon which gold was first found here? No; the selection belongs to my son.
591. Were you residing on the selection at the time of the discovery? Yes.
592. Therefore, you know all about it? Yes.
593. Will you tell the Committee the reason you settled down here? I tried to settle in Victoria, and I travelled from 1,200 to 1,400 miles trying to take up a selection, but I could not get one. Then I determined to try New South Wales. I had one son over here, and I wrote to him and asked him if there was any land here fit for selection. He replied that there was a piece at Hiawatha, which he thought had been forfeited. I wrote to him, asking him to come to the nearest telegraph station and wire to me, and then come on to Cootamundra and I would meet him there.
594. Then you took up the land for the purpose of making a home and cultivating it? Yes.
595. Was not the country at that time covered with mallee scrub? No; there were two blocks, but a fine piece of land in the centre was without any mallee upon it.
596. How many acres had you under cultivation? Twenty; we put wheat in.
597. With what result? We were late in the season, and we put it in on the chance of getting horse feed off it. It was sown at the commencement of August, and no rain fell upon it. It came up and began to dwindle away, and we turned the horses and cows upon it. Just at that time we found the gold.
598. There was no more cultivation after that, I suppose? No.
599. Are you able to state whether this part of the country is suitable for agriculture? I am perfectly satisfied that it is. 600.

Mr. F. Neeld. 600. Upon what do you base your opinion, seeing that you have had no practical experience? Only upon my experience in Victoria.

17 June, 1895. 601. But in Victoria you had a better rainfall than here? The rainfall in Sale is somewhat similar to what it is here.

602. What is it in Sale? Seventeen inches.

603. And do they grow wheat successfully there? Yes; it is the finest wheat country in Victoria.

604. Since the period you have mentioned, you have confined your attention to mining? Yes.

605. You saw the field start and you know what it is to-day? Yes.

606. What is your opinion about it? I think the field speaks for itself. The week before last I took a turn round the field, making a mental calculation as to the quantity of stone at grass. I found fully 15,000 tons of stone at grass, waiting crushing.

607. Do you know if any of the reefs have cut out? Yes; some have cut out, and more will be found.

608. I suppose in that respect it is very similar to other mining fields? Yes.

609. What is your opinion as to the permanency of the mines? There is no doubt as to the permanency of some of them. For instance, take our own claim. At the surface it came to a point. At 180 feet deep it is over 5 feet wide.

610. Carrying gold? Yes. There is no doubt about that being permanent.

611. What impression do you wish to convey when you speak of a permanent mine—that it is good for five, six, or seven years? Supposing ours did not go 1 inch deeper, we could not work it out in ten years.

612. Have you a large area of land? Yes.

613. Are there any other claims showing the same indication as yours? Yes.

614. Do you think they also will afford good returns for some years? There is no doubt about it.

615. Can you carry your mind back to April, 1894, and tell us what was the state of mining at that time? That was when the rush was going on.

616. And that was just at the end of a wet season? We had had a very heavy rainfall at the end of January. The squatters around here told me they had never seen a rainfall like it. Nearly 5 inches of rain fell in two days.

617. And I suppose the rush of traffic cut the unmade roads up very much? The roads were something abominable. It took from 9 in the morning to 4:30 in the afternoon to get from Barmedman to Wyalong.

618. At present the road is in a fairly trafficable state? Yes; it is good now.

619. Has the population increased or decreased since then? It has not increased.

620. Is it on the steady decline now? No; I think the cause of the decline is the want of water. The men cannot crush their stone.

621. Is it a want of water for use at the batteries? Yes.

622. Is there sufficient for domestic purposes? No; we shall be out of water in another few weeks. There is only one dam which we can get it from.

623. Then, if there is no rain for some months to come, the mines will, practically, be at a standstill? Yes.

624. Does not that open up a question which, for this part of the country, is almost as important as that of the construction of a railway, and that is the question of a permanent supply of water? The water question is, I consider, the great question here. I brought the matter under the notice of the Government twelve months ago last January. It is only lately that they have got the tanks sunk.

625. Do you think the provision the Government has already made for conserving water is sufficient? No.

626. I am speaking now of water for domestic use? No; it is not sufficient, because I am sure the population will increase when we get rain.

627. I suppose you understand that whatever water may be conserved in tanks by the Government will be for domestic use only? Yes.

628. And not for the use of mining machinery? Certainly not.

629. Without the mining machinery there will be no field? Certainly not.

630. How can water best be conserved for mining purposes? I should think by boring,

631. At what depth do you think water could be obtained? I could not tell. I think water could be got in the solid granite; but if it is got near a reef, it is bound to be mineralised and unfit for domestic purposes; but if it is got away from a reef it will be good.

632. Do you think it would be possible to obtain a sufficient quantity? I think it is worth the trouble of putting the bores down and trying.

633. Does any idea prevail here that water can be brought from Lake Cowal? Yes; I have heard it spoken of.

634. Do you know the country between here and there? No; but I have heard that that part of the country is 250 feet below the level of this; and if that is so it means a lot of money to get the water up here.

635. If your figures as to the level of the lake are correct, it would practically exclude a water scheme for this place? They could not get it by gravitation. They would have to pump it, and that means money.

636. Then your opinion is that the only alternative is to bore for it? Yes; or go higher up for it. It might be a question of bringing it from the Murrumbidgee.

637. How far is that? Seventy or 80 miles.

638. Do you know anything of the levels? I think it is higher than this part of the country; but I do not know.

639. Are you in favour of the extension of the railway to Wyalong, or are you opposed to it? I am neither in favour of it, nor am I opposed to it.

640. Do you think that if the railway were extended here it would help to develop the mines in any way? I think it would.

641. In what way? The largest plant in any of the colonies is going to be erected at Wyalong by Climo. I think stone will be brought here for treatment from all parts of the Colony. Of course it could not be brought here without a railway.

642. But that would not develop the field? It would help to do it.

643. My question is whether the extension of the railway would assist to develop this field? I know that Mr. F. Neeld, the Progress Committee got the Member for the district to ask, in the House, what had been the loss on the line from Cootamundra to Temora since the opening of this field, and I know that the reply was that it had been reduced. *17 June, 1895.*

644. Are the Committee to understand that in your opinion a water supply of a sufficient character will do more to develop the mining field of Wyalong than the extension of the railway? I am sure it would.

645. I suppose you have had many opportunities of talking this matter over with your fellow miners, and the public generally? Yes.

646. Can I accept your opinion as the general opinion which prevails here? Yes.

647. If you had a sufficient supply for battery purposes you would assume there would be considerably more mining done than there has been? Yes, and there would be more prospecting.

648. Therefore you argue that the population would increase? Yes.

649. And that the stores, hotels, and various other business places would be more permanently settled? As a matter of fact, only two or three new lines of reef have been found since the commencement, owing to the fact that men cannot get away to prospect.

650. In the event of the mining field here collapsing after a railway had been extended to the place, what traffic would there be to keep the railway going? There is plenty of good land here, and if it were opened for selection it would be taken up. Several of my old neighbours from the Golden Valley have been over here, and we were under the impression that all this land would have been thrown open about this time. They intended to come over here. One of them, a man with a very large family, and a good farmer, after I had taken him round and shown him the district said. "Well, Neeld, they say that Yalka is the pick of the Golden Valley, but Yalka is not a patch on this."

651. I suppose this is one of the gardens of New South Wales? I consider the soil here is fit to grow anything.

652. I take it that if the land were available and were taken up and put to profitable use, it would mean the maintenance of this township as a township for all time? Yes.

653. And if it could be maintained as a township there would be always more or less traffic from here to the metropolis? There was a traffic before the gold-field was opened.

654. How much? A tidy lot of wool was sent in the wool season.

655. I suppose one train a month would have carried it? It would not have taken many trains to carry all the wool in.

656. Have you any special points which you wish to bring before the Committee? No; excepting that Climo & Co. are going to lay out £8,000 or £10,000 on their works. When private people do this, they must be satisfied that the field is a permanent one.

657. Personally, you do not hold very strong views about the railway? No.

658. *Mr. Roberts.*] Do you know how much gold has been raised in Wyalong since the first discovery of the field? No.

659. Are you interested in more than one claim? Yes.

660. In how many? Three.

661. How many crushings have you had? Five or six.

662. Are you waiting for another now? We have 1,000 tons of stone at grass at present.

663. And you are unable to get it treated owing to the absence of water? We cannot get it treated unless we send it to Sydney, and the expense is too great.

664. How long is it since you had any rain here worth speaking of? We have not had any rain in the tanks for some months.

665. For six months? It is fully that and more since we had any water in the tanks.

666. Supposing an adequate supply of rain fell and filled all the tanks, how long would they last without further rain? I could not tell. The tanks were full at the end of last winter.

667. Have they been full since? No; they all are empty with the exception of a large tank 3 or 4 miles away. That is the only water tank we can depend upon now.

668. How much stone is paddocked waiting for crushing? Over 15,000 tons.

669. What do you anticipate it will yield per ton? You can average it all at 1 oz. to the ton at least. That makes it worth £60,000.

670. Actually standing idle now for the want of water? If they could have got that crushed there would have been a lot more stone raised. They cannot afford to put men on to raise more because they have no funds. Their money is lying in the stone at grass.

671. Then, there is no doubt, in your mind, that the primary requirement of Wyalong is a water supply? There is no doubt of that; we have the gold, and we want the water.

672. Do you consider the population of Wyalong is now settled? Yes; I am sure it would increase if we had a good water supply and the batteries were working.

673. *Mr. Davies.*] Was it your sons who discovered the gold? No; I discovered it.

674. Where? On my son's selection.

675. Were you searching for gold? The day I arrived here my sons met me at Barmedman. In driving through a fence I saw a tree which had been blown down. After looking at the roots, I said, "This ground ought to be auriferous." That first gave me the idea that gold was here.

676. And then you prospected? I did not prospect at once, because we had not got our huts built. I had been here six or seven weeks before I started to prospect.

677. And you found the gold? Yes.

678. Somewhere near where the tree was blown down? No, 270 chains from that.

679. So that you claim to be the pioneer or prospector? Yes; I am the prospector.

680. What have you spent in labour on your own claim? At present we have nearly forty men at work.

681. How long have you had them at work? For some months.

682. Do you regard the amount of money you have realised from your crushings as a good set off against the expenditure on labour? Yes, we are thoroughly satisfied.

683. And you state you have 1,000 tons at grass? Yes.

684. And you estimate it would yield 1 oz. to the ton? It will most likely go over that. That is the average of the whole field.

685. What will be the average yield of the 1,000 tons you have at grass? I think it might go 2 oz.

- Mr. F. Neeld. 686. You also state you have in sight enough work to carry you on for a long period? For the next ten years.
- 17 June, 1895. 687. What is the greatest depth of your claim? One hundred and sixty to 170 feet.
688. Are you troubled with water? We are just down to the water.
689. Do you anticipate trouble from it? No.
690. Are you making any provision for pumping? No; we had started to sink a shaft, intending to go down 300 or 350 feet; we should have erected a pump upon it and drained it, but owing to the "jump" we had to stop it.
691. What is the width of the reef? It varies from 9 inches to 3, 4, and 5 feet.
692. What are the walls composed of? Decomposed granite, we are not down into the hard granite yet.
693. Does the reef widen and thicken and carry gold as you get to a greater depth? Yes, but it is more highly mineralised.
694. Does it carry more gold to the ton than it does near to the outcrop? I believe more, but you cannot get it by the ordinary process.
695. You are not able to extract the gold by the ordinary process? No. The claim north of ours sent a lot of their stuff to Ballarat, out of which they got 9 oz. to the ton, and I am perfectly satisfied that if they had put it through the batteries here, they would have got as many pennyweights.
696. Have you any personal knowledge of that? No; it is only hearsay. I got it from the claim-owners themselves.
697. Did they show you anything to prove that they had obtained that result? No; but I have seen assays much higher than that.
698. But the assays are generally for small quantities—perhaps half-a-pound? Less than that.
699. As a miner, you would not go by that? Not unless it was a fair bulk sample.
700. You have stated there are 15,000 tons waiting for crushing? Yes.
701. The crushing plant on the field, even supposing you had water, would not be of any service to you; —that is to say you would lose most of the gold? The batteries do lose it.
702. And even then if you had abundance of water it would not be of any service to you? Yes, it would.
703. If you only got 2 ounces to the ton, and lost 8 or 9 ounces, it would not be of much service to you? But you could save the concentrates and get them treated afterwards.
704. Do you think most of the mine-owners, who have stone at grass, would resort to crushing at the local batteries, and save the tailings? Most of them do so.
705. But if you had abundance of water, would they do that, or wait until some other appliances were available? Many of them will be obliged to crush at once in order to get money, no matter what yield might result; but I am perfectly certain that when once the pyrites works start here they will do the principal work.
706. I understand you to say that most of the ore is of a refractory character? Very.
707. And will have to be treated by the works to be erected here in order to extract the whole of the gold? Yes.
708. And the field will not have had a fair test until works of that character are established? That is so.
709. You form your opinion upon tests which have already been made by sending bulk samples to be treated in Sydney and elsewhere? We had stone crushed here at the battery, and obtained 2½ ounces to the ton from it. We took the tailings and concentrates to Sydney, and from that we got over 8 ounces to the ton.
710. Was that from your claim? Yes.
711. Then you lose most of the gold in the ordinary treatment by reason of the ore being refractory? We do not get over 30 per cent.
712. Notwithstanding that great loss you say that most of the mine-owners would be inclined to put their stone through a battery here if they had water? They have no option.
713. How many claims are idle just now? I could not say; but I know there are applications every court day for suspensions.
714. You would not, I presume, want a railway to carry gold to Sydney? No.
715. I presume the principal use of a railway would be to bring produce and supplies to the district, and give facilities for passengers travelling? Yes.
716. That is the only advantage? We can manage to get to Temora now pretty easily; but last winter we could not do so.
717. You are not very strong about a railway at all? No.
718. You would rather have a permanent supply of water? Yes.
719. And a fair road? Yes.
720. Do you believe that would serve the public interests better? I have no strong opinions about the railway at all.
721. [Chairman.] You came here to farm? Yes.
722. Where were you going to take your produce to? We understood before we came over that the Temora line would be open in a short time, and that in eighteen months there would be a line to Barmedman.
723. You imagined you would have to draw your produce from Wyalong to Barmedman? Yes.
724. Could a farmer afford to do that? I think so, it is not a great distance.
725. Is it not 20 miles? It is only 16 or 17 miles from Barmedman.
726. Do you think an agricultural settlement would be fairly well served if a railway were within 17 to 20 miles? I think so. I think 30 miles from a line is pretty close.
727. What area of land suitable for farming settlement is there within 17 miles of Wyalong? Thousands of acres.
728. Are there 100,000 acres? Yes; fully that and more.
729. Do you believe 100,000 acres would be taken up by genuine farmers if a railway were built to Wyalong? Yes; I think so.
730. That is your opinion? I am sure it would.

Mr. John George Gough, battery proprietor, Wyalong, sworn and examined:—

731. *Chairman.*] Have you a knowledge of the whole of this district? Fairly.

732. You will understand that there are three things which control the scope of this inquiry. First of all Mr. G. Gough, there is the permanence of Wyalong as a gold-field; then the possibilities of the agricultural district in the vicinity of Wyalong; and then comes incidentally the question of a water supply for Wyalong, without which you cannot do very much with your gold? I think that covers the whole local position.

733. That combined with the difficulty of access to Temora. With regard to these three points can you give us any information? I will deal with the first. With regard to the permanency of Wyalong, of course I do not speak from a scientific point of view; but speaking as a practical miner of some thirty years' experience, I can say that I do not know of any field which promises, or has promised better. First of all there is an area of 10 square miles containing payable gold, with about twenty-five different lines of reef running parallel to each other in groups. Taking as the basis of the field the Mallee Bull line of reef—that is about the centre, and upon which Neeld's prospecting claim is situated—there is a line of reef 5,000 feet in length, which has crushed payable results from one end to the other—some as high as 15 ounces per ton, others 3 ounces, 2 ounces, and $1\frac{1}{2}$ ounce. In a line of reef of 5,000 feet, it is natural to expect that you will meet with poor shoots. Some of the crushings has been as low as 8 dwt.; but the bulk of the crushing from that 5,000 feet has been large samples. For instance, I treated one sample myself of 378 tons, which gave a gross yield of 1 oz. 11 dwt., or 590 oz. of gold. That was taken from the claim known as the True Blue. I also crushed another crushing of between 100 and 200 tons, which averages 3 oz. 2 dwt. That came from what is known as Cresser's Ledger Claim. I also crushed another crushing of over 100 tons from the Perseverance, on the same line, for something like 3 oz. and 2 or 3 dwt. per ton. Other machines I know of have crushed out other samples along the line with similar results. Lately there has been a crushing taken from the north of that line, which has been sent to Edwards' chlorination works at Ballarat, which has averaged 15 oz. per ton. Take that line as the centre of the field, and you then go $\frac{1}{2}$ a mile south-east, and come upon what is known as Conway's line. Upon that line there are Cassin's Mine, Conway's, and the Shamrock and Thistle, which crushed 5 oz. to the ton for large samples—over 100 tons. I crushed over 100 tons from Cassin's, which went 1 oz. per ton. Then coming further north from that line, we have Erin's Isle, which has crushed over 1 oz. per ton for large samples of over 100 tons. Going still south-east from there, you come to what is known as the Victoria line. I think there are about four claims on that. Each of these lines I have pointed out run parallel to the Mallee Bull, which I first described as the centre of the field. Out of the Victoria Mine there have been about 1,500 tons crushed, and the average is about 1 oz. per ton. There has been some stuff sent from Klink's on the same line—I think about 20 tons—which has averaged 11 oz., but that has been treated by the chlorination process. Coming $\frac{1}{2}$ a mile south-east from that, you have the Pioneer Mine, of which Mr. Neeld was the owner. Some of that, I believe, has gone as high as 5 or 6 oz. a ton; but what I have crushed on that line has been 2 oz., principally from the Christmas Gift in large samples of 200 tons. That exhausts what we could call the south-east portion of the field within the granite belt. I might explain that Wyalong proper exists in what is termed by our scientists a granite belt of very old formation, with belts of diorite and slate. Some permanently rich discoveries have been found still south-east in diorite, known as the Pine Ridge and Pine Hill. The Pine Ridge average crushing is between 2 and 3 oz. From Pine Hill, which is still further south-east, I crushed 5 tons from 100 oz., and I crushed 100 tons from the same claim for 23 oz. That deals with the whole of the gold discovered south-east from the Mallee Bull. Now we go north-east from that, and we begin on the line known as Stanley's Block. There has been a large body of stone crushed from that, ranging from 1 oz. 5 dwt. to about 6 dwt. a ton. Then there are several other claims—I do not remember the names for the moment—still north-east of that line, running also parallel, which have crushed with good results. There is another line, also running parallel about 200 yards, known as the Torn Cheque, which has crushed 18 dwt. per ton. That exhausts the discoveries within the granite belt going north-east; but still north-east, in the diorite belt, there were some rich discoveries made last week. Some of that stone is remarkably rich. It is somewhere beyond the Hospital Hill or north-east of the town and of the granite. We go south-east from the Mallee Bull and we have Taylor's Mine. That has crushed from 5 oz. to 2 oz. in large samples. There are five or six claims on that line. Then you go a little west from that, but still north-west from the Mallee Bull line, and come to what is known as the Hell-fire Jack. On that there are about five claims, which have crushed large samples averaging 1 oz. or $1\frac{1}{2}$ oz. and some as low as 15 dwt. a ton. Then going a little further west, barely 200 yards, you come to what is known as the Ri-Buck line, which has crushed 2 oz. to the ton. All these lines run parallel to each other. They are not the same reef, because they lie as do the fingers on your hand. Then we go a little west again and come to what is known as Pringle's Red Flag line. There is the Appeal Claim, Pringle's Red Flag, and I think two others, and the average crushings there would be something over 1 oz. That, as far as I know, exhausts the discoveries on the south-western portion of the granite belt. Directly west from the Mallee Bull line or True Blue Claim you come to what is known as the Kurragong Mine, which has crushed 1,400 or 1,500 tons of stone. Their average crushing is considerably over 1 oz. to the ton. Then, going north-west from the Mallee Bull line, you come to what is known as Hilderbrand's. Here there are three claims, and their average crushing is considerably over 1 oz.

734. You are sure of these amounts? Yes; because most of them I have crushed myself, and the reason I can give you the figures so accurately is because I wrote an article on the subject some time ago, and it appeared in the *Mining Standard*. I took the trouble to state the facts absolutely correctly.

735. *Mr. Davies.*] Could you produce the results from your books—that would be more satisfactory than a simple statement? I will give you what I have absolutely treated. Having come to Hilderbrand's portion of the field you then have the Welcome Stranger; I treated 107 tons in that claim for over 600 oz. of gold. I know by repute—and it can be substantiated by the local manager of the Bank of New South Wales—that their last crushing was over 200 tons with about the same result—6 oz. to the ton. West of that you have what is known as Gorman's line, and the Democrat—these have crushed between 1 oz. and 3 oz. per ton. Going directly west from that you have a bunch of claims known as Fraser's, the Gipsy Queen, and Perry's, which have crushed 5 oz., but as low as 2 oz. The area I have outlined would in square miles be about 10, so that I assume there are about twenty-five different lines of payable reef on the field, so far as they have been proved to their greatest depth, containing seventy payable claims. The deepest I know of on the field is about 180 feet, and at that level the gold has improved

Mr.
J. G. Gough. improved rather than otherwise. It has improved from the surface downwards. With regard to treatments, I find I have treated at No. 1 Battery 2,500 tons since the 10th June, last year. We had to shut down last March for want of water. The average was something over 1½ oz. per ton. At No. 2 Battery 17 June, 1895. we started crushing at the end of last September, and we have treated there about 3,000 tons, the average being about 1 oz. 7 dwt. per ton. Those 3,000 tons were from forty different claims. Those are the figures taken from my own books. With regard to my opinion as to the permanency of the field, as far as one can judge from a practical standpoint, I believe it has as good a future as any gold-field I have been on in New South Wales. The country is remarkably soft for 200 feet; you scarcely want to use a shot at all, and when you get to 200 feet you begin to mine exactly in the same way as you begin on most other fields as soon as you break through the surface of the hard rock. I do not think the water difficulty will be anything to speak of. There will be plenty of water, but nothing but what reasonable machinery can keep down. You may judge of the water supply from the fact that I have been running No. 2 Battery with water brought from the bottom for the last five weeks, and I have worked on that water about two-thirds time. Therefore, you will see that the flow is not very great so far.

736. *Mr. Roberts.*] How long have you been on the gold-field? I came twelve months ago last March.

737. So that you have really seen Wyalong grow? I think so; I had the first crushing plant on the field, running for five or six months before anyone else came.

738. After the statement you have made, I do not think it is necessary for me to ask you if you are assured of the permanency of the field? Of course my opinions may be wrong, as well as the opinions of any other man. You cannot tell what is below the surface; but judging from years of experience—and I have been mining ever since I was 14 years of age, and I have been on a number of gold-fields both here and in Victoria—I think the field has a good future before it.

739. Can you tell us the amount of gold which has been raised up to the present time? I could not tell you exactly. I think you will be more likely to obtain that information from the local bankers. I think most of the gold has passed through the bank here or in Barmedman.

740. Are there not several thousands of tons of stone waiting to be crushed? I should judge from the heaps I know to be in existence now, that there are about 5,000 tons of stone awaiting treatment on the field.

741. What do you think it would yield per ton? I think it is quite up to anything that has been treated, and perhaps better. I think the average of the stone now at grass will be fully 1½ oz. per ton.

742. May I ask what previous experience you have had in mining? I had a good many years' experience as an alluvial miner on the old Lambing Flat diggings; then I went to Grenfell twenty-seven years ago, and have worked with pick and shovel and hammer and drill. Of course I have been in business apart from mining, but during the whole of my life I have been interested in mining.

743. Therefore the opinion you give is, that of one who has had many years' experience in mining pursuits? I started mining when I was 14 years old, and I did nothing else until I was 32.

744. In your opinion, is there any necessity for the construction of a railway from Temora to Wyalong? I should say that if any necessity existed in the past it really exists now, and more so. In the first place, we have a district which has undoubtedly first-class agricultural soil surrounding it, and if the mines were to play out to-morrow, Wyalong would be Wyalong in the same way as Temora, Forbes, Young, and Parkes are towns to-day—the result of mining enterprise and industry.

745. You know as a fact, that the land around Wyalong is suitable for agricultural pursuits? The soil is rich chocolate soil. It grows abundance of scrub, and my experience is that land of this character, which will produce an abundance of scrub, will produce an abundance of anything else if you take the scrub off and plant it. I have seen some good crops of hay in the district.

746. Have you any knowledge of its being a wheat-growing district? Nothing beyond comparing the soil with that of Temora, which is very much the same. I believe the same results with regard to wheat growing would be produced here.

747. What about the water-supply? I am one of those who believe that people should help themselves. Really this is one of the best gold-fields I was ever on in my life for water. For instance, if I wanted water now I would simply get a condenser and condense the water which was being raised from the bottom. I have done that already, and I find it to be good drinking water. I am certain that one of the claims would produce enough water, if it were condensed, to serve the field very well—that is, if we were driven to those straits. Last year—in July, August, and September, as much rain fell as would have lasted us for the next five years if we had conserved it.

748. *Mr. Lee.*] For battery purposes? Yes; it ran away simply in shoots of water to waste, because we had not sufficient storage made. Of course we have profited by past experience, and most of us have made very large tanks. Messrs. Plumb and Shank are running with a good supply of water collected last August; they will be able to run for another eight or ten months even if no rain comes, simply because they collected a lot when it did fall.

749. Have you ceased to work at any of your batteries? Not at No. 2; but I would have done so, if it had not been that I had drawn water from the bottom.

750. Has ample provision been made now? Yes; I think if we once get our tanks full, we shall not be short as far as battery purposes are concerned. I might mention that I know the country between here and Lake Cowal, and I think the nearest point would be 28 miles. Generally speaking, there is an abundant supply of water there. There have been times in protracted droughts when it has been dry. For instance, I remember twelve years ago it was dry.

751. *Chairman.*] That was before the flood-gates were put there? Yes.

752. If they are kept in order it should never be dry? I hardly think so. Since the place has been improved, I do not think it could ever be dry. There is an enormous watershed to it, and there is an abundant water supply there. The expense of bringing that water to the field would not be a great undertaking. It is practically level country all the way.

753. You are speaking from hearsay, I think; we have the evidence of Mr. McKinney to the effect that the elevation is 130 feet? I would not consider that a great elevation to force the water.

754. But how about the distance? You would only have the friction of your pipes to contend with. I have put up a good many water-pipes, and have put water up 2 miles without any difficulty. Of course, it is simply a matter of engineering calculation.

755. Is there any elevation at Lake Cowal? Yes; about 6 or 7 miles on this side of it. I might mention that I am only referring to the matter of water to show, that as far as water is concerned, the railway need have no fear. The water question could not be any bar to the railway.

756. If you could get water by gravitation you would not, of course, think of a pumping scheme? Certainly not. Mr. J. G. Gough.

757. It would appear to us, without a knowledge of the country, that you would have to look somewhere above Wyalong, somewhere under the range, or to the Yeo Yeo Creek, for water? I do not think it is possible to bring a gravitation scheme direct to Wyalong. Speaking from a practical standpoint, if I were going to bring water to Wyalong, I would do one of two things—I would either pump it direct to the high ridge about a mile north, and gravitate from there over Wyalong, or I would pump it from the high point of the range between here and Lake Cowal, about 7 or 8 miles on this side of the range.

758. To Billy's Look-out? Yes; it is on the same line of range. That will be about 20 miles from here. I would pump it to a large tank on the top of that, and let it gravitate from there. I think that is the most expeditious way of bringing it. But with regard to water for battery purposes, my opinion is that the battery owners will have to spend their own money and make their own conservation. I am perfectly certain that for the expenditure of a few thousand pounds amongst them they can get an abundant supply, if they will only store what falls in a wet season.

759. You know the country thoroughly well? Yes.

760. Have you any hope from artesian boring in a country of this kind? I can only go upon what I read, and geological opinion is certainly against it.

761. We are out of the cretaceous formation? Yes; we are in granite country, and I have never heard of anybody getting through granite.

762. How far west would it be to the cretaceous country? I do not think you would get any to the west of the Lachlan country. My reasons for saying that are because I know the country lying between here and Lake Cargellieo. I know reefs exist there as they do here, and there are gold-mines working there and have been for some years past off and on. That being so, I think it is not likely that you will find any cretaceous bed between here and the Lachlan.

763. Then, if water is to be brought to Wyalong, you fall back on Lake Cowal? Yes; that is the most practical scheme, I think.

764. Would you dismiss any idea of the Narra Burra Creek, or the Yeo Yeo Creek, or the Bland Creek giving you a supply? Yes; because they are absolutely dry three parts of the year. I know the Yeo Yeo Creek from its source to Lake Cowal, and it is nothing but a chain of waterholes three-fourths of the year. I have seen the Narra Burra Creek almost dry from one end of the year to the other.

765. How far away is the range? The range I speak of is about 20 miles slightly north-east from here.

766. Do you know the range to the south, which seems to follow the main road? Yes; that is the range dividing the watershed from the Lachlan to the Murrumbidgee.

767. The range, according to the map, appears to be 7 or 8 miles from Wyalong? Yes; I think it comes closer than that at one point. According to my own calculations, I think the range could be tapped within 4 miles; but you are nearly as high here as you would be when you got to the top of it. The elevation west of this place is so flat that you would almost go over it without knowing it.

768. Are there suitable areas there for damming purposes? Yes; but you would get the same rainfall here as there, and if the excavation were taken along the field you would have it here instead of running along ditches, flumes, or through pipes.

769. I think you said there were seventy claims on payable gold? Yes.

770. And the mines are held as mining claims? Yes, as ordinary mining tenants' registered claims. There are no leases at present.

771. Then, necessarily, the miners upon the seventy claims must be widespread? Yes.

772. And you have no hesitation in stating that seventy claims on payable gold is an extraordinary average? It is the most extraordinary field I have ever been on in my life, without exception.

773. Did you ever on any new reef field see so many payable claims? Never; and I never saw so many reefs running parallel on any field that I have been on.

774. Is it not a source of great hardship to many of the claim-owners that they are not able to have their stone crushed for want of water? There has been considerable inconvenience caused in that direction certainly; but the reason is not so much that there has been no water there, but that the people did not come here quickly enough and make provision for it.

775. But, as a matter of fact, that is the state of affairs at the present time? Yes; great inconvenience is felt owing to the want of water. I think there are only three mills working at present, when there should be six.

776. And the consequence is that there is a large accumulation of stone, and little ready money? Yes.

777. You are of opinion that when the next heavy rainfall comes there will be sufficient water to keep the batteries going for some considerable time? Yes.

778. For how long? Twelve months.

779. Do you not think that the want of a permanent supply of water for battery purposes will always be a trouble here? There is no doubt we shall require very large tanks indeed if we get protracted droughts here.

780. You know from past experience that nothing shuts a field out so quickly as having to hang up the batteries? Quite so.

781. Then there is nothing at the present time of such vital importance to the field as a proper water supply? Yes; it is a very important matter.

782. Do you think if there was a reliable supply of water there would practically be no doubt about the permanency of the field for a very much longer period than would be the case if there were only an intermittent supply? There is no doubt that if we had a good supply of water the field would develop more rapidly than it is developing at the present time.

783. Would not one result of a water supply be cheaper crushings? If we had an abundant supply of water, there would be considerable employment of labour, which is at present absent. Mine-owners, instead of putting men on to work in the mines, as they would if they had water, are working them themselves. If there was an abundant supply of water, and they could get the stone crushed as they raised it, numbers of them would employ labour.

784. And would not a lot of the low-grade stone be put through the mill? Yes.

785. Is it not a fact that when the crushing plant is large and reliable, good and medium stone is sent to the mill at an average? Yes.

- Mr. G. Gough. 786. Whereas, when they can have a limited supply only crushed they pick the best? Yes.
787. Of course, the more stone which can be crushed the better for the field and the country generally?
- 17 June, 1895. No doubt.
788. In your opinion, is not the really burning question at the present moment the question of a water supply? I do not quite see that it is really a burning question. It is certainly an important question, and it would be a great thing for us if we had a water supply.
789. Supposing you had the choice between a railway and a water supply—which would be the better to develop the field? Personally, I should say, "Give me a railway."
790. At the same time you admit the necessity of a supply of water? Quite so. At the same time I am one of those who hold that the difficulty can be got over by private enterprise and by people helping themselves.
791. Mr. Davies.] Do you advocate the construction of a line of railway between Temora and Wyalong? Yes.
792. Would you advocate the construction of the railway if it showed an annual loss of £4,150? Yes. My reason for that is because it will mean a loss of that much or more to the State if they have to make a macadamised road to bring our goods here, and no one ever heard of a road paying. When I see the advantages which will result from the opening of a railway through a district like this, I say, "Never mind the loss of £3,000 or £4,000"; it is more than recouped by the extra production which is brought into existence.
793. You believe that, indirectly, it will be an advantage to the State, even though there may a loss on the actual working? I do. A road would always be a loss to the State. On the other hand, a railway would open up a large area of country and give facilities to a number of selectors, who have already settled in the district, to take their produce to market, and it would also induce further settlement.
794. But would it not be necessary to maintain a road, even though a line of railway were constructed? Not for the same expense; it would not have to be so costly.
795. But it would have to be maintained? Yes; but my experience in the past has been that the cost of maintenance is considerably reduced. Take the road from Murrumburrah to Young. There were six men continually on it before the railway was constructed, and now about one man does the work.
796. Another reason why you advocate the construction of the line is that you believe it will be the means of inducing a large agricultural settlement? Yes.
797. Is not this an extraordinarily dry country? It is not more extraordinarily dry than it is around Temora, Parkes, and Peak Hill.
798. But is not the rainfall there better than it is here? They are as hard-up there as anywhere. For instance, the mining industry at Parkes is shut down for want of water. I have an interest at Cooma-mundra, and we have been shut down there for four months for want of water.
799. But is not the rainfall better at Parkes and Temora than it is here? Very slightly.
800. But it is in favour of those districts? Of course, the further you get towards the coast-line your rainfall increases.
801. Then the rainfall is slightly in favour of those districts as compared with Wyalong? Yes.
802. Although the soil is equally as good here, the rainfall is not so general? Quite so.
803. What was the quantity of stone crushed up to March last? I have treated altogether 5,200 tons of stone since the 10th June. I do not know what the other plants have crushed.
804. I suppose the clerk would be able to supply the information? No doubt, if his data were correct; but no one has ever come to me to collect the quantities.
805. Supposing he states that 11,686 ounces of gold have been obtained from 7,328 tons, as the result of the crushing since the field has been opened, up to the 8th March last—would that be correct? Taking those figures with my own statement, it may be correct.
806. Would you regard that as an extraordinary yield for a field twelve months old? Yes, in view of the situation.
807. And in view of the fact that the decomposed granite can be almost picked out with a spade? Yes, under the circumstances. We are a long way out west here from civilization, and twelve months ago we were still further out. Of course the yield was lower than it would have been if we had been nearer to older mines, and there had been an abundant supply of water at the start.
808. You have stated that the reefs are easily worked up to the water-level? Yes.
809. Consequently, a great deal of stone can be got without any great effort? Yes; it is very easy ground to work.
810. Consequently, a large quantity of stone could be raised up to that level? Yes.
811. Now that they have got below that level it would be more expensive work? Yes.
812. But you say that the reef has widened in most cases where they have got to a greater depth? Yes, in many cases.
813. It makes and pinches out, practically, and then makes again? That is a feature of the soft country.
814. Do you condense the water you get out of the low levels for your engines? No, but I have condensed water; but I have never put up a proper condenser for the purpose of utilising the whole of the salt water. We are carrying water now for our boiler.
815. You do not condense the water out of the claims? No; we use it for the battery, but not for the boiler.
816. You have abundance of water from the deep shafts for your batteries? I am perfectly certain that when the whole of the mines get to water-level and start baling, there will be more water baled from the bottom than will be used by the batteries on the field.
817. You have no doubt whatever as to the permanency of the field? None whatever.
818. You advocate the line for the purpose of the development of agriculture? Not only for that, but it will be a means of developing the field. It will give greater facilities for people to send their stuff away. There is a great deal of ore on the field which cannot be treated by the plants here. Even if chlorination works were established it is a question whether any company would expend the amount of capital to erect works which would treat the whole of the output of the field. I do not think they would.
819. What is your battery? An ordinary battery—simple copper plates, silver wells, and blanketings.
820. You have heard Mr. Neeld say that a great deal of the gold is lost by the ordinary treatment? Yes; it is lost in the pyrites.

821. Most of the ore is of a mineralised character? Some of it; but some of it is fairly free stone. Mr. J. G. Gough.
What I have crushed has been in the granite belt.

822. Decomposed granite? Yes.

17 June, 1895.

823. And easily extracted? What gold is free is easily extracted. All the gold has pyrites more or less, but some has it much richer than others, and in some cases where the pyrites is the richest there is not much free gold—that is to say, a battery may only get $\frac{1}{2}$ an oz. to the ton. The pyrites from the battery, when concentrated to its pure state, would go 8 oz. or 15 oz. to the ton. That has to be reduced to a chlorine state before the gold can be obtained.

824. So that without those appliances you would lose most of the gold? You would lose a good deal.

825. Have you anything further to say in favour of the construction of a railway? I know of nothing beyond what I have already stated. We are in a good mining centre and appearances indicate that it is a permanent field. We are also in a good agricultural district. I think we might fairly hope that the conditions which have surrounded every gold-field in New South Wales will surround this—I mean that the rainfall has always increased where population has gone.

826. You advocate the battery-owners combining to make provision for themselves? Yes.

827. Leaving the Government to provide a domestic supply of water? Yes.

828. Chairman.] What is your opinion with regard to the future agricultural development of the district? I believe if perpetual leases were given at, say, 6d. per acre—which I regard as a fair price for the land in its present state—that, going towards Lake Cowal, coming westward across Humbug Creek, and then coming around southward to a distance of 20 miles south of Wyalong, there will be no difficulty in settling 100,000 acres. It appears to me reasonable to believe that people could be found to take it up.

Mr. John Walter Broughton, Manager of the Bank of New South Wales, West Wyalong, sworn, and examined:—

829. Chairman.] How long have you been resident here? Since the 21st April, 1894.

Mr. J. W. Broughton.

830. Mr. Davies.] What quantity of gold has been deposited with your Bank since that period? About 13,000 oz. The first parcel was deposited on the 18th July, 1894. That was from one of Mr. Gough's batteries—the only one which was working at the time.

17 June, 1895.

831. Does that include the whole production of the field? Yes.

832. Is there any other Bank than yours here? No.

833. So that the whole of the deposits of gold have been made at your Bank? Yes; several large parcels of stone have been crushed in Barmedman.

834. Does that come to you? No; it stays in Barmedman. The 13,000 oz. I refer to have been treated in Wyalong.

835. Have you any personal knowledge of the claims from which that gold came? It came from all parts of the field.

836. Where was the largest result obtained? From the Welcome Stranger line of reef.

837. That returned about $6\frac{1}{2}$ oz. to the ton? Yes; 6 oz. 5 dwt.

838. 105 tons were crushed? Yes, in one parcel.

839. Has anything been crushed from there since? Yes; 197 tons.

840. Independent of the 105 tons? Yes.

841. What did it give? Something over 6 oz.

842. So that it has improved? Yes, slightly.

843. Do you know of any other instance where a large parcel has been crushed, and where there has been an increased yield? Yes; the White Reef crushed on the 18th July, 1894, with a return of over 1 oz. They had a crushing a short time ago of 300 tons, and had a return of 2 oz. 11 dwt.

844. Where is that situated? It is the same line of reef as the Welcome Stranger—No. 2 South.

845. The same reef only some distance away? Yes.

846. Then whilst the Welcome Stranger had $6\frac{1}{2}$ oz. the other only had about 2 oz.? Yes.

847. What is the distance of the White Reef from the Welcome Stranger? About 200 yards.

848. Could you take the same reef any distance along the line and show a better result than 2 oz. to the ton? You can go north of the Welcome Stranger out about a mile, and the claims go from 2 oz. to 3 oz. 18 dwt. in large parcels of from 50 to 100 tons.

849. Is the Hidden Treasure on the same line as the White Reef and Welcome Stranger? It is supposed to be.

850. And the Three Stars? I do not know the Three Stars. I think it is west of that line.

851. Can you tell me any other portion of the reef large parcels of which have given a yield equal to 6 oz. per ton? About $\frac{1}{2}$ a mile west there is the Mallee Bull line, and Neeld's prospecting claim, which is a very rich one.

852. Is it on the same line as the Welcome Stranger? No; it is not on the same reef. I think 6 tons went for treatment to Ballarat the other day, and the return is 15 oz. per ton. I saw the returns.

853. The claim "Two-up," 180 feet deep, has 19 tons of stone crushed, and a return of 2 oz. to the ton. Did you see that gold? I have had several parcels of gold from there; it is a rich claim.

854. On what reef is the Star of Peace;—is it on the same reef as the Welcome Stranger? Yes, that is a very good claim.

855. 105 tons only gave a yield of 1 oz. 16 dwt.? Yes; but the concentrates went 3 oz. 5 dwt.

856. Is the Golden Fleece on the same reef? No; that is $1\frac{1}{2}$ miles south.

857. The reef is very wide at the Golden Fleece? Yes; they have a big body of stone.

858. But a small yield of gold? It averages about 1 oz. It is near the Currajong, which has crushed, I think, more stone than any claim on the field, and the average has been slightly over 2 oz.

859. What about Pine Ridge—Doyle and Party? That is about 3 miles south-west from the Currajong claim or the White Reef line.

860. Is it a big reef? Yes, it always went over 2 oz. to the ton, and sometimes over 3 oz.

861. Then all this gold and other gold for crushings, making a gross total of 13,000 oz., has been deposited with you? All the gold which has been obtained here from crushings has been deposited with the Bank. Several of the claims, Doyle and the Currajong, have crushed their stone in Barmedman.

862. And that does not come to your Bank? No.

863.

Mr. J. W. Broughton. 863. What has been the general opinion of those who have deposited gold with you as to the permanency of the field? All the miners think it will be a permanent field.

17 June, 1895. 864. They are all very hopeful? Yes; they consider it is the most wonderful field yet discovered in New South Wales.

865. *Mr. Lee.*] I should be glad if you would give your opinion as to the commercial aspect of the field during the time you have been here? It is in a very good position at the present time. I think there is more actual business done here in a day than in any of the country towns.

866. How is the business now as compared with the period when you first came here? It is quieter now. When I first came here there were 8,000 or 9,000 people here, but now the population will be about 5,000.

867. That is in both towns? Yes.

868. Has there been any sign of improvement in the shape of buildings? Yes; the town is improving every day.

869. Are the buildings chiefly of wood? Yes; there are some substantial wooden buildings, and brick buildings are going up now.

870. Does that incline you to the belief that people have great faith in the permanency of the town itself? Yes.

871. It is hardly to be supposed that people would erect brick buildings if they thought the gold was going to collapse in few years? No.

872. You know the commercial pulse of the town, and may be able to tell us whether there is any back to the district? Yes; a lot of country has been taken up in a westerly direction from here.

873. How far? Right out to Wollongough, which, I think, is about 30 miles from here. There are a good many selectors all along the road.

874. Do they do their business with Wyalong? They do; of course, they are simply running sheep at present. That is what they are depending upon for a living.

875. Are they selectors? Yes; selectors and graziers, with 5,000-acre blocks.

876. And little or no cultivation? No; they do not grow much except for their own use. They have no market for their produce.

877. Are you in a position to say that if the land is thrown open, there is a probability of there being more selectors than there are now? I do not think the country would be taken up at all if the railway did not come here.

878. Notwithstanding that portions of it might be resumed under the new Land Act, the country would not be settled unless the railway were brought here? No; I do not think the land would be taken up.

879. I suppose, with the road in its present state, business goes on without interruption? If we get rain, traffic will be at a standstill, but we can go on at present.

880. I suppose there is no shortage of supplies in the town? No; teams can travel between here and the railway in two days, but when it rains they cannot travel at all. There is no bottom to the road, and they become stuck up.

881. So far as you are able to judge, the prospects of the field are good? Yes.

882. And the business people think so too? Yes.

883. Otherwise you could not understand them investing their money? No.

884. *Mr. Roberts.*] Has it come to your knowledge that any great inconvenience has been experienced by the residents of Wyalong owing to the want of railway communication. Is there any difficulty in getting supplies here? There is no difficulty at present.

885. I suppose the only difficulty would be during the wet weather? Yes; you simply cannot travel at all in the wet weather. It would not be safe even for a man to walk on the road after heavy rain.

886. Then, I suppose, you favour the construction of a railway in preference to spending a large sum of money in making a road? Most certainly.

Mr. Robert John Campbell, licensed surveyor, Wyalong, sworn, and examined:—

Mr. R. J. Campbell. 887. *Chairman.*] Are you employed in this district? Only privately.

17 June, 1895. 888. To what aspects of the case do you desire to direct the attention of the Committee? Really, I have not given the question any consideration. I thought you might require me to speak on the water supply. That is the only question I have considered.

889. We have a report from you with regard to the matter—a report which you wrote to Mr. R. O. French. From that report it appears that you have come to the conclusion that the easiest way to bring water from Lake Cowal to Wyalong West will be by going a short distance up the Bland Creek, forcing the water for a distance of 10½ miles on to the range, a height of 300 feet; and thence it will gravitate down to Wyalong West? Yes; I might state that my estimate of the height of the country is almost guesswork; I had not an aneroid with me.

890. This is simply a general statement as to the best route? Yes; simply a flying examination of the country.

891. Can you offer any suggestion with regard to the cost? No.

892. What class of country is it from Wyalong to Lake Cowal? For about halfway to Wyalong—that is, to the Wyrra Range—the country is principally timbered with box, mallee, ironbark, oak and scrub; from the Wyrra Range northwards to the lake the country improves very much; but before getting to the lake it is pretty well all purchased land.

893. Do you know this country pretty well all through? Yes; I inspected it as an Inspector for the Government about nine years ago.

894. Do you see the line AB on the wall-map? Yes.

895. Starting north from Barmedman, and running north-westerly as far as Euglo Creek? Yes.

896. What kind of country is there to the north of that line? Very good agricultural country.

897. What kind of country is it south of that, and on to the range? That is inferior country, although in patches it is very good.

898. In other words, do you regard it as a very good area for agricultural settlement? No.

899. You regard that to the north of the line as better? Yes.

900. Will you subsequently hand in a report and tracing dealing with a water supply from Lake Cowal? Yes.

Mr.

Mr. Charles McHardy, Sergeant of Police, and Mining Registrar, West Wyalong, sworn, and examined:—

901. *Chairman.*] Did you give evidence before the previous Committee? Yes.

Mr.
C. McHardy.

902. *Mr. Lee.*] That was in April, 1894? Yes.

903. The Committee would like to hear from you some information as to the position of the field during the period which has elapsed between that time and the present, and also as to the present population? 17 June, 1895.
I think there are about 2,000 people less now than there were then.

904. How many do you estimate on all the field at the present time? Four thousand five hundred, within a radius of 5 miles.

905. Does that include men, women, and children? Yes.

906. Are those who are here mostly workers, or is there a large floating population? I think they are mostly workers now, the floating population has mostly gone.

907. Are many people coming into the district now? I cannot say there are.

908. I suppose, owing to the want of water, the amount of employment has been reduced? Yes.

909. And at the present time there is not very much paid labour in the district? No.

910. Most of the mining work is done by the owners of the claim? Yes; in nearly every case the registered owners work their own claims.

911. What progress has the township made since you last gave evidence? A large number of buildings have been put up, and a large amount of money has been spent on improvements.

912. Was East Wyalong in existence in April, 1894? No; it was commencing to come into existence at that time. I do not think there were more than half a dozen houses in it then.

913. How many licensed houses are there in the two towns? Eighteen at present.

914. Of that number how many are in West Wyalong? Ten, including King's Hotel.

915. Are the remainder in East Wyalong? Yes.

916. Are the improvements of such a character as to lead one to suppose that the investors have confidence in the field? Yes.

917. Are you in a position to give any evidence as to the actual quantity of gold raised on the field? Only up to the end of 1894.

918. And it was supplied to the Mines Department? Yes.

919. Can you tell us anything as to what has been turned out from the first of the year to date? No, it would only be an estimate.

920. I suppose, as a matter of fact, the return has fallen off? Certainly; because the batteries have been idle owing to the want of water.

921. At present the batteries are practically hung up? They are.

922. And the field is nearly brought to a standstill in consequence? No doubt.

923. Do you think that by excavating the people would ever be able to conserve sufficient water to keep the batteries going all the year round? The rainfall is so variable and unreliable that I doubt it.

924. Where were you stationed before coming here? Goulburn.

925. Is this your first experience in a dry country? I was at Cootamundra two or three years where it was pretty dry.

926. But this country is supposed to be even drier? Yes.

927. What do you estimate the rainfall here? I do not know; it has not been taken properly.

928. Anyhow, you doubt very much whether the ordinary rainfall would give sufficient water to keep the batteries going all the year round? I do.

929. That being so, are you in a position to suggest any course by which water can be brought here? I think the present prospects of the field justify an outlay of a considerable amount of money in getting water by some means or other. I consider it would amply pay to invest a large amount of money in obtaining a permanent supply.

930. Do you think this field will ever be properly developed unless there is a certain supply of water. I am speaking now of water for battery purposes? I think not; I have no faith in the rainfall up here at all.

931. You think at the best the rainfall must always be uncertain? It must.

932. And that it will fall in such an erratic way that it will not run? Exactly; it will be practically useless for filling the tanks.

933. Are many of the claims being abandoned? If they are abandoned most of them are taken up again.

934. Have you ever been stationed on a gold-field before? No.

935. You do not know much about the ups and downs of gold-field life? No; although I was at Temora a short time, but that was long after it was opened.

936. Have you any returns which you wish to bring before the Committee? I have copied out some returns upon which I base to some extent my estimate of the population of the field. The number of miners' rights issued in 1894 was 2,764.

937. And how many since the 1st January to date? About 1,900.

938. Is that for West Wyalong only? No; for the whole of the field up to 18 May.

939. Since that date a registrar has been appointed for East Wyalong? Yes; 330 business licenses have been issued up to the present date. The total amount of revenue collected by me since I became Mining Registrar is £3,300. The total number of claims now at work complying with the labour conditions is 600.

940. Within what area? Within a radius of 5 miles. I estimate 130 of those to be on gold.

941. Have 130 reported gold? They are not required to report gold except in the case of prospecting claims.

942. Do you know whether there is a tendency for the field to extend itself after the discoveries being made outside the radius of which you have spoken? Claims are being taken up in various outlying places such as Sandy Creek and Billy's Look-out. I do not say they are all payable. It is only the batteries which will prove that they are payable. I may state that good prospects of gold are being obtained at Billy's Look-out, Sandy Creek, and other places at a distance of from 20 to 30 miles from here.

943. Is Wyalong the nearest town to them? Yes; this is undoubtedly the centre of those places. There is a tremendous area of country about here which has not been prospected yet.

944. There is every indication, then, under a system of proper prospecting, that the field will become much larger than it is at present? I am certain of it.

- Mr.
C. McHardy. 945. What, in your opinion, is most required to properly develop the mines? A constant and permanent supply of water.
- 17 June, 1895. 946. Would that have more effect than the construction of a railway? I believe it would.
947. Mr. Davies.] What is the total revenue received from the 19th March, 1894, to the present date? About £300,
948. What is that from? From the sale of miners' rights, business licenses, survey fees, stamp duty on transfers, Warden's Court fees, and so on.
949. Do you know much of the country outside of Wyalong? No.
950. Supposing it is good country, would it be possible to grow wheat with a rainfall such as you have in the district? Yes; I think the rainfall is sufficient for the purposes of wheat-growing.
951. Have you any knowledge of the condition of the road between Wyalong and Temora during the last eighteen months? Yes; in the winter time it has been almost impassable.
952. Have you heard many complaints as to the condition of the road? Yes; it has been in a fearful state of mud, and in some places it has been almost impassable for ordinary traffic.
953. Do you think the construction of a railway to Wyalong, showing an annual loss of £4,150, would be justifiable in the public interests? No; I do not think it would be if it would show that amount of loss.
954. Then you would not advocate its construction? I should first want to know what it would cost to make a good road, and keep it in proper repair.
955. What would you think would be the annual cost of a good road suitable for the traffic of the district? I could not say; but before I should be inclined to give any opinion as to constructing a railway at a loss of £4,150, I should like to know something about the initial expense of a road, and the cost of keeping it in repair.
956. The road is fairly good just now? Yes.
957. You attribute that to the dry season? Yes.
958. Is the traffic likely to increase or decrease? As soon as the rain falls it will increase to a great extent.
959. For what reason? I expect a large influx of population as soon as there is a heavy fall of rain.
960. Do you think the results of the crushings will be an inducement for people to come here? Yes.
961. You regard the field as a permanent one? Yes.
962. And it is likely to be a permanent settlement? Yes; I have no doubt about it.
963. Then in view of the fact that you think the population will increase, do you think the Government will be warranted in constructing a line of a cheap description between Temora and Wyalong? I think so.
964. You are not in a position to express an opinion as to whether the country can be profitably cultivated or not? Most of the land I have seen I consider to be fairly good wheat-growing country; but I have not seen much of it.
965. What provision has been made for a supply of water for domestic purposes? The Government have made very good provision, only the rain does not come. Two tanks are made, but they are empty.
966. How long would they last the population upon the fields, if they were full? If they were full I think there would be sufficient for all domestic purposes, and would be likely to satisfy the wants of the people.
967. How long do you think they will last? In my opinion they would give more than a six months' supply.
968. The water in the district for domestic purposes, is it good? A large number of people have managed to save water in tanks.
969. Are there not several cases of typhoid at present in the hospital? I am not certain, I think there have been a few recently.
970. Have you heard any complaints of the want of water for domestic use? Yes.
971. I presume most of the complaints have been as to the want of water for battery purposes? Yes; complaints have been made as to the want of water both for domestic and battery purposes.
972. What provision has been made in West Wyalong for supplying the batteries with water? Dams have been sunk, but no rain fell to fill them.
973. And there is no water at present? No; except in one or two instances at the bottom of shafts,—which is not sufficient.
974. Then the field will be at a standstill unless you have a rainfall within the next month? It will be at a standstill until the rainfall comes.
975. Will the absence of rain be a means of driving men out of the district? It will be a means of depopulating the field.
976. Is the population gradually decreasing now? Yes.
977. At what rate per week? I could not say, but I can see it dwindling away for no other reason than the want of water.
978. Have you anything further to say with reference to the construction of a railway between Temora and Wyalong? I can only say that my opinion is that it would be as well and better to build a railway from Temora to Wyalong than between any other two places in the Colony at the present time.
979. But you believe a water-supply will be more useful, and would serve the public interest better than a railway at the present juncture? Yes, a permanent supply for battery and domestic purposes.
980. Would it be better and wiser, in the public interest, to spend money on securing a supply of water of a permanent character, than to construct a line of railway? I believe it would, provided it were permanent for both battery and domestic purposes.
981. The traction on the road is not so heavy as it was twelve months ago when stone was carried to Barmedman? No.
982. Nearly all the stone was carried to Barmedman at first? Yes.
993. That is not the case now I suppose? No.
984. So that the traffic from here to Barmedman would not be so great as it has been in previous years? No, nothing like it.
985. That traffic was very heavy? Yes.
986. It would cut up a light road which was not properly formed? Yes.
987. If the road were properly formed would it, in the absence of a railway, serve the purposes of the district for some time to come? It would be sufficient, of course.
- 988-98. And would the money spent in giving you a water-supply more thoroughly meet the wants of the district? Yes; I believe a permanent water-supply is better than a good road or railway.

Mr. Alfred Helyer, storekeeper, West Wyalong, sworn and examined:—

Mr.
A. Helyer.
17 June, 1895.

999. *Chairman.*] Have you a general knowledge of the district? Yes; I have been round it in every direction since I have been here—during the last fifteen months.
1000. Have you any knowledge of the Colony generally? Yes; I have been in a good many different districts, and have lived there for periods of months or years.
1001. Where have you been? I have lived at Parkes for about two years, and on the other side of Parkes for about six months. I have also been near Albury, where I lived for about twelve months. I have been on the North Coast between Byron Bay and Murwillumbah. I lived there for seven months.
1002. Have you been in Court all day? Yes.
1003. Has any statement been made to which you think exception should be taken? One part of the evidence with which I cannot agree has reference to the suitability of the land in the vicinity of Wyalong for agricultural purposes. I have been all round here, and I have not seen any place yet which I do not consider to be really good land for wheat-growing and general agricultural purposes.
1004. That is going north-east and west from Wyalong? Yes.
1005. You say there is a large area fit for wheat-growing? I think it is one of the finest wheat-growing countries I have been in.
1006. With what other places can you compare it? I can compare it with several districts in Victoria—the North-Western district for instance.
1007. You mean Wycheeproof and Horsham? Yes; I was all over the Wimmera country for eight years, and I took particular notice of agriculture. I have also been out in the western districts of Victoria, and I think the land about here is the finest I have seen for wheat-growing purposes.
1008. You mean to the north and east;—for instance, you would not call it good wheat-growing country between Temora and Barmedman? I am speaking between here and Barmedman. There is some very good land—in fact, I consider all this mallee country is first-class wheat-growing country.
1009. Exactly the same kind of country as they are growing wheat on in other parts? Yes; it is the same as that about Donald and Warracknabeal.
1010. They simply roll it down there? Yes; and after a few years all the roots come out. They drag out year by year as the harrows go over them, and after the ground has been cultivated six or seven years it can be ploughed with any ordinary plough.
1011. How do they get the first crop in? They roll the mallee down and leave it lying until late in the summer, and set fire to it. It may then be cleared for 2s. an acre. They then use the stump-jumping ploughs. It is a plough made specially for that kind of country. That goes over the stumps which are left, and which are broken off level with the ground.
1012. Does the mallee snap at the root when you put the roller over it? Yes; and it will break easier at the root than 3 inches above it.
1013. You say then that the mallee country here compares very favorably with the Wimmera country in Victoria? It is identical.
1014. What is the rainfall of the Wimmera country? It is not above 15 inches.
1015. Therefore, it is less than it is here? I think it is.
1016. You infer, therefore, that if wheat will do well in the Wimmera country it will do well here? I think it will do equally well if not better.
1017. Is there anything else you wish to say? I have been out from here to Lake Cowal, and I know the country. The farmers out there have told me that if they had a market here, they would go in more extensively for agriculture, whereas at present they are only going in for grazing.

Mr. James Magnus Jamieson, selector, Wyalong, sworn, and examined:—

Mr. J. M.
Jamieson.
17 June, 1895.

1018. *Mr. Roberts.*] Do you remember giving evidence in April, 1894? Yes.
1019. Have you anything to add to what you then said? No.
1020. Do you think the land about here is suitable for wheat-growing? Yes.
1021. Did you hear the evidence of the last witness? Yes.
1022. Do you agree with all he said? Yes; I come from the Cootamundra district. I have been here over five years, and I find that the land is quite suitable for growing wheat or hay.
1023. In what direction from Wyalong do you live? At about 10 miles south by west.
1024. What area have you under crop? About 50 acres. I only cultivate for my own use because I have no market.
1025. Do you feel the want of better facilities for getting your produce to market? Yes.
1026. If better facilities were afforded, would you be likely to extend your area under cultivation? By all means I would.
1027. Do you think the land would be quickly taken up for agriculture if a railway were constructed? Yes.

Mr. John Jones, selector, Wyalong, sworn, and examined:—

1028. *Mr. Davies.*] What evidence do you wish to tender to the Committee? As to the nature of Mr. J. Jones. the country.
1029. Do you endorse the evidence of the last witness? Yes.
1030. Is it a good wheat-growing district? Yes.
1031. But you require better facilities for getting your produce to market? Yes.
1032. What is the rainfall of the district? It ranges from 9½ to 27 inches. The driest year was 1888, which was 9½ inches. I have not recorded the present year.
1033. Do you keep a gauge? I have done so, and a record also.
1034. Do you send your returns to the Observatory? No; I keep them for my own purposes.
1035. What is the average rainfall? About 17½ inches.
1036. Is that sufficient to enable you to grow wheat profitably? Yes.
1037. What have you under cultivation? Nothing this year; mine is a small area.
1038. What is the extent of your holding? 2,500 acres.

1039.

- Mr. J. Jones. 1039. *Mr. Lee.*] You are of opinion that this country is suitable for growing wheat? Yes.
 1040. You also say you have had a rainfall of $9\frac{1}{2}$ inches? That was an exceptional year.
 17 June, 1895. 1041. Under those conditions would not wheat-growing be a very precarious kind of cultivation? It has not been to those who have grown it.
 1042. Would not there be a large proportion of bad years when the yield would be small? I do not think so. The year I have mentioned is one in fifteen.
 1043. You could not grow wheat with a rainfall of $9\frac{1}{2}$ inches? No.
 1044. Nor with 15 inches? Yes, we could.
 1045. Under severe conditions of that character, how could you grow wheat and send it to Temora, Cootamundra, and other places, and compete with growers who are placed under more favourable conditions? It may not be profitable; but still it is done. It is carted now from Hiawatha.
 1046. But can they make a living out of it? Well, they have to live.
 1047. Then whatever the land may be capable of, I suppose you are prepared to admit that it is not probable that a large area of country will be brought under cultivation? I think it is probable.
 1048. As against other districts more favourably situated? Yes; take Cootamundra, for instance. Land there, worked year after year, has given a poor return.
 1049. I suppose if it would pay you better to graze than to cultivate you would graze; if it paid you better to cultivate than to graze you would cultivate? Certainly.
 1050. I suppose you cannot hold out, as a strong inducement for the extension of the railway, any probability of the district being brought under wheat;—is there any probability of wheat being grown? Yes.
 1051. But there is no certainty of it? No; I cannot answer for anyone else.
 1052. Then you speak in general terms to the effect that wheat can be grown here, but it is problematical whether it can be grown in sufficient quantities to afford freight for a railway? That is so.

TUESDAY, 18 JUNE, 1895.

[*The Sectional Committee met at the Albion Hotel, Cootamundra, at 9 p.m.*].

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. JOHN DAVIES, C.M.G.		The Hon. CHARLES JAMES ROBERTS, C.M.G.
		CHARLES ALFRED LEE, Esq.

The Sectional Committee further considered the proposed Railway from Temora to Wyalong.

Mr. John Gordon, Resident Engineer for Roads, Cootamundra, sworn, and examined:—

- Mr. J. Gordon. 1053. *Chairman.*] Do you reside here? Yes.
 1054. Does your district go beyond Wyalong? It is only lately that I have gone to Wyalong—since the field broke out. I go as far as Marsden.
 18 June, 1895. 1055. Where is that? Twenty-five miles east from Wyalong.
 1056. Can you tell the Committee what operations you have at present in progress and what you intend to do with regard to the road from Temora to Wyalong? At the present time we are expending the balance of money from 1894 and 1895 in forming and graveling between Temora and Barmedman. There is no work going on at present between Barmedman and Wyalong.
 1057. What are your contracts between Barmedman and Temora? At the Temora end they are forming and graveling, and near the Ten-mile two contracts for forming and metalling are being carried out.
 1058. What is the total length of your contracts? About 2,200 yards— $1\frac{1}{4}$ mile altogether; that is the total of new work.
 1059. Does that exhaust your money? Yes, very nearly.
 1060. Therefore, I presume, no more work can go on until you get more money? No.
 1061. More will be voted, I presume, in the early part of the next half year? Yes.
 1062. We noticed going along the road different kinds of gravel;—for instance, the gravel nearest to Temora appeared to us to be inferior to that further on? Yes, the gravel is patchy. Last year I got some gravel, which was not so good as that which is coming out this year. In the bush we find little patches. There does not seem to be any thoroughly-defined gravel pit.
 1063. But before passing the material you see that it is suitable? Yes.
 1064. Have you inspected all the heaps on the road? Yes.
 1065. And do they appear to you to contain the best gravel that can be obtained? Yes. I warned the men in charge of the road to let me know if they found that the material coming out was inferior.
 1066. And you believe the gravel at present stacked on the road is the best obtainable? As far as I can learn it is the best they can find.
 1067. Will you tell the Committee your process of road-forming and its cost—I am speaking now of a gravel formation? We are forming the road 24 feet wide. It used to be 30 feet wide, but I find 24 feet is quite enough. We give it a round of 9 inches in the centre.
 1068. A crest of 9 inches? Yes; and this year I am putting on $1\frac{1}{2}$ cubic yard to the lineal yard of road on that formation. Where I find a fall can be obtained I drain it. In some parts I put a drain on each side; in other parts, only a drain on one side. Where there is the slightest indication of side-lying country to be had we form stone crossings. The country generally is so flat that if we put in culverts we could not get a discharge from them. We form stone crossings with a depression from 12 to 18 inches in the centre.
 1069. Having got your crest, you put the gravel on? Yes.
 1070. At the rate of $1\frac{1}{2}$ cubic yard to the lineal yard—that gives an average in depth of 9 inches;—what will that cost per chain in ordinary country—I mean for clearing, putting a crest on the road, and putting the gravel upon it? The road is all cleared there. We have had no clearing to do, but we generally get clearing done for 5s. 6d. a chain. Then the forming and graveling I estimate at about 7s. 6d. per running yard. The width of the road is 24 feet, and 18 feet are allowed for gravel.

1071. *Mr. Lee.*] Are you stating actual prices, or only an estimate? I am giving an estimate as between Temora and Barmedman.

Mr.
J. Gordon.

13 June, 1895.

1072. But, as a matter of fact, work is being done very cheaply? Yes.

1073. Would it not be better to base the amount upon the actual expenditure rather than to give an estimate, because I believe in every district now work can be done, in some instances, for one half the estimate of the engineers? I put down 2s. 6d. per cubic yard for gravel. The forming we get done now, in some instances for 6d. Those prices would have to be contingent on the state of the weather.

1074. What is your ordinary rate for forming? 8d. and 1s. We have scarcely ever had it done for 9d. At present prices, that would be 2s. 6d. for forming. Then the draining we get done for 3d., which is very low.

1075. What does it cost per chain to clear, form, and gravel;—what does it come to per chain? One and a half yards to the lineal yard would be 3s. for gravel, 6d. for forming, and 3d. for draining per yard. That would be 3s. 9d., at the rate of 1½ cubic yard to the lineal yard of road, or £4 2s. 6d. per chain for the gravel, forming, and draining. Then there is the clearing in addition to that where required, at 5s. 6d. per chain. Then there are three stone crossings to the mile at £5 each, or a total of £367 per mile.

1076. And that is the price at which you can get the work done? Yes; at present.

1077. Will a gravel road carry the heavy traffic? No; not very well.

1078. In fact, you cannot recommend it as a road suitable to carry the traffic? No.

1079. Supposing you can put down metal, instead of gravel, what will the cost be per mile? The only difference will be as between the metal which we should get at 5s., as against 3s. for 1½ cubic yard, to the lineal yard of gravel. That is 2s. a yard more. Then there is the blinding. If we put down metal we have to blind it. That would be from 3d. to 4d. at the lowest for the running yard. That is putting on 1 cubic yard of metal to the 1 yard of road.

1080. Are we to understand that metal will cost per chain £2 9s. 6d. more than gravel? Yes.

1081. How much more per mile? £198.

1082. Therefore, a metalled road will cost per mile £565? Yes.

1083. Would a road for that amount carry all the traffic from Temora to Wyalong? I think so.

1084. What is the distance from Temora to Wyalong? It is 22 miles to Barmedman, and from there it is 17 miles to Wyalong township. Wyalong West is 2½ miles further. Altogether it is between 41 and 42 miles.

1085. That means £23,165 for the whole of the road? Yes.

1086. Would such a road carry heavy traffic? I believe it would. It would require maintenance, and would have to be closely watched.

1087. What would your maintenance be? We should require at least 100 yards to the mile.

1088. How much to the mile? £25.

1089. Would that maintain it? That would have to be provided immediately with the other road, as a new road always requires more than an old one.

1090. Would £40 a mile maintain it? Yes.

1091. Would less than £40 a mile maintain it? No; £40 a mile would pay, I believe, for the material and the men's wages.

1092. Therefore, you think that the mean would be a £1,640 a year? Yes.

1093. How much can we take out of the road as being permanently dealt with already? Six miles between Temora and Wyalong.

1094. Has it been metalled? Gravelled principally.

1095. I mean so as to be able to carry a good heavy load? I look upon that part of the road as finished, and it will do with the usual attention.

1096. Would £20,000 make a first-class road to Wyalong? I think so, at present prices.

1097. And it would take £1,600 a year to maintain it? Yes.

1098. You dismiss the idea of gravel carrying heavy traffic? It will not do it with such gravel as we get there.

1099. The gravel appeared to us to be very inferior? It is too fine altogether, and is full of dirt. That is why I have abandoned it. I am abandoning the gravel altogether, as I do not put any faith in it at all.

1100. *Mr. Davies.*] How long have you been Resident Engineer for the Roads Department in this district? Eighteen months.

1101. Did you see a report furnished to the Department by Mr. Mullens, with reference to the cost of the road? I only saw a few remarks in the newspaper; but nothing in detail.

1102. How long have you been in the Service? I joined the Service in 1864.

1103. Your estimate differs very much from the one supplied to the Department by Mr. Mullens? The prices are put down very much lower than I ever knew them before.

1104. Is the road from Temora to Barmedman cleared for 1 chain in width? Yes.

1105. *Mr. Lee.*] Is not the road from Temora to Wyalong cleared right through? From Barmedman to Wyalong it is cleared ½ a chain, and from Temora to Barmedman it is cleared 1 chain.

1106. Then you must be slightly wrong in your figures, because you would not have to clear from Temora to Barmedman? No.

1107. *Chairman.*] There appears to be a considerable difference between the estimate furnished at headquarters and the statement you make; can you explain that difference? I believe it is caused by the fact that at first it was thought stone could not be had between Barmedman and Wyalong; but that there was stone only at Barmedman, or a short distance from it. Consequently the stone would have had to be carted a long distance. From inquiries I have made I have ascertained that stone is in every inch of the country. I have been assured that it can be obtained at distances of from 5 to 6 miles—that is at one point 5 miles, and then at another point from 5 to 6 miles further on. That would make an average for cartage of about 2½ miles. I think that will explain the difference between the first estimate and mine.

1108. *Mr. Davies.*] What did you give per yard for the mullock, which is called gravel, now lying on the road? From 1s. 11d. to 2s.

1109. It consists of slate and dirt; is that the best stuff you can get in the district? That is all we can get there.

1110. Is it not a waste of public money to put that stuff on the road? I have come to the conclusion it is no use putting it on, and I am doing away with it.

- Mr. Gordon.* 1111. Have you reported to the Department that it is waste? No; I have introduced stone instead.
 1112. How far have you to go for the stone? The contractor obtains it about 3 miles away, near what is called the Ten-mile, towards Reefton.
 18 June, 1895. 1113. Do you agree with what Mr. Scarr has stated that a new metalled road could be made for £46,000, and would be a permanent work, and would not cost much to maintain after being thoroughly made? In my opinion a road can be made for £20,000. I am only going upon the ruling prices and the information I have lately received as to the position of quarries between Barmedman and Wyalong. Some months ago my estimate would very likely have come up to that of Mr. Scarr. My estimate has been made on the supposition that we can get the stone, as stated by those who purport to know the country well, at from a distance of from 5 to 6 miles.
 1114. You believe, judging from the supplies you are likely to get and the rate of wages ruling, you can make a metalled road between Temora and Wyalong for about £24,000? Yes.
 1115. *Mr. Lee.*] And that, according to your own showing, is an over-estimate, because you have allowed for clearing all through, and that of itself will make a difference of £902? Yes; no clearing is required to Barmedman.
 1116. *Mr. Roberts.*] Have you seen the metal upon which you depend for a supply? No, I have not inspected it minutely. It appears to me to be probable that the metal will not be first-class. Still it will be the best obtainable in the district, and will probably do for all practical purposes. By "minutely" inspecting I mean that, although I have seen the reef, I have not had the metal taken up and tested so as to make myself absolutely sure with regard to it.
 1117. Why, in connection with an important matter of this kind, when the question of road construction is before the Department, did you not look carefully into the matter of metal? I had no metal contracts between Barmedman and Wyalong. I simply saw the outcrop.
 1118. Still, the question of the supply of metal is a very important one in that district;—would it not be well for you to make yourself perfectly sure with regard to it? That cannot very well be done until tenders are called for. Then the contractors look out and find metal sometimes where we cannot find it. I do not think there is any first-class material. It is admitted by those who tell me that metal can be found at an average distance of 5 or 6 miles that the metal would not be first-class; it would not be blue metal.
 1119. How long would it take you to make sure that you could obtain this metal supply? The best way would be to get a couple of men to go out with a pick and thoroughly examine the bush.
 1120. How long would it take you before you could let your superior officers in Sydney know what the metal supplies along the road really are? I think I could do it in a week. My own opinion is that there is no really good metal between Barmedman and Wyalong, and any quartz which there may be is not very good. It grinds away to such an extent that it will not stand the traffic.
 1121. *Mr. Lee.*] How much a mile is voted for that road? £680 was voted for the road last year, and £50 a mile has been voted for it this year.
 1122. That means £2,050? Yes.
 1123. I believe about £3,000 has already been spent on the road between Temora and Wyalong? Yes, about that.
 1124. Apart from the clearing which has been carried out from Barmedman to Wyalong, has there been any attempt at road-making at all? Nothing except the graveling and the corduroying at 11 miles from Barmedman.
 1125. Beyond that, there has really been no attempt at making a road? Not between Barmedman and Wyalong, with the exception of the corduroy.
 1126. During the time the road was so bad, which did you consider was the best part? The part which has been corduroyed.
 1127. And that was the reason you put in that work? Yes.
 1128. Is there any very bad place between Temora and Wyalong called Donkin's or Barmedman Lane? Yes; there is about 4 miles of it there.
 1129. Where the road was literally ploughed from end to end? Yes.
 1130. And where the road is fenced on either side? Yes.
 1131. What is the width of the road at that particular place? Three chains, and one chain is cleared.
 1132. At present, the road right through to Wyalong is trafficable owing to the long spell of dry weather? Yes.
 1133. What do you anticipate will be the result if the ordinary winter rains set in? Donkin's Lane will be almost like what it was last winter; it will very soon become impassable. I had a portion of it scrubbed so as to allow the traffic to pass over in dry weather; but it will be impassable in wet weather. Last year, three-quarters of a mile of it, at a distance of $1\frac{1}{2}$ miles beyond Barmedman, was very bad; it was totally impassable.
 1134. Beyond the few small pieces which you have been able to corduroy and gravel, the road from Temora to Wyalong is, with the exception of the clearing, in a state of nature? Yes.
 1135. Not even drained? A short portion of it is.
 1136. Would it be possible to put a crown on that road, open the drains, and keep it dry? I do not think so; the country is too flat.
 1137. But if you make a metalled road, you will have to get rid of the water somewhere? Yes; but if it were drained on each side the traffic would be confined, and in wet weather it would in a short time be totally impassable.
 1138. Therefore, in your opinion, it is better to leave it as it is, and allow the traffic to find its own tracks through the bush? Exactly.
 1139. I suppose, as the country is not fenced between Barmedman and Wyalong, there is an opportunity for the traffic to spread? Yes.
 1140. Do you see any other way of giving the Wyalong people an ordinary road trafficable in wet weather, except by making a metalled road? No.
 1141. Then you are strongly opposed to any attempt at raising the crown of the road and opening water tables? Yes.
 1142. You have admitted that the use of gravel would be, practically, a waste of money? I do not think you could get it.
 1143. But even if you put it on, it would be a waste of metal? Yes; I look upon its quality as very unsuitable.

1144. In view of the fact that there is an abundance of timber along the road, would it not be possible to put in considerable lengths of corduroy, similar to that you have put in near the Half-way House? There is a good deal of timber there, but it is very difficult to get it straight. If the timber were crooked and had to be trimmed or dressed, it would become very expensive.
1145. What was the cost per chain of the corduroy at the Half-way House? 6s. 6d. a yard, or £7 3s. per chain, and there are 53 chains of it. That makes the total cost £378 19s.
1146. What do you think would be the actual cost per chain of corduroy? I think, under ordinary circumstances, it might be done for 3s. 6d. for the corduroy, and 1s. for the ordinary gravel; in all, 4s. 6d. a yard. That is £4 19s. per chain, or nearly £400 a mile.
1147. [Chairman.] Does that include putting gravel or binding upon it? No; it would simply mean putting clay on the top.
1148. Then you would require to put rotten rock or gravel upon it? Yes.
1149. How much would the rotten rock cost per mile? About the same price as gravel—perhaps 2s. per cubic yard.
1150. If there is to be a vote of £50 a mile for the road, and corduroy, which is the cheapest possible form of road-making, cost £400 a mile, the total grant for that road will be very small? Yes; and it is only in similar localities that we can get material suitable for corduroy. Crooked timber is of little use. There would be spaces between the timber, and the gravel between would settle down and cause a trap for horses. The logs must be close. The man who did the corduroy to which we have been referring told me he had exhausted all the straight timber he could get, even in that scrub of belar down there.
1151. Under any circumstances, if the vote of £50 a mile is continued, it would take some years before a good road could be made from end to end? Yes.
1152. Will there be any possibility of diverting the road in any way, so as to obtain a better road to travel over? No; I do not think so. The scrubs and gulgai localities extend a long way on each side.
1153. Therefore you see no hope whatever, except to go on gradually and metal the road? That is the only thing we can do.
1154. And under the conditions you have enumerated, the road would be finished within the next ten years? Not without special grants.
1155. At present the traffic is not quite so heavy on the road? No; not so far as I can see.
1156. There was an immense traffic at first? Yes; you sometimes met three and four, and sometimes five teams, with sixteen or eighteen bullocks in each wagon, all following in the same track. No road would stand that in such weather as that we have had.
1157. Is the country of such a nature that the teams bog, or do they only cut the road up? It is more cutting, as a rule.
1158. And to about what depth do they usually cut it? I have seen them down 12 and 14 inches—down to the nave in some places.
1159. Does not the cleared portion of the road, nearly the whole distance, present an appearance of having been ploughed? Yes.
1160. Is it possible that the road will stand any traffic when the rain comes again? I do not think it will stand much. It is in a condition now to hold all the wet which falls.
1161. Is there not a possibility of traffic being brought to a full stop altogether? It is quite possible.
1162. Supposing, for instance, rain were to come in sufficient quantities to enable a large supply to be stored at Wyalong, sufficient to work the mines, that would also mean the cutting up of your road; traffic would increase very largely for the mines, and I should like to know what would be the condition of the road under such circumstances? In a short time it would be in the same condition it was in last winter. It would simply be impassable; in fact, I daresay it would be worse than it was last winter, because the available tracks are pretty well cut up. Last winter teams even had to take to the bush. They could not possibly attempt to follow the line. However, there was extra traffic last year which would not exist this year. Last year the road had to sustain double traffic, inasmuch as the stone from the mines was being brought back to Barmedman.
1163. You think it is possible, then, that the traffic would be of a lighter character? I believe it would.
1164. Do you see your way clear, in improving the road, to keep within the limits of the vote you are likely to have? No; the £50 a mile would go a very short way. We could only make a very small portion of the road with it.
1165. How many public vehicles are plying between Temora and Wyalong at the present time? About five.
1166. Are there five different lines of coaches? I think they belong to different people, but they do not seem to be doing much.
1167. Have you kept any record of the passenger traffic? No.
1168. Does it appear to you to have slackened off considerably? Yes, very much.
1169. I suppose you consider that the first flush of the field has worn off? There is no doubt of that. As far as I can see there is nothing like the number of teams on the road there used to be, and the coaches sometimes run without a passenger.
1170. Do you know Wyalong pretty well? Yes.
1171. Do you know the field? I have not been out for any distance.
1172. Are you led to believe the field will be of a permanent character for some years? I think it is likely, from all I can hear, but I do not suppose it will ever be a very rich field. However, opinions differ.
1173. In view of your position here, do you imagine there will be a permanent population there;—do you not think that Wyalong will now be a township for all time? I do.
1174. Hence the necessity of keeping open communications? Yes. I have noticed that there is more digging going on and more places are being opened up there.
1175. You have an idea of the traffic over the road? Yes.
1176. Do you think that traffic would be sufficient to keep a railway going? I do not think it would at present.
1177. Do you think the time has arrived when it would be expedient to construct a line from Temora to Wyalong? Taking into account what I have seen of the traffic, I do not think so.
1178. Am I to understand from your answer that you think it will be in the interests of the country to defer the construction of the line for a further period until the actual state of the field has been ascertained? I think so, although communication must be kept up.

Mr.
J. Gordon.
18 June, 1895.

Mr. J. Gordon. 1179. But you know better than I can I tell you that, no matter what money is granted for the road, it would be expended over a long series of years. A railway would be constructed quickly, and if it were constructed, what is the likelihood of the interest on the cost of construction and the working expenses being paid? From what I see of the traffic on the road, I do not think it would pay.

18 June, 1895. 1180. As a means of easy communication of course it would be desirable? Yes.

1181. But you do not think there is any present prospect of a railway being payable? No; I do not think so.

1182. *Mr. Roberts.*] You do not think the time has arrived when the construction of a railway from Temora to Wyalong would be justified? From what I have seen of the traffic lately, I think not.

1183. In view of the condition of the road, and the probability of Wyalong being a permanent field, do you think a special grant should be made for the construction of a road which would give a certain communication at all periods of the year? I certainly think so.

1184. What amount would, in your opinion, be necessary as a special grant? To do the worst parts of the road, which were impassable last winter, we should require from £7,000 to £8,000.

1185. If the Government granted a sum of £10,000, would that construct a road which, with an annual grant for maintenance, would keep in good condition for all time? I think so. On one occasion I made out an estimate, taking into account the different places which were impassable last year, and £10,000 was the amount I arrived at.

1186. Were you ever asked to report as to the necessity of a special grant? No; there are 10 miles of very bad road now. If that were attended to the ordinary yearly grant of £50 might keep the remainder of the road open.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

Railway from Temora to Wyalong.

SECTIONAL COMMITTEE.

APPENDIX.

A.

[To Evidence of Mr. J. Gordon.]

COST OF ROAD FROM TEMORA TO WYALONG.

Sir, When thinking the matter over this morning re cost of completing road from Temora to Wyalong, I think when calculating the cost per mile for stone, only one cubic yard per lineal yard was allowed for. Again, portions of the road will require brushing before putting on stone, and having thought the matter over carefully, I beg to submit the following, and trust it will be taken as my evidence on that portion of your inquiry :—

	Per lineal yard.
	s. d.
Forming and brushing 6 inches deep	1 6
Drain on one side	0 3
Metal, $1\frac{1}{2}$ cubic yard, per lineal yard.....	6 3
Blinding	0 3
	<hr/>
	8 3
Estimate without Brushing.	
Forming 24 feet wide.....	0 6
Drain on one side	0 3
Metal, $1\frac{1}{2}$ cubic yard, per lineal yard.....	6 3
Blinding	0 3
	<hr/>
	7 3

There are 42 miles from Temora to West Wyalong, only about six of which have been formed and gravelled. About 12 miles will require brushing before being metallised, which at 8s. 3d. per lineal yard = £726 3s. per mile, and adding £15 for crossings = £741 3s. per mile. There remains, after deducting as above and the 6 miles completed, 24 miles to be done in the usual manner, viz.:— Forming, &c., 7s. 3d. per lineal yard = £653 per mile, which with £15 added for stone crossings = £665 per mile.

Summary.

Forming, brushing, &c., 12 miles at £741 3s. per mile	£8,893 16 0
Forming, &c., 24 miles at £653 per mile	15,672 0 0
Maintenance metal, say, 100 cubic yards per mile on 36 miles for first year = 3,600 cubic yards at 5s. per cubic yard	900 0 0
	<hr/>
Cost to complete 36 miles	£25,465 16 0

The above is based on the very low prices for which work is now being done.

The Chairman, Sectional Committee, Public Works.

I have, &c.,
JOHN GORDON.

B.

REPORT ON AGRICULTURAL AND PASTORAL LAND WITHIN 20 MILES OF WYALONG.

Sir,

Wyalong, 18 June, 1895.

I have the honor to forward herewith report as required in reply to the enclosed letter of 17th instant. I have carefully examined the whole of the Crown lands within a radius of 20 miles of Wyalong, and in doing so have also examined the alienated lands of the locality. The agricultural land within a radius of 20 miles of Wyalong is comprised in three-fourths of the whole area of the piece of country to the south, west, and north of Wyalong, and may be fairly described as all the country west of a line drawn from Barmedman through Wyalong to Marsden ; and the land to the east of the same line is good pastoral land, but not well suited for agriculture.

The agricultural country just referred to is chiefly granitic, much decomposed, and consequently rich in most of the mineral elements required for successful cultivation. Together with the granite are belts of slate in small hills and ridges ; and these two formations, with their accompanying quartz and mineral veins, constitute the whole of the agricultural area.

Within a radius of 20 miles, there is an area of about 936 square miles of agricultural land, of which I estimate 702 square miles to be profitable agricultural land, clear of ridges or rocky hills.

As nearly as I can form an estimate, about 468 square miles, or half the total amount of agricultural land, is Crown land and reserves ; and I estimate about 320 square miles of Crown land, exclusive of reserves, within the agricultural area.

From the numerous inquiries made for land in this locality, it is most probable that all the agricultural and pastoral land within 20 miles of Wyalong will be taken up as soon as it becomes available for selection, and this in the face of the heavy expense which must be incurred before the land can be made use of for either agricultural or pastoral pursuits. Before any profitable results can be obtained from any holding in this locality, it will be necessary to enclose with rabbit-proof fencing and destroy the rabbits within the enclosure. This work, together with the necessary water conserving and the destruction of scrub, will be costly, and may operate against the immediate prosperity of this locality, which must eventually become a rich agricultural and pastoral district.

The best agricultural land in this locality is covered with a dense growth of cypress pine, bull oak, and scrubs ; pine and yellow box, also, always indicate a good agricultural soil.

There are considerable patches of dense mallee also, and this land is all good soil.

The ridges and stony rises are generally timbered with ironbark trees and various scrubs of a prickly nature ; these gritty soils have proved very good for fruit growth.

In different parts of this locality have been grown in profusion and perfection the following fruits and grains, and only under the usual conditions of good farming and without irrigation, viz., apricots, apples, almonds, cherries, figs, grapes, lemons, mulberries, oranges, pears, plums, peaches, wheat, barley, maize, lucerne.

APPENDIX.

In the pastoral portion of the country, within the 20-mile radius of Wyalong, the country east of Wyalong is of slate formation, and on the plains about the Bland and Back Creeks, an alluvial clay soil. This is timbered with balar, boree, or myall, and is not well suited for agriculture, being too intractable and not so rich in some of the mineral constituents of the granitic country.

Some time ago I forwarded to the Agricultural Department for analysis characteristic samples of the various soils found in this locality, but have not yet received any results of analysis. The soils submitted were—pine soil, mallee soil, balar soil, boree or myall soil.

The pine and mallee soils are over the whole of the agricultural area, and the balar and myall or boree soils over the greater part of the pastoral country; and from these samples an opinion of the chemical possibilities of this country can be obtained.

I have, &c.,

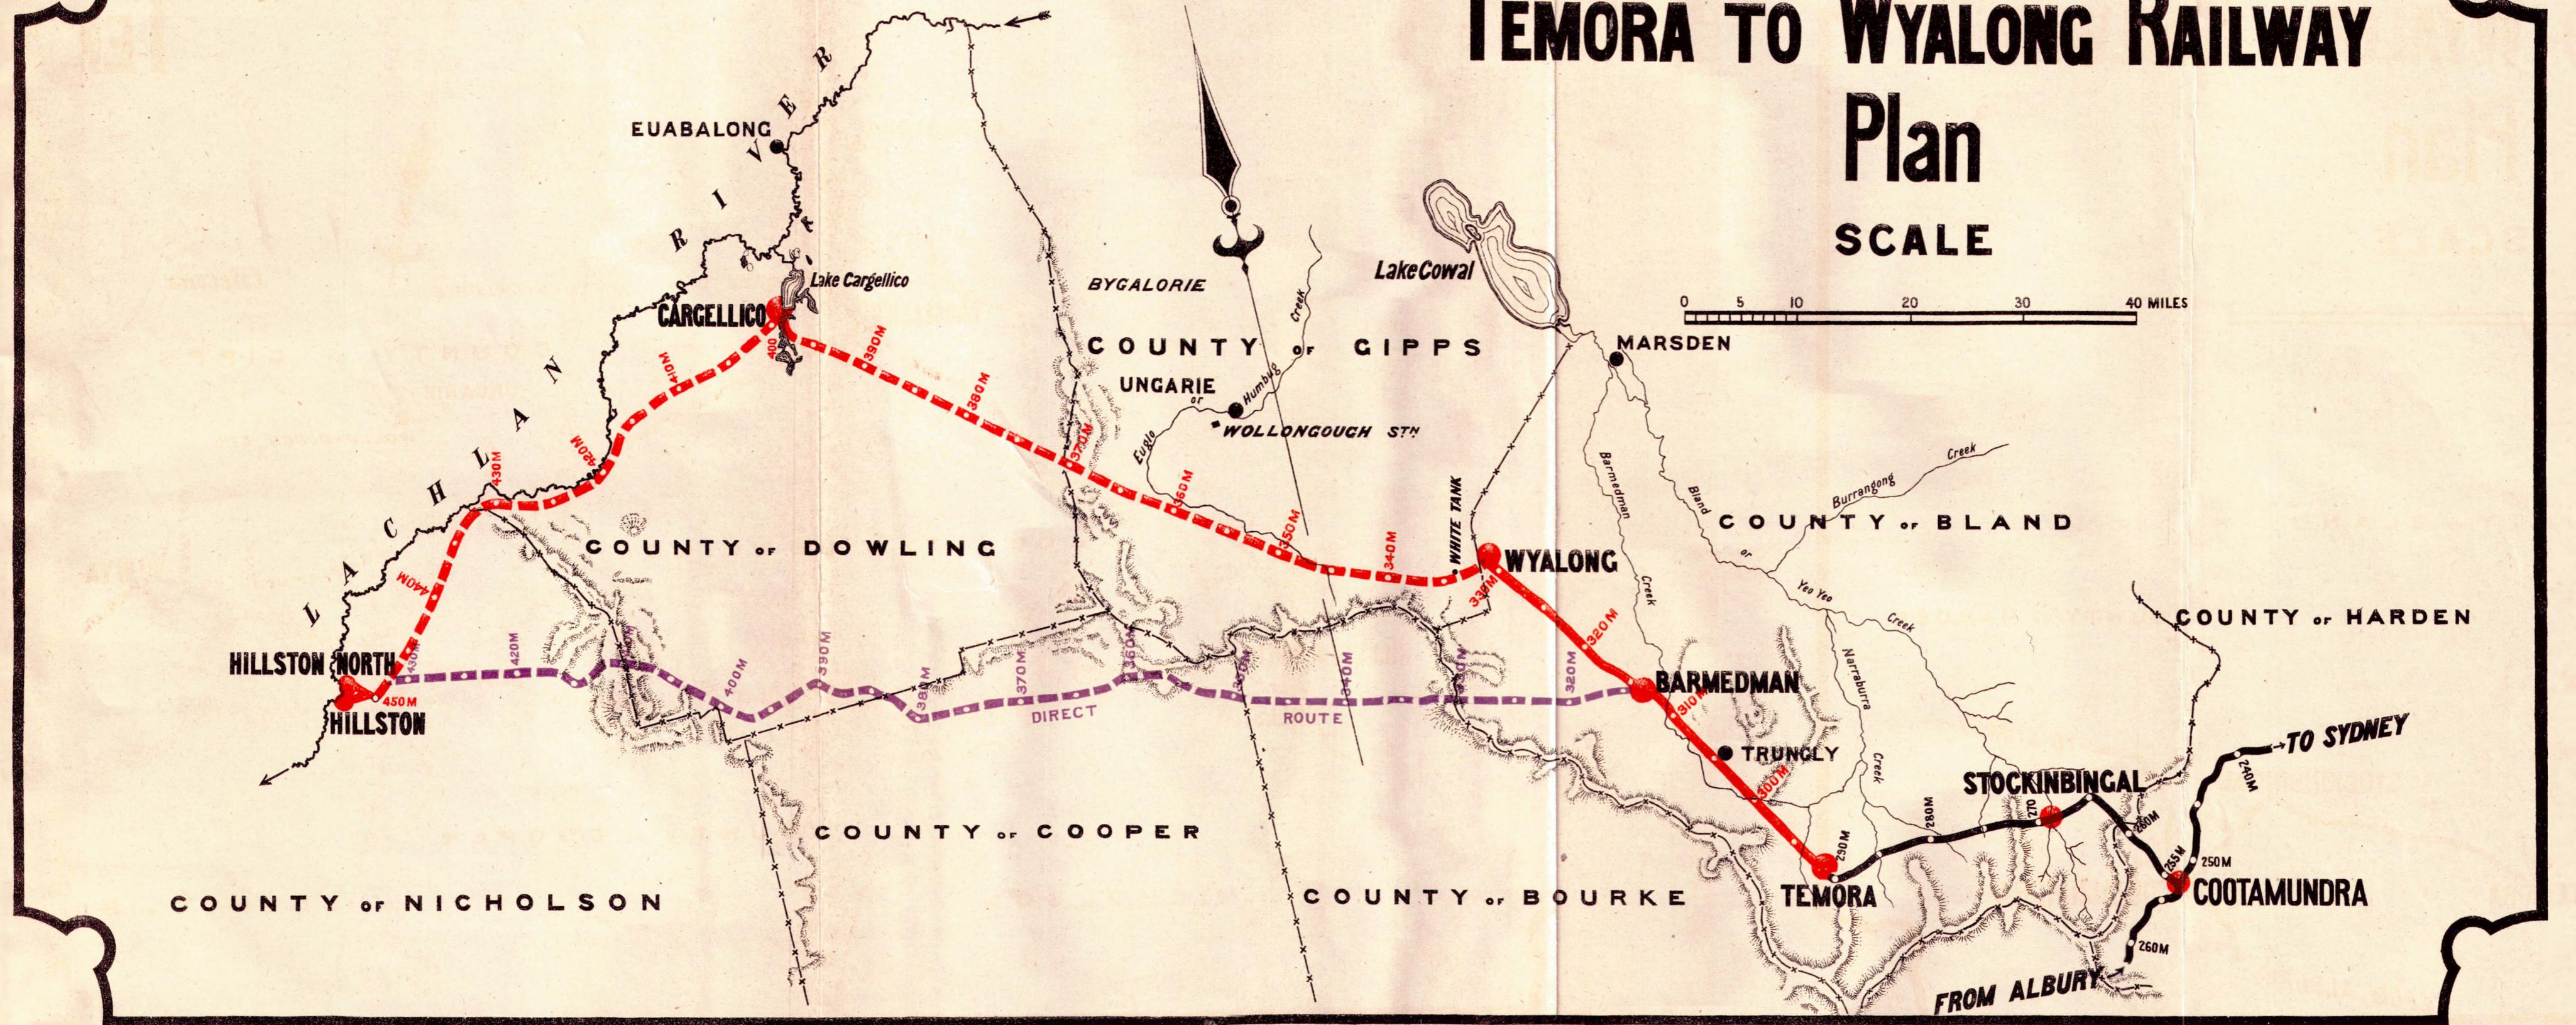

JOHN RICHMOND,
Staff Surveyor, Lands Department.

he Secretary, Parliamentary Standing Committee on Public Works.

No. 1.

The Crown Solicitor to The Chief Commissioner for Railways.

Dear Mr. Eddy,

Sydney, 28 March, 1890.

I could not get hold of Want until late yesterday afternoon, and therefore could not send you a note. He will take your brief with pleasure, and thinks you have been much ill-used of late. He agrees with me in thinking that you have no option—that you must prosecute. He also thinks it will be better that the prosecution should be in Sydney, on account of the newspaper reports being better taken than they are in the country.

I am sure that when you come to know each other you and he will be great friends.

Laurence had better draft the information at once, and show it to Want, at the same time giving him his retainer.

I have received the two newspapers.

Yours very truly,
JOHN WILLIAMS.

No. 2.

No. 2.

Messrs. Laurence and McLachlan to The Chief Commissioner for Railways.

Dear Sir,

As requested we now send memo. of our costs in connection with the prosecutions for libel, &c., which, as you will see, we have stated at 100 guineas, covering all work, attendances, &c.

This amount of course simply represents our own charges. As to Mr. Want's fees we propose to arrange these after conferring with him thereon.

With reference to the costs incurred in proceeding against the several proprietors of newspapers who had circulated the libel, we have succeeded in obtaining payment of costs from some of them, which receipts amount altogether to 15 guineas.

We propose therefore to make no charges in respect of the other parties who have not paid, and to treat the amount received as full satisfaction for our costs in respect of the whole of those matters, so that the enclosed memo. will represent the whole of our claim against yourself.

Yours truly,

LAURENCE AND McLACHLAN.

[Enclosures.]

Memorandum.

E. M. G. Eddy, Esq.,—

12, Spring-street, Sydney, 9 July, 1890.

To professional costs, charges, and disbursements to date in the undermentioned matter:—
Re libel—To costs herein as per letter of 9th July, 1890 £105
We also enclose Mr. Austin's account for 6 guineas for searches.

With compliments.

LAURENCE AND McLACHLAN.

Messrs. Laurence and McLachlan debtor to C. R. Austin,—

Sydney, 31 May, 1890.

To searching newspapers for copies of leader, "Alleged Audacious Nepotism," published in the *Tamworth News*, £6 6s.

No. 3.

Messrs. Laurence and McLachlan to The Chief Commissioner for Railways.

Dear Sir,

12, Spring-street, Sydney, 5 September, 1890.

You v. Joseph; You v. Martin.

We enclose herewith a memorandum of fees charged by Mr. Want, amounting to £222 17s. 6d. Mr. Want has asked us to let him have a cheque for the amount of his fees.

Yours truly,

LAURENCE AND McLACHLAN.

No. 4.

Messrs. Laurence and McLachlan to The Chief Commissioner for Railways.

Dear Sir,

12, Spring-street, Sydney, 22 September, 1890.

You v. Joseph; You v. Martin.

Referring to our letter to you of the 5th instant, accompanying memorandum of Mr. Want's fees, we have had several messages from him, and to-day a most urgent request for a cheque.

Would you kindly forward us a cheque so that we may pay Mr. Want's fees.

We have endeavoured to induce him to make a reduction in the total, but he declines to do so, and is importuning us for the amount as rendered.

Yours truly,

LAURENCE AND McLACHLAN.

No. 5.

Messrs. Laurence and McLachlan to The Chief Commissioner for Railways.

Dear Sir,

12, Spring-street, Sydney, 5 November, 1890.

To facilitate the adjustment of our books to 30th June last, we shall feel obliged by a settlement of the amount due by you to us at that date, viz., £105, and also £6 6s., Mr. Austin's account, which we have since paid, making, in all, £111 6s.

We are, &c.,

LAURENCE AND McLACHLAN.

LAURENCE AND McLACHLAN.

No. 7.

Messrs. Laurence and McLachlan to The Chief Commissioner for Railways.

Dear Sir,

We have to thank you for your cheque for £105, in payment of our costs. The counsel's fees amounted to £222 17s. 6d., and you sent us a cheque for £227, leaving a balance in your favour of £4 2s. 6d. We have since paid Mr. Austin's charges, £6 6s., so that the account at present shows a debit balance of £2 3s. 6d. We propose to accept your cheque in full satisfaction of our account, and have written off the last amount accordingly, so that you may now consider the account as squared.

Yours, &c.,

LAURENCE AND McLACHLAN.

No. 8.

Minute by The Colonial Treasurer.

Treasury Minute.

The Treasury, New South Wales, Sydney, 27 July, 1891.

Subject:—Costs of the Chief Commissioner for Railways, in libel action against Martin. THE above case, in which Mr. Eddy has to pay costs, amounting to £332, was so obviously undertaken in the public interests that I think the amount should be refunded in full, and I therefore beg to recommend this course to the favourable consideration of my colleagues.

W.M.

No. 9.

The Secretary to The Railway Commissioners to The Under Secretary for Finance and Trade.

I SEND you herewith copy of Martin's letter, as promised. Of course you will understand it is not to be made public.

H.McL.

[Enclosure.]

Milson's Point, North Sydney, 1 January, 1892.

Sir, I do not think, considering the time which has elapsed, that my motive can be misconstrued, when I say that I desire to convey to you the expression of my deep regret for my conduct last year in writing a libel upon you. I write this without reserve or qualification. The amende should have been offered before, I know, previous to the matter reaching the Court, but I was ill advised in every way. The apology I now make, so late in the day, might be considered by yourself supererogatory, but as I was temporarily employed in your Department I was certainly guilty of thoughtless ingratitude, as well as of folly. If, however, I erred, I have suffered grievously, in impoverishment and irretrievable ruin, and the closure of all avenues of regular employment.

I can only say, in conclusion, that I regret the tardy sense of propriety which impels me to this communication did not move me at a time when your anger might have been disarmed, and much trouble saved.

E. M. G. Eddy, Esq.

I am, &c.,
RESEIGH MARTIN.

No. 10.

Minute by The Colonial Treasurer.

Treasury Minute.

The Treasury, New South Wales, Sydney, 18 January, 1892.

Subject:—Payment by the Government of the costs of the prosecution in connection with the criminal libel action, "Eddy v. Martin."

I SHOULD be glad if the Under Secretary would be good enough to forward, for perusal by my honorable colleague, the Attorney-General, the enclosed papers in connection with the criminal libel action, "Eddy v. Martin." It is understood that Mr. McMillan submitted this matter to Cabinet for consideration of the question of the Government paying Mr. Eddy's costs, on the grounds that they were incurred in the discharge of a duty he owed to his public position, but the minute has been inadvertently lost in the course of its return to the Treasury.* The subject has recently been engaging my attention, but before arriving at a decision I should esteem it a favour if Mr. Barton would assist me with the benefit of his advising.

JOHN SEE.

The Crown Solicitor.—F.K., 18/1/92.

No. 11.

Mr. Railway Commissioner Oliver to The Secretary to The Attorney-General.

My dear Stephen,

Sydney, 15 February, 1892.

Thanks for your attention. I return a copy of the late Mr. Williams' letter. If Mr. Barton would only advise the payment of the cash Mr. Eddy has been so long out of pocket it would be most satisfactory. Mr. Eddy acted on the advice of the Crown Solicitor and by the direction of the then Minister for Railways, and the only mistake he made was in paying the accounts instead of sending them to the Treasury for payment. You might see that the matter is not lost sight of among the host of things Mr. Barton has to attend to.

Yours, &c.,

CHARLES OLIVER.

Approved.—G.R.D., 26/4/92. The Secretary to the Attorney-General.—C.W., B.C., 26/4/92. Place with paper *re* Reseigh Martin. The money should be paid, and I will write to that effect.—E.B., A.-G., 26/4/92.

No. 13.

The Crown Solicitor to The Under Secretary for Finance and Trade.

Crown Solicitor's Office, Sydney, 29 April, 1892.

Subject:—*In re* payment by the Government of the costs of the prosecution in connection with the criminal libel action, "Eddy v. Martin."

Sir,

I have the honor to return herewith the papers relating to the above matter which were forwarded to me from your Department on the 18th day of January, 1892, and to state that I have submitted them to Mr. Attorney-General Barton, a copy of whose advising thereon will be found herewith.

I have, &c.,

ERNEST A. SMITH,
Crown Solicitor.

OPINION OF THE HONORABLE THE ATTORNEY-GENERAL.

I FELT some difficulty in offering any opinion in this matter until yesterday, as not only did it seem that no question of law was involved, but the papers contained little in the way of data for the formation of an opinion. Yesterday, however, the Colonial Secretary forwarded a Treasury minute which had been found in his office, and under which Mr. McMillan, then Minister for Railways, recommended to Cabinet on 27th July, 1891, that the costs should be refunded to Mr. Eddy in full on the ground that the prosecution was undertaken in the public interests. That had been previously the tendency of my view, which is greatly strengthened by the emphatic declaration of Mr. McMillan, who being in office at the time of the prosecution probably knew every fact which tended to show that the course taken was a necessary one. In any aspect of the matter I do not think Mr. McMillan's decision should be disturbed. My honorable colleague the Colonial Treasurer will, I am sure, not think otherwise, but as I understand that he still desires me to advise formally, I do so. I am now clearly of opinion that these costs should be refunded to the Chief Commissioner for Railways. As, however, the matter in its way involves a question of policy, and the case may be referred to hereafter as a precedent by public officers of other Departments, who institute prosecutions for libel, my colleague will perhaps think it well to bring the matter before the Cabinet at the next meeting, this being also the course which Mr. McMillan had decided to take.

EDMUND BARTON,
Attorney-General.

No. 17.

The Chief Secretary, Sir George Dibbs, to The Colonial Treasurer.

My dear See,

Chief Secretary's Office, Sydney, 21 August, 1893.

Before I go I want you to authorise the payment of Eddy's costs. I specially want it done, as I have promised him it shall be paid, and my word must be of value.

Yours, &c.,
G. R. DIBBS.

No. 18.

The Examiner, the Treasury, to The Secretary to the Railway Commissioners.

Dear Mr. McLachlan,

5 September, 1893.

The Treasurer has approved of the payment of Mr. Eddy's costs in the libel action against Reseigh Martin. Will you kindly let me know the amount we shall have to pay? Is it £332?

Yours, &c.,
S. R. CORKHILL.

Yes.—H. McL.

No. 19.

Cabinet Minute.

The Treasury, 4 September, 1893.

At the last sitting of the Cabinet it was decided that the costs incurred by Mr. Eddy in the case of Eddy v. Martin should be paid, provided that Mr. McMillan gave a reply in the affirmative to a letter to be written by him to the effect that the late Government had agreed to pay them. Mr. McMillan having so replied, the Cabinet, to-day, confirmed its decision, and the Hon. the Treasurer will be good enough to pay the amount from the advance account.

GEORGE R. DIBBS.

The Under Secretary for Finance and Trade, B.C., 5/8/93.—C.W., P.U.S. Approved.—J.S., 5/9/93. Examiner.—F.K., 5/9/93. £332 passed for payment to-day.—S.R.C.

No. 20.

Mr. W. McMillan, M.P., to The Hon. Sir G. R. Dibbs, K.C.M.G., M.P.

* [Private.]

My dear Dibbs,

York-street, Sydney, August 21, 1893.

Our Government fully admitted Mr. Eddy's right to be paid out of the public funds, as the action was taken entirely upon public grounds, and I personally insisted on the policy of making it a criminal, not a civil, prosecution. It was to have been placed on the Estimates, as we thought that the better course. It should have come before the House long ago. I do not know why it was omitted. I trust it will not be longer delayed.

Yours, very truly,

W. McMILLAN.

On this note I would pay the money and fight the devils afterwards.—G.R.D., 21/8/93.
Honble. the Treasurer.

* On reference to Mr. McMillan it is found that he has no objection to the publication of this letter.

1894.

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAYS.

(CORRESPONDENCE BETWEEN THE CHIEF COMMISSIONER OF RAILWAYS AND THE GOVERNMENT,
RESPECTING BACK PAY AND RE-ENGAGEMENT FOR A SECOND TERM.)*Ordered by the Legislative Assembly to be printed, 6 November, 1894.*

The Chief Commissioner for Railways to The Minister for Railways.

Sir,

Sydney, 20 September, 1894.

I have the honor to invite your attention to the enclosed copy of correspondence regarding my engagement as Chief Commissioner of the railways of this Colony, particularly in respect to the question of salary.

You will observe therefrom that when signing the agreement entered into with Sir Daniel Cooper, Bart., on behalf of the Colony, it was in Sir D. Cooper's own words :—

" * * * Upon the distinct understanding that should his services hereafter prove to be satisfactory to the Government, an increase in the salary should be made ;" the original condition stipulated for by me under which the appointment was considered being :—

" Salary of £3,500 per annum, with seven years' engagement, any future advance being left open, results being the element to influence the Government regarding it ; or £3,000 per annum to begin with, with an agreement for an advance of £1,000 at the end of two years."

It was ultimately agreed that the commencing salary should be £3,000, and that the future increase should be "left to the justice of Government and Parliament."

Sir Daniel Cooper's letter of the 31st August, 1888 (extract from which is given above), shows clearly the understanding on the subject.

As the subject has been allowed to remain unsettled so long, I can only conclude that the exigencies of political life have prevented the Government from dealing with the question ; but as the arrears are now so considerable, and I am within a few weeks of entering upon the seventh year of office, and the question of re-engagement or otherwise will require to be dealt with almost immediately, I feel that as nothing has been done by the Government I must myself bring the question forward, and ask that it may be dealt with in that spirit of justice which I feel sure the Government and people of the Colony would wish to show towards me.

The result of the work of myself and colleagues is before the country, and requires no comment from me to assist the Government in coming to a decision as to whether my services have been "satisfactory."

In order that I might be advised by a legal mind in regard of my moral claim for consideration at the hands of the Government in this respect, I asked Mr. Want, Q.C., to give me friendly advice upon the question, and attached hereto is a copy of his letter to me.

I feel I may now safely leave the question in your hands to award to me that measure of justice upon which I relied when relinquishing my career in England ; but I may remark that, in addition to the ordinary work of administrating the great national property placed in the hands of myself and colleagues, I am sure the difficulties of various kinds surrounding the position I have the honor to hold could not have been anticipated when the appointment was first made.

I am, &c.,

E. M. G. EDDY.

To the Honorable G. H. Reid, M.P., Prime Minister and Minister for Railways.

[Enclosures.]

Dear Mr. Eddy,

I am treating your request to examine the papers in connection with the question of your right to an increase in salary just as you wish, viz., not to give an opinion with a view to any intended litigation, but giving you an opinion to guide you as to your position and your right to demand consideration at the hands of the Government.

In the first place, therefore, I will say that, from a legal view, it is the nearest shave of being a binding legal contract that I can imagine possible. In fact, had the negotiation been altogether verbal or by parol, the Government would have been legally bound to increase your salary as the circumstances now stand.

The

The fact, however, of the actual agreement being inwriting, and the words "it being understood," &c., excluded from it, that understanding has no effect in law. Your right, however, to demand it, and the justness of your claim, outside the legal aspect; can hardly be doubted for one moment. Nothing could be clearer to my mind than that the restriction to the £3,000 was adhered to in consequence of the hands of the Colonial Secretary being tied by Parliament, and that the appointment of the Commissioners being an experiment, the Government very properly guarded themselves by saying we will not put it in the contract, while on your part it seems to me you took the view that, while you were willing to allow the Government to protect themselves by a written contract, you thought you could safely rely on the unwritten code of honor of the Colonial Government.

Presuming that the present or any other Government were satisfied that you had "given satisfaction," then your part of the undertaking is fulfilled, and I can hardly believe that the Government would refuse to carry out their part. The very fact of there being so much said at the time of your appointment on this subject to the Agent-General and by the Colonial Secretary accentuated its importance.

The Colonial Secretary's wire of 9th June, 1888, after a full discussion of the question of increased salary, is in these words:—

"Re Eddy.—In agreement the Colony cannot be committed to further increase of salary, must be left to justice of Government and Parliament, &c."

No words can be clearer to convey to Mr. Eddy that he might safely rely upon the *justice of Government*. To place the matter beyond all doubt, when the Agent-General concludes the negotiations he again brings this question of depending on the *justice of the Government*. See his letter to the Colonial Secretary of 31st August, 1888.

Sir Daniel Cooper's letter to the Colonial Secretary contains these words:—

"You will doubtless remember in regard to the increase of salary that your telegram is distinct, that this point must be left open in considering the engagement, while Mr. Eddy consented to this, and also that in the agreement the Government should not be formally pledged to increase his salary, he nevertheless accepted the position of Chief Commissioner upon the distinct understanding that should his services hereafter prove to be satisfactory to the Government, an increase in the salary should be made, and I desire to call your express attention to this which is specifically referred to in the correspondence enclosed."

This document, and many others, emphasises the question of increased salary, which shows that the matter was not lightly treated, and that both parties were negotiating with that understanding.

No one could place any other construction on these papers except that you were led to believe you might rely upon the honor of the Colony, and I will venture as one of its citizens to hope that you have not trusted in vain.

19/9/94.

J. H. WANT.

RAILWAYS.

(CORRESPONDENCE RESPECTING THE ENGAGEMENT OF MR. E. M. G. EDDY AS CHAIRMAN OF THE BOARD OF RAILWAY COMMISSIONERS.)

Telegram from The Colonial Secretary to The Acting Agent-General.

[Confidential.]

Sydney, 4 May, 1888.

RAILWAY Act just passed, by which a Board of Commissioners appointed to manage Government Railways. Term of office, seven years; only removable by Parliament (see letter 4th April, 1887). Chief Commissioner's salary, £2,500. Wish to engage thoroughly experienced man of energetic character from railway service in England. * * * * * Salary fixed by Act; prospect of increase if services satisfactory. * * * * * Inform me before finally engaging. Urgent.

HENRY PARKES.

[Private and Confidential.]

Major Marindin to E. M. G. Eddy, Esq.

Dear Mr. Eddy,

1, Whitehall, 15 May, 1888.

The Agent-General for New South Wales asked me a few days ago to advise him in the selection of a man for the new post of Chief Commissioner of Railways of that Colony; salary £2,500, to be raised if services are satisfactory; term of office, seven years, only removable by Parliament, i.e., not by Ministry.

I took the liberty of mentioning your name (together with two others), as men whose services the Colony would be fortunate to obtain if willing to go.

The Agent-General now asks me to write to you on the subject, and to inquire whether you would take the post if offered to you, subject, of course, to the arrangements being satisfactory. If your answer be in the affirmative I fall out of the negotiations, and you will doubtless hear direct from the Agent-General, who, I may say, does not wish to advertise the appointment if he can get a good man without doing so.

Please understand that this letter is to be considered entirely private.

I may say that your name was the first on my list.

Yours, &c.,
F. A. MARINDIN.

E. M. G. Eddy, Esq., to Major Marindin.

Dear Major Marindin,

Glasgow, 16 May, 1888.

I am obliged for your letter of yesterday's date. Looking at my position in the railway service in this country, I do not think it would be a wise step on my part to go abroad for a salary of £2,500 per annum; could this salary be increased if I agreed to consider the question? Another point in connection

Telegram from The Colonial Secretary to The Acting Agent-General.

Sydney, 6 June, 1888.

ENGAGE Eddy at £3,000. Question of increase must be left open in considering engagement.

HENRY PARKES.

Telegram from The Acting Agent-General to The Colonial Secretary.

London, 8 June, 1888.

EDDY has accepted Chief Commissionership at £3,000 per annum, with increase, if services satisfactory to Colonial Government. Can leave September next. Colonial Government to provide free passage for himself, wife, and child. Send copy of Act appointing Commissioner. I will prepare agreement.

DANIEL COOPER.

Telegram from The Colonial Secretary to The Acting Agent-General.

Sydney, 9 June, 1888.

Re Eddy.—In agreement the Colony cannot be committed to further increase of salary. Must be left to justice of Government and Parliament. Passage out will be provided. Copy of Act will be sent.

HENRY PARKES.

Telegram from The Acting Agent-General to The Colonial Secretary.

London, 14 June, 1888.

HAVE closed with Eddy; £3,000. Increase salary left to justice of Government and Parliament. Sir Richard Moon, Chairman, and Findlay, General Manager, of London and North-western, assure me Eddy is very best man you could have selected in Great Britain.

DANIEL COOPER.

The Acting Agent-General to The Colonial Secretary.

Re Appointment of Chief Commissioner of Railways.

Sir,

With reference to the telegrams that have passed between yourself and this Department in regard to the appointment of Chief Commissioner of Railways under the Government Railways Act, 1888, I have the honor to forward herewith copies of correspondence between Mr. Edward Miller Gard Eddy and myself in relation to his appointment, authorised by your telegram to me of the 6th June last, as follows:—

“Engage Eddy at three thousand. Question of increase must be left open in considering engagement.”

It was considered preferable that Mr. Eddy should enter into a formal agreement as Chief Commissioner. I therefore instructed Mr. Want, the solicitor, in London, to the Government, to draw up this document for execution by Mr. Eddy and by myself on behalf of the Government of New South Wales. The part executed by Mr. Eddy I forward herewith, together with his letter to me, having particular reference to the understanding as to the future increase of his salary.

You will doubtless remember, in regard to the increase of salary, that your telegram is distinct, that this point must be left open in considering the engagement. While Mr. Eddy consented to this, and also that in the agreement the Government should not be formally pledged to increase his salary, he nevertheless accepted the position of Chief Commissioner upon the distinct understanding that, should his services hereafter prove to be satisfactory to the Government, an increase in the salary should be made; and I desire to call your express attention to this, which is specifically referred to in the correspondence enclosed.

I append copy of a letter addressed to me by Mr. Findlay, the General Manager of “The London and North-western Railway,” having reference to Mr. Eddy’s fitness for the position of Chief Commissioner of Railways of New South Wales.

I have, &c.,

DANIEL COOPER.

P.S.—Mr. Eddy leaves to-day for Sydney in the S.S. “Austral.”

[Enclosures.]

(2,914.)

My dear Mr. Eddy,

5, Westminster Chambers, London, S.W., 6 June, 1888.

In continuation of my note of last night, in which I informed you that I had telegraphed to the Government in Sydney, strongly recommending your appointment to the Railway Commissionership, at a salary of three thousand pounds (£3,000) per annum to commence with, I am pleased to say that I have this afternoon received a reply from my Government in the following words:—

“Engage Eddy at three thousand. Question of increase must be left open in considering engagement.—HENRY PARKES (Premier).”

I shall be glad to hear from you, at the earliest possible moment, whether you are prepared to accept this appointment, in order that I may again telegraph to Sydney for the information of my Government.

I need only say that, for the reasons I stated to you at our interview yesterday morning, how glad I should be if you can arrange to accept the offer of the New South Wales Government.

Yours very truly,

DANIEL COOPER.

E. M. G. Eddy, Esq., “Myross,” Aytoun Road, Pollockshields, Glasgow, N.B.

(2,985.)

(2,985.)

My dear Sir Daniel,

Constitutional Club, Northumberland Avenue,

8 June, 1888.

Referring to your letter of 6th June, and confirming our conversation of this afternoon, I beg to state that I accept the appointment of Chief Commissioner of Railways to the New South Wales Government at a *commencing* salary of £3,000 per annum, it being understood that if the result of my management of the railways is found satisfactory the salary will be increased.

I will arrange with the Caledonian Company to be free at the end of August.

The question of passage money, agreement, &c., I am sure I may leave in your hands.

Sir Daniel Cooper, Bart., &c.

I am, &c.,

E. M. G. EDDY.

Telegram from The Agent-General for New South Wales to The Colonial Secretary, Sydney.

8 June, 1888.

EDDY has accepted Chief Commissionership at £3,000 per annum, with increase if services satisfactory to Colonial Government. Can leave in September next. Colonial Government to provide free passages for himself, wife, and child. Send copies of Act appointing Commissioners. I will prepare agreement.

(2,985.)

Chief Commissionership of Railways.

My dear Mr. Eddy,

5, Westminster Chambers, London, S.W., 11 June, 1888.

With reference to the offer I made you, on the afternoon of the 8th instant, on behalf of the New South Wales Government, of the appointment of "Chief Commissioner of Railways" of the Colony, and to your letter of that evening, confirming our conversation, in which you state that you accept the above-mentioned post at a commencing salary of £3,000 per annum, "it being understood that if the result of my management of the railways is found to be satisfactory the salary will be increased," I would point out that it would be impossible for me, under existing circumstances, to insert a clause in your agreement to the foregoing effect; but if you are content to leave any future increase of salary to the justice of the Government and Parliament, I accept your letter at once.

The Colonial Government will provide free passages for yourself, wife, and child to Sydney.

Will you kindly reply to this at once.

Yours, &c.,

DANIEL COOPER.

E. M. G. Eddy, Esq., &c., &c., &c.

Constitutional Club, Northumberland Avenue, W.C.

Telegram from E. M. G. Eddy, Esq., to Sir Daniel Cooper.

(3,063.)

14 June, 1888.

LETTER of eleventh only reached me this morning. I agree to proposal regarding the future.

EDDY,
Glasgow.

(3,094.)

My dear Sir Daniel,

Caledonian Railway, Glasgow, 14 June, 1888.

Confirming my telegram, your letter of the 11th instant only reached me this morning.

I agree "to leave my future increase of salary to the justice of the Government and Parliament," as you propose. * * * * * Believe me, &c.,
Sir Daniel Cooper, Bart. E. M. G. EDDY.

E. M. G. Eddy, Esq., to The Agent-General.

Constitutional Club, Northumberland Avenue,

Dear Sir Daniel,

29 August, 1888.

In signing my agreement regarding my appointment to the position of Chief Commissioner of Railways in New South Wales, I have done so subject to the understanding come to between us regarding the future increment of salary, as shown in my letter of the 8th June, and your reply of the 11th of the same month, viz., that although what I originally stipulated for cannot be embodied in the agreement, £3,000 per annum is not to be considered the permanent salary. Any future increase, however, is to be left to the justice of Government and Parliament.

I have, &c.,

E. M. G. EDDY.

G. Findlay, Esq., to The Agent-General.

My dear Sir,

House of Lords, 8 June, 1888.

I had intended to have done myself the pleasure of calling on you with Mr. Eddy this afternoon to congratulate you on the selection you have made in him as Chief Railway Commissioner for New South Wales. I have known him pretty nearly his whole railway service, which has been principally with the London and North-western Railway Company. I have the highest opinion of his practical knowledge and ability and of his integrity, and I honestly believe no better selection could be made. I write this as I am prevented from accompanying Mr. Eddy to-day; but at some other opportunity I hope to have the pleasure of telling you personally what I have now very shortly written.

Yours, &c.,

GEORGE FINDLAY,
General Manager, L. & N. W. Ry. Cy.

The Agent-General to The Colonial Secretary.

Re appointment of Chief Commissioner for Railways.

Sir,

5, Westminster Chambers, Westminster, S.W., 7 September, 1888.

In continuation of my letter to you of last mail, dated 31st ultimo, S. 310-88, respecting the appointment of Mr. E. M. G. Eddy as Chief Commissioner for Railways, in which I forwarded to you one part of the agreement appointing that gentleman, I have now the honor to forward the remaining part, and to ask you to be so good as to give instructions that the part signed by me may be handed to Mr. Eddy upon his arrival in Sydney.

I have, &c.,

DANIEL COOPER.

The Minister for Railways to The Chief Commissioner for Railways.

My dear Mr. Eddy,

The Treasury, Sydney, 30 October, 1894.

The Cabinet have given their earnest attention to the question which you have brought before us; and I have to state, with reference to your claim under the correspondence between yourself and Sir Daniel Cooper at the time of your appointment, that the Government, under all the circumstances, and considering the time which has elapsed, cannot now see their way to recognise it by submitting a money vote to Parliament; but, taking your past services and the question of a second term into consideration, we are willing to give you leave of absence for an extended period during the last year of your term, and to ask you to represent us at the Railway Congress at London in June, with a liberal allowance for expenses, and offer you, subject to the approval of Parliament, a re-engagement for a second term of seven years at £4,000 a year.

I may add that I feel, as every one must who has watched your administration of our railways, the very highest appreciation of your great services to the country during a most trying time, and the highest opinion of the value of those services in the future. Indeed, nothing short of that could have prompted the (for this country) high offer of £4,000 a year for a second term.

Yours sincerely,
G. H. REID.

The Chief Commissioner for Railways to The Minister for Railways.

My dear Mr. Reid,

Office of Railway Commissioners of N.S.W., 31 October, 1894.

I have the honor to acknowledge the offer made in your letter of yesterday of re-engagement as Chief Commissioner of Railways at a salary of £4,000 per annum, and to express my thanks to the Government for the proposal made. After most earnestly considering the question of re-engagement, for various reasons I have decided not to accept a further term of office. In forwarding this letter I would beg to be permitted to express my appreciation of the terms of the offer of the Government, and your own kindly expressions regarding my services to the country.

My most grateful thanks are also due to the several Ministers for Railways who have represented the Department, for the whole-hearted support they have rendered to the Railway Commissioners in the House and elsewhere during most difficult times, and I must more particularly refer to the Hon. W. McMillan, M.L.A.

I must also express my highest esteem and regard for the able and loyal co-operation of my colleagues, Mr. Oliver and Mr. Fehon, throughout the whole period of our association. No better colleagues could possibly have been selected for me.

I shall always remember with feelings of the deepest gratitude and pleasure the confidence shown and the support given by the people and the press of the Colony to the Commissioners when they were working under most difficult and trying circumstances.

I need hardly say that I shall always take the deepest interest in the railways of the Colony, and if at any time my advice or views upon any important question relating thereto will be of any service to the Colony, I shall be very pleased to place the same at the disposal of the Government or Railway Commissioners.

I am, &c.,
E. M. G. EDDY.

1894.

No. I.

Mr. J. T. Campbell, C.E., and Mr. P. Wright, J.P., to The Members of the Walcha Railway Committee.

Gentlemen,

Walcha, 28 February, 1891.

In accordance with your request that we inspect the country lying between Walcha and the Great Northern Railway, to discover if possible a practicable route for a branch line to connect the town of Walcha with the above-mentioned railway, we have the honor to lay before you the following report under its various headings. A reference tracing is also herewith attached showing the present coach route between Walcha and Walcha Road railway-station, and the proposed route for a branch line. The proposed route is shown by a firm red line, and the road in use is tinted brown. A section of the proposed route is also shown, with approximate heights and gradients.

169—

REPORT.

[782 copies—Approximate Cost of Printing (labour and material), £5/16s. 3d.]

REPORT.

Route.

After careful inspection of the present line of road tinted brown on tracing, we found the country in its immediate vicinity as far as the Great Dividing Range (*see* tracing) suitable for an easy line of railway, but the grade from the range to the railway-station is much too great to admit of a junction at that place. At 224 miles from Newcastle, or 2 miles above the railway-station, the Great Northern Railway reaches the edge of the New England table-land, and at that point we are of opinion the proposed branch line should junction with the main line. To follow the proposed route, or the alternative on the south from that point, easy grades with moderate cuttings can be obtained throughout. The broken red line, C D, which is a more direct route, should not be overlooked in the event of a trial survey. The country through which it passes is somewhat more difficult, but we are not in a position to express a decided opinion regarding it.

Land.

The land through which the proposed line passes is alienated from the Crown, excepting the following reserves:—Forest reserve 1,008, water reserve 149, reserve 145, and the town common of Walcha, and about 2 miles of the land near the proposed junction which has lately been selected, but is not yet confirmed.

The largest owner of the land along the route, Edward Baker Boulton, who is also lessee of the run, and who, by the way, resides in England, is opposed to a railway interfering to any extent with his property. He is not opposed to having the present road widened to admit of a railway, which proposition, in our opinion is quite feasible, as far as the road may be followed.

The proposed route would involve the resumption of 136 acres of alienated land at an average width of 2 chains.

The improvements along the route are of a primitive kind, including ringbarking, fencing, and a few acres of clearing.

Formation.

The general formation throughout is shale, apparently of the Silurian age, and is intersected here and there by bands of soft white quartz-granite outcrops and gravel beds.

The rock is weathered to a considerable depth, especially the shale. Ridges of boulder basalt occur along the northern watershed of the main creek.

We may also state that the range shown on tracing running parallel in part to the Great Northern Railway, is a portion of the Great Dividing Range between the eastern and western waters of the Colony. This range is also the edge of the granite belt which forms for many miles the southern extremity of the New England table-land.

Watershed.

The area drained by the creeks from the south is about 20 square miles, requiring 800 square feet of water-way. The greater part of the drainage is confined to two creeks from the south, and the head of the main creek on the west. The largest opening need not exceed, say, 6 feet in height by 50 feet in length of the viaduct form, as the waters in flood time are sluggish, owing to the easy grade of the water area.

Timber.

There is a good supply of stringybark on all the main ridges of the district. The supply near the proposed route has been greatly diminished since the construction of the Great Northern Railway.

Cost.

In the absence of a trial survey we are not prepared to give an estimate of the cost with any degree of accuracy, but from our considerable knowledge of these matters, combined with a careful inquiry into the cost of lines constructed over similar country, we are of opinion that a substantial single line of railway similar to the main line need not cost more than £3,000 per mile, and to meet the requirements of Walcha and district, a line of similar gauge may be constructed for about £2,500 per mile, or about £30,000 for the total length of railway along the proposed route, the length of which is about 13 miles.

I have, &c.,

J. T. CAMPBELL, C.E.,

Licensed Surveyor.

PERCY WRIGHT, J.P.,

Grazier.

No. 2.

Report of Deputation to the Secretary for Public Works.

Department of Public Works, Sydney, 18 September, 1891.

Deputation.—Proposed Railway, Walcha to Walcha Road.

THIS morning a deputation, representing the New England Electorate, introduced by Messrs. Inglis, Lonsdale, and Copeland, M.s.P., waited upon the Minister for Works to represent the desirableness of a railway being made from Walcha railway station to Walcha Road.

The line, it was stated, would extend for about 13 miles through well watered agricultural districts from one of the largest principalities in that part of New England, and would tap very rich mining centres and auriferous areas. The local people display much public spirit in making roads, which were inadequate for the purpose of conveying grain to the railway. A light line, similar to that from Campbelltown to Camden, would relieve the farmers in the Walcha Road and adjacent districts of the heavy handicap of £1 per ton

on their produce. Such a line, it was contended, would not be a burden to the State. Generally, the soil was exceedingly productive, and Mr. Inglis stated there were silver-mines which compared favourably with the Great Comstock mines of America. The line would reduce the cost of road-making to a minimum, and largely promote settlement and transform large areas from pastoral to agricultural lands.

The MINISTER: Well, gentlemen, I have a fair knowledge of the neighbourhood of Walcha and the character of the country, and I am led to believe that it is very good agricultural country. My own impression, as well as yours, is that when its turn comes to be made, the line will be a payable one, but before you can have the railway a survey must be made. We must send up one of the Public Works Examiners to ascertain the character of the country truly, the probable cost, and returns in connection with the proposed line, and whether it would be likely to pay. All this must be ascertained without doubt, and as soon as I can spare one of the Examiners I will send him to the district to make the most careful investigation possible. You must understand, however, that I cannot send the officer at once, as there are other proposals to consider, and everything must be taken in turn. If, however, his report is satisfactory, a more careful survey will be made, and this, I think, is all I can promise, and all you can expect.

Put on the Examiner's list.—J.B., 23/9/91. Done, 24/9/91. Put by for the present.

Proposed Walcha Railway.

A STATEMENT was made by one of the members of a deputation which waited upon the Minister in regard to the proposed Walcha Railway, that a petition on the subject, with plans and other information attached, had been presented to the House.

Ask Mr. Webb what steps are necessary to be taken to obtain these papers for the use of the Department.

J.B., 18/9/91.

Mr. Wise,—The Petition was presented by Mr. Inglis without plans or documents. Possibly these are still in his hands. A copy of the petition referred to is attached.—A.W., 23/9/91. The Chief Clerk,—Ask Mr. Inglis for them.—J.B., 23/9/91.

No. 3.

Petition to the Legislative Assembly.

RAILWAY—WALCHA TO THE GREAT NORTHERN RAILWAY.

(PETITION FROM CERTAIN INHABITANTS OF THE TOWN AND DISTRICT OF WALCHA IN FAVOUR OF.)
To the Honorable the Speaker and Members of the Legislative Assembly, in Parliament assembled.

The humble Petition of the undersigned inhabitants of the town and district of Walcha,—

Respectfully showeth:—

1. That the pastoral, agricultural, and mining resources of the district are sufficient to justify the construction of a railway from Walcha to the Great Northern Railway, a distance of 12 miles, over a country of easy gradients.

2. That your Petitioners respectfully point out that, since the opening of the Lands Office in Walcha in May, 1887, the revenue derived from the district has been, up to June, 1891, £233,857, or an average of £16,704 per annum, during which time upwards of three quarters of a million acres have been alienated, being about one-fourth of the estimated area of the district. The foregoing amount of revenue is exclusive of the payments made direct to the Government, such as licenses, stock assessments, rent of runs, &c., which annually amount to several thousands.

3. That the revenue received at the Walcha Road railway station for the carriage of goods and passengers is upwards of £13,000 per annum. The receipts for the last year, ending June, 1891, show an increase of over £1,000 over those of 1890.

4. That your Petitioners desire respectfully to draw your attention to the remarkable increase of population in the district during the last decade, the numbers in 1881 being 309 persons, and in 1891, 3,016 persons—an increase of 900 per cent.

5. That your Petitioners would point out that Walcha is the first town on the table-land of New England, and that its climate and abundant rainfall make it most suitable for the production of all English fruits and cereals, and therefore a most desirable place for settlement—its present drawback being the difficulties and heavy cost of communication with the larger commercial centres.

Your Petitioners therefore pray that your Honorable House will be pleased to grant that a branch line of railway may be constructed to connect Walcha with the Great Northern Railway.

Your Petitioners therefore humbly pray that your Honorable House will take the foregoing matter into your favourable consideration.

And your Petitioners, as in duty bound, will ever pray.

[Here follow 828 signatures.]

No. 4.

The Under Secretary for Public Works to J. Inglis, Esq., M.P.

Dear Sir,

Department of Public Works, Sydney, 25 September, 1891.

Will you be so kind as to lend me the plans and documents which, according to the members of a recent deputation to the Minister respecting the proposed Walcha railway, were intended for presentation to Parliament with a petition on the subject, if they are in your possession.

I have, &c.,
J. BARLING.

No. 5.

No. 5.

J. Inglis, Esq., M.P., to The Under Secretary for Public Works.

Dear Mr. Barling,

30 September, 1891.

The plan was on the usual tracing paper, and I think I handed it to Mr. Bruce Smith, or sent it to you next day with a note. Kindly inquire of Mr. Bruce Smith if it is among any papers of his. If you cannot find it we must get a copy.

I have, &c.,

JAS. INGLIS.

Please make further inquiry.—J.B., 30/9/91.

No. 6.

The Honorary Secretary to the Walcha Railway League to J. Inglis, Esq., M.P.

Dear Mr. Inglis,

Walcha, 16 December, 1891.

Several of the folk having been worrying me to find out what has become of the Walcha railway, and as I could give them no further information than what Mr. Young told the deputation, the Committee of the Railway League suggested I should write you, to ask you if you would be good enough to make inquiry at the Department as to how the matter stands.

I have, &c.,

MAULE HILL,

Hon. Sec., W.R. League.

Mr. Barling,—Dear Sir,—Kindly read and return, and tell me if anything is being done re promised trial survey for Walcha railway.

Yours truly,

J. INGLIS.

Please get me the papers.—J.B., 19/12/91. Submitted, to inform that no new work, which will have to be provided for out of loan money, can be undertaken at present.—J.B., 23/12/91. Approved.—W.J.L., 31/12/91. Write.—J.B., 31/12/91. Mr. Deane.—D.C.M'L. (for U.S.), B.C., 8/1/92. Seen.—H.D., 9/1/92.

No. 7.

The Under Secretary for Public Works to J. Inglis, Esq., M.P.

Sir,

7 January, 1892.

With reference to the letter, dated the 16th ultimo, presented by you from Mr. E. M. Hill, of Walcha, upon the subject of the construction of the proposed Walcha railway, I am directed by the Secretary for Public Works to inform you that no new works which will have to be provided for out of loan money can be undertaken at present.

I have, &c.,

J. BARLING,

Under Secretary.

[The Hon. H. Copeland and Mr. E. Lonsdale, M's.P., were similarly informed.]

No. 8.

The Honorary Secretary to the Walcha Railway League to The Hon. H. Copeland, M.P.

Dear Sir,

Walcha, 7 January, 1892.

I am desired by the Committee of the local Railway League to ask you to be good enough to lay the accompanying letter before Mr. Barling, and ascertain how the matter at present stands. You were, I believe, one of the deputation which waited upon the late Minister for Works, who, I believe promised inspection of the proposed route.

I have, &c.,

E. MAULE HILL.

I shall be glad if Mr. Barling will furnish me with a reply.—H.C., 9/1/92. Send letter at once.—J.B., 9/1/92. See letter sent on, 9/1/92.

Sir,

Walcha Railway League, 7 January, 1892.

With reference to your letter acknowledging mine of the 16th December last on the subject of the proposed Walcha railway, I have been requested by my Committee to ask if you will be good enough to inform me if any and what steps have been taken to have the proposed route for the line inspected with a view to survey of same.

I have, &c.,

E. MAULE HILL,

Hon. Secretary.

The Under Secretary, Public Works Department, Sydney.

No. 9.

The Honorary Secretary to the Walcha Railway League to J. Inglis, Esq., M.P.

Dear Sir,

Walcha, 7 January, 1892.

Will you, at first opportunity, lay the enclosed (*see* following letter) before Mr. Barling, and ascertain how the matter at present stands. You were one of the deputation which waited on the late Minister for Works, who, I believe, promised an inspection of the route. Hope you will do what you can to push the project.

I have, &c.,

E. MAULE HILL.

No. 10.

The Honorary Secretary to the Walcha Railway League to The Under Secretary for Public Works.

Sir,

Walcha Railway League, 7 January, 1892.

With reference to your letter acknowledging mine on the 16th December last, "on the subject of the proposed Walcha Railway," I have been requested by my Committee to ask if you will be good enough to inform me if any and what steps have been taken to have the suggested route inspected with a view to future survey.

I have, &c.,

E. MAULE HILL,

Hon. Secretary.

Dear Mr. Barling,

9 January, 1892.

Kindly let me know what is being done in this matter. You know the interest I have taken in it, and the late Minister, Mr. Bruce Smith, clearly gave me to understand that the Department would do what it could to have the matter officially examined. I hope you will not let it slide, but do what you can to push on such inquiry and examination as may be useful.

Yours truly,

J. INGLIS.

This has been replied to; letter has crossed.—J.B., 11/1/92.

No. 11.

The Honorary Secretary to the Walcha Railway League to J. Inglis, Esq., M.P.

Sir,

Walcha, 26 February, 1892.

With reference to the letter addressed to you by the Under Secretary, Public Works, on the subject of a railway to Walcha, in which he states "that no new works which will have to be provided out of loan money can be undertaken at present," I have been requested by the Committee of the Railway League to point out that all the deputation which waited upon the Minister asked for, was an inspection of the country over which the proposed line would be taken. This the deputation was promised should be done, and I most respectfully submit that the trifling expense entailed thereby will not justify a refusal to carry out the Ministerial promise.

I would state also, with submission, that my Committee fails to see at the present stage any relevancy in the reference to the present difficulty in providing for new works out of the Loan Fund, as, under the most favourable circumstances, it would be a year or two before the work could be commenced.

Will you, therefore, be good enough to bring the matter afresh before the Minister, and urge an immediate inspection of the proposed route?

I have, &c.,

E. MAULE HILL,

Hon. Sec., Walcha Railway League.

Dear Sir,

You will see from the enclosed (*see* foregoing letter), that all that is asked at present is the carrying out of the promised examination of the proposed route, and as this will not involve any large expense, but will have to be done sooner or later as a preliminary, and as the district have undoubtedly been led to hope that this will be done, I very earnestly commend the matter to your favourable consideration, and ask for a corresponding answer.

Yours, &c.,

(for self and Mr. LONSDALE),

J. INGLIS.

Hon W. J. Lyne, M.P., Secretary for Public Works.

Mr. Copeland being out of town, I have not been able to ask him. 29/2/92. Let me see the other papers. What has been done in the matter?—J.B., 29/2/92. Mr. Jones may perhaps report. Submitted.—J.B. Omit.—W.J.L., 8/3/92.

No. 12.

The Honorary Secretary to the Walcha Railway League to The Hon. H. Copeland, M.P.

Sir,

Walcha, 26 February, 1892.

With reference to the letter addressed to you by the Under Secretary, Public Works, on the subject of a railway to Walcha, in which he states "that no new works which will have to be provided out of loan money can be undertaken at present," I have been requested by the Committee of the Railway League to point out that all the deputation which waited upon the Minister asked for was an inspection of the country over which the proposed line would be taken. This the deputation was promised should be done, and I most respectfully submit that the trifling expense entailed thereby will not justify a refusal to carry out the Ministerial promise.

I would also state, with submission, that my Committee fails to see at the present stage any relevancy in the reference to the present difficulty in providing for new works out of the Loan Fund, as, under the most favourable circumstances, it would be a year or two before the work could be commenced.

Will you, therefore, be good enough to bring the matter again personally before the Minister and urge an immediate inspection of the proposed route?

I have, &c.,

E. MAULE HILL,

Hon. Secretary, Walcha Railway League.

Forward to my honorable colleague for Works.—H. COPELAND, 4/3/92.

[A similar communication was addressed on the same date to Mr. E. Lonsdale, M.P.]

No. 13.

J. Inglis, Esq., M.P., to The Secretary for Public Works.

Dear Lyne,

Parliament House, Sydney, 9 March, 1892.

Oblige me and look up papers re proposed survey, Walcha railway. Let me have reply to my last letters. It was a decided promise by your predecessor, and should be carried out. All that is asked for is a preliminary survey at present.

I have, &c.,

J. INGLIS.

Submitted.—J.B., 17/3/92.

No. 14.

Extract from the *Debates of the Legislative Assembly*, No. 64, dated 28th March, 1892.

WALCHA ROAD TO WALCHA RAILWAY.

MR. INGLIS: I desire to ask the Secretary for Public Works, with reference to a promise which he made as to the Walcha Road to Walcha railway line, and whether he is prepared to carry out the promise made by his predecessor, the Honorable Member for The Glebe, that as soon as possible an officer will be sent up to make a preliminary survey of the railway, and to report as to the advisability and practicability of the route?

MR. LYNE: I did make a promise to look up this matter, and I found that a report in favour of sending an officer had been made to the Department; and I also ascertained, though I did not know it before, that a promise had been made by my predecessor on the subject. Although I think that if we carry out all the surveys proposed, we would require a great deal more money than we have at present; still, as in this case a promise had been given, I shall have no objection to a survey being made.

Resubmitted with the other papers.—J.B., 5/4/92. Submitted. A report may be obtained.—W.J.L., 26/4/92. Can Mr. Jones do this? It will be a very short matter.—J.B., 28/4/92. Mr. Hickson. Yes, I can arrange for this.—R.H., 29/4/92. Under Secretary, B.C. Inform Members for the District.—D.C.M'L. (for U.S.), 30/4/92.

No. 15.

The Under Secretary for Public Works to Mr. E. Lonsdale, M.P.

Sir,

4 May, 1892.

With reference to the proposal for the construction of a line of railway from the Great Northern Line to Walcha, I am directed by the Secretary for Public Works to inform you that an officer has been instructed to report upon the desirableness of such a line.

I have, &c.,
J. BARLING,
Under Secretary.

[Similar letters were sent to the Hon. H. Copeland and Mr. J. Inglis, M's.P.]

No. 16.

Extract from the *Debates of the Legislative Assembly*, No. 61, dated 22nd March, 1892.

RAILWAY TO WALCHA.

MR. INGLIS: I desire to ask the Secretary for Public Works whether his attention has been called to a promise made by his predecessor in office that an officer should be sent up to report upon the desirableness of a railway from the Great Northern line to Walcha? A promise has been distinctly made, and all that is now asked is that the officer who is generally sent out to report upon these matters should be sent up. I do not wish to put the country to any unnecessary expense; but seeing that the question has been fully debated before, and has had the attention of the honorable gentleman's predecessor in office, seeing also that all the papers are before him, and that a distinct promise has been made, I think I am only asking what is reasonable in requesting that that promise should be carried out.

MR. LYNE: The Honorable Member says he is only asking what is reasonable in requesting that I should carry out a promise. I do not know that I have made any promise in the matter, nor do I even know whether the papers have been before me. At all events, I have no recollection of them; but I will make inquiry to-morrow as to how the matter stands, and will see what has been made.

MR. INGLIS: That is all I ask.

The papers are now before the Minister. Resubmit in a week to see if any decision given.—D.C.M'L., 7/4/92. End of month.—27/4/92. Forward all papers to Mr. Jones through Mr. Hickson.—D.C.M'L. (for U.S.), 6/5/92. Mr. Roseby. Mr. Jones to see me before undertaking this work.—R.H., 9/5/92.

No. 17.

Report by Mr. R. E. Jones, Examiner of Public Works Proposals.

WALCHA is the most southern town on the New England table-land, and is situate 12 miles to the east Walcha. of the Great Northern Railway at Walcha Road, the latter being 320 miles from Sydney, and 222 miles Railway distances from Newcastle.

Like most towns off the railway line, Walcha considers its trade, importance, and prospects warrant the construction of a branch, and asks that what is termed the original error of not taking the northern line through the town should be remedied by a rail connection from Walcha Road. It is pleaded that 12 miles of heavy road haulage is a great hardship, causes inconvenience and delay, and greatly impedes the progress of the locality. No doubt there are disadvantages connected with this want of a railway, but it must be apparent lines cannot be made to every township, and I think these short branches can only be justified—1st. When there is a present or early probability of the line being a Branch railway. commercial success, giving a fair return for money invested and cost of working; 2nd. By providing improved facilities of transit, enabling distant producers to compete with those nearer the centres of consumption; 3rd. To aid in the establishment of new industries and occupations, which, without railway communication, could not profitably exist; 4th. When such branch forms part of a larger and more important scheme. Of course, in regard to any new line, the additional or fresh traffic brought on to the main or parent railway should not be lost sight of. There are cases, also, where saving in road maintenance should be considered, but generally this item is balanced by increased outlay on feeders to the new terminus, &c.

Walcha is a thriving municipality, containing at the last census 953 people; many of the buildings Walcha town. are of brick, and generally the town has an appearance of prosperity and permanency.

The district is at present essentially pastoral, although no doubt there are some thousands of acres, District. the soil of which is most suited for the production of cereals, especially wheat. As bearing upon the progress of the locality, I may state that in 1871 the census gave 246 as the population of Walcha District; in 1881, 309; while last year the return was 3,016—this great increase having taken place notwithstanding the absence of near railway facilities. The town post office receipts expanded from £712 for stamps in 1887 to £1,066 in 1891, while 3,500 telegrams were forwarded in 1888, as against 8,000 for last year.

The area within the trafficable sphere of a line to Walcha embraces 879,175 acres, made up of Trafficable area. 327,320 of alienated land, 371,836 Crown lands exclusive of reserves, which latter amount to 180,019 acres.

Stock, as per this year's return, includes 1,890 horses, 17,282 cattle, 317,072 sheep, and 950 pigs, stock. the owners numbering 161.

Last season, within the above trafficable area, 1,415 acres were cultivated, comprising 236 of wheat, Cultivation. producing 3,630 bushels; 103 maize, giving 2,070 bushels; 148 acres of oats yielded 3,196 bushels, whilst hay (oaten, wheaten, and lucerne) produced 965 tons from 608 acres. Five hundred and three tons of potatoes were obtained from 178 acres, but, although supposed to be a fruit district, only 41 acres were returned as being orcharding or gardens; artificial grasses were laid down on 1,611 acres.

The rainfall for the last seven years averaged 33·17 inches, with a maximum of 42·30 and minimum Rainfall. of 22·81.

Gold and silver mining is carried on to a small extent near the Tia River and at other places. The Mining. most important fields are, however, at Nyangula and Swamp Oak, where gold-reefing has been in operation for some time. The population, unfortunately, has of late greatly diminished; and as these "diggings" are equidistant from Walcha Road and Walcha, to both of which good departmental roads give access, they can scarcely be considered within the sphere of traffic of the proposed branch.

Very little good timber is to be found in the vicinity of Walcha; but, between Nowendoc and the Timber. falls to the Macleay, forest reserves exist, and, in what are known as "Murphy's Brush" and the "Comboyne Scrub," good red stringybark, blackbutt, sassafras, cedar, &c., are to be found; but the drawing to Walcha would not be less than from 30 to 40 miles. There is a little stringybark near Nyangula.

A tannery, two flour-mills, soap-works, woolscouring establishment, brick-works, aerated water Industries. factory, &c., exist in Walcha.

Four schemes have been put forward for the proposed branch:—

Railway routes—four schemes.

No. 1 is that suggested by Messrs. Campbell and Wright, starting at 224 miles on existing main line, or 2 miles above Walcha Road Station. The length given is 13 miles, with grades of 1 in 30, 70, and 35.

No. 2 differs only slightly from No. 1. Starts at 224 miles 17 chains; follows up Breakfast Creek Gully, where it crosses the previous scheme. It then bears southward, passing over Great Dividing Range at a low gap; joins No. 1 line near the Half-way House; and terminates in Walcha, near Dr. Boodie's residence.

Both these schemes are about same length, but latter gives better grades, although the ruling inclination would not exceed 1 in 50. Both would mean a junction with the main line or duplication to the present station.

No. 3 proposal starts at 224 miles 70 chains, where there is a good site for a dépôt, the idea being to transfer Walcha Road Station to this point. This scheme joins No. 2 at about 2 miles; after which it is identical. Length, about 13½ miles.

No. 4 commences at 600 yards north of Walcha Road; crosses Surveyor's Creek; then proceeds at back of township and police barracks; crosses the Dividing Ranges at a gap about half a mile south of the road to the station, and continues on the same side to near Walcha. Length, not quite 13 miles.

In the absence of surveys and levels it is difficult to determine the best route. The grades, No surveys or levels. however, of No. 1 preclude its adoption; while No. 3 means the abandonment of present station at Walcha Road, and the cost of providing another with necessary road connection, &c. I am inclined to think the residents at Nyangula and Swamp Oak would, with some justice, raise an objection to this scheme, although, it must be admitted, they have means of communication with Woolbrook, another station nearer Sydney. Of Nos. 2 and 4 I prefer the latter, which, I think, will be found the cheaper. Most southern route preferred. It also makes full use of the present accommodation at Walcha Road, and avoids the creation of another Ballast junction with the main line. I am afraid on either of the routes a better grade than 1 in 50 cannot be got on the western side of the Dividing Range.

Ballast.	Ballast will not be difficult to obtain, although not of very good description.
Sleepers.	Ironbark sleepers not obtainable within easy distance, but fencing timber is available, also water
Water.	from the Bergem-op-Zoom Creek.
Cost.	I estimate the cost of No. 4 scheme at £43,300, based on the supposition that second-hand rails may be used. There will be heavy works at Walcha Road, the crossing of the Dividing Range, and at the terminus at Walcha; hence the apparently high estimate.
Present traffic.	Calculating the present traffic for 14 miles, and deducting therefrom a small percentage for what would still go to Walcha Road, I find the revenue would amount to £1,003 per annum. Very little credit can be taken for wool or parcels, as the rates for the former, in grease, are the same from Walcha Road and all places north, while under the "Zone" system Sydney parcels would produce no revenue.
Interest on construction.	Taking, therefore, interest on the cost of construction at 4 per cent. we have £1,732, whilst maintenance and working, calculated for but seven trains each way per week at the small rate of 6d. per train mile, would require £2,580; so that to pay expenses a revenue of £4,312 per year is needed, and, as present traffic would only give £1,003, there is a deficiency of £3,309 to be met.
Working expenses.	It is not advanced, nor is it at all probable, that this branch will form part of a through line to the cost.
Extension towards coast.	It is clearly a matter of speculation as to what additional revenue may be expected by the extension of railway into Walcha. A strong point has been made of the large area of soil well adapted for the production of cereals, especially wheat.
Future revenue.	I have no doubt there are thousands of acres of rich soil within the districts that might be cultivated. The fact, however, remains that at present Walcha is not self-supporting in breadstuffs, for during the last twelve months no less than 290 tons of flour were imported by rail from Tamworth, Goulburn, and other places into the town. According to last return only 236 acres were wheat-producing, and it would require an additional 1,000 acres to give enough for the districts own consumption; and as the whole of New England Electorate, including Armidale, &c., had in 1891 only 3,440 acres under wheat, it can scarcely be expected the mere extension of 12 miles of line is going to revolutionise the production of grain within a radius of 40 miles of Walcha. The road carriage from the town to present railway station is 6d. per bushel. At present little fruit is grown in the district, although with suitable soil and climate this is difficult to account for. Potatoes are largely grown; the soil, especially around St. Leonard's and Orundumbie being favourable for root crops. An increase in this item of production may be expected, also in oats.
Passenger traffic.	Passenger traffic will undoubtedly expand, there being much to recommend Walcha as a summer resort, and the 12 miles of coaching from rail at present are a great drawback to the advent of visitors.
Increased traffic.	Granting, however, that passenger receipts will increase by 50 per cent.; goods, 30; stock, 100; that wool, with 30 per cent. increase, can be charged for at tramway rates, 5s. per ton (for 988 tons), and allowing for mails, parcels, and sundries, the probable revenue will not exceed £1,680, thus giving a likely loss on the line of £2,632 per year. Against this may be put additional traffic brought on to the parent or main line, which, after deducting working expenses at 61·6 per cent., cannot be put at more than £1,000. To this may be added a possible saving on road maintenance, say, £300, so that we have a net deficit of £1,332 per annum.
Influence on settlement.	That such a short extension should lead to much increase in settlement is highly improbable, and although there is a large area of Crown land available, much of this is of such a character that at present it is not even held under license, and being at some distance from Walcha the extra 12 miles to rail is of small importance. I therefore consider the proposed line will not produce much increment upon land still in possession of the State.
Timber traffic.	As already mentioned, the good timber requires from 30 to 40 miles of haulage even to the town, so that traffic in such, to any extent, is not probable, especially with respect to cedar, which at present is a "drug" even in the coastal districts where the road haulage is merely nominal.
Mining industry.	A line into Walcha would have little beneficial influence on the mining industry.

CONCLUSIONS.

It is possible the rapid progress which has taken place in the district during the last ten years may continue. I cannot however base my estimate of traffic on such an assumption, and having given careful consideration to the proposal for a branch line to Walcha, I am of opinion that the advantages to the community are not such as to warrant the Government in constructing what must be, at any rate for some years to come, a nonpayable railway.

[Laid upon the Table of this House in answer to Question No. 2, of 15th November, 1894.]

Question.

- (2.) RAILWAY REVENUE:—MR. STEVENSON (*for Mr. McGOWEN*) asked THE COLONIAL TREASURER,—
- (1.) What were the average returns which the net revenue of the railways yielded per annum to the capital invested during the last six years of their administration by Mr. Goodchap?
 - (2.) What are the average returns which the net revenue of the railways has yielded per annum to the capital invested during the six years of the present Commissioners' administration?
 - (3.) What was the number of miles of additional railway opened for traffic during the last six years of Mr. Goodchap's administration?
 - (4.) What was the number of miles of additional railway opened for traffic during the six years of the present Commissioners' administration?
 - (5.) Was any amount voted by Parliament during Mr. Goodchap's administration to repay the estimated cost of carrying Members of Parliament and others free by railway?
 - (6.) What has been the total amount voted by Parliament on this account during the administration of the present Commissioners?

Answer.

[NOTE.—Appended to the Return (which has been prepared by the Auditor-General) is a memorandum by the Railway Commissioners.]

Auditor-General's Report.

STATEMENT in reply to Questions Nos. 1 and 2, put by Mr. McGowen, on 15th November, 1894, to the Colonial Treasurer:—

Year.	Capital invested.	Net revenue.	Rate per cent.	Year.	Capital invested.	Net revenue.	Rate per cent.
<i>Under Mr. Goodchap's Administration.</i>							
Up to 1883.....	£ 19,677,466	£ 630,325	3·23	Up to 1889.....	£ 31,295,600	£ 1,042,021	3·33
1884.....	22,606,716	688,740	3·04	1890.....	32,486,102	927,940	2·85
1885.....	25,589,470	726,978	2·84	1891.....	35,582,892	936,721	2·63
1886.....	28,344,153	688,966	2·25	1892.....	37,417,319	1,123,384	3·00
1887.....	29,777,835	775,511	2·60	1893.....	38,560,649	1,233,804	3·20
1888..... inclusive.	30,693,665	896,727	2·92				
	Average...	2·81				Average...	3·00

NOTE.—The information as to capital invested, and net revenue, includes both Railways and Tramways, as it cannot readily be distributed to the two branches of the Service. It will be found in the Appendices to the Auditor-General's Reports to Parliament upon the Public Accounts of 1891, 1892, and 1893, and the principles on which the statements referred to are compiled, are explained in paragraphs 42 to 53 of the Report for 1891. The information for 1894 cannot be given until the accounts for that year shall have been completed, and the information for the broken periods of 1888 cannot be properly divided, but as three-fourths of that year were under Mr. Goodchap's administration, the whole year's transactions are considered to be fairly so classified.

Questions 3 and 4.—No records are kept in this Department that afford the information sought by Questions 3 and 4.

Question 5.—No.

Question 6.—For each of the years 1891, 1892, and 1893, a vote of £25,000 was given (and debited in full) for conveyance by rail without charge of Members of Parliament, distinguished visitors, school children, and others. For 1894 a vote has been taken for like purposes of £20,000, and is in course of application thereto.

Attached (A) to Treasury M.P. 593.

Railway Commissioners' Report.

THE Railway Commissioners state that the figures given by the Auditor-General for capital invested are not reconcilable with the figures that appear in the Railway Commissioners' Report for the following reasons:—

The Railway Report deals with capital of lines opened for traffic, the Railway Commissioners having nothing to do with the construction, and until the lines are handed over they naturally cannot, as they are not in possession, be expected to find interest upon them; the Auditor-General's figures include all moneys as expended upon the works.

The Auditor-General's net revenue return also is made up to the end of December; the Railway Commissioners' Reports are, as provided for in the Government Railways Act of 1888, section 45, subsection 2, made up to the 30th June in each and every year.

The Railway Commissioners' accounts are based upon the actual earnings and expenditure, and brought up to date in each report; the Auditor-General's figures are based upon the receipts paid into the Consolidated Revenue Account and the expenditure when it is charged against the Votes.

The actual figures dealing with the lines open for traffic and dealing with the accounts to the 30th June in each year are as follow:—

RAILWAYS ONLY.

Year.	Total Expenditure.	Total Earnings.	Net Earnings.	Total Capital expended.	Per cent. on Capital invested.	Average percentage.
1883	£ 1,177,788	£ 1,931,464	£ 753,676	£ 16,906,014	4·48	
1884	1,301,259	2,086,237	784,978	20,080,138	4·20	4·02
1885	1,458,153	2,174,368	716,215	21,831,276	3·37	
1886	1,492,932	2,160,070	667,078	24,071,454	2·90	
1887	1,457,760	2,208,235	750,535	26,532,122	2·96	2·90
1888	1,530,551	2,295,124	764,573	27,722,743	2·85	
1889	1,634,602	2,538,477	903,875	29,839,167	3·14	
1890	1,665,835	2,633,086	967,251	30,555,123	3·17	3·15
1891	1,831,871	2,974,421	1,143,050	31,768,617	3·59	
1892	1,914,252	3,107,296	1,193,044	33,312,608	3·58	
1893	1,738,516	2,927,056	1,188,540	34,657,571	3·48	3·52
1894	1,591,842	2,813,541	1,221,699	35,856,271	3·46	

TRAMWAYS.

1894	229,283	278,194	48,911	1,248,986	4·07	

If the object is to obtain accurate information as to the relative value to the country of the working of the railways during a period of twelve years, no proper comparison can without a large amount of inquiry be arrived at by a question like that under notice. For instance, as has been shown in the statement recently laid before Parliament, the following figures will have to be brought into consideration.

The Commissioners paid a sum of £50,000 on account of works carried out on the railways and tramways prior to 1888 and not debited against the working expenses.

For services rendered by other departments, now paid for, which were not debited against the railways under the old administration, a sum of £91,000 has been paid by the present Commissioners.

An additional sum of £583,000 has been expended out of working expenses upon the permanent way in excess of the amount paid for the previous six years, in order to bring the lines into a state of efficiency from the condition into which they had been allowed to fall by improperly saving working expenses.

An additional sum of £733,000 also has been spent upon the repairs and renewals of the locomotives, carriages, and wagons, so as to raise them from the state of disrepair into which they had been allowed to fall by an improper curtailment of expenditure.

With regard to the Tramways, an additional sum of £24,000 has been spent in renewing the permanent way over and above what was spent in the six years prior to the Railway Commissioners taking office. Seventy-six new tram-cars have also been built out of working expenses; and four motors, as against no renewals of this class for the six years prior to the Commissioners taking office.

The

The rates for the conveyance of permanent way materials for the Works Department have been reduced by a sum of over £90,000 during the present Commissioners' term of office. For the previous six years, had the rates which are now charged by the Railway Commissioners for the carriage of the Works Department's materials been in force, a sum of £66,500 only would have been paid, instead of a sum of £286,000 that was debited against the Works Department and credited to the earnings of the railways during that time.

Had the rates for goods traffic which were in operation in 1883 been in operation during the year closed on the 30th June last, an additional net revenue of £300,000—which would have been an additional tax upon those using the railways to that extent—would have been shown. This annual saving of £300,000 to the people is a great consideration.

An enormous additional burden has had to be borne by the present Commissioners in connection with unproductive lines, which had not to be borne by the late administration. For instance, taking those lines which were completed within a year or so of the present Commissioners taking office or after they assumed office, amongst which are to be included the lines to Kiama, to Cooma, North Shore line, Armidale to the Queensland border, and the Blayney-Murrumburrah line, the aggregate amount that has had to be made up out of the earnings of the general system to meet the deficit on these five lines alone, amounts to a gross sum of £1,164,000.

These are some of the points that require consideration if a proper and fair comparison is required; but the few figures given perhaps may be of service in showing that general consideration of services rendered to the country, condition of the property, and various other questions have to be dealt with.

The Railway Commissioners' policy throughout has been, whilst annually improving the financial position of the property, to reduce rates as much as possible to benefit the producers, and also to improve the position of the Staff where such a course was justified. Had they had only one object in view, viz., to make the largest financial return, and to allow the property to depreciate in value by reducing the working expenses as much as possible, they could have shown a great financial result, but a disastrous one for the country and those who use the Railways.

SUMMARY.

Additional expenditure incurred by the present administration not borne under the political system of management:—

	£
Services rendered by other Departments, now paid for	91,000
Arrears of payments brought into the accounts by present administration	50,000
Reduction in rates to Works Department	90,000
Additional sum spent in relaying and improving Permanent Way	583,000
Additional sum spent upon repairs of rolling stock	733,000
Additional payments made upon Tramway Permanent Way (76 new tram-cars and 4 motors also paid for)	24,000
Reduction in rates for one year, comparing 1894 traffic with 1883 traffic rates	300,000
Additional burden during past six years on account of some of the unprofitable lines opened within one year of Commissioners taking office	1,164,000
 As against the allowance of ...	 £
for services rendered, estimated to be worth £158,000,	90,000
There was paid to the late administration, for conveyance of materials for new lines, in six years ending 1888	286,000
The amount the present Commissioners' scale of charges would have given would have been	66,000
Showing, therefore, an excess payment to the late administration of about	220,000
If the present system of payment for unremunerative services and, at the same time, lowering rates for other Departments, in the way pointed out, had been adopted for the six years prior to 1888, the saving to the country would have been ...	130,000

1894-5.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAYS.

(INFORMATION RESPECTING EARNINGS, &c., FOR THE SIX YEARS ENDING JUNE, 1888, AND FOR THE SIX YEARS ENDING JUNE, 1894.)

Ordered by the Legislative Assembly to be printed, 7 March, 1895.

[Laid upon the Table of the House in answer to Question No. 10, of the 19th December, 1894.]

Question.

- (10.) RAILWAY COMMISSIONERS' REPORT FOR 1894.—MR. MCGOWEN ASKED THE COLONIAL TREASURER,—
 (1.) Referring to the Railway Commissioners' Report for 1894, page 2, do the figures therein given show an average return to capital for the six years ended 30th June, 1888, of 3·44 per cent.; if not, what percentage do they show?
 (2.) Do the figures in the same report, page 2, show the average return to capital for the six years of the Commissioners' administration ending 30th June, 1894, to be 3·39 per cent.; if not, what percentage do they show?
 (3.) In making the last calculation, have the Commissioners been debited with the advance of one million, made to them in 1889, less the amount returned to the Treasury?
 (4.) If the statement of accounts was debited, as suggested in preceding Question, would not the return to capital made by the Commissioners be less than the return made for the six years preceding their administration?

Answer.

The table in question is intended to show the gross and net earnings each year, as well as the capital.

The Million Vote is not included in the capital, as it would be improper to do so, the Act of Parliament authorising the money having prescribed the manner in which it should be dealt with, namely:—

"On the thirty-first day of December, one thousand eight hundred and ninety-one, the sum of seventy-five thousand pounds shall be paid from the Consolidated Revenue Fund, to the credit of a Special Trust Fund Account in a bank doing the Government business, and the like sum shall be paid to the said Special Trust Fund Account annually thereafter until a sufficient amount shall have accumulated to pay off and extinguish one million pounds of the Public Debt for Railways, and the Colonial Treasurer shall apply such accumulated funds, and for no other purpose whatsoever: Provided always that such Special Trust Fund, to the extent of moneys at the credit thereof, shall be available from time to time to pay off and extinguish Government Debentures issued on account of Railways and becoming due in the meantime."

If the value of the change of the system of control is wished to be arrived at, it might be shortly summarised as under:—

For the seven years prior to the Railway Act of 1888 coming into force, the gross earnings increased by £2,668,164, and the capital increased from £15,843,616 to £27,722,748.

The whole of the additional gross earnings were spent in working the lines, and the Treasury had to contribute an additional sum of £141,656 to pay the current working expenses.

For the past six and a half years the accumulated increase in gross traffic amounted to £3,429,596. Of this sum, however, 66 per cent., amounting in the aggregate to £2,262,626, was net profit to the Treasury. The addition to the capital has been less than was the case in the previous seven years, and a good deal of this capital expenditure (£2,435,465) had been approved, prior to the Railway Act of 1888 coming into force, for the construction of the Cooma and Illawarra lines, Hawkesbury Bridge, &c. After the Treasury has provided £300,000 in connection with the Million Vote, it will still have benefited to the extent of £1,962,626 for the six and a half years, although there has been spent during this period a sum of over £1,400,000 additional out of current working expenses, as compared with the previous seven years, in relaying and improving the permanent way, and in bringing the rolling stock into a better condition. Reduced rates have also been granted; improved facilities for travelling have been given in all directions, materials required for construction of new lines have been carried at largely reduced rates, thus enabling the expenditure on capital account to be kept down, and it is fully expected that for the year ending June next the working expenses will not exceed the working expenses of the year 1888, although the traffic will be about £500,000 in excess of what it was in that year. The Commissioners believe that they are correct in stating that this is a state of things almost unprecedented in railway working, looking at the fact of the reduction in rates, improved facilities, greater expenditure in the maintenance of the property, and that the rates of wages of the staff have not been reduced in any way.

1894-5.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAYS.

(RETURN SHOWING LAND RESUMED FOR.)

Ordered by the Legislative Assembly to be printed, 28 May, 1895.

[Laid upon the Table of this House in answer to Question No. 1, of 26th February, 1895.]

Question.

1. LAND RESUMED FOR RAILWAY PURPOSES.—*Mrs. STEVENSON asked THE COLONIAL TREASURER,—*
 (1.) What is the total sum paid by the Government for the resumption of land for railway purposes?
 (2.) The like information in connection with the other Departments of the Public Service during the last ten years?

Answer.

(1.)

The total amount paid for the resumption of land for railway and tramway purposes for lines open for traffic to 31st December, 1894, is as follows:—

Railways	£1,605,409
Tramways	82,817
Total	£1,688,226

(2.)

RETURN showing amount paid for land during the last ten years on account of the various Departments, other than Railways, as far as can readily be ascertained from the records of this Department.

Colonial Secretary	£6,450 0 0
Military Works	9,740 19 10
Fire Brigades	7,391 10 6
Public Parks	144,147 1 3
Lunatic Asylums	24,909 1 11
Governor's Country Residence	50 0 0
Free Public Library	5,768 10 4
State Children's Relief Department	5,800 0 0
Admiral's Residence	20,000 0 0
Police	47,433 10 4
Government Asylums	2,910 0 0
Treasury	11,100 16 8
Stamp Duties	6,500 0 0
Circular Quay and Woolloomooloo	319,053 11 5
Justice	30,961 1 7
Prisons	1,609 6 0

1894-5.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAYS.

(PARTICULARS RESPECTING THE DIFFERENTIAL RATES EXISTING BETWEEN THE COLONIES OF VICTORIA, SOUTH AUSTRALIA, AND NEW SOUTH WALES.)

Ordered by the Legislative Assembly to be printed, 10 May, 1895.

The Deputy Chief Commissioner for Railways to The Minister for Railways.

Office of the Railway Commissioners of New South Wales, Sydney, 7 May, 1895.

I BEG to enclose, for the information of the Honorable the Minister for Railways, a copy of the agreement entered into by the Railway Commissioners of New South Wales, Victoria, and South Australia, for the purpose of abolishing the differential rates which have for some time existed upon the railways of the respective colonies named, in regard to freights generally, and more particularly in connection with the wool traffic.

The operation of these rates has been fully explained in previous papers, and was more particularly referred to in a statement (copy of which is attached) laid before the Government by the Railway Commissioners of New South Wales in August, 1894, and therefore need not be again referred to in detail.

During the last wool season the New South Wales Railway Commissioners found it necessary, in defence of the legitimate traffic of the railways, to enter into active competition for the purpose of checking the serious abstraction of wool from New South Wales, resulting from undue competition by Victoria; and while being compelled to adopt this course, the Victorian Commissioners were repeatedly requested by the New South Wales Commissioners to come to a friendly settlement without, until recently, any success, and there is reason for believing that the Conference which was held in Melbourne and terminated on the 3rd instant, resulted mainly from the effective steps taken by New South Wales to retain the traffic just previously referred to. Whether this be so or not, it is highly satisfactory that the Conference took place, as, if the agreement which has been arrived at is finally confirmed, all complications in connection with the traffic in question will be removed, and each Colony will receive reasonable payment for services rendered, and the producers and consumers will in like manner pay fair and reasonable railway rates.

So far as the agreement affects New South Wales, it may be stated briefly that none of the ordinary published rates will be interfered with, the only alterations being a slight revision in the rates from stations between Table Top and Bomen, which are really anomalies arising from undue Victorian competition, and which have frequently given rise to irritation in adjacent localities which did not participate in the benefits of these rates.

As regards Victoria and South Australia, their rates, so far as relates to the border traffic, have been put up, the advantage to these colonies being the relief from unremunerative traffic.

As between Victoria and South Australia a system of "pooling" the traffic has been agreed upon, which does not concern New South Wales.

A

A special arrangement, however, was made with Victoria and South Australia as regards the traffic carried by river from Hay or east of Hay, which includes wool from districts north of the Lachlan. While the rates under the agreement affecting this traffic are not unfavourable to its coming to Sydney, in the past a considerable quantity of wool has gone to Melbourne; and in consideration of New South Wales making no exceptional effort to secure it for Sydney, beyond quoting the present rates, Victoria and South Australia are to pay New South Wales 40 per cent. of the increased price per ton which is to be charged on the wool from these localities carried by the railways of those colonies.

While it is possible that the New South Wales railways may not carry more wool, or, perhaps, quite so much, a better income will be derived. This statement refers to the direct result of the agreement. There is, however, what may be designated a probable indirect result, and that is, the greater inducement by a general equalisation of rates as between Sydney and Melbourne, which will afford producers an opportunity of sending their wool to Sydney, which has a superior position as a wool-market and a port of shipment.

In addition to the actual question of rates, there are other points in the agreement favourable to New South Wales. The abolition of the percentage reduction on dumped wool—which was 15 per cent. and 10 per cent. respectively by Victoria and South Australia, and 5 per cent. by New South Wales—is considerably in favour of the latter Colony. Further, the Victorian railway authorities have been in the habit of allowing a discount of 6d. per bale on 10,000 bales of wool and upwards secured by any one person or firm for Melbourne. This concession, which has been a considerable power in the diversion of traffic to Victoria, is to be abolished.

It is difficult, if not impossible, to state what the exact result of an agreement on such a very complicated question will be; but, taken as a whole, it is certainly one which New South Wales can enter upon with confidence, particularly as it is limited to a period of twelve months, subject to renewal by consent.

CHARLES OLIVER,
Deputy Chief Commissioner.

CONFERENCE with reference to the Differential Railway Rates existing between the Colonies of Victoria, South Australia, and New South Wales.

Present:

VICTORIA...	Mr. J. SYDDEZ, Chairman, Acting Railway Commissioners.
		Mr. T. H. WOODROFFE } Acting Railway Commissioners.
		Mr. R. LOCHHEAD }
SOUTH AUSTRALIA	Mr. J. H. SMITH, Chairman, Railway Commissioners.
NEW SOUTH WALES	Mr. C. OLIVER, Deputy Chief Commissioner.
		Mr. W. M. FEHON, Commissioner.

1. It was agreed that wool shall be carried at actual weight.

		s. d.
Echuca to Melbourne, Port Melbourne, or Williamstown	34 0 per ton.
Yarraweyah	34 11 "
Wahgunyah	40 9 "
Cobram	36 4 "
Yarrawonga	38 0 "
Wodonga	43 10 "

Other stations in proportion to mileage.

Albury, Hay, Jerilderie, Junee, Corowa, and all intermediate stations to Sydney	64 9	"
Morgan to Adelaide and Port Adelaide	25 0	"
Murray Bridge	25 0	"
Milang	25 0	"
Goolwa to Port Victor	5 0	"

and that the scoured-wool rates from the competing places named above shall be 29 per cent. in addition to the greasy-wool rates.

3. It was agreed by the Victorian and South Australian representatives that on all wool carried to the Victorian or South Australian railways by river from Hay, or east of Hay, an allowance of 40 per cent. of the difference between the present rate and the rate as agreed upon should be made to New South Wales.

4. It was agreed by the New South Wales representatives that the differential rates at present in force for wool to Albury should be abolished, and that the ordinary mileage rates should be charged, subject to the existing minimum charge of 4s. 9d. per ton for greasy and 6s. 2d. for scoured wool, exclusive of the junction charge.

5. Darling Wool and Merchandise.—It was agreed by the representatives of South Australia and Victoria that on the gross traffic carried by the railways of those Colonies a division of the receipts in the proportion of three-fifths to South Australia and two-fifths to Victoria should be made; working expenses at the rate of 25 per cent. to be deducted in each case before division.

6. It was agreed by the representatives of South Australia that the differential rate at present in force between Adelaide and Port Adelaide and Morgan, Murray Bridge, Milong, and Goolwa, should be abolished, and the ordinary tariff rate be adopted. That truck-load rates may be adopted between Melbourne and Echuca of 65s. 9d. per ton, and Swan Hill, 93s. 5d.; between Adelaide and Morgan, 40s. 9d.; Murray Bridge, 24s. 5d.; Milong, 26s. 3d.; and Goolwa, 28s. 6d. The Port Adelaide rates to be in the same proportion.

7. It was agreed by the Victorian representatives that the differential rates at present in force between Serviceton and Dimboola should be abolished, and the ordinary rates charged.

8. It was agreed by the New South Wales representatives that the present differential rate for merchandise between Albury and Wagga Wagga, and Corowa and Wagga Wagga, and all intermediate stations, should be abolished.

9. It was agreed by the Victorian representatives with respect to the Victorian border stations, except Swan Hill and Echuca, that Victoria should adhere to the local classification rate to Victorian border stations, but with liberty to adopt a truck rate for goods based on the existing Victorian 3rd class rate from Melbourne to Albury, namely, 70s. 4d., including the Junction charge, the rate of 70s. 4d. being the proportion which the New South Wales truck rate is to the Riverina 3rd class rate. This rate to be the minimum truck rate for mixed goods to all border stations, except Swan Hill and Echuca, and to apply locally; as regards Swan Hill and Echuca, the truck rate to be three-fourths of the existing Victorian 3rd class rate.

10. It was agreed by all the representatives that the truck-loads herein referred to should consist of not less than 6 tons of goods per four-wheeled truck consigned to one person; bogie trucks to be charged not less than as for two four-wheeled trucks.

11. The representatives of the three Colonies agree that no change whatever shall be made in the existing classifications, or in the agreed rates, so far as they affect the competitive districts, without the concurrence of the Colonies concerned. It was also agreed that any alteration in the classification or rates made in either Colony should be notified to the other Colonies within one month.

12. It was agreed by the representatives of the three Colonies that certified copies of the traffic affected by this agreement should be supplied by each Colony to each of the other Colonies quarterly.

13. The representatives of the three Colonies agree that the allowance for dumping be abolished, and that no rebates, passes, or privileges of any kind whatever should be made or granted for the purpose of inducing traffic to be forwarded by any particular railway.

14. It was suggested that these resolutions should take effect from the 1st June next, and should remain in operation for a fixed period of twelve months from that date. At the expiration of nine months another meeting to be held for the purpose of determining as to the continuation or revision of the agreement.

15. It was resolved by all the representatives that a decision should be obtained as to the adoption or rejection of the foregoing agreement, and the result communicated to the Commissioners of each Colony on or before the 10th instant

Melbourne, 3 May, 1895.

New South Wales Government Railways,
Sydney, 1st August, 1894.

Re Specially Low Rates on the Victorian Railways to secure traffic from New South Wales.

THE question of the efforts necessary to counteract the unreasonable preference given over the Victorian Railways on goods to and from New South Wales has long been before the New South Wales Railway authorities.

The geographical position has naturally given Victoria a great advantage in regard to traffic for districts in New South Wales contiguous to the Victorian border; and exception is not taken to the fact that much of the traffic to and from such districts finds its way over the Victorian Railways, but what is reasonably taken exception to is that an extraordinary preferential set of rates exists for the express purpose of attracting trade from places distant from the border and even from the centre of New South Wales—places within convenient distance from the New South Wales Railways.

The following may be quoted as an instance: A pastoralist writing to the Railway Commissioners under date of 25th June, urging as a reason why a reduced rate should be quoted for the conveyance of his wool to Sydney, states that now the carriage on wool to Melbourne overland is cheaper than sending to Sydney, and as the shearing supplies and general goods generally follow the wool route, all would be lost to New South Wales without a reduction. It may be pointed out that the wool from this station, which is about 80 miles from a railway station on our Western line, had previously come to Sydney. The property referred to lies in the centre of New South Wales, 240 miles from the Victorian border as the crow flies.

Other instances can be quoted, viz.:—The wool of one station, only a short distance from Bourke, is being sent to Melbourne this season by river and rail, a distance of about 1,500 miles, or nearly three times the distance from Bourke to Sydney, by reason of the preferential rate given by Victoria.

The maps which the Commissioners have had prepared are attached (*Exhibit C*), and shew at once the extent and scope of the preferential rates allowed by Victoria, and the pastoral districts from which wool grown in New South Wales and return stores are diverted to the adjoining colonies.

The New South Wales border is tapped at no less than seven places by the Victorian railways, viz., at Swan Hill, Koondrook, Echuca, Yarrawonga, Wahgunyah, Cobram, and Albury, all on the Murray, and to which the railways have been no doubt largely extended to attract New South Wales traffic.

The preferential rates appear to have been initiated about the year 1870.

Up to that time South Australia had done practically the whole of the Darling River business; but in the year named the Victorian Commissioner for Customs made a report to the Victorian Government on the prospects of diverting the Darling and Murrumbidgee traffic to Melbourne. The then Victorian Minister for Railways favourably entertained the proposals, differential rates were established, and a commission of 6d. per bale was offered to any carrier who was able to bring 10,000 bales of wool from the Darling during one season. This commission was gained by a Victorian firm the very same year; and from that time out the competition between South Australia and Victoria may be said to have become keener for the trade of the Murrumbidgee, Darling, and Lower Murray districts. But within more recent years the South Australian competition for the Murrumbidgee trade was practically abandoned.

The reductions then in operation were not of the unreasonable character that exist to-day. These have become accentuated from time to time as the better facilities in the way of railways given by the New South Wales Government naturally caused the people to use the markets of their own Colony, and to make use of the facilities provided at great cost and to the great improvement of their properties.

With regard to the latter point it is useful to turn to the initial circumstances connected with the Hay and Jerilderie railways, which run through districts to which the Victorian railways offer large special rebates, and are thereby largely affected by the Victorian preferential rates.

The

The Hay line especially was strongly and persistently agitated for by the people of the district, so as to enable them to trade with Sydney. In October, 1876, a petition influentially signed by the principal residents of Hay and district was sent through the then member for the district to the Government. It was represented that if the line were made it would be one of the best paying in New South Wales, and that the 49,000 bales of wool which were sent from Hay and Narrandera and districts to another colony during the season they were confident would be sent to Sydney were a railway extended to Hay. It was also represented that the merchandise imported into the district lying between the junction of the Lachlan River with the Murrumbidgee and Narrandera during 1876 was 10,000 tons, and this, it was represented, would not only be a source of revenue, but an extension of business to the merchants of New South Wales. It was confidently asserted that the line of railway would be able to compete on advantageous terms with the river traffic, as taking into consideration the delays inseparable from the transhipment of merchandise, and the cost of insurance and forwarding charges, together with the fact that for a portion of the year the river traffic was entirely suspended, at which time goods have to be brought at a much enhanced cost by teams from Deniliquin, the comparison of the cost would be found to be considerably less by rail from Sydney than from Melbourne.

The statement appended to the petition showed that the average cost of goods by river to Hay (from Melbourne *via* Echuca) was £5, and by road *via* Deniliquin, £8 per ton, while wool, on the back journey, cost from £6 to £8 per ton. The petitioners considered that the goods and stock traffic would give an additional revenue between Narrandera and Hay of £150,000, exclusive of passenger traffic, without regard to future developments.

In February, 1879, an influential deputation waited on the then Minister for Works to urge the making of a railway to Hay. It was represented that the line would be of great advantage to New South Wales, inasmuch as it would secure a large traffic then done with Victoria, and that owing to the fiscal policy of Victoria the people were almost unanimously in favour of trading with Sydney.

In November, 1879, further petitions were sent in urging the extension. One largely signed in Hay and district represented that a large portion of the trade of Riverina was lost to New South Wales by the absence of speedy and direct communication, and that the trade would be recovered as the Southern railway was extended westward. It was said that as soon as Hay was connected by rail with Sydney, practically the whole of the wool sent to Melbourne or Adelaide would be forwarded to Sydney, and the line should return a profit of 8 per cent. on the cost of its construction. So pressing was the requirement considered, that the petitioners urged that tenders should be immediately called for a line from Narrandera to Hay, and a condition imposed that the line should be completed within twelve months from the date of the petition.

In December, 1879, a deputation waited on the then Minister for Works, and presented a petition largely signed in favour of the railway to Hay and Jerilderie, mentioning that "the making of a bridge over the river at Narrandera, will enable the Government to run a branch line to Jerilderie and along the banks of the Yanco Creek, on which a very dense population of farmers and small pastoral tenants is now settled, and so afford them railway communication with Sydney, attracting them from Melbourne, and opening up a most important district to the trade and merchandise of Sydney merchants."

These repeated requests and sanguine expectations no doubt largely influenced the Parliament in sanctioning the construction of the line, as it was considered it would return a fair interest on the capital cost; but the unreasonable preference given by the Victorian railways have operated to such an extent as to render this line a most unprofitable one to the State. The magnitude of the loss will be best understood when it is stated that the 232 miles of railway from Junee to Hay and Narrandera to Jerilderie have, since the opening of the first section in 1881, notwithstanding the special inducements held out to agriculturists which have developed a large agricultural traffic, simply paid little more than the operating expenses, leaving the country to bear the interest of the cost of the money borrowed to build the line, this loss to date being about £610,000.

The rates charged by the Victorian railways prior to 1879 for goods and produce to and from New South Wales, while preferential in their incidence, were not of the unreasonable character that now exist; but the opening of the New South

South Wales line to Wagga Wagga caused the Victorian authorities to offer such attractions as would enable them to divert the New South Wales trade from its own lines, which had, at great expense, been constructed to the districts concerned.

In 1879 the rates over the lines, taking Echuca as an instance, were preferential to the extent shown below:—

	Classes.					Wool per Bale.	
	Miscel-laneous.	1st.	2nd.	3rd.	4th.	Un-dumped.	Dumped.
Ordinary rates	40/-	52/-	65/-	78/-	91/-	7/-	5/10
Preferential rate to N.S.W. district below Wentworth on Murray and beyond Wentworth on the Murray	30/-	30/-	30/-	30/-	30/-	5/-	4/-
Preferential rate to N.S.W. district, Murray district between Wakool Junction and Wentworth ...	*30/-	48/-	48/-	48/-	48/-

* Wire and Rock Salt only.

In 1882, however, finding that the extension of the New South Wales Railways into the Southern and South-western districts was accomplishing what it was intended should naturally be accomplished, viz., the securing of the trade to the New South Wales Railways, the Victorian authorities again modified their rates by offering still greater concessions to goods for the inland New South Wales districts, discriminating between districts which were lying within the influence of the New South Wales Railways and those more distant from the lines, offering to the former the greater bonus to withdraw the traffic from its legitimate market. The scope of the reduction was, by the published rates of the 31st January, 1884, as follows:— To Echuca the preferential rates for all New South Wales districts north of Gerogery and embracing the Murrumbidgee and Darling Rivers was 25/- per ton for rock-salt, 30/- per ton for other miscellaneous class traffic, and an uniform rate of 30/- per ton for each class 1st to 4th, and wool 4/6 per bale of 4 cwt. undumped, and 4/- per bale dumped. The same amount of preferential rates was also made applicable to Wodonga and Wahgunyah, the ordinary rates to which respectively were:—

To.	Classes.					Wool per 4 cwt. Bale.	
	Miscel-laneous.	1st.	2nd.	3rd.	4th.	Un-dumped.	Dumped.
Wodonga	48/-	62/6	78/-	93/6	109/-	7/6	6/4
Wahgunyah	44/6	58/-	72/6	87/-	101/6	7/3	6/1

The rates then in force continued without material alteration for some years. Soon after the present Commissioners took office they, deeming that the rates could be advantageously revised by both sides, opened negotiations with the Victorian Commissioners (Mr. Speight being then Chairman), the outcome of which, while removing anomalies, was mutually advantageous. However, within the last month the rates have been reduced to an extent that had never operated before.

Goods for consumers in the Darling River district are now being conveyed for 22/6 per ton between Melbourne and Echuca, but if the same goods were consumed at Echuca they would cost 87/7 per ton. Sugar, between the same stations for the Darling River district, is conveyed for 11/9 per ton, while if consumed at Echuca or anywhere inside the Victorian border it would cost 53/5 per ton.

Wool from certain districts in New South Wales is carried for 2/9 per bale, and in addition to this a drawback of 5 per cent. is given upon every 10,000 bales secured by any consignor, which, as is well known, could only be secured by carriers canvassing in the district for business, while the same wool if grown in Victoria would cost 6/1 per bale.

It is also to be especially borne in mind that the New South Wales rates apply equally to all traffic without reference to destination, whereas in Victoria no less

less than six scales of rates prevail to and from the same railway stations for exactly similar traffic, which is carried, so far as the railway service is concerned, under exactly similar conditions.

The importance of this question as affecting New South Wales will be realised when it is stated that during the years 1890, 1891, and 1892, 126,601 tons, or nearly one-third of the whole of the wool grown in New South Wales, was shipped from Victorian and South Australian ports.

Its having come to the knowledge of the Commissioners that the efforts of the Victorian railway authorities and forwarding agents were becoming more and more aggressive, they felt it necessary to bring the matter strongly under the notice of the Victorian Commissioners, and, accordingly, on the 12th June, addressed a letter to them as follows :—

" I am directed by the Railway Commissioners to draw the very serious attention of your Commissioners to the improper and unreasonable competition that is in operation for securing to the Victorian railways traffic within the borders of New South Wales which should properly be carried over the railways of this Colony—railways which have been constructed at great cost for the convenience of the people settled in the districts served thereby. In dealing with the question of the wool traffic of the coming season, the exceptionally low quotations given by Victorian agents to the New South Wales pastoralists for the conveyance of their wool to the Victorian railways, and thence to Melbourne, have brought the whole matter again under review (the quotations for this year being lower than they have ever been), and the Commissioners feel they can no longer remain quiescent in the matter. The rates they have before them (copy of table attached, *Exhibit A*) show that for certain sections of the wool belonging to New South Wales rates as low as 2/9 per bale are quoted from the border railway stations to Melbourne, whereas the ordinary scale of rates applicable to wool grown in Victoria charged from the border stations ranges from 6/1 to 8/9 per bale. The geographical position of the Victorian railways gives a commanding influence to your Colony, and the view held by my Commissioners is that this alone should satisfy your Commissioners in the matter without making reductions in the ordinary tariff, in some instances of as much as 40 to 60 per cent. The competitive rates adopted by Victoria are so unreasonable that wool from squattages 250 miles from the Victorian border and within less than 100 miles of the New South Wales Western Line, is influenced thereby; and my Commissioners are threatened with loss of traffic unless reduced rates are quoted by them. I am directed to ask whether your Commissioners are prepared to at once abandon these exceptionally low rates and adhere to the ordinary scale of rates applicable to your own traffic, as, unless this or a somewhat similar course is agreed to, my Commissioners will feel compelled to quote any rate that may be necessary in order to secure the legitimate traffic of this Colony to our own railways; but they think that such a sacrifice of railway revenue (when the difficulties surrounding the railway questions in the Colonies require so much caution and care) should not be incurred when a reasonable and fair arrangement could so easily be come to. I am to direct attention, also, to a similar class of unfair competition in regard to the merchandise traffic, which will also require to be dealt with on a more reasonable basis; but as the wool question is so urgent, I do not more than refer to the other point, so as to facilitate a speedy reply being given regarding the wool. As it is of the utmost importance that this question should be decided without loss of time, the Commissioners have directed Mr. Harper, the Goods Superintendent of the New South Wales railways, to visit Melbourne to-morrow, in order that he may, if necessary, give any further information your Commissioners may wish in regard to the details of the rates in question, so as to expedite a settlement, and enable him to bring back the decision of your Board."

The reply received on the 15th June was unsatisfactory, and is as follows :—

With reference to the question of rates, the Acting Commissioners, while sharing the views of your Commissioners as to the necessity for a mutual agreement between the railways of the three Colonies, regret that as the rates for this season have already been published by this Department, and persons interested informed that such rates would be strictly adhered to, they cannot see their way to agree to any alteration at present; and, further, as the matter is one of policy, and any change would require the passing of a fresh by-law, the Acting Commissioners are, of course, unable to commit the Government, with whom the final decision rests, to any particular line of action. The Acting Commissioners desire to convey to your Commissioners their assurance that the published tariff of the Victorian railways will be strictly adhered to in the meantime, and would be glad to know that your Commissioners had arrived at a similar decision with respect to the New South Wales rates. I am to add that the Acting Commissioners will be prepared to make recommendations, in time for next season, to the Government of this Colony, after giving the suggestions of Mr. Harper, together with any others that may be submitted in the *interim*, the fullest consideration."

As the Victorian Commissioners declined to come to an understanding regarding the wool rates, the New South Wales Commissioners had no alternative but to take steps to secure the carriage of the New South Wales traffic for the railways of the Colony; but being still anxious to come to a friendly arrangement in regard to the question of the carriage of merchandise, they again addressed the Victorian authorities, on the 19th June, as under, and to date (1st August) no definite reply has been received.

" I am directed by the Railway Commissioners to acknowledge the receipt of your letter of 15th June, in regard to the wool traffic of New South Wales, and to express their extreme disappointment at the question not being dealt with in a practical manner. It is not reasonable to suppose that my Commissioners can continue to allow traffic from the centre of New South Wales to be conveyed to Melbourne in consequence of your rates being reduced by 60 per cent. from the rates paid by your own people. My Commissioners feel that they have done their best to bring the matter to a friendly settlement,

settlement, which could have been effected in several ways to the advantage of both colonies; but as their efforts in this direction have not met with that reciprocity that should have been the case, they have no alternative but to carry out the decision intimated in my communication of the 12th inst., but this they do with great regret. I am now directed to invite your attention to the merchandise charges for New South Wales traffic conveyed over the Victorian Railways, incidentally referred to in my last communication, as my Commissioners are anxious to know whether your Commissioners will be prepared to abandon the exceptionally low rates adopted for New South Wales traffic as compared with the rates in operation for Victorian traffic conveyed over the same ground. The Commissioners observe from telegrams and paragraphs in the press that at the present moment the merchandise rates are under the consideration of your Commissioners, and trust, therefore, that they will be able to see their way to remove from the rate-book the differential rates now charged for New South Wales goods at the expense of Victoria and to the grave detriment of this Colony. I need only mention in this letter a few instances to show the improper and antagonistic position taken up in regard to this Colony, as I append hereto a printed sheet* (Exhibit D) showing a number of illustrations of the differential rates in question:—

		N.S.W. Traffic. Per ton.	Victorian Traffic. Per ton.
Melbourne to Swan Hill,—			
Galvanized iron in cases, and sugar in 5-ton lots		43/-	72/11
Sugar in 20-ton lots		38/-	72/11
2nd class goods		43/-	92/7
3rd class goods		43/-	112/4
4th class goods		43/-	132/-
Melbourne to Echuca—			
Fencing wire and wire netting...		25/-	41/3
Galvanised iron and sugar in 5 ton lots		30/-	53/5
Sugar in 20 ton lots		25/-	53/5
2nd class goods		30/-	66/7
3rd class goods		30/-	79/9
4th class goods		30/-	93/-
Melbourne to Albury (for places beyond in New South Wales)—			To Wodonga.
2nd class goods		66/10	82/4
3rd class goods		66/10	99/6
4th class goods		66/10	116/8

These illustrations show how, by unreasonable and improper rates, the Victorian railways are endeavouring to secure traffic belonging to New South Wales; and, as pointed out in my previous letter, my Commissioners feel that the geographical position of Melbourne (which is practically only half the distance from the border that Sydney is) should give Victoria an advantage with which your Commissioners should be thoroughly satisfied, and that the ordinary rates applicable to the Victorian railways for her own people should be made applicable to any traffic that wishes to find its way to and from Melbourne and New South Wales. I am directed to express the earnest hopes of my Commissioners that your Commissioners will be prepared to treat this merchandise rates question in a fair and reasonable manner, and so avoid the necessity for my Commissioners to make concessions in their rates which can be of no possible advantage to Victoria, and will entail an unnecessary and an uncalled for loss upon the railway revenue of this colony."

Sydney, 14th August, 1894.

The following reply from the Railway Commissioners of Victoria (through their Secretary), dated 13th August, was received on the above date:—

Adverting to your letters of the 19th June last and 25th ultimo, with respect to the rates on wool to and from Riverina, I am directed by the Acting Commissioners to say, while expressing their regret at the delay which has occurred, that, as before stated, the circumstances have not been such as to admit of their dealing further with the matter than was done in their letter of the 15th June last, which they are sorry to see was regarded as an evidence that the question had not been treated in a practical manner, and as also manifesting a lack of reciprocal feeling.

In view of the fact that any alteration this season would have caused disturbance to business arrangements already entered into, the Acting Commissioners regarded their reply as the only one they could give and also as sufficient. The same applies also to the request that the goods rates should be altered.

The Acting Commissioners regret that they cannot but look upon the request made as tantamount to a demand for a complete surrender, without equivalent, of the principles on which this Department has worked to retain possession of the trade in question, and for which it was the first to afford facilities.

While they admit that the geographical situation is a factor in the question, they would point out that other competition than that of your Colony has to be met.

Finally, they would say, with regret, that they are not in a position to make any alteration at present; but, as previously intimated, they will be glad at the end of the present season to confer with your Commissioners as to the rates to be charged in future.

* Since the letters of 12th and 19th June were written, a new rate-sheet has been published by Victoria and the tables have been amended to bring them up to date. (See Exhibits B and E.)

Sales over 4 cwt. will be charged 25 per cent. additional upon the rate for a 4-cwt. bale for every ewt. or portion of a cwt. in excess.

* An allowance of 6d. per bale will be made on all consignments of Darling wool from one consignor, amounting in the aggregate to 1,000 bales, during one season; and an allowance of 5 per cent. will be made on consignments from Hay or above Hay on the Murrumbidgee, amounting in the aggregate to 10,000 bales, during one season from one consignor. This is in addition to the reduced rates quoted above.

To Geelong, 9d. per bale added to these rates.

Bales over 1 cwt. will be charged 25 per cent. additional upon the rate for a 4-cwt. bale for every cwt. or portion of a cwt. in excess.

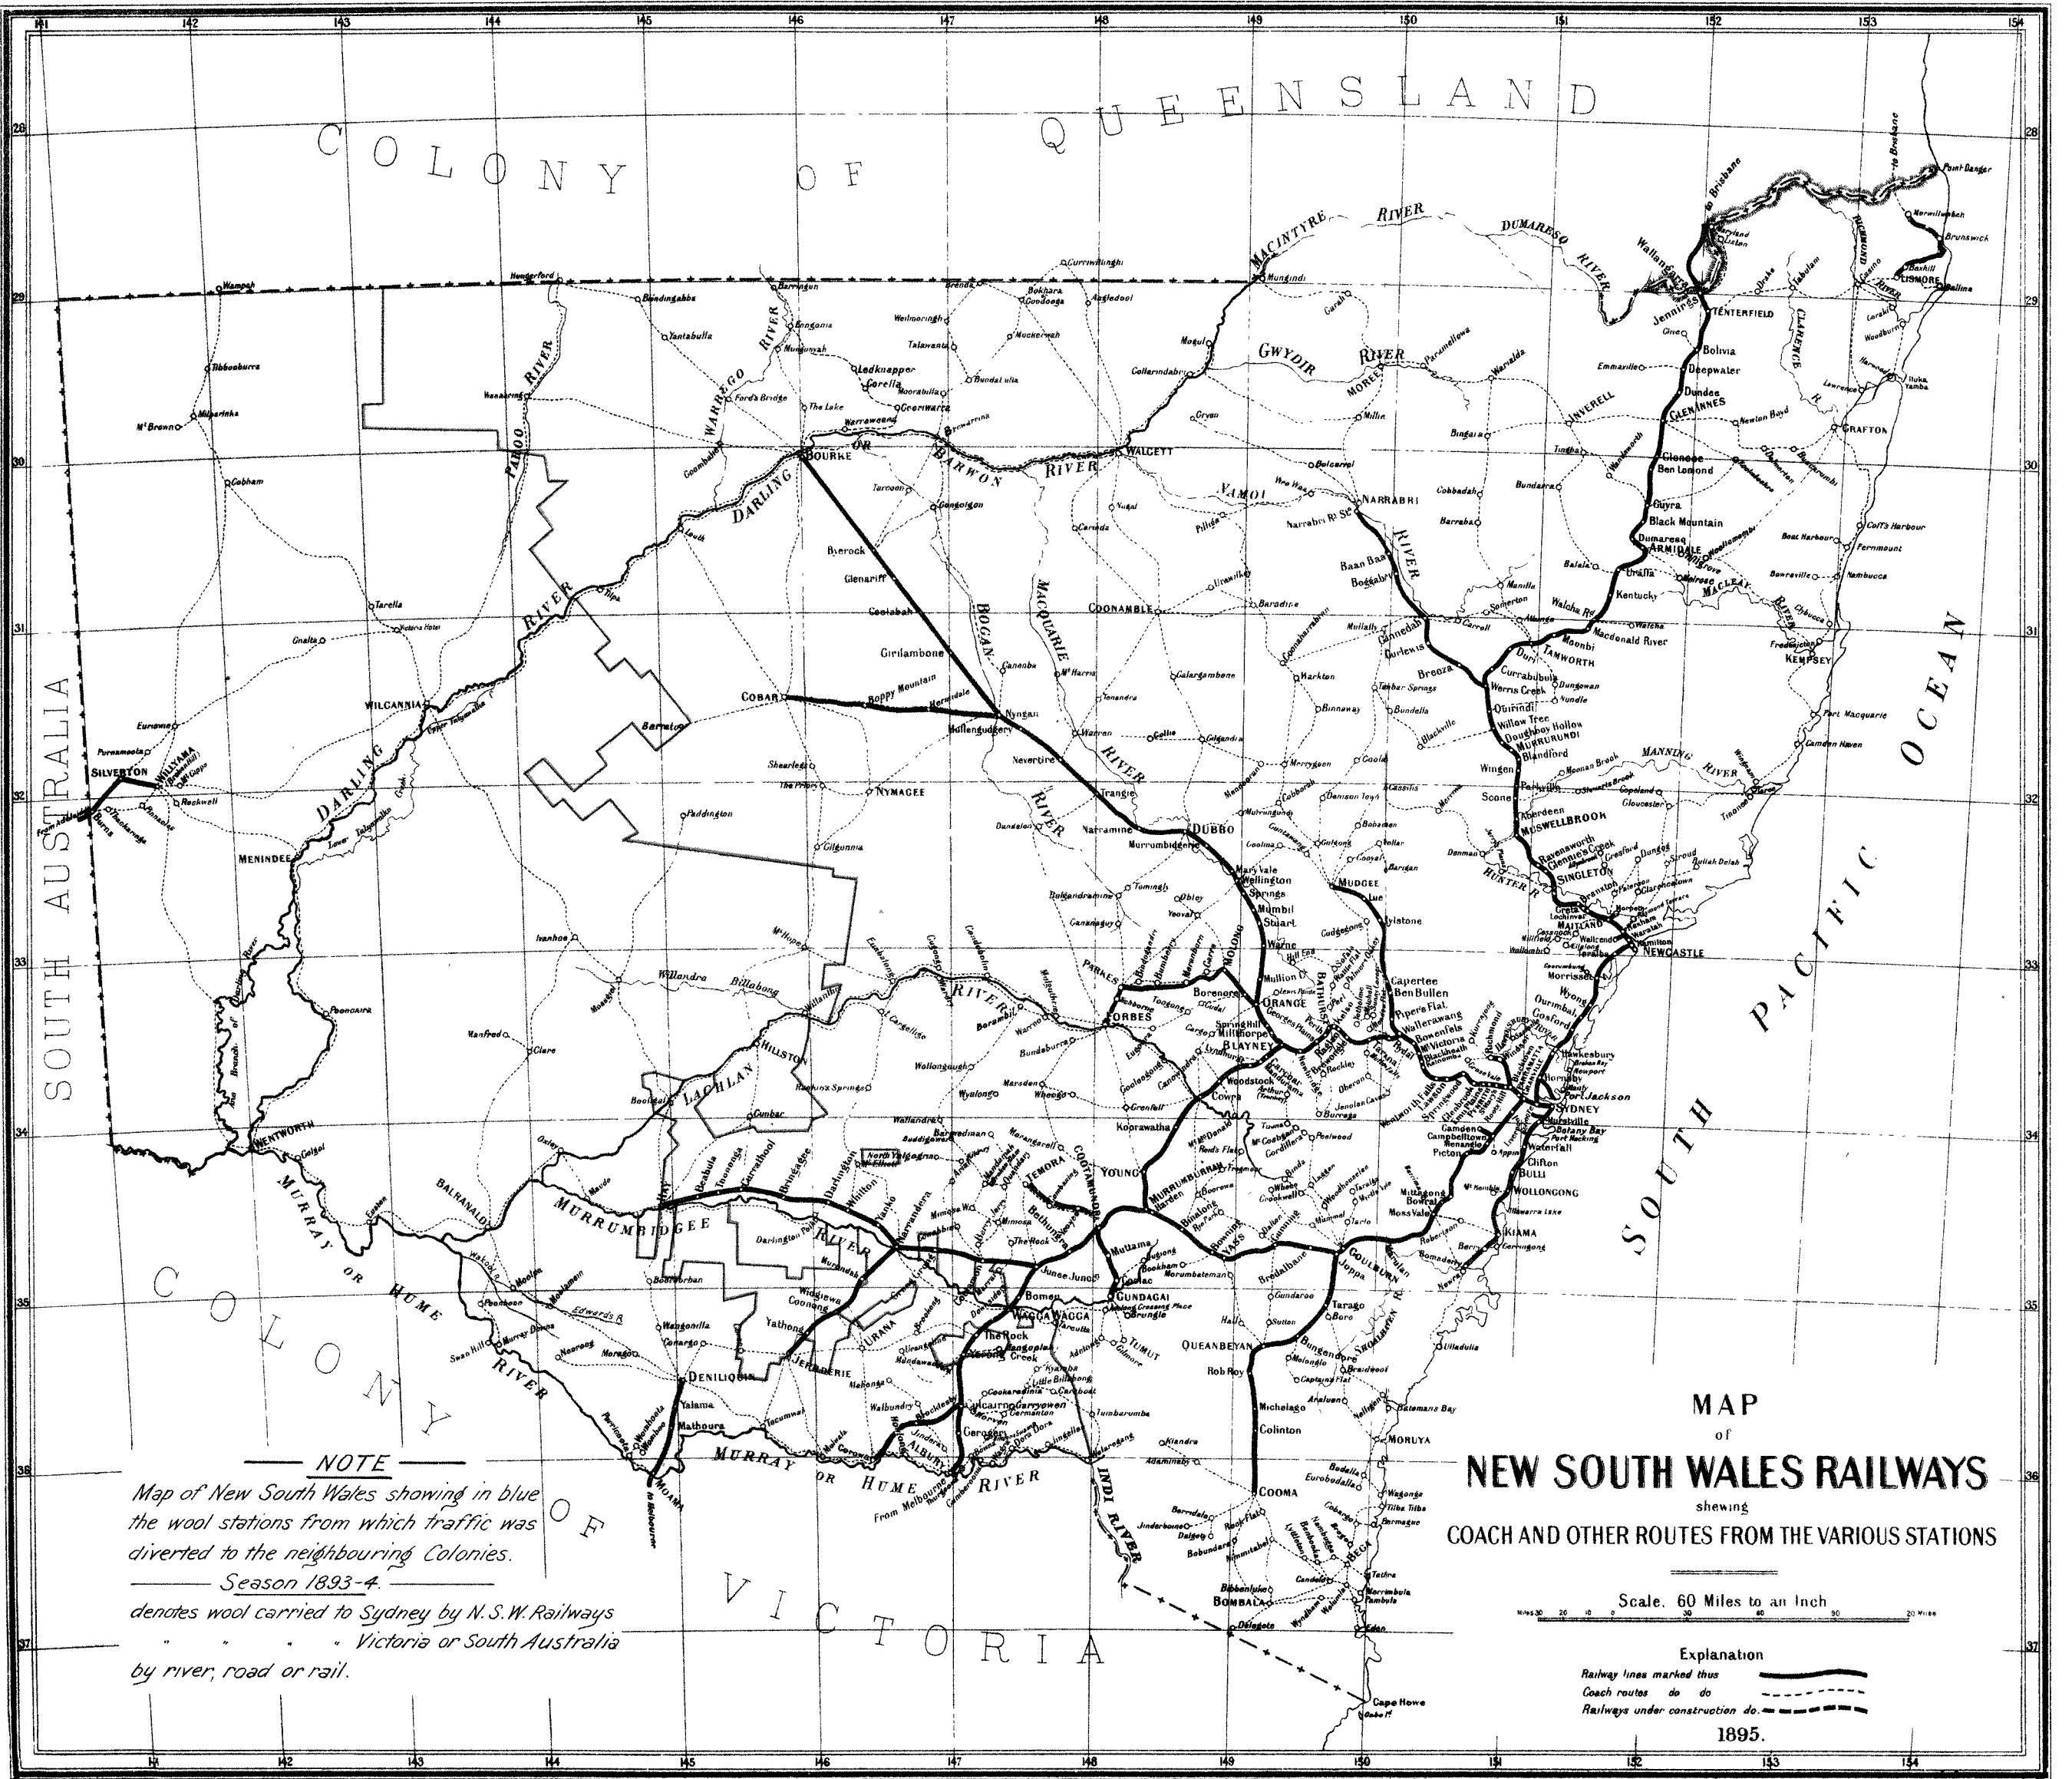

* An allowance of 6d. per bale will be made on all consignments of Darling wool from one consignor, amounting in the aggregate to 1,000 bales, during one season; and an allowance of 5 per cent. will be made on consignments from Hay or above Hay on the Murrumbidgee, amounting in the aggregate to 10,000 bales, during one season from one consignor. This is in addition to the reduced rates quoted above.

† The Pd. Figures are the Rates brought into existence by By-law No. 156, published July 5th, 1894.

‡ Rates which ceased to exist by issue of By-law No. 120, published July 5th, 1894.

§ To Geelong, 9d. per bale added to these rates.

1894-5.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAY ACCIDENT ON THE ZIG-ZAG.

(COPY OF REPORT RESPECTING.)

*Ordered by the Legislative Assembly to be printed, 27 March, 1895.**[Laid upon the Table of this House in answer to Question No. 10, of 27th March, 1895.]*

Question.

- (10.) LATE RAILWAY ACCIDENT ON THE ZIG-ZAG.—Mr. SCHEY asked THE COLONIAL TREASURER,—
 (1.) Will he lay upon the Table of this House a copy of any report that may have been made concerning the late railway accident on the great Zig-Zag?
 (2.) If so, when will the same be available?

Answer.

New South Wales Government Railways, Sydney, 14 March, 1895.

The Secretary,

In compliance with the Commissioners' directions, we have to report the result of our inquiry into the cause of the accident which occurred at top points, Lithgow Zig-Zag, 12th instant.

In this case, as the 7.45 Up Passenger, from Orange to Sydney, was being propelled, after passing top points signal cabin, a horse-box, followed by the engine and tender left the rails.

The train consisted of—

	T.	c.	q.
"P" class engine and tender, No. 461, weighing ...	91	0	0
Horse-box (containing one horse), No. 562, weighing (about) ...	5	0	0
First-class lavatory carriage, No. 406, weighing ...	21	11	3
Second-class lavatory carriage, No. 366, weighing ...	20	1	0
Lavatory B van, No. 364, weighing ...	19	4	0
Total	156	16	3

We append hereto the evidence of the following witnesses:—Driver G. Balmer; Fireman W. Brownlow; Guard D. Conroy; W. Price, officer in charge, top points; Ganger E. Noon; Fettler J. Dixon; Fettler J. Stafford; Sub-Inspector E. Farnsworth, Permanent Way Department; Foreman McNevin, Loco. Department, Eskbank; Carriage and Wagon Examiner A. Barner; Mr. McCarney, Loco. Inspector, Bathurst; Mr. R. Crawford, Station-master, Eskbank.

The driver states that the train left bottom points four minutes late, and that the speed ascending the Zig-Zag was rather slower than usual. After passing the signal cabin at top points he felt the tender bumping, and immediately stopped the train. His evidence is confirmed by the fireman, the officer in charge, top points, and guard also corroborates the driver's statement respecting the speed of the train coming up the middle road.

The ganger of the length says he was standing on the left-hand side of the train when it passed him, and that prior to its arrival he had been packing the sleepers. The carriage went all right, but as the horse-box (which was between the carriage and tender) passed him he saw it leave the rails followed by the tender. The two fettlers, who stood on the opposite side of the line, positively substantiate this statement.

Permanent-way Sub-Inspector Farnsworth states, that he inspected this portion of the road a week ago, and found it in good line and level. He travelled with this train, and immediately after the mishap gauged the road and found it quarter of an inch slack, but not out of line, and rails crippled by the derailment.

The

The wheels of the horse-box and tender were carefully gauged and examined by the carriage and wagon examiner and locomotive foreman and found to be correct.

CONCLUSION.

From the evidence taken and our personal inspection of the road and vehicles, we can come to no other conclusion than that the horse-box, which was a very light vehicle compared with the others, forming part of the train, was forced off the rails whilst the train was being propelled, and that its derailment also led to the engine and tender leaving the rails. The derailment took place on an 8-chain curve with a rising gradient of 1 in 42.

As the damage to the permanent way, vehicles, and interlocking was small, it is estimated that the total cost of repairs will not exceed £30.

We attach a sketch* showing the scene of the accident and position of the vehicles after the derailment.

No passengers were injured.

The horse, which was owned by Mrs. Brown, Bowenfels, was taken out of the box and stabled, and was subsequently removed by the owner. It was injured and shaken, its legs and head being cut and bruised.

The only employee in any way injured was the fireman, who had his feet slightly bruised.

H. RICHARDSON.
JAMES FRASER.
C. H. STANGER.

* Not laid on Table.

[3d.]

Sydney : Charles Potter, Government Printer.—1895.

1894.

SECOND SESSION.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAY FREE PASSES.

(RETURN RESPECTING.)

Ordered by the Legislative Assembly to be printed, 20 December, 1894.

RETURN to an Order of the Honorable the Legislative Assembly of New South Wales, dated 5th September, 1894, That there be laid upon the Table of this House,—

“A return showing all free passes over the Railways issued since the date to which the last of such returns was made up, such return to show the names of all persons to whom such passes were issued, the duration of such passes, the reasons for granting same, and the estimated cash value of the same.”

(Mr. Schey.)

RETURN of Free Railway Passes issued for other than Departmental purposes, from 1st June, 1891 (being date to which last Return was made up), to 1st October, 1894, showing reason of issue and period for which passes were available.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAY FREE PASSES.
(RETURN RESPECTING.)

Ordered by the Legislative Assembly to be printed, 29 May, 1895.

RETURN to an *Order* made by the Honorable the Legislative Assembly of New South Wales, dated 24th April, 1895, That there be laid upon the Table of this House,—

“A Return showing the names of persons holding periodical passes over the Railways of New South Wales during 1895, other than granted for Railway business; also showing why passes were granted and duration of such.”

(Mr. Cameron.)

RETURN showing the Names of Persons holding periodical Passes over the Railways of New South Wales during 1895, other than granted for Railway business; also showing why granted and duration of such passes.

Names.	Why Granted.	Date of Expiration.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAYS.

(RETURN RESPECTING PROPOSALS SUBMITTED FOR CONSIDERATION OF THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.)

Ordered by the Legislative Assembly to be printed, 7 March, 1895.

[Laid upon the Table of this House in answer to Question No. 11, of the 5th December, 1894.]

Question.

11. RAILWAYS PASSED AND REJECTED BY THE PUBLIC WORKS COMMITTEE:—*Mr. PARKES asked The SECRETARY FOR PUBLIC WORKS,*
 (1.) What railways have been passed by the Public Works Committee since the Committee was first established?
 (2.) How much does each recommended railway lose per annum, or how much revenue does each return, as the case may be?
 (3.) What was the contract cost of each?
 (4.) What was the complete cost?
 (5.) What railways have been rejected by the Public Works Committee since the Committee was first established?

Answer.

Question No. 11.	No. 2. Actual loss per annum, Working Ex- penses and Interest.	No. 3.* To 23 February, 1895.	No. 4.† Total Expenditure to 23 February, 1895.	Remarks.
Culcairn to Corowa ...	£ 8,023	£ 115,545	£ 205,494	Opened for traffic.
Goulburn to Crookwell	296,792	Construction not authorised.
Nyngan to Cobar ...	3,588	146,045	164,171	Opened for traffic.
Marrickville to Burwood Road	76,682	358,721	do do
Kiama to Nowra ...	12,968	230,832	809,552	do do
Lismore to Murwillumbah ...	11,695‡	582,057	164,338	do do
Cootamundra to Temora ...	1,943	91,760	359,251	do do
Molong to Parkes and Forbes ...	2,288	246,278	315,654	do do
Milson's Point Extension ...	11,173	83,080	Construction not yet authorised.
Kiama-Nowra into Nowra	do do
Cobar to Broken Hill	do do
Lismore to Casino	do do
Glen Innes to Inverell	do do
Narrabri to Moree	do do

* Exclusive of land, permanent-way materials, and other heavy charges. † No. 4 includes the items omitted in No. 3. ‡ Represents the actual loss since the line opened to the end of December. § First section opened 15 May, 1894; second section opened 24 December, 1894.

(5.) Moss Vale to Robertson; Grafton to Lismore; Mudgee to Gulgong; Broken Hill to Cockburn; Grafton to Casino; Jerilderie to Deniliquin; Eden to Bega; Deviation to avoid Lithgow Zig Zag; Temora to Wyalong (temporarily).

1894-5.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

CONTRACT FOR THE DELIVERY OF WOOL, &c.

(FROM DARLING HARBOUR AND REDFERN RAILWAY STATIONS.)

Ordered by the Legislative Assembly to be printed, 6 March, 1895.

Question.

3. MR. HOGUE asked THE COLONIAL TREASURER.—

- (1.) Will he lay upon the Table of the House a copy of the specification in connection with the tenders for the delivery of wool and other goods from Darling Harbour Railway Station from 1st day of April, 1895, to 31st day of March, 1896?
- (2.) The names and addresses of tenderers, and prices of all tenders received by the New South Wales Railway Commissioners for this contract?
- (3.) The names and addresses of the successful tenderers, stating whether their tender was the lowest one received?
- (4.) Is it customary for the Railway Commissioners to accept the lowest tender, provided such tenderer complies with the specification, and forwards the necessary deposit and bond with the tender?
- (5.) Did the lowest tenderer comply with the specification, and forward the necessary deposit in this instance?
- (6.) Is it a fact that the successful tenderers amended their offer, on or after the 25th day of February, 1895?
- (7.) Is it a fact that all tenders for the delivery of wool and other goods from Darling Harbour have been for a longer term than twelve months?
- (8.) In how many instances have the present contractors had the contract for the delivery of wool and other goods from Darling Harbour and Redfern Railway Stations transferred to them, they at the same time being unsuccessful tenderers?
- (9.) In what manner did the contractors receive the contracts from 1888 to 1892, and from 1892 to 1895?

Answer.

1. There will be no objection to lay this on the Table if moved for in the usual way, but probably the information afforded will render it unnecessary.

2. J. McMahon and Co., Circular Quay.—Wool, at per bale, 3½d.; at per butt, 2d.; at per bag, 1d. Goods, up to 5 cwt., 1s. each consignment; over 5 cwt. and up to 10 cwt., 1s.; over 10 cwt. and up to 15 cwt., 1s. 6d.; over 15 cwt. and up to 20 cwt., 2s. Sutton and Co., 74, York and Market Streets.—Wool, at per bale, 3½d.; at per butt, 1½d.; at per bag, 1d. Goods, over 1 cwt. and up to 5 cwt., 9d.; over 5 cwt. and up to 10 cwt., 1s.; over 10 cwt. and up to 15 cwt., 1s. 6d.; over 15 cwt. and up to 20 cwt., 2s. J. J. Gillham, 14, Cooper-street, Surry Hills.—Wool, at per bale, 3½d.; at per butt, 2d.; at per bag, 1d. Goods, up to 5 cwt., 1s.; over 5 cwt. and up to 10 cwt., 1s. 6d.; over 10 cwt. and up to 15 cwt., 1s. 9d.; over 15 cwt. and up to 20 cwt., 2s. Wright, Heaton, and Co. (Limited), 241, Pitt-street, Sydney.—Wool, at per bale, 4½d.; at per butt, 2½d.; at per bag, 1d. Goods, up to 5 cwt. each delivery, 1s.; over 5 cwt. and not exceeding 10 cwt., 1s. 3d.; over 10 cwt. and not exceeding 15 cwt., 1s. 9d.; over 15 cwt. and not exceeding 20 cwt., 2s. 3d.

3 and 4. The tender of Messrs. J. McMahon and Co. was accepted. The contract mainly consists in the cartage of wool in bales and bags, 511,917 bales and 5,720 bags being delivered from Darling Harbour for seven months ending January last, and for this service two tenders, Messrs. J. McMahon and Co. and Messrs. Sutton and Co., were equal. For the delivery of butts, 974 having been delivered, Messrs. Sutton and Co. were lower, but the difference represents a sum of £3 per annum only, and in view of the great importance of the contract and the very satisfactory manner in which Messrs. McMahon and Co. had carried out the work in previous years their tender was accepted.

5. Yes.

6. No.

7. No.

8 and 9. It is understood that in 1888, shortly before the Commissioners took office, Messrs. McMahon and Co.'s tender was accepted, a lower tenderer declining to take it up in the first instance, and Messrs. McMahon and Co. accepted the contract at the lowest tendered price. A contract was let in 1892 to Messrs. McMahon and Co., they being the lowest tenderers for the delivery, contractor supplying the labour required. The price tendered was 4½d., but at the request of the Commissioners the price was reduced to 4d. per bale. The contract was for one year, subject to renewal at the option of the Commissioners.

1894-5.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

PUBLIC WORKS ACT OF 1888.

(RESUMPTION OF LAND AT TARANA, FOR BALLAST QUARRY, BY THE RAILWAY COMMISSIONERS.)

*Ordered by the Legislative Assembly to be printed, 4 July, 1895.*NOTIFICATION OF RESUMPTION OF LAND FOR
RAILWAY PURPOSES UNDER THE PUBLIC
WORKS ACT OF 1888.

NEW SOUTH WALES, } Proclamation by His Excellency The
to wit. } Honorable Sir FREDERICK MATTHEW
(L.S.) DARLEY, Knight, Lieutenant-Governor
FREDK. M. DARLEY, of the Colony of New South Wales and
Lieutenant-Governor, its Dependencies.

WHEREAS the Railway Commissioners of New South Wales are desirous of acquiring the land referred to in the Schedule hereto for the purpose of maintaining the traffic on the Great Western Railway by providing ballast for the repairs of the said line between Sydney and Bourke, which work appears to the Commissioners necessary, and is such work as the Railway Commissioners are authorised to carry out pursuant to the "Government Railways Act of 1888;" and it is estimated that the cost of completing such work will not exceed the sum of £20,000: And whereas the said land is, in my opinion, required for carrying out the said work: Now, therefore, I, the Lieutenant-Governor aforesaid, with the advice of the Executive Council, in pursuance of the "Public Works Act of 1888," do hereby direct that the said work shall be carried out, under the "Public Works Act of 1888," by the said Railway Commissioners, who, in respect to the said work, I hereby declare shall be deemed to be the Constructing Authority: And in further pursuance of the provisions of the said Act, I do hereby direct that the said land may be acquired and taken for the purposes aforesaid under the "Lands for Public Purposes Acquisition Act"; and I do declare, by this notification to be published in the Gazette, and in one or more newspapers published or circulated in the Police District wherein the said land is situated, that the said land described in the Schedule hereto has been resumed for the public purpose hereinbefore expressed, that is to say, to provide a quarry for the supply of ballast for repairs of the railway between Sydney and Bourke, to the intent that upon the publication of this notification in the Gazette, the said land described in the Schedule hereto shall forthwith be vested in the said Constructing Authority on behalf of Her Majesty, for the purposes of the said "Public Works Act of 1888," for an estate in fee simple in possession, freed and discharged from all trusts, obligations, estates, interests, contracts, charges, rates, rights-of-way, or other easements whatsoever, and to the intent that the legal estate therein,

together with all powers incident thereto or conferred by that Act, shall be vested in such authority as a Trustee; and I declare that the following is the Schedule of land hereinbefore referred to:—

SCHEDULE.

All that piece or parcel of land situated in the parish of Eusdale, county of Roxburgh, and Colony of New South Wales, being part of John Wade's conditional purchase portion numbered 52 of the aforesaid parish: Commencing at a point on the western boundary of the aforesaid portion, distant 2,788 links from the north-western corner thereof; and bounded thence towards the west by part of the western boundary aforesaid, being a line bearing north 718 links; thence bounded towards the north by a line bearing north 58° 1' east 1,179 links to the eastern boundary of the said portion; thence bounded towards the east by part of the said eastern boundary, being a line bearing south 723 links to the railway boundary; thence bounded towards the south by the railway boundary, being lines bearing south 68° 16' west 309 links, south 61° 55' west 321 links, south 54° 11' west 310 links, south 45° 56' west 248 links, to the point of commencement, and containing 6 acres 2 rods 24 perches. Also, all that other piece or parcel of land, being part of the aforesaid conditional purchase or portion number 52: Commencing at the southern end of the western boundary of the said conditional purchase where it abuts on the northern bank of the Fish River; and bounded thence towards the west by a line, being part of the said western boundary, bearing north about 605 links to the railway boundary; thence bounded towards the north by that boundary, being a line bearing north 30° east 100 links; thence bounded towards the east by a line bearing south about 700 links to the northern bank of the Fish River; thence bounded towards the south by that river, to the point of commencement,—and containing 1 rood 12 perches, being a strip of land 50 links wide, the same being more particularly described and delineated on the plan attached to these presents, and coloured red thereon.

In witness whereof I have hereunto set my Hand, and caused the Great Seal of the Colony to be hereto affixed, at Government House, Sydney, this eighth day of June, in the year of our Lord one thousand eight hundred and ninety-five, and in the fifty-eighth year of Her Majesty's Reign.

By His Excellency's Command,

G. H. REID.

GOD SAVE THE QUEEN!

1894-5.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

ELECTRIC AND OTHER TRAMWAYS.

(MINUTE OF THE ENGINEER-IN-CHIEF FOR RAILWAY CONSTRUCTION ON.)

Ordered by the Legislative Assembly to be printed, 15 May, 1895.

Railway Construction Branch, Sydney, 25 April, 1895.

So much has been written lately on tramways, especially electric tramways, that it is difficult to find anything new to say. Several technical journals are entirely devoted to the publication of information referring to these matters, and several good practical hand-books describing and illustrating the most recent methods have appeared within the last few years. This literature, however, is not immediately available to those answerable for our expenditure, as it is too voluminous for study unless for the technical practitioner, and it becomes, therefore, desirable that some of the most important facts connected with tramway designs should be selected and placed before them, especially those, a review of which will show the defects inherent in our own system of steam traction, and the means by which the same can be improved. My visit to America and Europe has given me opportunities of judging of the value of different methods, better than what mere reading of descriptions and reports impart, and I trust, therefore, that the Minister will find this report of considerable practical value. I must say at the commencement that I have, as far as is possible, avoided the incorporation of statistics or other unreadable matter into the body of the report; but as I have a large quantity of such information in my possession it is available for use when called for. I confine myself, therefore, to such facts and views as will afford a general knowledge of the subject.

Few will, I think, maintain that the steam service in Sydney is a satisfactory one. It is objectionable on account of dirt, noise, and danger. It is said to ruin the streets for business purposes when laid down, but be that as it may, the objections against its use are such that its more general extension into such busy streets as George-street or Pitt-street, or the less crowded ones of Castlereagh or York Streets, would be the cause of general outcry, while the laying down of a steam tram-line along Macquarie-street would be looked upon as a desecration. There would not be the same objection felt to the existence of any other system of tramway along these streets, whether cable or electric, and such new lines are some or all of them very much wanted in order that the tramway service may at all compare in convenience with those of American cities. Our tramways as at present laid out—I speak of the steam tramways—all converge at the south-west corner of Hyde Park into one street—Elizabeth-street. Between this point and the terminus there are times of the day when the traffic is so great that the trams follow one another in such quick succession that there is little space between them. An increase in the number of trams would appear impossible; yet take any particular line, and it will be seen that the trams in that direction run only at long intervals. This could only be rectified by dividing and bringing some of the traffic into other parallel streets, but the objection to the employment of steam motors in those streets prevents that. That a more frequent service into the suburbs is wanted is clear, as in conjunction with the trams there are lines of omnibuses doing a good business; in fact, it almost seems as if the trams only get the leavings of the omnibuses. A frequent and quick service is wanted, with smaller cars or at least shorter trains. People do not want to wait until a train-load is made up. With an efficient tram service there ought on all lines to be at least one car in sight, for as soon as one goes out of sight another should be coming into view in the opposite direction. In this way people in a hurry will not have to take the first omnibus that comes, for they will know how little time they need wait for a car.

Seeing that steam has been tried and failed—What other method can be adopted? The choice lies between cable and electricity; for the fourth method, that of horse traction, is, with the steep grades of the Sydney streets, not to be thought of. The cable has many advantages, but it is very expensive, and the laying down of such a road entails temporary interference with the street surface and the traffic upon it in a very prejudicial way. Of course, if there was no alternative the inconvenience would have to be

be put up with, as has been done in the case of the King-street tramway, and there are perhaps places where, on account of density of traffic and grade, there would be no choice but to use the cable; but in most cases electricity serves the purpose, and in general it is far easier to apply and affords many advantages over any other system. It is easier of application and less costly for the construction of new lines, and it is the only substitute for steam on existing lines without entering upon entire reconstruction.

When the two proposals to construct tramways along King-street and George-street were being inquired into by the Public Works Committee, I strongly urged the adoption of electricity as motive power, pointing out, in my opinion, and judging by the practice in America, that the method was no longer in an experimental stage. It was difficult to persuade the members of the Committee of this fact, and consequently the cable was adopted for the King-street lines and the George-street proposal was rejected. At that time, however, 3,000 miles of road in the United States were being worked by electricity; at the end of 1891 there were 4,061 miles; end of 1892, 5,939 miles; at the end of 1893, 7,476 miles; and at the end of 1894, according to the latest published returns, about 9,000 miles had been laid down. I believe, at the time of the inquiry above mentioned, the statements of the journals as to the progress of the use of electricity in the States were looked upon as American yarns, and although it was believed that electricity had been tried, it was supposed to be in the state of a scientific experiment. There can be no doubt of it now. I think the most incredulous will believe in the best progress made, and the almost universal adoption of electric traction. Not only in all the cities of the United States, and in many of the countries of Europe, horses are being dispensed with and electricity adopted; but during my visit to America I saw several examples where the cable system laid down had been abandoned, and electricity used instead on the same road. In the 1893 Report of the New York Railroad Commissioners there are mentioned thirty-two applications received for change of motive power, and of these twenty-eight are for the use of electricity. To form an idea of the enormous extent to which it may be employed, I may state that the West End-street Railway Company of Boston have an equipment of 1,500 cars. Various objections were formerly raised against electricity as a motive power, some of which are the following:—

- (1) The only system which has received any measure of success is the overhead wire, which is dangerous.
- (2) It is unsightly.
- (3) It is not capable of surmounting steep grades.
- (4) It is not suitable for coping with heavy traffic.

With regard to the first statement that the only successful method is the overhead wire, this is not correct, as in Budapest the conduit system is completely successful, and there is nothing to prevent any other system with exposed conductor like Love's being a complete success if drainage is properly attended to. The overhead wire and trolley system is, however, the cheapest, and the one which in most cases I should recommend. Then as to the statement that it is dangerous—Most of this has arisen from the occasional falling of a broken telegraph line across the trolley line, and thus bringing the current to the ground. As the breaking of telegraph lines occurs in winter only in America, and is due to accumulated weight of ice and snow on them, which we do not have, the objection so far as we are concerned may be passed over as trivial. There are, besides, no currents dangerous to human life used; in America a pressure of 500 volts is the usual practice—this will kill a horse, but not a human being; in England 350 volts is the limit used. Practically, however, the danger is nil, and is actually so if proper guard wires are used when there is fear of other wires falling on to the trolley wires.

(2) "It is unsightly"—This statement is very much exaggerated, a newly laid out line is not necessarily unsightly, even when laid as in America with the wire over the centre of the road. The public should not form their judgment by the late Randwick and Waverley line which was clumsy in the extreme, nor even by the Military-road line on the North Shore, for the posts there are thick and heavy. Let any one look at the way the telegraph lines are carried along and across some of the Sydney streets, and then say whether we ought to raise objections against a new trolley line when hideous erections and crossings of wires are already tolerated. In most cases, however, the wire over the middle of the street can be avoided as I saw on the South Staffordshire line in England, which I mentioned in my preliminary report.

(3) "It is not capable of surmounting steep grades"—This objection is now quite out of date. I saw several examples of steep grades in America, and heard of many others. The Metropolitan line in San Francisco has grades of 13·8 per cent. equal to 1 in 7½, the San Mateo line 11·2 per cent. (I find I reversed them in my preliminary report). In Los Angeles there is a grade of 13 per cent. and there are others less steep, but still severe. A remarkable example of steep grades exists in Florence on the tramway, where a great deal of steady mounting is done on a grade of 8 per cent., or 1 in 12½. This work is done by the use of Sprague motors, which are far from being now the best and most approved type.

As to its not being suitable to cope with heavy traffic this is certainly a mistake. The Boston tramways are a complete refutation of this statement. The difficulty in Boston lies in the narrow streets and the constriction produced by having to pass all the traffic through a narrow neck.

At St. Louis, Captain McCulloch, who is the manager of several now incorporated tramway companies, told me that the Franklin Avenue cable tram has to be renewed, and that although his prejudices were formerly in favour of cable, he proposes to make the new line an electrical road. On this line the cars run every two minutes. Grip car and trailer have seating capacity of fifty-three persons, which means, that they may sometimes carry more than double this number, judging from the way the Americans crowd on and stand on all available space.

In America it is considered that electric lines are much safer to work than the cable, the cars are more completely under control, they can stop at any moment, can reverse or go on again at any point on the road, this is not the case with the cable. This is a very great advantage in crowded streets when collisions are likely to occur. If a cable car has to stop longer than its usual time at a street corner it cannot make up time; the speed is limited by that of the cable; with electric it is otherwise, the road being clear, high speed can be obtained and time lost regained. The speed at command is a most important advantage. In New York, on the Broadway cable line, I frequently noticed at the city end the cars running slow, letting the cable in fact slip through the grip so as to avoid running into vehicles in front; in this way a great loss of power and great wear to the cable result. In electric cars this, of course, would not occur as only the power required is taken from the conductor.

In the matter of speed electricity beats anything else but steam. It is true I saw in Chicago two cable roads speeded respectively at 13·85 and 15 miles per hour, but on the Haywards Electric Line, near San

San Francisco, the speeds obtained are from 25 to 32 miles per hour. On other lines also, high speeds are obtainable up to 24 miles, and when the cars are fitted with good proper brakes, these speeds are quite unobjectionable for suburban work. In consequence of the speed obtainable, the Americans prefer the electric lines if for no other reason, and the companies urge with truth that it is a source of economy as when higher speeds are used a less number of cars are employed.

Captain M'Culloch, who is an authority on tramway matters, gave me his opinion that, if he were laying down a long line, starting in a centre of population, where for some distance along heavy traffic might be expected; and running right out to a suburb, he would, even if it paid to put down a cable for the first part, adopt electricity throughout so as to avoid change of cars.

In order to give an idea of the circumstances under which it may be most economical to put down a cable road or electric road respectively, looking at it from the question of power to be supplied, all other things being equal, I will suppose that for a certain equipment of road twenty cars are run. Let it be assumed that the power required to drive the machinery and cable, as it very well might be, is 340 h.p., and that each car requires an average of 8 h.p. to draw it. Then, with the equipment mentioned, the total power will be $340 + (20 \times 8) = 500$ h.p. If the number of cars be doubled the power will not be doubled, but will be $340 + (40 \times 8) = 660$ h.p., or if the equipment be of fifty cars, and the engines still powerful enough to bear the extra strain, the total will be $340 + (50 \times 8) = 740$ h.p. Now, take the power required for electric traction, and assume the power lost on the road and absorbed by each car to be 16 h.p., then for twenty cars we require 520 h.p. as compared with 500 h.p. for cable, with forty cars 640 h.p. as compared with 660 h.p. for cable, but when the number of cars run is fifty the total power is 800 h.p. for electricity as compared with 740 h.p. for cable, so that there comes a time when the excess of traffic is so great that the cable pays best as regards fuel consumed. Of course, in making such calculations other considerations must not be lost sight of, such as the interest on the greater cost of road and power plant, which again requires more land and larger buildings for its accommodation.

I will now proceed to make some observations on the different methods of applying electricity for traction in America and elsewhere.

I will first take the accumulator or storage battery system.

In America this system has made no way. Either the interests in favour of other methods are too powerful or the system itself is essentially weak, otherwise it might be thought that in that country, at least, where new inventions are received with open arms, its introduction would have been welcomed.

The storage battery system has, of course, many advantages, each car taking its own power with it, and is, therefore, independent of the power-house and the other cars. A break-down does not mean even a temporary stoppage of the whole system, but there are serious drawbacks to contend with. In the first place the cars are very heavy as they are weighted up with the batteries, so that wear and maintenance of road becomes thereby affected; also, for the same reason, more power is required as the load to be moved is so much greater. Then the charging of the cells takes equally long to effect, or nearly so, as the discharging during running, so that a double number of cells have to be kept in hand. Then, again, there is a low limit to the power of any of the cells hitherto invented, so that steep gradients cannot be surmounted at all, for more cells implies more weight to haul, and therefore no corresponding gain. The steeper grades such as are negotiated by steam are not suitable to the storage battery system, for it is found that when the cells are drawn upon at more than a certain rate they rapidly disintegrate.

The result of all this is that the system is not suitable for grades heavier than 1 in 25, or perhaps 1 in 20, and does not pay a fair return upon capital.

I examined the working of the system in Birmingham and Paris. These are now acknowledged to be the most successful lines. They are very well managed and afford a considerable amount of comfort to the travelling public, but the shareholders get no benefit. I obtained returns of the working of the Birmingham cars which run along the Bristol-road. The company were so dissatisfied with the results that they recently made an application to the city authorities to allow the overhead wire to be used, in the same way as on the South Staffordshire Tramway, but their request was not acceded to.

Great results were expected from the use of the protected chloride cells, and it may be that the life of the cells will be indefinitely extended, but there will still be the drawback of deficiency of power for working steep grades, until some more powerful method of constructing the plates and perhaps some other material more suitable than lead is discovered.

I now give some particulars of the Bristol-road line at Birmingham and of the Paris lines.

On the Bristol-road tramway the cells used are the E.P.S., Epstein, and chloride. The E.P.S. cells contain stamped perforated plates. The positive plates are pasted over with red lead; the negative, with litharge. The Epstein have plates of minutely corrugated lead. In the chloride there are hard discs made first from chloride of lead and zinc. The discs are placed in position and lead is forced round them under pressure. The E.P.S. cells are more powerful than the Epstein, but less durable. The chloride plates are wrapped in asbestos cloth, and have also plates of wood placed between them when in position with perforations opposite the discs. These are what the company call protected plates. The cells are twelve in number for each car. The cars go into the shed and the cells are pulled out on to a frame on each side, which frame is movable, vertically, and is worked up and down by hydraulic power. There are two tracks with double rows of movable frames 8 feet high.

On the Bristol-road there are 3 miles of double line. The steepest grade is 1 in 19; the speed of the cars is limited to 8 miles per hour. There are twelve cars, of which seven are always working. Ten minutes is the interval between the cars. Their weight is 12 tons each. They are double-decked, and have seating capacity for fifty-two passengers. There is a controller for working in parallel or series. The electric plant has been supplied by the Electric Construction Company, but Mather and Platt have the patent for the new chloride cells. These cells have only been working for a short time in Birmingham, while in Paris they have been in use for two years. The connections of the cells are made solid, fused with a blow-pipe. Their life is expected to be twelve months. They are charged to run half a day. The working hours of the tramway are from 7 a.m. to 12 p.m.

In Paris there are three lines in operation, namely, from St. Denis to Madeleine, 9,250 metres in length; from St. Denis to the Opera, 9,250 metres in length; and from St. Denis to Neuilly, 6,000 metres in length. The steepest grades are 3·8 per cent. The trucks and motors are by Avely, of Lyons. The cells used are of the Laurent Cely type (reduced chloride); they are of two kinds, namely, those with discs, and finely corrugated plates on which the reduced chloride is painted.

M. Lomenie says the chloride discs cells are good, but the company are going to make improvements in the positive plates. M. Cataline says they prefer the second type, which is finely corrugated like the Epstein.

The plates containing the discs are said not to be strong enough, electrically. The speed of the cars is slow, being limited to $5\frac{3}{4}$ miles per hour.

The batteries are charged every two or three trips, mostly every two trips—say, every five hours—and they take five minutes to change. The cars hold fifty passengers.

The rails are 47 lb. per yard. The steepest grades are 3·8 per cent, or 1 in in 26·3. There are curves less than 20 metres. The motors are of the double reduction type in series. There are two on each car of 10 kilowatts each.

Recharging takes six hours. The weight of the car is 14 tons loaded, of which 3 tons are due to the battery, and $3\frac{1}{2}$ tons to the passengers. The traction necessary is 25 lb. per ton. The coal used is 2·3 kilogrammes per car kilometre.

It will be seen that the speeds are less than those frequently made by the steam trams in Sydney.

In Birmingham the cost of running and repairs, as given by Mr. Alfred Dickenson, is nearly 1s. per car mile, being nearly twice the cost of steam traction and nearly three times that of the cable.

The next methods which I shall refer to will be the various applications of the electrical conduit.

I examined two examples of these—in each case the conductor is carried on insulators in a conduit but not protected. These were the Love system at Washington, and Siemens and Halske system at Budapest. Mr. Waller, of Messrs. Kincaid, Waller, and Manville, a firm which showed me much courtesy during my stay in England, has since shown me designs of his own for an improved conductor to be laid in a conduit, but as this method has not been tried, I refrain from passing any remarks otherwise than to say that it seems of a promising nature.

Love's system appeared extremely satisfactory. It was tried first in Chicago, and the one at Washington differs in some minor details. There is a length of about a mile of double track laid down and worked by the Rock Creek Railway Company as part of their system. The president of that company testifies that—

- 1st. It can be kept in operation 365 days in the year with less delay than any system now in use.
- 2nd. It is absolutely impossible for anyone to be injured by the electric current.
- 3rd. It requires no skilled labour to operate it.
- 4th. Cost of maintenance as cheap as any known power.
- 5th. Does not increase the cost of insurance along the line of road.

The conductor is double, and of copper, the current being taken up by a shoe with double trolley fixed to the bottom of the car. This shoe is removed at the end of the section when the overhead wire commences.

Mr. Law, who had charge of the line, said, in reply to my inquiries, that the same system has been working in Chicago. The reason that it has not been taken up in the States is that, if it were shown to be successful, every city would insist on its adoption, which would mean great expense in alterations—every other system making and breaking contact. He further states that Love's system requires no electrician to look after conduit and conductor, all other systems do. The Weeliss system makes and breaks contacts, and has not yet worked satisfactorily.

The Budapest system is equally successful. In this case the conductor is of angle iron, and the current is taken up by a shoe, there being sliding contact instead of the trolley. The conduit is on one side of the road under the rail, and the slot is wide, but there is no reason why this should not be reduced to $\frac{1}{8}$ inches. This system has been so successful, and the enterprise has paid so well that all the horse tramways in Budapest (of which there is a large mileage) are to be converted to the conduit system.

In New York the General Electric Company are arranging to put down a conduit line, working with a pressure of 300 volts.

The overhead trolley system is that almost everywhere adopted in America. A single wire is usually suspended over the centre of the track, from cross wires fixed to neat wrought iron or steel tubular poles erected on the sides of the streets, or if the street is wide, poles with brackets on each side to carry the wires for each track are placed down the centre. This latter method is, however, not much liked, as the slender poles, which may not always be noticed, have been run against by vehicles. This, however, is an objection that might apparently be easily got over by proper protection and lighting.

The rails are used for the return current, and are therefore bonded in various ways to give the necessary conductivity at the joints. If the line is beyond a certain length, feeder wires have to be carried out from the central station for distribution of the current along the road.

In America the little grooved trolley wheel at the end of the rod at the top of the car has no radial motion. The wire is always suspended as near as possible over the centre of the road, and there is little tendency to jump off except on curves; then the wire takes a polygonal form and has to be stayed by numerous cross-wires, which, however, are very ugly. On the South Staffordshire line the conductor is carried on neat poles, with brackets, along the side of the street, the trolley wheel is fixed in a pivot and has complete freedom of rotation. The trolley follows the wire round angles and bends in the most remarkable way, so that the ugly stay wires at corners are rarely necessary.

In America, as before stated, it is the practice to use a current of 500 volts, while in England it is often reduced to 300 volts.

In Cincinnati the return current is carried by a second overhead wire and the electrical circuit is completed through a second trolley-rod and trolley—this has the effect of getting rid of the injuries done by electrolysis, to be presently noticed, but there are so many complications introduced at junctions and crossings and short circuits so frequently occur that the method is not for present adoption.

The question of how to get rid of the effects of electrolysis is one attracting the greatest attention in the United States and must do so wherever an imperfectly closed circuit exists. The conductivity of the rails as usually jointed being not complete, a portion of the return current tends to leave them and pass through the damp earth and gas and water mains. On its passage to the negative pole of the generator at the power station, it takes with it particles of the iron of the pipes, and in this way pipes have been seriously weakened or corroded through. It is a very serious matter indeed, and to get over this effect various methods have been tried. At Cincinnati, as already mentioned, a second overhead wire is used for the return current, but efforts have been mostly directed towards improving the bonding of the rail. The methods usually adopted, which however differ much in detail, consist in drilling holes in the adjoining

adjoining rails and connecting by copper strips or wires, the copper being in some way riveted to the rail or driven tight by copper plugs. When the lines are long and feeders are used for the overhead wires, collectors for the return current are sometimes used, and copper connections between street mains and the negative pole of the generator, as is the practice in Boston, United States, America. Probably the mode which has the best future, consists in electric welding of the joints of the rails. I saw $3\frac{1}{2}$ miles of road thus welded in St. Louis, and when I was in Brooklyn I watched the men at work welding the joints of the Nassau-street railway, which will be, I believe, 32 miles in length. In welding the ordinary current can be used, but it has to be transformed into a low voltage, during which process the current is enormously increased in volume. The rails are not welded end to end, but side pieces or chocks are placed opposite one another on each side of the rail brought up with the rail to welding heat and pressed in. I am waiting the results of last winter's cold, when it will be seen if the joints stand the forces of contraction sufficiently well. Even if a joint gives way here and there, it would be a great advantage to have the bulk of them welded, as the conductivity of such a joint is perfect, and special means might be adopted in a few places to complete the circuit. The joints cost about twice as much as an ordinary fastened and bonded joint.

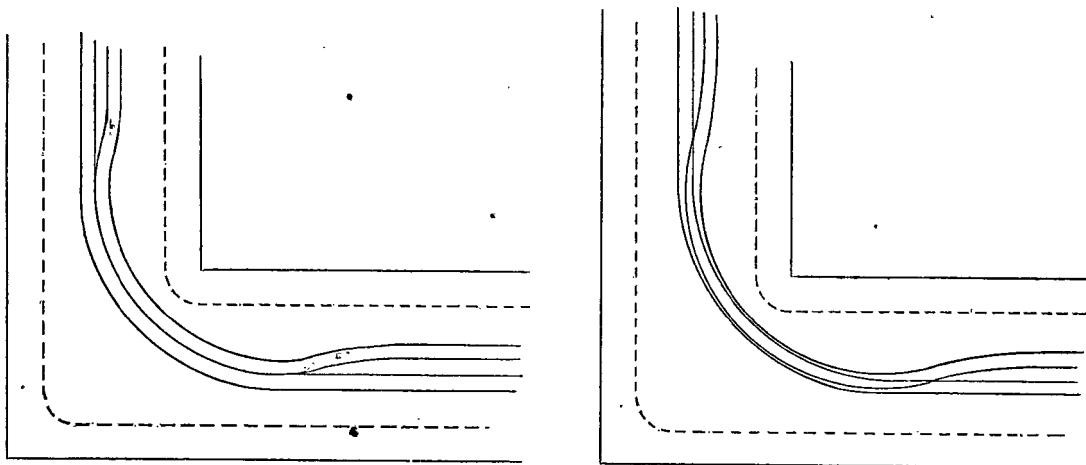

The rails used on tramways generally in America vary very much in weight, whether on horse, cable, or electric roads. In all cases the newer roads have the heavier rails. This is especially the case with electric roads, for which it is acknowledged the stiffest and steadiest road is the best; so that while it is possible to find 35 lb. rails in old roads, the later renewals of such lines as the Buffalo-street Railway Company's lines 95 lb. rails are being adopted. In the Western States in America especially grooved rails or guard rails are not used. It is the practice to use a rail with a horizontal expansion or step in each side of the head. This allows of the ordinary wheel traffic of the cities making use of this step or tread, and prevents wearing of the stone pitching next to the rail. In San Francisco, especially when the paving of the streets is so execrable, this precaution is specially necessary, as the traffic naturally seems to turn itself on to the tramways, the general surface of the street being almost too bad to use.

In some of the eastern cities the grooved rail is used.

At turnouts, the only switches generally used is a short plain tongue of metal on the concave side of the curve which the motor-man himself sets as he wants it, by means of a rod without descending from the car.

Curves are often set out with the greatest care. In Denver I was told that they were all tapered at the ends. Certainly the motion on entering or leaving those curves was extremely easy. High guard rails to the inner rail, projecting about $1\frac{1}{2}$ inch over the surface of the street, are used, and as the curves are passed sometimes at considerable speed these means are very necessary.

When two tracks turn round from a narrow street into one at right-angles, the inside line, in order to clear the corner is made to approach the other, or one rail is even made to coincide. In the latter case switches are required when one road leaves the other. In either case, as of course the cars cannot pass one another when on the curve, care has to be exercised to avoid collision, and the home-going or up-bound car has the right of road.

What has been said as to the strength of road, equally applies to electrical machinery and gearing, especially motors. Solidity and good workmanship are always applied, and in the electrical work of the leading firms in America, whatever some may say as to other branches of manufacture, there is no shoddy. It is recognised that anything to last must be well and thoroughly constructed, and, in consequence, many of the difficulties which at first beset electric railway engineering have now disappeared. Too much praise can scarcely be bestowed on the work of the General Electric Company and the Westinghouse Company, who practically divide the street orders between them—the former having the lion's share.

In the matter of cars there is a great variety of practice. The cars preferred by the West End Street Railway Company of Boston are single truck with two motors and 20-feet body. Mr. Serjeant considers this sufficient length, a longer length inducing pitching at high speeds. Such a car with equipments would weigh 7 tons. Those used at Denver are all double truck with one motor to each truck. Such cars are undoubtedly best for high speed, but they are generally not so convenient, as in order to give room for the bogie, the platform of the car has to be placed very high. These cars weigh up to 15 tons. The great drawback in using these cars when the work is heavy is that only half the load is available for adhesion. In order to get over this difficulty other forms of trucks have been designed by which the driving-wheels are made to take the largest proportion of the load. Such is the maximum traction truck in which 87 per cent. of the weight of the car is thus utilised. Robinson's radial truck has also been designed with that intention and the simultaneous action of the axles, which by a certain contrivance are made to run radially together on a curve, is intended as a substitute for the bogie principle. Both these I saw working satisfactorily at St. Louis.

A good mechanical brake is a great desideratum for tramway work, and is specially necessary when there are steep inclines. These remarks apply of course to cable roads as well. Of the various brakes in use I do not think any better contrivance can be found than the Genett brake, which has been applied to one of the Ocean-street tramway cars in Sydney.

Many of the power-houses in America show no complete design—they have been built up and added to piece-meal. In some cases opportunity for reconstruction occurs and then the entire plan can be properly thought out. In the newest plants the generators are fixed on the engine-shaft and the driving is direct. This may be by vertical engines of the marine engine type, such as are being erected in Buffalo. These engines are two in number and of 1,250-horse power each. A single large generator in each case, with 8 feet commutators, is a fixture on the shaft. Another example of approved installation is that of the Kent Avenue Power Station of the Brooklyn City Railway Company. Here there are four compound horizontal engines of the Allis type, each 2,000-horse power, and driving single generators with 7 feet commutators. On the other hand, in the new power-house of the West End Railway Company of Boston, the dynamos are in sets of three, driven from a counter-shaft. On the whole, opinion is strongly in favour of direct driving. Other and older plants consist of various types of engines. In the power house of the Omaha and Council Bluffs Company (one of the oldest electric tramway companies in America) Westinghouse high-speed engines have been in use for three years and are giving satisfactory results.

The favourite motor is the General Electric Company's G.E. 800. This motor is 1,700 lb. in weight, and thus 800 lb. less than its predecessor, W.P. 50. It is, with gearing, completely covered in, and so suspended that the jolting of the road is not directly conveyed to it. It is nominally of 25-horse power, but its power is much greater, and thus equal to any emergency.

The Westinghouse Company has also a new motor which gives splendid results. The winding is different to those of the General Electric Company, and there are four fields. The casing is so hung as to be opened from underneath, and so makes the motor accessible in a pit. With the older motors very good work is done. On the Omaha and Council Bluffs Line, some of the Sprague and T.H. motors are still in use. Much depends upon the care with which they are used. It is of importance to have sufficient power at command, and so avoid the risk of burning out. The new controller of the General Electric Company is a great safeguard in this respect.

The most recent motors are single reduction motors; the previous ones were double reduction and were very noisy. Direct acting motors—that is, motors placed on the axle—have been tried, but the speed is too slow for good working, and when anything goes wrong the motor cannot be detached, which is a great drawback. Mr. Jones, of the Los Angeles Consolidated Street Railway Company, was preparing a motor to be worked with worm and worm-wheel. I should think however the result would be doubtful. There must be much more friction and consequent wear in a piece of mechanism of this sort. The sprocket chain has been used for conveying power from motor to axle, but toothed gearing is undoubtedly the best.

A few facts connected with general management I should mention. Fares in America are uniform for short and long distances—in all cases 5 cents or $2\frac{1}{2}$ d., whether the passenger travels one block only or the whole distance, so that it sometimes happens that a journey of 10 miles can be made for the same fare. In England it is different. I noticed some tramways cut up into 1d. sections, while the horse omnibuses and trams have $\frac{1}{2}$ d. sections. In America, however, at least in the West, any coin less than a "nickel," or 5 cents., is never seen.

One important convenience to passengers is the use of transfer tickets. By applying for these a passenger can change from one line to another belonging to the same company without paying any increased fare. To such an extent is this done that I was told that a reporter in San Francisco had actually travelled about all one morning on one fare. This of course would be an abuse, but the system itself is a great convenience to the public and increases traffic.

Fares are registered on a box or dial at one end of the car—the latter are about the size of an ordinary clock and has a pointer—others have movable figures which change each time a cord is pulled by the conductor. As one or other of these contrivances is always used in America they must answer the purpose of a check fairly well.

When a double line is laid, entrance and exit are invariably closed by a screen on the side of the second line. With cars with longitudinal seats and end platforms this seems simple, but cars with cross seats have a wire netting screen, which, being light, can be shifted from one side to the other when the end of the journey is reached.

A few particulars of some of the best equipped lines which I saw in America may be of interest and are here added.

In San Francisco, at the time of my visit, there were more than 224 miles of tramways—of cable, 102·74; horse, 59·94; steam, 22·03; electric, 39·98, including some lines now being relaid; total, 224·69. Of this length, the Southern Pacific Railway Company held 167 $\frac{1}{2}$. I had the opportunity of having several interviews with Mr. Wilcutt, the Assistant Superintendent of the lines worked by the Southern Pacific Company, and he gave me facilities for inspecting the various lines and the power-houses. In San Francisco, the steepest grades in the world are worked by cable and electricity. Grades of 21 per cent., or rather more than 1 in 5 are worked by cable, while on one of the electrical lines a gradient of 1 in 7 $\frac{1}{4}$ occurs.

I have been furnished with sections of the San Mateo and Metropolitan Companies lines, and the Mission-street line. These I append to this report.

With regard to the San Mateo tramway it will be seen from the section that there are gradients against the traffic of 11·2 per cent. The cars used are of different kinds. Some are single truck, having two 15-horse power motors, and seating capacity for thirty. Others are double truck and have two 25-horse power motors and seating capacity for forty. The seating capacity, however, in the case of these cars, as well as in the case of others in use in the United States, is no gauge as to the number of people travelling, as, frequently more than twice the number allowed for find standing room, so that the single truck cars first mentioned, have often carried 100 passengers, and I went up one of the heavy grades when eighty-four passengers were on the car.

I noticed that the motor gearing of the cars became very much worn. This is due to its being entirely exposed to the dust and grit. The company working the line, for some reason or other, object to the covers used on the W. P. motors; and the newest types of motor have not yet been put into use.

The

The steepest grade on the Metropolitan Company's line is 13·8 per cent. The cars have two motors of 25-horse power each; they are single truck, with seating capacity for forty passengers. Twelve radial truck cars 50-horse power each are also used.

The Oakland, San Leandro, and Hayward line is about 12 miles in length, two types of cars are used—double truck, with two 25-horse power motors, weighing 15 tons; and single truck, with one 25-horse power motor. The speed attained is very high. The schedule necessitates a speed of 25 miles an hour; but speed diagrams, in my possession, show that a speed of over 30 miles an hour has been attained.

The lines worked by the Los Angeles Consolidated Electric Company, consist of 42 miles of electric road and 22 miles of cable, in addition to which there are two short horse lines, of which I have not the distance.

The electric cars have three different types of motors. There are forty-one of them altogether—fifteen gearless, ten double reduction, and sixteen single reduction. Both single truck and double truck cars are used. The motors are supplied by the Westinghouse Company.

The First-street line, which is an electric line, has grades varying from 5 per cent. to 13 per cent.; single-truck cars are used with two 25-horse power motors each. Mr. Clarke, the manager, intended to try a motor worked by worm and worm wheel, bathed in oil. I saw this in course of preparation.

The Denver Consolidated Tramway Company has 100 miles of track, including 18 miles of cable, which has been converted into electric road. Mr. Durbin, the general superintendent, prefers the General Electric Company for generators; the Westinghouse Company for motors. The two power-houses are somewhat inconveniently situated, being outside the city at a distance from the work. The curves are all tapered with high guard rails. The cars are all double truck, and work very smoothly. They seat fifty passengers. The motors are two to each car of 25-horse power each. The longest feeder is 7 miles. Coal is worth $2\frac{1}{2}$ dollars per ton, and costs per car mile $1\frac{1}{2}$ cent. Mr. Durbin's experience is that the Westinghouse motors burn out less frequently; the General Electric Company's motors require less power. The worst grade is 8 per cent., or 1 in $12\frac{1}{2}$; the gauge is 3 feet 6 in.; speed, from 10 to 15 miles per hour. Most of the rails still are of 42 lb., but 70 lb. rails flanged, on 8-inch sleepers, are now being adopted. At one power-house I inspected there were two 400-horse power generators at work, and one 400-horse power generator in reserve. The current was conveyed to the road by thirteen feeders.

The Omaha and Council Bluffs Railway and Bridge Company possesses the third oldest road in America. The company are using the original plant and motors with slight modifications. Mr. Dimmock gave me the following information:—Length of road, 30 miles, including loop in Omaha, and 7 miles of road in Council Bluffs; twenty-five cars of single truck, with two 10-horse power Thomson and Houston motors; two cars only equipped with two 15-horse power motors.

On Sunday, the 22nd July last, a car with two 10-horse power motors and trailer took 190 passengers, the grade on the approach to the bridge over the river being 6 per cent.

Operating expenses per car mile, '0871 dollars, motors and trailer reckoned separately, without interest and taxes. The road between the two cities is laid in railroad style, namely, on "cross-sleepers," with open top. The following is a return of the working for the months of April and June, 1894:—

Mileage for April	183,180 car miles.
Number of passengers	163,770.
Cost per passenger	'0416.
Receipts per passenger	'0742.
Mileage for June	184,931 car miles.
Number of passengers	191,376.
Cost per passenger	'0369.
Receipts per passenger	'0740.

At the power-house I found three 80-horse power generators, and one 135-horse power generator working; also one of 80-horse power; and one of 135-horse power in reserve. Of engines there were three of 200-horse power each, and one of 150-horse power Westinghouse high-speed.

The Omaha-street Railway Company has $6\frac{1}{2}$ miles of cable track operating; 5 miles of cable abandoned in favour of electric power; and 67 miles of electric road. The steepest grade on the cable line is in Thirtieth-street, and is 9 per cent. The steepest grade on the electric road is 6 per cent. Electric cars, single truck, with two 15-horse power Edison, Westinghouse, and Thomson, and Houston motors; seating capacity, thirty-five persons. The power-houses are close together, two companies being consolidated. They have in one of them one 200-horse power Corliss engine, and one 400-horse power Corliss, with generators of 80-horse power each. In the other power-house there is one 600-horse power Corliss engine; two 250-horse power, high-speed Westinghouse engines, and ten Edison generators of 135-horse power each.

The Evanston North Shore Electric line connects with the North Chicago cable line. There are iron poles of 400 lb. each in weight, very neatly erected. They are not so conspicuous as the telegraph posts and poles on both sides of the road. The rails are 80 lb. per yard, with lateral tread; cross-sleepers 2 feet apart, and broken stone ballast are used. Single truck motor-cars, with two 25-horse power motors, G.E. 800; capacity, forty passengers. Speed, up to 24 miles per hour. The W.P. motors first used are now being replaced by G.E. 800. The line has been opened a year and a half, and is 9 miles in length, double track. Trains of one motor-car and two trailers are run. No doubt the trailer helps to keep the single truck motor-car from pitching.

At the power-house of the Cass Avenue and Fairgrounds Railway Company, at St. Louis, there are three Allis-Corliss engines of 1,000-horse power each, with room for a fourth. There are three generators, each 800 K.W. multipolar; direct driven, also one generator of 300-horse power; speed 100 revolutions per minute. They have operated one year and three months. There are 30 miles of road, and 100 cars. Three miles of horse track, and 10 miles of cable are to be converted into the electric system. This line and the Broadway and Franklin Avenue cable lines are worked by the same company, Captain M'Culloch being the manager.

The Baden Electric Railway is a prolongation of the Broadway cable road. Its length is 3 miles, making with the Broadway line $10\frac{1}{2}$ miles, for one 5 cents fare. The rail used is 80 lb. in weight. All joints are electrically welded, the contract price for the welding being a dollar per joint.

The Union Depôt Railway Company works 70 miles of track. The cars are fitted with Robinson's radial trucks. Some are from 20 to 25 feet in length in the body, with a capacity for forty-two persons; others are 30 feet in length, and fitted with G.E. 800 motors; seventy-one single-truck cars are used, fitted with W.P. 50 motors. The radial truck cars work smoothly and admirably, but require careful gauging of road. All cars have longitudinal seats. There is one maximum traction truck car on trial. The engines are, four of them, of 500-horse power; one is of 250-horse power, and another 350; total, 2,600-horse power. There are 170 cars, in all, running. The steepest grade is 6 per cent., about $\frac{1}{5}$ mile long. The company pay interest on bonds and 10 per cent. on stock. The cost of working is 75 per cent. of the receipts. In May last 600,000 car miles were run, and the cost was .09116 dollars per car mile. The number of passengers carried in 1882 was 9,628,535, and the number of trips run 545,800.

On the Lindell-street railway large double truck cars are used, with maximum traction trucks. They work very smoothly. This line does the largest business in St. Louis. The number of passengers carried in 1892 were 12,411,794, and the number of trips run 632,020.

On the Cincinnati electric roads the rails first laid down are being replaced by grooved rails, where asphalt is used. They weigh 95 lb., and 86 lb. per yard, the latter being 6 inches high. These tramways are specially interesting as double trolleys are used throughout the city. Mr. Collins, the general superintendent, says this method is quite as cheap as proper bonding of the rails with copper. It is however complicated at the crossings and leads sometimes to short circuiting.

On the Clifton electric line, an elevator is used for raising and lowering the cars bodily between the two levels.

Mr. Little, the general manager of the Buffalo-street Railway Company, gave me the following particulars:—The operating expenses are 52 per cent. of the receipts, and amount to 10·71 cents per car mile, without interest and taxes. The plant and motors have been supplied by the General Electric Company or the firms which have been combined in that company. A few double-truck cars are used. Grooved rails of 95 lb. per yard, and 8 $\frac{1}{2}$ in. height, are now being laid down. This is the approved section. They have a groove 1 $\frac{1}{2}$ in. wide. The older rails have a 1-in. groove, shallower, and are placed on chairs; the new rails are on cross-sleepers and tied through the web. Deep fish-plates, with 12 bolts, are used. The number of miles worked by the company is 154. There are about 248 motor-cars in operation, or including trailers, 275. The main street and some other streets are asphalted. In the power-house there are six vertical marine engines, each driving, with pulley and belting, two Edison G. E. Company 200 K. W. dynamos; also three Ball engines, driving each one Edison G. E. Company 200 K. W. dynamos. There are also in course of erection two Lake Erie vertical marine engines, each of 1,250-horse power, direct connected with dynamos with 8-feet commutators. The engine-room is provided with overhead crane. The boilers, with two small exceptions, are of the Babcock and Wilcox type, fitted with Roney stoker. The air-pump is of the Worthington type.

In Brooklyn there are about 400 miles of electric roads. The principal company—the Brooklyn City Railway Company—owns 200 miles of road, which includes horse tracks. There are three power-stations, of which the Kent Avenue Station is the finest. There is a cable-road laid down on Park Avenue, but it has never been used as such, electric power having been substituted. The following is a description of the plant at the Kent Avenue Station:—There are four compound engines of the Allis type, made at Milwaukee, four generators, 1,500 K.W. each, and there is room for two more. These generators are compound-wound, direct connected, with twelve poles. The fields are of cast-steel; the commutators 7 $\frac{1}{2}$ feet in diameter. There are twelve brush-holders, each having six brushes, 2 $\frac{1}{2}$ -inch by 3-inch by $\frac{1}{4}$ -inch. The engines make seventy-five revolutions per minute. There are surface condensers and economisers. There are from 1,200 to 1,500 cars operating on the whole system, of which about 400 are motor-cars. Two overhead cranes, capable of lifting 60 tons each, have been provided in the engine-room; and there will be eighteen Babcock and Wilcox boilers in two tiers, with coal-weighing shoots to each boiler. There is an apparatus for hoisting coal from barges, which operation costs 1 $\frac{1}{2}$ cent per ton. A grab loads into hoppers, from which a bucket-ladder takes the coal into store. The store holds 5,000 tons. The operating expenses of the power-house are 1·7 cents per car mile. The feeder-wires are about $\frac{7}{8}$ of an inch in diameter. The elevated roads in Brooklyn do not pay, but the trolley roads do well. Electrolysis is avoided by connecting water-pipes with the negative pole at the generating station, also by special feeders overhead to rail.

On the Allentown and Bethlehem Rapid Transit Company of Pennsylvania there exists an 11 per cent. grade, over which all cars have to travel. They use W.P. 50 motors.

The Boston West End street Railway Company is one of the most important users of electricity in America. The new cars on this Company's line have a 20 feet body, single truck. This is the proper length according to the general manager's opinion; if longer than this he says they pitch. He does not like radial cars. The company possesses 1,530 cars, about half of them closed, and half open. Closed cars are used in winter, and driven by two motors of 25-horse power each. In summer, one motor is removed, and put to drive the open cars. The power-house is at Waltham-street. There are here six Allis triple-expansion engines, each driving three generators of 500 K.W., each by means of counter shafting. There is additional power in the old house. There are here ten engines, each 250-horse power, thirty generators, of 80-horse power, and twenty-four Babcock and Wilcox boilers.

The South Staffordshire line, in England, is one most worthy of attention. Mr. Alfred Dickenson, the engineer for this line, accompanied me over it. A good description of the same is to be found in the proceedings of the Institution of Civil Engineers, vol. cxvii, 1893-4, part iii.

The following is a statement of the cost per car mile for running and repairs, 1893:—

Running—		pence.
Wages	...	1·93
Fuel	...	0·48
Stores	...	0·43
Water and gas	...	0·08
Sundries	...	0·06
Repairs—Wages and materials	...	1·08
		—
Total cost per car mile	...	4·06
Number of miles run	...	262,694

In the month of August, 1894, the working expenses, according to Mr. Dickenson, were reduced to 3·68 pence per car mile. A

A report on tramways would not be complete without some remarks on other systems of traction than those already referred to. The most prominent of these as applicable to streets is the cable. San Francisco may be said to be the home, as it was the birth-place, of the cable system. It has still the longest mileage of cable roads, although Chicago, with its immense population, is vying with it. In San Francisco, nearly 103 miles are worked by cable. The Consolidated Market-street Company, which is controlled by the Southern Pacific Company, work the greater number. The main line is Market-street, down which now there is an enormous traffic; and the extensions along Valencia-street, Castro-street, and Haight-street are worked from the same power-house, at the corner of Market and Valencia Streets. This power-house is very much cramped, as engines have been added to cope with the increasing traffic. In addition, there is the Geary-street line, now a new and reconstructed line. The original cable trench was built of wood, and was adapted for a side grip. It has now been re-placed with concrete and iron frames, and the grip is a bottom grip. Another line is M'Alister-street. Two cables are worked from the power-house, one being 30,500 feet in length, which is acknowledged to be too long a length for convenient working. One cable is worked by a side grip, the other with a bottom grip. Another line is the Hayes-street line. These various lines coupling on to Market-street, but do not connect. A turn-table is placed at each end for the cars, which are combined grip and trailer, and have to be reversed at each end of the trip. The Howard-street line is also worked by the same Company. Some of the new power-houses are of very fine design, but the plant is much larger than required, it having been anticipated that large extensions would take place. There is a possibility, however, that any further extension would now be worked by electricity.

The grades on some of the other lines in San Francisco are extremely steep. California-street as steep as 1 in 4·8, but there is this advantage of the grade over those in Sydney, which are only half as steep. All intersections of cross streets are level, and the cars are never stopped elsewhere than on these level places. The result is that there is nothing like the strain at starting experienced in Sydney—in King-street, William-street, and Upper William-street—where the trams stop and start on the steepest parts of the line.

Various opinions are expressed as to the computed cost of working cable and electric cars in California. Mr. Wilcut, the Assistant Superintendent of the Lines worked by the Southern Pacific Company, is strongly in favour of cable for most work. He says that later cable cars only take 7 or 8-horse power each, whereas each additional electric car takes 25-horse power, so that where providing for future requirements this must be taken into consideration. Mr. Wilcut was unable to give me details of the cost of working the different methods adopted by the Company because, he says, no proper separate accounts have been kept, but he was now taking care to have all the details separated so that in future it would be possible to compare accounts. In Boston, he points out, electric roads cost 25 or 26 cents per car mile to work as against 18 cents for the cable, but the most of the cars in that city are large, and it is believed that another reason for higher cost, where it does exist, lies in the fact of the higher speed. I ascertained this, however, that the Consolidated Piedmont Cable Company, on the eastern side of the bay, who have cable roads, work some of them by electricity, and they state that they thus save 2 tons of coal daily, costing 6 to 7½ dollars per ton; also five men at 2½ dollars per day—or, in all, 5,000 dollars per annum, by the substitution.

Los Angeles affords a good opportunity of comparing the cost of cable and electric traction. Mr. E. P. Clarke, of Los Angeles Consolidated Electric Company, who possess 42 miles of electric road and 22 of cable, told me that the cost of the fuel consumption amounted to 109 dollars per month in each case, oil being the fuel used. The allowance for cable wear was 1,076 dollars: for motors, 500 dollars. In the 42 miles of electric road one power-house was ample, whereas the cable trams were worked from three different houses. On the First-street line 12 per cent. grades are used. Mr. Clarke says that, were it not for the numerous curves, this company would be better worked by cable; as it is, all the cable lines will, sooner or later, be converted to electric. The lines are worked with a bottom grip, which differs somewhat from the Geary-street grip. The type of rope used was one having twelve wires in the strand, six large and six small alternately, and the wire was very even and good. Crude petroleum is used for lubricating the ropes in preference to the mixture formerly employed.

Mr. Clarke says he prefers the electric system generally, if traffic is not too heavy, because it serves the public better, makes better speed, and a less number of cars are required. This concurs with the opinion expressed in San Francisco.

The Temple-street line in Los Angeles is not part of the consolidated system. Here there is a double side grip used. Part of the line is single track, with the up and down ropes both in the same tube. The grip is worked with a wheel, and is on a swivel, so that it can be inclined one way or the other to pick up the rope required.

Before leaving the consideration of the Californian tramways, I must mention the California Street Cable line. Here a new style of bottom grip, introduced by Mr. Stutt, engineer to the company, is used. He has also a special tension apparatus, which consists of a pulley and a $\frac{3}{4}$ -ton weight acting on the ropes between the driving drums. This is not, I think, a desirable method, as it introduces a reversed bend in the ropes. Mr. Stutt has also a track brake which has been found very serviceable. Mr. Stutt is engineer to the Piedmont Consolidated Tramway Company as well.

At Denver there is an admirably conducted Cable Tramway, which, however, is not in a flourishing financial condition. The receiver, Mr. Randolph, gave me the following information:—Relative tram car mileage 6,500 were worked by the cable; 11,000 by the electric system. The total length of track is 30 miles; total length of rope, 175,000 feet; the longest rope, 37,500 feet; the second longest rope, 32,000 feet. The speed of the cable is 10 miles per hour. The rope is 1 $\frac{1}{4}$ inch Roebling, costing 12 cents per lb. The actual horse-power developed is 1,000; 760 horse-power being absorbed by rope alone. There are forty-eight trains consisting of dummy and trailer, which run at intervals of six minutes. All are driven from one power-house. The latter is therefore much cramped. The grip is a double side grip, to suit some lines where the cable has to be taken up on the other side.

The capacity of the grip car is twenty passengers, of the trailer twenty-five passengers. The following is a return of the expenses, per car mile, of this company for the quarter ending the 31st March 1894:—

	Dollars.

The wages paid are—for foremen 2 dollars 40 cents for eight hours; helper 1 dollar 60 cents; train-man 20 cents per hour; other men from 50 to 60 dollars per month. Coal slack is used costing 2 dollars $37\frac{1}{2}$ cents per ton.

There is only one momentum curve. Mr. Randolph considers the risk of over-running outweighs the advantage of saving in the wear of the rope. A track brake is used. There is spur-gearing in the power-house. The latter is much crowded. Mr. Randolph prefers cotton rope driving, and will use Walker's drums when the existing ones wear out.

The other principal Tramway Company is the Denver Consolidated Transfer Company who work 100 miles of track by electricity. I mention this because 18 miles of cable road belonging to them is now worked by electricity.

At Omaha I visited the lines of the Omaha Street Railway Company. This company works $6\frac{1}{2}$ miles of cable track and has abandoned five miles of other track in favour of electric power.

In Chicago there is a considerable mileage of cable line worked by three companies. Following are some particulars of interest:—

The West Chicago Street Railway Company operate 183 miles of track of which 38 miles are cable, and 147 miles horse road. The latter will soon be converted into the electric system, steps having already been taken with regard to the same.

The principal power house is at the corner of Washington and Milwaukee Streets. Here there are two Corliss engines of 1,000 horse power each, but the indicated horse power is only 800. Walker drums are used, coupled together by gearing. At first one only was driven direct from the engine, but some loss was experienced through slip. The length of the cable is 8,500 feet. The diameter of the rope is $1\frac{1}{8}$ in. The outside wires are uniform. The speed is $6\frac{1}{4}$ miles per hour. A double side grip is used. At junctions, &c., when it is necessary to kink the slot, the rails are laid without a kink as the grip has a lateral sliding motion. This seems to be the general practice in Chicago. An electric strand alarm is used. At the corner of Milwaukee-street there is a signal box where the points are worked by hydraulic power. The line passes under the river in Washington-street through a tunnel. This was bought for the cable line, but it is very narrow. The smallest curves on this line are 50 feet radius. On Madison-street, 75 trains run; between 700 and 800 cars are used on the whole system.

The power house at Madison-street was finished in 1890. There are two Greene horizontal engines of 1,200 horse power each; 47,000 feet of rope. Here again there are Walker drums in use, connected by gearing. The speeds of the ropes are 12 miles and $13\frac{3}{4}$ miles per hour. There is also a power house at Vanburen-street, with Corliss engines driving on to two shafts provided with Walker drums. The engines are 1,500 horse power nominally, but only indicate 600 horse power. The grip is a bottom one, like that in use at Geary-street. The jaws are of soft cast-steel, and they last two weeks. At St. Louis, on the Franklin Avenue line, cast-iron is used for the purpose. The tunnel under the river is 30 feet wide, the cost of which was 1,800,000 dollars. In Chicago large dummies and trailer cars are used, the grip being situated generally at the front of the car. Trains are run with one dummy, and often with three trailers.

The Chicago City Railway Company, South side, have 38 miles of cable, 34 miles of electric line, and 91 miles of horse-tramway. The speeds of the various sections of cable are 10 miles per hour in the city, 12 miles per hour on the middle section, and 15 miles on the outside. The operating expenses of the cable are $8\frac{1}{2}$ cents per car mile. The principal power house is at 22nd street. Here there are two engines of the Wheelock type, with cylinders 36 in. x 72 in. The shafting is of steel forged 18 inches in diameter, swelled to 20 inches, with water jacketed bearings on main pedestals. This and the cable machinery are by Messrs. Robert Poole and Sons, of Baltimore. There are two driving pulleys working belting each 300 feet long and 62 inches wide, cotton faced with leather, made by the Underwood Mounting Company. These have been running for over two years, and are said to be capable of conveying from 2,500 to 3,000 horse-power. It is stated that some belting of this type has been running for seven years. These engines work up to 1,800 horse-power, and it is said that 33 per cent. only is absorbed by the cable. The total length of cable is about 20 miles; maximum number of trains, 175, consisting of one grip-car and three trailers. There is a spare engine with gearing, and acting through a sleeve coupling.

The cable drums are of the Walker type, both shafts driven. There are also two pairs of engines in reserve with gearing. It is stated that the Walker rings could be put on in two pieces dove-tailed. The boilers are of the Hazleton type, with Roney mechanical stoker. Coal slack is used, costing $1\frac{1}{2}$ dollars per ton. The boilers are worked for six months at a stretch. A vegetable compound is used to get rid of scale. A track brake is not used on this line. The Company use the Johnson brake. All horse lines will shortly be converted into electrical ones.

In

In St. Louis there are two cable lines taking a lot of traffic, viz., the Franklin Avenue and the Broadway lines. The former, as already mentioned, is shortly to be renewed, and will be converted into an overhead electric system. A few particulars of these two routes are added.

On the Franklin Avenue cable line Walker drums are used, geared together. There are four ropes; two sets of engines, 450 horse-power each. The grip used is the Volk bottom grip. Long tension ways are provided. The speeds are $9\frac{1}{4}$ miles per hour in the city, and 12 miles per hour outside. The cars run every two minutes when busy; grip-car and trailer coupled together, fifty-three persons capacity. There are 5 miles of road—that is, 10 miles of track—to be extended $1\frac{1}{2}$ miles. The lining of the tunnel is of wood, and requires renewing; the line will, however, be converted into the electric system.

The Broadway cable line at St. Louis is operated by the same Company as the one previously mentioned. The speed of the rope is 10 miles in the city, and 12 miles outside. There are $7\frac{1}{2}$ miles of double track. There are seventy trams when in full running, the interval being $1\frac{1}{2}$ minutes; half of the line is worked from each power-house. Walker drums, both driven, are used. The operating expenses are $7\frac{1}{2}$ cents per car mile, including interest and taxes. Electric cars are larger, and should be worked for 12 cents. The return for the year ending April, 1893, being over 5,000,000 car miles. Sixty-four per cent. of the power is required for the cable. The boilers used are Hazleton's tripod, with Roney stokers and feeding-trough to same.

At Cincinnati there are some cable roads where a side grip is used. On some cars this is worked by a lever; in others, by a wheel and worm.

Among the most recent introductions of cable lines in the United States, are two in New York—the Broadway cable line and the Third Avenue. The construction of the road is of a very solid description—the yokes are of cast-iron, and are wide enough to support the rails in addition to the cable tube.

At the time of my visit they had not been working a year, and no returns were obtainable.

The chief point of interest about these lines is that they are worked on what is called the duplex system—that is to say, there are two ropes, and laid in the tunnel side by side, one being driven, the other at rest and in reserve. The grips used are double side grips, so that either rope can be seized. The adoption of this double rope is necessitated by the fact that in New York the traffic is continuous throughout the twenty-four hours; and it is evident, therefore, that as there is no slack time to inspect and attend to repairs, the second cable is essential. The traffic of New York is quite exceptional in its character, and it is, so far as I know, the only city where traffic is carried on continuously during the twenty-four hours.

On the elevated railway trains run all night as well. It is quite certain that the duplex system is a most expensive one on account of extra construction, additional cables, and more reserve of engine-power in case of accident. I have already made some remarks on the traffic of this road and the comparative suitability of cable and electricity. It may be interesting to note that the power-plant working the said Broadway cable tramway is situated at Colston-street in the basement of a large building, and is quite invisible from the street. In spite of artificial ventilation the engine-house is terribly hot.

The length of double line worked from the power-house is $1\frac{1}{4}$ miles to South Ferry, and $1\frac{3}{4}$ miles to Thirty-sixth-street, thence to Fifty-ninth-street. The pulleys are 32 feet in diameter. The drums are not of the Walker type, but they are both driven. The indicated horse-power is 1,100, speeds of rope 6 and 8 miles; a rail is used with a wide groove. The intervals between the cars is thirty seconds. A man is always on watch for faults in the cable. The grip is situated in the centre of the car, and worked by wheels from either end. There are two wheels—one for the brake. No trailers are used.

The power-house at the City end of the Third Avenue cable line drives three ropes to run the City end on the duplex system. The length of ropes used on the whole line are as follows:—8,331, 19,038, 36,238, 36,049, 32,939, and 33,033. The drums are geared together. The Walker clutch, which is a disc, like on the West and Capon's, is used. There are three pulleys 32 feet in diameter.

The power-house, which is situated at Sixty-ninth-street, is three times as large as necessary. There are four engines (one only being used at a time), capable of developing 1,500 horse-power each. The cylinders are 40-inch by 72-inch. The boilers are thirty-two in number, return tubular. There were twelve running at the time of my visit. The design of engines and buildings is magnificent, but it is a pity to see such an enormous useless expenditure.

There are 180 cars in use on the Third Avenue cable line, and the interval between them is one minute. Bemis trucks, with band-brakes on pulleys, are used.

The principal traffic over the Brooklyn Bridge is worked by cable. Although this method is not applicable to ordinary streets, I think it desirable to give a few particulars. Mr. C. C. Brown, the engineer-in-chief, kindly showed me the work. The machinery for driving the cable was provided by Messrs. George Poole and Son. West and Capon's disc friction clutch is used. These have thirty-four plates, 5 ft. 6 in. in diameter. The grip has two pairs of horizontal wheels, having grooves lined with rubber and leather, supplemented with short solid rubber-lined jaws, the rope being lifted in place by external means. The pressure for holding the rope is transmitted to each wheel from the car platform by means of a hand wheel and rods through the medium of a wooden brake-shoe applied to the inside surface of the rim, which is flanged for the purpose. The brake-shoe serves the double purpose of applying the pressure and of checking the motion of the wheels until they cease to turn, when the car will travel at the same speed as the rope. Each car has independent action. There is a vacuum brake on each car worked by the axle; the brakes are independent of each other, and in charge of the conductor of the car. Four cars are coupled together, 15 tons each. Tilting pulleys with springs are used where the grip is put on at the Brooklyn end. Shunting is done by locomotives. The accommodation will shortly be doubled by putting lines outside the present platform and using double ropes. Expansion joints in bridge and platform girders, to slide, used. The movement is 16 inches in the centre of bridge and 9 inches at each end.

At Washington there is a very fine cable plant. There are three cable lines, all of which are worked from the one power-house, the cable being run out in two instances in separate tunnels to where the road commences. The engines are of the Corliss type, and the driving is effected by cotton ropes. The Walker drums are used, as with us. In Washington the electric overhead wires are not allowed, and there is a large traffic to be done by cable. Trains consisting of one grip-car and three trailers are used. The grip-cars are large and have the seats arranged crossways, the grips, however, being placed in the middle of the car. The power-house of the above Company is situated at Thirteenth-street.

The

The lengths of the ropes are as follows :—

23,500
31,600
27,700 + 2,000

$82,800 + 2,000 = 84,800.$

The boilers are of the Babcock and Wilcox type, with Roney stokers and feeders from floor above. Track brakes are in use.

Seventh-street is operated by the same Company, with independent cable and power-house.

Although this line is everything to be desired, both in construction and working, I am inclined to believe that with our present knowledge an electrical conduit line would perfectly cope with the existing traffic, and would be more economical, inasmuch as it would get rid of the large absorption and waste of power which now must be taking place through the cables having to be led from the power-house long distances to where the traffic begins.

I only visited one other cable line, viz., the Birmingham cable tramway. The power-station is situated at Hockley, where the cables are received on their way to Birmingham, and also those for working the line from Hockley to Handsworth. Steam is supplied by six Lancashire boilers, 6 feet in diameter, 24 feet long, generating steam of 80-lb. pressure per square inch. The engines are a pair of horizontal steam engines having jacketed cylinders 24 inches diameter, stroke 4 feet, making fifty revolutions per minute. Steam brakes are fixed under each fly-wheel. The main shaft is of steel, having 9½-inch journals.

The cars are constructed with two bogies; they carry twenty passengers inside and twenty-one outside.

The gauge is 3 feet 6 inches; rails of girder section, 98 lb. per yard; slot rails, 65 lb. per yard.

The cable is of steel wire 3½ inches circumference, and contains six strands of nineteen wires laid on a hemp core.

The cable tramway as above described has been extended from Hockley winding station as a double line 3 miles long, worked by ropes from Hockley station.

The following is the working account for twelve months ending 30th June, 1894 :—

	Total expenditure.	Expenditure per mile run.
Cable haulage	£6,366 16 6	2·19
Cables and machinery	2,611 4 9	.90
Car repairs	1,357 11 1	.47
Traffic expenses	3,713 1 0	1·27
Permanent-way and buildings	614 19 1	.21
General charges	1,839 7 5	.63
	£16,502 19 10	5·67

Little need be said on the question of horse traction. It is being generally superseded by electric traction, and it is only likely to hold its place permanently in cities which, like London, have narrow, curved, and heavily thronged streets. But even in London I believe that while the omnibuses on many lines will still continue to thrive, the horse tramways which start outside the sacred precincts of the central district and run rapidly outwards will soon be converted into electric lines.

To those who think that London is behindhand in using omnibuses so largely, I would only say that they are large and well-constructed vehicles, with comfortable cross seats on top where ladies even can ride, and that with the even wood-paved streets existing nearly everywhere, travelling by this method is by no means uncomfortable.

In crowded cities where the surface of the streets is insufficient to carry all the traffic, underground and overhead methods have been adopted to cope with the difficulty.

Of the first, the London Metropolitan and Metropolitan District railways are the best known, as well as the first constructed examples; while the City and South London railway—a tunnel line worked by electrical power—is the latest development; and so successful has this latter method proved that it has been adopted without hesitation for other proposed lines in London.

It is the opinion of many who are competent to judge that all underground lines worked by steam could easily be adapted so that electrical power could be used. Were this to be done with the Metropolitan and Metropolitan District railways in London the comfort of the passengers would be enormously increased, as there would be no smoke and dirt and choking sulphurous fumes which now exist, and it is tolerably certain from other examples of electric traction that the traffic could be conducted more economically. The difficulty of conversion from one system to another lies, of course, chiefly in the large number of locomotives on hand, which have been built specially for the particular traffic, and which would have, it might be thought, to be thrown on one side, but I am inclined to believe that the alteration might take place gradually. Another difficulty has been pointed out, viz., that the traffic is not all self-contained, but consists, to a large extent, of suburban trains coming in from distances outside. I do not think this need be a difficulty at all. At the worst, this small proportion of traffic might still be allowed to come in worked by steam-locomotives; the effect on the atmosphere of the tunnels would be small compared to what now exists. Might not an extension of the railway from Redfern into the city be worked by electric-locomotives?

Of the second or overhead group there are various examples. There are many railways running in and out of London carried on viaducts, coming therefore under this class; but the most remarkable specimens are the four lines belonging to the Manhattan Railroad Company in New York, and some similar lines in Brooklyn and Chicago. The peculiarity of these, and of the New York lines in particular, is that they follow some of the principal streets, in some cases the double line being supported by pairs of columns and girders over the roadway; in others the up and down lines are carried separately on single supports over the footpath. Say what one may in favour of the system, and of the design of the work, and the excellent management of the traffic, it is an abomination. It is bad enough for steam-motors to be noisily careering down the centre of some of the streets in a city like ours, but to be thundering along overhead and passing in front of upper-storey windows could only be tolerated, I believe, in America, where people in power remorselessly trample over the rights of others, and pride themselves on the freedom of the country.

In

In Chicago the principal overhead line, commonly called the "Alley Elevated," is not open to the same objection, as it follows for the most part an alley or back lane.

The noise of an overhead line is, of course, very objectionable, but the smoke nuisance can, to a very great extent, be obviated by the use of coke or anthracite coal, which is so abundant in America. In Chicago, however, a new overhead line, the "Metropolitan," is being equipped with electric power for drawing the trains while in Liverpool the overhead railway which runs the length of the docks, and which is not open to the objection which I raised against lines in city streets, is being successfully worked by the use of electric motors.

The following are some notes of the abovenamed lines:—

The Rapid Transit Company, Chicago, is commonly called the "Alley Elevated Company." The curves here are of 100 feet radius; trains of four cars, each seating thirty-eight persons; locomotives, Baldwin Compound; weight, 28 tons; load on drivers, 20 tons. The sides of the cars overhang the viaduct; the stations have platforms at car-floor level, and are situated at intervals of every three or six blocks. The fare is 5 cents for the whole journey, or part. A guard, or conductor, is in charge of each car. The locomotives have drawn as many as eight and nine cars. The drivers are 4 feet in diameter; wheel-base, 5 feet; length, 30 feet over all; weight of cars, 15 tons. The line generally is a double one. An incline has been made down to the repairing-shed; but all important repairs are done by contract. There is one high-pressure locomotive and forty-five compound do. The viaduct is of iron, over $3\frac{1}{2}$ miles; and steel, over $5\frac{1}{2}$ miles. The cost of the latter part was 150,000 dollars per mile, for the steel erected. The spans are 48 feet. The cost of the foundations, extra, was 30,000 dollars; and the cost of the permanent way, 38,000 dollars. There is much vibration. The weight of rail is 90 lb. The alley is 30 feet wide, and the company have to pay a nominal rent to the Council. This portion extends over a considerable distance. Elsewhere, the railway passes along the back of allotments. The locomotives cost 6,500 dollars each. They are larger and more expensive than necessary. The company have operated two years. There is an allowance for expansion in the girders, on every second span the girders have slotted holes.

The Lake-street Elevated Railway is controlled by the West Chicago Street Railway Company, and worked by steam-locomotives. They are very likely to be changed for electric-motors. This Company have obtained franchise to run to Wabash Avenue.

I was informed the design and rolling-stock are very similar to the Alley Elevated.

The uprights are let into stone blocks at the base. The schedule speed is 12 miles per hour.

The Manhattan Elevated Roads, New York, consist of parallel lines running the length of New York. The General Manager, Colonel Hain, kindly gave me facilities for inspecting the works.

The Eames Vacuum Brake, non-automatic, is used. It is a modification of Smith's. The drivers are 42 inches in diameter; truck, 26 inches; cylinders, 12 inches by 16 inches; total weight in working order, 24 tons. The boiler-pressure is from 120 to 160 lb. square inch. The maximum speed was 45 miles per hour. The rails are of 90 lb. weight, with flanged fish-plates having six bolts each. Ribbed tie-plates are used. The ties—that is, the sleepers—are 6 inches by 8 inches, yellow pine, vulcanised—that is to say, subjected to air-pressure of 250 lb. to the square inch without preparation, at a heat of 250 degrees. The transoms have stood eight years, and will probably last eight years more. The cost of the process is 25 cents each; the original cost, 25 dollars per thousand.

Some foundations run down 40 feet in depth, and the base is, in that case, 14 feet square. Trains are used with four and five cars each. There are about 250 locomotives, and 1,000 cars, which weigh 15 tons light, with seating capacity for forty-two passengers. Drip-pans are fixed to locomotives under the cylinders, glands, &c.; connected with the smoke-box of all the boilers there is a deflector for cinders and a catch-pit.

A new locomotive which I saw had the frame made out of a single ingot of steel, hammered and slotted from the solid without welding. The heaviest grades on this line are 2 per cent. The longest length, on the west side, is 10 miles; on the east side, 8 miles. The total length is 35 miles, double line. The fares are all 5 cents, for any distance. There is a fine and well-arranged coal-elevating apparatus at the coaling-station, with hoppers, each provided with weighing-machines for charging.

The Metropolitan Elevated Railway, Chicago, which will have a total length of 18 miles, is in course of construction, and will be ready for opening next spring. It is intended to use steel-rail conductor and electric motor-cars—not locomotives. This line is said to have cost £75,000 per mile; but this is probably a low figure, as part of the line has four tracks. The following is a description of the proposed plant, which has been given to me by Mr. Sunny, of the General Electric Company, that company having lately obtained the contract for the construction of the same. Car-bodies, 40 feet over corners; 47 ft. $2\frac{3}{4}$ in. over buffers; 33-inch wheels; 5 ft. 4 in. wheel-bases. Motor-cars equipped with two motors—that is, one motor on each of the double trucks. Two more motors can be added at any time in the future. The motor-car, equipped as above, will haul three trailers. The weight of the motor-car, loaded, is 63,500 lb. A train, consisting of a motor-car and three trailers, weighs 201,500 lb. The average speed will be 13 miles an hour. Trains will be run 2,000 feet apart. The electric-motors weigh 4,000 lb. each. The motors are capable of developing a speed of 40 miles per hour on a straight, level track. Horizontal effort is 2,000 lb. at a speed of 20 miles per hour. The motors are capable of developing 100 h.p. at the axle for two hours, without heating above 85 degrees centigrade. Maximum of efficiency, 85 per cent. Motors can deliver 150 h.p. for short periods, at the axle, without damage. Voltage is 500.

When the motor-trucks are equipped with the two additional motors, making four motors in all on the motor-car, the motor-car will be capable of hauling a six-car train, weighing 302,000 lb., at an average speed of 15 miles an hour. There will be fifty-five motor-cars.

The generator equipment is two 670 k.w. generators at 100 revolutions, capable of giving 1,116 amperes at 600 volts. Two 1,340 k.w. generators, 75 revolutions, with a capacity of 2,230 amperes, at 600 volts. The generators are capable of a 60 per cent. overload for short periods. Ninety-four per cent. efficiency.

The Liverpool Overhead Railway has a length of line of $6\frac{1}{3}$ miles double track, the gradients are easy, excepting two short gradients of 1 in 40 under crossing a coal-line. The sharpest curves are 7 chains radius. The line is carried on cast-iron columns, span 50 feet, with bowstring lattice and plate girders. The electrical conductor consists of a steel bar 4 square inches in section, of channel form, and is placed midway between the rails of each line. One train consists of two carriages, each 45 feet long, and 8 feet 6 inches wide, and two bogies with 7-foot wheel-base, and 2-foot 9-inch wheels. The trains are

are fitted with the Westinghouse air-brake, a hand-brake being also provided at each end of the train. The generating-station is under the arches of the Lancashire and Yorkshire Coal Railway; the coal is here tipped direct from the railway-trucks into hoppers placed over the boilers. The boilers are of the Lancashire type, with cross-tubes; they are of steel, six in number, each 8 feet diameter by 30 feet long, with a working pressure of 120 lb. per square inch.

The engines are four in number, each consisting of a pair of horizontal compound condensing engines, by Messrs. Musgrave & Co., of Bolton. Each engine will develop 400 h.p., at 100 revolutions per minute, with 120 lb. boiler-pressure. The dynamos are of the Elwell Parker type, one to each engine, from which the current is conveyed along the steel conductor already described, each dynamo having a normal output of 475 amperes at 500 volts and 420 revolutions per minute, or 1,200 electric h.p. in all.

The weight of locomotive equipment is about 125 lb. per passenger, and about 20 per cent. of the total weight of the train, with all seats occupied, each passenger being taken at 140 lb. weight.

According to tests at the generating-station, the mean efficiency or ratio of e.h.p. to i.h.p. was 88 per cent. The tests lasted over 3½ hours. The coal consumed was 4,032 lb. Total e.h.p. hours, 1,195; coal per e.h.p. hour, 3·37 lb.; coal per i.h.p. hour, 2·96 lb.

The cost of working, including lighting of stations and signals, for one month is as follows:—

	Pence per train mile.
Supervision ...	·416
Generating-station wages ...	·590
Drivers' wages ...	1·043
Coal ...	·718
Oil, waste, grease ...	·139
Water ...	·013
Stores and sundries ...	·105
Cleaning and repairs, &c., at car-shed—	
Wages ...	·521
Material ...	·430
	<hr/> 8·975
Allowance for signals and lighting ¹ ...	·271
	<hr/> 3·704

Train mileage, 41,430.

With regard to steam traction in streets, I have already shown that it is a most undesirable method, and its further extension should be avoided as much as possible. I saw steam-motors running in Leeds and Birmingham, but they are not liked, and sooner or later must give way to something better. Probably when the prejudice against electrical methods has worn away, we shall see a large substitution of the electric-car and overhead wire. It is difficult indeed to me to understand why the hideous steam-motors one sees in these towns should be tolerated, when the danger and unsightliness is so much greater than that of the electrical line.

I will now make some remarks on the Deceauville system, which has been introduced so successfully into France and other countries, for certain classes of traffic, although in my opinion it comes more under the category of tramways than railways. For tramway purposes, where cheapness is desired and the traffic is small, it is eminently suited.

It is capable, as traffic increases, of easily coping with the requirements. It is quite suitable for goods traffic (heavy and light), and for the carriage of stock and heavy armaments, convincing proof of which was given me during my visit to France.

It is a system also eminently suited where the traffic is of a purely local character—as, for instance, for the carriage of produce and passengers from the country into market-towns, and the reverse. It is suited for the carriage of sugar-cane and agricultural produce from field to factory or market, as the permanent way is light, and can be readily shifted from one spot to another. It is not so well adapted to the conditions generally existing in this country, where it is convenient that wool or live stock once loaded up should be taken without change to the port of shipment or the centre of consumption. In the case of wool bales, transference, where there is a change of gauge, could be conducted with a minimum of trouble if proper appliances are introduced; but with live stock, the changing from one car to another might be attended with very great difficulty, and perhaps danger, to the condition of the stock.

For mineral-traffic the system is thoroughly adapted. Lines thus laid down could follow the contours of the ground far better than the standard gauge line, and would, therefore, be undeniably cheaper. Transference of ore to the standard gauge trucks could be easily effected in the same way as is done at Ballymena, in Ireland, as mentioned in my previous report. I am inclined to think that at certain ports in this country, which for a long time to come are not likely to have railway connection with the main system, narrow gauge lines of this description could be laid down to connect them, *i.e.*, the ports with outlying agricultural lands lying higher up the rivers, the lines in this case being laid as near as possible along the roads.

Possibly such a proposal as the Eden to Bega Railway might be made on this system, although I must point out that in this case the line would have to contour round the hills to some extent, as the grades on the roads are of an impracticable character for steam traction.

The gauge used on the Deceauville system varies from 40 to 100 cm., but only two gauges, viz.:—60 cm. = 23½ inches and 1 m. = 39½ inches, are sanctioned by the French Government. The locomotives are of various types, weighing from 3 to 12 tons light, high pressure, compound, and double ended; but the type generally preferred is one weighing 10 tons light, and 13 tons in service, high pressure, with cylinders 10 in. x 12½ in., six wheels coupled 25½ inch diameter, capable of traversing curves of 82 feet radius, and hauling a load of 16 tons up a grade of 8 per cent., at a speed of 5 miles per hour. At the end of 1892 about 865 miles of tramway had been constructed on this system, and concessions granted for a large additional mileage.

Much is now done in the way of overhead traction, on ropes suspended at distant points on trestles and piers.

The

The lately constructed Devil's Dyke cable-way at Brighton, England, is an example of this, adapted for passenger traffic, while the application of the system in one form or another to carriage of minerals, sugarcane, and other produce, is very extensive. I am of opinion that such methods might be found very suitable in our own country for the transport of cane to railway or river from the hilly slopes, which are now coming under consideration in the Richmond and Tweed districts.

Not only would the first construction be much less on account of the large quantity of material and less labour per mile, but the length of the line would be indefinitely diminished, as it could go nearly straight across country, there would be little or no land taken up, there need be no severance, and the working expenses would probably be much less, as the maintenance of road in wet, boggy ground would be avoided. The cost of such a line, taking shortness and absence of land resumption into consideration, might possibly vary from quarter to half of that of a steam line.

Telpher lines are similarly suspended lines, but are worked electrically. The subject is one deserving much consideration, but too large a one to be included in this report.

The following appendices and diagrams are attached to this report:—

1. Comparison of the mileage of street railways in the United States for the years 1891, 1892, 1893, 1894.
2. Details of electric lines already completed in Europe.
3. Electric street railways of the State of New York. Extract from the 11th Annual Report of the Board of Railroad Commissioners for 1893.
4. Electric street railways of the State of Massachusetts. Extract from 25th Annual Report of the Board of Railroad Commissioners, dated January, 1894.
5. Gradient diagrams of electric tramways in San Francisco.

H. DEANE.

COMPARISON of the Mileage and Cars of Street Railways in the United States for the years 1891, 1892, 1893, 1894.

(From the *Street Railway Journal*).

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

OCEAN-STREET CABLE-TRAM ENGINE-HOUSE.
(CORRESPONDENCE RESPECTING COST OF SITE OF.)*Ordered by the Legislative Assembly to be printed, 26 September, 1894.**[Laid upon the Table of this House in answer to Question No. 20, of 12th September, 1894.]*

Question.

20. COST OF SITE FOR OCEAN-STREET CABLE-TRAM ENGINE-HOUSE :—**MR. CAMERON** asked THE SECRETARY FOR PUBLIC WORKS,—
 (1.) What was the price paid for the site for the Ocean-street cable-tram engine-house, and from whom was the purchase effected?
 (2.) Will he have any objection to lay any papers on the subject upon the Table of the House?

Answer.

NO.	SCHEDULE.	PAGE.

No. 1.

The Council Clerk, Woollahra, to The Under Secretary for Public Works.

Sir,

Borough of Woollahra, Council Chambers, 10 May, 1892.

I have the honor, by direction, to request that the Honorable the Secretary for Public Works will be pleased to appoint a date to receive a deputation representing this borough and Paddington, the object being to endeavour to dissuade the Minister from occupying or encroaching on any portion of the Rushcutter's Bay Reserve for tramway purposes. I have further to ask that a Thursday be not selected, as that day is inconvenient to several who wish to attend.

I have, &c.,

C. A. VIVIAN,

Council Clerk.

I presume this cannot be avoided.—J.B., 20/6/92. Mr. Deane. No; and the trustees quite approved.—H.D., 21/6/92. Under Secretary. Submitted to; so inform.—J.B., 22/6/92. Approved.—W.J.L., 27/6/92.

No. 2.

No. 2.

The Under Secretary for Public Works to The Council Clerk, Woollahra.

Sir,

17 May, 1892.

With reference to your letter of the 10th instant, in which you ask that arrangements be made by the Minister to receive a deputation from the Paddington and Woollahra Councils, in regard to the Rushcutter's Bay Reserve, I am directed to say that, owing to the number of prior engagements, Mr. Secretary Lyne cannot at present fix a date for the purpose, but, as soon as these have been disposed of, an appointment will be made, of which you will be apprised.

I have, &c.,
J. BARLING,
Under Secretary.

No. 3.

The Under Secretary for Public Works to The Council Clerk, Woollahra.

Sir,

Department of Public Works, Sydney, 1 July, 1892.

With further reference to your letter of the 10th May last, in which you ask that an appointment may be made for the Secretary for Public Works to receive a deputation from your Council in regard to the taking of a portion of the Rushcutter's Bay Reserve for tramway purposes, and to my reply of the 17th idem, I am now directed to inform you that the occupation of a portion of this reserve is quite unavoidable, and the trustees have approved of the action of the Department. The Minister, therefore, considers that your Council will see that a deputation on the subject is unnecessary.

I have, &c.,
J. BARLING,
Under Secretary.

No. 4.

The Town Clerk, Sydney, to The Under Secretary for Public Works.

Sir,

Municipal Council, Town Clerk's Office, Sydney, 12 May, 1892.

I have the honor to forward herewith copy of a petition presented to the Mayor and Council with reference to the erection of car and engine sheds on a portion of Roslyn Gardens. The petition has not been formally presented to the Council, but as a meeting of the Council will not be held for two or three weeks, His Worship now forwards the enclosed for the consideration of the Minister, believing that he has the matter under his attention.

I have, &c.,
HENRY J. DANIELS,
Town Clerk.

[Enclosure.]

Petition to the Mayor (His Worship, W. P. Manning) and Aldermen of the city in Council.

Sydney, 6 May, 1892.

We, the undersigned ratepayers, solicit your Council to take the necessary steps to solicit the Minister for Works not to resume a portion of Roslyn Gardens for cable tramway purposes. It is intended to erect car-sheds and engine-sheds on the park land. There being other available land in the locality, we desire to point out the injustice of taking a portion of our small recreation ground.

JOHN HUGHES.
THOMAS HUGHES.
(And 29 others).

Mr. Deane.—D.McL. (for U.S.), B.C., 13/5/92. This matter has now been settled. Mr. Fischer to furnish tracing of land.—H.D., 16/5/92. Tracing herewith.—G.F., 19/5/92. Engineer-in-Chief. There can be no objection to the site now fixed. Tracing forwarded for the information of the Honorable the Minister.—H.D., 19/5/92. Under Secretary. Mr. Deane is, I understand, to further consider this matter.—J.B., 21/5/92. The tracing shows the land required for the tramway engine and car sheds. Does the Minister approve of my including it in the Proclamation?—H.D., 26/5/92. Under Secretary. Submitted.—J.B., 27/5/92. This paper must stand over until Mr. Deane returns from Melbourne, after inspecting the tramways in that city.—W.J.L., 27/5/92. Mr. Deane.—D.McL. (for U.S.), B.C., 28/5/92.

I have been to Melbourne and seen the working of the cable tramways. Mr. Jas. Duncan showed me details and gave me his opinion on various points. I specially asked him his opinion as to the relative suitability of high ground or hollows for the site of the power plant, and he told me he considered it did not matter in the slightest degree. There would be no disadvantage in placing the engines on the low ground.—H.D., 17/6/92.

Submitted for approval.—J.B., 17/6/92. Approved re site as selected.—W.J.L., 17/6/92.
Mr. Deane.—J.B., B.C., 18/6/92. Mr. Fischer.—H.D., 20/6/92. Noted.—G.F., 20/6/92.

No. 5.

Memo. from The Supervising Engineer, Tramway Construction Branch, to The
Engineer-in-Chief for Railway Construction.

Subject :—Proclaimed Plans. Extension—King-street to Ocean-street.

29 June, 1892.

I BEG to forward herewith proclaimed plans (three), books of reference (three), and triplicate tracings (nine sets) for land resumptions required in connection with the construction of this tramway.

GUSTAVE FISCHER,
Supervising Engineer.
Forwarded

Forwarded for the signature of the Minister as Constructing Authority and for proclamation. Notice—Tracings to be forwarded to Land Valuer.—THOMAS R. FIRTH (for the Engineer-in-Chief). Under Secretary. The Land Valuer for proclamation notice.—D.McL. (for U.S.), 1/7/92. Mr. Rae for descriptions.—A.B. (for Land Valuer), 1/7/92. Very urgent. Descriptions herewith.—F.S.R., 8/7/92. Will Mr. Deane kindly initial, if correct, the draft notification, herewith.—A.B. (for L.V.), 12/7/92. T.R.F. (for Engineer-in-Chief), 14/7/92. Land Valuer, B.C., 14/7/92. Draft proclamation herewith for signature and seal of Constructing Authority.—A.B. (for L.V.), 4/8/92. Under Secretary, Public Works. Draft signed and returned herewith. Draft notice of confirmation herewith, to be initialled.—A.B. (for L.V.), 8/9/92. Engineer-in-Chief, Railways. Chief Assistant and Inspecting Engineer.—H.D., 8/9/92. Land Valuer.—H.D., B.C., 8/9/92. Minute for Executive Council and draft notice of confirmation herewith.—A.B. (for L.V.), 10/9/92. Under Secretary, Public Works.

No. 6.

The Under Secretary for Public Works to The Clerk of Petty Sessions, Sydney.

Sir, Department of Public Works, Sydney, 9 August, 1892.

I have the honor to inform you that a copy of the proclaimed plan and book of reference of the tramway from King-street, Sydney, to Ocean-street, Woollahra, has been forwarded to you this day, by post, and to request that you will be good enough to cause the same to be exhibited in the Water Police Court, Sydney, for the information and inspection of any persons who may have any pecuniary or other interest in the lands through which the same tramway passes.

I have, &c.,
J. BARLING,
Under Secretary.

No. 7.

Notification of proposed Construction of the Tramway from King-street to Ocean-street.

Department of Public Works, Sydney, 9 August, 1892.

It is hereby notified for public information, under the provisions of section 29, subsection v. of the "Public Works Act of 1888," that it is intended to construct a line of tramway from King-street, Sydney, to Ocean-street, Woollahra, in accordance with the plans and books of reference prepared in connection with the said line, which are now to be seen in the office of the Constructing Authority at Sydney, and at the office of the Clerk of Petty Sessions, Water Police Court, Sydney.

WILLIAM JOHN LYNE,
Constructing Authority.

Gazette, dated 12th August, 1892.

GOVERNMENT TRAMWAYS.

King-street, Sydney, to Ocean-street, Woollahra.

It is hereby notified that the construction of a cable tramway from King-street, Sydney, to Ocean-street, Woollahra, has been duly authorised, under the provisions of the "Public Works Act of 1888," and there is now open for inspection, at the office of the Minister for Public Works, the said Minister being the Constructing Authority for the said line, a plan of the said line and of the lands through which it will pass, together with a book of reference, in which is set forth a description of the said lands and the names of the owners and proprietors thereof, so far as the same can be ascertained. All persons, therefore, who may be interested in the said lands to be affected by the said line are hereby required to forward to the said Constructing Authority, within one month from the first date of the publication hereof, a notice in writing of any objection that may appear to them to exist to the adoption of the said line or any part thereof, or to any of the works proposed in connection therewith.—Dated at Sydney, this fourth day of August, in the year of our Lord one thousand eight hundred and ninety-two.

(L.S.) WILLIAM JOHN LYNE,
Constructing Authority.

The seal of the Constructing Authority was affixed hereto, at Sydney, this 4th day of August, 1892, in the presence of,

D. C. McLACHLAN.

No. 8.

Minute for the Executive Council.

Subject :—Confirmation of plan and book of reference, King-street to Ocean-street Cable Tramway.

Department of Public Works, Sydney, 10 September, 1892.

No valid objection having been taken to the proclaimed plan and book of reference in connection with the line of tramway from King-street, Sydney, to Ocean-street, Woollahra, I have the honor to submit these documents for confirmation by His Excellency the Governor and the Executive Council, together with the usual notice for publication in terms of the "Public Works Act of 1888."

WILLIAM JOHN LYNE.

Executive Council Office, 15 September, 1892.

THE Executive Council advise, as herein recommended, that the plan and book of reference of the cable tramway from King-street to Ocean-street, be confirmed in terms of the said Act.

ALEX. C. BUDGE,

Clerk of the Council.

Min. 9,743, 20/9/92. Confirmed, 24/9/92. Approved.—JERSEY, 20/9/92. Gazette.—
D.McL. (for U.S.), 27/9/92. Gazette, dated 30/9/92; No. 703, page 7911.

GOVERNMENT

GOVERNMENT TRAMWAYS.

King-street, Sydney, to Ocean-street, Woollahra.

Notice of Confirmation of Plan and Book of Reference.

With reference to the notice of the Minister for Public Works, dated 4th day of August last, relative to the taking of certain lands required for the purpose of making a tramway between King-street Sydney, and Ocean-street, Woollahra, and to make and complete certain works and conveniences in connection therewith: Notice is hereby given that no valid objection having been made to the taking of the lands required for the said tramway, or to the erection of the said works, the said plan and book of reference have been duly confirmed by His Excellency the Governor, with the advice of the Executive Council, in accordance with the "Public Works Act of 1888."

(L.S.) WILLIAM JOHN LYNE,
Constructing Authority.

The seal of the Constructing Authority was affixed hereto, at Sydney, this 14th day of September, in the year of our Lord 1892, in the presence of,—

D. C. McLACHLAN.

No. 9.

Memo. from the Supervising Engineer, Tramway Construction Branch, to The Engineer-in-Chief for Railway Construction.

King-street to Ocean-street Cable Tramway, Power and Car House.

Department of Public Works, Tram Construction Branch,

Supervising Engineer's Office, Beresford Chambers, 19 January, 1893.

I BEG to forward herewith, for submission to the Railway Commissioners, tracing showing proposed power and car house, for the King-street to Ocean-street cable tramway.

The land resumed allows for the erection of power-house and car dépôt, for forty cars and twenty-one dummies—the number required for working the line to Ocean-street—and admits of an extension of the car dépôt, as shown by dotted lines, for housing eighteen cars and nine dummies additional when required.

GUSTAVE FISCHER,
Supervising Engineer.

No. 10.

The Engineer-in-Chief for Railway Construction to The Secretary to the Commissioners for Railways.

King to Ocean Streets Tramway.

24 January, 1893.

I HAVE the honor to forward herewith tracing showing the proposed power and car house for the above tramway, and shall be glad if you will submit same to the Commissioners for an early decision, and inform me of the result.

The land resumed allows for the erection of power-house and car dépôt, for forty cars and twenty-one dummies—the number required for working the line to Ocean-street—and admits of an extension of the car dépôt, as shown by the dotted lines, for housing eighteen cars and nine dummies additional when required.

H. DEANE,
Engineer-in-Chief
(Per T.H.)

King to Ocean Streets Cable Tram.

Department of Public Works, Railway Construction Branch, Sydney, 27 January, 1893.

To Mr. Holmes,—

I SAW Mr. Moore this morning, who informed me that the tracing showing proposed power-house and car-shed, sent to the Railway Commissioners on the 24th, does not show the exact position of same; Commissioners want a small plan showing the exact position of these buildings.

H. WOODWARD.

Mr. Fischer to supply.—F.H. (for Engineer-in-Chief), 27/1/93. Tracing herewith.—G.F.,
31/1/93. Engineer-in-Chief.

No. 11.

The Secretary to the Commissioners for Railways to The Under Secretary for Public Works.

Government Railways of New South Wales, Secretary's Office, Sydney, 29 March, 1893

Sir,

I am directed to enclose plan of power and car house for the Ocean-street to King-street cable tramway, approved by the Railway Commissioners.

In returning the plan the Railway Commissioners wish it to be distinctly understood that their approval is intended only to cover the sheds and connecting lines, and is not to be taken as intimating their concurrence in the position selected for the building, as they consider that the site selected is a most expensive one, and if at any future time extensions of the buildings are required, additional heavy outlay would

would be required for land resumptions in connection with them; whereas if the vacant land on the opposite side of the street had been chosen it could have been obtained at a much lower price, and extensions made in years to come could have been provided for at a much lower cost.

I have, &c.,

H. McLACHLAN,
Secretary.

Submitted.—J.B., B.C., 10/4/93. Mr. Deane.—J.B., 10/4/93. Will Mr. Deane state his reasons for recommending this site?—W.J.L., B.C., 11/4/93. Mr. Deane.—J.B., 11/4/93.

No. 12.

Memo. from The Engineer-in-Chief for Railway Construction to The Under Secretary for Public Works.

King-street to Ocean-street Cable Tramway.

Department of Public Works, Railway Construction Branch, Sydney, 12 April, 1893.

THE site occupied by the engine-house is entirely on the park land. The car-house is on resumed land.

The Minister will, no doubt, remember that the site of the latter was not that originally chosen by me, which was on the park grounds, but the altered site was fixed upon after full consideration of the question, when I met the Minister and the Park Trustees on the ground, the latter having objected to the first site.

As to the inadequacy of the site, the Railway Commissioners must be in error. Sufficient engine-power has been provided for all possible extensions which can be worked from that point. There is more car room than at present required, and should the future necessitate any at present unanticipated increase, a small corner of the park could, without detriment to the latter, be added.

As to the land on the other side of the road being cheaper, it is no doubt due to its unsuitability for building purposes that it is so. This matter I considered before submitting the plan for proclamation, and I was convinced that the extra foundation would cost more than the increased cost of purchase of the present site. There is also a great advantage in having the engine-shed and car-shed, as it were, under one roof, which would be lost were they on opposite sides of the road.

H. DEANE,

Engineer-in-Chief.

Submitted.—J.B., 4/5/93. Seen.—Forward copy to Railway Commissioners.—W.J.L., 14/6/93. Forward copy.—J.B., 14/6/93. Copy forwarded to the Secretary to the Railway Commissioners, 16/6/93. Seen.—H.D., 23/6/93. Assistant Engineer for Tramways.—F.H., 24/6/93. Seen.—G.F., 26/6/93. Engineer-in-Chief.

No. 13.

The Under Secretary for Public Works to The Secretary to The Commissioners for Railways.

Sir,

16 June, 1893.

With reference to your letter of the 29th of March last, in regard to the site which has been selected for the power and car houses for the King-street to Ocean-street tramway, I am directed by the Secretary for Public Works to forward, for the information of your Commissioners, a copy of a minute on the subject which has been received from the Engineer-in-Chief for Railway Construction.

I have, &c.,

J. BARLING,
Under Secretary.

Re Trustees of Mrs. S. Blackwood.

No. 14.

Mrs. S. Blackwood's Trustees, forwarding Notice of Claim.

Extension from King-street to Ocean-street Cable Tramway.

Public Works Act of 1888.

Offer and Particulars of Claim for Land taken for Tramway Purposes.

To the Minister for Public Works,—

We hereby offer to accept from the Constructing Authority, as purchase money for the land (including buildings and fences erected thereon) of which we are the owners in fee-simple as Trustees for Mrs. Sarah Blackwood and others in remainder, delineated on the tracing plan attached to the notice of land taken, and numbered 12, which we hereby acknowledge to have received, containing 192 perches, more or less, and as compensation for damage by severance, by the , or otherwise caused by the execution of the tramway works, as particularly set forth in the subjoined schedule of claim, the sum of £2,836, which sum I declare to be our full claim in respect of the matters aforesaid.

Dated this 4th day of November, 1892.

ARTHUR ROBERT BLACKWOOD,
Pine Estate, Newtown.

V. A. SPENCE,

Young-street, Croydon.

To the Constructing Authority, Sydney.

Total amount of claim, £2,836.

ARTHUR ROBERT BLACKWOOD.
V. A. SPENCE.

If

If Mrs. Sarah Blackwood was left in undisturbed possession her present yearly income from lot 12 is £104, and after eight years and eighty-four days would at least be £160 per annum. On this basis we make the following estimate:—

	£ s. d.	£ s. d.
£104 per annum for eight years and eighty-four days	856 0 0	676 0 0
Present value of this, at 5 per cent. basis, is		
As the lease shows the property was let on an improving lease, under which the lessees were to spend at least £500, it follows that Mrs. Sarah Blackwood is entitled to the improvements at the end of the term, naturally expect a larger rental (say), £160 per annum as probable rent. This, on a 5 per cent. basis, is	3,200 0 0	2,160 0 0
Present value of £3,200, on a 5 per cent. basis, is		
		<hr/> £2,836 0 0

Offer and Particulars of Claim for Land taken for

Purposes.

To the Minister for Public Works,—

We hereby offer to accept from the Constructing Authority, as purchase money for the land (including buildings and fences erected thereon) of which we are the owners in fee-simple, as trustees for Mrs. Sarah Blackwood and others in remainder, delineated on the tracing plan attached to the notice of land taken, and numbered 16, which we hereby acknowledge to have received, containing 30 perches, more or less, and as compensation for damage by severance, or otherwise caused by the execution of the Tramway Works as particularly set forth in the subjoined schedule of claim, the sum of £1,460, which sum we declare to be our full claim in respect of the matters aforesaid.

Dated this 4th day of November, 1892.

ARTHUR ROBERT BLACKWOOD,
Pine Estate, Newtown.

VALENTINE ARTHUR SPENCE,
Young-street, Croydon.

To the Constructing Authority, Sydney.

ARTHUR ROBERT BLACKWOOD.
V. A. SPENCE.

NOTE.—Regarding the allotment No. 16, facing the bay, with a back entrance to Clement-street, it must be noted that this allotment has a front entrance leading from Waratah-street; it can be opened at any moment. Please see map of Barcom Glen Estate.

Land Valuer.—D.C.McL., B.C., 4/11/92. Mr. Rae for certificate.—A.B. (*pro* Land Valuer), 4/11/92. Herewith.—F.S.R., 21/12/92. Please report on title.—A.B. (*pro* L. Valuer), 21/12/92.

No. 16.

Mrs. S. Blackwood to The Under Secretary for Public Works.

Sir,

I beg leave to state that my property at Bayswater Road, Rushcutters' Bay, has been resumed for tramway purposes, and since the notice of resumption was served I did not apply for the rents, believing I had no right to do so.

Yesterday I received a letter from one of the tenants—Mahoney—stating his intentions of vacating the premises, in consequence of which I made inquiries at the Minister for Works office, and ascertained that the Act allowed me to collect the income from the property for three months after the notice of resumption was served. Acting on this information I sent my son to-day for the arrears of rent. Williams, the occupant of the shop, Bayswater Road, paid the amount due, but Mahoney, the occupant of the cottage facing the reserve, refused to pay the rent, and says he considers the amount due, £4 10s., will be very little compensation for the loss he will sustain by having to vacate the premises. As I do not know whether I am justified in compelling Mahoney by law to pay, I am compelled to ask your advice in the matter.

I have, &c.,

SARAH BLACKWOOD.

Land Valuer.—D.C.McL. (*pro* U.S.), B.C., 9/12/92. This should be referred to the Crown Solicitor as to whether Mrs. Blackwood can enforce the payment of rent under the circumstances.—J.B.T., 14/12/92. U.S., Works. Will the Crown Solicitor kindly advise?—D.C.McL. (*pro* U.S.), B.C., 14/12/92. Urgent.

No. 17.

The Crown Solicitor to The Under Secretary for Public Works.

Sir,

Crown Solicitor's Office, Sydney, 16 December, 1892.
I have the honor to return herewith the letter of Mrs. Sarah Blackwood, as to the rents of the property at Rushcutter's Bay resumed from her for tramway purposes.

I think that Mrs. Blackwood might be allowed to collect the rents of this property up to the time when possession is required by the Government, and she should be informed that the rents so collected by her will be taken into account, and be the subject of adjustment when the amount of compensation and interest is to be paid to her.

The tenant should pay his rent according to his agreement, and if he has sustained any loss he should make his claim as provided by the Statute.

What may be the legal powers of Mrs. Blackwood to enforce payment of the rent is a matter for her advisers to consider.

All that the Department can say is, that the Constructing Authority has no objection to her collecting such rents.

I have, &c.,

ERNEST SMITH,

Crown Solicitor.

Mrs. Blackwood might be informed in terms of the Crown Solicitor's letter.—A.B. (*pro Land Valuer*), 20/12/92. U.S., Works. Informed.—J.B., 21/12/93.

No. 18.

The Under Secretary for Public Works to Mrs. S. Blackwood.

Madame,

22 December, 1892.

With reference to your letter of the 7th instant, respecting the collection of rents for premises resumed from you for tramway purposes, I am directed by the Secretary for Public Works to inform you that there will be no objection to your collecting the rents of the property referred to up to the time when possession is required by the Government, and all such rents so collected by you will be taken into account, and be the subject of adjustment when the amount of compensation and interest is to be paid to you.

I have, &c.,

J. BARLING,

Under Secretary.

No. 19.

The Crown Solicitor to The Under Secretary for Public Works.

Blackwood Trustees to Minister for Works—King-street to Ocean-street Tramway.

Sir,

Crown Solicitor's Office, 13 February, 1893.

I have the honor to return herewith the papers sent me in this case with instruction to report on title.

I have examined the title, and find that by Crown Grant dated 30th May, 1844, 71 acres of lands in the parish of Alexandria, county of Cumberland, were granted to Thomas West in fee in fulfilment of a promise made to him on 1st December, 1811. By indenture of lease and release, bearing date 7th and 8th January, 1836, made between the said Thomas West of the one part, and Obed West of the other part, in consideration of a certain annuity to be paid to the said Obed West by the said Thomas West during his life, 12 acres 3 roods 19 perches, portion of the said grant of 71 acres, were granted and released unto the said Obed West, in fee subject to the said annuity. By indenture of settlement, dated 29th July, 1854, and made between the said Obed West of the first part, Sarah Blackwood, wife of William Blackwood, of the second part, the said William Blackwood of the third part, James Oakey and William Patten (trustees) of the fourth part, two portions of land, being lots 28 and 33 of a subdivision of the said 71-acre grant, called the Barcom Glen Estate, were conveyed to the use of the said trustees during the life of the said Sarah Blackwood (a daughter of said Obed West) for her sole and separate use for her life, and after her death upon certain other trusts therein mentioned. Both of these parcels, it appears by the certificate of identity, have been resumed.

By an indenture dated 1st November, 1892, Arthur Robert Blackwood and Valentine Arthur Spence were appointed trustees of the said indenture of settlement in place of James Oakey and William Patten, both deceased. As there is no power of sale contained in the above-mentioned indenture of settlement, the compensation money will have to be paid into Court.

I have made several requisitions on the prior title which have not yet been satisfied, but, in the meantime, I think Arthur Robert Blackwood and Valentine Arthur Spence, as trustees of the said indenture of settlement, and Mrs. Sarah Blackwood, may be dealt with as to the compensation to be paid for the land resumed, subject to my requisitions on title being satisfactorily complied with.

I have, &c.,

ERNEST A. SMITH,

Crown Solicitor.

No. 20.

Report by the Land Valuer.

King-street and Ocean-street Cable Tramway.

Particulars of Claim.

Claimant and owners—Arthur Robert Blackwood and Valentine Arthur Spence (trustees), and Mrs. Sarah Blackwood; reference number, 12 and 16; area taken, 1 rood 9 $\frac{1}{2}$ perches; amount of claim, £4,296.

This claim is made in respect of allotments 28 and 33 of a subdivision of the 71-acre grant, called the Barcom Glen Estate, taken for tramway purposes in connection with the King-street and Ocean-street cable

cable tramway. Allotment 28, reference number 12, is an excellent building site. It has 50 feet frontage to the New South Head Road, which is a most important thoroughfare. There is a large furniture shop and warehouse, with residence, workshops, stores, stables, and other buildings. The owners derive an annual net income of £104 per annum from this land for the residue of a lease, which had eight and a quarter years to run from the date of resumption, and they had the reasonable probability, indeed almost the certainty, of that income being increased by at least £1 per week at the expiration of the lease.

Allotment 33, reference number 16, has frontage towards Rushcutter's Bay on the north, and 50 feet to Clement-street on the south. The northern half of the allotment is low and wet; the southern half is well adapted for building purposes, and is high and dry. There is a cottage and outbuilding on the land.

Valuation.

The Under Secretary Public Works, Sydney.

J. B. THOMPSON,

Land Valuer, 7/4/93.

Will the Crown Solicitor kindly advise. Mr. Thompson will attend with the papers.—J.B., 7/4/93. I have had a long interview with the Crown Solicitor on this matter, and he agreed that the basis on which the valuations are made is correct, and in making the above suggestion I merely wished to show him the result.—J.B.T., 10/4/93. Under Secretary, Works.

Submitted.—J.B., 10/4/93. Approved.—W.J.L., 10/4/93.

No. 22.

Offer to Mrs. S. Blackwood.

Notice of valuation under the Public Works Act of 1888.

Fifth Schedule.

To Arthur Robert Blackwood, Valentine Arthur Spence, and Sarah Blackwood, claimants in respect of the land hereunder described, taken or injuriously affected under the Public Works Act of 1888.

TAKE notice, that the amount of the purchase money and compensation to be paid to you by the Constructing Authority for the interest belonging to you, or which by the Public Works Act you are enabled to sell, and for any damage that may be sustained by you by severance or otherwise by reason of the execution of the authorised work in respect of the land hereunder described and referred to in your offer bearing date the 4th day of November, 1892, and in the schedule of claim subjoined thereto, has (after taking into consideration and giving effect to by way of set off or abatement any enhancement in the

value

value of any land belonging to you adjoining the land taken or severed therefrom by the construction of the authorised work) been valued and assessed at the sum of £4,078 16s., and which sum is hereby offered to you by the Constructing Authority in full satisfaction and discharge of all such claims and matters as aforesaid, subject to your making out a title to the land or the interest claimed by you therein to the satisfaction of the Constructing Authority, as by the Public Works Act of 1888 is provided.

As witness the seal of the Constructing Authority, this 15th day of April, in the year of our Lord, 1893.

WILLIAM JOHN LYNE,
Constructing Authority.

Signed and sealed by the Constructing Authority, in the presence of,—

D. C. McLACHLAN.

Description of land taken or injuriously affected in respect of which claim has been made.

All that piece or parcel of land situate in the parish of Alexandria, county of Cumberland, containing by admeasurement 1 rood 9 perches and 3-10ths of a perch, more or less, and numbered 12 and 16 on plan and book of reference of the King-street and Ocean-street cable tramway.

Sent to Mrs. Blackwood, Summerhill, 15/4/93.

No. 23.

Messrs. Deane and Deane to The Secretary for Public Works.

Sir,

Sydney, 17 April, 1893.

With reference to the notice addressed to Messrs. A. R. Blackwood, Valentine A. Spence, and Mrs. Blackwood, dated the 15th April instant, offering the sum of £4,078 16s. as compensation for land required for the construction of the King and Ocean Streets cable tramway, we are instructed to accept such amount, provided interest is paid in addition.

We have, &c.,

DEANE AND DEANE.

The Land Valuer.—D.C.McL. (for U.S.), B.C., 19/4/93. Claimants might be informed that interest at the rate of 5 per cent. will be allowed from the date possession was obtained up to the date of payment of the compensation money.—A.B. (pro Land Valuer), 5/5/93. Under Secretary, Works Inform.—J.B., 6/5/93. Let papers now go on for completion.—J.B., 15/5/93. Abstract of title certificate and voucher for £4,078 16s. to Crown Solicitor.—A.B., 16/5/93.

No. 24.

The Under Secretary for Public Works to Messrs. Deane and Deane.

Gentlemen,

Sydney, 10 May, 1893.

With reference to your letter of the 17th ultimo, accepting offer of compensation for land resumed for tramway purposes at Rushcutters' Bay, on behalf of Messrs. A. B. Blackwood, V. A. Spence, and Mrs. Blackwood, on condition that interest is allowed thereon, I am directed by the Secretary for Public Works to inform you that interest at the rate of 5 per cent. per annum will be allowed to your clients from the date possession of the property was obtained to date of payment of such compensation.

I have, &c.,

J. BARLING,

Under Secretary.

No. 25.

Messrs. Deane and Deane to The Under Secretary for Public Works.

Sir,

Sydney, 16 May, 1893.

We have the honor to inform you, with reference to your communication of the 10th instant, stating that interest at the rate of 5 per cent. per annum would be allowed, as therein mentioned in respect of land resumed for tramway purposes at Rushcutters' Bay, that we have written, inquiring our clients' wishes concerning the matter, and when we hear from them will again communicate with the Department.

We have, &c.,

DEANE AND DEANE.

No. 26.

Messrs. Deane and Deane to The Under Secretary for Public Works.

Sir,

Sydney, 18 May, 1893.

With reference to your letter of the 10th instant, in which you state that interest at the rate of 5 per cent. per annum would be paid to Messrs. A. R. Blackwood, V. A. Spence, and Mrs. Blackwood, on account of land resumed for tramway purposes at Rushcutters' Bay, we have the honor to state that we are instructed by our clients to inform you that they accept the terms of your letter.

We have, &c.,

DEANE AND DEANE.

The Land Valuer.—D.C.McL. (for U.S.), B.C., 25/5/93. Mr. Rae for certificate.—A.B., 23/5/93. Certificate was forwarded to the Crown Solicitor on 21/12/92.—F.S.R., 25/5/93.

No. 27.

The Crown Solicitor to The Land Valuer.

Blackwood's Trustees to Minister for Works.

Sir,

Crown Solicitor's Office, 6 July, 1893.

I have the honor to forward herewith engrossment of conveyance and registration copy, in order that a plan of the resumed land may be drawn thereon.

I have, &c.,

ERNEST A. SMITH,

Crown Solicitor.

Mr. Rae for plans.—A.B., 8/7/93. Herewith.—F.S.R., 14/7/93. Conveyance and registration copy to Crown Solicitor.—A.B., 17/7/93.

No. 28.

The Crown Solicitor to The Under Secretary for Public Works.

Blackwood's Trustees to Minister for Works—Ocean-street Cable Tramway.

Sir,

Sydney, 24 August, 1893.

In this matter an application has been made to me for the interest on the compensation money to be paid to Mrs. Blackwood.

Mrs. Blackwood is the person entitled to the rents and profits of the land resumed, and I, therefore, see no objection to the interest being paid to her as proposed. The compensation money was paid into Court on the 19th instant, and the voucher should, therefore, be calculated from the time the Government obtained possession up to that date, and made out in the name of A. R. Blackwood and V. A. Spence, trustees of Mrs. Blackwood.

I have, &c.,

ERNEST A. SMITH.

Land Valuer.—D.C.McL. (for U.S.), B.C., 25/8/93.

No. 29.

Messrs. Deane and Deane to The Under Secretary for Public Works.

Blackwood's Trustees to Minister for Works.

Sir,

Sydney, 29 September, 1893.

With reference to an inquiry from the Valuation Branch of your Department as to the amount of rent received by Mrs. Blackwood since the date of resumption of her land at Rushcutters' Bay, we have the honor to state that Mrs. Blackwood has informed us that she has not received any rent in respect of the said land since the 27th March last.

We have, &c.,

DEANE AND DEANE.

The Land Valuer.—D.C.McL. (for U.S.), B.C., 30/9/93. Interest voucher for £81 0s. 4d. herewith.—A.B. (pro Land Valuer), 10/10/93. Crown Solicitor.

No. 34.

Mr. W. Haynes to The Secretary for Public Works.

Honorable Sir,

39, Paddington-street, Paddington, 25 November, 1892.

Having submitted a claim for the resumption of land taken by the Government for the purpose of tramway extension from King-street, Sydney, to Ocean-street, Woollahra, the proprietors beg most respectfully to point out that Mrs. Haynes, having a life interest only, if any delay occurs, will seriously miss her only and immediate weekly income of £3 8s. May I ask if this could be obviated, she having no other income whatever (the undersigned, her husband, being 66 years of age and out of business and employment), the capital value being vested in her children under a trustee.

Suggestion and proposal.

To accept the capital value in the new 4 per cent. funded stock at par, Mrs. Haynes being allowed to draw the interest only by quarterly payments from the date of notice of resumption, viz., 11th October, 1892.

I have, &c.,

WALTER HAYNES.

Can this be expedited in any way; it seems an urgent case.—J.B., 25/11/92. Land Valuer. The Crown Solicitor's report on the title has not yet been received.—J.B.T., 14/12/92. Will the Crown Solicitor kindly expedite.—J.B., B.C., 14/12/92.

No. 35.

Mr. W. A. Gilder to The Secretary for Public Works.

Haynes to The Minister for Public Works.

Dear Sir,

Sydney, 25 November, 1892.

Herewith I enclose abstract of my client, Mrs. Jane Margaret Haynes' title to land situated at Rushcutters' Bay, resumed for the purposes of the King-street and Ocean-street tramway, in pursuance of notice dated 11th October, 1892.

Yours, &c.,

W. A. GILDER.

Land Valuer.—D.C.McL. (*pro U.S.*), 26/11/92.

No. 36.

Mr. W. A. Gilder to The Under Secretary for Public Works.

Haynes to The Minister for Public Works.

Dear Sir,

Sydney, 1 December, 1892.

On the 25th November ult. I wrote you herein, enclosing abstract of title, but by an oversight part of the title was omitted to be abstracted. I now enclose you herewith further abstract, which should precede that sent previously.

Yours, &c.,

W. A. GILDER.

The Land Valuer.—D.C.McL. (*pro U.S.*), B.C., 5/12/92. Mr. Rae, for certificate.—A.B. (*pro Land Valuer*), 7/12/92. Herewith.—F.S.R., 20/12/92. Please record on title.—A.B. (for Land Valuer), 20/12/92. Crown Solicitor.

No. 37.

The Crown Solicitor to The Under Secretary for Public Works.

[Urgent.]

Jane Margaret Haynes to The Minister for Public Works.—King-street to Ocean-street Tramway.

Sir,

Sydney, 3 February, 1893.

I have the honor to return herewith the papers sent to me, with instructions to report on the title to the land resumed herein.

It appears from the certificate of identity with the papers that the resumed land forms part of the land comprised in the following indentures, viz.:—

Indenture dated 12th September, 1857, registered No. 418, Book 51.

Indenture dated 9th February, 1877, registered No. 457, Book 167.

Indenture dated 7th December, 1881, registered No. 558, Book 235.

Indenture dated 1st July, 1892, registered No. 417, Book 495.

The indenture of 12th September, 1857, is a settlement by Obed West in favour of Jane Margaret Dobson, her husband, William Thomas Dobson, since deceased, and their children, of two parcels of land, being lots 29 and 32 of the Barcom Glen Estate.

The settler's title is not disclosed in the abstract of claimant's title, but in the abstract furnished in the case of Mary Ann Wilcox, a grant to Thomas West, dated 30th May, 1844, and an indenture of release dated 8th January, 1836, Thomas West to Obed West, registered No. 237, Book —, and registered No. 828, Book 7, are abstracted.

The trustees of the settlement being required to join in the claim, new trustees have been appointed (the original trustees being dead), by an indenture dated 16th January, 1893, and the claim has been signed by the present trustees and other parties interested under the settlement.

I have examined the title, and find that Mrs. Jane Margaret Haynes and George Parker Jones the younger, and Joseph James Wood, the present trustees of the settlement of 12th September, 1857, may be dealt with as to compensation to be paid for the land resumed, subject to such land being identified as part of the land described in the Crown grant of 30th May, 1844, and indenture of release of 8th January, 1836, descriptions from which I send herewith.

I have, &c.,

E. A. SMITH,

Crown Solicitor

(Per E. A. LUMSDAINE).

Jane M. Haynes to The Minister for Works.—King-street to Ocean-street Tramway.

Sir,

Sydney, 6 February, 1893.

Referring to my letter of the 3rd instant reporting on the title herein, I have the honor to forward herewith abstract of prior title received from the claimant's solicitor.

I have, &c.,

E. A. SMITH,
Crown Solicitor

(Per E. A. LUMSDAINE).

The Land Valuer.—D.C.McL. (*pro U.S.*), B.C., 6/2/93. Mr. Rae.—A.B., 10/2/93. Certificate herewith.—F.S.R., 13/2/93.

No. 39.

Mr. W. Haynes to The Under Secretary for Public Works.

Sir,

39, Paddington-street, Paddington, 23 February, 1893.

I have the honor to apply to you, having received no later communication than the 28th November, 1892 (in reference to Mrs. J. M. Haynes and trustees in the matter of the reclamation claims for lands required at Rushcutter's Bay for the Ocean-street cable tramway), and to urge your early consideration, as it has deprived her of her entire income of £163 10s. per annum, and beg you will inform me of the progress that has evolved; and further, to say that Mrs. Haynes is entirely without funds, and that the uncertainty involves her in serious difficulties, as she cannot make any arrangements for obtaining necessary funds for daily requirements, which are very pressing and intensifying. All legal information has been supplied as applied for.

I have, &c.,

WALTER HAYNES.

Land Valuer for report.—D.C.McL. (*pro U.S.*), B.C., 24/2/93.

No. 40.

Mr. W. Haynes to The Secretary for Public Works.

Ocean-street Cable Tramway Resumption.

Honorable Sir,

157, Paddington-street, Paddington, 4 April, 1893.

I have now to make claim for protecting Mrs. Haynes' property, situate at Clement-street, Rusheutter's Bay:—From 1st January, 1893, to 23rd March; caretaker, twelve weeks at 30s., £18. And I shall have a further claim for consequential damages for not having received any acknowledgment of my claim, and deprivation of the only means of existence. This is on behalf of Mrs. J. M. Haynes' life interest.

I have, &c.,

WALTER HAYNES.

Land Valuer.—D.C.McL., B.C., 5/4/93. I do not think this claim can be admitted.—J.B.T. 6/4/93. Under Secretary, Works. Inform.—J.B., 8/4/93. Mr. Walter Haynes, 13/4/93.

No. 41.

Report by The Land Valuer.

King-street and Ocean-street Cable Tramway.—Particulars of Claim.

7 April, 1893.

Claimant and owners, Jane Margaret Haynes, and George Parke Jones and Joseph James Wood (trustees); reference number, ; area taken, 1 rood 6 $\frac{1}{2}$ perches; amount of claim, £4,361 10s.

THIS claim is made in respect of allotments 29 and 32 of a sub-division of the 71 acres grant called the Barcom Glen Estate taken for tramway purposes in connection with the King-street and Ocean-street tramway. Allotment 29, reference number 13, is in a good position, and well adapted for building purposes. It has 50 feet frontage to New South Head Road, which is of great value. An income of at least £2 per week can be had from this property without any doubt. Allotment 32, reference number 15, has frontage towards the Harbour on the north, and 50 feet to Clement-street on the south. It is low and swampy at the northern end, and good dry building land at the south. There is a good house and outbuildings on the land.

No. 42.

The Under Secretary for Public Works to Mr. W. Haynes.

Sir,

Sydney, 13 April, 1893.

With reference to your letter of the 4th instant, claiming £18 for protecting Mr. Haynes' property, resumed for the King-street and Ocean-street tramway, I am directed by the Secretary for Public Works to inform you that such claim cannot be allowed.

I have, &c.,

J. BARLING,

Under Secretary.

No. 43.

Offer to Mr. W. Haynes.

Notice of valuation under the Public Works Act of 1888.

(Fifth Schedule.)

To Jane Margaret Haynes, George Parker Jones, jun., and Joseph James Wood, claimants in respect of the land hereunder described, taken or injuriously affected under the Public Works Act of 1888.

TAKE notice that the amount of the purchase money and compensation to be paid to you by the Constructing Authority for the interest belonging to you, or which, by the Public Works Act, you are enabled to sell, and for any damage that may be sustained by you by severance, or otherwise, by reason of the execution of the authorised work in respect of the land hereunder described and referred to in your offer bearing date the 23rd day of November, 1892, and in the schedule of claim subjoined hereunto, has (after taking into consideration and giving effect to by way of set off or abatement any enhancement in the value of any land belonging to you adjoining the land taken or severed therefrom by the construction of the authorised work) been valued and assessed at the sum of £3,837 16s. 4d., and which sum is hereby offered to you by the Constructing Authority in full satisfaction and discharge of all such claims and matters as aforesaid, subject to your making out a title to the land or the interest claimed by you therein, to the satisfaction of the Constructing Authority, as by the Public Works Act of 1888 is provided.

As witness the seal of the Constructing Authority, this 15th day of April, in the year of our Lord, 1893.

WILLIAM JOHN LYNE,

Constructing Authority.

Signed and sealed by the Constructing Authority, in the presence of,—

D. C. McLACHLAN.

Send to Walter Haynes, Esq., 39, Paddington-street.

No. 44.

Mr. W. Haynes to The Land Valuer.

Dear Sir,

157, Paddington-street, Paddington, 17 April, 1893.

I have the honor to acknowledge receipt of notice of award *in re* the Ocean-street cable tramway resumption. Will you kindly oblige me by giving the items forming the amount of each resumed allotments, Nos. 13 and 15, for my guidance and information, and you will much oblige Mrs. Haynes, her trustees, and

I have, &c.,

WALTER HAYNES.

It has always been considered inadvisable to furnish the information sought by Mr. Haynes prior to acceptance of the offer, and I cannot do so without instructions.—J.B.T., 18/4/93. Under Secretary, Works. Inform, 19/4/93. Mr. Walter Haynes, 24/4/93. Ocean-street cable tramway resumption, Rushcutters' Bay and Bayswater Road; No. 13, building, fencing, feet of lands at per foot, per cent. for forced sale; No. 15, building, fencing, feet of land at per foot, per cent. for forced sale.

No. 45.

The Under Secretary for Public Works to Mr. W. Haynes.

Sir,

Sydney, 24 April, 1893.

With reference to your letter of the 17th instant, asking to be supplied with the items making up the valuation on the claim of Mrs. Haynes and her trustees for land resumed at Rushcutters' Bay for tramway purposes, I am directed by the Secretary for Public Works to inform you that such information cannot be given prior to the acceptance of the offer.

I have, &c.,

J. BARLING,

Under Secretary.

Under Secretary
(Per D.C.McL.).

No. 48.

Mrs. Haynes' Trustees to The Under Secretary for Public Works.

Sir,

157, Paddington-street, Paddington, 8 May, 1893.
We have the honor to inform you that the award for land resumed at Rusheutters' Bay for the purpose of the Ocean-street cable tramway has been accepted, and will thank you to supply the items making up the valuation of claim.

We have, &c.,

J. M. HAYNES.
GEORGE P. JONES, JUNIOR, } Trustees.
J. J. WOOD,

Land Valuer.—D.C.McL. (*pro U.S.*), B.C., 9/5/93. Two certificates, three abstracts of title, and voucher for £3,837 16s. 4d. to Crown Solicitor.—A.B., 12/5/93.

No. 49.

Mrs. Haynes' Trustees to The Under Secretary for Public Works.

Sir,

Paddington, 15 May, 1893.

We have the honor to inform you that, on application by Mr. Walter Haynes at the Crown Solicitor's office this day for information as to when the award as to claim for land, &c., resumed at Rusheutters' Bay on account of the "Ocean-street Cable Tramway" would be available, was directed to apply to you for instructions to enable Mrs. Haynes to obtain her income from the interest derivable on the amount awarded as per valuation, £3,837 16s. 4d., at 6 per cent., and to send in a statement as to what amounts had been received from tenants since the 11th October, 1892. We, the undersigned, now beg to make such application and furnish accounts received from Mr. Robinson from the 11th October to 24th December:—

	£	s.	d.
10 weeks and 4 days, at 21s. per week...
Mr. Williams, a cheque for

Mary Anne Wilcox, forwarding Notice of Claim.

Extension from King-street to Ocean-street.

Public Works Act of 1888.

Offer and Particulars of Claim for Land taken for Tramway Purposes.

To the Secretary for Public Works,—

I HEREBY offer to accept from the Constructing Authority, as purchase money for the land (including buildings and fences erected thereon) of which I am owner of an estate for life, delineated on the tracing plan attached to the notice of land taken, and numbered 17, which I hereby acknowledge to have received, containing 31·9 perches, more or less, and as compensation for damage by severance, by the _____ or otherwise caused by the execution of the _____ works, as particularly set forth in the subjoined schedule of claim, the sum of £2,101, which sum I declare to be my full claim in respect of the matters aforesaid.

Dated this 21st day of November, 1892.

To the Constructing Authority, Sydney.

MARY ANNE WILCOX,
Dallinga, South Grafton.

SCHEDULE OF CLAIM.

Land resumed—31·9 perches.

Estimated value—50 feet to reserve and Clement-street, at £25 per foot, £1,250.

Improvements taken—Stone cottage, £600; wood fence, £10; and stone kitchen, £50. Damage by severance or otherwise, 10 per cent. on £1,910, for forced sale, £191. Total amount of claim, £2,101.

No. 55.

The Under Secretary for Public Works to Messrs. Holdsworth and Son.

Gentlemen,

21 April, 1893.

With reference to your letter of the 11th instant, respecting the claim of Mrs. Wilcox for land resumed for tramway purposes at Rushcutters' Bay, I am directed by the Secretary for Public Works to inform you that the matter is awaiting the report of the Crown Solicitor on the title, and he has been asked to expedite.

I have, &c.,

J. BARLING,
Under Secretary
(*Pro D.C.McL.*)

No. 56.

The Crown Solicitor to The Under Secretary for Public Works.

Mary A. Wilcox to the Minister for Works—King-street to Ocean-street Tramway.

Sir,

Crown Solicitor's Office, Sydney, 17 July, 1893.

I have the honor to return herewith the papers sent to me, with instructions to report on the title to the land resumed herein.

It appears from the certificate of identity with the papers that the resumed land forms part of the land comprised in the following documents, viz.:—

Crown grant to Thomas West, dated 30th May, 1834. Indenture of release, dated 8th January, 1836, Thomas West to Obed West. Indenture of settlement, dated 28th July, 1854. Obed West, 1st part; Mary Ann Wilcox, 2nd part; James Fowler Wilcox, 3rd part; and James Oatley and William Patten, trustees, 4th part.

By the last-mentioned indenture, the land is conveyed to James Oatley and William Patten, and their heirs, to the use (after the determination of the life estates therein limited in favour of Mary Ann Wilcox and James Fowler Wilcox) of the child, if only one, or the children, if more than one, of said James F. Wilcox and Mary Ann Wilcox, and if more than one, to take in equal shares as tenants, in common, and the heirs and assigns of such child or respective children, the share of any child dying under the age of 21 years without having issue being taken by the other children. The settlement contains a declaration directing the Trustees for the time being, after the deaths of Mr. and Mrs. Wilcox, and so long as any child shall be under the age of 21 years, to receive the rents and profits, and to deal with the premises as if the said Trustees or Trustee were or was the actual beneficial owners or owner thereof.

By an indenture, dated 2nd May, 1893, made between James Nepolian Oatley of the one part, and Thomas John West and Robert Allen of the other part, the last-named parties have been appointed Trustees of the settlement in the place of the original trustees, who are both dead.

It appears that the claimant, Mary Ann Wilcox, died on the 22nd November, 1892, her husband, James Fowler Wilcox, being then dead, leaving eleven children, two of them being still under the age of 21 years. I have, therefore, written to Messrs. Holdsworth and Son, who acted for Mrs. Wilcox, to know if the claim sent me is to be considered as made on behalf of the trustees, and all parties interested under the settlement. If so, an offer may be made to the new trustees, Messrs. Thomas John West and Robert Allen.

I have, &c.,

ERNEST A. SMITH,
Crown Solicitor.

No. 57.

Messrs. Holdsworth and Son to The Crown Solicitor.

Cable Tram Resumption—Rushcutters' Bay—Wilcox, claimant.

Dear Sir,

Sydney, 25 August, 1893.

Will you please inform us what state this matter is in; it appears to us to have been delayed a very long while, and this delay acts extremely hard against our clients, because before the property was resumed, they lived on the rents therefrom, but since then the buildings have been pulled down, and part of the means of their subsistence has gone. You will, therefore, see the plight our clients are in, and we trust that you will do what is necessary to expedite the completion of the matter.

Yours, &c.,

HOLDSWORTH AND SON.

No. 58.

The Crown Solicitor to The Under Secretary for Public Works.

Mary A. Wilcox to Minister for Lands, King to Ocean Street Tramway.

Sir,

Sydney, 28 August, 1893.

Referring to my letter of the 17th ultimo reporting on the title herein, I have the honor to state that I am informed by Messrs. Holdsworth and Son in their letter of the 22nd ultimo, that the claim sent in by Mrs. Wilcox, who has since died, is to be considered as a claim made on behalf of the present trustees and all parties interested under the settlement. An offer may now be made to the trustees, Thomas John West and Robert Allen, as advised in my letter.

I enclose a copy of Messrs. Holdsworth and Son's letter of 25th instant, urging completion of the matter.

I have, &c.,

ERNEST A. SMITH,
Crown Solicitor.

The Land Valuer.—D.C.McL. (pro U.S.), B.C., 16/10/93.

No. 60.

Report by The Land Valuer.

23 October, 1894.

King-street to Ocean-street Cable Tramway—Extension from King-street to Ocean-street.

Particulars of claim:—Claimant and owner, Mary A. Wilcox; reference number, 17; area taken, 31 $\frac{1}{2}$ perches; amount of claim, £2,101.

As I find Mr. Thompson's valuation on the adjoining blocks were at the rate of £15 per foot on 50 feet frontage, and as block 17 is certainly equal, if not more valuable to 16 and 15, by reason of access or frontage of 18 feet to Waratah-street, I cannot value the land at less than given for 15 and 16, and indeed, if the valuation was objected to by the claimant, I would have to give an increased price per foot of £1, which I do in my valuation. Although, I submit, Mr. Thompson's value as of the other blocks, as what should be offered. Buildings having been removed before my inspection, and as the amount claimed is less than the valuation of the Government Architect, i.e., £731 4s., of course I allow the amount claimed, viz., £660.

	Valuation:	£	s.	d.
50 feet to reserve at £16 per foot	800	0	0
Buildings, &c., and as claimed	660	0	0
Forced sale at 10 per cent.	146	0	0
Total	<u>£1,606</u>	0	0

T. F. WALLER,
Land Valuer.

The Constructing Authority, Sydney.

Claim, £2,101; valuation, £1,606; recommended, £1,500.—Submitted for approval. Submitted.—J.B., 24/10/93. Approved.—W.J.L., 27/10/93. Will the Engineer-in-Chief be good enough to initial the description on notice of valuation herewith?—3/11/93. Mr. Fischer, 6/11/93. Correct.—G.F., Engineer-in-Chief, 8/11/93. Notice of valuation herewith for signature and seal.—A.B., 11/11/93. Under Secretary, Works. Offer made, 17/11/93.

No. 61.

Offer to Trustees of Mrs. M. A. Wilcox.

Notice of Valuation under the Public Works Act of 1888.

(Fifth schedule.)

To Thomas John West and Robert Allen, trustees of Mary Ann Wilcox (deceased), claimant in respect of the land hereunder described, taken or injuriously affected under the Public Works Act of 1888.

TAKE notice, that the amount of the purchase money and compensation to be paid to you by the Constructing Authority for the interest belonging to you, or which by the Public Works Act you are enabled to sell, and for any damage that may be sustained by you by severance or otherwise by reason of the execution of the authorised work in respect of the land hereunder described and referred to in your offer bearing date the 21st day of November, 1892, and in the schedule of claim subjoined thereunto, has (after taking into consideration and giving effect to by way of set-off or abatement any enhancement in the value of any land belonging to you adjoining the land taken or severed therefrom by the construction of the authorised work) been valued and assessed at the sum of £1,500, and which sum is hereby offered to you by the Constructing Authority in full satisfaction and discharge of all such claims and matters as aforesaid, subject to your making out a title to the land or the interest claimed by you therein to the satisfaction of the Constructing Authority, as by the Public Works Act of 1888 is provided.

As witness the seal of the Constructing Authority this 16th day of November, A.D. 1893.

WILLIAM JOHN LYNE,

Constructing Authority.

Signed and sealed by the Constructing Authority in the presence of—

D. C. McLACHLAN.

Offer made to Messrs. Holdsworth and Son, solicitors, Pitt-street, Sydney, 17/11/93.

Description of land taken or injuriously affected in respect of which claim has been made.

All that piece or parcel of land situate in the parish of Alexandria, county of Cumberland, containing by admeasurement 31 $\frac{1}{2}$ perches, more or less, and numbered 17 on plan and book of reference of the King-street and Ocean-street cable tramway.

No. 62.

No. 62.

Messrs. Holdsworth and Son to The Secretary for Public Works.

Cable Tramway Resumption—Rushcutters' Bay—Wilcox, claimant.

Sir,

75, Pitt-street, Sydney, 24 November, 1893.

We have submitted your offer of £1,500 as compensation for the land resumed herein to our clients, who have instructed us to reply that they cannot accept such offer, as they think that sum totally inadequate, considering the value of the land in the locality. We, therefore, have the honor to request that the matter be reconsidered. We may add that our clients are willing to accept the sum of £2,000 without prejudice.

We have, &c.,

HOLDSWORTH AND SON.

Land Valuer.—D.C.McL. (*pro U.S.*), B.C. 25/11/93.

I think, under the circumstances, that an offer of £1,677 might be made, *i.e.*, giving my valuation, £1,600, and £71, the difference between their claim for the buildings and the valuation thereof by the Government Architect.—T.F.W., 29/11/93. Under Secretary, Works.

Submitted.—J.B., 4/12/93. Approved.—W.J.L., 12/12/93. Write.—J.B., 12/12/93. Messrs. Holdsworth and Son, 15/12/93.

Sir,

75, Pitt-street, Sydney, 27 December, 1893.

We have the honor to acknowledge the receipt of your letter, dated the 15th instant, offering, without prejudice, the sum of £1,677, in lieu of £1,500, previously offered for compensation for the land resumed herein, and we have conferred with our clients thereon, and they instruct us to accept such offer of £1,677, subject, however, to the understanding that interest, as is usual in such cases, shall be allowed at 6 per cent. from the date of the resumption to the date the compensation money is paid. This, we think, is understood.

HOLDSWORTH AND SON.

The Land Valuer.—D.C.McL. (*pro U.S.*), B.C., 28/12/93.

Messrs. Holdsworth and Son might be informed that interest on the compensation money at the rate of 5 per cent. will be allowed from the date the Constructing Authority obtained possession of the premises to the time of payment.—A.B. (*pro Land Valuer*), 4/1/94. Under Secretary, Works.

Submitted.—J.B., 5/1/94. Approved.—W.J.L., 8/1/94. Certificate, two abstracts of title, and voucher for £1,677, to Crown Solicitor.—A.B., 1/2/94.

No. 66.

The Under Secretary for Public Works to Messrs. Holdsworth and Son.

Gentlemen,

15 January, 1894.

With reference to your letter of the 27th ultimo, accepting offer of compensation in the land claim matter of the trustees of Mrs. Wilcox, for land resumed for the King-street and Ocean-street cable tramway, on condition that interest is allowed thereon at 6 per cent., I am directed by the Secretary for Public Works to inform you that interest will be allowed at that rate from the date the Constructing Authority obtained possession of the property to the time of payment of the compensation money.

I have, &c.,

J. BARLING,
Under Secretary.

Extension from King-street, Sydney, to Ocean-street, Woollahra.

Public Works Act of 1888.

Offer and particulars of claim for land taken for tramway purposes.

To the Honorable William John Lyne, Constructing Authority,—

I HEREBY offer to accept from the Constructing Authority, as purchase money for the land (including buildings and fences erected thereon) of which I have a leasehold interest for a term of eight years and two months (with a promise of renewal for a further term of ten years), delineated on the tracing plan attached to the notice of land taken, and numbered 12, which I hereby acknowledge to have received, containing 19½ perches, more or less, and as compensation for damage by severance by the tramway, or otherwise caused by the execution of the tramway works, as particularly set forth in the subjoined schedule of claim, the sum of £3,495, which sum I declare to be my full claim in respect of the matters aforesaid.

Dated this 1st day of November, 1892.

To the Constructing Authority, Sydney.

DAVID S. WILLIAMS,
Care of R. B. ASHER, Solicitor,
41, Castlereagh-street, Sydney.

SCHEDULE OF CLAIM.

Reference No., 12.

Land resumed—19½ perches. Leasehold; interest, eight years and two months to run, with a promise of renewal for further term of ten years, £1,100; damage by forced sale, £110.

Improvements taken—Buildings, consisting of shop and adjoining buildings, stabling, workshops, &c., erected under building lease; damage by severance or otherwise, by reason of annihilation of trade, and loss by forced sale of stock and business caused by resumption, £2,285.

Total amount of claim, £3,495.

DAVID S. WILLIAMS.

No. 74.

The Under Secretary for Public Works to Mr. R. B. Asher.

Sir,

With reference to your letter of the 1st instant, forwarding, on behalf of Mr. David Williams, particulars of claim for land resumed for the King-street to Ocean-street cable tramway, I am directed by the Secretary for Public Works to request that you will furnish this department with a copy of your client's lease for submission to the Crown Solicitor.

Mr. R. B. Asher to The Under Secretary for Public Works.

Re Claim of David S. Williams.

Sir,

41, Castlereagh-street, Sydney, 28 November, 1892.

With reference to your letter of the 24th instant, I have the honor to forward herewith, as requested, a copy of the lease of land resumed for the King-street to Ocean-street cable tramway, and at the same time to inform you that the residue of the term created by such lease has become vested in the abovenamed claimant.

I have, &c.,

RICHD. B. ASHER.

Mr. Rae, for certificate.—A.B. (*pro L. Val.*), 1/12/92. Herewith.—F.G.R., 29/12/92. For report on title. Crown Sol.—W.E.T. (*pro Land Valuer*), 29/12/92.

No. 76.

Mr. R. B. Asher to The Under Secretary for Public Works.

Sir,

41, Castlereagh-street, Sydney, 24 January, 1893.

Referring to the claim of David S. Williams, dated 1st November last, for land resumed for the King-street to Ocean-street tramway, I have the honor to request that same may be dealt with and treated as a special case.

My client, to-day, informs me that the surveyors are now engaged pegging out on his property, and he has been given to understand that the erection of the engine-house is shortly to be proceeded with.

In view of this state of facts and the serious damage that will result owing to my client's business being disturbed and the workmen rendered idle, besides the sacrifice of his stock-in-trade, I must beg that you will cause inquiry to be made into the claim in question without further delay.

I have, &c.,

RICHD. B. ASHER.

Land Valuer.—D.C.McL. (*pro U.S.*), B.C., 24/1/93. Urgent. This matter is with Crown Solicitor for report on title, and he has promised to expedite.—A.B. (*pro Land Valuer*), 27/1/93. U.S., Works. Inform.—D.C.McL. (*pro U.S.*), 28/1/93.

No. 77.

The Under Secretary for Public Works to Mr. R. B. Asher.

Sir,

2 February, 1893.

With reference to your letter of the 24th ultimo, respecting the claim of Mr. David S. Williams for premises resumed for the King-street to Ocean-street tramway, I am directed by the Secretary for Public Works to inform you that the matter is awaiting the report of the Crown Solicitor on the title, and he has promised to expedite.

I have, &c.,

J. BARLING,

Under Secretary

(*Per D.C.McL.*)

No. 78.

The Crown Solicitor to The Under Secretary for Public Works.

David S. Williams to Minister for Works—King-street to Ocean-street Tram.

Sir,

Crown Solicitor's Office, Sydney, 4 February, 1893.

I have the honor to return herewith the papers sent me in this case, with instructions to report on title herein.

The claim is made by David S. Williams, whose title is a lease from Olaf William Blackwood to Joseph M. Arnold and David S. Williams, dated 3rd August, 1886.

The term of this lease is fourteen years from 3rd January, 1886, at a rental of £65 per annum for the first five years, and £104 for the remaining eight years. By a deed of dissolution and assignment, dated 17th December, 1891, the partnership then existing between Messrs. Arnold and Williams was dissolved; and all the interest of the said Joseph M. Arnold in the said lease was assigned to David S. Williams. I am not at present in a position to say whether the lessor (Blackwood) has a good title to the land resumed, but as I understand it is desired to make the offer in the case as soon as possible, I think David S. Williams may be dealt with as to the amount of compensation to be paid, subject to the lessor's title being found satisfactory, and to the conditions of the lease having been observed.

I have, &c.,

E. A. SMITH,

Crown Solicitor.

The Land Valuer.—D.C.McL. (*pro U.S.*), B.C., 6/2/93.

No. 79.

Mr. D. S. Williams to The Under Secretary for Public Works.

Dear Sir,

104, Bayswater Road, Sydney, 28 February, 1893.

Some four months ago the Government gave me notice that they required my premises for a cable station in connection with the Ocean-street cable tramway. I put in what I consider a very low claim

claim through my solicitor, Mr. Asher, over three months ago, but up to date cannot get an answer as to when my claim is to be settled; so that I can arrange to have another warehouse built. It will mean ruination to me if you resume before I have another place ready.

I am, &c.,

DAVID S. WILLIAMS.

Land Valuer.—When is the valuation likely to be submitted in this case?—D.C.M.L. (*pro U.S.*), B.C., 1/3/93. Please hurry it on. It seems a very urgent matter.—J.B., 1/3/93.

No. 80.

Mr. D. S. Williams to The Land Valuer.

Dear Sir,

See minute of Under Secretary, dated 25/9/94. Under same cover I am enclosing a statement of my various accounts for the year 1892, as requested, and you will please note the splendid connection I have. My customers number the very best names in Sydney.

When sending my claim to the Government I did not anticipate a second moving, thinking that my claim would have been settled ere now, thereby giving me plenty of time to have made arrangements for building a new warehouse. As I stated to you personally, I have not the money at my command to start until I receive my compensation from the Government.

I am taking "Pononvino," Victoria-street, from Messrs. Hardie and Gorman for six months, at a rental of £130 per annum, to store my furniture, and shall be compelled to build temporary workshops until I can make the necessary arrangements to get new premises erected. This will take at least six months to complete. During this time I shall not be able to show any of my stock, as the houses taken are only private residences, which, of course, will mean a great loss of business. I may state that I shall have to purchase about 2 tons of corrugated iron, besides timber and labour, in building the new workshops. This, also, will be a big outlay. I ask your careful attention *in re* loss of business in not having suitable premises to show my goods, and consequent expenses in having to erect workshops as above mentioned.

I employ eight men, at an average wage of £2 10s. per week. These comprise upholsterers, cabinet-makers, carpet-beaters, polishers, &c., &c.; also one seamstress, at 21s. per week. The above have all been regularly employed by me during the year 1892, and are at present.

Trusting the information given will enable you to give me a prompt settlement of my claims.

I am, &c.,

DAVID S. WILLIAMS.

P.S.—I estimate that it will cost at least £80 to move my furniture backwards and forwards.

Mr. Williams attached to his letter a list of transactions with his customers. I have submitted this list to the Minister, who concurs with me that as it contains purely private business transactions, it should not be printed. There is no objection, however, to the Honorable Member who moved for the papers perusing the document if he so desire.—J.B., 25/9/94.

No. 81.

Report by The Land Valuer.

King-street and Ocean-street Cable Tramway.

7 April, 1893.

Particulars of claim:—Claimant and lessee, David S. Williams; reference number, 12; amount of claim, £3,495.

This claim is made in respect of a lease of allotment 28 of a subdivision of a 71-acre grant, called the Barcom Glen Estate, which has been resumed for tramway purposes in connection with the King-street and Ocean-street tramway. The lease was for a period of fourteen years from the 3rd January, 1887, and it had, therefore, eight years and eighty days, or eight and a quarter years, to run at the date of resumption. Mr. Williams at that date was subject to a yearly rental of £104 in addition to rates and taxes. Mr. Williams was bound by a covenant in his lease to erect buildings on the land worth £500, within the first and second years of his lease, and this covenant he more than fulfilled by the erection of buildings worth £862 7s. Mr. Williams' business was that of dealing in, manufacturing, and repairing furniture, together with carpet-beating and other work incidental to his business. His transactions of all kinds amounted to about £3,550 per annum, as shown by statement herewith, and the net profits realized—that is, exclusive of rent, taxes, wages, bad debts, interest on capital, &c.—would be about 10 per cent. on that amount, or £385 per annum.

	£ s. d.
To recoup cost of buildings (£862 7s.) as to residue of term, present value of £61 11s. 5d. p. a. for eight and quarter years 407 10 0
Disturbance of trade—twelve months' profits 385 0 0
Depreciation of stock—5 per cent. on net profit 192 0 0
Cost of removal twice, at £60 each 120 0 0
Cost of temporary shed, £140—less value of materials, £50 90 0 0
Value of lease 100 0 0
Forced surrender at 10 per cent. 129 10 0

The Constructing Authority, Sydney.

J. B. THOMPSON,
Land Valuer.

Claim, £3,495; valuation, £1,424 10s.; submitted for approval.—J.B.T., 7/4/93. Submitted.—J.B., 10/4/93. Approved.—W.J.L., 10/4/93. Offer sent to Mr. R. B. Asher, Solicitor, 15/4/93.

No. 82.

Offer to Mr. D. S. Williams.

Notice of Valuation under the Public Works Act of 1888.

(Fifth Schedule.)

To David S. Williams.

Claimant in respect of the land hereunder described, taken or injuriously affected under the Public Works Act of 1888.

TAKE notice, that the amount of the purchase money and compensation to be paid to you by the Constructing Authority for the interest belonging to you, or which by the Public Works Act you are enabled to sell, and for any damage that may be sustained by you by severance or otherwise by reason of the execution of the authorised work in respect of the land hereunder described and referred to in your offer bearing date the 1st day of November, one thousand eight hundred and ninety-two, and in the Schedule of Claim subjoined thereto, has (after taking into consideration and giving effect to by way of set off or abatement any enhancement in the value of any land belonging to you adjoining the land taken or severed therefrom by the construction of the authorised work) been valued and assessed at the sum of £1,424 10s. (one thousand four hundred and twenty-four pounds ten shillings), and which sum is hereby offered to you by the Constructing Authority in full satisfaction and discharge of all such claims and matters as aforesaid, subject to your making out a title to the land or the interest claimed by you therein to the satisfaction of the Constructing Authority, as by the Public Works Act of 1888 is provided.

As witness the seal of the Constructing Authority, this 15th day of April, in the year of our Lord 1893.

WILLIAM JOHN LYNE,

Constructing Authority.

Signed and sealed by the Constructing Authority in the presence of—

D. C. McLACHLAN.

Description of land taken or injuriously affected in respect of which claim has been made.

ALL that piece or parcel of land situate in the parish of Alexandria, county of Cumberland, containing by admeasurement 19 perches and one-fifth of a perch, more or less, and numbered 12 on plan and book of reference, of the King-street to Ocean-street Cable Tramway.

Offer and Particulars of Claim for Land taken for Tramway purposes.

To the Minister for Works as Constructing Authority,—

I HEREBY offer to accept from the Constructing Authority, as purchase money for the land (including buildings and fences erected thereon) of which I am tenant, delineated on the tracing plan attached to the notice of land taken, and numbered 16, which I hereby acknowledge to have received, containing 30*1/4* perches, more or less, and as compensation for damage by severance, by the tramway, or otherwise caused by the execution of the said works, as particularly set forth in the subjoined schedule of claim, the sum of £30, which sum I declare to be my full claim in respect of the matters aforesaid.

Dated this 31st day of January, 1892.

DANIEL MAHONEY,
108, Pitt-street.

SCHEDULE OF CLAIM.

Land resumed—Reference No., 60; 30*1/4* perches. Total amount of claim, £30.

DANIEL MAHONEY.

No. 92.

The Land Valuer to Mr. H. R. Way.

Sir,

With reference to your letter of the 31st ultimo, respecting the claim of Mr. Daniel Mahoney, as tenant of premises resumed for tramway purposes, King-street, Sydney, to Ocean-street, Woollahra, I have the honor to request that you will be good enough to furnish this branch with a copy of your client's lease. I have, &c.,

ALFRED BROWN
(*pro* Land Valuer.)

No. 93.

No. 93.

Mr. H. R. Way to The Land Valuer.

Sir,

I have the honor to acknowledge the receipt of your letter of the 13th instant, respecting the claim of Mr. Daniel Mahoney, and have to inform you that my client has not a lease of the premises, but has been in occupation for years past.

The premises suited him admirably, and if he had not been compelled to vacate by reason of the tramway works he would have remained in occupation of the same for years.

If you require to have the above facts verified, I am in a position to do so by declaration.

I have, &c.,

H. R. WAY.

Mr. Rae for certificate.—A.B., 16/2/93. Please report on claim and title.—A.B. (*pro* Land Valuer). Crown Solicitor.

No. 94.

The Crown Solicitor to The Under Secretary for Public Works.

Daniel Mahoney to Minister for Works.

Sir,

Crown Solicitor's Office, Sydney, 17 March, 1893.

I have the honor to return herewith the papers sent to me with instructions to report on title. It appears from the certificate of identity with the papers that the land resumed was occupied by Daniel Mahoney, and he may therefore be dealt with as to the compensation money to be paid in respect of his occupancy.

I have, &c.,

ERNEST A. SMITH,
Crown Solicitor.

The Land Valuer.—D.C.McL. (*pro* U.S.), B.C., 18/3/93.

No. 95.

Report by The Land Valuer.

Constructing Authority, Sydney.

King-street and Ocean-street Cable Tramway.

Particulars of Claim.

Claimant and tenant, Daniel Mahoney; reference number, 16; area taken, 30·1 perches; amount of claim, £30.

Report.

THIS claim is made in respect of reference number 16, being allotment No. 33 of a subdivision of the Barcom Glen Estate, taken for tramway purposes, in connection with the King-street and Ocean-street cable tramway.

The claimant having no lease is dealt with as a weekly tenant.

Valuation.—Inconvenience and loss by forced removal—£10.

J. B. THOMPSON,

Land Valuer,

Claim, £30; valuation, £10.

7/4/93.

Submitted for approval.—J.B.T., 7/4/93. Submitted.—J.B., 10/4/93. Approved.—W.J.L.,
10/4/93. Offer sent to H. R. Way, 15/4/93.

No. 96.

Offer to Mr. D. Mahoney,

Notice of Valuation under the Public Works Act of 1888.

(Fifth Schedule.)

To Daniel Mahoney, claimant in respect of the land hereunder described, taken or injuriously affected under the Public Works Act of 1888.

TAKE notice, that the amount of the purchase money and compensation to be paid to you by the Constructing Authority for the interest belonging to you, or which by the Public Works Act you are enabled to sell, and for any damage that may be sustained by you by severance or otherwise by reason of the execution of the authorised work in respect of the land hereunder described and referred to in your offer bearing date the 31st day of January, 1893, and in the Schedule of Claim subjoined thereto, has (after taking into consideration and giving effect to by way of set off or abatement any enhancement in the value of any land belonging to you adjoining the land taken or severed therefrom by the construction of the authorised work) been valued and assessed at the sum of £10, and which sum is hereby offered to you by the Constructing Authority, in full satisfaction and discharge of all such claims and matters as aforesaid, subject to your making out a title to the land or the interest claimed by you therein to the satisfaction of the Constructing Authority, as by the Public Works Act of 1888 is provided.

As witness the seal of the Constructing Authority, this 15th day of April, in the year of our Lord 1893.

WILLIAM JOHN LYNE,

Constructing Authority.

Signed and sealed by the Constructing Authority in the presence of,—

D. C. McLACHLAN.

Description

Description of land taken or injuriously affected in respect of which claim has been made.

All that piece or parcel of land situate in the parish of Alexandria, county of Cumberland, containing by admeasurement 30 $\frac{1}{2}$ perches, more or less, and numbered 16 on plan and book of reference of the King-street and Ocean-street Cable Tramway.

Sent to Mr. H. R. Way, solicitor, 15/4/93.

No. 97.

Mr. Mahoney to The Under Secretary for Public Works.

Sir,

I beg to inform you that I will accept the sum of £10 in full compensation, the amount at which my claim has been assessed in respect to my tenancy of a house, Rushcutter's Bay, resumed by your Department in connection with the cable tram extension, King to Ocean Streets.

I am, &c.,

DANIEL MAHONEY.

The Land Valuer.—D.C.McL. (*pro U.S.*), B.C., 12/6/93. Mr. Rae, for description.—A.B., 16/6/93. Herewith.—F.S.R., 3/7/93. Entd. Description, certificate, and voucher for £10 to Crown Solicitor.—A.B., 5/7/93.

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

PATENT GRIP IN USE ON CABLE TRAM.

(RETURN RESPECTING.)

Ordered by the Legislative Assembly to be printed, 11 December, 1894.

RETURN to an *Order* of the Honorable the Legislative Assembly of New South Wales, dated 6th December, 1894, That there be laid upon the Table of this House a return showing,—

- “ (1.) Whether a patent grip is in use on the recently opened cable tram.
- “ (2.) Whether it is working successfully or satisfactorily.
- “ (3.) Whether it has any injurious effect upon the cable.
- “ (4.) Whether it has been found necessary to make any alteration in its working parts or details since being first fitted on this line.
- “ (5.) Whether any portions require frequent renewal.
- “ (6.) What has been the cost incurred for general repairs and renewal of parts up to the end of November.
- “ (7.) Whether the railway or tramway officials were called on to report (prior to its adoption) as to the advantage likely to result from the use of this appliance; and, if so, the purport of such report.
- “ (8.) The sum paid for right to use this grip, and the name of the vendor.
- “ (9.) The cost of supplying and fitting the grip to each dummy car, and how many have been fitted.
- “ (10.) Whether the appliance is patented; if so, when, and to which colonies do patent rights extend.”

(Mr. Bavister.)

(1.) Yes.

(2.) The Tramway Locomotive Superintendent reports that the grip has given considerable trouble, but that the improvements made have now largely overcome the difficulties experienced.

(3.) It is considered that the length of time the grip has been in use has not been sufficient to demonstrate the ultimate effect of the grip on the cable.

(4.) Yes.

(5.) Yes.

(6.) £876 0s. 4d.

(7.) Yes; the Tramway Locomotive Superintendent inspected 3 bottom grippers imported from America, and reported the Vogel Gripper, modified to suit this line, was the best of the 3 submitted, but he, at the same time, recorded his opinion in favour of a side gripper.

(8.) £3,000; John Storer.

(9.) £50 12s. Twenty cars were fitted.

(10.) It was patented in New South Wales on the 17th September, 1892. The papers do not show if patented in the other colonies.

[782 copies—Approximate Cost of Printing (labour and material), £1 1s. 6d.]

1894.

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

MR. J. F. COOK, LATE CONDUCTOR, TRAMWAY DEPARTMENT.

(PETITION FROM JAMES FREDERICK COOK, PRAYING THAT HE MAY BE HEARD AT THE BAR OF HOUSE BY COUNSEL IN REFERENCE TO HIS DISMISSAL FROM THE SERVICE.)

Received by the Legislative Assembly, 11 December, 1894.

To the Honorable the Speaker and the Honorable the Members of the Legislative Assembly, in Parliament assembled.

The humble Petition of the undersigned,—

RESPECTFULLY SHOWETH:—

1. That for eight years prior to the 1st day of September, 1890, your Petitioner was employed as a Conductor in the Tramway Department of the Railways of New South Wales, being an employee of the Commissioners for Railways from the passing of the Government Railways Act of 1888 to the said 1st day of September, 1890.
2. That during the said period of service prior to the said 1st day of September, 1890, your Petitioner was not guilty of any misconduct of any kind whatsoever, and your Petitioner received all the concessions made by the Railway Regulations for good service.
3. That on Saturday, the 30th day of August, 1890, your Petitioner, who was conductor of a tram running from Bridge-street to the Randwick Racecourse, was charged by James Roberts, the officer at the head of your Petitioner's Branch of the said Service, with defrauding the Railway Commissioners of the sum of 10s. received by your Petitioner as fares of passengers by the said tram, and your Petitioner was thereupon suspended by the said James Roberts from the said service.
4. That on the following Monday, the 1st day of September, 1890, your Petitioner received notice from the said James Roberts that he found your Petitioner guilty on the said charge, and that your Petitioner was therefore dismissed from the said Railway service.
5. That your Petitioner was entirely innocent of the said charge, was not informed upon what evidence he had been found guilty of the same, nor had any opportunity whatever to meet the charge been afforded him before he was dismissed.
6. That your Petitioner, regarding his case as being within section 71 of the Government Railways Act of 1888, applied immediately after the said notice to the Railway Commissioners of New South Wales for an appeal against the decision of the said James Roberts with respect to the charge made against your Petitioner.
7. That the said Commissioners refused to hear the evidence of witnesses on your Petitioner's behalf in refutation of the said charge, stating they could not waste their valuable time over the matter, and would not alter the said decision.
8. That the said charge is the first accusation of any kind ever made against your Petitioner during his lifetime, and your Petitioner suffers more from the said accusation than from his said dismissal, and is grieved that the said accusation should be taken by the said James Roberts and the said Commissioners to have been proved without any proper opportunity being given to your Petitioner to meet his accusers, and to rebut the charge made against him.
9. That on the 26th day of September, 1893, your Petitioner again respectfully appealed to the said Commissioners for the opportunity to clear his reputation of the unfounded charge, and the said Commissioners on the 11th day of October, 1893, refused the said appeal.
10. That on the 17th day of October, 1893, your Petitioner applied to the Honorable the Minister for Railways of New South Wales—at that time, the Honorable John See, M.L.A.—to be given an opportunity to rebut the said charge, and clear his character, but received no reply from the Honorable the Minister.
11. That on the 25th day of October, 1893, the Solicitor for the Railway Commissioners, James Thom, wrote asking your Petitioner to call upon him; and thereupon your Petitioner called on the said solicitor, and was asked by him the names of your Petitioner's witnesses, and what each could prove, and your Petitioner then asked the said solicitor if there was to be an inquiry, and offered to give the names and the substance of the proof of the said witnesses, if the said inquiry had been ordered, and thereupon the said solicitor informed your Petitioner that unless the said names and proofs were given to him

him unconditionally, he would advise the said Commissioners to refuse the said inquiry, and your Petitioner would then hear no more of the matter. Your Petitioner then declined to give the information so sought, and thereafter heard no more of the matter from the said Commissioners.

12. That your Petitioner then wrote to the then Honorable Minister for Railways for New South Wales, informing him of the proceedings which had ensued, between the Solicitor for Railways and your Petitioner, to which your Petitioner received a reply referring him to the Railway Commissioners, to whom your Petitioner had twice appealed without redress.

13. That, during the Session 1893-1894 of your Honorable House, Mr. W. H. Sharp, then one of the Members for Redfern, gave notice of motion:—

"That a Select Committee be appointed, with power to send for persons and papers, to inquire into "and report upon the circumstances connected with the dismissal of James Cook from the "Tramway Service. That such Committee consist of Mr. Cook, Mr. Bavister, Mr. Langwell, "Mr. Scott, Mr. Henry Clarke, Mr. Dowel, Mr. Darnley, Mr. Lees, Mr. Willis, and the mover," but the said motion was not reached during the said Session.

14. That, in September and October, 1894, your Petitioner again appealed to the Honorable the present Minister for Railways, the Honorable George Reid, for an inquiry in which your Petitioner might clear his character, and the said Minister, on the 22nd day of October, 1894, replied that he could not reopen the case.

15. That your Petitioner regards his said dismissal and degradation as being brought about in a manner contrary to the spirit and provisions of the Government Railways Act of 1888, and contrary to the natural right which every person has to be heard before he is condemned.

16. That your Petitioner verily believes that, were a proper inquiry now held, his innocence of the offence alleged against him would be fully established.

17. The grounds of this belief, in addition to those already stated, are briefly as follows:—

- (a) That your Petitioner paid in seventy-four fares for a car that could only reasonably hold seventy.
- (b) That your Petitioner has reason to believe that a deliberate conspiracy was formed to procure his dismissal.

18. Among others your Petitioner has the following reasons for believing that a deliberate conspiracy was formed to procure his dismissal.

- (a) That before leaving Bridge-street yard, it being the busy time of the day for race traffic, viz., 11:35 a.m., he coupled together two cars to form his tram, such being usual.
- (b) That Superintendent James Roberts ordered your Petitioner to uncouple one of the cars, and only take one, a most unusual proceeding.
- (c) That an officer of the Department avers and proffers to swear that he, the said officer, remarked to the said Superintendent, James Roberts, "Cook ought to take three cars," and the said Superintendent, James Roberts, replied to the said officer, "Let him go; we want him to get a crowd on. Brown and Payne will meet him at Cleveland-street, and put him away. He is no good."
- (d) That the said Brown and Payne did meet your Petitioner at Cleveland-street, but did not speak to your Petitioner, or did they, to all appearances, make any count of the passengers.
- (e) That after arrival at Randwick, your Petitioner was asked by the clerk to whom he paid over the full amount of the fares he had collected, "Did you have Brown and Payne with you"; to which your Petitioner made reply, "Yes." The said clerk then said, "I hope they did not catch you," and your Petitioner made reply, "I'll forgive them if they did."
- (f) Your Petitioner then returned to Bridge-street yard with his train, and immediately received orders to go to the office and see the said Superintendent, James Roberts, who accused your Petitioner of not paying in the amount of ten fares which he had collected. Your Petitioner denied the accusation, but the said Superintendent, James Roberts, would not heed the denial, and suspended from duty your Petitioner.
- (g) That some time after one of the officers averred, in the presence of a witness, now procurable, that your Petitioner was dismissed the Service innocently, and was the victim of a conspiracy, and your Petitioner has now in his possession a statement to this effect signed by this witness.
- (h) That these facts becoming known to certain of the tramway employees, they induced your Petitioner to wait with them on Mr. Hoyle, then one of the Members of your Honorable House for the district of Redfern, and that many documents relating to the case were entrusted to the said Mr. Hoyle.
- (i) That the said Mr. Hoyle thereafter stated to several tramway employees that the said Superintendent, James Roberts, had waited on him (Hoyle) twice, had gone on his knees and begged of him (Hoyle) not to go any further with the case, for the sake of his, the said Superintendent, James Roberts' wife and children.
- (j) That about this time your Petitioner had overtures made to him to take up his former position in the Department, but, acting on the advice of the said Mr. Hoyle, your Petitioner refused to do so.
- (k) That the said Mr. Hoyle kept your Petitioner dallying without taking any such action as he had previously promised, for the purpose of obtaining an inquiry into your Petitioner's case, and finally stated to your Petitioner that he (Hoyle) had lost all the papers entrusted to him by your Petitioner and referring to this matter.

Your Petitioner therefore prays,—

1. That your Honorable House may take such proceedings as to your Honorable House may seem just to enable your Petitioner to re-open his said case, so as to enable him to appear and be heard to defend himself on the said charge.
2. That your Petitioner may be heard at the Bar of your Honorable House, by counsel, in support of this his humble Petition.

And your Petitioner, as in duty bound, will ever pray.

JAMES FREDERICK COOK.

Sydney, December, 1894.

1894.
(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

COMPENSATION PAID TO MR. CLIFF FOR LAND RESUMED AT
LAVENDER BAY.

(RETURN RESPECTING.)

Ordered by the Legislative Assembly to be printed, 6th September, 1894.

[Laid upon the Table of the House in answer to Question No. 15, of 29th August, 1894.]

Question.

- (15.) COMPENSATION PAID TO MR. CLIFF FOR LAND RESUMED AT LAVENDER BAY:—MR. ASHTON asked THE COLONIAL TREASURER,—
- (1.) Is it a fact that the sum of £40,000 has been paid to Mr. W. J. Cliff in connection with the resumption of his land at Lavender Bay?
 - (2.) Is it a fact that the same property was valued some three years ago by a well-known firm of valuers at £8,000?
 - (3.) Who was the valuer on the part of the Government in the transaction referred to; by whom was he appointed; and on whose recommendation?
 - (4.) Will the Colonial Treasurer place all papers in connection with this transaction upon the Table of the House?

No. 1.

Messrs. Norton & Co. to The Secretary for Public Works.

Extension of Milson's Point Railway.

Sir,

Marlborough Chambers, O'Connell-street, Sydney, 4 September, 1891.

With reference to the notice served by you upon the Caledonian Mortgage and Agency Company (Limited), we have the honor to enclose herewith the claim of the above-mentioned company, together with an abstract of their title to the land resumed, of which they are the mortgagees, in fee-simple.

We understand that Mr. Cliff, the owner of the property, has given notice that he requires you, as Constructing Authority, to resume the whole of the property.

We have, &c.,

NORTON & Co.

[Enclosure.]

PUBLIC WORKS ACT OF 1888.

Notice of Claim and Abstract.

To the Minister for Public Works, as Constructing Authority.—

3 September, 1891.

In pursuance of the "Public Works Act of 1888," the Caledonian and Australian Mortgage and Agency Company (Limited) hereby give you notice that the company claim compensation in respect of the land hereunder described, which has been taken under the said Act. The amount of such claim, and other the particulars required by the said Act, are stated in the subjoined abstract.

ABSTRACT.

Names and descriptions of parties claiming and nature of their interests, whether tenants for life, in tail, or otherwise	The Caledonian and Australian Mortgage and Agency Company (Limited), c/o Messrs. Gibbs, Bright, & Co., claiming as mortgagees.
Situation and description of property	The whole of the land comprised in indenture of mortgage dated 3rd August, 1887, registered as No. 633, book 368, and in memorandum of mortgage registered as No. 124,320, from John William Cliff to the claimants, which comprises the 2 rods 38 3 perches, Nos. 91 and 92 on the plan or book of reference.
Quit-rents payable if leasehold, name of landlord, term of lease, and rent reserved	The claimants are mortgagees in fee free from all quit-rents, claims, charges, and incumbrances.
Names of occupiers, distinguishing whether tenants-at-will or under lease, rent reserved, terms, &c.	J. W. Cliff, as owner, in fee subject to mortgage to the claimants.
Particulars of claim, specifying separately the amount claimed for value of property and for compensation... ...	Principal and interest due on mortgages above mentioned — Principal due 1st June, 1892.. £6,000 0 0 Two half-yearly payments of interest due 1st December, 1891, and 1st June, 1892.. £480 0 0 Less allowance if punctually paid 120 0 0 360 0
Dates and other short particulars of documents of title ...	Total principal and interest due on mortgage £6,360 0 Abstract of title:—6th January, 1881, conveyance, Carr and anr. to Adams. 6th May, 1881, conveyance, Adams to Giblin. 14th July, 1881, conveyance, Giblin to Fox. 26th July, 1881, mortgage, Fox to Leathes. 28th July, 1884, reconveyance, Leathes to Fox. 31st August, 1885, conveyance, Fox to Cliff. 3rd August, 1887, mortgage, Cliff to claimants. 19th January, 1881, certificate of title, vol. 516, fol. 186. 3rd August, 1887, mortgage, Cliff to claimants.
Names of persons having the custody of documents, and place or places where the same may be inspected, and name of claimant's solicitor or agent	Messrs. Norton, Smith, Westgarth, & Co., solicitors, 2, O'Connell-street, Sydney.

CALEDONIAN AND AUSTRALIAN MORTGAGE AND AGENCY CO. (LTD.).

By its attorney,

ALF. FURNES & CO.,

37, Pitt-street, Sydney.

PUBLIC WORKS ACT OF 1888.

Extension from the North Shore Railway to Milson's Point.—Offer and particulars of claim for land taken for Railway purposes.

To the Minister for Lands, as Constructing Authority,—

I hereby offer to accept from the Constructing Authority, as purchase money for the land (including buildings and fences erected thereon), of which I am owner, delineated on the tracing plan attached to the notice of land taken, and numbered 91 and 92, which I hereby acknowledge to have received, together with other land referred to in my notice of 6th April, 1891, and your reply thereto of 25th June, 1891, containing 6 acres and 22 1/4 perches, more or less, and as compensation for damage or otherwise caused by the execution of the said works, as particularly set forth in the subjoined schedule of claim, the sum of £54,263 17s., together with the sum of £2,500 for loss on sale of furniture, which sum I declare to be my full claim in respect of the matters aforesaid.

Dated this 14th day of July, 1891.

JESSIE L. CLIFF,

108, Pitt-street, Sydney

(By H. R. WAY).

To the Constructing Authority, Sydney.

JESSIE L. CLIFF.

No. 2.

The Crown Solicitor to The Under Secretary for Public Works.

Sir,

Crown Solicitor's Office, Sydney, 3 June, 1891.

I have the honor to return herewith departmental papers on the subject of the claim made by Messrs. Way and Way, on behalf of Mrs. Cliff and J. W. Cliff, and state that having examined the plan submitted with the papers, it appears to me that the whole of the property is occupied as one holding, and that it is so intersected by the railway that the proprietors are entitled to call upon the Constructing Authority to take the whole of the property. I accordingly advise that the claim made be acceded to.

I have, &c.

(for JOHN WILLIAMS),

Crown Solicitor,

R.S.

The Land Valuer.—D.C.McL. (for U.S.), B.C., 5/6/91. Mr. Cliff's solicitors might now be informed, as advised by the Crown Solicitor.—J.B.T., 8/6/91. U.S., Works. What amount does the extra land involve?—J.B., 9/6/91.

No. 3.

The Crown Solicitor to Messrs. Way and Way.

Re Railway Extension to Milson's Point.

Dear Sirs,

Crown Solicitor's Office, Sydney, 25 June, 1891.

In reference to your letters to the Land Valuer, and the notice by Mr. and Mrs. Cliff to the Constructing Authority of 8th April last, in respect of land belonging to them at North Shore, and resumed for railway purposes, Nos. 91 and 92 on the plan of the Milson's Point railway extension, I am instructed to inform you that the Constructing Authority is prepared to purchase the whole of the holding held as one property through portions of which the railway passes. Kindly submit a claim in respect thereof, together with an abstract and particulars of your clients' title, with a plan of the land thus offered to be purchased, to enable it to be valued. As the purchase is thus made compulsory by your clients' action on the Constructing Authority, no claim of compensation for forced sale will be entertained.

I have, &c.,

(for JOHN WILLIAMS),

Crown Solicitor,

R.S.

No. 4.

The Crown Solicitor to The Under Secretary for Public Works.

Re Railway Extension to Milson's Point.

Sir,

Crown Solicitor's Office, Sydney, 26 June, 1891.

With reference to your B.C. minute of the 23rd instant, forwarding the papers relating to the counter notices given by Messrs. A. W. Charlton, M. Charlton, and R. Charlton, Mr. and Mrs. Cliff, and Mr. Buckland, with instructions for me to reply thereto, I have the honor to return herewith the papers in this matter, and to state that I have sent answers to the various solicitors. I also enclose copies of letters to Messrs. Way and Way, Messrs. Fitzhardinge, Son, and Houston, and of one letter to Messrs. Creagh and Williams. Three letters were sent to Messrs. Creagh and Williams—one relative to claim of A. W. Charlton, another to the claim of R. Charlton, and a third relative to the claim of Messrs. R. and M. Charlton; but as these three letters were in the same terms, I have only sent a copy of the last-mentioned letter. I call special attention to the wording of these letters. I am under the impression that in sending in my several advisings of 3rd June, I pointed out in a memo. not now with the papers, that I came to the conclusions then advised, based partly on the former advisings of this Department, and on the English and Colonial decisions, but that I was more induced to do so from a consideration of the fact that the purchases thus made compulsory on the Department would be the cheapest way of acquiring the land, as the claims for severance would be greater than the loss on re-sale of the property. If the matter comes to be contested, I have great doubts, not about the construction itself of the 78th section of the Public Works Act, but as to its application to a case like the present, having in view the 76th section of our Act, which is not in the English Act, and renders a sale or conveyance unnecessary, where there has been, as in this case, a compulsory taking under the 30th section of the Act. In my own view, it is at

at least arguable that the 78th section only applies to a compulsory purchase under the 32nd section of the Public Works Act, part II, but whether this be so or not, I have no doubt about the propriety of the course now taken in the cases dealt with if properly and skilfully followed up. I would ask you to invite the attention of the Land Valuer to the terms of my letters, in which I have refused virtually to resume, but have offered to purchase on terms of the parties submitting an offer to sell at a price to be named by them, with a plan and abstract of their title, but for the reasons set out therein, have pointed out that no claim of compensation for forced sale will be entertained. Until the claims are lodged the valuer is not called upon to make any valuation, and the course I recommend is that steps be taken at once to have the surplus land sold by auction through Messrs. Richardson and Wrench, as soon after the claim is received as it can be safely done, so as, in the first place, to fix through Messrs. Richardson and Wrench, the present market value of the property, and, in the next place, to avoid having so much of the public funds tied up in property not wanted for railway purposes. I venture to think that by the exercise of tact and a little management, and bearing in mind the enhancement given to all property at North Shore by the railway, the Government, by taking the whole of the property, ought to have little or no compensation to pay in any of these cases, and that so far from the notice under the 78th section being a tax on the line, it ought to be a reduction of the cost.

I have, &c.,

JOHN WILLIAMS,

Crown Solicitor.

These copies do not appear to have been sent.—J.B., 29/6/91. Mr. Thompson, please see me at once about this.—J.B., 29/6/91. Very urgent.

No. 5.

The Crown Solicitor to The Under Secretary for Public Works.

Milson's Point Railway Extension.—Cliff's Claim.

Sir,

Crown Solicitor's Office, Sydney, 15 July, 1891.

I have the honor to state that I have been served with a claim and plan on behalf of Mrs. Cliff, and have demanded an abstract of her title.

Meanwhile it is most important that inquiries should be made respecting the property, and its present value fixed by the most certain and reliable means, as to which I should be glad if you would instruct the valuator to see me.

I understand that Mr. Gregg has been specially retained in these cases on behalf of the Minister.

I have, &c.,

JOHN WILLIAMS,

Crown Solicitor.

Mr. Thompson.—Please attend to this at once.—J.B., 15/7/91.

No. 6.

Mr. A. W. Gregg to The Land Valuer.

Re Cliff's Lavender Bay Estate.

Dear Sir,

98, Pitt-street, Sydney, 21 July, 1891.

I have carefully thought over the matter of proposing sale of residue after railway requirements, and am of opinion that the property as a whole possesses a feature that could not well be attached to a division, the large and highly improved grounds, by a unique plantation of trees, appear most appropriate to the mansion, if anyone can be found able to buy the place.

The portion of land laying between railway line and water could be offered separately being severed from the main area. If the then residue should not find a buyer in its entirety, then I would propose to make three lots of it thus:—

1. House with balance after following are provided for.
2. Blue's Point Road, frontage by a depth of from 100 feet to about 140 feet.
3. "Neepsend" Cottage from railway line back to the cliff; bounded on one side by Buckland's property and so far on the other side of this estate as may be deemed ample ground for it, for it must be remembered that the site of cottage will not be so favoured with view, &c., when railway is constructed, nor have absolute water-frontage, and, therefore, the same appreciation of it cannot be expected, hence, less ground would be suitable.

I have, &c.,

A. W. GREGG.

The above recommendation of Mr. Gregg's sets out an arrangement agreed to by that gentleman, Mr. Sievers, and myself at a conference on the matter, as being that which we thought the best mode of offering the property for sale in the first instance. Should it not find a purchaser at a satisfactory price, we agreed to then recommend that it should be submitted according to the method suggested in the last paragraph of Mr. Gregg's letter. The manner in which the property should be subdivided if not sold in accordance with the former recommendation, as a whole, is shown on the accompanying tracing by red.—J. B. THOMPSON, 5/8/91.

No. 7.

The Crown Solicitor to The Under Secretary for Public Works.

Sir,

Crown Solicitor's Office, Sydney, 28 July, 1891.

I have the honor to forward herewith an abstract of the title of Jessie Louisa Cliff, and to request that I may be supplied with descriptions and certificates of identity, the land compulsorily taken being distinguished by separate descriptions and certificates from the land which the Constructing Authority is called upon, under section 73, to purchase.

I have, &c.,

JOHN WILLIAMS,

Crown Solicitor.

Land Valuer.—D.C. McL. (for U.S.), B.C., 28/7/91. Mr. Rae,—A.B. (*pro* Land Valuer.) Descriptions and certificates herewith.—F.S.R., 8/9/91.

No. 8.

No. 8.

Mr. H. R. Way to The Secretary for Public Works.

Re Extension of Railway to Milson's Point.

Sir,

108, Pitt-street, Sydney, 27 August, 1891.

Referring to the resumption by the Constructing Authority of Mrs. J. W. Cliff's property at North Shore, I have the honor to inform you that if desired Mrs. Cliff would be willing to dispose of the residue of her property adjoining that resumed, and have the whole included in the present resumption.

I am instructed to make this offer, as it is considered that, as the Constructing Authority has taken the bulk of the property, it would be advantageous to the Government to have the residue.

I have, &c.,

H. R. WAY.

Mr. Thompson.—J.B., 28/8/91. The Land Valuers have carefully considered the suggestions made on behalf of Mrs. Cliff, and beg to state that as they totally disagree with the advice given in the last paragraph of this letter, they have, therefore, to advise that the proposal made therein be declined.—J.B.T., 2/9/91. U.S. Works.

Will Mr. Thompson please see me about this.—J.B., 7/9/91.

No. 9.

The Crown Solicitor to The Under Secretary for Public Works.

Milson's Point Railway Extension.

Sir,

Crown Solicitor's Office, Sydney, 24 September, 1891.

Referring to the advisings contained in my several letters of the 3rd and 4th June last, and my letters of 26th June and 13th July last, returned, with reference to the claims of the Messrs. Charlton, Mr. and Mrs. Cliff, and Mr. Buckland, I have the honor to forward herewith the claim of Mrs. Jessie L. Cliff, dated 14th July, 1891, for the land delineated on the tracing plan attached to the notice of land taken and numbered 91 and 92, together with the other land referred to in the counter notice of 6th April, 1891, a claim being also included for loss on sale of furniture.

As Mrs. Cliff appears to be entitled to the property for which compensation is claimed, subject to certain mortgages to the Caledonian and Australian Mortgage and Agency Company (Limited) and the London Chartered Bank of Australia, I think an offer may be made by the Constructing Authority to Mr. and Mrs. Cliff and their mortgagees for the fee simple of the land taken, and the land which the Constructing Authority is required to take and purchase by the notice of 6th April, 1891, as a whole, but the offer when prepared should first be submitted for my approval. As regards the claim for loss on sale of furniture, no particulars as to Mrs. Cliff's title, or of any losses sustained in respect thereof, have been received, and I do not see how this portion of the claim can be entertained.

I have, &c.,

ERNEST A. SMITH

(For the Crown Solicitor).

No. 10.

Report by The Land Valuer.

Milson's Point Railway Extension—Particulars of Claim.

The Constructing Authority, Sydney,—

Sydney, 8 January, 1892.

Claimant and owner, Jessie L. Cliff; reference numbers, 91 and 92; area taken, 2 roods 38 $\frac{1}{4}$ perches; area required to be purchased, 5 acres 1 rood 23 $\frac{9}{16}$ perches; total, 6 acres 0 rood 22 $\frac{1}{4}$ perches; amount of claim, £56,763 17s.

REPORT.

This claim is made in respect of land taken for railway purposes on the extension to Milson's Point. It contains a total area of 6 acres 0 rood 22 $\frac{1}{4}$ perches, being 2 acres 38 roods 3 perches, delineated on the tracing plan attached to the notice of land taken, numbered 91 and 92, together with the other land referred to in Mr. Cliff's counter notice, 5 acres 1 rood 23 $\frac{9}{16}$ perches. The property is situated at the head of Lavender Bay, and is divided into two portions, known as "Waiwera," and "Neepsend" respectively, and both of which have frontage to the waters of the bay. On each of these subdivisions of the land, large and costly mansions have been erected, especially "Waiwera," which is a fine building, and occupies one of the best sites around the Harbour. The grounds have been highly improved at great cost, and altogether this is a very desirable position, and being well sheltered, commanding splendid views of the Harbour, and although within a mile of Circular Quay, quite secluded; it is perfectly unique, and of very great value. Of the many various ways of estimating the value of this property, two especially recommended themselves for adoption by the Valuers:—1st. To regard the property as a whole, and to compute the value of the fee simple from the assumed annual value. 2nd. To sub-divide the property into building allotments, estimating the value of such sub-division as unimproved land at per foot frontage, and adding thereto the value of all buildings thereon and improvements to the land itself. The first mode of valuation is in this case objectionable, as it would be based on an assumed annual value which there is not sufficient data to make with precision; therefore the result could not be satisfactory, and would be difficult to support by evidence. 3rd. The second method, which is that adopted, gives more definite and satisfactory results, as the value per foot of the sub-division gives the value of the naked land with great accuracy, and when to this is added the value of buildings and other improvements, as appears to be necessary, it will be found to give as correct a result as can be obtained. The value of the houses is given as furnished by the Government Architect, whose detailed valuation is herewith, and that of the improvement of the grounds has been computed from an estimate supplied by Mr. Samuel Purchase, horticultural expert. The amount claimed for loss on sale of furniture has not been allowed, in accordance with the Crown Solicitor's advice in his letter of 24th September last.

The Crown Solicitor also advises in the same letter that the offer, when prepared, should first be submitted for his approval. The usual allowance for forced sale has not been made, in accordance with the Crown Solicitor's advice.

	<i>Valuation.</i>	<i>£ s. d.</i>
Blue's Point Road, 211 ft. 9½ in., at £16	3,388 13 4

J. B. THOMPSON,
Land Valuer.

8th January, 1892.

Claim, £56,763 17s.; valuation, £41,134 5s. 7d. Submitted for approval.—J.B.T., 8/1/92.

Cabinet approves of Richardson and Wrench's valuation being obtained for these properties as estates—a valuation of each property as a house and grounds; the opinion of the Attorney-General to be obtained as to the liability of the Crown to take over the whole of the estates, instead of payment for the part taken and an allowance for severance.—G.R.D., 11/1/92.

I shall be glad if the Crown Solicitor will consult with the Attorney-General upon this matter.—W.J.L., 12/1/92. Messrs Richardson and Wrench requested to submit valuation. January, 1892, B.C., Crown Solicitor.—J.B., 12/1/92.

No. 11.

Messrs. Richardson and Wrench to The Under Secretary for Public Works.

Dear Sir,

98, Pitt-street, Sydney, 18 January, 1892.

In reply to your inquiry the property "Neepsend" house and grounds is included in the sum of £10,320.

We have, &c.,

RICHARDSON AND WRENCH.

No. 11A.

Valuation by Messrs. Richardson and Wrench.

Re Mrs. and Mr. J. W. Cliff's property, Lavender Bay, resumed for Railway purposes about the 19th March, 1891.

98, Pitt-street, Sydney, 15 January, 1892.

At the time of the resumption this property was one of the prettiest presentations to the eye of travellers on the harbour, or from the Milson's Point Road, from parts of which it could be seen. It was an old plantation, and required many decades of years at least to bring to maturity the handsome trees of choice descriptions which the railway works have in part displaced.

The area of land being large, and its surface irregular, sloping from a height to the water's edge, allowed it to be apportioned into several attractive features in connection with a superior family residence, and so made it an acceptable home to an occupant or to a buyer who might have desired to acquire it. Then its water frontage afforded the privileges of yachting and bathing, apart from any prospective enhanced value that would be attached to that portion especially for future commercial purposes, such as stores, which could be worked with vessels and city by means of steam-launches and barges, the value of the land here for that object being so much less than city land, and its relation to the various discharging wharfs may be reckoned as fairly central.

The site of claimants' late residence is undeniably a desirable one, elevated, and commanding extensive pleasing views, and the house is of large accommodation. Within the boundaries from Lavender-street to top of cliffs many thousands of pounds must have been expended over a course of years, and if computation was to be made on the basis of cost of free-stone in the present market for that article, the sum would be very considerable, but it may be sufficient to estimate the property more in the light of a realisable value (as at the time when taken by the Crown) having regard to the known desire of the Government to deal liberally with owners whose properties have to be resumed for the services of the public. Say,—

295 ft. 8 in. land frontage to Lavender-street, depth on part west about 81 ft. 1 in.; then on part south bearing easterly about 91 ft. 10 in.; then again on west about 163½ feet; then on other part of south about 100 feet to rock cliff; then by said cliff north-easterly about 260 feet; then on the east by a line northerly 82 feet, extending to Lavender-street, to commencing point £4,140

House, &c., as... 6,500

£10,640

Paddock, 210 ft. Blue's Point Road, x 200 ft., with improvements thereon 3,500

Water frontage and residue lands in the resumption and improvements 10,300

£24,460

Admittedly, the real estate market is less active than it was, and the fact of railway constructing at the places will, we fear, have the effect of removing the charm which hitherto attached to this nest position.

Looking at the additions vendors made to the large house, it is not improbable that, for better convenience, a great deal of rock was cut away at rear, which necessarily would be a heavy cost.

RICHARDSON AND WRENCH (LTD.)

We have not included what is usually called compensation for forced surrender. That is a matter for the Minister's discretion.—R. and W. (Ltd.)

No. 12.

The Crown Solicitor to The Under Secretary for Public Works.

Sir,

Crown Solicitor's Office, Sydney, 24 February, 1892.

With reference to your B.C. minute of the 12th ultimo, forwarding the papers relating to Mrs. Cliff's claim in respect of land taken for the Milson's Point railway, in order that the opinion of the Attorney-General might be obtained as to the liability of the Crown to take over the whole of the estate instead of payment for the part taken and an allowance for severance, and your B.C. minute of 13th instant, enclosing correspondence on the subject of counter notices to be seen by the Attorney-General, I have the honor to forward herewith a copy of the case submitted by me and the Attorney-General's opinion thereon. It will be seen from the latter that the Attorney-General is of opinion that the whole of each property must be taken. I would accordingly suggest that an offer be now made to Mrs. Cliff for the land taken and the land which the Constructing Authority is required to purchase and take by notice of 6th April, 1891, and as compensation for damage caused by the execution of the railway works, subject to the claimant making a title to the land thus offered to be purchased to the satisfaction of the Constructing Authority.

As regards the claim for loss on sale of furniture, Mrs. Cliff should be informed that this portion of her claim cannot be entertained. The papers sent with your B.C. minutes, notice of taking of 19th March, 1891, counter notice, claim of 14th July, 1891, and plan furnished by Mr. Way, are returned herewith.

I have, &c.,

ERNEST A. SMITH,

Crown Solicitor.

The Land Valuer, B.C., 25/2/92. Submitted.—J.B., 26/2/92. Offer amount of Messrs. Richardson and Wrench's valuation, with 10 per cent. added for forced sale.—W.J.L., 5/3/92. Mr. Thompson to prepare notice which, under the peculiar circumstances of the case, should, I think, be first approved by the Crown Solicitor.—J.B., 7/3/92. Notice of valuation herewith for Crown Solicitor's approval.—J.B.T., 7/3/92.

CASE FOR OPINION.

Milson's Point Railway Extension.—Claim of. Mrs. J. L. Cliff.

UNDER the provisions of the Public Works Act of 1888, the Constructing Authority has taken for railway purposes the land shown on plan of extension of the North Shore to Milson's Point—a notice of land taken dated 19th March, 1891, in respect of reference Nos. 91 and 92 on plan of extension, to which was attached a tracing showing the portions taken, was given by the Constructing Authority to John Cliff. A counter notice, dated 6th April, 1891, having been given by Mr. and Mrs. Cliff to the Constructing Authority, stating that they would not sell or part with the portions described in the resumption notice unless the Constructing Authority would purchase and take from the said Jessie Louisa Cliff the whole of the lands and premises known as "Waiwera" and "Neepsend," and the Acting Crown Solicitor having been instructed to reply thereto, a letter dated 25th June, 1891, was sent to Messrs. Way and Way, informing them that the Constructing Authority was prepared to purchase the whole of the holding held as one property, through portions of which the railway passes, and they were asked to submit a claim in respect thereof—together with an abstract and particulars of their clients' title, with a plan of the land thus offered to be purchased, to enable it to be valued.

On 14th July, 1891, Mrs. Cliff submitted an offer and particulars of her claim, offering to accept as purchase-money for the land delineated on the tracing plan attached to the notice of land taken, together with other land referred to in her notice of 6th April, 1891, and reply thereto of 25th June, 1891, and as compensation for damage or otherwise caused by the execution of the said works as particularly set forth on the subjoined Schedule of Claim, the sum of £54,263 17s., together with £2,500 for loss on sale of furniture.

A plan of the properties claimed by Mrs. Cliff has also been supplied. At the date of the resumption notice the land comprised in this plan was divided into two properties, known respectively as "Waiwera" and "Neepsend," the former being occupied by Mr. and Mrs. Cliff, and the latter by Major Bartlett under a lease from J. W. Cliff. Each of these properties had a frontage to Lavender Bay, of which they had been deprived by the railway; a gardener's cottage, lawn-tennis court, and summer-house have been also taken from "Waiwera" by the resumption notice of 19th March, 1891. The land taken from each property forms part of the ornamental grounds or gardens in which the house stands, and was used with the house.

An abstract of Mrs. Cliff's title has been delivered, and requisitions thereon made and replied to, and further requisitions on searches have been made as regards the land compulsorily taken.

No offer has been made to Mrs. Cliff, but an offer was made to, and accepted by, Major Bartlett, in respect of his leasehold interest in "Neepsend."

A Crown grant of reclaimed land, dated 14th May, 1885, comprising portions of the property known as "Waiwera" and "Neepsend," has been issued to Mr. Harmsworth Robert Way, who, on the abstract, is said to hold as trustee for Mrs. John William Cliff.

By an indenture of settlement, dated 26th April, 1889, made between John William Cliff of the first part, Jessie Louisa Cliff of the second part, and Harmsworth Robert Way (trustee) of the third part, the land therein described, comprising portion of the property known as "Waiwera," was conveyed unto the said trustee and his heirs, to such uses, upon such trusts, and to and for such ends, intents, and purposes as the said Jessie Louisa Cliff should, notwithstanding coverture by any deed or deeds, or by her last will and testament appoint, and in default of and until such appointment to the use of the said trustee, his heirs, and assigns, upon trusts in favour of Mrs. Cliff and her children therein declared (subject as to the land firstly described to a mortgage dated 3rd August, 1887, John William Cliff to the Caledonian and Australian Mortgage and Agency Company, Limited), and to any liens or encumbrances affecting the same.

By an indenture, dated 16th March, 1891, made between John William Cliff and Jessie Louisa Cliff, his wife, of the one part, and Harmsworth Robert Way of the other part, the said John William Cliff and Jessie Louisa Cliff, in exercise of a power given to them by an indenture dated 29th June, 1889, appointed that the land thereafter described (comprising the property known as "Neepsend," and the remaining portion of the property known as "Waiwera," except a small portion of "Neepsend" under

under Real Property Act, of which Cliff and wife are registered proprietors, a power of appointment being given to them or the survivor by any instrument registered under the provisions of the Real Property Act) should thenceforth go, remain, and be unto the uses thereafter declared, that was to say, unto the said Harmsworth Robert Way and his heirs, to such uses, upon such trusts, and to and for such ends, intents, and purposes, and in such manner as the said Jessie Louisa Cliff should, notwithstanding coverture, and whether covert or sole by any deed or deeds, or by her last will and testament appoint, and until and subject to such appointment, and so far as any such appointment if made and incomplete should not extend, to the use of the said Harmsworth Robert Way, his heirs and assigns, upon trusts for Mrs. Cliff during her life, for her separate use, with remainder in default of appointment, to the use of the right heirs of the said Jessie Louisa Cliff.

Portions of the properties are mortgaged to the Caledonian and Australian Mortgage and Agency Company (Limited), and other portions are mortgaged to the London Chartered Bank of Australia, who are second mortgagees of portions mortgaged to the Caledonian and Australian Mortgage and Agency Company (Limited). The mortgagees have notified their willingness to concur in the sale of the properties to the Government.

The property known as "Waiwera" includes portions of a street marked "Upper Bay View-street" on a plan of John Carr's subdivision.

The following documents are sent herewith:—

1. Milson's Point Extension Railway Act of 1890.
2. Copy notice of land taken.
3. Notice by Mr. and Mrs. Cliff of 6th April, 1891.
4. Offer and particulars of claim of 14th July, 1891.
5. Plan of "Waiwera" and "Neepsend."
6. Letters from Acting Crown Solicitor to Under Secretary for Public Works, copies of letters addressed to solicitors for various claimants (including letter to Messrs. Way and Way of 25th June, 1891), a letter from the late Crown Solicitor, and a case, and Mr. A. H. Simpson's opinion on subject of counter notices.
7. The consents by the mortgagees to concur in sale of the properties.
8. A plan of John Carr's subdivision.

The opinion of the Attorney-General is desired by the Cabinet on the following points:—

1. Is the Crown bound under the notice given under section 78 of the Public Works Act to take over the whole of each of these estates instead of paying only for the part taken and making an allowance for severance?
2. Assuming that the Crown is not bound to purchase the whole of either of these properties, does the letter of the late acting Crown Solicitor, dated the 25th June, 1891, constitute an agreement to purchase the whole or make any difference in this respect?
3. Whether, in case it should appear that no title can be shown to that part of Upper Bay View-street, shown on Carr's subdivision as a road, the claimant loses his right to insist on the purchase by the Government of the whole of "Waiwera," or can he insist on the purchase of the remainder of these estates, omitting the road?

ERNEST A. SMITH,
Crown Solicitor.

No. 13.

Opinion of Attorney-General.

Claim of Mr. and Mrs. Cliff—"Waiwera" and "Neepsend."

19 February, 1892.

I AM of opinion that section 76 of the Public Works Act must be read subject to section 78, and that the provisions of the former clause are thus inapplicable where a counter-notice has been given under the latter. If this construction be not adopted it is difficult to see why section 78 was passed at all. It could not, as appears to have been suggested by the late acting Crown Solicitor, be reasonably held to apply to the cases mentioned in section 32 part I, for by part II of the same section the Constructing Authority might exercise compulsory powers in the same cases, and so defeat the rights given by section 78.

(a) Schwinge v. the London and Blackwall Rail-Company. 3 M. and Giff 30.24 L.J. Ch. 406.

(b) King v. Wycombe Rail-way Company. 29 L.J. Ch. 462.

(c) Gardiner v. Charing Cross Railway Company. 31 L.J. Ch. 181.

(d) Marson v. London C. and D. Railway Company. L.R. 6 Eq. 101 and 7 Eq. 546.

(e) 57 L.J. Ch. 270.

(f) See Schwinge's case and Marson's case above cited, also Metropolitan Railway Company v. Woodhouse. 34 L.J. Ch. 297.

(g) See Wells v. Chelmsford Board of Health. 15 Ch. d. 108.

The effect of the counter-notice under the similar section in the Lands Clauses Act of 1885, has been held to be to arrest and suspend the operation and effect of the original notice to treat required by section 30 of our Act, and section 18 of the English Act (a), and as it is plain that land can only be compulsorily taken, and therefore "finally appropriated" in accordance with the provisions of the Act, I do not see how, when the original notice, the very foundation of the right to take, is so suspended, the Constructing Authority can be said to have "finally appropriated" any part of the land at all, within the meaning of section 76. Though after a counter-notice the Authority may abandon his original notice, and refuse to take any part (b), he cannot, after such counter-notice, proceed to appropriate the part without exposing himself to liability to an injunction, or a declaration that he must take the whole (c). As therefore, I think section 76 cannot override section 78, the English decisions upon the meaning of the word "house" will apply. As it appears that each property is physically one whole, without interruption by roads dividing it into parts, and as it is stated, and appears to be the fact, that the line of the railway deprives both of a most valuable adjunct, viz., the water frontage, and of ornamental gardens or grounds which form part of one whole physical locus on which the houses stand, the whole of the grounds respectively seem to come within the test laid down in the English cases, namely, that they would pass in a conveyance or lease of the houses themselves, and that consequently the whole of each property must be taken. [See one of the latest cases on the subject, Kerford's case (d).] (2) If there were any doubt as to the liability of the Crown to take the whole, I should be strongly inclined to think that the assent to purchase given in the letter of the 25th June, 1891, after receipt of the counter-notice, would go far to establish the relation of vendor and purchaser between the parties, from which neither could recede (e). (3) The road does not appear to be essential and necessary for the purpose of the railway. Unless it is so the defect of the title to it would not, in my opinion, preclude the owners from insisting on the purchase of the remainder, but an abatement in price should be allowed (f). Even if the road were necessary for the purposes of the railway, the Constructing Authority would have power to deal with it under section 27, subsections 3 and 4. [See the case cited.]

EDMUND BARTON,
Attorney-General.

No. 14.

No. 14.

The Crown Solicitor to The Under Secretary for Public Works.

Sir,

I have the honor to return herewith the papers relating to Mrs. Cliff's claim in respect of land at Lavender Bay, referred to me with your minute of the 7th instant, for the purpose of settling the notice of offer to be made to the claimant.

I have carefully read the report and valuation of Messrs. Richardson and Wrench, on which the offer is to be founded, and have compared it with the valuation made by the Government Valuator.

Messrs. Richardson and Wrench give the values of only two specific portions of the land, viz.:—

1. The 295 feet frontage to Lavender-street, and
2. The 210 feet to Blue's Point Road x 200 feet to George-street.

In these values Mr. Thompson substantially agrees with Messrs. Richardson and Wrench.

Messrs. Richardson and Wrench value the house known as "Waiwera" at £6,500—Mr. Thompson, adopting the figures given by the Government Architect, putting it at £9,054.

The only other item given by Messrs. Richardson and Wrench is "water-frontage and residue lands in the resumption and improvements, £10,320."

At first sight it would appear as if "Neepsend House" was not included in the valuation, but I am told it is intended to include same in this last item of £10,320.

Mr. Thompson's valuation of the balance of the property, after excepting the three items above mentioned, amounts to £23,556, and this he makes up as follows:—

"Neepsend House" and grounds	£7,571
355 feet in George-street	£3,550
184 feet in George-street, with frontage to Lavender Bay, 125 feet					3,760	
						7,310
Improvements founded on estimate of Purchase & Co.		8,675
						£23,556

It appears to be certain that whatever sum is offered there will be a contest with the claimants, and I think, therefore, that it is desirable to ascertain at as early a stage as possible, and before any offer is made, how it is that the evidence which is at present available on behalf of the Government is so conflicting.

I think it would be advisable to ask Messrs. Richardson and Wrench to be good enough to furnish further details in explanation of the item £10,320, viz.:—

1. Value of "Neepsend House."
2. The 2 acres 1 rood of land which goes with "Neepsend."
3. The 500 and more feet of land in George-street after deducting the 200 included in the portion already valued, and including the water-frontage.
4. The improvements, including the plants, &c.

I have, &c.,

ERNEST A. SMITH,
Crown Solicitor.

Perhaps the Minister will authorise our obtaining further information from Messrs. Richardson and Wrench, re the subject, as suggested by the Crown Solicitor.—J.B., 10/3/92.

Mr. Wrench saw me, I think, twice about this valuation, and had all the papers necessary referred to him. It was clearly understood that the whole of the land and house property included in the valuation given by Mr. Thompson is included in that form by Messrs. Richardson and Wrench.—W.J.L., B.C., 11/3/92.

Crown Solicitor.—J.B., 11/3/92.

No. 15.

The Crown Solicitor to The Under Secretary for Public Works.

Sir,

I have the honor to return herewith the papers relating to Mrs. Cliff's claim in respect of land at Lavender Bay, sent with your minute of 11th instant, for the purpose of my settling the notice of offer to be made to the claimant, which I have prepared and send herewith.

I have, &c.,

ERNEST A. SMITH,
Crown Solicitor.

Submitted for signature.—J.B., 16/3/92.

No. 16.

Offer to Jessie Louisa Cliff.

Jessie Louisa Cliff—Claimant in respect of the land hereunder described, taken or injuriously affected under the Public Works Act of 1888.

THE Constructing Authority hereby offers to you the sum of £26,906, for the purchase of the fee-simple in possession free from incumbrances, of the land hereunder described and referred to in your offer bearing date the 14th day of July, 1891, and in the schedule of claim subjoined thereto, together with the buildings and improvements thereon, and in full satisfaction and discharge of all claims and demands for any loss or damage sustained by reason of the execution of the authorised work, or in anywise relating thereto or connected therewith. This offer to be subject to your making out your title to the land to the satisfaction of the Constructing Authority.

As witness, the seal of the Constructing Authority, this 16th day of March, A.D. 1892.
Signed and sealed by the Constructing }
Authority, in the presence of, }

D. C. McLACHLAN.

W. J. LYNE,
Constructing Authority.

Description

Description of land taken or injuriously affected in respect of which claim has been made.

ALL that piece or parcel of land situate in the parish of Willoughby, county of Cumberland, containing by admeasurement 6 acres 22 $\frac{1}{4}$ perches, more or less, being the whole of the premises known as "Waiwera" and "Neepsend," Lavender Bay, and being the land delineated on the tracing plan attached to the notice of lands taken, given by the Constructing Authority to John William Cliff, dated the 19th day of October, 1891, and other lands and premises which the Constructing Authority is required by a notice given by the said J. W. Cliff and Jessie Louisa Cliff, dated the 6th day of April, 1891, to purchase and take from the said Jessie Louisa Cliff.

No. 20.

Request for the Appointment of an Arbitrator.

In the matter of the "Public Works Act of 1888" and of certain portions of the "Lands for Public Purposes Acquisition Act" incorporated therein; and in the matter of the extension of the North Shore railway to Milson's Point; and in the matter of the resumption, purchase, or sale of certain land and premises at North Shore, better known as "Waiwera" and "Neepsend," owned by Jessie Louisa Cliff, wife of John William Cliff, of Sydney, in the Colony of New South Wales, gentleman, resumed, purchased, or sold under the provisions of the said Act; and in the matter of the notice dated the 19th day of March, 1891, signed and sealed by the Constructing Authority, and the counter notice, dated 6th day of April, 1891, and the letter of the Crown Solicitor, dated the 25th day of June, 1891, addressed to Messrs. Way and Way, solicitors, Sydney, and the claim of the said Jessie Louisa Cliff, dated the 14th day of July, 1891, and the offer of the Constructing Authority, dated the 16th day of March, 1892.

To The Minister for Public Works,—

Referring to the notice of resumption, signed and sealed by the Constructing Authority, dated the 19th day of March, 1891, the counter notice dated the 6th day of April, 1891, signed by the said Jessie Louisa Cliff and John William Cliff, the letter of the Crown Solicitor, addressed to Messrs. Way and Way, solicitors, Sydney, the claim of the said Jessie Louisa Cliff, dated the 14th day of July, 1891, and the offer of the Constructing Authority, dated the 16th day of March, 1892, which offer I have refused, and do refuse to accept, a dispute having arisen as to the amount of money which I am entitled to receive in pursuance of the Public Works Act of 1888, and of certain portions of "The Lands for Public Purposes Acquisition Act" incorporated therein, in regard to such resumption, purchase, or sale aforesaid: Take notice that, in accordance with the powers and authority conferred on me by, in virtue of, and under the provisions of section 42 of "The Public Works Act of 1888" and its subsections, I require that

the

11

the matter or matters now in dispute between us be referred to arbitration as in the said Act provided, and that I request you to appoint an arbitrator to act on your behalf in the hearing and determining of such matters in dispute and in all other matters arising out of or incidental thereto; and further take notice that I hereby nominate and appoint George Evans, of Sydney, in the Colony of New South Wales, solicitor, to act as arbitrator on my behalf in all the matters hereinbefore mentioned; and I further request that all further notices or communications arising herefrom be addressed to my solicitors, Messrs. Macnamara and Nathan, of Jamieson-street, Sydney.

Dated this 25th day of April, A.D. 1892.
Witness to the signature of Jessie Louisa Cliff,—

H. E. WAY, Solicitor, Sydney.

JESSIE L. CLIFF.

No. 21.

Messrs. Macnamara and Nathan to The Secretary for Public Works.

Re Cliff's Resumption.

Sir,

Sydney, 26 April, 1892.

With reference to the notice of appointment of arbitrator, &c., sent to you yesterday by registered post, we shall be much obliged if you will use every expedition in the appointment of your arbitrator. We understand that you have no objection to Mr. Andrew Lyell being umpire; and if this be so we shall have no objection, on Mrs. Cliff's behalf, to consent to his appointment. Formal appointment of umpire can be made in accordance with the 44th section of the Public Works Act.

We have, &c.,

MACNAMARA AND NATHAN.

No. 22.

The Under Secretary for Public Works to Mr. J. H. Kirkpatrick.

Sir,

Public Works Department, Sydney, 27 April, 1892.

I am directed by the Secretary for Public Works to enclose herewith your appointment to act as arbitrator on behalf of the Constructing Authority, in the matter of the claim of Mrs. Jessie Louisa Cliff, for land resumed for the Milson's Point Railway Extension, and to request that you will be good enough to place yourself in communication with the Crown Solicitor.

I have, &c.,

J. BARLING,

Under Secretary.

[*Enclosure.*]

To all whom these presents shall come,—The Constructing Authority sends greeting:—

WHEREAS the Minister for Public Works, the Constructing Authority, duly appointed for the purpose of that portion of the Milson's Point Railway Extension, passing through the County of Cumberland, in the Colony of New South Wales, has taken possession of certain lands, situate at Lavender Bay, in the said Colony, described in the plan hereto annexed, coloured red and blue, of which Jessie Louisa Cliff is in possession, and claims to be entitled as owner; and the Constructing Authority has offered to pay to the said Jessie Louisa Cliff the sum of £26,906 as compensation for the said land, and for all damage which the said Jessie Louisa Cliff has sustained, or may sustain, by reason of the execution of the works forming a portion of, or connected with, the said Milson's Point Railway: And whereas the said Jessie Louisa Cliff claims the sum of £56,763 17s. as compensation for the said land, and all damage which she has sustained, or may sustain, by reason of the said works, and the Constructing Authority aforesaid has declined to pay the last-mentioned sum, and is desirous of appointing an arbitrator so that the question of disputed compensation in the matter aforesaid may be settled by arbitration, in pursuance of the provisions of the Act of the Governor and Parliament of New South Wales, 51 Victoria, No. 37: Now, therefore, know ye, that in pursuance of the provisions of the said Act the Constructing Authority doth hereby appoint John Hunter Kirkpatrick to be arbitrator on behalf of the Constructing Authority for the purpose of determining the amount of compensation, if any, to be paid by the Constructing Authority aforesaid in respect of the premises: Provided always that nothing herein contained shall be taken as a waiver of the right of the Constructing Authority aforesaid to require the said Jessie Louisa Cliff to produce evidence of her title to the said lands after the making of any award hereunder.

WILLIAM JOHN LYNE.

In witness whereof the Constructing Authority has hereto set his Hand and Official Seal, at Sydney, in the Colony aforesaid, this 29th day of April, in the year of our Lord one thousand eight hundred and ninety-two.

THE seal of the Constructing Authority was affixed hereto in the presence of,—

J. BARLING.

Arbitration case of Mrs. J. L. Cliff, North Sydney. Mr. George Crane and J. H. Kirkpatrick. Umpire, Mr. A. Lyell. The arbitrators being unable to agree as to the award, the case was remitted to the umpire for his decision.—J.H.K., Sydney, June, 1892.

No. 23.

The Crown Solicitor to The Under Secretary for Public Works.

North Shore Railway.—*Re Cliff's Claim.*

Sir,

Crown Solicitor's Office, Sydney, 11 May, 1892.

I have the honor to report that the arbitrators in this matter have appointed the 25th instant for the hearing of this case, at the office of Mr. Andrew Lyell, the umpire, Union Bank Chambers, Pitt-street.

Steps should be at once taken to obtain the evidence required in support of the amount of the Government's offer, and I think it would be advisable to obtain from Messrs. Richardson and Wrench further details in explanation of the item £10,320 in their valuation, referred to in my letter of the 10th March last. I return all the papers in the matter.

I have, &c.,

ERNEST A. SMITH,

Crown Solicitor.

No. 24.

No. 24.

The Crown Solicitor to The Under Secretary, Public Works.

Re Cliff's Arbitration.

2 June, 1892.

Our counsel think we should have soundings taken to show the depth of water for, say, 10 feet out from Cliff's water frontage.

Would you please give the necessary instructions to have the work done at once, so that the evidence may be placed before the arbitrators to-morrow afternoon at 2 o'clock, to which time the hearing will be adjourned.

I have, &c.,

ERNEST A. SMITH,

Crown Solicitor.

We ought to have similar evidence ready in the other cases at Lavender Bay fronting the water, but this can be obtained later.—E.A.S. Will Mr. Tillett please have this done at once?—J.B., 3/6/92. It is required by 2 p.m. to-day without fail.—J.B. I recommend that the Land Valuer be asked to supply us with plans of the other cases referred to herein.—J.A.T., 11/6/92. I concur.—C.D., 11/6/92. The Under Secretary, Public Works. Land Valuer.—D.C. McL. (for U.S.), 14/6/92. Plans herewith, North Sydney Investment Co., K. Grant, Wilson and Martin.—T.B.T., 20/6/92. Mr. Darley. Mr. Halligan to take soundings.—G.T., 7/7/92.

The railway works are under construction in this locality, and on the accompanying prints I have shown, in dotted red lines, the present position of the contractor's tip. The Crown Solicitor might be asked to say if soundings outside this will be of any use. The only soundings we have at this place were taken to fix the reclamation limit line about nine years ago.—G.H.H., 8/10/92.

I recommend that the Crown Solicitor be informed as above, and be asked if further information on the subject is required.—G.T., 10/10/92. I concur.—C.D., 11/10/92.

A plan showing the original soundings in front of the properties facing this bay can be obtained at the Survey Office. This would be much more valuable than soundings taken now in front of the completed reclamation, as this reclamation is subsequent to resumption.—C.D., 11/10/92. The Crown Solicitor.—J.B., B.C., 13/10/92.

No. 25.

Declarations of Arbitrators.

In the matter of the Act 51 Vic. No. 37, and in the matter of the arbitration between Jessie Louisa Cliff and the Constructing Authority, respecting the taking by the Constructing Authority of 6 acres 0 roods and 22 $\frac{1}{4}$ perches of land, for the purpose of the North Shore Railway Extension to Milson's Point.

I, GEORGE EVANS, do solemnly and sincerely declare that I have no interest, either directly or indirectly, in the property in question, and that I will faithfully and honestly, and to the best of my skill and ability, hear and determine the matters referred to me, under the provisions of the "Public Works Act of 1888."

No. 26.

Award.

28 June, 1892.

In the matter of the Public Works Act of 1888, and in the matter of the extension of the North Shore Railway to Milson's Point, and the claim of Jessie Louisa Cliff.

To all to whom these presents shall come,—

I, ANDREW LYELL, of Sydney, in the Colony of New South Wales, accountant, send greeting: Whereas, by virtue of the "Public Works Act of 1888," the Constructing Authority, as constituted by the said Act, was authorised to take and appropriate for the purposes in the said Act mentioned such parts of the lands and premises of any person whomsoever as might be necessary and proper for laying out, making, and using any authorised work, and all other works, matters, and conveniences connected therewith: And whereas

whereas on or about the 20th day of August, 1891, the said Constructing Authority duly gave notice under his seal of office to Jessie Louisa Cliff, of Sydney, in the Colony of New South Wales, wife of John William Cliff, of the same place, gentleman, that the said Constructing Authority had taken and finally appropriated and did thereby require and take for the duly authorised work therein referred to as the proposed line of railway known as the Milson's Point extension, the lands in the schedule thereto, and that the said Constructing Authority was willing to treat as to the compensation to be made to all parties for the lands so taken and the damage sustained or that might be sustained by them by the exercise of the powers conferred by the Act before referred to, and in and by the said notice the Constructing Authority demanded from the said Jessie Louisa Cliff the particulars of her estate and interest in the said lands and of the claim made by her in respect thereof: And whereas the land described in the schedule to the lastly-recited notice comprised parts only of the houses known as "Waiwera" and "Neepsend," and the said Jessie Louisa Cliff, by counter notice under her hand, and under the hand of her said husband, dated the 6th day of April, 1891, intimated that the land in the said recited notice described would not be sold or parted with unless the Constructing Authority would purchase and take the whole of the said land and premises known as "Waiwera" and "Neepsend," which the Constructing Authority consented to do: And whereas, in pursuance of the hereinbefore-recited notice of the 20th day of August, 1891, and of the consent of the Constructing Authority to take the whole of the lands and premises known as "Waiwera" and "Neepsend," the said Jessie Louisa Cliff, on or about the 14th day of July, 1891, by statement in writing, informed the Constructing Authority that she was willing to accept for the land (including buildings and fences thereon) described in the said recited notice of land taken in the said recited notice of the 6th day of April, 1891, and as compensation for damage or otherwise caused by the execution of the said works, the sum of £56,763 17s.: And whereas the Constructing Authority offered to pay to the said Jessie Louisa Cliff, on the 16th day of March, 1892, the sum of £26,906, as and for the compensation for the value of the said land and premises, and for such damage as aforesaid, and have not offered to pay any other or larger sum whatever in respect of the same: And whereas the said Jessie Louisa Cliff and the Constructing Authority did not agree as to the amount of compensation to be paid as aforesaid, and a dispute arose between them as to the same: And whereas the said Jessie Louisa Cliff, by a notice in writing under her hand dated on or about the 25th day of April, 1892, and directed to the Constructing Authority, did, by virtue of the 42nd section of the "Public Works Act of 1888," and its sub-sections, require that the matter or matters then in dispute should be referred to arbitration, as in the said Act provided, and did request the Constructing Authority to appoint an arbitrator in his behalf in the hearing and determination of such matters in dispute, and in all other matters arising out of or incidental thereto, and did by the notice now in recital nominate and appoint George Evans, of Sydney, in the Colony of New South Wales, solicitor, to act as arbitrator on her behalf in all the matters thereinbefore referred to: And whereas pursuant to the said notice, the Constructing Authority duly appointed John Kirkpatrick, of Norwich Chambers, Sydney, aforesaid, to act as arbitrator on his behalf in the matter of the said Jessie Louisa Cliff's claim for land resumed as aforesaid: And whereas the said arbitrators, before they entered into the consideration of any of the matters so referred to them as aforesaid, respectively duly made and subscribed in the presence of a Justice of the Peace, the declaration required by the "Public Works Act of 1888," which declarations are annexed hereto: And whereas the said arbitrators, before they entered upon the matters so referred to them, did on the 6th day of May last, in pursuance of the said Act, by writing under their hands, duly nominate and appoint me, the before-mentioned Andrew Lyell, to be umpire, to decide any matters relating to the premises on which they should differ, or which should be referred to me; and did by such writing also extend the time within which the award herein should be made to the 30th day of June, 1892: And whereas the said arbitrators took upon themselves the burthen of the reference, and duly heard and considered the allegations and proofs of the said Jessie Louisa Cliff and of the Constructing Authority, concerning the amount of the said compensation: And whereas the said arbitrators disagreed and differed respecting the matters referred to them by writing under their respective hands, dated the 16th day of June, 1892, referred the inatters to me as umpire, to decide upon the amount of compensation to be paid to the said Jessie Louisa Cliff, under and by virtue of the provisions of the "Public Works Act of 1888": Now know ye that I, the said Andrew Lyell, having taken upon myself the burthen of the reference, and having before entering upon or taking into consideration any of the matters referred to me, as aforesaid, duly made and subscribed, in the presence of a Justice of the Peace, the declaration required by the "Public Works Act of 1888," which declaration is annexed hereto, and having heard and considered the allegations and proofs of the respective parties, do make this my award in writing of and concerning the premises in manner following—that is to say, I do award and assess the amount of compensation to be paid by the said Constructing Authority, in respect of the taking of the said lands, premises, and damage at the sum of £40,508, and I further settle the costs of, and incident to, the arbitration to be paid by the said Constructing Authority to the said Jessie Louisa Cliff, at the sum of £750.

In witness whereof I, the said Andrew Lyell, have hereunto set my hand and seal, this 28th day of June, 1892.

Signed, sealed, and delivered, by the said }
Andrew Lyell, in the presence of,— }

ANDREW LYELL.

JAMES C. THOM, Solicitor, Sydney.

Forward to the Crown Solicitor. I am not satisfied with this award, and an appeal will be made to the Supreme Court.—W.J.L., 30/6/92. The Crown Solicitor.—D.McL. (for U.S.), B.C., 30/6/92. Crown Solicitor, 1/7/92.

No. 27.

Mr. A. B. Armstrong to The Secretary for Public Works.

Sir,

I have the honor to state that I am appointed by J. W. Cliff to act in his behalf in arranging a settlement of this long-standing case.

5, Spring-street, Sydney, 4 July, 1893.

I have, &c.,

A. B. ARMSTRONG.

Land Valuer.—J.B., B.C., 5/7/93.

How does this matter stand?—J.B.

No. 28.

Mr. J. H. Kirkpatrick to The Secretary for Public Works.

Sir,

Having been requested to furnish a report in connection with the claim of Mrs. J. W. Cliff for compensation for land and buildings resumed for railway purposes at North Sydney, I herewith attach a short statement of the total amount claimed, together with the amount offered and the witnesses' valuations, as given on oath before the arbitrators during the hearing of the case in May, 1892.

You will notice, by looking over the statement above mentioned, in which the witnesses' valuations are set forth, that there were ten witnesses called by the claimant, who gave their evidence as to the value of the property as a whole, and the average of their valuations was £41,581 14s. There were only four witnesses called by the Crown, whose average valuation was £25,499 15s., giving a net average of £33,540 14s. I have purposely left out two valuations from the average, namely, Mr. Binders, called by the claimant, and Mr. Watkins, called by the Crown; also the amounts given by the witnesses who valued the buildings only.

In view of there being ten witnesses, called by the claimant, who were of the opinion that the property in question, when resumed, was worth (say) about £41,500, and only four witnesses who gave their evidence that the property was worth about £25,500, and as the witnesses on both sides are acknowledged to be the best and most reliable authorities on land and property valuations that could be brought forward in the city, I am of the opinion that another average ought to be struck as between the averages of £33,540 14s. 6d. and £41,581 14s., which would give a sum of £37,561 4s. 3d. I am not in favour, in a general way, of averaging valuations given in witnesses' evidence, but in this case, which I consider is an exceptional one, I feel justified in doing so from the fact that the best authorities in the city were before the arbitrators on their oaths, and no doubt gave their opinions conscientiously; there being, therefore, ten as against four. I think, taking out four of the best on each side, there would still remain six witnesses on the claimants' side whose opinions were ignored if the first average were adhered to. By taking the second average all the fourteen witnesses' opinions and valuations are fairly considered. It may be contended that if matters of this kind were to be settled by averages, great abuses might take place, and that mere numbers should not decide such cases. That may be so. I feel pretty certain that if this claim is taken into the Court the Government will have to pay more than the second average sum of £37,561 4s. 3d., for the following reasons: In the first place, the Government Valuer gave a higher valuation than £37,561 4s. 3d.; the umpire also gave a higher award than the sum just mentioned; the arbitrators not agreeing, although the one appointed by the Crown was agreeable to award the sum of £33,540 14s. 6d.

I am, therefore, of the opinion that if the claimant goes to the Supreme Court she will succeed in obtaining a verdict for more than the amount I have set down, namely, £37,561 4s. 3d. I may also point out that the costs would be considerable, owing to the large number of expert witnesses that would have to be paid, and the time the case would occupy. I do not think 10 per cent. for forced sale usually allowed in land resumption cases should be allowed in this case, as the sale could not be considered a forced sale; a small portion was, no doubt, a forced sale, but the greater portion was sale or purchase forced upon the Government. With regard to interest, I do not consider myself qualified to give an opinion.

In conclusion, I am of the opinion that the sum of £37,561 4s. 3d., or (say) £37,500 might be offered to Mrs. J. W. Cliff in full compensation for the land and buildings resumed at Lavender Bay for railway purposes, known as "Waiwera" and "Neepsend." The above-mentioned sum should be understood as including all percentage usually allowed for forced sale, and interest on amount of compensation from date of resumption.

I have, &c.,

J. H. KIRKPATRICK.

No. 29.

Mr. A. B. Armstrong to The Secretary for Public Works.

Sir,

5, Spring-street, Sydney, 14 December, 1893.

I respectfully desire to draw the favour of your attention to the fact that the sworn evidence of ten of the leading valuers of Sydney have (taking an average of their values) fixed the value of land herein at £42,398 18s. 4d., which value is only partially controverted by evidence of five valuers, leaving the preponderance of evidence adduced in favour of the amount named.

To

To bring the matter of my client's claim to conclusion, I am desired to offer the whole claim, inclusive of interest to date, for the sum of £40,000, and to take payment in the form of funded stock.

In the event of your acceptance of this offer, I am instructed to state that an application for such stock to the amount stated above, will be at once forwarded through your Department for minuting in settlement of the claim.

In view of this offer, I have to request that the whole case may be again viewed by your Department. I am to add that this offer is to be considered entirely without prejudice to Mr. Cliff's claim should the matter, through non-acceptance of this offer, become the subject of legal action.

I have, &c.,

A. B. ARMSTRONG

(Agent for J. W. CLIFF).

Land Valuer.—D.C. McL., B.C., 15/12/93.

I have not been in any way connected with this case, but I do not see what argument Mr. Armstrong has brought forward of sufficient weight to make the Minister offer £40,000 when he refused to pay the award of £40,508, and when previously Messrs. Richardson and Wrench's valuation was only £26,906, including the 10 per cent.—T.W., 19/12/93.

Submitted.—J.B., 20/12/93.

No. 30.

Mr. A. B. Armstrong to The Under Secretary for Public Works.

Sir,

Sydney, 27 December, 1893.

Referring to my letter of 14th instant, I have now the honor to enclose an application for stock to the amount named in my letter, as the amount for which the claim may be settled.

I have, &c.,

A. B. ARMSTRONG

(Agent for J. W. CLIFF).

[*Enclosure.*]

New South Wales Funded Stock (56 Victoria No. 1)—Application for "Stock" (for ordinary use),—A separate form must be used for each parcel of stock.

Sir,

Sydney, 27 December, 1893.

I beg to apply for the purchase of £40,000 of "New South Wales Funded Stock," under the provisions of the "Funded Stock Act of 1892," and I refer you to the Honorable Minister for Works for payment of £40,000 in payment for the same.

The "stock" is to be inscribed in the name given in Schedule on other side.

I have, &c.,

A. ARMSTRONG,

5, Spring-street, Sydney.

No. 31.

Mr. A. B. Armstrong to The Secretary for Public Works.

Sir,

Sydney, 8 January, 1894.

In this matter I beg respectfully to draw your attention to the fact that the offer now submitted to your Department for consideration is for full settlement, inclusive of interest, and that the amount of such offer is less than a total of the average of all witnesses, with interest at 5 per cent. added. In fact the total of such average and interest exceeds by £3,000 the sum for which it is now proposed to effect settlement.

I have, &c.,

A. B. ARMSTRONG

(Agent for J. W. CLIFF).

No. 32.

Mr. E. A. Smith to The Hon. W. J. Lyne, M.P.

Dear Mr. Lyne,

"Cossington," Neutral Bay, 12 January, 1894.

I have looked through the evidence in Cliff's arbitration again to-night. My own opinion is that we ought to stand to the offer of £37,500 (to include interest and costs) already made by you. It is liberal enough. If we go to trial I do not think they will get a verdict amounting to the award, £40,500. If they do not reach those figures they will have to pay all the costs, both of the arbitration and the trial. This was what happened in Blue's case, and the parties were afterwards sorry they did not accept the offer made to them. This case is similar. Plaintiff will have a very hard task to get near the figures of this excessive award, and the more they look at it the less they will like it.

I think we should stand to your offer, and if they will not take that fight it out. They will be sorry for it, and the country will not, I think, be worse off when it is all over than if £40,000 is paid now.

I have, &c.,

ERNEST A. SMITH.

No. 33.

Memorandum by The Crown Solicitor.

Memorandum.—*Re Milson's Point Railway—Cliff's claim.*

Crown Solicitor's Office, Sydney, 16 January, 1894.

In this case an offer has been made by the London Chartered Bank, through their solicitor, Mr. Macnamara, who really represents the claimant in this matter, to settle the claim for the sum of £40,000, which sum is to include all interest and costs, and the papers have been unofficially referred to me, and Mr. Macnamara was requested to call upon me with the view of my discussing the matter with him, and expressing an opinion as to whether the offer made should be accepted or not.

I have re-read the evidence taken on the arbitration proceedings, and have gone very carefully into the figures with my chief clerk, Mr. Parkinson, who represented this office in instructing Counsel at those proceedings.

I have also had a long conference with Mr. Macnamara.

After a very careful consideration, I have come to the conclusion, though not without great reluctance, that it would be wise to accept the offer now made.

It will be observed that the offer of £40,000 includes interest and costs.

As this resumption was made in March, 1891, and possession, I understand, was taken in June, 1891, there will be two and a half years' interest payable on the sum ultimately awarded. That interest, in view of a recent decision of the Chief Judge in Equity, would have to be calculated at 6 per cent. The present offer, therefore, amounts to a proposal to accept £35,000, or rather less; for two and a half years' interest on £35,000, at 6 per cent., will amount to £5,250.

The sum awarded by the umpire was £40,500 with costs; the present offer, therefore, amounts to a proposal to reduce the sum awarded by about £5,750, and the abandonment of the costs, which are at present estimated at £750, but which will tax at less.

In round numbers, therefore, the Bank are conceding £6,500.

In determining whether this offer should be accepted, the main question to be considered is whether it is likely that the claimant will be able to hold this award if the matter goes before a jury.

After the conclusion of the arbitration proceedings it was the opinion both of myself and of the Counsel employed in the case that this award of £40,500 was excessive.

A review of the evidence affords further illustration of the great extent to which opinions of this kind—i.e., opinions of value—will differ. On the one hand, we have three witnesses for the claimant, well-known auctioneers—Messrs. Gorman, Little, and Batt—swearing that the property is worth something over £40,600; and on the other hand we have an auctioneer of good standing, Mr. Watkins, declaring the property to be worth only £16,000. Between these two extremes is Mr. Gregg, who has a great reputation in these matters, swearing to £24,460, and it was on his figures that the Government offer was made.

With regard to the three witnesses for the claimant, it should be borne in mind that they admitted that theirs were not independent valuations, but that their figures were arrived at after a general consultation; and each substantially admitted that in the early part of 1891 it would have been impossible to find a purchaser of this property at the figures mentioned by them. The only way in which it can be attempted to reconcile this conflicting evidence is by showing that the valuation in each case depends upon the standpoint taken up by the party valuing.

The valuation made by the claimants' witnesses is based, apparently, more on the consideration of what the property had cost the owner to create. There can be no doubt that there had been a very large outlay on the property.

On the other hand, Mr. Watkins bases his valuation, doubtless, on what would be the selling price, viz., the price which would be put upon it if the owner had no wish to name a reserve which would be absolutely prohibitive. From the owner's point of view—the man who had spent these large sums of money in creating this property—it may be he would not think of parting with it for a less sum than £40,000; in other words, there is a value in his eyes arising from what may be called sentimental considerations.

From the point of view of a man who is seeking a residence, and is likely to be a buyer, it may be that Mr. Watkins' figures would be nearer the mark.

The question is, which of these two views is the correct one.

In putting the matter before the jury, the Crown would be able to show that considerations of a sentimental kind ought not to come into this case. We are dealing here practically with the mortgagees, the owner having mortgaged the property to its full value—in other words, had parted with it—and the value of the property to the mortgagees is, or ought to be, the value which they hope to get for it in the market. I think that this contention could be urged with considerable force before a jury, but inasmuch as the evidence to be adduced by the Crown will show that the value from this point of view should be a sum varying from £24,400 to £30,000, there being witnesses who could be called on the trial who were not called at the arbitration case, their valuations exceeding the Crown's offer; and in view of the fact, as is well known, that juries are inclined to favour the claimant in these cases, I think that it is more than likely that, although the amount of the award will not be reached, the verdict will be for some sum between £30,000 and £40,000. What that will be, of course, it is impossible to foretell. Should this sum be over £35,000, the Crown will, of course, be in a worse position than it would be by paying £40,000 now; and even if the verdict should be for £35,000 only, the Department will still be out of pocket to the extent of the whole of the solicitor and client costs of the trial, which will be certainly very considerable. A verdict of £33,000 amounts, with the interest added, to £38,000, and if you add to that the amount of the solicitor and client costs of the trial, it will be seen that even on such a verdict the Crown would gain little, if anything, by refusing the offer to take £40,000 in full settlement.

On the other hand, if the jury should come to the conclusion that the £40,500 awarded is a fair sum, I think it will be impossible to set that verdict aside on the ground that it is against the weight of evidence; and if such a verdict is obtained the result would be that the Crown would have to pay something like £50,000, and the costs of both sides both on the arbitration and on the trial.

On the whole, therefore, I am inclined to think that it would be prudent to close with this offer.

Of

Of course there is a question to be considered other than that of mere prudence, and this is the principle involved. I think it is the duty of the Crown to contend as strenuously as possible against these inflated valuations and awards which appear in all these claims against the Government, but perhaps this principle has been sufficiently vindicated by the notice of appeal and the reduction by the claimant of the sum awarded to him by the umpire to the extent of £6,500.

ERNEST A. SMITH,
Crown Solicitor.

18/1/94.

P.S.—The papers now returned, which are all that were forwarded to me, do not appear to be complete.

In view of this opinion upon the prospects of a trial in this case, I approve of the sum of £40,000 being paid, which is to cover purchase money, interest, and all costs and charges.—W.J.L., 18/1/94. Valuer to note, also Crown Solicitor should see at once as to what steps should be taken to give legal effect to this decision.—J.B., 18/1/94. Noted.—T.W., 20/1/94. The Crown Solicitor, 20/1/94.

No. 34.

Mr. A. B. Armstrong to The Under Secretary for Public Works.

In the matter of resumption of land for Railway Purposes, Milson's Point Extension—J. W. Cliff.

Sir, 5, Spring-street, Sydney, 25 January, 1894.

I have the honor to request that I may be informed of any decision arrived at herein.

I have, &c.,

A. B. ARMSTRONG,
Agent for J. W. Cliff.

Land Valuer.—D.C.McL. (for U.S.), B.C., 25/1/94.

These papers are with the Crown Solicitor, but I think Mr. Armstrong, acting as agent, proposed the settlement, or a similar one to that adopted, and I presume he wants the information for the purpose of his being acknowledged as an agent. Before answering his letter, I should like to have the opinion of the Under Secretary.—T.W., 5/2/94. U.S., Works.

I should like to see the papers showing Mr. Armstrong's connection with the case.—J.B., 7/2/94. I have marked with a cross in blue pencil the papers identifying Mr. Armstrong in the settlement of this matter.—T.W., 31/2/94. U.S., Works. Seen.—J.B., 7/3/94.

No. 35.

Mr. M. J. Macnamara to The Secretary for Public Works.

Re Cliff.

Sydney, 12 March, 1894.

This matter is now ready to settle, all documents have been executed, and the voucher has been signed. You were good enough to say that if you could expedite the payment in any way for me, you would do so. I am arranging to have the matter settled on Wednesday at the Treasury; if you can do anything to ensure the "sovereigns" being ready for us on that day I shall be obliged. I do not want to take a voucher which may take a fortnight to go through.

I have, &c.,

M. J. MACNAMARA.

No. 36.

Mr. M. J. Macnamara to The Secretary for Public Works.

Re Cliff.

Sydney, 16 March, 1894.

Just a few lines to remind you to be good enough to see whether you cannot arrange to pay this compensation money to-day without waiting for an Executive minute, which cannot be obtained before Tuesday. As I pointed out to you, £40,000 was agreed to be taken without interest, and the understanding between us was, I think, that the settlement should be a prompt one. If the matter is delayed till after Tuesday, it means a loss of £6 a day to my clients between now and then. If the money can be paid, I shall take it as a favour if you will, as promised, send me a telephone message.

Yours, &c.,

M. J. MACNAMARA.

The money may be paid, and the Treasury informed that an Executive Minute will follow.—W.J.L., 16/3/94. Papers returned.—B.C., Treasury, 19/3/94. Land Valuer.—D.C.McL. (for U.S.), B.C., 20/3/94.

Plan II. Scheme as recommended by the Committee.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

HARBOUR IMPROVEMENTS AT NEWCASTLE.

REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the first Session of the present Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, and the Public Works (Committees' Remuneration) Act of 1889, 53 Vic. No. 11, to whom was referred the duty of considering and reporting upon "the expediency of carrying out certain works of harbour improvement at Newcastle," have, after due inquiry, resolved that "it is expedient the proposed harbour improvements at Newcastle, referred to the Committee by the Legislative Assembly, be carried out by repairing the southern breakwater to the extent of 200 feet washed away, and extending that breakwater for a further 300 feet; by constructing the first section only of the northern breakwater; and by constructing the southern guide-wall as proposed;" and in accordance with the provision of sub-section IV, of clause 13, of the Public Works Act, report their resolution to the Legislative Assembly:—

1. The scheme, as proposed by the Department of Public Works, comprises the construction of a new northern breakwater, and of wave-traps on the northern and southern sides of the harbour, and the repair of the southern breakwater at its extremity beyond Nobby's, where it has been partly washed away by the sea; the object of the works being to increase the depth of water on the bar by creating a scour at the harbour entrance, and thus to make the port more suitable for shipping of deep draught. The depth of water there in the fairway at low-tide, at present, is 20 ft. 6 in., and it is believed this can be increased to 25 feet, the sand upon the rocky bottom being removed by the scour which the works when constructed will produce. The breakwater, which is quite distinct from the present one on the north side of the harbour, it is proposed shall commence at a point about half a mile along the beach on the ocean side of Stockton, running out at first towards the south-east; and then, curving in a north-easterly direction until in line with the present breakwater, at a distance from its eastern extremity of 550 feet, it will extend in two sections to a distance of 3,750 feet—one section being of 3,000 feet, and the other 750 feet. It will be formed of heavy blocks of rough stone obtained from a quarry at Waratah, tipped into the water, and will be 10 feet high at the starting-point and 15 feet at the finish. The space between the new breakwater and the beach, 10 acres in extent, will form the northern wave-trap, the inlet gradually filling with sand until it becomes a shallow bay with a shelving, sandy bottom, upon which it is believed the waves coming in from the open sea will expend themselves. The southern wave-trap will be formed by constructing a guiding wall 1,000 feet in length in a north-easterly direction from a point a little to the east of the boat harbour, at the end of the Queen's Wharf, the space between the wall and that portion of the shore of the harbour near the commencement of the southern breakwater, an area of 8 acres, being gradually filled with sand washed there

Description of
Departmental
scheme.

there by the incoming waves, as in the case of the corresponding work on the northern side of the harbour. The repair of the southern breakwater comprises the restoration to its original condition of 200 feet of the structure. It is considered that between five and six years will be occupied in the construction of the works, and that after the effect of the first section of the northern breakwater has been ascertained it may be found unnecessary to proceed with the second section.

**The proposed
northern
breakwater.**

2. In the opinion of the officials of the Department of Public Works the new northern breakwater is the most important of the proposed works. Acting as a guide-wall it is expected to conduct the outward flow of water across the bar in such a manner that the scour will sweep the present accumulation of sand, and the silt coming down the river at any future time of flood, into deeper water where they can neither be an obstacle nor an inconvenience to vessels leaving or entering the port. Deep water, it is believed, will exist in the vicinity of the breakwater, and a ship rounding into the harbour should have much increased facilities for entering safely. In fact it is thought by the late Engineer-in-Chief for Harbours and Rivers the deep water will cling to the breakwater, and that there may be as much as 28 to 30 feet north of the anticipated fairway. The fairway, however, will be at what is considered a safe distance from the breakwater, and though there may be deeper water north of it the proximity of the breakwater will, except under the most favourable conditions, prevent vessels from using that deeper water without risk.

**The southern
guide-wall.**

3. The southern guide-wall, besides being necessary to the formation of the southern wave-trap is intended to direct the current of the harbour towards the northern breakwater, and so assist the scour which is required to operate on the bar. At present, in its progress through the harbour to the sea, the outward current meets with reefs and foul ground which greatly interfere with a steadiness of flow, and the guide-wall, it is anticipated, will divert the main part of the current into the fairway, where it will be free of the obstacles which now disturb it, and so sweep steadily out of the harbour.

**The wave-
traps.**

4. The proposed wave-traps are described as being designed in accordance with a well-known principle in marine engineering. No work of the kind has hitherto been constructed in New South Wales, and, therefore, the full effects of such a method of impounding waves from the sea have not been realised here; but a natural wave-trap of this kind, in the form of a small bay and sand-spit, exists at Newcastle, near the site of the proposed guide-wall, and is said to have proved very effective. Very heavy waves running along the southern breakwater in bad weather are said to expend their force in this little bay. In other countries wave-traps on the same principle as those now proposed have been constructed at harbour entrances, and Sir John Coode's designs for improving the entrances to several rivers along the coast of this Colony include methods for entrapping waves. The theory of the wave-flow at harbour entrances, such as by the proposed works it is intended the Newcastle harbour entrance shall be, is that waves entering the harbour between two piers divide and are drawn towards either pier along which they run until they meet with some obstacle upon which they may expend themselves. As will be found stated in the evidence of the late Engineer-in-Chief for Harbours and Rivers, although a wave may enter the harbour "in one solid line, extending from one breakwater to the other, it will not run far into the inlet before it divides into a V form. The skin friction will draw it to the sides, the wave will divide, and one portion will keep to the north side and the other to the south," and at a certain point there will be, comparatively speaking, still water. Unless there were in the way of the two divisions of the wave, as they run along the sides of the breakwaters, something to intercept them, they would continue their course up the harbour and seriously interfere with the safety of the shipping, and it is to provide against their going too far that the wave-traps are designed.

**The southern
breakwater.**

5. The repair of the southern breakwater is necessary from the circumstance that this structure protects the port from southerly and south-easterly seas. The washing away of 200 feet beyond Nobby's admits of these seas breaking upon the bar to an extent which at times endangers shipping, and, unless this portion of the breakwater be restored to its original condition, not only will this danger at the bar continue but there will be an absence of very necessary protection to the new northern breakwater.

6. The estimated total cost of the works is £141,000, stated as follows:—

	Estimated cost.
Northern breakwater, first division	£70,650
Preliminary work in connection therewith—such as wharfs at Bullock Island and Stockton, sidings on Bullock Island, railway across Stockton to breakwater, cranes, plant, and punts for conveying stone	13,000
Supervision and contingencies (say)	4,350
Total, first division of north breakwater...	£88,000
North breakwater, 2nd section of 750 feet	32,000
Total cost of north breakwater	120,000
Repairs to and strengthening existing north breakwater as slips occur	3,000
Southern breakwater—estimated cost to restore and strengthen end	7,000
Southern guide-wall, including branch line, plant, &c.	11,000
Total...	£141,000

7. Having obtained from the Under Secretary for Public Works and the late Engineer-in-Chief for Harbours and Rivers a description of the proposed works, and a statement of the reasons for proposing them, and for believing they will prove effectual; from the Superintending Engineer of Dredges, particulars of the dredging operations carried on at Newcastle; and, from the Collector of Customs, some information with respect to the trade of the port,—a Sectional Committee visited Newcastle, for the purposes of inspection and the taking of local evidence. They examined the existing harbour works and the localities where it is proposed the new works are to be constructed; acquainted themselves, by personal inspection, with the position and condition of the bar; and took evidence from a number of witnesses intimately acquainted with the port, and closely interested in the progress of its trade. They also inquired into the flow and effects of flood-water in the river; and for that purpose proceeded up the Hunter to Hexham, Raymond Terrace, Morpeth, and Maitland. On their return to Sydney the Committee took further evidence, calling before them the Principal Assistant Engineer of the Harbours and Rivers Branch, Department of Public Works; some masters of vessels trading to Newcastle, and others possessing a knowledge of the port and its requirements; the Secretary to the Railway Commissioners, with reference to the profits, if any, derived by the Government from the haulage and shipment of coal at Newcastle; the Government Geologist, as to the coal-seams in the district, and the probable duration of the coal supply; and the Engineer-in-Chief for Public Works, who, in addition to now being the officer under whose direction the proposed works will be carried out, has had a long experience of Newcastle Harbour by reason of having been for a number of years the resident engineer there for superintending harbour improvement operations. This brought the inquiry to a point at which it appeared desirable to obtain the evidence of some competent engineer independent of the Department of Public Works and of the Government; and accordingly Mr. Good, M.I.C.E. was requested to visit Newcastle and report upon the proposed works.

8. Complaints are constantly being made to the Department of Public Works of the inconveniences to the shipping trade of the port from the shallowness of the water on the bar. From time to time the condition of the bar has improved by, as the officials of the Department assert, the scour hitherto running out of the harbour pushing the bank of sand forming the bar further seawards, but more probably, as other witnesses have stated to the Committee, by the sand-bank being to a certain extent distributed, and therefore flattened. During the last twenty years, the late Engineer-in-chief for Harbours and Rivers says, the bar, on an average, has deepened some 4 feet, and moved outwards from 800 to 900 feet. But, notwithstanding the improvement which from one cause or another has taken place the fact remains that the depth of water at the present time is not sufficient to meet the requirements of the port. Vessels drawing, when loaded, from 22 to 23 feet of water are not always able to leave with full cargoes, and the inconvenience and loss arising from this disability have been protested against by the owners as well as by the masters of the vessels. The Shipowners' Association of Liverpool, England, have written to the Marine Board at Newcastle on the subject, and memorialised the Chamber of Commerce. This Shipowners' Association represents a net tonnage of about 750,000 tons, and comprises almost all the sailing shipowners of Liverpool.

Many

Many of their vessels have been at times engaged to load coal at Newcastle, and while the trade is regarded as growing, the vessels engaged in it are increasing in size and draught of water. Letters of complaint have also been received by shipping agents at Newcastle from large steamship owners who state they are precluded from sending their steamers of deepest draught to Newcastle for coal. Vessels have been obliged to leave the port with cargoes some hundreds of tons less than they were capable of carrying, and frequently steamers have been obliged to proceed to Sydney to complete their loading. This is regarded as seriously detrimental to the interests of Newcastle, and as many of the vessels which remain away from Newcastle do not load at any other port of the Colony, it is injurious to the trade of New South Wales generally. The coal production of Newcastle has reached 2,605,142 tons for the year, the figures for 1894, and a large and increasing export business is carried on in wool, frozen meat, and produce generally. A number of returns relative to the trade of Newcastle are published as an Appendix to the evidence given before the Committee, and will be found both interesting and important. As the Sectional Committee remark in their report, these returns do not, in all respects show the elasticity which might be desired, but this is due to much of the imports reaching Newcastle by coasting steamers from Sydney, where the goods are transhipped from steamers too large to visit Newcastle, and to this coastal trade not being included in the Newcastle Custom House statistics. The evidence of the Sub-Collector of Customs indicates that the shipping visiting the port will increase in amount every year, that the export of coal is keeping up satisfactorily, and that not only have the general exports an upward tendency but their value is greater than that of the coal sent away.

Newcastle
Harbour.

9. The difficulty experienced in obtaining a scour in Newcastle Harbour is said to be due to the entrance being lob-sided, the tide entering and leaving broadside on. Sand from the deposits north of the entrance is swept in by the flood-tide and is constantly adding to the bank which forms the bar. No adequate protection exists to intercept it, and the ebb-tide has no effect in washing it back to sea, as, flowing out to the north and east without any scouring force, the tidal action which ought to be obtained is lost. Inside the harbour silting up takes place chiefly through the deposit of soil brought down the river in flood-time, and so very large is the quantity deposited that at the present time silt is being dredged at the rate of 3,000,000 tons per annum. For a long time, and until comparatively recent years, the accommodation inside the harbour was very limited. Old sand-banks existed, and these were periodically added to by the silt brought down with the river water. Dredging was commenced in 1859, at which date a large sand-bank extended across the harbour from Stockton to Newcastle, with a channel on the north side and another on the south, and accommodation in what is known as the Horseshoe for the mooring of one vessel only. The bank has since been removed, but while its removal has largely increased the accommodation for shipping in the part of the harbour where it existed, the absence of the scouring channels that were in connection with it has led to the silting up of other parts of the harbour in every time of flood.

The bar at
the harbour
entrance.

10. The bar at the entrance to the harbour has always been an obstacle or source of inconvenience to vessels of more than moderate size and draught. The information before the Committee with regard to it dates many years back, but definitely from 1867, in which year a flood reduced the depth of water upon it from 18 feet to 14 or 15 feet, and its position was very nearly as far out as the end of the first section of the proposed new north breakwater. At this time the southern breakwater between the mainland and Nobby's, constructed in 1835 and 1843 by convict labour, was in a condition of great disrepair, and the present northern breakwater was in course of construction. In 1872 the repair of the southern breakwater as far as Nobby's was effected, and the extension along the reef beyond Nobby's was completed in 1883. The northern breakwater was finished in 1886, and, the Committee are informed, showed remarkable results in the scouring out of sand seawards; but while beneficial in that respect, it had, before its completion, offered greater facility for the entrance of waves into the harbour, and it was only when the southern breakwater was completed that what threatened to be a serious trouble arising from the entrance of the rough seas was to a considerable extent modified. The southern breakwater did much to prevent the waves from entering, and thus greatly lessened the inconvenience experienced inside the harbour during bad weather.

When

When the existing works were finished, the depth of water on the bar at low tide was about 22 feet—quite sufficient at that date for the class of vessels trading to the port. Now, when the tendency is to build ships of a much larger size, the water on the bar is only 20 feet 6 inches. At least 3 feet may be obtained, it is considered, by scouring away the sand, and if necessary 2 or 3 feet more by blasting away the rock.

11. The report of the Sectional Committee deals with the principal points in the inquiry, and recommends—

- (1.) That the southern breakwater be made up to the 200 feet which has been washed away and be extended for a further 300 feet.
- (2.) That the first section only of the northern breakwater be constructed at present.
- (3.) That the southern guide-wall be constructed as proposed.

The Sectional Committee's report.

In addition to these recommendations the Sectional Committee, in an appendix to their report, suggest, when plant be available, the removal of Stony Point rock, and the discontinuance of the practice of discharging sand and silt from punts in the open sea. These recommendations and suggestions the Committee approve.

12. The evidence relating to the different works, though generally bearing out the Departmental proposals, does not support them to the extent which would justify the Committee in concluding that they are exactly what are necessary to secure the results desired. In the opinion of the Committee the extension of the southern breakwater is as essential as its repair. It will bring about a much smoother condition of water on the bar, by that means increasing the available depth, and it will be so much additional protection to the port. It will probably be found that no more of the northern breakwater than the first section will be required, and possibly it may not be necessary to construct that section further than to a point opposite Nobby's. The Committee suggest that the repairs and extension of the southern breakwater be the first work proceeded with; but if that course should be regarded by the Department as undesirable, both breakwaters should be carried on simultaneously, and in order that the effect of the southern breakwater upon the bar and in relation to the northern work may be properly ascertained, the Committee recommend that the northern breakwater be not extended beyond a point opposite Nobby's until the southern breakwater has been completed. The extension of the southern breakwater should be in a direct line with the existing work. Opinions as expressed by the witnesses examined by the Committee on this point differ, but the Committee consider that the best results will be obtained by a direct extension.

13. In these conclusions the Committee are strongly supported by much of the evidence. The Harbour-master at Newcastle, with twenty-two years' experience of the port, is emphatic in the opinion that the southern breakwater should overlap the northern, and approves of the length the Committee recommend. It is essential, he states, to the safe condition of the harbour, and to the improvement of the bar, as unless the northern breakwater be protected from the seas which now roll across the entrance from the reef of rocks known as "Big Ben," these seas will be conducted by the breakwater up the harbour and so produce a range dangerous to shipping at anchor or at the wharfs. An appendix to his evidence, describing the beneficial effects which followed the construction of the present southern breakwater, has an important bearing upon this point. The extension of the southern breakwater as an indispensable work is advocated also by pilots at Newcastle, by the master of one of the tug-steamers employed in connection with the dredge service, and by master mariners, who in command of foreign-going and coastal vessels trading to the port, are well able to speak of the bar and to say what is best to be done in regard to it. Mr. Good's report confirms the evidence of numerous witnesses that by extending the southern breakwater the rough water will be thrown further out, and smoother water, equivalent to an extra depth, will consequently be produced on the bar. The range in the harbour, he states, will be diminished if not stopped altogether, as the northern breakwater being well protected by the southern, waves which would otherwise strike it and roll up the harbour will, to a great extent, pass clear of the end of the work. The officers of the Department favour the construction

Evidence in support of the Committee's recommendations.

of the works as they were designed by them, and referred to the Committee for inquiry. But the late Engineer-in-Chief for Harbours and Rivers will be found on page 9 of his evidence to explain how the construction of the existing northern breakwater before the extension of the southern to its present limits, drew the waves in heavy weather into the harbour to such a degree as to greatly disturb the shipping, an inconvenience which only ceased when by extending the southern breakwater the northern structure was protected; and the Engineer-in-Chief for Public Works admits that the extension of the southern breakwater to the length the Committee recommend would give a greater length of calm water seaward, and therefore a proportionally increased available depth of water on the bar.

Cost of extending the southern breakwater.

14. It is estimated that the cost of extending the southern breakwater to the length the Committee consider desirable would be about £31,000. The estimated cost of constructing the second section of the proposed northern breakwater is £32,000. If, therefore, the second section of the northern breakwater be found not to be required, which is probable, the lengthening of the southern breakwater should not increase the estimated total cost of the works as referred to the Committee.

Dredging in Newcastle Harbour.

15. In agreement with the suggestion of the Sectional Committee with regard to the dredging operations in Newcastle Harbour, the Committee are of opinion that the practice of conveying the sand and silt to sea should be discontinued. Not only, as the Sectional Committee point out, is the practice expensive and the material of value for reclamation works, but works of this nature are now in course of construction in the harbour, and the sand and silt should be used there or in the carrying out of similar works. Much of the dredging now done is in consequence of the silting up of portions of the harbour by débris brought down the river in times of flood. In the past this effect of floods in the Hunter District has had a very detrimental effect upon the condition of the harbour, but with the scour which the proposed works are expected to produce the evil should be lessened. From the evidence it will be seen that there is no danger of the proposed breakwater and southern guide-wall retarding the flow of flood-water to sea, as with the construction of these works the discharging sectional area will not be less than that which exists at present.

Resolution of the Committee.

16. The resolution arrived at by the Committee, passed on Thursday, 9th instant, is contained in the following extract from the Committee's Minutes of Proceedings:—

Mr. Davies moved,—

"That, in the opinion of the Committee, it is expedient the proposed Harbour Improvements at Newcastle, referred to the Committee by the Legislative Assembly, be carried out by repairing the southern breakwater to the extent of 200 feet washed away, and extending that breakwater for a further 300 feet; by constructing the first section only of the northern breakwater for the present; and by constructing the southern guide-wall as proposed."

Mr. Hayes seconded the motion.

On the motion of Mr. Trickett, seconded by Mr. Gormly, the motion was amended by the omission of the words "for the present," and the motion, as amended, was passed on the following division:—

Ayes. 7.

Mr. Ewing,
Mr. Davies,
Mr. Roberts,
Mr. Hayes,
Mr. Lee,
Mr. Gormly,
Mr. Molesworth.

Noes. 4.

Mr. Humphery,
Mr. Trickett,
Mr. Hoskins,
Mr. Chanter.

THOS. EWING,
Chairman.

Office of the Parliamentary Standing Committee on Public Works,
Sydney, 16 May, 1895.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

HARBOUR IMPROVEMENTS AT NEWCASTLE.

WEDNESDAY, 20 MARCH, 1895.

Present:

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERT,	JAMES HAYES, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	ROBERT HENRY LEVIEEN, Esq.
The Hon. JAMES HOSKINS.	JOHN MOORE CHANTER, Esq.
The Hon. JOHN DAVIES, C.M.G.	CHARLES ALFRED LEE, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	JAMES GORMLY, Esq.
EDMUND WILLIAM MOLESWORTH, Esq.	

The Committee proceeded to consider the proposed Harbour Improvements at Newcastle.

Joseph Barling, Esq., Under Secretary, Department of Public Works, sworn, and examined:—

1. *Chairman.*] Have you a statement to make with regard to the proposed Harbour Improvements at Newcastle? Yes; as follows:—

NEWCASTLE HARBOUR IMPROVEMENTS.

THE proposal before the Committee was referred by the Legislative Assembly for its consideration on the 14th March, 1895, in the following terms:—"That it be referred to the Parliamentary Standing Committee on Public Works to consider and report on the expediency of carrying out certain works of harbour improvements at Newcastle."

J. Barling,
Esq.

20 Mar., 1895.

I shall probably not be required to give the early history of the construction of the harbour works at Newcastle, which were commenced in the early part of the century. I may, however, state that the first stone was tipped in that portion of the southern breakwater beyond Nobby's in 1875, and the northern breakwater was commenced in 1861. The expenditure to date on the southern breakwater is £103,789 18s. 1d., and on the northern breakwater £19,636 0s. 5d., that is so far as the records in the Department show. No doubt there must have been some expenditure earlier of which, however, we have no record. It may be useful to the Committee if I refer to two reports of the late Captain Allan, who was then Harbour-master at Newcastle, dated respectively 30th April, 1880, and 16th June, 1882, and I do this to show the undeniably good effects which the construction of these breakwaters has had on the improvement of the bar. The first report I should like to read is that dated 30 April, 1880, as follows:—

Sir,

I have the honor to forward by same post for your information a copy of soundings taken in the fairway over the bar in July, 1871; also a copy of soundings carefully taken this month on the same line of bearings, leading light-towers in line, from which it will be seen that there is an increase in the depth of water of 3 feet 6 inches. The former soundings were taken in the usual way, with a sounding pole, but in this case a second pole with an iron probe 9 feet long attached was used, for the purpose of ascertaining the nature of the bottom on the bar (see margin of soundings); the blue line shows the depth to which the iron probe penetrated after hard driving.

I also enclose copy of soundings taken 26th instant in the north channel, where in 1860 there was an obstruction or bar of considerable length, with not more than 13 feet 6 inches of water over it at low water, whereas by these soundings you will observe there is not less than 20 feet at low water. As neither of these channels has been dredged, I can only attribute this great improvement in the depth of water to the construction of the northern and southern breakwaters, together with the large amount of dredging that has been done in the harbour, thereby admitting a much larger volume of water, and causing a greater scouring influence in the several channels. There still remains a considerable portion of the Horseshoe Bank in the middle of the harbour, which is the cause of strong eddies and irregular sets of tide. When this is removed (which I believe is contemplated) this port will be one of the most safe and commodious in all the Australasian Colonies.

Loaded vessels having to cross the bar must, of course, be guided by the ocean-swell, which very materially alters the depth.

The President of the Marine Board.

I have, &c.,

D. T. ALLAN,

Harbour-master.

Then there is a subsequent report dated the 16th June, 1882, which I will read:—

Sir,

I have the honor to forward for your information copies of soundings in the fairway of this harbour, taken under favourable circumstances, 27/4/81 and '82, which show a steady increase in the depth of water over those taken in 1880. This serves to confirm my opinion expressed in my letter on that subject dated 30/4/80. The increased depth of water is owing to the very large amount of dredging done in the harbour, thereby admitting a large volume of water, which has greatly increased the scouring influence between the southern breakwater and the northern retaining wall (or breakwater). The latter has had the effect of removing a large sand-spit, which was partly above water, running out from Scott's Point, and caused a very dangerous eddy that does not now exist. Where it was dry, there is now 8 feet of water at low tide, and I have no doubt that, if the retaining wall is kept in repair, there will soon be 20 feet, thus giving about 150 feet more width in the narrowest and most intricate part of the harbour.

J. Barling,
Esq.
20 Mar., 1895. The North Channel still continues to increase in depth through the same influence. I may note that the much dreaded Oyster Bank, abreast of Nobby's, is now a thing of the past; where there was only 7 feet there is now 19. All these increased depths in the fairway and North Channel, where the dredges have never been employed, must be the result of extensive dredging in the harbour, which has caused a great scour in the fairway, as already expressed.

I have also forwarded copies of soundings taken across the harbour in 1860, with those taken on the same lines of bearings in May, 1882, which must be interesting to all concerned, as they show the enormous quantity of silt that has been removed, to obtain the present accommodation. You will observe the position of the red buoy on the south elbow of the Horse-shoe, where there was only 4½ feet, there is now 20 feet at low water; also, the white buoy on the north arm of the Horse-shoe, where there was 10 feet, there is now 21 feet at low water. Both of these buoys have been removed, being no longer required. The deep water extends a considerable distance to the westward beyond what is shown on the chart, until the end of the high-level coal staiths comes in line with cathedral.

Within a short distance off the wharf there is not less than 23 feet across the harbour, over a sand-bank that formerly dried at low-water (see chart enclosed); but, notwithstanding all that has been done, a great deal more space is required to meet the requirements of the large ships and steamers now visiting this port.

It was only a few days ago that 50,000 tons of shipping were safely moored in this port (which proves its capabilities), that a few years ago was a mass of sand-banks forming dangerous eddies and intricate navigation. Such is the result of judicious engineering, which has made this once dreaded harbour to be perfectly secure, and safe to enter or leave by day or night.

The President, Marine Board.

I have, &c.,
D. T. ALLAN,
Harbour-master.

In 1867, soundings on the bar showed from 14 to 15 feet; soundings were again taken in 1871, when they had increased to 17 feet, showing a marked improvement. In 1880, soundings showed 21 feet; and at the present time there is a minimum depth at low water of 22 feet. It is believed that when the scheme now proposed is carried out a minimum depth will be obtained of 25 feet. By the removal of a small patch of rock, which, however, is not included in the scheme, the depth can be further increased by 3 feet. The Committee are probably aware that continued complaints have been made to the Department as to the shoaling of the harbour. This was due to successive floods, but chiefly to the great flood of 1893. The Department is now doing its best to cope with this evil, and at the present time there are employed in deepening the harbour two large ladder-dredges and one sand-pump dredge working respectively one, two, and three shifts per diem. This represents an output of something like 2,500,000 tons per annum. The following is a statement of the steps which have been taken since 1891 to the present, which has eventuated in the present scheme being placed before the Committee:—“In June, 1891, Mr. Walsh (Resident Engineer) reported the shoaling-up of the entrance to Newcastle Harbour, and as a remedy for this growing evil, Mr. Darley recommended that the northern breakwater be extended from 500 to 600 feet, which was always contemplated as necessary. The Minister approved (13th January, 1891) of a sum of £18,000 being noted on the Loan Estimates for the purpose; but this amount was subsequently struck out. The Marine Board, in July, 1892, forwarded a report from Henry Newton, Harbour-master, Newcastle, with regard to the shoaling-up of the entrance, and that officer suggested the extension of both the southern and northern breakwaters. On the papers being referred to Mr. Darley, he again strongly recommended the extension of the northern breakwater; but the Minister decided (30/8/92) that the matter should stand over for the Newcastle Harbour Trust. The Newcastle Marine Board in September, 1893, again drew attention to the shoaling that was taking place. Mr. Darley drew attention to his previous recommendation, and Mr. Secretary Lyne, on 10th October, 1893, minuted: ‘Let the amount be submitted for consideration on Loan Estimates.’ A deputation, representing the Newcastle Chamber of Commerce, together with the Mayor of Newcastle, introduced by Messrs. Scott, Fegan, Graham, and Walker, M.P., waited upon Mr. Lyne, in May, 1894, and urged that some scheme be devised for deepening the bar at the entrance to Newcastle Harbour, and improving the mooring accommodation inside the bar. The deputation asked the Minister to consider the question of appointing a Board of Inquiry, to consist of three members of the Chamber of Commerce (Newcastle), the Government officials, and the Harbour-master, for the purpose of inquiring into the best means of deepening the bar and improving the harbour generally. The Minister, in reply, said Mr. Darley had recommended that the dredge ‘Hunter’ be sent to Sydney, and the ‘Samson’ to Newcastle, temporarily; this would assist the dredging; and as regards the bar, the first thing to be done was to extend the northern breakwater, which work Mr. Lyne said was a matter entirely for the engineers, and there was no necessity for them to sit with the Committee of the Chamber of Commerce. There was no objection, however, to Mr. Darley meeting the Chamber of Commerce to hear their views, and he would instruct him to do so, and also, to have full investigation made for a report. Mr. Walsh was then instructed to have a complete survey made of the bar, and fresh soundings at entrance. The Marine Board, in June, 1894, forwarded copies of correspondence received from different foreign ship-owners pointing out that through the shallowness of the harbour their vessels had to leave without a full cargo, and urging that increased dredging be carried out.” As this is rather an important document, I thought I had better incorporate it in the evidence. I have here a letter from the Secretary to the local Marine Board, Newcastle, dated 1st June, 1894, in which he again urges particular attention to the great and growing necessity for increased dredging operations to the harbour. That letter was sent on to our Department, enclosing a letter from the Shipowners’ Association of Liverpool, dated 12th April, 1894, and addressed to the Secretary to the Harbour Board, Newcastle. That letter is as follows:—

Sir, Shipowners’ Association, 6, Water-street, Liverpool, 12 April, 1894.

We are directed by the Committee of this Association to inform you that cases have recently come under their notice of vessels belonging to members of this Association which, having been loaded at your port, have not been allowed by the Harbour-master to leave the port fully laden. We append particulars of a few of these cases.

We understand the ground upon which the Harbour-master required these vessels to leave the port without being fully laden was that the ships could not safely be laden to a deeper draught by reason of the want of water in the harbour.

It appears also that, in the case of one of the vessels, the “Forteviot,” it was stated that the whole harbour had silted up more or less through the floods.

Our Committee are informed, however, that vessels can safely load to a draught of 23 feet or even 23 feet 6 inches—except in time of floods—although they are obliged by the Harbour-master to leave with a much less draught.

Under these circumstances, our Committee desire us to ask you to be good enough to inform us that instructions have been given by your Board to the Harbour-master as to the maximum draught at which vessels must leave the port, and whether, in the cases of the vessels named below, the Harbour-master was acting with the authority of your Board. Is the Harbour-master authorised to require vessels to load only to any specified draught?

We are, &c., WRIGHTMAN, PIDDER, & CO.,
Secretaries.

The Secretary, Harbour Board, Newcastle, New South Wales.

The

MINUTES OF EVIDENCE—HARBOUR IMPROVEMENTS AT NEWCASTLE.

3

The "Fortevoit"—3,145 tons gross and 2,962 tons net, with a freeboard of 5 feet 10 inches, was required by the Harbour-Master to leave Newcastle with a draught of 22 feet 7 inches, in consequence of which, instead of carrying 4,830 tons, she had to go away with only 4,560 tons on board.

J. Barling,
Esq.

The "Doomby Hall"—2,069 tons gross, 1,998 tons net, with a freeboard of 5 feet 5½ inches. In December, 1889, left Newcastle Harbour with a cargo of 2,946 tons of coal, which was considerably less than a full cargo. She was not allowed to load deeper.

20 Mar., 1895.

The "Glenlu"—1,894 tons gross, 1,847 tons net, with a freeboard which allowed her to draw 22 feet 6 inches, had to leave the port with a draught of 22 feet 3 inches on an even keel.

The "Pythomene"—1,954 tons gross, 1,796 tons net, in 1893 loaded a cargo of 2,920 tons gross weight and 2,863 tons net, and was obliged to leave with a draught of 22 feet 3½ inches on an even keel. The captain wanted to load 2½ inches, but was not allowed to do so.

Copy of Letter sent in reply.

Sirs,

Office of the Local Marine Board, Newcastle, 26 May, 1894.

I have the honor, by direction of the Local Marine Board, to acknowledge receipt of your letter of the 12th April last, and in reply thereto, beg to state that the Harbour-Master at this port acts with the full authority of the Local Board, and is empowered to use his discretion as to the draught of water vessels should load to. In doing this he is assisted by his staff of pilots, with whom he carefully sounds the channel, and gives them the greatest limit commensurate with safety, having also regard to the state of tides, whether neap or flood, or what may have resulted after floods in altering the depth.

By same mail I am sending you a copy of our Harbour Regulations.

I have, &c.,

W. D. WEATHERILL,

Secretary, L. M. Board.

Messrs. Wrightman, Pidder, & Co., Secretaries, Ship-Owners' Association, 6 Water-street, Liverpool.

As directed, Mr. Darley met the members of the Chamber of Commerce, and in regard to the bar told them he was having a survey made, &c., and before this was completed he could not report fully about extending the breakwaters. With reference to the dredging, Mr. Darley promised to make a recommendation, which was as follows:—"That an extra crew be provided for the two dredges—'Newcastle' and 'Samson'—thus working the 'Newcastle' for three, and the 'Samson' for two shifts of eight hours each. This would entail a further outlay at the rate of £6,600 per annum." These extra shifts, it was thought, would not be necessary after the end of 1894. The dredges, however, are still working with these shifts. The Minister approved of this arrangement on the 19th June, 1894. In answer to Mr. Ellis, M.P., at the Legislative Assembly, Mr. Young, on the 17th October, 1894, stated he would obtain a report upon the question of extending the south breakwater, and would bring the matter before the Cabinet. Mr. Walsh, about this time, reported that there was a sandspit working from the north across the fairway, which is seriously affecting the entrance to the port. On the 3rd December, 1894, Mr. A. B. Portus (Dredge Superintendent), prepared a statement showing the delays to dredges during 1892 and 1894 in consequence of rough weather, and he estimated that fifty-nine days of eight hours would be saved by the dredges if they could dump the barges in the Newcastle harbour for reclamation purposes. Mr. Darley, in December, 1894, forwarded a comprehensive report on the proposed improvements. He had surveys and soundings taken, and compared them with those taken in 1874, when the last complete survey was made. The new survey shows that during the last twenty years the bar has on an average deepened some 4 feet, and moved outwards from 800 to 900 feet. A vast accumulation of silt has taken place outside the bar, where there was formerly deep water; in other words, the deep water has been moved considerably further out. This accumulation, it is quite evident, is due to the loss of scouring action through the entrance. The one way to remedy this defect, and to improve the entrance, is to extend the northern breakwater out well to the north-east. Mr. Darley is aware that he will meet with some opposition in this recommendation to extend the north breakwater, on the grounds that this breakwater caused a swell to enter the harbour before the southern breakwater was extended so far out as it now is, and he has therefore designed a wave-trap which will most effectually put an end to any trouble of the kind. I remember from my own knowledge, about the extension of that breakwater, that there has been persistent opposition to that extension on the ground that it conducts the sea into the harbour, and gives such a range that the vessels cannot lie in safety at the wharf. The object of the wave-traps, as shown on the plan, is to impound the waves before they run up the harbour.

2. You express no opinion as to the efficacy of the work? None whatever. That is a question for the engineer, but I know of my own knowledge where the difficulty has been in the matter. Mr. Darley has provided for that by a wave-trap on the northern and southern sides. Mr. Darley does not propose to extend the present northern breakwater any further but to commence practically a new one some distance up the beach, and run out in a south-easterly direction, gradually curving into a straight line a prolongation of the present northern breakwater, keeping some 500 feet north of the end of the existing work, and thus form a completely effectual wave-trap. As regards the southern breakwater, Mr. Darley, considers the distance to which it was originally extended quite sufficient, and cannot recommend any work being done there, further than to make it up to its former length, and strengthen it thoroughly. The following is an estimate of the works proposed:—

Northern breakwater, first division	£70,650
Preliminary work in connection therewith—such as wharfs at Bullock Island and Stockton, sidings on Bullock Island, railway across Stockton to breakwater, cranes, plant, and punts for conveying stone	£13,000
Total, first division of north breakwater	88,000
North breakwater, 2nd section of 750 feet	32,000
Total cost of north breakwater	£120,000
Mr. Darley considers that it will be time enough to decide upon this further extension (750 feet) when the action of the first section is observed. He thinks it more than probable that it will be found desirable to carry the work the whole way out.	
Repairs to and strengthening existing north breakwater as slips occur.....	£3,000
Southern breakwater—estimated cost to restore and strengthen end	7,000
Southern guide wall, including branch line, plant, &c.	11,000
Total	£141,000
	Mr,

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

J. Barling, Esq. Mr. Darley has also shown on the plan a portion of the north harbour reclamation works, which were proposed some time ago, and a vote taken for commencing the formation of the enclosing dykes. A survey, however, of the lower portion of the Hunter River now in hand will have to be completed before the exact position of the limits of reclamation can be defined.

20 Mar., 1895. 3. Is anything said by you about the cost of that reclamation? It is not included in the scheme at all.

4. *Mr. Davies.*] What is the amount already spent? I am not quite sure, but I can easily let the Committee know. I think it is under £5,000, at any rate. This work will have a twofold effect beneficially. First it will train the lower portion of the river to one channel, and do away with the necessity for the constant dredging that now takes place in the shifting channel; it will also supply a suitable site for disposing of all the silt likely to be raised in the harbour for many years to come. At present the silt is being towed out to sea nearly 2 miles. Mr. Darley has also shown on the plan a large area off Stockton Point hatched red, which he proposes should be dredged to a depth of 26 feet. At present this projecting point acts as a groin, and diverts the ebb current across towards the dyke, causing silting in the north channel. On the 20th February, 1895, the Marine Board forwarded a letter from the Local Marine Board, Newcastle, stating the Harbour-master had reported that the depth of water on the bar had decreased to 20ft. 6in., and they again urged the extension of the south breakwater. A sum of £5,000 was voted in Loans, 1894, towards reclamation North Harbour, Newcastle—balance, £3,500; and there is also a balance of £3,118 11s. 5d. on the vote of £11,000 Loans for Northern Breakwater, Newcastle, 1894.

5. *Chairman.*] The recommendation was to extend the southern breakwater? No; merely to make it up. It practically comes to an extension, however, because the end of the southern breakwater has been flattened down, and there are 200 feet to be made up.

6. Is that reclamation work part of the harbour improvements at Newcastle? No; it is not before you.

7. Then you carry out two schemes within half a mile of each other, one of which is submitted to the Committee, and the other is not? No; that is not before the Committee at the present time. The last information I have on the subject is the result of a deputation which waited on the Minister in Newcastle on the 16th March of this year:—

Messrs. Dick and Fegan, Ms. P., introduced a deputation representing the Newcastle Chamber of Commerce to the Minister, at the Great Northern Hotel, Newcastle, this morning, to urge the necessity for carrying out the proposed works for the improvement of Newcastle Harbour as soon as possible.

The President of the Chamber of Commerce strongly urged the execution of such works as would make Newcastle Harbour a port where vessels of the heaviest tonnage could ship full cargoes of coal with complete safety, which at present, he pointed out, was an impossibility, and would remain so until certain necessary improvements had been carried out. For the information of the Department, he would suggest that a full inquiry be made regarding the ship "John Kerr," lying alongside one of the cranes at Bullock Island, which inquiry, he stated, would clearly show what difficulties shipping have at present to contend with at Newcastle in the matter of loading coal and getting away to sea.

The Minister, in replying, said, that in consequence of representations which had been made to the Department, the Engineer-in-Chief was instructed to prepare a scheme for the improvement of the harbour at Newcastle. That scheme he had prepared, and it was a complete one, and, of course, a costly one. Mr. Darley considered that if this scheme were carried out, it would overcome all the difficulties shipping had to contend with to-day. The works would cost £141,000, and the proposal to refer the scheme to the Public Works Committee had been passed by the House on last Wednesday night; but how long it would take the Committee to prepare and submit their report on the subject he could not at present say. He hoped, however, it would not be long, and that the result would be such as would enable him to obtain the approval of Parliament to the proposed works being carried out. So far as he was concerned the very best should be done to have the difficulties at present complained of removed, and the harbour made capable of accommodating ships of the largest class; for he recognised that unless this were done Newcastle would always be greatly handicapped in regard to the export of coal.

I have here a statement showing the amounts expended on Newcastle harbour, commencing from the earliest date we have in our books to 1894.

8. Does it embrace all works and yearly expenditure? It comprises the northern and southern breakwaters, Newcastle wharf extension, lighthouse repairs, signal station, boat shed, hydraulic cranes, and so on.

RETURN showing the amount expended in connection with Newcastle Harbour to 1894.

	£	s.	d.
Southern breakwater	103,789	18	1
Northern	19,636	0	5
Newcastle—Wharf construction and erection	35,310	14	10
" Lighthouse repairs	407	15	4
" Signal stations	190	12	0
" Boat shed	673	6	7
" Boatharbour	1,232	4	0
" Steam-crane	1,308	12	1
" Purchase and erection of steam cranes	10,415	17	4
" Steam cranes, working expenses, and repairs	5,864	19	2
" Additional steam cranes	8,992	8	8
" Coal staiths	30,768	14	:
" Hydraulic engine-house, cranes, &c.	20,000	0	0
" Screw-moorings	1,875	0	0
" Lamps on wharf	60	0	0
" Removal of rocks	18,871	18	7
" Beacons, southern breakwater	303	19	8
" Wharf and shipping facilities Newcastle, Bullock Island, and Stockton (exclusive of steam cranes, Newcastle wharf)	288,065	3	1
" Wharf repairs	15,490	9	10
" Dyke, Bullock Island	1,958	14	3
Boatharbour, Bullock Island	2,207	12	10
" Jetty at Stockton	252	2	8
Excavation of silt by dredges	477,084	11	8
Reclamation, North Harbour, Newcastle	1,146	3	0
Dredge, &c., for Newcastle	19,966	6	4
Punt for "Vulcan"	1,220	0	0
New steam dredge	48,950	14	2
Construction of three punts for dredge "Newcastle"	3,500	0	0
Large iron punt for dredge "Newcastle"	4,936	15	0
	£1,124,480	14	4

9. *Mr. Hayes.*] Have you a return of the revenue at Newcastle? No.

10. *Mr. Gormly.*] You have no return showing the income derived from Newcastle? No; we have been trying to obtain the information, but it is not quite ready yet. I think it will come more directly from the Collector of Customs.

11. Is the amount of £1,124,000 the entire cost of works at Newcastle? Yes.
12. I suppose you have no personal knowledge of Newcastle Harbour? I have been there a number of times, but it has not been on engineering business.
13. You have no special knowledge about Newcastle? No.
14. *Mr. Trickett.*] Is the money which has been spent on the Bullock Island resumption an annual vote? As far as the dredging is concerned, it is an annual vote, with the exception of the actual cost of the dredges themselves. That is from a loan vote. But the working of the dredges is charged to an annual vote. The wharfage which has been put up at Bullock Island has been charged to loan vote.
15. Is that an annual vote for improvements in Newcastle Harbour? I do not know that we can exactly call it an annual vote. The dredging vote is annual.
16. For Newcastle? For Newcastle and the whole of the Colony.
17. It is not a separate vote? No. Our vote for dredging when the dredges are in full operation is something like £105,000 a year.
18. I suppose that the dredges are always kept at Newcastle? They are always at work there.
19. I suppose you do not know what proportion is spent at Newcastle in dredging works? It is very easy to obtain. Returns were laid on the table of the House not long ago showing the proportion. There are at present the sand-pump "Juno," the "Dorus," the rockbreaker "Poseidon," a grab dredge, and the "Newcastle."
20. In debiting Newcastle with dredging expenditure, do you debit it with the cost of these dredges, seeing they are all there? Yes; in the returns there is a certain cost debited.
21. *Mr. Davies.*] What is the cost per ton of raising the silt and taking it to sea? About 3½d. per ton.
22. What is the quantity of silt raised by the dredges? I would rather hand you in a report on the subject, if you will allow me. I have a detailed statement, which was laid on the table of the House yesterday.
23. Can you tell me the amount of shipping and traffic which passed into Newcastle and out of it five years ago, and compare it with last year? I have not got it here.
24. I want to know whether trade has increased or decreased? The Collector of Customs could inform you on that subject.
25. I want to know, before the Committee gives its assent to this large expenditure, whether there is a justification for it by reason of the growing trade? That I recognise as a most important question, and, recognising its importance, I thought the best way would be to leave it to the officer who would be able to give the information direct.
26. Did I understand you to say there had been two loan votes, or proportions of loan votes, already spent in certain reclamation works? Yes; the sum of £5,000 was voted towards the reclamation of the north harbour, Newcastle, and we have not done very much of that.
27. The only sum spent of late years has been that £5,000? I should not like to say that, because undoubtedly some other expenditure has taken place; reclamation works have been going on for some years past.
28. In connection with the scheme which is now submitted to the Committee, the estimated cost does not include the retaining-walls? No; the scheme before you does not include anything of that kind.
29. *Mr. Lee.*] Do you remember whether there has been any representation made by the people of Maitland, or Williams, or Patterson, with reference to a scheme facilitating the escape of flood waters? Yes.
30. Have any of those representations included the improvement of the harbour at Newcastle? They would not include anything of that kind at all.
31. Inasmuch as it is now proposed to narrow the entrance to the harbour? Although you narrow the harbour, you would have to deepen it as well.
32. Do not the people of Maitland view the narrowing of that entrance with a great deal of alarm? I do not know that I could say that. I do not remember that particular aspect of the case. It is possible it is so.
33. Is there not a very large movement on foot in that locality at the present time for the purpose of having something done to facilitate these matters? Yes; a public meeting was held a few days ago.
34. So far as you know they have offered no protest against the narrowing? I do not think they have entered any protest against our work. There have been difficulties raised as to the cuttings proposed in the river, because some of them were afraid that by taking out the bends of the river it will carry the water down much quicker to the land lying below and submerge them.
35. What I wished to elicit was whether this scheme was involved in any way with the scheme to relieve the Hunter River of floods? The two things are not considered together at all, although I daresay the engineer had in his mind the question whether this work would have any prejudicial effect higher up.
36. But I want to know whether there is anything in the Department to that effect? I do not remember.
37. *Mr. Molesworth.*] Has Sir John Coode made any recommendation with regard to improvements at Newcastle? No; but Mr. Gordon has made some recommendations with regard to the floods on the Hunter. I do not think Sir John Coode had anything to do with the matter.
38. Are these proposals the Engineer-in-Chief's own recommendations? Yes.
39. Do I understand that the proposals before us are partly those of the late Engineer-in-Chief and partly those of the present Engineer-in-Chief? I do not think these are exactly the late Engineer-in-Chief's proposals, but I know from my own knowledge of Mr. Moriarty that he was in favour of extending the northern breakwater. Whether he would have done it in that way I cannot say.
40. Are not these wave traps a new idea with regard to harbour improvements in this Colony? I do not think so.
41. Is there any place in this Colony with similar traps? Yes, it is not a new idea.
42. *Chairman.*] Perhaps there are no works in the Colony requiring them? Mr. Carleton tells me there are some of the same kind on the Clarence, and another on the Richmond. With regard to Mr. Lee's question about narrowing the entrance, Mr. Carleton has pointed out to me that the entrance is not narrowed by this work.
43. *Mr. Hoskins.*] Was not the late Sir John Coode brought out here by the Government to report upon the best means of improving the entrances to the rivers of the Colony? Yes.
44. In reply to a question of Mr. Molesworth you said that the late Engineer-in-Chief for Harbours and Rivers,

J. Barling,
Esq.
20 Mar., 1895.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

J. Darling, Rivers, Mr. Moriarty approved, as far as he took the matter in hand, of the proposed improvements at the entrance to Newcastle Harbour. The late Engineer for Harbours and Rivers was here when Sir John Coode was here, was he not? Yes.

20 Mar., 1895. 45. Can you say whether Sir John Coode was consulted by the Department as to the best means of improving the entrance to the harbour of Newcastle, and improving the harbour of Newcastle as well? I do not think so; he may have been. I daresay Mr. Moriarty had some conversation with him on the subject, but I do not think he was formally consulted. He was consulted about the Wollongong Harbour works, about Darling Harbour improvement, about the Lake Macquarie entrance, the Clarence entrance, the Macleay, and the Richmond, and I am not sure whether he did not go to the Tweed and the Bellinger, and the Manning, too.

46. Then he was not consulted as to the best means of improving the entrance to the principal port of the Colony, apart from Sydney? I do not think he was formally, because I do not think there was any question then as to Newcastle.

47. Although Mr. Moriarty had this scheme in contemplation? I do not know that he had. Of course Mr. Moriarty had under contemplation the extension of the southern breakwater, and that was really projected by him. All that we have to do now with the southern breakwater is to make up the 200 feet which has been battered down. I am aware from personal knowledge of Mr. Moriarty that he was in favour of the extension of the northern breakwater, but I am not able to say whether he would have projected it in the way proposed. I know he was in favour of the extension of the northern breakwater, and I am well aware that there was great opposition to its extension.

48. Then the proposal to expend this large sum of money in improvements to the entrance of Newcastle Harbour arises from Mr. Darley's own views of the subject, and not from any information given by the late Sir John Coode? I think not.

49. **Mr. Levien.**] And from representations by the shipowners? Yes; of course, the size of ships has been gradually increasing.

50. **Mr. Chanter.**] You stated just now that the whole of the expenditure, going back as far as you records extend, on the improvements to Newcastle Harbour, amounts, roughly speaking, to £1,124,000? Yes.

51. That does not include the expenditure in connection with the dredging works which are going on along the dyke? That would include everything.

52. It would be possible for you to give information to the Committee as to the actual expenditure on Newcastle Harbour, including Bullock Island and other improvements? Yes.

53. You say you are not in a position to give the Committee information as to the amount of revenue obtained? No. At the same time I recognise that that is a cardinal feature in the matter. I thought it would be better to leave the matter to Mr. Powell to give direct evidence on the point.

54. A certain portion of expenditure is charged to loan fund, and the other to annual vote? Yes.

55. Can you say, roughly, how much out of the £1,124,000 has been charged to loan? I would rather you left that question open for the present, and I will obtain the information.

56. **Mr. Lee.**] Is Mr. Gordon in the employ of the Department? No.

57. Is he in the Colony? I do not think so; he was an engineer, well known in Melbourne.

58. He made that report on the Hunter River flood scheme? Yes; he once held an important official appointment in Victoria, but he has left that many years, I think.

59. And he is not available at the present time in this Colony? I am not quite certain whether he is in Melbourne now. He called on me six months ago, but whether he has gone or not, I do not know.

60. **Mr. Davies.**] Had Mr. Hickson anything to do with the harbour works at Newcastle? He was resident engineer there for a number of years.

61. Had he anything to do with the carrying out of any improvements? Yes; certainly.

62. And many of them are his own recommendations? Of course he was a subordinate in the office then to Mr. Moriarty.

63. And he was the resident engineer? He was called the assistant engineer.

64. And they were carried out under his supervision? Yes.

65. The present local engineer is Mr. Walsh? Yes.

66. Has Mr. Walsh furnished the data upon which you have made your report to-day? Mr. Walsh has furnished certain data, no doubt.

67. I mean as to depths? Yes; no doubt.

68. He has made the soundings? No doubt, under his supervision.

69. Under the direction of Mr. Darley? Yes.

70. What is the width across from the northern to the southern breakwater? 1,400 feet.

71. What is the narrowest portion of it? About 1,200 feet.

THURSDAY, 21 MARCH, 1895.

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHREY.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. JAMES HOSKINS.

The Hon. JOHN DAVIES, C.M.G.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

JAMES HAYES, Esq.

ROBERT HENRY LEVIE, Esq.

JOHN MOORE CHANTER, Esq.

CHARLES ALFRED LEE, Esq.

JAMES GORMLY, Esq.

EDMUND WILLIAM MOLESWORTH, Esq.

The Committee further considered the proposed Harbour Improvements at Newcastle.

Cecil West Darley, Esq., Engineer-in-Chief, Harbours and Rivers Branch, Department of Public Works, sworn, and examined:—

C. W. Darley, 72. Chairman.] What are you? Engineer-in-Chief for Harbours and Rivers.

Esq. 73. The plans before us have been prepared under your supervision? Yes.

21 Mar., 1895. 74. They are plans for improvements to the navigation of the port of Newcastle? Yes.

75. So as to enable deep ships to enter the port of Newcastle? Yes; to enable large vessels to have free access to the harbour.

76. And also to furnish them with loading appliances? That is not before the Committee just now. It is to enable the ships to get to the existing appliances, and any further that may be constructed. Esq.
77. And those railways and cranes are only incidental to the harbour works? They are necessary adjuncts to the harbour, but not before the Committee.

21 Mar., 1895

78. Have you viewed this question from every standpoint? Yes; but the particular work under consideration is the entrance to the harbour.

79. Do you realise that the question is likely to arise as to whether the contraction of the mouth of the Hunter may not affect the floods in the Hunter? Yes.

80. Are you prepared to answer any questions in regard to the work? I think so.

81. Perhaps you will make a statement? Yes; I will first make a statement to the Committee. I might mention that my knowledge goes back nearly twenty-eight years. I arrived in Newcastle on the 12th July, 1867, and a few hours after that I went out in a steamer, and took soundings on the bar, the first public work which I did in the Colony. At about 12 o'clock that day the soundings which I got showed a depth of between 14 and 15 feet of water on the bar.

82. Can you show us where the bar was at that time? It was in a line very nearly north by west of a line through Nobby's.

83. Can you say that the bar would lie fairly well between the first extension of the northern breakwater and Nobby's? Yes; in a line between Nobby's and very nearly as far out as the end of the proposed first section of the work.

84. That fairly describes the position of the bar twenty-eight years ago? Yes. There was then 14 or 15 feet of water on the bar. There had been more water previously, but owing to the heavy floods which took place in June, 1867, it had silted up. In June, 1867, there was a heavy flood, accompanied by a very heavy easterly gale, which caused the bar to shoal up. At that time there was a contract in existence for constructing the northern breakwater with bluestone ballast from Melbourne. In 1861, a vote of £5,000 was taken for the construction of the northern breakwater. In 1862 there was a second vote of £5,000; and in 1866 there was a third vote of £5,000. That money was being expended when I went to Newcastle, in the formation of a breakwater with stone deposited from Melbourne vessels. It was confined to that kind of stone on account of its being heavy stone. The contractor got so much a ton for taking the stone from the ship, the Government supplying rails and trucks. Ships' ballast was being run out to form the breakwater. There was also a contract for repairing the southern breakwater in like manner with ships' ballast. What was known then as the southern breakwater was a structure which was made between the years 1835 and 1848, by convict labour, between the mainland at Signal Hill and Nobby's. Originally Nobby's was an island.

85. What was the condition of that bar;—did the sea break through? There were two channels through which small vessels used to enter. One channel was known as the 10-feet entrance. The 10-feet entrance was as nearly as possible in the position of the present leading mark of the north channel. There was likewise another channel not quite so good, nearly 10 feet, a little to the north of that.

86. Is that line marked with leading marks? There are two towers constructed indicating the line of the North Channel. There is one tower on the breakwater and another at its base. These stand nearly over the old 10-foot entrance to the harbour. There is a well-known sailing-master, Captain Campbell, still living, who was one of the last to enter by that channel. He sailed through there, I think, in the year 1845. The channel was closed up shortly after that. That breakwater was constructed with stone from the Signal Hill. The stone being of a very indifferent character it had fretted away, partly by the action of the sea and partly by the action of the atmosphere. When I went to Newcastle in 1867 the breakwater was breached through, and the sea was breaking heavily through several gaps into the harbour. One gap was so washed out that at high tide it was almost possible to take a boat into the harbour through it. I found that a contract was in existence when I arrived for repairing that structure also with ships' ballast bluestone, which was being carried out from the end of Queen's Wharf. There was no crane at the end of the wharf in those days, and the ballast was run out on a siding and tipped there. I watched these operations for a short time, and found that the ballast was altogether too light for the work which it was expected to do. Every sea used to wash away the stonework. I reported the matter to the Engineer-in-Chief, Mr. Moriarty, stating that we should never get that breakwater made unless we got large stones to construct it. He then asked me to examine the district and report as to how stone was to be procured. I saw that there was a difficulty in getting material, as the material in the immediate locality was quite unfit for the work. I then examined the whole of the district about Lambton and Wallsend, and found what I deemed to be a suitable quarry on the property of the Waratah Coal Company, where there was an outcrop of fairly hard blue sandstone, locally termed by the miners "post."

87. It is the same quarry that you intend still to use? Yes; it is about 6 miles from Newcastle. At that time the Waratah Coal Company was just about to develop the coal seam which overlies this rock, but at the place which I picked, the coal seam was nipped out. I found that we could get a large quantity of stone with very little stripping, the coal rising to the southward. Mr. Moriarty approved of the quarry, and eventually came to terms with the Waratah Company about getting the stone. We had no power to resume land in those days, and we had to take the stone out on royalty. The company constructed their line practically up to the entrance to the quarry, and whilst we were developing the quarry, they were developing the coal-mine. They hauled the stone for us, and put it on the railway at the junction of the Great Northern line, and the Commissioner for Railways carried it to the breakwater for us. A sum of money was voted for the work. In those days the Government never thought of granting large sums of money for any work, and we never got a larger sum than £5,000. With only £5,000 at our disposal, we could not see our way to get the necessary plant for undertaking a big piece of work. If we had got the necessary plant our money would have been gone, and we should have had none to carry on the work with. We had to carry on the work with indifferent appliances, and when we got fairly into swing with the work, and the men all trained to it, the money ran out, the works were stopped, and the men were scattered all over the Colony. Another vote of £5,000 would then be obtained, the men would be got to work again, and that sum would run out. In that way the work was carried on with a succession of starts and stops, and for want of proper plant we could not carry on the work economically. Nevertheless, taking it as a whole, the work was carried out at a very reasonable price; it was carried out entirely under my directions by day-work. We never took any contracts, and, taking the work right through, the price averaged about 5s. a ton, a quarter of which went for royalty and haulage, so that the Government

got

C. W. Darley, got a good deal of it back. In due time the works were started. When I went there in 1867 it took me a little time to look round and see what was really wanted; I suppose about six months. I had to watch the process going on of tipping ballast. Then I reported that we were wasting money by using ships' ballast. Instructions were then given to look for a quarry sometime during 1868. I find that then preliminary arrangements were made to work the quarry, and our appliances on the breakwater for receiving and unloading the stone were ready. We had to construct very heavy waggons for carrying the blocks of stone over the Government railways. We used to carry down 22 and 24 ton stones. We were obliged to put springs under the trucks because the Commissioner would not run them without, and I had to get springs made specially for the purpose. We commenced to load on the 24th February, 1869, at the quarry, and on the 22nd April, 1869, we tipped the first large stones. Before that we had been tipping small stones. In December, 1870, the work ceased for the want of funds.

88. *Mr. Davies.*] How far had the breakwater been constructed in 1870? At that date, we had constructed 1,438 feet of the breakwater; that was three-fourths of the distance along the line. In 1869 a vote of £5,000 was taken for the breakwater; and in 1869, another vote of £5,000. These two votes were taken in time to enable me to use £10,000; but when that was exhausted we had again to stop the work. The work was resumed on the 13th July, 1871, that being after seven months' delay. The men were scattered over the Colony, the plant was more or less out of order, and everything had to be re-organised for a fresh start. In 1871 a further vote of £5,000 was taken. That lasted only until the 19th February, 1872. Then we had to stop the work again. I know that Mr. Moriarty represented to the Minister the difficulty which we were under, as I had repeatedly stated the great loss which had occurred through these stoppages, and that the work should be either stopped altogether or carried on continuously. But the Government could not see their way to grant more than £5,000 at a time. When the work ceased in February, 1872, it had reached Nobby's. We had completed the work that was then authorised, and as it was then finished so it stands to this day. The only thing that we have done since was to build, with roughly-dressed blocks of stone, the inner harbour face, so as to get the benefit of the whole width on the top, and make it a public promenade. It stands to this day as it was finished in February, 1872.

89. *Chairman.*] You have not told us the weight of the blocks which you used? There are a great many smaller stones, but they average something like 10 tons each. We used stones up to 22 and 23 tons in weight. There is a large number of 17 and 18 ton blocks, and from 10 to 15 tons would be the average weight. The smaller stones were put into the harbour face, and the best blocks into the sea face. The next step was the extension of the breakwater beyond Nobby's. There was a reef extending out beyond Nobby's, and going as far as what is known as Big Ben Rock, near the south end of the breakwater. Ships entering the port at that time always found great difficulty in regard to navigation during heavy weather, owing to the seas meeting them broadside on as they entered the harbour. They had to go well to the eastward to round Big Ben, and after rounding, and when running into the harbour, they were exposed to south and south-east seas coming broadside on.

90. The main entrance to the harbour still remains round the entrance to Nobby's, although the 10-feet channel is sometimes used? The main entrance was always to the north of Nobby's.

91. What was the depth of the water? It used to vary. I think at one period they had as much as 18 feet of water there. The first sounding I took gave from 14 to 15 feet on the bar. In 1816 the depth on the bar was 18 feet. To get over the danger and difficulty of ships entering, I recommended, in my report, that we should extend the breakwater right out along the reef, so that as soon as ever a ship rounded up she should be under shelter. The scheme was approved of at the time, and the money was asked for. Then, for the first time, we got a £10,000 vote. That was in the year 1874. The first thing then to be done was to form a railway round to Nobby's. All our appliances had to be dismantled and carried out to Nobby's for the purpose of constructing the new extension. The work was then proceeded with, and the first stone was tipped beyond Nobby's on the 7th January, 1875. On the 7th March, 1876, the work ceased for want of funds. In 1876 the Government voted £35,000, and the work was resumed on the 7th July, 1876. It went on continuously then till the 4th August, 1880, and had to cease again through the money being exhausted. That was the longest spell of work that we had, being a period of four years. In 1881 a further sum of £20,000 was voted, and the work was proceeded with again and finished in 1883.

92. Can you give us a tabulated statement showing the length of work done between the different dates? Yes. Practically nothing has been done to the breakwater since 1883, but some of the point has been washed down and spread out. One gale after another has drawn out the point and spread the stone. The stone is not lost; it only goes to form a base. In tipping from the top we cannot spread it out to a very large base. It will stand at a slope of little more than 1 to 1. We have to let the sea draw it out, and after it is drawn out, and when we have constructed the top it will stand for many years. It is well spread out, and when the new top is put on as I suggest, and for which I have put down a sum of £7,000, I anticipate that the work will stand secure for many years to come. It has a solid base now to work on. I do not propose to go out any further with the southern breakwater than it was originally taken, but I deem it quite safe. It covers Big Ben, so that a ship, if she keeps clear of the breakwater, will have to keep clear of Big Ben, which was the serious danger. For many years we had a bell-buoy moored close to Big Ben, but as soon as the breakwater was carried out that was rendered unnecessary, and it was removed. There is now a light near the end of the breakwater, which is eclipsed as a further safety to keep ships clear of Big Ben. As long as they do not run on to the breakwater they are kept clear of danger. The northern breakwater was constructed in the same manner as the southern.

93. Were the stones used there of the same weight? Yes; the same class of stone.

94. Did they come from the same place? Yes; but we did not face up the harbour face of the extension, that being unnecessary. It is rough on both faces. The northern breakwater was continued for some distance out with blue-stone, and the stone was spread back. The brown tint on the wall plan to the south of the breakwater represents ballast that had to be tipped, and which was washed back. The sea used to spread it all over. Arrangements were then made to secure the end, and to extend it with large blocks. For that object I constructed a heavy punt, suitable for carrying blocks of stone across the harbour, with the necessary appliances in the shape of cranes for lifting and lowering the stones. We commenced work with the large stone on the northern breakwaters on the 31st July, 1871. We continued until 7th February, 1872, and then ceased. Up to this date we deposited 8,146 tons of large stone. Work was again resumed in June, 1883, and finally stopped in May, 1886; during this period 27,607 tons of stone

stone were deposited, making in all 35,753 tons of stone sent to the northern breakwater. Before we commenced constructing the northern breakwater with large stone there was a sandy spit to the south of the breakwater inside, which was really the old Stockton Point. There was grass growing about 500 feet out from the breakwater in a southerly direction, and it extended round to the wharf. The line of breakwater was laid out across the point to let it cut away and widen the harbour. The point continued there whilst we constructed the breakwater with ballast; we never got out far enough to influence the current and the tidal action that kept the point there, and the stone was scattered back again. But the change which took place when we commenced to put large stones in, and held our own, was most remarkable. Since we commenced getting out beyond high-water mark with the stone, that point commenced to disappear very rapidly. I had a stack of sleepers that were landed on the grass bank, and we used them as we wanted them. After the first week's tipping the sand commenced to go so rapidly that I had great difficulty in saving the sleepers. You would see a 20-ft. lump go all at once, and it was not safe to go near the edge. Although an enormous mass of sand was being moved, it did not move at all on a flood tide; the action took place on the ebb tide, so that it went outwards. As we went on with the work every bit of the sand disappeared, leaving the ballast clean, and we had the tide running the whole length of the breakwater. Something then took place which caused the Newcastle people some alarm. As we got deep water along the breakwater, the waves entered the harbour more freely, and made the water very disturbed indeed during heavy weather at Queen's Wharf, where they loaded coal. The water deepened at the entrance, and the sand was scoured away. The waves entered the harbour, and no doubt created a certain commotion along the wharf during bad weather. But that was done before the southern breakwater was extended. There is no doubt that the extension of the southern breakwater stopped the waves from entering, and the inconvenience that had been felt then ceased. Of course, in heavy weather, still, they get disturbed water, as they must do in any harbour situated so close to the ocean. As the northern breakwater went out, so gradually the beach to the north of it advanced, until now the point pretty clearly coincides with the beach. The wedge-shaped bank of sand shown on the map accumulated at the back of the breakwater. We went ahead of it very fast; but the work has been stopped for a great many years. It is only during the last ten years that it really gained up to the work. As soon as it did the old action that formed the point before commenced again, and a sand-spit commenced to form again south of the breakwater. The tide in entering the harbour draws on to the coast, and it draws the sand round the point, so that instead of having a sand-spit and shallow water to the south-east end of the north breakwater, we have now got it to the north-east end.

95. Is that shown by your soundings? The soundings show it. It has restricted the water-way.
 96. Can you tell what depth of water there was when the breakwater was completed, and what depth there is to-day, taking a certain point from the breakwater? There was an average of 7 feet at low water in front of the breakwater when we stopped for some distance out.
 97. What distance—50 feet? A couple of hundred feet or more. Then it dipped away to 10, 11, and 12 feet out towards the Cawarra buoy.
 98. You have not told us what the depth is to-day? There is close under the breakwater $5\frac{1}{2}$ feet, a little distance on 12 feet, then it is 11 feet and $11\frac{1}{2}$ feet. No great change has taken place lately.
 99. Where is the shoal you mention which was originally at the south-western corner and is now at the north-eastern corner? That is at the harbour entrance.
 100. Can you tell us what depth of water there was when you completed the work on that shoal, and what depth there is to-day? 175 feet from the point of the breakwater, and about 100 feet out there is only $8\frac{1}{2}$ feet now; 400 feet out there is only $12\frac{1}{4}$ feet of water.
 101. Do you know what there was before? There was quite 18 feet of water there.
 102. You say, then, that it has shoaled 6 feet? Yes; quite that. When these works were finished in 1883 the depth of water on the bar was about 22 feet at low water, and that was generally considered quite sufficient for the class of vessels then trading to the port. In fact, we were well up with the requirements. We had no complaints from shipowners.
 103. That depth of water was sufficient for the trade at that time? Yes.
 104. What year was that? About 1881.

105. The depth of water then was abundant for the shipping entering the port? Yes; but of late years there has been a tendency to build ships larger and larger, and during the last two or three years many complaints have reached the Government from shipowners in Great Britain that they could not send larger ships here unless the port be deepened, and that the ships had, in some cases, to leave the port without their full loads. I have no doubt that the Committee can get information upon that point from other sources. Complaints have reached the Government that ships have had to leave the port short of their full load. On account of the insufficiency of the water on the bar they do not deem it safe for ships to leave with a full cargo. The Minister called on me then to report on the means of deepening the entrance. Of course, from what I have said, you will admit that I have reason to know something of the port. I caused a new survey to be made—new soundings and borings—and made a further careful study of the whole subject. But it was apparent to me, and has been for many years, that the whole difficulty in getting a scour in Newcastle Harbour arises from the lobsided nature of the entrance. The tide enters and leaves the harbour broadside on. I do not think you can find a parallel case in the harbours of the world—an attempt to keep a harbour open under such unfavourable conditions as exist at Newcastle. My only surprise is that the harbour is as good as it is. We have an inexhaustible supply of sand to the north, tending with the tide to sweep in across the harbour, and nothing to intercept it. We have got the flood tide sweeping the sand in, and instead of the ebb tide being concentrated to sweep out the entrance, it is scattered north and east broadside out of the harbour. The tidal action is lost, and that is the only thing that can help us to keep the entrance open. There is but one way of getting over the difficulty, and that is by the extension of the northern breakwater. I know there is an impression abroad that the extension of the southern breakwater would do good, but I venture to say that if you take the southern breakwater 2 miles out, you will not deepen the harbour 1 inch—you will still have the sand coming in, and not going out. To extend the breakwater, I was met with the difficulty, which I knew existed before, of drawing the waves into the harbour. If the port of Newcastle existed some 2 or 3 miles up the river, I would not hesitate about extending the present northern breakwater; but the shipping being carried on so near to the ocean, it becomes necessary to adopt some means of intercepting the waves entering the harbour. You must extend the breakwater if you are to make a proper entrance to that port. If you extend it continuously on the old line the waves will be drawn in, and you will get disturbances

C. W. Darley, disturbances in bad weather. I decided not to continue the old lines, but to go to the northward and start a new breakwater, leaving a space between the two breakwaters of 550 feet, to form what is known as a wave-trap. It is a well recognised principle in marine engineering. The waves in entering the harbour between two piers always have a tendency to be drawn to the piers. What is known as skin friction will attract the waves. Although the wave may enter in one solid line, extending from one breakwater to the other, it will not run far into the inlet before it divides into a V form. The skin friction will draw it to the sides, the wave will divide, and one portion will keep to the north side and the other to the south, and at a certain point you will get, comparatively speaking, still water. You get the smooth water in the centre, the wave running along the breakwater. To intercept the wave running into the harbour, I designed the wave-trap. It is between the end of the present end of the northern breakwater and the southern curve of the new works. On the south side of the harbour we have always had a wave-trap; it is a small one, but it has been very effective. That is between the end of the wharf, or what is known as the lifeboat slip, and the end of the breakwater. There is a sand-spit, and dozens of applications have been made for the extension of the wharf to the breakwater, and others for the right to enclose that bay and use it for various purposes, but I have always reported against them, and Mr. Moriarty always opposed any interference with, or closing of, that bay, for that alone has been a protection to the Newcastle wharf. Very heavy waves running along the breakwater in heavy weather expend their force on the wave-trap on the south side. Their force is expended, and the result is that immediately to leeward we have, comparatively speaking, smooth water at the wharf. When I had the new survey made, I also had borings taken, which we never had done before to any great extent, and traced out the rocks on every fairway to find their depth, and it became quite evident that by moving the channel a little to the north we can get 25 feet of water without removing any rocks. Many applications have been made to remove the rocks, but there is really no bare rock at present; there is sand overlying it everywhere. By removing the fairway a little to the north, which we can very well do, and which is in every way advisable to do if the new works are carried out, we shall have 25 feet without touching any rock, and 25 feet at low water will probably be sufficient for all time, and by removing a little rock we could get 2 or 3 feet more.

106. The present depth is 21 feet? Yes.

107. And the effect of the improvements will be to give 3 or 4 feet more depth of water without blasting operations? Yes.

108. And 2 or 3 feet more with small blasting operations? Yes.

109. Can you let us know what those small blasting operations would cost? I will do so. I think that 25 feet will be sufficient for any ships that are likely to enter the port.

110. You thought 21 feet sufficient ten years ago? Yes; but if ships are built much deeper than they are built now they will have to alter all the docks in England. The tendency now is to go in for length and width of beam rather than to deepen the ships. With the view of forcing the channel over, and at the same time getting the scour better on to the bar, I have designed the southern guide wall shown on the map. It would serve the double object of directing the current northward and forming an effective wave-trap. At the same time the wave-trap there is a secondary idea, because we have already a fairly effective wave-trap. One object in pushing the current more to the north is to divert it clear of what is known as Stony Point. That is a point lying due west from the centre of Nobby's. The ebb current in leaving the harbour at present has a very serrated surface to run along. First it meets a reef and some foul ground. The result of that is to set up a disturbing action. It then meets Stony Point, and gets another interfering action, then passing on it meets another at the base of Nobby's. I want to keep the body of the current north of those three obstructions, which cause friction and disturbing action to the free flow of the current.

111. The current at present flows down the eastern side and under the wharfs? It meets the reef off the end of the wharf, where it is intercepted and broken. It meets a second reef at Stony Point, where it is again intercepted and broken. Every one of these points creates a certain amount of turmoil, and interferes with the steady flow of the current in the main channel. By the guide wall that I have shown on the map, I want to lift the main part of the current free from these disturbing points towards the fairway. It will then have a fair sweep out of the harbour. What I expect to gain if that work is carried out is an entrance that it will be always safe to take. The danger of what is now known as the Oyster Bank, where the "Cawarra" was wrecked, and a large steamer called the "Colonist" is now standing wrecked, will no longer exist. If the breakwater is taken out to the end of the second section there will be deep water off the point, and for some considerable distance to leeward of the point, so that if a ship in rounding into the harbour misses the immediate entrance, there will be room for her to drift a considerable distance before she meets with any serious danger. Now if a ship drifts a few hundred feet out of the fairway, as the "Colonist" did the other day, she is lost. If the breakwater is taken out, and that danger is covered, the safety of the port will be immensely enhanced. The spit previously described as forming to the southward, at the inside of the northern breakwater, will be swept away. The tendency to form will cease, as the action forming it will be cut off, and the current will take it away in the very same way as the current took it away when the breakwater commenced to extend beyond high-water mark. I anticipate that we shall have deep water along that breakwater all the way, and it is quite possible that deep water may cling to the breakwater. If so, we may have as much as from 28 to 30 feet of water north of the anticipated fairway.

112. It is possible that there will be 28 feet there? We can get 28 feet without meeting rock. The more we go to the north the deeper it is.

113. Do I understand that you can get a depth of 28 feet without blasting operations? Yes.

114. Right into the mouth of the harbour? Yes, right in. I say that that is possible, but I would not recommend it as a permanent channel, because it will be rather close to the breakwater. Keeping 100 feet from the breakwater we meet with no rock above the 30 feet contour. At 150 feet from the breakwater we can get 29 feet without touching rock all the way in. The least boring on that line is 29 feet.

115. How wide would that channel be without blasting? It would be about 300 feet wide. In pointing this out, of course I do not advocate that as a channel, because it would be unwise to attempt to have that main channel close to the breakwater. It would be unwise for permanent navigation. I prefer to show a fairway at a safe distance from the breakwater; that is, about 500 feet from it. The gain to the port by increasing the depth of the water from 22 to 25 feet would be very great indeed. It is laid down by some

some of the best authorities that the commercial value of any increase in the depth of the harbour varies as the cube of the depth, and the difference between the cube of 22 and the cube of 25 gives an increased commercial value of 50 per cent. That is really what is gained. It adds to its commercial value by 50 per cent. A recent author says: "Although no exact rule exists, as vessels vary very considerably in their draught, the following may be taken as approximately correct:—'Ships of a registered tonnage of from 1,500 to 2,000 tons require 22 feet of water; ships of a registered tonnage of from 2,000 to 3,000 tons require 23 feet of water; ships of a registered tonnage of from 3,000 to 4,000 tons require 24 feet of water.'"

21 Mar., 1895.

116. *Mr. Davies.*] What authority are you quoting? I am quoting from Wheeler, a late writer on the subject.

117. *Chairman.*] Does he make the statement that the difference between 22 feet and 25 feet is equal to 50 per cent? Yes.

118. What is the rise in the tide at Newcastle? From 4 feet to 5 feet 6 inches. Of course we get tides up to 6 feet 3 inches, but those are exceptional.

119. There will be 26 feet of water at high tide if you get what you expect by your improvements? At neap tide we shall get 4 feet extra.

120. At high tide, therefore, you would have from 26 to 27 feet under your system? Yes.

121. How much would you want under the keel? Generally about 4 feet, but it varies according to the weather. On some days, after a gale, when there is a heavy swell, it would not be safe to go out with only 4 feet under the keel, but the pilots generally expect to have 4 feet.

122. Is it possible to ascertain the cost of work done at Newcastle prior to your coming here? I am afraid there is no record of it. There was a report to the Legislative Council in the year 1836, which, no doubt, will be in the records of the House. There is also a report of a Select Committee of the Legislative Council on the Newcastle Breakwater. That Committee was appointed on the 3rd July, 1849, and the report was signed by Edward Hamilton, and presented to the Council on the 14th August, 1849. He says in that report:—"In 1836, when one-fourth only of the line was completed, Lieutenant Colonel Barney, who at that time held the appointment of Commander of the Royal Engineers, was desired by the Governor, Sir Richard Bourke, to inspect the work and report upon it. The Committee have been anxious to see the report in the hope that it will afford much valuable information bearing on the inquiry, but no trace of it could be found in the Colonial Secretary's office." If that report could be found it probably would be very valuable.

123. Assuming that you had to deal with Newcastle as it was, would the scheme before us be the best possible scheme to carry out for the improvement of the harbour, supposing that you were not controlled by that southern wall and the northern breakwater? No; if I had a free hand, knowing as much as I know now about the harbour, I should design the southern guide wall first; I should then start from the commencement of the present southern breakwater, and go out nearly to Stony Point, continuing parallel with the present entrance across the base of Nobby's, and along the northern limits of the reef on which the southern breakwater is. That would force the channel to the north. North of the southern breakwater there is a reef which is a source of danger—it would be better if it were covered by a breakwater.

124. How far apart are your contour figures? Six feet.

125. What is the distance between those figures? About 50 feet; opposite the base of Nobby's, about 120 feet.

126. Is this your evidence—that if you were building a southern breakwater now, you would move it about 150 feet further north? I should like to say 250 feet further north.

127. Would you make any alteration with regard to straightening the breakwater? I would keep it about parallel but further north.

128. In that case you would keep it parallel to the southern breakwater further north? Yes.

129. What would then become of your northern wave-trap? I should design on the same principle but move it further north. If we were commencing on a clean sheet, from what I know of the port now that is what I should do—move the entrance further north, and get clear of the rock altogether. But we cannot do it now.

FRIDAY, 22 MARCH, 1895.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. JAMES HOSKINS.

JAMES HAYES, Esq.

The Hon. JOHN DAVIES, C.M.G.

ROBERT HENRY LEVIEN, Esq.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

CHARLES ALFRED LEE, Esq.

The Committee further considered the proposed Harbour Improvements at Newcastle.

Cecil West Darley, Esq., Engineer-in-Chief, Harbours and Rivers Branch, Department of Public Works, sworn, and further examined.

130. *Chairman.*] You see on the large map longitudinal sections over the line of the fairway;—we should like you to say a word or two about that? There are three sections taken longitudinally—one on the line of the fairway going out of the harbour, and one 100 feet to the north, and another 100 feet to the south. The section shows the contour of the bottom at various depths. The red line shows the contour of the bottom in 1874; the black line shows the contour of the bottom in 1894. The soundings indicate that the silt has been swept down at low water, and, instead of being carried to sea, has been dropped into deep water immediately outside the bar. In that way some 600 or 700 feet of silt has been deposited outside the bar advancing it bodily. The bar itself has advanced about 800 feet.

22 Mar., 1895.

131.

C. W. Darley, 131. You see the lower portion in the middle section;—was that the original deep water? So far as the Esq. hard line goes, it was the original bottom. The silt was washed down and deposited behind the bar. It is caused by the loss of the scouring action of the current. The current is not sufficient to keep the silt in suspension. If you can train the current so as to retain the silt in suspension it will carry it out much further, until it reaches the littoral current which will disperse it.

22 Mar., 1895. 132. The littoral current passes down the coast at the rate of about 3 miles an hour? In the Newcastle Bight there is an inner littoral current which has a more northerly tendency. The outer current is from north to south; but Newcastle is in a deep bight, and the current takes a sweep round from Red Head in the bight to meet the coast current. The friction sets up a sort of whirlpool in Newcastle Bight. Coming down from Port Stephens the friction of passing the bay causes a back current round the bay, so that the currents leaving Newcastle Harbour tend to the north rather than to the south. Any drift wood going out of the harbour takes a northerly course.

133. At the mouth of the Hunter River the littoral current tends in a northerly direction;—at what rate does it tend in a northerly direction? A great deal will depend on the state of the floods—from 2 to 3 miles an hour.

134. We should be justified in saying $2\frac{1}{2}$ miles an hour? Yes. The large deposit taking place, and the moving of the bar outwards, are clearly traceable to the loss of current to carry the silt further on. Instead of its remaining in suspension and being swept out, it is dropped suddenly. The present bar is almost exactly $\frac{1}{2}$ a mile outside the point of the northern breakwater.

135. You say it has been pushed out 800 feet? It has been pushed out 700 or 800 feet. In designing this entrance, or an entrance to any harbour, an engineer must consider the watershed and the probable amount of water which has to pass out under various circumstances. I had to make a study of the river further up, and sectional areas at various points were taken out, low water being adopted in all cases. I took out a sectional area at Raymond Terrace, just below its junction with the Williams River. I have taken one section on the river at that point, and therefore below the point where any waters of importance join the Hunter. At that point the sectional area at low water is 8,935 square feet. At a point 3 miles below Raymond Terrace, generally known as Boiling Down, the flood waters are fairly well concentrated, not having much escape either to the right or the left. There the sectional area is 10,862 square feet. The sectional area there is much larger than it is up above. The reason of the smaller area at Raymond Terrace is that when floods come they overflow the country; they are more concentrated at the latter point, and they are still more concentrated at Hexham. At Hexham there is high land at one side, and the river has not the same power of spreading there. The sectional area at Hexham is 12,512 square feet. We have got three sections—one at the junction of the Williams River, one at Boiling Down, and a third at Hexham.

136. Your argument is that your sectional area of 10,000 or 12,000 feet is all the water that has to pass over the bar? Very nearly all. The area at the point where I apparently contract the channel between the north breakwater and the end of the south guide wall, across the channel at right angles to the fairway, the sectional area, assuming no scour takes place is 30,980 square feet. I told you yesterday that if the work is carried out a scour will undoubtedly take place. Assuming that the bottom remains absolutely as it is, the sectional area will be 30,980 square feet, which is three and a half times the area at Raymond Terrace, three times the area 3 miles below Raymond Terrace, and two-and-a-half times the area at Hexham. But if that takes place, which I am sure will take place, the sectional area will be 41,420 feet. I hold that the bank must go the moment the influence of these works is felt; therefore I am satisfied that I have taken a very low estimate in putting the sectional area at 41,000 odd square feet.

137. You are taking it at low water? Yes.

138. The discharging power of the river depends not only upon the sectional area, but upon the fall or slope? Yes.

139. How do these compare with those places? They are practically the same—the tide nearly goes up to Maitland. It is almost a uniform slope to the entrance.

140. Mr. Hayes.] Is there a slope from Raymond Terrace down to Newcastle Harbour? The low water or mean-tide level was the same almost from Newcastle to Maitland, but it has been disturbed by land-slips. I remember when the tide rose 12 or 18 inches at Belmore Bridge. The mean tide would be practically a level line.

141. Chairman.] Do you mean absolutely horizontal? Absolutely horizontal.

142. Mr. Lee.] The water level at Maitland and the water level at Newcastle do not differ? I must explain. You are aware that a lot of land-slips have taken place. In 1867, when I first went to Maitland, we had a tidal range, I think I am right in saying, of 18 inches, at Belmore Bridge. During the flood of 1870 large land-slips took place, and the course of the river was altered; the river was artificially dammed up at Pig Run and one or two other places. The river was permanently raised at Maitland, and that effect has been produced still more by subsequent floods, so we do not get the tidal range now that we used to get at Maitland. I think I am right in saying that there is no tidal action at Maitland; but formerly there was—it went up to the falls. The cause of Maitland being fixed where it is, was, that people could cross the river there.

143. Is there a difference between the sea-level at Newcastle and the level at West Maitland? I have all the information, but I have not come prepared with it.

144. Chairman.] Do you know what amount of water finds its way into the river below the large sectional area you have given us? A very insignificant quantity.

145. Therefore we need not consider any water coming into the country below Hexham? There is nothing to speak of below Hexham. Ironbark Creek runs into the river, but the discharge from it is very small. The section taken from Stony Point to the point north of the present breakwater is 22,400 square feet.

146. That is 8,000 feet less than at the end of the guide wall? Yes. The southern guide bank does not contract the channel. With the channel in its present condition, from the point of that work the area is 30,980 feet. At Stony Point it is 22,400 square feet. At a point about 300 feet north-easterly of Stony Point and the north breakwater it is 22,750 square feet, and at the point from the base of Nobby's, square across the channel, to the new breakwater, the present area is 28,600 feet. We have got from $2\frac{1}{2}$ to $3\frac{1}{2}$ times the discharging capacity at the entrance to Newcastle harbour that we have at any point in the river above. But we have a better discharge apart from the area. It is a straight run out with nothing to impede the water; and deep water gives a better discharge than a wider channel with shallow water—there is less friction.

147. We can take the various sectional areas as giving a fair index of the discharging power of the river? C. W. Darley,
Yes. During a river flood there is no flood-tide. The water is going out all the time. The tidal action
is overcome by the action of the flood. The water is to some extent raised at the entrance. In the big ^{22 Mar., 1895.}
flood of 1893 the water spread there some 2 feet higher than high water at the head of the harbour, but
at the entrance, it about maintained high water level the whole time.

148. Would it not appear from that the water would be passing out over the bar rather more quickly
than in the river? No; the actual velocity would be approximately the same. It is quite enough to say
that the gradient from West Maitland to the ocean in a big flood is, practically speaking, a uniform line.

149. Will you hand in the information which Mr. Barling gave you? Mr. Barling put a minute into
my hands stating that the Committee wished to know the total cost of the reclamation works at Newcastle
harbour, the price of such works, and the votes to which the works have been charged. The total cost
of the reclamation works in Newcastle harbour to date, charged to votes, is £17,342 11s. The reclamations
at Newcastle previous to sand pumping works consisted of ballast discharged from ships and
deposited behind Bullock Island dyke. That cost the Government practically nothing. The plan on the
wall shows Bullock Island in the old days, when Mr. Moriarty determined to make a ballast dyke
looking forward to the shipping of the future, and also for the improvement of the harbour by
making a long training wall. He instructed me to lay out a curve from the top end of Bullock
Island down to nearly opposite Newcastle. I put in posts every 200 feet, and the place was pro-
claimed under the Navigable Waters Protection Act as a licensed ground for depositing ballast, and ballast
coming from ships was allowed to be discharged within the line. In those days the greater part of
the ballast was discharged from ships in the stream. They had to pay lighters to take the ballast
from them. We gave the lighters a place in which to deposit the stone, but we paid nothing for
it. We got many hundreds of thousands of tons of stone deposited. We constructed three small
ballast jetties, and they were kept employed, one ship after another discharging ballast. Then a period
came when we had sufficient ground made to use for coal-shipping purposes. We kept widening it to
make room for sidings, and we constructed the engine-house half way between the dyke and the island at
the same time still receiving ballast and making ground. We then made out a line for permanent
wharfs to the further end of the inland, and divided the wharf into 100 feet sections, which would
eventually work into one permanent continuous wharf. If you made a continuous wharf 600 feet long
you would have room for only two ships, but by opening it out we made room for six ships, and ultimately
for ten or twelve ships discharging ballast, and we very rapidly got a great deal of land formed. The
reclamation at the north end behind the Bullock Island dyke has nearly always been made with ships'
ballast, costing the Government nothing, except the cost of rails and waggons which we supplied.

150. *Mr. Davies.*] Was it that that cost £17,000? The reclamation cost nothing. The £17,000 was the
cost of keeping a dredge in the basin pumping up that area 600 feet wide. In one operation we have
been dredging deep water in the basin and making the land. All the wages to the men employed in
working the dredge amounted to £17,343, and that was charged to the annual dredge vote. The dredge
has reclaimed about 25 acres of land.

151. No portion of that is charged to the Loan Account? No. Half-acre blocks of land on the island
were freely selling at £2,000 fifteen years ago. It would not be unreasonable to conclude, therefore, that
the land is worth £50,000. It is worth that to the Government as a shipping place. We are also doing
a small amount of reclamation on the Stockton side of the harbour. There is what is known as Scott's
Point at Newcastle, where a sand-bank extends a long distance into the harbour. I am very anxious to
see that all removed and deepened. It will let the water out of the harbour more readily and more
uniformly, instead of its all being sent to the westward. When that bank is removed we shall get a
more uniform discharge of the water from the harbour. We have commenced on it by making a wall of
ballast, again costing the Government nothing. We had a sand dredge employed lifting the sand up and
filling in behind; so that whilst we are dredging, instead of keeping steam-pumps going and towing the
silt out to sea, we land the silt, and do the whole thing in one operation. The total expenditure was
£17,000. That is the total expenditure in dredging and reclamation work up to date. The next question
that Mr. Barling put in my hand was as to the total cost of dredging in Newcastle harbour, the rate per
ton, and the vote from which the money was paid. The whole cost has been charged to the annual dredge
service votes. Contingencies and small portions to the Newcastle Improvement Loan, and to a loan vote
for the reclamation of the north harbour at Newcastle. The total cost of dredging to date in Newcastle
harbour is £477,084 11s. 8d., and the rate per ton right through 4'865d. In fairness to Newcastle I must
point out that this money has not all been spent simply to improve Newcastle harbour. It was spent to
maintain Newcastle harbour as against the injury done to it by the river. Had the river floods not
occurred, years ago we could have removed all the dredges from Newcastle harbour; but so long as the
Hunter discharges silt into the harbour as it did in 1893, depositing something like 3,000,000 tons of silt
in a week, we must keep the dredges at work. It is not a fair thing to say "you have spent so much to
improve Newcastle harbour." You have done it as against the injury done by floods which, if nothing
was done, would very soon fill up the river. It is a fair charge on the revenue of the country.

152. *Mr. Levien.*] I suppose there was more silt brought down by that flood than by any other? Yes; it
was the most destructive flood that I ever heard of. By the dredging that we have done since 1893 we have
just about regained the position that we were in before the flood occurred. We are now sending out silt
at the rate of 3,000,000 tons a year. In their best days they never turned out of the Clyde more silt than
we are turning out. The next question is, the total cost of the dredges that has been charged to Newcastle
Harbour Vote. The amount is £78,572 15s. 6d., which has been paid from various votes for the construc-
tion of dredging plant; and the whole expenditure at Newcastle was, from Loans, £604,429 4s.; from
Revenue, £570,051; making a total of £1,124,480 14s. 4d.

153. *Mr. Hoskins.*] Reverting to the question put by the Chairman respecting the action of flood-waters,
I understood you to say that if there was a high tide coming into the harbour the water in the harbour
would be 2 feet higher than the water in the river above? No; the big flood of 1893, in one portion up
the harbour, was about 2 feet higher than high-water mark.

154. You told the Chairman that when the tide was down there was no difficulty in the flood-waters
flowing out of the river; but that when the tide was high the tidal water was higher than the flood-water
flowing out of the river? What I said was, that there was no high water and no low tide during a
flood. There is one stream of water maintained at one level for a certain period. Ships do not swing at
all during a flood.

- C. W. Darley, Esq., 155. Then I may take it that is impossible that the action of the tide can back up the flood-water in the river? Only to a very small extent.
- 22 Mar., 1895. 156. Then any fear that may be expressed by the residents on the upper part of the river as to their being flooded by the water overflowing from the river, is not justified by any deficiency in the means of exit of that water to the ocean? No; the water has free egress to the ocean.
157. You stated, yesterday, that complaints had been made of vessels not being able to leave Newcastle with a full load. Were those complaints referred to you? Yes; I have had to report on some.
158. From whom did they emanate? From some shipowners in Liverpool. One or two wrote to that effect. I think I am right in saying that one letter came to the Chamber of Commerce at Newcastle, and through the Minister to me, and another came through the Marine Board to me. The complaint was that a firm of Liverpool shipowners would be obliged to withdraw their ships from the trade if they could not fully load them at Newcastle.
159. That only had reference to one or two firms? Yes.
160. Are you aware that vessels leave Newcastle with loads of coal ranging from 2,500 tons to upwards of 4,000 tons? Yes.
161. Are you aware that a steamer some time ago left Newcastle with a quantity of cargo and bunker coal exceeding 5,000 tons? I believe that a ship has left Newcastle with 5,000 tons on board.
162. It is not an uncommon occurrence for vessels carrying from 2,000 to 4,000 tons to leave the harbour? No.
163. A vessel that conveys such large cargoes must be of the average size? Yes; but some ships can carry a cargo of 4,000 tons at a certain draught, and others would require a much greater draught.
164. But the tendency of ship-building now-a-days is to make steamers longer and of wider beam, so that they do not draw so much water as they otherwise would do? There is a tendency to do that. The construction of the Suez Canal has tended to bring about larger carrying capacities without increasing the draught.
165. If complaints have been made are they complaints for which there is any good foundation? I cannot shut my eyes to the fact that a ship leaving port with only part of her cargo does a great deal of damage to that port. I met the Newcastle Chamber of Commerce some time ago, and I expressed myself to the effect that I thought the Pilot Department were a little over-anxious about keeping clear of the bottom; a little too timid. It is a fault on the right side, no doubt; but I said I thought they might have allowed some of the ships they stopped to load to their full capacity; but instead of that they stopped some ships from loading the last two or three inches, and sent them to sea. I did think from some things which occurred that they perhaps erred on the side of excess of caution.
166. What is the depth of the water on the bar at high tide at Newcastle? Twenty-two feet at low water, 26 feet at neap tide, 27 feet 6 inches at the spring tide.
167. If you have 27 feet at high water is there not a sufficient depth of water underneath the keel of a vessel to dispel the fear of her touching the bar? It just depends upon what a pilot considers a safe margin to leave under the keel. One pilot may say "I require 6 feet under the keel of that ship," another will say "I will chance it with 4 feet." Of course it greatly depends on the weather. If there is any swell on, it may not be safe to go out with even 6 feet of water under the keel. In fine weather it is easy to get out with much less.
168. Have you had any complaints made to your Department from the pilots as to the state of the bar at Newcastle harbour? Frequently.
169. Is it not a fact that quite a number of vessels carrying large cargoes leave the harbour of Newcastle at night? Of course, but they do not draw much water.
170. But I mean steamers carrying large cargoes of coal—2,000 or 3,000 tons? Some of these coal tramps are built so as not to draw much water. But we get a class of ships coming to Newcastle for coal different from the class of ships that visit coal ports like Cardiff and Newport in England. They rarely get first-class ships at Cardiff and Newport to load coal. Here we have to load a high class of ships. They come here on their way to China and other places.
171. Do they not at Cardiff load first-class ships to go out to the east? The coal trade there is carried on very largely by what are called the tramps.
172. Complaint is made about the access to Newcastle harbour owing to the steamer "Colonist" being lost there;—was not that steamer taken out at night? That loss was caused by a blunder and neglect. The man went out of his course. There was a Marine Board inquiry, and I think the decision was that he had committed an error of judgment.
173. *Chairman.*] Where is the "Colonist" lying? She is lying at a point covered by the second section of the breakwater.
174. *Mr. Hoskins.*] Are not the strongest gales that are experienced at Newcastle from the south? No; east and south-east.
175. Has not a bank of sand formed inside the northern breakwater, along to the end of it? Yes; I explained that yesterday.
176. Has not that arisen from the southerly gales coming around the southern breakwater? No; it was caused by the flood-tide running along the north beach and bringing the sand in with it.
177. Supposing you extended that breakwater, is there not a probability that the sand will be deposited in front of the breakwater still? No; I do not think it is possible for the whole of that deep bay to get filled up with sand. In any case, if that work was run out we should have a proper discharge, which would sweep the sand out again. At present the current is lost.
178. I understand that outside the bar there is a deposit of sand? Yes.
179. To obviate that you propose to construct another breakwater further north? Yes.
180. Could you not utilise the oyster-bank, which is really a breakwater, instead of making a new one? That is what we are doing; we are on the top of it. That is how I propose to cover the danger.
181. Did not the Chamber of Commerce at Newcastle, in their complaint about the harbour, state that more dredging ought to be done there? Yes; they are always complaining that there is not enough dredging done. If a flood comes they think we ought to dredge out 3,000,000 tons of silt in a week.
182. Is it not a fact that during the last two years there has been more berthing accommodation at Newcastle for vessels coming to take cargo than there were vessels requiring it, in consequence of the strike and slackness of trade? Of course trade has been disturbed by strikes, but nevertheless the output of coal is increasing.

183. How many steam and hydraulic cranes have you in use at Newcastle? There are twelve.
 184. And how many coal staithes? The A.A. Company have coal staithes.
 185. Is there a sufficient depth of water at each of those berths? Not at all of them; some are rather shallow, but they are used for small vessels.
 186. Cannot vessels get quick despatch at Newcastle? Average vessels can get quick despatch.
 187. What is the bar at Newcastle;—is it a sand or a rocky bar? It is sand down to 25 feet.
 188. Do you want to take it deeper than 25 feet? There is only 22 feet now, and 3 feet of sand on the rock.
 189. *Mr. Lee.*] Did you say that the rock bottom would be 26 feet below the level of low water? Twenty-five feet.
 190. *Chairman.*] You have told us that a little north of the fairway you could get 30 feet? Yes; it gets deeper going north; but in the fairway shown on the plan the depth is 25 feet.
 191. *Mr. Hoskins.*] Do you not think that with the view to affording better accommodation such as is required for vessels of large draught it would be better to deepen the bar than to make a breakwater further out to the north looking to the fact that the northern breakwater has caused the silting up? That is the very thing that I propose to do; but I require the northern breakwater to do it.
 192. You do not feel that you could deepen the bar until you have this extension of the northern breakwater? No.
 193. I suppose that you do not anticipate meeting with any great difficulty in removing that rocky bar if necessary, by the aid of machinery? I do not propose at present to touch the rock at all.
 194. But supposing you wish to make it deeper? It may be done in the future, but I do not see the necessity for it. I think that 25 feet will meet the requirements of the port for all time.
 195. Have you not been using a machine cutting the rock at the bar? Yes.
 196. Is it still in use? We are not cutting just now, we are using it to lift the rock which it has cut. We deepened the point that we wanted to deepen with the machine, and we are now using it for lifting the rock. We are very shortly going to put it to work to deepen another place up the harbour.
 197. We are clearly to understand that if the Committee recommend the extension of the northern breakwater as you suggest, that is a preliminary to the deepening of the bar? That will deepen the bar by the scour that it will afford.
 198. Is there not this danger to be apprehended, that if you extend that northern breakwater further out than it is now it may cause the silt to form still further out and still obstruct the entrance to the harbour? I do not think it will. Experience in marine engineering indicates that there is no risk of that. The scour will be concentrated, and the silt will be swept out of the entrance until it meets the littoral current, which will disperse it. Instead of the sand being left in the entrance it will be carried away by a concentrated current in the main channel.
 199. If you erect this proposed extension of the northern breakwater will you not be curtailing the entrance to the channel over the bar? That is what I want to do; but not so much as it is curtailed at present.
 200. But will there not be a greater difficulty and risk to vessels attempting to enter the harbour during heavy weather? No; there will be much less risk.
 201. Even though you may curtail the width of the entrance to the channel? Yes; because now, if a ship misses the entrance she drops on to the oyster-bank, but with the deep channel a tug-boat could bring her into the entrance safely. If she misses the entrance she will drop to leeward, and will have a uniform current instead of a cross current to deal with. At the present the current flows broadside out, and there is a tendency for the ship to be drawn on to the oyster-bank.
 202. Does not that show that the gales are strongest from the south? I am speaking of the current.
 203. Does not the wind influence the current? No, not a great deal.
 204. How long is it that you have spoken of this proposed alteration in the harbour of Newcastle? I have been thinking of it ever since I have been in Newcastle, but it is only lately that the Minister called on me to bring up a scheme for improving the port.
 205. The services of the late Sir John Coode were retained; was it with your advice? No, by Mr. Moriarty's.
 206. When he was out here did you ask his opinion on your proposed extension of the work at Newcastle? It was not thought of then, that is some ten years ago, and the accommodation at Newcastle at that time was looked upon as sufficiently good.
 207. Then the complaints of the inadequacy of the accommodation provided in Newcastle harbour for vessels are of recent origin? Yes; they have originated during the last three or four years.
 208. How many dredges are employed in Newcastle harbour? Two ladder-dredges at Newcastle and one on the river, two suction-pump dredges and one grab-dredge up the river. One of the ladder-dredges is working two shifts, making it equal to two dredges, and one is working three shifts, which in all is equal to five dredges working eight hours.
 209. Then there are more dredges in Newcastle harbour than there are in Sydney harbour? Yes; they are required.

TUESDAY, 26 MARCH, 1895.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHREY.
The Hon. JAMES HOSKINS.
The Hon. JOHN DAVIES, C.M.G.The Hon. CHARLES JAMES ROBERTS, C.M.G.
JAMES HAYES, Esq.
ROBERT HENRY LEVISON, Esq.

CHARLES ALFRED LEE, Esq.

The Committee further considered the proposed Harbour Improvements at Newcastle.

Cecil West Darley, Esq., Engineer-in-Chief, Harbours and Rivers Branch, Department of Public Works, sworn, and further examined:—

C. W. Darley, 210. *Chairman.*] You were to furnish information to-day in regard to the effect of the wave-traps? Esq. Since I was here last I have looked up some cases, where wave-traps are provided. Of course the exact shape and position of the wave-traps must in every case depend on the outline of the harbour, and all the various local circumstances have to be taken into account in the way in which the wave-trap is designed. You cannot have two traps made exactly alike, but the principle holds good in all cases. I have here a list of fourteen harbours where such traps exist. They are as follows:—Aberdeen Harbour, Malamoco Harbour, Alexandria Harbour, Dover Harbour, Newhaven Harbour, Tynemouth Harbour, Ymuiden Harbour, (Amsterdam Ship Canal), St. Jean De Luz Harbour, Outer Mole, Odessa Harbour, Outer Mole, Hartlepool Dock, Hartlepool West Dock, Belfast Dock, Sunderland Dock, Westport, N. Z. Dock. When Sir John Coode was out here he prepared designs for improving several rivers along the coast, and his plans show wave-traps very similar to those at Newcastle. He designed wave-traps at the Clarence River, Manning River, Lake Macquarie, and the Macleay River. Some writers on the subject termed them stilling-basins, and Mr. Stevenson, who is an engineer of very large experience indeed in harbour works, and who is a very close observer, and who has written on the subject a great deal, says in his work under the head of basins.

As before mentioned it is essential when the exposure is great that there be either a considerable internal area or else a separate basin outside the entrance to the inner basin, for the waves to destroy or spend themselves. Such a basin would, if possible, enclose a portion of the original shore for the waves to break upon, and when circumstances preclude this, there should be a flat talus wall of at least three or four to one, as recommended by the late Mr. Bremner of Wick. Mr. Scott Russell has found that talus walls of one to one or steeper will allow the waves to break fully, but will reflect them in such a manner as might in some cases make the entrance difficult, or even [dangerous of access and the berthing within unsafe.

What he recommends, if possible, is to enclose a portion of the original shore for the waves to break upon. That is what I have done. I have cut off a portion of the original shore to draw the waves on to expend their force. Under the head of "Seaside Channels for reducing waves" the same authority says, that in the harbour of West Hartlepool an ingenious and novel device for reducing the height of the waves has been carried out by Mr. R. Ward Jackson and Mr. Casebourne. Interior expansions have been made to communicate with narrow canals running landwards and which ultimately join the sea outside of the harbour. The portion of the wave which has been detached by spreading in to the lateral channel is thus conducted entirely out of the harbour into the open sea. At Mullaghmore, County Sligo, where the run was troublesome in stormy weather the baso basin, has, I am informed, been much smoothed by an opening made at the upper end of the harbour through which the swell passes out to the beach, instead of being reflected by the inner wall. As I have said before no two harbours can be designed on exactly the same lines. They have to be varied according to the circumstances of the case. In shallow water there is always a tendency for the waves to go on to the shallow water at right angles to the shore. Any close observer on a beach or bay such as Bondi can see this. No matter how the sea may be running on the coast if you stand at any part of that bay you find the sea approaching as nearly as possible at right angles. That holds good in all cases. The waves run on the beach at right angles although it may be a southerly sea, and the portion of the bay is sheltered. The seas are drawn in at right angles to the beach so that there is a tendency for the seas to be drawn to the breakwater. The sea will run in and break on the breakwaters, both to the north and to the south of the harbour. It will be found that those waves which do not actually expend themselves on the breakwater will run on to the beach. That can be observed now at Newcastle on the south side. Waves of more or less force can be seen coming along the south breakwater, round Stony Point, and expending themselves on the existing wave-trap on the south side. Were it not for that the waves would probably run up the harbour, and cause serious inconvenience to the shipping. I feel quite certain that if the works are carried out on the lines shown, there will be no disturbance caused by waves in the harbour. Of course, there is a certain amount of ground swell that we cannot keep out, but there would be no disturbing run of water. I might point out that waves are propagated by vessels passing through the Suez Canal, and those waves cause a great deal of scour to the banks, and a great deal of harm from erosion, although the vessels go at a reduced speed through the canal. In the Suez Canal, therefore, a system of wave-traps has been adopted. This has been done since I was there five years ago. Along the sides of the canal they are constructing artificial bays of stone and fascines to trap the waves. I have here a photograph which will illustrate what they are doing. The action of the waves in the Suez Canal is the same as that of the waves at Newcastle. The waves now caused by the vessels passing through the canal will be drawn into these little bays which they are constructing along the banks of the canal.

211. With the northern breakwater in existence, and the wave-traps, in your opinion, will the water in Newcastle Harbour be as smooth after these works have been carried out as it is at present? Quite so.

212. *Mr. Davies.*] What was the reason that actuated you in departing from the retention of the northern breakwater and running a line parallel? Why did I not continue the present breakwater?

213. Yes? To prevent the seas from running into the harbour, and to enable me to form a wave-trap.

214. Is that the only reason that caused you to form that sort of boomerang-shaped breakwater;—instead of running your line parallel with the existing breakwater you ran it into a curve? The curve is necessary to get on the line of the breakwater. You must approach it with a curve.

215. What I want to know is how it is that you have not continued the straight line through to the point;—is it to provide for the wave-trap? Yes.

C. W. Darley,

Esq.

26 Mar., 1895.

216. Simply for that purpose? Yes.
217. Are there any other harbour works in the Colony where similar provision is made for wave-traps? There is at the Clarence River where the works are in course of construction.
218. Have they wave-traps there? It is part of the design; when the work is completed it will have a wave-trap exactly similar to those at Newcastle.
219. Do you know any other harbours in the world where they have adopted wave-traps? I have mentioned fourteen.
220. And are those fourteen all constructed on that principle? They are all similarly arranged for arresting the waves in the harbour.
221. Do you regard that as absolutely necessary as an approach to the harbour at Newcastle? I do.
222. On the southern side you also make provision for a wave-trap? Yes.
223. When waves are from the south and travelling across, what tidal influence would that have on the northern side? It will have no influence on the tide—its only effect will be when there is a heavy sea to arrest the waves which are running into the harbour.
224. When the wave strikes on one side would it not rebound on to the other? No, it will run along that side; it runs along the breakwater now.
225. Would it be necessary to strengthen the head of the present breakwater alongside your wave-trap on the northern side? Yes; I have put a sum of money on the Estimates for that purpose.
226. Do you propose to continue the wall of the breakwater round to the basin of the wave-trap? Only to strengthen existing works.
227. Has there ever been any previous proposal to deal with the approaches to Newcastle Harbour in the manner in which you propose to deal with them now? No.
228. Are you familiar with previous proposals that were made in Mr. Moriarty's time? Yes.
229. Do you remember what they were? Only the works as now carried out.
230. Was there not an extension of the southern breakwater proposed by Mr. Moriarty? Not beyond the point to which it was extended.
231. That was the final point? Yes.
232. What other proposals did Mr. Moriarty make to improve the entrance to the harbour? I cannot recollect any that were not carried out. I might explain that Mr. Moriarty never felt himself in a position to commence one large scheme for the permanent improvement of the whole port, because until latterly we were never allowed more than £5,000 at a time. He was not certain of getting more allowed, and he was asked to do what he could with £5,000.
233. You believe that all the works contemplated by Mr. Moriarty have been carried out in connection with the Newcastle Harbour? Everything that was laid down on the plans has been carried out.
234. There has been £1,124,000 18s. spent on Newcastle Harbour? Yes, that is so.
235. I think you have stated that you remove 3,000,000 tons of silt per annum by means of five dredges in Newcastle Harbour? Yes.
236. That is deposited about 2 miles outside the harbour? A great deal has been taken out of the harbour, but during the last four years we have reclaimed about 25 acres of land with a portion of the silt.
237. Then you spend nearly £40,000 a year in dredging Newcastle Harbour? We are spending money at that rate just now.*
238. The interest on the capital already spent, some £1,200,000, comes to another £40,000, so that the harbour is costing at present about £80,000 a year? I have not the exact figures.
239. If you take the expenditure up to date, which is £1,124,480, that at $3\frac{1}{2}$ or 4 per cent. will represent an annual interest of about £40,000 a year, then there is a similar sum for dredging, making £80,000 a year; is not that the annual charge? I might mention that nearly half of that sum has been spent from revenue, not from loans.
240. That is the cost to the country. There is no direct income derivable from the Newcastle Harbour, is there? Yes.
241. What income is there? There is pilotage, and there is a charge on the coal going out which more than pays the interest on the outlay.
242. Do you know the amount received? Fourpence a ton.
243. Do you include the cost of the cranes? Yes, everything.
244. Then you regard the income from the coal as almost sufficient? There is 4d. a ton very nearly clear profit on every ton of coal that is shipped. The minimum charge is 10d. a ton, leaving 6d. for haulage, but a large quantity of the coal is generally hauled 2 or 3 miles and 6d. a ton pays very handsomely indeed. That covers shipping which is only 1d. a ton, and there is a clear profit of 4d. for every ton of coal shipped.
245. Do you know the gross amount of revenue received in that way? Something like £27,000 a year, I think.
246. Have you a statement of the amount received? Yes. Last year there were 1,728,000 tons of coal shipped by the Government. The year before the quantity of coal shipped by the Government was 1,854,100 tons, giving an average for the two years of 1,791,200 tons, and that yielded a clear revenue of £29,853 16s.
247. That is for the two years? No, that was the average amount for the two years, 1893 and 1894.
248. That is the net payment after making all the deductions? That is at 4d. per ton.
249. What deductions have to be made from the 4d. per ton? I think it is fair to take the whole 4d. as clear profit, because the minimum haulage rate of 6d. per ton certainly pays for the labour of shipping, which is only a trifle over 1d. a ton. A great deal of the coal is hauled only 2 or 3 miles to the cranes, and the usual thing is to pay 1d. or 2d. per mile, but the Government get 6d. a ton for that short distance. I hold that the 6d. a ton haulage amply covers the cost of working the cranes.
250. You believe that it leaves a clear 4d. a ton after all expenses are paid? Yes, I consider that it does. Last year, pilotage brought in £17,000, removal dues £3,400, tonnage rates £8,324. That is another £28,000.
251. Making a total revenue derived from coal something like £60,000? The direct revenue will be £56,500. Then there are, of course, the customs passing through the harbour.

252.

* NOTE (on revision):—It should be made clear that the figures, 3,000,000 tons per annum, quoted as the output from Newcastle are based on the present rate of dredging, with one dredge working three shifts and one working two shifts and two sandpumps. The annual cost on this basis is £27,300, but as this is only emergency work the average annual expenditure may shortly be reduced £17,200 for working the dredges one shift each only.

C. W. Darley, 252. There is revenue of £56,500 a year as against an expenditure of £80,000 a year, so that there is still a shortage of income compared with the expenditure? I cannot admit that the whole of the dredging for the last six or eight years is fairly chargeable against the harbour. It has been necessary to maintain the harbour against damage done by the river. It cannot be looked upon as a charge against the harbour at all. It is a charge to maintain the highway.

26 Mar., 1895. 253. By reason of floods on the Hunter? If it had not been for the floods we might have withdrawn all the dredges except one, years ago.

254. I want to ascertain from you what will be the effect if your project is carried out and the northern breakwater is built, as you suggest, at a cost of £141,000. Will any saving be effected in the cost of dredging? I do not say that there will be any saving effected directly, but it will make a better harbour. No harbour works would ever be carried out if you looked for immediate savings.

255. You will still have to go on with the same system of dredging? So long as the river sends down silt we must dredge it out or abandon the harbour.

256. Did you say that by contracting the entrance to the harbour you will create a greater scour? No, I am not contracting the entrance.

257. If the works are carried out will the entrance to the harbour be much more contracted than it is at present? No.

258. Then the running out of your northern breakwater to the point indicated on the plans will not narrow the channel or the entrance to the harbour? It does not interfere with the narrowest point. The narrowest point is between the existing point of the breakwater and Stony Point. The new works will tend to widen the channel at that point by increased scour.

259. Then the increased scour will not dispense with the necessity for dredging? Not up the harbour—we do not dredge at the mouth.

260. Will the water take away the silt in consequence of the narrowing of the channel? It will prevent its being deposited in the fairway, and on the bar. The silt will be carried out to sea. At present the silt coming down shoals up the bar.

261. I think you have stated that the works, if carried out, will give a greater depth of water? Yes.

262. Do you propose to blast out any portion of the rock? Not at present.

263. The depth you anticipate being able to obtain will be 25 feet? Twenty-five feet without touching the rock.

264. If the northern breakwater is carried out what will be its effect upon flood-waters as far as Singleton on the Hunter? It will not affect the flood-waters in the Hunter in any way.

265. Will it not cause the greater flooding of the country? No.

266. You believe that the narrowing of the channel in constructing the northern breakwater to the point shown on the plan will not have the effect of backing up the storm-waters? None whatever.

267. There would be no injury at all in that way? No, I am quite certain of that.

268. Will the flood-waters be able to make their exit as readily through the proposed entrance of the harbour as they could have done if the proposed work were not constructed? I think it will make it easier. There would be a more direct scour, and there will not be the confusion, owing to the seas crossing the harbour, that we have at present.

269. If it has that influence would it not be the means of carrying away a great deal of silt and sand that comes down by floods from the higher portions of the Hunter? I do not know that it would. It would prevent any deposition of mud in the entrance to the fairway.

270. You think it will be absolutely necessary, as long as we have floods in the Hunter, to continue dredging? It will be.

271. Your proposed retaining-wall is not included in the estimate here, but I presume that it will be carried out at an early date. Will that help to create a scour, and prevent the silting up of the harbour? It will; it is largely designed with that object.

272. What would be the expense of the proposed retaining-wall and reclamation works which are not included in this estimate? The work at present in hand is costing very little. We are making a wall with ships ballast, which is discharged for nothing.

273. You get the material for nothing? We are getting about 20,000 tons of stone every year, and 80,000 tons of clay and sand.

274. Delivered on a portion of the proposed reservation area? It is delivered where we want it. The ships have to get rid of it, and we offer them facilities by giving them jetties, and they pay the expense of landing and tipping the stone.

275. Then if that proposal is carried out for the erection of the retaining-wall would it very much contribute to the prevention of the filling up of the harbour? It will contribute very largely to that. The velocity of the current will be retained in the harbour, instead of being distributed as it is at present.

276. By the contraction of the volume—it will create a greater velocity and scour? The silt will be held in suspension, and will go to sea better.

277. Can you tell me the probable cost of that work;—even though you get most of the material for nothing, will there not be a large amount of labour required? I have not made an estimate, for this reason, that I am making a detailed survey of the whole of the flats. They have not been surveyed for over twenty years. To carry out the design fully it must be a work of a great many years, and the construction of the walls can just be kept in advance of the dredging. One great object to be attained in carrying out this work is that it will give us a site for discharging our silt, instead of our having to send it out to sea. I want to stop that by getting a place where we can deposit the silt and pump it ashore, thus making land and gaining in time. Some time ago I had a return prepared showing the loss of time to the dredges through bad weather. When bad weather comes on we have to stop towing the silt out to sea, and in consequence of that to stop dredging. I find that during the last five years the loss of time through stress of weather has averaged fifty-nine days a year. That comes to very nearly one-sixth of the year. With this dumping ground in the harbour that would be entirely got over. We should have a shorter distance to tow the silt, the dredges will be kept going much easier and the work will be materially cheapened. I find that towing the silt to sea costs more than pumping it on shore. If we dump the silt into the harbour and pump it ashore with a stationary dredge, one pumping dredge will keep two or three going. The silt is brought from the ladder dredges, dumped alongside the pump dredge and pumped ashore. That is cheaper than towing it out to sea.

278. Have you any idea what the difference per ton will be in the cost? It costs us quite 3d. a ton to O. W. Darley, Esq., tow the silt out to sea, and we can pump it ashore for less than 3d. The cost of towing the punt would be 3d. or 4d. a ton alone.*

26 Mar., 1895.

279. The short distance that you will have to take the silt will make it much cheaper than having to tow it out to sea? It is much more economical to land it than to take it to sea, besides which we should get one-sixth more work out of every dredge.

280. You have not prepared any estimate of the cost of the reclamation works, but you intend them to extend over a number of years? They will take a number of years. I have not prepared an estimate, because I have not made a survey to lay out a detailed scheme by which it is proposed to reclaim something like 920 acres of land.

281. Will the value of the 920 acres equal the cost of the work? It will be more than equal, and it will be reproductive.

282. It will be a reproductive work, and a work of great utility? Yes.

283. And it is not likely to be an expensive work, seeing that you get the principal part of the material free of cost? It will not be an expensive work, because we shall be able to get material from the ships quite fast enough to carry it out.

284. Has the shipping trade of the port of Newcastle during the past five years increased or decreased? It has increased.

285. Notwithstanding the strikes in the coal-mining industry it has increased? The export of coal has certainly increased during the last five years.

286. We want to know whether there is a growing trade to justify this large expenditure? It is a growing trade.

287. Have the wool and frozen meat added much to the exports from the harbour? The direct shipment of wool has increased very largely of late years. It has only grown up during the last twelve years.

288. Are not the ships which enter the port of Newcastle now much larger than those which formerly traded to that port? Individually the average tonnage has increased very much.

289. There are larger ships frequenting the port, and that is one of the reasons that prompts you to make provision for better harbour accommodation? Yes.

290. The frequent visits of large vessels make it absolutely necessary for a better entrance and a deeper channel? I consider so.

291. Have you had recommendations made to you by the Chamber of Commerce as to the necessity for deepening the channel? Yes; from the Chamber of Commerce, and from the Marine Board.

292. Have you frequently, for years past, made recommendations to the Government as to the improvement of the approaches to the Newcastle Harbour? I have called attention to the necessity of doing something to improve the entrance.

293. And to carry out the proposals submitted by you would effectually remove the difficulties on entering the harbour—larger ships would be able to trade to the port? Yes.

294. [Mr. Lee.] You have already said that twenty-eight years ago there were 14 or 15 feet of water on the bar? Yes.

295. And the high flood of 1867 shoaled the bar? That was the effect of it. There had been 18 feet of water previous to 1867.

296. Do you remember how much of the breakwater on the southern side had been completed at that time? None of the breakwater beyond Nobby's.

297. How much between the main land and Nobby's? The old breakwater was in a dilapidated state.

298. Up to that period, had it been made of ballast? It had been made of stone from Signal Hill. But when I went to Newcastle in 1867 it was in a dilapidated state, more or less destroyed.

299. Have you any data in your office to show the state of affairs between the mainland and Nobby's before there was anything done to it at all? We have old surveys.

300. Was there not a channel through which small craft used to pass? Yes; there was a 10-feet channel, which was used by small coasting craft. It was rather a dangerous one to take, on account of the reef outside.

301. Since 1867, the Department strengthened that breakwater between the mainland and Nobby's, until at last it became consolidated? Yes.

302. And since that year they have been extending the southern breakwater out to its present point? Yes.

303. And with the exception of that piece of northern breakwater at Stockton the northern portion of the harbour was quite open? Yes.

304. Have you noticed that since you extended that southern breakwater the flood waters in the Hunter River have continued to get higher and higher? There have been some bigger floods since, but it was simply owing to excessive rainfall.

305. The highest flood on record, I believe, is that of 1893? No; the highest was in 1870, before there was any work done there at all.

306. That, I think, is merely guess work? I think not. I got the actual levels from Mr. G. B. White.

307. Where were those levels to be found? At East Maitland, and at the tannery on the hill outside West Maitland, on the northern road. Mr. White gave me the marks where the flood reached, according to his own measurements.

308. The information that you have, so far as it goes, proves that the water may have been a certain height at that particular point;—that might be owing to the Patterson and Williams rivers being up? Yes.

309. The highest flood that you have any reliable data about is 1893? Yes; the highest that I have any data about.

310. All the greatest floods during this generation took place between 1867 and 1893? Yes.

311. At that period all the coast on the northern side of the harbour was perfectly free; that is to say, it was not encumbered even by the present breakwaters, starting from 1867? Yes.

312. That space between the centre of the northern breakwater, taking a straight line from the northern beach to the commencement of your proposed northern breakwater was also open to the influence of the tide? Yes.

313. Consequently it afforded a very large opening for the escape of water coming down the Hunter River? But it all had to pass between the narrower entrance between Stony Point and the North Spit.

314. All that space was open then? Yes; but it was not available for the discharge of water. 315.

* NOTE (on revision):—The cost here quoted was the average cost in former years given in error. Towing silt to sea at Newcastle now costs less than 1d. per ton, say 4d. per ton.

C. W. Darley, 315. If the water was there that space was open? If the water was there it had all the Pacific Ocean to Esq. discharge into.

26 Mar., 1895. 316. But it had to go through the narrow neck of the Newcastle Harbour? Yes; between Stony Point and the breakwater.

317. After passing Stony Point on the north side was not all that space open to the influence of the tidal waters? Yes.

318. And notwithstanding that that was open, and that your breakwater was on the southern side only, that space was not sufficient to allow the Hunter River flood waters to pass out quickly enough? It was amply sufficient.

319. How do you account for the flood water being backed up behind? I do not see that it was backed up to any extent.

320. Do you take the sectional area that you have already given us as a basis in your calculations as to the exit of the water? Yes.

321. I want to draw your attention to the sectional area at Hexham—the widest point on the river—and the sectional area between the south training bank, and the north breakwater, which is 30,980 square feet? Yes.

322. The area at the discharging point, then, at the south training bank, would be two and a half times greater than it would be at Hexham? Yes.

323. I presume that the sectional area at Hexham represents the quantity of water that the river would contain at that point up to the bank level? Yes.

324. Has it occurred to you that certainly not more than one-third of the flood-waters comes down the Hunter River, but that two-thirds of the water finds its way over the country? It depends upon the locality. At some points of the river it all has to pass down the river.

325. From Singleton downwards is it not on record that the river has overflowed at many points? Yes.

326. And the river runs above the level of the banks—that is to say that the river is not large enough to carry the flood-waters? You want to name a particular place. At West Maitland it is all stagnant water. 327. It is water that has gone out of the river because the river was not big enough to carry it? Yes; but it is stagnant water.

328. There are very rarely two floods alike—it is generally higher at one flood than at another? Yes.

329. At the last flood this year the water about Hexham was somewhat higher than in the year 1893? No two floods are alike anywhere.

330. That being the case, the whole country is inundated;—would that not go to prove that its carrying capacity at the entrance to the harbour would be severely taxed? No; not at all. The running of the water is straight out. It goes past the northern breakwater, and if these works are carried out it will maintain that course with a better channel than it has at present south of the northern breakwater. The new entrance will be a better discharging entrance than the present one.

331. At the places at which you took your sectional areas—Raymond Terrace, Boiling Down, and Hexham—are the banks of the river in flood-time under water? To some extent they are under water, but not in all cases. The water has not been over the hill at Raymond Terrace where the hotel is. There is also a high hill at Hexham. The water that is out of the main channel is stagnant water; the current is confined to the river. There is stagnant water all over the Hexham swamps, but no flow.

332. But as soon as the river falls does not the water flow back into it? Yes; the water is stored up and returns to the river afterwards. That prolongs the time of the discharge.

333. As the outlet proposed by you at the port is so much larger in square measurement than the sectional area at Hexham, how does it come about that any flood-waters remain at Hexham at all? A gradient is required to make the water run. It rises about 30 feet at Maitland, and that forms a gradient which creates sufficient velocity to carry the water off. Hexham comes about nearly in a straight line from zero at Newcastle. Up to a 30-feet rise at Maitland it is almost a uniform line disturbed at one or two points by local influences, but for practical purposes it is a uniform gradient.

334. How do you account for this enormous deposit of silt in the harbour? It has occurred of late years through the harbour being wider in front of Stockton than it used to be. In the old days there was a sand bank extending from opposite the town of Newcastle up to the point of the Bullock Island dyke. That area I have seen quite dry at low water. The necessity for improving the harbour from time to time required us to remove that bank on the south side and the construction of the dyke, and the effect has been to draw the current more to the south side, leaving the water on the north almost like settling ponds—slack water, and that is where the deposit took place.

335. All the shoaling has taken place just inside the western point of the northern breakwater? Yes.

336. Has it not been held by the residents in that locality for many years that the backing up of the sea-water by severe storms during flood time has had a material influence in preventing the flood waters from escaping? I have heard statements of that kind. I received a letter from a gentleman, who stated that he had been a careful observer of the matter for many years, and he says that the storms were always accompanied by high seas, and he said after close study of the matter that it was quite evident that if we could keep the salt water from entering the harbour it would put an end to the floods, and he asked me how that could be done.

337. You propose to contract the entrance to the harbour by this breakwater? No, I do not; I object to that statement.

338. If you build a wall beyond the oyster bank and another one on the southern side, you certainly contract the entrance to the harbour? I do not contract it. It is still wider in the new work than anywhere at present.

339. You do not contract it any more than it is contracted already as between Stony Point and the northern breakwater? It will be wider than it is at that point now.

340. Than the point between Stony Point and the northern breakwater? Yes.

341. But Stony Point and the northern breakwater are inside the harbour? One point is outside.

342. The terminal points of your northern and southern breakwaters will be considerably out in the ocean? Yes.

343. Under the stress of a severe easterly gale will there not be a quantity of water forced through that opening against the flood waters passing the other way? Yes; but that you cannot avoid. That exists already.

344. Would not the shoaling of the harbour go to prove that there has been some influence of the tides as against the flood waters? No. Having a wider area the velocity of the water has been reduced, and this allowed the silt in suspension to be precipitated.

345. Is it not the flood waters being impeded at the outlet that has caused a deposit of silt? The water C. W. Darley,
will not go slowly at the outlet if the works are carried out. I want to maintain its velocity. Esq.
346. Will it not be impeded when there is a flood tide and an easterly gale? That does not stop the 26 Mar., 1895.
water from going out. The velocity of the current is due to the gradient.
347. When flood-water is flowing out, and there is an easterly gale blowing, which will be the stronger of
the two? In a gale of wind you will always have a disturbed entrance.
348. If the flood current is the weaker of the two, it will be brought to a standstill? It will not be
brought to a standstill. It will run out as long as there is a gradient, no matter how the sea is outside.
349. You have already told us that the flood-water was higher in the harbour than the flood-tide? Yes.
350. Will you be good enough to tell us why it should be higher there within a few hundred yards of the
ocean? It is a slope due to the gradient of the flood-waters starting at zero; as you go up the river it
rises. It commences at Maitland, and runs down to the mouth of the harbour to zero. If you go up the
harbour you get higher flood-water.
351. If the construction of these training-walls will have the effect of sucking in the water, for which you
are going to provide wave-traps, what will be the result? It will not have the effect of sucking in the
waves. Any waves that enter the harbour opposite the training-walls will be drawn to the wall, and will
expend their force on the wave-traps.
352. They have no influence then in drawing more water? Certainly not.
353. You have had something to do with the survey of the Hunter River, have you not? Yes; from
time to time.
354. Did you report upon some scheme for the easier escape of the flood-waters? Yes; for relieving
Maitland.
355. Would you object to say what that proposal was, or whether it touches the question? It does not
touch the question at all in my opinion.
356. Did you propose to provide an outlet for the water through Newcastle? Yes.
357. Not to take it by way of Port Stephens? Certainly not.
358. After many years of experience of the river Hunter, and of the Port of Newcastle, and the effect
of the highest floods in that locality, you are of opinion that the improvements which you now suggest,
will in nowise affect the flood waters? I am quite sure that it will not in any way injuriously affect the
river. It will in no way impede the discharge of the flood-waters. I think it will give a more uniform
and steady discharge of the flood-waters through the entrance.
359. You will create a greater scour? We shall have a better current and a deeper channel.
360. In the face of our knowledge of these floods, which are getting worse every year, do you not think
that if your proposal is carried out exactly, as you expect, it will be absolute ruin to those people up the
river? I do not think it is possible that it can affect the people up the river in the least. If you did
contract the entrance to a considerable extent, it would not affect Maitland, but I hold that the scheme
will not contract the entrance.
361. The flood-level is higher in the harbour than the tide is at the full. That is the flood-water.
362. Is there not some impediment in front of it? It is the water coming down quickly.
363. *Mr. Humphery.*] How long had the northern breakwater been completed before the southern break-
water was commenced? The southern breakwater was commenced before the northern breakwater.
364. I am speaking of the extension from Nobby's outwards? The northern breakwater was nearly half
completed in 1872, and the commencement of the extension of the southern breakwater beyond Nobby's
took place in 1875. There was a stoppage of the northern breakwater then until 1883 when the works
were resumed.
365. Why was there a stoppage? Because there were no funds.
366. Why was not the northern breakwater proceeded with when the funds became available instead of
the southern breakwater being commenced? Because the money was voted for the southern, and not the
northern breakwater.
367. Can you tell us what caused the money to be voted for the southern instead of the northern break-
water? Because it was there that there was the greatest danger. The most necessary work was covering
the reef along which it ran, so as to make it safe for ships to enter the harbour.
368. Was this breakwater extended from Nobby's to its present extreme point before you commenced the
northern breakwater? No; the two were going on concurrently.
369. Do you remember whether it was the extension of the southern breakwater which had the greatest
effect upon the channel? It had the desired effect, because it took away at that time the broadside
action on the bar of the seas coming across the reef. Ships had to run in parallel with the reef, and the
southerly and south-east seas cross at right angles to the fairway, so that ships rounding up under the
breakwater got in under shelter from the south-east sea.
370. Do you think the extension of the northern breakwater, making it almost the same length as the
southern breakwater, would lead to an accumulation of silt when the flood-waters cannot escape? No;
the flood-waters will always escape.
371. When they cannot escape by reason of a strong easterly or south-easterly gale? That does not
keep flood-water back.
372. But would it not lead to an accumulation of silt? No; we should still have the scour.
373. You think that silt would not accumulate at the northern side? There will be a scour which will
keep the silt in suspension until it is carried out.
374. In the event of a strong easterly gale prevailing during a heavy flood in the river, do you think the
length of the passage, by reason of the extension of the northern breakwater, would so delay the escape
of the flood-water as to have an injurious effect during the continuance of the gale upon the channel? I
hold that it will not prevent the escape of the water.
375. Will flood-waters travel just as speedily through the lengthened passage between the breakwaters as
through the shorter one? If it has to travel over a bigger entrance you lose in velocity, and have the
deposition of silt that takes place now. We have a deposition of silt on the bar now through the loss of
velocity in the current caused by its opening out broadside on the harbour.
376. In one of the letters laid before the Committee—I think by Mr. Newton—it is suggested that both
breakwaters should be extended;—do you think that the extension of the southern breakwater is
necessary? I consider it quite unnecessary to extend it more than to the original point that it was
taken to.

C. W. Darley, 377. Have you considered Mr. Newton's suggestion? Yes. A good many people have suggested that we should continue the southern breakwater, but I know that it would be perfectly abortive to do that, Esq. and nothing else.

26 Mar., 1895. 378. In your opinion it would not deepen the channel? It would not.

379. *Mr. Hayes.*] The effect of the improvements which you have made in Newcastle Harbour has been to increase the facility for the flood-waters to escape? Yes; it has.

380. You have enlarged the capacity of the entrance? There is a larger capacity than there was formerly.

381. All the improvements have assisted in discharging the flood-waters—they have not checked them? Quite so.

382. You said that the sectional area at Stony Point was 22,750 square feet? Yes; that is the smallest section.

383. And that really governs the exit of the water as a whole? Yes.

384. Then you are of opinion that if you carry out the work as shown on the plan the effect will be to improve instead of retarding the discharge of the flood-waters? Yes.

385. By giving a larger sectional area? It would deepen the existing channel and give a better discharging area.

386. You expect to deepen it by 3 feet? Yes; without removing rock.

387. You think there is no possible danger of the discharge of the flood-water being retarded by the works that you propose to construct? I am satisfied that it will not retard it.

388. On the contrary it will improve it? It will be a better outlet.

389. Assuming that some scheme is carried out to let the flood-waters get away more rapidly to the sea could that be done with the present state of the entrance? I do not see that the present design would, in any way, interfere with any work that might be proposed to draw off the flood-waters.

390. And you think there would be no difficulty, if these proposed works are carried out, in giving a free outlet to any possible quantity of flood-waters that may be brought into the Newcastle harbour? It will in no way impede the discharge of the water.

391. You said something about the tortuous nature of the river from Maitland down to Newcastle, impeding the flow of the flood-waters? Yes.

392. If anything were done to improve that it would give a greater discharge of water at the mouth of the river? Yes.

393. And still you think there would be quite sufficient room for that? Yes, quite sufficient.

394. In the case of an easterly or south-easterly gale would not a wave striking against the northern breakwater stop the discharge there? A wave does not stop the discharge.

395. Will not the current running in check the flow of the flood-waters if there is a gale? A wave running in does not mean that the water is actually running in. It is more what may be termed a wave of oscillation. If you put a boat on the wave it would not run in. It is not running in, but the momentum is passing in.

396. Until it breaks? Then it becomes what is termed a wave of translation, but entering the harbour it is a wave of oscillation. At present there is no obstruction whatever to the flow of the waves—they go right across to the northern side. But if you have a breakwater the wave will be diverted into the harbour.

397. Do you think that the wave trap would absorb all that? I do.

398. You are clear on that point;—you stated before that at the west end of the northern breakwater there was a shoal, and the effect has been since the breakwater was formed to remove that shoal? Yes. There was a bank south of the northern breakwater, which is all gone now.

399. It is now forming at the eastern end of the northern breakwater? It is forming again, but nearer to the eastern end on the inside.

400. It shoaled nearly 10 feet since that has been done? In some parts it has. It deepened out, then shoaled up again.

401. You also stated that the current there was northerly? It trends towards the north.

402. There is silting going on to the north of the breakwater? That is owing to the in-draught of the current meeting the beach and drawing into the harbour at flood-tide. It brings in the sand.

403. Then the action of the scour there does not affect that shoal? If the new work is carried out the sand will be intercepted and cut off, and the scour will take out what has been deposited.

404. How have you proposed to carry out this work, by contract or day labour? I think I would recommend its being initiated by day work to get everything into working order, then carried out by contract.

WEDNESDAY, 27 MARCH, 1895.

Present:

THOMAS THOMSON EWING, Esq. (CHAIRMAN.)

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JAMES HOSKINS.

The Hon. JOHN DAVIES, C.M.G.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

JAMES HAYES, Esq.

ROBERT HENRY LEVIEEN, Esq.

CHARLES ALFRED LEE, Esq.

The Committee further considered the proposed Harbour Improvements at Newcastle.

Cecil West Darley, Esq., Engineer-in-Chief, Harbours and Rivers Branch, Department of Public Works, sworn, and further examined:—

C. W. Darley, 405. *Mr. Hayes.*] I wish to ask whether the lengthening of the breakwater proposed would not in any way retard the outflow of the water owing to what you call skin friction? No.

27 Mar., 1895. 406. In giving your evidence before, you pointed out that skin friction had a great deal to do with retarding the flow of water? It will not retard the flow of water out of the harbour, because there will be a better discharging channel than there is at present.

407. You pointed out in your evidence previously that the flow of water was retarded by friction? It is in shallow water. This will be deep water, therefore there will be a good discharging channel.

408. You think that the depth of the water in that channel would overcome the skin friction? It will. C. W. Darley,
 409. Mr. Roberts.] I understand that you have been professionally engaged, on and off, in works the object Esq:
 of which was to improve the navigation at Newcastle during the last thirty years? During the last 27 Mar., 1895.

410. Consequently you have had every opportunity of making yourself acquainted with what was required from time to time to improve the entrance to the port? I have.

411. How long is it since the last works in connection with the breakwater were completed? It is about nine years since the works were stopped on the north breakwater.

412. Has anything further been done since then? Nothing of any importance.

413. What was the depth of water on the bar at low tide when the last works were completed? I think it was about 21 feet.

414. And what is the anticipated depth if the proposed works are carried out? Twenty-five feet.

415. And the estimated cost of the whole works is £141,000? Yes.

416. Are you quite sure that your estimate is well within the mark? I am quite sure.

417. The figures have been carefully prepared? They have been carefully prepared from past experience, and I consider that I have allowed a liberal estimate.

418. Will you explain, in as few words as possible, what we shall get for this £141,000? We get an extra depth of water on the bar of 3 feet at low water. We shall get a safer entrance for ships, in coming into or going out of the harbour at any time; and the risks attending the presence of the oyster bank will be got rid of. The oyster bank is to the leeward of the port.

419. Ships will be able to leave the port of Newcastle either by day or by night with greater safety than at present? They will be able to leave at any time, even in bad weather, with much greater safety than they can at present.

420. And in addition to that, will this scheme enable the flood-waters from the Hunter to escape more readily? I believe it will be a better discharging channel for the river than there is at present.

421. Can you tell me what is the depth of the water at the entrance to Sydney harbour at low tide? Twenty-eight feet in the eastern channel.

422. There is a sort of bar at the entrance to Sydney harbour? What is known as the Sow and Pigs Flat.

423. I have heard it stated that at times there has been a difficulty about large steamers entering Port Jackson, the ships having to wait for high tide? Those large steamers generally prefer to wait for high tide.

424. How many feet of water are there in that channel? At low tide there are 28 feet of water in the eastern channel.

425. How wide is the channel? 400 feet, giving an ample approach always.

426. Am I justified in believing that there is a greater depth of water by 6 feet in the entrance to the port of Sydney than there is in the entrance to the port of Newcastle? Yes.

427. Then it is really necessary to have 28 feet to allow the large steamers that frequently visit Sydney to enter the port? Yes, to allow the large mail boats, and the large men-of-war to enter.

428. If it was thought necessary for those steamers to go to Newcastle, of course we should require a depth of 28 feet there? Yes.

429. Will there be any blasting operations to carry out to enable you to get this extra depth of water, or do you anticipate getting it from the extra flow from the river? I am only proposing to have a depth of 25 feet of water, and that can be obtained by the natural scour. But, as I pointed out before, at least 29 feet can be obtained by the removal of a very small quantity of rock.

430. Are there many blasting operations to be carried on to get this depth of 25 feet? No.

431. My reason for asking that was, that I wanted to ask you whether you did not think it would be wise, whilst you were getting a depth of 25 feet, to make it 28 feet, so as to allow the large steamers that are in the habit of entering the Sydney harbour to enter the Newcastle harbour? It would cost about £24,600, putting down a very liberal estimate, to obtain a 28-feet channel on the same line of fairway that I have proposed.

432. That is in addition to the £141,000? Yes.

433. Do you not think that would be a desirable thing to do, so as to make one work of it;—would it not be more economical? No; it is quite an independent work, and I do not think the port would require it. I do not think that there is any probability of the same class of ships as the large mail-boats having to go to Newcastle.

434. You do not think that the trade of the port of Newcastle requires it? No.

435. But should it be deemed necessary in a few years, there would be no difficulty in carrying out the work at a cost of about £25,000? No.

436. If I understand rightly, you intend to spend about £7,000 on the southern breakwater? Yes; to restore it to its original condition.

437. Then you contemplate going further out; at present it goes as far as Big Ben? We only intend to go as far as it was originally extended.

438. Is that to Big Ben? It is north of Big Ben.

439. Then on the northern side the wave-trap would work; the beach there is left in its natural state, is it not? The beach will be left in its natural state.

440. And at a point further on your stonework commences? The new work will have to commence north of the present work, and curve round to get into the required line.

441. And to what distance will that wall or breakwater be built from the point of commencement on the beach? Altogether, to the extreme end; including the first and second sections there will be 3,750 feet of work.

442. That really constitutes the whole of the work—the building of that northern breakwater, and the improving and strengthening of the southern breakwater? Yes; and the construction of a southern guide wall.

442½. What is the object of that wall? It has a two-fold object—it is to lift the stream of the current clear of three reefs; one reef which really forms the base of Signal Hill; the second reef, known as Stony Point; and a third reef formed at the base of Nobby's. The tide when leaving the harbour is disturbed at those three points, interrupting its free flow. I want to lift the current clear of those points, and to move

C. W. Darley, move the fairway and centre current further to the north, where we shall get deeper water without meeting rock.

27 Mar., 1895. 443. Does it not preserve the present wave-trap, which has proved so effectual for some years? It will make a more effectual wave-trap than we have at present.

444. You have no doubt as to the efficacy of these wave-traps? None whatever.

445. Have they proved successful in the many places that you mention in your evidence? Yes, entirely successful; and they are always adopted in modern works.

446. And you have had experience of one on the southern side of the port of Newcastle? Yes.

447. You have no hesitation in saying that it will be most desirable, in the interests of the port of Newcastle, that this work should be carried out? I think it is a desirable work, seeing how the size of vessels is increasing—larger vessels coming to our coast.

448. *Mr. Levien.*] Has the whole of the money which the works at Newcastle have cost been charged to loans; and, if not, how much has been charged to revenue? £604,400 has been charged to loans, and £520,000 has been charged to revenue.

449. Is the revenue received from the port of Newcastle sufficient to pay the interest on the loan money which has been spent there? I think it does fully.

450. *Mr. Hoskins.*] You included in the £56,000 which you mentioned yesterday as the amount received annually, the cost of the conveyance of the coal from the pits to the port? No, I did not. I included a charge of 4d. per ton over and above that. There is a minimum charge of 10d. per ton made for all coal brought from the nearest pit, and that is made up of 4d. per ton for craneage charges, for shipping, and the cost of the cranes is included in the loan expenditure.

451. *Mr. Levien.*] Is not the increased height of the floods at Maitland due partly to the construction of embankments along the river which prevent the flood waters from spreading over the adjoining land? It is.

452. There is an embankment from Maitland down to Bulwarra and as far as Pig Run? Down to Pitnacree Bridge. I have pointed out in my reports on the subject that the effect of the construction of extensive embankments about Maitland will be to raise the floods up.

453. Before those embankments were made the water escaped much sooner? It spread out all over the country, and what is known as the Wallis Creek country absorbed an immense area towards the Wentworth swamps. It is shut out now by a series of embankments and flood-gates.

454. If the channel at Maitland had the same area that it had at Newcastle there would be no floods at all on the Hunter? There would be floods, but not such large floods. There would be no destructive floods.

455. The dredges that are in use do not come near the northern breakwater? No.

456. They are used more up Bullock Island way? The most easterly point that they come to is the eastern end of the north channel, a little to the west of the commencement of the northern breakwater.

457. Where is the most dredging done? Most of it is done on the western side of Stockton.

458. *Mr. Hoskins.*] As coal is what would be termed dead weight cargo as compared with wool, would you consider it desirable to have a greater depth of water under the keel of a vessel laden with coal going over the bar than under a vessel laden with other cargo? It makes very little difference if you have 3,000 tons in a ship whether it consists of coal or wool. It is entirely a matter of the draught of the ship.

459. *Mr. Humphery.*] I observe that the northern breakwater is divided into two sections, the first section to cost about £110,000, including the improvements to the southern breakwater, and the second section to cost £32,000. Is it your intention to postpone the construction of the second section till after you have completed the first, in order to ascertain the action of the first section before commencing the second? We have divided up the estimate to show what could be done for the money. I think it is desirable that the work should be carried out to the end. Of course the progress would be comparatively slow, and the action would be seen as the work progressed, and it would be decided then whether to go on with the rest or not. It would not be necessary to stop the work, because the action would develop itself as the work progressed.

460. Therefore, by the time you completed the first section you would arrive at a decision whether it would be necessary to go on with the second section? Yes.

461. What you propose to do at present is to construct a breakwater of 3,000 feet? To construct the 3,000 feet first.

462. *Mr. Davies.*] In the event of the proposed works being authorised by Parliament, how long would it take to complete them? Between five and six years.

463. Would you regard the present as an opportune time for the carrying out of the work, as far as the labour market and the price of materials are concerned? I think so. I think it would be a very desirable time to do it; there is plenty of labour.

464. Would not the proposed work be carried out much more economically at present than it could have been five years ago? It could be carried out now cheaper than it could have been five years ago.

465. Then, if the works were authorised it would be prudent to proceed with them as early as possible, in view of the present state of the labour market and the price of materials? I think so.

466. You said yesterday, I think, in answer to a question of mine, that if the work were carried out as proposed there would be no saving effected as far as dredging is concerned—that you would still have to provide for the taking out of the silt that is brought down by the floods in the Hunter River? Until such time as the training works in the northern portion of the harbour are completed, the dredging would have to continue; but I think that when those works are carried out, in the course of time there would be a better scour through the harbour, and the silt will be carried in suspension through the harbour and out to sea.

467. Then you regard the reclaiming works and the training walls as of as much importance as the entrance to the harbour? Yes; I look upon it as important.

468. In the event of the proposed harbour works being effected, do you recommend that we should proceed also with the training walls and the reclamation works? It is in progress now.

469. But not on a very large scale, is it? We have got a considerable length of wall made around the west side of the improvements.

470. What will be the total length of the training wall when the work is completed? We have not yet got the surveys, and the scheme is not really matured and laid down: but to carry out the whole scheme it may require 9 to 10 miles of walls altogether.

471. What proportion of that is already done? About half a mile.

C. W. Darley,
Esq.

472. So there will be about $9\frac{1}{2}$ miles to construct? Yes.
 473. But you believe that it will have a very great influence on the channel and that it will create a scour which will prevent the silting up of that portion of the harbour? Yes; we naturally look forward to that taking a long time. It will be a site for receiving silt for years to come.

27 Mar., 1895.
 474. But if the work takes a long time, and is carried out in the way you have initiated it, it will be an economical way of constructing the training wall? The yearly expenditure will be very small.

475. You look upon it as an important work? I do.

476. One which will eventually cause a large reduction in the cost of dredging? Yes.

477. *Mr. Levien.*] Is the entrance considerably wider now than it was some years ago in its original state? Very much wider and deeper. Opposite the northern breakwater it is quite 500 feet wider now than it was twenty-five years ago, and it is deeper there too.

478. So that generally the entrance is much safer than it was twenty-five years ago? It is.

479. *Mr. Hayes.*] If Parliament decides on carrying out the work, the annual expenditure will not exceed £30,000? I think it will be under £30,000 a year.

480. *Mr. Humphery.*] It is possible that the second section may not be necessary? I think it will be necessary.

481. You think the expenditure will not stop at the sum of £110,000? No; I think it will be found desirable to go right on.

482. *Chairman.*] That will be four years hence when the need for the extension will develop itself? From four to five years.

483. The end in view of the works is to obtain deeper water in the harbour? Yes; a deeper approach and a safer entrance.

484. Would it be possible for a dredge to work on the Newcastle bar? Hardly; it would be attended with a great deal of risk.

485. A dredge could not discharge itself? It would have to be a self-loading dredge, and it would be attended with great difficulty and risk to work on the bar.

486. Supposing the dredge could work on the bar, would it be a difficult matter to get a depth of 2 feet more? I do not think that unless you adopt means of training the work it would be permanent. What caused it to silt up once would silt it up again, and you would have to dredge it over and over again.

487. With regard to the expense of the work—would it be a very lengthy undertaking to get 2 feet of water? It would be a long and tedious work. There would be days and days when the dredge could not go out there at all. It would be attended with great risk. You would have the oyster bank immediately under your lee.

488. You could use the dredge for dredging inside the harbour when the weather was unfavourable to dredging on the bar? Well, I think it would be attended with a great deal of risk to the dredge itself, and to ships passing in and out of the harbour.

489. You are aware that they are using dredges for exactly the same class of work in South Africa, at Port London? Yes, but I do not know what the exact circumstances are there. I doubt whether they are doing it in the narrow channel of a river. I do not think it is in a river mouth. You could only work at one tide; you could not work in the flood tide, only in the ebb tide, because the flood tide would carry the sand up the harbour. It would be certainly an unwise, and almost an impracticable proceeding.

490. If the water was smooth enough, would it not be a cheap way of getting rid of the sand? No, it would only be temporary. The sand would come back there in a week or two.

491. In your opinion it would not be advantageous to work the sand pump-dredge on the bar? No.

492. *Mr. Levien.*] Mr. Lee asked you a question about it being the general impression up the Hunter that when a storm came on the heavy sea kept the flood-waters back; is the current of the waters running down the river stronger than the waves coming in? The current running down the river is stronger than the waves.

493-4. So the waves do not stop the current going out? They do not.

495. *Mr. Roberts.*] Is the reclamation work a portion of the present scheme? We are constructing that now by making a ballast wall on the harbour side and pumping silt in from the dredge.

496. That work is going on at present? It is in progress now.

497. It will be charged to the dredgework? Yes, we are also dredging away the sand-spit from Scott's Point, which runs across the harbour and to some extent blocks the water. We are removing that to allow of a clear flow of water down the harbour.

498. *Chairman.*] Are the Committee to understand that no matter how strongly the easterly sea is running in it has no effect upon the flood inside the river? No appreciable effect.

499. That wave momentum which you spoke of yesterday does not stop the tide from running out? It has no effect on the tide when running out.

500. On the river side of the bar it would appear that at a certain portion of the tide there would be 3 feet more of water than there would be out in the open sea? About $1\frac{1}{2}$ mile from the bar the flood-water is about 2 feet off high-water mark. I have got the tide-gauge readings during the high flood of 1893, so as to have the actual figures, and I find that the flood affected the high tide very little. The tide-gauge reading on Saturday, 11th March, 1893, was 6 feet 2 inches. That was at its greatest height. Then, when it ought to have been low water, we had 5 feet 8 inches. We had little or no range of tide; only 6 inches instead of 4 feet 6 inches rise and fall. The water was not backed up above the high-water level at the entrance.

501. It kept uniformly at high-water level? Nearly. On Wednesday, 8th March, 1893, there were 4 feet 3 inches at high water and 1 foot 8 inches on the gauge at low water. On Thursday, the 9th, at high water, 5 feet 5 inches; at low water, 3 feet 6 inches. On Friday, the 10th, high water, 5 feet 9 inches, and low water 4 feet. On Saturday, 11th, high water 6 feet 2 inches; low water, 5 feet 4 inches. On Sunday, 12th, high water, 5 feet 11 inches; low water, 4 feet. Then, on the 13th, high water, 5 feet; low water, 2 feet 3 inches.

502. *Mr. Davies.*] When was the highest point? On Saturday, the 11th, 6 feet 2 inches. That corresponds to a good spring tide. The highest water was equal to a spring tide, but the water did not fall within 5 feet as low as it ought to have fallen.

503. *Mr. Lee.*] What should have been the height of the tide on the 11th March, in the absence of the flood? I should have to look up the directory for that.

C. W. Darley, 504. *Chairman.*] Out in the open sea there is a rise and fall of 4 or 5 feet; therefore there is a difference at one portion of the tide of 3 feet (say) 4,000 feet out from the mouth of the river? It would extend

27 Mar., 1895. 505. It is perfectly clear that when you get out into the open sea, the water coming down the river does not raise that? It would affect it for a certain distance out.

506. Till it gets fairly out into the open sea? Yes.

507. Therefore you get an elevation of 3 feet at one portion of the tide? You want to calculate what the tide should have been that day to arrive at that, and its continuation of gradient in coming down the valley.

508. You have already explained that on flood days there is no rise and fall, or rather it is limited to some 10 inches? Yes; the highest point of the flood on that day.

509. *Mr. Davies.*] Is it clear that on the 11th March, 1893, there was a difference of only 10 inches between high and low tide? Yes.

510. Have you any record of it? It takes place in every flood. During every flood that we have had for years, we did not get the ebb-tide, the water ran continuously for some days.

511. *Mr. Hayes.*] The gradient which you referred to at Hexham would be about 20 feet? No, 8 or 9 feet.

512. The gradient from there runs down to a point some distance out of the harbour? Yes.

513. If, as you say, the rise and fall at flood time is only some 10 inches, the point where it runs down to zero must be some distance outside? It must be some distance outside; but it is very hard to locate that.

514. *Mr. Davies.*] Was there a spring-tide on the 11th March, 1893? I could not say without looking the matter up.

515. *Chairman.*] Is there any other statement you wish to make? I wish to refer to one or two matters. In giving my evidence the other day I was rather misled in reading some returns which I had prepared. I was asked some question about the £17,000 paid for reclamation, and I said in answer that all of that was charged to revenue. I find that that is not so; about half of it was charged to loans, and the other half to revenue. There was an arrangement made that the cost of a portion of the work should be charged to loans, and a portion to revenue. When speaking, yesterday, in reference to the cost of towing, I stated that it was 3d. per ton. The cost was from 3d. to 7d. per ton, in some cases, up to 1882, but lately the cost has decreased very much at Newcastle. I find that the cost now is only $\frac{1}{4}$ d. a ton. In many rivers in the Colony it does cost 3d. and 4d. and as high as 7d. a ton, but not at Newcastle. I wish to make that correction.

516. *Mr. Davies.*] What does it cost lifting and towing the silt? About $\frac{1}{4}$ d. is the cost of towing only; dredging with the sand-pump costs about $1\frac{1}{2}$ d. a ton. We can save about $\frac{1}{4}$ d. per ton. I have stated that in the bend of a river the water will head-up higher on one side than on the other. I have here an authority on the subject. Wheeler says: "From observations made at Basle, on the Rhine, it was found that there was $10\frac{1}{2}$ inches difference between one side of the river and the other."

517. *Chairman.*] Do you not see the difference in the position—one is a constantly expanding force coming down the river, and the weight of the water causes it to rise on one side; but when the force is expended by getting out into the open sea, it appears that the motive power is gone? It goes out a little distance, and you just want to get that point. You want the whole thing in a diagram to understand the peculiar action of two currents meeting—the flood-tide and the river current. You can only make it clear by a diagram.

Alexander Brown Portus, Esq., Superintending Engineer of Dredges, Harbours and Rivers Branch, Department of Public Works, sworn, and examined:—

A. B. Portus, 518. *Chairman.*] What are you? Superintending Engineer of Dredges.

Esq. 519. You have had a long experience in the Newcastle district? Yes.

27 Mar., 1895. 520. *Mr. Humphery.*] How long have you been in charge of dredging operations? I have been Superintending Engineer since 1880. Previously I was connected with dredging, starting in 1865, making thirty years altogether.

521. Have you had the immediate supervision of dredging operations at Newcastle? It has been a kind of dual arrangement. Latterly the District Engineers have recommended when the work should be carried out, and I have charge as far as the working is concerned.

522. Are you acquainted with all the work done there and its cost? Yes.

523. Will you briefly narrate the history of the dredging operations immediately previous to the completion of the breakwaters, and subsequently? Dredging was started in Newcastle in the year 1859. A dredge was built specially for the purpose of dredging at Newcastle, and in the Hunter River. A vote of £40,000 was taken for the Hunter River improvements, and the dredge was built out of that vote, and it started work at Newcastle in 1859. A very small amount of work was performed at Newcastle, because river work had to be carried on at the same time. Things went on thus until 1864, when a sum of money was put on the Estimates for a second dredge for Newcastle. There had been a great deal of contention between the people on the river and the people at Newcastle about the use of the dredge. The difficulty was got over by money for a second dredge being placed on the Estimates, and sometimes both dredges worked at Newcastle. At that time there was a great central sand-bank extending from the north to the south of the harbour, from Stockton on one side to Newcastle on the other, with a ship channel on the north side, and a channel on the south side. There was just space in the horseshoe for one ship to be moored, and it took a dredge (almost constantly at work) to keep the horseshoe berth deep enough for a single ship. A great many complaints were made at Newcastle about the accommodation for vessels, and Parliament voted sufficient money to build another dredge—a very large dredge, and it was not till that dredge started work in 1875 that any permanent improvement, as regards the area for ships began.

524. Was 1875 about the year that the southern breakwater was commenced? It was before 1875. The northern breakwater had been constructed in small patches. It was afterwards run out to its present position.

525. What was the condition of the harbour in 1875, when you commenced with the Newcastle dredge? The central bank had not been removed to any considerable extent. The Newcastle dredge worked at it night and day, and a great deal of work was done. It was not very long before we had such an enlarged area that half-a-dozen laden ships could be moored in the harbour. When the late floods came down a great

great deal of filling up took place. In the old time, when the central bank was there, we had very little A. B. Portus, deposit left by floods. The silty water went down the channels with considerable velocity and was swept ^{Esq.} seawards. But since the whole place has been deepened there has been a very considerable deposit after ^{27 Mar., 1895.} every flood, so much so that I suppose last year nearly seven-eighths of the dredging was to bring up Hunter River bank soil. During the removal of the central bank we were dredging sand, afterwards it was mud.

526. Do you say that the widening of the channel led to the depositing of flood silt in the channel? I say that the widening of the channel has had the effect of causing these flood deposits to take place there.

527. Formerly, when there was a narrow channel, the silt was carried out to sea? Yes. The floods have been much heavier of late years than they were in the old days.

528. Is it correct that, although you have deepened the approach to Newcastle, it has increased the expense of dredging operations and has rendered dredging operations continuous in order to remove the silt which was formerly carried out to sea? The work of the dredges since 1888 has been chiefly that of removing the silt brought down by the floods.

529. What was the cost of the dredging operations in 1875? We had two dredges there then.

530. Have you any papers showing the cost of dredging operations from 1875? I should have to refer to the tables. It would not be half of the total cost of the dredging expenditure now. We had the dredge "Newcastle" working two shifts in 1875, and the dredge "Hunter" was working two shifts also.

531. Is it correct that the cost of the dredging operations is now nearly double what it was before the deepening of the channel? No; that is hardly a fair statement. We have lessened the cost very considerably of late years. The cost per ton rate is little more than half what it was, say, twenty years ago.

532. Has the work been doubled? Yes; the work has been doubled. I say that subject to correction, I can give the amount exactly by referring to the tables.*

533. Would the cost of dredging operations be fairly chargeable to Newcastle, as Newcastle has had the benefit of a deeper channel which has led to the accumulation of silt? I consider the cost fairly chargeable to Newcastle up to a certain time, when the channel was made deep enough for the ships to moor there. The cost subsequently is hardly fairly chargeable to Newcastle, because it was for dredging silt brought down by the floods.

534. Did you not say that before 1875 the silt was all carried out to sea? Yes, nearly all.

535. And the deposit at Newcastle had not increased? But we were removing sand from 1865 to 1875, and later. We were taking out this great central sand bank. That I consider a fair charge to Newcastle because it increased the accommodation for ships.

536. What is the present cost of dredging at Newcastle? Last year the dredge "Newcastle" removed 1,190,000 tons, and the cost was slightly under 2½d. a ton for dredging and depositing the silt at sea. The work of the sand-pumps does not reach 2d. per ton.

537. You were speaking about the dredging operations after 1875? We went on dredging the bank until it was removed. Then there was a large area for ships. The flood deposit was not so marked at that time, but about 1889 there was a considerable accumulation from floods. Then the heavy floods coming in 1890 and 1893, filled up the harbour to a very large extent. Since 1893 we may be said to have been almost wholly engaged in removing Hunter River deposits with the ladder dredges.

538. Do you think the deposits lessened the force of the scour in the channel? They do in this way, there is a less body of water coming in from the sea, and less scour upon the bar in consequence.

539. Is it probable that when you have removed the deposit there will be a greater scour on the bar, and that any portion of the deposit near the end of the breakwater will be taken away? The deepening of the bar which took place I consider due to the effect of the breakwater, and in consequence of the greater body of water coming into the harbour, caused by the deepening of it by dredging and the increased scour produced thereby. The deepening of the bar is attributable to these two causes, but chiefly, I think, to the extension of the northern breakwater. The result became very manifest after the southern breakwater was extended. There has been as little water on the bar as 15 feet; sometimes it would be 20 feet. It was very uncertain as far as the depth was concerned. It was this uncertainty of the depth of the water upon the bar that militated to a great extent against vessels coming to Newcastle. They could not rely upon a regular depth at the bar. That has been to a large extent cured, almost wholly cured, as far as a depth of 21 feet is concerned, by the extension of the southern and northern breakwaters.

540. *Mr. Davies.*] What does it cost to tow the silt to sea from the Newcastle Harbour? The cost of work last year was a little less than 2½d. per ton—1d. for towing, and about 1½d. for lifting. This was the dredge "Newcastle's" dredging.

541. What was it for the year 1893? A little more than that. I could give the amount exactly by referring to my books.

542. Did it cost considerably more than it cost last year? It cost very much more some time ago.

543. What is the highest price that you have paid for lifting and towing the silt to sea from Newcastle Harbour? I suppose 6d. or 7d. per ton.

544. Is the towing done by your own boats? Yes, by our own steamers.

545. At the time you speak of, when it cost 6d. or 7d. a ton, was the silt towed out by your own boats? Yes.

546. What is the quantity of silt and sand that you lift in the harbour? The total last year was 2,200,000 tons; but we are going on more rapidly now, and a greater quantity will be lifted this year.

547. A larger quantity this year than last year? Yes, by the sand-pumps and ladder-dredges combined.

548. Will the present year show larger operations of lifting and pumping than any previous year? I anticipate so.

549. How do you account for the larger quantity of silt and sand being found in the harbour this year as compared with previous years? There was quite as much material to be lifted last year, but the appliances were not sufficient. Now we have more appliances for removing the silt.

550. Have you got additional dredges? We have sand-pumps.

551. Are they an improvement upon the original dredges? Yes; the sand-pumps are a great improvement. This year the output will not merely be Hunter River deposits, much of it will be sand, because at Stockton we are cutting down the point and reclaiming, and similarly we are reclaiming on the other side, at the new basin. We are pumping the material ashore.

552.

* NOTE (on revision):—In 1875 the tons were 650,760, costing £17,762 8s. 1d.; in 1894 the tons were 2,153,920, costing £26,556 17s.

- A. B. Portus, 552.** Did I understand you to say that the principal portion of the material raised is mud from the embankments of the Hunter? I was speaking of the 1,170,000 tons raised by the dredge "Newcastle." We have another ladder-dredge called the "Samson"; in all two ladder-dredges and two sand-pumps. The sand-pumps are lifting sand on to the reclamation areas, and the ladder-dredges are raising mud, which is carried out to sea.
- 27 Mar., 1895.
553. Where is the sand on which the dredges are employed? It is lifted in the basin in course of construction. There is one sand-pump there, and the other is employed on the Stockton side.
554. You are depositing a good deal of sand on the Stockton side? Yes.
555. Is the reclamation area shown on the map finished, or is it in course of construction? It is in course of construction.
556. Have you found that where the works are being carried on, opposite Stockton, there is a less deposit of silt and sand than there formerly was? No; we are breaking into new ground there altogether. But there has been a great deposit of silt opposite Stockton nearer the sea. A strong current came down on the south side, and there was no current on the other.
557. Are you familiar with the proposed works for the purpose of improving and deepening the entrance to Newcastle harbour? Yes.
558. What influence do you think the works will have if they are carried out, as far as the accumulation of silt and sand is concerned; will the narrowing of the channel have the effect of scouring out the harbour? It will have some influence; but we shall still have to keep the dredges going.
559. So there will really be no economy as far as the work is concerned? There would be some economy if the floods ceased; but as long as the floods occur the dredges must be kept going.
560. Then the real advantage of the proposed works, if they are carried out, will be to scour the entrance, and make deeper water for the shipping trade? Yes.
561. Have there been many complaints made to you in reference to the want of safety in the approach to the harbour? Many complaints have been made by people trading to the port of Newcastle, ships having to go away insufficiently laden.
562. What is the nature of the complaints? That there is not sufficient water inside the harbour for the ships to be taken off to the buoys; but the chief complaints are, as to the want of water on the bar, the larger class of vessels having to be sent away without being sufficiently laden.
563. Is there much change in the character of the shipping which now comes to Newcastle, as compared with what came formerly? Yes; very much larger vessels come.
564. What trade are they engaged in? In the coal trade; some vessels go there for wool.
565. Are there any large steamers taking wool and meat from the port of Newcastle? Wool is taken from there; but I am not certain about meat being taken.
566. Has there been any improvement in the trade and commerce in the port of Newcastle during the last five years? Yes; I think the quantity of coal shipped has increased.
567. Notwithstanding the continuous strikes? I think the average for the three years is higher than it was for any preceding three years, notwithstanding the strikes.
568. The quantity exported has been larger? Yes; the trade in coal and wool, &c., is carried on by large steamers going there—the Aberdeen line and others.
569. If the works are carried out as proposed, will it give greater security coming to and leaving the port of Newcastle, by increasing the depth of water in the channel? Yes: undoubtedly it will.
570. Will that have the effect of increasing the trade of Newcastle? I believe it will.
571. Have any complaints been made to you by traders to Newcastle of the want of safety in the approach? Not so much of the want of safety as the want of depth of water on the bar.
572. There has been no complaint about the port not being safe to approach? No, not on that score.
573. From your long knowledge and experience of the port do you regard it as a safe one at all times? It is not as safe a port as Sydney Harbour, but I consider it a safe port.
574. Are you of opinion that if the breakwater on the northern side is extended as proposed by your Department it will make the approach to the port still safer? I am.
575. Do you believe it necessary to extend the southern breakwater beyond its present extremity? I think the southern breakwater should be continued up to its original distance, as proposed; then the matter could be tested as to the deepening of the water on the bar, and if necessary the breakwater could be continued still further. I do not think it will be necessary. I think that the extension will deepen the water at the bar, and let vessels drawing 26 feet enter the harbour.
576. You do not think it necessary to go beyond the present original boundary? No; you would get away out into deeper water then; the effect of the extension of the northern and southern breakwaters has been to shift the bar seaward about 600 feet.

THURSDAY, 28 MARCH, 1895.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHREY.
The Hon. JAMES HOSKINS.
The Hon. JOHN DAVIES, C.M.G.

CHARLES ALFRED LEE, Esq.

The Hon. CHARLES JAMES ROBERTS, C.M.G.
JAMES HAYES, Esq.
ROBERT HENRY LEVIEEN, Esq.

The Committee further considered the proposed Harbour Improvements at Newcastle.

Alexander Brown Portus, Esq., Superintending Engineer of Dredges, Harbours and Rivers Branch, Department of Public Works, sworn, and further examined:—

- A. B. Portus, 577. Mr. Davies.]** I was asking yesterday, when the Committee rose, if the proposed northern breakwater were carried out to the point which the Department suggest, what influence it would have on the channel? It would have the effect of deepening the bar, carrying the deposited material to seaward just as the extension before has had that effect; but it will do it to a greater extent.
- 28 Mar., 1895.
578. You will see from the plans that the Department propose to leave a space near the proposed breakwater which the Engineer-in-Chief proposes should be for a wave-trap? Yes. 579.

579. Have you had experience, here or elsewhere, of wave-traps? No; but I have read about them. A. B. Portus,
 Esq.
580. And do you confirm the opinion of the Engineer-in-Chief that a wave-trap is likely to be of very great service at that point? Yes; as regards keeping the water still in the harbour. 28 Mar., 1895.
581. It will have an influence upon the waves? Yes; the best authorities on engineering recommend wave-traps or stilling-basins as they call them.
582. Do you favour the circular form of the breakwater on the northern side of the new works? Yes.
583. Will that be as strong as if the existing breakwater were continued straight through dispensing with the wave-trap? It will not be as strong, but we never have any very severe weather from a north-easterly direction. Most of our bad weather is from the south and south-east and east.
584. That is where the difficulty hitherto has existed? Yes; the south-east gales coming in.
585. Then, from your general knowledge of the port and the proposed work, you are of opinion that the works if carried out, will deepen the approach to the harbour and will keep it free from silt, and that a scour will be created which will give a better and safer entrance than there has been hitherto to the port of Newcastle? Yes; I consider that it will have the effect of deepening the bar. That will be the principal good result arising from it. I base my opinion upon what has occurred in the past. I always looked upon it as an unfinished harbour, the north breakwater being incomplete.
586. What influence would the narrowing of the entrance to the harbour by the extension of the breakwater have upon the floods in the Hunter River? I take it that it will not be narrowed at all by the extension of the breakwater. The same sectional area will be preserved, and the channel will be improved by the scour.
587. If that breakwater was not carried out on the northern side would not the water get away quicker? No. It would be governed I consider by the sectional area between the pilot boat-shed and the northern breakwater.
588. Is it narrower there than it would be at Stony Point? There is not very much difference. In 1874 Mr. Keele made a survey, and the sectional area was 29,762 square feet from the boat harbour across to the first point on the northern breakwater, and the sectional area at Stony Point was 28,536 square feet.
589. Are you satisfied in your own mind that the works will not have the effect of backing up the flood waters in the Hunter River by reason of the carrying out of the northern breakwater? I cannot say that it will. The river will be no worse than it is at present. There will be a better scour because the channel will be deepened.
590. Are you of opinion that the additional depth which you will have in the waterway will make up for any contraction of the entrance caused by the northern breakwater? I think so.
591. Have you anything further to mention to the Committee? Yesterday you spoke about the cost of dredging the harbour.
592. You promised to bring a return? Yes, but it is not quite finished. I have a diagram here which shows the relative cost of dredging the harbour.
593. Do you produce a diagram showing an estimate for the dredging which has taken place in the various harbours, including Newcastle, over a period of years? Yes.
594. How many years? Over a period of twenty years.
595. That will show the cost and quantities taken out in each of the bar harbours in the Colony? No, it shows the total quantities. We have dredged nearly 60,000,000 tons altogether, and the quantity dredged at Newcastle is 23,000,000 tons.
596. Very nearly half of the total has been dredged at Newcastle? Yes, twenty-three sixtieths.
597. Will that diagram show the cost of each year? Yes.
598. And the dredging at Newcastle and all the other ports? Yes. I find that the work at Newcastle in 1875 cost 5½d. per ton, and that last year the cost averaged 2·95d.
599. When that diagram is completed will you hand it in? Yes.
600. The cost to the Department for lifting and depositing silt in Newcastle harbour is less now than it has been for years past? Yes, it is much cheaper.
601. Is that wholly attributable to the fact that you have sand-pump dredges, or that you have a cheaper system of punting? The general management has a great deal to do with it. We work during the whole of the twenty-four hours with one of the dredges, sixteen hours with another, and the dredges are all in first-class order. We claim to dredge cheaper in New South Wales than similar work is done in any other part of the world.
602. It is cheaper here than it is in any other part? Yes, judging by Mr. Wheeler's book published last year.
603. Does he give the relative cost? Yes; he states what is done on the Clyde, on the Tees, and in different ports in Europe and America. He gives an instance of dredging on the Clyde, the material having to be towed 7 miles. I compared the cost with our dredging at Sydney and Newcastle, and in both cases our work is cheaper than the Clyde work.
604. You have not credited your Department with the land which was reclaimed by dredging? No.
605. On the Stockton side you are reclaiming now? Yes. But in calculating the relative cost of dredging here and dredging in England that does not enter into the reckoning. There is scarcely any reclaiming done in England. On the continent a little is done, and a good deal is done in the United States.
606. As far as your knowledge goes the dredging is done much more cheaply here than in England? I do not say much more, but it is cheaper.
607. *Mr. Lee.*] Would you be kind enough to point out on the map of Newcastle harbour the area from which you have taken the silt during 1894? It extends from the western end of the northern breakwater in a line with Watt-street to a point where the extension of the dyke wall would cut the southern bank of the river to the south-west corner of the present training-wall, following then in a southerly direction to Watt-street, then following the Hunter River, where it would intersect the southern bank of the river, then following the western bank of the river to about Robertson-street, then by a line across the river to the eastern bank, and from the eastern bank to the point of commencement. In addition to that reclamation dredging has been done inside the basin.
608. That is the area within which you took over 1,000,000 tons of silt in 1894? Not over the whole of that area, over a portion of it.
609. You have already stated in reply to a question that since the flood of 1893, you have been engaged in removing the deposits left by the flood? Yes; in conjunction with dredging for reclamation purposes. Some of the dredges have been engaged in the basin, and others on the northern point removing sand which would not be silt from the Hunter. 610.

A. B. Portus, Esq. 610. I understand you to say that since the flood of 1893, you have been wholly engaged in removing the deposits of that flood? Two of the dredges were so employed, and the other two were engaged on the reclamation works.

28 Mar., 1895. 611. Can you draw a distinction between flood deposits and the ordinary sand silt? Yes.

612. That amount of material has been taken out within the area indicated? Yes.

613. Was the water, prior to your dredging out that area, deeper or shallower than that in the channel after the deposit of 1893? It varied very much. In the horse-shoe it would be 26 or 27 feet; that would be more than it was on the bar. In the upper part of the harbour in some places it shoals to about 18 feet, and on the Stockton side 18 feet.

614. Was there any clearly defined line as to where that flood line ceased on its passage out? Yes; in a line from Watt-street.

615. And from that point out to sea there was very little? Very little.

616. Could you give the Committee any theory of your own as to why the floods deposit so much matter in that particular spot? My theory of it is this: As I stated yesterday, in the old times, when we had a large central sand-bank in the harbour, there was little or no deposit after floods; the stuff was swept seaward, and we seldom found more than 9 inches of deposit. We commenced to have these flood deposits after we had dredged the harbour out, the current becoming sluggish at the wide and deepened area.

617. I should like that point made clear;—when the bar and the channel were practically in a state of nature, there was very little flood deposit? I do not say the bar; I am speaking about the inside of the harbour.

618. Is it because the water within the harbour had been deepened that the floods were depositing so much silt? It is deposited, not only at the time of the floods, but it goes on slowly for weeks and months afterwards, just as special deposits take place up the river where the conditions are somewhat analogous.

619. About the time when the sand-bank was removed, was anything done to deepen the channel seaward? The southern breakwater had been run out.

620. Had that section of the southern breakwater the effect of causing a greater scour, and making the water deeper;—was there a deepening of the channel in the outward passage? Well, it had its influence on it.

621. Did it deepen it? Yes; it must have done. Soundings were taken by the Harbour Master in 1871, and they revealed a considerable depth due to the scour.

622. You were dredging the sand-bank about the time that the southern breakwater was being extended? Yes.

623. Consequently you were deepening the channel there? Yes, by the breakwater, and our dredging indirectly assisted that work. We gave a greater area for the tide to come in, and more scour was created.

624. About what year was that? In 1875 we commenced to deepen the bank; we had been deepening it before, but there was no visible effect before 1875.

625. This and the breakwater work were completed long before 1893? Yes.

626. Then, notwithstanding that you deepened the channel, and the breakwater had set up a greater scour, the deposit in the harbour in 1893 was greater than ever? Yes, by reason of the great flood of 1893. Serious floods before had contributed to it. There was a heavy flood in 1876, and then a cessation of floods for about thirteen years. We had a flood in 1889, two floods in 1890, and a great flood in March, 1893.

627. In 1893 the outlet of the port had been considerably improved from various causes? It would hardly be fair to say 1893, because there had been floods before that.

628. The port of Newcastle had been considerably improved? Yes.

629. And in 1893 there was the highest flood on record? Yes.

630. And that left the heaviest deposit of silt ever left in Newcastle harbour? Yes.

631. That being the case, how does it come about that that silt deposited itself in that particular spot—that is to say, at the commencement of the scour, or, rather, that is where it terminated? There has always been a greater depth there and the channel is narrow, therefore the scour is greater there than further up. Deposits always take place where the current is sluggish owing to increased width.

632. But at that particular point you had contracted the current? No; we had been increasing the area by removing the central bank.

633. But, at the same time, you had been contracting it on the north side—on the northern breakwater? No; after the northern breakwater was erected the effect was to sweep away the sand-bank that existed there.

634. Had you much opportunity of personally observing the influence of floods and tides? It is fifteen years since I left Newcastle.

635. You were there during some of the high floods? Yes.

636. Do you agree with the theory that in time of flood if there is a heavy easterly gale blowing up it impedes the outlet of the flood-waters from the river? I believe it does, especially south-east gales. Generally the floods come at a period when the south-east gales prevail, but the gale is generally over before the flood-waters come down the river. The gale rages whilst the rainfall is going on.

637. You think it possible that it does pile up the waters at the entrance to the port, and thus prevents the rapid outflow of water? My experience is that the south-east gale was not raging when the great body of flood-water came down the river.

638. The south-east gales have blown when the flood-waters were very high? Yes. But generally it will be found that the fury of the gale has passed. An easterly gale would be more likely to have such an effect.

639. At all events, any gale would have an influence on the water going out of the port? It must necessarily back it up.

640. Supposing that the flood-waters were coming strongly down the harbour, and the entrance to the port was blocked by a heavy gale, would not that cause a temporary stoppage of the flood-water, or reduce the current, and make it more or less stationary, and thus enable the flood-water to deposit its sediment;—is there anything in that theory? I do not think so. The deposit always takes place for some weeks after the flood—it goes on slowly. I believe that greater harm has resulted from a series of small floods than from a large flood. That of 1893 was exceptional. The small floods are most disastrous. The mud is kept in solution, and the flood-tide meets it and a deposit takes place.

641. You have known the Hunter River for a great number of years? Yes.
 642. You are aware that the river overflows its banks at many points? Yes.
 643. And covers very large areas of country? Yes.
 644. Do you know the sectional area of the river at Raymond Terrace, and at Boiling Down, and at Hexham? Yes.
 645. We have it in evidence that the sectional area of the port is two and a half times as great as the sectional area at Hexham, which has the largest area at any point on the river? Yes, I should think it would be about that.
 646. You are aware that an enormous body of flood-water does not come down the river channel at all? Yes.
 647. That portion of it which overflows can only find its way into the river channel again at some lower point when the water has subsided at that point? Yes.
 648. Therefore it would not be strictly sound to depend on this or the sectional area at Newcastle carrying all that volume of water which goes over the river banks? It would be governed by the height at Hexham. It is on record the greatest height that the flood waters have reached at Hexham, and a sectional area was taken from that.*
 649. I think sectional areas are usually given of the carrying capacity of the river, but the water has been many feet over the banks at Hexham? Yes.
 650. After your long experience you are of opinion that the extension of these harbour works will not do away with the necessity for dredging in the harbour? The extension will not do away with the necessity.
 651. But what has happened in the past is likely to continue? Yes. As long as the port of Newcastle has the area that it has at present for shipping we may expect to have deposits of silt.
 652. If you were not to keep removing the silt your area for berthing ships would, of course, decrease? It would, and in the course of years it would go back to the condition that it was in twenty-five years ago.
 653. As far as can be seen at present these dredges will have to be kept at work? They will.
 654. Do you view the proposed harbour works as an assistance for keeping the harbour clear, or only as the means for affording a better sea-way into the port? I look upon them primarily as necessary to afford better access for the ships; a great benefit will be derived from the deepening of the bar.
 655. Mr. Hayes.] Were you in Newcastle when the northern breakwater was made? I was.
 656. There was a bank, as indicated on the plans, in the harbour when they commenced constructing the breakwater? There was.
 657. And the effect on the breakwater was to remove that shoal or sand-bank? Yes.
 658. Has that bank now formed at the eastern end of the northern breakwater? Nothing like to the extent that it was originally.
 659. Mr. Darley says that the water has shoaled there nearly 10 feet on the north-eastern end of the breakwater? When did that take place?
 660. Since the northern breakwater was erected? I think there was an accumulation of sand inside.
 661. The effect of the breakwater has been to remove the shoal on the western side of the northern breakwater and to cause a deposit on the eastern side? No; the great bulk of the sand has been swept away; but there may have been some deposited on the inside. It would not be right to say that it had been shifted from one end to the other.
 662. Have you anything to do with the work outside? No.
 663. Then you do not know practically whether it would be the case or not? It would not be fair for me to say anything about it, as I have not been living there for fifteen years.
 664. Was the northern breakwater finished before they commenced the extension of the southern breakwater from Nobby's? I think that the two works were going on together about 1874.
 665. Was the northern breakwater extended very much before you commenced the southern breakwater? Yes; it had been extended some distance before that.
 666. What is the effect of the extension of the northern breakwater as regards bringing the waves into the harbour? Opinions were divided as to the result of extending the northern breakwater.
 667. I want your own opinion? My own opinion was that there was very little difference. I considered that any uneasiness of the ships in the harbour was due to the fact of the ships being moored so short a distance from the ocean. In any harbour in the world so near the ocean vessels would lie quite as uneasily as they do at Newcastle. In any harbour so situated you would have a like condition of things to that at Newcastle.
 668. After the southern breakwater was extended to its present position, did not that make the harbour much quieter? Yes; it was quieter after that.
 669. The effect of extending the southern breakwater was to relieve the harbour? Yes, to some extent.
 670. Did it not relieve it altogether? Not wholly. During heavy gales there would be a swell inside, but it mitigated the swell to a very great extent.
 671. You have been in Newcastle when flood-waters have been going out during a heavy flood? Yes.
 672. Were you there in 1875? Yes.
 673. That was before you removed the bank? Yes; we had just commenced at that time.
 674. In your opinion has the removal of the bank facilitated the discharge of flood-waters from the Hunter? I cannot say that it has. We have no means of judging. It would be governed by the discharging area at the Boat Harbour.
 675. I suppose it was essential to remove that bank to provide accommodation for the shipping? Yes. There was an outcry on all sides about the want of accommodation.
 676. And the effect of that was to deposit silt in the still waters? Yes.
 677. But it was essential to do it? Yes. Newcastle might have shut up her port if increased accommodation had not been given to the shipping.
 678. You have had considerable experience in dredging operations? Yes.
 679. Would it be possible, in your opinion, in fine weather to dredge on the bar, in order to give an increased depth of water? It would be rather a risky business. It would be absolutely impossible to use ladder-dredges on the bar. It might be feasible to dredge with sand-pumps in very fine weather. The work could not go on at flood-tide, because, in dredging with a type of sand-pump suitable for dredging in rough water, a very large percentage of the sand lifted flows over the top of the combings back into the sea before the hopper can be filled. The percentage of sand lifted with the water is about one-fifth, or say

A. B. Portus,
Esq.
28 Mar., 1895.

* NOTE (on revision):—I find on inquiry that both at Newcastle and up river the area was taken at low water.

A. B. Portus, say one part of sand to four parts of water. During flood-tide that sand would be swept into the harbour, Esq. and would do a great deal of harm.

28 Mar., 1895. 680. Would not the ebb-tide carry it away? No, I do not think so. It is sea sand, and sea sand deposits very readily.

681. But there are strong currents going out there. We have been told by Mr. Darley that since the extension of the southern breakwater the bar has gone seaward 800 feet. Does not that show an immense scour? Doubtless that sand would be swept away if it were deposited in a part of the harbour where the current was very strong; but probably it would be deposited where there was no strong current and there it would remain. It would be dangerous work dredging on the bar with the oyster-bank on one side of you and a reef on the other.

682. You do not think it would be practicable? I do not think it would be a very great success. Then there is always a chance of it filling up again—it would be an irregular bar. The great curse of the harbour in the old days was that sometimes it was deep on the bar, and sometimes it was shallow, and the commercial community had no confidence in the port.

683. Is it not a fact that the bar is now silting up year by year? There has been considerable filling up 700 or 800 feet seaward off the original bar and there has, during the past year, been a still further filling up, but I think it has been caused by the scour that we have had the advantage of for the past few years not being strong enough owing to the reduced quantity of flood-water coming in as a consequence of the diminished space in the harbour.

684. Then in the last year or two has the area of the water in the harbour diminished? It has been diminished by the floods. We have been gradually removing the deposit—we removed over 1,000,000 tons last year. Now more water can come in, and there is a greater scour.

685. Then the scour is now improving? Yes; and I anticipate that the silt shoaling that has taken place lately will disappear as we go on dredging.

686. To what extent has the harbour silted up? It silted up from about 26 feet in many places to 19 feet, and in some places to 13 feet.

687. That is being removed? Yes, rapidly.

688. You anticipate that when you get to the original depth again the scour will be increased? It will get back into the condition that it was in seven or eight years ago.

689. You will see by the longitudinal section on the map a bank going out to sea to a considerable extent? That I take to be the section of the sand sent seaward by the northern and southern breakwaters being extended out. We always looked upon the bar as a plateau of rock about 23 feet, and extending about 700 feet a little to the east of north from Nobby's.

690. Looking again at the longitudinal section the effect has been to remove the bar, say 800 feet, out into deep water? I have seen as little as 15 feet on the bar. In 1880 we took soundings on it, and found 21 feet of water on the bar. We used a probe and found rock at about 23 feet. The shoal has gone away seaward, and now it has accumulated up to about 23 feet for a distance out.

691. What are the most recent soundings on the bar? About 22ft. 6in.

692. Of course you do not attempt to give any opinion as regards the result of the proposed works? Judging from what has occurred in the past, as I have said before, I have no hesitation in forecasting that the deep water will be extended further out, the accumulation will be swept out to sea, and the bar will be deepened north of the present line of fairway.

693. You think the effect of the proposed work will be to increase the scour, carry the bar out to deeper water, and deepen the channel generally? Yes, to some extent.

694. *Mr. Roberts.*] The large accumulation of silt is immediately outside the bar, is it not? Yes.

695. Could you tell me the farthest point seaward at which dredging operations have taken place? Not farther than a line running due north from the Boat Harbour? The farthest point is from a line running from the root of the guide-wall to about midway between the original shore-line shown on the map.

696. What is the greatest depth of water in which you have been using the dredge? About 32 feet.

697. That must necessarily be in smooth water? Yes; for ladder dredges. With sand-pumps you can work where there is a slight lift of the sea.

698. You would not recommend the use of a dredge to remove accumulations of silt outside the bar? No, it would not be desirable. The best plan would be to extend the breakwater. It is not recommended by engineering authorities to do by dredging what can be accomplished by training-walls.

699. I presume you have made yourself thoroughly acquainted with the proposed improvements? Yes, I have.

700. Do they entirely meet with your approval? Yes.

701. Is there anything, however small in detail, that you could suggest to the Committee which might be included in the scheme? I do not think so.

702. Has your attention ever been directed to the efficacy of that wave-trap on the southern shore? We have had no experience of wave-traps in this Colony. Sir John Coode designed one for Westport, in New Zealand, but it was only completed last year.

703. I think we have it in evidence that a wave-trap has existed for some years to the eastward of Stony Point? Inasmuch as Stony Point and the contour of the shore lines between Stony Point and Boat Harbour furnish a natural wave-trap, that is correct.

704. Has it come under your notice that that wave-trap has prevented rough seas from entering the harbour? It has mitigated the movement, and operated very beneficially.

705. Do you think the wave-trap suggested for the northern breakwater will also prove successful? Yes; I was very much pleased when I saw the design; I thought it was an admirable idea.

706. You feel satisfied that the erection of that northern breakwater will have the effect of causing a greater scour, and so get rid of this accumulation of silt? I have no doubt in my mind about it, judging from what has occurred in the past.

707. *Mr. Levien.*] Do you think that if they extend this northern breakwater, and repair the southern breakwater, that will retard the flood-waters on their way to the sea? No; I do not think that it would. I think that would be governed by the area extending across from the northern breakwater to the southern guide-wall. I think in the long run it will be a distinct advantage, because the scour will go on, and the section across there will be deepened.

708. There would be a wider escape for the water than there is now? No; it would be governed by the sectional area which I have mentioned.

709.

709. Mr. Lee asked the other day, whether, if there was a great sea on, that would retard the flood. A. B. Portus, Esq.
 water from going out? I think it would to some extent.
710. And it would keep the flood-waters back? Yes; as long as the gale lasted. But my recollection is that the gales are generally antecedent to the coming down of the flood-waters. *28 Mar., 1895.*
711. Is it not the general opinion of the people up north that the gales keep the flood waters back? Yes; but my observation has been that the force of the gale was over before the flood waters reached Newcastle, the gale continuing afterwards, but not to the same extent.
712. At all events if there was a gale at a time when a flood was coming down, and big seas were breaking in, it would keep the water higher up the Hunter than it would if there was no gale at all? Yes; especially if it was an easterly gale.
713. *Mr. Hoskins.* Are the Committee to understand that from your observations the breakwater that has been built on the southern and northern sides of the entrance to the port of Newcastle has caused a scour that has deepened the bar? Yes.
714. It has been stated in a memorandum laid before the members of this Committee that the depth of the water at the bar now is 24 feet; do you believe that that depth has been caused by the erection of the breakwater? Yes; and by the scour thus caused, and also, as I have stated, in consequence of the dredging inside of the harbour making room for a greater body of water to come in from the sea. That, in conjunction with the breakwaters, has caused the scour.
715. You think that the dredging of the harbour has caused a greater flow of water through the entrance? I do.
716. Would not that have a tendency to relieve the flood waters in the upper part of the river? The floods come down with such extraordinary force that it is scarcely an element in the calculation. No doubt it does help it, but not to a very great extent.
717. At the same time the improvements made in the channel of the entrance to the harbour have led to the more rapid discharge of flood waters into the sea? I consider so.
718. Although it is fifteen years since you resided on the Hunter, do you frequently make visits there? Yes.
719. We are told that the work is to cost £140,000, the operations to be extended over five or six years. Do you not consider that at favourable times dredging might be carried on at the bar and the depth of water be thus increased without going to the large expense of extending the breakwaters? If we had some very large sand pumps suitable for the work, I think it might be done; but it is problematical whether it would be a success. I consider that the extension of the breakwaters will be a success. The other would be a piece-meal way of dealing with the matter, and there would be a liability of the bar silting up again. It is not recommended by engineering authorities in the old country to dredge where you can carry out training walls.
720. Have you not a dredge called the "Jupiter" which could carry out that work? The "Jupiter" could work there.
721. I am asking this in consequence of the great expense proposed to be incurred in deepening the harbour. Are you not aware that dredging is being continually carried on at the mouth of the largest river in Europe—the Danube? Yes; I am aware of that.
722. Do you know that there are extensive operations carried on at the bar of the Mersey? Yes; but I do not think there is any place where the risk would be so great as it is at the entrance to Newcastle harbour. You are between Scylla and Charybdis. On one side you have the oyster bank, and on the other side you have a reef. It would be difficult to work a sand pump at such a place. I would rather attempt to dredge out at sea than on the Newcastle bar.
723. You consider, from the narrowness of the entrance, that there would be peculiar dangers attendant upon such an operation? I do.
724. Do you not consider, looking at the amount of money it is proposed to expend, that dredging on the bar in fine weather would be more economical than carrying out the expensive works now proposed? Looking at the fact that the prosperity of the country is so largely mixed up with the prosperity of Newcastle—the coal of Newcastle being of the best, if not the very best, in the world—I think it would be a wise policy to spend a large sum of money in making as good a port as possible at Newcastle.
725. I suppose you have an idea of the amount of money that has been spent there—upwards of £1,000,000? Yes; and I am well aware how very largely it has contributed to the welfare of the country too.
726. Has it come to your knowledge, from reliable sources, that with one or two exceptions the vessels that go to Newcastle can take away two loads of coal, vessels carrying 3,000, 4,000, and even 5,000 tons? Yes; but there is an increasing tendency to go in for large steamers. Newcastle will be left behind if she has a bar which limits the size of the vessels which can enter the port.
727. Do you know that some of the ports of England have bars? Yes; but there is a great rise and fall of the tide there.
728. Have not vessels of the White Star line, the Port line, and others gone and taken loads of coal from Newcastle, and is not one of the Gulf steamers there now? Yes.
729. Have you known of many going away without being fully laden besides that five-masted French ship? I have known several to go away without taking a full load. Complaints have been received from people in England that owing to the bar the vessels could not be fully laden.
730. I suppose you know that some very large vessels go to Newcastle? Yes.
731. Larger than the vessels which went there twenty years ago? Yes.
732. Can you give the draught of the vessels of different sizes, say, 3,000 tons, 4,000 tons, and 5,000 tons burden? The draught of the vessels varies.
