At a special meeting of the Railway Committee, held this afternoon, the following resolutions were adopted:—1. "That this meeting heartily approves of the action taken by Messrs. See, Purves, Fergusson, Murray, Copeland, and other Members of Parliament, in taking exception to the omission by Government from the Ministerial policy this Session of the proposal for the construction of the Grafton and New England railway." 2. "That, in the opinion of this meeting, the Government should make provision during the present Session for the construction of a line of railway from Grafton to Central New England (Glen Innes), and that the Members for the Northern Districts be requested to promote the furtherance of this end by every possible means." 3. "That a public meeting be convened by the Chairman for Monday next for the purpose of adopting a petition to Government urging that provision be made this Session for the construction of a railway from Grafton to Glen Innes; that a second petition to Parliament in support of such a proposal be made; also that the Mayor (Mr. T. Page), Messrs. G. Foott, J. H. Munro, and S. See be appointed a sub-committee to draft petitions and prepare resolutions for a public meeting, and do any other acts that they shall consider calculated likely to contribute to the attainment of the object in view." 4. "That a copy of the foregoing resolutions be forwarded by the Chairman by the first post to Messrs. See, Purves, Fergusson, Murray, Copeland, and the other Members of the Assembly." The committee meeting was more largely and influentially attended than any for a long time past, and the only persons who voted against the resolution for the route to Glen Innes were Messrs. P. Marcolino, T. Shoveller, and W. Attwater. One speaker (Mr. S. See) stated that over 300 tons of merchandise were at Grafton awaiting carriage to Glen Innes and the neighbourhood, some of which had been there for over six months, independent of what was taken by over 170 teams now on the road.

No. 60.

J. M. Purves, Esq., M.P., to The Secretary for Public Works.

Re Railway from Grafton to Glen Innes.

Sir, Sydney, 8 December, 1881.

Referring to my letter of 1st August last in connection with the existing trial survey for the construction of the abovementioned railway, I would most respectfully and earnestly express a hope that the Government may be able to see their way to having it improved and worked up on some principle similar to that adopted as regards the western line, by which means a considerable reduction on the estimated expenditure may be effected, and the construction of the railway prove no extraordinary difficulty.

I understand that the surveyors engaged on Quinn's line have almost completed their work, and I desire that they may be sent at once to work up the present survey, especially at the part where it presents some little difficulty. I need hardly allude to the great want that at present exists for cheaper and more rapid carriage between that part of the table-land and the coast. That is self-evident from the quantity of supplies now lying at Grafton awaiting carriage, not taking into consideration the number of people who get their supplies from Brisbane. I am a director of a company that has just obtained a large quantity of iron from Brisbane, it being the cheaper and quicker route.

Respectfully asking for this most important matter your earnest and immediate consideration.

I have, &c.,

JNO. M. PURVES.

Forward to Engineering Department.—CH.A.G., B.C., 28/12/81. Everything suggested by Mr. Purves has been done, and the surveyors are at work on the length from South Grafton to Glen Innes.—J.W., 5/1/82.

(1.) GRAFTON AND NEW ENGLAND RAILWAY:—MR. FERGUSSON *asked* THE SECRETARY FOR PUBLIC WORKS,—If the Government have reconsidered the Grafton and New England Railway; if so, is it the intention of the Government to take action this session?

MR. LACKEY answered,—The Government will not be in a position to submit any proposal for this railway during the present Session.

No. 62.

J. See, Esq., M.P., to The Secretary for Public Works.

Sir, Sydney, 9 December, 1881.

I sincerely trust that you will recommend the Government to reconsider the matter of placing a sum of money upon the Loan Estimates for the purpose of constructing a line of railway from Grafton to Glen Innes.

There can be no doubt but that the line would pay, no matter how expensive the cost, as the trade between Grafton and the table-land is increasing daily, and already there is sufficient trade to pay the working expenses. If there was a railway the trade would be four or five times what it now is, because a very large quantity of stuff that is now sent to and from Brisbane would be shipped *via* Grafton. The importance of these Northern districts should not be overlooked. The output of tin is largely on the increase, and now represents fully half a million sterling per year. The wool trade is considerable and on the increase, and the stimulus that would be given to agriculture would be enormous, because in the district are some of the finest lands in Australia. Therefore, on commercial as well as national grounds, I strongly urge upon you to ask Parliament for the necessary loan this Session. I am sure the majority of the House would support it, and, if no better route is yet available, adopt the old one with alterations; and if before next year a cheaper route can be found, so much the better. It cannot, in my opinion, be a fatal reason because all the routes are not surveyed that we should not have the vote submitted, and it will in my humble opinion be quite competent and proper for the Government to recommend another route that the House may sanction it if found to be better than the one proposed.

There is an impression abroad that your Engineer-in-Chief is opposed to this line, and will do what he can to prevent its construction. If such is the case I hope the Government will act independently of his advice, and in view of the reputation the Government bears of being a "Railway Government," that they will undertake this important work this Session, and obtain the vote whilst Parliament is willing to grant it. Money cheap, and the necessities of the people demands it.

I have, &c.,

JOHN SEE.

Railways.—J.R., B.C., 13/12/81.

Sir, Department of Public Works, Sydney, 12 December, 1881.

Referring to your communication of the 9th instant on the subject of a line of railway from Grafton to New England, I am directed to inform you, after making surveys for a considerable time in different directions between the Clarence and the table-land, the route from Grafton to Glen Innes is considered the most eligible. Instructions have therefore been given to the surveyors now in the district to make a complete survey of this line.

Under these circumstances it will not be possible to place any sum of money on the Estimates for the present year, but plans will be prepared and ready to lay before Parliament during next Session.

I have, &c.,

John See, Esq., M.P. JOHN RAE.

Sir,

Sir, Department of Public Works, 12 December, 1881.

Referring to your communication without date, received this day, on the subject of a line of railway from Grafton to New England, I am directed to inform you that after making surveys for a considerable time in different directions between the Clarence and the table-land, the route from Grafton to Glen Innes is considered the most eligible. Instructions have, therefore, been given to the surveyors now in the district to make a complete survey of this line, and plans will be prepared and ready to lay before Parliament during next session.

I have, &c.,
JOHN RAE.

Extract from the *Sydney Morning Herald*, 16th December, 1881.

CLAIMS OF THE NEW ENGLAND DISTRICT FOR RAILWAY COMMUNICATION.

[From our own Correspondent.]

A RAILWAY meeting was held this evening at the Theatre Royal. The Mayor presided, and there was a large attendance. The theatre was crowded. After telegrams received from the district members had been read, a motion was submitted that the meeting terminate. An amendment was moved by Mr. J. H. Munro, seconded by Mr. D. Braham, that the following petition to the House of Assembly be adopted by this meeting, and signed by the Mayor as chairman, and forwarded by him to J. See, Esq., M.P., for presentation :—"To the honorable the Members of the Legislative Assembly of New South Wales. The petition of the residents of Grafton, in public meeting assembled,—Humbly showeth, That, for several years past the people of the Clarence and New England districts have urged upon successive Administrations, and upon Parliament, on national as well as on local grounds, that a railway should be constructed from the Clarence to New England. That in support of this demand voluminous statistics and other particulars have been submitted both to the Executive Government and to Parliament, setting forth the overwhelming claims of the large population, and the unlimited natural resources of these districts to consideration in the matter of railway construction. That so weighty have those claims been considered by various Administrations, that explorations of the country and trial surveys have been made at various points, one at least of which trial surveys, your petitioners are informed, is thoroughly practicable, and the estimated cost moderate, considering the enormous interest at stake, and in view of the future development of the resources of the districts of New England and the Clarence, and the increased settlement of population therein. That so important has this question been considered by successive Administrations that frequent and unconditional promises have been made that the railway from Grafton to New England should be undertaken. That the failure to fulfil the promise so made has led to a feeling of distrust and dissatisfaction in the minds of many people in respect to their treatment at the hands of the Government of New South Wales, and tends seriously to destroy all confidence in Ministerial utterances. That your petitioners submit that promises made to the people by the Executive Government, especially in respect of important public questions, should be faithfully carried out, if it is, as it should be, the desire to act justly to the people of all parts of the country, and so induce them to act with loyalty towards the Crown, and to have a firm reliance on the good faith of those entrusted with the administration of public affairs. That your petitioners fully expected, in accordance with previous promises, that the present session of Parliament would not be allowed to pass without provision being made for the construction of this much-needed and important railway line. Your petitioners have been assured that the Railway Department are prepared to recommend the adoption of a line of railway already surveyed from Grafton to Glen Innes, and they respectfully submit that under such circumstances to allow another year to pass without making provision for this line will be a great injustice to these northern districts as well as to the country generally, and go far to confirm the people in the opinion that the outlying districts of the Colony can expect but scant consideration at the hands of the central Government located at Sydney. That in addition to the reasons formerly urged in support of this claim, and which appear on the records of your honorable House, and before the Executive Government, your petitioners desire to submit that the time has arrived when provision should be made for the large and rapidly increasing population of the Clarence district being connected by the nearest and most practicable route with the railway system of the Colony. That your petitioners having learned with much satisfaction that such a route has been discovered, and that it has received the approval of the Railway Department, desire to submit that the construction of the line along that route should be no longer delayed. Your petitioners, therefore, humbly pray that you will take the premises into your most favourable consideration, and grant them such relief as to your honorable House may seem meet, and as will ensure the continued reliance of the people of these districts in the honour and justice of those entrusted with the administration of public affairs." The resolution was carried by an overwhelming majority, amidst loud applause.

LEGISLATIVE ASSEMBLY, MONDAY, 19 DECEMBER, 1881.

6. RAILWAY FROM GRAFTON, *via* GLEN INNES, TO INVERELL :—Mr. Murray presented a Petition from James H. Hindmarsh, Chairman of a public meeting of residents of Inverell and District, in favour of the construction of a line of Railway from Grafton, *via* Glen Innes, to Inverell; and praying the House to take the matter into consideration.
Petition received.

No. 69.

Extract from the *Sydney Morning Herald*, 19th December, 1881.

THE document sent to the Legislative Assembly, by order of a public meeting, held at Grafton last Thursday, in regard to railway communication between the Clarence and New England, reads more like a remonstrance than a petition. It accuses the Administration of failing to fulfil an oft-repeated promise, hints

hints at a consequent "distrust and dissatisfaction in the minds of many people in respect to their treatment at the hands of the Government of New South Wales," which seems to imply that the Government of some other country has treated, or would treat, them better than their own has done; and it repeatedly impeaches the good faith of Ministers and their justice and impartiality. If such language were addressed to Parliament, the petition would be rejected on the ground of not being respectfully worded; but as the Government is not Parliament, but only a body of men enjoying for the present the confidence of Parliament, that objection may be held inapplicable. Still we fail to see what the petitioners can gain by the use of such censorious expressions. Last Session over seven and a half millions sterling were voted for railways all over the Colony, and the Government has lost no time in preparing the necessary plans, and getting them approved by Parliament. Grafton is left out, because the Government is not yet satisfied that a good practicable route has been discovered, to say nothing of the best route. On all hands it is agreed that a railway from the Clarence to New England will be difficult, and its working expenses heavy, on account of the length and steepness of the gradients. A few weeks or months expended in exploration may save a large first cost, and a still greater sum in easier conditions of traffic for the future. The line over the Blue Mountains was a triumph of engineering, but it is believed a much better route might have been found, and that the working costs of the present line could have been materially reduced if closer study had been given to the curves. Another such costly experiment over the New England Ranges should be avoided if possible, and the Government is not to be blamed for seeking adequate information before committing itself to a definite plan. That Grafton and Glen Innes, or at all events the Clarence and New England, will be connected by railway before long, is tolerably certain; but the residents themselves are not so absolutely agreed upon the best route as to be entitled to lecture everybody else for not instantly making up his mind.

NEW ENGLAND RAILWAY REQUIREMENTS.

[From our own Correspondent.]

Grafton.

THE following letter from the Premier, in reply to one addressed to him by Mr. See, Member for Grafton, appears in to-day's *Examiner*, together with other correspondence, *re* railway:—

"20 December, 1881.

"In reference to our several conversations on the subject of connecting the Clarence with the table-land of New England by railway, I am, as I have often stated, in favour of the work being done. It is now eight or nine years ago since I gave my assent to this proposal. My retirement from office sufficiently explains why I did not attempt to do what I had no power to do for some years, from 1874 to 1879. Since the present Ministry took office at the close of 1878, other works of national magnitude have engaged the attention of the Works Department, but the question of opening the far Northern districts by railway to the navigation of the Clarence River has not been neglected. All the preliminary work, which has been of an exceptionally difficult character, has, in fact, been gone through, and plans may now be prepared, and the proposal submitted to Parliament within a few months; but if the work itself has been one of unusual difficulty, consideration, of policy of exceptional weight have to be determined in connection with the Clarence railway. It will unquestionably compete with the Great Northern line for traffic, and in this respect will occupy an unprecedented position in our railway construction. No other line has been made which directly competes with a line already opened, and upon this arises the serious question of the railway being worked for some years at a heavy loss. I do not myself enter into these considerations with any feeling of doubt, but that your railway would be so far successful that in a very few years its benefits would fully justify the expenditure. I believe it would in an unprecedented degree contribute to the development of the resources of the rich districts which it would unite and bring together. I have, therefore, no hesitation in stating my opinion that provision ought to be made for the construction of this railway during next year.

"Yours, &c.,
HENRY PARKES."

No. 73.

Memo. from W. J. Fergusson, Esq., M.P., to The Secretary for Public Works.

Dear Mr. Lackey, Sydney, Friday, 1882.

I start for Glen Innes to-morrow night; will you let me have the latest information about the Grafton and Glen Innes railway; I am sure to be asked about it.

Can I get it by to-morrow morning?

And oblige, yours, &c.,
WM. J. FERGUSSON.

Four surveyors now in the Clarence district have had instructions to make a complete survey of the line from Grafton to Glen Innes as early as possible, and I believe some of them are now engaged upon this work.—J.W., 20/1/82. Inform Mr. Fergusson in these terms.—J.R., 20/1/82. See also Sir Henry's answer to Mr. Fergusson on Business Paper of 15th December, 1881.—J.R. Railways.—J.R., B.C., 20/1/82.

Sir, Department of Public Works, Sydney, 20 January, 1882.

Referring to your communication of this day's date, I am directed to inform you that four surveyors, now in the Clarence River district, have received instructions to make a complete survey of the line from Grafton to Glen Innes as early as possible, and it is believed that some of them are now engaged upon the work.

I have, &c.,
JOHN RAE.

Railway Extension in the New England District.

[From our own Correspondent.]

Glen Innes.

The Railway Conference met this afternoon, presided over by the Mayor of Glen Innes, Mr. Edward Jones. There were fifteen delegates present, including Messrs. D. M'Rae (Furracabad), T. Bawden, J.P., S. W. Burridge, J.P., Alderman Utz, J. M. Munro, and Frank Norrie. Mr. Bawden delivered an exhaustive address, pointing out the immense superiority, in a national sense, of a line of railway from Grafton, *via* Glen Innes, to the West, over either a line from Grafton to Armidale, or Grafton to Tenterfield. The address was very much admired, and considered a pronounced answer to the opposition to the Grafton Glen Innes railway. It was unanimously agreed that the railway should start from Grafton, and travel *via* Glen Innes to the West. This resolution was proposed by Mr. S. See, and in seconding it Mr. S. W. Burridge particularly referred to the railway having been made from Grafton to Glen Innes in 100 miles, and costing £150,000 less than the previous estimate. It was agreed to form leagues in all the centres of population in central New England and the West. A memorial to be drawn up for presentation to the Government, and also a petition, asking the support of Parliament. A deputation, consisting of members of the Conference, will wait upon the Hon. A. Renwick to-morrow afternoon. The Conference agreed, further, that a deputation, composed of Sydney, Grafton, and New England residents, should wait upon the Government and present the memorial.

No. 82.

Minute by The Secretary for Public Works to The Under Secretary for Public Works.

25 April, 1882.

A deputation from Glen Innes will call on me on Friday at 12 to present a petition in favour of Glen Innes being the point to which the railway be taken.

J.L.

Get necessary information.—J.R., 25/4/82. Railways.—J.R., B.C., 25/4/82. Mr. Quodling.—J.B., B.C., 25/4/82. Mr. Palmer.—W.H.Q., 25/4/82. Information herewith.—H.P., 27/4/82.

No. 83.

Extract from the *Daily Telegraph*, 3rd May, 1882.

A member of the deputation which waited upon the Minister for Public Works on Friday to urge a speedy construction of the railway from Grafton to Glen Innes, and thence westward to Inverell, said that at the latter place wheat could be bought in large quantities at 4s. 6d. per bushel, whereas in Sydney it was worth 6s. 2d. Supposing this to be correct (for there is no reason to doubt the accuracy of the statement) we have what may be considered a very good explanation why the price of bread in Sydney should have been raised from 7d. to 8d. the loaf. We have been officially informed during the present year that there are 14,000,000 of acres on the table-lands of New England admirably adapted to the growth of wheat. Of these rather less than half a million are under cultivation. The question does not appear to be, at the present time, whether 4s. 6d. per bushel does or does not pay the free selector, but how he should get his produce more cheaply to a very much better market. At the present time he would have to cart his wheat 100 miles before it would reach the railway. If the line were open the entire distance from Glen Innes to Sydney, the Commissioner for Railways would bring it down for him and charge him 8d. per bushel. It seems needless to point out how the difference between 8d. per bushel and 2s. 2d. would stimulate production, and help to avoid the expenditure of the half million per annum which we pay to Victoria, South Australia, and New Zealand for breadstuffs. The 2s. 2d., let it be observed, is a price for carriage that has to be paid irrespective of the value of wheat per bushel. The cultivators have at present nearly half a million acres under crop, which must produce a much larger amount than is required for local consumption. There they scarcely know what to do with wheat when it is grown. Carriage by dray, always costly, has been rendered almost impossible by drought. Here there is a brisk demand for it at what should be a highly remunerative rate. The only cure for this state of things is an extension of the railway.

If the deputation did not know beforehand the nature of the reply that would be given by Mr. Lackey its members cannot have bestowed much attention upon the course of passing events. As soon as the preliminary surveys are completed the Government will be prepared to recommend to Parliament the route that should be adopted. It is now nearly two years since the trial surveys, in what appeared to be the hottest of haste, were ordered. They are not completed yet, and if they were the difficulties of the farmers would be a good way from the end. Before the Commissioner can bring their wheat to Sydney the extension from Homebush to Waratah has to be carried out. It is in a much forwarder stage than

than the line from Grafton to Glen Innes, because the money was voted long ago. But how does it stand? The surveys from the Hawkesbury to Waratah have yet to be completed. The break between Newcastle and Sydney is almost as fatal to the northern wheat-growers as the dray carriage from the table-lands of New England to the Great Northern railway. What appears to be one cause of delay is that the terminus of the line has not been determined at either end. No doubt the people of Grafton would like the line to begin with them. At Ballina and the Richmond River they may be credited with the same intentions. But this has nothing whatever to do with a line from Inverell to Glen Innes, which, if it were now commenced, might be in readiness for use as soon as the Great Northern line shall be carried to the latter place. The difficulties on the route from Grafton to Glen Innes have been so great that surveys have been made of a line from Richmond River to Tenterfield. However desirable it may be that a railway should be made from the coast at Grafton or the Richmond to Glen Innes or Tenterfield, it seems very much more important that farmers should be able to profitably bring under cultivation the 14,000,000 of acres in the New England district, which all accounts agree are so admirably adapted for wheat-growing.

It is not very long since the members of the deputation had the opportunity of stating their case to a Minister while he was on the spot. Evidently they have faith in the old maxim of "Line upon line, and precept upon precept." So has the Minister. When a long-suffering deputation reminded him that there did seem to be delay in constructing the extension of the northern railway, there was the stereotyped reply. The Department seems to be in a chronic state of "considering" and "surveying." Instead of these we want railways and other much-needed public works. The case of the farmers, forced to sell their wheat at least one-third under its value, is also that of the miners. Nature has been singularly bountiful in the district, but the Government as yet has done very little for it. There is mineral ore of various kinds in great abundance, but means for transit are sadly needed. Even the difficulty that has had to be encountered in the trial surveys is proof of this. Dr. Renwick's party, when on the late Ministerial tour, found the road a terribly rough one. What, then, must it be for the conveyance of ore and wheat? Nearly impassable is the only correct description that can be returned. A little more vigour, strength, and determination seems to be required in the Survey Department.

No. 84.

Minute by the Engineer-in-Chief to The Secretary for Public Works.

Department of Public Works, Railway Branch, Engineer-in-Chief's Office,
Sydney, 28 April, 1882.

Subject:—Trial Survey—South Grafton to Glen Innes.

THE amended trial surveys between South Grafton and Glen Innes are well advanced. Every effort is being made to reduce the enormous earthwork quantities as shown on the section of the original survey, and also to reduce the distance from Grafton to a junction with the Northern Railway near Glen Innes. The country throughout is very rough, and a great deal of careful surveying must yet be done before an accurate estimate can be made.

I think this route will, on the completion of the surveys, be shown to be the least costly of any yet surveyed, and will certainly be much shorter than any other between Grafton and the Northern line. A trial survey has lately been completed from Glen Innes to Inverell, in continuation of the survey from the coast, by which the distance from Grafton to Inverell is shown to be about 155 miles.

JOHN WHITTON.

(*Per* W.H.Q.)

Forward copy to Mr. See, M.P., at once.—J.R., 28/4/82. Railways.—J.R., B.C., 28–29/4/82. A trial survey is being made from Tabulam to Tenterfield, also from Byron Bay to Tabulam, both of which will be completed about the same time as survey from Grafton to Glen Innes.—H.P., 28/4/82.

No. 85.

Extract from the *Sydney Morning Herald*, 29th April, 1882.

THE PROPOSED NEW ENGLAND RAILWAY.

A DEPUTATION, consisting of Messrs. See, Murray, and Fergusson, Ms.L.A., waited upon the Minister for Public Works yesterday for the purpose of urging the construction of a line of railway from Grafton to the table-land of New England.

Mr. SEE presented a memorial which had been agreed to at a conference held at Glen Innes some time ago. The memorial urged the Government to submit a vote during the ensuing Session for the construction of the first section of the line. He was aware that the Government were having surveys made, and he was quite prepared to repose every confidence in the Government in reference to the construction of this line. He would, therefore, content himself with submitting the memorial, and expressing the strong hope that the Government would see their way to propose a sum during the ensuing Session to meet the cost of constructing the first section.

Mr. MURRAY said the subject of the construction of this line, and the splendid resources of the magnificent district which it would open up, had already been fully dealt with by deputation after deputation, and the Minister was no doubt quite as fully cognisant of all phases of the question as any member of the deputation. He gave the project his warm support, and as an illustration of the benefits that would probably accrue to the people of Sydney by the increased facilities for communication with the northern districts, mentioned that at the present moment wheat was selling at 6s. 8d. in Sydney and 4s. 6d. in Inverell.

Mr. FERGUSSON hoped that the Government would not allow the next Session to pass over without some definite steps being taken to have this work carried out.

Mr. LACKEY said this matter had been under the consideration of the Government for some time, and it was a great mistake to suppose that any unnecessary delay had taken place or that any promises had been broken. The Government had promised to construct a railway from Grafton to the table-land of New England, and they had taken all the steps they could to carry that promise into effect. In connection with a work of that kind the strictest examination of the route was needed, and continuous surveys had

to

to be made of the different routes. The Government had not yet decided which route they would recommend to Parliament, nor indeed was he himself in a position to recommend to the Cabinet the adoption of any particular route. In order that the deputation might know what had been done, he would read the latest report furnished by Mr. Whitton in connection with this work. Mr. Whitton wrote:—"The amended trial surveys between South Grafton and Glen Innes are well advanced, and every effort is being made to reduce the enormous earthwork quantities as shown on the section of the original survey, and also to reduce the distance from Grafton to a junction with the Northern Railway near Glen Innes. The country throughout is very rough, and a great deal of careful surveying must yet be done before an accurate survey can be made. I think the route will, on the completion of the surveys, be shown to be the least costly of any yet surveyed, and will certainly be much shorter than any other between Grafton and the Northern line. A trial survey has lately been completed from Glen Innes to Inverell, in continuation of the survey from the coast, by which the distance from Grafton to Inverell is shown to be about 155 miles." He had also ascertained that a trial survey was being made from Tabulam to Tenterfield, and another from Byron Bay to Tabulam, both of which would be completed about the same time as the survey from Grafton to Glen Innes. He had given instructions to have these surveys carried out as quickly as possible. The Government were anxious to have the work completed as soon as possible, but the country through which the line would have to pass was a difficult country, and it was very necessary to have it accurately surveyed. There were three sets of surveyors on the different lines, with imperative instructions to get on as fast as they possibly could to enable the Government to recommend the adoption of the least expensive and most practicable route. He was as anxious as the residents of the district that the work should be carried on speedily, so that the people might have the undoubtedly great advantage of railway communication. He would see that every exertion was used with the view of enabling the Government to ask Parliament next Session for its concurrence in the expenditure for this line of railway.

No. 86.

J. See, Esq., M.P., to The Secretary for Public Works.

Sir, Sydney, 17 May, 1882.

In connection with the surveys for the proposed line of railway from Grafton to the table-land of New England, I respectfully request that a survey may be made of a line into North Grafton from Glen Innes, or from any point of the line now being surveyed that the surveyors may deem most expedient.

I shall feel obliged if you will concur in this request, and let me have your decision in a day or two, and oblige

Yours, &c.,

JOHN SEE.

Inform Mr. See that three railway surveyors will be instructed to examine the route suggested in his letter, with a view to a survey being made.—J.L., 19/5/82. Railways.—J.R., B.C., 19/5/82. Forward to Engineer-in-Chief.—CH.A.G., B.C., 26/5/82. Mr. Palmer.—W.H.Q., 29/5/82. I will attend to this when at Grafton, probably in about a fortnight.—H.P., 12/6/82. Mr. Palmer.—W.H.Q., 5/7/82.

The present survey from South Grafton to Glen Innes commences on the river bank, immediately opposite to North Grafton. If the railway should be made from North Grafton to Glen Innes, a site for the terminus would have to be selected in North Grafton, and the line as surveyed at South Grafton should be produced across the river to such terminus. This will hardly require a survey, as the cost of crossing the Clarence, and the extra expense of carrying the line through North Grafton, might be allowed for in making the estimates of the different proposed routes.—H.P., 21/7/82. The Engineer-in-Chief.

J.W.—28/7/82.

Sir, Department of Public Works, Sydney, 19 May, 1882.

In compliance with the request contained in your letter of the 17th instant, I am directed to inform you that the surveyors now engaged on the trial survey for a railway line from Grafton to the New England Table-land will be instructed to examine and report upon the locality suggested, with the view to a survey being made of a trial line from the line above referred to into North Grafton.

I have, &c.,

John See, Esq., M.P. JOHN RAE.

INVERELL.

[From our Correspondent.]

WE have had stirring times here lately. The excitement in connection with the great railway question was intense, and resulted in the largest meeting ever held in Inverell. Some time ago a branch of the Clarence-New England Railway League was formed in town. Two of our leading citizens were appointed joint secretaries, and numerous meetings were held. The result was that large numbers, representing all classes, joined the League. A monster meeting was advertised for the 6th instant. It was anticipated that Mr. Murray, our representative, and several other Members of Parliament, would be present. Owing to the postponement of the opening of the railway to Uralla, his fellow-member could not come to Inverell, but Mr. Murray fulfilled his promise, and, with several delegates from Glen Innes, took part in the meeting. The business transacted at that meeting was simple but important. The first resolution set forth was the necessity for a railway from Grafton *via* Glen Innes to the table-land of New England, and thence westward, and referred to the rich and inexhaustible tracts of pastoral, agricultural, and mineral land along the proposed line; also, to the necessity of at once constructing a line from Glen Innes to Inverell. This was ably moved by Mr. Mayne, our late mayor, supported by several speakers, and carried with enthusiasm. A petition to be forwarded to Mr. Murray, for presentation to Parliament, was next

 adopted.

adopted. This was a long and exhaustive document, conclusively showing the claims of this part of New England. Among other things it pointed out that the engineering difficulties had been over-estimated—that a zigzag line would not be required, and that the cost would not exceed per mile that of the extension of the Great Northern line from Tamworth, that the line would develop over 1,000,000 acres of the finest wheat land in Australia, capable of producing wheat sufficient to supply the Colony; that, in addition to the carriage of wheat, there would be tin—6,500 tons of which were produced last year in the district—wool, wine, &c.; that the proposed line was the only line which would properly tap the northern part of the Colony, which could not be accomplished by any deviation north to Tenterfield or south to Armidale, from Grafton. The question has taken strong hold of the public mind, and in the various centres, where branches of the Railway League have been formed, all are working harmoniously. A monster meeting will be held in Grafton on Tuesday, 18th instant. Delegates from Inverell and Glen Innes are now on their way thither.

THE NEW ENGLAND RAILWAY.—LARGE MEETING AT GRAFTON.

ONE of the largest public meetings ever held in Grafton in connection with the agitation for a railway from Grafton to New England took place here last night in the Theatre Royal.

Mr. J. MAYNE, of Inverell, in an effective speech, showed the importance of opening the western country by a railway from Grafton, and quoted official statistics fully bearing out his statements.

Mr. R. LEWIS, of Glen Innes, observed that, although a line to Tenterfield would be more advantageous to him, still he advocated a central line through New England. He refuted the statements recently made by the Tenterfield delegates in reference to the relative importance of Tenterfield and other towns to the west of Grafton.

Mr. DODD, of Glen Innes, urged the residents to be united, so that the Government should have no excuse for postponing the construction of this long-promised line.

Messrs. S. SEE, J. H. MUNRO, and J. BOWDEN also spoke in defence of the action adopted at the recent conference at Glen Innes, and showed that advantage had been taked by the Tenterfield delegates of the feeling in Grafton as to the site of the terminus, in order to secure votes in favour of the Tenterfield route. Mr. Bowden proved by statistics that last year nearly £65,000 were paid for carriage upon the Glen Innes road.

Mr. G. FOOT proposed—"That this meeting approves of the construction of a line of railway from Grafton to the west by the most direct and practicable route as that which will conduce most successfully to the prosperity of these districts and the Colony generally."

Mr. J. PAGE seconded the motion.

Mr. H. MAURICE suggested that the words "direct and" be omitted from the resolution.

This proposal was seconded by Mr. BOWDEN and accepted by the mover and seconder. The motion was then put in its amended form and carried almost unanimously.

Votes of thanks having been passed to the Glen Innes and Inverell delegates, and the chairman, the meeting terminated.

The proceedings were frequently interrupted by the unruly conduct of about forty lads and a few persons of maturer years, whose action was condemned by the advocates of both routes.

In the course of the evening the Chairman read a telegram from Mr. F. Utz, a large miller at Glen Innes, announcing that he had just built a mill to grind 100,000 bushels of wheat per annum, and that last year he alone received 500 tons of general merchandise from Sydney by way of Grafton.

[From the *Sydney Morning Herald*, 20 July, 1882.]

COUNTRY NEWS.

[From our own correspondent.]

Grafton, Wednesday.

A RAILWAY meeting was held last night, which did not terminate until 11 o'clock. The early part of the evening's proceedings was marked by very unseemly interruptions from a number of boys, led on, it is said, by a few adults. The speakers subsequently received something like a fair hearing. The last speakers were Messrs. J. H. Munro, T. Bawden, G. Foott, J. Page, H. Maurice, and H. Moore, of Inverell. Mr. Foott moved, and Mr. Page seconded, the following motion:—"That this meeting approves of the construction of a line of railway from Grafton to the west by the most direct and practicable route, or that which will conduce most successfully to the prosperity of those districts and the Colony generally." After discussion, Mr. Maurice moved an amendment to omit the words "direct and." This was seconded by Mr. Bawden, who said he did so in the interests of unity. The mover and seconder withdrew their original motion, and the amendment was substituted and carried unanimously. A vote of thanks was accorded to the delegates. Fully 600 people were present. The Inverell and Glen Innes delegates were taken down the river to-day for a trip, and inspected the sugar-mills, which are just beginning to work.

[From the *Sydney Morning Herald*, 5 July, 1882.]

IMPORTANT RAILWAY MEETING AT GRAFTON.

[From our own correspondent.]

ONE of the largest public meetings ever held in Grafton assembled last evening in the Theatre Royal. Addresses were delivered by Messrs. Lee and Whereat, delegates from Tenterfield, advocating the construction of a railway from Grafton *via* Tenterfield in preference to one *via* Glen Innes. The theatre was packed in all parts, it being estimated that from 600 to 700 people were present. Mr. W. Kinnear was appointed Chairman. Delegates from Casino, Mr. H. J. Simpson, Mayor, and Mr. F. G. Crouch, were also present. An apology was read from Lismore delegates, the Mayor, and Dr. Bernstein. Messrs. Lee

Lee and Whereat made speeches similar in effect to those already delivered at Casino and Lismore, maintaining that the line *via* Tenterfield would have the easiest gradients, be the cheapest in construction, and the best on broad national grounds, as calculated to support a large population. The speakers drew comparisons between the rival routes to Glen Innes, to show that the latter could not compare with the other. They said they advocated the line with Grafton terminus, and no other, and the people of the Richmond River, in the most unselfish manner, agreed to support them. They now asked the people of Grafton to join them in demanding the only line which could be got without difficulty. They said the question must soon be definitely settled in Parliament, and made a strong appeal to the people of North Grafton not to accept the line to Glen Innes, which would leave the terminus at South Grafton. They condemned the action of the Grafton delegates at the Glen Innes conference, and replied specially to an address delivered there by Mr. Bawden. They said the Conference should have been held on neutral ground, such as Grafton or Tenterfield. They could not send delegates to Glen Innes, where they would have been swamped by numbers put in to outvote them. They asserted that, notwithstanding statements emanating from Glen Innes, Tenterfield was a richer agricultural district than Glen Innes. Mr. Whereat said he ground more wheat in his mill at Tenterfield in three months than went through all the Glen Innes mills in a year, besides his three other flour-mills. The Tenterfield delegates got a very good hearing, although they were interrupted at times. Messrs. Simpson and Crouch followed with short addresses, admitting the justice of the claims of the Grafton terminus line, and advocating the Tenterfield route, which would permit the Richmond River to participate eventually in the benefits by a branch line from Tabulam. A resolution was then moved by Mr. H. Maurice, J.P., and seconded by Mr. W. Hann, "That, having heard the railway scheme from North Grafton to Tenterfield fully explained by the delegates from Tenterfield and Richmond River, this meeting is of opinion that it is the only one of a national character which has been proposed for connecting the table-land of New England with the Clarence River, and is also the best suited to promote the interests of people in the Clarence district; and it therefore pledges itself to co-operate with Tenterfield and the Richmond River in their endeavours to secure its adoption by the Government." The motion was supported by the Hon. E. D. Ogilvie, M.L.C., who said that at one time he had advocated that the railway ought to go from Tenterfield to the nearest point of the Clarence at Lawrence, because he thought towns should come to railways, not railways to towns. He freely admitted he had now changed his opinion, because he saw such important interests centre at Grafton as could not be passed over. He saw, also, that the divided agitation was weakening the cause, and would give the Government an opportunity to shirk the railway altogether. He was convinced now that if they got the railway it must be from North Grafton. With that conviction he joined the Tenterfield League delegates. It had been hinted that he was only supporting the line to Tenterfield to get it to Lawrence, but he appealed to the two delegates present if he had not always, as now, advocated the terminus at North Grafton, and no other. He now stood before them all, and stated publicly here that he would advocate the North Grafton route and no other, and he was not a man to go back upon his word. It had also been stated that he supported the line because of the large quantity of land he had there. He had always before advocated the line down the valley of the Richmond, not coming near his property, and it now seemed that there was a concensus of opinion that the line should come to the valley of the Clarence. It had been urged that the Government should not be interfered with in the choice of line. This would have been the proper course if adhered to, but when they found that others did not do so, he thought they should keep silent no longer, particularly as the line which was not the best was being forced on the country. In reply to an interjected remark that he held all the best land, he said that railways had been made in other countries through purchased land. It mattered not whether they went through public or private land, provided they went through good land which would be cultivated and support a population. The land bought from him would be as good as from anyone else. The speaker was often interrupted by uncomplimentary remarks, and he told the meeting he would stay until it had heard him. He concluded amidst applause and cries of disapprobation. The motion was then submitted, and carried by a large majority. Mr. E. Hockey moved the adoption of a petition, to be signed by representatives of the Clarence, Richmond, and New England, and presented to Parliament, in favour of this line. It was seconded by Mr. W. Attwater and carried. The Mayor made a few remarks complaining of the delegates having gone out of their way to ridicule South Grafton, which was entirely uncalled for. A vote of thanks to the chairman and cheers for the Queen and the delegates concluded the proceedings, which did not terminate until 11 o'clock.

[From the *Sydney Morning Herald*, 7 July, 1882.]

RAILWAY EXTENSION IN THE NEW ENGLAND DISTRICT.

[From our own Correspondent.]

THE largest, most influential, and unanimous meeting ever held in Inverell, took place this afternoon, in the Masonic Hall. Mr. R. L. Murray, M.P., four delegates from Glen Innes, and residents from all parts of the district attended. The first resolution was moved by Mr. Mayne, seconded by Mr. Gibson, and supported by Messrs. Burridge (Glen Innes), Mr. Murray, M.P., and others, as follows:—"That, in the interests of this Colony it is necessary at once to construct a line of railway from Grafton to the inexhaustibly rich agricultural, pastoral, and mining lands stretching from Glen Innes, Inverell, and thence westward." It was next moved by Mr. G. Woods, seconded by Mr. W. Gihome,—"That a Petition adopted and presented to Parliament, embodying the following facts:—That the line, to be of any benefit to Inverell district, must come direct from Glen Innes, and any deviation north to Tenterfield or south to Armidale would be opposed to our best interests, as by recent trial surveys a line *via* Glen Innes would be under 140 miles, whilst *via* Tenterfield would be about 220; that this district could more than supply the requirements of this Colony in breadstuffs, as one million acres of magnificent, rich lands could be laid under cultivation; that the portion under wheat for years past yielded an average of 20 bushels. The line would tap the great tin-mines, which produced last year 6,500 tons of ore, valued in Sydney at £400,000. Hence the urgent necessity of at once constructing the section from Glen Innes to Inverell." The resolutions were unanimously carried, and the Petition was signed by all present. Thanks to the delegates, and to the Mayor for presiding, closed a most harmonious meeting. Mr. Murray, M.P., arrived last night, and was cordially received. He addressed the electors to-night.

No. 98.

Minute by The Secretary for Public Works.

24 March, 1882.

Railway—Grafton to Glen Innes. Get what information Mr. Whitton has, and give Mr. See, M.P. He leaves for Grafton on Saturday next. J.L.

Mr. Rae. Mr. Whitton.—W.H. (for U.S.), B.C., 25/3/82.

Trial surveys of various routes recommended by residents of the Clarence district as likely to prove easier than those chosen by the Department have been made, and have been found to be impracticable. The routes originally surveyed by the Department, viz., from South Grafton to Glen Innes, and from Lawrence to Tabulam and Tenterfield, are now being resurveyed, adopting curves of smaller radii and steeper grades, with a view of reducing the estimates, and an additional route is being surveyed from Byron Bay to Tabulam. These surveys I expect to be completed in about four months.—H.P., 27/3/82. The Engineer-in-Chief.

Under Secretary for Works.—W.H.Q. (for Engineer-in-Chief), B.C., 27/3/82. Railways.—J.R., B.C., 27/3/82.

Extracts from Votes and Proceedings.

Legislative Assembly, Wednesday, 30th May, 1883.

(22.) Grafton and Glen Innes Railway:—Mr. Purves asked the Secretary for Public Works,—

(1.) Have the surveys been completed of the Grafton and Glen Innes Railway Line, and of the Tenterfield and Grafton Line?

(2.) Have the plans, sections, and specifications of the above lines been completed; if not, when will they be finished?

(3.) Will the Government next Session submit a proposal to construct a line of railway from the Clarence to New England.

Mr. Wright answered,—

(1.) Yes.

(2.) The plans and sections of both lines are now in course of preparation, and will probably be completed by the end of June.

(3.) The railway policy of the Government will be considered during the recess.

The Glen Innes–Inverell Railway.

To the Editor.

Sir,—On the advent of the assembling of Parliament it may not be out of place for one who knows the New England district, as well as perhaps any person, to express his views on the question of the rival lines for the construction of the railway to that criminally long-neglected town of Inverell, and the magnificent and unequalled district of which it is the capital; the hope of the writer being that Members of the House will compel the Government to include in its proposal a line that will pay interest on its cost, and develop the resources of a district which is not surpassed—if it is equalled—in Australia. Unfortunately for Inverell, there are no fewer than three proposals for its railway, from as many different points. Commencing with the Uralla proposal, I cannot for a moment suppose that the Ministry is serious in giving this line any consideration whatever. After leaving Uralla, with the exception of small areas on the frontages of the creeks, or in the gullies, the line would pass through most wretched poor country, wholly unfit to support population, and would only touch good farming land when it reached Inverell. The sole recommendation of this line is that it would pass through the tin-mines and Tingha, 16 miles from Inverell. The next proposal is to make the Mother of Ducks the starting-point for the Inverell line. Well, this line would pass through excellent land nearly all the way. Then comes the original proposal, Glen Innes to Inverell; and this line would pass through land of exceptional richness from end to end—land capable of maintaining in happiness and prosperity half the present population of the Colony. Besides, this line would fully meet the wishes of both Inverell and Glen Innes, and further, it

has

has been permanently surveyed, and actually approved by Parliament. Then again, it would form a strong link in that great chain which must, in the early future, connect Grafton—the natural seaport—with the practically limitless country, of surpassing excellence, to the westward. Why then, in the name of all common honesty, is the construction of a line such as this delayed? Fifteen years ago agitation was commenced for the Grafton-Inverell line, with good prospects of early success. Places that then had scarcely a name have long since been connected with the outer world by rail; and the line to Kiama, running parallel with the ocean, was opened only to-day. Lines have been made that do not pay even working expenses, as the Hay line; yet such a district as Inverell is neglected. Surely there is more in this than the public is aware of. It may be that there is a good deal of underground engineering going on somewhere. Armidale (represented by a Minister and an ex-Minister) is most anxious that the Inverell line should start from that poking little place "the Mother of Ducks," in order to cut off the large and important town of Glen Innes from being the junction, and so, in a large measure, benefit itself by injuring a rival township. Surely there is patriotism enough in the House to force the Ministry to do justice to a town and district destined at an early day to take high rank in the great centres of manufactures, agricultural, grazing, and mining industries of the Colony.

3rd October, 1888. JOHN SMITH.

[From the *Sydney Morning Herald*, 25 September, 1888.]

MESSRS. SEE AND EWING, M's.L.A., AT GLEN INNES.

[From our Correspondent.]

MESSRS. See and Ewing, M's.L.A., addressed a crowded meeting at Glen Innes on Saturday night. The Mayor presided. Discussing the railway policy, Mr. See said he journeyed up the Newton Boyd Road, over the Big Hill, and was disappointed. He had been frightened by stories, but he could not see anything formidable about the hill; the journey could be made on a bicycle. The Big Hill was the merest mite in comparison with the Blue Mountains, yet a railway was constructed over them. The two positions were identical in many important particulars, and the necessity for a railway over the Blue Mountains and the necessity for a line from Grafton to the west. The proposed line would secure a great interchange of productions; an enormous trade would spring up between the tropical productions of the Clarence and the semi-tropical productions of New England. It would be the precursor to new and great industries, and in the development of that part of the Colony. No one acquainted with the subject could have any doubt that without the assistance of the coast table-land railway the trade of New England would go to Brisbane. As it was, bullock-teams were plying between Grafton and Glen Innes, and competing successfully against the railway. No clearer proof should be needed than this. Grafton was the natural outlet for the trade of New England and the western country. They had a magnificent district; rich in every kind of material resources, and with especially rich and prolific land, but they wanted a market for their productions. Where could they get that market unless they sought the coast district? He was pleased to notice that the residents of Grafton, Glen Innes, and Inverell had united, and were making common cause in demanding the Glen Innes-Inverell railway. How could there be a doubt as to the national character of the work? This was recognised by the leader of the present Government, as in the course of speeches delivered by him in 1872 and 1874 he strongly supported the claims of the coast table-land railway. In taking that view the Premier took his stand upon purely patriotic grounds. He denied that the country between Glen Innes and Grafton was barren. Apart from its fruit-growing qualities and magnificent timber, it also, no doubt, contained untold mineral wealth. What was the sum of £2,000,000 for building a railway through a country like that? But, above all, it would open the door to commerce on the coast, Mr. See did not approve of differential rates; they were unfair to the public as a whole, and he thought the proper course was to open up the different intermediate ports. That was the policy adopted by the Queensland Government, and it was found to work well. The Government of this Colony seemed to entertain no such expansive views. Mr. See then proceeded to discuss fiscal matters, arguing in favour of protection.

Mr. Ewing also addressed the meeting in support of the cause of protection.

[From the *Daily Telegraph*, 25 September, 1888.]

MESSRS. SEE AND EWING, M'S.P., AT GLEN INNES.

AT 4 p.m. on Saturday last Mr. John See, M.P., arrived in Glen Innes from Grafton, for the purpose of stating his views with regard to the proposed railway from Grafton to Inverell. Mr. Ewing, M.P. for The Richmond, joined Mr. See at Glen Innes, and these gentlemen addressed a most enthusiastic meeting in M'Cormack's music-hall the same evening, at which Mr. Fitzhardinge, the Mayor, presided. Mr. See, in the course of his speech, stated that the difficulties of this scheme had been vastly exaggerated, and that the traversing of the Big Hill by a railway could be accomplished at a less cost than over the Blue Mountains. He stated that it was his conviction that if this measure is not carried out by the present Government it assuredly will be by the next, and pointed out that the construction of this line would establish communication with the whole of the north coast districts, and would not only traverse the richest sugar-land in the colonies, but would open out the finest country for timber and minerals and encourage settling on land capable of supporting tens of thousands of inhabitants. Mr. See, during the delivery of his speech, was repeatedly interrupted by uproarious applause, more especially when he quoted speeches both of Sir Henry Parkes and of Mr. Sutherland, delivered in the years 1872 and 1874, strongly in favour of the proposed line, and said that if in those days the railway was deemed necessary it was ten times more so now.

Mr. Ewing, M.P., in a most humorous speech, strongly supported Mr. See's views, and both gentlemen were of opinion that a radical change is necessary in the fiscal policy of the Colony.

[From

[From the *Sydney Morning Herald*, 19 July, 1888.]

DEPUTATIONS.—THE GLEN INNES-INVERELL RAILWAY.

A DEPUTATION from the Glen Innes-Inverell district waited on the Colonial Secretary yesterday to urge the construction of a line of railway from Glen Innes to Inverell. The deputation consisted of the following:—Messrs. Moore, Mathison, Dibbs, O'Connor, Dangar, Waddell, Wall, See, Levien, Melville, Black, Dowel, O'Sullivan, Fletcher, Cooke, Colls, Ives, McFarlane, De Courcy Browne, Haynes, Lyne, Stevenson, Bowes, Gormly, Fitzgerald, Jones, O'Mara, Hassall, McCourt, Penzer, Ms.L.A.; Messrs. G. A. Cruickshank, P. C. Campbell, J. Sinclair, G. Arthur, and J. J. R. Gibson, representing Inverell; Messrs. F. Utz, S. Burridge, G. M. Simpson, H. Vincent, R. Lewis, J. Munro, and C. Bloxome, representing Glen Innes; and Messrs. R. P. Abbott, Jamieson, Hoffnung, Jackson, Thos. Davis, Ross, W. H. Armstrong, Dewsbury, A. H. Moore, Tillock, Lassetter, and Harris.

Mr. MOORE, in introducing the deputation, said their object was to respectfully ask the Government to reconsider the matter of the proposed railway to Inverell, and submit the same to Parliament, in order that it might be referred to the Public Works Committee. The line from Glen Innes to Inverell had received the approval of Parliament, the money had been voted for it, the plans had been submitted to the Legislative Assembly, and only now awaited the approval of the Legislative Council. It came like an earthquake on the district when it was found that this line was not included in those to be submitted to the Public Works Committee. It was absolutely indisputable that this line would open by far the best country of any of the routes proposed, and would be the means of connecting two very important centres. As well as the great importance of reaching the Queensland market there was the very weighty consideration of reaching the Clarence River. The Premier so far back as twenty years ago, and at various times since, had spoken in unmistakable terms of the desirability of connecting the Clarence River with the rich table-lands of New England.

Mr. CRUICKSHANK spoke in favour of the line being taken from Glen Innes, and stated that all those who had any stake in the district were of the same opinion. They were entirely opposed to the line being taken from Guyra or Kentucky. The land through which the Glen Innes line would pass was rich agricultural land, and was all in the hands of settlers.

Mr. MATHESON pointed out that the people of the district were almost unanimous in desiring that the line should go to Glen Innes.

Mr. BURRIDGE said he believed it was the Government of Sir Henry Parkes who made the proposal which they were now advocating. He had been in the district for twenty-seven years, and he was in a position to say that the line from Glen Innes would be best for the country. He hoped the Premier would allow the question to go before the Public Works Committee. He had heard Ministers for the last ten years advocate the Clarence waters being connected with the table-lands.

Mr. SEE said he had such great confidence in the business capacity in the Public Works Committee that if the route from Glen Innes to Inverell were submitted to them as an alternative proposal, he believed their report would be overwhelmingly in favour of it.

Mr. DIBBS said the whole matter in connection with this line had been thrashed out before, and in fact the line had been endorsed by Parliament. A loan Bill to cover this line had been passed by the House. The approval of the Legislative Assembly was also obtained to the plans and sections, and it was only through the extraordinary action of the Legislative Council that the line was not constructed. This line had no right to go before the Public Works Committee, except so far as the tenders were concerned. He held that Parliament having settled the question, the line should be made, and that was the view he intended to take in the House. He would like to see the Premier give his assurance that he would do his best to get the plans and sections passed through the other House.

Some other gentlemen having spoken,—

Sir HENRY PARKES replied. He said that as they were aware the Government had proposed to Parliament a line to connect Inverell with the Great Northern line at Guyra. What the deputation asked the Government to do was to reverse that proposal and carry the line from Inverell to Glen Innes. All he could say now was that he would represent what the deputation had represented to him to the Government of which he was a member, and he would do that almost immediately. (Hear, hear.) There was a Cabinet in a few minutes, and at that Cabinet he would represent faithfully what the deputation had brought under his notice. (Hear, hear.) It seemed to him almost certain that if they had to reconsider the connection of Inverell with the Great Northern line that it would involve a little delay. As their proposals would be submitted to Parliament to-morrow, it appeared to him that if they had to reconsider this question they would not be able to include the line in these proposals. That would cause a delay of three or four months—(hear, hear)—so that they must be prepared for that. (Hear, hear.) All he could say, speaking for himself and assuming that he could speak for his colleagues, was that they desired to serve the country, and he trusted they would serve the district by the connection which would be made between Inverell and the Great Northern line. (Hear, hear.) It was perfectly true that a long time ago he put before Parliament the importance of connecting the table-land with river navigation. He held that opinion now. (Hear, hear.) He held the opinion very strongly that it was a sound policy for this country not to direct the internal trade of the country to Sydney or any other single port, but to open all our lines of navigation and utilise all outports. (Hear, hear.) He held that opinion as strongly now as he ever did, and he did not think he had consciously done a single thing merely to direct traffic to the port of Sydney. (Hear, hear.) All he could say now was that he would represent the matter to the Government, and though he was not in a position to promise it, he should be quite prepared to concur in a reconsideration of the question. (Hear, hear.)

[From the *Daily Telegraph*, 17 October, 1888.]

THE INVERELL-GLEN INNES RAILWAY.

A PETITION, to which are appended over 2,000 signatures, being a supplementary one to that sent from Grafton by the Clarence Harbour and Railway League, was forwarded by the Glen Innes League to Sydney yesterday. The petitions are to be presented to the Governor by a monster deputation, which will consist of about 100 of the leading residents of the Clarence districts and of Sydney. The object of approaching Lord Carrington is to point out how neglectfully the people of the Clarence districts have been treated by the successive Governments, and to ask the intercession of His Excellency in urging on the construction of authorised lines of railway on the Clarence, and from Inverell to Glen Innes. The joint petitions have been signed by about 8,000 persons. The trade between Grafton and the western districts continues to increase. There are now some forty teamsters engaged on the line, and as the bulk of the wool this season will go by the Clarence to Sydney, the traffic will be considerable. The carriage from Grafton to Inverell is taken at £4 10s. per ton, which means a saving of more than £2 per ton by rail from Sydney to Glen Innes.

No. 122.

Extract from the *Daily Telegraph*, 23 October, 1884.

THE GRAFTON-GLEN INNES RAILWAY.

AFTER a debate, which began soon after the House met, and terminated half an hour past midnight, the Government proposal to construct a railway from Grafton to Glen Innes, thus connecting the central territory of New England with the nearest seaport, was carried by twenty-nine to twenty-seven. A close division was expected, and as the argument drifted hither and thither during the course of the debate, it was difficult, if not impossible, to tell how the vote would go. We are glad the House has sanctioned the line, though the cost is appalling to timid financiers, who talk as though the interest on money invested in railways had to be defrayed out of taxation—taken out of the pockets of people who are not directly benefited by the cheap and swift facilities of traffic. But for the fact that the Grafton-Glen Innes line has to ascend a mountain range, and will necessarily be one of the most expensive railways for its length in Australia, the House would have voted it years ago. Two millions is an enormous sum of money to be spent on so short a road, but our enlarged opportunity of borrowing has apparently diminished it. When we could only borrow a small number of millions in a given period, and had to make the terms very easy for the English investor, we were compelled to spend what we could get on the most necessary and promising lines. But now we have a more prosperous Colony and a broader credit. We have a magnificent general revenue to fall back upon, and a recent record of railway revenue we are all proud of. Even now there is much to be said against the Grafton-Glen Innes lines on the score of its costliness, and it was said abundantly, vigorously, and eloquently last night. But there is a little more to be said in its favour, and that, too, was well said last night. The Clarence River members were thoroughly equal to the occasion, and contributed very solid support to the Government. Sir Henry Parkes was once more the chief opponent. That, however, is not in the least degree to his discredit. He simply did his duty as the representative of Tenterfield. He was elected for that constituency with a view to securing his powerful advocacy for a Grafton-Tenterfield line, and he fulfilled his trust loyally. He certainly made the best of a bad cause, but the cause was so bad that it was easy for inferior men to expose the fallacies he was compelled to employ. What the House felt it had to decide was not whether the railway should go to Glen Innes or Tenterfield, but whether a line should be constructed to Glen Innes. That or nothing. And honorable members, after the best debate which has yet taken place on separate proposals of the railway policy, decided that the two millions should be invested. It is a bold vote, but we believe it will be justified by the future.

No. 128.

Mr. Railway-Surveyor Cumming to The Engineer-in-Chief for Railways.

Trial Survey, South Grafton to Glen Innes—Report on Rhodes' proposed line *via* Camboodjha River.

Sir, Copmanhurst, 16 June, 1885.

I have the honor to report that I have traversed and levelled 10 miles of the Camboodjha River, from the junction with the Clarence towards the summit.

This portion of the river is very flat, rising only 455 feet in the 10 miles. The remaining portion is very steep, as it rises 2,550 feet in 13 miles. To gain the summit the line will require to rise 1 in 40 from the river; consequently, the formation will be about 900 feet above the bed of the stream for several miles. I find that the ground about this level is quite impracticable, being extremely rugged, and intersected by immense ravines.

The tributaries near the junction with the main stream are nearly level, and the slopes or banks of the river vary from 1 to 1 to 2 to 1. The line will, therefore, require several tunnels and some immense viaducts, from 300 feet to 800 feet high. A practicable line could not be got with even 5-chain curves, as the ravines are so narrow and rugged.

All the spurs and ranges in this neighbourhood are of the same character, being extremely rough and broken, and very unsuitable for a railway. The line must, therefore, follow some long river, and must keep near the level of the bed, to avoid tunnels and high viaducts. The Camboodjha River is too short, being so flat near the mouth and so steep near the summit. The Mann is the only long river that runs

runs in the proper direction (east and west) for a line from Grafton to Glen Innes. The Nymboi and the Henry, joining the Mann on the south bank, run about north and south. The first long river north of the Mann is the Rocky River; it rises near Glen Innes, and joins the north arm near Tabulam. These rivers, I am told, are rougher than the Mann.

When I went over Rhodes' line we went up the bed of the Camboodjha River, and came down the Mann River line, from 75 miles to 16 miles.

I am now quite certain that the line *via* the Mann River is by far the cheapest and shortest that can be got from South Grafton to Glen Innes.

Per same mail I send county map and plan of 10 miles of the Camboodjha River.

I have, &c.,

JOHN CUMMING,
Railway Surveyor.

Mr. Deane.—W.H.Q., 22/6/85. According to Mr. Cumming's report, Mr. Rhodes' route is quite impracticable. It would, therefore, be useless to waste any more time over the survey.—H.D., 30/6/85. The Engineer-in-Chief.

Sir, Camp, 28 May, 1885.

I have the honor to report to you that I have commenced the survey of the Camboodjha River, and have traversed and levelled 4 miles. I intend to run a traverse line far enough to test this route. I will report again in about a fortnight, when I will have half the river surveyed.

I have, &c.,

The Engineer-in-Chief, Railway Department, Sydney. JOHN CUMMING.

Mr. Deane.—J.W., 5/6/85. Noted.—H.D., 9/6/85.

No. 129.

Report by Mr. Railway-Surveyor Walker upon Quinn's Route.

Railway Survey Office, Pitt-street, 20 August, 1885.

QUINN'S route, as originally pointed out by him to Mr. Warren, was to cross the Mann or Mitchell River at the present crossing of the survey from South Grafton to Glen Innes, which is now being permanently staked, and to follow down the river (here called the Cangi, or South River) to where the Dandahra Creek runs into it; thence to attempt the ascent of the table-land, which, as Mr. Deane shows on Papers 85-2,982, from Mr. Warren's heights, would be a rise of 1 in 9. That this was Quinn's original route is shown by Mr. Warren's letter, 81-1,486, and I myself know it from Mr. Warren.

Mr. Warren, in this letter, suggests an alternative route, viz., to attempt the ascent from the present adopted survey, crossing of the Mann River, along the range which follows the general direction of the river.

This route Quinn has adopted as his own.

I assisted Mr. Warren to survey this route, and our surveys joined not far from the heads of the Dandahra Creek, or, what Quinn calls, in his letter, Dandahra Gorgy gullies.

I surveyed the part through the Dandahra country, starting back at Glen Elgin Station. There were very heavy works on parts of that, especially getting out of Oaky Flat, where they would certainly be as heavy as anything to be found on the present permanent survey up the Mann River. The ascent to the top of the Dividing Range was considerably over 1 in 40, and though, in descending the other side of the range, I did not, as Quinn states in his letter, exactly adhere to the route he showed me, the difference was immaterial, and what extra distance was put in made the grade easier.

However, I did survey past a point which Quinn himself showed me as one where Mr. Warren and himself had agreed to attempt a line, but which is far distant from the route which he shows on his sketch, and which he has adopted as his own.

I was over nearly the whole of Mr. Warren's part of the survey, and remember the leading facts. Quinn states that Mr. Warren, after topping the range at the heads of Cangi Creek, should not have surveyed the line through the Dandahra gullies, but he had not topped the range there, and therefore he was obliged to follow round the spurs and gorges to get distance, for, as Mr. Warren states in his letter, he required 15 miles to get up, and the heads of Cangi Creek are approximately only 6 or 7 miles from the crossing of the Mann River—that is to say, assuming the height of the table-land to be 2,700 feet. Quinn thinks that it can be surmounted at the rate of (say) 320 feet per mile.

Mr. Warren often told me that the works along this line were entirely prohibitory, involving tunnels through all the spurs which were not broad enough to take a curve round, and stupendous viaducts over the gorges.

Mr. Warren was unable, through the character of the country, where there is no feed for horses, or shelter of any kind, to thoroughly examine this route before he commenced to survey, else I am quite certain that the report he would have given of it would have prevented a chain, level, or theodolite ever being taken on the ground with a view to surveying for a railway.

W. DOUGLAS WALKER,
Railway Surveyor.

Seen.—H.D., 20/8/85. For the Minister's information.—J.W. (*per* W.H.Q.), B.C., 27/8/85. Under Secretary. Railways.—J.R., B.C., 31/8/85. Seen.—F.A.W., 7/9/85.

Dear

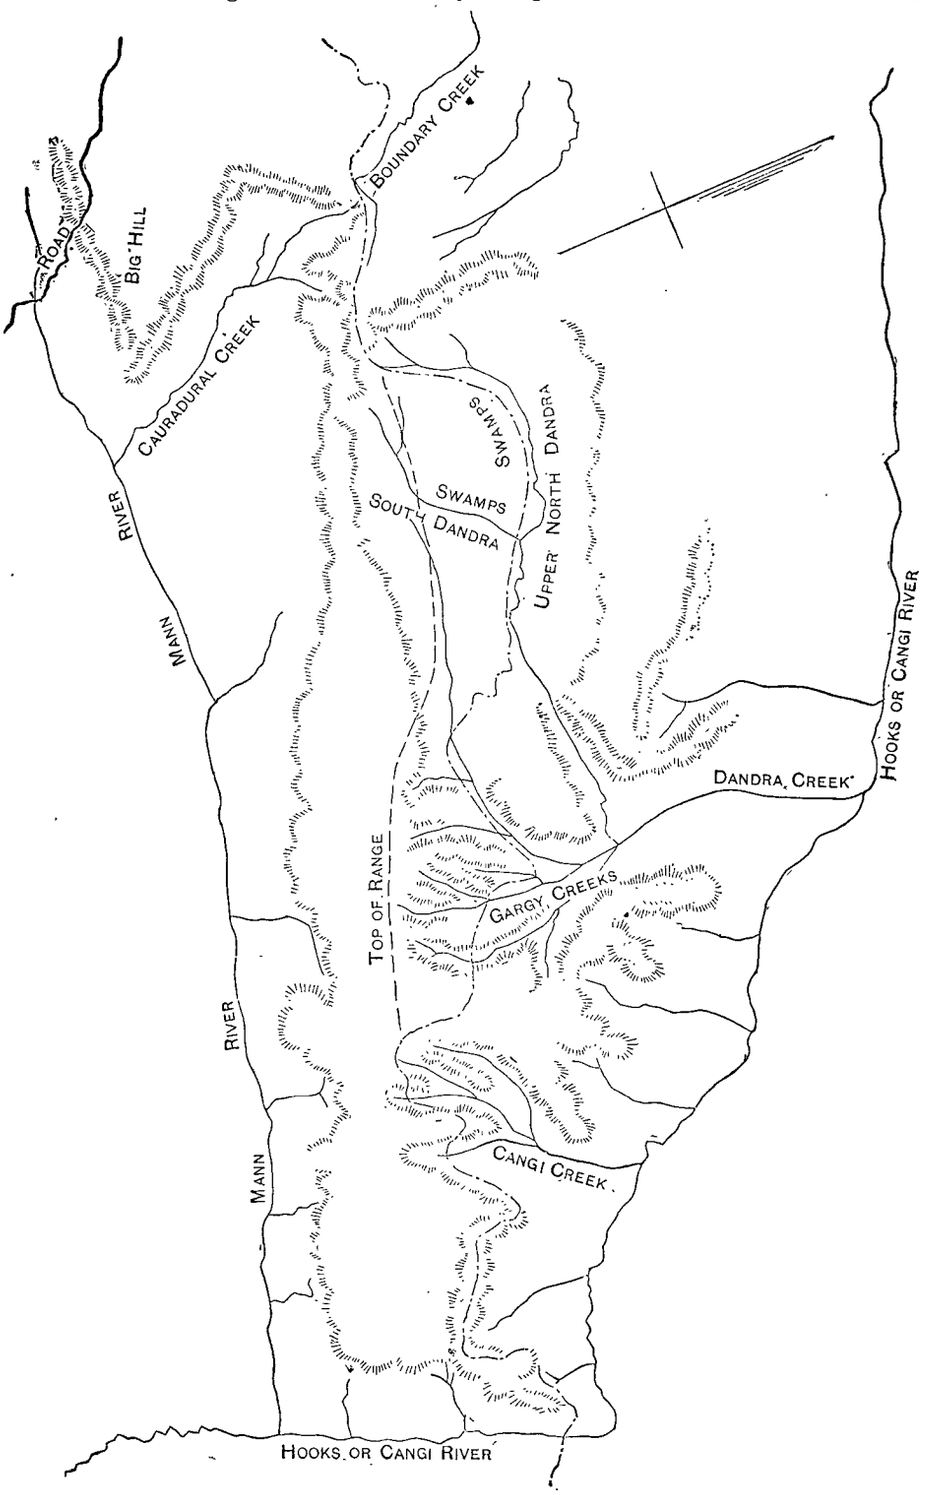
W. J. Fergusson, Esq., Castlereagh-street, Sydney,—

Dear Sir, Emmaville, 10 August, 1885.

Yours 6th instant to hand, in which you think that the Railway Department is not favourable to my offer *re* a further examination of the route that I showed to the surveyors, Mr. Warren and Walker, for Grafton to Glen Innes railway, and that they consider I should have written about it long ago. I beg to state that I was not along the surveyed line, nor on it, from May, June, and July, 1881, to May, 1885, nor was I aware of the fact that Mr. Warren surveyed the line down through the Dondra Gorgy Gullies after topping the range at the heads of Cangi Creek, nor that Mr. Walker surveyed down the North Dondra, instead of down the South Dondra Swamps. It may seem ridiculous for me to state that they went astray, and yet it is a fact, and enclosed I send a memo. of Mr. Walker's that may give some slight proof of it; but still I do not wish to lay the blame on the surveyors. They had to wade through a perfect maze or jungle and winding ravines that would puzzle and bewilder any mortal man, and although the surveyors actually went astray, still the surveyed line is only 86½ miles, which is 20 to 30 miles shorter than any other that can be found, and still 8 to 10 miles can be reduced from its length; besides, I most positively assert that many of the—I may say nearly all—serious difficulties that caused the original survey to be condemned can be avoided. Ten days would be sufficient for a surveyor and one man to go with me over the route to prove whether it is really worth surveying again or not, and surely the route is worth that small trial before it would be just or wise to condemn it. Hoping for a trial.

I am, &c.,

P.S.—Enclosed find rough sketch. Private by next post. H. QUINN.



This

This rough sketch (dotted and dashed line) shows top of the range. But being aware of this very important fact, he followed down by a spur until he was led into the Gorgy creeks or gullies, which he mistook for parts of the Cangi Gorge, but really were tributaries, as shown, of the Dondra Creek. He should have kept by the red dashed line and not gone near the gorges of the Dondra.—H.Q.

Mr. Whitton for report. This man appears to know the country well, and I think his letter is worthy of careful consideration.—F.A.W., 17/8/85. Mr. Deane.—W.H.Q., 19/8/85. I have referred this letter to Mr. Walker, and append his report. I do not see that any good can be gained by further exploration.—H.D., 20/8/85.

[Extract from *S. M. Herald*, 19 June, 1885.]

(From our own correspondent.)

Casino, Thursday.

At a public meeting held on Monday night the following resolution, moved by Alderman Gully and seconded by Mr. W. Yabsley, J.P., of Coraki, was unanimously adopted:—"That in view of the fact that Parliament has by a very large majority adopted the proposal submitted by the Government for the construction of the line of railway from Grafton to the Tweed *via* Casino, Lismore, and the Brunswick, this meeting is of opinion the permanent survey and construction of the line should be undertaken without any further delay, more especially from the fact that such a line will provide highly necessary internal communication and unquestionably tend to develop the resources of the districts concerned, and thereby benefit the Colony generally." The Mayor was requested to telegraph this resolution to the Minister for Works.

W. J. Fergusson, Esq., M.P., Castlereagh-street, Sydney,—

Dear Sir, Emmaville, 22 July, 1885.

I beg to inform you that I have lately been over Messrs. Warren and Walker's survey of the railway route that I showed them for the Grafton-Glen Innes railway, and I am sorry to say that I find the survey has been erroneously diverged from its proper course, and consequently not only made the line 8 to 10 miles longer than it should be, but it has also caused the survey to pass over gorges that I would not think of bringing a railway through. But I wish it to be distinctly understood that I do not wish in any way to blame the surveyors for this misfortune, but I must blame myself and those who should have supported me, to remain with the surveyors until the survey was got through the scrubby part of the route. However, I wish you to see if you can get the Department to allow a surveyor once more to go with me over the route to make an authentic report on what I can (and do not think I make any mistake) show him, to prove that the line can not only be made 8 to 10 miles shorter, but also that nearly all the great obstacles that were met with on the original survey can be completely avoided. And bear in mind that Messrs. Warren and Walker's survey was only 86½ miles from Grafton to the main Northern line, near Dundee (by far the shortest yet surveyed) say nothing about the 8 or 10 miles that can yet be deducted from it, and it will also open up one of the largest timber forests in the Colony, besides a very large tract of country that is now lying perfectly dormant.

Hoping you will let me know what may be done in this matter.

I have, &c.,
H. QUINN.

P.S.—Rhodes' route, now under course of survey, will not be less than 120 miles long, and it must follow on fully half of my route; and I may inform you that Mr. Surveyor Warren diverged the Mann River line on to a part of the route that I showed him.—H.Q.

Engineer-in-Chief for Railways.—W. J. Fergusson, 27/7/85. Mr. Deane,—See previous papers herewith.—W.H.Q.

It would appear from Mr. Warren's Report, 81–1,486, that he did explore sufficiently carefully the route pointed out by Quinn, and that he found it impracticable. He states that on the main creek, which was the one to be followed, there are falls 4 miles from the junction with the South River, the top of which are 2,700 feet above the sea. The junction of the Dandarah with the river is at a lower level than where the adopted route crosses, and the latter is only 436 feet above the sea, so that according to Mr. Warren's report the rise of the creek in 4 miles must be at least 2,700—436=2,264 feet, or 566 feet per mile, giving a rise of 1 in 9. It would be therefore waste of money and time to examine the route further.—H.D., 3/8/85. The Engineer-in-Chief.

No. 132.

J. See, Esq., M.P., to The Secretary for Public Works.

Dear Sir, Sydney, 8 April, 1889.

I have the honor to respectfully request that you will be good enough to inform me if anything has been done in the matter of the Grafton-Glen Innes line of railway?

As I understand the Commissioners are about to inspect the Grafton to Tweed route, I respectfully request that you will be good enough to submit the Grafton-Glen Innes route to their consideration, with your request that they would inspect this route at the same time. They could proceed to Glen Innes, and go over the route to Grafton, then inspect the Tweed route.

Yours, &c.,
JOHN SEE
(*per* ALBERT ALLEN).

Mr. Whitton,—Will you kindly let the Minister know how this matter stands.—J.B., B.C., 10/4/89. The sum of £2,000,000 was voted (in 1884) for the construction of a railway from Grafton to Glen Innes. Papers herewith.—J.W. (*per* W.H.Q.), B.C., 12/4/89. Under Secretary. Submitted.—J.B., 12/4/89.

No. 133.

F. A. Wright, Esq., M.P., to The Secretary for Public Works.

Sir, 241, Pitt-street, Sydney, 11 November, 1889.

Herewith please find a long letter addressed to myself from the Railway League at Glen Innes. This letter was received by me some time past, but being desirous of personally presenting it to you, I have refrained from sending it before this. As, however, I leave Sydney shortly for my electorate, I think the matter should be at once placed before you.

Glen Innes, as you are doubtless aware, is almost due east from Grafton, and is in a direct line between that place and Inverell. I hold very strong views about the necessity of connecting Inverell with the Main Northern railway system at Glen Innes, quite irrespective of what may be done to connect with the coast, as the distance is not only less between these two places than any other proposed route, but the country is far superior. If it is considered desirable to construct a railway from the table-land to the coast (and I certainly think it is so), and anything like a fairly practicable route can be got from Glen Innes to Grafton, then there can be no doubt that in the interests of the country that route should be adopted. The enclosed letter explains that a new route has been discovered, which is perfectly practicable by easy grades, and that it passes through very valuable country. I attach with the letter a sketch plan of the district, showing the routes marked upon it, as surveyed from Inverell to Glen Innes, and from thence to Grafton; the newly discovered route is shown on the plan, deviating from the surveyed line to the north, passing along Combadja Creek, and thence by Gordon Brook to South Grafton. This sketch plan has been prepared by Mr. Greaves, who for thirty years was the district surveyor in that part of the country, and knows the whole district intimately. He tells me that this proposed new line will pass through land particularly good for agricultural purposes, and very rich in forests of cedar and other valuable timbers, and although it will make the distance between Grafton and Glen Innes rather more than the surveyed route, it will pass through such a vastly superior country as to more than compensate for the extra length of line to be constructed. It will (if the new route be found a practicable one) be a very much shorter line than the proposed line from Guyra to South Grafton, either *via* Coff's Harbour or direct, and Mr. Greaves informs me that it will pass through a decidedly better country than the line from Guyra. If, upon examination, this is shown to be correct, I think there cannot be any question as to which route should be preferred, for the simple reason that, as I have stated before, Glen Innes occupies the most central position in the table-land of New England, and being immediately east of Inverell, and the splendid rich country west of Inverell, would point out unmistakably this route as the main line from Grafton to the west.

It is not necessary for me to write you a long letter on the subject, because until the practicability of the route be definitely ascertained by competent engineers, it is useless to discuss it; but in view of the letter which I now place before you, I would respectfully ask that an officer be despatched to examine this country carefully, and to verify or otherwise the statements of the Railway League at Glen Innes, which I have every reason to believe will be found absolutely correct. In the interests of the electorate I have the honor to represent, and the country generally, I beg to request that prompt steps may be taken to examine the route in question. The members of the Railway League in Glen Innes whose names are attached to the letter will provide a guide for the surveyor, and do all things necessary to assist him in the performance of this work.

Yours, &c.,
F. A. WRIGHT.

P.S.—I may state that I was very anxious to see you in company with Mr. Greaves before that gentleman left Sydney, but unfortunately the appointment we had with you fell through, through your inability to give us the necessary hearing. Mr. Greaves' residence of thirty years in the district in the capacity of district surveyor gives him an authority to speak that I think no other man in the Colony has. He knows the whole country intimately, has traversed every portion of it, and as he is disinterested, having no property that could be affected by it, I take it, his evidence would have been of considerable value to yourself.

Say Minister very much regretted his inability to keep his appointment with Mr. Wright, and that he will have the proposed route examined at once.—J.B., 13/11/89. F. A. Wright, Esq., M.P., 14/11/89. Mr. Deane.—J.B., B.C., 14/11/89. Urgent.

I should have much liked to see Mr. Greaves when he was in Sydney. It is a pity he was not asked to call at this office. To judge from Mr. Surveyor Cumming's report, 85/2,500, of 16th June, 1885, the proposed route would appear to be impracticable, but I should like to see the country again examined. Mr. Barling has promised to get Mr. Wright to call at this office before anything further is done.—H.D., 22/11/89. Under Secretary, B.C.

[*Presented*

[*Presented by F. A. Wright, M.P.—Enclosure.*]

F. A. Wright, Esq., M.P., Sydney,—

Glen Innes, 3 October, 1889.

Dear Sir,

We, the members of the Grafton and Western Railway League, have come into possession of very important information relative to a new route which has been discovered between Grafton and Glen Innes.

We, therefore, respectfully request you to bring the following facts before the Honorable Minister for Works, with the object of attaining a trial survey on the route herewith indicated.

The Committee of the League are prepared to guide the surveyor along the proposed route, which is estimated can be done comfortably within one week, and place all information in detail in his hands.

The Route.

Starting from Glen Innes, north of surveyed line by Mr. Warren, *via* Glen Elgin, Oakey Creek, by the head of Boundary Creek, crossing some of the northerly waters of the Dandarha Creek; thence along the valley of Coombadjha Creek across the south branch of the Clarence River; along the valley of that river, *via* Newbold and Ramornie, to South Grafton. The distance will not exceed 100 miles.

Advantages.

The advantages claimed are cheapness of construction, inasmuch as the descent from the table-land is made down a long open valley, and therefore would obviate sharp curves, retaining-walls, and steep gradients. The line will run through very good country, consisting of heavily timbered cedar scrub, flats, and open lands suited to agriculture. Valley of Coombadjha is about 15 miles north of present Mann River route, and never has been submitted to any trial survey. The nature of the country is so free from physical difficulty that a buggy can be driven to Grafton if the scrub is cleared and a few small crossings were constructed.

Nearly the whole of the country which will be opened by this line is the property of the Crown, the greater part of which is fit for settlement.

On the Coombadjha Valley the land is similar and equally as fertile as the Dorrigo and Bastobrick scrubs.

On the whole of the route there is not 10 miles of bad railway country.

The extensive timber trade which would be developed if this country were opened up would be practically unlimited, as extensive forests and scrubs of ironbark and other hardwoods, also of cedar, beech, rosewood, satin-woods, &c., are known to the explorer and forest ranger, and easy of access.

The existence of minerals (tin, gold, and copper) has been proved in payable quantities; indeed, at Cangai, the gold reefs now being opened out bid fair to equal anything yet found in the Northern districts.

Considering this route would offer to Inverell and the great western country the most direct and shortest outlet to the port of the Clarence, we regard it as one of national importance, and as the present Minister for Works is so alive to the necessity of connecting these rich districts with the coast, we feel confident it will commend itself to his unbiassed judgment.

The people of this district are so confident that a good line exists between the respective towns mentioned that they will guarantee to have a track cleared in the event of a trial survey being granted. They will also guarantee to guide the surveyor, and blaze the track.

Commending this to your earnest and immediate consideration.

We have, &c.,
S. W. BURRIDGE.

Telegram from F. A. Wright, Esq., M.P., to Engineer-in-Chief for Railways.

22 November, 1889.

KINDLY inform when you will reach Glen Innes make trial survey to Grafton. Reply at once.

No. 135.

Memo. by Mr. District-Engineer Hutchinson to The Acting Engineer-in-Chief.

Exploration for Railway from Glen Innes to South Grafton *via* Coombadjha Creek.

Railway Construction Department, Sydney, 16 July, 1890.

IN compliance with your instructions, I beg to inform you that I have examined the above proposed railway route, and I have the honor to submit herewith my report.

For the first 5½ miles the permanently surveyed line would be adopted; thence by the head-waters of Skeleton Creek to the head of Glen Elgin Creek, crossing the main road near Bald Nob; thence for about 3 miles along east bank of Glen Elgin Creek; thence north-easterly through heads of French's Creek, Log Gully, and Bloor's Gully, and round head of Oaky Flat, immediately under "The Bluff," to Bench mark No. 10 on Mr. Warren's survey; thence across to Duffer Creek, and up that creek to top of "Haystack Spur"; thence along west side of Gibraltar Range to a gap in said range, about half a mile to the north of tree marked ↑ over GD over V over 82 on boundary survey; thence through this gap to the head of Coombadjha Creek, and along the south bank to its junction with South River; thence across this river, and along its south bank, to the Clarence River; thence along south bank of Clarence River to join the permanent survey at Ramornie Station; thence along the permanent survey to South Grafton.

From the junction of the permanent survey with the Great Northern Railway to Glen Elgin Creek the country is comparatively easy, and there would be no works of any importance on this portion of the route.

From Glen Elgin Creek to the gap in Gibraltar Range, a distance of about 18 miles, the route becomes more difficult, as the country is broken up into ridges and gullies, which would necessitate some deep cuttings, high banks, and perhaps one or two short tunnels.

The level of gap in Gibraltar Range was found to be 3,550 feet, and not 3,000 feet, as stated by Mr. Archibald in his letter to the Glen Innes Railway League, of 4th May, 1890, and as the level of Glen Innes is 3,518 feet, this gap is a little higher than the latter place, instead of 500 feet lower as represented. Up to this point, therefore, nothing has been done towards making the descent from the table-land of New England. The total length of the Coombadjha Creek from the gap in Gibraltar Range to its junction with the South River is about 25 miles, and the total fall in that distance, 3,000 feet, and, therefore, nearly the whole of the descent is made along the valley of this creek, and if the fall of the creek was uniform there would be a continuous grade for 25 miles of 1 in 44. The creek, however, does not fall at a uniform rate, as besides an abrupt fall of about 500 feet in 20 chains the top portion of the creek falls more rapidly than the lower ends.

As

As before stated, the gap in Gibraltar Range, which is the head of the creek, is 3,550 feet above sea-level. The top of the falls, about 7 miles from head of creek, is 2,318 feet; the bottom of falls, about 20 chains farther down the creek, 1,800 feet. At 15 miles from head of creek the level is 958 feet, and at junction of creek with South River, 543 feet.

Assuming the line to start with a cutting 50 feet deep on top of gap, and to have a gradient of 1 in 40 to the falls, the line at top of falls would be 258 feet above the bed of the creek, and from this point to the junction of the creek with South River, a distance of 18 miles, there would be a continuous grade of 1 in 48, and the line would be at an average height of about 600 feet above the bed of the creek. If the line could follow along the creek at a height of from 50 to 100 feet above its bed the ground would be pretty favourable, except in a few cases, where the spurs run close down to the creek, but as this is impossible, and as the mountains at higher levels rise abruptly, and have numerous spurs and ravines running out from them, I consider that the country is quite impracticable for railway purposes at the level along which the line would have to be taken.

Where the proposed line crosses the South River there would be some difficulty in getting a crossing at right angles.

For the next 3 or 4 miles along the south bank of the Clarence River the works would be of a very expensive character, as the mountains rise very abruptly from the river, and the line would have to be constructed along a very steep sideling. From this point to the junction with the permanent survey at "Ramornie," the works in some places would be heavy, but this section would, I think, compare favourably with a similar distance from "Ramornie" towards Glen Innes on the permanent survey.

It will be seen from this report that, in my opinion, the valley of the Coombadjha Creek is an impracticable route for a railway, and I consider that it would be a waste of time and money to make a trial survey of this route.

W. HUTCHINSON.

C. Legh, Esq., Hon. Secretary, Glen Innes Railway League,—

Dear Sir, Glen Innes, 4 May, 1890.

On the accompanying chart I have marked approximately the position of that part of the proposed railway route where the ascent to the table-land is gained along the valley of Coombadjha Creek, and herewith I beg to submit the following notes for your guidance:—

The principal question being the ascent of the table-land from the low-lying valley of the Clarence River, I have given my attention particularly to that part of the subject, and have now marked the track along that portion of the route, and while I indicate the course into Glen Innes from the point where the elevation to the table-land is attained, as also from the beginning of the ascent from a point near the confluence of the Mitchell and Clarence Rivers into Grafton, these parts of the route may well be left out for your future consideration, as in either case I have indicated an alternative route.

Starting from Glen Innes the route may take the course surveyed, *via* Yarrowford to the Dividing Range, between the watershed of the Rocky and Mitchell Rivers, part of this portion being already marked and surveyed, or from Glen Innes by the head waters of Skeleton Creek; thence near the old Bald Nob and near Lewis' sawmill, and leaving the Black Mountain to the eastward, along past the head waters of Oaky Creek to the point in the watershed of the Rocky and Mitchell Rivers before mentioned. This last appears to me preferable, as it is about the same distance, and avoids any descent into the valley of the Rocky River below the level of the adjoining table-land, and passes through country that is fairly fertile, particularly so from near Lewis' mill to the head of Boundary Creek, where the line would be passing through one of the finest brush forests on the eastern table-land.

From this point the descent is commenced, and the course is about north-east across the head waters of the left branch of Dandahra Creek to a low gap in the range which forms the watershed of Coombadjha Creek. This last 8 miles of country is of little value, being a table-land of granite ridges and marshy flats; it, however, presents no engineering difficulties in the way of making a railway.

Once the watershed of the Coombadjha Valley is attained the country entirely changes, and is covered with dense scrub, and the soil is exceedingly rich. The course of the line would thence traverse this valley to near its confluence with the Mitchell River, and it is along this part of the route when the greater part of the descent from the table-land is made. The valley is about 20 miles long, and the reading of my aeronoid would indicate that the elevation at the point I have marked where the valley would be entered to be about 3,000 feet, and the elevation at the confluence of the Coombadjha and Mitchell waters to be about 500 feet over sea-level, which would give an ascent of about 2,500 feet to be made along this 20 miles of the route; this would give an average grade of about 1 in 52 along this 20 miles.

The valley of Coombadjha being very open, the country along its right hand particularly so, forming in large flat terraces which would give ample room to carry the line along the bank for its whole length.

The formation of this valley is generally trap and slate rocks, and the soil very fertile, the first 10 miles being covered with a dense cedar scrub, which extends northward for a distance of from 25 to 30 miles, and is heavily timbered with many valuable woods, such as beech, rosewood, &c. There are extensive flats which, when cleared, would form the best of agricultural land, and once this part is passed the remainder of the valley forming part of the Yulgelbar Run is noted for the richness of its pastures.

The Coombadjha Valley joins the Mitchell or South River near its junction with the Clarence, and from this point there are two routes available, going to either South or North Grafton. The one would cross the Mitchell near its junction with the Clarence; thence along the right bank of that river through Newbold and Ramorne, joining the present surveyed route about 16 miles from South Grafton. The other would cross the Clarence River above the junction; thence through Gordonbrook and Coobdale into North Grafton.

Either of these lines would pass through country highly suitable for settlement, which is indeed so well known that it is not necessary for me to describe it.

I would estimate that the distance of this route from Glen Innes to South Grafton to be about 103 miles, and to North Grafton about 110.

I regret that the time at my disposal is too limited to do full justice to this subject.

Yours, &c.,

J. W. ARCHIBALD.

No. 137.

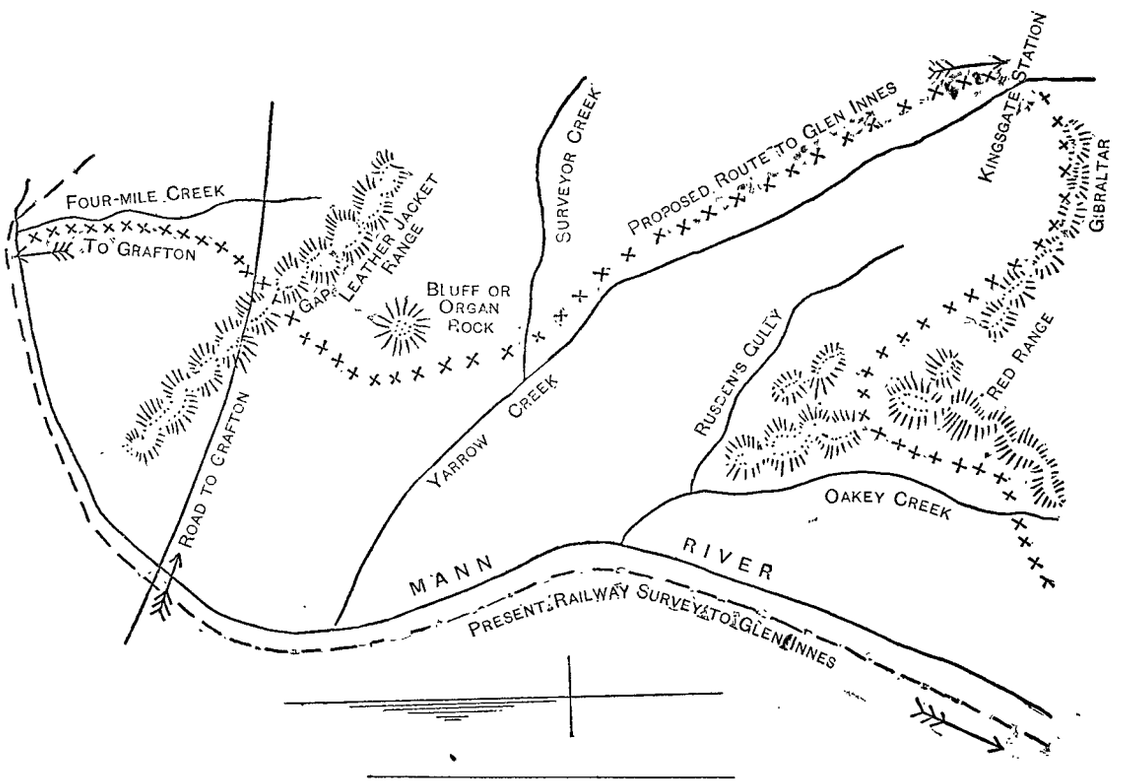
Memo. of Route proposed as a deviation from the surveyed Railway Route between Glen Innes and Grafton.

THE chief difficulty on the above line having been found in the section between the foot of the Big Hill and Shannon Vale Station, the route now described is proposed to avoid these difficulties. The surveyed route rises very rapidly from the foot of the Big Hill to Shannon Vale Station, through a narrow gorge, which it follows along the left bank of the Mann River, when the line has to be carried on cuttings along the face of the steep declivities abruptly overhanging the river. The deviation will follow the opposite, or right side of the river, where there is room to make the ascent by easy gradients and without expensive cuttings by following the watershed of several small tributaries and the course of Yarrow Creek.

The difficulty expected by Mr. Surveyor Hutchinson in rising from Kingsgate to Red Range is avoided by following the northern slope of the range round to the Mann River, which is crossed at a point below the site of the new bridge, on the road from Glen Innes to Red Range; thence there is an easy ascent from the river to the crown of the main range, which is crossed about 5 miles from Glen Innes.

Starting from Glen Innes, the proposed route crosses the Beardy and the main range, reaching the Mann River at the point already indicated; thence after crossing the river it follows a spur of the Red Range to Kempton's selections; thence to Avandele's, on Oakey Creek, which rises in Perry's Swamp and falls in the Mann River; thence down the right bank of Oakey Creek, after leaving which it skirts the northern slope of Red Range, going easterly through a gap in the spur from said range, which divides Rusden Gully from Oakey Creek; then continuing under the range, and leaving a bluff, locally known as Gibraltar, on the right, till Kingsgate Station is reached, where the route crosses Yarrow Creek; thence following the right bank of that creek, which is also a tributary of the Mann, northerly to below its junction with Surveyor's Creek, which is crossed some distance above the junction; then leaving Yarrow Creek, so as to hug the range under the Bluff, or Organ Rock, and crossing Leather Jacket Range at a gap close to the present coach road from Grafton to Glen Innes; thence down Four-mile Creek, to join the present railway route after it crosses the Mann River.

The route above described is in its main features the same as marked many years ago by Mr. Surveyor Hoyle, whose pegs and trees can be followed over a great portion of the distance. There are no steep gradients nor any heavy works. The chief difficulty lies between Oakey Creek and Kingsgate for a distance of about 7 miles; but on the whole the route does not increase the total length of line between Glen Innes and Grafton.



No. 138.

Minute by The Acting Engineer-in-Chief for Railways to The Under Secretary for Works.

Subject:—Glen Innes to South Grafton, *via* Coombadjha Creek (Mr. Hutchinson's exploration.)

Department of Public Works, Railway Construction Branch, Sydney, 21 July, 1890.

I HAVE the honor to forward herewith Mr. District-Engineer Hutchinson's report on his exploration of the country between Glen Innes and South Grafton, *via* Coombadjha Creek.

It will be seen that at the end of the first 23 miles from Glen Innes the line is still at the same level as at the commencement, and that nothing had been gained in the descent towards Grafton, the altitude of this point being 3,550 feet, not 3,000 feet, as stated by Mr. Archibald. From here, a very rapid drop along the Coombadjha Creek takes place; the creek, unfortunately, has not an even fall. At

one

one place, indeed, there is a drop of 500 feet in 20 chains; the consequence is, that in order to get a workable grade the line would have to be kept, for the most part, at a considerable height above the creek, through extremely rough country with a steep sidelong slope, and intersected by deep ravines.

From the mouth of the creek to the junction with the surveyed line, this route presents no great difficulties.

The conclusion to be drawn from Mr. Hutchinson's report is that the Coombadjha Creek route is impracticable, and that it would be a waste of time and money to make a trial survey of it. This view is entirely in accordance with that expressed in Mr. Cumming's report of 16th June, 1885. The Glen Innes Railway League were made acquainted with the result of this exploration, but it appears to have been considered that Mr. Cumming did not take the right direction, and, therefore, that a fresh exploration was desirable. This has now been made, with the result shown above.

Map and report appended hereto.

H. DEANE.

Ask for copy to be sent to Mr. Wright, M.P., and also to Messrs. Scarr and Price.—J.B., 23/7/90.

[*Enclosure.*]

Memo. to the Acting Engineer-in-Chief.

Exploration for Railway from Glen Innes to South Grafton *via* Coombadjha Creek.

Railway Construction Department, Sydney, 16 July, 1890.

In compliance with your instructions, I beg to inform you that I have examined the above proposed railway route, and I have the honor to submit herewith my report.

For the first 5½ miles the permanently-surveyed line would be adopted; thence by the head waters of Skelehn Creek to the head of the Glen Elgin Creek, crossing the main road near Bald Nob; thence for about 3 miles along east bank of Glen Elgin Creek; thence north-easterly through the heads of French's Creek, Fog Gully, and Bloor's Gully, and round head of Oaky Flat, immediately under "The Bluff," to bench-mark No. 10, on Mr. Warren's survey; thence across to Duff Creek, and up that creek to the top of "Haystack Spin"; thence along west side of Gibraltar Range to a gap in said range, about half a mile to the north of a tree marked "G.D." on boundary survey; thence through this gap 82 to the head of Coombadjha Creek, and along the south bank to its junction with South River; thence across this river and along its south bank to Clarence River; thence along south bank of Clarence River to join the permanent survey at Ramornie Station; thence along the permanent survey to South Grafton.

From the junction of the permanent survey with the Great Northern Railway to Glen Elgin Creek the country is comparatively easy, and there would be no works of any importance on this portion of the route. From Glen Elgin Creek to the gap in Gibraltar Range, a distance of about 18 miles, the route becomes more difficult, as the country is broken up into ridges and gullies, which would necessitate some deep cuttings, high banks, and perhaps one or two short tunnels.

The level of gap in Gibraltar Range was found to be 3,550 feet, and not 3,000 feet, as stated by Mr. Archibald in his letter to the Glen Innes Railway League of 4th May, 1890, and as the level of Glen Innes is 3,518 feet, this gap is a little higher than the latter place, instead of 500 feet lower, as represented. Up to this point, therefore, nothing has been done towards making the descent from the tableland of New England. The total length of the Coombadjhe Creek from the Gibraltar Range to its junction with the South River is about 25 miles, and the total fall in that distance 3,000 feet, and therefore nearly the whole of the descent is made along the valley of this creek, and if the fall of the creek was uniform there would be a continuous grade for 25 miles of 1 in 44. The creek, however, does not fall at a uniform rate, as, besides an abrupt fall of about 500 feet in 20 chains, the top portion of the creek falls more rapidly than the lower end.

As before stated, the gap in Gibraltar Range, which is the head of the creek, is about 3,550 feet above sea-level. The top of the falls, about 7 miles from the head of the creek, is 2,318 feet; the bottom of falls, about 20 chains further down the creek, 1,800 feet. At 15 miles from head of creek the level is 958 feet, and at junction of creek with South River, 543 feet.

Assuming the line to start with a cutting 50 feet deep on top of gap, and to have a gradient of 1 in 40 to the falls, the line at top of falls would be 258 feet above the bed of the creek, and from this point to the junction of the creek with South River, a distance of 18 miles, there would be a continuous grade of 1 in 48, and the line would be at an average height of about 600 feet above the bed of the creek. If the line could follow along the creek at a height of from 50 to 100 feet above its bed, the ground would be pretty favourable, except in a few cases where the spurs run close down to the creek; but as this is impossible, and as the mountains at higher levels rise abruptly and have numerous spurs and ravines running out from them, I consider that the country is quite impracticable for railway purposes at the level along which the line would have to be taken.

Where the proposed line crosses the South River there would be some difficulty in getting a crossing at right angles.

For the next 3 or 4 miles along the south bank of the Clarence River the works would be of a very expensive character, as the mountains rise very abruptly from the river, and the line would have to be constructed along a very steep sideling. From this point to the junction with the permanent survey at Ramornir, the works in some places would be heavy; but this section would, I think, compare favourably with a similar distance from Ramornir towards Glen Innes on the permanent survey.

It will be seen from this report that, in my opinion, the valley of the Coombadjhe Creek is an impracticable route for a railway, and I consider that it would be a waste of time and money to make a trial survey of this route.

W. HUTCHINSON.

No. 139.

Memo. by Mr. District-Engineer Hutchinson to The Acting Engineer-in-Chief.

Glen Innes to Grafton Railway.

Railway Construction Department, Sydney, 31 July, 1890.

I beg to submit herewith my report on Mr. Hook's proposed railway route between Newton Boyd and Glen Innes.

Briefly stated, Mr. Hook's proposal is to follow along the south bank of the Mann River, from its junction with the Henry River to Yellow Jacket Creek; thence up that creek to the Gap, where the main road leaves the creek and descends to Mitchell; thence under a high mountain range, by a tunnel about 1½ miles long, to Surveyors' Creek, or else to the same creek by following round the range under the "Organ Rock"; thence on to Yarrow River, cross this river, and on to Kingsgate Run and the Red Range, which is the level of the New England tableland.

To connect the permanent survey with this route the Mann River would have to be crossed at some convenient place above its junction with the Henry River. From this point to the Four-mile Creek the country is pretty level, and the works would be easy. At the Four-mile Creek the ascent to the tableland would begin, and from about the next 6 miles to the Mitchell Gap, where the main road leaves the creek, there would be a continuous grade of 1 in 40. On this portion of the line there would be some deep cuttings and high banks, but no serious engineering difficulties.

From the Mitchell Gap to Surveyors' Creek Mr. Hook proposes to tunnel through the mountain, and estimates the length of tunnel at about 1½ miles. I went over the top of the mountain, and estimate the length of the tunnel at about 3 miles, and therefore the only practicable way would be to go round

the

the range under the "Organ Rock." The works on this section would be very heavy, and in order to reach Surveyors' Creek at a suitable level the gradient for the greater part of the distance would require to be 1 in 40. From Surveyors' Creek to Yarrow River the country is very rough, consisting of spurs and deep gorges.

From Yarrow River to the table-land Mr. Hook describes the route in such a vague way that it is impossible to follow it. I found, however, that a trial survey had been made up the Yarrow River and on to the top of "Red Range," and in my opinion this survey is the only practicable way in which a line could be taken from the Yarrow River to the table-land.

This survey follows up the east bank of the Yarrow River over easy country to "Kingsgate" Station. It then crosses the river, and commences the ascent of the Red Range, and reaches the summit in a distance of about 7 miles. I followed along this survey, but thinking that I would be able to see the section of it on returning to Sydney, did not take any notes of levels or distances. On making inquiry at the Trial Survey Office, I found that all the plans and sections of the route were destroyed in the Garden Palace fire, and that no information about the route was in the office.

From the Yarrow River to the summit of Red Range there is a considerable rise, and I should say that for 6 or 7 miles there would be a continuous grade of at least 1 in 40. From the summit of Red Range to Glen Innes the country is comparatively level, and the works would be easy.

On the permanently-surveyed line between Mitchell and its junction with the Great Northern railway the total length of 1 in 33 grades is 8 miles 67 chains, and the works along the Mann River are of the most expensive character. On Mr. Hook's proposed route I consider that the gradients would be better, and, with the exception of the route from Mitchell Gap to Yarrow River, the country is more open and suitable for railway purposes.

I would suggest the advisability of having a survey made of the line from the Four-mile Creek to the top of the Red Range, as in the event of this portion of the route proving practicable it would be an easy matter to complete the survey at each end afterwards.

W. HUTCHINSON.

Memo. to The Acting Engineer-in-Chief, Railway Construction Department.

Sydney, 18 July, 1890.

In compliance with your request for a progress report, I beg to inform you that I have examined a portion of Mr. Hook's proposed railway route between Glen Innes and Grafton, and also the country between Yarrow River and Glen Innes *via* the Red Range, and although I have not yet had time to go fully into the matter, I believe that this route will admit of better grades than those on the first 26 miles of the permanently-surveyed line.

W. HUTCHINSON.

Re route for railway, South Grafton to Glen Innes.

Dear Sir, Hillgrove, Picton, 29 January, 1890.

When, on 25th instant, I gave to yourself and Mr. Firth some information on the above-named subject, Mr. Firth omitted to reduce my statement to writing, because, as he said, he could recollect it sufficiently for the purpose required. I fancy it is impossible for him to do so. I have, therefore, prepared a rough statement as a guide for anyone who may survey the said route, and which I herewith enclose.

Should any further explanation be desired, I shall still be prepared to give it if called upon.

I cannot spare time to engross the papers properly, and hope that you, or some other person, will be able to read my writing, and if you can hereafter allow a copy to be made and sent to me, I shall esteem it a favour.

Yours, &c.,

H. Deane, Esq. J. HOOKE.

Guide to find route on which to survey a line for a railway from South Grafton to Glen Innes, and reference to the main works required thereon.

To leave South Grafton at the point already surveyed for a railway line; to follow that line over the watershed between the Clarence and Terara Rivers; then at a convenient place to diverge from it, and proceed over easy country along near the present dray road to the bridge on said road across the Terara River, and avail of it for a railway bridge; thence by some deep cutting through long sandstone ridges on to the valley of Chambigne Creek; follow on by a gentle ascent over easily worked country up the northern branch of Chambigne Creek, to near the range dividing the fall of water up to the Terara from that into the Hooke or Nymboi River; thence by some deep cutting and a short tunnel through schists and loss trap under a gap on the range on to Doughboy Creek; thence by an easy descent and light work on the south side of that creek to the Hooke, Nymboi River, and by bridge across that river. At this point the river is about the same width as at the Buccarumbi Bridge, or perhaps less. If a railway were constructed by this route the bridge at Buccarumbi might be removed, and a road made along the western side of the Nymboi River from Buccarumbi to such suggested railway, in length about 9 miles, at no great cost, and would be quite sufficient for the requirements of Buccarumbi, Dalmorton, &c. Thence from the suggested new bridge by an easy descent along the southern side of the Nymboi River to Cungelbong Creek; and thence by an easy ascent along the southern side of that creek up to near the junction of its two main branches. Between the proposed bridge last referred to and this point there are several bluff points of spurs from the ranges abutting on the river and creek, which would require some deep and sideling cutting. At or near the junction of the southern and western branches of Cungelbong Creek, a bridge would be required over one or both, as found to be best; thence by a gentle ascent and easy route up the course of the western branch of Cungelbong Creek to the junction therewith of the Main Northern branch; thence by a still gentle ascent, but more work, up the course of that creek to the mountain range dividing the Cungelbong Creek from the Mann or Mitchell River; thence by some deep cutting and a tunnel, the latter perhaps 1½ mile in length, under the mountain, apparently composed of schist, trap, and perhaps gold, on to a small creek, name unknown, running in on the bottom side of the Mann or Mitchell River; cross that creek; thence by a deep cutting and sideling around a bend of the Mitchell River on to a flat on the Henry River; by a bridge across that river at a good place a little above its junction with the Mitchell. A short distance from Henry River a sideling along the foot of a sugar-loaf ridge at a bend of the Mitchell River. From the Henry River, by an easy ascent

along

along the southern side of the Mitchell River; and, with exception of the sideling just referred to, of easy work over loose soil to the Newton Boyd Four-mile Creek, which is a good place for a railway station as a depôt for the requirements of ascending the high land beyond; and also for Newton Boyd country. To cross the Four-mile Creek and flat on a raised way, in order to commence a greater ascent, and to admit of the present road traffic going underneath; thence across some rising ridges to Leather Jacket Creek; cross that creek and flat on a raised way for similar reasons mentioned at Four-mile Creek; thence along the north-western side of Leather Jacket Creek, on the side of a loose granite range, to where the dray-road at a long gap leaves the said creek and range, and falls down to Mitchell township and river at the foot of the "Big Hill." Over this said gap, which may may be called the "Mitchell Gap," and is perhaps over a quarter of a mile in length, a railway line should pass on a raised way for reasons similar to that suggested at Four-mile Creek and Leather Jacket Creek, and the material for raising the way could advantageously be obtained from a tunnel which should here be commenced. At this point there should be an elevation of about 350 feet attached above that at the Four-mile station, while by the surveyed route there cannot be more than 50 feet attached at the Mitchell township and foot of the "Big Hill," which is just abreast of this point. Whether my estimate before given of the elevation of Newton Boyd, and places westward thereof on to Glen Innes, be a fair approximation or otherwise, it is certain that by my suggested route a rise of about 300 feet can be attained at this point on Leather Jacket Hill more than can be attained at Mitchell township; and that whatever elevation there is to rise from Newton Boyd to Shannon Vale, my suggested line starts from Leather Jacket Creek, or Hill, with an advantage of about 300 feet over that of the surveyed line at Mitchell township, and has nearly double, or at least one-half, more distance in which to rise the remainder. At this point above referred to, the dividing ridge between the Leather Jacket Creek and Mitchell River rises abruptly several hundred feet on to a semi-table-land, the ridge leading on to a higher range on the south side, and the semi-table-land being flanked on the north side by a granite peak called now "The Organ Rock." This semi-table-land appears to be composed of loose material, the range referred to on the south being of trap formation, and the Organ Rock and its surroundings being of granite. From the raised way along the gap before referred to a tunnel of perhaps 1½ mile in length should be made under the said semi-table-land, to emerge on a creek I think called "Surveyor's Creek," coming partly from the said low table-land, and partly from the high range referred to above it, running with slight fall for a few chains, and then falling abruptly down a gorge into the Mitchell River. It will be well if this comparatively level portion of Surveyor's Creek can be attached by a tunnel, as it would favour an onward course, whereas, if the creek has to be crossed anywhere along the gorge referred to, the work of constructing a railway line would at this place be much greater. It is not absolutely necessary to construct a tunnel under the table-land referred to, as a sideling route might be made around the Organ Rock Range, which could reach the Surveyor's Creek in about 3 miles. Such a sideling would give the advantage of attaining a higher level at Surveyor's Creek than a tunnel would; but against that there would be disadvantages from danger of landslips along such a precipitous range. Although that might be guarded against to some extent by short tunnels through some of the most prominent points, which plan best to adopt could of course be ascertained by a survey of both. A tunnel appears to be most desirable. Taking up the running at Surveyor's Creek, much will depend on the elevation attained at that creek as to the work further on; but in any case, thence through gaps, deep cuttings, and high fillings-up, and probably one or two tunnels of no great length, on to Yarrow River; and an attempt should be made to reach this river as high up as a fair gradient will admit of, in order to ease the work beyond it. The Yarrow River is, where here referred to, all along a narrow gulf, and could be easily bridged, the way across it leading about west; thence from Yarrow River along through somewhat similar country as that indicated from Surveyor's Creek to Yarrow River, but of less extent, and requiring less labour, on to easier traversed ridges on the Kingsgate Run; and along over said ridges, continuing to maintain a good ascending gradient, on to the commencement of the rise to the Red Range; and along that rising ground to the Mitchell River; thence along side of the Mitchell River by sidelings and occasional deep cuttings; and it might be desirable, although not absolutely necessary, to make one or two short tunnels through the bluff points of spurs reaching out from the Red Range, on to the lower end of the Shannon Vale Run; thence by an easy gradient and light work over low ridges, and away from the river across a bend again to the said Mann or Mitchell River to a place where at stony points the banks are high on both sides of the river—this point is, perhaps, 1½ miles above the junction of the Skeleton or Skelton Creek; the point referred to is a good one for a bridge over the river—thence from said river by an easy gradient to ascend to the Main Dividing Range, at a depression thereon leading to the Ten-mile Hollow, the water from which falls into the Beardy Water under a mile above the Yarrowford Head Station. Through the Main Range above referred to some deep cutting would be required, but I do not think it would admit of a tunnel. From the Main Range above referred to a choice of routes may be taken:—(1.) By an easy descent, and with light work, along the north side of the Ten-mile Hollow to the point of a stony granite ridge abutting on the Beardy River, a little above Yarrowford Station; at this place the rivers narrow, with a flat on the west side thereof: Bounded by a high stony ridge corresponding with that on the opposite side—over this river and flat a bridge and a raised way, the latter on pillars, could be easily constructed—thence by an easy ascent, and light work, on to a depression in the watershed between Beardy River and Farruckabad Creek, or from the Main Dividing Range before referred to. (2.) By an easy descent, and light work, on the south side of the Ten-mile Hollow, to the Beardy River, at a place where the river is narrow, with high banks on each side thereof; this point is over a mile higher up the river than the point near Yarrowford, and is a better place for a bridge; thence by an easy ascent, and light work, with only one moderate cutting, to the depression in the ridge between Beardy and Farruckabad before stated. No. 1 is the shorter route, but would cost more for a bridge and a raised way than the other. No. 2 is the longer, but is the better place for a bridge. Either line could be easily constructed. Going back to the depression on the watershed between Beardy and Farruckabad before stated; and thence by an easy descent, with some light cutting, through low ridges into the town of Glen Innes. I do not know in what part of the town the railway station is, but wherever it may be, as far as the features of the country are concerned, it can be easily reached from the depression in the watershed last referred to.

Addendum.—In comparing this suggested route with the surveyed line it may be said:—(1st.) Of the lower portion thereof (*a*), that it would save an expensive bridge over the Uralas; (*b*) that a bridge across the Nymboi would cost less than a bridge across the Mitchell; (*c*) that with slight cost for a track from

Buccarumbi to opposite Doughboy Creek, it would render available the material of the Buccarumbi Bridge; (*d*) that it would be many miles shorter than the surveyed line from South Grafton to Newton Boyd country, and would cost less to construct, except (*e*) the cost of an expensive tunnel. 2. Of the upper portion thereof (*a*) the distance between Newton Boyd country and Glen Innes, or Yarrowford, as it may be, is much the same in either case; (*b*) the permanent way of the suggested route would be more costly to construct than the surveyed line would; (*c*) the suggested line would save a station for Yarrowford; and last and greatest of all (*d*), that the suggested route would give a much easier gradient to ascend to the table-land, and be much safer and cheaper to work throughout all time than the surveyed line would.

H. Deane, Esq. J. HOOKE.

Mr. Firth.—W.H.Q., 3/2/90. This had best be handed over to Mr. Hutchinson before he starts, and perhaps he will commit it either to memory or paper.—T.R.F., 4/2/90. Mr. Hutchinson.—W.H.Q., 5/2/90.

Hon. Bruce Smith, Minister for Works, Sydney,— Hillgrove, Picton, 7 January, 1890.

Sir,

Referring to a letter from your department, No. 89-3,683, dated 23rd December, 1889, *re* my offer to indicate a route for a railway from Grafton to Glen Innes, and stating that "Mr. Secretary Bruce Smith will be happy to receive any information on the subject you may wish to offer," I have now to request (as intimated in my letter of 14th December) that you name a time and place at which you will be prepared to receive the information I can offer, and I beg to respectfully suggest that at such time you be attended by a surveyor, who, in the event of its being decided on to make a trial survey of the route I will describe, will be deputed to make such survey. If the surveyor has already been over the country, if only by the road, all the better. Any surveyor would be much better fortified by a personal interview with me under your or Mr. Barling's instructions than he could possibly be from any written statement of my description, however explicit it might be, if it were otherwise supplied to him.

I am, &c.,

J. HOOKE.

Acknowledge, and inform that at any time he calls Mr. Deane has been instructed to go into the whole matter with him.—B.S., 11/1/90. J. Hooke, Esq. Mr. Deane.—D.C.McL., *pro* U.S., B.C., 13/1/90. Seen.—H.D., 17/1/90.

Hon. Bruce Smith, Minister for Works,— Hillgrove, Picton, 14 December, 1889.

Sir,

The Clarence River newspapers show that there is still an agitation for a railway from Grafton to Glen Innes.

I know the country between these places well, and could indicate an eligible route for a railway that would be about 10 miles shorter than the surveyed line, and although it would require two long tunnels, it might not cost more, or even so much, to construct as the said surveyed line would, while it would admit of a much easier gradient to ascend to the table-land, and be easier and cheaper to work throughout all time.

Should you feel disposed to receive the information I can give on the subject, I will, after due notice, wait upon you at any time you may appoint.

I am, &c.,

J. HOOKE.

Thank, and send to Mr. Deane for any remarks he may have to make.—B.S., 16/12/89.

I see no objection to hearing what anyone has to say on this matter. A surveyor will be sent up after the new year, to investigate the route recommended by Mr. Greaves, late District Surveyor.—H.D., 18/12/89.

No. 141.

Minute by the Acting Engineer-in-Chief for Railways to The Under Secretary for Public Works.

Subject:—Glen Innes to Grafton.

Department of Public Works, Railway Branch, Engineer-in-Chief's Office,
Sydney, 11 August, 1890.

When proceeding to inspect the proposed Coombadjha Creek route between Grafton and Glen Innes, which lies to the north of the permanently-staked line, Mr. District-Engineer Hutchinson had Instructions to examine also that proposed by Mr. Hooke, the position of which is on the south side.

The part of this route which deserves chief attention is that near the Glen Innes end, as it would be the means of cutting out the almost impracticable ascent of the Mann River, between 8 and 21 miles from Glen Innes, with its steep sidelings, sharp curves, and 1-in-33 grades.

Mr. Hooke's line involves a tunnel 3 miles in length, between Yellow Jacket and Surveyor's Creek. Mr. Huthinson finds, however, that this can be avoided by going round the hill. The result of the exploration is that Mr. Hutchinson has found a route which, in my opinion, deserves further investigation by survey, as it seems almost certain that the ruling grade will not be steeper than 1 in 40, as against 1 in 33 on the present line, and the country traversed is much more suitable for railway construction.

Part of Mr. Hutchinson's line coincides with that of a trial survey made in 1875, but which was abandoned, apparently because it was found impossible to get down into the valley of the Mann near the junction of Surveyor's Creek, instead of continuing the line on, as shown in blue on the map.

I have the honor to recommend that a trial survey be made of the route between the junction of the Four-mile Creek and the table-land, a distance of about 20 miles, as this will be sufficient to test its value.

H. DEANE,
Acting Engineer-in-Chief.

Mr. Hutchinson's report and plan forwarded herewith.

List for trial survey to be made.—B.S., 12/8/90. Approved by Minister's order, No. 2,135.—D.C.McL., 14/8/90. B.S.

No. 143.

Memo. to The Acting Engineer-in-Chief, Railway Construction Department.

Sydney, 20 August, 1890.

A PORTION of Mr. Hooke's proposed railway route from Grafton to Newton Boyd was examined by the late Mr. Surveyor Francis, whose report, briefly stated, is as follows:—

From South Grafton to the Orara River the country presents no difficulties, the first work of any importance being a bridge over that river. The route then follows up the valley of the Chambigne Creek, and for the first 10 miles the works would be easy and the grades good; for the next 2 miles there would be more work, and a continuous 1-in-40 grade. The line would then go through the Buccarumbi Range, with a tunnel about a mile long, and come out on to Doughboy Creek; thence down that creek to the Nymboi River, over favourable country. At this point the route examined by Mr. Francis diverges from that described by Mr. Hooke. Mr. Francis followed up the Nymboi River to Buccarumbi, and thence up the north bank of the Little River to Broadmeadows, a distance of 30 miles, over country of the most difficult description. From Broadmeadows to Newton Boyd two tunnels would be required, each about 40 chains long, otherwise this section would not be difficult. In concluding his report, Mr. Francis said, "The route between Grafton and Newton Boyd explored by me, and described in this report, does not appear to me to possess any advantages over the route already surveyed. On the contrary, I am of opinion that a survey would prove it to be more costly."

Continuing Mr. Hooke's line from the Nymboi River, he proposes to cross the river near its junction with Doughboy Creek, and follow it down to the Cunglebung Creek; thence up that creek as far as practicable; then tunnel through the mountain dividing the Cunglebung from the Mann River; and thence along the Mann River to the Four-mile Creek, opposite Newton Boyd. Mr. Hooke states that on this route there would be some deep and sideling cuttings, and a tunnel about 1½ mile long through the range dividing the Cunglebung Creek from the Mann River.

W. HUTCHINSON.

I have already reported on what I consider the most important portion of Mr. Hooke's suggested route, namely, that which would have the effect of cutting out the almost impracticable part of the staked line between 8 and 21 miles from Glen Innes, with its sharp curves and long grades of 1 in 33. With regard to the part between Grafton and Newton Boyd, about half of this had already been reported upon by Mr. Surveyor Francis, with the result that, with the exception of a tunnel 4 miles in length, no great difficulties would be found there. The second half, however, of this portion of Mr. Hooke's route is different. At the Newton Boyd end there would be serious difficulties, and I believe that the staked line would be found to be much cheaper to construct, although it may be longer, and to have much better grades.—H.D., 21/8/90. Under Secretary.

No. 148.

Petition.

[Forwarded by J. See, Esq., M.P.]

To the Honorable the Minister for Works, Sydney,—

Sir,

We, the undersigned residents of the Grafton district, humbly submit that for many years the people of this district have been promised a railway from Grafton to New England, but the engineering difficulties in ascending the table-land have been of such a character as to necessitate careful and lengthy investigations as to the best route to adopt.

Understanding that you have now completed most exhaustive inquiries on this question, and that you are now satisfied you have discovered a practicable route, we, your humble petitioners, most humbly pray that you will submit to the Public Works Committee a railway from Grafton to New England by such route as you consider most practicable at the earliest date possible, with a view of having the line constructed without further delay. And we, as in duty bound, will ever pray.

[*Here follow signatures.*]

John See, 16/1/91. Will Mr. Deane please report what progress has been made in this investigation.—J.B., 16/1/91.

The Guyra to Grafton survey is still in progress; 124 miles out of about 150 completed. Tenterfield to Casino—One survey just commencing; another will follow as soon as possible. Grafton to Glen Innes to be further tested. A surveyor instructed to do this.—H.D., 22/1/91. Under Secretary.

Best to inform that the surveys are not yet completed, and that until they are it will be quite premature to come to any decision on the subject.—J.B., 23/11/91. Approved by Minister, Order No. 412.—D.C.McL., 6/2/91. Inform.—J.B., 7/2/91.

John See, Esq., M.P.,— Department of Public Works, Sydney, 10 February, 1891.

Sir,

With reference to the petition presented by you on the 16th ultimo, from residents of the Grafton district, in regard to the construction of a railway from Grafton to New England, I am directed by the Secretary for Public Works to inform you that until the necessary surveys now in progress are completed it would be quite premature to arrive at a decision upon the subject.

I have, &c.,
J. BARLING
(*Per* D.C.McL.),
Under Secretary.

No. 149.

No. 149.

Mr. Surveyor Little to The Engineer-in-Chief for Railways.

Glen Innes to Grafton.

Sir, Camp, Red Range, 15 February, 1891.

I have the honor to acknowledge receipt of Mr. Burge's memo. of 12th instant, this day (Sunday), and beg to state that I have ridden over the country between the Red Range and the Four-mile Creek, at the junction with the Mann River, with guide Finlay M'Killop, and arrived back at camp at the Red Range on Friday evening. This part of the work would have been completed sooner had it not have been for the very wet weather that we have experienced, and consequently caused the delay, as it rained from the 6th to the 9th almost continuously. We left the camp at Red Range on the 10th, and our progress was greatly impeded by misty and showery weather and the rough country. I followed along Mr. Hoyle's route as well as possible, and from the barometrical heights which I took, am doubtful as to whether a practical line can be got in this direction (on account of the wet and misty weather the barometrical readings would not give satisfactory results as regards correctness of heights), as the descent from the table-land at the Red Range is very rapid from near John Marshall's selection, No. — of portion 4, in the parish of Kingsgate, county of Gough, round a peak known as "Larkins' Peak," and thence under Gibraltar Rock to Kingsgate. It would be impossible to get round this peak (Larkins' Peak) without using very sharp curves, steep grades, and heavy works, as the spurs are narrow and the watercourses deep and broken. However, it might be accomplished by a tunnel from 40 to 60 chains in length, and on a descending grade of at least 1 in 40 for about 5 miles, and thence on to Kingsgate or Yarrow Creek. When I reached the Kingsgate Creek I went in search of a more practicable route, and followed up a creek known as Sheep-station Creek, from its junction with the Kingsgate, at the old station called by that name. The creek referred to has an easterly course, and rises in a mountain called Blair Mountain, about 12 miles distant from Stonehenge, on the Main Northern Railway, south of Glen Innes. There is a gully, which has an easy descent from the table-land, near Mr. Ballard's selection, and runs into Sheep-station Creek. This is the route I intend trying down on to the Kingsgate Creek, and then follow the line suggested by Mr. Hutchinson. This route, I think, will give better results as regards earthworks and works in general, but a 1-in-40 grade for about 5 miles, which might be worked up to better advantage when a thorough trial survey is made.

From Surveyor's Creek to the Organ Rock, or locally known as "Tommy's Peak," the descent is very rapid, and it appears to me that the grade would be at least 1 in 40 for a continuous distance of about 9 miles on to Leather Jacket Creek. This is the route round the river, and the works would be very expensive and heavy.

I do not think it possible to get a line from Surveyor's Creek to Leather Jacket Creek by tunnel, as described by Mr. J. Hooke, as the tunnel would be fully 3 miles long, if not more, as stated by Mr. Hutchinson, and on a continuous grade of at least 1 in 30, from observations taken, and the only practicable route between these two points, in my opinion, would be by following the river (Mann River).

The average fall of Leather Jacket Creek (not Yellow Jacket Creek) is about 1 in 25; but by skirting the sidelings and crossing the creek a couple of times a practicable grade could be got. From the Junction of Leather Jacket Creek with the Mann River to the Four-mile Creek there is no serious difficulty.

To-morrow (Monday), 16th instant, I hope to start a flying survey along route mentioned, and will push along as rapidly as possible, and hope to be completed in about five weeks' time.

I have, &c.,

A. GEO. LITTLE.

Mr. Burge.—H.D., 19/2/91.

I saw Mr. Little at Glen Innes on the 26th ultimo, though I had not the opportunity of seeing the ground. From his description, after exploring different routes, he finds that one known as Hoyle's, is the only one likely to lead to any result. He is running a vertical and horizontal traverse on this, and has got about half-way down at 1 in 40, over very rough ground indeed. There appears to be a spur called "Larkins' Peak," which Mr. Little's line would pierce by a tunnel. It has occurred to me that by extending this part of the line into a spiral, mostly underground, of (say) 12 chains to 15 chains radius, about 70 chains to 90 chains additional length would be gained, and (say) 100 feet dropped down at one point. This, though it would undoubtedly be an expensive expedient, might make an otherwise impossible line below practicable; but nothing can be said on this point till further information is to hand. I have, however, instructed Mr. Little to have in view the lowering of the line in this way as he carries on his operations downwards.—C. O. BURGE, 5/3/91.

Put by.—H.D., 12/3/91.

No. 150.

Mr. Surveyor Little to The Engineer-in-Chief for Railways.

Glen Innes to Grafton.

Sir, Camp, "The Big Hill," *via* Glen Innes, 17 March, 1891.

I have the honor to report progress on this survey, and beg to state that I have got down to Surveyor's Creek, being a total length from the point of starting of 17 miles.

The works, as far as I have gone, will be exceedingly heavy, and think that there will be a possibility of obtaining a 1-in-50 grade maximum when the line is thoroughly worked up. I have taken cross-levels on 10 miles of this length, so that when the plan and section are plotted a line can be struck out. The crossing of Surveyor's Creek is a heavy feature in the line, as the southern side has to be traversed some distance in an easterly direction, and then cross to the northern side, with a 12-chain radius curve and viaduct fully 100 feet high; and thence in a westerly direction till the eastern side of the Mann River is reached; and then that river has to be hugged right along its course.

A. GEO. LITTLE.

Mr.

Mr. Burge.—H.D., 19/3/91.

From Mr. Little's reports, written and verbal, it is clear that the great difficulty here is not so much the grade as the expensive works to be met with, which can only be avoided by exceeding the standard curvature and following surface more closely. It appears to me that if this railway is to be made at a reasonable cost, and, I presume, otherwise it will not be proposed, it can only be done by adopting sharper curvature. Except for the passenger portion, for which change of vehicle would in any case be made at Glen Innes, the traffic of this line would not be through to Sydney, but mainly from coast to table-land, viz., to Queensland border on the north, Inverell on the west, and (say) Armidale on the south, covering about 280 miles, and it appears to me that it is worth consideration whether sharper curves, with the provision of special rolling-stock adapted to them, might not be justifiable in connection with such a considerable length of traffic as this. The Ceylon railways, with a gauge of 5 ft. 6 in., have numerous curves of 5 chains radius, with 1½-chain intervals, on 1 in 50 grades, easily worked at 12 miles per hour by bogie stock (6 feet rigid wheel-base), as a rule, but actually taking ordinary trucks 7 ft. 6 in. wheel-base. It is clear that the adoption of such curves as these might make this line possible, and, by enabling the distance to be lengthened, reduce the 1 in 50 grade contemplated by Mr. Little; also, by reducing cuttings, make slips less likely.—C. O. Burge, 20/3/91.

Glen Innes to Grafton.

The Engineer-in-Chief,—

Sir, 17 March, 1891.

I have the honor to state that I am this day shifting my camp from Kingsgate to the foot of the Big Hill, on the Main South Grafton Road, which will be my last main camp, as I can finish from this camp with temporary camps, as I have had to do on this length. The distance from the camp I have just left is about 12 miles to the Big Hill (at Mitchell), but have to travel a distance of 50 miles to reach that place with bullock team. The country being too rough to pack any more than 1 cwt. on each horse, it will take three days to get round with the team, and expect to reach there by Thursday next, 19th inst., providing it does not rain too heavily, as it is raining at present, and every appearance of it continuing.

I have, &c.,

A. GEO. LITTLE.

In the meantime the usual course should be adopted for the sake of comparison with other lines to the coast.—H.D., 21/3/91. Mr. Burge. Noted.—C. O. Burge, 23/3/91.

No. 151.

Mr. Surveyor Little to The Engineer-in-Chief for Railways.

Sir, "Big Hill," 6 April, 1891.

I have the honor to acknowledge receipt of memo. 91-171, also telegram on the 5th inst. Referring to the subject of this memo., I respectfully beg to state that the work I have done on this survey is, I think, sufficient to obtain an estimate of probable cost, grades, curves, and works.

I have taken a through section, also cross-levels for the whole length, with the exception of the first 4 or 5 miles at the Red Range, so that a moderately accurate section can be obtained by striking a line through these cross-levels. The direction of route, I am certain, is the only possible one to connect the low land with the table-land, and as the nature of the country is so confined, is impossible to diverge more than a few chains either side of traverse run. Beyond where the Leather Jacket Creek junctions with the Mann River, do not think it necessary to continue the traverse, as this portion presents no difficulties, only slightly undulating, and no serious fall. I have not had time to plot my work up thoroughly, but have plotted my traverse and part of the section for nearly the whole distance I have gone, which is the most difficult portion. Weather permitting, I hope to have finished the whole of the necessary length on the 14th inst.

It will take a week or ten days to complete the plotting of plan and section.

I have, &c.,

A. GEO. LITTLE.

Mr. Burge.—H.D., 7/4/91.

Mr. Little appears to have obtained more particulars towards getting data for an estimate of this line than his previous reports would indicate. Having these, should Mr. Little, on sending up his plans for revision, remain on the ground with the view of working them up into a regular trial survey, so as to bear proper comparison with the trial survey now being begun, Casino to Tenterfield? Perhaps the Acting Engineer-in-Chief has already personally instructed him. I imagine that by the time Mr. Little sends up his plans there ought to be very little left to do on the Inverell line.—C. O. Burge, 11/4/91. Acting Engineer-in-Chief, Grafton.

You will understand from my telegram that I had already instructed Mr. Little to run a line from top of Red Range into Glen Innes so as to permit of through section and estimate being completed.—H.D., 14/4/91. Mr. Burge.

Yes.—C. O. Burge, 20/4/91.

No. 153.

Mr. Surveyor Little to The Engineer-in-Chief for Railways.

Glen Innes to Grafton.

Sir, "Weetaliba Run," *via* Mudgee, 25 July, 1891.

In compliance with memo. 91-612, I have the honor to report finally upon the flying survey of portion of the line Glen Innes to Grafton, viz., Glen Innes to the Four-mile Creek, *via* the Red Range. Starting at a point on the Main Great Northern Railway, at 320 miles 43·10 chains, and about 2½ miles to the south of the Glen Innes station. From the junction with the main line this survey has an average easterly bearing to the Red Range, and goes through good agricultural and sheep pasture lands of a basaltic nature, undulating, and moderately easy works.

On this portion there are two rivers to cross, viz., Beardy and Mann Rivers, each of which will require a substantial bridge of from 3 to 4 chains in length, and from about 30 to 40 feet in height respectively, so as to carry off the flood-waters, which flow in a good body. Each river drains a considerable area of country. There are also four small creeks, but would not require more than medium timber openings.

The

The descent of the Red Range (summit of table-land) starts at the crossing of Oakey Creek, and near its source, and at corners of portions 32–34 and 11, owned and occupied respectively by John Marshall and Benjamin Goodwin, in the parish of Red Range, and county of Gough, and follows the course of that creek on its eastern slope to a saddle in the range called Sandy Camp, on the slope of Larkin's Peak; thence along the slope of the range, crossing Rusden's Gully, and through Allan Ballard's selection (No.—, parish of Kingsgate, county of Gough), at the foot of a bluff of rocks known as Gibraltar; thence crossing Yarrow Creek, near the junction of Sheep-station Creek with that creek, at the old Kingsgate Station; thence in a northerly course along the eastern slope of the Mann River, crossing Surveyors' Creek on a curve; thence on to crossing the Main South Grafton Road at about 1½ miles to the east of the bridge crossing the Mann River at the foot of the Big Hill (village of Mitchell); thence along this river for about 3 miles, and crossing the river and joining the originally permanently-staked line at about 30 miles from Glen Innes. I also ran a traverse along the main road to show (as an alternative) the practicability of a line down Leather Jacket Creek (as reported on by Mr. Hutchinson), which would necessitate a tunnel of from three-quarters to 1 mile in length, so as to get through the spur of the range which forms the watershed of the Mann River and Leather Jacket Creek: thence on and crossing that creek, and following its eastern slope to near where it junctions with the Mann River, and following the direction of the main road to Newton Boyd, &c., and crossing the Mann River near the junction of the Four-mile Creek, and joining the permanently-staked line.

I only carried my survey as far as the junction of the Leather Jacket Creek with the Mann River, as from this point on to the Four-mile Creek there is no serious difficulty.

The grade of 1 in 50 as maximum will necessitate very heavy and expensive works; and from the beginning of the descent from the summit of the Red Range, going around Larkin's Peak, a succession of sharp curves will have to be used on account of the sharp and narrow spurs that run from the range, and to obtain this grade it will necessitate, as suggested by Mr. Burge, a spiral tunnel from 70 to 90 chains in length, which length of tunnel, when set out, would, I think, be reduced, as the nature of this portion of the mountain offers facilities for reducing the length of tunnel and easy construction of this undertaking. From this point on to the end of my survey the works in general will be exceedingly heavy, as the ground is of such steep sideling, and consisting of a succession of narrow and broken spurs, which cannot be traversed with reasonable radii curves, consequently the cuttings will be deep and numerous, and steep banks.

In the construction of this line it will have to be borne in mind that owing to the rotten nature of this portion of the country (principally rotten granite) that special works will have to be carried out to secure the safety, and prevent enormous land-slips, which I have witnessed while carrying out this survey.

Although the route *via* Leather Jacket Creek would probably be more costly than the one *via* the river, I would suggest the former route, as the works would be of a less dangerous nature, as the ground is more solid, and no very steep sidelings, as on the route *via* the river.

The country from the Red Range to Newton Boyd is mostly used for cattle pasture, and there is no doubt as to the immense mineral wealth within this radius. Gold and other mineral reefs are being worked within a few miles of this route, viz., Dalmorton and other fields, consequently, opening up a large extent of mineral-bearing country.

General Summary.

Bridges.—There will be required, at least, five large bridges, viz., Beardy River, Mann River (first crossing), Yarrow Creek, Surveyors' Creek, and Mann River (second crossing), and probably one at Rusden's Gully, with numerous timber openings and waterways.

Earthworks.—Exceedingly heavy; 50-foot cuttings and banks numerous.

Tunnels.—Owing to the nature of the country, numerous tunnels will be required to obtain the necessary grade and avoid dangerous sidelings.

Ballast.—Basaltic rock; very good and plentiful.

Timber.—Over the portion of this length I saw very little timber suitable for railway purposes; but ascertained that first-class timber (ironbark and red gum) abounds in quantity.

Brick soil.—The soil between Glen Innes and the Red Range is apparently good brick-making soil.

Water supply.—Plentiful, and easy stages.

Carriage.—The cost of cartage on this line for construction will be an expensive item, owing to the roughness of the country, and long distances have to be travelled to attain short distances.

Grade.—Ruling grade, 1 in 50.

Curves.—Limit, 12 chains radius.

I have, &c.,
A. GEO. LITTLE.

No. 154.

Memo. to Engineer-in-Chief.

Glen Innes to Grafton.

Department of Public Works, Railway Construction Branch, Sydney, 15 September, 1891.

In making a rough estimate of the original survey of the above, when not deviated from by Mr. Little's flying survey, which has a ruling grade of 1 in 50, I find four or five lengths (about 4¾ miles in all) of 1 in 40, which can be only properly cut out by survey.

There is also at the Grafton end, adjoining the Clarence, a good many deep creeks, crossed necessarily at a very high level, and at great expense, to be above Clarence River flood backwater. Possibly, deviations to avoid them, even with rougher earthwork sections, would reduce cost.

If a fairly trustworthy comparison with the other New England and coast lines is desired, should not a surveyor be sent to investigate the above?

The quantities on this portion were taken out and disposed for a 15-foot base. Shall I regrade for an 18-foot base, which is that on which the upper portion is estimated?

This lower end also of the line would seem to give scope for great reduction in cost by the adoption of exceptionally sharp curvature, as already advocated (91–1,298), for this line, in view of the great length of the traffic covered, warranting an otherwise unjustifiable provision of special rolling-stock.

C. O. BURGE.

No. 155.

No. 155.

Memorandum to The Engineer-in-Chief.

Glen Innes to South Grafton, *via* Big Hill and Red Range.

Department of Public Works, Railway Construction Branch,
Engineer-in-Chief's Office, Sydney, 8 October, 1891.

In forwarding herewith estimate of above, I draw attention to following :—

The deviation *via* Red Range made by Mr. Little is of the nature of a flying survey only, and the estimate for this part may be largely increased or diminished when a more detailed survey is made.

As regards the rest, the estimate is based on the existing permanent survey, and as this was originally graded for a 15-foot base, the 18-foot base now taken gives an enormous quantity of spoil, probably a million and a half cubic yards, say £200,000 which might be saved merely by regrading. There are also, as already pointed out to you (91–4,288), several lengths of 1 in 40, while the deviation *via* Big Hill is graded to 1 in 50, and the line appears otherwise capable of improvement.

Probably the present estimate is, on the whole, considerably in excess.

Heavy rails are provided for.

C. O. BURGE.

No. 158.

F. A. Wright, Esq., M.P., to The Secretary for Public Works.

Sir, Legislative Assembly, 29 February, 1892.

I notice by to-day's papers that a survey and estimate of the cost of constructing a railway between Guyra and South Grafton has been completed, and I understand that there is a survey and estimate of the cost of a line between Tenterfield and Grafton also being carried out.

In view of the fact that the railway survey of the Glen Innes-Grafton line is a very imperfect one, and that the estimate of the late Engineer-in-Chief was only a guess, may I ask that the country between Glen Innes and Grafton be also explored, surveyed, and the cost of the railway properly estimated. The railway surveys of this line are very imperfect. This is shown to be the case by a very great improvement made upon a portion of the line by subsequent surveys, and a thorough survey of the whole of the line would, I am convinced, still further improve it, and reduce the ridiculously high estimate of cost made by Mr. Whitton.

As the question of the construction of the line between the west and the coast is one that cannot be immediately dealt with, it is well to have a perfect examination of the country, and the projected routes carefully surveyed and reported upon. As this has been done in the case of the Guyra-Grafton line, and is in course of being done with the route from Tenterfield to Grafton, I have to ask, on behalf of the district I represent, Glen Innes (which is immediately west of Grafton), that the same consideration be extended to that route as to the other places, and that you will give the necessary instructions for the Engineer-in-Chief to have a new and complete survey of the line Grafton to Glen Innes and an estimate of the cost of constructing same obtained.

Yours, &c.,
F. A. WRIGHT.

Will Mr. Deane kindly say how this matter stands.—J.B., 2/3/92.

The survey Guyra to Grafton has been completed, and estimate made, as already reported. The survey Glen Innes to Grafton was completed along a certain route, and permanently staked, but a portion of this line has been since much improved, the heavy grades and sharp curves having been cut out. No proper estimate was ever made of this route, Mr. Whitton refusing to give one till the line had been completely staked and cross-sectioned. There are other parts besides that which have been cut out which, I believe, could be much improved, and if a fair comparison is to be made between this route and that from Guyra, it is most desirable that the other parts of the Glen Innes-Grafton line should undergo revision. On the other hand, of course, if the Glen Innes-Grafton route is condemned, on other considerations this work would be unnecessary. There is no survey being made between Tenterfield and Grafton, but between Tenterfield and Casino, the latter line making a junction with the Grafton-Casino line about 10 miles south of Casino.—H.D., 4/3/92. Under Secretary.

Submitted.—J.B., 11/2/92. This must stand over for the present.—W.J.L., 12/3/92. Inform.—J.B., 14/3/92. F. A. Wright, Esq., M.P., 21/3/92. Mr. Deane.—D.C.McL., for U.S., B.C., 23/3/92. Seen.—H.D., 24/3/92.

Sir, 21 March, 1892.

With reference to your letter of the 29th ultimo, urging that the country between Glen Innes and Grafton be explored and surveyed, and that a proper estimate be prepared of the probable cost of the construction of a line of railway, I am directed by the Secretary for Public Works to inform you that the consideration of this matter must stand over for the present.

I have, &c.,
J. BARLING,
Under Secretary.

No. 159.

F. A. Wright, Esq., M.P., to The Secretary for Public Works.

Sir, Legislative Assembly, 6 April, 1892.

On the 29th February I wrote you asking for a re-examination and survey of the line of railway between Glen Innes and Grafton, and on the 21st March received a reply that the matter must stand over for the present. Allow me to again bring this matter under your notice, and to urge the granting of my request.

I am quite well aware that the proposal to connect the Northern Railway with the seaboard is a work that cannot be undertaken for some time to come, but as a very careful examination and survey of the line from Guyra to South Grafton has been made, and I understand there is one now in course of completion

completion between Tenterfield and Casino, to connect with the Grafton-Tweed Railway, I think, in justice to Glen Innes, the same attention should be bestowed on the Glen Innes-Grafton route. The expense would not be very heavy, and I know of my own knowledge that the first examination of this line was of a most crude and imperfect description, and, from many sources of information, I believe a re-examination and resurvey of the whole route would result in the discovery of a very much better line of communication, and through much better country than the original one passed through.

In a conversation I had some months ago with Mr. Wm. Val Miller, the Roads Superintendent at Glen Innes, he gave me to understand that he himself could find a much better route than that originally surveyed, and that if he could get some little assistance in his office he could devote a greater portion of his time to the exploration of this line, and a survey of it could be accomplished at comparatively small cost to the Department. Mr. Miller has had considerable experience as a railway surveyor, and understands, I believe, thoroughly what he is talking about. This, I think, is worthy of your consideration, as it may mean minimising the cost of this work.

Trusting I shall shortly be favoured with a reply, notifying me that you have approved of my application for re-examination and survey of the line of railway in question.

I am, &c.,
F. A. WRIGHT.

Mr. Deane for report.—D.C.McL. (*pro* U.S.), B.C., 11/4/92.

No. 160.

Minute by The Engineer-in-Chief for Railways to The Under Secretary for Public Works.

Subject :—Glen Innes to Grafton.

Department of Public Works, Railway Construction Branch, Sydney, 13 April, 1892.

In reference to the annexed, please see my minute on Minute Paper 92-1,278, as to the possibility of improving the line; there is no doubt in my mind that it can be done to a considerable extent.

A portion of the original survey was dealt with last year, with the result that by the adoption of a deviation the ruling grade for this length was made 1 in 50, as against 1 in 33.

On other parts of the original survey there are grades of 1 in 40, which, I believe, can be cut out. To say the least, the survey is, in my opinion, an unsatisfactory one, and requires revising.

As to the possibility of finding a route entirely different from the one in question, I am extremely doubtful. Deviations of portions would probably suggest themselves, but hitherto all attempts to find any other practicable route, except that by the Mann River, have failed.

If the Honorable the Minister approves of this revision of the survey, there are enough surveyors in this Department to do this work without seeking assistance outside. At the same time, I shall be extremely glad to receive any information which might lead to the discovery of a better line.

H. DEANE,
Engineer-in-Chief.

Submitted.—J.B., 20/4/92. Revise survey.—W.J.L., 27/4/92. Mr. Deane, and inform.—J.B., B.C., 28/4/92. Please see me about this.—W.D., 2/5/92. Assistant Engineer for Trial Surveys.

Done. It was arranged that Mr. Cumming will undertake this on completion of his present work, which will be almost directly, and that I shall visit the locality myself as soon as I can get away from Sydney.—C.O. Burge, 5/5/92. The Engineer-in-Chief.—W.D., 10/5/92.

I find that there is a very carefully cross-levelled plan of this line, independently of the permanently staked one, and I went through this very carefully at Grafton with Mr. Cumming, laying out deviations through the cross-levels, resulting in the obtaining of 1 in 50 grades, without any difficulty, at the four places where steeper grades occur. As to getting a better section at the Orara River and at Cattle and Nobby's Creeks, that is doubtful, but Mr. Cumming is to test these. With regard to the precipitous portion, between where Mr. Little's descent of the Big Hill from Glen Innes ends, to 69 miles from Glen Innes (original mileage), between which latter and Grafton Mr. Cumming is to work, the cross-levels show that it is very possible that the very long tunnels may be reduced and cut out. A young and active surveyor alone should be detailed for this work, as no other would be of any use. I am sure that the employment of curves of 5-chain radius with a special engine stock for the considerable length that this connecting line covers would reduce the cost of it enormously, as suggested by me in 91-1,298.—C. O. Burge, 30/7/92.

Perhaps Mr. W. Kennedy might be told off for this.—W.D., 2/8/92. Assistant Engineer, Trial Surveys. Mr. W. Kennedy instructed.—C. O. Burge, 3/8/92.

No. 161.

Minute by The Secretary for Public Works.

Subject :—Railway communication between Inverell and Grafton.

Department of Public Works, Sydney, 29 July, 1892.

In the course of the representations made by the deputation introduced by Mr. F. A. Wright, M.P., and accompanied by Mr. Alex. Hutchison, M.P., which waited upon the Colonial Treasurer and myself at Glen Innes on the 27th instant, in favour of the construction of a railway from Glen Innes to Inverell, reference was also made to the proposal to continue the line from Glen Innes to Grafton.

I said that in my opinion there was at present no justification for the construction of a line from the table-land to the coast, which would necessitate a very heavy expenditure, but that I was quite prepared to have a thorough exploration of the route made. W.J.L.

Mr. Deane.—J.B., 8/8/92. This matter is being attended to.—W.D., 15/8/92. Under Secretary, B.C. Put with papers, 15/8/92.

No. 163.

Mr. J. Cumming to The Engineer-in-Chief for Railways.

South Grafton and Glen Innes Railway.—Proposed route *via* Washpool Creek.

Sir, South Grafton, 28 September, 1892.

I have the honor to report that I have gone over the proposed line *via* the Washpool Creek to about 8 miles from its junction with the Clarence. Mr. Penrose, manager of Yugilbar Station, is the only one who knows this route, and he was laid up with cold and influenza when I was at his place last Sunday. He is willing to go over it about the end of November, the weather at present being very cold and stormy.

The ascent to the table-land must be explored on foot, as the country is too rough for riding. It is better to do this in summer time, as we will have to camp out two nights, without a change of clothes, in blankets.

Mr. Penrose has written to the Hon. T. H. Smith explaining this.

The new route will be about 30 miles longer than the one *via* the Mann River, but it goes through fairly useful country, fit for settlement, for the first 50 miles from South Grafton.

I have, &c.,
JOHN CUMMING.

Forwarded for the Minister's information. It is evident that the exploration should be started about the end of November, when the weather is more favourable for camping out without tents or blankets.—H.D., 5/10/92. Under Sec. Inform Mr. See.—W.J.L., 6/10/92.

Sir, 15 October, 1892.

With reference to your representations in regard to the exploration of the proposed route of the South Grafton and Glen Innes Railway *via* Washpool Creek, I am directed by the Secretary for Public Works to inform you that, as the nature of the country necessitates the exploration being made on foot, the work will have to be undertaken about the end of November, when the weather is favourable for camping out without tents or blankets.

I have, &c.,
J. BARLING,
Under Secretary.

The Hon. John See, M.P.

No. 164.

Mr. J. Cumming to The Engineer-in-Chief for Railways.

Proposed route, *via* Washpool Creek, from Grafton to Glen Innes.

Sir, Copmanhurst, 13 December, 1892.

I have the honor to inform you that I have explored the above line, and have to report as follow:—

The line follows the trial survey from Grafton to Tenterfield as far as Yugilbar, crosses the north arm of the Clarence at the latter place, thence follows the range forming the water-shed between the Washpool and Coombadjha Creeks, and joins the Coombadjha Creek route at the head of that creek.

The approximate length from Grafton to Glen Innes is about 131 miles.

The portion from Grafton to Yugilbar will give a moderate section, and the country is fairly good for farming and grazing.

The middle portion, from Yugilbar to the head of the Coombadjha Creek, has plenty of length to make the ascent from 400 feet to 3,000 feet with 1 in 50 grade, but the country is of the most rugged and mountainous character, and will give an enormously expensive section requiring from 15 to 20 miles of tunnels and viaducts.

The remaining portion, from the head of Coombadjha Creek to Glen Innes, is through easy country, and will give a light section.

It is not advisable to have this route surveyed, as the length is 30 miles more than that of the Mann River line, and the cost of construction is from 20 to 50 per cent. more than that of either the Mann River or the Don Dorrigo lines.

I have, &c.,
JOHN CUMMING.

Assistant Engineer for Trial Surveys.—F.H., 19/12/92.

Sir, Copmanhurst, Clarence River, 14 November, 1892.

Per same mail in one parcel I send you plans and section of a deviation of the North Coast line at Grafton and of Nos. 1, 2, and 3 deviations of the Glen Innes and South Grafton permanently-staked line.

No. 3 sharpens the curves from 20 to 12 chains and increases the length by about 15 chains, but greatly reduces the earthwork and culverts, and flattens the grade from 1 in 40 to 1 in 50.

I will go over the proposed route *via* Washpool Creek about the end of the month, as arranged with Mr. Penrose, Yugilbar, unless I get further instructions.

I have, &c.,
JOHN CUMMING.

Engineer-in-Chief, Railway Department, Sydney.

Assistant Engineer for Trial Surveys.—H.D., 17/11/92. These plans have been received; curious to say, as far as they go, these deviations giving 1 in 50 grades show considerably easier works in every way than the 1 in 40 lengths which they replace, while the cost of the additional length is comparatively trifling.—C. O. BURGE, 24/11/92. Who made the original survey?—H.D., 28/11/92. Assistant Engineer for Trial Surveys. Mr. Cumming himself.—C. O. BURGE, 29/11/92. Engineer-in-Chief.—I shall be glad to know why Mr. Cumming did not pick out the best line in the first instance.—H.D., 30/11/92. Mr. Cumming.

Telegram from Mr. J. Cumming to The Engineer-in-Chief for Railways.

WILL finish here on the 7th; send instructions.

Mr. Cumming has been wired, if his present instructions have been carried out and no further improvements are possible, he is to break up his camp and return to Sydney.—C. O. BURGE (*per* C. McD.S.), 10/1/93. Mr. Cumming has returned to Sydney.—F.H., 13/1/93.

No. 166.

Mr. J. Cumming to The Engineer-in-Chief for Railways.

Glen Innes and South Grafton Railway.

Sir, 28 January, 1893.

I have the honor to report that I have completed the survey of the proposed deviations of the above line, altering the 1 in 40 grade to 1 in 50.

No. 1, from 99 miles 75 chains 0 links to 101 miles 47 chains, is 2·95 chains shorter than the old line. It does not affect the grades or earthwork, and is intended to alter the station ground.

No. 2, from 95 miles 56 chains to 98 miles 32 chains, increases the length by 11·78 chains, and requires 12-chain curves against 16-chain, but does not increase the cost of construction.

No. 3, from 91 miles 10 chains 47 links to 92 miles 56 chains, is 14·79 chains longer, and requires 12-chain curves against 20-chain, but considerably reduces the earthworks and culverts.

No. 4, from 76 miles 34 chains to 78 miles 59 chains 46 links, is 19·46 chains longer, and requires 12-chain curves against 15-chain, but considerably reduces the earthworks.

No. 5, from 72 miles 78 chains to 75 miles 37 chains, is 7·02 chains longer; slightly increases the cost of construction, but does not require sharper curves than those on the old line.

From the nature of the country on the lower half of this line, the best routes that can be got with 1 in 40 and 1 in 50 grades will be similar in every respect, except a slight difference in length in favour of the steeper grade.

I have, &c.,
JOHN CUMMING.

No. 167.

Memorandum to The Engineer-in-Chief for Railways.

Glen Innes to South Grafton.

Department of Public Works, Railway Construction Branch,
Engineer-in-Chief's Office, Sydney, 15 March, 1893.

Three estimates with abstracts, diagram map (*Appendix* B). Papers, 92-4,559, &c.

HEREWITH I beg to forward report estimates divided into three parts and diagram map of the above amended survey.

This was undertaken to reduce the ruling grade of the original permanent section, on the main descent, from 1 in 33 to 1 in 50, and of the lower portion from 1 in 40 to 1 in 50, as well as to reduce the cost of the works throughout.

As regards the gradient question, this has been effected.

With regard to the work, no estimate was ever made of the original line, but an inspection of the two sections is sufficient to show that, notwithstanding the considerable increase of length which is involved by attaining the two objects, a large reduction has been made.

The amendment of the portion comprising the main descent from the table-land, corresponding to Part I of the estimates herewith, and generally known as the Red Range route, was surveyed by Mr. Little in the early part of 1891, and the amendment of the remaining portions being then held over, an interim report and rough estimate were sent in under date 8th October, 1891, which the present ones, based on the amendment of the whole line, and gone into with much greater detail, supersede.

Part No. 1 of the estimate, which rests on Mr. Little's work, which is a flying survey only, is liable to be considerably altered on a proper trial survey being made. Parts II and III, being based on the original permanent survey and on deviations therefrom surveyed in the usual trial survey form, are more trustworthy. The estimate, therefore, as a whole, is not so accurate as those of the rival routes, *via* Tenterfield and Guyra. The section of Part I is mostly compiled from cross-levels on a traverse only, and in a few cases where these have not been long enough to reach the development of the best line, the section is rather problematical, and that too in plans where heavy works are involved.

The line begins by a junction with the Great Northern railway at 321 miles from Newcastle, and about 2 miles south of Glen Innes station. From here to 321 miles 60 chains the section is assumed, but by varying the curve used, a fair section will probably be obtained. The junction as traversed on the ground in the flying survey is at 320 miles 43 chains, and being unsuitably placed at the foot, a gradient is not entertained in this estimate.

The line, whose general direction on the table-land is easterly, crosses Beardy waters at 323 miles 17 chains, and turning sharply to the south at 324 miles for a mile, proceeds then north-westerly to the crossing of the Mann River at 328 miles 66 chains, about ¾ mile below the road bridge. The direction then is mainly easterly to the 335th mile, where the drop from the table-land begins. This is the highest point on the line, and it is about 100 feet higher than the summit of the original line. The valley of Oakey Creek is now followed with a north-easterly bearing, down, on the ruling grade of 1 in 50, to Larkin's Peak, a precipitous spur jutting out in a north-easterly direction from the Main Range. At Larkin's Peak the new line is only about 1½ miles distant from the original line at the other side of the Mann River valley, but it is 440 feet above it in elevation.

Advantage is taken of this promontory of Larkin's Peak, as suggested by me to Mr. Little, to fall suddenly down about 200 feet in about 35 chains, as the crow flies, by means of a spiral. The spiral is flattened out to an oval shape, so as to expose a considerable portion of it as an embankment to absorb stuff,

stuff, to shorten tunnels, and to help their ventilation by lengthening the development, thus easing the grade through them to 1 in 100 through No. 1 tunnel at 339 miles 45 chains, which is 739 yards long, and to 1 in 78 through No. 2 at 340 miles 30 chains, which is 562 yards long.

The effect of this spiral alignment is that at 338 miles 43 chains the line is only 2½ chains distant in a direct line from a point 1¼ mile further on by the railway mileage, there being a difference in levels of about 103 feet, while at 339 miles 20 chains, where the line again approaches itself within 3 chains, the lower point is over 1½ mile further by rail, and 100 feet below.

The line, after leaving the spiral, scarps the eastern side of the spur, which is thus utilised, and heads the eastern fork of Oakey Creek, encountering a short tunnel (No. 3), 119 yards long, at 341 miles 17 chains. A sharp horse-shoe bend takes the line round the spur between this last and Rusden's Gully, which is crossed at 343 miles 14 chains.

The line has a generally easterly but very tortuous course from this point to Yarrow Creek, at 346 miles 27 chains, the grade being somewhat easier in this interval. This creek is now followed down closely on its eastern bank to its junction with the Mann River, tunnel No. 4, of 184 yards, being met with at 351 miles 31 chains. The line now follows the Mann River, and just beyond the confluence of the Yarrow Creek with it the outer line, in order to avoid the deep and wide chasm of Surveyors' Creek, 250 feet below, has to diverge sharply to the right to get across it higher up. In doing so spurs have to be pierced by tunnels Nos. 5 and 6, of 129 and 507 yards respectively. The creek is passed at 352 miles 47 chains, and the Mann River is rejoined about 353 miles 20 chains, the old line at 20¾ miles from Glen Innes being close at the other side of the water.

The Mann River is more or less closely followed to 357 miles 40 chains, skirting the Organ Rock, opposite the surveyed township of Mitchell, tunnels No. 7 (409 yards), No. 8 (372 yards), and No. 9 (396 yards) being here necessary between 357 miles 75 chains and 359 miles 10 chains, crossing Stirrup-iron Creek between the two latter at 358 miles 62 chains.

The Mann River is again approached at 359 miles 60 chains, a short tunnel (No. 10) of 101 yards occurring at 360 miles 32 chains.

The Mann River is crossed at 362 miles 15 chains, at a considerable skew, which probably might be greatly reduced on further investigation, and the original survey joined at 362 miles 29·70 chains, this point corresponding with mileage of latter, 29 miles 49·40 chains from Glen Innes.

Part No. 1 of the estimate extends to this point.

The original line is now adopted to 363 miles 16·68 chains (new line through mileage being used in this report throughout, except where specially mentioned), the only alteration being in grading, the former line having been graded to suit a 15-foot base for the cuttings, the amended 18-foot base requiring a lifting of the formation to suit disposal.

The old line so taken follows closely down the northern bank of the Mann River, a tunnel (No. 11) of 66 yards occurring at 362 miles 46 chains, and, calling the Red Range line deviation No. 1, a slight deviation (No. 2) occurs from 363 miles 16·67 chains to 363 miles 28·91 chains, merely to improve the ninth curve on the old line to 10-chain radius, the latter being the limit on the new one; and, after passing through tunnel No. 12, of 63 yards, at 366 miles 9 chains, a similar alteration for curvature is made from 366 miles 10·83 chains to 366 miles 19·46 chains.

At 370 miles 74·39 chains to 372 miles 34·77 chains, a deviation (No. 4) to improve the line is made, reducing the earthwork, the additional length being 4·02 chains. This is the nearest point to the surveyed township of Newton Boyd, which is about 1 mile away on the other side of the Mann River.

The next deviation (No. 5) is from 373 miles 63·53 chains to 374 miles 25·78 chains, and reduces earthworks and height of bridges considerably. The extra length is 1·65 chain.

No. 6 deviation is similar in object, and is from 374 miles 30·15 chains to 374 miles 60·89 chains, involving extra length of 1·20 chain.

Beyond this the banks of the river become very precipitous, and a considerable number of tunnels, mostly short, through jutting spurs impossible to get round, follow here, enumerated as under:—No. 13, 286 yards; No. 14, 66 yards; No. 15, 52 yards; No. 16, 84 yards; No. 17, 130 yards; No. 18, 31 yards; No. 19, 75 yards; No. 20, 91 yards; No. 21, 42 yards; No. 22, 351 yards; No. 23, 35 yards.

No. 7 deviation now follows, and is very important, cutting out the long 1,305 yards tunnel of the old line, by going round the spur which that line went straight through. The works on the deviation, however, are heavy, and include a short tunnel (No. 24) of 80 yards, at 388 miles 53 chains. Omitting this, the deviation would probably cost, at the outside, about the average of the whole line per mile (say) £18,000. It begins at 388 miles 5·59 chains, and ends at 389 miles 49·26 chains, giving an extra length of 60·33 chains. The saving effected by this deviation would, therefore, be as under:—

Original line—Tunnel (say)	£65,250	
Permanent way	1,850	
		£67,100
New line—Tunnel (say)	4,000	
Works, £18,000 × 1½ mile	27,000	
		31,000
Saving		£36,100

The next deviation (No. 8) has the same object as No. 7, effecting it in much the same way. It begins close to the end of the previous one at 389 miles 64·1 chains and ends at 390 miles 58·87 chains, giving an extra length of 29·74 chains.

The saving may be estimated on the same plan as under:—

Original line—Tunnel (say)	£40,900	
Permanent way	1,317	
		£42,217
New line—Tunnel	15,300	
Works, 75 chains at £18,000 per mile	16,875	
		32,175
Saving		£10,042

Tunnel

Tunnel No. 25, of 306 yards, as above, is included in this deviation. Tunnel No. 26, of 88 yards, follows immediately at 390 miles 69 chains, and deviation No. 9 begins at 391 miles 35 chains, ending at 392 miles 5·25 chains, with an extra length over original alignment of 0·21 chains, effecting a reduction in earthwork.

The works here get gradually easier, the line still skirting the Mann River, which is crossed at 402 miles 45 chains, and a E.N.E. course taken through the parishes of Braylesford and Duckan Duckan towards the Clarence River, the valley of which is now taken down to Grafton. Tunnel No. 27, of 330 yards, is at 406 miles 5 chains, and is the last.

Deviation No. 10 substitutes 1 in 50 for 1 in 40 grades of the old line, and begins at 406 miles 75·45 chains, ending at 409 miles 41·45 chains. There is practically no difference in the amount of work in this case. The extra length is 7·02 chains.

No. 11 easing the grade to the same extent, curious to say, lightens the earthwork and culverts considerably, though the length is increased by 19·44 chains. This begins at 410 miles 38·49 chains, and ends 412 miles 63·93 chains.

At 416 miles the line adjoins the south bank of the Clarence River, passing Copmanhurst, on the northern bank, about 419 miles, Nobby's and Cattle Creek at 419 miles 36 chains and 420 miles 55 chains respectively, and crossing the Orara River at 422 miles 11 chains.

An expensive feature of the line is the great height of the formation level over the beds of these watercourses, rendered necessary to be above the flood-level caused by the Clarence River backwater. Unsuccessful attempts were made in each of these cases to deviate so as to cross the creeks higher up, where the bed would be higher and the flood no worse.

After crossing the Orara the line takes a south-easterly direction, and between it and South Grafton the following deviations have been surveyed:—

No. 12, from 425 miles 31·40 chains to 426 miles 79·93 chains, largely reducing earthwork, and at the same time the grade from 1 in 40 to 1 in 50, at an increased length of 14·79 chains.

No. 13 also making reductions of a considerable character, while easing grade to same extent. This is from 430 miles 14·72 chains to 433 miles 2·50 chains, lengthening line by 11·78 chains.

No. 14, in connection with improved approach to South Grafton station and wharf, and to junction with line from Guyra and the south. There is no practical difference in amount of works between it and the old line except as effected by regrading, which is independent of location. It begins at 434 miles 45·55 chains, and ends 436 miles 14·55 chains, being 2·95 chains shorter than the previous line.

The approach to South Grafton is made by the line bending north-easterly, intersecting arm of flood-area (1876) between 434 miles 59 chains and 435 miles 24 chains, junctioning with the North Coast and Guyra line at 435 miles 31·21 chains, and, jointly with that line, crossing the overflow of the Clarence flood-marks at 435 miles 52 chains and 435 miles 75 chains, entering then upon the proposed terminal station-ground, the centre line being parallel to and 4 chains from Bent-street, South Grafton. The production of the line on to the river-frontage crosses Alipon Creek at 436 miles 8·90 chains, being under flood-level (1876) as regards surface of ground from 435 miles 75 chains to the end.

The original line along the south bank of the Clarence, running down stream, is now adopted to 436 miles 57·55 chains, corresponding to 102 miles 10 chains from Glen Innes on the old survey, which is the terminal point.

In nearly all the deviations the length of curvature is increased, but its severity decreased as regards the western end of the line, as compared with the old permanent survey, many 8-chain curves occurring on it, 10 chains being the limit on the new line. There are, however, many more 10-chain and other nearly as sharp curves on the new line than on the old.

A 1 in 50 ruling grade, as against 1 in 33, but at the expense of additional length of 12 miles 33·43 chains, has been obtained. The deviations to lessen works are responsible for an aggregate additional length of 1 mile 14·12 chains, making a total addition of 13 miles 47·55 chains.

The earthworks are moderate, at least as compared with the greater part of the rest of the line, from the Glen Innes junction to the summit, from which they are exceedingly heavy, to the junction with old line at the second crossing of the Mann River; the cuttings here too are very insecure, and the liability to slip may make more tunnelling necessary than has been provided for. The work is then rather lighter to about 376 miles, where heavy work again occurs for over 20 miles, the rock, however, being of a sounder character than that on the descent. The remainder of the line is of a more moderate character, but still fairly heavy.

The tunnelling has been already referred to in order. The length, in the aggregate, amounts to 3 miles 18·82 chains.

There are several large bridges on all the sections, over rivers and creeks, as well as to span ravines. Beardy Waters, Mann River (three crossings), Yarrow Creek, Hell-hole Creek, Oakey Creek, Cooradooral Creek, Walabla Creek, Cattle Creek, Orara River, and five ravines, varying from one 42-foot steel span, with three 24-foot timber openings over a ravine, to three 200-foot steel spans over the Orara River, and eight 123-foot and two 42-foot steel spans over third crossing of the Mann.

Besides these there are ninety-three 14-foot timber openings provided to deal with the Clarence flood at South Grafton, and owing to a large portion of the line immediately adjoining what might be called the main drainage of the district passed through, viz., the Mann River, there is an unusual number of moderate sized openings required for its larger tributaries at their maximum discharge points, and its smaller drainage is greatly cut up.

With regard to materials, stone for ballast is plentiful throughout, and for building through the central portion. Timber is to be had, but not close to the line as a rule, and carriage is expensive, generally on account of the precipitous character of the country. Material for brickmaking is available at the Glen Innes end.

Water is plentiful, and may probably be supplied in many cases by gravitation direct into the tanks.

The capabilities of the country passed through may be called agricultural and pastoral on the table-land, practically non-existent on the mountainous portion from the summit to Newton Boyd; cattle-producing from there to South Grafton, but very limited in width for nearly half this length.

This survey, with its estimates, following the arrangement of its original, runs right into South Grafton and to the banks of the Clarence, the last portion, 1 mile 26·34 chains, containing very expensive station works, engine accommodation, and flood-viaducts being common to it and to the North Coast railway;

railway; so that if the latter be considered as ultimately necessary, this portion should belong to the latter system, as was done in the parallel case of the Tenterfield to Casino line, the survey and estimate of which was finished at Montgogerie Junction, on the Grafton and Lismore line.

In case this view should be taken, I supply as under the amount to be deducted from Part III of the estimates herewith, viz., £39,782 11s. 3d., leaving that total £374,234 2s. 9d., or £11,430 9s. per mile.

As submitted, however, the total of the three estimates is £2,058,480 16s. 4d., or £17,788 9s. 3d. per mile.

C. O. BURGE.

No. 170.

J. See, Esq., M.P., to The Secretary for Public Works.

My dear Sir, Sydney, 1 February, 1895.

I send herewith a letter from Mr. G. H. Varley, of Grafton, and two extracts, one from the Grafton, or, rather, *Clarence Examiner*, the other from the *Glen Innes Examiner*. These all urge that a fresh survey should be made of the proposed Grafton-Glen Innes railway—that the route indicated would shorten the route by some 14 miles, and effect a great saving on the last estimate made of the cost of this line. Mr. Varley suggests that Mr. O. Lloyd should be put in charge of the survey, as he is well acquainted with the country, and the people have confidence in him.

I strongly urge, therefore, that the route suggested be surveyed, viz, up Chambigne Creek—through the range to Dough Boy Hollow; thence up Cunglebung Creek, and through the range to Newton Boyd—joining the lately-improved section from that place to Glen Innes. This will not be a costly work; and if the survey, as suggested, is carried out, it will give great satisfaction to a number of people resident upon the Clarence River, and in the Glen Innes District.

Yours, &c.,
JOHN SEE.

Acknowledge and let me have report.—J H.Y., 20/2/95. Mr. Deane.—D.C.McL. (*pro* U.S.), 22/2/95.

The central portion of this direct line, which was advocated by Mr. Hooke, does not seem to have been reported upon, although I am nearly certain that some aneroid levels were taken, which showed serious difficulties in the way of a good line being obtained. However, I think the best way will be to have the matter tested by actual survey. It will set the matter at rest, and I therefore recommend this step.—H.D., 5/3/95. Under Secretary.

[*Enclosure.*]

Dear Mr. See, Grafton, Clarence River, 22 December, 1894.

I enclose two extracts, from the *Grafton Examiner* and *Glen Innes Examiner*, touching on improvements of the survey for railway from South Grafton to Glen Innes. It is urged that this amended survey, particulars of which are sent herewith, should be made in order to set the question at rest for the future, as to which is the best line in the interest of the country. The Minister, as you of course know, has promised to consider all projected lines. The consideration cannot be complete until this amended survey has been made, and a mistake once made in a matter of railway construction will be very difficult to remedy. As it is, the line from South Grafton to Glen Innes will prove less costly to construct than either of the other lines suggested, and less costly to use by the people than either of those, consequently it has even now the most favourable features for establishing and maintaining a traffic in the interest of the country. But if 14 miles of haulage can be saved, even at the same cost as the line already surveyed, a great advantage will be gained. But if, as many persons think, the total cost can also be reduced, a still further advantage will be gained, and the time hastened when the line is likely to be undertaken. What is urged is that the Minister should have this survey undertaken at once, and if a suggestion could be made, it would be that Mr. O. Lloyd, who has done such good work in respect to other lines in this part of the country, should be entrusted with the duty of exploring the country indicated, and making the improved survey. Mr. Lloyd is, I believe, still on the Glen Innes-Inverell survey; his name is mentioned in connection with the Grafton line, because it is believed that the public would have confidence in him, from his known ability. In the event of this surveyor being entrusted with the work, and a comparatively free hand, much information, perhaps not at present available to officials, could be placed at his disposal. The great success of the Tenterfield-Casino survey, we hope, will influence the Minister in granting this application.

1. The suggested improvement of the survey is: Leaving the present survey about 4 miles out of South Grafton; proceeding thence to the Orara, and making by best route for Chambigne Creek Valley; proceeding up that valley to range dividing that creek from the Nymboida River; through the range to Doughboy, crossing the Nymboida River; and thence following up Cunglebung Creek Valley to the range dividing the waters of that creek from those of the Henry River; through that range to Newton Boyd; and thence on to connect with Mr. Little's latest survey.

2. Improvement of Little's survey near the Red Range.—The improvement suggested being to keep nearer to the Mann River, in place of ascending the Red Range and again descending.

The country in both of these localities needs to be thoroughly examined. The existing survey is, as you know, 114 miles in length; the length of the line along the course indicated would be something like 100 miles, it being almost direct.

The Honorable John See, Member for Grafton. Yours, &c.,
G. H. VARLEY.

[*Sub-Enclosure.*]

Extract from the *Grafton Examiner*.

RAILWAYS.

THE subject of light or pioneer lines of railway is coming very much to the front. The Railway Commissioners have recently inspected the route for one of those proposed lines between Jerilderie and Berrigan. They have now been requested by the Minister for Works to report on the prospects of similar lines from Parkes or Forbes to Condobolin, and from Bourke to Brangar, on the Queensland border. This line would be about 84 miles in length, intended to tap the Queensland border. Another line spoken of is the Goulburn-Crookwell line, some 34 miles in length. This line has been before the Public Works Committee, and was recommended to be carried out, provided the cost did not exceed £4,500 per mile, with gradients of not less than 1 in 50. Another survey is being made with a view to bringing down the estimate to within the amount recommended by the Committee. It is feared by the Minister that this cannot be done, and, further, that in any case it cannot be constructed on the light or pioneer system. The Narrabri-Moree line is intended to be a light line, so far as the cost is concerned. The Glen Innes-Inverell route is said to be too difficult to permit of the construction of a cheap line. This latter line is stated by the Minister to be under the consideration of the Government, and that it was the intention of the Government to consider every proposed line in the country before it left office. This is a significant suggestion, and should arouse the people of the table-land to action in view of a direct line of communication with the port of Grafton. The latest surveys have shown that the cost of the direct line can be materially reduced in comparison with the original estimate. With the latest survey it has been shown to be the cheapest line to construct of all those projected from the table-land

table-land to the coast. Not only that, it is the shortest and most direct, and consequently would be the cheapest to use by those conveying produce or merchandise. Still, there are those who hold to the opinion that the cost of the line may still further be largely reduced upon close inspection of the country, taking in a route which would be more direct. The route suggested up Chambigne Creek, through the range to Doughboy Hollow, thence up Cunglebung Creek, and through the range to Newton Boyd, joining the lately-improved section from that place to Glen Innes. Would it not be well if a move were made to bring this matter under the notice of the Minister, with a view to the survey being completed before the Government proceeds to consider "every proposed line" on its merits? The Glen Innes-Grafton line, as it is, stands out prominently as the national line, but none the more the less, if improvement is capable, reducing the first cost and ultimate charges, that improvement should be sought in the public interest.

[Extract from the *Glen Innes Examiner*, 11th December, 1894.]

THE GRAFTON-WEST RAILWAY ROUTE.

THE *Grafton Examiner* suggests that a more direct survey of the railway line from Grafton to Glen Innes should be made, and it is suggested that the Minister should be asked to send up a party of surveyors to undertake the work. A gentleman who is thoroughly acquainted with the intervening country writes to say:—"There is much to indicate the importance of that survey being made. It is stated by what I believe to be competent authority that the route is some 10 to 15 miles shorter than the surveyed route. Such a saving in haulage for all time is an important item in wear and tear, management expenses, and particularly in respect to charges to those using a line. An authority has given it as his opinion that the shortened line (even though tunnels would be needed to pierce the ranges from Chambigne to Doughboy and from Cunglebung Water to Newton Boyd) will be less expensive to construct than the surveyed line, the bridges required on the shortened line being neither so numerous nor so large as those that would be required on the other. Besides, the facility for bridge-building as regards sites is much superior, in comparison, on the shorter line. The subject is one that should certainly be investigated, and I do not think it will be asking too much if the Minister were solicited to have a survey and estimate carefully made at once, in anticipation of that consideration promised with regard to all proposed lines. The Government are anxious to provide work of a reproductive character for the unemployed. Here is an important step in the inception of such a work. More than that, the construction of such a line—by bringing adjacent districts into closer touch with each other, will do more to remove the pall of depression that hangs over the country than anything else. Many other reasons might be urged in favour of the survey and the work, but I need not repeat what has been so frequently stated." There is a good deal of force in the foregoing remarks, and we think no time should be lost in bringing under the notice of Mr. Young the expediency of having the improved survey made at as early a date as possible.

No. 171.

Memo. from Mr. C. McD. Stuart to The Engineer-in-Chief for Railways.

Glen Innes to South Grafton.

Department of Public Works, Railway Construction Branch,
Engineer-in-Chief's Office, Sydney, 28 February, 1895.

Sir,

I beg to forward herewith a tracing showing the originally permanently-staked line from Glen Innes to South Grafton in red, and the proposed alterations *via* Red Range and Kingsgate, and between the crossing of the Mann River and South Grafton, by dotted red lines; also the explorations of alternative routes by double-dotted lines.

The rough estimate of the original line, 102 miles in length, was £1,999,200, or an average of £19,600 per mile, the limiting grade between the table-land and Newton Boyd being 1 in 33, and between the crossing of the Mann River and South Grafton 1 in 40.

By the proposed alterations *via* Red Range, &c., the length of the line is 115 miles 57·59 chains; total cost, £2,058,480 17s. 4d.; and average per mile, £17,788 9s. 3d. Of this, part No. 1, the deviation *via* Red Range, is 41 miles 43·80 chains in length, and is the most costly, being £945,279 5s. 8d., or £22,751 15s. 5d. per mile. The limiting grade *via* this route is 1 in 50.

As the proposed new route has to pass through the ranges between Chambigne Creek and the Nymboida River, and between Cunglebung Creek and the Henry River, it would probably be as costly as the last mentioned, and the grades on the intermediate portion not as good as those down the Mann River.

CHAS. McD. STUART.

The routes explored and shown by double-dotted lines on the accompanying tracing were abandoned owing to the difficult nature of the country passed through, as also Mr. Warren's trial line *via* Dandahra.

Mr. Hooke, I believe, at various times advocated a line through Newton Boyd. Can you not show this line on the tracing? It partly coincided with an explored line of Mr. Francis and part with Mr. Little's line. The intermediate portion does not seem to have been reported upon, although I am under the impression that Mr. Little or Mr. Cumming took some aneroid levels.—H.D., 5/3/95. Assistant Engineer for Trial Surveys.

Herewith Mr. Francis's report, 78–1,164. The line described by him has been added on to the map now returned. There is no record of the aneroid heights referred to.—C. O. BURGE, 11/3/95. Seen.—H.D., 13/3/95.

No. 172.

Memo. *re* new Survey asked for by Mr. See, M.P.

Proposed South Grafton to Glen Innes Railway.—Suggestion that a route up Chambigne Creek, through the range to Doughboy Hollow, &c., should be surveyed.

ON the 1st February last Mr. J. See, M.P., forwarded a letter from G. H. Varley, of Grafton, urging, in connection with the proposed South Grafton to Glen Innes railway, that a route should be surveyed up Chambigne Creek, through the range to Doughboy Hollow, thence up Cunglebung Creek, and through the range to Newton Boyd. This route, it is considered, would be shorter by 14 miles than the one surveyed.

Mr. See also sends extracts from the *Clarence River* and *Glen Innes Examiners*, in favour of the line up Chambigne Creek, &c., and he strongly urges that a survey be made. Mr.

Mr. Deane minutes as follows:—

"The central portion of this direct line, which was advocated by Mr. Hooke, does not seem to have been reported upon, although I am nearly certain that some aneroid levels were taken, which showed serious difficulties in the way of a good line being obtained. However, I think the best way will be to have the matter tested by actual survey. It will set the matter at rest, and I therefore recommend this step."

About how much will this survey cost.—J.B., 28/11/95.

I told Mr. See, M.P., that I would send a surveyor to make a careful preliminary examination as soon as possible, if the people of Grafton would provide a guide having local knowledge to accompany him.—J.H.Y., 28/11/95.

As I presume it is not likely this proposal will be considered in the near future, is it worth while spending any more money at present on the survey? It has already cost £17,961.—J.B., 6/3/95. No. Must stand over.—J.H.Y., 8/3/95. Inform.—D.C.McL. (*pro* U.S.), 9/3/95.

Noted; but it is scarcely correct to say that these surveys—that is, the trial surveys, presumably—have cost £17,961. According to Mr. Carpenter's account, £8,000 would be nearer the mark, and it is not the fault of the line that a lot of work had to be done twice, the plans having been burnt in the Garden Palace fire.—H.D., 28/3/95.

Memorandum to Engineer-in-Chief.

Trial Surveys from South Grafton to Glen Innes.

Department of Public Works, Railway Construction Branch,
Engineer-in-Chief's Office, Sydney, 7 March, 1895.

With reference to the cost of above trial surveys, I find that the following is the estimated amount:—

Original survey, say plans destroyed in Garden Palace fire	£4,600
Second survey, say	3,000
Subsequent explorations and deviations	1,000
Total to 1884	£8,600
Since above the per. survey has cost (charged to vote of £2,000,000)	9,361
Total	£17,961

Sir, 12 March, 1895.

With reference to your letter of the 1st ultimo, enclosing a communication from Mr. G. H. Varley, of Grafton, urging that in connection with the proposed South Grafton to Glen Innes railway a survey should be made up Chambigne Creek, through the Range, to Doughboy Hollow, thence up Cunglebung Creek to Newton Boyd, I am directed by the Secretary for Public Works to inform you that the matter must stand over for the present.

I have, &c.,
J. BARLING,
(*per* D.C.McL.),
Under Secretary.

John See, Esq., M.P.

No. 173.

J. See, Esq., M.P., to The Secretary for Public Works.

My Dear Sir, Sydney, 28 March, 1895.

I wrote to you a few days ago upon the subject of a further survey of a line of railway from Grafton to Glen Innes, and I regret that you have replied to the effect that you cannot consent to this being done. With that letter I sent you a long letter from Mr. Varley, of Grafton, and extracts from the *Glen Innes and Clarence Examiner*, in which strong and forcible arguments are used why it should be done. I do trust that you will reconsider your decision, and approve of the survey being done, and thereby satisfy for the time being a very large (some thousands) number of persons interested in this great national work.

Yours, &c.,
JOHN SEE.

Submitted.—J.B., 2/4/95. Mr. See may be informed that until the much more urgent survey work on hand has been completed this cannot be done.—J.H.Y., 5/4/95. Inform.—Jno. P. (for U.S.), 5/4/95.

Sir, Department of Public Works, Sydney, 11 April, 1895.

With reference to your letter of the 28th ultimo, further in regard to the question of making another survey for a line of railway from Grafton to Glen Innes, I am directed by Mr. Secretary Young to inform you that until the more urgent survey work on hand has been completed the survey asked for cannot be made.

I have, &c.,
J. BARLING,
Under Secretary.

John See, Esq., M.P.

No. 175.

O. Lloyd, Esq., to The Engineer-in-Chief for Railways.

South Grafton to Glen Innes Railway—Report of exploration made by O. Lloyd from South Grafton to Newton Boyd by way of Chambigne and O.B.X. Creeks and the Boyd or Little River.

The Engineer-in-Chief, Railway Construction Branch,

Sir, Department of Public Works, Sydney, 8 February, 1896.

I have the honor to inform you that, in accordance with your instructions to that effect, I left Sydney on the 7th ultimo, arriving at Grafton on the afternoon of the 9th January.

As several of the members of the Chamber of Commerce were absent from Grafton, I was unable to obtain the necessary information I required until the 10th ultimo, when there was a meeting of the Railway Committee. That

That body did not appear to have any definite scheme to propose as to my operations, the feeling apparently being that I was to have a free hand in regard to route to be tried.

The only suggestion offered was made by Mr. T. Bawden, and such was based, so far as I could gather, on a proposal by one Rhodes, who had acted as guide to Mr. Cumming on one occasion, and had led him into all sorts of impossible country.

Mr. Bawden's idea was that a line might be tried up Chambigne and down Doboy Creeks, crossing the Buccarumbi Range near where the two creeks head together; then down into the Nymboi River across the same, and grade up a creek known as Wellington Creek; tunnel through a high range dividing the Nymboi and Mann River waters; cross the Mann and up Cooraldooral Creek; thence route was to be as might be best found to the table-land.

Nearly the whole of the country proposed to be caused to be explored by Mr. Bawden had been previously reported upon, and most strongly condemned by Messrs. Warren, Cumming, and Francis, and I had additional information furnished to me as to aneroid heights, by Mr. W. J. Mulligan, manager of the Coramba and Chambigne mines.

Mr. Mulligan assured me that there is a rise of 3,000 feet from the Mann River to the head of Cooraldooral in a distance of 10 miles at furthest.

I think from representations made by me to Mr. Bawden that he is satisfied as to the inutility of further exploration in the direction named. Having abandoned the Chambigne-Doboy connection, I determined to try a line up the Chambigne and O.B.X. Creeks, as shown on attached tracing in solid red ink.

In the event of a survey being made the connection with the existing line would, I imagine, be somewhere near the 97-mile peg on the staked route. Mr. Francis, in a report as to the value of the Chambigne Creek Valley for railway purposes, writes very favourably of such.

Indeed, the country generally from South Grafton to the Orara River is very easy, both as regards grade and works.

From the assumed connection at 97 miles the first creek met with is Deep Creek.

The provision allowed by the Roads Department for this waterway is three openings of dimensions as under,—32 ft., 34 ft., 30 ft. respectively, the extreme height of the bridge from the lowest point in the creek to the Stringers being 13 feet, and the length of bridge over all 104 feet.

The next work of any magnitude would be a bridge over the Orara River, which I should propose crossing somewhere above the junction of Chambigne Creek, as roughly indicated in solid red line on accompanying tracing.

Orara or Bawden Bridge.—The total length of the road bridge over the Orara (situated about ½ mile below my assumed crossing) is 396 feet, the greatest height being 75 feet, and the number and dimensions of openings being as under, 38, 121, 121, 38, 28, 28 feet respectively.

I understand that the provision made for water clearance is only just about sufficient, so that although a railway survey would miss to some extent the volume of water contributed by the Chambigne a considerable margin would have to be allowed over the sectional area of the road bridge to make us secure.

Following up the valley of the Chambigne, I found the banks favourable, the creek sufficiently straight, and the rise nominal. From the level of the deck of the road bridge over the Orara to the junction of the O.B.X. Creek with the Chambigne, I found a rise of about 80 feet in a distance of about 5 miles. The area of settlement, timber supply, and population will be dealt with further on.

My preliminary examination had in view the crossing of the O.B.X. Creek just above its junction with the Chambigne, and working the north side of the O.B.X.

The waterway allowed for by the Roads Department in their bridge (since washed away) over the O.B.X. Creek consisted of a timber bridge of three openings; dimensions as under,—21 ft., 35 ft., 20 ft.; extreme height 16 feet, such allowance being inadequate.

The O.B.X. Creek is somewhat tortuous, and at one place, at about 13 miles (E. Collins' allot. 34), the bank descends rather abruptly, but generally speaking the works would be of an easy nature, and the bed of the creek only rises 110 feet in a distance of 4½ miles.

Buccarumbi Range.—From a point at about 14 miles on the red line it will be found necessary to commence to make grade in order to get height to cross the Buccarumbi Range. That range is the most difficult feature I met with between Grafton and Newton Boyd; and before any through survey be undertaken, I would respectfully suggest that a section showing the range crossing from (say) 14 miles to 20 miles be tried. Through the courtesy of the officers of the Roads Department at Grafton, I was able to obtain reliable data as to levels from opposite my assumed 14 miles (on the road mileage about 19 miles 40 chains) to the summit of the range, a rise of 600 feet. I contemplated being 100 feet higher than the road at my 15-mile peg, which will leave me 500 feet to negotiate in a length (which could be obtained) of 5 miles.

The country is very much broken from 15 miles to 19 miles; cross spurs will have to be cut through, but owing to the density of the saplings and undergrowth from 17 miles 40 chains to 19 miles it is impossible to form any correct estimate, or even an approximate one, as to the nature of the works. I think, however, that a tunnel may be avoided, although without some sort of survey it is impossible to say positively.

The formation from the east side of the range to Grafton is carbonaceous (conglomerates are met with for some miles along the O.B.X.), so that the cuttings will be comparatively easy to work.

There is a narrow gap in the range near where I have shown the line as crossing, and the ground falls abruptly to the east, so that a tunnel would be short.

On the west side of the Buccarumbi Range no difficulty will be met with. I found a fall of 300 feet from the summit of the range to the level of the deck of the road bridge over the Nymboi River in a length of about 5 miles.

In the event of a survey being undertaken, I think the north side of Buccarumbi Creek will be adopted from about the 20-mile mark on the red line. I do not anticipate that it will be found necessary to cross the creek more than once. Where the road crosses the creek near the 24-mile on red line the provision for waterway is as under—28 feet, 28 feet, 38 feet openings respectively, the extreme height of bridge being 15 feet. Where I should propose crossing, the creek is comparatively narrow.

Two road crossings will be necessary, the one at 20 miles, the second at 24 miles 40 chains.

Near the 23-mile point (red line) a bluff occurs which will necessitate a rather heavy cutting, but the rock is soft, alternating shales and sandstone (Devonian series). Several small culverts will be required from 20 to 23 miles.

Nymboi River.—I assumed that the Nymboi will be crossed somewhere, as shown on tracing, above the junction of the Boyd or Little River.

The road bridge over the Nymboi is of dimensions as under:

Total length, 698 feet; height (greatest), 50 feet; openings, 29, 52, 146, 146, 146, 57, 59, 57 feet. This is estimated to be an ample allowance; but as the Little River contributes at least 30 per cent. of the water volume dealt with by the road bridge, a smaller structure should suffice for railway purposes.

After crossing the Nymboi, I should propose following the south bank of the Little River, keeping just above flood reach.

There is not much to choose between the two banks; the south side has some advantages which with the fact that the road follows the north side lead me to adopt the former.

I had in view following the creek on the south-side to about 48 miles 40 chains.

The late Mr. Francis writes in most scathing terms of the Little River. He says in his report that the creek would require to be crossed repeatedly, but a glance at the accompanying tracing will sufficiently disprove such necessity. I find that instead of the creek being so tortuous as represented, it is remarkably straight. Fully two-thirds of the route from 25 miles to 48 miles 40 chains is favourable for railway purposes, the creeks crossed being, with three exceptions (Chandler's, Pine, and Bobby's Creeks), little more than gutters requiring (say) 3-ft. culverts on the average. The drainage area of these smaller water-courses is insignificant, but the side slopes being steep, a sudden thunder shower, with a heavy local rainfall, must be considered. There are several steep places to be dealt with in following the Little River; but from a minute personal inspection of the difficulties, I can but arrive at the conclusion that the worst of such is preferable to the average of the bad country encountered on the amended line-survey from Newton Boyd to Copmanhurst. My time was so limited that I had not an opportunity of comparing the two lengths, viz., the original or amended survey with my own exploration, but from information afforded to me by Mr. W. Kennedy, and an inspection of the cross-sections taken, I feel sure that the balance would be found to be in favour, mile for mile, of the Little River route. Attached is a telegram from Mr. D. Houison, Inspector of Works in the Roads Department, as to the cost of construction (other than metalling) of the main road running parallel to my proposed survey. Mr. Houison puts the average cost per *lineal* yard at about £2,000 per mile for a road base of 15 feet, such price including, as I understand, retaining-walls, which form a conspicuous feature in the road formation.

From my own observations of the cuttings along the road survey, I can state that they are taken out vertical, or nearly so that the angle of repose of the side embankments is less than ½ to 1, and that I failed to detect any serious sign of "slip"; on the contrary the sides of the hills are densely timbered, which alone should tend to hold the surface, nor are there any boulders or dangerous overhanging cliffs.

From the level of the deck of the Nymboi bridge to Dalmorton, a distance of 11 miles, I found a rise of 280 feet; and from Dalmorton to Broadmeadows, where I contemplated crossing the Little River, I found a rise of 220 feet in a length of about 12⅓ miles.

From about the 49 mile, as shown in red ink on accompanying tracing, it would be necessary to commence to make grade to get up to Grosse's Gap at about 54 miles. I have indicated as nearly as possible the route a survey would follow.

A sufficient length to secure a grade of 1 in 50 could be obtained from Broadmeadows to Grosse's Gap, but a short tunnel would be required to get through the hill, as it rises very abruptly in the last 7 or 8 chains.

I should imagine that a tunnel of some 10 chains should suffice.

In grading up from 49 miles a spur near the 51 miles will require to be cut through; but with the exception of such work and the short tunnel referred to above the works will not be found to be heavy should a survey be carried out.

I made the rise from 49 miles to Grosse's Gap, a distance of about 4½ miles, 425 feet.

The rock where encountered will be found to be soft and easily worked. The formation is Devonian sandstones and shales.

From Grosse's Gap to a junction with the Mann River survey I explored two lines, as shown in dotted red ink on tracing herewith, but found both to be impracticable, so that I was compelled to follow Bruser's Creek down to its junction with the Henry River; then along the north bank of the Henry, keeping just above flood-level, to a point where the Henry empties itself into the Mann. The crossing over the Mann to connect on to the survey made by Mr. Kennedy will be difficult, and will have to be, I fear, on curve; there will be a rather heavy cutting also. From 40 miles on Mr. Kennedy's amended survey there is no possibility, so far as I could see, to do other than adopt the Mann River survey up to where Mr. Little crossed the Yarrow River. I was unable to trace Mr. Little's survey throughout, but was sufficiently close to it to give me a general idea of the country. Unless the Yarrow Creek survey, which I more recently explored, gives the results which I imagine a survey would show, I consider that Mr. Little's line by the Red Range exhausts all the possibilities.

It is without doubt that more extended cross-sections would show great possibilities of improvement in the Red Range route. My recent exploration had in view the connection of Mr. Little's survey with Glencoe. It may at once be stated that it is impossible to connect at Glen Innes, but the aneroid readings I took lead me fully to the conclusion that Glencoe could be connected with a ruling grade of 1 in 50 and comparatively easy works. All the creeks were in flood, and I was unable to see some of the bends of the Yarrow as well as I should have liked, but taking the line generally it seemed fairly smooth, certainly a great deal easier than the Red Range. I have attached a rough tracing showing what country I explored up to Newton Boyd, and I shall, before leaving for Condobolin to-morrow, mark as nearly as I possibly can, the route followed by me from Mr. Little's survey to the Mann River, where I abandoned the exploration, as the country thence (where I cross the Mann) to Glencoe is so easy that a junction with the main line at or near Glencoe is a mere matter of detail.

I collected a lot of information as to the population and other matters, but inasmuch as my instructions had only in view the finding of a practicable route, avoiding as much as possible the heavy works on the Mann River, I think it rests with the Grafton people to state their case, as I do not wish to make myself into a partisan of any particular route.

I can, however, affirm this much, that the country from 4 miles on my rough tracing to about 40 miles, is densely timbered with ironbark and spotted gum. The ironbark extends to the south, so I am informed, for 10 miles.

Also with regard to a comparison of the Mann and Little Rivers, that nearly the whole of the rock encountered on the Mann is either granite or diorite, whereas on the Little River it is described as Devonian sandstone and shales.

At the same time, as I said before, I should respectfully request that not one shilling be spent on any through survey until the Buccarumbi Range be tried. It is the key to the whole survey up to Newton Boyd. If such proved favourable then, that a rough traverse be made from where Mr. Little crossed the Yarrow Creek up the Yarrow station, or some 3 miles higher; thence, as will be indicated on the parish maps, to the Mann River, from which point it may be accepted as favourable up to Glencoe.

I omitted to mention that I made an examination of the Henry River from Newton Boyd, but found it absolutely impracticable.

I have, &c.,
OCTAVIUS LLOYD.

Forwarded for the Minister's information.—H. DEANE, 7/4/96. The Under Secretary.

Telegram from Mr. D. Houison to The Assistant Engineer, Public Works Department.

12 February, 1896.

LITTLE River cuttings all let per lineal yard. Cost of main cuttings, 10s. to 35s., of 15 feet roadway (say) £2,000 per mile.

Telegram from Mr. G. H. Varley to The Government Surveyor.

STATEMENT—Schools and attendance, Grafton, Newton Boyd, South Grafton, 225 pupils; Chambigne, 32; O.B.X., 33; Buccarumbi, 15; Dalmorton, 57; Cowendoog, 10; Newton Boyd, about 20; Ramornie, 60; Mann River route, only school, Cangai, about 20.

No. 176.

O. Lloyd, Esq., to The Engineer-in-Chief for Railways.

Sir,

Railway Survey Branch, Sydney, 11 March, 1896.

I have the honor to supplement my report in regard to my recent exploration from Mr. Little's crossing of the Yarrow Creek towards Glencoe, and having reference to attached compilation from the parish maps.

I have marked on the compilation, as nearly as I could, the route inspected by me from Mr. Little's crossing of the Yarrow Creek near 25 miles 10 chains on his "Red Range" survey to where I terminated my inspection on the Mann River.

The aneroid heights may be accepted as fairly correct, as on regaining Glen Innes, my reading was only minus 25 feet of the true height at the railway station.

You will observe that the reduced level at the Yarrow Creek (Mr. Little's survey) is 2,830 feet (that is at my assumed junction with his line), and that in a length of 7½ miles, I found a rise of only 430 feet.

I think that grade should be made at an earlier stage than that I have shown, say from 7 miles, but such is a matter of detail to be dealt with should you sanction a survey.

I think it is quite probable that from 12 to 17 miles my line as shown in red on attached compilation is considerably out of position.

I could find the line of country I traversed easily enough myself, and could suggest the services of a man (S. M'Master), who accompanied me, should you approve of a survey, and another surveyor than myself undertook such.

From the position shown of my terminal point of aneroid observations on the upper Mann, there exists no difficulty in reaching Glencoe, as in a distance of at least 6 miles, a rise occurs of 430 feet only, my last reading in the bed of the Mann River being 3,400 feet, and the height at Glencoe being 3,793 feet, and the intervening country is quite easy.

I have, &c.,
OCTAVIUS LLOYD.

Forwarded for the Minister's information.—H. DEANE, 7/4/96. The Under Secretary.

No. 177.

The Secretary, Grafton Chamber of Commerce, to The Secretary for Public Works.

Sir,

Grafton, 25 March, 1896.

I have the honor, by direction of this Chamber, to ask you to be good enough to furnish me with a copy of Mr. Surveyor Lloyd's report on his exploration of the Grafton-Glen Innes Railway survey. I might add that it was through the Chamber that the fresh explorations were asked for.

Thanking you in anticipation.

I have, &c.,
JAS. C. WILCOX,
Secretary.

Sir,

7 April, 1896.

In compliance with the request contained in your letter of the 25th ultimo, I am directed by the Secretary for Public Works to forward you a a copy of a report of exploration made by Mr. Surveyor Lloyd in connection with the proposed South Grafton to Glen Innes Railway.

I have, &c.,
Under Secretary and Commissioner for Roads.

Jas. C. Wilcox, Esq., Secretary, Chamber of Commerce, Grafton.

No. 178.

John See, Esq., M.P., to The Minister for Public Works.

My dear Sir, Sydney, 26 March, 1896.

I shall feel greatly obliged if you will let me have a copy of Mr. Lloyd's report upon the Grafton-Glen Innes trial survey recently made by him. I understand that it is now completed and before you.

Yours, &c.,
JOHN SEE.

Mr. Deane.—Jno. P. (for U.S.), 28/3/96. Inform, 30/3/96. May be furnished.—J.H.Y., 30/3/96. Two copies of report attached.—H. Deane (*per* S.M.), 2/4/96. Under Secretary. Have tracings been made to go to Mr. See and local Chamber of Commerce?—Jno. P. (for Under Secretary for Public Works and Commissioner for Roads), 8/4/96. Mr. Deane. One tracing is finished, and the other will be ready on Saturday, the 11th instant.—H.D. (*per* F.H.), 10/4/96. The Under Secretary. Forward then to Mr. See and the Chamber of Commerce.—Jno. P. (for U.S.), 14/4/96. These tracings were forwarded on the 11th instant.—J.W.H.

Sir, 2 April, 1896.

In compliance with the request contained in your letter of the 26th ultimo, I am directed by the Secretary for Public Works to forward to you a copy of Mr. Surveyor Lloyd's report on the exploration made by him in connection with the proposed Grafton to Glen Innes Railway.

I have, &c.,

John See, Esq., M.P. Under Secretary and Commissioner for Roads.

Sir, 11 April, 1896.

I have the honor to forward herewith tracing to accompany report of exploration made by Mr. Surveyor Lloyd in connection with the proposed South Grafton to Glen Innes Railway, a copy of which was forwarded to you a few days ago.

I have, &c.,

John See, Esq., M.P. Under Secretary and Commissioner for Roads.

No. 179.

The Secretary, Grafton Chamber of Commerce, to The Secretary for Public Works.

Sir, Grafton, 10 April, 1896.

I have the honor, on behalf of this Chamber, to thank you for Mr. Octavius Lloyd's report of the exploration of the South Grafton-Glen Innes Railway, which has been forwarded to us through Mr. John See, M.P.

I am directed by this Chamber to respectfully urge that Mr. Lloyd's suggestions be carried out as early as possible.

Trusting you will give this matter your most favourable consideration.

I have, &c.,
JAS. C. WILCOX,
Secretary.

Reply that the matter will receive my consideration.—J.H.Y., 16/4/96. Write.—P.S., Under Secretary for Public Works and Commissioner for Roads, 16/4/96.

Sir, 17 April, 1896.

I am directed to acknowledge the receipt of your letter of the 10th instant, in which you ask that the suggestions made by Mr. Surveyor Lloyd in his report of the exploration in connection with the South Grafton to Glen Innes Railway may be carried out as early as possible, and to inform you that the matter will receive the Minister's consideration.

I have, &c.,

Under Secretary and Commissioner for Roads.

J. Wilcox, Esq., Secretary, Chamber of Commerce, Grafton.

No. 180.

J. See, Esq., M.P., to The Secretary for Public Works.

My dear Sir, Sydney, 11 May, 1896.

I enclose a letter from the Secretary of the Chamber of Commerce, asking that before a final survey of the proposed Grafton-Glen Innes Railway is made that a trial survey be made over the Buccarumbri and Red Ranges, as suggested by Mr. O. Lloyd in his report, and I have pleasure in urging that this request be complied with.

Yours, &c.,
JOHN SEE.

Mr. Deane.—Jno. P. (for Under Secretary for Public Works and Commissioner for Roads), 13/5/96. Noted.—H.D., Engineer-in-Chief for Railway Construction, 13/5/96. Submitted.—F.H., Under Secretary for Public Works, and Commissioner for Roads. Say that this will be done.—J.H.Y., 14/5/96. Write, 14/5/96. A letter has been written to this effect upon another paper.—J.W.H., 14/5/96. Chief Clerk. Mr. Deane.—Jno. P. (for Under Secretary for Public Works, and Commissioner for Roads), 15/5/96. Seen.—H.D., 16/5/96.

[*Enclosure.*]

[*Enclosure.*]

John See, Esq., M.P., Sydney,—

Dear Sir, Grafton, 8 May, 1896.

I have to thank you for your letter of the 24th ultimo, also copy of the letter you addressed to the Hon. the Minister for Works, and I am directed to say that Mr. Lloyd suggested in his report that the Buccarumbi and Red Ranges have trial surveys made before proceeding with the through survey.

I am pleased to note mention of this important national work has been referred to by His Excellency the Governor, and also by the Sydney press.

I am, &c.,
JAS. C. WILCOX,
Secretary.

No. 181.
Minute by The Secretary for Public Works.

Department of Public Works, 14 May, 1896.

I PROMISED Mr. See that, in reply to a recent communication of his, he should receive a letter stating that when surveyors could be spared from more urgent works, I would authorise the surveys recommended by Mr. Lloyd on Grafton to Glen Innes line. J. H. Y.

Sir, 14 May, 1896.

In reply to your recent communications on the subject, I am desired by Mr. Secretary Young to inform you that when surveyors can be spared from more urgent works, he will authorise the survey of the line recently explored by Mr. Surveyor Lloyd in connection with the proposed railway from Grafton to Glen Innes.

I have, &c.,

John See, Esq., M.P. Under Secretary and Commissioner for Roads.

No. 183.
J. See, Esq., M.P., to The Secretary for Public Works.

My dear Sir, Sydney, 22 April, 1896.

Adverting to the interview that I had with you on Monday last respecting the proposal that I made that a trial survey be made of that portion of the Grafton-Glen Innes proposed railway recently explored by Mr. O. Lloyd, I again desire to urge upon you the importance of having the survey made, as it is believed that it will very materially reduce the cost of making the line.

As to the importance of the Grafton-Glen Innes line there can be no gainsaying. It will bring into communication with the Clarence River, Glen Innes, Inverell, and the north-western portion of the Colony upon much more advantageous conditions than they enjoy at present, or can be made to enjoy under the present or any connection, save connection with Clarence. Money is cheap, labour plentiful, and I feel sure that this great national work can be carried out hundreds of thousands of pounds cheaper than it was thought that it would cost some years ago. I consider the people in the north-east and north-west portions of the Colony are entitled to have the survey asked for carried out with the object of very shortly having the railway constructed.

Yours, &c.,
JOHN SEE.

Inform him that this matter must stand over for the present.—J.H.Y., 6/5/96. John See, Esq., M.P., informed, 8/5/96. Mr. Deane to see.—JNO. P. (for Under Secretary for Public Works and Commissioner for Roads), 8/5/96. Seen.—H.D., Engineer-in-Chief for Railway Construction, 12/5/96.

8 May, 1896.

URGING that a trial survey be made of the route recently explored by Mr. O. Lloyd, for the proposed railway from Grafton to Glen Innes. The Minister has decided that this matter must stand over for the present.

John See, Esq., M.P. Under Secretary and Commissioner for Roads.

No. 185.
Minute by The Engineer-in-Chief for Railways.

Subject :—Glen Innes to South Grafton.

Department of Public Works, Railway Construction Branch, Engineer-in-Chief's Office,
Sydney, 24 June, 1896.

IN reference to the annexed, Mr. Statham called upon me on the 22nd with a series of parish maps showing his proposal. From his explanation, I judge that before a decision is come to as to the line to be finally adopted, his route should be carefully examined throughout by a railway surveyor, as it seems to promise an opportunity of getting better grades and easier work over critical portions of the country traversed. If such examination gives favourable results, it would be desirable to have a trial survey made, always supposing that, as a matter of railway policy, the Glen Innes-Grafton connection is the best.

I beg to recommend that, in the first place, an examination be made of Mr. Statham's route as soon as a surveyor is available for the purpose.

H. DEANE,
Engineer-in-Chief for Railway Construction.

Submitted for approval.—F.H., 27/6/96. Appd.—J.H.Y., 29/6/96. Mr. Deane.—JNO. P. (for Under Secretary for Public Works and Commissioner for Roads), 29/6/96. Noted.—H.D., 30/6/96. Mr. Burge. Seen.—C. O. BURGE, 1/7/96. Mr. E J. Statham offering to give information as to the best route for a railway from the Clarence to the table-land of New England. Submitted for approval to ask Mr. Statham to see Mr. Deane.—F.H., Under Secretary for Public Works and Commissioner for Roads, 8/6/96. Approved.—J.H.Y., 8/6/96.

Dear

Dear Mr. Young,— "Fenella," Frederick-street, Rockdale, 28 May, 1896.

As the question of the railway from the Clarence to the table-land of New England is again on the board, it has occurred to me that I can give information which will materially assist the Government in coming to a decision on the matter. My experience of over twenty years in the districts mentioned has afforded me exceptional opportunities for acquiring a knowledge of the country, and it came within the scope of my business to study the physical features, so that perhaps I know more about them than anyone else. Having no interests to serve other than the public interest, being free from the influence of any political party, and unbiassed by any local prejudices, I can give you an honest statement of facts which will enable you to come to a decision on this important question. I ask no remuneration, and do not propose to put you to any expense, merely requesting to be afforded access to plans, and that I may be furnished with such lithographs and tracings as I may require to illustrate a report.

I am, &c.,

E. J. STATHAM.

I suppose this can be done without any expense to the Department.—F.H., 2/6/96. Mr. Deane.

Several surveyors have been employed from time to time picking out what appeared to be the best routes for survey, and local residents have had abundant opportunities of airing their views on the matter and getting their suggestions tested. It scarcely seems possible that there should be another route yet unexplored which would eclipse all the rest. At the same time, in such rough country it is not well to be too positive. If Mr. Statham can throw any further light on the subject, or make any suggestions of value, I shall be very glad to receive them and consider them. The question as to whether Guyra and Grafton, Glen Innes and Grafton, or Tenterfield and Casino is the proper connection is, of course, one of railway policy rather than of engineering superiority. I shall be very glad to let Mr. Statham have access to the plans. There would be no expense, I think, as he does not propose to go into the field. Perhaps Mr. Statham could be asked to see me.—H.D., 5/6/96. Under Secretary.

Sir, 8 June, 1896.

With reference to your letter of the 28th ultimo, in which you offer to give the department information which will assist in determining the best route for a railway from the Clarence to the table-land of New England, Mr. Secretary Young desires me to ask that you will be so good as to see Mr. Deane, the Engineer-in-Chief for Railway Construction, on the subject, at your convenience.

I have, &c.,

The Under Secretary and Commissioner for Roads.

E. J. Statham, Esq., "Fenella," Frederick-street, Rockdale.

John See, Esq., M.P., Sydney,—

Dear Sir, Grafton, 3 July, 1896.

I am directed by the Committee of the Chamber of Commerce to ask you to ask the Honorable the Minister for Works to carry out the surveys, as promised by him when surveyors were available, of the Grafton-Glen Innes Railway, as suggested by Mr. Surveyor Lloyd.

I am also requested to state that it is the wish of the Chamber that Mr. Lloyd be sent, if possible.

Thanking you for your replies *re* other matters. I am, &c.,

JAS. C. WILCOX,
Secretary.

No. 186.

J. See, Esq., M.P., to The Secretary for Public Works.

My dear Sir, Sydney, 8 July, 1896.

I herewith hand you a letter from the Secretary of the Chamber of Commerce, asking that a surveyor may be sent to survey the route between Grafton and Glen Innes, recently explored by Mr. Surveyor Lloyd, and which the Honorable Minister for Works promised should be done as soon as a surveyor was available.

Yours &c.,

JOHN SEE.

Mr. Deane.—Jno. P. (for Under Secretary for Public Works and Commissioner for Roads), 9/7/96.

On another paper I have recommended the examination of a route proposed by Mr. Statham, which, I think, should be done first, so that the two routes may be compared before further survey is undertaken.—H. Deane, Engineer-in-Chief for Railway Construction, 13/7/96. The Under Secretary.

Submitted.—F.H., 14/7/96. Under Secretary for Public Works and Commissioner for Roads. Inform Mr. See, M.P., that I have approved of action recommended by Mr. Deane as above.—J.H.Y., 15/7/96. Mr. Deane.—Jno. P. (for Under Secretary for Public Works and Commissioner for Roads), 17/7/96. Seen.—H.D., 17/7/96. Mr. Burge to see.

After seeing the Engineer-in-Chief on this matter, I wired to Mr. Powell to take up this work on completion of the Moree-Inverell survey, first coming to Sydney for instructions.—C. O. Burge, Principal Assistant Engineer for Railway Surveys, 22/7/96.

Sir, 16th July.

With reference to your letter of the 8th instant, enclosing a communication from the Chamber of Commerce, Grafton, asking that a survey may be made of the route for a railway between Grafton and Glen Innes, recently explored by Mr. Surveyor Lloyd, I am directed to inform you that, in the first place, an examination will be made of a route proposed by Mr. Statham, so that the two routes (Mr. Statham's and Mr. Lloyd's) may be compared, before further survey is undertaken.

John See, Esq., M.P. I have, &c.,

Under Secretary and Commissioner for Roads.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAY FROM BROKEN HILL TO MENINDIE.

(PETITION FROM THE MAYOR, ALDERMEN, AND INHABITANTS OF BROKEN HILL AND MENINDIE, IN FAVOUR OF.)

Received by the Legislative Assembly, 23 *June*, 1896.

To the Honorable the Speaker and Members of the Legislative Assembly of New South Wales.

The Petition of the Mayor, Aldermen, and inhabitants of Broken Hill and Menindie,—

RESPECTFULLY SHOWETH:—

That your Petitioners have no little confidence in their belief that your Honorable House will favourably entertain the constructing of a railway from Broken Hill to Menindie, in connection with the proposed Sydney to Condobolin line of railway, for the following, among other, reasons:—

That the construction of the missing link of railway communication between Broken Hill and Menindie has become an absolute necessity, not alone in the interests of the inhabitants of Broken Hill, but of the whole country, seeing that it will tend greatly to reduce the cost of living, and to vastly increase trade and commerce throughout New South Wales; give employment to a large number of unemployed men; create the establishment of many small industries; bring about a great increase of population; prevent, in the future, so large a proportion—of £2,000,000 sterling per annum in value—of the manufactures and products of Broken Hill passing over other than the railways of New South Wales, or the great financial benefit accruing thereof passing into other than our own national exchequer; and be, in every way, a reproductive work of immense monetary value.

That a large proportion of your Petitioners earn their livelihood at an occupation far from conducive to health, necessitating a frequent change of air and scene, and which could be obtained by excursions to Menindie; beyond which many of your Petitioners would, for the benefit of their wives and children, avail themselves of the opportunity, through the issue of workman and season tickets, of residing on allotments of land at centres of population between Broken Hill and Menindie.

That your Petitioners respectfully suggest that, conjointly with the construction of a railway from Broken Hill to Menindie, provision should be made for the conservation of the waters of the Darling, by which not only the mining companies would benefit, in the easier and more profitable treatment of hundreds of thousands of tons of low-grade ores, which could be treated at the water's edge, but the nation, in what your Petitioners believe to be a matter of far deeper import and value in the future, the creation of hundreds of thousands of tons of produce, through the irrigation of vast areas of land, so suitable for the purpose, between Broken Hill and Menindie, adjacent to and along the banks of the Darling.

Your Petitioners, therefore, humbly pray that your Honorable House will be pleased to acquiesce in the promotion of, and to facilitate the passing into law, any Bill introduced by the Government having for its object the construction of a railway between Broken Hill and Menindie.

And your Petitioners will ever pray, &c.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

ELECTRIC TRAMWAY FROM CIRCULAR QUAY, SYDNEY, TO THE REDFERN RAILWAY STATION; AND ALSO ALONG HARRIS-STREET TO THE INTERSECTION OF JOHN-STREET.

REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the first Session of the present Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, and the Public Works (Committees' Remuneration) Act of 1889, 53 Vic. No. 11, to whom was referred the duty of considering and reporting upon "the expediency of constructing a line of Electric Tramway from Circular Quay, Sydney, to the Redfern Railway Station; and also along Harris-street to the intersection of John-street," have, after due inquiry, resolved that it is expedient the proposed tramway should be constructed; and, in accordance with the provision of sub-section IV of clause 13 of the Public Works Act, report their resolution to the Legislative Assembly:—

History of the proposed work.

1. On 1st October, 1889, the Minister moved in the Legislative Assembly that the question of constructing a cable tramway along George, Pitt, and Harris Streets be referred to the Parliamentary Standing Committee on Public Works for consideration and report. The Committee reported, on 4th June, 1891, that it was not expedient to construct the proposed tramway. In arriving at this decision they thought it would be wise, before expending the large amount of money represented by the estimate (£120,000), to await the results of the construction of the King-street to Ocean-street line; there was also a difference of opinion among the Committee as to which system would be more suitable—the cable or electric traction. On 18th September, 1895, the Minister gave instructions that the necessary information should be prepared to enable him to refer the proposal now under consideration to the Public Works Committee. The Railway Commissioners reported on 6th December, 1895. The Minister, on 11th December last, moved in the Legislative Assembly—"That it be referred to the Parliamentary Standing Committee on Public Works to consider and report on the expediency of constructing a line of Electric Tramway from Circular Quay, Sydney, to the Redfern Railway Station; and also along Harris-street to the intersection of John-street."

Official description.

2. The proposed electric tramway will start on the eastern side of Circular Quay, the double track following the curvature of the Quay, passing the wharfs of the various ferry companies, thence by way of Queen's Wharf to George-street, and along the centre of that thoroughfare until it junctions with the existing steam tramway opposite the Benevolent Asylum. From that point to the Railway Station, and to Harris-street, the existing tracks are used. At the corner of George-street West and Harris-street a double track junction provides for the connection of the proposed tramway along Harris-street, on which street the double track will be laid in the centre until reaching Church-street; which extension beyond John-street is rendered necessary for shunting purposes. The motive power is to be generated at the existing power-house of the Ocean-street cable tramway at Rushcutters' Bay. The

electric

electric current will be conveyed thence to George-street by means of buried armoured cables, which will there be connected with accumulators, and from thence the overhead wires will convey the current to the motors on the cars. For the greater part of the distance it is proposed to carry the overhead wires on ornamental iron poles, erected in the centre of the streets at distances of about 120 feet. These will be protected by a low kerbing, acting as a wheel-guard. In the narrow portion of George-street, below Bridge-street, span-wires will be adopted, as also in some other portions, such as junctions, where it will be found expedient to use this method of construction. The total length of line to be constructed is about 6¼ miles, single track. The gradients vary from 1 in 17 to 1 in 457, with only a few short lengths of level. The gauge is to be that of the existing tramways—4 feet 8½ inches.

Estimated cost.

3. The estimates of cost were prepared by the Engineer-in-Chief of the Railway Construction Branch, in conjunction with the Railway Commissioners and the Electrical Engineer to the Department of Railways. A summary of the figures gives the following totals :—

Road construction	£62,500	
Car-house	9,200	
	71,700	
Say		72,000
Outside electric work		15,000
Power plant	12,800	
Rolling stock	23,200	
		36,000
Total...		£123,000

Since the foregoing estimates were made up an extension has been proposed by the Railway Commissioners, at Circular Quay and opposite to the Railway Station, the cost of which will be £7,500. These additions bring the total estimated cost of the proposed work to £130,500.

Railway Commissioners' Report.

4. The Railway Commissioners, in their Report, point out that the proposed electric tramway will afford a convenient means of communication between the most important parts of the city. It will also convey the bulk of the traffic to the Railway Station, thus relieving the existing steam tram-lines. They estimate the total annual cost of the scheme submitted, without the alterations, at £32,497, the items being:—Interest, at 3¼ per cent. on the capital cost of £123,000, £3,997 (£4,241 with alterations); cost of motive power and car repairs, including electric car drivers, £15,000; cost of conducting traffic and general expenses, £11,000; cost of permanent-way, maintenance and repairs, £2,500. The annual revenue is expected to amount to £45,000, and the estimated annual profit to £12,503, being more than 10 per cent. on the £123,000. The Commissioners state that for years past they have "called attention to the great necessity for relieving the Bridge-street yard and Elizabeth-street of a portion of the traffic, so as to enable better facilities to be afforded to the districts served by the existing lines"; and they "propose ultimately, when the western suburbs lines are converted to the electric system, to divert nearly the whole of the trams running to and from those suburbs to the George-street line, leaving the Elizabeth-street line available for the eastern suburbs traffic." By this means a more frequent service in all directions will be afforded to meet the convenience of the travelling public.

Witnesses examined.

5. After hearing the evidence of the Engineer-in-Chief of the Railway Construction Branch (who submitted particulars and details of cost and exhibited plans illustrative of the proposed tramway), the Committee examined the following witnesses:—The Secretary to the Railway Commissioners; the Electrical Engineer to the Department of Railways; the Tramway Traffic Superintendent; the Registrar of the Metropolitan Transit Commission; Mr. J. Musson, C.E.; Mr. H. B. Lassetter (Messrs. F. Lassetter & Co., George-street); Mr. J. Macpherson (Messrs. Holdsworth, Macpherson, & Co., George-street); Mr. W. Newman (Messrs. David Jones & Co., George-street); the Mayor of Sydney (Alderman I. E. Ives); Mr. Norman Selfe, M.I.C.E.; the Secretary to the Electric Telegraph Department; Mr. J. O. Callender, M.I.C.E., Consulting Electrical Engineer; Alderman C. E. Jeanneret; Mr. A. C. F. Webb, M.I.C.E., Consulting Electrical Engineer; Mr. T. Raw, Engineer, Government Architect's Branch, Department of Public Works; Mr. J. Pope (Messrs. Farmer & Co., Pitt and George Streets); and Professor Threlfall, of the University of Sydney.

6. The Departmental estimate of the probable traffic on the proposed tramway is, in round figures, 5,000,000 passengers on the Railway trams, and 2,000,000 passengers on the Harris-street, or Ultimo trams, or a total of 7,000,000 passengers per annum. At current fares, this large traffic is expected to yield an annual revenue of £45,000, George-street returns being estimated at £32,000, and Harris-street £13,000. In the opinion of the Tramway Traffic Superintendent the foregoing estimate is by no means an excessive one considering that the King to Ocean Street cable tramway, which, it is said, does not serve so large a population, carries nearly 4,000,000 passengers annually. The Registrar of the Metropolitan Transit Commission, under examination, regarded the total of 2,000,000 passengers per annum as the probable traffic on the Harris-street section of the line as a very large estimate. That officer placed returns before the Committee which give the estimated number of passengers carried annually by omnibuses plying between Pyrmont and Sydney as 689,156, and between the Redfern Railway Station and Sydney at 2,328,720. These estimates, however, do not appear to have taken into account the very considerable intermediate passenger traffic which would in all probability make use of the tramway service. Departmental estimate of traffic.

7. It is reprepresented, on behalf of the Department, that the electric tramway can be run at a cost of $9\frac{1}{4}$d. per tram-mile, which is stated to be a less sum than that incurred on any tramway either in this city or in Melbourne. On the King to Ocean Street cable line the expense is $10\frac{3}{4}$d., on the North Shore electric line it is 1s. 2d., the Melbourne cable tramway costs 1s., and the steam trams in Sydney cost 1s. 10d. per tram-mile to run, the comparisons to be drawn being, of course, qualified by the accommodation afforded by the varying circumstances of the several systems. Cost per tram-mile.

8. The Superintendent of the Metropolitan Fire Brigades does not apprehend much difficulty from the overhead wires, and he offers no objection to the scheme. Possible obstruction to the Fire Brigades.

9. Opposition has been offered to the proposal to construct an electric tramway in George-street, on the ground that the extension of the railway into the city is a work of much greater necessity, and will thereby be delayed. In the opinion of the Committee George-street has a traffic peculiar to itself which will be sufficiently heavy to ensure a good return on the capital outlay even should the railway be extended into the city. And the Committee, in making their recommendation, desire to express the opinion that the construction of the proposed tramway should not be regarded as retarding the consideration by the Government of any proposed extension of the railway into the city. The City Railway.

10. A comparison of the width of George-street with that of important thoroughfares in other cities carrying either cable or electric tramways is not altogether unfavourable to the former. According to the Departmental statement, the width of George-street in its narrowest part—between Queen's Wharf Road and Bridge-street—is 33 feet; in every other portion of that thoroughfare the minimum width ranges from 43 feet to 75 feet between the kerbs. A portion of Broadway, New York, which has a cable tram service and a very heavy traffic, varies in width from 42 feet to 43 feet. Clark-street, Chicago, having an electric tramway, with centre poles and a very heavy traffic, is 47 feet wide. At Minneapolis and St. Paul there are electric overhead systems, with centre poles; the thoroughfares through which the trams run range from 40 feet to 70 feet in width. At Havre, electric trams are run along streets the respective widths of which are 48 feet, 33 feet, and 25 feet. The minimum width in Leeds is 34 feet, in Birmingham from 36 feet to 45 feet, centre poles being used in each case. The experience of other parts of the world, therefore, leads to the conclusion that George-street is sufficiently wide, even at its narrowest part, to carry a double line of tramway, provided the traffic be properly regulated and controlled. Width of streets—a comparison.

11. The proposal to construct a tramway in George-street raises the question of traffic regulation. The traffic is congested in the principal streets of the city at certain times of the day. Heavily laden lorries, drays, and vans should not be allowed to impede the traffic when other routes as suitable and less crowded are available. The opposition, based upon the obstruction to the traffic, originates in the fact that it is not generally understood that the tram-cars will not be an addition Regulation and control of traffic in the metropolis.

to

to the present traffic but in substitution for a portion of it. A large proportion of the heavy vehicular traffic should be diverted from George-street and Pitt-street to less important thoroughfares.

Advance of electric traction.

12. Electricity as applied to street tramways has made immense strides in Europe and America during the last few years. Numerous instances may be cited in which electricity has displaced, and is displacing, other methods of traction. In the city of Bristol, England, a line of electric tramways on the overhead-wire principle is working satisfactorily. Birmingham, too, has adopted the electric overhead-wire system. There is also an electric overhead line in the Isle of Man. Some of the tramways in Dublin are worked on the electric overhead system. The Leeds Corporation has passed resolutions authorising an expenditure of over £200,000 for the conversion of their lines to the overhead trolley principle. Already one important line is in working order, and the system is to be considerably extended. There are several proposals for new lines in England, and this notwithstanding the stringency of the Board of Trade Regulations. On the Continent, at Brussels, Hamburg, Stuttgart, Lubeck, Havre, and elsewhere, electric overhead systems are working successfully. In the United States the overhead wire is rapidly superseding all other methods. In Chicago there are 304 miles of electric tramways, as against 81 miles worked by the cable. A portion of the cable system in San Francisco is being replaced by the electric, using overhead wires; and cable lines in Philadelphia and Pittsburg have been converted to electric in order to have one uniform system throughout.

Various forms of electric traction.

13. Having arrived at the conclusion that electricity is the power being adopted in most parts of the world for street traffic—and is rapidly replacing all other methods—it became necessary for the Committee to decide between the various systems, viz.:—

1. Accumulator.
2. Conduit.
3. Overhead wire.

1. *The Accumulator system* is not a commercial success anywhere, the weight necessary making it cumbrous, and the cost of working preventing it from being generally adopted.

2. *The Conduit system*, although it renders unnecessary the erection of poles in the streets, cannot be entertained—

(1) Because of the heavy initial expense.

(2) Because of the improbability of its acceptance for the suburban area, thus making it difficult to obtain an uniform system over the city and suburbs.

3. *The Overhead-wire system* has the advantage of comparative lowness in initial cost, with the certainty of giving uniformity over all adjacent areas. It has also the further advantage of cheapness in working, and is the system which has found favour in most cities where electric traction has been adopted.

Utilization of surplus power at Rushcutters' Bay.

14. The plant at Rushcutters' Bay can only be regarded as capable of supplying the generating power for electric traction over a limited portion of the city. When extensions take place a generating station will be essential in a central position, and where coal can be landed at the lowest cost; therefore, pending that, any outlay at Rushcutters' Bay cable station should be as small as possible. The 500 horse-power at present available there should be utilised, any incidental alterations being carried out as cheaply as possible. It has been stated in evidence that the feeding cable need not be buried, and that it can be carried on poles with perfect safety. The Committee have not been able to obtain in detail reliable figures as to the saving that would be effected, but it will be at the lowest estimate £5,000. Two important matters are bound up in the question which have not yet received Executive consideration—

(1) The extension of the King to Ocean Street cable tram.

(2) The adoption of electric traction in lieu of the present steam service.

If it be intended to extend the cable tram, then the machinery at Rushcutters' Bay should be used for cable traction alone. If electric traction is to replace the present steam service it will be well to select a site for a central generating station, and erect the power plant there, instead of spending a large sum of money on temporary works which may be abandoned in the near future.

15. The streets of a city are designed primarily as a means of transit, and not as alleyways for telephone or telegraph lines. In the construction of this tramway, in regard to the details, electrical and mechanical, every known means should be adopted to reduce external disturbance to a minimum. This having been done should disturbance still exist it must be dealt with by alterations to the lines so affected. Streets for traffic.

16. No serious disturbance to the telegraph lines seems to be apprehended, but in regard to telephone wires, although the evidence of experts varies, the weight of evidence proves that they will be injuriously affected. When a system of electric tramways, using an overhead trolley wire in conjunction with an uninsulated return, runs adjacent to telephone lines using an earth return, there is without doubt some disturbance caused to the latter. This disturbance, which may be greater or less, according to the care with which the tramway lines are erected, arises from two causes:— Effect of electric traction on telegraph and telephone wires and pipes.

1. Stray currents, leaking from the earth return wire, and affecting all earthed wires in the vicinity to a greater or lesser degree.
2. Induction, due to variation in the strength of the current on the tramway conductors, caused primarily by the variation in power consumed by the motors when starting or stopping, and secondly by bad or varying contacts between the car and trolley wire, and car and rails.

Taking, first, the disturbance arising from stray currents: By providing ample sectional area for the return current, an efficient bonding of the rails, and placing the rails in direct contact with the concrete, leakage or stray currents will be reduced to a minimum. The disturbance arising from induction is much more difficult to deal with, and although much can be done by using a special form of trolley or bow, and ensuring perfect contact with the trolley wire and rails, there still remains the disturbance caused by the variation of current in starting and stopping cars. This cannot be removed, but may be reduced by the adoption of proper precautions. The inevitable fluctuation of the electric current on the tramway system will still be prejudicial to all telephone lines in the vicinity. It is improbable, with the precautions proposed to be taken, that there will be much injury to pipes from electrolysis; but if any, it can readily be ascertained and corrected.

17. There appears to be only one method of absolutely counteracting this disturbance, and this consists in discarding the earth as a return for the telephones and adopting a complete metallic circuit. In a system of telephone lines with metallic circuits, the two wires to each subscriber are run parallel and as close to each other as possible, thus any exterior disturbing cause affects both wires equally, and the current in the two wires being in opposite directions the disturbances are neutralised. The alteration of a system from earth to metallic returns involves the duplication of all wires, at a considerable cost. This is, however, the greatest item to be faced, as the existing instruments can be utilised for either system. The adoption of metallic circuits will, it is admitted, give complete immunity from disturbance and in addition greatly improve the telephone service, ensuring perfect and complete privacy. The evidence shows that the advantages of metallic returns to a telephone system are recognised throughout the world, and almost all large cities have either already converted their systems or are now doing so, Berlin, which is an exception, having an obsolete service. Metallic circuit—its effect.

18. That the work of conversion can be done without material interference to subscribers is proved by the experience of other cities. Since the telephones in such places as Christiana and Stockholm are satisfactorily worked on an annual charge to each subscriber of about £5 10s., with all the extra cost of metallic returns and underground mains, there does not appear to be any reason why Sydney should be committed to an obsolete and admittedly inefficient system for a period of twenty years, and have to face an enormously augmented cost of conversion at the end of that period because of an expansion of the inferior system during the interval. It will be necessary either to reconstruct the present switch-board or to obtain one of the latest kind specially designed for metallic circuits. Conversion possible without great public inconvenience.

Metallic circuits must ultimately be adopted irrespective of electric trams.

19. The Electric Telegraph Department, supported by the evidence of scientific witnesses, admits that the introduction of metallic circuits will sooner or later become imperative, irrespective of the introduction of electric traction. A system of telephones using earth returns is so sensitive that it is peculiarly susceptible to disturbance from exterior causes—earth currents, thunderstorms, and telegraph wires—while with such a system it is practically impossible to prevent what is known as "cross-talk." All these difficulties disappear at once on the adoption of metallic circuits, and complete privacy and improved communication are at once secured. In London and other English cities copper wire has been largely used to replace the ordinary galvanised-iron wire, but this alteration became a necessity partly through the corrosive effect of the damp and fog-laden atmosphere of those cities, and although to replace iron by copper wire would be an improvement, this precaution does not appear to be absolutely necessary in Sydney. There is no doubt, however, that, electrically, copper wire is superior to iron.

Present telephone system.

20. The Secretary to the Electric Telegraph Department gives the cost of the present telephone service at £108,000, yielding a profit of about 15 per cent. The State should seek to give the best service at the lowest paying rate, and the Sydney telephone system does neither one nor the other. Not only are messages by telephone liable to be overheard, but Professor Threlfall stated anyone knowing the Morse alphabet could "read telegraphic messages all day long," the telephone picking them from the telegraph line. The telephone service, as it is at present, therefore, not only fails in usefulness from ineffectiveness, but is liable to frustrate all efforts put forth to preserve the secrecy of the telegraphic service.

Cost of conversion.

21. The estimated cost of conversion to metallic circuits is stated by the Secretary to the Electric Telegraph Department to be, in his opinion, £236,456. Since the present system cost only £108,000 the statement is remarkable—it carries with it, however, the ultimate abandonment of the whole of the present system, much of which, it has been previously explained, can be utilised in the new service. The Engineer-in-Chief for Railway Construction; Mr. Callender, Electrical Engineer; and Mr. Raw, give the amount as about £50,000; and Professor Threlfall believes this figure to be a fairly correct approximation.

Decision of the Committee.

22. The Committee have, by six votes to five, affirmed the expediency of constructing the proposed electric tramway.

Resolution passed by the Committee.

23. The Committee considered the evidence taken in their inquiry, with a view to arriving at a decision upon it, on Friday 1st and Wednesday the 6th inst., and the following extract from the Minutes of Proceedings will show the resolution that was passed:—

On Friday, 1st May, 1896:—

Mr. Trickett moved—

"That in the opinion of the Committee it is expedient the proposed Electric Tramway from Circular Quay, Sydney, to the Redfern Railway Station, and also along Harris-street to the intersection of John-street, as referred to the Committee by the Legislative Assembly, be carried out."

Mr. Lee seconded the motion.

Mr. Humphery moved—

"That the motion be amended by the omission of all the words after the word 'Station,'"

Mr. Wright seconded the amendment.

The debate upon the motion and amendment was adjourned until Wednesday, 6th May.

On Wednesday, 6th May, 1896:—

The adjourned debate upon Mr. Trickett's motion:—

"That in the opinion of the Committee it is expedient the proposed Electric Tramway from Circular Quay, Sydney, to the Redfern Railway Station, and also along Harris-street to the intersection of John-street, as referred to the Committee by the Legislative Assembly, be carried out," upon which Mr. Humphery had moved as an amendment,—

"That the motion be amended by the omission of all the words after the word 'Station'"—

was resumed.

Upon

Upon the question that "the words proposed to be omitted stand part of the motion," the Committee divided as follows:—

Ayes, 6.	Noes, 5.
Mr. Ewing,	Mr. Humphery,
Mr. Roberts,	Mr. Davies,
Mr. Trickett,	Mr. Clarke,
Mr. Lee,	Mr. Hassall,
Mr. Fegan,	Mr. Wright.
Mr. Black.	

The amendment was therefore negatived.

The motion was then passed on the following division:—

Ayes, 6.	Noes, 5.
Mr. Ewing,	Mr. Humphery,
Mr. Roberts,	Mr. Davies,
Mr. Trickett,	Mr. Clarke,
Mr. Lee,	Mr. Hassall,
Mr. Fegan,	Mr. Wright.
Mr. Black.	

THOS. EWING,
Chairman.

Office of the Parliamentary Standing Committee on Public Works,
Sydney, 8 May, 1896.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

ELECTRIC TRAMWAY FROM CIRCULAR QUAY, SYDNEY, TO THE REDFERN RAILWAY STATION; AND ALSO ALONG HARRIS-STREET TO THE INTERSECTION OF JOHN-STREET.

WEDNESDAY, 18 *MARCH*, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (Chairman).

The Hon. Frederick Thomas Humphery.	Charles Alfred Lee, Esq.
The Hon. John Davies, C.M.G.	John Lionel Fegan, Esq.
The Hon. Charles James Roberts, C.M.G.	Thomas Henry Hassall, Esq.
The Hon. William Joseph Trickett.	George Black, Esq.
Henry Clarke, Esq.	Francis Augustus Wright, Esq.

The Committee proceeded to consider the proposed Electric Tramway from Circular Quay, Sydney, to the Redfern Railway Station; and also along Harris-street, to the intersection of John-street.

Henry Deane, Esq., Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn and examined:—

1. *Chairman.*] You are acquainted with the details of this proposed work;—what plans do you put in? A map showing the route by a red line of 8 chains scale; a 40 feet plan in two parts, showing the course of the line along George-street and Harris-street; two sections gradient diagrams, one of George-street and the other of Harris-street; a plan showing the terminus at Circular Quay and proposed additions; a plan showing the junction at the Railway Station, Redfern; and a drawing of the permanent-way. H. Deane, Esq. 18 Mar., 1896.

2. Have you any written statement to make dealing with the line? Yes, a short statement showing the steps that have been taken from the commencement. It contains the history, description, and cost of the line, and is as follows:—

George-street Tramway.

The first steps in regard to the construction of a line of tramway in George-street would appear to have been taken on 1st October, 1889, when Mr. Bruce Smith moved in the Legislative Assembly that the question of constructing a cable tramway along George, Pitt, and Harris Streets be referred for the consideration of the Parliamentary Standing Committee on Public Works.

The motion having been passed, the Committee reported accordingly on 4th June, 1891, their decision being that at that time it was not expedient to construct the proposed tramway. This decision was based on what they considered as important reasons. In the first place, they thought it would be wise, before expending the large amount of money represented by the estimate (£120,000), to await the results of the construction of the King-street to Ocean-street line, and there was also a difference of opinion among the Committee as to which system would be more suitable—the cable or the electric.

The following is a short description of the cable line then proposed, together with estimated cost, so that a comparison can be made with the present one:—

It was intended that the line should start at the intersection of Church and Harris Streets, proceed along that street to George-street, turn into George-street by a sharp curve, and continue along George-street into Queen-street, and thence turn into Pitt-street, along which it would proceed as far as Bathurst-street. Turning into Bathurst-street it would continue until George-street was again reached, and from that point it would proceed parallel to the down track as far as the terminus at the foot of Harris-street.

The length was 6¼ miles. The estimated cost of construction £120,000, and the annual cost of working was estimated at £43,000. The value of the passenger traffic was estimated at £60,000. The cars were to run every three minutes.

The Railway Commissioners in their report of 17th September, 1889, estimated that the annual profit on this line would be £17,000, or equal to 14 per cent. on the investment. The proposal, they considered, would afford a convenient mode of communication between the most important parts of the city, and it would also carry most of the traffic to the railway station, and thus relieve the present steam tramway.

It was thought at the time that the only possible method of conducting traffic in the somewhat narrow and crowded streets of the city was that proposed, by which the cars running towards Circular Quay should go down George-street, and return *viâ* Pitt-street. By thus dividing the traffic, delays and interruptions would be minimised, and enable a frequent and regular service to be maintained. It was pointed out that this method of running up one street and down another was open to certain obvious objections, but it had been successfully adopted in many instances, notably in Philadelphia, a city of nearly 1,000,000 inhabitants. Opinions have now however completely altered with regard to this, which I will presently explain.

The

H. Deane, Esq.

18 Mar., 1896.

The present proposal is one by which the over-head wire electric system would be adopted.

On the 18th September, 1895, Mr. Secretary Young gave instructions that the necessary information should be prepared to enable him to refer this proposal to the Public Works Committee. The Railway Commissioners on the 12th October, 1895, were asked to report in accordance with the provision of the Public Works Act, and their report, which is dated 6th December, 1895, is as follows:—

Office of the Railway Commissioners, Sydney, 6 December, 1895.

PROPOSED Overhead Wire Electric Tramway—Circular Quay, Sydney, to the Railway Station and Pyrmont, *vid* Harris-street. Length, 3 miles and 12 chains of double line.

IN accordance with Section 13 of the "Public Works Act of 1888" we beg to report as follows:—

Cost of Construction—	
Cost of permanent-way (including alteration of pipes) and car-shed (as estimated by the Engineer-in-Chief for Construction)	£72,000
Overhead wires, bonding, telephones, &c., and power cables	15,000
Generating power at engine-house, rolling-stock, and motors	36,000
Total estimated cost of construction	£123,000
Annual Cost—	
Interest, at 3¼ per cent. on capital cost	3,997
Estimated cost of motive power and car repairs, including electric car drivers	15,000
Estimated cost of conducting traffic and general expenses	11,000
Estimated cost of permanent-way maintenance and repairs	2,500
Total estimated annual cost	£32,497
Annual Revenue—	
Estimated value of passenger traffic	45,000
Estimated annual profit	£12,503

or equal to over 10 per cent. on investment.

The proposed line will afford a convenient mode of communication between the most important parts of the city. It will also convey the bulk of the traffic to the railway station, and thus relieve the present steam tramway lines.

We have for years past called attention to the great necessity for relieving the Bridge-street yard and Elizabeth-street of a portion of the traffic, so as to enable better facilities to be afforded to the districts served by the existing lines; and we propose ultimately, when the western suburbs lines are converted to the electric system, to divert nearly the whole of the trams running to and from those suburbs to the George-street line, leaving the Elizabeth-street line available for the eastern suburbs traffic. By this means we hope to be able to afford a more frequent service in all directions.

The Seal of the Railway Commissioners of New South Wales was affixed hereunto this 6th day of December, 1895, in the presence of—
H. MCLACHLAN, Secretary.

E. M. G. EDDY, Chief Commissioner. (L.S.)
CHARLES OLIVER, Commissioner. (L.S.)
W. M. FEHON, Commissioner. (L.S.)

The following is the official description of the line:—

Proposed electric tramway from Circular Quay, *via* George-street, to the Redfern Railway Station, and to Harris-street, Ultimo, in the City of Sydney—

Length of track	6¼ miles.
Estimated cost	£123,000.

Starting with a loop opposite the Port Jackson S.S. Company's wharf at Circular Quay, the double track follows the curvature of the Quay, passing the wharfs of the various ferry companies, thence by way of Queen's Wharf to George-street, and along the centre of George-street in a southerly direction until it junctions with the existing steam tramway opposite the Benevolent Asylum. From that point to the Railway Station and to Harris-street, the existing tracks are used. At the corner of George-street West and Harris-street, a double track junction provides for the connection of the proposed tramway along Harris-street, on which street the double track will be laid in the centre until reaching the proposed terminus at Church-street.

The motive power it is proposed to generate at the existing power-house of the Ocean-street cable tramway, which is located at Rushcutter's Bay. The electric current will be conveyed thence to George-street by means of buried armoured cables, which will there be connected with the overhead wires by means of which the current is conveyed to the motors on the cars.

The overhead wires will, for the greater part of the distance, be carried on ornamental iron poles, erected in the centre of the streets at distances of about 120 feet. These will be protected by a low kerbing acting as wheel-guard. In the narrow portion of George-street, below Bridge-street, span-wire construction will be used, as also in some other portions, such as junctions, where it will be found expedient to use this method of construction.

A car-house will be erected in a position adjacent to the proposed tramway.

The total length of line to be constructed is about 6¼ miles, single track.

The gradients vary from 1 in 17 to 1 in 457, with only a few short lengths of level, while the curves will be numerous, although, with the exception of a few, they will not be sharp.

The gauge is to be 4 feet 8½ inches, as on the existing tramways.

Estimate.

Road	£62,500		
Car-house	9,200		
	£71,700	(say)	£72,000
Outside electric work	...	...	15,000
Power plant	12,800		
Rolling-stock	23,200		
			£36,000
Total			£123,000

It

H. Deane, Esq. 18 Mar., 1896.

It will be seen that the present proposal differs from the former one, not only in the matter of motive power, but also in that of location; the design includes a double line of rails throughout, instead of dividing the traffic by running it up one street and down another. It was thought originally that the traffic of George-street was too heavy, and the width of the street insufficient, to permit of a double line being conveniently laid; and it was pointed out that in Philadelphia, where some of the streets are narrow, this method had been adopted. In Philadelphia, however, the streets where this method is adopted are very much narrower than is the case with George-street; and in other cities, streets as narrow or narrower than George-street, and carrying equally heavy traffic, have double lines of rails laid down. Perhaps the most important instance is that of Broadway, New York, which in spite of its name, is, at the city end, very narrow, the width between the kerbs being only 42 feet. George-street in its crowded part near the General Post Office, measures 43 feet.

In Boston, Massachusetts, U.S.A., the streets are very much narrower, yet often two lines of rails are laid down them.

In Leeds, England, where it is proposed to run a double line of tramway, from Kirkstall to Roundhay Park, the width between the kerbs in Boar-lane, where the traffic is most constricted, is only 34 feet.

London and Birmingham also have double line tramways running through narrower streets than George-street.

By the construction of the tramway along George-street the traffic must eventually be very much lightened, as a number of omnibus lines which at present run will thereby be rendered unnecessary.

The overhead electric system of construction is now extensively used throughout the United States and Canada, and is superseding the cable system. It is also extensively used on the Continent of Europe, and several lines of this kind have been constructed in the United Kingdom.

Since submitting this proposal to Parliament the Railway Commissioners expressed a desire that the loop at the Circular Quay, and shown on the plan in green, should be further extended so as to pass through the gates.

Near the Railway Station, at Redfern, and opposite the end of Devonshire-street, an alteration has also been suggested, shown in green on the plan. These additions, estimated to cost £7,500, will bring the total to £130,500.

The proposal is to deliver passengers in the same position as at present at the Redfern Railway Station, but there will require to be some extra wiring laid down. With regard to the plan of the junction at Redfern, the red lines show the route as originally proposed, and as submitted to Parliament, and referred to the Committee. The lines go along George-street, and run right out to the Pitt-street line, and effect a junction there. The lines along Harris-street run right out to meet the existing line in George-street and make a junction there. The Railway Commissioners wish that the lines shown in green should be carried out, in order to make a more effective junction, to enable the traffic to be carried on with greater convenience. There is a connection also shown in green, which will enable the Railway trams to go up to the Railway Station. The trams to Harris-street, coming along George-street, would turn off at the green line, and, without passing the junction, turning into Devonshire-street and the Railway platforms, would junction again with the existing line near Terminus-street, and then get on to the turn-off into Harris-street.

3. Is the line shown in green single or double? Double. The red line on the plan of the terminus at Circular Quay shows the line first submitted. There is a loop shown in red opposite Goldsborough, Mort, & Co's. There is a large space there, and I thought that terminus would do very well. There is considerable space there for drays.

4. What is the wharf opposite to the loop? The Manly wharf.

5. Why did you decide to make the terminus where you have made it? Because there is a wide space there.

6. What was the reason for extending the terminus? Because it was thought that the loop marked in red would interfere with the wool drays.

7. The present proposal also brings the line closer to the mail steamers? Yes; and there is this to be said about the wool stores in Macquarie-street, and Circular Quay, that unloading takes place along Macquarie-street, so that there is not likely to be the same interference between the tramway and the wool traffic as there would otherwise be.

8. What is the elevation of Macquarie-street above the loop at the terminus? About 35 feet; but that is not an important point. The extra cost, due to the alterations the Commissioners have asked to be carried out, is £7,500, which will have to be added to the cost previously given. I hand in a list of the minimum width of different streets.

George-street and Harris-street Electric Tramway.

Minimum width of streets traversed, between kerbs:—

Circular Quay	120 feet.
Queen's Wharf Road	100 „
George-street between Queen's Wharf Road to Bridge-street	33 „
„ „ Bridge-street to King-street	43 „
„ „ King-street to Park-street	45 „
„ „ Park-street to Bathurst-street	75 „
„ „ Bathurst-street to Goulburn-street	60 „
„ „ Goulburn-street to Campbell-street	51 „
„ „ Campbell-street to Harris-street	75 „
Harris-street	48 „

I have to hand in a Book of Reference and the report of the Railway Commissioners, dated 6th December, 1895.

9. At that time the total estimated cost of construction was £123,000? Yes.

10. Did your Department prepare the estimates? I prepared them in conjunction with the Railway Commissioners and Mr. Elwell.

H. Deane, Esq. 18 Mar., 1896.

11. Since when a sum of money requires to be added? Yes, £7,500.
12. Therefore the total amount is £130,500? Yes.
13. That will make some slight difference in the interest at 3¼ per cent? Yes.
14. Your Book of Reference shows simply Crown land and Corporation land? Yes; we run along the street the whole way.
15. In 1891 the Public Works Committee was of opinion that a cable tramway was a wiser work to carry out than an electric tramway? Yes; that was in the case of the Ocean Street and King Street line.
16. Are you of opinion that electrical knowledge has increased so materially in five years that you are strongly justified in constructing this work? I may say that I recommended electricity at the time of the laying down of the cable tramway, and I have no reason to conclude that I was wrong then. But the reasons are all the greater now as electrical science has made such advances.
17. How do you propose to furnish the power necessary to work the line? By generators placed at the power-house at Rushcutter's Bay, the power to be transmitted from there by a cable.
18. What is the power you have at present at Rushcutter's Bay? I suppose the engines there will work up to nearly 1,000 horse-power. We are using at the maximum about 400 horse-power.
19. What surplus do you consider it reasonable to provide for on a cable? The surplus of power which was provided at Rushcutter's Bay was intended for a branch line to Hargrave-street and for an extension to Rose Bay. It was not intended for the George-street line, and therefore it is proposed to reserve that power for local use.
20. You are going to generate the extra power required at Rushcutter's Bay? Yes; there will be room in the power-house at Rushcutter's Bay to supply it.
21. There is available some 400 or 500 horse-power after providing for the motive power necessary for the cable line at Rushcutter's Bay? Yes; but that may be required for other purposes and should not be used in this instance.
22. Why do you not propose to utilise that power for the George-street tramway? Because it may be required for other purposes. For instance, there is a proposition now to run an electric line on to Rose Bay. It would be necessary to provide 100 horse-power for that.
23. It appears then there is likely to be an extension to Rose Bay and other places, for which the Rushcutter's Bay power might better be utilised? Yes, exactly.*
24. What horse-power is required to work the electric tramway in George-street? About 300 horse-power would generally suffice.
25. Therefore it would be ample to work George-street if it were wise to use it? Yes.
26. Have you taken into consideration the effect of the electric current on the telegraph lines at present in George-street? Yes. It will not make any difference to them.
27. It will have no effect upon them? No. A great deal of damage which has been done in America and elsewhere by what is called electrolysis is largely due to defective bonding of the rails. These rails, of course, will be very carefully bonded, and this will remove the risk of damage. Then as regards telephones, the modern system of telephones is to have close circuits, so that it cannot affect them.
28. Are you aware that the erection of the only electric tramway we have in the Colony—at North Sydney—so affected the Manly circuit that they could not work it? I do not think that those rails are very well bonded, inasmuch as the line was originally laid down for steam motors. By bonding, I mean making a perfect contact for the current of electricity to pass along between the rails at the joints. There is only just loose contact in an ordinary road, but where you make electrical contact you have to ensure the close connection of the metals in some way or other. There are several ways of doing it, some more or less effective. The rails need not absolutely touch; but you can connect them by means of an intermediate material like a bar of copper, or by another kind of metal altogether, such as has lately been proposed. If they are not thus bonded, the current escapes, and there is a loss of force. It escapes into any pipes, or into any substance that will carry it.
29. *Mr. Black.*] Does it remain in the atmosphere until it finds a congenial resting place? No; it goes into the earth. It would escape into the damp earth, and then, there being pipes laid in the damp earth, it would by preference go along those pipes; but there is no harm done in going along the pipes; it is where it leaves them again, to get to the negative pole of the generator, that the mischief occurs. The current, in leaving the pipes, and going across to the negative pole of the generator, takes with it particles of metal.
30. *Chairman.*] You adopt the overhead wire system known as the Thomson-Houston system? Yes.
31. You have considered the accumulator system and the conduit system? Yes; and I have come to the conclusion that the overhead wire is perfectly safe; and that it is the most economical and satisfactory.
32. Is that the experience of the world? Yes.
33. It is spreading very rapidly, whereas the others are not? That is so. In England they are very particular, and the Board of Trade there has very stringent regulations; but, in spite of that, there exists a number of proposals for new lines. Recently, a line has been laid down in Bristol, on the overhead system,—and in Dublin also, when I was in England, there were three in existence.
34. You are aware that an accumulator was tried from the terminus at Bent-street to the railway system? Yes.
35. Are you prepared to give any information with regard to it? I think you had better get the information from the Railway Commissioners. I mention in my report that that system has not been a success anywhere.
36. It is an impracticable system? Yes, at present. It has been worked in some places; in Paris for instance. I also saw it working in Birmingham, but I know they are losing money over it.
37. What are the main objections to the accumulator system? The cost and maintenance of the cells.
38. Has the weight anything to do with it? The weight of course is heavy compared with the power you can get out of them. The extra weight is considerable, and the system is not successful, because of the cost of maintaining the cells and the impossibility of getting power to work steep grades.
39. Is it a system liable to break down? No, I do not think so.
40. Would there be any objection to electric cars and steam motors travelling on the same line? No.

41.

* Note (*on revision*):—All the surplus power will sooner or later be required for the Ocean-street line and extensions, and should not be touched for any other purpose.

41. Would it be possible to run electric cars on the present lines to the Railway Station? Yes; but the rails would have to be bonded and an overhead wire would have to be laid. H. Deane, Esq.
42. Would it cost much to bond the rails? Not very much, from £100 to £150 per mile. 18 Mar., 1896.
43. What would the wiring cost? The poles and wiring for this particular line I put down at about £1,000 per mile for a single line.
44. What would be the cost of laying the cable to bring the power from the generating station? The cost for the whole, arrived at in consultation with Mr. Elwell, was £8,300, or £2,600 per mile, that is for what is called the feeder and return.

THURSDAY, 19 *MARCH*, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (Chairman).

The Hon. Frederick Thomas Humphery.	Charles Alfred Lee, Esq.
The Hon. John Davies, C.M.G.	John Lionel Fegan, Esq.
The Hon. Charles James Roberts, C.M.G.	Thomas Henry Hassall, Esq.
The Hon. William Joseph Trickett.	George Black, Esq.
Henry Clarke, Esq.	Francis Augustus Wright, Esq.

The Committee further considered the proposed Electric Tramway from Circular Quay, Sydney, to the Redfern Railway Station; and also along Harris-street to the intersection of John-street.

Henry Deane, Esq., Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

45. *Chairman.*] Have you any further information to place before the Committee? I produce a detailed estimate of the cost of the George and Harris-streets tramway. It is as follows:— H. Deane, Esq. 19 Mar., 1896.

George-street.	
Roadway, 294 chains at £99	£29,106
Crossover, Circular Quay	200
Crossing cable	600
Junction, George-street West	900
Alterations to mains	5,200
,, wood-blocking	600
Harris-street.	
Roadway, 210 chains at £83	17,430
Crossover at terminus	100
Junction, George-street West	900
Alterations to mains	1,400
,, wood-blocking	300
	£56,736
Engineering and contingencies, 10 per cent.	5,673
Total	£62,409
(Say) £62,500.	

46. Does that embrace all expenditure in connection with the breaking up of the road and placing it in the position in which it is at present? Yes. The figures for car-houses are:—

George-street.—Car-house, proportional amount	£7,000
Harris-street.—Car-house, proportional amount	1,000
	£8,000
Engineering and contingencies, 15 per cent.	1,200
(Say) £9,500.	£9,200

47. Why do you charge 15 per cent. for contingencies instead of the usual 10 per cent.? There is a little doubt about the possible cost of the car-house. There is the cost of the land to be considered. It will be very easy for the estimate to be increased by what we may have to pay for land to the extent of about £400, which would really be the extra 5 per cent. I have some further figures with respect to outside electric work, &c., which are as follow:—

Outside Electric Work.

George-street.	
Signals	£300
Line telephone	200
Bonding	640
Poles	1,600
Wiring overhead	400
Main feeder and return	6,300
Harris-street.	
Signals	150
Line telephone	100
Bonding	440
Poles, &c.	900
Wiring overhead	300
Feeder across Darling Harbour	1,500
	£12,830
Engineering and contingencies, 15 per cent.	1,924
(Say) £14,750.	£14,754

George-street.—

H. Deane, Esq.

19 Mar., 1896.

George-street.—Power plant proportion		£9,150
Harris-street.—Power plant proportion		2,000
		£11,150
Engineering and contingencies, 15 per cent.		1,673
(Say) £12,800.		£12,823
George-street.—Thirty-five motor cars, at £500		£17,500
Harris-street.—Five motor cars, at £500		2,500
		£20,000
Engineering and contingencies		3,200
		£23,200

Summary.

Road construction	£62,500	
Car-house	9,500	
		72,000
Outside electric work	.....	14,750
Power plant	12,800	
Rolling stock	23,200	
		36,000
(Say) £123,000.		£122,750

COST OF ADDITIONAL WORKS PROPOSED BY THE RAILWAY COMMISSIONERS AT THE CIRCULAR QUAY AND OPPOSITE TO THE RAILWAY STATION.

	£	s.	d.
Additional permanent way at Circular Quay, 6 chains, £200	1,200	0	0
,, ,, Railway Station, 11 chains, £200	2,200	0	0
Junctions, 2 at £900	1,800	0	0
Crossover, 1 at £300	300	0	0
Signals, &c., lump sum	700	0	0
Bonding, 17 chains, at £4 10s.	76	10	0
Poles, 12 at £20	240	0	0
Wiring overhead, 17 chains, at £3	51	0	0
	£6,567	10	0
Engineering and contingencies, 15 per cent.	984	10	0
(Say) £7,500.	£7,552	0	0

48. *Mr. Wright.*] You visited Europe and America a short time ago? Yes.
49. Have you seen many tramway systems in operation? A great many.
50. What electric systems have you seen? Most of them were the overhead wire system; the conduit system at Washington; the conduit system at Budapesth, and the overhead electric railway at Liverpool.
51. I presume you gave them close attention? Yes.
52. And you are of opinion the overhead system which you recommend is the best? It is undoubtedly the most successful.
53. Have you made electricity a study? I have studied it as far as my time will permit. I do not pretend to be an expert electrician. It is a speciality which no professional man would be able to take up unless he devoted the whole of his time to it.
54. Do you know anything about Mr. Elwell's past services—before coming to the Colony? He used to be a member of the firm of Elwell, Parker, & Co., now the Electrical Construction Company.
55. You are firm in the belief that an electric tramway in Sydney would be a success both commercially and otherwise? Yes.
56. There is no fear of failure? None whatever.
57. We are not asked to spend £130,000 in an experiment? No; it is not an experiment.
58. What kind of roadway do you propose to lay? The roadway will consist of grooved rails of 83 lb. to the yard, resting on the concrete base which carries the wood-blocking. Below the rails in George-street it is proposed to deepen down and give 10 inches of concrete; but I propose to leave Harris-street undisturbed.
59. Will there be any sleepers? No.
60. Will there be anything between the concrete and the rails to act as a buffer? No; it is not necessary. It is the style which is used now. I saw it used in Birmingham. It is also used here on the George's River Road, at Newtown, and in Oxford-street for the steam trams. It is not so suitable for steam tramways, but it is for the lighter electrical motor cars. The rail is a strong one, and it is strongly bound at the joints.
61. How do you fasten the rail? There is, as shown on the plan, a plate under the joints. The rails have fish-plates with six bolts.
62. Are they the ordinary fish-plates? Something like them, only deeper, because the web of the rail is deeper.
63. Will there be any struts or ties? Yes; the plan shows the ties. It is not necessary for them to do more than keep the gauge. The tendency is always for the gauge to widen. The wood blocks are fitted into the rails.
64. You are guided by practice in other places with regard to a roadway? Yes. We have the same class of roadway here now, but, of course, it is subjected to worse conditions under the steam motors. This is altogether a better road. The new rail will be different in shape from the present rail; it is better supported on the web, and the groove is of a better shape. Altogether, I am sure it will be very satisfactory.
65. In laying the road you will have to take up the wood-blocking, but not the concrete? Along George-street it will be necessary to cut through the present concrete to give a greater depth—just along the line of the rails. Some of the concrete may be pretty sound, but other portions certainly are not.
66. I suppose you will have to cut through a great many gas and other services? I think it is very likely. The estimate in regard to the alterations to mains is very uncertain. It may only cost one-half of the estimate of £5,200. The estimate is based on the cost of the alteration of mains on the Ocean-street tramway.

H. Deane, Esq.

19 Mar., 1886.

67. Have you taken into consideration the cost of the piece of land which will be required for the car-house? Yes.
68. Is that included in the estimate? Yes.
69. What sized piece of land will you require to stable all the cars? Something like 250 ft. x 140 ft. will do.
70. I am afraid you have not allowed sufficient margin for the cost of the ground and the erection of the buildings? Of course the building would be a very inexpensive one.
71. How many cars do you estimate to have suitable accommodation for? The total number of cars provided for is forty, but it would be desirable to provide for eighty or a hundred. Supposing at any future time it were necessary to accommodate more cars it could be done, as is done in America, by erecting several floors and running them up in lifts.
72. With regard to the main feeder and return—what does the return mean? That is the return current; it is like a double copper cable, insulated. The main feeder in this particular case is placed alongside the other, only it will be insulated.
73. Can you give us some idea as to the route it would come? It would come down one of the parallel streets, I should think—possibly Liverpool-street.
74. There is no danger, then, of injury to the water-mains, the gas-mains, and the telephone lines? No.
75. Have you consulted Mr. Walker, the chief of the Electric Telegraph Department, about the possibility of an electric tramway going along George-street? No.
76. Will it have any effect on the working of the instruments in the operating-room? Not the slightest, if an efficient bond is provided. If the rails are properly bonded for the return circuit, so that the current can get back properly to where it started, there is no danger whatever.
77. You are quite satisfied you have made sufficient allowance in your estimate for contingencies? Yes.
78. There is no danger of the estimate being largely exceeded in any one item? No. You will quite understand that with regard to the electrical details, I have been guided very much by Mr. Elwell.
79. You cannot say then, of your own knowledge, as an electrician, you have made ample provision for all the work in connection with the line? I would rather leave the electrical details to Mr. Elwell.
80. What sized engines do you propose to work? We propose to provide three engines of 300 horse-power each, one to work the usual traffic, one to work holiday traffic, and one in reserve. It will be necessary probably to provide an additional boiler to those at Rushcutter's Bay.
81. How many dynamos will the engines drive? There will be one dynamo for each—direct acting.
82. And the cost you say will be £12,823 for three engines, one boiler, and three dynamos, and all the necessary gear in connection with them? Yes.
83. That is an estimate upon which you can speak with some degree of certainty? Yes.
84. There is an item of £17,500 for thirty-five motor cars for George-street, and of £2,500 for five motor cars for Harris-street. That estimate, I suppose, was supplied to you? That is entirely Mr. Elwell's estimate.
85. To sum the matter up, you undertake the responsibility of the estimate in regard to the roadway and machinery, but in regard to the electrical plant and appliances, and motive-power, you simply put down the figures supplied by Mr. Elwell? I am satisfied of everything, except the main feeder and the motor cars. I have no doubt Mr. Elwell will be able to satisfy you with regard to them.
86. With regard to the proposed extension of the tramway from the originally proposed site in front of Mort's store to a distance further along the Quay, would it not be a good thing to run it as far as Hill, Clark's store, opposite the Orient and P. & O. boats? I am half inclined to think it would.
87. Beyond Hill, Clark's store, there is a lot of ground which would make a good terminus;—do you think instead of stopping where it is proposed to stop, it would be better to extend the tramway further on in order to take in the traffic of the Orient and P. & O. Companies? I would recommend that the terminus he made where it is at present proposed to be made.
88. Would it not be better to extend it around the Quay? If I were doing that I think I should try to run it as far as the Botanical Gardens, and give the people who visit the gardens the benefit of it.
89. *Mr. Black.*] What is your reason for preferring the overhead electric system to the cable system? If you have a copy of my report, I could point to where that matter was dealt with. In the first place, it is very much cheaper in the way of construction, and there are other advantages in favour of the electric system. In my report I say:—

> In America it is considered that electric lines are much safer to work than the cable, the cars are more completely under control, they can stop at any moment, can reverse or go on again at any point on the road. This is not the case with the cable. This is a very great advantage in crowded streets when collisions are likely to occur. If a cable car has to stop longer than its usual time at a street corner it cannot make up time; the speed is limited by that of the cable; with electric it is otherwise; the road being clear, high speed can be obtained, and time lost regained. The speed at command is a most important advantage. In New York, on the Broadway cable line, I frequently noticed at the city end the cars running slow, letting the cable, in fact, slip through the grip so as to avoid running into vehicles in front. In this way a great loss of power and great wear to the cable result. In electric cars this, of course, would not occur, as only the power required is taken from the conductor.

90. Your principal objection is that the cable system is more expensive, and the second objection is that the speed of the cable cars is regulated by the speed at which the cable can be worked? Yes; and the electric cars are more under control.
91. How do you arrive at your estimate of the cost of the maintenance of this system? That is the Railway Commissioners' estimate.
92. I suppose it is only by a comparison with the cost of maintenance of lines running in other countries? You will find in my report the cost of maintenance given in several cases.
93. But I want to know if you think you can arrive at an accurate estimate when, with the exception of the line at North Shore, and the experimental line between Randwick and Waverley, you have had no lines of that character constructed in the country? There should be no difficulty in making an estimate, having regard to different circumstances in Sydney.
94. You think that, despite the fact that you have had little or no local experience, despite the fact that in most cases the cost of the material here will vary considerably from its cost in Germany and America, you can furnish a fairly accurate estimate of the cost of maintenance? Yes; it can be done.
95. Mr. Wright has asked you certain questions with reference to carrying the tramway nearer to Fort Macquarie, with the view of serving those who visit the P. and O. and other steamers;—do you not think that it

H. Deane, Esq. 19 Mar., 1896.

it would be even more advisable to extend the tramway along the other side of the Quay, with a view to picking up the large passenger traffic which comes from the direction of Miller's and Dawes' Points? I think that had better be treated as a separate question afterwards. I fully believe this is the best course for the tramway. It would meet the general convenience of the public better than any other route, but it is very possible that it may be worth while to consider a branch down to Miller's Point afterwards.

96. You think at present it would be inadvisable to carry it down in that direction? I look upon that as a separate question altogether.

97. I look upon the proposed tramway system as a feeder to the ferry boats, and for the convenience of the people who live in the older part of Sydney—the Miller's Point end? What you really want to serve is the people travelling to and from Circular Quay along George-street to the Railway Station. That traffic will be of a regular nature. With regard to the traffic down to Miller's Point, although it may possibly be a continuous stream, the passengers will be more of a casual or incidental character.

98. If you prefer the overhead system for the reasons given, why do you prefer the overhead system to the underground system of conveying power? Because it is cheaper, and you have everything under better control.

99. Do you mean that it is more easily got at? That is what I mean. If you had the conduit system through the Haymarket, you might sometimes get the conduit flooded, and get a great loss of current, if not an actual sticking up of the cars.

100. Could not that be overcome by carrying the cable there through a water-proof tunnel? No. Usually the conductor has to be exposed, because the underground trolly or shoe takes it directly off the exposed cable. There are other systems, but they have not been sufficiently tried yet to be worth recommendation.

101. Then the initial cost of the overhead system is less than that of the conduit system, and the maintenance, because of its greater accessibility, is less? Yes.

102. I suppose, if you run double lines, you will have the double bracket posts with two arms? Yes.

103. I see it is proposed to protect these posts from traffic by what they call a wheel-guard, below the curbing? Yes.

104. I will admit that the wheel-guard would protect your poles from the ordinary horse traffic, which is under control, but you know as well as I do that such a curbing would be no protection from runaways? I should put up a stone or iron pillar at each end. The cross section on the permanent-way plan shows the base of the pole.

105. What area does the curb occupy around each post? A width of 3 feet.

106. I suppose it is something after the fashion of the refuges you see in the middle of roadways? Yes; but I do not think it can be used very well as a refuge.

107. What would the width of the base be? Three feet; and its length would be 5 or 6 feet.

108. Do you think that that would be a sufficient protection from runaways? Yes.

109. I suppose, however, if it does not prove a protection—and in some cases it might not—there would be some danger to human life from contact with the wires if a circuit were made? There would be no circuit made—the wire is insulated from the poles.

110. Has there been any recent discovery which has obviated the frequent loss of human life, which used to occur in the American streets where the overhead system was in use, from the accidental bringing of electrical wires to the roadway? No, there is no new discovery, except practical common sense. The reason those accidents used to occur was from the careless way in which telegraph lines were run across the streets, overhead, in all directions. In many of the American cities any company, and almost anybody, had the right to run a wire from house to house, and the consequence was that the sky in those cities looked more like a cobweb than anything else. When one of those came down on the wire or conductor, it would very likely drag it to the ground or break it, and then there would be an accident, but that need not occur anywhere in Sydney. The telegraph lines are not run about in that style, and in any place where telegraph or telephone lines cross the electric wire, if there is any chance at all of breaking down, guard wires can be placed. That is the practice now in America, and I believe for a good many years past there have been practically no accidents of that kind.

111. You do not think there is likely to be any immediate discovery in electrical traction which would in any way supersede your proposed scheme, or render it impossible for you to use it with improved appliances, that is if improved appliances were discovered? If improved appliances were discovered, of course, even the money spent on this tramway would not be thrown away.

112. Do you think it possible you could adopt the improved appliances for your proposed plant? Yes.

113. On the double bracket system, how many wires would be used to convey the electricity from one post to the other? One wire for each track.

114. Will a span wire be used? No; those are to obviate the necessity of span wires. In the narrow part of the streets, span wires would have to be used, because you could not put posts in the middle.

115. Will the wires be at the extremity of each bracket or in the centre? At the extremity.

116. What height do you propose to have the brackets? Nineteen or 20 feet.

117. Do you think that high enough to be perfectly safe from some of the very high loads which occasionally pass through the streets? Yes.

118. Do you not think that some of the wool loads which go down George-street are higher than that? No; I think you will find the maximum is about 16 feet.

119. When you speak of 19 or 20 feet, do you mean the height of the post or the height of the bracket? The height of the bracket; the post is higher.

120. You think 19 or 20 feet is high enough for the purpose of safety? Yes.

121. What distance do you propose to have the poles apart? 120 feet.

122. Is it not usual in some countries to have them as far as 60 yards apart? I have known them 140 or 150 feet apart, but 120 feet is the recognised distance. Telegraph poles run about 200 feet apart.

123. I suppose you propose to use the tubular iron posts? I think so.

124. Is it proposed to supplement the electrical power in connection with this system by the use of accumulators? No; that will not be necessary in this case.

125. But I suppose if you found, after experience, that sufficient power was not generated to carry on the traffic with speed by means of the wires, it would be possible to supplement it by the use of accumulators, or would you recommend an increase of the power-house? I do not think, as it is at present proposed

to

H. Deane, Esq.
19 Mar., 1896.

to have the power, there will be any advantage in having accumulators. There are distinct advantages in some cases where you have to run your power for a distance and there is a drop of the voltage towards the end of the line.
126. Where lines of considerable length are constructed, the loss of voltage, I suppose, becomes a serious matter? Yes.
127. Is it possible to run a double line of cars by the overhead electric system a distance of 5 miles by means of power supplied from a central engine-house without feeders? It would not be the practice to do so.
128. You think that over a great distance like that, the loss of voltage would be so great that the use of supplementary feeders would be necessary? Not only that, but over a long line you would have to convey a great deal of power, which would mean a very heavy copper conductor carried along the line. It would be more economical on that account alone to carry a feeder separately, and feed along the line every couple of miles or nearer.
129. The medium to carry power from the central engine-house over such a distance would require to be so heavy that it would be cheaper to use a lighter medium and have feeders? Yes.
130. In the double-line electric system, is there any danger involved by the cars running off the line? No.
131. Supposing a car ran off the line when it was meeting a car coming the opposite way, and there was a collision, would there be any danger, under those circumstances, beyond that of an ordinary collision? No.
132. There would be no danger by the meeting of currents? No.
133. Have you known of such cases? No; it has never occurred, and it could not occur.
134. Why not? Because the car is not charged with electricity. Besides that, both the wires are charged with a positive current, so that there would be no tendency for any electricity to pass from one to the other.
135. Is any special knowledge required by the men in control of the cars? They soon learn it. The knowledge required to run a car is very simple.
136. Have you any idea as to the system of instruction in other places? Supposing in Sydney there was absolutely no one who could do it, you would have to bring in two or three men to teach the others. It would very soon be done. The expert men would travel on the cars, and the others would be there to watch their movements.
137. The electric system is, of course, infinitely lighter on the roadway than the present steam traction? Yes.
138. Do you think it is lighter than a cable car? No; the electric motor cars are a little heavier—they will be about a ton heavier.
139. That involves more wear and tear of the roadway? That is nothing—the car would still be a light one. There is no working of cranks. It is a smooth rotary motion—that of the electric motor—without any jerk of any kind.
140. Do they use brakes on the electric cars? Probably the samebrake—Gennett's brake—as is used on the cable tramway would be adopted. It is an air-brake.
141. *Mr. Trickett.*] Is any inconvenience likely to arise in regard to fire escapes when a fire breaks out? I do not think there would be any trouble on that account. What trouble there might be would certainly be got rid of by the central pole system of carrying wires.
142. When we were inquiring into the Williams-street tramway that was pointed out in Sir John Fowler's report to be the principal objection. He referred to the obstruction to fire-escapes and other high vehicles. In your opinion, is not that an important objection? I do not think any importance is to be attached to it.
143. In the American cities, as far as your observation went, did any inconvenience occur in that respect? I never heard any of the tramways objected to on that account.
144. I suppose, in case of a large fire happening, the wires could be cut for the time being? You could switch off the current and cut the wires.
145. The traffic in the street would necessarily be suspended? It would be impossible to work past a fire.
146. You propose to bring all your power from the Rushcutter's Bay engine-house to the central point somewhere in George-street;—is there not a danger that it may become injured at some time, and the whole of the motive power be cut off? No; it would be carried in what is called an armoured cable—a cable wound round with steel wire, and buried in the ground. It would be very strong, and capable of resisting abrasion.
147. I take it that this proposal is to cost £123,000 plus £7,500; taking from that the sum of £23,000 for rolling-stock, it leaves in round numbers about £108,000 as the cost of construction? Yes.
148. That would be for 3 miles and 12 chains of double line, or for 6¼ miles of single line? Yes.
149. That brings the cost of construction to about £18,000 a mile? That includes the engines and the car-house. It means that the road construction, pure and simple, is £62,500 for 6¼ miles of line, or £10,000 a mile. That is not out of the way when you have to carry the line along a paved road. It is not like a country line; it is not even like a tramway laid down on a suburban road.
150. It seems to me so much heavier than many of the lines constructed in America? Of course, if you have a ballasted and cross-sleepered road, you could make it very much cheaper than that. The usual cost of a tramway made with ballast and sleepers, and a blue-metalled top, is £3,500 to £4,000 a mile.
151. In a report in an American journal the cost of the road-bed is put down at £1,500 per mile;—would that be a wood-block road? No; if it is a road at all it is one upon which no one would like to drive a buggy.
152. A memorandum has been submitted to the Committee by the Railway Commissioners regarding electric traction; it is dated November, 1895, and says "the cost in New York is about £10,000 per mile of single track"? That would be in regard to a paved road somewhat similar to what we have here.
153. In this report there is a paragraph which refers to the great saving which is now being made in engine houses by the use of what they call centrifugal fans? I know that system.
154. Is it a successful one? Yes; it is reported to be quite successful. It is to obviate the necessity of building high chimney stacks.
155. Could not a great saving have been effected in that respect at Rushcutter's Bay? In that respect it could.*
156.

*NOTE (*on revision*):—The saving at Rushcutters' Bay would have been about £400. Against that advantage would have to be set the higher annual maintenance and the cost of working.

H. Deane, Esq. 19 Mar., 1896.

156. Is this a very recent invention? It has only come into use during the last two years.
157. The reason I ask you these questions with regard to the cost of the tramway is because of a paragraph which I see in Mr. Elwell's evidence on the William-street line. On page 221 of this evidence he states, "It is estimated by a tramway engineer that the whole of the existing lines in Sydney can be converted into electric lines at a cost of £360,000." If that can be done, £131,000 seems to be a rather excessive sum to spend on a little over 3 miles of line? But this is a new line. I do not know what justification he has for saying it can be done for that amount. I should be sorry to say it is not very much underestimated, but there is this difference—all you would have to do to convert the present lines would be to bond the rails, and to provide the power and use the existing lines.
158. I understand you to say the road-bed is to cost £10,000 per mile? Yes; in the wood-blocked streets.
159. What will be the cost of the road construction from Circular Quay to Redfern? £40,300, which includes the alterations to junctions and mains. The cost of the construction in Harris-street will be £22,200, the former being 294 chains, and the latter 210 chains, a difference of about 1 mile. With regard to Harris-street, although there is a bit of the road which is only macadamised, I have provided for wood-blocking right to the end. I do not think that the wood-blocking will be more than 200 chains.
160. In the estimate of the Harris-street portion, you have allowed for about 200 yards of wood-blocking which is not now provided for? Yes.
161. Do the estimates for the two car-houses include the cost of land which would be required for their erection? It is intended to include the cost of land.
162. What will the car-house itself cost? £3,000 or £4,000.
163. It would have to be a pretty large building for the George-street line? Yes.
164. If you propose bringing a lot of the western suburbs traffic along George-street, your car-house site ought to be such that a larger house can be built if necessary? Yes; although if you were cramped for room you could have extra storeys, and run the cars up by lifts, as is frequently done in America.

FRIDAY, 20 *MARCH*, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (Chairman).

The Hon. Frederick Thomas Humphery.	Charles Alfred Lee, Esq.
The Hon. John Davies, C.M.G.	John Lionel Fegan, Esq.
The Hon. Charles James Roberts, C.M.G.	Thomas Henry Hassall, Esq.
The Hon. William Joseph Trickett.	George Black, Esq.
Henry Clarke, Esq.	Francis Augustus Wright, Esq.

The Committee further considered the proposed Electric Tramway from Circular Quay, Sydney, to the Redfern Railway Station; and also along Harris-street to the intersection of John-street.

Henry Deane, Esq., Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

H. Deane, Esq. 20 Mar., 1896.

165. *Chairman.*] Have you prepared a statement separating the cost of the George-street tramway from the cost of the Harris-street tramway? Yes. It is as follows:—

George-street Tramway.

Road construction	£40,300	
Car-house, proportional amount	8,300	
		48,600
Outside electric work	£10,855	
		10,855
Power plant, proportional amount	£10,500	
Thirty-five motor-cars	20,300	
		30,800
		£90,255
(Say)		£90,440
Additions, proportional amount		5,625
		£96,065

Harris-street Tramway.

Road construction	£22,200	
Car-house, proportional amount	1,200	
		23,400
Outside electric work		3,895
Power plant, proportional amount	£2,300	
Five motor-cars	2,900	
		5,200
		£32,495
(Say)		£32,560
Additions, proportional amount		1,875
		£34,435

166. *Mr. Trickett.*] Have you separated the cost of the cars for the Harris-street tramway from the cost of the cars of the George-street tramway? Yes; the engineering and contingencies are all included.
167. You provide for this armoured cable from Rushcutter's Bay to George-street;—would that have to be continued to Harris-street for the purpose of sending on the Harris-street cars? Yes.
168. And an underground cable? Yes.
169. Have you included that in this estimate? Yes.

170.

H. Deane, Esq.
20 Mar., 1896.

170. Does not your estimate of the cost of these two tramways seem somewhat disproportionate, when one looks at the length of the two lines? Yes.
171. Will you explain why the George-street line is estimated to be so much more expensive than the other? In the first place the road construction is somewhat more expensive. I have taken the road construction at £99 per chain for the George-street line, and at only £82 per chain for the Harris-street line. Then, of course, the proportion for the car-house, for the power plant, and for the motor-cars is far higher on the George-street line, because more work is to be done. We have to provide power for a larger number of motor-cars. The service on the George-street line is proposed to be a minute service, and on the Harris-street line only a five minutes service. So that really for the same length you would want five times the power and the accommodation.
172. As regards the extra expense of road construction, why should it be so much more expensive on one line than on the other? Because in George-street there is very much heavier road traffic, and it is very desirable that we should have a secure foundation. The concrete in George-street is not so satisfactory as the concrete in Harris-street, which is the later job. Another thing is that in checking the cross-levels I found that the cross-sections of Harris-street might be much more readily adopted than is the case in George-street in many places. In George-street we want a more substantial foundation than in Harris-street. The risk that is run is the risk to the electrical road; it is not to the ordinary traffic.
173. You have been on the Continent and in America lately? Yes.
174. Do you think it is preferable in every way to have an overhead conductor to an underground one? Yes.
175. Has that been the experience of other countries? Yes.
176. Will you state briefly the objections to the underground conduit system? The chief objection to the underground conduit is the expense and some little difficulty in keeping it clear of water in the low portions of the road where the street might be liable to flooding, and the general difficulty of keeping up the insulation, which is greater than it is with the overhead system.
177. Is there danger also of the underground wire being affected climatically? No; you could have a closed conduit.
178. The memorandum which has been placed before the Committee speaks of a perfect motor being now obtainable for the overhead system;—are you aware of any particular motor which is specially adapted for working the system? Yes. The motor that will probably be adopted will, I think, be the latest type of motor—the same as I saw working in America. The General Electric Company, which is a combination of the Thomson-Houston, Sprague, and Edison Companies, make a motor which they call the G.E. 800. It is the best type of motor that they make up to the present time. Then the Westinghouse Company have also a new motor, which is a very satisfactory one. It is a little bit heavier though than the General Electric Company's motor.
179. Which of these motors would you suggest for use here? I do not think it matters very much. I perhaps like the G.E. 800 motor.
180. Does that mean 800-horse power? No; I think it is the manufacturers' number. They are nominally 25-horse power motors.
181. And the cost of these two motors would be about the same? Yes.
182. During your trip abroad, did you make any inquiries as to the accumulator system? Yes.
183. Has it been perfected at all since this question was last considered here? It is not satisfactory.
184. Will you now tell us the result of your inquiries as to the accumulator system? In my report on electric and other tramways, at page 3, I say:—

> I will first take the accumulator or storage battery system.
>
> In America this system has made no way. Either the interests in favour of other methods are too powerful or the system itself is essentially weak, otherwise it might be thought that in that country, at least, where new inventions are received with open arms, its introduction would have been welcomed.
>
> The storage battery system has, of course, many advantages, each car taking its own power with it, and is, therefore, independent of the power-house and the other cars. A break-down does not mean even a temporary stoppage of the whole system, but there are serious drawbacks to contend with. In the first place the cars are very heavy, as they are weighted up with the batteries, so that wear and maintenance of road become thereby affected; also, for the same reason, more power is required as the load to be moved is so much greater. Then the charging of the cells takes equally long to effect, or nearly so, as the discharging during running, so that a double number of cells has to be kept in hand. Then, again, there is a low limit to the power of any of the cells hitherto invented, so that steep gradients cannot be surmounted at all, for more cells implies more weight to haul, and therefore no corresponding gain. The steeper grades, such as are negotiated by steam, are not suitable to the storage battery system, for it is found that when the cells are drawn upon at more than a certain rate they rapidly disintegrate.
>
> The result of all this is that the system is not suitable for grades heavier than 1 in 25, or perhaps 1 in 20, and does not pay a fair return upon capital.
>
> I examined the working of the system in Birmingham and Paris. These are now acknowledged to be the most successful lines. They are very well managed, and afford a considerable amount of comfort to the travelling public, but the shareholders get no benefit. I obtained returns of the working of the Birmingham cars which run along the Bristol Road. The company were so dissatisfied with the results that they recently made an application to the city authorities to allow the overhead wire to be used, in the same way as on the South Staffordshire Tramway, but their request was not acceded to.
>
> Great results were expected from the use of the protected chloride cells, and it may be that the life of the cells will be indefinitely extended, but there will still be the drawback of deficiency of power for working steep grades, until some more powerful method of constructing the plates and perhaps some other material more suitable than lead is discovered.

Then I give some particulars of the Bristol Road line of Birmingham, and of the Paris lines, and further on I say:—

> In Birmingham the cost of running and repairs, as given by Mr. Alfred Dickenson, is nearly 1s. per car mile, being nearly twice the cost of steam traction, and nearly three times that of the cable.

185. According to your report the accumulator system is not sufficiently advanced for you to recommend its adoption here? No.
186. Is it receiving full attention, do you think, at the present time? I think there are people working at it constantly. When I was in Manchester I went to the works of the Chloride Company, and I know that they are doing what they can. Mather and Platt, of Manchester, are chiefly interested in these works. I know that others connected with that patent, and with other patents, are working for the purpose of getting a more durable and powerful plate.
187. I suppose you acknowledge that if a perfect accumulator could be devised it would be preferable in every way to this overhead system? I think there would be many advantages in the accumulator system, especially

H. Deane, Esq. 20 Mar., 1896.

especially for outlying traffic, and, if not, I doubt very much whether even with a good kind of improved battery it could be run more cheaply than the overhead system, but there would of course be advantages connected with it.

188. I suppose that if the conduit were matured there would not be very much difficulty in applying that to the motor-cars that would be used?* No. Even supposing it were found afterwards that the conduit system were suitable, there would be nothing lost here except the overhead wire. The conduit system in New York, I may state, costs a great deal more per mile than did the cable line in Sydney, because there is a great deal more material in the conduit system than we had in our cable line.

189. Did you go into the question of the best generating system which could be adopted? I did examine the different styles of generators. I mentioned in my report what I had seen. The improved method of driving is by direct action. It is the practice now to place the generators on the shaft of the engine, and drive them direct instead of by belting or ropes.

190. You have stated, I think, that in many of the cities in America and Europe the streets are quite as narrow as George-street, Sydney, and that in those streets electric trams with a double line are laid and worked, without causing great inconvenience? Yes.

191. Did you notice if the traffic was as great there as the traffic we have in George-street? Yes; I have only made comparisons between those places where the traffic is as great as it is here.

192. You know that every kind of traffic goes along George-street—waggons, cabs, omnibuses, and light and heavy traffic of all kinds? Yes.

193. In many cities in America, and on the continent, this traffic is regulated, and only a portion of it is allowed to go along certain thoroughfares? Yes.

194. Do you think that is done in order to prevent the crowding of the streets? I daresay a good deal of that is done, but in New York the great crowding of the streets was due to the heavier traffic—in the city end of Broadway, I mean. In New York there are no cabs. Everybody travels either by the overhead line or by the tramways, but there is a good deal of heavy traffic at the city end. I think as it has always to be concentrated on Broadway—which is the only good street—they go by preference along there. There is no regulation to stop them.

195. And no outcry is raised against them on account of their causing public inconvenience? I did not hear of any. I think it is taken as a matter of course.

196. Is the traffic of these streets quite as great as, or greater, than the traffic in George-street? Yes.

197. Do you think its progress is blocked in a great measure by the existence of vested interests in the way of the overhead wire system? I think it has been so to some extent in America, but in England, and on the continent, it certainly is not so. In Brussels different methods of accumulator traction have been tried for very many years past, but they are not a success.

198. *Chairman.*] Have you prepared an estimate of the cost of adapting electricity to the existing line from Bridge-street to Redfern with a five-minutes service? Yes, it is as follows:—

Outside electric work	£5,600
Car-house, present accommodation to be used	.....
Power plant proportion	3,200
Eight motor-cars	4,640
Total	£13,440

199. *Mr. Lee.*] Are the Committee to understand that the railway station would be the electric termination of the proposed line? Yes.

200. And that the Harris-street line would be a separate and distinct service? No. Every fifth car would run through to Harris-street.

201. Would there be a connection or a continuation of the electric system from the station to Harris-street? The plan on the easel shows the junction at Redfern. The railway trams will pass along the two red lines, going up George-street till they come to the black lines, which represent the existing line.

202. At what point would it touch? Just opposite the Benevolent Asylum—at the corner. The line into the station would have to be wired. Then for the Harris-street traffic, the trams would turn off where the green line is shown.

203. Is that an existing line? No; it would be a new line. That line will have to be wired until it comes on to the existing line, near Terminus-street. The wiring would have to be continued right round into Harris-street.

204. There would be a continuous electric traction from Circular Quay to the railway-station; also to Harris-street, and thence to the terminus in Harris-street? Yes; only that opposite to the Benevolent Asylum there would have to be an additional piece of line laid down to carry the electric current.

205. You have prepared a statement showing the width of York-street, King-street, and Pitt-street at different points? Yes; it is as follows:—

York-street.	
Jamieson-street to Barrack-street	35 feet.
Barrack-street to Market-street	36 ,,
Market-street to Druitt-street	66 ,,
King-street.	
Ferry to George-street	35 ,,
George-street to Elizabeth-street	36 ,,
Elizabeth-street to St. James' Church	34 ,,
Pitt-street.	
Circular Quay to Hunter-street	35 ,,
Hunter-street to King-street	38 ,,
King-street to Bathurst-street	36 ,,

206. At which of these points would it be necessary to use a span-wire? In all these cases I would use it. I would not attempt to put central poles in any of these streets, only on York-street, between Market and Druitt Streets, where there is plenty of width, you could do it.

207. I want to know exactly the spots where these span-wires would be used? I think that in George-street until the width is reduced below the 43 feet, the central poles and brackets should be used; but where it is less than that span-wires should be used. 208.

*NOTE (*on revision*):—I understood this question to apply to the conduit system, and answered accordingly. The ordinary cars would not be suitable for the storage battery system; other cars constructed with plenty of room to carry the cells would be required.

H. Deane, Esq.
20 Mar., 1896.

208. Are all the other portions of George-street wider? Yes.
209. There will be no necessity to use span-wires at these intermediate points? No.
210. But there would, you think, at the points you have indicated? Yes.
211. The statement you read shows the several points where the span-wires would have to be used? Yes.
212. Are there any others? No; except it may be necessary at the junction, near the railway-station to use some span-wires. That is a matter which would have to be gone into in detail and arranged. I could not say at the present moment. It has not been gone into in detail. It is possible that some span-wires may be necessary there.
213. How do you propose to use the span-wires in George-street—from poles fixed at every kerb, and from pole to pole, or from house to house? From pole to pole. In some places elsewhere, they are fixed from house to house, and it may be possible to do so here, but I have not provided for that. It could not be done without examining carefully the condition of each house where you propose to put up the wire.
214. Have the Government power to make such an attachment to a private house? I do not propose to do it, unless it is found desirable afterwards.
215. But has it not been decided by the Department definitely whether at that particular point the connection would be made from post to post, and not from house to house? No; that is a detail which may be gone into at any time. The estimate includes the erection of poles and span-wires for that section.
216. But supposing the owner of a private house were to object to a span-wire connection of that sort? I say the estimate provides for the erection of poles and span-wires.
217. It would assist largely to allay public feeling if it were known whether it has been definitely settled by the Department how they were going to fix the span-wires? On poles.
218. That is definitely settled? Yes; that is the proposal. I only mentioned the other alternative, as it has cropped up, that it might be done if found more convenient.
219. In the case of the junction near the Railway Station, it would be necessary, I presume, to put up two rows of poles for the purpose of carrying the span-wires? I think what may be necessary will be to run poles down the centre of the green line, and when you get on to George-street West, nearly opposite to the entrance to the railway yard, to start there with span-wires, because there is no room for central poles between the existing roads. An arrangement of span-wires must in some way be introduced for the branch lines into the station.
220. That point has received consideration? Yes.
221. In your travels through America, did you see tramways running up one side of the road, and down the other side—that is close to the kerb? I have seen it in the country, or in suburbs, but not in cities. I do not remember a single instance in any city or in any important suburb where they have run close to the kerb.
222. What are the Departmental objections, or the natural objections to putting one line of rail at one side of the street, so as to deliver passengers on to the kerb, and taking another line in a similar way down the other side of the street, thus doing away with the central poles? The objection to that plan would be that there would be no room for standing carts and carriages.
223. Is that the only objection? I think that is the only objection, but it is a very serious one.
224. But is that objection a greater one than the objection to putting passengers down in the centre of a very busy and narrow street? There has been no difficulty found elsewhere that I know of.
225. You are aware that in several places the Ocean-street cable tram runs alongside the kerb? In Upper William-street North and Upper William-street South, which it may be said are half streets, and really must be treated as such. The reason why the roads were taken near the kerb there was that the other kerb might be left free.
226. If the passengers could be taken up and set down on to the pavement direct it would, of necessity, obviate a probable danger to the passengers, and would also avoid the interruption to the vehicular traffic which would be caused by the erection of the central posts? I do not think there is anything in that objection. In King-street no difficulty is experienced. It is true that there is less traffic in King-street than there is in George-street, but if there were any difficulty found at all I think that some of it would be apparent in King-street.
227. As regards the policy of putting down an electric tramway in George-street, I presume you do not wish to offer any opinion? I am very strongly in favour of it. It was to consider the general question that Mr. Secretary Lyne gave me a commission to go round and examine into these matters.
228. To acquire the information, with a view of ultimately extending the system through the whole of the city of Sydney? Yes.
229. This proposal is placed before the Committee on the ground that it will relieve the existing tramway of the eastern traffic? The eastern traffic would still be preserved to the existing tramway.
230. No matter whether it comes from west or north, if the traffic wishes to get to the east it must use the existing tramway? Yes.
231. If the western traffic wishes to get to the railway terminus it must use the existing tramway? Yes.
232. Are not the capabilities of that tramway sufficient to carry all the traffic to the railway station? No.
233. Why? There are not half enough trams. My experience is that there ought to be two or three times as many running into the suburbs as there are.
234. Are not one half of these trams running partially empty? A great many of the trams run partially empty, because the omnibuses compete too severely with them. I have stood sometimes at the top of Oxford-street, and seen five or six omnibuses pass before a tram comes along. It is not to be expected that people, if they are in a hurry, will wait for a tram to come. The consequence is that the tram-cars, instead of being fairly full, have to take the leavings of the omnibuses.
235. Is it not a fact that the extension of the tramway service has quadrupled the number of omnibuses? I daresay it has induced a lot of people to live out along the tram-lines.
236. Is not the fact known to you officially that the omnibuses have increased in every direction, and are running in antagonism to every tramline? Yes; I know they are.
237. Do not they also accomplish the journey in less time than the trams do? That I have not observed.
238. Do not they travel the distance for a less fare? In some cases I believe they do.
239. Is it fair then to charge the want of public conveniences as being the cause of the partially empty trams? I do not think you can put it in that way. I thought I had explained my opinion.
240. Do you urge that this tramway along George-street would be the means of excluding a number of public vehicles, such as omnibuses and cabs, from the traffic in that street? It would enable people to travel by electric cars, instead of omnibuses and cabs, in many cases.

241.

H. Deane, Esq. 20 Mar., 1896.

241. That may be;—but do you think it would reduce the number of the omnibuses running in the street? I think it would, eventually.
242. The omnibuses would have to go into George-street whether this tramway be built or not? Yes.
243. The starting point of many of the passengers who travel in these omnibuses would be beyond the starting point of the trams? Yes.
244. And once the passengers were seated in the omnibuses they would be taken to their destination? Yes.
245. Particularly when the fare on the omnibuses is less than the fare on the trams? Yes.
246. Would it not follow that the traffic along George-street must remain as great as it is, and would probably increase as time went on? Yes; but I said "eventually," because if I had charge of the affair and the money, I should make all haste to have all the lines fitted up electrically, so as to make a complete service. I know that is what the Railway Commissioners want to do.
247. But do you not see that when the whole of the suburbs are connected by tram there must of necessity be an omnibus service? Yes; I think there would be few omnibuses though.
248. As long as that omnibus service prevails the omnibuses must come in and out of the city? Yes; but there would be fewer of them.
249. Under these circumstances, how would the traffic in the main street be relieved? There would be fewer omnibuses.
250. Are you in a position to say whether the omnibus traffic that proceeds to the eastern suburbs goes by way of Pitt-street? I think so.
251. And the traffic to the western and south-western suburbs by way of George-street? I believe that is so.
252. You stated that in Broadway, New York, there are no cabs;—are there many omnibuses? No.
253. You also stated that the heavy traffic was very great there;—do you not draw a distinction between heavy traffic and light, quick traffic? Yes.
254. For instance, you have a tramway service running in a comparatively narrow street like George-street, and you have a large stream of light quick traffic going in both directions along the streets;—does it not increase the danger to the pedestrian going to and from the ordinary tram? I do not think there is any danger to be anticipated. I have ascertained that according to the Board of Trade regulations in England the minimum width between the kerb and the nearest rail is 9 feet 6 inches, and in all cases we shall have more than that width, except in that narrow constriction near the Queen's Wharf Road, where the space between the kerb and the nearest rail is exactly 9 feet 6 inches wide. In laying out the tramway we more than meet the Board of Trade regulations; and, as the Committee know, they are specially strict in England with regard to these matters.

Hugh McLachlan, Esq., Secretary to the Railway Commissioners, sworn, and examined:—

H. McLachlan, Esq. 20 Mar., 1896.

255. *Chairman.*] You have placed before the Committee some memoranda made by the Railway Commissioners of New South Wales with regard to electric traction? Yes.
256. It deals with the general principle of electric traction? Yes; it is the result of the observations, to a large extent, of the Chief Commissioner for Railways while in England.
257. Have you a statement to make in regard to this tramway proposal? No; but I intend to hand in the statement which has been circulated, and I understand that the Commissioners' report has been read.
258. Can you tell us how the scheme originated? It was originated five or six years ago. It was originated to a very large extent by the necessity for giving some relief to the steam trams. We have a great number of steam motors running and the Commissioners would like to give a better service in some directions, but at present they are hampered very much by the want of room. In their reports from time to time the Commissioners have made some reference to this matter which, perhaps, I may read. As far back as June, 1889, they said:—

EXTRACT from Annual Report, year ending 30th June, 1889.

The terminus at Bridge-street is not adequate for the traffic. It is, however, to be hoped that the cable tram scheme submitted by the Government to Parliament will be approved, and if this is done considerable relief will be afforded, both to the Bridge-street terminus and the crowded lines along Elizabeth-street.

Then in June, 1891, the Commissioners stated in their Annual Report:—

EXTRACT from Annual Report, year ending 30th June, 1891.

The congestion of traffic in Elizabeth-street, and the limited space in Bridge-street yard, cause the business to be carried on under great difficulties during the busy period of the day.

We had hoped that the scheme for cable trams to Circular Quay would have been authorised ere this, and so not only have provided a great public convenience by the new means of transit, but also have materially relieved the existing tram lines into the terminus.

Again, in June, 1892, the Commissioners remarked in their Annual Report:—

EXTRACT from Annual Report, year ending 30th June, 1892.

We drew attention in our Annual Report last year to the necessity for action to be taken with regard to the relief of the Bridge-street yard, either by coming to a decision regarding the extension of the railway into the city, or by providing a cable tram service between the present station at Redfern and the Circular Quay, but we regret that no action has yet been taken. The question is a most urgent one, both in the direction of giving necessary relief to the existing lines, and also to provide a more efficient service for the railway passengers.

The matter was also referred to in the Report for the quarter ending December, 1892, in these terms:—

EXTRACT from Report, quarter ending 31st December, 1892.

We would draw attention to our Annual Reports for 1891 and 1892, wherein we pointed out that the facilities in connection with the existing tramways were being curtailed, and the business was carried on under great difficulties, owing to the limited space in the Bridge-street yard and the crowded condition of Elizabeth-street, and asked that a cable line between Circular Quay and Redfern Station should be constructed. This line would undoubtedly be remunerative, and until this relief is afforded, facilities we wish to extend to some of the suburbs cannot be given.

It was also referred to again in the Report for 1893. It was looked upon by the Commissioners as a desirable work which would pay, which would be a great convenience, and which would, at the same time, give a great amount of relief to the steam trams. We have about 1,200 steam trams running up and down that part of Elizabeth-street which is common to the eastern and western suburbs, and of that number I think 180 are running to the railway station.

259.

H. McLachlan, Esq.
20 Mar., 1896.

259. *Mr. Clarke.*] I presume that this proposal was made by the Commissioners to supersede, to a certain extent, the use of steam trams? Certainly, between the railway station and the city for the present.
260. Is it found that the steam motors do not do their work properly, and to the satisfaction of the public? They do their work very well. They have been, I think, a great convenience to the public, but there has been some progress in street traction since steam motors were first introduced. At the time they were introduced there was no other system known.
261. Still there has been a great improvement made since steam motors began to run a few years back? There have been improvements made in the cars; but the system is, to a very large extent, the same.
262. As regards the cable tram at North Shore, and the cable tram that runs along King-street, what has been the result of the working of these two cable trams? The Commissioners have not yet published a complete year of the transactions on the Ocean-street line. It was opened in September, 1894. For the first year the earnings were not very considerable—2 per cent. practically. The expenses were very heavy. The appliances were not thoroughly in working order. But on the basis of the last four or five monnths' workings, when things seem to have got down to a fairly normal limit, as far as expenses are concerned, the earnings are about 5 per cent. This year we expect to pay about 5 per cent.
263. That shows a considerable improvement? A very considerable improvement.
264. Will you give similar information in regard to the North Shore cable line? That line never has paid. It pays about 2 per cent. It is an expensive line.
265. I presume the same remark will apply to the electric tramway which was established between Randwick and Waverley, and afterwards abandoned? It passed through a district where the traffic is light.
266. And the electric tram at North Shore? There is no profit on that line. Last year it did not pay expenses; but this year it is expected to pay expenses.
267. You are, I presume, entirely in favour of this electric tramway being constructed along George-street? Yes, the Commissioners recommend its construction.
268. Do you think it can be worked more economically than could a cable tram? We have not had a very wide local experience, but that seems to be the experience of people in America where it has been very largely adopted. Five or six years ago electric traction was commencing to make a big start. Let me quote a few figures from an engineering journal to show the growth of the traffic. At that time it had become practically a new power; but there was a big dispute as to which system was the better. Since that time pretty well every extension has been made by electric traction. At the present time in the United States there are 10,630 miles of electric tram roads as against 532 miles of cable tram-roads. One system has remained stationary and the other has gone ahead. The Chicago people, who have the most complete system of cable roads in the world, are giving up their cable roads, and taking to electric roads. The American people would never adopt the electric system unless it was better than the cable system.
269. What are the chief reasons for the Commissioners originating this system? They say it is the best system, according to the experience which was gained by the Chief Commissioner when he was at home recently, and by Mr. Elwell, who went through Europe and America especially to gain information on this subject.
270. Have you considered that in a narrow crowded street like George-street, it would be dangerous to the public to have a double line of tramway there? It has not been found dangerous in other places. I think we have practical experience in King-street that it is not dangerous to the public. The average width of King-street is a little more than the average width of lower George-street.
271. You must expect a much greater traffic on the George-street line than on the Ocean-street line? Still it gives a very good idea as to whether any danger or inconvenience will be caused by the introduction of the system.
272. It has been explained by Mr. Deane, that it is intended in the narrow portion of George-street, particularly that portion near the old Queen's Wharf, to put poles on each side of the street as near to the kerb as possible, and in those portions where the width is greater, to have these poles placed in the centre of the street, and protected by guards;—do not you think that even in that way it would be dangerous to the traffic? I do not think so.
273. And to the passengers? I should not think so.
274. And even with single poles placed in the centre of the street, although they may be protected, they would be very dangerous to horse traffic, to cabs, and vehicles? I should not think so. I think that objection can be pretty well answered by the experience of other places where electric poles and wires are used, and where, I understand, they are not found to be inconvenient or dangerous.
275. Have you considered that many property-owners, as well as business men, would object to have a tram in George-street, because it would interfere with their businesses, and be injurious to their properties? I should think that the business people of George-street would be rather pleased to see a tram there, because it would bring in traffic which now passes out of the street; in fact, I have seen one or two letters from George-street shopkeepers, urging that it should be constructed; at any rate, we have seen no opposition to the scheme. If they felt strongly about the matter, no doubt they would have petitioned against the adoption of the scheme.
276. Would it be necessary to have new cars for the line in George-street? Yes.
277. You cannot utilise the old cars in any way? New cars are included in the estimate. The cars would be made somewhat similar to the cable cars.
278. Have you taken into consideration any more than is suggested in that report what profit might be derived from the opening of this electric line? No. The estimated savings are based on the traffic we are likely to gain.
279. Would not this line, to a certain extent, reduce the earnings or the profit on the existing lines? That certainly would happen. The net earnings would suffer a little, but the expenses of working that traffic would be saved.
280. Supposing a railway were made from Redfern terminus to Circular Quay, would it not interfere not alone with the George-street traffic, but with the traffic on all the existing lines? It certainly would affect the earnings of the cable line as at present estimated, but at the same time there would be sufficient traffic, even if the city railway were made, the Commissioners think, to make this line a paying one, and it would give a relief to the steam trams, which will enable the Commissioners to give a better service to the other suburbs.
281. If you have a railway from Redfern to Circular Quay and a tramway from Circular Quay to Redfern

H. McLachlan, Esq. 20 Mar., 1896.

Redfern Railway Station, would not one interfere with the other? Certainly. I would admit at once that the railway to Circular Quay would decrease the profit which is estimated to be derived from this electric tram, but at the same time the electric tram would still serve its purpose as regards the local traffic. I daresay many railway persons would still find it convenient to get out at Redfern and to go to their places of business by a street tramway rather than by a railway.

282. It is proposed, Mr. Deane said, to carry on the present system to the eastern suburbs for a time as well as to Botany? Yes. The only effect this new line would have immediately on the steam tramway would be the diverson of the railway traffic and local traffic.

283. But the tram-lines to Paddington, Randwick, Botany, the Glebe, Leichhardt, and all the other places would still be carried on? Yes; that is, for the present, at any rate. I presume it is intended ultimately to work these lines on the electrical system. The Commissioners think that this system would be found to be so convenient to the public, that it will lead, sooner or later, to its adoption on the other lines.

284. Have you taken into consideration the number of omnibuses that are running from the suburbs at very low fares, in competition even with the trams? Yes.

285. Will not that interfere to a certain extent with the earnings of this electric line? It would interfere to some extent, but that has been allowed for in the estimate. The same thing happened on the Ocean-street line. People prefer the cable-cars when they can ride in them. I think people would prefer the tram-cars.

286. I suppose you are aware that from some of the suburbs—Randwick, Waverley, and many other places—the omnibuses are carrying passengers to Sydney at a much cheaper rate than are the trams? Yes; we know there is an extensive omnibus competition.

287. There are also omnibuses running along George-street? There is a good number of omnibuses running to the Railway Station. It is expected to get most of that traffic on the tram-line.

288. Why is it proposed to have overhead-wires instead of the conduit system? The overhead-wires are considered to be more economical and better to work. The electrical engineer would be in a position to give you more definite information about the merits of the two systems.

289. In the report which the Railway Commissioners have laid before the Committee, there is a paragraph alluding to the conduit or underground system? Yes.

290. This apparently seems to be pretty favourable to the conduit system? In America the system they laid down is the overhead-wire system—it offers less interference, it is cheaper, and the Commissioners think it is better than the other. It is far better for the Committee to get an expert's opinion on that point.

291. You believe that the overhead-wire system is better and cheaper than the other? The Commissioners are satisfied that it is better at the present time.

292. Notwithstanding that some little danger might result to the passengers or to the traffic? I believe there is very little liability to danger, as the wires are now controlled. In America, where they have 10,000 miles of electric tram-line, there has been no danger experienced from the use of the overhead-wires.

293. Is it possible that any danger may arise from the electric trams coming in contact with the telegraph wires in George-street and Harris-street? You will find from the report of the Commissioners that arrangements have been made, and regulations laid down which really do away with the risk which used to prevail. But that is another point upon which you had better get an expert's opinion.

294. Can you state the reason why the line should be extended down Harris-street, where the traffic is nothing compared with what it is down George-street? The Commissioners think it is a line which will prove a profitable one. If you go along Harris-street you will notice that it is pretty thickly populated, and there is a good deal of street traffic there; knowing that, the extension can be made at not too great a cost.

295. But seeing that we have a bridge from Market-street to Pyrmont, do you think that people would take advantage of the trams even from the Railway Station to the end of Harris-street, when they can go by a much cheaper and easier route over the bridge to Pyrmont? If you can depend upon getting over the bridge. I am afraid if you were in a hurry you would take the tram, because the bridge might be blocked for half an hour while a vessel was going through.

296. Do you think a line from Redfern Station to Harris-street would pay? The Commissioners think it would be a profitable line.

297. Have any statistics been prepared to show that it would pay? It is proposed to call the traffic officer who will give full information.

298. *Mr. Fegan.*] I suppose the reason why you have made this proposal is because you have found that it is really necessary to change your tramway system, especially to deal with the traffic to and from the railway? Yes; ever since June, 1889, the Commissioners have been urging that this relief should be given.

299. What percentage does the steam tram service earn? The last published report of the Tramway service as a whole shows that it was $3\frac{2}{5}$ per cent.

300. What was the percentage on your cable tram service? The Ocean-street line was opened about 15th September, 1894, and for the period ending 30th June, 1895, it returned only 2 per cent. Since that time the line has got down to a normal condition. The expenses are less, and the earnings are better. For the last six months the line has returned about 5 per cent.

301. You believe this electric tram will give greater facilities to the people to get to their places of business than the steam trams give? Yes; it will bring the traffic into a more central part of the city; it will also give the Department that relief which the Commissioners have been for so long asking. It will relieve Elizabeth-street of the railway traffic.

302. But is it a fact that a large number of persons take the omnibuses to their place of business simply because if they were to take the tram they would have to walk a longer distance? Yes; there is not only business traffic but there is a good deal of traffic from Circular Quay which this tram-line would catch.

303. It will be speedier than the steam tramway? I do not know whether it will be much speedier.

304. At what rate do the steam trams go? The electric tram on North Shore runs up to about 10 miles an hour, but in the city where the stoppages are very frequent, the speed depends on the number of passengers taken. You cannot get a quick run at any time. I do not like to say that it would be faster than the other.

305. It takes half an hour to travel in a steam tram from Newtown Road to Bent-street? I think it takes about half an hour from Enmore. H. McLachlan, Esq.
306. Do not you think it is a long time to take to make that short journey? The number of stoppages regulates the time to a large extent. With frequent stoppages you cannot get a quick run at any part of the journey, and much time is consumed in picking up and setting down passengers. 20 Mar., 1896.
307. Do you think that this electric service will be more economical than the other service? More economical and convenient.
308. How will it be more convenient? One of the inconveniences of steam trams is that it does not pay to make a run except with a decent load, and, therefore, you cannot run frequently; but with electric trams you have one car following another down the street at very short intervals.
309. It means that you will employ a greater number of hands? I do not think that comparison has been worked out, but there would be a considerable number of men employed in working the trams.
310. How many men do you employ now on a steam tram? You have two men and one conductor with you, and where you are using three cars, two conductors.
311. How many men would you have on an electric car? A driver and a conductor.
312. So that that would mean, as you are going to run the trams frequently, the employment of more hands? Yes; but no comparison has been made of the number of men likely to be employed.
313. Have you an estimate of what it will cost for fuel? No; that was all worked out and gone into carefully by the Commissioners with the officers in framing the estimate. The Commissioners take the responsibility of supplying the estimate. They considered the details before they prepared the estimate.
314. What service do you propose to give on this new line? That has been worked out too. It would be a very frequent service. In the busy times of the day you would have the cars following very close upon one another. At night they would not be run so frequently. The service would be regulated to meet the traffic, as on the Ocean-street line, where they run every three minutes in the busy portions of the day.
315. During the busy portions of the day the traffic is very much congested on the railway trams? One of the reasons why the Commissioners want this relief is to get a freer road for the steam trams. We have about 1,200 steam trams running every day in Elizabeth-street.
316. Have you any data which will enable us to compare this electric system favourably with the present steam system? No. The electric service will be more frequent than the other; it will run to a more convenient part of the city, and the Commissioners think it will be a financial success.
317. Would it be as safe as the present system? The Commissioners think it would be perfectly safe, but on this point you will be able to get expert evidence from the electrical engineer.
318. On what basis do you come to the conclusion that a 10 per cent. profit would be earned. The details are given.
319. But £8,000 has to be added to this sum? An addition of £8,000, at 3¼ per cent., would reduce the earnings to about 9⅓ per cent.
320. Have you made any scale of fares or charges for this new line? Yes, the Commissioners had something in their minds in framing this estimate.
321. Have you found that wherever you have established a steam tram line you have beaten the omnibuses off the road? The omnibuses do run in competition in many places. In very many cases they give wages which we could not attempt to give. They give very long hours and very low wages.
322. I suppose the major part of the competition is owing to the insufficient number of trams and the length of the journey? Not altogether that.
323. Do not you think it has a great deal to do with it? No; because you will find a lot of competition right in the city, where we run trams very frequently.
324. If you could run a tram frequently, do you not think it would alter the position? Certainly. The more frequent, and the more convenient the tram, certainly the better the opportunity for getting the traffic.
325. Outside Sydney you have got the greater portion of the traffic ultimately;—for instance, taking the tram-line from Newcastle to Wickham, there are very few omnibuses running now, because you have given the people a good service? Yes.
326. And it is the same to Plattsburgh and to Merewether? Yes. The more frequent the service the better you can compete against any other service. With steam trams it does not pay to run with small loads, and you have to run with a heavy motor and with three men; but with a cable or electric tram, where the controlling expense is the same, it does not cost you more for power to run trams frequently.

TUESDAY, 24 MARCH, 1896.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

The Hon. JOHN DAVIES, C.M.G.	CHARLES ALFRED LEE, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	THOMAS HENRY HASSALL, Esq.
HENRY CLARKE, Esq.	FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Electric Tramway from Circular Quay, Sydney, to the Redfern Railway Station; and also along Harris-street to the intersection of John-street.

Hugh McLachlan, Esq., Secretary to the Railway Commissioners, sworn, and further examined:—

327. *Mr. Hassall.*] I presume the Railway Commissioners have gone pretty carefully into the question of this tramway? Yes. H. McLachlan, Esq.
328. Can you, as their representative, state whether they think it will be a payable speculation or not? The result of their consideration is shown in the report which has been read to the Committee.
329. In a report on electric and other tramways which was furnished to the Legislative Assembly on the 15th May last, there is an assertion which I cannot quite understand—"that steam has been tried and failed";—is that opinion arrived at after a comparison of the receipts and expenditure? I do not know the report you refer to, but to a large extent the scheme has answered satisfactorily. It was practically the only system known at the time it was adopted by the late Commissioner. But since then such a 24 Mar., 1896.

great

H. McLachlan, Esq.

24 Mar., 1896.

great improvement has been made in street traction that steam has been quite superseded by other systems—first by the cable system, and now by electricity, which, according to expert evidence, is certainly the best one for street traction. It is better, more convenient, and more economical than steam.

330. The steam tram is now practically out of date? Practically.

331. In consequence of other methods of traction being cheaper and more convenient in every possible way? Yes.

332. In this report it is stated, "There are, perhaps, places where, on account of density of traffic and grade, there would be no choice but to use the cable." I should judge from that passage that the traffic might be so heavy in a thoroughfare like George-street that the electric appliances would not be able to deal with it? There is no doubt that the electrical appliances will be able to deal with any traffic in George-street. That is the opinion of the Commissioners.

333. And in Harris-street? Yes.

334. There are no grades sufficiently steep to necessitate the use of the cable system? No.

335. Do you know what the steepest grade is? The Commissioners, in the first paragraph of their statement, say:—

> Now that a fairly perfect motor is obtainable, the question of economical working on grades, even up to 1 in 8, has been satisfactorily solved, and a number of cities may be enumerated where electric cars are working on grades exceeding 1 in 12; the extra power required makes little difference in the cost.

336. Can you give any evidence as to the efficiency of the various systems of electric traction? The Commissioners propose that their electrical engineer should be examined on this subject; but as far as they are aware the overhead electric system has proved itself by experience to be the best one. The reasons for this conclusion will be stated by their expert engineer. The soundness of their conclusion is shown to a large extent by the adoption of the overhead electrical system practically to the exclusion of all other systems. There are a few lines laid down on the conduit system, and a few lines on the accumulator system, but practically the whole of the electric tramways are laid down on the overhead system.

337. I notice in this report that the conduit system established in Budapesth is completely successful? Yes.

338. As there appears to be some objection to the erection of the poles to carry the overhead wires, it is desirable to ascertain why the conduit system would not be equally as satisfactory as the overhead system? As far as I can ascertain, the conduit system so far has proved itself to be much more costly and more liable to interruption. It would be like putting a cable road down in George-street. You can understand how it would interfere with the traffic to put down a cable road. The overhead system does not interfere with the surface of the road so much. The overhead-wire system has proved to be less liable to interruption, to be more economical, and to be more certain in its working.

339. Have you considered the question of the horse-power necessary to drive the respective systems? No; that is a matter for an expert to consider.

340. Would not this tramway be a great public inconvenience where the vehicular traffic is so heavy as it is in George-street? Of course, the narrower the street is the more interruption there would be from any tramway. In other cities, with streets no wider than the streets of Sydney, they have a double line of tramway running up and down the streets. I think King-street affords a proof that a double line of tramway in George-street will not prove such a handicap as some people imagine it will. King-street is only 2 feet 8 inches wider than the narrowest part of George-street.

341. What gauge do you propose to adopt? The standard gauge—4 feet 8½ inches.

342. You could not well compare the traffic in King-street with the traffic in George-street? Where the busy traffic is in George-street the street is wider. I do not think the traffic is denser in Lower George-street than it is in King-street, and it will relieve George-street of a number of omnibuses.

343. There are streets running parallel with King-street which carry a great deal of vehicular traffic, such as Market-street and Hunter-street? There are streets running parallel with George-street—York-street and Pitt-street.

344. But does not the bulk of the traffic run from the Railway Station towards Circular Quay? Yes; but by the adoption of this tram you will relieve George-street of a lot of omnibus traffic.

345. A great deal of the traffic towards the western suburbs practically goes down Market-street? I do not think there is any omnibus traffic over the bridge.

346. A good deal of vehicular traffic, as well as other traffic out towards the western suburbs, goes down Market-street, so that King-street would not be looked upon as the main thoroughfare? There is certainly a big vehicular traffic in King-street. There are cities in different parts of the world with streets no wider than the streets of Sydney, and with a bigger traffic on them. I believe that Broadway in New York in certain parts is very little wider than Lower George-street, and there I should think the traffic would be much greater than it is in Lower George-street. In Boston and other places the streets are also equally narrow.

347. Do the Commissioners think that this line will pay? Yes.

348. And pay well in competition with the omnibuses? Yes.

349. How does the traffic on the existing tramways compare with the omnibus traffic? The omnibus traffic competes in a good many directions with the trams, but the trams have been paying their way practically up to date.

350. Do not you think, if a better system were adopted, the trams would pay much better than they do? I think so.

351. There are six 'bus proprietors in Waverley running, I think, eight 'buses into the city at a fare of 3d. for the through journey, while the fare on the tram is 4d.;—do not you think that practically gives them an advantage over the trams? It would seem so.

352. It must be admitted that they derive a good deal of benefit, because they are all able to live at the work? Yes.

353. Do you think the establishment of either an electric or a cable tram would be more beneficial to the public, and result in largely increased returns to the Department? The Commissioners think that by the adoption of the electric system generally they would be able to compete better with many competing services for the ordinary traffic. The steam tram is an expensive one to run. It does not pay to run a steam tram with a light load, but with the electric system you can afford to run the cars much more frequently.

354.

H. McLachlan, Esq.

24 Mar., 1896.

354. Can you give any information as to the working of the cable trams to Ocean-street? For the first nine and a half months of its existence it paid a little under 2 per cent. on the cost of construction. At first a good many expenses had to be borne by the revenue. Since then the working of the tram has become less costly, the traffic has been better, and it is paying 5 per cent. on a total cost of £170,000. It would have been paying over 10 per cent. if it had been constructed within the estimate of the Commissioners.
355. The Commissioners think that a tramway through the busy part of the city would be equally satisfactory, if not more so? They do; and they think that electricity is a better power to use, as it has been developed since the cable line was laid down.
356. *Mr. Wright.*] You have a tramway running to Redfern Station, the Glebe, Forest Lodge, Balmain, Newtown, St. Peter's, Waterloo, Redfern, Botany, Surry Hills, Randwick, Paddington, Waverley, Bondi, and Ocean-street? Yes.
357. Is it not a fact that on every tram-line the 'buses are able to compete successfully with the trams? Yes, 'buses are running.
358. Is it not a fact that you can go from Sydney to Bondi Beach for 3d. by 'bus, as against 4d. by tram? I have not the Bondi fares here.
359. Are you aware of any other city with a tramway system where the 'buses are successfully competing with the trams? Not of my own knowledge.
360. You are aware that in Melbourne the 'buses have entirely disappeared from the streets? Yes.
361. You would account for that, I suppose, by the very good service they have, and the frequent trams they run? The Omnibus Company themselves started the tramway service there.
362. There are many other companies running 'buses in Melbourne besides the Tramway and Omnibus Company? I am not aware.
363. I suppose you assign as a reason for the disappearance of the 'buses the good and frequent service which is afforded by the cable tram? I am not acquainted with the conditions. The Municipal authorities may not have cared to license opposition 'buses.
364. Looking at the fact that the 'buses are successfully competing with the State trams here, not by reason of the infrequency of the tram service, because I have frequently seen persons allow the trams to go by until a 'bus came along, has it not struck you that the item of expense is a big factor in this thing? The 'bus company are running at a cheaper fare, and are not paying so much in wages.
365. From the answer you gave, I take it that you regard the infrequent service in some instances as the cause of allowing the 'buses to compete? It must affect us to some extent. Another reason is that the 'buses run to a more central part of the city.
366. The 'buses do not run quite as frequently as the trams? They generally run in front of the trams.
367. I, as a traveller from the suburbs, have frequently seen five or six persons waiting at a corner for a 'bus to come, and allowing the tram to pass by;—can you give any idea what fare the Commissioners propose to charge from the Railway Station to Circular Quay? The fares have not been definitely settled. The Commissioners may want to make some intermediate section, but their idea is to charge 2d. for the through journey.
368. What do you charge on the railway trams? The fare is 1½d.
369. Do you think the Commissioners are likely to get 2d. if the 'buses can render the service for 1d.? I do not think the 'buses will.
370. Do not you know that a short time ago a very powerful company was started in Sydney to run a penny 'bus service to the railway station, and that the Transit Commissioners refused to grant them a license? I do not think the company was started. I remember that a company was mooted.
371. If a company is prepared to carry people to the station for a penny by 'bus, how can the Commissioners reasonably expect to get the traffic with a 2d. fare? At the present time no 'bus runs for less than 2d. to the railway station. The Commissioners would rather not give the fares, because circumstances may cause them to alter them, as they altered the sections on the Ocean-street line right up to the last moment. At present they think the through fare will be 2d.
372. Do you think the public are likely to patronise the trams at 2d. for the journey when they can travel in the 'bus for 1d.? I do not think it will pay a 'bus to run for 1d.
373. A company in this city have applied for a license for twelve 'buses to run to the railway station for 1d.? I do not think that fare would honestly pay for the horse-feed and the 'buses, and a living wage for the men.
374. What traffic can you reasonably expect to get in George-street other than what is now carried in George-street by 'bus, and by your steam trams from the railway? These two items alone are what the traffic has been calculated upon.
375. It appears from the report you submitted that you contemplate the disappearance of all the 'buses? Of the railway 'buses to a large extent.
376. There are only four or five railway 'buses in all? The officer who took out the traffic took the actual number of passengers travelling.
377. The 'buses from the Glebe, Leichhardt, St. Peter's, and Newtown will still ply in George-street? Yes.
378. And these 'buses will be competitors with your tram? As far as the expected revenue from this tram-line is concerned all the traffic carried by the through 'buses was not considered as local business.
379. But you lose sight of the fact that these 'buses passing up and down the street partly loaded would be active competitors with you for the George-street traffic? The trams would run so frequently, and the people would find tram travelling so convenient, that I think if they had to wait a minute for a tram to come, they would prefer to wait that time, rather than take a 'bus.
380. The Commissioners have not found it so on the Ocean-street line? There is not a great deal of local traffic running there now.
381. 'Buses are still running? Only one-half the number that used to run when the line was opened. Our earnings have gone up considerably on the cable tram. It is now earning £2,500 a month.
382. Can you give us any idea as to the relative cost of working the electric system as against the cable system? It is shown to some extent in the Commissioners' paper.
383. I cannot see anything in their paper on that head? There is a memorandum of the cost. It is difficult to give a comparison, because they run under different local conditions, as a rule.

H. McLachlan, Esq. 24 Mar., 1896.

384. You are not in a position, I suppose, to give the cost of electricity *versus* the cost of steam or cable? No; but I daresay our engineer will be able to give that information.
385. Do you know that the city of Sydney is almost a unique city in this respect, that with our narrow streets we have no back lanes to carry our mercantile traffic? I am not aware.
386. In any other city in Australia—Melbourne, Brisbane, or Adelaide—the whole of the mercantile traffic is taken through back lanes, but in George-street, Sydney, nearly all the goods are taken in across the pavements? There is no comparison with Melbourne, on account of its wide streets, but our principal goods traffic is done in York-street and Clarence-street.
387. We have large business houses in George-street? A good deal of the goods business is getting out of George-street.
388. Large houses are taking in their goods across the pavement in George-street because there are no back lanes? Yes.
389. If you go to any of the drapers' shops in the afternoon you will find three or four lorries in front of their doors loaded with goods? Yes.
390. In the estimate of the cost of this tramway you add 3½ per cent. as the interest on the money;—are you satisfied that you have ever got, or can ever get money at 3½ per cent.? Yes; I think it is a reasonable rate to allow.
391. Have you ever got money at that rate? The Government of the Colony floated a 3 per cent. loan last October. Nearly £7,000,000 was subscribed; and the average amount realised was £96 18s. 3d. per cent.; and about the 20th February last a cablegram was received from the Agent-General saying that New South Wales 3 per cent. stock was at par. That is one instance I give.
392. We did not get par for it? We got £96 18s. 3d. per cent.
393. Less 2½ per cent. brokerage? There is no 2½ per cent. brokerage. Since then South Australia floated a loan of nearly £1,000,000. About £4,000,000 was offered, and their average was £97 4s. 11d. per cent. The money market is easy, and it is reasonable to take 3½ per cent. as about the price at which we can borrow now.
394. Are you prepared to state that the Railway Department has ever received money at as low a rate as 3¾ per cent., all charges being paid? I take the last 3 per cent. loan, which realized practically £97 per. cent. The brokerage is ½ per cent., and the Bank costs come to about ½ per cent., representing 1 per cent, which is only paid when the loan is floated. That is only $\frac{1}{20}$ per cent. spread over twenty years.
395. You have to pay the advertising charges? On a loan of £1,000,000 that does not come to a very big item, and it is only paid once.
396. I ask you whether the Railway Department has ever received money at as low a rate as 3¾ per cent. net? I instanced the last loan, which realised £97 per cent., and since it was floated the stock has reached par.
397. Was that a railway loan? It was a loan for public works. No loan is raised for a railway specially.
398. You state emphatically that money has been received for the construction of railways at a less rate than 3¾ per cent.? Yes; that is spread over the whole term of the loan.
399. I am asking if there is one individual case? I have given an instance. I think the facts are clear enough.
400. Can you explain why, with all the appliances which the Department have at their command, and with a tramway running to every suburb for a distance of 5 or 6 miles you cannot monopolise the traffic on each line. Do you think it is owing to the high fares you charge that the 'buses so successfully compete with your trams? I do not think you can consider the fares too high. The fares are reasonable, but there are a number of circumstances to be considered.
401. The country has spent large sums in constructing tramways in all directions from Sydney. The tramways are not paying anything like the money they should pay, and I want you, as Secretary for Railways, to explain why they do not produce better results? The tramways have been profitable; they have been paying 4 per cent.
402. Why should such successful private competition take place with the State tramways? First of all the 'buses in many cases run in front of the trams. We cannot run the trams too frequently. In many cases the 'buses run alongside the doors of the people, and they run through more central parts of the city. The Railway Commissioners endeavour to pay as reasonable a rate of wages as they can to their employees. The 'buses simply pay, as far as I can see in many cases, starvation wages—I understand that some men have been paid 5s. a day for fourteen hours' labour. That information was given in reply to a question asked in the House some time ago.
403. You think one important fact is that the 'buses can secure labour very much more cheaply than the Commissioners can? They have secured it.
404. By that means they are able to out-bid you for the service? I think that is one reason.
405. You know it is generally admitted that horse traction is much more expensive than steam traction; and even admitting that you are paying a larger wage than the 'bus Company pays, you must recollect this fact, that a 'bus carrying twenty passengers pays a man, and a tramway carrying 120 passengers pays two or three men? It pays three men. But you must recollect also that we have to pay £40,000 a year to keep the roads in order for the 'buses to run on. During the last few years we have had to pay £40,000 a year in this way, while the 'buses are not taxed at all.
406. Your answer is that you have to make your own roads, whereas the 'bus Company's roads are made by the various municipalities? And to a large extent by the Tramway Department.
407. *Mr. Lee.*] If you could add £40,000 on to your profit, it would show a good return for the tramways? Yes.
408. *Mr. Wright.*] You think that if the 'bus companies had to pay a moderate proportion of the expenditure for road maintenance, they would be in a worse position than the tramways are—that they would not pay in fact? I do not think they can pay very well now. We have a 'bus company in the city, and I do not think it has paid many dividends for the last few years.
409. From inquiries of different people, and from my reading, I find that in every city but Sydney, where a tramway system has been introduced, they have managed to knock the 'buses off the roads, whereas in Sydney, instead of diminishing, the 'bus traffic is steadily increasing month by month? Yes.
410. Are you able to say whether it would be possible for the Commissioners to run at a reduction on the present rate, and still make the trams pay the interest on the cost, and the working expenses? That is

H. McLachlan, Esq.

24 Mar., 1896.

is a question I would not like to answer—with our present steam trams. I think the Commissioners have an idea that with electricity they could do something better.

411. *Mr. Trickett.*] Can you tell us by what means you estimate £45,000 as the value of the passenger traffic on the electric tramway? The traffic officer who collected the information will presently appear before the Committee.

412. Is the North Shore electric tram-line a paying concern? No; it is not paying interest. It is hardly in a favourable locality, because the population is so sparse.

413. What was the idea of putting the line there? The Commissioners did not build the tramway or recommend its construction.

414. What power have you there for generating electricity—the same engine as drives the cable? There has been some little addition made, but practically the engine-power in the cable house is used to a large extent to work the electric line.

415. That would appear to be a cheaply worked line? It is a cheaply worked line, considering the traffic. According to the last return it was costing 7d. a car mile, which is fairly cheap.

416. The following paragraph appears in the paper handed in on behalf of the Commissioners:—

> Taking a station of moderate size, under average conditions, where coal is about 10s. per ton, wages about the same as in Sydney (the maximum rate in America), the cost of power (including repairs and renewals), stores of all kinds and superintendence, does not usually exceed 1d. per car mile.

I do not think any line is run for 1d. per car mile.

417. According to your own paper it is done? That represents only the cost of the power. It does not include the cost of the conductor, the driver, or the men on the track. On page 4 of their report the Commissioners say that the Chicago City Railway Company's balance-sheet shows the operating expenses per car mile as follows:—Cable 5d.; electric, 8d.

418. These two items would be about the same here? The cost depends very largely upon local circumstances. I think it averages about 7d. in America.

419. Is the line at North Shore running satisfactorily now? Very satisfactorily.

420. There are no breakdowns? No. It has been working very smoothly for a long time past.

421. *Mr. Davies.*] Did the Railway Commissioners place themselves in communication with the municipal authorities as to whether they possessed the right to lay down this tram in George-street? No.

422. Was not that one of their first duties? No, because the Commissioners do not take the initiative in regard to laying down the line or making arrangements for its construction. That is a matter for the Government to deal with. I should think it would be provided for in the Bill authorising the construction of the line.

423. Have not the Commissioners on all past occasions when they have had to deal with city trams had to make arrangements with the city corporation? In respect of existing lines. A new line is not under the control of the Commissioners until it is finished. With the exception of making a report to the Government the Commissioners have nothing to do with the initiation of a line.

424. Are you not aware that the streets within the boundaries of the city are absolutely under the control of the corporation? Yes.

425. The corporation has supreme power over the streets unless you get additional legislation? Yes.

426. Would it not have been a courteous thing for the Commissioners to have asked the civic authorities whether they would consent, on behalf of the citizens, to have these gallows erected across a narrow street like George-street? That is not the duty of the Commissioners.

427. It is not the duty of the Commissioners to usurp the authority of the city corporation? No. The policy of making any line does not rest with the Commissioners, but with the Government.

428. Would it not have been a reasonable thing for the Commissioners to have communicated with the city authorities? I am inclined to think that the Commissioners would consider it rather outside their power to take that course. They do not deal with a new line until it is handed over, and they take it that all preliminaries have been settled by other authorities.

429. Do you think after the example we had of that toy, which you erected between Randwick and Waverley—the electric tramway with overhead wires, which was an absolute failure—the citizens are going to submit to having a tramway of that kind laid down in the city? I think the citizens will, because it will be a public convenience. As a matter of fact the poles now used are not very unsightly, for great improvements have been made in this respect. In all other cities the poles are adopted without, apparently, giving any trouble.

430. Supposing a fire were to break out in a five-storied building in this narrow street, how could the brigade possibly extinguish the fire without interrupting the line and disturbing the traffic for hours, perhaps for weeks? It has been possible in the past, with a much more elaborate system of telegraph wires, to do that. But, as a matter of fact, with the new system of tramways, they have short feeding sections, so that if one were interfered with, it would cause very little interruption to the traffic;—it is not a new question you are dealing with. Over 10,000 miles of electric tramways exist in other parts of the world, and, as far as we are advised, without practically any inconvenience to the public.

431. We have had the practical example of your electric tram between Randwick and Waverley;—is it not a fact that the income derived from that tram was not sufficient to pay the porter's wages? Yes; simply because there was no traffic on the line. It had not paid very well as a steam tramway. The electric tram was started as an experiment on a part of the line where, if it failed, there would be less interruption than there would have been on any other part of the line. It was admitted that it was not a line which would prove financially successful.

432. What engineer was responsible for that expenditure? Mr. Cracknell was adviser to some extent at the time. It was laid down on the then best known system of electric traction. To some extent the Public Works Committee of that date pressed for the experiment being made.

433. On account of its failure it was removed to North Shore? Not on account of its failure.

434. Then why did you not allow it to remain where it was? Because it was found that it might be more useful at North Shore. It has never been a failure.

435. Is it not a fact that there was not sufficient money taken on that electric line at Randwick to pay the wages of the porter? I think in nine months it earned £300 or £400. It did not pay working expenses, and no other system would have paid working expenses there.

436. It did not pay for the two men who worked the tram? I think that is just about what it did pay. No system

H. McLachlan, Esq.

24 Mar., 1896.

system would have paid there. It was tried in a district where there was practically no traffic. It was considered the best place in which to make an experiment with the electric system, and the experiment was largely pressed for by the Public Works Committee of the day.

437. How will it facilitate the traffic along George-street to have these overhead wires erected from Harris-street to Circular Quay? It will give the public a more convenient means of travelling. It will be a more suitable and convenient means of travelling than a 'bus.

438. I suppose you are aware that in Melbourne the City Council have the power, and that they have exercised the power, of levying a rate on all the trams? Yes.

439. Supposing the City Council here were to adopt that plan, what would become of your profits? It would be very unfair if the tax were levied on the tramway, and not on the 'buses. If it were levied all round the public would simply have to pay it.

440. Would it not interfere very largely with your profits;—if the City Council assess the capital value of your property at 5 per cent., and the competition with the 'buses is so keen that they can run at a much lower fare than you can do, is this tramway likely to relieve the streets at all of the traffic? Half the 'buses have gone off the Ocean-street cable line already, and I think if an electric line were built in George-street it would take the great bulk of the traffic. In my opinion it would certainly get the railway traffic.

441. Are there not frequent break-downs on the electric tram at North Shore? No.

442. Not within the last three or four months? No, it has been working very satisfactorily.

443. I was over at North Shore a little more than three months ago, and the tramway was stopped and could not run? There have been one or two accidents; but, on the whole, the running of this tram has been very satisfactory.

444. Have the Commissioners got a comparison between the cost of the overhead system and the cost of the accumulator system? I will read one or two papers which have been written on the subject. Mr. J. Clifton Robinson, who is one of the leading tramway authorities in England, and who is now managing several electric tramway companies, contributed to the *Pall Mall Gazette*, of 12th November last, the following article upon the advantages and feasibility of electric tramways for London:—

We have received the following from Mr. J Clifton Robinson, A.I.C.E., who is widely known on both sides of the Atlantic in connection with matters of tramway management and engineering:—

To the Editor of the *Pall Mall Gazette*,—

Sir,

The "plea by one who wants them" in your issue of the 1st instant, raises a question of the greatest importance to the whole of London, and I would crave a little of your space to show, in the first place, what has stood in the way of this advance in tramway traction, and thereafter to illustrate its benefits by reference to tramway extensions and conversions in which I have been actively engaged for the past two or three years. The result of extended observation and practical knowledge is my conviction that up to the present time no method of traction has been introduced that is so safe, so economical, and of such universal applicability as the overhead trolly system,

Of the Portrush and Giant's Causeway electric tramway, and the accident which recently occurred there, it is not necessary to say more than a few words. The line is situated in an open and sparsely-populated country district, and being practically isolated from the ordinary path of travel, the exposed electrical conducting rail had hitherto proved generally innoxious. The tramway, or rather light railway, was opened about fifteen years ago, when little or nothing was known of electric traction methods, and a plan was introduced which no sane man, even at that time, would have suggested for use in town, and which even in the most forlorn and distant regions would not now be proposed for use. The only merit of the Portrush line is the lesson it early afforded of the value of water power in generating the electric current for traction purposes.

The conduit system is not one that has commended itself for practical use. Its capital cost approximates to that of a cable tramway, making it financially possible, if possible at all, only in the most densely-populated districts, and excellent climatic reasons can be adduced why it should not be adopted in this country. It is a significant comment on its value that in the past ten years, when all mechanical means of traction have been eagerly sought after, the conduit system is only found in tentative use in New York, and at Buda-Pesth and Blackpool.

The County Council Objection.

As regards the obstacle in the way of introducing electric traction into London, the most instructive way I can show this is to give a plain narrative of facts. In the autumn of 1894, the London United Tramways (Limited), of which I am the Managing Director, turned attention to the powers granted to their predecessors, the West Metropolitan Company, under Acts of Parliament passed in 1889 and 1891. These included the reconstruction as double line of the tramway in the Uxbridge Road, between Shepherd's Bush-green and Acton, and my Company sought to take advantage of the opportunity when rebuilding this line to introduce the most approved form of electric traction as an object lesson within the metropolitan area. From various considerations, such as the width and the suitability of the roadway, the character of the district, and the opportunity afforded of combining the electric lighting of the road with the working of the new tramway, the company regarded the circumstances as especially favourable, and proceeded to obtain the necessary consent of the local authorities. The assent of the Hammersmith Vestry was unanimously granted on the 14th of November last year, after members of the Vestry had visited Havre, as one of the most recent and most easily accessible examples of the adoption of the overhead-wire system within a busy city. The Vestry also appointed a deputation of their Works and Electrical Committee to attend the London Council in support of the company's application. Statements showing fully what was proposed, and indicating the extraordinary progress of electric traction in America, on the Continent, and in this country, as well as illustrations of the general appearance of the line then under construction at Bristol, were submitted by me. The matter was remitted to a Committee whose report was strongly against the consent being granted, the objections raised by this Committee being apparently of an entirely sentimental character. With such a report presented to it, it is, perhaps, hardly surprising that the London Council refused its consent, though it is a thing to marvel at that the refusal, which was carried by a large majority, was really the act of the so-called "progressive" members of the Council, and was based upon such fantastic assertions as that the plan would "becloud the sky with a metallic cobweb," or that in America surrounding property had deteriorated where electric overhead traction had been introduced. If these objections are well grounded, how are we to reconcile the construction or conversion of 10,000 miles of electric tramways on this system in America within the last eight years? The refusal was given on 29th January last.

Some Object Lessons.

As, however, illustrations of practical success are of more value than myriads of unfounded objections, I should like to show briefly what has just been done in Bristol, on the basis of my report to the directors, and what is in progress in Dublin, Leeds, Birmingham, Glasgow, and other large cities. The electrical overhead line at Bristol, which was inaugurated on the 14th of October, forms part of the system of the Bristol Tramways and Carriage Company (Limited), founded in 1875, and now comprising a system of 18 miles of tramways. The electric section, 4 miles in length, consists of 2 miles of line reconstructed, leading from the heart of the city to St George, and 2 miles of new line, opening up the manufacturing district of Kingswood, the route presenting every possible difficulty, including narrow and congested thoroughfares. Gradients up to 1 in 15 are encountered, and these are surmounted by the electric motor car, trailing an ordinary car, both fully loaded, and maintaining a uniform speed of 8 miles an hour without apparent effort or difficulty.

The "trolley" wire is supported at a height of 21 feet from the ground, in some parts by centre standards, carrying also the electric light, and in some cases also the gas-lamps, and sometimes upon standards at the kerb, with an arm or bracket supporting the two wires. The standards are placed at an average distance of 120 feet. The best testimony to the

H. M'Lachlan, Esq.

24 Mar., 1896.

the success of the installation, apart from the many signs of public appreciation since the opening of the lines, is afforded by the opinions expressed at the inaugural ceremony by Professor Sylvanus Thompson, F.R.S., whom everybody will recognise as one of the most competent electricians of his time. On behalf of the gas and water interests of Bristol, Professor Thompson watched the process of construction both openly and by covert visits, and his testimony is that, while the efficiency of the mode of traction is unquestionable, the requirements of the Board of Trade for the safety of the public and for the prevention of electrolysis in the street pipes had been most fully carried out. The Bristol local authorities and the Bristol people fully endorse his views as to outward appearance and practical working of the new system. A beautifully illustrated pamphlet, describing the Bristol installation, has been prepared, and to those who cannot visit the City it will show conclusively how futile are the so-called æsthetic objections to the overhead trolly system. Some further practical facts may be stated.

On one of the Bristol horse lines, now carrying two and three-quarter millions of passengers yearly, the loss from lack of speed over this difficult route is calculated to amount to "a sinful waste of one year in a week." The electric car can double the daily mileage, and thus give twofold the accommodation to the public. The car is fitted with electric brakes, by which, independently of the line circuit, the motor-man can stop the car within its own length, even on the steepest descent. The cars are larger and more commodious. They are self-lighted (so to speak) with the electric light at night, and already a quarter of a million of passengers have been carried in safety, and without hitch or delay, despite the disadvantages of opening a new electric system at this season of the year. Outside the power-house, the whole staff of men and boys has been drawn from the ordinary horse-car service, and with a very short training became efficient in the management of the motors.

In Dublin, my company, in the southern district, is just on the eve of completing the entire conversion of their tramways on the electric overhead system. These lines started from a central point in South Dublin, run to Black Rock, Kingstown, and Dalkey; a total length of 16 miles of track will be completed during the present year. During the short interval which has elapsed since the Bristol line has been put in operation the Corporation of Leeds have passed resolutions by decisive majorities covering an expenditure of £249,233 in the conversion of their lines to the overhead trolly system of electric traction, while the Public Works Committee of the Corporation of Birmingham have also framed a strong report to the Council, recommending its adoption in the city, in substitution of horse tramways.

The case of Rouen is of great value from the point of view of the present discussion. Within three days of the adverse decision of the London County Council, and with the knowledge of that decision, the authorities of Rouen granted a concession, not for one year with obligation to remove, as we offered at Hammersmith, but absolutely for a period of forty years, to reconstruct and extend the tramways there on the electric overhead system. Aided by a report drawn up by me for the directors of the company, by their own personal and prolonged inspection of the Havre electric tramways, and with fifteen years' experience of horse and steam traction to guide them, this decision was arrived at by a majority of 27 to 7 in the Municipal Council of Rouen. It is hardly necessary to emphasise the contrast those cases present in view of the action of the London City Council.

I am, &c.,

J. CLIFTON ROBINSON.

To that article Mr. H. Scholey, who is also a tramway authority at home, made the following reply in the *Pall Mall Gazette* of the 14th November:—

Electric Tramways for London.

To the Editor of the *Pall Mall Gazette*,—

Sir,

If Mr. J. Clifton Robinson had not been a very modest man he might have said much more than he did about the advantages of electric traction. Not being weighted with much modesty I shall, with your permission, insist on one or two important points.

The economy in electrically working tramways is so marked that even if it had involved some sacrifice of the beauty of our streets it would have deserved the most careful consideration. To give one instance from America as showing the comparative cost of electricity and any other forms of power, I will quote the West End-street Railway of Boston. In 1888, before electricity had been introduced on the lines, the percentage of expenses to earnings was 82 per cent. The gradual adoption of electricity brought this figure down from year to year until, in 1894, it stood at 66·44 per cent., notwithstanding that old stock, rendered obsolete by the introduction of electricity, had been written off. It is such instances as these that account for the 10,000 miles of electric track, and the £50,000,000 of invested capital which roughly represent American street railway enterprise at the moment.

In the light of the West End railway results it is well to consider what obtains on English tramways. The cost of working horse lines in this country may be anything from 7d. to 1s. per car mile, but it is more often nearer the latter figure. Steam trams, with their greater noise and nuisance, rarely cost less than 9d., while they occasionally figure at 1s. 2d. I am quite aware that there are many difficulties in the way of obtaining accurate working results of British tramways; but I have taken a few figures at haphazard from "Duncan's Manual." In this we find that at Leicester, the lines of which are entirely worked by horses, the 9·58d. per car mile, and the percentage of expenses to receipts is 84·10. At Leeds, where steam trams are used, with the exception of a short length worked by electricity, of which I will speak later, the percentage of expenses to receipts is 99·24. Under these circumstances it is not surprising that the company pays no dividend. At Leamington things are not very much better, for the expenses per car mile amount to 11·25d., and the percentage of expenses to receipts stands at 85·41. Keighley and Ipswich, with horse traction, cost over 90 per cent. of the receipts. The two or three instances of steam traction which I have encountered are still more disastrous. The steam trams at Dudley and Stourbridge cost as much as 12·12d. per car mile. Burnley figures out at 11·69d., and the Huddersfield municipal tramways are as high as 15d. per car mile. The average cost per car mile of the London tramways is slightly over 9d.

Now, as a matter of fact, electrically-worked tramways ought and can be made to work at less than 6d. per car mile, and the percentage of expenses to receipts ought not to be more than 60 per cent. Indeed, I shall be very much disappointed if the recently opened Bristol tramways do not beat this figure.

I am not sure that it is altogether wise to be constantly referring to what has been done in America and on the Continent. Many people object to American figures because local conditions there are so vastly different from what obtains here. But for the purpose of satisfying these objectors I will refer to an electrical line that has been in use at Leeds for three or four years. It is a well-known fact that this is really a poor specimen of an electric line, and certainly does not represent modern practice. Not only is it inefficient, it has also to deal with a very peculiar traffic. Yet in spite of its inefficiency it continues to be worked at 6d. per car mile. It would not be very easy to find a horse line, much less a steam line, worked as cheaply as that.

There is no work for which a horse is so unfitted as that of hauling a tram car. In this case it is not the pace but start that kills.

A word with regard to the spoliation of the streets, the fear of which has prevented so many of our worthy councillors from appreciating the merits of electric traction. We are blessed with few thoroughfares that can be compared with the streets of Milan, Genoa, and Marseilles, yet the electric tramway flourishes there, and it is not considered that the beauty of the streets has suffered at the hands of the electrical engineer. Indeed, I have a personal knowledge of careful inquiries made amongst the inhabitants of these towns, and there was absolutely no objection raised on æsthetic grounds. The County Council, when adjudicating upon overhead tramways, overlooked a very important point—that is, none of the London thoroughfares which are traversed by tramways are remarkable in any way for beauty. It would be a system of surpassing ugliness that could spoil Blackfriars, Gray's Inn, and Pentonville roads; yet, whether rightly or wrongly, it is to such streets that tramways have been relegated.

The tram car has hitherto been the poor man's vehicle, but I look to electricity to so improve and revivify it that it will become the most popular of public conveyances.

Yours, &c.,

22, Paternoster Row, E.C., 13 November, 1895. H. SCHOLEY.

445. *Vice-Chairman.*] What is the expense per car mile in Sydney? It is 1s. 10d. for steam; the wages are very much higher here than at home.

446. What is the cost per car mile on the cable line to Ocean-street? I do not recollect what it is.

447. *Mr. Davies.*] Have the Commissioners had a comparison made between the cost of laying down a cable tram and the cost of laying down an electric tram? Yes.

448.

H. M'Lachlan, Esq.

24 Mar., 1896.

448. Which system would be the more expensive? The cable system.
449. Have you particulars of the difference in the capital cost of the two systems? No; that is a matter for Mr. Deane to deal with.
450. I understand the proposal is to develop power at the power-house at Rushcutter's Bay at an additional expenditure of £36,000 or £37,000? Yes.
451. And the power is to be brought by cable to Harris-street and to Circular Quay? Yes.
452. Have you any idea as to what it will cost? It is all included in Mr. Deane's estimate.
453. Would it cost a little more to lay down a cable absolutely than to take the power from the power-house to those two points by cable? That is a matter upon which an expert can give better evidence. As far as I am informed, the cost of the cable would be very much higher. Mr. Deane and Mr. Elwell will be able to give you the actual figures.
454. Would it not be more economical to erect a power-house at Circular Quay, where the Government have abundance of land, or at the Benevolent Asylum site, where there is abundance of Crown land, than to go down to Rushcutter's Bay and bring the power by cable to Harris-street and to Circular Quay? No; in the opinion of the engineers the more economical plan has been followed of having the power at Rushcutter's Bay. There is practically no loss in the transmission of the power.
455. Is it not a fact that all scientists assert that there is a great loss in the transmission of the power for any great distance? I understand there is practically no loss.
456. Is it not a well-known fact that there is a loss? There used to be a loss; but with the improved system there is very little leakage.
457. You do not know exactly the route by which the feeding cable is to be brought? No.
458. You do not know what the cost will be? No.
459. It is only a rough estimate that Mr. Deane has given? No; I should think it is as clear an estimate as could be given by an experienced and capable man.
460. Is it possible for Mr. Deane to give a clear estimate when he does not know what route he is going to take? That has all been thought out. It is not a new thing which is being submitted. The steam tram was first introduced. It was found to be too expensive to work. It was superseded by the cable tram, and since that time electric traction has proved itself to be a decided success. There are only about 600 miles of cable tramways in the United States. Within the last seven or eight years they have built 10,000 miles of electric trams. As these people spend their own money, and are conversant with both systems on the spot, I think it is a strong argument as to which system is the better one. They would not throw away their money in laying down electric trams if the cable system was a better or a cheaper one.
461. Can you state the difference between the cost of working the cable tram and the cost of working the electric tram? We have no experience of that to my knowledge.
462. This is simply a haphazard sort of estimate? I think that practical result is certainly the strongest argument we can find in favour of the electric system.
463. Going back to the question of erecting overhead wires in narrow streets;—it is proposed in the wider portion of George-street to put in the centre of the street a column with a double arm, and in the narrow portions, where the distance is only 36 feet from kerb to kerb, to erect poles on each side with a single arm? Yes.
464. How high will the wires be from the ground? I think it is 17 feet.
465. Will that be sufficiently high to permit of the wool traffic going along the street? I think so.
466. You are aware that the Government have expended thousands of pounds in building subways in which to place the telegraph wires? I see that they are doing so; but you must recollect that there was a regular network of telegraph wires across the streets. With this tramway there will be only one or two wires. You will see by this illustration in my hand that the proposed posts are not at all unsightly, and that they do not seem to detract from the appearance of the streets. In English cities the public do not view them with disfavour, and there is quite as strong a public feeling in other cities as there is in this city.
467. *Mr. Lee.*] When you stated that the Ocean-street cable tram is paying 5 per cent. on a capital cost of £170,000, did you mean to convey the idea that it is paying 5 per cent. over and above interest and working expenses? No; 5 per cent. over working expenses, or, as we usually say, 5 per cent. on the cost of construction.
468. Is it 5 per cent. after deducting working expenses, and not deducting interest? Yes.
469. Practically showing a profit on the whole transaction? Yes.
470. How was it that the Commissioners' estimate of £80,000 for the construction of that line came to be exceeded by £90,000? It is a question for the Constructing Engineer to answer. The line was handed over to us complete. That was the capital with which the Commissioners had to deal.
471. Do the Commissioners submit this electric tramway proposal as part of a complete system of running electric trams through the city and suburbs? No; they submit this line on its merits in the first instance, but they think that before long it will prove to be such a success that the public will almost demand its extension. The Commissioners are satisfied that it will be an economical thing to extend the system to other systems. They feel sanguine that the result of introducing this electric tramway will be so marked that the public will see the wisdom of extending the system.
472. Has this line been selected with a view to the easy extension of the system? Two or three considerations have influenced the Commissioners. First of all it is a line which will pay; and above that consideration it is a line which will give what the Commissioners have been pressing for since 1889—a great amount of relief to the steam trams. We are running over 1,200 steam trams in and out daily along Elizabeth-street. If you can take off the trams which are running to the Railway Station, it will give a large measure of relief to the steam trams, and enable the Commissioners to give a better service to the suburbs.
473. Supposing an electric tramway is constructed in George-street, will not the Railway trams still run along Elizabeth-street? There will not be direct Railway trams unless on special occasions, because the Railway traffic will pass down George-street. The Newtown, Leichhardt, Botany, Glebe, and Forest Lodge trams will still go past the Railway Station. We run about 180 steam trams a day between the Railway Station and Bridge-street.
474. It is contemplated to discontinue the steam trams to the Railway Station? Yes.
475. And passengers, if they wish to go direct to the railway, will have to go *via* George-street? Yes.
476. Otherwise they must take a passing tram? Yes.

477.

H. McLachlan, Esq. 24 Mar., 1896.

477. What great advantage will it be to the Department, inasmuch as the trams will still have to run over the track, to omit a few trams? It will be an immense relief to the Department to get rid of 180 trams a day. The street is too crowded, and the congestion at Bridge-street is too great. We can give some relief to the other suburbs by giving a better service.
478. Would it not be an enormous inconvenience to the public to be compelled to go to George-street to take the only direct tram to the Railway Station? The benefit to the public would be enormous, because most of the traffic is in George-street. That is why the 'buses to some extent are successful in competing for the traffic. George-street is a more central part of the city than Elizabeth-street.
479. Admitting that it would be a great convenience to George-street people to get to the station direct, do you think it is necessary for the public convenience to have both means of access to the railway station? I do not know that there would be sufficient traffic, except perhaps at the very busy times, when the Commissioners might run special trams; but, practically, the railway traffic into the city will be along George-street. At one time the 'buses used to run down Pitt-street and George-street, but they found that the great bulk of the traffic went into George-street, and, therefore, they ran a very limited service in Pitt-street. The further east you go the less convenient it is for the public to be borne. There is no doubt that George-street is the central part of the city.
480. Is it in contemplation, if this line succeeds, to extend the system generally, as well as to apply it to the existing steam trams? That is the Commissioners' view.
481. But at the present time the Commissioners have not decided upon a general scheme? No.
482. Was not a proposal for a cable tram in Harris-street submitted to the Public Works Committee some few years ago? George-street and Harris-street.
483. Has the traffic, in the opinion of the Commissioners, been sustained to such an extent as to warrant the construction of an electric tramway? Yes. They recommended the construction of a cable tram, and their opinion is not altered.
484. Notwithstanding the fact that since that time increased accommodation is proposed to be given by means of a new bridge to Pyrmont, they think this tramway will be a paying concern? Yes.
485. *Mr. Davies.*] Is it to be understood by the Committee that if this system of electric trams is adopted the Commissioners will give up the idea of extending the railway to the city? I did not say that.
486. Would there be any necessity for both? I think so. I think both would be successful, although of course it must be admitted that a good deal of traffic which would be taken by the electric tram would pass on to the city railway. It would divide the traffic.
487. You do not know whether the Commissioners have made up their minds to abandon the city railway extension? They have not abandoned it.
488. *Mr. Wright.*] Are you aware that the bulk of the Pyrmont traffic would be into the city and out of the city? Still there are a number of 'buses running to Harris-street on a Saturday night. As many as seventeen 'buses are running through the city on a Saturday night.
489. You think you will be able to divert that traffic round by the Railway Station, instead of the people going by the shorter route across the bridge or the ferry? The 'buses do not go across the bridge.
490. Are there seventeen 'buses running to Harris-street? I have heard that there are as many as seventeen 'buses running to Harris-street on a Saturday night.
491. Are they Balmain 'buses passing down Harris-street, or are they local 'buses? I cannot say of my own knowledge.
492. *Vice-Chairman.*] Have you given the cost of operating the Melbourne cable trams? No; but you can get their half-yearly balance-sheet.
493. You have not ascertained what the cost per car mile is there? No.
494. Would not that be a guide to enable the Committee to arrive at a fair comparison between the cost of the cable tram and the cost of the electric tram? Circumstances alter so much, according to localities.
495. In Melbourne, what circumstances would cause any very great difference in the cost per mile? In one case you run a system about 2 miles long; in the other case you run a system 40 miles long; and therefore the proportionate cost of the power in the longer system would not be anything like so great as in the shorter system. If we had the mileage of the North Shore and Ocean-street cable lines controlled by one power-house, we could reduce the expense considerably. It depends again upon the population of the locality. It is difficult to compare two systems, unless you have similar circumstances in each case.
496. Do you know the wages paid to grip men by the Melbourne Company? The Melbourne Company have been altering their wages considerably. The rate of wages we pay cannot, I think, be considered an extravagant one. Conductors receive from 6s. 6d. to 7s. a day, and gripmen from 7s. 6d. to 8s. a day.
497. Do you know what they receive in Melbourne? I have had particulars; but I cannot speak from memory.
498. Is it higher than it is here? It was higher; but I believe it is now lower.
499. I suppose there is not much difference? They have reduced wages there by 35 or 40 per cent.
500. Are you aware that in a paper on electric traction, prepared by the Commissioners for the information of this Committee, it is mentioned that in Chicago, which is taken as a fair example of the advantages of this system, the cost of operating per car mile is 8d. for electric traction as against 5d. for cable traction? Yes; but I think there is a different system of hauling.
501. The explanation appears to be that the earnings of the electric system are greater, because the cars are run more frequently? In their paper the Commissioners say:—

> One is at once struck with the fact that, although the electric traction costs more than the cable on the Chicago city lines, the revenue is more than proportionately greater. This is easily explained by the method in which the cars are worked. The cable cars usually run three together, whilst the electric cars usually run singly or with one trailer. Consequently, in the one case every mile run counts as two or three, and, in the other case, as about one and a half.

502. If the cost were given as per car mile, it would be a fair comparison? The estimate is not for a single car mile. If it were worked out as per mile it would be better.
503. Do you know if the Commissioners have fully taken into consideration the difficulties, if there are any, of running a line of tramway in George-street, and placing the wires in the centre of the street, between the rails? Yes; they have fully considered that.
504. Are they of opinion that the very heavy traffic of George-street will adapt itself to the altered conditions? Yes; according to the experience of other cities where the two lines are in operation.

H. McLachlan, Esq. 24 Mar., 1896.

505. That is the view they take? Yes.
506. Accepting the estimate of Mr. Deane as to the cost of construction, what return do you expect to receive? It would be a little less than 10 per cent., as Mr. Deane has added an item since the Commissioners' estimate was made.
507. Do the Commissioners estimate that they will get a return of 10 per cent. on an outlay of £123,000? Yes.
508. Do you know on what basis that estimate was made? On the basis of what they consider will be the actual traffic. The traffic officer who collected the statistics upon which it is to some extent based will appear before the Committee.
509. Was the information which you propose to furnish to the Committee through the traffic officer before the Railway Commissioners when they made their estimate? It was.
510. They consider that their estimate is not an excessive one? That is so.
511. *Mr. Wright.*] You expect to make £12,500 a year net on this line? Yes.
512. That is nearly as much as you make on all the other lines put together? No.
513. What are the net earnings on the tram-lines? In 1895 it was £45,000 on the city and suburban lines, and on the Ocean-street line it will be about £7,000 or £8,000 a year.
514. *Vice-Chairman.*] Have you estimated the probable earnings on the line if it is made to the railway station, and is not carried down Harris-street? Yes.
515. How much per cent. would be the proportionate return on the cost of the line between Circular Quay and the railway station? I have not that information worked out separately. The traffic officer will furnish the figures.
516. Did it strike the Commissioners that it might be desirable to construct a line between Circular Quay and the railway station, and not to take it down Harris-street? Not to my knowledge.
517. Therefore, you did not make any attempt to ascertain what return would be earned on the line as far as the railway station? No.
518. Have you had before you an estimate of the probable traffic in Harris-street? We have an estimate of the probable traffic. It has been worked out separately from the traffic to the railway.
519. In your opinion, would it be advantageous to discontinue the line at the railway station, or to continue the line down Harris-street? I think it would be profitable to run the whole system as is proposed.
520. *Mr. Wright.*] Can you state from memory what wages you are paying to each class of tramway employee? The conductors get from 6s. to 9s. a day, the firemen from 7s. 6d. to 9s. a day, and the motor-drivers from 11s. to 14s. a day, all working 110 hours per fortnight.
521. *Mr. Lee.*] You stated that it costs the Commissioners over £40,000 a year to maintain the streets through which the steam trams run;—do the Commissioners maintain the roads themselves or do they hand over that money to the City Corporation? The Commissioners maintain their own lines.
522. By reason of an understanding between the City Council and the Commissioners? No. The Commissioners have power under the Act to run trams through the streets.
523. Do not they also maintain the roads for so many feet on either side of the tram-track? For a certain distance beyond the outer rails.
524. In conformity with the statute, or in accordance with an arrangement with the City Council? In conformity with the statute.
525. How do you make a road for the 'bus traffic to pass over? We have to maintain a good width of the street in perfect order, and as a rule the drivers find that portion to be the best maintained portion of the street. They run over it; they pay nothing; and we have to keep the road in order for them.
526. Do you happen to know whether an electric service has the same effect in disturbing the road as a steam service? It would have very much less effect, because there would not be the same weight on the road.
527. Do you contemplate a heavy expenditure in George-street for the maintenance of George-street, so as to carry on the electric trams? No, the estimate is £2,500. The street traffic will affect the track.
528. Any damage which is done to the streets by the Railway Commissioners is repaired, and does not involve the City Council in any loss? Yes; it must be a great advantage to the City Council to have a tramway in a street, because one-half of the street is maintained in good order by the tramway authorities.
529. Do you remember that when the Ocean-street proposal was being considered, Mr. Burdekin, the mayor, raised a question as to the right of the City Council to obtain a certain percentage of the earnings of the tram? I recollect that he gave evidence.
530. Do you remember that that question was raised at the time? Yes.
531. Has that view ever been enforced, or attempted to be enforced, by the City Council? No, not to my knowledge.
532. Have they ever asserted their right to a percentage of the earnings? Not to my knowledge.
533. The cable tram has been laid and worked without any demand of that kind being made by the City Council? Quite so.
534. And what has governed the laying of a tram in that street is likely to govern the laying of trams in other streets? I think so.

John Kneeshaw, Esq., Tramway Traffic Superintendent, Department of Railways, sworn, and examined:—

J. Kneeshaw, Esq. 24 Mar., 1896.

535. *Vice-Chairman.*] What position do you hold? I am Tramway Traffic Superintendent under the Railway Commissioners.
536. Have you prepared any returns for the information of the Committee? No; but I am prepared to give the Committee information as to how I made up my estimate of the traffic.
537. Are you prepared to give the information now? I was told that I should not be called upon to give evidence until Monday.
538. Will you be able to give your evidence in a more complete form if your examination be postponed until to-morrow? Yes.

WEDNESDAY,

WEDNESDAY, 25 *MARCH*, 1896.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

The Hon. JOHN DAVIES, C.M.G.	CHARLES ALFRED LEE, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	THOMAS HENRY HASSALL, Esq.
HENRY CLARKE, Esq.	FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Electric Tramway from Circular Quay, Sydney, to the Redfern Railway Station; and also along Harris-street to the intersection of John-street.

John Kneeshaw, Esq., Tramway Traffic Superintendent, Department of Railways, sworn, and further examined:—

J. Kneeshaw, Esq. 25 Mar., 1896.

539. *Vice-Chairman.*] Will you state briefly how you arrived at your estimate of the probable earnings and working expenses of the proposed electric tramway in George-street? I calculated that we should carry 5,240,000 passengers on the railway trams, and 2,100,000 passengers on the Ultimo tram, or 7,340,000 passengers per annum. That is not a very high estimate, considering that on the Ocean-street line, where there is not nearly so thick a population, we are carrying nearly 4,000,000 passengers per annum. Working that out at the current fares, I make the annual revenue £45,500. We had a series of accounts taken during last October and November, when we stationed responsible men at a number of street corners to count the 'buses as they passed, and the loading of the 'buses. These returns I summarised. I went into them very thoroughly, and it was on these figures that I based my estimate of the traffic.

540. You had better give the summary? It is rather an elaborate statement, because I had the accounts taken at five distinct places for a week between certain hours. I worked these out in detail, and then took the average per day.

541. Will you explain this statement in such a way that your evidence may be understood? An account was taken at the principal crossing-places. I averaged each day's traffic at each place. I then made an allowance for the 'bus passengers we do not expect to get at all in the railway trams. I deducted a further allowance from the 'bus traffic, which we might reasonably expect to get, but which I did not want to include, as I did not want to be over-sanguine with the estimate. I dropped a considerable portion of that, with the result that I do not think the figures I took are in any way high. They do not come up to the estimate which was made two or three years before by other officers who were making the same calculations. I did not take the same high estimate as they did, for the simple reason that trade had fallen off to a certain extent, and we were not getting the same amount of traffic on either the tramways or the railways now that we were getting when they framed their estimate.

542. You are of opinion that you have under-estimated rather than over-estimated the probable earnings of this proposed tramway? I am convinced that I have under-estimated rather than over-estimated, and that we shall get £45,500 a year. By running railway trams only I anticipate that we shall get £32,000 per annum, and on the Ultimo section I estimate that we shall get £13,500 per annum.

543. What fares have you based your estimate on? On a through fare of 2d.

544. Have you estimated for a special fare between Circular Quay and the railway station? The estimate is based on a through fare of 2d. The distance from Circular Quay to the railway station by the proposed George-street tram will be much longer than the distance from Bridge-street to the railway station by the steam tram.

545. In that case would not the George-street trams be running in competition with the Elizabeth-street tram, where the fare is 1½d. to the railway station? We should discontinue running the steam trams from the railway station—that is, the through trams. I have estimated that fully 75 per cent. of the present railway traffic would go into George-street. People want to go that way, and they will not go by steam when they can get down George-street by electric tram.

546. What further information have you to give? I do not think I can say anything more with regard the passenger traffic. I have explained how I got the information. I went into the matter very thoroughly, as a result of the count of the various 'buses. We had the 'buses counted from early morning until late at night, so that actually we got the number of passengers they carried on the up and down journeys past four different points.

547. You are prepared to say that the Committee may regard your estimate as an under-estimate? I am quite prepared to say it is an under-estimate rather than an over-estimate of the traffic.

548. Will you now give some information as to the cost per car mile as regards the Melbourne cable tram, the Ocean-street cable tram, the North Shore electric tram, and the steam trams? There are two different ways to give the figures for mileage. There is the tram mileage and there is the car mileage. In the case of some lines it is worked out on the car mile; in the case of our lines it is worked out on the tram mileage. That may mean one, two, three, or four cars. All our figures are based on the tram mileage. I have, therefore, had to reduce the Melbourne cable line to tram mileage rather than car mileage. I estimate that there are 2 cars on each Melbourne tram. The expenses of the George-street electric tram would be 9¼d. per tram mile; on the Ocean-street line it is 10¾d. per tram mile; on the North Shore electric line, according to the latest figures I could get, it is 1s. 2d. per tram mile. It is rather less than that now, because the traffic is increasing, and the expenses are decreasing. In the case of the Melbourne cable line I found, after very careful calculation, the cost to be 1s. per tram mile. The working expenses on the whole of the steam trams here is 1s. 10d. per tram mile. The George-street electric line shows the best results, the William-street cable line shows the next best results, and the Melbourne cable line comes third. In preparing the information about the Melbourne line, I did the best I could with their balance-sheet, and with certain information which is given by the chairman of the board at the annual meeting, for they do not publish returns the same as is done here.

549. Would that mean that that for the steam service—1s. 10d. would be the comparison as against 9¼d. for the electric service? Yes.

550. The same number of passengers being provided for by both services? No; not in all cases.

551. To make a fair comparison would it not be necessary to take that into consideration? No; we have had to take the number of miles run. It would work out in the ratio of 9¼d. per tram mile with vehicles carrying 120 passengers. On the steam trams the load would vary from two or three cars, and the estimate might be taken at 150 passengers. There is not a great deal of difference in that way. The

comparison

J. Kneeshaw, Esq. 25 Mar., 1896.

comparison of the working expenses as against the gross revenue on the George-street electric line would, in accordance with the estimates here, be 62·63 per cent. On the steam lines the proportion is 81·82, and that has been reduced very considerably of late years. That is about the lowest we can now get on the steam trams. On the electric tram we can get the proportion down to 62·63. Of course, as the electric system is extended we could bring that percentage of working expenses down still lower, because we are only dealing now with 3 miles 11 chains, and the cost of supervision would be about as much for that length as it would be for another length of 3 miles.

552. In estimating the expenses of the electric system, how have you obtained the information? I worked out an estimate for the traffic staff, and I obtained information from the Locomotive and Permanent-way Departments as to what their probable annual expenses would be.

553. Have you based your estimate on the cost of running in America? No; on the local cost.

554. Which would be very much higher than it is in America? Very much higher. Leaving out the question of interest, I estimated that working expenses would be £28,500, and the gross revenue £45,500, leaving a balance of £17,000 for interest.

555. In your estimate, have you distinguished the general expenses for maintenance and equipment from wages of conductors, power-station expenses, and car-station expenses? Yes; I have included all these three.

556. Will you now give the details of your estimate? The general expenses for conducting the traffic would be £11,000, the permanent-way, for maintenance and repairs, £2,500, and the motive power, including the repairs and the wages of the car-drivers, £15,000. On that basis the profit would be between 12 and 13 per cent. I feel sanguine that we shall get over 10 per cent. without any difficulty.

557. Is there any further information you wish to give? In conversation with a number of business men from time to time about this electric tramway I have found, as a rule, that the George-street business people are very favourable to its introduction, as being conducive to reducing the noise in the street. They look for this electric tram in order to get a better service. It is not really possible to do anything more under existing circumstances, because the yard in Bridge-street is so congested that it is very difficult to get an extra tram or two in sometimes. During the busy hours we often have over 100 trams in and out of the yard in one hour, and during the day the average number of trams in and out of the yard is 1,220. During a busy hour, by the time-table we have ninety trams in and out of the yard; but on holidays, or any busy Saturday when cricket matches are being played, we have from 110 to 120 trams in and out of the yard. It is really impossible to get more in and out during these times. Something will have to be done sooner or later to give other facilities, because we cannot increase the traffic from the yard.

558. You think the time has arrived when provision must be made in some streets other than Elizabeth-street for the conduct of the traffic? Yes. I think the time will come when we shall have not only a tram down George-street, but also a tram down Pitt-street. Sydney people are given to travelling. The streets of Sydney are hilly compared with the streets of Melbourne, and we find that even now the Melbourne public travel far more than do Sydney people, having the facilities to travel. I am satisfied that with tramway facilities here the people would travel much more than they do. There are thousands of people of a morning who walk from the Railway Station as far as the Cathedral or the Town Hall who, with an electric tram in George-street, would take that tram where they would not take a 'bus under present circumstances.

559. Have you taken into consideration in your estimate of the probable increase of traffic by the use of the electric system that many people who now walk between the Railway Station and the Post Office may use the tram? I have made an allowance for that, but I have not been too sanguine in my estimate. I am satisfied that they will eventually use the trams in very large numbers, particularly with a frequent service, and with nice light cars carrying a few more passengers than do the cars on the Ocean-street line. They will be induced to use the trams in the same manner as people are induced to use them in Melbourne.

560. When you speak of a quick service, what interval do you propose to have? The railway trams will run at an interval of 1 or 2 minutes throughout the day.

561. *Mr. Trickett.*] Have you had any experience in the working of electric traction in this country or elsewhere? Yes; in the working of the electric tram at North Shore.

562. What is your experience of the working of that line? My experience is that it is economical, but the system has not had a fair show, because the plant is very much out of date. It was introduced here a number of years ago, and used on an extension line between Randwick and Waverley. Modern appliances will enable the work to be done far more economically than that plant will admit of.

563. Is it liable to break down at any time? No; we have not had any breakdowns with it, beyond very slight mishaps through the carelessness of the staff, with the pole in one instance. But then it is speedily remedied. I am not aware of the system itself having broken down for some considerable time.

564. I suppose you base your estimate of the working of this electric tram in George-street on the running of electric trams in other countries? I know by the scientific papers, and the data we have of the use of tramways in other countries, they are successful there. I know there is the traffic in George-street to be conveyed.

565. In the paper which the Railway Commissioners submitted about electric trams in other countries, they say that there are a great many more passengers standing up than sitting down, that the cars are always inconveniently crowded;—do you think the passengers would like to have people standing in front of them all the time they are travelling? I do not see any reason why a certain proportion should not stand for a short distance. In many cases I find the public do it for preference. We find instances of that on the Ocean-street line, and at North Shore—on both the cable line and the electric line we find that people frequently prefer to stand on the platform to sitting inside.

566. There are no complaints of that? No; I have never heard complaints of the cable or electric tram being overcrowded. The travelling public regard the electric or cable tram as a tram, but you cannot get them away from the opinion that the steam tram is a railway, and they expect to get a seat.

567. You stated that you had spoken to a number of business people in George-street, and that they are favourable to the introduction of an electric tram;—did you explain to them that it would be necessary to erect overhead wires to carry the power through the street? Invariably in discussing the matter I have explained to these people that there would be overhead wires with central poles.

568. Did they raise any objection to that? Not the least.

569. Have you considered that the overhead wires will possibly affect the telegraph wires which are so thickly suspended along the sides of our streets? I have considered that question. I can only say that

by

J. Kneeshaw, Esq.
25 Mar., 1896.

by reading the scientific papers, I learn that they do not affect telegraph wires in any way. It was so with some of the older systems, but now that modern science has been brought to bear on the question, the overhead wires do not in any way affect either telephone wires or telegraph wires.
570. You do not think there will be any fear of that? I do not think there will be the slightest fear. If there had been, there would have been much greater difficulty in the larger cities on the Continent and in America, where there are many miles of electric traction.
571. How long have you been Superintendent of Tramways? I have been connected with the tramways directly for six months. Previous to that, I was in the Railway service here. I have been connected with railways and tramways for over twenty-two years.
572. A considerable portion of this route is of about the same width, I suppose as King-street? Yes: it is narrow at a very unimportant point just before coming to Bridge-street; but in other parts, as a rule, it is much wider than King-street.
573. I daresay you remember that when it was proposed to run a double line of tramway from the foot of King-street to the top of Ocean-street, there was a great outcry as to how the traffic would suffer? Yes.
574. What has been your experience in that respect;—have the public complained at all? My experience is that the traffic has not suffered at all, and that there have been no complaints since the line has been got into thorough working order; and with this electric tramway I am satisfied that it will be the same.
575. There will be no inconvenience to the traffic in George-street? Not the least.
576. Have there been any accidents since the cable tram began to run up King-street? The accidents with the cable tram have been very few. I have not worked out any figures, but I think I am perfectly safe in saying that the percentage of accidents on the cable tram is far less than on the steam trams.
577. Have there been many accidents of any consequence through colliding with vehicles crossing the streets, or going along the streets? There may have been some such accidents—I cannot call them to mind just now. They always will occur. There have been no special accidents; and the accidents have been very infrequent.
578. Have they been of such a number as to involve the Department in any considerable amount for compensation? Certainly not.
579. Nor has loss of life occurred except in very few instances? The only accident I remember where there was loss of life was in the case of a couple of children through their own want of care in running in front of the tram. They might just as easily have done that in front of a bus.
580. And the case of the old lady who jumped off the car the other day? Yes.
581. Have the Department considered which would be the better system—the underground conduit, or the overhead wire system? I think they have, but that is not a question which has come before me. That has been dealt with by the electrical engineer. I know from the scientific papers I have read that the conduit system is not going ahead at such a rate as the overhead wire system.
582. Can you explain how it is that the 'bus traffic especially to the eastern suburbs has developed so largely during the last year or so? It has developed by reason of the fact that the steam service is not frequent enough, and that the 'buses have cut in between the service. Not only have the 'buses done that, but they have gone into the by-streets, and practically landed the people at their own doors. Had we had a more frequent service originally, and with an opportunity of having by-lines off the main line, the 'buses would not have had a chance to cut in. To give the best service we can with the steam tram, it means a ten-minutes interval up to say Paddington, a twenty-minutes or thirty-minutes interval to Waverley, and the same to Bondi. With electric traction it would be quite possible to give perhaps a two-minutes service to Bondi Junction, and possibly a five or ten-minutes service to Waverley, without in any way increasing the cost as with the present system.
583. Do you not think the lower fare on the 'buses has had a good deal to do with the development of this traffic? No; I do not think it has had such a marked effect upon it. I think it is through being able to run at more frequent intervals. If people are standing on the street waiting for a vehicle to convey them to the city, they will take the first conveyance which comes along. And if two or three 'buses pass between the trams, they will take the 'bus.
584. Do you know whether the 'buses run more frequently than the trams? I am not aware of any instance. As a rule any information I have shows that we have a much more frequent service of 'buses than of trams.
585. That argument would apply during a certain portion of the day; but in the business portion—from 8·30 a.m. to 9·30 a.m., and from 4·30 p.m. to 6 p.m., it would not apply, because the people could go right through in the trams? It applies equally in the morning, because whilst we may have an extra tram or two running in the morning, the 'buses throw their whole weight into that morning service, and they go down a number of streets the trams do not run in, so that they really pick up the people at their own doors. More than that the 'buses run right down into Pitt-street, and land the people near their places of business. That suits a certain class who have a business in Pitt-street; others who have a business at the north end of Phillip-street will perhaps go by the trams, no matter how many 'buses may pass.
586. That will always prevail because it is proposed, I understand, to continue to take the eastern suburban traffic along Elizabeth-street? Yes; but there is no doubt that eventually if we work the whole of the western suburbs, say, from Circular Quay, an arrangement will be made to take a certain portion of the eastern suburban people into the heart of the city. But a more frequent service, I know, will improve the passenger traffic. I found that out only quite recently with regard to some slight modification we made in what we call the through trams; it had a marked effect on the traffic.
587. Is this proposal looked upon as an experiment with electric power? No; I think electricity has gone beyond the stage of experiment. I am quite satisfied that it has been tried thoroughly, and that it will be a success here. It may be only the commencement of a much greater extension of the system, and sooner or later we shall have a lot of Sydney trams worked by electricity.
588. Seeing that it is not yet decided which is the better system—the conduit or the accumulator—do you think it is wise to go in for this expensive system of overhead wires when the whole of the posts and wires will be disused and thrown aside if the accumulator system should be perfected? I do, because I think it is settled beyond all possibility of doubt that the overhead wire system is a success. At the present time the greater portion of the electric traction of the world is carried on by means of the overhead wire. It is very questionable whether the conduit system will ever be so successful. There are even railways being worked now in America at a high speed with the overhead wire. I read only recently that in some instances they were maintaining a speed of 40 miles per hour.
589. Supposing the railway is brought into the city would not that interfere very much with the earning power of this expensive tram-line? I do not think it would have much effect on the George-street line,

J. Kneeshaw, Esq. 25 Mar., 1896.

no matter where the city railway comes into the city. There is still a large local traffic in George-street, which will require some easy means of transit. I quite look forward to the time when we shall have not only a tram in George-street, but also a tram in Pitt-street.

590. How did this proposal come about to run an electric tramway along Harris-street;—is there a great traffic down Harris-street? I do not know how the proposal has originated, but I do know that there is a very large population along Harris-street and down at Ultimo. It is very thickly populated all along the line of route, particularly after passing the Technical College. There is a large number of the working class living right away down at Ultimo.

591. Is it a moving population who will be likely to use this tramway? My recollection is that it is not particularly a business street; that it is a residential suburb. It strikes me that it is a class of community that will pay to use such a line of tramway. Even at the present time, the 'buses are conveying, roughly, 1,500 persons a day from Harris-street.

592. From various parts of Harris-street into the city? Yes; that is the Pyrmont 'buses only.

593. *Mr. Wright.*] Would it pay the tramway to take that number? No; not to take that number alone. I say the 'buses are bringing that number into the city without taking into account any intermediate traffic between Regent-street and Ultimo.

594. *Mr. Trickett.*] Have you put down the number likely to be carried between Harris-street and Ultimo? I made an allowance. I consider we shall carry over and above what the 'buses are bringing, roughly speaking, 1,000 people a day between Regent-street and Pyrmont.

595. Would 2,500 passengers a day provide sufficient remuneration to justify the construction of this tramway? Yes; that would make it pay, assuming that the tram also gets a certain portion of the city traffic, and gives a better service in the city.

596. Are you going to treat it as part of a whole line from Sydney right round to Ultimo, or only as a branch line? We should treat it as a whole line. We should run trams right through.

597. You do not generally do that with branch lines? It would do much better work to treat it as a whole and run the trams right through.

598. You did not treat the Woollahra line in that way? It was treated in that way for a certain time, and eventually it was found not to pay. They ran a local tram, and that paid worse still.

599. You think the traffic you have estimated to get will be sufficient to pay the interest and working expenses? Yes; I estimate that it will pay from 12 to 13 per cent. profit.

600. I suppose that profit will be gained, assuming that all the 'buses are knocked off? No; because I have carefully left out of my estimate a very large proportion of the passenger traffic which I know the 'buses are carrying, so as not to be too sanguine.

601. You will have the 'buses to contend with the same as the other trams have, and directly you run a tram along Harris-street, I suppose the 'buses will run along parallel streets in order to get the passengers? Yes; but they cannot get such a chance of competing with the electric tram in Harris-street, because there is not such a number of parallel streets to run down.

602. *Mr. Davies.*] Did I understand you to state that the cost of the electric tram in George-street would be 9¼d. per tram mile, and that the cost of the cable line to Ocean-street is 10¾d. per tram mile? Yes.

603. You have no grades in George-street equal to the grades in the Ocean-street line? No.

604. The traction is much more expensive on the Ocean-street line than it would be on the other line? The grades do not make much difference on the cable line as far as the expense is concerned.

605. Considering that you have already proved the cable system on the Ocean-street line, and that it costs you only about 1½d. more per tram mile than it will cost you to run this electric tram in a very narrow street, would it not be better to stick to that which you know will be a certainty, and be attended with no objectionable features, such as overhead wires and posts? 1½d. per tram mile, taking 730,000 tram miles per annum, will make a marked difference. I think the difference is so great as to warrant the use of electricity in preference to the cable.

606. One is a reality, but the other is an assumption;—you have no proof of what the electric system will cost? We have the proof of what they can do in other countries. We know that there they can work electricity at a certain cost, and we know that we can do as well as they can.

607. You have tried electricity here, and it has not proved such a success? Yes; but it was introduced here several years ago. It was not a success at that time, but with the aid of modern science it is greatly improved.

608. Was the electric tram you had between Waverley and Randwick a financial success? No.

609. Was it not run at a very great loss? It was run at a loss there. It is run at a loss even at the present time. But what I wished to convey was that the electrical appliances used on that line were very out of date, and much more expensive to work relatively than the electric appliances that can be introduced at the present time.

610. Briefly, there is an improvement in electricity for the purpose of traction? A very decided difference within the last two or three years.

611. The George-street line will be similar to the North Shore line? The line at North Shore is the one we had at Waverley, with the old appliances.

612. In the case of George-street, how far apart will the posts be? Every 120 feet I understand.

613. Supposing a fire were to break out in a large five or six storey building in George-street, would it not break the circuit and stop the whole traction? No. As far as I understand it will not prevent the whole traction; it will only prevent it between certain points on either side of the fire. The same stoppage would occur now with a steam or cable tram if the firemen had to take their hoses across the track.

614. *Mr. Wright.*] You have short breaks in the circuit? Yes.

615. *Mr. Davies.*] Do you think it desirable in a narrow street like George-street to erect pillars to carry overhead wires? I believe the public will be quite satisfied with them, and that they will consider the posts ornaments.

616. You do not remember the great quantity of frieze work and posts put up by the Telegraph Department in George-street at a cost of thousands of pounds, which had to be removed? I do not remember that.

617. As the difference is so small between the cost of the cable system and the cost of the electric system, according to your own estimate, do you think it is preferable to adopt the electric system in George-street? I do.

J. Kneeshaw, Esq. 25 Mar., 1896.

618. Would it not be wiser to adopt the conduit system rather than the overhead system in that narrow street? I can hardly answer for the conduit system. It is a question for the electrical engineer to answer. I can only tell you what opinions I have formed from reading scientific papers. I think that whilst the conduit system may be very successful under certain conditions, as a rule, it is not so successful as the overhead wire system which has been tried, and proved to be absolutely successful now that we have improved appliances.
619. Can you point to one case where the conduit system has been a failure? No, not at this moment; but I have read of instances recently in which it has not proved a success. I cannot call them to mind just at this moment.
620. Where did the case you refer to occur? It was one case in an American town. I read about it in the *Street Railway Road Journal*, I believe.
621. You are aware that even your own little electric tram at North Shore has broke down several times? That is very likely.
622. And that the cars had to be drawn by horses? Yes; it is what might be termed a very old-fashioned plant now.
623. What difference will there be between the plant for this new scheme and the plant at North Shore? I cannot tell you the difference, but I know that there have been most decided improvements made in electric appliances within the last two or three years, and that the means of connecting the rails with special bonds and other improvements in the electrical machinery, have put it beyond all doubt and experiment.
624. You estimate the return from the railway tram service at £33,000 per annum; do the earnings of the steam trams to the railway station approach anything near £30,000? The earnings on the railway trams at the present time are roughly £18,000 gross per annum.
625. You expect to get double that return on this electric tram line to the Circular Quay? I think it is a very reasonable estimate.
626. If you have a tram service between the Railway Station and Bridge-street, returning £18,000 a year, how are you going to double that return by constructing an electric tramway? Because at the present time there is a tremendous lot of traffic which goes away from the Railway Station in 'buses, which never goes near the tram at all.
627. Would not a large proportion of that traffic still go away in 'buses? No; the railway traffic would not go in the 'buses at all if there was a quick service of electric trams starting from the very station.
628. Supposing the electric tram were constructed to the Railway Station, would it be necessary to extend the railway in order to carry passengers into the city? I do not know that it would be necessary. It may be that eventually the city railway will be extended to the city, but I am still of opinion that we would earn good interest on the electric tram in George-street, that there will always be a certain number of passengers who will alight at the present Railway Station; and, in addition to that, there is a very large local traffic to be done in George-street.
629. Seeing that you depend absolutely upon the local traffic to get your return of £32,000, would it be necessary to extend the railway into the city? I do not know that it would be necessary to construct the city railway.
630. If you have the tram service it would not be necessary to construct the city railway? I do not think it would be.
631. You believe the electric tram would serve all the purposes of a city railway? Yes.
632. You evidently do that because you base your calculation upon getting the whole of your income pretty well from the railway traffic? That is so.
633. *Mr. Lee.*] How many passengers do you estimate these cars will carry? I am assured that they will carry from fifty to sixty passengers each.
634. It is to be a two-minutes service? Yes; it will be more frequent probably at certain portions of the day, and it may be less frequent perhaps in the early morning and in the evening. Roughly speaking it is to be a two-minutes service.
635. To keep up that service you will require to have a very large equipment of cars? No. A round trip will be done in, I should say, from thirty to thirty-two minutes. That would mean only from sixteen to seventeen sets of cars at work—that is, one car and one motor car to form a tram.
636. You would not have more than two vehicles on a tram for a quick service? We do not want to put large trains, we want quick loading—a quick entry and a quick exit.
637. If necessary the system could be run with a two-minutes service? Without any difficulty at all.
638. I presume you will admit that to run any service requires a wonderful amount of care and organisation? Yes; but, of course, we shall have power-brakes, and light trains will be much more easily handled than the heavy steam trams. We run down here very often—I might say a quarter-minute service.
639. You will not pretend to say that it will be an over-calculation to estimate that the service will have to run every two minutes? I do not think it is an over calculation. We should start a tram from the termini every two minutes if that time is determined upon.
640. You stated that your steam trams are street railways running to a time-table service, and carrying upwards of 300 passengers? No; we never carry as many as 300 passengers, unless there is a great crowd coming away from the cricket ground.
641. You run occasionally three cars from the Railway Station;—how many passengers do they hold? The seating capacity is 210.
642. Is not the inward traffic by train very great indeed from 8 a.m. till about 9·30 a.m.? It is very heavy between those hours.
643. You frequently run three tram-cars at a time to accomodate the traffic? Yes.
644. How are you going to move that traffic in cars carrying only fifty passengers at a time? As I explained, there would be one trail car and one motor on each tram. We should start two or more trams, as the traffic required it.
645. But you have stated that it will be a two-minutes service? I explained that we would run the cars more frequently at certain hours, and less frequently during other portions of the day.
646. But you could not possibly have a perfect stream of cars, one on top of the other, right down the street. There must be some little interval of time between the running of the cars? Yes; an interval

of

J. Kneeshaw, Esq. 25 Mar., 1896.

of thirty seconds would be as much as we would require, seeing that it was a very exceptional case. It is only about three trains that arrive that will overfill more than one tram, and when they do we can start another tram in thirty seconds. That will be far better despatch than they are getting from the steam trams. We frequently keep a tram waiting for one, two, or three incoming trains, because we cannot have a more frequent tram service. We keep people who arrive by the first train back two or three minutes at times, until some other train comes in.

647. Have you considered that point? I have.

648. Do you consider it an important point in connection with the investigation? I do not see that there is any difficulty in overcoming it.

649. You are satisfied that it can be overcome? Perfectly.

650. You are satisfied that the service will carry the inward traffic without any doubt? Yes; I went into the matter very carefully when I was first informed as to what number of passengers would be conveyed on each electric tram.

651. The same inconvenience would not be likely to apply to the outward traffic? No; not to such an extent. If it came on a heavy shower of rain we might sometimes have a rush in the evening, but experience would soon teach us between certain hours to run down a few extra trams over and above the ordinary service—that is, between 8 a.m. and 9·30 a.m., and between 4 p.m. and 6 p.m. After 8 o'clock you would not want such a frequent service. You would probably want a rush of trams to meet the theatre-goers.

652. I suppose your trams run about eighteen hours a day—from 6 a.m. to midnight? Some of them start at 5 a.m.

653. You have to carry on an average 800 hundred passengers an hour to make up your estimate for the year? Roughly speaking, from 800 to 900 per hour.

654. That in itself would require a very frequent service? We could do it with a four-minutes service, and that is only half what is proposed.

655. You have told the Committee that it is the intention of the Commissioners to abandon the railway trams? Perhaps I should not have conveyed a definite expression that the railway trams would be abandoned. I believe myself that they will be abandoned. The matter has not been thoroughly discussed, nor have the Commissioners given any instructions. My impression, as tramway superintendent, is that steam trams to and from the railway station will be abandoned, and that there will not be sufficient traffic to warrant their being run.

656. Will you be prepared, after consultation with the Commissioners, to state definitely whether that is their intention or not, because it is a point of very great importance to this inquiry? I would say this now, that we should probably continue to run certain through trams in the morning and in the evening, but during the day the service would almost cease to exist, seeing that the trams from the western suburbs would more than meet all the requirements of railway passengers.

657. You stated that the earnings on the railway steam trams are £18,000 a year roughly, and you propose to get £32,000 a year by abandoning the steam trams to the railway, and confining the railway traffic to George-street. To obtain that result it will cost for construction alone £123,000; or in other words it will require an outlay of £123,000 to earn £14,000? Yes; but then there will be a very marked saving in the working of the railway steam line. The motors and cars that are saved on line will be diverted to the other lines, and utilised there.

658. I want to elicit whether the Commissioners are desirous of abandoning the existing line of transit to the railway station for the purpose of putting another line in its place? We are not abandoning it altogether, because there are a large number of trams in the western suburbs which are quite capable of doing more work. That will meet the requirements of railway passengers who want to come along Elizabeth-street. We shall save £9,000 a year by taking off the steam motors from the present railway service.

659. That is in maintenance and working? Yes.

660. But supposing the present system were converted into an overhead electric system, would not that meet the requirements of the travelling public? No; it would not meet the requirements of thousands of persons who every morning walk from the railway station along George-street, and who would be conveyed by an electric tram running down that street.

661. In other words, the Commissioners, in addition to proposing a saving of £9,000, and relieving Elizabeth-street of the railway traffic, consider it necessary, for the proper convenience of the public, that some system of tramway should be built in George-street? That is correct. I would like to put the case in another way. On the return traffic from the Circular Quay there are thousands of persons landing from the harbour boats who will not walk up the steep grade to take a tram at Bent-street, but who take other means to go down, or walk down to the more level parts of the city. There is a very large traffic to be obtained from the steamers. Then, again, every Monday very large crowds congregate on Circular Quay to see the mail steamers depart.

662. What fare have you based your calculation upon as regards the railway station? A through fare of 2d.

663. Supposing you are met with an opposition with a 1d. fare? Even then I am still satisfied that if that had to be met there would be a very large return for interest. With the existing rates I calculate that the interest would be 13 per cent., and if the fare were reduced one-half it would still give us 6½ per cent. It is quite possible that the section might be divided. The Commissioners might decide to do that later on.

664. You do not fear any opposition at a reduced rate? No.

665. You regard the electric tram service as one which will be so superior, and so convenient to the public that they will use it? Yes.

666. And in sufficient numbers to give a large return? To make it pay well.

667. Supposing an electric tram is not laid down in George-street, will not the steam tramway be sufficient to carry all the traffic to the railway for very many years to come? No; the facilities are more than taxed to their utmost. You cannot give as satisfactory a service as you desire owing to the great glut of traffic in the street. A minor accident in the street opposite to this building for two or two and a half minutes in the morning will block the trams right away back to Market-street.

668. That will continue to be the case even if you have an electric tram in George-street? No; because we shall divert a certain amount of the traffic.

669.

J. Kneeshaw, Esq. 25 Mar., 1896.

669. How many trams a day will you take off? Ninety-five each way; 190 in all.
670. You run 1,200 trams a day, so that the relief you give will be very small in proportion to the amount of traffic you do? But if electric traction is once introduced into George-street, there is very little doubt that it will soon grow and be extended.
671. Why not adopt it at once for the whole service, and get rid of this costly tram in George-street? In any case, we would still want a second terminus in the city, for with one terminus there is not sufficient room to work the traffic.
672. You reiterate that, notwithstanding what may be done to the existing route, there must be an additional route provided? We want another outlet. We cannot work the traffic as we are.
673. That is the ground you take up? I take it up very strongly, having to work the traffic.
674. No matter what may transpire in regard to the existing line in Elizabeth-street, you must have another outlet? Yes.
675. And the best thing which can be recommended is an electric tram in George-street? Yes.
676. As being preferable to the city railway? I think so. It is far less costly, it is far easier, and far cheaper to work.
677. If a general system of electric trams is carried out, do you consider that the city railway will not be necessary? I do not say that there will be no necessity for a city railway if we have a general system of electric trams. I do not see that there will be any necessity for it at present.
678. Have you considered that that means that the goods traffic will have to be conveyed on vehicles through the city for all time to come? I have not considered it very thoroughly at all. The only point of view from which I have considered it is, that even if the railway were brought into the city, we would still have a sufficiently large traffic in George-street to make that line pay well.
679. *Mr. Clarke.*] Are you aware what it will cost to form and work an electric tram from Redfern to Harris-street? No. I only know approximately what the cost of a through line would be.
680. It has been stated here that the Harris-street portion of the line will cost £30,000. If it will cost that amount, would the traffic from the Railway Station to Harris-street be sufficient to enable it to pay 10 per cent. on that sum? I have not worked out any figures on that basis. I have always assumed that we would run the trams direct from Circular Quay to Harris-street. I have looked upon these trams as giving a useful service to the city.
681. Do you think there is a sufficient number of passengers to justify the formation of that portion of the line? I do; because it is a thickly-populated locality. I have driven and walked over the locality many times.
682. Would not a large proportion of the traffic from the eastern side of Darling Harbour as far as Pyrmont utilise the ferries or the bridge instead of the trams? People do not care to use the Pyrmont Bridge, particularly foot passengers, because there is always a risk of being blocked. They would take the electric tram to run them down to their destination.
683. Would not a certain number of the working class that reside on that part of the Ultimo estate, prefer to walk rather than to pay 1d. or 2d. to ride? I do not think so, because even with a through fare of 2d., if they travel during workmen's hours, they would travel at the workmen's fare of 1d. I believe we would get them.
684. Would not this tram-line compete with the steam trams? No; it would not come into competition with the steam trams, except the railway trams, which would, most probably, be taken off, and allow a saving of £9,000 to be made. This saving I have not taken into account in connection with the working expenses of the electric tram.
685. Would not a great number of steam trams be run along Elizabeth-street to the Glebe, to Leichhardt, and to Botany? They will be run until such time as a general electric system for the western suburbs is an accomplished fact.
686. Would not the passengers which these trams would take interfere with the earnings of the electric tram? I do not think so. The electric tram would turn off at Regent-street, and the steam trams other than the railway tram, do not take up many passengers either at Regent-street or in George-street. After that point the two lines diverge.
687. It is proposed to continue running the steam trams to the eastern suburbs? Yes.
688. Would not the large number of passengers who go along Elizabeth-street in the steam trams to the eastward interfere with the earnings of the electric line? No; because in making my estimate of the passenger traffic to the Railway Station I have not included all the traffic. I have included only 75 per cent. of the existing railway traffic.
689. You are aware that there is a considerable 'bus traffic to Redfern station along George-street, as well as to all the suburbs, particularly the eastern suburbs? I have taken the 'bus traffic into consideration. It is on the account I had of that 'bus traffic that I formed my estimate.
690. Are you aware that the 'bus fare from Sydney to Randwick is 3d. and to Coogee 4d., while the tram-fare from Sydney to Coogee is 5d.? That is very likely.
691. Do you think that the electric tram in George-street will do away with the 'buses altogether? Not altogether, but it must reduce the number to a very great extent.
692. You think that the electric cars will be so convenient, and the service so frequent, that it will very likely be the means of stopping the 'buses to a certain extent? To a certain extent it will, because the electric trams will be far more popular. It will not do away with them altogether. It will absorb probably more labour than there is at present employed on the 'buses.
693. I think you stated that if an electric tramway were laid to Harris-street there would not be such a great necessity to extend the railway to Circular Quay? As I said later I had not given the question of the city railway extension so much consideration, except from this point of view, that if the city railway were made I still considered that the electric tram down George-street would earn good interest.
694. Presuming that a railway is made to Circular Quay at some time or other from Redfern, would the passengers who come from the suburbs along the railway line care to get out of the train at Redfern, and take the electric tram in George-street;—would they not prefer to go right on to the terminus? Perhaps so. At the same time there must always be an enormous local traffic in George-street that will make this tramway pay.
695. You think that the city railway extension, if it is carried out, will not interfere, to any great extent, with the George-street traffic? Not to any great extent.

J. Kneeshaw, Esq. 25 Mar., 1896.

696. *Mr. Hassall.*] In framing your estimate you depend more on the local traffic than on the suburban traffic? I depend very largely on the local traffic in George-street—that is to say, on the intermediate traffic.

697. Therefore, the argument that the railway passengers would not be likely to use this tramway would not affect your calculation to any great extent? I do not think so.

698. *Mr. Wright.*] I suppose you are not an electrician? No.

699. What experience did you have of the working of tramways before you assumed your present position? I have not had any great experience in the working of tramways except in New Zealand, where I had to inspect them on several occasions for the Railway Commissioners. I have seen a number of tramways worked in nearly all the towns of New Zealand.

700. Was your railway experience gained in New Zealand? In New Zealand and in the colonies.

701. In reply to Mr. Hassall, you said that your calculation of the George-street traffic was based on the local traffic primarily, assisted by the present railway traffic? The local traffic was taken very largely into consideration in making my calculation.

702. Where did you get your data from of your local traffic, or how did you get it? By stationing men at various corners, counting the passengers in the 'buses, and watching them alight, and forming estimates of the passengers that only travelled for a certain distance.

703. I assume that you had a man at the corner of King-street;—supposing a 'bus were coming in with twenty passengers, was he capable of discerning what number of the passengers was picked up in George-street, and what number was carried in from the suburbs? He could get a very fair estimate. I had another means of making an estimate. If, on the Ocean-street line, where we have a comparatively thin population, as compared with the traffic in George-street and Harris-street, we can get 4,000,000 passengers per annum, and with only about the same length of line, we can fairly expect 7,300,000 passengers in George-street.

704. The eastern suburbs—Rushcutter's Bay, Darling Point, and Potts' Point—are sites worth seeing in Sydney, and is it not quite possible that a great proportion of your passengers are mere casual visitors? No; not to that extent. The passengers travelling on that line are residents.

705. Do you not think that almost every man or every person that visits Sydney makes it a point to go out as far as Darling Point to see that aristocratic suburb and its beautiful buildings? That is not my experience. My experience is that when people come to Sydney, as a rule they go down the harbour.

706. You stated to Mr. Lee that the 'bus traffic along Harris-street is about 1,500 passengers per day;—do you expect to increase that traffic with the electric tram to 2,500 passengers per day? Yes; because I take it that we would most probably have a section.

707. You expect that traffic to be very nearly doubled by virtue of the introduction of the electric tram? We do.

708. Do you expect to knock off the 'buses coming in from Balmain, Drummoyne, and Ryde, and to acquire all that traffic? They would probably not knock off coming from Drummoyne and Ryde.

709. You would still have to meet the competition from the local traffic in Harris-street? I do not look upon it as competition. I am perfectly satisfied that with a quick service passengers will travel by the electric trams.

710. You stated that a great number of persons walk from the railway station in preference to riding? Considerably more persons walk from the station than go in the 'buses and trams.

711. Is it not a fact that the great majority of these passengers are gentlemen who, following sedentary occupations, walk down from the station for the sake of the exercise, and that no matter what conveniences you may provide, hundreds of persons will still walk to and from the station? I do not think so. Even in wet weather these people walk.

712. They walk because their business takes them down George-street;—do not you think that a number of these persons walk for the sake of getting a constitutional? A few do, but they are not a large number, all things considered.

713. Notwithstanding the fact that the steam trams running along Elizabeth-street will drop the people at every cross street, and that a line of well-appointed 'buses will run along George-street, you think that if an electric tram were laid down in George-street the greater proportion of these people would ride down George-street in that tram? Not the greater proportion, but a much larger proportion than there is now. If we got the great proportion it would pay much better than I have estimated.

714. Supposing that the present steam service to the railway is done away with, and that this electric tram is laid down, your annual returns will be reduced on the one hand by the earnings on the steam service to the railway, and reduced on the other hand by the expenditure on that service? It may be that the returns from the steam tramways would show a slight reduction by the diversion of the railway passengers to the electric trams.

715. You would lose all the profit you now make on the railway trams? Yes.

716. You told Mr. Lee that the electric cars would carry about fifty passengers each;—what staff would you attach to each car? A motor-driver and a conductor.

717. As you propose to give a two-minutes service as against a ten-minutes service, can you state what the cost in wages would be with the new system as against the cost with the present system? I could not answer the question right away.

718. Am I right in assuming that it would be necessary to employ a much larger number of men with a two-minutes service? Yes.

719. Consequently, your expenses would be correspondingly increased? We would want to employ a much larger number of men for this frequent service, and allowance has been made for that in the estimate.

720. After making these allowances for the increased staff, you still think that the line will return 12 per cent.? Thirteen per cent. on £123,000.

721. The Commissioners propose an additional expenditure of £7,000 in order to take the line along Circular Quay? That would reduce my estimate to 12 per cent.

722. Have you spent many years in making estimates of this kind? Yes; I have had a good deal to do with them at various times.

723. I presume you consider yourself competent to form a fair approximate estimate? I do. I have given a lot of study to this question.

J. Kneeshaw, Esq.
25 Mar., 1896.

724. Do you think that in a narrow street like George-street, at some points only 36 feet wide, a double line of electric trams, with possibly a double line of vehicles on either side of the street, unloading or loading goods, will not offer very serious impediment to the traffic; in fact, block the traffic altogether? No. I consider that the traffic will be much more easily conducted with electric traction in the street, and a certain reduction in the number of 'buses, than it is now.
725. Have you estimated what percentage of the vehicular traffic would be saved in George-street by the introduction of the electric tramway? No.
726. Take the 'buses alone? I have not worked that out.
727. I find that there are as many as 186 'buses plying in George-street independent of the railway 'buses? I made the number 171.
728. These 'buses will all continue to run, I suppose? They will only continue to run for a time, because eventually as the electric system is extended people will get on the electric tram here, and be taken through to the western suburbs.
729. Do you think that men living at Newtown, St. Peter's, Arncliffe, or Marrickville, while they can ride to Sydney in a 'bus for 3d., will get off the 'bus at the railway station, and pay you 2d. to run them down George-street in your electric tram? It will probably enable the Railway Commissioners to completely revise and reduce the present tram fares by bringing in a more economical system of traction.
730. I assume, as both you and Mr. McLachlan have stated, that the fare on the George-street tram will be 2d.; in view of that fact, do you think it is likely that men who can travel by 'bus a distance of 7 miles to the Circular Quay for 3d. will get off their 'bus at Redfern and pay you 2d. to carry them down George-street? Perhaps not in the way you put it. At the present time we will not get the whole proportion.
731. Therefore, the whole of these 171 'buses will continue to run along George-street? Not the whole of them. Some of them will cease to run.
732. The 'buses ran you off the Woollahra line—they are gradually running you off every tram-line in the suburbs? I am afraid they will continue to do so as long as we have steam trams.
733. What chance is there of the number of the 'buses in George-street being reduced while that steam service to the suburbs continues to exist? I think that the number will be reduced. I think that a large number of persons will take the electric tram along to Regent-street. It may lead to a total revision of 'bus routes. Passengers will go down on the electric tram, because they like it. The 'buses may probably start from Regent-street instead of from Circular Quay.
734. In answer to my question whether there was any reasonable hope of your being able to knock off the 'bus competition in the suburbs, you said, "No, as long as you had the steam trams"? Not so much in the suburbs; but we shall compete against the 'buses in the city.
735. From St. Peters you have not only a tram service, but a railway service; but, nevertheless, the 'buses from that place are competing—and multiplying in number—with your trams;—in view of the fact that these 'buses bring persons to Circular Quay for less than what you charge either by rail or tram, almost more quickly than by tram, and almost as quickly as by rail, do you think that these passengers will get off the 'buses at Redfern Station and pay you 2d. to carry them along George-street? No, not from those far distant suburbs.
736. Then I do not see how you are going to very largely diminish the 'bus traffic unless by knocking off the railway 'buses? We will knock off the railway 'buses. Some of the others must come off. And when we have electric traction down George-street, the question of fares will most certainly be considered, and probably by some simple arrangement of an overlapping section between Regent-street and Newtown Road junction we can meet the whole difficulty as regards the 'bus fares, and enter into a successful competition.
737. If such a thing is probable, would it not be advisable to put this Committee in possession of the facts by pointing out, as one inducement, why we should consent to this proposal, that you intend to relieve the streets of the enormous amount of traffic? I am fully of opinion that we shall relieve the streets of a large proportion of the 'bus traffic. It may not be in the first month or two; but eventually the 'bus traffic will be taken out of George-street. It will be very greatly reduced.
738. Will you furnish the Committee with a return of the number of drivers, firemen, and conductors employed in the steam service to the Railway station, and the number you contemplate employing in the electric service to the Railway station? I will.
739. Who is responsible for the construction of the electric tram at North Shore and the accumulator car that was run? Mr. Downe has charge of the power-house, but Mr. Elwell is the engineer in charge of the electric portion of the plant.
740. I suppose the whole of the work was done under his supervision and direction? I think it was.
741. Was he the constructor of the accumulator car that was run? Yes.
742. What was your experience of that car? I did not see much of its running. My experience was that it was too heavy, and it did not give such good results as might be anticipated. It was an experiment.
743. Mr. Lee elicited that 210 railway passengers at times wanted to be conveyed in one tram from the railway station, and that to convey this number you require to use three steam tram cars, but that an electric car will only carry from fifty to sixty passengers, and in answer to that objection I understood you to say that in that case you would have to break the two-minutes service and run two or three cars together;—is that the answer you gave? Yes; in this way—that the greatest load we can take from the railway station under existing circumstances with a steam tram is three cars, equal to carry 210 passengers, and that with the electric tram we can take a motor car and a trail car, equal to from 110 to 120 passengers. We can run two of these at an interval of fifteen or twenty seconds.
744. How are you going to provide for taking the cars into the station every half minute;—will not that necessarily disarrange your whole service at once? No.
745. If you propose to run a two-minutes service from one end, how can you possibly arrange to run a fifteen-seconds service from the other? Because, as the railway station is a terminus I can keep two or more trams standing there to be worked into a special service if I want them. I should be prepared to meet the busy traffic. I would have a reserve of cars at either end.
746. I presume that whenever you introduce a fifteen-seconds service from the railway station these cars will be cut off at the Circular Quay? We will shunt them at Circular Quay.

747.

J. Kneeshaw, Esq. 25 Mar., 1896.

747. Can you explain why it is that Sydney is the only city in the world with an expensive system of tramway service, in the hands of one firm, which cannot successfully compete with the 'buses? Because we have an expensive system of street railways, which do not meet the more modern requirements, because these street railways are not run down into the best streets of the city; because, as they are street railways, we cannot give that frequency of service which the public require; and again, it is due to the contour of the city of Sydney.

748. The service to the railway station is a ten-minutes service? It is not an even ten-minutes service. The trams run to connect with certain trains. At times we may run a five-minutes service, and at other times it may be a fifteen-minutes or ten-minutes service. We run to connect with all the principal trains.

749. With a tram service running to meet all the principal trains, and with a steam tram running past the Railway Station to Redfern, Leichhardt, Newtown, Glebe, Balmain and Forest Lodge; in view of that extraordinary amount of traffic, how is it that thirty-four 'buses can be successfully employed in running to and from the Railway? Because these 'buses bring their passengers from George-street, where the greatest bulk of the passenger traffic has to come from, and because our trams are run down Elizabeth-street, where there is really no business house or population on one side of the street—nothing but a park.

750. That is a good reason, but it must be remembered that a great number of the passengers do not do business in George-street. It is now almost a retail street. The commercial houses are nearer your tram service than in George-street. The great wool houses and the Government offices, in which a great staff of clerks and other people are employed, and the great proportion of the banks are quite as near your tram service as George-street. Nearly all the legal fraternity, who must number some hundreds, are much nearer your steam service? It must be remembered that to get on to the steam tram all the people you refer to have to walk up hill, but when they go into George-street they go down hill. That is one inducement for them to go into George-street; and frequently, when people leave their offices, they want to go into the principal street in the city to do some shopping, and there they find themselves alongside the 'buses, which they take.

THURSDAY, 26 *MARCH*, 1896.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

The Hon. JOHN DAVIES, C.M.G.	CHARLES ALFRED LEE, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	THOMAS HENRY HASSALL, Esq.
HENRY CLARKE, Esq.	FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Electric Tramway from the Circular Quay, Sydney, to the Redfern Railway Station; and also along Harris-street, to the intersection of John-street.

John Musson, Esq., civil engineer, sworn, and examined:—

J. Musson, Esq. 26 Mar., 1896.

751. *Vice-Chairman.*] You are a civil engineer, and you desire to make a statement to the Committee in connection with the proposed electric tramway from Circular Quay to Harris-street via George-street? I wish to submit a statement relative to the route proposed for the electric tram lines:—

I venture to state that the Commissioners have not given sufficient consideration to the heavy traffic, which will be heavier in the future in the neighbourhood of the Exchange, which includes the large shipping and mercantile offices and the Government Departments. All the 'buses from the eastern suburbs and down Pitt-street pass through this locality, as well as the greater portion of the ferry passengers, and being the shortest route, this traffic will continue.

Possibly wanting the above information the Construction Branch of the Railways have proposed the longer route via Lower George-street to Circular Quay, which certainly will not benefit the locality referred to, and the traffic therefrom will be lost to the Department. The public will be inconvenienced. Considering the good roads in the city, and cheap fodder, the 'buses successfully compete with the trams.

The route I suggested is the shortest and most direct route and, a very important consideration, it can easily and economically be connected with the existing tram-line, and form a circle railway, and it will also connect the present line with Circular Quay. Wanting that facility now is no doubt a very heavy loss to the Department, as the 'buses discharge their passengers within a few paces of the steamers from the furthest suburbs for 2d. fare.

The very able and exhaustive report of Mr. Engineer Deane, gathered from personal observation in Europe and America, is of great value to New South Wales.

The route I propose is to leave George-street at Bridge-street (instead of Lower George-street), and thence down Bridge-street to and over Macquarie-place to Circular Quay, moving round a circle at Circular Quay, without any shunting on the return journey. This route is about 10 chains shorter than that proposed by the Department.

I also suggest that this line should connect, via Bridge-street, with the existing steam-motor line at corner of Phillip and Bridge Streets. It may be necessary to take a small slice of the vacant ground at that corner, which is Government property. The line could also shunt off into the motor-yard. The grade is a little heavy. The elevation above high-water line is about 55 feet. This extension would enable the present trams to go to Circular Quay, via Macquarie-place. There are no engineering difficulties in the way. It would also enable the proposed electric line during construction to be worked by steam motor, and when completed in case of emergency.

An alternate route from Macquarie-place to Phillip-street would be via Bent-street, taking a slice of the Educational Department ground, and possibly a small slice of the Union Club ground. The elevation here is about 75 feet above high-water line. The distance from Macquarie-place, via Bridge-street, is about 10 or 12 chains, which is about the distance saved if my route is adopted from George-street.

Should your Committee approve, the Department might think proper to reconsider the entire route to Miller's Point, and instead of going via Dawes' Point, adopt a Kent-street route, leaving George-street at and proceeding up Charlotte-place (if the grade permits) or to run into and along Clarence-street to King-street, thus capturing the Darling Harbour and ferry traffic.

In adopting the Kent-street route, the Department might receive the coke they use direct from the Gas-works, and convey it in their own tip-trucks to the different tram yards. I think the saving would be considerable. Coke could also be conveyed in both cases by night as freight to the distant suburbs.

Another and important item would be the carriage of the wool by tram from Darling Harbour to Circular Quay at early morning or night. For that purpose a branch line from the George-street line could be taken to Darling Harbour.

I forgot to mention that in adopting the route I propose, ferry passengers to North Shore could be secured, provided the tram fare was 1d.

The saving in working expenses would be considerable. The proposed route is marked on dotted line on the map.

A new tram-yard could be found—possibly the reserve in Macquarie-place. The ground now used for that purpose would in value, I think, pay for resumed land in Hunter and Bligh Streets.

J. Musson, Esq.
26 Mar., 1896.

752. *Mr. Davies.*] Do you desire to supplement your statement? I think not.
753. You have put your whole case in the statement? Pretty well; it requires some explanation.
754. The only difference of opinion between yourself and the Department is the deviation from George-street, via Bridge-street to Macquarie-place, following the route of the 'buses? As far as the plan shows, I think that is all, except any further extensions I suggest going up Charlotte-place, via Kent-street to Miller's Point.
755. That is not included in your present proposal? No.
756. Do you propose to use the accumulator system or the overhead system for this scheme? I did not touch at all on the working of the system.
757. But you are competent to express an opinion upon that point? The overhead system is, in my opinion, the best system.
758. As it is suggested by the Department? I have carefully read Mr. Deane's report, and I have read many other papers on the subject, and I am certainly of that opinion. It is the most favoured system throughout the world.
759. Do you know of any case where the accumulator system has failed, where it has been used as a motive-power for a tramway? I cannot recollect any particular case. The fact is that I adopted the system as proposed.
760. And the only change you would suggest in the Departmental system is the deviation, and that it should be so constructed as to enable you to have a sort of circular tram? Yes.
761. With a circular tram service taking in the steam as well as the electric tram? Yes.
762. The traction would be over the same rails by the same route as the electric tram? Yes; but in the event of anything happening to the electric line everything is stopped, whereas you can put a steam motor on the line at once.
763. Do you think it is desirable to have overhead wires erected on poles in a narrow street like George-street? I do not see how it can be avoided, unless by means of an elevated tram road.
764. Would not the accumulator system dispense with the necessity for that? I do not think it is as good as the electrical overhead system.
765. Would not the accumulator system provide a fair service free from obstruction to vehicular traffic? The general opinion is in favour of the overhead system.
766. And that is your opinion? Yes; I have had no practical experience of the working of electric trams.
767. The only change you would suggest would be the deviation you indicate on this tracing? Yes; and the extension of the existing line from Phillip-street down Bridge-street. That would enable the existing line to get to Circular Quay, which is a very great consideration.
768. Practically, that covers the whole of your representation? Yes.
769. *Mr. Hassall.*] I believe you gave evidence with reference to the proposal to construct a cable tramway down George-street? I proposed an elevated road worked by any system.
770. I believe you suggested some deviation of the route into York-street and down to Charlotte-place? I really forget. It was the elevated road I suggested then. I am still very much in favour of having an elevated tram in crowded parts.
771. But on that occasion you thought it would be better to take the tramway over the market reserve to York-street, and run along that street into Wynyard-square and Charlotte-place? Yes; the idea was to avoid the narrow and busy part of George-street, if I recollect aright.
772. On this occasion you suggest going down George-street and getting away up towards Elizabeth-street? That is the Departmental plan. I only suggest a deviation at Bridge-street. I did not suggest the George-street plan, but I do not think you can have a better plan running down than the one running down George-street.
773. I suppose you are aware that the intention is to lay down a double line, and to confine the whole of the system to one street as much as practicable? Yes. It appears to work so very satisfactorily in King-street that the theoretical objections I expressed before are to a great extent removed. And Mr. Deane's report as to the electrical overhead system is very satisfactory.
774. Your only object in coming here to-day is to point out that, in your opinion, instead of going right down George-street, it would be better to deviate through Bridge-street and Macquarie-place on to Circular Quay? Yes; and to extend a line to join the existing line.
775. What benefit would that be? It would enable the existing line to take passengers down to Circular Quay, which is a very great consideration. As regards the suburbs, I may speak on behalf of my own family. Whenever they want to take an outing on the water they take an omnibus, although we are close to the tram.
776. A tramway down George-street to Circular Quay would obviate all that difficulty? Yes; but still you want it from two points to do that. You have two lines, and both might do it. Again, if this line connects with the new line, it can easily be done to work on the circular system.
777. Do you not think the gradients are rather steep to get down to Circular Quay with a steam motor;—do you not think that there would be some great difficulty in making a connection with the terminus here at Phillip-street? None whatever. You could take a slice of the vacant ground at the corner of Bridge-street. It is rather stiff—it would be better if it were not so stiff, but still it could be easily done. There are heavier pinches than that on the lines.
778. Where? There is one going to Balmain, and, I think, in Elizabeth-street the grade is about the same as it is in Bridge-street. Bridge-street, I take it, is about 1 in 16 or 17. Another route I would suggest is to take it about the corner of Bent-street and Phillip-street, which is 75 feet above high-water line.
779. Pretty stiff gradients to overcome? It is stiff, but still it may be overcome, and especially by taking a slice of the Union Club ground.
780. Do not you think that persons residing about Miller's Point, and on the western side of Circular Quay have as much right to be considered, as regards tramway facilities, as the people who are now served by the tramways to this terminus? They would be served in just the same way. They would come from Miller's Point and Lower George-street, and there would be doubtless a branch line down there.
781. If an electric tram is laid down, according to the Departmental plan, it will be much nearer to the residents of Miller's Point and of that locality? Yes; but Miller's Point is but a very small unit of the whole. It would be shorter by way of the Argyle Cut.

782.

J. Musson, Esq. 26 Mar., 1896.

782. You admit that they have no tramway there? Yes.
783. They have a tramway down Elizabeth-street which serves the city and suburbs? Yes.
784. So they are fairly well served? Yes.
785. You want to bring the other tram round to them to give them increased accommodation? No. I also propose that they should be served by Kent-street.
786. By another tram altogether? Yes; by a single line.
787. It would be all the better, I admit, if we had a tramway in every street, but there is the expense to be considered? The expense would not be greater in going round Dawes' Point.
788. *Mr. Wright.*] Have you any idea of the cost of your proposed deviation? The cost of the deviation certainly will not be greater than the cost of the other. It will be less, because it will be 10 chains shorter.
789. According to this plan the distance seems rather longer? No; it is about 10 chains less.
790. What special benefit will be served by that deviation? The Exchange traffic will not be served by the new tram.
791. But the traffic from Circular Quay, from which the bulk of the traffic would be derived, will be served by the electric tram, and it is only a comparatively short distance from the Exchange to George-street? The distance is about 10 chains. That part would be left out altogether. The line can still extend down George-street.
792. Is there anything more in your proposal than a desire on your part to be original, and to strike out a path different from that suggested by the Department? I beg your pardon. I think it is a better plan. It is no benefit whatever to me.
793. I see nothing to be gained in this proposal. You propose no gain unless it is a desire to be original, and to have a separate scheme from the Departmental one? I beg your pardon. It is more direct, and it is shorter.

Harry Beauchamp Lassetter, Esq. (Messrs. F. Lassetter & Co., Ltd.), sworn, and examined:—

H. B. Lassetter, Esq. 26 Mar., 1896.

794. *Vice-Chairman.*] You are one of the managing directors of the firm of F. Lassetter & Co. (Ltd.)? I am deputy-chairman.
795. Your senior expressed a desire to give evidence with reference to this proposal, having, on a previous occasion, appeared as a witness in opposition to a proposal to construct a cable tram in George-street, and I understand he has, unfortunately, been obliged to go away? He has gone to Europe.
796. You are prepared to give expression to the opinions which you know he entertained in regard to the present proposal? Yes.
797. *Mr. Lee.*] You are aware that it is intended to put down a double line of electric tramway from Circular Quay to Redfern Station, and to Harris-street? I do not know anything about Harris-street.
798. You desire, I suppose, to give evidence as to the effect it would have upon the business in George-street? And also as to its convenience to the public.
799. Will you state your views to the Committee? I think from the point of view of the public convenience a tram is very much preferable to a 'bus. George-street, for private traffic, is now almost impassable, for there are so many lines of 'buses running at various speeds, and heavy carts blocking the traffic. I think the trams would take away the 'buses and make George-street better than it is now.
800. You are aware that a number of the 'buses now running through George-street come from some of the remote suburbs which are not touched by the tram-line, and which will not be touched by this electric tramway, therefore, the inference is that these 'buses will continue to travel through George-street if this tramway is made? But I think the principal traffic on the 'buses is from the railway station. I refer to the four-horse 'buses.
801. These 'buses would only form a small proportion of the 'bus traffic? The others come, I believe, from the western suburbs—from Darlington. It is proposed eventually, I understand, to bring all the traffic from the western suburbs along George-street. That will take away all the western 'buses.
802. You think it would be a desirable thing to get rid of some of the 'buses? I am sure it would.
803. Have you noticed that of late years the 'bus traffic has increased very much? Yes; the number of 'buses is very great now.
804. Do you find that it interferes with business generally to have this traffic in the street? I do not think the general public use the 'buses. It is mostly in the morning and in the evening that the 'buses are run to convey to and from the city the clerks and other people in employment here.
805. But there is a continual stream of 'buses running along the street? Yes.
806. I presume it is the construction of the 'buses and the failure of the wood-blocking which make the 'buses such an intolerable nuisance? An intolerable nuisance. In some cases it is almost impossible to conduct business. Opposite to our premises we have a new pavement laid close together, but I notice very little improvement on the old system, as far as the noise of the traffic goes. If you have your window open you have to talk very loudly.
807. For that reason alone, you think that some steps should be taken to ameliorate that state of things? Yes, I think that a tramway along a street directs the traffic of that street. If you are driving along George-street you will see very few of the 'buses keeping close to the kerb, that very often the 'buses and even the hansoms and the carriages keep out in the middle of the street. The traffic in George-street is not properly conducted as it is in the narrow streets in other large cities where it is continuous. The various speeds of the different classes of vehicles interfere with the traffic, whereas with a tram-line they must keep close to the kerb. I think a tramway directs the traffic rather than impedes it. For instance, it is far easier, I think, to drive along William-street since the cable tram has been laid than it used to be, because people must keep to the proper side of the road.
808. Is the delivery of goods to the warehouses in George-street made very largely from that street, or is it made from York-street? It all depends upon the depth of the premises. If the business premises go right through to York-street the delivery of goods takes place in York-street. I think most of the large firms have entrances in York-street—Brush and Son, Briscoe, Drysdale, & Co., and our firm have an entrance in York-street. There are only the smaller shops, as far as I know, which have no back entrance.
809. *Mr. Wright.*] That is between King and Market Streets only? Yes; that is as far as I can speak about. I think some of the houses facing the markets have a back entrance, but I cannot speak of my own knowledge.

H. B. Lassetter, Esq.
26 Mar., 1896.

810. *Mr. Lee.*] These are all large firms, necessitating the daily employment of heavy teams? Not the daily employment, but as the ships come in.
811. This delivery of heavy goods goes on nearly every day? It varies according as the ships come in. There are various seasons.
812. Would not that be an obstruction to tram traffic in a narrow street like George-street? I do not think it would be as much an obstruction as the 'buses.
813. You seem to hold that the usefulness and convenience of the tramway would be the means of driving a certain number of 'buses out of the street? Yes. When my father gave his evidence five years ago he was very much opposed to the introduction of a tramway of any kind. He had had no experience of tramways, except horse tramways, in the street, and he has spoken only, I think, of his experience of many years ago when they had a tramway in Pitt-street. Since that time he has travelled in Europe, and seen the different systems, and he sees that it does not impede the traffic at all.
814. I think that on that occasion Mr. Frederic Lassetter was of opinion that the tramway would be a great convenience, and would not injure people, but he thought it might be a source of danger? I think so; but he had no great practical experience of these tramways. He had not seen the system properly working as it is now worked in Europe and London.
815. Has he altered his opinion? Entirely.
816. Was he prepared to swear that that was his present opinion? He came here the other day for that purpose.
817. Your firm offer no objection to this proposal? None at all.
818. I suppose you are not prepared to speak on behalf of others? Yes. Here is a paper which I sent out to-day at ten minutes to 1 o'clock to be signed. It is to this effect:—"We, the undersigned ratepayers, having premises in George-street, are in favour of an electric tramway being laid from Redfern Station to the Circular Quay, *via* George-street." It has been signed by some firms.
819. Will you state the names of the firms who have signed the paper? Lassetter & Co.; Cowles and Dunn; Eastway Brothers; Bosch, Bartlett, & Co. (none of these last three firms have entrances into York-street); Brush and Son; Bennett and Wood; Standard Paint Company; Beard, Watson, & Co.; W. H. Glenn and Son; W. Walker, Sons, and Bartholomew; Gray Brothers; C. T. Priddy & Co.; J. Bennett & Co.; Gowing Brothers; M'Lean Bros. and Rigg; S. J. Hayward; J. B. Brady; and Farmer & Co.
820. Farmer & Co. have an entrance from George-street? Their goods entrance is in George-street. This circular was sent out at ten minutes to 1 o'clock to-day, when most of the people were away at luncheon. We could have collected many more names if we had had time.
821. From what you have seen of street traction in the various cities of Europe, how do you think it compares with the state of Sydney streets—as regards the width of the street and the order of the traffic? I think the traffic in George-street is very great. It compares with most of the large leading cities like Birmingham or Manchester. In Manchester the streets are wider. There are very few private carriages, and very few cabs in that city, and most of the traffic is done by horse trams. The rest of the traffic in the streets is heavy drays. It is some years since I was in Manchester. In Birmingham I have seen steam tram and horse tram. The traffic in that city is very large, but the trams do not interfere with the working of the ordinary traffic. In Sydney you see very few private carriages with ladies shopping as you do in London. There are very few carriages in the streets here in the day-time.
822. But there is an enormous number of public vehicles in the streets of Sydney? A tremendous number.
823. And an enormous number of drays and lorries? A great many drays; but these could go in other streets than George-street.
824. It is caused a good deal by the fact that the railway depôt is at the southern end of the city, and the fact that the water frontage is at the other end of the city influences the dray traffic? That is so. But I think drays could use any other street than George-street.
825. You think it would be an easy matter to divert that traffic into one of the by-streets? Yes; it could be diverted at the Town Hall along York-street.
826. That is done in other cities in the world? Yes.
827. The congested state of the traffic in George-street has been almost the work of the last twenty years? I can only speak of the last seven or eight years.
828. If it is necessary in your opinion to have a tram system to convey the public, do you think the traffic is likely to increase in such proportion during the next twenty years that the trams may become a positive obstruction to the traffic? I think things are improving every day. The traffic is increasing every day in the street. The 'bus traffic is mostly between 8 a.m. and 9 a.m., and from 5 p.m. to 6·30 p.m. The trams would carry all that traffic.
829. With a two minutes service there would be a continuous line of tram-cars going along the street in each direction;—would not that be a serious obstruction to ordinary heavy traffic which might want to cross the road? I do not think so, if the traffic was properly organised. In large cities policemen direct the traffic, and insist upon people keeping to the right side of the road, and close to the pavement; but here people are allowed to drive as they like and where they like.
830. Are you aware that it is proposed to erect a centre pole in the street with a double arm? I think that would be a most excellent thing. It would keep the traffic to its proper side of the road. The traffic certainly wants to be directed, whether we have a tramway or not.
831. A tramway, you think, would go a large way towards directing the traffic? I have driven in a good many streets, and I think George-street is the most difficult one I have ever had to drive in. In the wide part of the street, down below Brickfield Hill, it seems to be harder still to drive, because the wider the street the more the people spread out.
832. You are not aware of any valid objection which could be offered against this proposal? No, I have none at all.
833. Your own opinion is very strongly in favour of it? Very strongly.
834. You appear to be supported by the other merchants in the street? I could get more names if desired. These are the names of only a few persons just round about where we carry on our business.
835. *Mr. Clarke.*] You think that a double line of tramway in George-street would not interfere with the traffic to a great extent, or be injurious to the public, or dangerous to drays or vehicles? I do.
836. Many persons in George-street who have not a back entrance like your firm has would have to load their goods in that street? Yes.

H. B. Lassetter, Esq.

26 Mar., 1896.

837. With a two-minutes tram service, it would be necessary sometimes, I presume, to cross from one side of the street to the other? Yes.
838. Would not that be a difficult thing to do? I do not think it would be any more difficult than it is now. Take Cheapside, where there is a continuous stream of buses and cabs all day long, and with little side streets going off, and the cross traffic. There is no difficulty there.
839. You think that there will be no inconvenience caused by the tram in that respect? None at all.
840. Have you seen the working of the conduit system in the old country, or on the continent? No; I can give no scientific opinion on the working of that system.
841. *Mr. Hassall.*] Have you had any experience of the traffic in Oxford-street? I have been along that street repeatedly.
842. Have you noticed that between 8 a.m. and 9 a.m., and between 5 p.m. and 6 p.m. it is very heavy? I have never been there during those times. I have only been there between 10 a.m. and 4 p.m. I have never been through the street in the early morning.
843. You have not been in the street when the traffic is heaviest? Never.
844. Oxford-street would be as wide as George-street? A little narrower from College-street to Darlinghurst.
845. Do you not think a double line of trams in George-street would to a great extent interfere with the vehicular traffic? I think it would be far less inconvenient than the present system, because it would direct the traffic. If the traffic were properly conducted George-street could carry a great deal more vehicles than it does. The people pull out into the middle of the street—they do not keep to the sides.
846. The traffic could be regulated at any time, tram or no tram? Yes; it ought to be regulated now. I think the street is a disgrace.
847. On the easel you will see a plan of George-street, showing two electric tram-cars in the centre of the street, in front of the Post Office, a total width of 43 feet from kerb to kerb, and 12 feet from kerb to tram-car on either side;—do you think a strip 12 feet wide is sufficient to carry all the traffic up or down George-street in the busy portion of the day? Of course, the tram-cars will not be there all the time.
848. Practically, the tram-cars will be running all the time, and you will have to look out for them. Supposing that they do run every two minutes? I do not think there would be any difficulty in arranging the traffic. I certainly think that drays should not be allowed to go along the street.
849. Is not George-street one of the principal business thoroughfares in the city? George-street and Pitt-street.
850. These are the streets in which people—carriage people principally—do their shopping? I am sorry to say that there are not many people who keep carriages now-a-days. I do not think there will be any objection to the proposal.
851. A great majority of the large stores, having no back entrance, are compelled to take in their goods over the footpath? Yes.
852. You have seen drays backed up against the path, with the horse's head right out in the middle of the street? I do not see that very often in George-street.
853. Have you any idea how many licensed 'buses are plying in George-street? No.
854. I suppose you would not be surprised to hear that about a couple of years ago 185 licensed 'buses were plying in the street? I had no idea that there were so many.
855. These 'buses average eight trips per day, which means that they pass a given point sixteen times a day each; and the evidence taken with reference to the cable tram proposal was that these 'buses passed a given point—say, the Town Hall—about 3,000 times in one day? Tremendous.
856. That is quite irrespective of cabs;—do not you think the requirements of the people are fairly well met when they have a 'bus passing every few minutes? I think a great many persons object to travelling in a 'bus, because it is a very uncomfortable means of conveyance, and is not to be compared with trams at all.
857. How do you account for the fact that the 'buses are competing successfully with the trams from the various suburbs around Sydney? I am not aware of that.
858. And for the fact that they are well patronised, and in fact able to run passengers at a lower rate than the trams do? Not from Ocean-street to King-street. On that route the 'buses used to run every 3 minutes, but now they run, I think, every quarter of an hour.
859. That would be alongside the cable tram? I can quite understand that the steam trams are wretched things to travel in. But if you had comfortable cars on a cable tram you would find that the people would patronise them, and that the 'buses would not be able to compete with them.
860. Do not you remember that the 'buses ran off the steam trams to Woollahra? Yes. Steam trams are very unpleasant to ride in. The Woollahra tram was run off by the cable tram. Directly the cable tram was started people left the steam tram to come to Ocean-street. They used to walk down the hill to catch the cable tram, although it was further for them to go, because they preferred that mode of conveyance.
861. They prefer the cable tram to the steam tram; but it was the 'buses which knocked the steam tram off? I think it was the cable tram.
862. Does it not seem rather strange that the 'buses are still able to compete successfully with the trams? I do not think it is, because I would sooner travel in a 'bus than in a steam tram, where the cars are very uncomfortable. I use the cable tram a great deal myself every day.
863. Have you seen the electric tram working in any part of the world? No, except at Marseilles; and then I did not take very much notice of it.
864. I suppose, like the ordinary tourist, you did not take any particular interest in the electric tram there? No. If the working of the electric tram is as good as the working of the cable tram I should certainly say that it would be a very great advantage to the city.
865. You do not know what results have been obtained by the electric tram? No.
866. What are your principal grounds for advocating the construction of a tramway, whether cable or electric, down George-street? I think it would be a convenience to the public. I think a railway to Hyde Park would be better still; but as we do not seem to be able to get a city railway, I think a tramway would be a great convenience, especially to those persons employed in George-street and to people coming from the suburbs. Rather than face the steam trams or 'buses, I think a great many people, whatever shopping they have to do, do not come up into the city at all, but stop down near the Railway Station.

867.

H. B. Lassetter, Esq.
26 Mar., 1896.

867. You think a tramway, electric or cable, would bring people to the centre of the city? Yes.
868. And would be a benefit to all the storekeepers and others in the centre of the city? I am speaking from a selfish point of view now.
869. So that practically, looking at the proposal from your point of view, your advocacy is dictated by selfish motives? Yes; I think the public convenience should be considered first.
870. Judging from a remark of yours I should imagine that you have little hope of the railway being extended to the city, at any rate for some considerable time? Yes.
871. And in the meantime, to meet the requirements of the public, and also to benefit others who reside more centrally in the city, you advocate the construction of a tramway down the principal thoroughfare? Yes. I was asked a question just now about crossing the streets. I find that there is very little difficulty in crossing Elizabeth-street, where the cable trams come every three minutes and the steam trams, I suppose, every two minutes, or in crossing the tram-line at Park-street, or at any of the streets. The crossing is very easily regulated. All these lines of 'buses go along the street.
872. There is no doubt that you can regulate any traffic, but the main street traffic is practically that which runs from Circular Quay up towards the Railway Station? Yes.
873. The traffic in the cross-streets is not so heavy as it is in George-street? No. The traffic in George-street, as far as private carriages are concerned, has greatly decreased. People cannot afford to keep them. I think the principal people who use private vehicles, are those who come in from a distance to their offices or work. I was astonished on going down George-street to see the decrease in the number of private carriages. Outside our own place people walk now. You do not see carriages drawn up now as you used to do.
874. Do you think that is the effect of the running of the cable tramway and the other trams? I think it is the effect of the depression.
875. You hope that the construction of this electric tram will bring about an improvement? I am sure it would.
876. *Mr. Wright.*] There are two parts of George-street with back entrances, viz., on the western side, between King and Market Streets, and on the western side, between Wynyard-lane and Margaret-street? Yes.
877. I suppose you know enough of the city to know that, as regards the remaining portion of George-street from end to end, the business houses, either big or little, have no back entrance? I think some of them have.
878. Do you not think that a house, in taking in goods across the pavement, will encounter very serious difficulties from the introduction of this tramway—taking into consideration the fact that the tram traffic will be a rigid traffic, which cannot be diverted one inch to avoid the heads of a pair of horses, and that the 'bus traffic is an elastic traffic, which can be moved to meet the requirements of the roadway—considering that the trams would either go along or stop to avoid a collision; and considering that the distance from the kerb to the outer rail on either side is 12 feet, or rather, that the distance from the side of the tram car to the kerb is 11 feet;—do you think then there is sufficient room to allow a pair of horses to back in and load? Not to back in and stand with the horses' heads right out into the street.
879. If they stand parallel with the kerb, there will be no possibility of any vehicle being able to pass between the lorry and the tram? A vehicle if stationary will occupy a small space, and a driver coming along on the near side, as the case may be, will be able to watch his opportunity to get past the tram.
880. He would not have much opportunity to pass the tram, especially as it is proposed to run a thirty-second service—possibly a fifteen-second service—to meet the rush of traffic in the early morning to and from the station. If a driver were coming along with the tram, he could ease up when he was coming to this obstruction, and just follow the tram and get round on the other side. It would be a momentary obstruction.
881. You do recognise the fact that a rigid service like the tram service, would be more likely to cause a congestion and stoppages of traffic than an elastic service like a vehicular one? Of course the traffic now is very bad. I say if the traffic were properly regulated, it would be better. But I do not think the tramway would interfere with the traffic.
882. I see your contention, but I wish to point out to you that if a tram were going down the centre of the road, there would not be sufficient space between the kerb and the tram to allow two vehicles to pass? They would have to follow with the tram, but that would only be for a short distance, I understand, in George-street—for not more than a quarter of a mile, I think. And I do not think the class of shops in that narrow portion of the street import very much goods, or carry very much goods across the pavement.
883. Take a large shop like Holdsworth, Macpherson, & Co.? They load all their goods from the back. They have facilities for loading.
884. There are other large business firms down there, for instance, Harris and Attwood? They are wine merchants, and they are not always taking in goods.
885. They are often taking in goods. But you think it would be a convenience to the travelling public, and would conduce to the prosperity of Lassetter & Co. to have this tramway down George-street? I have not the slightest doubt about it.
886. And that it would possibly cause a number of people who now stop down at Hordern's to come up into the city? I do not say Hordern's in particular. Theirs is a different class of trade from ours.
887. But you are aware that Anthony Hordern and Sons are universal providers? The people who go there do not come up to us. We do a different class of trade.
888. The Tramway Superintendent admitted in evidence that 171 'buses ply in George-street, that of that number, thirty-four 'buses ply between the Railway Station and Circular Quay, and that the remainder come from the Glebe, Newtown, Leichhardt, and other suburbs. I suppose you recognise the fact that the construction of this tramway will not diminish the number of these 'buses? I think it will. If the idea of the Commissioners to divert the whole of the western suburban traffic by George-street is carried out, I think it will take away these 'buses. Very often now I use a 'bus along George-street. I very often get on the Forest Lodge 'bus. But these 'buses are not used by the people from the suburbs. They fill up from the Railway Station.
889. That is a purely local traffic? There is a great local traffic.

890.

H. B. Lassetter, Esq. 26 Mar., 1896.

890. But considering that the 'buses to the suburbs are not only competing successfully with the steam trams, but are gradually growing in numbers, and gradually increasing their number of passengers—according to expert information, carrying as many passengers per day as the steam trams do—do you think it is likely that these passengers will disembark outside the Railway Station for the purpose of paying 2d. to ride the rest of their journey in the electric trams? I do not think they would do that. A lot of these outlying 'buses will be diverted.

891. Supposing that the thirty-four railway 'buses were wiped out, there would still be nearly 140 'buses running in from outlying suburbs, so that you would have to face this difficulty: that you would have almost the same 'bus traffic, and that on the top of that traffic you would have the electric tram service? I think a great deal of the 'bus traffic will be taken away.

892. It will not be taken away unless they alter the steam service? I understand from the papers that they are going to alter that service.

893. That is in the dim future? It ought to be done.

894. What sort of congestion do you think the continuation of this suburban 'bus traffic and the introduction of the tramway traffic will produce in George-street? I do not know whether it would carry all that traffic, unless it is diverted to some other street.

895. It would certainly tend very much to the congestion of the traffic? I think it would—that is, if it were so.

896. I am assuming that it will be so? I do not admit that it will.

897. Assuming that the outside traffic remains as it is, do you think that if an electric tramway is constructed through George-street, and the railway 'buses are done away with, there will be a very great congestion of the traffic? I think there would, if the other 'buses remained, but I do not believe they would.

898. The experience of the last three or four years is that year by year the 'buses running side by side with the steam tramways are increasing, and taking a larger proportion of the passengers? I can quite believe that. I think steam trams are terrible things to ride in. They jar on the nerves, and everything else.

899. Have you any idea of the number of passengers carried along George-street per day? No. One hundred and eighty-five 'buses making six trips a day would, I suppose, carry an average of ten persons a trip.

900. They average more than that number;—they come from a distance of 5 or 6 miles outside Sydney, and take people to any part of George-street for a penny less, in many instances, than is charged on the steam tram? Yes.

901. I suppose, on the whole, you consider that Sydney is badly provided with street locomotion? Very badly.

902. You think that the present tram service running along as it does on the eastern extremity of the city, hardly supplies the wants of this great city? It is terrible.

903. You think George-street would be the best street to construct this line in? I do, as it is in the heart of the city.

904. A proposal was made some years ago to have a single line running down George-street and Pitt-street, and your father bitterly opposed the proposal at the time? He did, I believe.

905. And I think nearly all the mercantile men in Sydney who gave evidence also expressed their disapproval of the proposal? Quite so; but I think they have all changed their opinion.

906. Their ground of dissent was that a single line along either street would interfere very considerably with the traffic? Yes.

907. In face of the fact that the electric tram will be a double line, you still think, and Mr. Frederic Lassetter also thinks, that in place of being a detriment it will be a benefit to George-street? I suppose he, with others, was without any experience of the working of such lines in crowded streets.

908. He has had the experience of a system of steam tramways here? You cannot gauge by that. That is almost like a street railway.

909. He has had the experience of the cable tram? Yes.

910. And he has seen a very perfect cable system in Melbourne? Yes; but the streets are wider there.

911. Notwithstanding whatever knowledge he may have of these things, whether it be little or much, he and other gentlemen occupying prominent commercial positions opposed the construction of a single line of tramway in George-street and Pitt-street on the ground that it would very seriously interfere with business in the city? Yes. I suppose King-street is no wider than George-street, and yet the cable tram does not seem to affect the traffic there.

912. When I tell you that between George-street and the foot of King-street there are twenty-seven empty shops now, you will say that the cable tram does affect the traffic? Not from George-street upwards.

913. I mean going downwards? I do not think the tramway has done that.

914. I know these shops were not empty before it was constructed? Some of them, I think, were only just going up.

915. As far as your knowledge goes, you believe that this tramway in George-street will be a benefit, not only to the residents of that street, but to the community generally? I think it will be advantageous both to the public and shopkeepers, and also to people doing business in George-street.

916. *Mr. Trickett.*] There is a considerably heavy traffic in George-street? Yes.

917. Do not you think the construction of this tramway in George-street would have the effect very much of sending a lot of this heavy traffic into Pitt-street, to the detriment of, people there? I suppose some of it would go to Pitt-street. A great deal of it would go to Castlereagh-street, and a great deal to York-street.

918. It would hardly go to Castlereagh-street, as the grade from the Circular Quay is so steep. Would it not mostly go to Pitt-street? I do not think it would. York-street would carry a great deal more traffic than it does.

919. It could, but the heavy traffic seems to choose the most crowded streets? I think it should be a matter of police regulation as it is in London. In London the 'buses are not allowed to turn into Cheapside from Ludgate Hill. They are not allowed to go along certain streets, and the heavy traffic is diverted.

920. Do you, as a business man, think it is desirable that if an electric or any tram is constructed along George-street, early legislation should be passed to regulate the way in which the traffic should go? Yes, whether a tram is made or not. I think it is absolutely necessary now to regulate the traffic.

921. When Mr. Frederic Lassetter was examined in 1890, he strongly advocated that if a tramway were laid down from Circular Quay to the Railway station it should be a single line along George-street returning

H. B. Lassetter, Esq. 26 Mar., 1896.

returning by way of Pitt-street;—do you think that would meet the requirements of the traffic? I do not think it would be objectionable, but it would entail extra expense, I suppose, from a railway point of view.
922. Would it not leave more room on either side of the track to carry the ordinary traffic? It would.
923. Do you think that people would look upon that as objectionable as having to walk from one side of the street to the other when they wanted to go the reverse way? I do not believe the people would.
924. It is a very short distance between Pitt-street and George-street? It is. It would make an alternative route if the electric tram could turn the corner at the Town Hall and go to Circular Quay *via* York-street.
925. If that were not practicable, you think that even a double line of tramway could be laid along George-street without causing any great inconvenience? I feel sure of that.
926. You stated that notwithstanding the good pavement we have in Sydney, especially in the new part opposite your premises, the noise of the traffic is very great? It is intolerable.
927. What is the cause of the noise? I suppose it is because the 'buses are so badly constructed.
928. It is owing to the want of proper box-axles? Yes, and the construction of the 'buses altogether. The 'bus is dirty, and it is not so good for the public as is a tramway.
929. As a business man, you do not look upon this tramway as a substitute for a railway into the heart of the city? Certainly not.
930. Only as an auxiliary to take the traffic to the railway and to the western suburbs? Yes.

Alfred Edward, Esq., Registrar, Metropolitan Transit Commission, sworn, and examined:—

A. Edward, Esq. 26 Mar., 1896.

931. *Vice-Chairman.*] Are you in a position to make a statement with regard to the 'bus traffic in Harris-street and in George-street? I am prepared to state the number of 'buses which pass the railway-station and run into the city.
932. Will you be good enough to make your statement? The number of licensed 'buses passing Christ Church is 161. Of that number thirty-one 'buses go to the railway-station. Only twenty-six 'buses run *via* George-street from Circular Quay to the railway-station, and five run *via* Pitt-street. The 'buses running out to all the southern and western suburbs—to the Glebe, Forest Lodge, Darlington, Redfern, and Newtown—number 161; and in that number I include eleven 'buses which run past the railway-station regularly between Pyrmont and Circular Quay.
933. *Mr. Wright.*] We were told yesterday that nineteen 'buses are running on that route? Eleven is the number licensed for this year on the route.
934. *Vice-Chairman.*] Have you had any opportunity to ascertain the average number of passengers carried? I can only make an estimate of the number. A 'bus would run on an average about seven trips a day—making 1,127 trips each way per day, and on each trip a 'bus would carry on an average about ten passengers. Some 'buses carry more than that average; some carry less. The railway 'buses carry considerably more.
935. *Mr. Clarke.*] Can you state the number of passengers which are carried from Harris-street and Pyrmont along George-street to Circular Quay? There are eleven 'buses running from Pyrmont. Each 'bus would run on an average about eight journeys per day, making eighty-eight trips each way; and as the 'buses are small ones a 'bus would carry on an average eight passengers; so that the 'buses would carry 704 passengers per day each way. That is a good estimate.
936. Only 700 passengers each way per day? Yes.
937. How can you account for the 'buses running between Sydney and the suburbs taking a considerable amount of the traffic from the steam trams? The 'buses are quicker and cleaner, and run more often, and in some instances they are cheaper. The 'bus service is a better one than the steam-tram service.
938. Would not these 'buses, if this electric tramway is constructed, take away a good deal of the fares, not only from the steam tram to the westward but also from the electric tram itself? I do not think the 'buses could compete with the electric tram, if it is anything like the electric tram running on the other side of the water; but they certainly would continue to take a large number of the passengers from the steam trams, no matter whether this electric tram is made or not.
939. Would not that interfere with the fare received by the steam trams? Certainly. If there were half the number of 'buses running the electric tram would pay much better than it would with a number of 'buses plying side by side with it.
940. You think the 'buses will be obliged to leave off running? I think that if an electric tramway is started between the railway station and Circular Quay the 'buses would very soon cease to run to the railway station. It would have a certain effect on all the other 'buses, because they rely to a good extent on what they term the street traffic—that is, the traffic between the Post-office and the railway station.
941. Would not the 'buses from the suburbs still land their passengers at convenient places along George-street? Undoubtedly. Whilst the steam trams run out to the suburbs these 'buses will continue to run, and the passengers by the 'buses are not likely to alight at the railway station and get on to the electric trams.
942. As regards the considerable 'bus traffic from the eastern suburbs, would it not be affected? It would not be affected in the slightest degree. None of these 'buses go near George-street—they go down Pitt-street.
943. Should a railway be made from Redfern to Circular Quay, would it interfere with the earnings of the electric tram? Most decidedly it would seriously affect the earnings of the tram.
944. You think that if the railway is to be extended there is no necessity to construct an electric tram? I think the electric tram is absolutely unnecessary, provided that the trains run to the city.
945. Considering that there is not much probability of the railway being extended to Circular Quay, do you think that this electric tramway would be a financial success? I do not know.
946. It is stated by the Commissioners that it will cost about £133,000? I do not know if it would pay on that outlay, because the electric trams would have to compete against 'buses, and the Commissioners would have to keep the fares down in order to compete with the 'buses.
947. It is stated on behalf of the Commissioners that the tram will earn 10 per cent? I think if it is to cost the sum stated there will be some difficulty in earning that amount, considering the competition which they will have to face, although they would be very well patronised.

A. Edward, Esq. 26 Mar., 1896.

948. Are you of opinion that it would not pay 10 per cent. on that outlay? I would not like to say off-hand, without giving the matter some consideration.
949. Are you conversant with the overhead electric system? Only from seeing the working of the system at North Shore.
950. Do you think that this electric tramway would be any source of danger to the traffic in George-street? An occasional cab or two may get knocked over. I do not think the danger will be very serious. I think there will be great delay in the traffic along George-street if a double line is laid, because right along on each side of the street you will see vehicles standing at various places, and 'buses or other vehicles passing would necessarily encroach on the tram-line, and would not get out of the way. They would go along in their ordinary course.
951. I presume, as it is a public road, unless a special Act is passed, it will be difficult to prevent the 'buses from doing it? In a minor degree, sometimes that occurs now.
952. Have you any idea whether there is any interruption to the traffic in King-street between the wharf and Sussex-street since the cable tramway commenced to run? Frequently the trams have to stop, and frequently vehicles are delayed by the trams. Both have to give way at times. There is an immense amount of slow traffic in that locality. It is not so easily shifted as light traffic; it takes some time to get out of the way.
953. Would that occur to a certain extent in George-street? I think there would be more or less a block of the traffic all along the busy portion of the street, say, from Bathurst-street to Bridge-street.
954. *Mr. Hassall.*] How long have you held your present position? Eight years.
955. You are capable, then, of forming a pretty good opinion as to the effect of the tramway upon the traffic in George-street? I think so.
956. Will you explain whether the licenses for vehicles have increased or decreased in number during the last few years? They have increased considerably, but only as to 'buses within the last three years. The cabs increased wonderfully until about three years ago, when the depression set in, and since that time they have not increased. But the 'buses have increased very considerably during the past two years.
957. In your evidence before the Public Works Committee in December, 1890, you stated that 185 'buses passed through George-street in that year; that on an average they made eight trips a day each way; that they passed a given point about 3,000 times a day; and that in Pitt-street fifty-three 'buses were plying;—will you explain how it is that we have only 161 'buses plying in George-street to-day? I make the number of licensed 'buses to-day 161. I will check the figures I gave in 1890 when I return to the office. There is apparently a difference of twenty-four 'buses to be accounted for. Up to a short time ago eight or ten 'buses were running to Balmain. The penny ferry has knocked these 'buses off the line. Again, only six 'buses are now running to Darlington, whereas at one time twelve 'buses used to run there. I cannot explain at this moment how to account for the remaining eight 'buses
958. You said in 1890 that there were about twenty-three 'buses running in Harris-street;—can you state whether the number of 'buses has decreased in that street? The Balmain 'buses which have been knocked off used to run via Harris-street.
959. Have you any idea how many vehicles pass along George-street? I could not say without having a check made. On one occasion I had the empty cabs checked at the corner of King-street, and there was an average number of 100 cabs passing that corner per hour. I should think that all the 'buses and private vehicles would be more than double the number at that point.
960. I suppose the suburban 'buses look to the pick-up traffic between the Post Office and the railway station to recoup them to a certain extent for the low fares they charge for the through trip? That is so.
961. How do they manage to compete so successfully with the steam trams? Most of these 'buses are owned privately in the outlying places. They have no managerial expenses to bear. They cut it very fine. The Omnibus Company, whose managerial expenses are larger, do not ply very far out as a rule. They restrict their operations to places which are adjacent to the city, and which are very thickly populated. The only way in which I can account for these 'bus proprietors being able to compete with the steam trams is that they have no wear and tear on the roadway to make good, and that they manage their own 'buses.
962. They work their 'buses economically, and their expenses are less comparatively than the expenses of the steam trams? Yes.
963. And consequently they are able to run for a lower fare, and so get the traffic? Yes.
964. Have you had any complaints lately of the congestion of the traffic in the principal streets? Not specially. There is always a certain amount of complaint as to the congestion of traffic in a busy thoroughfare. The worst place is the block along George-street, between Hunter-street and Market-street.
965. Have you had any complaints with regard to the traffic in Pitt-street since the cable tram has been started? Not necessarily. But the traffic in Pitt-street is always congested. The street is so narrow, and there is always such a number of vehicles standing outside the doors in that street, between King-street and Market-street.
966. They reduce the traffic way very considerably? Undoubtedly.
967. Is the heavy traffic regulated in any way? No. Within the past eighteen months a committee of the City Council held a number of meetings to deal with this question, and their decision was that it would be an unnecessary interference with the rights of citizens to dictate which way the traffic should go.
968. Have not the Transit Commissioners any power to deal with the traffic? Not as regards private traffic. We regulate which routes the 'buses shall travel, but not the cabs.
969. And the wool drays? We have no control over the wool drays. Being special constables, our officers have the same control as a policeman would have; but we have no power to lay down what routes they shall follow.
970. Is the power vested in the City Council? Entirely. My own opinion is that the heavy traffic should certainly be restricted from going into portions of George-street and Pitt-street.
971. Is not this heavy traffic the principal cause of the congestion and the blocks in the streets? Very little of this wool traffic goes into George-street. The congestion is caused by the slow traffic, like the drays, which saunter along a good distance from the kerb, not on the middle of the road, but sufficiently far from the kerb to cause a good deal of congestion.
972. Do not you think some step should be taken to regulate this particular traffic? I do. I do not think it should be allowed to use the busy streets.

A. Edward, Esq.
26 Mar., 1896.

973. Cannot the Transit Commissioners take any steps in that direction? Not directly; but they made certain recommendations to the City Council, and the City Council has taken no steps to that end.
974. What vehicles do the Transit Commissioners control? Licensed 'buses, cabs, and vans.
975. Do not the licensed 'buses, as a rule, ply up and down the centre of the street, and pull up in the centre of the street to the detriment of other traffic? I do not think, as a rule, that is done.
976. I have seen it done scores of times? It does happen, and we do our best to cope with it.
977. As a rule, relying on their weight and strength, they bump light vehicles out of the road? It is mostly for the public convenience that they pull up in this way. As soon as they see a passenger they pull up wherever they happen to be. A 'bus cannot very well get in to the side of the road, because there is generally some vehicle standing at very short intervals. If they were to pull into the side of the road, it would be one tortuous way in and out. Whilst a 'bus is in motion it is very difficult to keep near to the side of the road.
978. Is not one of the most serious complaints against the 'bus traffic the fact that they habitually pull up in the middle of the street, irrespective of what may be behind them? I have not heard it seriously complained of.
979. Would not a frequent tramway service in George-street materially reduce the number of 'buses and cabs? It would knock off the railway 'buses, and if it went to Pyrmont it would knock off the Pyrmont 'buses. It would have a slight effect on the other 'buses. I do not think it would have any immediate effect, but within a year or so I daresay 15 or 20 per cent. of them would go.
980. They would gradually go off the road? No; not more than that percentage. That would be about their standing point.
981. Have you ever heard of the suburban 'buses racing the through trams? Oh, they beat the trams easily. Supposing a 'bus and a tram start level, the 'bus picks up its passengers about its starting-point, and, therefore, it gets a fair start, but the tram pulls up at each stopping-place until the first section is run, and at that time the 'bus is out of sight, and is very rarely caught again.
982. Take the Waverley tram, which pulls up at each stopping-place until it gets to Queen-street, and then has a fair run down Oxford-street, Paddington, and just about catches up to the 'bus on Barrack Hill;—have you ever heard of a pretty good race taking place down Barrack Hill between a tram and a 'bus? No.
983. Is it not a dangerous practice for a 'bus-driver to indulge in as regards unfortunate nervous passengers? It is indeed. The question of fares has not been touched upon. I think it is quite possible that 'buses could be run from the railway station to Circular Quay at a penny fare.
984. Was not an application to that effect made some time ago to the Commissioners and disallowed? It was granted eventually. The other 'buses came down to 2d., and told this man that they would come down to 1d. if he started. They frightened him off.
985. *Mr. Wright.*] Was not his first application refused? It was refused until he submitted proper vehicles. He would not say what kind of vehicles he proposed to run. We would not license a second-class vehicle, even to get a 1d. fare.
986. *Mr. Hassall.*] Supposing this electric tramway did not have the effect of reducing the number of 'buses very materially, do you still think that George-street would be wide enough to carry the whole of the traffic? I think it would be exceedingly inconvenient from a traffic point of view. It would suit the travelling public, but it would be very inconvenient to the traffic.
987. Do you think it would be necessary for the Transit Commissioners to take steps to remove a portion of the traffic out of George-street? They certainly would not do it. They are not going to take away the best part of the road from 'busmen who have been running there for years simply to throw it into the hands of the Government who are running tramways.
988. These men have practically a right to the road, and you could not take away that right without giving them compensation? The Board could take it away without giving them a penny, but they would not.
989. Is it not a fact that whenever a line of 'buses changes hands the purchaser inevitably pays for the plant, the goodwill, and the right to the road? Undoubtedly. A 'bus was bought the other day. The whole plant was valued at £180, but the buyer gave £300, paying £120 for the goodwill and the right to the road.
990. Do you think an electric tram, consisting of a car and a motor-car, could take about three times as many passengers as a 'bus? No; the big railway 'buses carry easily thirty passengers, which means that they carry thirty-five.
991. What is the biggest load you ever heard of being carried in a 'bus? Once I saw seventy-five people on a big 'bus belonging to Stewart. It was privately engaged for a football match. The people rushed the 'bus, and the driver was powerless.
992. You do not think any tram-car would carry more than you saw on that 'bus? No; I suppose, as a rule, a dummy and a car would carry more than a 'bus.
993. On the electric tramway each car will carry fifty-two passengers? That is more than a 'bus will carry.
994. What is the height from the surface of the road to the crown of the hat of a passenger sitting on the top of a 'bus? I should say 12 feet.
995. *Mr. Wright.*] Can you state approximately the number of 'buses that pass the Exchange per day? I think it is between fifty and sixty.
996. *Mr. Trickett.*] You stated that you think the number of 'buses would decrease if this tramway were started;—how does that agree with the fact that in the eastern suburbs the 'buses have increased, I should think, five to one, roughly, notwithstanding the running of the trams? Only the difference in the class of tram would affect it.
997. Nothing else? A quicker service.
998. You think that a quick service on this tramway would have the effect of keeping the 'buses off the street? I think it would between the railway station and Circular Quay.
999. A witness has stated that it would have the effect of regulating the traffic in a direct line, and preventing it from wobbling about the streets so much as it does;—do you believe it would? I do not.
1000. You do not think it would make any difference in this respect? I think there are so many stationary vehicles alongside the shops that you cannot get the through traffic to go direct, unless it keeps in the middle of the road, which would be on the tram-line.

1001.

A. Edward, Esq. 26 Mar., 1896.

1001. You still think that the vehicles would go all over the street? They could not keep in the centre of the road when the tram was coming; they would have to pull aside, but I fancy the trams would be frequently delayed. With an electric tram it would not be so bad as it is with the cable tram. An electric tram can be stopped anywhere, or slowed down, whereas a cable tram has either to go at the usual pace or to stop.

1002. The tramway superintendent has stated that he expects to carry 5,000,000 passengers by this electric tramway to the railway, and 2,000,000 passengers along Harris-street per annum;—would you like to say whether that is anything like a correct approximation of the traffic? I do not know as regards the railway, except that a lot of the present railway train traffic would be diverted, but as regards Harris-street, I think that 2,000,000 passengers per annum would be an exceedingly large estimate.

1003. Can you supply any figures which would help the Committee to check this estimate? I can tell you the exact number carried by 'bus during 1895 between Pyrmont and Sydney. I can give the number of passengers carried by the 'buses plying directly to the Railway Station—not by the ordinary pick-up 'buses—and I can supply an estimate of what the other 'buses would be likely to pick up. Pyrmont is very peculiarly situated. It is very thickly populated, but the people are not going the whole way round by the electric tram when they can get across in the boat for 1d. and walk up the hill. Ultimo is not very thickly populated. And even there, supposing you are at the Technical College, it is quicker to walk to Anthony Hordern's and jump on the tram at 1d. less than to ride round in the electric tram. I was asked on the previous occasion which route I thought would be the better one for a tram to take—towards Pyrmont, or past the mortuary along Regent-street. There is no question that the left-hand turning is the better one to take. Eleven 'buses ply to Pyrmont, and about thirty 'buses ply the other way. Pyrmont could not be looked upon, as far as 'bus traffic is concerned, as a remunerative place to run to. The line between the Railway Station and the Circular Quay is the best line in the city.

1004. To go down as far as John-street to go into Sydney is in a great measure like taking two sides of a triangle as against one? Yes. There is not very much traffic except old women and invalids between Sydney and Pyrmont by 'bus, nor would there be by tram. The only traffic would be direct from Pyrmont to the railway station.

1005. *Vice-Chairman.*] You estimate that the 'bus traffic to Ultimo is about 1,400 a day? It may be a shade more than that.

1006. That would be less than half a million a year;—it is represented to the Committee that the probable traffic from Harris-street by the electric tram will be 2,000,000 per annum;—what is your opinion concerning that estimate? I regard it as a very large estimate.

FRIDAY, 27 MARCH, 1896.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

The Hon. JOHN DAVIES, C.M.G.	CHARLES ALFRED LEE, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	THOMAS HENRY HASSALL, Esq.
HENRY CLARKE, Esq.	FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Electric Tramway from Circular Quay, Sydney, to the Redfern Railway Station; and also along Harris-street to the intersection of John-street.

Henry Deane, Esq., Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

H. Deane, Esq. 27 Mar., 1896.

1007. *Vice-Chairman.*] Do you desire to make an additional statement to the Committee respecting the proposed tramway? At the request of the Committee I have had an investigation made as to the amount of vehicular traffic on Pitt-street and George-street. I instructed Mr. Fischer to get the investigation made for me. He put three men on to observe the traffic contemporaneously at three different points. The following is his report:—

IN accordance with your instructions, I have made an investigation as to the amount of vehicular traffic carried upon King-street and George-street, with the results shown on attached detail sheet.

It will be seen that the density of traffic at the various positions chosen is almost as—King-street, between George and Pitt Streets, 1; George-street North, below Bridge-street, 2; George-street, between G.P.O. and King-street, 3. As regards the effect of the King-street cable tramway upon the vehicular traffic in King-street, this is very difficult to estimate, as we have no records of what the traffic was before the opening of the tramway. However, in the City Surveyor's evidence given before the Public Works Committee on the King-street Tramway, the number of vehicles passing the intersection of George and King Streets between 3 p.m. and 6 p.m. is given as 965 per hour. My investigation shows that at present only about 800 per hour pass there now, but whether this is entirely due to the cable tramway, is very difficult to tell. Perhaps the officers of the Transit Commissioners may be able to give information on this point.

RETURN of vehicular traffic in George-street and King-street.

Location.	Time.	Friday, 20 March, 1896.	Monday, 23 March, 1896.	Average for both.
King-street, between Pitt and George Streets	10 a.m. to 12·30 p.m.	425	496	460
	3 p.m. to 5·30 p.m.	513	564	538
	Total for five hours	938	1,060	998
	Per hour	188	212	200
	Per minute	3·13	3·53	3·33
George-street North, below Bridge-street	10 a.m. to 12·30 p.m.	820	940	880
	3 p.m. to 5·30 p.m.	930	870	900
	Total for five hours	1,750	1,810	1,780
	Per hour	350	362	356
	Per minute	5·83	6·03	5·93

If

H. Deane, Esq. 27 Mar., 1896.

If you add 200—the average per hour in King-street—with 587, the average per hour between the Post Office and King-street, you will get fairly approximately the traffic crossing the intersection of George and King Streets in both directions. I also desire to state the estimated cost of adopting electricity to the existing line from Bridge-street to Redfern Station with a five-minute service. Outside electric work, £5,600. Car-house. I put down nothing for the car-house, because the present accommodation would be used. The proportion of the power plant required would be £3,200, and eight motor cars, £4,640, making a total of £13,440.

1008. That would give an electric service between Bridge-street and the Railway-station in substitution for the present steam service? Yes; for the railway service. That estimate is based on the figures which have been given for George-street and Harris-street. I think it is fairly comparable.

1009. *Mr. Lee.*] When your examination was interrupted on the last occasion we had got to the point of distinguishing between the heavy traffic and the light traffic in the street, and the danger to pedestrians in consequence of the heavy traffic, and your answer was that you saw no danger? I should like to supplement the information I gave in this way—that I think it might be a good thing in the broader part of George-street, where people going to and from the trams would have a longer distance to cross to make the places where the bracket poles are erected more in the nature of refuges than elsewhere. It would be a very great convenience. It would be a very great improvement in this street to have resting-places halfway across for the people.

1010. Would you make these places a little longer and wider? Yes; but that is not a part of the scheme, and the cost is not included.

1011. You have supplied supplementary plans to show the position which the trams would take in the streets? Yes.

1012. Will you kindly explain these plans to the Committee? I have prepared two diagrams showing the two sections of George-street, where the greatest objection might be made to a double line of tramway. The plan on the right shows the narrowest part, near Queen's Wharf Road. It will be seen from the diagram that the distance from centre to centre of the rails will be 9 feet, and in that place, we have as the distance between the kerb and the rail, 9 feet. That only occurs for a very few feet in the length of the street, and beyond this point, where the constriction takes place, there will be rather more.

1013. *Mr. Wright.*] Do I understand that you would have a 9 feet instead of a 6 feet way? There is no 6 feet way in tramways. It is a common thing in America to have the rails even closer than the 4 feet shown. I have seen cars run almost touching as they pass. That is a dangerous thing to do.

1014. *Mr. Lee.*] What is the distance between the cars on the cable tram? About 2 feet. The other diagram shows the narrowest width of George-street between Bridge-street and King-street. It is 43 feet between the kerbs. There it will be seen the distance between the centre of the rails is 12 feet, which gives a clear width of 5 feet between the cars. The distance from the kerb to the rails is 13 feet.

1015. This would be sufficient for a single line of vehicular traffic, but not wide enough for a double line? No; but the cars are not always standing there—they are moving on like other vehicles.

1016. Do you contemplate that it will be a two-minutes service, or perhaps, a more frequent service at times? Yes, a minute service.

1017. Would not that offer a greater obstruction to the ordinary traffic? I do not think so. The distance between the cars would be an average of 235 yards.

1018. So long as they are all moving? Yes.

1019. It is when these things are standing that the great obstruction takes place? When they are at a standstill.

1020. Do not you think that, even with that space left in George-street, where these widths prevail, there would have to be some law passed to control the ordinary traffic? I do not see why there should be.

1021. You may notice that, at the present time, from want of proper control, it is a common thing to see cabs rushing up and down in the middle of the road in front of a 'bus, and then darting off to the other side—dodging about to get through? Yes.

1022. If the centre portion of the road will be so largely occupied with the tram, do not you think that of necessity the ordinary vehicular traffic would have to be kept under actual control? I think it will be very beneficial to travelling in George-street; it will separate the two lines of traffic, so that they will not be able to mix up and go on the wrong side of the road, as they frequently do now.

1023. The running of the cars, and the presence of the centre poles, will tend towards the proper division for the traffic? Yes.

1024. Have you any idea of the height of the highest loads that pass down the street? I do not think, as a rule, it is more than 16 feet.

1025. I think a statement was made the other day that the loads have been known to be considerably higher. It is a practice to load the trollies with very high loads of wool? Yes; but probably that would be in Pitt-street more than in George-street. There is no doubt that such loads ought not to be permitted. It would be quite competent for the Municipal Council or the Government to regulate the loading.

1026. Taking into consideration the contingency that an extension of the tram may necessitate larger traffic passing over the line, and constantly under the wire, would the wire be sufficiently high to admit of that? Quite.

1027. You do not think it is possible that any vehicle can be loaded so high that the wire can be cut? No; not if the wire is kept about 19 feet above the ground. I think it would be perfectly safe.

1028. You have thought that matter out? Yes.

1029. Could you give any idea as to what it would cost to extend the electric power if it became necessary to universally adopt this system in the city. For instance, if it were introduced into Pitt-street or York-street, is there any definite basis on which you can calculate what it would cost to extend the service? You could reckon it if you knew what the service would be.

1030. Supposing that by-and-bye it was found desirable to lay down an electric tram in Pitt-street, and an electric tram in York-street, would that necessitate the supplementing of the power at Rushcutter's Bay? Yes; you would require power for each division. The power proposed to be provided for the George-street tramway would allow of some margin, but still it would not be sufficient for working another line in Pitt-street or another line in York-street.

H. Deane, Esq. 27 Mar., 1896.

1031. Not for any extension? No.
1032. Then if an extension were necessary the cost *pro rata* in providing power would not be so great as it was in the first instance? No; if you require a small amount of power you have to duplicate, but if you have a larger amount of power, with, perhaps, a spare machine, it would be quite sufficient, so that the proportionate charge does not amount to the same.
1033. As regards the overhead system, you have stated that you have not the slightest doubt as to its capacity for carrying the proposed traffic? Yes.
1034. You have based that statement very largely upon your experience in other countries? Yes.
1035. I have before me a publication of, I think, great weight in the engineering world. I will read a passage from *The Engineer* of 1st November, 1895, to show that there is a certain amount of doubt about the overhead system. The article is headed "Electrical Traction in the United States," and after referring to matters of detail, it goes on to say:—

> Evidences of change in this direction are not wanting, and there is little doubt but that some of the overhead lighting traction and telegraph companies are about to have a bad time of it. Thus it is stated that open war has been declared between the city authorities of one large city and overhead wires of all kinds. The various electrical companies, fearing that the town Council would move for an injunction, have forestalled it, and moved for an injunction to prevent the Council from making an order to remove all overhead wires to conduits. It seems to be understood, however, that this is but a device to gain time, and that the overhead wires must go. Popular opinion in such matters moves very slowly, but, like the mills of the gods, it grinds very fine. The overhead wire and the trolly have been found essential. In this country, town Councils have been denounced as "absurd conservatives, opposers of progress," and so on, because they told the electricians that if they wanted to run tram-cars by electricity they must find another way of doing it. A trolly has had a very fair trial in the United States. It has been successful in augmenting the income of the United States Patent Office very sensibly. The system began modestly with unbarked pine poles on the outskirts of the towns. It has progressed inwards. One of the first evidences of its decaying popularity was the substitution for the pine poles of ornate columns, with decorated arms to carry the wires. The intrinsic merits of the system were found, even in the United States, to want backing up by concessions through the demands for the beautiful. And now, at last, we are told that the trolly must go. In various towns it has been voted a public nuisance. New Orleans is one, Augusta is another; others will follow. It is not for nothing that so powerful an organisation as the Westinghouse Electrical Company has taken up the Washington system, illustrated in our issue for 7th December, 1894, and since improved by the Westinghouse Company. It has been very fully tried in the United States. The trolly was originally made in Germany. We venture to think that the men of the United States can produce something better. The conduit system has never had a fair trial yet, because so long as the public will tolerate the trolly there was not sufficient stimulus to try anything else. We venture to predict that a succeeding generation will look on the overhead wire and the trolly much as we do at Puffing Billy or Locomotive No. 1.

1036. You see that there is a doubt thrown upon the overhead system by the writer of this leading article? I have heard of that article. The doubt that is there pointed out is not as to its commercial value or its success, nor as to the value of the overhead wire as a conductor of electricity, but as to whether it is a proper thing to have overhead wires running through the streets. That, of course, does not express any doubt as to the suitableness of the system for conducting the traffic, or as to whether it will pay or not. It is the æsthetic question, as to whether overhead wires should be tolerated. Now, it is a very curious thing that in spite of the opinions of the writer in *The Engineer*, who undoubtedly is pervaded by the same spirit which has blocked electricity in so many cities in England, this overhead system is making advances; that in Chicago which is one of the largest cities in the United States, and which probably not many years hence will be the largest, they have introduced about 100 miles of overhead wire within the last eighteen months (I am not quite sure if there are not nearly 200 miles); and that in conservative England they have recently opened a line on the overhead-wire principle in Bristol. There is one already in Leeds, outside the city, and it is proposed to erect one right through the heart of the city. There is the South Staffordshire line which I mentioned in my report. There is one in the Isle of Man, and recently there has been one projected, and I believe completed, in Dublin. On the Continent, where they certainly pay a great deal of attention to appearance, many of the principal cities are largely provided with electric tramways on the overhead system. Even in the smaller capitals like Stuttgart, they have gone in for it extensively, and they have certainly gone to some expense to make it as little objectionable as possible. At any rate they have done it, and they perceive that the advantages of this particular system so outweigh all disadvantages, that I think on the Continent generally you will find there is no hesitation about the matter at all. I should doubt very much whether you would ever find that in the boulevards of Paris the overhead system will be adopted. Still, I would not like to say that it never will be. It may be the same with the Ringstrasse in Vienna and in some other places, but there are a great many very important and beautiful cities on the Continent that possess tramways on the overhead-wire system. Milan is a notable example.
1037. Showing that the system has spread largely, not only in America, but through Europe, and is now spreading through the United Kingdom? Yes.
1038. In the early days of the overhead system, was it not the practice to have a net-work of overhead span-wires? Yes.
1039. And is it possible that the objections raised so largely by the writer in *The Engineer* may apply to that system which is not only a source of danger but a great eyesore in any city? I think it is very likely. When these tramways were first made, there was very little care taken to reduce the unsightliness of these points, for instance, at curves it is very difficult to do without a certain number of span-wires. But in America they used to be altogether careless as to the matter of appearance. Every one had a right to run a telegraph-wire from house to house, and the sky looked like a cobweb. They have got past that stage, and I saw many nice examples of the overhead system in America, even although they had not paid so much attention to it as they do on the Continent, and it is quite unobjectionable.
1040. The proposal to erect a centre-pole and brackets, with a number of span-wires just at one or two corners will, to a very large extent, do away with the objection which used to apply to the overhead Thomson-Houston system, a system of span-wires for suspending the traction? There is no doubt about it.
1041. You do not approve of the general system of span-wires? No; I prefer centre poles, which are much more sightly.
1042. And which are more easily controlled under any contingency which may arise? I think so, undoubtedly.
1043. You have had an opportunity of seeing other systems in all the principal cities in the world, and the result is that you recommend the one as per diagram, with a centre pole for a double line of tram? Yes. That diagram shows a very simple pole. On that design you could have any amount of elaboration.

H. Deane, Esq. 27 Mar., 1896.

1044. Are you in a position to give the Committee an assurance that this work can be carried out for about the sum you have stated? If the scope of the work is not enlarged, and there are no difficulties put in the way of keeping below the sum, I certainly am of opinion that that estimate is a fair one.
1045. The work could be carried out for that sum as nearly as possible? I believe it will cover it.
1046. I wish to direct your attention to the enormous increase that took place on the recommendation to the Public Works Committee in the case of the Ocean-street cable line;—at the time you gave evidence before the Committee, you were positive in your own mind that the work could be carried out for the amount proposed. The Committee adopted that amount, and the work cost nearly £100,000 more than that sum? It cost twice as much.
1047. It is natural that this Committee should require a most positive assurance from you, as head of the Construction Branch, that a mistake of that kind is not likely to occur again. I should be very glad to hear how it came about that your estimate was so largely increased? With regard to the George-street tramway, I am perfectly satisfied with this estimate. For that which I stated I take the responsibility. I mentioned the other day that the feeder cable and the motor cars were estimated by Mr. Elwell. With regard to all the rest—the bulk of the sum—I am quite prepared to say that it is quite sufficient. As regards the Ocean-street cable tram, I think the Committee, seeing how largely the estimate of the cost of that line was added to, have a perfect right to draw a comparison. Last year I made an explanation to the Minister of the reason why that tramway cost such a large amount of money, and I believe the papers in connection with that explanation have been laid upon the table of the House. I have a statement which is somewhat fuller than the one I handed to the Minister.
1048. The Committee would be very glad to hear your statement? I wish to mention first that the total cost of the cable tram, including land, has been £169,847 8s. 5d. The land and legal expenses amounted to £12,490 3s. 6d., leaving the net cost of the works as £157,359 4s. 11d. When I made my estimate of £80,000 I said the matter had been gone carefully into. So it had, and so far as one could tell, it was a fair estimate. I would not like to depart from that; as far as the light went which we could obtain on the subject at the time, £80,000 seemed to be a very fair estimate, but still it was not quite enough. However, if circumstances had not arisen to run us into expense, in directions which could not have been foreseen, I still believe the line would have been made for a little over £80,000.
1049. It would appear that there were several items of expense which could have been foreseen by the Construction Branch? Yes.
1050. That there were several small items which appear to have been overlooked in the estimate; among the items I see, "Rails, £5,000; brakes, £1,118; patent, £3,000; extra size of car-sheds, £1,000; caretaker's cottage, £400";—I presume these items were not provided for in the original estimate? No.
1051. And, consequently, taking that portion of the expenditure into consideration, you exceeded your estimate by more than the statutory allowance of 10 per cent.? Yes.
1052. Nearly 20 per cent. for these items alone? Yes.

John Macpherson, Esq. (Messrs. Holdsworth, Macpherson, & Co.), sworn, and examined:—

J. Macpherson, Esq. 27 Mar., 1896.

1053. *Vice-Chairman.*] You are a member of the firm of Holdsworth, Macpherson, & Co., George-street? Yes.
1054. *Mr. Clarke.*] Are you of opinion that an electric tram from Circular Quay to Harris-street is necessary? I think it is very desirable indeed. I think it is almost a necessity.
1055. From the Old Queen's Wharf to nearly as far as Barrack-street, George-street is very narrow, and the traffic is very heavy, and do not you think this tramway would be dangerous to the travelling public and to the ordinary traffic? I have thought that matter over. I think it would rather facilitate than impede the traffic. It would regulate the traffic, and relieve a great deal of the present congestion.
1056. In what way would it be a benefit? A great many of the 'buses would not run at all. The present 'bus traffic is not at all adequate to the requirements of the city. If the 'buses were taken off the street, as a great many of them would be if an electric tram were built, this congestion would be removed.
1057. Are you aware that the 'buses from all the suburbs compete successfully with the steam trams? Coming from Waverley on the tram I frequently see a 'bus racing against a tram. Once or twice I was nearly run over myself, and I believe some people were run over. It is a very dangerous practice to indulge in. The 'buses are competing in a sense with the trams.
1058. I understand that the 'buses are competing successfully with the steam trams, and that 180 'buses are employed running to the suburbs? Every morning from Charing Cross you will find the 'buses with all the young men coming into town. The 'buses are competing in that sense with the trams.
1059. Are the 'bus fares cheaper than or the same as the tram fares? The fares, I believe, are now the same on our line. I think the question is not whether the 'buses are able to compete with the trams, but whether the public are having the conveniences which they ought to have.
1060. You think an electric tram in George-street will do away with all the 'bus traffic? No; with a lot of it. Take my own case. Many times during the week I hire a cab before I would go into a 'bus. Scores of times I walk from Bridge-street to Market-street, and I know there are hundreds of people doing the same. Rather than go into a 'bus they will walk all the way to Market-street. With a tramway in the street that would not be done.
1061. Have you considered this difficulty, that in the narrow part of George-street, say, close to your premises, a double line of tramway would leave a very short space on either side of the track for vehicles to load or unload at the various places of business? Yes; but what do I find now? Only yesterday I saw five or six 'buses running to and fro at the same moment, go past our place. If there was a tram in the centre of the street, I presume a number of these 'buses would not be running at all. It would not interfere with the loading or unloading so much as the present traffic does. The traffic with the 'buses is absolutely congested in that particular spot.
1062. Even without the 'buses, do not you think with a free way of 9 or 10 feet between the kerb and the tramline on either side of the street, it would be almost impossible for drays to deliver goods to the various stores, or to load goods at the various stores? Very few drays load in front of warehouses. It is very seldom you see a dray in front of our place. I suppose the same thing applies to other places all the way up George-street. Very few drays load or unload in front of a warehouse.
1063. Have you a back entrance? Yes; of course there are parcel deliveries and light traffic occasionally in front.

J. Macpherson, Esq.
27 Mar., 1896.

1064. Are you aware that a great many business houses in George-street have not a ack entrance? I am; but even then I do not think that there would be any difficulty in the matter. I think there would be room enough.
1065. It is intended, I believe, to run a two-minutes service;—how would it be possible, in many cases, with congested traffic for vehicles—whether drays, 'buses, or private vehicles—to get from one side of the street to the other without running considerable danger? There may be some danger in doing that; but I presume the same thing obtains in other parts of the world where the streets are not wider than the streets of Sydney. I think the running of the trams would minimise rather than increase the danger.
1066. There is some danger likely to be encountered in that narrow street, with three or four 'buses passing at one time, and cabs running too? I do not think the danger would be more with the trams running than it is now. I do not say that there might not be danger there; I am not competent to say that.
1067. It is proposed to erect poles in the centre of the street from Park-street to the Railway station, and thence down Harris-street, and in the narrow portions of George-street to erect a pole at the kerb;—do you not think that the central pole, although it may be guarded to some extent, will be rather dangerous to vehicles;—should a horse happen to run away, is there not likely to be a source of danger there? I would not like to express any opinion on it. It is possible that there may be some danger there.
1068. Are you aware that business people generally are in favour of the construction of an electric tram? I have not met a single one who is not in favour of its construction. One of the great drawbacks to business people is the noise. In our front shop nearly the whole of the day we cannot hear a word that is said. We are obliged to take people inside to hear what they have to say. I am a director of a leading insurance company, and although we close our windows and our doors and I sit within a few feet of the secretary I cannot hear him reading the minutes sometimes.
1069. Do you think an electric tramway through George-street would be for the public interest? I decidedly think so.
1070. *Mr. Wright.*] You are aware that the tram traffic is different from the ordinary 'bus or vehicular traffic, inasmuch as it is a rigid traffic, and cannot get out of the road? Yes.
1071. The evidence shows that from 170 to 180 'buses are plying in George-street;—that of this number forty-five 'buses are employed between the Railway Station and Circular Quay and between Harris-street, Ultimo, and George-street, presuming that those forty-five 'buses are knocked off by the electric tram, from 130 to 140 'buses will still run in the city to the outlying suburbs;—do you think the 130 or 140 'buses running in George-street, and with a double line of electric tramway in that street, would not cause a still greater congestion of traffic? I am not prepared to say that there would not be danger in connection with it. In Oxford-street there is a double line of trams, and an immense number of 'buses and vehicles. A tremendous opposition was raised to the construction of that line, and it was alleged that it would be a source of great danger. But during all these years, as far as I can remember, there have not been very many accidents in the street.
1072. The number of 'buses plying in Oxford-street is less by one-half than the number plying in George-street, and the heavy traffic in George-street is very much heavier than the heavy traffic in Oxford-street? I admit all that.
1073. You think there is danger of congestion of traffic, and stoppage of traffic? There might be.
1074. You, as a merchant, have very fine premises with a back entrance; but you must remember that many of the drapers' shops, especially about Brickfield Hill, have no back entrance, but have to take in their shipment of goods over the pavement? I am aware of that.
1075. I suppose you have seen half a dozen cases lying on the pavement, and the men taking the tops off? I have seen that.
1076. What will be the position of one or two trollies in any portion of George-street: with the rigid tram-line within 9 feet of the kerb, and a tram passing at intervals of a few minutes, perhaps at an interval of half a minute, do you not think that there will be a very great danger of a serious block in the traffic then? I can see a possibility of it; but after all, I think, if the thing comes to be worked out, the danger you anticipate will not be realised.
1077. You must remember that the distance from kerb to tram is 9 feet, that a trolly is 7 feet wide, and that you have to provide for moving traffic, besides stationary traffic? I think you are supposing an extreme case. You do not have trollies standing at every shop down Brickfield Hill.
1078. You think the traffic will accommodate itself to the altered circumstances as it has done in Oxford-street? I think it would. I am reasoning from the past.
1079. You have been in Melbourne. Often enough.
1080. You know the very fine tramway service in Melbourne? I do.
1081. Do you think we can run a double line of electric trams in George-street as they do in Melbourne, without causing inconvenience? The streets are wider in Melbourne.
1082. Considering that George-street carries a much larger traffic, and is narrower, do you think we can run a similar service without causing inconvenience or interfering with the traffic? I think the traffic would accommodate itself to the circumstances of the case. I do not think there would be so much difficulty about it as either you or myself may see now.
1083. You spoke of the congestion of traffic opposite to your place, just now? Sometimes there is.
1084. Are you aware that not one-half of the 'buses go past your door? I am.
1085. Are you aware that more than one-half of the 'buses turn out of George-street into Wynyard Square? Yes.
1086. If you have a possible congestion of traffic opposite your place, with only one-half of the 'buses running down to Circular Quay, what will be likely to obtain further up the street where the street is no wider, with a double 'bus traffic and the tram traffic? When I say there is a congested traffic I do not mean that there is a block. You see two or three 'buses and two or three drays there at a time.
1087. If the traffic opposite your place were doubled by doubling the number of 'buses, and if you had a double line of electric trams running along the street, do you think there would be any danger of the stoppage of traffic there? Possibly there might. I think that if there were a double line of 'buses and a double line of trams, there would be some danger of a momentary stoppage.
1088. Do you think it would be a severe strain on the traffic of the street? I do.
1089. But you think the tram would be a benefit to the city and a convenience to the inhabitants? That is exactly what I think.
1090. But you do not consider yourself sufficiently expert to say what effect it would have on the very large volume of traffic in some parts of the street? No.

William

William Newman, Esq. (Messrs. David Jones, & Co.), sworn, and examined :—

W. Newman, Esq. 27 Mar., 1896.

1091. *Vice-Chairman.*] You are a member of the firm of David Jones & Co., George-street? Yes.
1092. *Mr. Hassall.*] How long have you been with the Company? About thirty-four years.
1093. Where is your place of business situated? At the corner of Barrack-street and George-street.
1094. What business do you carry on? General drapery, outfitting, furnishing, and clothing—all the articles that are generally sold by a large shop.
1095. How long has the business been established? Since 1838.
1096. I suppose you have a good many carriage customers? Yes; a great many.
1097. Do they shop at any particular time? They shop from 10 to 4 generally, or perhaps 5.
1098. Do you think this electric tramway would assist to injure your business? I am under the impression that, from Circular Quay to the Town Hall, the street is too narrow to admit of a double line of tramway, and that it would seriously impede the convenience of carriage customers coming to our shop.
1099. Your shop and other shops lower down the street? Yes.
1100. Peapes and Shaw have a large establishment about 50 yards lower down the street;—is the street at that point as wide as it is opposite your shop? I think it is exactly the same width.
1101. Is George-street one of the main traffic routes of the city? Yes; the main traffic route.
1102. For both light and heavy traffic? Yes.
1103. Have you noticed many lorries or wool drays travelling down the street? A great number. We have thought that, for the convenience of the carriage traffic, and other vehicular traffic, the lorries and wool drays should be diverted into another street.
1104. In your opinion, the law requires to be altered to enable this traffic to be controlled? Yes; and to keep the heavy traffic out of the main business street.
1105. I suppose you are under the necessity of loading and unloading large packages of goods? A great number.
1106. Where do the vehicles stand, as a rule, when they are delivering the goods? At the side entrance in Barrack-street. We have a special dock for the carts to come in and discharge.
1107. Running back into your own block of buildings? Yes.
1108. Have you noticed that in George-street loading and unloading takes place in front of the business houses? Yes; that is the impediment to the lighter traffic. It blocks the way frequently.
1109. Supposing a lorry were standing on one side of George-street, between the Post Office and King-street, and another lorry were standing on the other side of the street, how much room would they occupy? I should imagine that with the space at their disposal no other vehicle would be able to pass.
1110. Would each lorry take up about 8 feet? From 7 to 8 feet.
1111. According to the plan there, George-street is 43 feet wide opposite your shop, and the distance from the tram-car to the kerb on either side is 12 feet, so that with a lorry standing on one side of George-street at that point it would be practically impossible for any other vehicle to pass between the tram-car and the lorry? Yes.
1112. It would be dangerous? It could not be done.
1113. From your knowledge of the traffic in George-street, do you, as a business man of many years' standing, think it is advisable to place further obstruction in the way of the vehicular traffic? I do not think it is advisable to lay down a double line of tramway.
1114. Do you think the street would carry a single line of tramway? I think it would.
1115. In the event of taking the single line down George-street, and wishing to make a circuit back to the Railway Station, what alternative course would you suggest? Pitt-street.
1116. It is narrower than George-street? It is a little narrower, but I do not think it is practicable to have a double line in George-street, and to maintain anything like the present traffic. It would seriously impede the carriage and light traffic. It would inconvenience people driving in carriages, gigs, and buggies.
1117. The City Council have gone to a great deal of expense to make George-street practically a perfect street to drive on? Yes.
1118. You think a double line of tramway would injure the business houses along the street to a certain extent? Yes.
1119. Have you any knowledge of the Harris-street traffic? Not much knowledge of that traffic.
1120. Practically, your knowledge of this route is confined to George-street? Yes.
1121. Do you think the 'bus traffic along George-street practically answers requirements, or would a tramway service be more convenient? I can imagine that a tramway service for persons going short distances would be more convenient than a 'bus, because the trams are more regular than the 'buses.
1122. And would be patronised pretty largely by the travelling public? I think so.
1123. Do you think it would have the effect of driving some of the vehicular traffic off the road? I think it would.
1124. Thirty-five or 50 per cent.? It would be from 25 to 50 per cent.
1125. Do you think the tram would interfere much with the cab traffic? It might on wet days. There is more room on wet days than on dry days.
1126. Do you think that with covered tram-cars the public would take advantage of them rather than patronise the cabs? They would if they were just going along George-street.
1127. Supposing they were going to the railway station? They would take the tram.
1128. That would probably drive half the 'buses off the route? It might.
1129. And that to a certain extent would relieve the congestion of traffic? To a certain extent.
1130. You think it is advisable to take a single line down George-street and return with a single line up Pitt-street, and come into George-street to the Town Hall? Yes; that has been my opinion from the first. If this electric tram is to impede the introduction of the railway into the city, as I imagine it will, I think there are more serious objections to it still. For the public convenience the railway should be brought into the city. It would both be a saving to the public and a great convenience. We have to pay 4d. per day to go to the railway and back, and for the same money we can travel 5 or 6 miles on the railway.
1131. In your opinion, is it more advisable to construct the city railway than the electric tram? I think it is altogether more advisable to extend the railway into the city—and the time is opportune now both for purchasing property and employing men—than to construct a tramway.
1132. You do not think it would be necessary to construct the two? No.

W. Newman, Esq. 27 Mar., 1896.

1133. *Mr. Wright.*] If railway experts have stated in their evidence that even if the city railway be extended to Port Jackson, they would still recommend the construction of this tramway as a convenience to citizens, what would you say to that proposition? I should say a tramway would be a great convenience whether the railway went into the city or not. Viewing the tramway apart from the dangers and narrowness of the street, it would be a great convenience.
1134. You think that even if the city railway is constructed it is possible that the tramway would be an advantage and a paying concern? With a single line in one street.
1135. If you thought that your advocacy of this tramway would be prejudicial to the extension of the city railway, would you oppose the construction of this tramway *in toto*? Yes.
1136. Is that opinion shared by many citizens? It is entertained by all I know who have considered the question.
1137. I understand that a large section of the community, if it were known that this tramway would be the means of retarding the city railway extension, would offer a strenuous opposition to the proposal? I think public meetings would be called to oppose the tramway.
1138. *Mr. Lee.*] George-street opposite to your warehouse is rather narrow, and in consequence of the nature of your business, which is very largely a carriage business, you object to any obstruction in George-street? Any undue obstruction.
1139. Would it not be possible to accommodate the carriage traffic in Barrack-street? The carriage traffic sometimes occupies Barrack-street and George-street.
1140. Having in view the great public convenience it would be to the community as a whole, do you not think the question of carriage traffic would be a minor one? I am obliged to view the subject in relation to the requirements of our own business.
1141. You are speaking from a personal point of view? Yes.
1142. If the traffic in George-street were so ordered that only ordinary passenger vehicles and light vehicles would be allowed to travel there, would it not remove your objection to a very large extent? To a very large extent. But as long as the 'buses and the drays and the general heavy traffic are allowed to go along George-street, I should say that a double line of tramway would be too much for the street to carry.
1143. In that respect you confirm the evidence which Mr. Pomeroy, a member of your firm, gave before the Committee in 1890? I do not know. I have not consulted Mr. Pomeroy. He is not in the firm now, but I meet him daily.
1144. Although it might be a convenience to your business, if it were shown that it would be a convenience to a very large section, you would not oppose it on the ground simply of its interfering with your business? No; although it would be a serious question for us, as a firm, to consider.
1145. Is it not a fact that additional facilities for the public to get into the city increases the business in the city? Yes. It was noticeable that when a tram ran along Pitt-street some years ago the carriage traffic went out of Pitt-street to avoid as much as possible the danger which was then run with the trams. The traffic was not nearly so large then as it is now.
1146. It was taken up because it used to pull the wheels off the vehicles, but the modern kind of construction is so different that there is no danger of that kind to be feared? I can quite understand that.
1147. After all, you offer no serious objection to this proposal, provided that other things dovetail into it, such as the proper ordering of the traffic;—the centre poles in the street, and the running of the cars in the centre of the street will, to a certain extent, necessitate an altering of the traffic? Yes.
1148. And consequently it will remove your objection to a certain extent? Yes.
1149. You will admit that no kind of street traction, no matter what it may be, can be free from that objection on the part of business people? I freely admit that.
1150. You would give a trifle to get rid of the terrible noise in the street? Yes.
1151. If the tramway brought about an alteration in that respect, it would do good? As long as it did not interfere with carriage and light vehicular traffic.
1152. If the street were a little wider opposite to your place, you would not offer any objection to the proposal? If it were as wide as it is at Brickfield Hill, there would not be any objection at all.

TUESDAY, 31 *MARCH*, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (Chairman).

The Hon. Frederick Thomas Humphery.	Charles Alfred Lee, Esq.
The Hon. John Davies, C.M.G.	John Lionel Fegan, Esq.
The Hon. Charles James Roberts, C.M.G.	Thomas Henry Hassall, Esq.
The Hon. William Joseph Trickett.	George Black, Esq.
Henry Clarke, Esq.	Francis Augustus Wright, Esq.

The Committee further considered the proposed Electric Tramway from Circular Quay, Sydney, to the Redfern Railway Station; and also along Harris-street to the intersection of John-street.

William Douglas Bear, Esq., Superintendent, Metropolitan Fire Brigades, sworn, and examined:—

W. D. Bear, Esq. 31 Mar., 1896.

1153. *Mr. Roberts.*] You know that it is in contemplation to construct an electric tramway from a point on the Circular Quay along George-street to the railway station, thence along Harris-street to Pyrmont? Yes.
1154. Are you aware that it is also in contemplation to adopt what is known as the overhead system? Yes.
1155. Have you seen that system in use in any part of the world? I have not.
1156. But are you familiar with it? I am conversant with it.
1157. Do you think that overhead wires would interfere to any serious extent with the work of your brigade? The overhead wires would be bound to interfere with us to a greater or less extent, just as the present telegraph wires do; but it would be easier to cut the stretchers with a pair of nippers than it is to cut the present telegraph wires. At the present time it would take a quarter of an hour to cut the telegraph wires in front of some of our warehouses, and in that time a building might be gone. In many cases

W. D. Bear, Esq. 31 Mar., 1896.

cases the tall poles and the telegraph wires prevent our ladders from touching the walls of a building. With regard to the overhead electric tramway wires, however, all we should have to do would be to carry nippers and to cut them. The voltage of these overhead wires, however, would be a greater nuisance to us, and in wet weather, or when a great deal of water was being used, might disable our men.

1158. Have you often had to cut the present telegraph wires? Very seldom. In some cases the telegraph wires assist us, because we are able to lean our ladders against them and fire away.

1159. It would only be the work of a second to clip an overhead wire, and you could then work without inconvenience? Yes. I have taken the measurements shown on the plan, and I find that the stretchers are from 18 to 20 feet above the roadway.

1160. What is the result of the consideration that you have given to this matter? I consider that we should do wrong to stand in the way of the city. Whatever may come forward we are bound to have to fight it, and I would sooner fight an overhead wire system than I would fight an underground wire system such as I have seen in San Francisco.

1161. You are of opinion that the overhead system is superior to the system you saw in San Francisco? From what I have read of it I am positive that it is.

1162. Because you would be able to grapple with it at once? Yes. My experience by reading about the old country with reference to underground wires, was that if not properly insulated the soakage from them interfered with the water-pipes and the gas-pipes, and I am informed that that is so right throughout America.

1163. I suppose you are frequently in communication with all parts of the world? Yes.

1164. And the Committee may accept it as your opinion that the overhead system is superior to the underground system? I should not like to express that opinion, because I know that some of the American cities are greatly prejudiced against the overhead system. The fire brigades in particular object to it, because they are not able to work their water-towers and ladders as they would like to do. I am of opinion, however, that we must deal with difficulties as they arise, and I take it that if every ladder carries a pair of the ordinary long 8-ft. nippers, we shall be able to cut the stretchers and get the wire out of the way. The only difficulty, as I said before, is with regard to the voltage. At the present time, in wet weather, when dealing with telegraph wires, the men often have to drop everything, and, of course, then you are likely to lose the ladder, or even a man's life.

1165. *Chairman.*] That is because the electric current is conducted right into the man's body? Yes; it goes right through the man, and then on to the ladder again, and so to the ground. This happens more especially when it is wet. The moment the man clutches the ladder the current runs through him, or if he touches the iron lever, and consequently he is powerless, unless he insulates himself by using the tails of his coat or something like that to catch hold with.

1166. But you mentioned a further difficulty in regard to the nipping of the wires? At the present time we carry a pair of nippers to cut the telegraph wires, and we should have to carry special long nippers with indiarubber handles for these stretchers. I take it that if the ladders were to touch the electric tramway wire in wet weather the men on them would not be able to do anything, because the voltage would be so great, consequently we should have to cut the stretchers, so as to let the wire get out of our way.

1167. *Mr. Roberts.*] I understood you to say that there is danger from the voltage of the telegraph wires? Yes.

1168. You do not view the extra danger from the voltage of this tramway wire with alarm? No.

1169. And as Superintendent of Fire Brigades you offer no opposition to the construction of the proposed line? None whatever.

1170. *Mr. Wright.*] You have had no experience of electric tramways? None whatever, except what I have seen in America.

1171. You saw the conduit system in use in San Francisco? Yes.

1172. Did you make much inquiry about it there? The system was only just coming into use when I left, but the great difficulty in connection with it I understand was that the conduit got blocked up, and the current then ran to the iron rails.

1173. Did you place yourself in communication with the Fire Brigades office there in connection with the matter? I went to the Fire Brigades office, but not in regard to this matter.

1174. You heard nothing else against the system? No; except as to the cost of it. They were sinking all the gas and sewerage and water pipes away from the conduit.

1175. But they now claim that by having a return wire to the station they prevent any break in the circuit? But if you touch the wire and make earth yourself, you are bound to receive a shock from the current.

1176. I understand that at present when you rest your ladders against the telegraph wires, your men are sometimes rendered inefficient, because of the current? Yes.

1177. With this tramway system there would only be a small number of wires which would not affect you at all? The wires will be bound to interfere with the ladders in the case of large fires, because these ladders are 33 ft. long, and in being hoisted would be bound to catch the straining wires.

1178. But when in position they would not rest against these wires? No.

1179. If the wires were carried along near the kerb-stone the ladders would rest against them? Yes.

1180. How would you deal with the difficulty? By cutting the straining wire.

1181. Would not that stop the tramway service for the time being? Yes.

1182. So that the whole service might be stopped because of a fire in George-street? Yes.

1183. You have no stronger objection to the proposed overhead wires than you have to the present system of telegraph wires? I have not so strong a feeling against them.

1184. Provision has been made to carry the whole of the telegraph and telephone wires in George and Pitt Streets underground;—that will do away with a great deal of difficulty? Yes.

1185. And you do not apprehend much difficulty from this overhead wire? No.

1186. Do you think the conduit system would be better if a perfect return were obtained? Undoubtedly, from my point of view.

1187. It would be better for the fire brigades? There are a good many opinions in regard to that matter. The *Engineer* in some of its articles speaks very loudly about the soakage destroying the water and gas pipes.

1188. But it would be more convenient for the general public, and better for you, if the wires were placed underground? Such a system would be very costly, but it would prevent interference with us.

1189. *Mr. Trickett.*] Would the proposed tramway interfere with the working of the Fire Brigade Station near

W. D. Bear, Esq. 31 Mar., 1896.

near the Circular Quay? No; of course they would have to take greater care in turning out, but many of the main stations in London have much narrower streets to turn out into.

1190. George-street from Queen's-place pretty well up to Park-street is rather narrow;—would two tram-cars abreast there interfere with the progress of a fire engine? Well, we should either have to wait for them, or they would have to wait for us; but I do not see that the difficulty would be very great. Of course when we are at work on a fire it will be impossible for the trams to run. Under the present system of water supply, which I got the Water and Sewerage Board to carry out, our hydrants are connected with the mains under the pavements on both sides of the street, and directly we get two or three hydrants at work from opposite sides of the street the trams will have to stop. I do not see, however, that the running of the trams will interfere with the progress of a fire engine on its way to a fire. We can now get to any part of the city in three minutes. In six minutes I can have six steam fire engines in any part of this city.

1191. Mr. Deane suggested that before the tramway wire was cut in case of fire, the current could be turned off in some way;—I suppose that if that were done it would simplify your operations? It might do so in some cases, but I think that in the excitement of the moment it would be found that we should have to cut the wires first. When life is in danger, and five or six people have to be got out of a building, you cannot stop.

1192. I think the proposal of the Department is that there should be some ready way of turning off the current at frequent intervals along the street;—that, I suppose, would facilitate your work? Yes; I have heard about that, but there would be great danger of accidents if the whole tramway system were suddenly stopped. One car might run into another, and so on. At the same time, when you read up about what has been done in many other cities, you do not find that there have been many accidents.

1193. At all events, you do not anticipate any trouble in connection with this tramway system? I know that we have to face trouble, but I do not expect tremendous trouble. Our ladders are not nearly so long as the ladders they use in America, although they can be taken as high. We travel, as a rule, with 33 feet, whereas in America they travel with 46 feet; but our ladders go to the same height as the ladders in America—80 feet.

1194. In some parts of George-street it is proposed to put up standards—the wires being carried on projecting arms;—do you think that would be a good plan? That would cause no interference. My largest ladder travels 12 feet 6 inches high at the end, so that I would be well underneath this tram wire. Then in the wider parts of George-street there would be 12 ft. of clear space in which to travel, hoist, and turn round. As my largest ladder is on a turntable, I could hoist it to a certain height, and then turn it and get it right up without interfering with the wire. Where the stretchers go right across the street we could cut them and go on with our work without interfering with the current-wire.

1195. But when you cut the cross-wires would not the current-wire fall to the ground? It would sag; but I do not think it would fall to the ground.

1196. Might it not sag so low as to touch people on the ground? Yes, it might.

1197. That would be very dangerous? Well, Mr. Elwell told me that the voltage would not be enough to kill anyone, though it would give one a great shock.

1198. Do you think that you would be likely to have to cut more than one of the cross-wires? I do not think so. I have been here close on twelve years, and I have not had to cut the telegraph wires more than half a dozen times.

1199. If only one stretcher were cut, the sagging of the current wire would not be very great? I should not think so. Then, again, there are fire-alarm boxes at almost every 300 or 400 yards, and it would be easy to go to one of these boxes and give notice of a fire. The moment notice was given to any of the fire stations it could be sent on to the power station, and the current could be cut off at once. In this city you have an advantage which you have nowhere else in the world, in being able to go to these boxes and communicate with any part of the city, right up to Parramatta.

1200. *Mr. Fegan.*] How long have you occupied your present position? Eleven and a half years.

1201. Have any of the men under you been killed during that time? Three or four men have been killed since I have been here, but not by electric wires.

1202. Were any of those deaths attributable to the telegraph wires being in the way? No.

1203. *Mr. Hassall.*] Could not some precaution be taken against the danger arising from the electric current by putting non-conducting material upon the ladders? No; because it is the water that carries the current, and if you were to put the best non-conducting substance upon the ladders—and it would not be possible to do that—you would have the current transmitted by the water or rain running down them.

1204. Then the danger arising from contact with the current will always remain? Yes. The greatest trouble I have had in dealing with electric wires was at a fire at McLean Bros. and Rigg. I do not know whether they were using a greater amount of battery power that day—in fact, I should not think they were; but it was raining, and I had about twenty men on the ladder at one time or another before we could get it hoisted into position, because of the electric current from the wires. The lever of the ladder is iron, and directly the rain got on to it the current made earth and came right through. We reckon that it is a worse job to handle ladders when telegraph wires are about than it is to deal with chemicals such as jalap, salt-petre, and so on. The current takes all the strength out of the men.

1205. What height are your ladders when running? One runs to a height of 12 ft. 6 in., the other 12 ft. 1 in. Allowing for the springing and jerking in transmission from ½ foot to 1 foot, I should say that 13 ft. would be sufficient.

1206. If the wires were carried on standards erected in the middle of the street the fire engines or ladders could go along on each side without being interfered with? Yes. At the present time, I might mention, many of the telegraph wires are only 15 ft. above the pavement, although the Act says that they should be 18 ft. above the pavement.

1207. If the wires were carried on standards they would cause no obstruction to your ladders? No.

1208. Obstruction would be caused only by wires stretched from one side of the street to the other? That is so.

1209. And you could go under such wires? Yes; though when we got to the scene of the fire we should have to cut one or two of them.

1210. Perhaps you would have room to raise your ladders without cutting the wires? I think that in most cases we should not have to cut them. Our ladders are in three sections. In America the ladders are in two sections of 40 ft. each as a rule, but we carry our ladders in three or four sections, making a shorter length to run through the streets.

Paul

Paul Bedford Elwell, Esq., Electrical Engineer, Department of Railways, sworn, and examined:—

P. B. Elwell, Esq. 31 Mar., 1896.

1211. *Chairman.*] You have a full knowledge of the scheme before the Committee? I believe so.
1212. Do you desire to make a statement to the Committee? I have a few notes which I should like to read, and which I think may facilitate inquiry into the technical electrical points of this scheme.
1213. Have you treated the question under headings, dealing with it from various points of view, such as the engineering point of view, the traffic point, and the point of view of danger? I have only dealt specially with the electrical engineering aspect.
1214. What do you consider that embraces? The construction of the conductors, and of the power plant, the method of transmission from the power station to the line, and the construction of the motors and cars which it is proposed to run.
1215. Have you entered at all into a comparison between this system, and the conduit system, and others? I have studied all possible systems of electrical traction.
1216. Have you entered into the consideration of traffic? I have considered that matter in making my enquiries.
1217. Are you prepared to deal with it? Yes.
1218. Can you advise us with regard to the question of danger? Yes.
1219. Can you give the Committee information with regard to cities in other parts of the world where electric trams are in use, as to the width of the streets there, and the nature of the traffic in the streets? I have some information with regard to that matter.
1220. Will you read your statement? Yes; it is as follows:—

Note on the Electrical Working of the proposed George and Harris Street Tramway.

It is proposed to operate this tramway by the overhead electric system in its most improved form, and to obtain the necessary electric energy from the existing power-station at Rushcutter's Bay.

The diagram shows the general arrangement of the station, the black lines indicating existing plant and machinery, and the red lines the proposed additions.

The latter would consist of three combined sets of engines and slow-speed generators, each of 200 kilowatt capacity (300 horse-power), connected with the existing boilers, which would be increased in number by two. Two of the combined sets would be in daily use, the other being held in reserve.

The current from the generators would be first led to a main switchboard of marble panels, where the necessary measuring and controlling instruments would be fixed, and, from this switchboard, the current would be led by two copper cables well insulated and protected from injury by steel armour, laid underground (say) *via* Barcom-street, Campbell-street, Belmore Park, and the Benevolent Asylum, east boundary, to the Railway Station. A common return conductor of very low resistance would also be laid on the same route.

At the Railway station would be fixed the accumulator batteries, referred to further on, and from this point the proposed tramway would be supplied with current.

The general arrangement of the overhead wire would be as follows:—

At Circular Quay, ornamental cast and wrought iron columns, surrounded by a granite base serving as a refuge for pedestrians crossing this wide thoroughfare, would be erected, and two single hard-drawn copper wires, one for the up and the other for the down line, would be carried at a height of 18 feet from the ground by ornamental brackets on these columns. The arc lamps now used to light this part of the Quay might advantageously be placed on the new columns and the wooden poles removed.

From Circular Quay to Bridge-street, or thereabout, the pair of overhead wires would be carried by steel span-wires, at a height of 18 feet, between neat iron posts on opposite sides of the street at distances of about 120 feet. Or the span-wires might be attached to the house-walls by ornamental rosettes such as may be seen in many Continental cities and, more recently, in Coventry (England). Poles would not be required in this case.

Along the remaining portion of the route similar posts and brackets to those designed for Circular Quay might conveniently be used, the roadway being of sufficient width to allow of posts being placed in the centre.

Accumulators.

An important feature in the proposed electric tramway is the use of accumulators or storage batteries for the purpose of equalising the load on the steam plant at Rushcutter's Bay, economising the outlay in cables, and providing a reserve power in the event of any temporary interruption of the supply. The steam plant also can be shut down as soon as the passenger traffic for the day is over, and any shunting or light running can be worked from the accumulators. The latter also serve for lighting purposes.

The first illustration of storage batteries being used for this purpose was carried out by the Railway Commissioners in connection with the Military Road Tramway, and, since that time, the system has been introduced by the Oerlikon Company at Zurich, on two lines, by Dr. Hopkinson in the Isle of Man railways, and others. It is also being introduced in the States.

As above mentioned, the batteries of accumulators would be placed at the Railway station in any convenient spot, either above or below ground, and this would form the point of distribution of current to the several sections of the line by feeder-cables laid underground. From Circular Quay to the Town Hall might form one electrical section; from the Town Hall to the Railway station another; and Harris-street might be divided in a similar manner. Each of these sections would be operated independently of the others.

The use of accumulators is not a necessity in connection with the system, but it effects considerable economy in working.

Cars.

It is proposed to adopt a similar closed car to those now running on the Ocean-street cable line, but of larger dimensions, and with roomy platforms at the ends. A certain number of open cars, with reversible garden seats, awning, and blinds may also be used in the warm weather.

As a rule these cars would run singly at very short intervals, but, when required, two could be run together. It is proposed to construct thirty-five motor-cars for this service, each car to be fitted with two 25 horse-power single reduction motors, completely protected from dust or mud, with the gears running in oil. The starting, stopping, and reversing arrangements to be of the most convenient and economical type, and to include a power-brake to pull up the car in the shortest possible space, in addition to the usual hand-brake. The arrangement of springs carrying the car body will permit of the greatest comfort to passengers whether it be heavily loaded or nearly empty, and the time occupied in travelling from the Railway station to Circular Quay would be about twelve minutes. The cars would be well lighted at night by incandescent lamps.

Electric traction by accumulators (carried by each car, and so rendering them completely independent so long as the charge lasts) has made little or no progress in America, owing to opposing interests in the overhead wire system and the facilities with which concessions or franchises have been obtained for the latter. Accumulators are, however, about to be again tried on one of the New York lines, and the system to be adopted is practically the same as that now worked in Paris.

In Paris, accumulator cars have been working satisfactorily, from a public point of view, for some years past, and various types of accumulator and methods of manipulating them at the charging depôt have been tried, the latest being a combination of the "Chloride" negative plate with the "Tudor" positive. These are carried in one large tray or box suspended beneath the car body instead of under the seats as formerly.

But under the most favourable circumstances this system of working tramways cannot successfully compete with the overhead wire, and, unless a lighter and more durable type of accumulator is obtainable in the future, it must always be so.

Accumulators may, however, be advantageously used in conjunction with the overhead wire in a similar manner to that introduced by the Commissioners on the Military Road, and since adopted in similar cases on English and Swiss tramways. The accumulators are not carried by the cars, but are stationed permanently as a reservoir of power ready to be given out when sudden demands of traffic require it or a temporary breakdown occurs at the power-station. They are specially useful on long lines with small and fluctuating traffic, but are also of great value on city lines with continuously heavy traffic.

Prevention

P. B. Elwell, Esq.

31 Mar., 1896.

Prevention of Injurious Action upon Water or Gas Pipes.

Owing to insufficient return conductor having been provided in many cases when electric traction was first started on a large scale in America, the current passing from the motors to the rails had to make its way as best it could back to the power-station, and, where water or gas pipes afforded an easier passage than the earth, it naturally took advantage of them. This caused an electrolytic action to be set up between the tram-rails and the pipe-lines through the moist earth, and so long as the current only passed into the pipes no harm was done. But where the current had to quit the pipes and again pass through the earth to the power-station the electrolytic action corroded the pipes, and some remarkable specimens may now be seen in the historic collections of the tramway companies.

It was consequently found necessary to provide a good metallic return equal to or better than the overhead wires and feeder cables, and when this had been done, the subsequent reduction in the coal bills at the power-stations showed plainly that the tramway companies had been paying dearly for the power absorbed in corroding the pipes. Corrosion is now a thing of the past in all well-designed systems.

In England, the Board of Trade issued regulations drawn up at a conference of water, electrical, gas, and railway engineers, providing very thoroughly for an efficient return conductor in all cases.

Risk to Life caused by Overhead Electric Tram Wires.

An impression has been made upon the public mind that the current from the overhead electric tram wire is dangerous to human life, and that accidents have occurred resulting in death from shocks received. This impression has probably been caused in the first place by confusing the tramway wires with high-tension electric-light wires largely used in America, from which many accidents have occurred, and, secondly, from the fact that electric cars have been and are being driven at very high speeds without suitable power-brakes and fenders. Sixteen miles an hour is a common speed in the States, and any appliance for stopping quickly other than the ordinary hand-brake is almost unheard of. Similar danger would be caused by the steam trams in Sydney if no power-brake was used. But with a good power-brake, such as the Commissioners have introduced on the Ocean-street cars, an electric tram can be stopped in a shorter distance than is practicable with the heavy steam trams.

As regards risk from the current, there is no case on record where any person has been killed, and it has been proved times without number that the full strength of the current may be received without injury to human life. If it were not so, the English Board of Trade would not have permitted the system to be used in Leeds, Bristol, Coventry, Birmingham, and other places.

1221. You have made no mention of the effect which the construction of this tramway would have upon telegraph wires? It is usual where telegraph wires cross tramway wires to provide them with fuses, so that in case of accident the telegraph circuit would be instantly fused, and thus prevent injury resulting to the instruments.

1222. Is it expensive to provide fuses? No; the expense is very small.

1223. Are the telegraph lines affected by being in close proximity to the tram wires? Not in any way.

1224. Is it a fact that the telegraph line to Manly was so affected by the electric tram-wire on the Military Road that considerable expense was incurred in removing the difficulty? I have not heard of it.

1225. You state distinctly that the proposed electric tramway in George-street would have no effect whatever upon the telegraph and telephone wires there? It might have a slight effect upon the telephone wires, but its effect upon them would depend almost entirely upon the good conductivity of the tramway arrangements. It is found that whenever the conductivity is deficient the noise in the telephones becomes excessive.

1226. The trouble arises from defective bonding? Yes.

1227. *Mr. Lee.*] What do you mean by defective bonding? The rails for the purpose of the return current have to be bonded together by means preferably of copper cables or bars, which are riveted to the ends of the rails.

1228. *Mr. Wright.*] There must be perfect continuity? Yes.

1229. *Chairman.*] If the bonding is not effective the telephone wires and possibly the telegraph wires are affected? Yes. It is a good sign that something is wrong with the line when the telephone wires are affected.

1230. *Mr. Black.*] In some cases the rails have been welded together? Yes; that has been done to a considerable extent in America. I watched it being done myself, and they seemed to be very slow over it, but it has been very successful. I do not think the breakages, even in the coldest weather, when the strain is excessive, have exceeded 3 per cent.

1231. *Chairman.*] Can you tell us something as to the width of the streets in other parts of the world where these electric tramways are used? I measured a street in Minneapolis where they only use centre-poles, and I found that the width between the kerbs varied from 40 ft. to 70 ft., and as far as I could hear they had experienced no difficulty in working the traffic.

1232. What is the width between the kerbs in the narrowest part of George-street? Thirty-four feet.

1233. Can you give us any instance of a similarly narrow street where a tramway is worked? The Rue de Paris, in Havre, which is the main commercial street there, I found to be 33 ft. in width, and they were using a double line of rails there.

1234. What is the population of Havre? About 140,000.

1235. Is the traffic there as heavy as the traffic in George-street? Yes; in the Rue de Paris.

1236. Is there any town or city in which these trams are used in a street as narrow as George-street? They have a double line of rails in Broadway, New York, which averages 42 ft. 10 in. in width, as nearly as possible.

1237. Have you a list of the widths of the various streets in different cities in which trams are being worked, with the population and the amount of traffic in those streets? I did not measure the streets in Boston or Philadelphia; but speaking from memory, I have no doubt that in many streets there, where they have a double line of rails, the width is practically no greater than the width of George-street at its narrowest part.

1238. Would it be possible to give us such a table? Perhaps a good illustration would be the condition of Broadway at the present time.

1239. Where the width is what? Practically, 43 feet.

1240. Is that at the narrowest part? No; that is the average width of the part where the greatest traffic used to be, and where there is now the greatest traffic on the trams. It is the main artery of the city, and there is no parallel street in that part of the town.

1241. Can you tell us what is the narrowest part of Broadway? I cannot; but I will see what information I have amongst my papers with regard to the width of streets.

1242. You do not desire to use the surplus power of the engines now at Rushcutter's Bay, because there may be some extension of the cable tramway towards Woollahra? Towards Paddington.

1243. Can you tell us what scheme is projected? I do not know what scheme is projected, but I know that provision has been made in the station for another cable.

1244. What is the surplus power available at Rushcutter's Bay? It should be about 500 horse-power.

1245.

1245. How much horse-power will you require for the George and Harris Street tramway? The average power required through the working day will be a little under 300; but the maximum power required at certain moments might be over 500. P. B. Elwell, Esq. 31 Mar., 1896.

1246. Have you sufficient power at Rushcutter's Bay should you desire to utilise it? I think there would be just sufficient power.

1247. Could you utilise it? It could be utilised, but that would necessitate an expenditure almost equal to the amount required for the new machinery it is proposed to place there.

1248. Can you tell us definitely what the difference in cost would be? It would not be more than £2,000, but the present boiler-power might be fully utilised.

1249. Is that arranged for in the scheme before us? Yes.

1249½. And the only possible difference in expenditure would be £2,000 at most? Yes.

1250. You approve absolutely of the scheme before us, and state that only £2,000 at the utmost could be saved upon it, while that would virtually be a waste in view of future extensions;—you say that it would not be wise to use the surplus power you now have at Rushcutter's Bay, in view of possible cable extensions? Yes, and also in view of the possibility of electricity being used for the existing tramways. These large generators might be applied to the cable engines in the future in addition to the proposed plant.

1251. What portion of the estimate before us are you responsible for? I am responsible for the purely electrical portion.

WEDNESDAY, 1 *APRIL*, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (Chairman).

The Hon. Frederick Thomas Humphery.	Charles Alfred Lee, Esq.
The Hon. John Davies, C.M.G.	John Lionel Fegan, Esq.
The Hon. Charles James Roberts, C.M.G.	Thomas Henry Hassall, Esq.
The Hon. William Joseph Trickett.	George Black, Esq.
Henry Clarke, Esq.	Francis Augustus Wright, Esq.

The Committee further considered the proposed Electric Tramway from Circular Quay, Sydney, to the Redfern Railway Station; and also along Harris-street to the intersection of John-street.

Paul Bedford Elwell, Esq., Electrical Engineer, Department of Railways, sworn, and further examined:—

1252. *Chairman.*] You have some information to lay before the Committee incidental to questions asked last meeting, and in answer to a letter you have received from me? Yes. With regard to the question of the loss of power or leakage between Rushcutter's Bay and the Railway Station, I may say that in considering the transmission of electrical energy the great thing to be considered is the heating of the conductor. No electrical current can be passed through any conductor without heating it, and the degree to which the conductor is heated is the extent of the loss incurred in transmission. A cable 1 inch in diameter would heat just twice as much as a cable of double the sectional area with the same current passing through it. Consequently in the smaller cable the loss would be double the loss in the larger cable. It is purely a question as to the expense to which it is advisable to go in capital cost, in order to save working expenses. In calculating for the cables between Rushcutter's Bay and the Railway Station I allowed for an average loss of about 3 per cent; that is to say, at certain times there would be as little as 1 per cent. lost, while at other times the loss would be nearly 5 per cent. There is no leakage; the cable is practically safe against leakage. P. B. Elwell, Esq. 1 April, 1896.

1253. Is it immaterial where the generating station is placed? Immaterial apart from the cost of cables. A cable to transmit, say, 500 horse-power from Rushcutter's Bay to the Railway would only cost one-fourth as much as a cable to transmit the energy double the distance, because the latter would not only have to be twice as long, but it would also have to be twice as large.

1254. How far is it by the route you have chosen for the cable from Rushcutter's Bay to the Railway Station? About 130 chains. The cable would be 260 chains long. By doubling the voltage at the station you reduce the necessary size of the conductor to one-fourth, because double the pressure at the station sends double the quantity through the conductor with the same loss. It is purely a question of calculating suitable pressure from the point of generation to the point of distribution.

1255. What will the 260 chains of copper conductor cost? Considering the loss at an average of 3 per cent. it would cost about £3,500.

1256. Therefore, if you had the generating station adjacent to the tram-line you would save approximately £3,500? Yes, in capital cost; but if you are working other lines it depends upon how far they are distant from the generating station. The cables could be taken to the nearest point upon the tram-line, and if that were done it would be best to take them along William-street and Park-street.

1257. But which would be the best scheme? I thought the matter out and I found that the Railway Station would be far the better centre for distribution, because there is ground available there, and by adding to the accumulators we could use them for lighting the whole of the railway premises and so save our central station at Eveleigh. That saving would be considerable.

1258. Presuming that eventually electricity will be used for the whole of our tramway systems, where would you consider the best place at which to generate the power? The larger the system of tramways to be worked the less important it becomes to have the generating station at the centre of distribution, because in any case there must be sub-stations at which the electrical pressure is reduced from a high pressure distribution underground to a low pressure distribution for the overhead wires. Once you begin to use high pressure distribution—which must be done on any large system in order to save cost of cables—the locality of the central station becomes of less importance. The main point to be considered is where can the power be generated as economically as possible—that is, where can plenty of water be obtained for condensing purposes, and where can coal be obtained as cheaply as possible, not only having regard to the price, but also to the cost of conveyance from the waggons or boats to the boilers.

1259. Is Rushcutter's Bay such a place? It is not perfect, but it approaches perfection. For instance, there would be no difficulty in taking a light tramway down to the bay over the existing water-course, and a pier could be thrown out at which boats could unload. The coal, if brought by railway, could be

P. B. Elwell, Esq. 1 April, 1896.

lifted off the barges into hopper waggons, or, if brought direct by ship, could be unloaded into waggons, and the hopper bodies of these waggons could be conveyed by means of cranes right into the stokehole.

1260. But if you build a wharf and tramway specially to meet the requirements of the generating station, you must add that to the cost of the electric trams? Yes.

1261. What is the estimated daily consumption of coal for the proposed electric tram service? I think I ran it out at about 5 tons.

1262. If only 5 tons a day would be required would it be worth while to make a tramway and wharf for unloading coal? No; I do not think it would. I was considering the construction of a very much larger power station.

1263. You would regard Rushcutter's Bay as a suitable position for a generating station to supply power to the whole of the tramways? It would, perhaps, be a question whether, if it were decided to run all the tramways by electricity with future probable extensions, taking in the suburban railway lines, it would not be better to lay down a station more exactly suitable for the purpose.

1264. Is the Rushcutter's Bay site a suitable one? The site is very fairly suitable.

1265. Have you thought carefully about the position of a central station in the event of electricity being adopted on all the tram-lines? Originally, I thought that some site at Pyrmont would be the most suitable, being connected directly with the railway and with the harbour, and being sufficiently central for all purposes, but the initial cost for the George and Harris Street line would be very much greater if such a site were adopted than if the building at Rushcutter's Bay were utilised.

1266. You are utilising the boiler power and building space available in the Rushcutter's Bay building? Yes; we have the chimney-stack, the cranes and all fittings, and the boilers and condensers, and as I explained yesterday, in the event of extensions we could put generators on to the existing cable engines. As regards working expenses, that arrangement tells still more. If we construct a new station for the George and Harris Street line we should practically have to double our staff, whereas by working that line from Rushcutter's Bay we would only increase the staff a little.

1267. What would a new generating station for George and Harris Street cost? If it were only laid out for George and Harris Street, and provided for no extensions, it could be built for about £30 per horse-power. Having a maximum of 900-horse power available, it would cost about £32,000.

1268. That would be the additional cost if the Rushcutter's Bay station were not in existence? Yes; that would be the cost of building a station solely for the George and Harris Street line.

1269. Then, it would appear reasonable to add to the cost of the proposed line what you estimate to save by utilising a portion of the present arrangements at Rushcutter's Bay? I do not see that it would tell in the capital cost, but it ought to be divided in the working expenses; that is to say, the proper share of the generating station expenses should be allocated to the George and Harris Street line, and so relieve the cable line of certain expense.

1270. You have boiler power and other accommodation which at present stands charged to the cable tramway? Yes.

1271. What do you save by utilising these? If the Rushcutter's Bay station could be used, there would be a saving of £20,000, because about £12,000 would have to be spent upon additional plant—two boilers and an engine.

1272. By utilising the surplus accommodation and surplus power now at Rushcutter's Bay, you are able to submit this scheme for an electric tramway to us at an estimate of £20,000 less than would otherwise have to be framed? Yes.

1273. What would be the yearly wear and tear upon the conducting cable leading from the generating station to the track? Not more than $2\frac{1}{2}$ per cent.

1274. How long will the cable last? So far they have found no appreciable deterioration in such cables. There is no reason why they should not last 100 years; but, of course, it has yet to be proved that they will.

1275. Two and a half per cent. upon £3,500? Yes.

1276. What do you estimate to be the amount it would be wise to set aside for wear and tear? £100 a year.

1277. Supposing it were thought wise to do without a connecting cable, and to place the generating station in some other place, what would it cost? I do not see how these cables could be dispensed with except for the George-street line alone. If the central station were placed at Redfern they might be dispensed with for both George and Harris Streets, but for any extension of the system the cables must be used.

1278. What would it cost to build a station at Redfern? A central station at Redfern would save £3,500. Such a station for George and Harris Streets alone would cost about £32,000.

1279. You have not yet told us definitely whether you think Pyrmont will eventually be the situation of the principal generating station? If Pyrmont is chosen as the site the cable tramway will be driven by an electric motor, so as to save the staff at Rushcutter's Bay; that is to say, the engines will be taken from Rushcutter's Bay and used for the central station, and a couple of electric motors will be put in their place at Rushcutter's Bay. Two men would then be sufficient to manage the whole of the machinery at Rushcutter's Bay, working one shift each, and there would also be a saving of coal.

1280. Could you remove the boilers from Rushcutter's Bay to Pyrmont and still have ample power to run the cable trams? Yes; by using the electric motors, the tram to Paddington, which would be a very awkward route for an electric line, because the grades are very severe, could be worked by a cable driven by electricity. The first place at which I saw this done was Chicago, where they were saving between £2,000 and £3,000 a year by doing away with one cable station and driving the cable-drums by electric motors from their central electric station.

1281. In the event of your having the central generating-station at Pyrmont or some other suitable position, and utilising Rushcutter's Bay as a sub-station, what will be the value of the space unoccupied at Rushcutter's Bay? The boiler house, the chimney stack, and the space occupied by the engines, would then be practically useless. They make up more than one-fourth of the whole building.

1282. Then what proportion of the cost of the whole building would be lost? The chimney cost about £2,000, and I understand that the whole building cost something like £20,000; so that about £6,000 or £7,000 worth of buildings would be unused.

1283. Have you calculated the cost of the car-shed in connection with the electric tram? No; I have not. Mr. Deane deals with that matter.

1284. What other information have you to give us? I have a statement of the width of streets in which I have seen tramways at work in other places. I did not go into the matter very closely while away, because

because it was not at all the thing that I went to inquire into, and of course I gave up my time to what I considered would be most useful. But I measured some of the streets, and the information I obtained is shown in the following return :— P. B. Elwell, Esq. 1 April, 1896.

Place.	Population.	Street.	Width.	Remarks.
New York	2,835,000	Broadway	42′ to 43′	Cable.—Very heavy traffic.
Chicago	1,700,000	Clark-street	47′	Centre Poles.—Very heavy traffic.
Minneapolis and St. Paul	415,000	.....	40′ to 70′	Centre Poles.—Traffic about the same as Sydney.
Havre	130,000	Bould. Strasburg	48′	Centre Poles.
		Rue de Paris	33′	Side Poles.
		Rue de Paris	25	Single Line : Side Poles.—Traffic about the same as Sydney.
Birmingham	500,000	.....	36′ to 45′	Centre Poles.—Traffic about the same as Sydney.
Leeds	390,000	.....	34′ minimum	Centre Poles.—Traffic lighter than Sydney.

1285. That portion of the Rue de Paris which is 33 ft. wide would compare with George-street below Bridge-street, as far as width is concerned ; how would it compare as to traffic? The traffic in Havre is quite as heavy as the traffic in that part of George-street which you mention.
1286. How does the traffic in Leeds compare with the traffic here? The traffic in Leeds would hardly be equal to the traffic in George-street.
1287. Would the traffic be as heavy in Leeds as on that part of George-street near the harbour? It would be more that kind of traffic. The traffic in Leeds is not so much passenger traffic as heavy traffic. I have also a statement showing the estimated capital cost of the electrical portion of the proposed George and Harris Streets tramway :—

Poles, overhead wire, rail-bonding, &c.	£4,800
Additions to power plant at Rushcutters' Bay	12,800
Underground cables and accumulators	8,400
Motors, gear, trucks, and all other electrical equipment for motor cars ...	10,500
Lighting, telephone communication, &c.	800
	£37,300

Estimated working cost per car-mile—6·5 pence.

1288. *Mr. Lee.*] If the tramway were taken around the Circular Quay as far as the P. and O. Wharf, would that increase the cost of the electrical portion of the work to any extent? That extension would increase the length of the line by about 200 yards, and would increase the electrical cost by about £200.
1289. *Chairman.*] How? That would be the cost of the extra poles, overhead wire, and rail-bonding.
1290. How does the working cost of the proposed line compare with the working cost of electric systems in other parts of the world? Since higher wages and rather shorter hours have to be allowed for here, the working cost of the proposed line is about 1d. per car-mile more than the cost of the best systems in the States.
1291. That is where they generate power by using coal? Yes.
1291½. Speaking generally, would coal be about the same price in the States as here? I think it would.
1292. How does the estimated working cost compare with the cost of the tramway systems of Great Britain? I did not go into the cost of electric trams in Great Britain, because at the time of my visit nothing of any consequence had been running. Since then, however, they have equipped part of Bristol and Coventry with these trams, and they are going in for them in Swansea and Leeds on a larger scale. On the Continent, however, I found that the electric tramways were working still more cheaply. There are some splendid electrical overhead systems in Brussels, Hamburg, and Lubeck. In the last-named place the cost went as low as 4½d. per car-mile.
1293. How do you account for that? By the very low wages paid. At Lubeck I found that the drivers of cars got only about 18s. per week, with a small percentage on the takings. The wages here constitute the largest item in the working expenses.
1294. Can you divide your estimate of working expenses up into various items, such as wages, generation of power, and so on? I have not the actual figures before me now. The cost of wages will depend upon the number of cars run at a time, because it takes no more men to run two cars at a time than to run one car.
1295. On page 4 of "Memoranda regarding electric traction made by the Railway Commissioners," it would appear that the operating expenses per car-mile of the Chicago city railway came to 8d.? I found that their calculations were made in such a manner that their figures would not compare with what we were doing in Sydney. The cable trams in Chicago are generally run three cars at a time, and the electric trams two cars at a time. In Minneapolis I found them working by electricity at 5d. a car-mile, which would compare more nearly with the accounts made out here.
1296. Then how do you get your figures with regard to the cost of a car-mile in America? From various statements. As far as I could understand, in Chicago they were calculating the cost at per tram-mile and not at per car-mile.
1297. *Mr. Black.*] In America, if they have an additional car, it does not increase the number of conductors employed? On the Chicago city lines they have an enormous traffic, and with three-car trains they have two conductors. I would not be sure whether they have one or two conductors where there are two cars. In the case of large cars, with a great many people getting in and out, I think they have a conductor for every one.
1298. Then the saving is not in conductors but in motor-men, because while running three cars at a time you would only require two motor-men for six cars ; but running two cars at a time you would require three motor-men? Yes. On other lines where the traffic is not so heavy they could do perfectly well with one conductor for two cars. I read the answer in the *Engineer* of Nov. 1, to which reference was made yesterday, and as an antidote I would refer the Committee to a leading article in the same journal, published on 3 January last.
1299. *Mr. Black.*] In reply to the first article? No ; another leading article on the same subject.

P. B. Elwell, Esq. 1 April, 1896.

1300. *Chairman.*] You recognise that the *Engineer* is a paper of good standing? Certainly.
1301. The article on electrical traction in the United States was rather a drastic one? Yes. I might mention generally that what I saw of electric overhead wires in the United States was most objectionable. The style of the poles and wires was about as bad as it could be. In Brooklyn it is abominable, and would not be tolerated for a moment in Sydney.
1302. *Mr. Lee.*] These tramways are constructed by private companies, I suppose? Yes.
1303. *Mr. Black.*] Have the people no control over these private companies? Apparently they made no stipulation as to the manner in which the construction should be carried out. Now, however, they stipulate for a much better class of work, and the new work done in the States is very good, especially in Chicago. The following is an extract from the article of 3rd January:—

> Looking at the systems of street electric railways now in use, it appears that the overhead wire is the only one which has yet been found to pay.
>
> Both Dublin and Bristol are using the aerial conductor, and the splendid series of illustrations of foreign practice, which have recently appeared, prove to persons who have had no opportunity of personal inspection that the overhead wire can be made an ornament, and not an eyesore, even in streets of good architecture. The prejudice against such wires will, perhaps, gradually disappear in this country, and the railways in South Staffordshire, the Isle of Man, Leeds, and elsewhere, prove that the system is well adapted to the requirements of the public. The well-arranged system in many German cities must certainly lead us to think that we are very much behind on this point.

There is a similar article in the *Street Railway Journal* of January, 1896, a paper which corresponds with the *Engineer*, so far as street railways are concerned:—

THE OVERHEAD WIRE SYSTEM.

[Extract from *Street Railway Journal*, January, 1896.]

THE overhead wire system is the only one which has proven entirely adequate and satisfactory in the varying conditions found in American cities. This system alone has withstood the severest storms of the North; and the dry and gritty sands and salt moist breezes of the Gulf States. This system alone possesses that almost infinite power of adaptation and flexibility which has enabled it to handle the enormous traffic of our great city thoroughfares as efficiently as that in the barren wastes of "real estate" in the suburbs, or that of high speed rapid transit lines between cities and towns. The overhead wire system has its faults, and is quite as often cursed with bad management as blessed with good, but against all difficulties and obstacles thrown in its way it has triumphed and has won a place in popular regard which makes it certain that it will never be displaced by any other system offering less conveniences or a poorer service to the public.

1304. *Chairman.*] You regard the article from the *Engineer* of 3rd January as a reply to the article of 1st November? I regard it as an antidote, or a qualification.
1305. *Mr. Roberts.*] Is the overhead system at present in use in Broadway, New York? No; the system there is a cable system; but Broadway has been extended, and is now being worked on the electric system with a conduit, with a view to utilising the cable conduit down Broadway as an electric conduit.
1306. How long has the conduit system been in use in Broadway? I am referring to the Amsterdam Avenue extension. It has not been working many weeks. The line in Lennox Avenue has been working since August last.
1307. What system were they using before? Horse traction.
1308. That is down Broadway? Yes; they have overhead wires in New York, but not on the Broadway line.
1309. *Chairman.*] Have you anything further to say with regard to the article in the *Engineer*? No; I thought the best plan would be to read the extracts which I have just quoted.
1310. You would make it appear that there has been a change of opinion? In England they are always changing their ideas as they hear of each new thing.
1311. You believe that policy of the *Engineer* with regard to electric tramways has altered, as evidenced by the extract which you have read? Yes; opinion has been altering very rapidly in England, and in the last six months there has been shown a decided tendency towards the rapid extension of the overhead-wire system. With regard to Mr. Crawford's letter, which was referred to me, I may say that it reads as though it were written seven years ago. You can hardly imagine it to be of so recent a date as the 28th March; its statements are so absolutely unreliable. For instance, as far as Chicago is concerned—and that is one of the greatest cable cities in the States—they have not extended their cable system for the last two years, though they have extended their electrical system by something like 200 miles, and right through the heart of the city. On the Chicago city railway electricity has been substituted on over 40 miles of former horse tramway, reducing the mileage of horse tramways to less than 10, and bringing the electric mileage up to 118. On the North Chicago lines the electric mileage is about 80, while on the West Chicago line it is about 122.
1312. In extending their tramways they are adopting electricity? Entirely. In Clark-street they have occasionally forty double motor-cars and thirty-five trailers in a length of about 2 miles.
1313. Is your objection to the conduit system primarily one of cost? I think I may say that it is primarily one of cost, but an almost equal consideration is that it is practically untried. Personally, there is nothing I should like to do more than to lay down a conduit line, and I feel confident that I could carry it out successfully, although such a line has never yet been carried out, except at Buda Pesth, and there under exceptional conditions.
1314. What would be the difference in cost between the conduit system and the overhead system? According to Mr. Deane's figures on permanent way construction the cost of a conduit line for George and Harris Streets would be something like £23,000 per mile single track, or £46,000 per mile double track—that is, made in the same style as the electric conduit in New York.
1315. How would the working expenses compare? They would be precisely the same.
1316. But there would be an initial cost of nearly £100,000 extra? Yes. I should like to add, however, that it is most important that we should have a uniform system of tramways throughout the city and suburbs to facilitate economical working. If both the conduit and the overhead systems were used it would necessitate the fitting up of cars with double appliances to enable them to run on both lines.
1317. Have you any further information? I was asked to give the working cost of the Randwick to Waverley electric tram. The following are the figures in regard to that tramway:—Started, 9th November, 1890; stopped, 20th April, 1892; time of operation, 15⅓ months; car miles, 44,761; train miles, 42,191; loco. charges, £3,049; total charges, £4,255; per car mile, power, 16·34d.; per car mile, total, 22·8d. I may say that the cost per car mile for power should not as a rule exceed 1d. The tramway was constructed before I had anything to do with the tramway system here.

P. B. Elwell, Esq. 1 April, 1896.

1318. *Mr. Lee.*] Could not that extreme cost be accounted for? Yes, to a very great extent. They had not suitable engines or suitable boilers, and the road was most costly to work because it had a normal traffic of one car only. The cost of working a central station for a single car must always be high.
1319. That was a steam tramway temporarily converted into an electric tramway, and the bonding was not complete? It was a poor bonding.
1320. The whole thing was of a temporary character? Yes.
1321. And only an experiment? Yes.
1322. But an experiment which did not receive fair play? I should not like to make that statement.
1323. The work, if carried out under proper modern conditions, would cost a great deal less? That is quite possible. If the work had been carried out under an experienced electric tramway manager things would no doubt have been very different.
1324. *Chairman.*] You totally disregard the Waverley experiment as giving experience? Yes.
1325. What has been the success of the North Shore electric line? The cost of working that line averages 7d. per car mile, the same cars being used as were used on the Randwick line, though they are fitted up in a more modern fashion. The cost is exceptionally low, considering the low normal traffic there. We are able to work the line at so low a cost by utilising the spare power of the cable engines at Ridge-street, and we only had to put on two boys at the station when we started the electric trams.
1326. Were the generators at North Shore very expensive? They cost about £600 each.
1327. Do you regard that as expensive? No.
1328. How is it that the cable plant at North Shore can be used without employing expensive generators while the plant at Rushcutter's Bay cannot be used without employing expensive generators? The cable and electric systems at North Shore are on a much smaller scale, and I was able to arrange a counter-shaft to allow of the generator being run at a comparatively high speed, which would be impracticable at Rushcutter's Bay.
1329. Was the electric tram at North Shore a success at first? With the old motors it was never very successful, because of the very heavy loads that had to be carried on Saturdays and Sundays. As many as 95 people have been counted upon a motor car and 150 on a motor car and trailer. Of course that pulled the old-fashioned motors to pieces.
1330. You have no knowledge at all of that tramway affecting the electric telegraph lines? I did not understand that question yesterday. I understood you to refer to a tramway at Adelaide. On the Manly Road I originally arranged for the tramwire to be carried on the same poles as the telegraph wires, thinking that it would look far better. This plan has been tried in other cities since then, though it had not been carried out then, and it has been shown that there is no objection to it. The telephone wires, however, were disturbed because of the inefficient return at first provided. The rails were not bonded, and reliance was placed upon a single return wire which was run down the centre. Since then, however, I have connected the rails all along the line with the main water-pipes, and I have not heard recently of any complaints about the telephone wires being interfered with.
1331. Was the completion of the bonding the only step taken to prevent interference with the telephone wires? Those were the only steps taken which had any effect. I understand that other steps were taken, but they made no difference.
1332. What were the other steps? The wires were moved in some places to the other side of the road.
1333. Was anything further done? Not that I know of. The English Board of Trade carefully considered this question before giving permission for the construction of electric tramways. They first provided for a very efficient return being made in all cases, and where telephone wires ran parallel to tramway wires for any great distance—say for many miles—they provided that the tramway companies must give permission to the owners of the telephone wires to insert induction coils in the tramway service.
1334. Therefore, it was apprehended on general principles that there might be some difficulty? Yes; in some cases.
1335. You state that at North Shore the lines were moved to the other side of the road;—was that effective? It was of no effect at all. I did not expect that it would be.
1336. Who suggested their removal? I understand that the suggestion came from Mr. Walker, of the Telegraph Office.
1337. Are you aware that copper wire was run the whole length of the telegraph lines? No.
1338. You say that interference with telephone wires is caused from defective bonding, and that if the bonding is properly carried out there is no danger? Yes.
1339. Why was not this foreseen? The rails were laid down before it was determined to adopt the electric system there, and to save tearing up the road at every rail joint I tried to do without bonding.
1340. *Mr. Black.*] Did I understand you to say that you have placed the wire in communication with the water-pipes? The rails; that is the return conductor.
1341. Has that caused any electrolytic action? No; it has saved the electrolytic action, which only takes place when there is no metallic connection. In that case the current passing back to the generating station carries with it minute particles of iron. The Military Road line is not one which would stand a large capital outlay, so that we had to manage there as economically as possible. A return copper conductor ought, in all cases, to be used. The comfort of speaking on a complete metallic circuit is out of all comparison with the ordinary telephone speaking. You do not hear any one on the same line, or any noise. If the system were adopted in Sydney, speaking by telephone would be perfectly comfortable compared with what it is now.
1342. *Chairman.*] Is that system adopted elsewhere? Very largely. In some places they are obliged to use metallic circuits.
1343. Have you the original cost of the Military Road line? No.
1344. Nor of the saving which has been effected by using the cable plant at North Shore? We saved the cost of engine and boilers, station, and everything there. I can let you know the amount of the saving.
1345. Do you consider that a satisfactory electric tramway now? Yes; it has been working very well for the last eighteen months.
1346. You consider it a good specimen of an electric tramway? Of a cheap electric tramway. Of course, the poles and brackets are not pretty; they were put up as cheaply as they could be. The earnings at the present time are in excess of the expenditure, but not much.
1347. How do you make up the cost of 7d. per car mile? I receive monthly statements from the different

P. B. Elwell, Esq. 1 April, 1896.

different branches as to the various charges. The estimate is quite accurate; there is no question about it.

1348. You have not yet shown us how you make up the 6½d. on the George-street line? I estimated the cost of my branch of the work. The complete estimate was formed on my estimate and statements supplied by the Commissioners.

1349. *Mr. Humphery.*] How do you reconcile the statement that in Chicago the cost of working per car mile is 8d., and that there they pay lower wages and work longer hours, with the statement that here the cost of working will be only 6½d.? The wages are very much higher in Chicago than they are in Sydney and the hours are the same. It was the only place where I found wages to be higher than they are in Sydney. The traffic there is exceedingly heavy, and they pay the men as highly as three dollars a day each for eight hours.

1350. Is that the explanation? I think that that accounts principally for the difference. I never found trams worked so expensively, so far as the wages were concerned, as the Chicago trams.

1351. *Chairman.*] Have you any further information? Yes, with regard to the experimental accumulator car. The actual cost of working that car was 1s. 6d. per mile; but from the data obtained during the experiment I was enabled to estimate that if the system were generally adopted the cost would be only 1s. a mile. The car used was a standard 70-seat car.

1352. The cost would be 1s. as compared with 6½d. for the overhead system? No, 6½d. is the cost of running 40-seat cars. With similarly seated cars the cost would be as 9d. for the overhead system to 1s. for the accumulator system.

1353. That estimate is based upon your experience here? Yes, and no better experience has been obtained anywhere else. The experiment was highly satisfactory. I estimated that the cost would be approximately what it turned out to be. Of course the arrangement was a make-shift one. We charged the car from the existing electric lighting plant at Eveleigh, and everything was arranged cheaply, so that the materials used could be employed elsewhere afterwards.

1354. Do you regard the steam tramway service as satisfactory? No, I do not.

1355. Did you regard the accumulator service as satisfactory? Yes, so far as it went, considering the size of the car and that it was running in between the steam trams. The revenue obtained paid the working expenses of the car.

1356. What was the initial cost of the experiment? About £2,000, and the material has all been utilised again elsewhere.

1357. What did the £2,000 include? Two motors and trucks to carry the car, a battery of accumulators, and the fitting up of the car.

1358. What has become of the material used? The motors are being or will be used on the Military Road line, with the extension that is now being made. The accumulators have been put as a reserve power at the Ridge-street cable station, and the car can be run on the ordinary tram-lines.

1359. Why did you not use a rapid running car with which to make the experiment? The car was built by the Locomotive Department, and they turned out what they considered a very good car.

1360. *Mr. Black.*] Do you not think that the car was rather long for the purpose;—it appeared to me to have a pitching motion? I think that was mainly owing to the road. It is not a smooth road.

1361. *Chairman.*] Why did you not continue to run the car if the experiment was satisfactory? The experiment was conclusive.

1362. Conclusive of what? As to the cost of accumulator traction in Sydney.

1363. Was it necessary to test that? Yes. I found that there was quite a strong feeling among some of the authorities on tramways that accumulator cars would be the best to use in Sydney, and the experiment showed that they could be worked with very favourable results, if the charging was done at a general electric supply station. In that case the accumulators could be charged at practically no expense to the station, because they could take the current when it was not required for other purposes. The accumulators could be charged at any time with the spare power of the station.

1364. Was it necessary to have this experiment in order to prove that the accumulator system was not the best system? I think so.

1365. And it proved that? It proved that the accumulator system was more expensive to work than the overhead system.

1366. Was the experiment sanctioned in the first instance to prove the cost? Yes.

1367. And you proved the cost to be prohibitive? No.

1368. What did you prove? We proved what the cost was.

1369. What was it? The experiment showed that the cost of running, say, twenty cars by means of accumulators would be under 1s. a mile, which would correspond with a cost of 9d. a mile for the overhead system with the same sized cars.

1370. Therefore it proved the cost to be too high? It proved the cost to be higher than the cost of the overhead system.

1371. Therefore, other things being equal, it would be wiser to adopt the overhead system? Yes.

1372. What does the cable system cost? I do not know what the Ocean-street cable is costing now. The cost of cable traction varies enormously, according to the nature of the traffic.

THURSDAY,

THURSDAY, 2 APRIL, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (Chairman).

The Hon. Frederick Thomas Humphery.	Charles Alfred Lee, Esq.
The Hon. Charles James Roberts, C.M.G.	John Lionel Fegan, Esq.
The Hon. William Joseph Trickett.	Thomas Henry Hassall, Esq.
Henry Clarke, Esq.	George Black, Esq.

The Committee further considered the proposed Electric Tramway from Circular Quay, Sydney, to the Redfern Railway Station; and also along Harris-street to the intersection of John-street.

Paul Bedford Elwell, Esq., Electrical Engineer, Department of Railways, sworn, and further examined:—

P. B. Elwell, Esq. 2 April, 1896.

1373. *Chairman.*] I understand that you have some information as to the exact arrangement you propose to make for the utilisation of Rushcutter's Bay station in connection with the proposed tramway? The first question to consider is whether it would be advisable to use the extra power of the engines at Rushcutter's Bay for the proposed electric tramway—whether it would be wise to use it.

1374. *Mr. Black.*] When you say "wise," do you mean economically? Economically from a working point of view, and considering the security of working.

1375. You include that consideration? Yes.

1376. Then it is not only the economical working of the line that you consider? No. To do such a thing would practically be to put all your eggs into one basket, because an accident to the cable engine would stop not only cable trams, but the electric trams as well. Supposing the other engine were undergoing repair—and it might be in that position for some days—a breakdown of the working engine would stop both cable and electric trams.

1377. *Chairman.*] You have two boilers there, have you not? The boiler-power would be the same in either case.

1378. Therefore, what you say applies only to the engines? Yes. If we put down separate engines for the George and Harris Streets line, and the electric system were extended, as it seems practically certain that it will be, to all the lines, we could apply generators to the cable engines with very great advantage, and we should have something to fall back upon at any time. We should then have always one small and one large engine to fall back upon in case of a breakdown. The proposed generators for coupling to the cable engines would cost about £3,500 each, fixed complete and coupled to the engines. They would weigh about 40 tons each, and their speed—58 revolutions per minute—would be sufficient to supply 400 kilowarts, or about 500 electric horse-power each, which would be ample for the George and Harris Street lines. The cost of the two would be about £7,000. The extra boiler-power which we must have, whether we utilise the existing cable engines or put down separate engines, and other arrangements which we would have to make, would make a total cost of £12,000 for the station, a difference of about £2,000 between the two estimates. The generators would be very economical ones. They would probably run for twenty years without any material repair, owing to the slow rate of speed.

1379. Have you the cost of the cable tramway per car-mile? I think I can ascertain that for you. The following is a statement in regard to the Military Road electric tramway:—

Length of new line—2 miles 13 chains; total length electrically operated—2 miles 36 chains.

Cost of construction	£17,697	
Rolling stock	7,148	including £7,076 transferred from Randwick-Waverley line.
Machinery	1,852	
Total	£26,697	

Additional cost that would have been incurred had not the existing cable station and spare power been utilised, estimated at £4,500.

Working expenses in pence per car-mile:—

	First year of operation.	Second year.	Third year.
Locomotive branch	6·52	6·97	Not yet complete, but will be about
Traffic	1·47	1·89	
Permanent way	3·08	2·00	
	11·07	10·86	7.5

The decrease effected in the present year is largely due to improved motors.

The electric cars pass over 23 chains of the cable line, which is a double track; the rest of the line is a single track, with three crossing-places.

1380. *Mr. Humphery.*] You have supplied new motors there? Yes; new motors to all the cars. Those were charged to the working expenses in the second year.

1381. What is the reduction in cost per car-mile? The reduced cost of working amounts to 3½d. per car-mile. I have here an interesting extract from the report of the Leeds Corporation Tramway Committee, which visited Brussels and Havre in order to form an opinion as to the advisableness of putting an electric tramway through Leeds. It is as follows:—

Brussels.

At Brussels we found an exceptionally complete and well-laid-out sample of the overhead system. There are two lines electrically operated, having a total length of about 19 miles, and thirty-five motor cars, each one of which takes a trail car. Before the introduction of the electric system a large portion of the lines was worked by steam, and although the municipal authorities at Brussels opposed strongly the introduction of the overhead wires, the Belgian Government and public opinion caused them to give way, and the satisfaction now given is very great. With the steam locomotives the smoke, coal-dust, and condensed water made the route decidedly unpleasant. Now, with the electric traction, the improvement is most marked. The electric system fulfils the requirements of the public much better than the steam trains. The increase of traffic since the lines have been opened, we are informed, is very considerable, amounting to 100 per cent.

Havre.

P. B. Elwell, Esq.

2 April, 1896.

Havre.

At Havre is one of the most complete examples in Europe of electric traction on the overhead system. The whole of the network of the Havre trams, which was originally operated by horses, is now electrically equipped. The cars are fitted up in very good style, and the electric equipment is of the latest pattern. The overhead line is a good example of this class of work. In the narrow streets the wires are suspended over the track by cross wires of steel, fixed in some cases to ornamental brackets let into the walls of houses, and in other cases by steel posts. In the broader boulevards there are centre posts with ornamental arms on each side carrying the trolley-wire, and electric lamps are placed on the top of every alternate post. The effect is extremely good. There are about 560 posts. Of this number, 85 have arc lamps on them, lighting about 4½ miles of thoroughfare. We understand that it is likely that the number of arc lamps is shortly to be increased. The generating plant is placed in the central station of the local electricity supply company, with whom the tramway company have made a contract for the supply of electrical energy.

1382–3. Are the lights supplied by the machinery that operates the tramway? Yes.

1384. Do you propose to supply electric lights along the tram route? If it were required there would be no difficulty in doing it.

1385. Would there be any additional cost? The additional cost for George-street, from the Quay to the Railway Station, that is about 2 miles, would be the expense of providing about 50 horse-power, supposing the lamps were placed at intervals of 50 yards, which would be an effective distance. The cost of supplying these from the tramway current would come to about £500 a year, including the cost of attending to the lamps. That would be about £8 each for 1,000-candle lamps. I have here descriptions of the Bristol electric tramway which was opened a few months ago:—

ELECTRIC TRACTION ON THE BRISTOL TRAMWAYS.

(Extract from *Lightning*, 17th October, 1893.)

A PECULIAR interest attaches to this line, which can claim to be unique in many respects. It is as already stated, the first line constructed under the new Board of Trade regulations, and its equipment embodies the latest improvements in modern practice. Further, we may take it as broadly typical of the overhead lines to be constructed in the near future, with the somewhat important modification that most of the coming municipal electric tramways will be supplied with energy from the same works which provide the neighbourhood with electric light.

The chief objection hitherto raised by local authorities, in this country, against overhead systems of electric traction has been based on the assumption, that of necessity, they must be unsightly. It is easy to see that in former days there was good ground for this assumption. The early American system of fixing span-wires across the roadways between two posts, and suspending the overhead conductors from these span-wires, was highly objectionable in appearance, and it is not to be wondered at that our municipal bodies steadfastly set there faces against its introduction into this country. But time has brought improved methods, and it is not too much to say that a well-planned modern system of overhead conductors is not only free from any approach towards ugliness, but is, on the contrary, calculated to considerably improve the general appearance of our average busy thoroughfares.

With regard to the second objection, the Board of Trade regulations provide effectually against undue interference with existing telegraph and telephone wires, and require stringent precautions to be taken to prevent all likelihood of damage to gas and water pipes from electrolysis. The successful working of the tramway under these rigid restrictions will help to allay the opposition—engendered by an exaggerated fear of leakage currents—of the gas, water, and telephone interests; and this in itself will be no small accomplishment. With these preliminary observations, we pass on to give a short history of the undertaking.

The generating station is situated in Beaconsfield-road, close to St. George's Church, and about equi-distant from the two ends of the line, which is in all upwards of four miles in length.

The line starts from the end of Old Market-street, and runs in an easterly direction *via* Lawrence Hill and Bedfield-road to the London-road and Kingswood.

The line throughout its length is handicapped by pronounced gradients and curves. Between Old Market-street and St. George there are several inclines of 1 in 30, 1 in 32, and 1 in 35; immediately before reaching the points leading into the power station there is an incline of 1 in 15 for a length of 220 yards; and past the depôt on the road to Kingswood are gradients of 1 in 17 and 1 in 20. The road continues to rise until it approaches the Kingswood terminus, where it reaches an elevation of 300 feet above the starting point in Old Market-street.

Line.

The length of the new electric line is slightly under 4 miles, and it consists of double line, single line with passing places, and interlacing line. The interlacing line has been used very liberally in places where otherwise single line, with passing places, would have been necessary. Although costing more to construct than the latter, the adoption of the former method in narrow roads has two important advantages. In the first place, all the complications of points and crossings, with the consequent decrease of average speed that occur upon a single line with passing places, are rendered unnecessary; secondly, the interlacing line, by preventing cars from passing one another in a narrow street, ensures compliance with the Board of Trade regulations on this point.

Overhead Conductors.

The arrangement of the overhead gear has been planned with a special eye to appearance, and the contractors have succeeded in turning out a line which should go far to prove that, instead of being inherently ugly, the overhead equipment may be made the occasion of artistic display.

The overhead gear is entirely supported from standards set either in between the two tracks or at the edge of one footway, the latter method prevailing. These standards are at an average distance of about 30 yards apart, and are made of steel tubes in three lengths, which overlap for a considerable distance, and are shrunk together whilst hot. At the summit of each standard so formed is a strong bracket ornamented with a tasteful design in wrought ironwork, and from the ends of these brackets depend the insulators supporting the trolley wire.

The standards are embedded in concrete to a distance of 6 feet below the ground level, and each is surrounded for a short portion of its length above the footway by a cast-iron base which is merely slipped over the post, and in no way takes any of the strains to which the standard is subjected.

Throughout the whole length of Old Market-street, a particularly wide thoroughfare, with four lines of tramway, the standards are placed in the centre of the roadway, two lines of tramway passing on each side of them. The alternate posts are utilised for supporting the arc lamps with which the corporation light the street; and the effect of the whole arrangement is extremely good. Centre posts are also used at Lawrence Hill and Bedfield-road, where the tramway is some distance from the pavements.

1386. *Mr. Trickett.*] Have you had any practical experience of electric tramways except in connection with the Military Road tramway and the recent accumulator experiment? Yes; I was engaged on the Blackpool electric line in 1886 and upon the Port Rush electric railway in Ireland in 1885.

1387. What system is in use at Blackpool? The conduit system.

1388. If I remember rightly you strongly favoured the conduit system when before the Committee on a previous occasion;—what has caused you to change your views? That was in 1890. When I first came out here I had not seen anything like good work on the overhead system. In fact, it had been used only to a very small extent, except in outlying places in the States, and from my experience at Blackpool I was confident that I could make a thoroughly good conduit line here. On finding out, however, what great expense a conduit line would be in Sydney and what difficulty there would be in working it in combination with the existing lines, I changed my opinion.

P. B. Elwell, Esq. 2 April, 1896.

1389. In generating all the power at one station is there not a danger if anything breaks down of the whole system coming to a standstill? Everything would be arranged to prevent a breakdown at the tation. The only possibility of breakdown would arise from the bursting of a boiler, or from fire. The bursting of a boiler might totally disarrange the station for a time, but it would be extremely improbable, and so, too, would be a fire, because the station can be made practically fireproof.
1390. I ask the question because when you gave evidence before your objection to the cable tramway was that in case of a breakdown at the central station the whole system would stop;—is there any fear of a stoppage of the main current between the power-station and George-street? Not under the present system—not even so much as if there were a separate station for George-street. Six years ago the general impression was that it was better to have several stations to provide against breakdowns, but since then the stations have been so much improved, all possible precautions being taken against breakdowns and stoppage of supply, that you can depend more upon one perfect station than upon several isolated stations.
1391. You would have one main wire to George-street, which would convey the current for propelling the cars from the Circular Quay to the Redfern Railway Station; but how about the Harris-street extension? I would take a pair of cables from Rushcutter's Bay to the railway with a common return cable. The common return cable could not possibly break down, and it is only remotely possible that either of the leading cables would suffer an injury. If one of them were injured we could continue to use the other.
1392. *Chairman.*] Yesterday you made no reference to the common return cable? The estimate given yesterday includes the cost of the two leading cables and a common return cable. From the point of distribution at Redfern there would, in the first instance, be very short cables to the nearest sections of George and Harris Streets; then there would be longer cables also laid underground, to some point near the Post Office or the Town Hall, and a similar distance along Harris-street.
1393. *Mr. Trickett.*] Each working independently of the other? Yes.
1394. You stated that the Railway Commissioners had adopted some accumulator system on the Military Road tramway to be used in case of emergency;—is that in actual working now? Yes; it has been working nearly three years.
1395. I understood you to say that it had been introduced into the States—where? It is being introduced into the States now, but it is only during the last year or so that they have felt sufficient confidence in accumulators to use them for that purpose. Accumulators have been used principally in Germany and England.
1396. How long would that accumulator work in the case of a breakdown or disconnection of the overhead wire? My idea in placing the accumulator on the Military Road was simply to level the load-line; that line is normally one car with sometimes a trailler, and sometimes two cars, and the power taken fluctuates extremely. At one moment the car will take as much as 40 horse-power and at other times nothing at all. The accumulator, which was made under my designs and placed at the end of the line, absorbs the power from the generator when the cars are not taking any, and gives it out again when they require a sudden draft of current. It works just like an hydraulic accumulator. For that reason I made it with a very small storage capacity, but with very large powers of discharge. For instance, you can take 100-horse power from it for a few minutes.
1397. Then if the generating station broke down, the car would still run on for some distance? As a matter of fact, a car started one morning when the engine was not doing work, and ran to the other end of the line and nearly back again before they found the current fall off. I intend applying the same system to all lines, for two reasons: First, to level the load, which is a very important matter in economical working; and, secondly, to provide for the running of cars in the case of a break-down.
1398. But if there were no connection with the overhead wire, would the cars be able to proceed by means of accumulators within themselves? No.
1399. So that if anything happened to the overhead wire, a stoppage of the traffic would result? If the wire were broken or cut, a section of the line would be rendered useless until repairs had been effected.
1400. Mr. Deane said that the wire would be divided into sections, and that in case of fire only a small section would have to be disconnected;—how long would these sections be? I thought of working with sections of three-quarters of a mile, but of course there is no limit. It is extremely improbable that the wire would be interfered with in the case of a fire, because it will run along the middle of the road.
1401. Only the cross wires would be cut? Yes; and the cutting of those wires would not cause any trouble, though the trams would have to run more slowly over the sections.
1402. But if the cross wires were cut would not the main wire fall down? No; because the distances between the cross wires are not great enough for that. Then, too, provision will be made to carry the hoses across the street without interfering with the working of the trams. A kind of portable bridge will be made about 10 feet long, which will raise the car about the height of the hose.
1403. Mr. Bear told us the other day that he frequently rests his ladders against the electric telegraph wires, and that the current going down the ladders incapacitated his men. Supposing the ladders were in contact with the tram wire, would the current be strong enough to affect the men? Yes, if there were water on the ladders. The cross wires, of course, would be harmless.
1404. But the main wire would give a very strong shock? Yes; the men would feel it very much. They could not work on a wet ladder which was in contact with the main wire.
1405. In your travels did you specially inquire as to the inconvenience arising in the case of large fires? Yes; I took special notice of that in most cases.
1406. With what result? I could not see that the wires would interfere in any way.
1407. Did you make inquiries? Yes; I made inquiries all round. In America, where they have most wires, they have made modifications in their arrangements so that at the first signal of a fire the current may be cut off from any portion of the line.
1408. As far as you know no inconvenience has been caused? Yes.
1409. In how short a time could the cars be stopped in case of emergency, supposing they were running at their ordinary speed? A car running at the normal speed of 10 miles an hour could be pulled up in its own length.
1410. That would be by means of the power brake? Yes; and if necessary the motors could be reversed. Of course in greasy weather the car might slide a little further.

P. B. Elwell, Esq. 2 April, 1896.

1411. In one of the papers placed before the Committee it is suggested that the accumulator system has been considerably delayed by reason of the monoply that exists in connection with the overhead system; what are your views upon that point? I think the system would have made more progress if the principal manufacturers in the States had not been pushing forward the overhead system to such an extent.
1412. They do not seem to experiment with the accumular system in America, as much as in other places? No. The accumulators are working very successfully in Paris, but the cost is higher than the cost of the overhead system. Here I think it is quite probable that we may use a certain number of accumulator cars for running out to distant suburbs where a frequent service is not required.
1413. Seeing that the accumulator system is now being used to drive ordinary carriages, does it not seem strange that it should not be applied to vehicles running smoothly upon rails? The difficulties are less in the latter case; but people do not mind going to great expense in connection with private vehicles.
1414. These private vehicles are very costly? The electric vehicles are very costly. The most successful of these motor carriages seems to be that operated by a kerosene or oil engine.
1415. But is not that work in combination with electricity? No. Of course you can obtain a charge of oil anywhere, but it is difficult to obtain a charge of electricity.
1416. In view of the fact that a great deal of money would be wasted if a change had later to be made from the overhead to the accumulator system, do you still recommend the accumulator system for the proposed line? Certainly. In the event of the accumulator system being improved, which is remotely possible,—though no material improvement has been effected in the system during the last six years,—the cars would be used first on lines having a small traffic. The very last use of them would be on lines such as George-street where the traffic is heavy. Such a system would be most economical when the service was not too frequent.
1417. If a change were made what would be the cost? It would be comparatively small. The expense of the accumulators would be the main item. The existing power arrangements would continue.
1418. But there would be the loss of the overhead wires and the pillars? The poles would probably be wanted for electric lighting purposes.
1419. The cost of change from the conduit to the accumulator system would be very much greater? Yes.
1420. What voltage will be used on the proposed line? Normally 500 volts. The English Board of Trade has fixed that voltage as absolutely safe so far as human life is concerned.
1421. Have you seen the electric tramway in Hobart? No; but I saw similar cars made by the same contractors working in Genoa and another place.
1422. Is not that rather an out-of-date system? I do not consider it equal to the other overhead systems that I saw. The cars make a whistling noise as they go along and look clumsy, but the system is quite practicable.
1423. What system would you recommend for the proposed line? The overhead wire system.
1424. Any patent? No.
1425. Are these systems patented in America? Some of them are, but as a rule the main principle throughout is the same. Each of the makers has his own special points to recommend.
1426. There is nothing to pay for the patent right? No.
1427. Could you adopt the Thomson-Houston system here without paying for the patent rights? Yes; practically the same system. Of course it would be best to obtain tenders for the different portions of the work. As far as the overhead wire was concerned, our own engineers could carry that work out perfectly well.
1428. You could take the best out of everything you have seen in your travels and design a car without paying anything for patent rights? Yes; I found that in Chicago the companies were doing their own work, simply obtaining supplies—dynamos, generators, engines and so on from the makers. They design their own overhead work.
1429. The machinery in the body of the car and the dynamos would have to be bought in America from the patentees? In the first instance, they would have to be bought, but if we had a very large system it might pay us to manufacture. In that case we should not have to pay for any patents.
1430. What system is in use in Bristol? There they have Thomson-Houston generators, Willan's engines, and G.E. motors on the cars. The boilers are Babcock and Wilcox, I believe. Those are very favourable boilers because of the practicable impossibility of their bursting.
1431. The proposed line seems to me a very expensive one,—the estimated cost is £130,500? Yes; permanent-way always seems to me to be very costly in Sydney. It is so, especially where there are many pipes and where there is a wood pavement.
1432. What sort of pavement have they in Bristol? Macadamised road.
1433. *Chairman.*] What difference would there be, with the exception of the bonding, between a line necessary for George and Harris Streets and a line such as that in Elizabeth-street? There would practically be no difference. The bonding is such a small item in comparison with the total cost of the line that you may neglect it.
1434. You consider that it would cost as much to make the permanent-way for the proposed tramline in George-street as it costs to make the permanent-way where we have steam motors running? Although the electric cars and the cable cars are much lighter than the steam motors, it has been found economical to lay down the best type of permanent-way in the first instance. The following is a statement of the lengths of cable and electric tramways in Chicago:—

West Chicago lines	30 miles cable,	120 miles electric.
North „	17 „	66 „
Chicago City lines	34 „	117 „
Total	81 miles cable,	304 miles electric.

1435. Have you any information as to the number of passengers carried? No; the balance-sheets will not be out for two or three months yet.

WEDNESDAY,

WEDNESDAY, 8 *APRIL*, 1896.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

The Hon. CHARLES JAMES ROBERTS, C.M.G.	JOHN LIONEL FEGAN, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	THOMAS HENRY HASSALL, Esq.
HENRY CLARKE, Esq.	GEORGE BLACK, Esq.
CHARLES ALFRED LEE, Esq.	FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Electric Tramway from Circular Quay, Sydney, to the Redfern Railway Station; and also along Harris-street to the intersection of John-street.

Paul Bedford Elwell, Esq., Electrical Engineer, Department of Railways, sworn, and further examined:—

1436. *Vice-Chairman.*] Have you prepared a statement as to the respective merits of the cable and the electric systems since the last meeting? I have prepared this statement:— P. B. Elwell, Esq. 8 April, 1896.

THE only conclusion to be arrived at after making a general inspection of European and American systems of tramways, is that the cable must now be relegated to the list of special appliances to be used in exceptional situations, but to be avoided wherever it is practicable to introduce a flexible system, *i.e.*, capable of indefinite expansion with economy.

There is no question as to cable lines paying well where the traffic is heavy enough, but there must always be a point at which the cable must terminate, because it could not be made to pay with only a suburban traffic. Consequently there must be a break in the system, causing inconvenience to the public, as well as expense to the working.

In Chicago, where there are several cable lines with very heavy traffic, the companies are trying various expedients to avoid trans-shipment of passengers from cable to electric cars, at the end of the cable sections. In some cases they are running electric cars over cable lines, and in other cases they are drawing the cable cars behind the electric-motor cars, the tendency being to discard the cable altogether—mainly on account of the inconvenience.

In San Francisco the following extract from the February number of the *Street Railway Journal* of New York, 1896, shows that the cable has actually been discarded, owing to the greater popularity and economy of the electric cars.

In the month of September, 1873, or a little over twenty-two years ago, the first cable street railway in the world was started in San Francisco. This line was on Clay-street, where the grades are from 10 to 16 per cent., and its original object was only to furnish means of transporting passengers over lines that were not feasible for horse or steam traction, as these were the only systems in use for street cars at that time. The road was a success mechanically and financially from the start, and its fundamental features were quickly copied on other roads in this city and in other cities.

Articles have appeared in Eastern journals from time to time to encourage San Franciscans in the belief that the cable system was really more economical than the electric, except on long suburban lines, but for about a year and a quarter the Market-street Railway Company has owned electric roads of its own, and has been making data for itself. Snow has not bothered the Company at all on its cable roads, nor has the frost closed up the slot. The expense for cables has not been abnormal, and the original construction was most substantially done in iron and concrete. In fact, the conditions for cable-road traction in San Francisco are the equal of any in the world, and the construction and operation of these roads are unsurpassed. The Market-street Company, however, has become convinced that the people prefer to ride on electric cars, and that the electric-cars carry the people more cheaply than does the cable. These results were not obtained from a few electric cars run on level lines and at high rates of speed, but from the operation of upwards of 150 cars at from 1½ to 2½ minute headway at times, and on lines having grades as high as 14½ per cent. Most of these cars are subject to frequent interference from the heavy wagon traffic on the down town streets, and all of them are governed by the rule ordering reduction of speed at the crossing of each intersecting street.

The Company began cautiously by changing its old horse-car lines to electric lines. Later it decided to equip with electricity the route of a franchise designed to be a cable road, and for which 30,000 dollars' worth of cable material had already been bought. The routes of all new franchises were then ordered to be equipped as electric roads, and finally it decided to abandon the use of the cable on one line—Ellis-street—and substitute electricity. This last decision is considered by many as very significant, and as foreshadowing the changing of not only all cable roads on the level to electric roads, but the changing of all cable roads on grades accessible to electric cars, and not only the cable roads of the Market-street system, but also those of the other cable roads in the city. The Market-street Company maintains at present six cable-power houses, and each has its two large monthly items of fuel and labour. Every time a cable power-house can be dispensed with, and the lines operated by electricity, that power-house's item "labour" is wiped out, and the item "fuel" is reduced, both on account of the lesser fuel required per car mile for an electric road as against a cable road, and because the cable-houses are usually run non-condensing, whereas in the electric power-house the engines are run condensing.

The same may be said of Philadelphia and Pittsburg, where cable lines have been converted to electric in order to have one uniform system throughout.

1437. Have you any other statement to make? That is all.

1438. *Mr. Trickett.*] This paper which you have just read and handed in is confirmatory of your former evidence, that the transition is entirely in favour of the electric system? Yes.

1439. You quite understand, in considering this question, that one of the important items which the Committee have to consider, with the view of getting the matter considered possibly by Parliament hereafter, is the matter of expense? Yes.

1440. I understood the other day that a certain part of this work will be carried out by Mr. Deane, such as the roadway—that portion of the work will be under his superintendence, will it not? I believe that the whole of it will be carried out, nominally, by Mr. Deane.

1441. You having been sent by the Government of New South Wales, through the Railway Commissioners, to a considerable portion of the world for the purpose of getting experience in this particular kind of traction, will you be entrusted, as far as you understand, with the carrying out of this line if the Committee recommend and Parliament sanctions it? I understand so.

1442. That being so, can you give the Committee detailed information to enable them to arrive at the cost of that portion of the scheme which will come under your particular direction? I have already made a statement as to that.

1443. Then the answer to my question is contained, you say, in question and answer 1287? Yes.

1444. We understand, then, from that answer that out of the total estimated cost of £130,500, the portion which will come under your control will cost only £37,300? Yes.

1445. Leaving a balance of £93,200 to be expended for laying the permanent-way? Yes, and the rolling-stock—that is, the car bodies principally.

1446. Laying the permanent-way, supplying the rolling-stock, and supplying the car bodies, but not the motors, because you have charged for them? Yes.

1447. What are the trucks which you charge for? The trucks are the undercarriages of the cars; motors and trucks really go together.

1448. Then would you kindly tell us what this £93,200 is to be expended on, so far as you can see; you are going to expend £37,300 for the items enumerated in question and answer 1,287? Yes.

1449.

P. B. Elwell, Esq. 8 April, 1896.

1449. What is the country to get for the £93,200, the difference between your amount and the total estimate given by Mr. Deane of £130,500? I understand that that would consist principally of the permanent-way and the car-shed, and the land necessary for it.
1450. Does not that seem to you a very large sum for a short length of tramway such as this is, a little over 3 miles? It is very high, but I understand that various contingencies are provided for in case of having to remove water-pipes and various difficulties that may be encountered in George-street.
1451. Well, those certainly are contingencies to be provided for, but the provision would seem to be very ample, I should say;—do you not think so? I believe very ample provision has been made for all contingencies.
1452. It really comes to about £30,000 a mile? Yes.
1453. From your recent travels and inquiries do you not think that, by way of comparison, that is a very large amount? It is higher than I have met with in any case, but I understand that the cost of laying the rails in the wood-blocking is more expensive than under any other circumstances.
1454. *Vice-Chairman.*] Have you any statement showing the cost of construction in any other part of the world? I have details of the cost of a permanent-way in macadamised roads in the United States.
1455. Have you seen the electric system in operation in any city wood-paved like ours? No.
1456. Have you the details you refer to with you? I have not them here, but I have them in my report to the Commissioners, which, however, I have not got with me now.
1457. *Mr. Trickett.*] You see that one of the chief functions of this Committee is to ascertain the cost of carrying out a work of this kind, and it does strike me that this amount is very high indeed for such a short length of tramway as that proposed, and putting down your own amount, which is a somewhat moderate one, we want, if we can, to get at the cost of this permanent-way, if you can help us at all? Of course Mr. Deane has taken that entirely.
1458. You have not conferred with Mr. Deane on this subject? Not on the cost of the permanent-way.
1459. Did you supply him in the first instance with those details which you have given to-day? Yes.
1460. So we may conclude that he has taken your items as the probable amount of the work you there set out? Yes.
1461. Can you inform the Committee as to the cost per mile of any other lines of tramway that have been recently constructed in this or any other country? I may read you the following extract:—

There being no hardwood pavement in use on American tramway lines I have taken for comparison with the cost in New South Wales, what may be considered a standard form of construction of double track which I saw being laid on a macadamised road in the neighbourhood of Buffalo.

The figures are obtained from the contractor who possesses a high reputation for good work, and who inquired if there was any chance of obtaining a contract on a similar scale in Australia.

Rails, 60 feet long, girder type, 7 in. deep, weighing 73 lb. per yard.
Sleepers, 8 ft. x 9 in. x 5 in., said to be good for nine years, fitted with angle-plates or knees (acting as chairs).
Ballast, 6 inches, machine crushed, under sleepers, 5 inches between sleepers, and 7 inches on top. Total, 18 inches
Fish-plates, 24 inches long; eight bolts.
Electrical bonding. Two U shaped No. 0 copper bonds riveted in the flanges below the fish-plates. Also a similar copper connection across every third pair of rails, including both tracks.
Total cost per mile of single track, £2,400.

1462. Where is that? That is the line that has just been finished between Buffalo and Niagara.
1463. Would that be a line that vehicular traffic would cross and re-cross? Yes.
1464. But still not such a class of road as would be necessary in George-street and Harris-street, Sydney? No; as far as the road went, it would be the simplest form of work;—no pipes to be interfered with, and no pavement.
1465. You have no other comparison which you have made? No; I could not obtain any complete details of the cost in other places.
1466. *Mr. Clarke.*] With reference to the overhead system which it is proposed to bring into operation in George-street and Harris-street, you have already given evidence that you consider it to be the best system at the present time? Yes.
1467. As to the cost; in fact, it is the best and cheapest mode of traction at the present time? Yes; it is the cheapest system of traction.
1468. Do you think that the accumulator system which has been in use from Redfern to the terminus near Circular Quay is not suitable? Not at all suitable for George-street. It is quite possible that that might be found the cheapest system of traction for outlying suburbs where a very infrequent service is required.
1469. The conduit system, then, you entirely disapprove of? As far as George-street is concerned. Apart from all other considerations, a conduit could be made to work fairly economically. Although the first cost would be very much higher than that of the overhead wire, the working cost would not be higher as far as I can tell; but the difficulty would be where the conduit line ended and the overhead electric line began. It would entail carrying double appliances on all the cars. We could not possibly continue the conduit system into the suburbs.
1470. Are you aware that it is intended ultimately to convert the present system of trams to the electric system? Yes.
1471. Have you any idea of what the cost of converting the present steam tram system to the electric would be? The conversion of the existing steam lines into electric traction by the overhead wire would cost from £1,000 to £1,200 per mile of double track.
1472. Have you taken into consideration the advisableness or otherwise of a single line commencing at Circular Quay and going up George-street, and another line going through Pitt-street, and uniting somewhere in George-street, near Park-street? Yes; that is a scheme which was brought before the Public Works Committee some years ago.
1473. Yes; four or five years ago? The only drawback was that it appeared to me that it would not meet the demands of the traffic so well as the double line in George-street.
1474. Do you consider there would be more danger in having a double line in George-street or a single line, as I have just intimated? I think it would be preferable in every way, on account of general safety and convenience, to have a double line in George-street and no line in Pitt-street, so that people wishing to drive through would always have Pitt-street clear.
1475. I suppose you are aware that many years ago there was a horse tramway in Pitt-street? So I understand.

1476.

P. B. Elwell, Esq. 8 April, 1896.

1476. Have you taken into consideration the expense of a single line, as I have already mentioned, or a double line up George-street;—which would be the cheaper? The double line up George-street. There would not be a great deal of difference, but the difference would be naturally on the side of the double line. The double line must be cheaper.
1477-8. I noticed that in the evidence you gave a few days ago you said you were aware of the working of some lines at Blackpool and Port Rush, in Ireland;—under what system do those trams work? The Port Rush line was the first electric railway in the world, I believe, and that was made along an ordinary road—on one side of the road, so that the conducting rail, which in that case took the place of the overhead wire, could be carried about 18 inches from the ground, close to one side of the road, and so be out of the way of the traffic. It would not be suitable for city traffic at all. The Blackpool line is a conduit line, and has been fairly successful from the beginning.
1479. The Port Rush line is a very short one, is it not? About 10 or 12 miles.
1480. From Port Rush to Bushmills? Yes.
1481. Are you aware whether that line exists still, or whether it has been abandoned? It still exists.
1482. *Mr. Hassall.*] How long have you studied this question of electric traction or electric motor-power? Since 1878.
1483. Have you given the matter personal attention since then? Yes.
1484. And you have taken a trip to the older cities of the world in order to obtain the fullest information with respect to the best motive power for the conveyance of passengers in a city? Yes.
1485. And what conclusion have you arrived at? That a system of traction by means of the overhead conductor, if properly arranged, is by far the best and most suitable in nearly every case.
1486. Is that on the ground of economy, as well as everything else? Yes.
1487. On the ground of increased facilities and conveying the public at minimum cost? That is really the main point—the greatest facility of conveyance, with the convenience of expansion in any desired direction with economy.
1488. For rapid and safe transit of a large passenger traffic? Yes.
1489. You have compared the cable system, the conduit system, the accumulator system, and the overhead-wire system? Yes.
1490. And you have definitely arrived at the conclusion that the overhead-wire system is the preferable one of the lot? Without question.
1491. *Mr. Fegan.*] I understand that your evidence went so far as that you had not heard that the electric tram interfered with the telephone wires at North Shore? I misunderstood the question in that case. I understood that it referred to some line at Adelaide.
1492. Have you heard that there was some interruption caused at North Shore through the tram? Yes.
1493. Would you give us the reason for that interruption? The overhead wire on the Military Road runs parallel to the telephone wires for a distance of about 2 miles, and it is necessary for me to explain that so long as an uninterrupted current of electricity is carried along those conductors at the side of the telephone wires, no effect of any kind is produced on the telephone wires. For instance, you might carry 1,000 horse-power through those conductors, within an inch of the telephone wires, and you could not possibly produce any inductive effect on the telephone wires, but the moment that the current is interrupted then it produces a distinct disturbance of the telephone, and when the current starts again you get a similar effect, though not so great, so that all interruptions of the tramway current are reproduced to a greater or lesser extent on the telephone wires, and it is found that without touching the telephone wires for a moment the best way of reducing the effect upon them, as far as the tramway conductors are concerned, is of course to put them as far away as possible to begin with, and the next is to have as perfect a return conductor as possible through the earth. Both the telephone and the electric tram currents return together through the earth, and if the electric tramway currents are distributed all over the earth, as they must be if they have not a good return conductor of their own, they interfere to a great extent with the telephone, and in the first instance on the Military Road we had what was a decidedly defective earth return on the tramway wires.
1494. I suppose you remember that several cases were brought before the Supreme Court in America between telephone companies and tramway companies as to the great interference caused to the electric current of the telephone wires? Yes. There have been several cases, and I think that, without exception, the final decisions have been, first, that the tramway companies must make good earth returns for their wires, and, next, that the telephone companies should have a metallic circuit, and no earth return at all.
1495. What would it cost for a metallic circuit in this city;—have you any idea? No, I have not; but it would be a very large sum.
1496. But you think this work could be carried out without interfering with the telephone wires? Yes; with a good earth return on the electric tramway wires there would be no more interference with the telephones than there is at the present time in the city.
1497. What constitutes a good earth return? The best possible would be a rod of copper running through the ground, but as the steel rails are already there we utilise those to the greatest possible extent by joining the ends of the rails with copper bonds, so that there shall be no electrical resistance at the fishplates. It will be, practically, a continuous conductor. The steel rails weight for weight are only about one-sixth or one-seventh as good a conductor as a solid rod of copper would be, but then they are a very much larger section.
1498. Do you remember the case in Glasgow which came under the notice of the authorities there, where the telephone company—which is a private company, I believe—had to put up double wires? The telephone companies had to put up double wires in all cases I have heard of if they wished to have a perfect system.
1499. I suppose you remember the case, do you not? I do not remember that particular case, but I know several cases which I have carefully followed in England, and the decision has been that the tramways are of more importance to the travelling public than the telephones, and that the preference ought to be given to them, especially as it costs far less and is far more profitable to have a metallic circuit on the telephones than it would be on the tramways.
1500. I suppose that the cost would run into thousands of pounds to have a metallic circuit in Sydney? Yes, all over the system; but along George-street alone it would be a small matter.

P. B. Elwell, Esq. 8 April, 1896.

1501. But if it needed a metallic circuit for George-street it would, of course, affect the greater portion of the wires, would it not? To a small extent it would—according to the distance they run parallel.
1502. Affect almost the whole circuit? Yes; but I do not think the tramway wires would have anything like the interrupting influence that the existing telegraph wires do in George-street.
1503. I understand you to say that you had charge of the Blackpool electric tramway? I designed the machinery, motors, and generators for Blackpool and several other lines in England.
1504. Did the public find any fault there with the telephonic communication? I never heard of any complaint at Blackpool.
1505. And you saw it in full working order, I suppose, before you left it? Yes.
1506. And no complaints whatever were made against it? No.
1507. That was on the conduit system? Yes.
1508. And it worked satisfactorily? Fairly; it was put down in too cheap a manner at first, and it had to be partly relaid.
1509. It was put down for visitors because in the summer Blackpool is a great watering-place? Yes; I think it was worked all through the winter in every case, but, of course, the traffic then was very small compared with the summer traffic.
1510. The summer traffic is very large there? Yes.
1511. Do you think it is necessary to have the road along which the tramline will run from George-street to Harris-street paved with wood-blocks? I think that is a question for the municipal authorities.
1512. It would make it a much better road when once put down—a more permanent way? It is certainly to the advantage of the permanent way to have it wood-blocked.
1513. And it would not take so much to keep it in repair as it would otherwise? No; it would not.
1514. And it would be safer? Safer in every way.
1515. *Mr. Wright.*] You are, I understand, a properly-qualified electrical engineer? Yes.
1516. And you feel quite satisfied, with your professional attainments, to undertake this or any similar work? Yes.
1517. In answering a question about the cost of constructing a road in America, which you took to be as near an approximation as you could get to a wooden road, you talked about sleepers and ballast;—was that a tramway or a railway? It was a tramway, but intended for high-speed working, up to at least 20 miles an hour.
1518. Do you approve of the system proposed here of laying down these rails on solid concrete without any buffer in the shape of a sleeper? Yes; I found that the best construction in Boston and New York was carried out in that way.
1519. Was, in fact, laid solid? Yes; on the concrete.
1520. Was that in wood-blocked streets or macadamised roads? Either macadamised, or granite paved, or asphalted.
1521. Well, take the granite paved as being the nearest approximation you can get to wood-blocking, do you think that having the rails on the concrete would have the effect of disturbing the roadway itself? I do not think it would have so much effect as heavy-wheeled traffic on the pavement.
1522. In giving your figures as to the work that would come under your cognisance. you quoted these things:—"Overhead poles, overhead wire, rail-bonding, &c., £4,800; additions to power plant at Rushcutter's Bay, £12,800; underground cables and accumulators, £8,400; motors, gear, trucks, and all other electrical equipment for motor cars, £10,500; lighting, telephone communication, &c., £800; total, £37,300"—those, you say, would come under your immediate control? Yes.
1523. Would you look at Mr. Deane's estimate on page 6? This appears to include the whole of the work.
1524. But looking at his answer to my question number 85, you notice that Mr. Deane says that he takes the responsibility of everything excepting the purely electrical work, and he includes the machinery in his work? It is rather difficult, of course, to divide the electrical machinery from the purely mechanical machinery. In fact, it is almost impossible to draw the line.
1525. But I may suppose that you are satisfied that Mr. Deane should have the supervising of the additional engine-power? Yes; I think so. I think the entire work ought to be carried out with his approval. I am simply acting really as consulting electrical engineer to Mr. Deane.
1526. Is it a fact that the overhead-wire system in certain portions of America has been strongly protested against, and is in danger of being removed? There is no doubt that in some places the municipalities are trying to make the tramway companies introduce the conduit system.
1527. For what reason? The main reason is because of the very objectionable style in which they have put up most of their overhead wire work.
1528. Then you think that their work is badly done? Very badly done, indeed, in most of the old cases; but, on the other hand, in Europe, where I saw really good overhead work in some of the most ornamental cities, there was no objection of any kind raised to the overhead wires.
1529. You found it largely worked? Very largely. It has been extended very rapidly.
1530. I gather that from your experience as an electrical engineer, you think it is the best system that has yet been made known? Yes; the conduit in most places would be difficult to extend, owing to the very much greater cost.
1531. From your experience, or from your knowledge, as an electrician, do you think there is any likelihood of electrical locomotion advancing very far beyond what it is at the present time? It is possible that a different system of working may be introduced—that is, what is called a three phase.
1532. Do you think it is possible that the advance in science will enable us to have electric motive-power on other than rigid roads? No; I do not see any prospect of that at all.
1533. You think there is no prospect of science so far advancing as to enable us to have electric traction on ordinary roads—what I call the independent traction, as against the rigid traction of the railway? I believe that private electric carriages and vans may be introduced, because on good working pavements they could be run with very little more resistance than on rails, and, of course, being able to take a van-load of goods from one spot to another without transhipping to any line of rails would be a very great convenience. But the cost of the traction must always be greater than on rails with overhead wires.
1534. Would it be very much greater with good wood-blocked roads than on lines, supposing there was a smooth surface? The cost would mainly be greater owing to the necessity of using the accumulators, each vehicle carrying its own propelling power.

P. B. Elwell, Esq. 8 April, 1896.

1535. There is no possibility then of the system of overhead wires being adopted for independent vehicles? I do not think it is practicable. It would entail the necessity of steering the car exactly underneath the overhead wire. There would be a great many difficulties.
1536. And you look upon the proposal now before the Committee as in no sense of the word an experiment? In no sense whatever.
1537. You think from your knowledge as an electrical engineer that you are proceeding on perfectly safe lines in recommending this system of traction for the city of Sydney? Absolutely; beyond all doubt.
1538. *Mr. Lee.*] In the event of the overhead system being adopted, and it being subsequently discovered that the accumulator principle was preferable for practical purposes, could the overhead system be converted into the accumulator at a minimum of cost? The only cost that would have been incurred that might have been avoided by introducing accumulators in the first place would be the cost of overhead wires and poles. Everything else could be utilised.
1539. Well, in that case, if it were necessary to adopt the accumulator system in a few years, it could be applied to the cars that would be then running under the overhead system? Perfectly.
1540. And the overhead wires could be removed? Yes.
1541. Can you from memory say what is about the cost per mile of that portion which would be dispensed with? From £1,000 to £1,200 per mile in the city, but then the wire would be worth just as much as if new, and the ornamental poles could be used for lamp posts or other purposes in other places.
1542. Does the present estimate of cost admit of any future extension of the system—for instance, if this turns out right, it would be thought well, perhaps, to put it in Pitt-street, and I want to know if it could be carried into Pitt-street without increasing the power? The mains running from Rushcutter's Bay to Redfern as well as any accumulators that were put down would all provide to some extent for extensions, that is the extra cost of making the extensions would be very much smaller than if those mains and accumulators were not there.
1543. It would require some additional expense if the system had to be extended to some other street? You could extend it a mile, or a couple of miles, perhaps, without.
1544. Supposing it were decided to extend it to Pitt-street by-and-bye? I would simply put down perhaps one or two more boilers and one more engine.
1545. And that would meet the whole case, except the cost of construction? Yes.
1546. Have you in your special travels through electrical America and other countries met with streets as narrow as George-street, and carrying as great a traffic, through which electric traffic was conducted? I have met with streets on the average quite as narrow as George-street, and with quite as heavy traffic both in Europe and America, but especially in America, with quite as heavy traffic as in George-street, and which did not average any greater width than George-street.
1547. I do not want it in detail, but I ask you for a point blank reply, because you have been sent out into the world to inquire into this matter, and we want to put your evidence before the country; have you met with streets as narrow as George-street, and with as great a traffic as George-street, and through which electric traffic has been conducted? I have.
1548. And have you found that among the many electric systems in use the overhead system is in advance of all others for street traction purposes? Very much in advance.
1549. Well, then, you are of opinion that, if the estimated cost of construction is not exceeded, and if the estimated expense of maintenance is not exceeded, the figures, so far as your Department is concerned, can be relied upon? Yes.
1550. And do you think it is possible that the cost of conducting the traffic will exceed the estimate? I do not.
1551. Could you make any suggestion by which this proposal could be improved without impairing its economy and efficiency? No; I could not.
1552. Therefore, you are prepared to recommend to this Committee a system which from your researches you are clearly of opinion can be adopted with safety, and will carry the traffic as well as it is carried in the streets in any other part of the electrical world? Yes, I am.
1553. It has been said here that the reason why the cost of the power-house at Rushcutter's Bay so largely exceeded the estimate was in consequence of putting in additional power, which power was capable of driving from two to three times the length of cable; that being the case, how does it come about that the boiler-power is not sufficient to drive the motors for the electric tram? I understand that only sufficient boilers were put in for the King-street to Ocean-street cable line, but provision has been made in the boiler-house for two more boilers, and there is convenient space, with very little addition to the building, for five more, and the chimney stack is equal to ten boilers in all.
1554. *Mr. Black.*] Have you not said that the distance between the standards would be about 120 feet? Yes.
1555. What would be the distance between the span-wires? The same distance in an ordinary run, but rounding a corner or running down Circular Quay there would be more of them.
1556. In reply to a question put by Mr. Lee you said that in the event of accumulators being substituted for the overhead wire system the only loss would be on wires and standards;—would there be no loss with regard to disused buildings? I think not.
1557. You think they would be used for the production of power? Just the same.
1558. Is it probable that any development of the motocycle would render it capable of taking the place of a tramway system? I do not see any probability at all.
1559. I suppose that in such an event it would render all the rigid roadways unnecessary? It would in such a case, but I think that even considering only the question of labour—the extra labour entailed in steering the trams especially—it would cost more than the maintenance of the permanent-way. Without rails, all vehicles would have to be steered, and that would entail very constant and very careful work, and the cost of paying the men to do that would be greater than the cost of the maintenance of the rails.
1560. *Mr. Roberts.*] Am I right in understanding that the amount of engine-power to be procured from Rushcutter's Bay is about 500 horse-power? Roughly yes, as a maximum.
1561. How much power will then be left available for the further extension of the present Ocean-street cable tramway? Taking all the power as duplicated—that is to say, that you would never be using more than half the power of the house, there will still be about 200 horse-power left.
1562. Would that be sufficient for any contemplated extensions of the cable system? Yes; that would be

P. B. Elwell, Esq. 8 April, 1896.

be sufficient for any contemplated extensions, but with very little alteration the station could be increased to any desired power.

1563. You do not intend to utilise the power at present in existence at Rushcutter's Bay, do you? As far as the boilers are concerned yes, but not as far as the cable engines are concerned. We would use all the boiler power jointly for the two lines, but it is considered that it would be better to leave the cable engines alone until a larger provision has been made against any possible accident.

1564. Then what really is intended to be done, I understand, is that you will convey the power by an underground cable from Rushcutter's Bay to Redfern? Yes.

1565. But what sort of work will really be necessary within the Rushcutter's Bay buildings to enable you to do that? Two more boilers, and three combined engines and electric generators.

1566. And if this electric system should be generally adopted throughout the city and suburbs, would there be sufficient space in the Rushcutter's Bay building then from which to procure the necessary power? Yes; it could be extended without difficulty. Probably the most convenient way would be to take a small portion of the existing car-shed into the engine-house. That would be all that would be necessary, because the boiler power with present arrangements would be sufficient—that is to say, there is room there for ten boilers altogether.

1567. Owing to the probability that this electric system will be generally adopted throughout the city and suburbs in lieu of the present steam tramway system, do you not think that it would be more economical to start afresh and to erect a power-house capable of supplying the necessary power for the electrical system throughout Sydney and suburbs, instead of utilising the Rushcutter's Bay building which, I should imagine, would be hardly satisfactory, in view of the possible extensions to which I have referred? I thought at first that it would be a great deal better to lay out a station for the purpose of generating electricity, but after considering all the points at the Rushcutter's Bay station, I came to the conclusion that there would be very little difference in the long run between the cost of working from there and the cost of working from any other point that you could choose, and the initial cost, of course, would be very much greater in a new station.

1568. I forget if you furnished any figures with regard to the initial cost of a power-house for the electric system alone? I think I did give some approximate figures for a power-house for George-street.

1569. Would that be for the proposed line only? For the proposed line only.

1570. Was it about £32,000? Yes, it was.

1571. You have been consulted, I presume, as to the conduct of this power from Rushcutter's Bay to Redfern, and the utilisation of the present buildings there? Yes.

1572. And you quite approve of the scheme as laid before the Committee? Yes, I do.

1573. Under all the circumstances you think it is the best thing to be done? Yes.

1574. *Mr. Fegan.*] What would it cost to have a metallic return for the electric tram;—have you gone into an estimate for that? There is a system—only one that I am aware of—where a metallic return is used. That is in Cincinnati, in the United States, and the effect generally is bad, because not only are there double overhead wires—that is, two wires over each line of rails—but constant accidents are happening through short circuiting of the line. Any disturbance may produce an accident, and it is in consequence of the complex nature of those overhead wires that the system has not been repeated.

1575. So you could not recommend a metallic return? I could not.

1576. Are you aware that Lord Kelvin considers it absolutely necessary that metallic circuits for the telephone system should be adopted—of course, Lord Kelvin is an authority on electricity? Yes, he is an authority, but I do not remember seeing his opinion in particular.

1577. What is your opinion? I feel sure that would be his opinion.

1578. Do you approve of that? Yes.

1579. I suppose you have not gone into an estimate of what it would cost to make that in a place like Sydney;—I suppose £100,000, or something like that? I think that would be more that the total cost.

1580. You have not gone into the matter? No.

Philip Billingsley Walker, Esq., M.I.C.E., M.I.E.E., Secretary to the Electric Telegraph Department, sworn, and examined:—

P. B. Walker, Esq., M.I.C.E. M.I.E.E. 8 April, 1896.

1581. *Vice-Chairman.*] Are you familiar with the proposal before the Committee to construct an electric tramway along George-street to the Redfern Railway Station, and thence along Harris-street—a double line? Yes; I have looked over the plans, and so far as I can judge of the scheme I think it is a very good one. It appears to me to embrace all the latest improvements in connection with electric traction wires in England, America, and on the Continent; but there is one thing that has to be looked to, and that is the protection of the telephone wires connected with the Postmaster-General's Department.

1582. Do you think the system proposed would affect the working of the telephone lines to any serious extent? I think it would. It is a fact well known to all electrical engineers that where electric traction wires are brought into operation on the same ground as telephone wires, they materially affect the working of the telephone system.

1583. Touching the proposed electric tramway in George-street, would that affect the electric wires throughout the city, or only along the route? It would affect the wires materially throughout the city, because it is not only along George-street that you have to deal with. At all the intersections of the streets right to the Railway Station, there are branch lines forking out into each of the streets, and those wires would all be affected, and every wire coming in touch with those wires would also be affected by a traction wire through induction.

1584. Briefly explain in what manner they would be affected? They would be affected by induction; that is to say, anything affecting the main wire would impart an induced current into the wires laid from them to the different exchanges, and it might extend a mile or 2 miles, and affect the wires 2 miles away.

1585. Are we to understand that all the wires in George-street would be affected? Every wire would be affected.

1586. And wires in other streets would to some extent be affected? Decidedly so.

1587. Is there not some proposal to put all telephone wires underground? There is not a proposal to put all the telephone wires underground, but the Postmaster-General is making arrangements to put certain wires underground in George-street and Pitt-street, but still that would not in any way alter the effect of the traction wire on the telephone system. It would affect it just the same underground as it would overhead.

1588. It would be diminished in no way? No.

1589. You say that you approve of the proposed tramway as a public convenience? Yes. 1590.

P. B. Walker, Esq., M.I.C.E., M.I.E.E. 8 April, 1896.

1590. Have you given any consideration to a possible method of overcoming this apparently serious difficulty in the way of its construction? Yes, I have. The only way I see of overcoming the difficulty is to adopt a metallic circuit—that is to have a go and return wire for the telephone system. Of course, that is only a matter of expense, and it is a system that is adopted in all parts of the world now. In America they have adopted it very largely, and it has been a source of trouble amongst the telephone and traction companies there as to who should pay for it. The traction companies have had a lot of trouble over it, but in many cases they have come to an amicable arrangement amongst themselves about this, and have agreed to pay half the cost of the alterations that were necessary in order to meet the case.
1591. Is the effect of your evidence that with electric tramways a metallic circuit for the telephones becomes an absolute necessity? It does in my opinion.
1592. With electric tramways that metallic circuit might be dispensed with? No. At present we have a very good system, and that would have to be entirely altered.
1593. What would be the cost of providing a metallic circuit consequent on the construction of the electric tramway? If it were put up throughout the whole of the city and suburbs it would cost £250,000. If it were only in the city it would cost £175,000. The present system has cost the Government, exclusive of instruments, £92,690 up to date, and it is a very good system and working very well.
1594. I understand from your evidence that it would not be possible to work the electric tramway system and the telephone system in conjunction without a mininum expenditure of nearly £200,000 in order to provide a metallic circuit for the telephone system? I do not think it would be possible.
1595. That is the only way in which the two systems could be worked together? That is the only way in which they could be worked satisfactorily.
1596. Have you any information on this subject of the electric tram system and the telephone system worked in conjunction? Yes; I have numerous extracts I could lay before the Committee.
1597. Could you prepare a statement on the matter? I could make a *précis*, including the extracts.
1598. Are you prepared to submit a statement quoting from authorities in support of the evidence that you have given, which of course will carry weight? Yes, I am.

THURSDAY, 9 *APRIL*, 1896.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE CHAIRMAN).

The Hon. CHARLES JAMES ROBERTS, C.M.G.	JOHN LIONEL FEGAN, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	THOMAS HENRY HASSALL, Esq.
HENRY CLARKE, Esq.	GEORGE BLACK, Esq.
CHARLES ALFRED LEE, Esq.	FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Electric Tramway from Circular Quay, Sydney, to the Redfern Railway Station; and also along Harris-street to the intersection of John-street.

Alfred Edward, Esq., Registrar, Metropolitan Transit Commission, sworn, and further examined:—

A. Edward, Esq. 9 April, 1896.

1599. *Vice-Chairman.*] You produce a statement with regard to the probable traffic between the Redfern Railway Station and the Harris-street terminus, and between the Harris-street terminus and the Redfern Railway Station? Yes.
1599½. What steps have you taken to ascertain that information? I placed a man near the Railway Station from the 29th March to the 4th April inclusive, that is a whole week, and he counted all the passengers on each 'bus as it passed there. That would give the number of passengers which the 'buses took to Pyrmont and which they brought from Pyrmont to that point.
1600. What point do you speak of when you say the Railway Station;—where did you stand your man? At the corner of Regent-street and Harris-street, and George-street West.
1601. That is beyond the Railway Station? Yes; about 50 yards past the gates.
1602. You are referring now to the probable Harris-street traffic? That is exactly what it is; I have taken a whole week through.
1603. Will you read the statement?

I have a statement of the number of passengers carried by omnibuses between Pyrmont and Railway Station, from Sunday, 29th March, to Saturday, 4th April, inclusive.

I have taken the number carried this week as a basis for calculating the number carried per annum, but would like to add that this is probably one of the best weeks in the year, and during the winter months the number carried would be considerably less.

I also enclose an estimate of the number of passengers carried annually by the omnibuses plying from Pyrmont and Railway Station to Sydney, and, although unable to obtain the actual figures from the Sydney Omnibus Company, I have gone to considerable trouble to obtain the average earnings of these 'buses, and consider the return a liberal one.

PASSENGERS carried on 'buses between Pyrmont and Railway, from 29th March to 4th April, inclusive.

	From Pyrmont.	To Pyrmont.	Total.
Sunday, 29th March	767	784	1,551
Monday, 30th ,,	996	949	1,945
Tuesday, 31st ,,	682	779	1,461
Wednesday, 1st April	872	995	1,867
Thursday, 2nd ,,	1,073	1,030	2,103
Friday, 3rd ,,	916	906	1,822
Saturday, 4th ,,	1,268	1,234	2,504
Totals	6,574	6,677	13,253

Passengers	13,253
Weeks	52
	26,506
	66,265
Passengers per annum	689,156

A. Edward, Esq. 9 April, 1896.

1604. You consider that a liberal estimate, because the week was an unusual week? Yes; it contained holidays.

Estimated number of passengers carried annually by 'buses plying between Pyrmont and Sydney—877,470.

1605. That would include those already mentioned as carried to the Railway? Yes. That leaves a balance of about 200,000 which is what is called the pick-up traffic.

Estimated number of passengers carried annually by 'buses plying between Railway Station and Sydney—2,328,720.

I base that calculation on these returns. At Pyrmont the average earnings of an omnibus at present, which is a very good time to take an average, because their earnings are as high now as they are at any part of the year, are 35s. per day; and on a Sunday the 'buses earn on an average of 45s. per day. Thirty-five shillings per day for 313 days in a year comes to 10,955s., and 45s. per day for fifty-two Sundays comes to 2,340s.; making a total of 13,295s. The passengers are charged 2d. each, therefore, there are six passengers for each shilling, and there are eleven omnibuses plying between Pyrmont and Circular Quay; and that gives a total of 877,470 as the estimated number of passengers carried by the Pyrmont 'buses to Sydney and back again, and on the same ground the railway 'buses earn an average of 40s. per day. They work only on week days, not at all on Sundays. That makes 313 days, and calculated on that basis with thirty-one 'buses it gives a total of 2,328,720 passengers per annum carried by railway 'buses to Sydney and back.

1606. *Mr. Wright.*] They are 4-horse 'buses, are they not? Only six of them. These six 'buses run six journeys in the day, doing the busy trips; most of the others are 2-horse buses which run regularly throughout the day.

1607. The Pyrmont buses are 2-horse 'buses, are they not? They are all 2-horse 'buses.

1608. You think the estimate which you have now furnished is a fairly liberal one? I believe it is an over-estimate of the actual number of passengers carried by the Pyrmont 'buses.

1609. You think that if you took the actual returns every day they would not come out quite so big as you have estimated? I do.

Norman Selfe, Esq., M.I.C.E., M.I.M.E., sworn, and examined:—

N. Selfe, Esq., M.I.C.E., M.I.M.E. 9 April, 1896.

1610. *Vice Chairman.*] Will you describe your qualifications? I am a member of the Institute of Civil Engineers, London, and also a member of the Institute of Mechanical Engineers of England. I am also a citizen of forty years' standing—and that is the most important, because I am here as much as a citizen as an engineer.

1611. *Mr. Lee.*] What is your object in appearing before the Committee to give evidence? I have been asked by several people interested in the city of Sydney to give evidence; and I was also asked by the Secretary to the Committee if I had anything to say on the subject, and I said that I should like to lay three or four points before the Committee for their consideration, and if they liked further information on those points I should be very willing to amplify them. All that I propose to say to-day will be very brief.

1612. I shall be glad then if you will lay before the Committee the objects which you have in view? The first point is that the proposed tramway seems to be a disconnected scheme—without any connection with the eastern, western, northern and marine suburbs. I think that anything that is done towards extending inter-communication in this city should be part of some complete scheme, which the proposed electric tramway does not seem to be. I am prepared to say that a complete city railway could be constructed for nothing—that is to say, that the incidental improvements to the city will pay for the city railway—that the city railway could be carried out in conjunction with the utilisation of what is now waste ground in such a way that the increased value of that waste ground, consequent on the construction of the railway, would practically pay for the railway.

1613. In other words you are prepared to show that it will be more advantageous to adopt a system of city railway, than a system of tramways? I am, because a city railway running down the western side of the city would have a series of stations within a very few yards of George-street, and if there were a station in Wynyard Square, one adjoining the Town Hall, and one abreast of the Circular Quay, it would so reduce the traffic at present in George-street, that it would largely perform the work which this electric tramway is proposed to do, without taking up a street.

1614. Are the plans on the walls those prepared by yourself in explanation of your scheme? The plans on the walls are pictorial illustrations made since the report of the Royal Commission was issued, and based on a digest of the evidence given before that Royal Commission.

1615. They have been prepared by yourself? They have been prepared in my own office at my own cost.

1616. On a scheme thought out by yourself? Yes.

1617. Will you be kind enough to explain those plans to the Committee, so that they can grasp the idea? The first part of the scheme is to utilise about 50 acres of ground which is now situated between Elizabeth-street, Pitt-street, the Belmore Markets, and Devonshire-street, and largely covered by the burial ground, and the Benevolent Asylum, as you see on plan No. 1. I propose that the ground should be levelled, as per plan No. 2. I would then make Devonshire-street at least 100 ft. wide, and throw open the space to the station, so as to have a large central city station like the termini of the railways in the great cities of Europe and America, which would be sufficient for the long distance traffic. From the centre of that station would run a 100-ft. avenue, down the level ground to Belmore markets, passing through a square about 500 ft. each way. Castlereagh-street would be extended right through the new ground so as to meet Castlereagh-street, Redfern, so that the trams instead of, as now, having to go from Elizabeth-street into George-street, and then back in front of the Railway Station, obstructing the legitimate railway traffic, would continue straight through.

1618. You mean that the trams passing from Castlereagh-street to Redfern, would continue straight through instead of turning to the station? Yes; the result of laying out this site would give about 10,000 ft. of frontages for sale.

1619. Frontages to what streets? To new Castlereagh-street, to the Square, to this main avenue, to Pitt-street, and to these cross streets proceeding past the cemetery area, which at an estimate of £200 a foot, would amount to £2,000,000. The Government taking a scheme like that in hand would not be bound to rush the market with their property; they could abide their time. If the terminus is built as is shown on this plan, it is very evident that the sites in its neighbourhood would command very large sums.

1620. You have dealt with the cemetery area, which you propose should be utilised in the way indicated? It is to find the money principally, and improve the city at the same time.

1621.

N. Selfe, Esq., M.I.C.E., M.I.M.E.
9 April, 1896.

1621. Have you estimated that there would be a large amount of money obtained from the sale of the frontages which would be created in the way you have stated? Yes.
1622. Will you proceed then with your scheme from that particular point;—how do you propose to get from the Railway Station to the cemetery side—overhead or under? The station* would be on its present site.
1623. How do you communicate with the cemetery side? I do not do so. The present Redfern terminus site would be only for long-distance traffic.
1624. You do not propose to go beyond that, across Devonshire-street? Not across Devonshire-street; but on arriving at the Redfern tunnel, where the present Darling Harbour line turns off, I would ease the grade of that line, which is now rather steep, and would make four lines of railway where there are now only two lines to go under the present George-street, by the Cyclorama. As soon as the new line got under George-street, it would turn to the back of George-street, behind Pemell's, and over Hoskins', and Tangye's premises, and run parallel to George-street, with the first station nearly opposite Anthony Hordern's, between Engine-street and the bridge, the end of the station being shown on the plan. From there the line would run level on a viaduct right over properties of very little comparative value—over the top of Messrs. Tangye's and Hoskins' premises level, going north, until it touched the ground about Goodlet and Smith's yard. It was originally intended to go in front of the Cathedral and the Town Hall, with a station at the present market site; but as the market site is now occupied, the site of the old Masonic Hall could be utilised by going to the back of the Town Hall. That would give a station in the very heart of the city, between Druitt-street and Market-street. The next station would be in Wynyard-square. To see the effect of going north from Wynyard-square, we take plans 3 and 4. Plan 3 shows the whole of that part of Sydney known as "The Rocks," every house on it being drawn from sketches, from Jamieson-street to where George-street and Lower Fort-street unite. Under this scheme it is proposed to resume 30 acres of the "Rocks," a large portion of which there are at present no titles to, and which, as you can shake hands across many of the streets with a neighbour on the other side of the way, could be purchased for a very small amount. When that site is resumed, it is proposed to level it and to make a continuation of George-street, which now turns very much to the right and runs downhill to the old Queen's Wharf. It is proposed to run a new George-street from the bottom of Gallows' Hill or Essex-street through Ives' Bond, as shown on plan 4, and erect a station on the western side of the new George-street, the present Lower George-street not being disturbed. That station would be bounded on the east by new George-street, on the west by a new street, and on the north by Argyle-street, and would be exactly abreast of the present Commissariat stores near the Circular Quay, and close to the steamers' wharf. When that station is built with all the necessary lines, it would take about 10 acres out of the 30 acres resumed, and you would have 20 acres of this site, right in the centre of the mercantile and the shipping heart of Sydney, which is now a relic of the early whaling days, upon which fine buildings could be erected, and would be able to sell the property. You would have about 2,000 feet of frontage to new George-street to sell. The railway having arrived at a sunken station in Wynyard-square, would divide into three arms. The western arm would continue along the high ground at the back of the Princes-street frontage, following the natural surface ground, and, crossing Argyle-street at the same level as Princes-street, it would be in a position to be continued to the North Shore at any time that the country is warranted in bridging the harbour to North Shore. It is part of that complete scheme. That would give you a bridge at an incline from Wynyard-square of 1 in 50, which is the ruling grade on the North Shore line, and it would also give you 150 feet head for vessels. The right-hand branch of these three would cross George-street and Pitt-street, over the site of the building now called Change Alley, at an elevation of about 25 feet above the Circular Quay, on steel columns—a viaduct in fact—in such a way that it would not interfere in the slightest degree with the present traffic of the Circular Quay, and then running into the hill under the Domain near the Water Police Station, would continue as the eastern suburbs railway round to Paddington, Waverley, Woollahra, Randwick, and Alexandria, and back to the circular railway, which is exactly the scheme approved by Mr. Deane and the Railway Construction Branch, and by Mr. Eddy, the Chief Railway Commissioner, and by Sir Henry Parkes when he was in power. I may say that as to the eastern suburbs there is no difference of opinion. The only particular in regard to which I do not agree with the other proposals is that instead of going across near St. James Church, and compelling all the passengers who want to go to the Circular Quay or the Manly steamers to walk that distance, I propose to take the line across the Circular Quay, and in this way I bring the western, eastern, northern, and the harbour suburbs traffic to a focus at the Circular Quay, and in such a way that the stations are not on the Quay, but just a biscuit's throw from it, and you have there a centre, and anybody coming from Randwick could go to Manly, or anyone could go from Hunter's Hill to Burwood, and have a minimum amount of distance to walk in changing from one means of transit to another. The 10 acres of this level site which I have just spoken of would be for a station for such trains as those running to Liverpool and Penrith—short-distance trains—and in this way we should have travelling parallel to George-street, and at a very short distance from it, a northern line, eastern circle, western circle, and the direct traffic line from the station. There would be four distinct lines of traffic running parallel to George-street which would probably give you a train every five minutes; in fact, it could be made just like the circular railway in London. Under this scheme we should get Strathfield, Hornsby, and the northern suburbs, and the city railway connected in one large circle, and we should connect the eastern suburbs, Paddington, Waverley, Woollahra, in a smaller circle, and we should connect the main suburban line to Parramatta with all the city and eastern suburbs stations direct.
1625. Does that complete the description of your proposal? That, I think, is all I need say.
1626. That is an outline of the scheme? Yes. There is a great deal of detail that might be gone into to show why it should be carried out.
1627. You have offered no opinion as to whether, in the event of its being considered advisable to have a system of tramways in the city, that system should be an electric one or any other? I think that before this Committee recommends the construction of an electric tramway, they should have before them the fullest information as to the working of the Paris tramways, which are worked under the compressed-air system. The compressed-air system has been so developed during the last three or four years that its efficiency has been doubled, and at the present time I believe there is 10,000 horse-power being worked in Paris in supplying compressed air, not only for tramways, but for multifarious objects. That is one point which I think this Committee should have before it—a comparative statement as to the merits of the compressed-air system and the electric system. 1628.

* Note (*on revision*):—Main terminus.

N. Selfe, Esq., M.I.C.E., M.I.M.E.

9 April, 1896.

1628. *Mr. Black.*] Is the compressed-air system worked above ground? The pipes are laid under the ground from a power-station just the same as from a cable station.
1629. The vehicles run above ground? Yes.
1630. It is not on the exhaust-tunnel plan? No.
1631. Will you kindly state what you mean by the compressed-air system? Under the compressed-air system a car or dummy carries a small engine which is worked by compressed air, and this is supplied by a pipe like a gas or water pipe laid along the street, and at any crossing-place a driver can take in sufficient air in half a minute to run him 2 or 3 miles. A number of devices are in existence for taking the air in automatically—as the tram goes slowly over a certain spot, it makes a connection and takes in the air.
1632. In that case there would simply be the roadway and the pipe? Yes.
1633. No overhead gear? No overhead gear whatever.
1634. How long has that system been working? About fifteen years; but it laboured until lately under the great disadvantage that they got only about 33 per cent. efficiency of the main engines, whereas with electricity they got (say) 75 per cent., but by recent improvements they have brought it up until they get 90 per cent. efficiency now.
1635. Do you know how many miles of travelling there are? I know that there are a number of towns in France, and some in Switzerland.
1636. You were speaking of Paris just now? Speaking apart from Paris, I know that it has been running for some years under the Megarski system; but recently it has been adopted in Paris under the Pardy system of taking the air from mains like water-pipes under a street, so that the car has nothing whatever to carry but small reservoirs, which can be charged at intervals from the main.
1637. There is a connection between the car and the main worked by the man working the car? Yes; I myself saw in San Francisco an experimental car charged in twenty-nine seconds which ran for 2½ miles with that charge and with about twenty people aboard—that is some years ago.
1638. You say you remember it some fifteen years ago in Paris? It is some fifteen years that the compressed-air system of Megarski has been running in France.
1639. How long since it has been adopted in Paris? Under the improved system of Popp, compressed air has been supplied all over Paris for working machinery generally, the same as we have the hydraulic power here for a number of years; but only during the last year or so has it been adapted to the tramways.
1640. That feature of traction having appealed to your intelligence, has it occurred to you that in that progressive part of the world, America, the electric system appears to have taken a complete hold as a system of traction for cities? That is the simplest thing in the world. There is a halo of mystery which surrounds electricity, and people believe electricity is capable of everything. You have only to make a proposal connected with electricity, and you can get £100,000 to develop it before you can get 10s. for anything else.
1641. That is hypothetical to a considerable extent? No; it is a fact.
1642. Let us deal more with the facts of the case; there are hundreds of miles of electric tramway in America at the present time conducted by a very progressive people who, we should imagine, would adopt any more complete and less expensive system, such as that set forth by yourself;—how is it that they have not adopted it? Because the Americans try every new thing; and when it does not answer they pull it up. Twelve years ago the Americans were far ahead of the people in England in electric lighting. There is hardly an electric-lighting system in existence in the United States at the present time which was in existence there twelve years ago, because it is utterly out of date; and we have no evidence whatever that the electric system in use in America to-day will be looked on in ten years time.
1643. Can you mention any part of the world where this compressed-air system of traction is generally used? I can only tell you now where it is largely used.
1644. Is that not in an experimental form? I do not think so, considering that I rode upon compressed-air tramways twelve years ago.
1645. But in the city of Paris to-day they have electric trams and horse trams, have they not? Yes.
1646. And you say the compressed-air trams as well? Yes.
1647. So there is a mixture of systems there? Yes.
1648. Therefore the compressed-air system has not subdued every other? What I want to say is, that this Committee should have absolute data before them before they decide.
1649. How is that to be obtained by the Committee? The Departmental officers who supply you with information should be asked for their data.
1650. Are you aware of any experts in the city of Sydney who are conversant with the compressed-air system? I presume that the officers of the Railway Department who are recommending this electric system are prepared to show the Committee why they do not recommend the compressed-air system.
1651. Then you are of opinion that, if the compressed-air system is a success, it would be much wiser to use it for the city of Sydney tramway system than the overhead-wire system? I am of opinion that it would be better to so do, for these reasons: First of all, the labour required to manage it is of a much lower grade. There is nothing to get out of order—a simple ploughman could work the air-engine. It is like driving a donkey-engine on the wharf. The air would be supplied from large engines of economical type, like those at the power-house working the cable tramway. There would be no disturbance of the telephone or telegraph system. There would be no danger of injury from any fracture of wires, or anything of that kind. If the power could be supplied at the same price, it has so many advantages to warrant its adoption that, with the little experience I have had, I think it certainly ought to be thoroughly investigated. I am not saying that it is better, but I say that it presents so many features to recommend it that it should be thoroughly investigated before we adopt a system of electricity, especially the overhead-wire system.
1652. Do you know anything of the speed attained? It would run any speed that would be allowable on the street. Of course, compressed air was used in the making of the great Simplon tunnel and the Mont Cenis and St. Gothard tunnel.
1653. Even now you are unable to inform the Committee that as a system of traction it has been generally adopted in any city? It has generally been adopted in the city of Nantes, I think, continuously for ten or twelve years—under one system, which is a system not so far advanced as the one in use in Paris.
1654. Would there be any disadvantage in mounting steep grades with that power? Anything that any motor will go up it will go up with compressed air—anything where the wheels will turn. The compressed air has only to turn the wheels the same as electricity has, therefore the question of grade does not apply to any particular system of power. Where steam would go compressed air would go.

N. Selfe, Esq., M.I.C.E., M.I.M.E. 9 April, 1896.

1655. Steam or electricity, or any other system? Yes.
1656. Leaving out of view for a moment the question of the city railway, and having well in view your very large travels and experience in the matter, have you any strong objections to raise against having a system of tramways in the streets of Sydney—George-street in particular? I think that George-street being the centre of our retail traffic, and being opened nearly every week for sewers, water-pipes, gas-pipes, and hydraulic companies' pipes—hardly a week goes by in which it is not disturbed—if two lines of tramway are laid down that street you must give up all hopes of having any other traffic on the street, unless you first of all make a subway the whole length of the street, and put all the gas, water, sewer, and hydraulic pipes in that subway, so that if you once make a beautiful street with a tramway you will never have to break the surface again, but can go down man-holes to the subway.
1657. That, I presume, would apply to any system—compressed air, or any other? Yes; that applies to a system of tramway, whether it is electrical or cable, or compressed air.
1658. Is that your chief objection to the tramway system in George-street? Yes, that is my principal objection. Three or four friends having places of business in George-street have said to me how strongly they are opposed to it—how it will injure their business—and I can see at once that it would; but the objection they take would be minimised if there was a subway to prevent the breaking up of the street for the pipes.
1659. In other words it would drive the present large vehicular traffic out of that street altogether? Yes; people could not go in their carriages, for instances, to David Jones'.
1660. Why do you lay such stress on the water and gas mains in George-street;—do they not exist in other streets of the city as well? Not to anything like the same extent.
1661. Do they not in King-street? Well, they are small, and they are not main trunks. My office is in George-street, and I may say that hardly a week goes by that George-street is not opened up.
1662. But of necessity there must be all that system of pipes in King-street, must there not—water, gas, and hydraulic power? Branch mains; but I think the main trunks run along George-street.
1663. But the fact remains that there are the systems there? Yes; but not to the same extent.
1664. Have you noticed any objection of that character since the cable tram was constructed in King-street? The cable tram has not been open very long. There are no heavy mains in King-street that I am aware of.
1665. But if the objection is a very serious one, would it not apply in a minor degree? It would, I have no doubt.
1666. But have you noticed that there has been any great obstruction? I am very seldom in King-street, but I see a great deal of George-street.
1667. As a matter of fact, as far as the city of Sydney is concerned, they are perpetually breaking up streets from the beginning of the year to the end of it? I suppose that during the last ten years they have spent enough in breaking up streets to make a subway twice over.
1668. Have you ever seen in any other city such a system as that which is adopted by the City Council of Sydney in tearing up the streets? It is not the City Council, but the Gas Company, and the Water and Sewerage Board, who can do as they like under their special Acts.
1669. Are you aware that it is proposed to remove these pipes to a site on either side of the road—that under this proposal to construct a tramway, part of the estimated cost would be for the removal of these pipes, and the placing of them in such a position that if they have to be interfered with, it would not interfere with the tramway line? I do not know anything about that.
1670. If such were the case, would it not minimise your objection? Yes; if it were part of the proposal to put the pipes in a subway, that would meet the case.
1671. Or in any other way? If it is proposed to put them under the path, it is nearly as bad to rip up the path as the road and much worse for foot-passengers.
1672. Well, supposing that those objections were overcome, do you think that the running of a tramway through George-street would materially interfere with the general traffic of the street? It would interfere with the general traffic—of course it would largely drive the 'bus traffic out. I do not know that that would be an unmixed evil—perhaps that would be good. I have no prejudice against the tramway at all, but only want to present the different aspects of the question.
1673. Are you acquainted with New York? Yes.
1674. You know Broadway? Yes.
1675. That at the city end is very narrow? Yes.
1676. And carries a traffic much greater than George-street does? Yes.
1677. And have they not a system of electric trams there? Yes; but the license to run those electric trams was given against the wishes of the citizens, and a number of aldermen got into gaol through it.
1678. But they ran, nevertheless, and the traffic is now being conducted? Yes.
1679. Coming back to the idea of the city railway, supposing that the city railway were brought in somewhat on the lines indicated by yourself, would that not still leave the necessity for dealing with the congested passenger traffic in George-street, Pitt-street, and Castlereagh-street? That opens up another point which I was going to bring before the Committee, and that is this: George-street and other streets of the city, now that the blocks are put so close together, present a surface on which the traction of an ordinary vehicle is as small as it is on a railway—that is to say, an ordinary vehicle presents all the advantages as regards reducing the tractive power that a tramway does—and there has been such a development of motor cariages lately that it appears probable that within a few months we shall be able to have horseless omnibuses that will be able to run on a street like George-street, closely blocked, at as small an expense as a tramway. One great object in having a railway, or tramway, is, that vehicles should run at the smallest expense for tractive power, and whether horse or any other power is used, a certain expenditure of power can drag a bigger load than could be drawn on a rough road. With large wheels like those on ordinary omnibuses running on the close blocks of George-street a horse would probably draw as heavy a load as he could drag a big load on a tramway with the ordinary small wheels, and on George-street, with ordinary omnibuses, a horse will drag as big a load on the blocks as on rails, with a larger diameter of wheels.
1680. But no system of horseless vehicles could be adopted by a company, or by the State, to conduct a traffic? It could be adopted by a company. I have no doubt that a company will run them in opposition to this tramway before long, if the tramway is put down.

1681.

N. Selfe, Esq., M.I.C.E., M.I.M.E. 9 April, 1896.

1681. But could a system of that kind compete against a three or five minutes tramway system? I do not see why the Sydney Omnibus Company could not run in opposition to horseless omnibuses alongside your tramway car, if they introduce these motors that are now so successful in Paris and other European centres. They could run all over the street where they liked, and the tramcar would be confined to the rails.

1682. But I think you will admit that that system of traction is somewhat in its experimental stage at the present time, is it not? It is experimental so far as that it is being improved every day; but it has reached a practical stage.

1683. Well, having to deal with matters as they now stand, and if it is found that a traffic exists, and it is necessary to deal with it, you would not offer any reasons why a tramway should not be constructed? I only offer this as a reason for going slowly with this proposal, that is all.

1684. You have not quite answered my question yet. I asked you whether, in the event even of a city railway being constructed, as suggested by you, would it not be necessary to deal with the congested traffic in George, Pitt, and Castlereagh Streets—that is to say, the mere fact of there being a city railway would not deal with that traffic? I answered that question by saying that if there is a railway on the west side of George-street, which could be approached from George-street, I think Castlereagh-street would be about the best street for a tramway, and not George-street, where it would run so close to the railway.

1685. Are you keeping in view the fact that this proposed tramway is to go through Harris-street to Pyrmont? Oh, yes.

1686. That would be outside the scope of your proposed route for a city railway? Well, of course, any tram that came along Pitt-street or Castlereagh-street could go along Harris-street.

1687. Have you ever considered that the suburbs of this city bear a very strong relation to the traffic in the city; that is to say, that the traffic from the suburbs pours in and pours out of the city every day? It is on that that I base the whole of this proposal.

1688. And which to a certain extent was met by the steam tramway extension, was it not? Yes; but in connection with nearly all the traffic that now comes in from the suburbs the passengers have to change from a train to a tram, which they would still have to do under the electric system, because it is only a system disconnected from the railway, and passengers would have to alight, whereas by the city railway system persons coming into business would come in from all the suburbs, and be discharged at the station nearest to their place of business.

1689. That would apply to those persons living near to the suburban railway stations; please confine your thoughts for a moment to the 'bus and tramway traffic which also comes from the suburbs, and suburbs which are not within reach of railway stations; that is the traffic which it is proposed to meet by a system of tramways? The only tramway I have in my mind is George-street and Harris-street, and possibly Pitt-street. As far as Circular Quay and Harris-street are concerned, it would be merely in competition with the railway 'buses. Harris-street would, of course, be a separate branch, and would serve a suburb not now served by tramways, but I do not see that there would be any great advantage in changing at the Railway Station into an electric tram, as compared with changing into a George-street 'bus.

1690. Your sympathy, of course, is strongly in favour of railway extension into the city? Yes.

1691. At the same time, are the Committee to understand that you do not offer any very strong objection to a system of tramways? No; except in George-street. I think that George-street is narrow, and it would be a good thing for the city if you could keep a tramway out of George-street.

1692. That being one of the main arteries, would it not be a street likely to offer the greatest traffic, and hence the largest revenue? Yes; it might offer the largest revenue. If George-street were like Market-street, San Francisco, it would be a very different thing. Broadway, of course, is narrow, and the tramway there is not an unmixed advantage.

1693. The city of Sydney, considering the population at the present time, is very large, is it not? Exceedingly large, I think.*

1694. If the population within easy reach of the city increases in the same ratio within the next twenty-five years, it will be almost impossible to get through the streets? Well, Sydney is all moving southward.

1695. But viewing the fact that necessity arises for dealing with the passenger traffic at the present time within the city, your general opinion is, that the tramway would do better in some other street than in George-street? For certain reasons. If this electric tramway is intended to do away with the present railway tramway down Elizabeth-street, it would be much more convenient for the business people on the western side of the city, and if it does not cost too much money, I see the advantage it would be; but as I said when I commenced my evidence, I am afraid that a tramway down George-street will mean the indefinite postponement of a city railway.

1696. *Mr. Clarke.*] I think you have stated that you have no objection to an electric tram running in George-street? Not *per se*. But I would far sooner have the conduit system than the overhead wire system. With the little I know of the electric business, I cannot conceive how the overhead wire system could be carried out without to some extent interfering with the telephone and telegraph wires.

1697. But leaving that out of the question, is not the conduit system more expensive? Certainly it is, and it is not so thoroughly developed.

1698. But the conduit system is in operation, I suppose, in some parts of the world? In America there are three or four systems now being largely exploited. In fact, if I may say so, I think the Committee ought to examine Professor Warren, who gave an address to the University Engineers' Societythe other night on the electric tram systems in the United States, in which he explained a great deal about the conduit system.

1699. There is another system which has been partially tried in Sydney—that is, the accumulator? That is not sufficiently developed. It has of course been tried in two or three different ways; it means carrying an enormous load in the car.

1700. Would it not, then, answer generally? The accumulator system means carrying at least as heavy a load as the passengers;—that is, if you carry 2 tons of passengers, you have to carry 2 tons of accumulators.

1701. You would require to have larger and heavier cars? Yes.

1702. You think that on the whole the overhead electric wire system is not equal to the underground or conduit system? I think the overhead system is much more liable to danger and difficulties with the wires,

* NOTE (*on revision*):—This question I think was, "The traffic into and out of the city of Sydney, considering the population at the present time, is very large, is it not."

wires, the wires breaking and injuring either foot passengers or horses, and that the conduit system is much safer.

1703. The cable trams at present run from King-street to Rushcutter's Bay;—do you consider that system is suitable for the public, or do you consider an electric system cheaper and better? I would prefer to have a cable system in George-street rather than an electric system. The cable system from Rushcutter's Bay is one of the most successful in the world. It has been carried out under greater difficulties than exist in any city that I am aware of, or have read of where they have laid a cable road.

1704. Notwithstanding the difficulties, and the expense being double what was at first intended, you think it is a success? Yes. There would not be anything like the number of turns and twists in a cable tram in George-street that there are in the King-street-Ocean-street cable tramway, where the rope has to go round about 750 wheels from one end to the other, in order to turn the numerous corners, and a cable road in George-street would be a much greater relative success than it is on the east and west route.

1705. In connection with the present cable tram, have you ever heard of any obstruction to the traffic, more especially at the King-street end? You see it every day. You cannot ride upon the tram without seeing people who have to get out of the way. Everybody has to give way to it. The conductors sometimes get frantic and ring the bell for people to get out of the way, and the people have to make room for them. You cannot stand anywhere near the tram without seeing how the public are incommoded if they have vehicles of their own.

1706. I suppose that is only in King-street? Of course it is really nothing. The individual must give way to the community. There is nothing in that, except that in George-street, which is so much of a promenade to the retail shops, there seems to be, in my opinion, a desire not to obstruct the ordinary traffic if you can help it.

1707. But is not that portion of George-street from Park-street to the railway terminus much wider than King-street? Oh, yes. From Druitt-street to the Railway Station much of what I have said does not apply.

1708. You merely then allude to the lower portion of George-street, from the Circular Quay, or what is called the Old Queen's Wharf, to Druitt-street? Yes.

1709. What is your opinion of having a single line in George-street going one way, and having another line in Pitt-street starting from the Circular Quay and going as far as the Town Hall, and then having a double line to the Railway Station along George-street? Well, as a citizen I would prefer the two single lines in two streets, but as an engineer I know that it would cost a great deal more than having two lines in one street. It would be much more economical to have the two lines in the one street; therefore, speaking from an engineering point of view, I should have to recommend the two lines in one street. But looking at the matter from the point of view of hindrance to the ordinary traffic of the city, I think it would be an advantage if the traffic were to go in one direction through one street, and in the opposite direction through another.

1710. But you have stated that would be more expensive? Yes.

1711. Do you think that a double line in George-street would be dangerous to vehicular and pedestrian traffic, particularly in the lower portion of George-street; as I have no doubt you are aware it is intended in the wider portion of the street to have single poles, and in the narrow portion of the street it is intended to have poles on the kerb on each side;—you have said that you consider it dangerous to some of the carriages going to the shops? "Dangerous" is a relative term. I think there would be accidents occasionally; there are bound to be accidents under any system.

1712. But I suppose you are aware that this system is working in England, America, and on the Continent, and, according to report, is working satisfactory? Oh, yes.

1713. Then, do you see any objection to having it in George-street in the same way? Only that in America they are always developing it. They are now developing the conduit system, and there are two or three cities that are putting that down, and if they make it a success within the next month or two, and find it is preferable to the overhead system at not very much greater expense, I think it would be much better for Sydney to adopt the conduit system. It would require more engineering—more science. Of course there is no particular science in the overhead system; it is simply poles and wire.

1714. I think you have stated that the overhead system would be dangerous in interfering with the telephone and electric telegraph wires? I think so, but I am not a telegraph engineer, and would not give an absolute opinion. I may say that in Hobart the tramways are run with overhead wires. They are very ugly, and make a very nasty squeaky noise, although they are by one of the greatest firms of electrical engineers in the world.

1715. Can you state how the electric system is working at the present time on the North Shore? No, I cannot. I know it has been in the experimental stage, always changing, for a long time.

1716. *Mr. Roberts.*] I understand that you do not appear here as an opponent of the proposed electric tramway? In no way.

1717. But you suggest that it would perhaps be better for it to go down some other street than George-street? Yes; I think it would be better if, at any rate, one line were out of George-street, and I would sooner see both lines out of George-street and in such a street as Castlereagh-street.

1718. Does it not strike you that a large amount of the passenger traffic would be lost to the tramway if it were not in such a business thoroughfare as George-street? Well, that is as though the people existed for the tramways, and not the tramways for the people. I take it that the tramways are not to be there as a private speculation, but as belonging to the State for the accommodation of the public, and of course it is a question of give and take. You have to accommodate a certain section of the public at the inconvenience of another, and I am trying to look at the matter from the aspect of getting the greatest good for the greatest number.

1719. But does it not strike you that a large amount of the passenger traffic on the George-street tramway would be what is called pick-up traffic—persons engaged in business going from one part of George-street to another—passenger traffic that would not be obtained if the line were to go down another street, such as Castlereagh-street? Certainly you would lose that traffic.

1720. Either that, or if the tramway were constructed down Castlereagh-street, do you not think that a large portion of the business traffic would be taken out of George-street altogether? I think that a large number of people who now go down to their business morning and evening by the George-street omnibus would in preference go by the electric tramway, even if they had a little farther to walk to Castlereagh-street;

N. Selfe, Esq., M.I.C.E., M.I.M.E. 9 April, 1896.

street; but I think that you would lose the pick-up traffic of persons going shopping. They would not go to Castlereagh-street and then go back to George-street.

1721. And the probability is that Castlereagh-street would become what George-street is to-day? We do not find that the tramway in Elizabeth-street has made that another George-street.

1722. Do you not think it appears to be coming that way—there is a larger number of business premises in Elizabeth-street now than there was a few years ago? Yes; but only what you might expect from the expansion of the city.

1723. With regard to the objection that you have to the tramway going down George-street, namely, that the street would have to be taken up so often for communication with the water, gas, and hydraulic pipes, if the tramway were put down Castlereagh-street, for instance, the same objection would then hold good which now applies according to your argument to George-street? Yes. But there is not so much private traffic of carriages and buggies in Castlereagh-street as there is in George-street.

1724. But if the tramway went down Castlereagh-street probably that traffic would go there too—a large amount of the business traffic of George-street would go into Castlereagh-street, and then your objection about taking up the street would be applicable to Castlereagh-street? After a number of years it would; but it would take a very long time to get it away from the present business premises in George-street.

1725. Do you not think that if a tramway went up George-street, with a one-minute service, the vehicular traffic would be entirely driven out of George-street, and therefore those difficulties which you have mentioned with regard to the carriages drawing up to the large establishments, such as David Jones', would dwindle away, because, as a matter of fact, there would be scarcely any omnibus traffic in George-street with a one-minute tram service? I think that a tramway in George-street would do away with the omnibus traffic in George-street, and that, I think, would be an unmixed benefit.

1726. You will admit that an efficient one-minute tram service in George-street would serve all the people wishing to travel from one end of George-street to the other, or to the Railway Station? Yes, I think so.

1727. *Mr. Wright.*] I gather from your evidence that one of your principal objections to this tramway is that it is not a perfect scheme? That, so far as I can see, it is not connected with any suburban arrangement; it is merely, as I understand it, from the end of Harris-street to the Circular Quay.

1728. But if the Department say that this scheme is only a portion of a complete scheme to be ultimately carried out, would that alter your views on the subject? If I saw the plans of that scheme it might.

1729. For instance, if the Department contemplate eventually connecting the Glebe and Newtown, and all that outlying district, with the city by electric tram, would that lessen you objection;—if the Department say you may look upon this only as a tentative scheme with the view of ultimate extension—as a section of a whole scheme, in fact—would that lessen your objection to it? That would only apply to it as far as being connected with the present tram service.

1730. Altering the present steam service? Yes; and converting it into an electrical system. But I do not mean that. I mean in connection with the railway suburbs. Persons living it the railway suburbs at the present time, and those places that will be railway suburbs soon, such as the eastern suburbs and possibly suburbs in other directions, including the northern suburbs in a few years, when there is a bridge across the harbour, should, in my opinion, be able to get to the very heart of the city by rail, and it does not seem that this tramway would in any way give them that connection. People would have to get out at Redfern as they do now, and change into an electric tram, and it is only a question of degree as to whether it would be a little more comfortable than omnibuses rattling over the blocks. I do not think it would be much better than omnibuses if the blocks were smooth from one end of the street to the other.

1731. But if the Department suggest this tramway from George-street to Harris-street as a tentative scheme, and as a portion of a larger scheme to be carried out later on to all the suburbs, would that remove your objection to it? No. If this is a success they will convert the whole of the present trams into an electrical system, but my objection is that it will not enable passengers to get down George-street from the north and south of the city without changing, as they do now. Every morning thousands of passengers come in and they go out at night, and lots of them walk from Redfern as far north as King-street, or else take the tram or omnibus; and I maintain that at this latter end of the nineteenth century, in a city like this, people should be able to go without changing, say, from Burwood to King-street.

1732. You have had something to do with electricity, as an architect and an engineer, have you not? Yes, a good deal.

1733. Have we in Sydney any man whom you consider a first-class scientist as an electrician? I think that one of the best scientists as an electrician is a tutor at the Technical College. I forget his name at the present time. He is a scientific electrician. I am not an electrician. I have had to do with electrical engineering, and I examine into nearly all the electrical systems that are brought out here, and know exactly what is done here.

1734. Would you, as a business man, invest £1,000 in any electrical tram system in Sydney under any electrician you know here? No; I do not think I would.

1735. I want to ask you, as an engineer, a question on construction;—it is proposed by the Department to construct this tramway by laying rails of 70 and 73 lb. to the yard on the concrete, and with wood-blocking up to them, simply having tie-rods from rail to rail;—do you, as an engineer, think that that is a proper road to lay down in Sydney? It all depends upon the width of the flange. If the flange of the rail is a very wide one, and a piece of felt is put between the iron and the concrete I consider that is preferable to putting wood in.

1736. The flange cannot be very wide with a rail of 73 lb. to the yard; it is not a very big rail for a tramway? I cannot answer that question without knowing the weight of the vehicle.

1737. The car and dummy are estimated to carry 120 people; do you think it is a sound road if you lay down iron on concrete, considering the great concussion that there would be? With very heavy roads and light cars I do think it is a good thing, but it is a question of degree. Iron and concrete form the most perfect union with one another, and it is all a question of the weight of the rail and of the car. With light cars that would be a good system.

1738. Well, 120 human beings, averaging 1 cwt. each, would make 8 tons on eight wheels? Yes. With car and dummy there would be at least 2 tons on each wheel, I suppose.

1739. You think that with a big solid wheel and flange it is sufficient? Yes; but in an ordinary way I would prefer it laid on the concrete with some felt.

1740. With a buffer between? Yes.

N. Selfe, Esq., M.I.C.E., M.I.M.E. 9 April, 1896.

1741. *Mr. Black.*] In driving a tramway system by means of compressed air what should be the diameter of the pipes used? That is entirely dependent on the distance from the centre of supply and the number of cars to run. For the traffic in George-street, the cars running every few minutes, you might, perhaps, require 7-inch or 8-inch pipes; for a light traffic, 6-inch pipes; or for a smaller traffic, 3-inch pipes. The car which I saw charged was charged through a 1¼-inch pipe.

1742. It is usual to apply the air at fixed intervals? The pipes under the street are one immense reservoir of air.

1743. But I mean to supply the motors—about how far? It is simply a question of the dead weight. The Magarski cars to which I have referred took in enough charge to last for eight hours, but then they had to have reservoirs which weighed 1½ tons. By being able to charge at short intervals during the time passengers alight at prominent street corners or stopping-places you are able to reduce the weight of your reservoirs to a few hundredweight, and that makes your car so much lighter to travel about, so much easier on the rail, and so much less weight to propel.

1744. How is the air supplied—from standpipes or from the main? It can be supplied from standpipes, but as the system has been carried out hitherto the air has been supplied from something like a fire-plug. A piece of pipe with hose on it is simply pushed down a hole, and a supply of air is obtained from the reservoir.

1745. Does that necessitate a large opening? About 3 inches in diameter altogether, but in Paris there are some places where the car charges itself as it passes along; the wheels touch a trigger, and the pipe sticks up and makes a union automatically with the reservoir on the car.

1746. It is on the same principle as that on which some railway engines take up water? Yes; somewhat.

1747. Have you any reports of any kind from newspapers or otherwise on the running of those trams? There has been an account of them in the different scientific papers. There is a tremendous amount of literature on compressed air.

1748. You could not give the Committee any dates or name any journals, so that we might be able to obtain them? I could to-morrow let the Secretary know where to find an account.

1749. Will you do that? Yes, I will.

1750. You appear to imagine that if the city railway were constructed on the lines laid down by you, a tramway along George-street would not be necessary—is that your opinion? That is my opinion, absolutely.

1751. Taking into consideration the possible great development of Sydney, do you not think that your opinion is perhaps not well-founded? It is only an opinion, given for what it is worth. I might alter my opinion to-morrow, but I base it on this: That York-street is only a few yards from George-street, and if you had a passenger station in Wynyard-square—abreast of where we are now sitting—one near the Town Hall, and one on Brickfield Hill, with trains running, as they do on the underground railway in London, every three minutes on a circle, the *raison d'etre* for a tramway would almost disappear.

1752. But you see there will always be a large number of people travelling from one end of George-street to the other, independent of those who travel along the street for the purpose of going to the Railway station—a number of people who do not desire to go out of George-street in order to get from one end of it to the other, and if we have reason to suppose that the traffic in George-street has greatly increased, do you not think that for the George-street traffic alone it would be desirable in the public interest to have a service of some kind in that street for the carriage of passengers? I do. I see all the advantages of a tramway in George-street.

1753. You know, of course, that in Melbourne they have a tram service along Bourke-street, and also one along Collins-street? All those streets are more than double the width of George-street at the north end.

1754. I am not dealing with the width of streets, but the fact that there you have two streets running on parallel lines for the whole of their extent, until they both abut on Spring-street, but nevertheless both of those lines, although they have different termini, are payable;—do you not think it is possible that in a city like Sydney, with its great possibilities of development, tramway lines might be run along parallel streets even so near as George-street and York-street, that there might be a tramway service along Pitt and Castlereagh Streets as well, and yet all might pay? I think it is possible that ultimately they would.

1755. And taking also into consideration the fact that, no matter when the construction of a city railway might be decided on, the whole of the care necessary for laying it down and all the obstacles in the way of its construction, are likely to take a considerable time, even after the route has been decided upon, do you not think that it would be necessary to have something to fill up the gap in the meantime for the public convenience? Yes.

1756. You appear to have an objection to the electric overhead system because you think it is likely to go out of date before long? That is the principal thing—because I think it will be superseded.

1757. Supposing we had an overhead electric-wire system, what would stand in the way to prevent its conversion into a compressed-air system? Well, nothing at all, except that you would throw away all your motors.

1758. Could not they be adapted to the compressed-air system? No. An electrical motor, of course, would not be adapted for compressed air.*

1759. The cost of standards and overhead wires is trifling, I think—only some £4,000? Very small, relatively.

1760. That does not influence you? Not at all. What I think is that in Sydney we always seem to depend so much upon what is done somewhere else, and do not ever go in for original research. We constructed an electric line at Randwick which proved nothing but what was known before. Compressed air has been brought a certain distance, and I do not see why New South Wales should not try to bring it a step further, or, at any rate, ascertain what has been done, and it can be done at a very moderate cost.

1761. I think it is perfectly within the province of this Committee to discuss any means by which a tramway could be run along George-street—any motive power, whether it be electric or otherwise; I do not think there is anything to prevent us from discussing the advisableness of using compressed air or recommending

* NOTE (*on revision*):—This applies to the motive machinery only. The cars themselves it might be possible to convert.

N. Selfe, Esq., M.I.C.E., M.I.M.E. 9 April, 1896.

recommending it; what we are concerned with is an economical system of tramway along George-street which will serve the public well;—you seem to think that a system of tramway in George-street would be likely to destroy the trade there, as I understand you, partly because it would interfere with it as a public promenade? Yes; people going in their own vehicles.

1762. That would not apply if George-street were a wider street, would it? No.

1763. The construction of a tramway in Collins-street, Melbourne, has not destroyed that street as a public promenade, but, I think, has rather increased the number of promenaders? As I pointed out in reply to Mr. Clarke, my views do not apply to the south end of George-street so much, but more to the denser population of the northern end; but after all it is only a secondary matter.

1764. If you have a line so laid that there is no interference with the wheels of private vehicles, and if by the use of a tramway line you remove a quantity of other traffic which is independent and can use whatever part of the street it likes, and if you substitute for that a rigid system of traffic which must run in one groove, do you not think that, to some extent, you would have increased space available for the private vehicles? If you ensure that space being available by putting the pipes in an underground tunnel, I think a tramway in George-street will be a splendid thing for the city in many ways, if you ensure that the street shall not be continually broken up.

1765. My reason for thinking so is that in driving about the city I have always found it much easier, if it were not for the inconvenience of the service caused by the bad way in which the rails are laid, to drive along Elizabeth-street than along George-street, and my objection to driving down George-street was because of the great quantity of 'bus traffic all over the street and not in any fixed groove; in Elizabeth-street the trams carried more traffic than the 'buses in George-street, but went along a defined track, and I knew exactly where to go, and that the place I was in was a safe one? I agree with you in that.

1766. That traffic, which carries great numbers of passengers, but which is rigidly fixed on one route, does not interfere so much with people driving private vehicles as that traffic which can select its own route? Because the drivers of private vehicles are certain that if they keep on their ground the other traffic will not run over them.

1767. I am not quite clear as to what you said about the conduit system;—would you prefer the conduit system to the overhead-wire system? I would if it is really practicable at all, even if it cost many thousands of pounds more.

1768. You know that it is very much more expensive? I do.

1769. Have you heard anything of the recent objections to its use in San Francisco? I have not; but I know that it is being developed every day, and that improvements have been brought out only within this last month.

1770. But you have not studied the conduit system lately, as opposed to the overhead system? I have no practical acquaintance with it in actual work.

1771. Do you think that the accumulator system is impracticable? Not impracticable generally, but it is commercially impracticable at present, I believe.

1772. You recommend the construction of a tunnel under the street for the purpose of carrying all the pipes and the telephone and telegraph wires? Yes; the gas, hydraulic, water, and sewerage mains.

1773. Would you recommend that along all the trunk lines of the city? If they reach the importance that George-street has attained.

1774. Whether there were trams there or not? Yes; quite apart from the tramways, it is desirable.

1775. But would such an isolation—because I suppose it would be an isolation—of pipes and wires make all electrolysis impossible in connection with an electric tramway on the overhead-wire principle? That would largely prevent it, because each wire would be supported on insulators, and it is only by induction or leakage that injury could occur. They would not be in contact with the earth.

1776. Would that render the bonding of the rails unnecessary—the bonding of the rails, as I understand it, is the connecting of each rail with the next rail by copper wire, to prevent the current from leaving the rails? The tunnel would not make any difference in that matter.

1777. You think the bonding would be necessary? Yes, of course; but under recent conduit systems there is no electric current passing in an exposed conductor excepting immediately under the car, and it is impossible for a horse or a human being to put his foot on any piece of metal that is not cut off from the current; but as under the overhead system, of course the rails could be used for the return current.

1778. Have you given much thought to the motocycle system, which is now coming into vogue? Yes; I have given considerable attention to it.

1779. Do you think it is possible that any public service could be run by means of the motocycle? If all that is claimed for it is true—and it seems to be true so far—then it is possible.

1780. Do you think it is possible, with greater developments of the art of motocycling, to run a two-minutes motocycle service in a street like George-street? It would be possible, but I do not think it would be desirable.

1781. I suppose, if it were possible, it would be necessary to confine the running of the motocycles within certain limits? I do not see how you could put any restrictions on a motor vehicle that you do not put on an omnibus drawn by horses.

1782. Do you think it would be advisable to allow them to steer all over the street? Well, you allow omnibuses to do it, and they take up less room than the omnibuses do. You would have to pass fresh regulations if you found that they took liberties which are not granted to omnibuses.

1783. You are aware, of course, that, with the use of a vehicle which is not run along rails, steering gear is necessary, and that a great factor of expense in any service whatever is that of labour; and, therefore, the steering gear being necessary with the motocycle, it would be necessary to pay the wages of one steersman for every motocycle? I do not know why the steersman could not start and stop a motocycle the same as a man starts and pulls up an omnibus.

1784. You think one man could act as driver? One man does act as driver on a small motocycle.

1785. You do not think, then, that it would be an item of expense to be considered? I think it would be merely the substitution of power for horses.

FRIDAY,

FRIDAY, 10 *APRIL*, 1896.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY, (VICE-CHAIRMAN).

The Hon. CHARLES JAMES ROBERTS, C.M.G.	JOHN LIONEL FEGAN, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	THOMAS HENRY HASSALL, ESQ.
HENRY CLARKE, Esq.	GEORGE BLACK, Esq.
CHARLES ALFRED LEE, Esq.	FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Electric Tramway from Circular Quay, Sydney, to the Redfern Railway Station; and also along Harris-street to the intersection of John-street.

Isaac Ellis Ives, Esq., Mayor of Sydney, sworn, and examined:—

I. E. Ives, Esq. 10 April, 1896.

1786. *Vice-Chairman.*] How many years have you been in business in the city? I have been in business on my own account at the Argyle Bond since 1859; but I have been in Sydney since 1856.
1787. The growth of the city has been under your observation for forty years? Yes.
1788. *Mr. Clarke.*] Can you give us any information on the subject of the proposed tramway? Since this matter was first broached my time has been more than fully occupied both night and day, so that I have had very little opportunity to go into the details of the proposal.
1789. Are you in favour of the proposed line? I am not.
1790. Will you explain why? One main reason is that I think that the construction of such a tramway would prevent the construction of the railway into the city; and I consider that such an extension of the railway would be of great benefit, not only to the people of Sydney, but also to the producers in the country, who would thereby be enabled to send their produce direct from the station at which it was loaded to the warehouse or to the ship's side.
1791. Do you think that the proposed tramway would interfere with the general traffic of the city? I am of opinion that it would interfere very materially with that traffic. If I may be allowed to say so, I think that, in offering this proposal to the public, the peculiar formation of Sydney has been to a great extent lost sight of. That portion of the city lying between Dawes Point and the Railway Station is bounded to a great extent on two sides by the waters of the harbour, and the access from the harbour to George-street—which is the main artery of traffic—is in every case very steep, and if George-street is to be taken up by an electric tramway the rest of the traffic of the city will be materially interfered with.
1792. Do you think that the proposed line will be dangerous to pedestrians? I think that it will interfere materially with the traffic of the city, taking into consideration the peculiar contour of Sydney.
1793. Would it interfere with the loading or unloading of goods in those parts of the city where the streets are narrow? At Essex-street, George-street is only 33 feet 2 inches in width between the kerbstones, and as 16 feet are to be taken for the tram, that will leave only 8 feet 6 inches on either side for the traffic of the street, which would make it impossible for some kinds of traffic to get along; and if the electric tram came into collision with, say, a load of wool it would come off second best. Then, too, 8 feet 6 inches would not allow any vehicle to stand opposite any shop-door in George-street while goods were being loaded or unloaded. Such an arrangement would not allow half a chest of tea to be unloaded at a chinaman's shop, or a cask of beer at a publican's.
1794. *Mr. Black.*] Did you ever see a vehicle 8 feet 6 inches wide? No; but they have to unload "end on."
1795. *Mr. Clarke.*] Would the tramway be dangerous to pedestrians? Undoubtedly; because if goods were being unloaded, and the pathway were covered with goods, as you see in different places at all hours of the day, the foot passengers would have to step out into the road, and there would be no room for them.
1796. It is proposed that there shall be a two-minutes tram service. Would that make it difficult for vehicles to pass? I take it that a two-minutes service would be a continuous service. I should be very sorry to have to get between trams running every two minutes. Besides, they would not run exactly to time.
1797. Is there a large amount of passenger traffic in Harris-street? There is a considerable amount of traffic there. About 125 vehicles of all kinds turn out of George-street into Harris-street per hour.
1798. Do you think that the traffic is sufficient to justify the construction of an electric tramway through the street? I think that it would to a great extent. Harris-street is the main artery of traffic in that part of the city. The Government have expended a great amount of money there, and all the traffic to the railways and other Government sheds goes along Harris-street.
1799. You are aware that a number of vehicles licensed by the Transit Commissioners run along Harris-street? Yes.
1800. Do you think that the 'buses there would interfere with the earnings of the proposed tramway? I think that that is a matter beyond my province. I am not a shareholder in any of the 'bus companies.
1801. You have no control over the traffic of the licensed vehicles? Personally I have no control over them.
1802. The Corporation has no control over them? No; the Transit Commissioners control the licensed vehicle traffic in the streets.
1803. If the Transit Commissioners wished, could the heavy traffic be diverted from George-street into some street which has less traffic? No; we have not the power to do that, as I read the Act. I may mention that the City Council endeavoured to have a scheme of that sort formulated, and we were informed by the City Solicitor that we had not any power to make by-laws on the subject.
1804. Unless an Act of Parliament was passed, doing away with the Transit Commissioners and giving the Council special power, you would have no power at all? We have no power.
1805. Is that a desirable state of affairs? It is a very undesirable state of affairs, and that is not our only grievance.
1806. Are you aware that the 'bus fares are lower than the tram fares? I am not aware what the tram fares are to be.
1807. The tram fares to the suburbs are much higher than the omnibus fares? I think that that is ample proof that the public are better served by the omnibuses than by the present steam-trams, while the former are certainly the more cleanly.

1808.

I. E. Ives, Esq. 10 April, 1896.

1808. You think that it would be inadvisable to construct the proposed tramway, because it would interfere with the extension of the railway to the Circular Quay? I am of opinion that it would be a great disadvantage to have the proposed tramway for the reasons I have already given. I am sure that such a tramway would be very inconvenient to the citizens, although some of them seem to think to the contrary.

1809. Mr. Lassetter has stated that personally he would be very glad to see a tramway carried through George-street? I saw that; but Mr. Lassetter was speaking for himself, and he is in the happy position of possessing a frontage to York-street. Few others are in that position. He does not receive his heavy goods in George-street. All his heavy work is done in York-street. He never requires to back a dray up to his George-street front. But further down, by David Jones', Robertson's, John Sands', and those places, you will find eight or ten gateways in George-street, at which very heavy loads are received every hour of the day, and the proposed tramway would inconvenience the shopkeepers there to a very large extent. Not only would the shopkeepers be inconvenienced, but the citizens generally would be affected.

1810. From Barrack-street down to Queen's Wharf there are not many people in George-street who have back entrances? Every man from Wynyard-street has a back entrance. Orme, Keigwin, & Co., for instance, employ trolleys with four horses, and you will often see them waiting to get into a 9-or 10-feet way. How could those people conduct their business if the proposed line were made? It takes more than two minutes for a trolly to turn into a gateway like that.

1811. It is ultimately intended to run a much more frequent service than a tram every two minutes? Well, in that case the tramway would either have to stop, or the people there would have to throw up their business.

1812. Mr. Newman, of David Jones & Co., approves of a single line of tramway up George-street, returning along Pitt-street? That would not suit. It would be too expensive.

1813. The expense would be more, but there would not be so much danger to traffic? If you take Pitt-street as a whole the average width is much less than the average width of George-street. There, again, you are met with the difficulty of there being more entrances and more gateways than there are in George-street.

1814. You think, then, that even a single line of tramway in George-street would not be advisable? I think that the tramway is altogether a mistaken idea. I do not think that the proposal is suitable for a city like Sydney. If you had a city like Bathurst or Goulburn, with streets 100 feet wide, and on level ground, it might answer; but in Sydney, where space is so limited and traffic so heavy, anything of the sort would create danger, and, in the end, prove a nuisance to the people conducting business along the line of route.

1815. Do you remember that some years ago there was a horse tramway down Pitt-street? I remember it well. I never drive over the street now without remembering how the rails stood up.

1816. Why was that tramway removed? I know that it killed two or three of our prominent citizens. There were several old friends of mine run over and killed by it, although it was only a horse tramway.

1817. *Mr. Fegan.*] I suppose you are not well up in the science of electricity? No; I am not an electrician.

1818. You come to give evidence more upon the question as to how the proposed line will affect the commerce of the city? I am not prepared to give any evidence whatever of a scientific nature.

1819. You object to the construction of the proposed tramway principally because you think that the extension of the railway into the city is a work of greater necessity? That is one of my principal reasons. A city railway would remove the necessity for those abominations of steam-trams, and would do away with the idea of an electric tramway altogether.

1820. Are you speaking now as Mayor of the city, or in your private capacity? I am here as the Mayor of the city of Sydney, and whatever I say here I say as the Mayor of Sydney.

1821. Have any petitions been presented to you or to your Council against the project by the Committee? No.

1822. Are you aware that the Committee have received petitions in support of the project into which we are inquiring? I am not aware of it.

1823. Is it not rather strange to you that, besides Mr. Lassetter, who, as you have pointed out, is in a better position than the majority of business people, a number of persons should have signed a petition in favour of the proposed tramway? I must decline to give an opinion unless I see the names of the petitioners and know their places of business.

1824. What stand do you take, as Mayor of the city, against the project before the Committee, when you have not heard the citizens' opinion upon it? As far as I am individually concerned, I was asked if I would attend here. I received a notice requesting me to attend on the Tuesday, I think, and on the following Thursday I held a finance meeting. Before that meeting closed I announced to the aldermen that I had received the notice, and I asked them if they had any directions to give me. They said that they were satisfied to leave the matter in my hands, because they were all opposed to the project. One of the daily papers then went out of the way to ridicule me, because of my attitude in regard to the matter, and now you ask me do I come here in my private capacity or as Mayor of the city, and if, as Mayor of the city, have I ascertained the opinion of the citizens in regard to the line. Then you ask me to give an opinion upon a matter about which I can know nothing.

1825. Has any public meeting been held in condemnation of the scheme? I have not attended any.

1826. If there were any such meeting, you would, in all probability, be asked to preside at it? The probability is that I should; but in explanation of the fact that there has been no public meeting, I might say that there seems to be a desire to rush this matter through during the Easter holidays, when the public mind has been engaged, in a manner that it never has been before, in a round of pleasure. This thing is dropped like a bombshell upon the people, so that they have had no time to do anything.

1827. *Vice-Chairman.*] I think you are in error. The inquiry commenced some time ago, and it is proceeding in its regular course. Advertisements have been inserted in the newspapers, asking persons interested to attend here as witnesses, and in no case has evidence been refused? The sittings of the Committee have been carried on during a long series of holidays, when, I say, the public mind has been filled with other things; but I do not wish to impute motives to the Committee generally or to its individual members.

1828. *Mr. Fegan.*] Has not the time come when some better means of transit should be given to the people than the steam tramways which we have now? I am quite convinced that we require a better service than the present steam tramways.

1829.

I. E. Ives, Esq. 10 April, 1896.

1829. According to the evidence of scientific men electric tramways are better than any other system that has yet been discovered;—do you not think that Sydney should be as well off as other cities in regard to modes of transit? I quite agree with that view, and I think that we are a long way behind now; but if you want to bring Sydney ahead you must extend the railway from Redfern to Circular Quay. It costs me as much to travel from Redfern to my office as it does to travel 14 miles on the railways.
1830. You think that the construction of the proposed tramway will keep back the extension of the railway into Sydney? A tramway can never answer the same purpose as a railway. A railway into the city would be of advantage, not only to the people living about Sydney, but also to people in such places as Bourke, Hay, and Deniliquin.
1831. Do not hundreds of people travel down George-street by the 'buses? I think there must be thousands every week.
1832. Would not an electric tramway provide for that traffic, and be better and quicker than the 'bus service? I have no doubt that a two-minutes tram service would carry any ordinary passenger traffic.
1833. Do you not think that there would be plenty of room for vehicular traffic in a street 33 feet wide? But you propose to construct a tramway which will leave only 8 feet 6 inches of roadway on each side.
1834. Can you suggest anything better? I understand that, according to the best authorities, 32 feet is the narrowest width allowed for a double track of tramways. That being the opinion of experts, it would be useless for me to oppose it.
1835. Trams are working not only in small continental cities, but in the great city of New York, where the roadway is narrower than that? Yes.
1836. Do you not think that if the proposed tramway were constructed the vehicular traffic would be lessened? It would depend upon the fares charged upon the tramway.
1837. I do not think that the fares charged will be higher than those charged at present? Well, at the present time a man can ride from the University to Miller's Point for 2d.
1838. Would you get into a 'bus if there were one of these trams passing? Well, with the 'bus you would get 50 per cent more in point of distance for 2d. than you would get with the tramway.
1839. Business men do not look at a penny when they are in a hurry, and an electric tram would go much quicker than the 'bus? No doubt if a man were in a hurry he would take the speediest conveyance going towards his destination. I am fully convinced that since the omnibus fares were reduced more people travel in the 'buses and fewer cabs are used.
1840. Do you not think that David Jones & Co. are in an extremely good position by reason of their having Barrack-street into which to unload their merchandise? They have one of the best positions in the city.
1841. Do you think that a tramway in George-street would interfere with their business;—would there not still be plenty of carriage room in Barrack-street? Well, there is another view which perhaps Mr. Newman in giving evidence did not take into consideration. Immediately opposite David Jones & Co. there is the railway receiving depot, and sometimes you will find six or eight or ten vans waiting there, and the street so blocked as far as the Commercial Bank that you cannot get through with a cab or anything else. This is especially the case in those portions of the day when David Jones & Co. are very busy, and there are a great number of carriages outside their doors.
1842. You think that a tramway in George-street would hinder the natural course of business there? I think it would interfere very materially with all the merchants along the line of route.
1843. Do you not think that a good tramway would popularise George-street more than anything else? It would be no use for George-street to be popularised if people could not do their business there. You might make the tramway popular as the Manly boats have been made popular by the reduction of fares to 3d., but if the trams are run to the detriment of firms like Orme, Keigwin & Co., nothing is gained. If business has to give way to passenger traffic business men must move into other streets.
1844. But you admit that greater facilities for travelling should be given to the citizens than those they now possess? I have not heard of any complaints about the present arrangements, except as to the tax it is to be landed at Redfern, and have to go such a long way to get into the town. Private enterprise, however, has done as much as it can to remove the difficulty. The streets are full of licensed vehicles, and you can get from one door to the other for 2d.
1845. But compare 2d. with the fare of 1½d. on the tramway? But if for 2d. you get 2d. worth instead of 1½d worth, where is the difference.
1846. Do you not think that the Commissioners should do something to improve the present arrangements? I should be very pleased if they would extend the railway into Sydney.
1847. Do you know what the cost of the proposed tramway would be as against the cost of the proposed city railway as at one time estimated? At the present time we do not frame estimates upon estimates made a few years back.
1848. Have you any idea what a city railway would cost under present circumstances? I have not gone into the figures, but I would be prepared to give a sketch map of a railway which would tap the whole of the traffic and serve the wharves, without going through the heart of the city as was proposed years ago, with the necessity of resuming most expensive land.
1849. *Mr. Hassall.*] Is it your opinion that some steps should be taken to give the City Council power to regulate the street traffic? I am of opinion that that power should be in the hands of the City Council.
1850. More particularly since it is in contemplation to construct a tramway along one of the principal streets of the city? That is undoubtedly an additional reason why the Council should have full control of the street traffic.
1851. Do you think it would be dangerous to allow heavy traffic, light traffic, and all kinds of vehicles, to traverse a street in which tramways were running? I think so. It must be remembered that, although in going along the street the traffic would have to keep to its own side of the road, vehicles would occasionally have to cross the street, and in doing that they would have to pass in front of the trams.
1852. You think that the construction of a double line of tramway in the principal artery of the city would cause public inconvenience? I do; under the rules by which the traffic of the city is now governed.
1853. If the power to regulate the traffic was vested in the Council, would that remove many objections? No doubt it would. At the present time I consider it a disgrace that heavy traffic should be allowed to go along George-street. At the present time, however, we have no power to prevent a man from carrying a 40-feet ladder along that street.

I. E. Ives, Esq. 10 April, 1896.

1854. You think that it is absolutely imperative that the right to control the traffic should be vested in the City Council? It is necessary that the right to control the traffic should be given to us before any tramway is made.
1855. I understood from something you said earlier in your examination that the public have had practically no time to consider this matter fully? Well, personally, I have not had the opportunity of consulting the City Surveyor, or to see the plans.
1856. Do you think it desirable that an expression of public opinion should be obtained before this matter is finally decided;—would you desire to be allowed to give further evidence after obtaining an expression of public opinion, or an expression of the opinion of the members of the Council? I presume that I can get a copy of the evidence given to-day, and see my brother aldermen upon the matter. Do you wish that I should call a public meeting myself to obtain an expression of opinion from the citizens.
1857. I understand that the Council are perfectly satisfied that you should appear here to-day as their representative, and that your opinion is practically the opinion of the Council? That is so.
1858. I judge that you are of opinion that Mr. Lassetter, in giving evidence here, was actuated more by selfish motives than by anything else? I have not seen his evidence. It caught my eye in the newspaper, and I used his name to show how the tramways might be of advantage to him, but not to other people, he being very favourably situated.
1859. Is there any back lane from Park-street to Bridge-street on the eastern side of George-street? None that I know. There are gateways which serve the purposes of two or three shops on each side of them.
1860. Consequently, all the heavy goods for the shops along that part of George-street have to be landed on the pavement, and taken through the front door? That is so. Harris and Ackman have a back lane from George-street on the northern side of the Royal Hotel.
1861. Their business frontage is in Pitt-street? Yes. But their heavy traffic comes down George-street. Farmer & Co. too take in all their goods at the George-street entrance, with the exception of a few things that go in at Market-street. Further down you find a few lanes, like Abercrombie-lane and Dean's-place, the buildings in which are approached from George-street principally.
1862. So that, in your opinion, a double line of tramway down George-street would interfere with business operations there, and to a certain extent be a danger to the public? Yes.
1863. Are there any back entrances from Market to Barrack Streets on the western side of George-street? You have Stedman's gateway opposite the Royal Hotel. It feeds the frontages to George-street. Then I do not think there is anything until you get down below George Robertson & Co., where you have two gateways. Between Wynyard-street and Margaret-street there is Wynyard-lane running parallel with George-street, and then Dynon, and Sandy have a back entrance off Margaret-street Below Jamieson-street you have a 10-feet lane serving the Bank, and going right down to Peate and Harcourt's.
1864. Has not the opening of Moore-street increased the traffic in Barrack-street? I have not noticed it.
1865. Is not the traffic exceptionally heavy at the crossing from Barrack-street to Moore-street? I cannot see that it is heavier than at other crossings, but I have not paid special attention to the matter.
1866. Would not a city railway and the proposed tramway be two different things;—the tram traffic would consist more of the local traffic along George-street, while the train traffic would be composed of passengers who are at the present time landed at Redfern? Yes. And the train, if extended into the city, would reduce the earnings of the tramways.
1867. Do you think that a city railway and the proposed tramway are both necessary for the convenience of the public at the present time? I consider that a city railway would not only serve the people about Sydney but the whole Colony.
1868. In the event of the railway being extended into Sydney the Commissioners would increase the fares. Possibly they would. A single return first-class ticket to where I live costs 2s. 2d., whereas I have to pay 2s. for a cab to take me from Redfern to my office.
1869. Would not the proposed tramway, if constructed, suit you? It would not go near enough to my office. I should still have a quarter of a mile to walk. The omnibus drops me at my door if I care to take it.
1870. Would the proposed tramway serve people living or doing business in Clarence-street;—what area do you think it would serve? It is impossible to answer that question. You have boats coming in on that side from the various water suburbs, whose passengers would not all use the tram, though some of them might.
1871. Do you think the people resident in the western water suburbs would take the tram along Harris-street and down George-street in order to get to York or Clarence-streets? The people living in the western water suburbs do not land at Pyrmont. They land at the foot of Erskine-street, Lime-street, or King-street.
1872. I am not speaking of the Parramatta River traffic; I am speaking of the residents of Pyrmont, who have now a penny ferry. Do you think they would take the tram and come round by Harris and George Streets? I think it would be very doubtful. Those persons can now get right into the heart of the city in two or three minutes; but it would take them a long while to get round in the tram.
1873. You think no great reliance can be placed upon evidence stating that those people would use the tramways? I certainly am not of the opinion that they would use it.
1874. Do you not think that it would be better, instead of taking the tramway along Harris-street, to turn it up Regent-street, and serve that densely-populated portion of the city which is not too well off for means of communication now? Well, the present steam tramway does not tap that district at all. The Botany tram is of no service to the residents of Alexandria, Golden Grove, Chippendale, and so on.
1875. As a business speculation, do you think it would be better to turn the tram up Regent-street? I think you would get a great deal of traffic if you did.
1876. Have you any idea as to the number of people coming into town from that direction, as compared with the number of people coming in along Harris-street? A great number of people come in along Regent-street. People come in that way from Botany, Alexandria, Waterloo, Darlington, and the whole district between Pitt-street, Redfern, and the Newtown Road.
1877. Do you think that a tramway going in that direction would be better than a tramway along Harris-street? Judging from the population of the district it would serve, I think it would be better.
1878. Is not the present 'bus service of the city pretty satisfactory? I think there are more vehicles than are actually required, especially is that so with regard to cabs. 1879.

1879. People have every facility for getting backwards and forwards to their places of business? I have not heard any grumbling.
1880. I presume that it has cost the Council a good deal to put the street into order for wheeled traffic? Yes; a considerable sum.
1881. In the event of the roadway being interfered with by the laying down of a tramline, would the Council be put to expense, or would it all be defrayed by the tramway authorities? The tramway people would have to pay for the whole cost of the line, but considerable expense would be entailed upon the Council.
1882. You think that the present requirements of the city are fairly met, and that at present there is no necessity for constructing this tram? Those are my opinions.
1883. *Mr. Roberts.*] Have you made yourself familiar with the plans of the proposed tramway? Nothing has ever been submitted to me by this Committee. I have seen none of the evidence that has been taken, except what has appeared in the newspapers.
1884. Have you made any application to be allowed to inspect the plans or read any of the expert evidence that has been given in open court at this inquiry? I have not.
1885. Do you not think that if opportunity were afforded you to look into the matter more fully you might moderate your opinion with regard to the proposed line? I have not the remotest idea as to what evidence you have to submit to me that would alter my opinion. I think it would have been better if I had had the evidence first.
1886. It seems to me that it would be as well if you were in a position to make yourself acquainted with the question about which we want you to give evidence? I explained earlier in the afternoon that on account of other pressing duties I had not been able to give attention to this question. It was only at the urgent request of your Secretary yesterday that I consented to come here this afternoon, and I have public duties awaiting me as soon as you have finished with me.
1887. In general terms, you are not favourable to the construction of any tramway in George-street? My long knowledge of the city and of the business conducted in that street compels me to say yes.
1888. You give that answer without any knowledge of what it is proposed to do? Yes; beyond the bare fact that it is proposed to run a double line of tramway from the Circular Quay to Redfern through George-street.
1889. Remembering that electric tramways are being worked in much more populous cities than Sydney, and in streets as narrow as George-street, do you not think it would be a wise thing to let the citizens of Sydney have the advantage of them? If you can show me that those cities are in any respect, as far as situation is concerned, similar to Sydney, I will say yes. Sydney is built upon one or two ridges, and the bulk of the traffic is from or to the water. If the city had been laid out on a bowling green it would have been different. I think you will find that none of the cities to which you refer compare in point of situation to Sydney. They have not the same steep inclines and contracted space as Sydney. Literally, we have only two streets, George and Pitt Streets, running through the middle of the city.
1890. You are very much in favour of the construction of the city railway? Yes.
1891. Do you not think that there is room not only for a city railway, but for an electric tram as well? Well, in London, although they have underground railways, with trains leaving every two minutes, the number of cabs and omnibuses in the streets has not been diminished. The greater the facilities provided the more the use.
1892. Do you not think that a two-minutes tram service in George-street would ultimately do away with nearly all the 'bus traffic there? Probably it would, or the 'buses would have to be constructed on a smaller scale.
1893. Is it not a fact that in Melbourne the omnibus traffic has almost wholly disappeared? I have not been in Melbourne lately; but you cannot compare that city with Sydney. There are no steep gradients and hills there, and the main business part of the city is not hemmed in by the water.
1894. Is it not a fact that since they have had an efficient tram service there the omnibuses have almost entirely disappeared? I believe that to a very large extent the 'buses have been removed from the heart of the city because of the trams.
1895. I understood you to say that your two objections to the proposal before us are that the tramway would interfere with the unloading of drays in George-street and would prevent the construction of a city railway? I consider that the tramways would interfere most materially with the conduct of business in the city.
1896. Have any complaints reached you in regard to the interference with business of the cable tram which is running in a street as narrow and as busy as George-street? Various complaints have been made to the Council in reference to the King-street tramway, especially by the people west of George-street.
1897. Have these complaints taken the form of a public protest by the citizens? The complaints have been forwarded by the Council to the Tramway Department, with a view to having the evil remedied. I think they have appeared in the public press on two or three occasions.
1898. Has any public petition been presented to the Council complaining of annoyance to business people caused by this tram? No public petition on the subject has been presented.
1899. What is the nature of the complaints that have reached you? Some of them have been in connection with danger to life and limb; there have been general complaints arising from obstruction of the street and interruption of traffic.
1900. I understood you to say that in objecting to the proposed tramway you were echoing the opinion of every alderman in the Sydney Municipal Council? That is so.
1901. Has any public discussion taken place in the Council in regard to the proposed line? Nothing except that which I mentioned earlier in my examination.
1902. Are the objections of the aldermen to the proposal based on the same ground as your individual objections, or have they other grounds of objection? The aldermen, individually and collectively, are opposed on broad principles to the construction of the proposed line, but I would not undertake to give the exact opinion of any individual alderman.
1903. Have the aldermen made themselves thoroughly familiar with the proposed scheme? Some of them have. Some of them appear to be more familiar with it than I am.
1904. Do you know whether they have seen the plans or asked for any information as to the details of the scheme? I do not.

I. E. Ives, Esq. 10 April, 1896.

1905. *Mr. Wright.*] I suppose you are aware that the principal streets and every suburb of Melbourne have tramways? Yes.
1906. And are you aware that there are lines of 'buses coming from the Glebe, Newtown, Camperdown, St. Peter's, Forest Lodge, Golden Grove, Botany, Redfern, Strawberry Hills, Balmain, Drummoyne, Ryde, Petersham, and Enmore, all of which land their passengers in George-street, and nearly all of which come through George-street? Yes.
1097. Do you think that the construction of the proposed line would mean the discontinuance of all those 'buses? Certainly not. I have already pointed out that a man would not walk from the Glebe to Redfern to take this tram to the city when he could ride the whole way in a 'bus for 2d.
1908. So that all the traffic that the trams would take from George-street would be the railway 'bus and the Pyrmont 'bus traffic? Yes. If all the people from the railway and from Pyrmont took the tram.
1909. But the rest of the 'bus traffic will continue? Yes.
1910. And you think that the traffic in George-street will be largely congested if the trams run there every two minutes, and in busy parts of the day every thirty seconds? I feel convinced that the trams would obstruct the other traffic, and prevent people from transacting their business in George-street.
1911. And you think that if the tramway is made a great number of business people will have to abandon their premises in George-street, and go elsewhere? I think that it will be utterly impossible for the people in George-street to conduct their business as they do now, and that the value of the business premises there will deteriorate very largely in consequence.
1912. You have pointed out that Sydney is the only city in the world where the great volume of traffic is confined to one street? Yes; Sydney is built upon a ridge, and the only street along that ridge is George-street.
1913. George-street is the great artery for all pleasure, shopping, and heavy traffic? Yes; that street takes the bulk of the traffic.
1914. You know of no city which is in a similar position? I do not remember any.
1915. You are familiar with Melbourne? I am.
1916. There is no street in Melbourne which will compare with George-street? Certainly not, considering the amount of traffic in George-street. The Melbourne streets are all very much wider than our streets, and since Melbourne is built on a plain, the facilities for traffic there are much greater
1917. Do you know any street in Melbourne that carries one-third of the traffic carried by George-street? I do not. I have not seen anything like the traffic in the Melbourne streets that I have seen in George-street.
1918. To the best of your belief you are now expressing the opinions of the citizens of Sydney? That is what I am endeavouring to do.
1919. You did not come here to express your own opinions in antagonism to those of the people whom you represent? Not in the slightest degree. I came here in my public capacity.
1920. You were in Europe some short time ago? Eleven years ago.
1921. Then you know nothing about modern tramway arrangements? I have seen nothing very recent.
1922. Were you in Glasgow? Yes; and saw the tramway service there.
1923. What are the streets of Glasgow like? Some of them are very narrow, and the traffic is very heavy.
1924. There is a great amount of 'bus traffic there? Yes.
1925. You consider that the citizens of Sydney are fairly well served at present, and that if any additional means of communication are required a railway should be constructed instead of a tramway? Those are my opinions.
1926. *Mr. Black.*] Do you not think that the fact that, although the Hobson's Bay Station, in Melbourne, is only three minutes walk from Collins-street, and about five minutes walk from Bourke-street, and the Melbourne tramway system is a very complete one, invalidates your conclusion that a city railway in Sydney would render a tram service unnecessary? I say that the Melbourne railway is in no sense a city railway.
1927. Most of the Melbourne suburbs are placed in direct communication with the city by railway, and yet there are trams running to the city from most of those suburbs? The people coming by the trams live in suburbs to which there is no railway.
1928. Not at all; for instance, there is a tramway to St. Kilda and a railway to St. Kilda, a tramway to Hawthorne and a railway to Hawthorne;—supposing our railway conveyed passengers to within two minutes walk of the G.P.O., do you not think that there would still be a great amount of tram traffic? The trams are feeders to the railway, as omnibuses were before trams were invented.
1929. That is no answer to my question;—you object to the construction of a tramway in George-street because you think that the traffic there is already too much congested;—do you not think that one great reason for that congestion of traffic is the running of so many 'buses? The population of the city demands the employment of 'buses as a means of transit.
1930. Does not the bulk of the traffic in George-street consist of 'bus traffic? I do not feel disposed to answer that question.
1931. Is it not a fact that in George-street you often see three or four 'buses running abreast and trying to pass each other? I have nothing to do with the street traffic.
1932. Do you not think that a tram traffic which would be confined to a particular course in the street would be better than a traffic taking its own course and steering all about the street? Well, of course, the electric tram would keep its own course; I do not suppose it will be crotchety, and jump off the rails.
1933. Do you not think that other vehicles would find it more easy to avoid collision with traffic of that kind than they do under the present system to avoid collision with one another when every 'bus-driver has almost the whole width of the street to drive upon? Collisions could hardly be fewer than they are now. It is very rarely that you hear of a collision of a serious nature unless when a cable tram runs into a steam tram.
1934. I saw three serious collisions mentioned in the newspaper on one day recently; you appear to imagine that the construction of a tramway in George-street would interfere with the unloading of vehicles there;—is it usual where there is much traffic to back vehicles into the pavement and unload from the rear? Well, you cannot pass up George-street at any hour of the day without seeing it done.
1935. Do you not think that the practice is a dangerous one? There is no doubt that there is a very great amount of danger in it, but the thing is done all the same.

I. E. Ives, Esq. 10 April, 1896.

1936. Are there many business places of importance in George-street—I do not allude to cigar-shops, and little peddling fan-tan places like you see in Lower George-street—which have not gateways or side entrances? Fully two-thirds of the places there have no side entrance.
1937. You stated that the 'buses were more cleanly than the trams—I suppose you alluded to the steam-trams? Yes.
1938. Do you think that the 'buses would be more cleanly than the cable or electric tram? There is a good deal to be said about the matter one way and another.
1939. Do not a large proportion of the travellers by 'bus from the Circular Quay get out before they come to the Railway Station? That may be so between 11 o'clock and 2, but during the rest of the day most people are through passengers.
1940. But in the middle of the day most people are travelling from one point in George-street to another point in George-street? I could not say.
1941. At all events there is a large traffic of that character which the proposed tramway would serve? No doubt the trams would serve a large part of the city traffic, but no one would take the electric tramway to Redfern, and then proceed by 'bus to Newtown or the Glebe.
1942. May we not conjecture that the low 'bus fares now prevailing are due to the competition of the trams? I think that the reduction in 'bus fares came about because the proprietors found that they could not get 3d., and so they took 2d., feed being very cheap at the time.
1943. Is it not a fact that before the trams ran the 'bus fares from Waverley, Randwick, and Woollahra were 1s. and 6d.? Thirty-five years ago I paid 1s. to take the 'bus from Redfern to Argyle Cut, but I have not paid that price lately.
1944. You appear to think that the running of these trams will increase the danger to life and limb, but does not every additional vehicle that runs increase that danger. We could scarcely eradicate the danger unless we prohibited the traffic altogether? That is a view generally accepted.
1945. You appear to think that it would be dangerous to have lorries crossing the tramline? That was a danger that occurred to me at the moment.
1946. I suppose you know that the trams will be provided with heavy brakes, and that they will be bound to respect the street traffic? I presume that they will have the best appliances that the ingenuity of man can provide.
1947. Does the rattling of the 'buses in George-street interfere with the meetings of the Council at the Town Hall? No; we never hear it.
1948. You appear to consider that the Committee have somewhat slighted you in connection with this matter? I did not say that. I said that I was asked to give evidence when I had no time or opportunity to collect data. I have had no intimation as to the topics upon which you intended to question me.
1949. Do you not think that if you had told the Committee that you wished to have your examination postponed they would have been glad to accede to your request? I think I have already said that I did point out that I had no time.
1950. Of course you have had no opportunity of reading the evidence of Messrs. Holdsworth, Macpherson, & Co.'s representative? I have not.
1951. That gentleman, after expressing a desire that the tramway should be constructed, stated that very few business-houses in George-street were without a back entrance, and that the running of the trams would minimise the danger that now exists? Holdsworth, Macpherson, & Co. do all their heavy work in Hamilton-lane. George-street is only used by their customers.
1952. I understood you to say that some of the petitioners in favour of the construction of the tramway might be interested parties, because of the position of their business premises;—is that correct? I do not think I made use of that expression. I said that I had not seen the names of the petitioners.
1953. You said that until you saw their names and knew where their business premises were you could not know their reasons? Yes. But I did not say that they were actuated by interested motives.
1954. Would it not be fair to infer that those opposed to the construction of the tramway are also actuated by interested motives? I was asked to give an opinion about a petition which I had not seen, and of which I heard nothing, and what I said was merely an explanation.
1955. In view of the great possibilities of this city, and its yearly increase of traffic, do you not think that not only a city railway but a tramway in George-street or Pitt-street, or both streets, would be necessary to cope with what I might call the intermediate traffic of the place? There is always an intermediate traffic. The railway creates a traffic of its own.
1956. Is there not a pick-up traffic which could not be served by the railway, and is not that traffic growing to such dimensions that within a very brief period it will be necessary to make further provision for it? I think that something should have been done before now for the regulation of the street traffic. I think that, by proper regulation, George and Pitt Streets could be relieved of more than half the vehicles now travelling along them, and that would leave a clear and unobstructed thoroughfare for what was left.
1957. You are of opinion that any arrangement that would lessen the number of vehicles in George-street would be a public benefit? I think that if we had power to regulate the traffic it would be as beneficial to the city as the construction of the proposed tramway.
1958. *Mr. Trickett.*] When the King-street tramway was under the consideration of this Committee, Mr. Burdekin, the then Mayor of Sydney, was examined, and in reply to the question, "Has the proposed tramway along King-street to Ocean-street been discussed officially in the Municipal Council?" he said that the subject of tramways generally had been discussed, and that the Council were of opinion that, inasmuch as the roads were maintained at the expense of the citizens, consideration should be given to this fact when a proposal of the kind then before the Committee was under investigation;—has this subject come under the consideration of the Council since? The matter has been discussed at the Town Hall, though not at a meeting of the Council, and the aldermen and myself are of opinion that if the Government or any private persons use the streets in the way proposed the City Council should obtain revenue from them.
1959. Was that discussion sufficiently general for you to state that that is an objection which you now urge? The same opinion now prevails in the Council as prevailed when the King-street tramway was under investigation.
1960. Have the Council made any representation to the Government on this subject? Not that I am aware of.

I. E. Ives, Esq. 10 April, 1896.

1961. Is it intended to make any? It is intended to take up the whole matter of the better conduct of traffic in the streets, and of the control of the streets generally by the Council, both as concerns traffic, and as concerns water and hydraulic mains, and so forth. The matter has not been on the minute-book, but it will be there. It is under consideration by the aldermen, and will come before the public in a short space of time.

1962. Is it likely to be dealt with shortly, so that any determination may come before the Committee? I do not think that any definite decision will be come to during the present inquiry.

1963. Do you not think that the question is one which should be brought prominently before the aldermen? Yes; it is a very important question.

1964. *Vice-Chairman.*] Are you aware that for some years past the Railway Commissioners have been calling attention to the congestion of traffic in Elizabeth-street, and to the necessity of providing other means than those at present existing to move the population? The tram traffic has taken almost complete control of Elizabeth-street. There is very little other traffic in Elizabeth-street.

1965. Are you able to make any suggestions which would carry out the views of the Commissioners, and be acceptable to your Council? Not at the present moment.

1966. You object to a tramway in George-street—can you suggest any other street in which to construct a tramway to relieve the congestion in Elizabeth-street? The congestion of traffic in Elizabeth-street is caused by the traffic coming from the eastern suburbs.

1967. Do you not think the public convenience will be better consulted by the construction of a tramway down George-street than by allowing the congestion of traffic in Elizabeth-street to remain? To my mind the congestion of traffic in Elizabeth-street is of no moment to the public, because Elizabeth-street is out of the city proper. But when you speak of a tramway through the heart of the city, that is a very different matter. I take it that if the traffic in Elizabeth-street is congested now, and you make a tramway down George-street, the traffic there will shortly be congested, and that would be a very serious matter.

1968. Well, must not some provision be made to meet the public convenience by providing better means of transit along some of the streets? The public have not demanded better means of transit.

1969. Must we not take into consideration the necessity of providing some better means? Has there been any demand for it by the public. I think that if the Council were armed with authority to regulate the street traffic the public would be well served by the present 'bus service.

1970. Well, can you make any suggestion whereby the Commissioners could relieve the congestion of traffic in Elizabeth-street? I could not do so on the spur of the moment, as I am not acquainted with the facts of the situation.

TUESDAY, 14 *APRIL*, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (Chairman).

The Hon. Frederick Thomas Humphery.	Charles Alfred Lee, Esq.
The Hon. Charles James Roberts, C.M.G.	John Lionel Fegan, Esq.
The Hon. William Joseph Trickett.	Thomas Henry Hassall, Esq.
Henry Clarke, Esq.	George Black, Esq.

Francis Augustus Wright, Esq.

The Committee further considered the proposed Electric Tramway from Circular Quay, Sydney, to the Redfern Railway Station; and along Harris-street to the intersection of John-street.

Philip Billingsley Walker, Esq., M.I.C.E., M.I.E.E., Secretary to the Electric Telegraph Department, sworn, and further examined:—

P. B. Walker, Esq., M.I.C.E., M.I.E.E. 14 April, 1896.

1971. *Mr. Humphery.*] When last under examination you were to prepare a statement in reference to the subject of our investigation? Yes. I have prepared such a statement, and it is as follows:—

In dealing with the question of the proposed electric tram-line scheme intended to traverse George and Harris Streets, I have looked over the plans, and it seems to me to be a very good scheme, based on the latest practices for the construction of electric trams adopted in England and America, and to a limited extent on the Continent.

It is necessary in considering this scheme to provide for the protection of the Postmaster-General's telegraph and telephone wires throughout the city, and I therefore feel that it is my duty to lay before the Committee such technical points upon this matter as will prevent future trouble in regard to the Postmaster-General's wires.

It is well known to all electrical engineers that electric traction wires are a great enemy to the telephone, because the one is worked by an electrical energy of hundreds of amperes of current, whereas the other is affected by less than a milliampere, thus showing clearly that the greater power must necessarily swallow up the weaker power, when brought into juxtaposition in the working out of such a system. Therefore it involves a matter for grave consideration as to the best course to adopt in regard to the future arrangements of the telegraph and telephone wires throughout the city.

There is no doubt in my mind that if the proposed electric tram scheme is carried out, it will entail a complete alteration of the whole telephone system now existing, comprising some 2,000 miles of wire throughout the city, which would mean an additional heavy expenditure to the Government, as it would necessitate the placing of the whole telephone system under a metallic circuit, costing somewhere about £175,000 on an overhead scheme, and if this had to be extended to the suburbs it would cost about £250,000. To put it underground, under a complete subway system, would cost half a million of money.

There are 1,553 circuits (partly in cables and partly on bare wires) along George-street and Harris-street, and 2,058 subscribers on this route, that would be affected by the action of the tram along George-street, and not only would these wires suffer from the working of the tram, but the whole telephone system more or less throughout the city would also suffer, because in passing up George-street, at the junction of each of the cross streets, the wires on the poles in the cross streets would also be affected by the tram, owing to the poles in these streets carrying wires which run into George-street, and this would continue to other wires in bye-streets throughout the city, so that any disturbance propagated in the wires in George-street would be distributed from wire to wire in all parts of the city, although not actually on the route of the tram. I have proved this by practical experience in connection with the working of the North Sydney electric tram, where I had occasion to use a piece of wire erected at Middle Head sometime last year. This wire was erected upon poles carrying other wires in the same direction as the Military Road electric tram, and alongside the electric tram, and the interference caused by this piece of wire, a few hundred yards in length, at Middle Head, by induction, was propagated to such an extent that it was continued on past the tram, causing the speech at times to be so bad that it was impossible to work the telephone. In addition to this, the action of the tram on these wires was, by induction, extended through the cable across the harbour to South Head, affecting the telephone on that side of the harbour, where the motion of the tram could be distinctly detected from the vibration through the telephone, thus showing how widely the electrical energy required for the working of the tram overpowers the telephone.

The

P. B. Walker, Esq., M.I.C.E., M.I.E.E. 14 April, 1896.

The action of an electric tram on the telephone causes a constant humming sound, and frequently when the tram starts, or any disconnection takes place in the trunk leading to the feeder wire, a shrill sound, like a syren in the distance, is heard through the telephone, and which so affects it that the voice cannot penetrate through it sufficiently to make a person understand when using the telephone. There are numerous instances in the attached papers [*see Appendix* A] relating to complaints from residents of North Sydney, Chowder Bay, and Manly Beach, showing the trouble the North Sydney tram has been to the subscribers and the public, and the Department has had to go to considerable expense in removing a number of poles on to the opposite side of the street, with a view of modifying the difficulty; but, notwithstanding this fact, there still exists a deal of trouble in connection with the working of the telephone system along the Military Road and to Manly Beach.

I understand that the Committee has been informed that no trouble exists in connection with the working of this tram line, but I think that a perusal of the correspondence attached, from persons who are constantly using the telephone, will be sufficient answer to any such statement.

I would point out to the Committee that on opening up the telephone line to Manly Beach so much trouble was caused by the electric tramway that it became necessary to use a copper metallic trunk line, with translators, for a considerable time, in order to overcome the action of the tramway upon the telephone wires; but after alterations had been made, and the wire had been removed to the other side of the road at the Mosman's end of the line, the working slightly improved for a short time. It afterwards became as bad as ever again, which I attribute mainly to some alteration the Railway Department made in the type of dynamo used at the power-house at North Sydney, and the Railway Department have requested us to communicate with them whenever any difficulty arises in connection with the North Sydney telephone system, but, although the new power introduced seemed at first to modify the difficulty, ultimately the troubles proved as great as formerly.

We have managed to work single-wire circuits for some time, but the effects of the tram are always felt more or less and we have on several occasions called the attention of the railway officials to it, according to the arrangement made with them. In the case of Mr. Halstead's line near the end of the terminus of the tram-line at Mosman's Bay. We found it impossible to work this with a single wire, and, consequently, the Department was put to the expense of erecting a return wire, and the Chowder Bay Hotel line has also caused a great deal of trouble, frequently becoming unworkable, and producing complaints from the proprietor of the hotel. We shall have to put this under a metallic circuit ultimately, as well as the Quarantine, Military, and other lines in this direction, so that the Postmaster-General's Department will thus be saddled with a heavy expenditure in connection with this electric tram system, that properly should be shared by the Commissioners for Railways.

In my opinion there is really only one effective way of overcoming this difficulty, and that is by having a complete metallic circuit throughout the city and suburbs, (*i.e.*, go and return wire), or a double wire for the electric tram, so that the commercial and general public may not suffer any inconvenience from the action of the electric tram-line. It is, however, a question of great moment what this work will cost, and also as to which Department of the Government should bear the expenditure, but that of course is a matter for the Postmaster-General to deal with.

I have attached extracts from evidence of authorities of electrical engineers in other parts of the world [*see Appendices* B and C], and by these it will be seen that the opinion which I have expressed is fully supported by them, and I wish to say that my only reason for making these remarks is solely to prevent any future trouble in connection with the Postmaster-General's wires, as it is evident that if the proposed scheme of tramway is adopted it will be necessary to make provisions for a complete metallic circuit for the telephone systems throughout the city and suburbs, as the only remedy to get rid of the action of the tramway upon the telephone wires.

There is another point which perhaps it is well the Committee should have information upon. I refer to the practice of attempting to work two telephone systems on the one switchboard in the Central Exchange (*i.e.*, single wire and metallic circuit), which, I consider, practically impossible. To attempt it would simply be trying an experiment that would lead to much greater expenditure hereafter, and this is borne out by the greatest authorities in America and England; but, even if it could be done, the interference, in my opinion, would be so great that it would ultimately force the entire use of a metallic circuit, and I would not feel justified in recommending this when we have such a satisfactory system now working on the single wire and earth return circuit.

I am acquainted with, and have seen the principal telephone systems working in America, France, Germany, Austria, and the United Kingdom, as well as all the exchanges in Australasia and New Zealand, and in most countries (especially America) where electrical traction wires have been introduced, and the telephone authorities have been compelled to adopt metallic circuits. This has led to some trouble between the telephone and traction authorities, which in most cases in America, where it has principally occurred, resulted in amicable arrangements being arrived at for the contending parties to share the expense, though in the United Kingdom it has led to litigation, compelling alterations to be made in order to meet the circumstances. In this Colony of course the telegraph and telephone systems, as well as the railways, are under the Government; therefore, it becomes a question of expediency as to incurring the extra expense that would be involved in carrying out the alterations rendered necessary for the protection of the telephone system if the electric tram is introduced.

P. B. WALKER, M.I.C.E., M.I.E.E.,
Secretary of Telegraph Service.

APPENDIX A.

Dear Mr. Kidd, The Vicarage, Neutral Bay, 12 February, 1894.

You will doubtless remember meeting me at "The Rangers" on the occasion of Miss Millett's wedding. Our mutual friend, Mr. W. J. Lyne, told me yesterday that you might be able to remedy what is really a great inconvenience to me, and to all who have telephones fixed in our houses at Neutral Bay. The noise caused by the electric tram is so great that our telephones are almost useless. Mr. Vernon complains, too, of this grave defect. Can our wires be fixed on the other side of the Military Road? Or (far better) can they be fixed so as to establish communication *via* the foot of the Bay, adjoining the reclaimed land at Neutral Harbour?

I shall be glad to point out to any official this defect, and I shall be most grateful to you for a favourable reply.

Yours, &c.,
G. NORTH ASH.

Dear Sir, Sydney, 8 May, 1894.

I have the honor to again bring to your attention the defects in the electric current on the North Sydney telephone wires on the Military Road district.

Evidently, the escape of electric current from the tram cable into the telephone wires is going on to such an extent that the telephone system is very defective, and at times quite useless.

Is it possible that anything short of removing the wires to elsewhere can remedy or lessen the difficulty?

Apologising for troubling you in this matter.

I am, &c.,
W. L. VERNON.

To the Deputy Postmaster-General.

My dear Sir, The Vicarage, Neutral Bay, 22 May, 1894.

May I call your attention to the great difficulty which we experience in hearing messages through the medium of our telephone.

I believe that the disturbance is caused chiefly by induction and by leakage from other circuits. I cannot help thinking that the only thorough method of obviating this intolerable nuisance is by making the telephone circuit a metallic one, *i.e.*, by using a wire as a return in lieu of the earth. This would not necessitate a return wire for each circuit, as one return wire of copper will suffice for several lines running in the same direction.

This method was successfully adopted in London some time ago.

May I call your immediate attention to the nuisance of which I have written.

Yours, &c.,
G. NORTH ASH.

The Hon. J. Kidd, M.P.

Dear

P. B. Walker, Esq., M.I.C.E., M.I.E.E. 14 April, 1896.

Dear Sir, "Rockley," Manly, and 81 Pitt-street, 25 April, 1895.

Knowing how more than anxious you are to do your utmost to give us a complete and useful telephone service, I, with every confidence, entreat you to have something done whereby we can make ourselves heard between Manly and Sydney, for at the present time all we can hear is the noise of the electric tram, and we have to put down the receiver in despair when the tram is going; and when is it not? I would be willing, if necessary, to contribute, with other subscribers, to help pay the cost of having the telephone wire removed from the vicinity of the tramline so that I may avoid the ear-splitting noise. Relying on your usual courtesy to do what you can to remedy this trouble. Yours, &c.,

Manager, Telephone Department. D. MOSES.

Sir, Manly Co-operative Steam Ferry Company (Limited), No. 5 Jetty, Circular Quay, 26 April, 1895.

I beg to draw your attention to the serious inconvenience caused by the telephone wires running so close to the electric tram wires between Sydney and Manly. At times it is almost impossible to use the telephone with success. If you could manage to have the wires removed a short distance I am sure you would earn the gratitude of all the Manly subscribers as well as of those who have occasion to communicate with Manly. Yours, &c.,

W. G. GERMAN,

The Secretary, Electric Telegraph Department, G.P.O. Secretary.

Sir, The Corso, Manly, 27 April, 1895.

I regret to have to complain of the service which obtains between here and Sydney, but there are times when it is utterly impossible to get a clear and distinct communication, and you will agree with me, I am sure, when I say that this is not as it ought to be. I have been told that the cause of the indistinctness is the closeness of the telephone wire to that of the electric tram. Be this as it may, I feel that I am quite justified in bringing the matter under your notice in the hope that something may be done to remedy the existing state of things. The service is not of much benefit unless it is perfect. Yours, &c.,

The Manager, Telephones, G.P.O. ALEX. CUTHILL.

Memorandum from H. Townsend Robey, Auctioneer and Property Agent, Esplanade, Manly, Tel. 19, to Manager, Telephone Dept., City.

Dear Sir, 27 April, 1895.

I have the honor to inform you that when the cable tram is working it is almost impossible to use the telephone between here and Sydney, and as more trips will be required by the North Sydney traffic it will become worse. I, therefore, trust you will endeavour to get the matter remedied as soon as possible. I would also suggest that the Police-station be connected with the Telephone, Manly Exchange.

H. T. ROBEY.

Dear Sir, Trafalgar-square, Mosman, 9 October, 1895.

Please find enclosed cheque for telephone. I trust you will connect other wire, for there are times when it is useless—we cannot understand a word; other times it is quite distinct. Please send acknowledgment for cheque. I have mislaid account. Yours, &c.,

The Manager, Telephone Department. JAMES HALSTEAD.

61, North Sydney Telephone Exchange, 18 September, 1895.

I HAVE been compelled to work Manly Exchange through translators since yesterday.

Chowder Bay Hotel and James Halstead are unworkable owing to the disturbances from the electric tram.

G. J. LANGESCHWERDT,

The Manager, Telephones. Exchange Foreman.

---

18 September, 1895.

IF things do not improve very much it will be necessary to continue using a metallic circuit to Manly, and get two more trunk-lines erected. Mr. Halstead's line, which terminates close to the terminus of the tram-line, is quite unworkable, and it is necessary that another wire be erected between there and North Sydney Exchange at once.

Secretary of Telegraph Service. S. J. WATSON.

Sir, Board of Health Offices, 127, Macquarie-street, Sydney, 9 April, 1896.

In reply to your oral inquiry of the present date, I am directed to inform you that the telephone line between these offices and the Quarantine Station at North Head is frequently, and very inconveniently, interrupted by the influence of the electric tram running along the Military Road, North Sydney—so much so that at times conversation has to be many times repeated, or else abandoned.

In this connection I would refer you to my previous complaints of a similar character.

I have, &c.,

C. A. SIMMS,

The Secretary for Electric Telegraphs, General Post Office. Acting Secretary.

Sir, Council Chambers, Manly, 9 April, 1896.

Referring to the matter of the telephone system in our suburb, I have the honor to inform you that great inconvenience is at times caused assumedly by the North Shore electric tram.

At times it is utterly impossible to communicate with Sydney; and it was only to-day that on several occasions the replies were utterly unintelligible. I have, &c.,

Trusting you will be able to remedy our inconvenience. T. C. HAYLOCK,

Council Clerk.

Dear Sir, Manly, 10 April, 1896.

We, the undersigned subscribers to the Telephone Exchange, regret that we again have to complain of the great noise on our line, which has been very much worse than usual the last few days, and which interferes very seriously with the transmission of messages. The interference is so great, and the messages have to be repeated so often, that one dreads to be called to the machine, and the doubt in the end as to whether the message has been properly received renders the whole thing practically useless.

We, therefore, rely upon your help in this matter, and beg to urge you to have the matter remedied at once, and to subscribe ourselves,

Yours truly,

A. C. M. HILL.
T. C. HAYLOCK, Council Clerk.
GEO. L. RICHARDSON, Corso, Manly.
BUTLER BROS., Corso, Manly.

Secretary of the Telegraph Department. SYDNEY C. WILKINS, Esplanade, Manly.

APPENDIX B.

[*Electrical Review*, 16th December, 1892, page 732.]

NATIONAL TELEPHONE COMPANY *v.* LEEDS TRAMWAY COMPANY.

Extracts from Evidence.

Sir Richard Webster's remarks on metallic return wires for tramways and the interference caused by electric tramways to the telephone system.—"There was also the well-known principle of using an insulated metallic wire as a return. That system had been successfully used, and perhaps the most successful tramway at present known, that at Buda Pesth, was worked upon that system, which could be quite conveniently used without any disturbance of telephonic or telegraphic lines in its neighbourhood." After describing the Trolley Tramway system, which is identical with the one proposed for Sydney, he says:—"In the case of the telephone the current used was quite light; but the pressure of the tramway current

current was very considerable, something like 300 volts. In addition to that, the difficulty, if not the impossibility, of making a good contact between the trolley and the conducting wire was such that the potential was constantly varying, so that there was continuously going on, whilst the cars were running, a discharge of current of rapidly-varying intensity to the earth in close proximity to the telephone wires, which in many instances ran along the same streets. This, it would be established by evidence, meant constant and violent changes of current in the telephone circuit by means of induction, which rendered the telephones within the electrical field absolutely inaudible for a space of time, very often many minutes together, and sometimes continuously during the business hours of the day when the tramway was working; sometimes a musical humming would be heard, sometimes a groaning and grunting. Perfectly independent people would give testimony that the effect on the telephonic circuit was to render it for commercial purposes absolutely useless."

P. B. Walker, Esq., M.I.C.E., M.I.E.E. 14 April, 1896.

[*Electrical Review*, 23rd December, 1892, page 759.]

Dr. John Hopkinson on two systems of telephone communication worked from one board.—"It is perfectly simple, is it not, and feasible, to have part of your system furnished with metallic returns, and part with earth returns? There are drawbacks in doing that, but it is possible."

Lord Kelvin on disturbances caused by electric tramways to telephone lines.—"He went to Leeds on 3rd June for the purpose of examining into the disturbances in the telephones there. He first listened at the central station of the company at Commercial Buildings, and afterwards at the Roundhay Call office. The disturbances were very severe, and the starting and stopping of the tram-cars could be heard perfectly. There was a humming sound, which he believed was due to the dynamo. There was also a rough sound, and altogether a very loud roar during the time the tram was running, so much so that it made conversation almost impossible; he thought for ordinary subscribers quite impossible. In his opinion the disturbance would interfere very seriously with the commercial usefulness of the telephone. The causes of the disturbance were the changes of the strength of current and an electrification of the wire or wires of the tramway system. He was acquainted with the defendant's system, and believed that system likely to produce serious disturbances. The connection by trolley was objectionable, because there was a varying resistance between the wire and the trolley. The wire was not perfectly rigid, but hung by steel hangers, and sagged somewhat, so that there was varying degrees of contact between the trolley and the wire. There was also a varying contact between the wheels and the rails. He had heard of flashes being seen between the wheels and the rails. That was due to the wheel hopping on the rail, and certainly produced a disturbance in the telephone. Anything like dirt or a stone on the rail which made the wheel jump, or if the wheel did not press uniformly on the rail, would cause a disturbance."

Sir Richard Webster: A question was put yesterday as to whether or not the disturbances in the telephones could not be got rid of by duplicating the wire affected for a limited portion only of the circuit, and then going to earth. In your opinion, would that cure the disturbance? I believe the disturbance might be cured for a particular subscriber by duplicating his wire and keeping his system wholly insulated, but that would be exceedingly inconvenient.

Short of that, I wanted to call your attention to the limited alteration suggested of duplicating only a small portion of the way, and then only partially, and having earth return at the central station or to another subscriber;—would that get over the difficulty? I believe it would not. I have reason for this view in the fact that duplicated wires—perfectly insulated wires—do get over the difficulty of ordinary induction disturbances; but when one point is put to earth the disturbances are immediately heard. Since the Court rose yesterday I have tried that. I have long known that that was the case from information given to me, but I wished to prove it by hearing it myself, and I went to the central station of the National Telephone Company in Oxford Court, and several cases were shown to me taken according to what lines we could find free at the time, and in each case the most marked disturbance was produced by touching the previously-insulated metallic circuit with a wire leading to the ordinary earth of the station.

I understand you to say that if the suggestion were made that there should be what I should call a local doubling for either the whole or a bit of a particular subscriber's line, when that came to be coupled up at the central station with another circuit which was taken to earth at the central station the disturbance would arise just as much? Yes.

Mr. Justice Kekewich: Might arise? It certainly does arise in the cases that are known; in many cases that are known, and I believe in every case that has been tried.

Sir Richard Webster: And practically nothing but an absolute and complete establishment of the telephone system throughout on the double wire with no earths would have the effect of curing it? So far as evidence from observation goes that is the case.

I want to put this case to you: Here is a tram-line, and here is the exchange, a mile or two from the tram-line, as I believe it is at Leeds;—here is a subscriber, whose wire for some distance runs parallel with the tram-line and is taken to earth near the subscriber's house;—what I suggest is that instead of taking him to earth at his house you should bring back a return wire and take it to earth near the exchange? Yes; that is a very good suggestion. I do not think that would cure the disturbance from what I heard with my own ears last night.

You, as a scientific man, would scarcely consider that an experiment of that kind, with the conditions of which outside the office you knew nothing, was sufficient to base a theory on, would you? It would be an auxiliary towards a theory certainly. It suggests that we have no demonstration whatever, that the protection against the telephone disturbance would be practically sufficient if one point of the complete circuit is put to earth.

The disturbance that you heard, of course, may have been due to conduction, or to some other cause? Conduction and induction. If there were imperfect insulation there would be something of conduction.

Have not the facts which have led you to this opinion been really drawn from experiments on long-distance wires? No, not from long-distance wires, but from wires of a few miles length. In fact, if I remember rightly, it was before the wire to Birmingham was laid at all that this effect was first noticed. There were many efforts to cure the disturbance. It was supposed that a metallic circuit with one point insulated would cure the disturbance. Practically it was ascertained it does not. You have it always in every case.

Your suggestion is that in order to cure the disturbance the metallic return must not go to earth, but must be a complete return? Must be insulated everywhere.

[*Electrical Review*, 6th January, 1893, page 15.]

Mr. Reginald Alexander Dalzell, Manager of the North Lancashire District of the National Telephone Company, on disturbance on telephone wires with earth return.

Sir Richard Webster: A suggestion was made which I think you happen to be able to say something about; I refer to the suggestion of taking a subscriber whose return earth would be affected by the tramway, back to a subscriber at another distance, and allowing him to come back through that subscriber's wire;—would that cure the defect? No; it would not cure it. I tried that, and whilst there was a slight improvement, it was nothing that would do any good. One knows also that that is not effective from practice on other lines. When we are working a loop-line it is absolutely necessary for us to have that line insulated throughout. If it is a wet day, and we get a contact with a wet branch of a tree, or something of that kind, the balance of the line, I cannot say why or how, is upset, and we get noise on that line immediately it is passing through an affected area—an area where there is any disturbance from outside causes.

Mr. Daniel Sinclair, Engineer and Electrician-in-Chief to the National Telephone Company, on the difficulty in working metallic and earth returns in conjunction with one another.

He had a very large experience of the effect of earthing a portion of a circuit where there was a metallic return, and he was able to say that that would not get rid of the difficulty from disturbances. He had gone through similar experiments to that described by Mr. Dalzell over and over again, because it was of immense importance to see if they could do what had been suggested. If they could have done that they would have overcome a difficulty that had cost them many thousands of pounds in erecting their switch-boards. Snow had done serious injury to the telephonic system, especially in London, and an increase in the number of overhead wires would increase the liability to injury from that source.

Cross-examined by Mr. Bousfield: You probably know that in Stockholm the Government has insisted upon the whole of the wires being furnished with metallic returns? I do not know that. What I do know is that when I was there in October of last year the large exchange had not metallic returns, but that the Government exchange had. The Government exchange at that time had about 600 subscribers, and the private exchange several thousands. The subscribers on the one exchange could communicate with the subscribers on the other, so that the metallic returns were capable of being worked in conjunction with the earth returns.

Then

P B. Walker, Esq., M.I C.E., M.I.E E

14 April, 1896

Then your experience teaches you that there is no practical difficulty in working a number of metallic returns in conjunction with a larger number of earth returns? My experience does not teach me that there was no difficulty

But it was done in Stockholm, and done successfully? I cannot say it was done successfully

Why not? Because the fact of joining a loop on to a single wire introduces another piece of machinery When that is used the speech is weakened

It was done there with transformers, was it not? I am not sure

It was done by the same system that has been put to some of the witnesses of having a line partially single and then doubled on itself? All I can say is, if it is done that way it cannot be successful

You are familiar with working an earth line in conjunction with a complete metallic line? Yes, that is done by means of a translator

The cost of these translators is about 9d each? No, it may vary from 8s to 20s.

I suppose you are speaking of the translators used on your trunk lines? Yes

Would that be so for short distance connections such as I have suggested in Leeds? The repeaters or transformers would be the same, we have only one class

You can use a transformer which would be a matter of only a few pence? I think not

Re-examined by Sir Richard Webster If you get more than one of these transformers in a line, is there any difficulty in ringing up? Yes; and they reduce the effective talking as well

[*Electrical Review*, 13th January, 1893, page 41]

Mr. William Henry Preece, F R S, Chief Engineer and Electrician to Her Majesty's General Post Office, President of the Institution of Electrical Engineers, and a Member of the Institution and Council of Civil Engineers

He had for many years had control of the electrical department of the Post Office, both of the telegraphs and the telephones With regard to telegraphs, the earth return was invariably used, and they found that they were not interfered with by tramways or electric light currents For telephones also it was the invariable practice of the Post Office to adopt a metallic return When telephones were first brought to this country, some fifteen years ago, he took an immense amount of trouble to investigate the various disturbances to which telephones were subject, and he tried to separate and differentiate the various causes He came to the conclusion that the only possible way of making a telephone work satisfactorily and clearly was to use a metallic return The Telephone Company had never suggested to the Post Office that the telegraphs were a nuisance to them, but he knew, as a matter of fact, that the telephones were disturbed by the telegraph wires, and the fact that they were able to read messages from wires 80 feet away led to a very interesting investigation, which was still proceeding, and which was rather opening their eyes as to the distance to which disturbances could be carried. The messages referred to were messages sent upon a circuit from London to Bradford, and they were read upon some local circuit in London There was no more delicate instrument for picking up and indicating stray vibratory currents than the telephone. Cross talk was quite common on the telephones in London, but one got quite used to it, and was able to carry on a conversation without noticing it, as one would do in ordinary conversation in a room whilst other people were talking all round There were other disturbing sounds, arising from all kinds of causes the Metropolitan Railway; the South London Railway, the electric light currents; the earth currents, the atmospheric currents, especially when thunder was about, it was impossible, in fact, to differentiate from the sounds you heard the causes of those sounds With a metallic circuit all those disturbances were avoided

Mr Justice Kekewich I should like to know that I understand it I gather from the map and from what I have heard that the particular district with which we are dealing is what may be called a suburb of Leeds, and it is not densely populated Supposing these conditions were changed, as they might very well be, and you had a great many houses there, side by side in rows and squares and so on, each of which required the telephone, and you had to supply double metallic returns, returns for every house, then it would come to a very serious matter indeed, and if it is right there, it is right in a great many other places too

Mr Bousfield (to witness) You think it is the right thing to do everywhere? I do, undoubtedly

What is your view as to the course of an electric current connected to water pipes laid in the earth—I mean as regards the amount which would follow the water pipes, and the amount which would break through the earth? That is a very difficult question indeed to answer The behaviour of currents through the earth is very remarkable, and however perfect the earth may be between two stations, connected by an earth plate, the lines of current sweep around over an immense area In Leeds itself we have found traces of conduction of these tramway currents 1,200 yards away from the tramway line, and in South Wales, where I have recently been making some experiments, we have even traced these earth currents to a distance of quite 2 miles from the circuit

With reference to telegraphs, you have had interference from similar things to tramways, have you not? Yes, we have had interference from the South London Electric Railway

That is worked with an insulated return? A single wire and earth return, but they use the rails for the return inside an iron tube The Deptford electric light current disturbed the telephone circuits, but not the telegraph circuits, that witness remembered A tramway might disturb more than electric light currents, but not more than such a system as that carried out at Deptford, which was on alternate current lines In Leeds itself, the Post Office lines had no disturbance, but they did have the presence in their telegraph circuits of small currents which they had no doubt came from the tramway

APPENDIX C

[*The Electrician*, 23rd June, 1893, page 207]

EXTRACTS of evidence given before a Joint Committee of both Houses of Parliament (England) appointed to consider the question of protective clauses to be inserted in private Bills relating to electric traction

Sir Courtney Boyle, K C B, Permanent Secretary to the Board of Trade, stated that * * * there was no doubt that, either by leakage or by induction, the tramways, when they used electricity, might inadvertently cause electrical disturbance in the vicinity of their circuits That disturbance caused material interference with the very delicate, sensitive instruments used by the Telephone Company and the Telegraph Company The metallic return circuit was used in some systems The telephone companies had got the earth, and used the earth, and they pleaded to be allowed to use the earth by prescriptive as well as by inherent right Electric traction, both on tramways and railways, was growing in popularity, and would grow still more if the question of the use of the earth return could be settled

Asked "Have there been any decisions on the question?" Yes; the case known as the Leeds case, which was between the National Telephone Company and the Leeds Corporation A special inquiry was organised by Mr MacRory, whose report showed that undoubtedly there was interference with the sensitive instruments of the National Telephone Company In delivering that judgment, Mr Justice Kekewich said, "True it is that the analogy introduced above"—that is, the use of land for extraordinary purposes—"holds to this extent the plaintiffs are using for extraordinary purposes"—the plaintiffs being the Telephone Company—"but admittedly it is a lawful purpose, and though under an obligation to obviate mischief in their own operations with their neighbours, they are under none, in my judgment, to protect themselves from the defendants or others" The learned Judge went on to say that the defendant's plea was good in law, and they are not responsible to the plaintiffs for any mischief caused by their working. The defendant's authority was derived under a provisional order confirmed by Act of Parliament A little further on the Judge said, "The defendants are expressly authorised to use electrical power, and the Legislature must be taken to have contemplated it, and to have condoned by anticipation any mischief arising from the reasonable exercise of the power" Practically, the defendants—that is to say, the Tramway Company—enjoyed certain advantages from the decision, because they had a provisional order confirmed by Parliament

Asked by Mr Brunner Are there no more cases of mischief resulting from electrical disturbance than those you have mentioned? * * The number of tramway companies using electricity at present is very small, and the electric lighting companies are forbidden to use earth, so that the danger does not, and cannot, occur very often; but if you sanction electricity for traction purposes the number of instances in which there might be danger would grow

By Earl Russell The argument is that the expense is much less to the telephone companies to use the insulated returns than to the tramway companies? That is the argument advanced by the tramway companies, and there is a great deal of weight in that. The tramway companies say, "It will cost us a very great deal to protect our system absolutely from

from danger. It would not cost the telephone companies very much." And, on the other hand, the telephone companies say, "We have established a very large and far-reaching system of telephoning, which is very largely in the interests of the public, and we do not see why we should be obliged to alter our system because other people may injure us."

By Sir Bernard Samuelson: Do the electrical tramway companies admit responsibility regarding accidents occurring through leakage or earthing? They say it is almost impossible to prevent leakage; the phrase used is "absolutely impossible." There is an instance brought forward from Buda-Pesth, where it is stated that it has been done.

By the Chairman: You are representing neither one interest nor the other. You have simply come to put before us the matter as it was placed before the Board of Trade? I have no interest whatever to represent. The difficulty has been so overwhelming that the Board of Trade itself has decided, as regards its own provisional orders, that we had better appeal to a stronger tribunal to settle what we had better do.

Mr. Preece was then called. He had given a great deal of attention during the past ten years to the disturbance created in the existing wires by the new and important applications of electricity to electric lighting and to the working of railways during that period. They had found their (the Post Office) telegraphs and telephones were gradually being disturbed. The disturbance arose from two causes: the first was due to the passage of currents of electricity through the crust of the earth; and the second arose from what was called induction. The currents through the earth were the more serious ones. The effects due to induction were easily removable, but of course it would cost money. The whole telegraphs of the world at the present moment were worked with the use of the earth, and the telephone being the child of the telegraph, had originally in America also used the earth as part of the circuit. The first telephone which was fixed in London was fixed on a metallic circuit. Ever since then the Post Office had invariably used metallic circuits. The Telephone Company, on the other hand, in their town systems used the earth, but in their trunk systems, which was very extensive, used metallic circuits.

Mr. William E. L. Gaine, General Manager of the National Telephone Company, was asked—Supposing that electric traction of a similar character to that which is employed on the tramway at Leeds were sanctioned and used on the Liverpool tramways, would all these lines of wires be so disturbed that you would have to turn them into metallic circuits? Judging from the experience the Company has at Leeds, undoubtedly that would be so. Those lines would be valueless for commercial purposes. I am particularly anxious to impress my views with regard to this on the Committee. Mr. Preece in his evidence yesterday was very strong; it appeared to me that the remedy of the telephone company was to duplicate their wires, but I doubt whether Mr. Preece or anybody else realised what that meant. This system has been built up for a number of years, and their 3,500 or 4,000 wires coming into the Liverpool Exchange had to come in all over the roofs for which switchboards, &c., had been put up. The great bulk of the switchboards of the country were single boards; it meant the taking out of those—an enormous work, and the re-erecting of the entire system; and he had no hesitation in saying that if the Leeds tramway were planted in the City of Liverpool to-morrow, Liverpool would be deprived of the telephone for at least five or six years. He would not undertake to reduplicate the wires and rearrange that system under that time. Asked—"You have said nothing of the enormous cost; those switchboards are very expensive, are they not?" A switchboard for an exchange the size of the Liverpool Exchange would not be less than £20,000. That, of course, did not take into account the cost of way-leaves and ordinary repairs and maintenance. The Leeds tramway ran through one of the outskirts of Leeds, and it disturbed, comparatively speaking, only a few lines—twenty-six lines. Although they had only twenty-six lines disturbed in Leeds, the cost of putting them on to a small extra exchange was between £600 and £700. If this was carried out to its logical conclusion, and assuming that the traction were to be universal all over the country, he estimated that it would cost the company not very far from £2,000,000 of money.

By Mr. Forwood: If the tramways were to be worked by electricity they would want four or five years' notice of it. The underground system was more economical in maintenance, but it did not give so efficient a service telephonically as an overhead wire. There was nothing so good as an overhead wire.

Dr. John Hopkinson: He made an inspection of the Leeds tramway in 1891. He also went into the Leeds Telephone Exchange, which was on the single-wire system, and on using the telephone he heard a noise which would rise and fall at a varying pitch, so that it was impossible to converse with any distinctness. He could hear the cars stop, and could hear distinctly that there were two cars running by the difference of the pitch in the note. The sound diminished in loudness as the cars took a larger or smaller current. When the cars stopped there was practically no disturbance.

When asked: In your opinion was that noise such as would prevent the proper working of the telephone exchange on the single-wire system? Yes, undoubtedly it was. He had had an experience of telephone exchanges worked on the single-wire system where there was no electrical tramway, and found that there was no disturbance.

Lord Kelvin stated: In the summer of last year he accompanied Sir Frederick Bramwell to Leeds to make an inspection of the tramway works there. He found that the return circuit was not insulated, and there was a very great disturbance on the neighbouring telephone lines. He attributed the disturbance partly to leakage and partly to induction.

In answer to Mr. Prember, who asked whether the tramway was worked by a direct current, he replied:—Yes; but the current continually alters. Multiplication of contacts on the car would diminish the disturbance. He thought the disturbance could be prevented by having two conductors and keeping the conductors of the tram-line wholly insulated.

[*The Electrician*, 30th June, 1893, page 234.]

Mr. D. Sinclair, Engineer-in-Chief of the National Telephone Company, was asked by Mr. Moulton if any change was ordered would it take any considerable time to make it? Taking the town of Liverpool, there were 3,500 telephone wires. If they had to metallic those overhead, the standards which carry the present wires would not be sufficient, so that it would mean sweeping down the entire system and building up a new system to carry twice as many wires. Inasmuch as it was impossible to work an exchange partly on the single and partly on the double on any large scale, they would have to make the change all at once.

The Chairman asked how it was done in London, because evidence had been given that in London the system is being exchanged at the present moment? The witness said that in London they were doing substantially what he had suggested. They were providing extra wires so as to make the metallic circuit, but with a few solitary exceptions they were not yet put into operation, as they could not work the mixed system.

Sir Frederick Bramwell: Having described the system of working electrical cars at Leeds (the trolley) Sir Frederick Bramwell proceeded to say that the disturbance to the working of the telephones caused by the tramway was intolerable. In the Exchange, when the cars were at work they lost as many words as they heard.

Mr. James Swinbourne, on behalf of the Electric Traction Companies: In America it was found, as at Leeds, that it (electric traction) interfered with the telephones, and the solution there was very simple; the authorities there came to the conclusion the roads were meant for traction, and not for talking through. He did not think it would be possible to make the insulation (of the traction wires) so good as that it would not disturb telephones, and in some degree disturb also the railway people. If there were a clause that any interference with the telephone work would render them liable to an injunction, no engineer would proceed to put up a traction system. In addition to the difficulty from leakage there was also the difficulty of induction, and the latter he considered generally the more important cause of disturbance. In the Leeds case he agreed with Dr. Hopkinson that induction was a greater disturbing factor than leakage; induction would take place with the most perfect insulation.

Mr. R. E. Crompton stated his firm, in connection with several other firms, had been asked by the Glasgow Corporation to carry out an undertaking on the understanding that they should take over the responsibility of complying with the protective clauses introduced into their provisional order, and they found themselves utterly unable to take the responsibility on their shoulders. He spent a long time trying to find out if it were possible to devise means to so arrange their plant that they should not affect the telephone lines, and the results of his investigation was that he was reluctantly obliged to write to the Glasgow Corporation and inform them that they could not undertake the responsibility. He found that there was no known means in the world of doing what they were asked.

When asked whether he meant it is practically impossible to insulate electric tramways in such a way as not to interfere with telephones, he replied, I found it was impossible to so insulate (traction wires) as to make it quite certain that we should not interfere with telephones.

Asked again, "Is it possible to insulate in such a way as to ensure non-interfering with the telephones?" In my opinion, it is not possible.

Major Cardew, Electrical Adviser to the Board of Trade, called by the Committee as an independent witness, stated: A constant unvarying current would not affect telephones in the least, however much was escaping to earth, but in the case of tramways it was always varying. Sparking of the contact, sparking of the brushes, vibration in the motor, and in the way in which the motor was wound, was sufficient to cause the sudden variation.

By

P. B. Walker, Esq., M.I.C.E., M.I.E.E.

14 April, 1896.

By Major Darwin: The effect of inductive action from tramways upon telephones might be experienced for some hundreds of yards, but as regards leakage there were so many things to be considered that it would be difficult to say where the effect might be stopped, or where it might be found. It depended upon what pipes were in the ground, the nature of the ground, and also on the volts lost in the ground.

[*The Electrician*, 7th July, 1893, page 267.]

Necessity for metallic returns.

Mr. Balfour Browne, addressing the Committee on behalf of Municipal Corporations im England and Scotland, stated:—"The fact was that the telephones were not complete or perfect until they had a metallic circuit; and whatever the tramway companies might do it would be impossible, practically, to insulate so as not to interfere with the telephones."

Mr. Langdon said:—"This was not a question of electric traction against all the world; it was a question of the telephone against the world. The remedy was obvious; to get efficient telephones they must have metallic circuits."

Mr. Cripps, in addressing the Committee on behalf of the Traction Companies, said:—"Mr. Preece and all the other witnesses had stated the same—that the best system of telephonic communication was the metallic circuit return; that was the proper remedy, and that was the remedy for which the clause provided."

[*The Electrician*, 30th June, 1893, page 234.]

Mr. Sinclair's evidence was then proceeded with, and in reply to Mr. Cripps, he said that at Glasgow at the present time, to a limited extent, they used the same exchange for metallic and earth returns. At Stockholm there was very considerable difficulty in working some telephones on one system and some on another. While in the case of the National Telephone Company *v.* Graff Baker, he had said that the earth returns were capable of being worked in connection with the metallic returns—it was a question of degree. Up to 5 or 10 per cent. they could very well be worked together, but he understood they were now providing metallic switch-boards at Stockholm, which bore out what he strongly insisted upon—that when it became necessary to metallic the circuits it became necessary to metallic the circuit all round. Asked whether the difficulty of reaching over the switch-board could not be met by having additional operators, he said the best and only system, which was used in all large exchanges, was to have only one operator.

The Chairman: I understand what you mean is this: you have a great number of operators, but each of those operators is so placed that he or she can work every wire that comes into the place? The witness said that was exactly it. The largest exchange he had ever seen actually operated was 6,000 on the multiple system, so that they could imagine what it was;—that the operator had 22 inches or 23 inches to sit in, and within her reach they had to bring the connection for 6,000 lines. The operator on the other side had also to reach 6,000 lines, though, of course, they borrowed from each other to some extent.

Mr. Cripps: Why should there be greater difficulty on the metallic system than on the earth system of one operator reaching all the points of contact? The witness said that he did not contend that there would be greater difficulty, but the difficulty came in when they had a mixture of both. The reason greater space would be taken up was because they could not put forty into a space which was made for twenty.

1972. *Chairman.*] Would it be a very expensive thing to furnish a return wire in connection with the tramway? I think it would cost fully two-thirds more.

1973. £50,000 or £60,000? I should say it would.

1974. At the present time you are putting some of your wires underground? Yes; our telephone cables.

1975. Are not overhead wires the best? No doubt overhead wires with copper conductors are the best.

1976. Then why put your telephone cables underground? Because it is more convenient for the city.

1977. Is the convenience of the city sufficient compensation for a defective arrangement? It will not be a defective arrangement. It will practically be the same as the overhead arrangement.

1978. Will it be as good? Yes; it will not be a metallic circuit, but provision will be made for that ultimately.

1979. Are you sure that a metallic return for the city would cost £175,000? I am quite sure of it.

1980. Are there any metallic returns in use here? No.

1981. Is it usual with a telephonic system to have metallic returns? In most parts of the world it is.

1982. Why is there not a metallic return in use in Sydney? Because it is expensive.

1983. Is a metallic return regarded as a necessary adjunct to a telephone system? It is considered necessary where electric traction is used.

1984. But, irrespective of electric traction, is it not necessary to prevent disturbance by reason of noise? Of course it is wisest where there is much noise or interference to have a metallic circuit. Although the Government here have no metallic circuit, I have put down a very complete system for the military authorities at Middle Head and South Head in connection with the forts.

1985. Apart from the possibility of electric traction being adopted in the city, will not a metallic circuit ultimately be required here to prevent disturbance from ordinary noise? Certainly not.

1986. In London they have a metallic circuit? Yes; because they consider it most effective, though, of course, it is expensive.

1987. Our system being without a metallic circuit is not complete? It is a complete earth system, sufficient for all practical purposes.

1988. Is a metallic circuit used in connection with telephone systems in most parts of the world? No; only where there is electric traction.

1989. But in a great city is a metallic return system the best? Yes, decidedly.

1990. Do you not think it reasonable to suppose that inasmuch as London and other places have adopted the metallic return system, Sydney will some day have to adopt it? No. I think they adopted it in London because they foresaw that electric-traction wires and electric-light wires were likely to come greatly into use there. Electric-light wires do not affect the telephones so much as electric-traction wires do.

1991. In extending your telephone system are you furnishing metallic circuits? No, I am getting metallic cables for the underground tunnels; but it is not proposed to use them as metallic circuits at present, because there are no metallic switchboards.

1992. Eventually you will use them as metallic circuits? If we are forced to do so.

1993. How long would it take you to make the preparations necessary for dealing with the difficulty which would be created by the erection of electric-traction wires in the street? At least four years, and probably longer.

1994. *Mr. Humphery.*] I think you said, in answer to the Chairman, that in London metallic circuits had been adopted by all the companies? Not by all the companies; only by the Post Office authorities. The London Post Office authorities have only about 600 miles of telephone, and there are some 30,000 or 40,000 miles of telephone wires in London.

1995. Practically, your statement demonstrates that an electric tramway along George and Harris Streets would interfere with the working of more than 2,000 telephones, and that apart from the cost of providing complete

complete metallic circuits to minimise this interference, four years would be occupied in effecting the necessary change? It would take fully that, because you will have to rebuild the whole system before making any alteration. You would, in point of fact, have to duplicate it. P. B. Walker, Esq., M.I.C.E., M.I.E.E.

1996. I observe July, 1893, is the date of your latest extract from the *Electrician;* has anything occurred since that date to modify the conclusion then arrived at, and do you adhere to the very positive evidence already given by you both as regards the effect of electric-traction wires on telephones and the great cost that would be incurred by your Department if electric tramways were constructed here? I see no reason to alter my opinion; the opinions I supplied to you are selected from the very best authorities up to date, and later authorities have not altered these opinions. 14 April, 1896.

1997. In dealing with the proposal under consideration, do you desire the Committee to definitely understand that not less than £175,000, and probably considerably more, would have to be expended upon alterations to our telephone system before an electric tramway, if constructed, could be operated without serious disturbance to the telephone? Certainly.

1998. *Mr. Trickett.*] Will you look at Mr. Elwell's evidence—Questions 1221 to 1228;—his evidence would appear in some way to bear out the objections you have raised? Yes.

1999. But he seems to infer that by bonding the rails with copper connections a return circuit would be made something similar to the metallic circuit to which you have referred;—do you think it will be sufficient? Lord Kelvin does not think that it is, and I agree with him.

2000. You think that this bonding would not be sufficient to prevent disturbance to the telephone wires? Yes.

2001. Have you and Mr. Elwell thrashed this question out? No; he had an interview with me about it, but I was not able to gather any particulars from him.

2002. When you speak about providing metallic circuits to the telephones, you mean that every telephone wire must be duplicated? Quite so.

2003. That, you think, is the only way of effectually preventing disturbance? Yes.

2004. Now will you kindly look at Questions 1330 to 1341? I quite agree that a metallic circuit is absolutely necessary where an electric-traction wire is being used. I cannot agree, however, with the statement that this copper connection of the rails has had the effect of preventing disturbance of the telephone wires on the Military Road tram. Mr. Elwell's statement is contradicted by complaints which have been received within the last day or two.

2005. Then look at the statement contained in answer to Question 1492? That is quite right where a current is travelling along a parallel wire. If it is a permanent current it does not affect the other wire, but if it is an interrupted current it does affect it.

WEDNESDAY, 15 *APRIL*, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (Chairman).

The Hon. Frederick Thomas Humphery.	Charles Alfred Lee, Esq.
The Hon. Charles James Roberts, C.M.G.	John Lionel Fegan, Esq.
The Hon. William Joseph Trickett.	Thomas Henry Hassall, Esq.
Henry Clarke, Esq.	George Black, Esq.

Francis Augustus Wright, Esq.

The Committee further considered the proposed Electric Tramway from Circular Quay, Sydney, to the Redfern Railway Station; and also along Harris-street to the intersection of John-street.

Philip Billingsley Walker, Esq., M.I.C.E., M.I.E.E., Secretary to the Electric Telegraph Department, sworn, and further examined:—

2006. *Mr. Lee.*] I think that, in reply to a question asked by Mr. Humphery yesterday regarding the cost of constructing the telephone system, you gave an estimate of some £52,000? I found, on looking over the evidence this morning, that I had made an error there. The total cost of construction is £92,690. I have corrected that in the evidence. P. B. Walker, Esq., M.I.C.E., M.I.E.E.

2007. I think you also said that the contemplated cost of giving an electric return for the telephone system would be £150,000? £175,000. 15 April, 1896.

2008. How do you account for the large discrepancy between the first cost and the cost of putting in a return service? Of course the extra cost would be made up by extra switchboards for the metallic circuits. There will be a large amount for that. It would cost about £25,000 to get extra switchboards, and then the system that we have got now was not so large as it is at present; it has gradually grown. Therefore to double a big service would cost a much larger sum than it would cost to build it up to what it is at present. The cost of construction would probably be about £150,000, and it would cost about £25,000 for the extra machinery to work the exchange. That is how I make out the cost.

2009. If you had a metallic circuit in existence now, and all future connections were made on the same basis, would it cost the same in proportion? You could not actually put up any metallic circuit in connection with the present system. Before you did anything you would have to entirely duplicate the present system; therefore it would have to be wiped out altogether, because you could not work your instruments in conjunction with it whilst putting in a new system which would have to be done so as not to inconvenience subscribers. Therefore you would have to go to the expense of putting up an entirely new system before you could do anything with this system, except in one or two cases where you could use a second return wire. Out in the suburbs you could do it in some cases, but in the larger portion of the system you would have to build the whole of the lines.

2010. As head of the Department, do you expect that system to grow very largely in the future? Yes; in fact, it is growing very rapidly now.

2011. Within the next twenty years it may probably treble itself? Yes, it will probably treble itself.

2012. And will necessitate a net work of wires probably all over the main streets of the city and suburbs? Quite so.

2013. The gist of your objection, and the authorities you have quoted, is that the main interference would be by way of induction? Quite so.

P. B. Walker, Esq., M.I.C.E., M.I.E.E. 15 April, 1896.

2014. In front of your office—the George-street frontage—at the present time are there not a very large number of wires entering the building? Yes, there are.
2015. Coming by way of Barrack-street? Yes.
2016. Is the whole of the telegraphic and the whole of the telephonic system conveyed through that frontage? No, certainly not.
2017. Only a portion of it? Yes; we have 962 wires going down Pitt-street, and nearly 1,000 wires going up Pitt-street, and then we have a number of wires going up Moore-street into Castlereagh-street, and distributing in all parts of the city.
2018. About what height would the lowest of those wires be from the street surface? About 18 feet.
2019. The proposed tram-wire would, I believe, be about 18 ft. 6 in. from the street surface? Yes; that would be 6 inches above ours. The lowest wire is 18 feet, but the highest wire may be 40 feet—that is, we have posts 35, 40, and 50 feet high in all parts of the city, and we are taking them out every day and putting in fresh posts to provide for further extensions.
2020. The raising of those wires in George-street to a level a few feet higher would not be a matter of very great difficulty if circumstances should warrant it? That would not rectify the matter in the slightest.
2021. What would be the effect upon those wires of having a tram-wire 6 or 18 inches from them;—you have already told us of induction;—would it be to a greater or lesser extent? There is no doubt that there would be a great deal of induction, but it would be difficult to say the exact amount of disturbance.
2022. But would the disturbance of your wires be greater on account of their close proximity? Most certainly.
2023. That in itself would be a serious trouble at that particular point? Most decidedly it would.
2024. Have you any knowledge of the working of the telephone and electric traction systems in America? Yes.
2025. Can you cite any instances where the telephonic services either in America or Europe have been disturbed by the electric traction system? I could cite numerous instances, but at present I have not got them at my fingers' ends. I know there are numerous cases in America, which is the principal place for traction wires. There are some 10,000 miles under traction in America, and in many cases there the companies have come to an amicable arrangement as regards the traction wire and the telephone. The result has been that the telephone companies have had to resort to a metallic circuit. In Edinburgh, not very long ago, the telephone company made the Corporation duplicate their wires—that is, they made them put up a metallic circuit for them, in consequence of their adopting a traction system. Those are cases I know of, and I have no doubt that I could turn up a number of cases if they were required.
2026. You know of many instances occurring in different parts of the world of interference with the telephone system where electric traction is used? Yes.
2027. You are satisfied of that? Quite so.
2028. You have also within your knowledge the fact that in consequence of those disturbances the companies have had to come to an arrangement, and make such alterations as would permit of the telephone services being properly used? Yes.
2029. Is that the gist of your evidence? Yes.
2030. Therefore that is an interference which is by no means new? Certainly not.
2031. It is well known to electricians? It is well known to electrical engineers.
2032. Then, so far as your extended knowledge goes, you have that knowledge corroborated by the interference that has occurred at North Shore? Yes.
2033. That is a matter of actual practical experience? An actual fact.
2034. Therefore, whatever may have been written and said by eminent men in other parts of the world, you, in your position, have been able to prove the same thing? Quite so.
2035. And the complaints which you have received from constituents in connection with the telephone exchange have placed you in a position to be able to say that that interference existed not only before the alterations were made in the electric tram at North Shore, but has also existed since the alterations were made, and exists to-day? To a certain extent it does exist still.
2036. And you have already said that you will not be able to get rid of that difficulty unless you spend a large sum of money in putting down a metallic circuit? Quite so.
2037. *Mr. Wright.*] You stated just now, in answering a question put by Mr. Lee, that you thought the telephone system would gradually increase, and in the course of twenty years would treble itself? Yes.
2038. Now, as a matter of fact, if that be the case, can you do much longer without a metallic circuit? Well, of course, that is a question that would have to come up later on.
2039. Supposing that you had twice the present number of subscribers to the telephonic system, could you work it satisfactorily without a metallic circuit? I daresay we could work it satisfactorily, but it would be much better if we put in a metallic circuit.
2040. You are aware that at the present time there is considerable difficulty in the streets where the wires cross—that the telephone system is not satisfactory? I am aware of it. That is a thing which exists in connection with all exchanges where circuits are used. You find it in Melbourne ten times more than in Sydney.
2041. And necessarily it will exist? Yes; so long as you have no metallic circuit.
2042. You still think that if the number of subscribers were doubled you could work it as it is worked now? Yes, it could be worked.
2043. I suppose that every additional 100 subscribers would increase the difficulty? Of course that would increase the difficulty.
2044. *Mr. Black.*] I want to ask you one question, to begin with, in regard to technical terms;—are the words "transformers," "repeaters," and "translators," convertible, synonymous terms? Yes. Well, "translators" are what we use for telephones. They are really "repeaters." "Transformers" are used for electric-lighting purposes. A "translator" is merely a "repeater" of the current that goes through, in the shape of an induction coil. It acts as a sort of "repeater" to the main wire.
2045. I understand that your objection to a system of metallic circuit in telephone matters is on the score of expense? Yes.
2046. If a telephonic metallic circuit would prevent induction, would not a tramway metallic circuit be as, or even more, successful in that direction so far as the telephone is concerned? It would answer just as well.

2047.

2047. I mean that, if you make a metallic circuit on your tramway so complete that there is no danger, by variation or any other means, of your telephonic communication being affected, would not that so far as the tramway is concerned remove your difficulty? Yes; but even if you had a metallic circuit, as in the case of the Buda-Pesth line, you will always find that leakage takes place. That has been proved in connection with the Buda-Pesth system which is considered to be one of the best systems extant.

2048. I understand that there are other means of interference with the success of telephoning, such as the telegraph wires, electric light currents, and all great noises, such as that of a railway? They affect it only slightly—not sufficient to interfere with it.

2049. Do you agree, on the whole, with the evidence given in this document handed in by you? I do.

2050. I want to read a few extracts—I have here the evidence of Mr. Wm. Henry Preece, F.R.S., Chief Engineer and Electrician to Her Majesty's General Post Office, President of the Institution of Electrical Engineers, and a Member of the Institution and Council of Civil Engineers; this, I believe, was evidence given before some Commission, was it not? Before the Electric Light Committee, I think it was.

2051. And reported in the *Electrical Review* of the 13th January, 1893, folio 41; that gentleman says:—

> With regard to telegraphs, the earth-return was invariably used, and they found that they were not interfered with by tramways or electric light currents. For telephones also it was the invariable practice of the Post Office to adopt a metallic return. When telephones were first brought to this country, some fifteen years ago, he took an immense amount of trouble to investigate the various disturbances to which telephones were subject, and he tried to separate and differentiate the various causes. He came to the conclusion that the only possible way of making a telephone work satisfactorily and clearly was to use a metallic return. The telephone company had never suggested to the Post Office that the telegraphs were a nuisance to them, but he knew, as a matter of fact, that the telephones were disturbed by the telegraph wires, and the fact that they were able to read messages from wires 80 feet away led to a very interesting investigation, which was still proceeding, and which was rather opening their eyes as to the distance to which disturbances could be carried. There was no more delicate instrument for picking up and indicating stray vibratory currents than the telephone. There were other disturbing sounds arising from all kinds of causes: the Metropolitan Railway; the South London Railway; the electric light currents, the earth currents, the atmospheric currents, especially when thunder was about; it was impossible, in fact, to differentiate from the sounds you heard the causes of those sounds. With a metallic circuit all those disturbances were avoided. In Leeds itself we have found traces of conduction of these tramway currents 1,200 yards away from the tram-line, and in South Wales, where I have recently been making some experiments, we have even traced these earth currents to a distance of quite 2 miles from the circuit. The Deptford electric light current disturbed the telephone circuits, but not the telegraph circuits.

From that I pass to the evidence of Mr. Balfour Browne, as reported in *The Electrician* of the 7th July, 1893. Addressing the Committee on behalf of Municipal Corporations in England and Scotland, he said:—

> The fact was that the telephones were not complete or perfect until they had a metallic circuit, and whatever the tramway companies might do it would be impossible, practically, to insulate so as not to interfere with the telephones.

Mr. Cripps, in addressing the Committee on behalf of the traction companies, said:—

> Mr. Preece and all the other witnesses had stated the same—that the best system of telephonic communication was the metallic circuit return. That was the proper remedy, and that was the remedy for which the clause provided.

There are two or three points that arise in connection with that evidence—one is that if it be true that these earth currents can be traced to a distance of quite 2 miles from the circuit, then it appears to me that if you have anywhere within the city of Sydney an electric overhead system you will have disturbance with your telephonic system unless you have a complete metallic circuit either in connection with your telephones or the tramways;—is that not so? Quite so.

2052. It appears also to me, from reading this evidence, that with the increasing noise of the metropolis, its probable lighting by electric light currents within the next few years, and with the construction of a city railway, no matter how great the expense, you will eventually be forced to apply a metallic circuit to your telephone arrangements? Then it becomes a question as to who should bear the expense—whether it should be a charge against the Railways or against the Postmaster-General's Department.

2053. But do you not think it is inevitable, if the telephonic system is to be improved, or even maintain its present, what seems to me, very low standard? No. The present telephone system is about the most perfect telephone system there is in Australasia, and will meet all requirements for the next ten years.

2054. Then I am sorry for the rest of Australasia; I always avoid using the telephone as much as I possibly can; I would rather walk a mile than speak through a telephone for two minutes; I would rather carry a message to a man than use the telephone, such is my experience of it;—do you not agree with me that the construction of a city railway and the erection of electric lighting apparatus throughout the city will be apt, as those able scientific witnesses have stated, to interfere with your telephonic system? There is no doubt that ultimately they will interfere with our telephonic system if they are largely introduced into the city. Electric lighting, however, does not interfere so much as electric traction.

2055. Are not the electric lighting cables so insulated as to render their interference with the telephonic system small? Of course induction takes place, but not to a very large extent.

2056. Supposing that it were possible, which I believe you do not admit, to so bond or weld the tramway lines, or to so use other means that the metallic circuit was complete and there was no leakage at all, would it not, even under those circumstances, be necessary for non-interference that there should be also a complete metallic circuit in the telephonic system? I do not consider that any bonding would make a traction service complete sufficiently to protect the telephonic system unless you had a metallic circuit. Of course, if the traction-line were made so as to have a complete return circuit then there would be no necessity for a metallic circuit for the telephone lines, and that return circuit must be by some means or other similar to the Buda-Pesth traction-line circuit—must be a return wire.

2057. You say that the influence of an electric tramway over a telephone is greater than all the other disturbing causes put together? Yes.

2058. Is it not a fact that much of the interference with telephones by electric tramways is due to variation in the force of the current? It is due to various causes. It is due to leakage, induction, and to constant breaking and making of contact; they all combine together and interfere with the working of the earth circuit of the telephonic system.

2059. In telegraphs the earth return is invariably used? Yes; but traction does not affect that.

2060. How is it that the telegraph wires escape the tramway current? Simply because they use a stronger current, and it is not so easily overpowered.

2061. It is not necessary for the purposes of the telephone to use any stronger current than that which you use at present? No, certainly not. We only want a light current.

P. B. Walker, Esq., M.I.C.E., M.I.E.E. 15 April, 1896.

2062. Is it a fact that electric lighting companies are forbidden to use the earth as a return? They are in some cases.
2063. Do you think that it is true, as stated, that there is absolutely no leakage in the electric traction system in use at Buda-Pesth? It is stated so, but there have been instances of slight leakage occurring, notwithstanding the perfectness of the system there.
2064. You have heard nothing that would lead you to believe either that the system is perfect or that it is imperfect? I think it is about as perfect a system as could be made.
2065. Is it so perfect that if a similar system were in vogue here the interference with your telephonic communication would be infinitesimal? I believe so.
2066. Do you think that the bonding of rails, or the welding of rails, would sufficiently prevent leakage to minimise interference with your telephonic communication? I do not think that any bonding would prevent leakage.
2067. Is it a fact that the conduit system of electric traction is in use in Buda-Pesth? I believe it is, from the statement that I have seen.
2068. Do you look on that as furnishing the reason why the Buda-Pesth system does not interfere with the telephonic system in that city? Not from the fact of its being a conduit system—only from the fact of its being a return circuit.
2069. Then do you think that if in connection with the overhead wire system there was a return circuit that would be as successful in its insulation as the conduit electric traction system at Buda-Pesth? If there were a return circuit I have no doubt that to a very great extent it would relieve the telephone of all its difficulties.
2070. The return circuit in electric traction is as easily used in connection with the overhead system as in connection with the conduit system? I see no difficulty; it is only a matter of expense.
2071. Of course the overhead system is cheaper than the conduit system? No doubt it would be cheaper. The whole system of metallic return for telephones is only a matter of expense.
2072. You have had considerable trouble in your head office from the noise of the omnibuses in George-street? Not in George-street, but in Pitt-street we had some little noise, but that has all been removed.
2073. Has the repaving of Pitt-street quite removed the disturbance? Yes.
2074. With the wearing away of the pavement, will that disturbance not arise again? Of course, the disturbance did not arise to such an extent as to prevent the working of the exchange, and it did not actually effect the working of the wires, but merely affected the hearing of the operators; it had nothing whatever to do with the working of the wires. It had quite a different effect from that which a traction line would have on the telephone wires.
2075. Well, to sum up your evidence, your objection to the use of the electric tramway system in any part of Sydney, whether overhead or conduit, is due to the fact that under ordinary circumstances it would greatly interfere with telephonic communications? Quite so.
2076. If by the use of a complete metallic return—and I believe that is only possible with a return wire on the trams—there were no such interference as you fear, your objection to the electric tramway system would be removed? Quite so.
2077. *Mr. Humphery.*] You think that it may be necessary eventually to have a metallic circuit for a telephonic system;—is it not a fact that at the present time in Liverpool, according to your statement, there are 3,500 telephones worked by an earth circuit? Yes.
2078. And in London six-sevenths of the telephones are similarly worked? Yes; there is a large number worked by the earth return in London, but in Liverpool they have metallic circuits as well as the earth return.
2079. What proportion in Liverpool? I could not say exactly; but they have metallic circuits, I know, in some cases.
2080. Would it be only a very small proportion? Only a small proportion.
2081. So the general practice at the present time is to use earth circuits? The general practice where they have any interference from traction wires or other causes is to use the metallic circuit.
2082. It only becomes necessary to have a metallic circuit where electric traction or other disturbance exists? Quite so. We use the same system as they have in all other parts of Australia.
2083. *Chairman.*] Can you tell us how you make up the amount of £92,690? In the early part of the working of the telephone system we did not keep a distinct statement for it. It used all to be put down as telegraph work as well as telephone work; therefore we could not give a distinct statement of it. But the total amount for the construction of lines is £52,690, and for instruments about £40,000. That makes £92,690; but that does not include the salaries and wages of officers working the exchanges. It is merely the cost of the instruments and the wages paid in connection with the construction of the work. The cost of erection was £52,690, and the cost of telephones, switchboards, fittings, wires, and other material was £40,000.
2084. What is the estimated cost of the subway you are now putting down in Pitt-street? £30,000 has been voted.
2085. Will £30,000 pay for it? Yes, £30,000 will cover its cost; that is, the whole of the subway system.
2086. Why are you building it? Simply because the wires are so crowding the streets that we cannot put up any more poles. We must have a means of getting out, and are obliged to put it underground.
2087. You mentioned yesterday that you had ordered a certain quantity of metallic wire? A few miles of it.
2088. Why did you order that wire? For the purpose of using it at some future time, for when we put it in a tunnel it is more difficult to shift than an overhead wire. Of course we cannot use a metallic wire for a single circuit without earthing one wire. We will have to earth one wire, but I intend to use it for a single circuit and it can be adopted for a metallic circuit at some future time.
2089. When you use a subway a metallic circuit becomes pretty well a necessity? Not always.
2090. Well, on general principles, is it not so? Not necessarily so. You can use a single circuit for it as well as you can an overhead circuit. It is not an absolute necessity by any means to use a metallic circuit.
2091. Will you say whether it is generally used or not? That I could not say.
2092. You are not aware? I am not aware of any case.
2093. Still, this wire which you said you had ordered will come in for a metallic circuit some day, if necessary? It will be useful for a metallic circuit when a metallic circuit is introduced.

2094. The cable is so constructed that it will do for a metallic circuit? It will be suitable for that. Of course I am only looking ahead in doing that, as every careful electrical engineer should do.
2095. With a metallic circuit would cross-talking on telephones be done away with? Entirely.
2096. And, therefore, are we justified in believing that with a metallic circuit you would have a more efficient telephonic system than at present? You would have a most efficient and complete service.
2097. In other parts of the world where the electric tram on the trolly system is used, and where telephones are also used, in every instance, as far as you know, is a metallic circuit used? In America, where they have something like 10,000 miles under electric traction, they have a large number of metallic circuits, and they are putting in metallic circuits every day. On the continent, in some cases they have metallic circuits and in some cases they have single wires. In the United Kingdom, in many cases they are adopting metallic circuits. In Glasgow they have recently had to put in a metallic circuit, and also in Edinburgh.
2098. In other cities where there is no electric tram are they also using the metallic circuit? In other cities there are some cases where they are using a metallic circuit, and other cases where they are using the earth return circuit.
2099. The metallic circuit improves the telephonic communication always, and it becomes a necessity when you have the trolly system in connection with electric trams? Yes; it becomes an absolute necessity in order to obtain a perfect telephonic system.
2100. We have here a report from the Postal and Telegraphic Conference at Hobart, of which you were a member, dated 8th November, 1894. There is a statement here that the Joint Committee of the House of Lords and the House of Commons agreed to this finding, which has your approval as a member of the Conference:—

> That it is not, in the present state of electrical science, to the interest of the public to insist upon electrical tramways using an insulated return conductor, and that such insistence would retard the development of electric traction.

In other words, I read that in this way—that the streets are intended for traffic purposes, and you throw the obligation of protecting the telephones on the telephone management itself? That is quite right. It is only a question as to who should bear the expense.
2101. The Joint Committee of the House of Lords and the House of Commons came to the conclusion, and this Conference apparently approved of their finding, that the metallic circuit, which is a means of preventing any interference, should be provided by the telephone companies, and not by the tramway companies? But the Government, and not telephone companies, are running the telephone system here.
2102. But, on general principles, if there are two companies—one a telephone company and the other an electric tram company—in that case, with certain restrictions that are laid down by the Board of Trade, the protecting has to be done by the telephone company? Of course the Board of Trade had laid that down, but it does not follow that the Government would.
2103. That would be so, only you explain that the Government own both the telephones and the trams? Yes; and it becomes a question as to which Department should bear the expense.
2104. The Government bear it in either case? Yes.
2105. But it has been decided by the highest authorities you could have—and I presume our legal findings in this Colony would follow the findings in England and America—that the roads are primarily for traffic, and that electricity is a legitimate mode of transit? Of course that is not a question for me to decide at all.
2106. Will you grant that the roads are made for traffic, and that electric transit is a reasonable means of transit, and that, therefore, it should not be called upon to protect the telephone from what happens incidentally from legitimate transit work? That is not a question for me to admit.
2107. Is that not a fact, though? That is the decision of the House of Lords, but it is a question for the Postmaster-General to decide in this case. I will not offer an opinion on that.
2108. *Mr. Wright.*] In answer to a question put by Mr. Black, you said that if the tramways provided a metallic circuit that would not do away with the difficulty? Yes.
2109. I refer to the evidence given by Mr. Elwell;—he is asked at Question 1574—

> What would it cost to have a metallic return for the electric tram;—have you gone into an estimate for that?

His answer is—

> There is a system—the only one that I am aware of—where a metallic return is used. That is in Cincinnati, in the United States, and the effect generally is bad, because not only are there double overhead wires—that is, two wires over each line of rails—but constant accidents are happening through short circuiting of the line. Any disturbance may produce an accident, and it is in consequence of the complex nature of those overhead wires that the system has not been repeated.

So that it would appear there is considerable difficulty in providing a metallic circuit for the tramway itself? I doubt it very much. Of course Mr. Elwell has had experience of that, and I have not. I have never heard anything of the kind in Cincinnati, and I have been there myself.
2110. If Mr. Elwell is right in his reply, then the tramway could not supply a satisfactory metallic circuit of itself? I doubt it very much.
2111. Taking your own evidence, the wires along which the trolly runs, the connecting wires, the stay-wires, the rails, all being means of leakage and induction, it appears to me impossible to have anything like a metallic return? You can have a return easily. You can make a return over the rails; it only necessitates an extra wire.
2112. But would not there be leakage from extra off-shoots, the stay-wires, and from induction itself? The induction is the worst thing, not so much the leakage. It is bad, and will always be so.
2113. You are still under the impression that the tramway might itself provide a metallic circuit? It might provide a means by which the difficulty might be overcome.
2114. *Mr. Fegan.*] I notice that your evidence goes to prove that it is almost impossible to construct this tramway satisfactorily without having a metallic circuit return? Quite so.
2115. Did you ever mention to your Department the necessity of having a metallic return before this scheme was proposed? I do not think that I have mooted the question of a metallic return absolutely.
2116. But you have been of the opinion that it would necessarily follow on account of the complex system of your telephones? Of course the next ten years might necessitate it.
2117. I suppose you have complaints made by subscribers as to the constant interference with their wires, apart from North Shore? Oh, yes; such complaints as are common to all telephone exchanges, about cross-talk, &c.

P. B. Walker, Esq., M.I.C.E., M.I.E.E. 15 April, 1896.

2118. Complaints as general as they are from North Shore? Not complaints of the same character—not caused by electric traction.
2119. But people who are subscribers to the telephone exchange, apart from the electric traction at North Shore, write to you on account of the interference with their wires? They write on account of the interference with the wires by cross-talking, and that sort of thing, but we get very few complaints of that character.
2120. Can you give the Committee an estimate of the return of the telephonic system to the Department; I mean the interest paid on the original cost? I could not give you that without looking up the matter.
2121. I suppose you could furnish it, if necessary? Yes. If the Committee wish it, I could get a statement made up.
2122. Will you do so and send it to the Secretary? Yes.
2123. I understand that it is your intention to commence laying a cable? Yes; we are going to put some cables in the tunnels when they are completed.
2124. As head of the Telegraph Department, or as an officer of the military service, in which capacity did you lay the metallic circuit on the Military Road in connection with the fortifications? Purely in my military capacity. That metallic circuit was laid because, in consequence of the great noise in the batteries from the firing of the guns, &c., it would not be possible to work the military telephone wires satisfactorily without having a metallic circuit. The noise would be terrific there during an engagement, and, therefore, to provide a complete arrangement to avoid all that and get over the difficulties in connection with it, I suggested a metallic circuit.
2125. And you, as Lieutenant-colonel of the corps of Engineers, recommended it and superintended the laying of it? Yes; and I have a very complete system there.
2126. So you have a very good idea of what will be the cost if you have to take a metallic circuit through Sydney? It is only a very small affair there.
2127. But having laid one will give you a good idea in connection with the matter? Yes; but that system is totally distinct from the Postmaster-General's Department.
2128. You think that in the course of some years—say eight or ten years—the number of subscribers will increase so much that you must have a more efficient service than you have now? It will have to be done gradually; it is a thing that cannot be done immediately. It is a very difficult matter, and it may take six years to do it.
2129. If Parliament votes the money at once? It would take fully six years to put a metallic circuit in for Sydney and suburbs with our increasing business; but it might be done in four years for the city only.
2130. But there is no doubt that the time will come when a metallic circuit will have to be made in Sydney? It may come within the next ten or fifteen years.
2131. Do you think that the telephonic communication is of greater advantage than quick transit to passengers? I should think that telephonic communication was more important to some people than quick transit. Business people would, of course, go for the telephone as the most important thing in connection with their business. Transit is a thing you can get almost all day, but you cannot get a telephone every minute through the day.
2132. According to your evidence, electric traction would interfere more in the vicinity of the tram than, say, at Waverley? Most decidedly the interference would be more in the vicinity of the tram. Of course in the outside districts it would simply be propagated by the induction that would be carried through the other wires.
2133. Do you think that the metallic circuit could be laid for less than £250,000 through the whole of the city and and suburbs? Of course that is merely an estimate; the work might be done for less, or it might cost a great deal more.

Henry Deane, Esq., Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

H. Deane, Esq. 15 April, 1896.

2134. *Mr. Lee.*] Will you now read the statement which you said you would prepare, as to why the cost of the King-street to Ocean-street cable tramway was more than the estimate? I have been asked to give an explanation of the reason why the cost of the King-street to Ocean Street cable tramway was so much higher than the estimate. This subject was reported upon by me last year to the Minister for Works, and the papers in connection with it were laid on the table of the House. Most of what follows is taken from the report above mentioned. In the first place, I need scarcely point out how difficult it was to make an estimate for a work which, in the matter of grades and curves, was without its parallel in Australia, or even in the world. No detailed plans had been prepared; they would have involved considerable time and expense, and it is not usual to prepare them at that stage. However carefully, therefore, the matter might be considered, the estimates would of necessity only be approximate, and these were very difficult to make in consequence of the absence of similar experience in Sydney and the peculiar character of the work. At the time the proposal to construct this tramway was submitted to Parliament, it was assumed that all the iron and steel work and machinery might be imported. When, however, plans were ready for inviting tenders, the Minister then in power decided that all plant and materials should, so far as possible, be obtained in the Colony. From this cause alone the expenditure was very largely increased, and I have no hesitation in stating my conviction that had this Branch been free to import all material, and had the original scope of the work not been extended, the cost would have little exceeded £80,000. Alterations to mains cost £6,490. It was impossible to anticipate such an expenditure. I put down the amount of £4,000 as entirely unforeseen. Instructions were given by the Minister to provide additional engine-power and car-house accommodation for proposed extensions of the line to Rose Bay and Paddington. The estimated cost of these, namely, £20,000, was submitted and approved. The Railway Commissioners represented that a loop at the top of William-street would be required for the working of the traffic. This proposal, which was estimated to cost £2,000, was approved by the Minister, and has been carried out. The car-shed was designed to accommodate cars of a larger size than those afterwards adopted. The plan was submitted to the Railway Commissioners and approved. Had the ground plan been arranged at the first for the smaller cars a reduction could have been made. I have, however, put down nothing for this. In consequence of the instructions to order everything possible of colonial manufacture, the engines, slot beams, steel brackets, yokes, and the

H. Deane, Esq. 15 April, 1896

the ironwork for roof were more expensive. I have calculated that an additional cost of £17,529 was due to these circumstances. The foundations to the chimney-stack were unexpectedly heavy, and cost about £500 additional. The rails for the permanent-way, when the tramway was first proposed and the estimate made, were intended to be of a section obtainable in the market, and such could have been landed in Sydney for £7 per ton. On the advice of Sir John Fowler a special type of rail was about to be ordered by the Railway Commissioners for their own renewals, and they asked that similar ones should be adopted for this tramway. The quantity ordered being small, and the section perhaps difficult to roll, the price charged for these special rails in England was high, and landed in Sydney they cost nearly £12 per ton. This made a difference in the cost of the permanent-way material of £5,000. The rolling-stock, which was left to the Railway Commissioners to deal with, was estimated originally at £5,500; the actual cost has been £8,600, or £3,100 in excess, since which cost of fitting air-brakes, amounting to £1,118 2s. 5d., has been added. A sum of £3,000 was paid for the patent for the use of a principle involved in the construction of the grip, which was naturally not included in the original estimate. In order to find work for the unemployed, the Minister ordered the drawings of the roadway to be pushed on and tenders called long before the rest of the drawings were in a sufficiently advanced stage. Under ordinary circumstances this would not have been done, as, in order to save interest on capital, all the various portions of the work, roadway, buildings, and machinery should have gone on concurrently, but the Minister ordered it otherwise for the reasons above given. The cost of the tramway has been affected by this action—the construction of the works has been spread over a longer period, supervision has lasted longer, and an amount for maintenance of roadway had to be included which would otherwise not have been charged to capital. The payments to M'Sweeney for materials supplied and work done in connection with this extra maintenance amounted to £3,635 16s. 9d. In the original estimate it would appear that office expenses and supervision were left out. These amount to a large sum, namely, £7,753 18s. 1d., on account of the length of time over which the work was spread. It is certain that a proportion of this should have been covered by the original estimate, but in consequence of the time over which the work was spread, the cost has been increased by at least £1,500. To meet the request of the Park Trustees, a caretaker's cottage was erected and fencing provided at a cost of £430. This was looked upon by the Minister as fairly due, seeing that park land had been taken without any other compensation. Beyond the above amounts there is an additional but very material cause for increased expenditure which was inadvertently left out of my report last year. Had the site selected been one where æsthetic considerations had been of less importance, a much plainer and cheaper building could have been erected. A plain building to answer all the purposes of a cover would probably have been erected for £4,000 less than the actual cost. The undesirableness of having anything unsightly in so prominent a position does not require to be argued out, and it is not surprising that the trustees of the reserve and the residents of the neighbourhood interviewed the Minister with a view of obtaining a promise from him that an ornamental structure should be erected. Instructions were given accordingly, and I venture to say that the result has been successful, and considering the object in view, there has been no extravagance. The above items amount in the aggregate to £72,067, making with the estimate a total of £152,067. The total expenditure charged to the Construction Vote is £169,849 8s. 5d., which includes a sum of £12,490 3s. 6d. for land and legal expenses, leaving the net cost of construction at £157,359 4s. 11d. This shows an excess over the calculated amount above of about £5,300 only. An analysis of the items making up the sum of £72,067 for extras mentioned above, will show that of this the sum of £38,648 has been due to additions or alterations to the original scheme specially ordered, that £22,665 is due to the particular methods adopted, and which were beyond my control, that £4,500 only was due to unforeseen contingencies, and that the sum of £6,254 for office and supervision is the only part of the whole expenditure which it might be said should have been covered by the original estimate. Granted this, I would point out that it is less than the 10 per cent. allowed by the Public Works Act. For the rest of the extra expenditure I cannot be held responsible. During my trip to America I had an opportunity of comparing the Ocean-street cable tramway and power-house with many others of the most approved type, and I assert most emphatically that this line is constructed according to the best modern designs, and compares favourably with any other that I have inspected. In fact, I have seen nothing better in the whole course of my travels. There is at the power-house a reserve of from 400 to 500 additional horse-power, which will serve for an extension to Rose Bay, or for any other branch or branches in the neighbourhood which may be determined upon, to meet possible increase of traffic in the cable line itself. Had this additional power not been provided, but only the net amount for working of the line in accordance with the original proposal, a very considerable cost in engines and buildings would have been necessitated when any additional works were authorised. This further expenditure is now obviated. In consequence of the extra space available, it will now be possible, as already explained, to house the engines and generators for the George-street electric tramway. I would therefore point out that the country possesses a very good and profitable asset, and very good value for the money expended. The cable tramway is paying over 5 per cent., which is a better return than other investments made for many years past, and when the capacity of the power-house is fully utilised, as it will be some day, it may be expected to pay very much more.

2135. Have you any knowledge in your branch of the constructing of metallic return circuit lines in connection with electric traction? Yes; I know of their existence.

2136. Have you had occasion to make an estimate of the cost, per chain or per mile, of putting them in? No; it does not come within my province.

2137. That would be more in the province of Mr. Elwell, perhaps? Well, it is a matter that could be more fully reported upon by telegraph and telephone engineers, or electrical engineers in general practice.

2138. But is it not a point upon which Mr. Elwell will be able to give us some information? I think that Mr. Elwell will very likely be able to tell you something. I could easily furnish an estimate, and satisfy the Committee that it is a correct one, but I think the Committee would be better able to obtain the information from some independent source, and I do not wish to come into conflict with another civil servant. I should like to recommend that the Committee examine Mr. Callender, a member of the firm of Callender and Son, electrical engineers, London, who is at present in this city. He is an authority on electrical work, and has been frequently consulted on the subject. I have read Mr. Walker's statement, and I should like to make a few remarks upon it. In the first place, there is no doubt that the system of subways, which Mr. Walker says will be such an extraordinarily costly one, has already been initiated.

2139.

H. Deane, Esq. 15 April, 1896.

2139. That is, subways to carry the telephone wires? Yes; it was initiated before this tramway was submitted to Parliament, and the Government are practically committed to some expenditure on that account. Then, again, I understand, from my reading and from information received from electricians, that when you lay telephone wires underground you must have a metallic circuit—that you cannot work them otherwise. The Government have already ordered wire for the purpose, as Mr. Walker has told the Committee. I think that some 10 or 12 miles of this twisted cable has been ordered and the contract let for it. I have very good reason to believe that Mr. Walker's estimate for providing a metallic circuit for the telephones is far too high. It would be possible for the Committee, if they have not done so already, to obtain an exact estimate of cost for the whole telephone system in Sydney. In completing the metallic circuit it will, I understand, be necessary to alter or modify the switchboard. There will be some expense in connection with that, and there will be a second wire required if they are placed overhead, but all the present instruments, telephones, and all the apparatus otherwise will be of use. They will not have to be altered or duplicated.

2140. You say that the Committee could obtain an exact estimate of cost? I think they could.

2141. From what source? I should think Mr. Callender or Professor Threlfall would be able to give you a very fair estimate.

2142. But while you are admitting that, you are admitting the necessity for having a return circuit? I believe in the necessity for having a return circuit quite apart from the tramway. I believe that the telephonic service in Sydney will never be complete and thoroughly satisfactory until there is a metallic circuit. I think there is not a business man nor a private individual who has a telephone who does not find it excessively annoying from time to time, because he cannot get any message along the line, or instead of getting his own message along the line he hears somebody else's. It is repeatedly occurring. I have frequent difficulty in connection with my own telephone, especially in certain weathers, and even in what is apparently good weather there are serious interferences.

2143. We all know that the system does not now appear to be as perfect as it might be; but there arises this point, that, without going into the actual details of the cost of providing this telephonic metallic circuit, it will be a costly matter? It will be a costly matter.

2144. When the electric traction was suggested for George-street, how was it that this prospective large cost was not taken into consideration at that time? Because it was never considered that it was necessary to provide for it.

2145. You are on a very important point now, and if you wish to elaborate it now is the time to do so? I should like to say that in no part of the world, so far as I know, have electric-traction companies had to pay for the metallic circuits of telephone companies; the onus of it has always been put on the telephone companies, and the Joint Committee of the House of Lords and the House of Commons, which is referred to in the appendix to Mr. Walker's statement, and which was appointed to consider the question of protective clauses to be inserted in private bills relating to electric traction, decided that electric-traction companies should only be required to carry out the Board of Trade regulations, and have nothing to do with providing metallic circuits for telephone companies.

2146. But in this country both these services are performed by the Government? I know that. Therefore, whether the metallic circuit is paid for by the Works Department, or whether it is paid for by the Telegraph Department, is a matter of little importance, provided that it is necessitated by the construction of the tramway; but I should like to point out that it is not necessitated actually by the construction of the tramway—that is shown by the action of the Joint Committee of both Houses of Parliament in England. If it had been they would have laid some duties on the traction companies, but they have not done so. Although Mr. Walker says that it is not necessary, I believe he acknowledges that in London, where there is no electric-traction company at present, the Government telephones have a metallic circuit because it is better, and if it is better it is necessary, because you ought to have the thing as nearly perfect as possible.

2147. You said just now that it would make very little difference who paid the cost of providing this metallic circuit; well, if the construction of the electric tramway necessitated the expenditure of £150,000 more to complete the telephonic system, do you not think that the tramway system should be charged with a certain portion of that expenditure, because it necessitated the money being expended? If it were necessary on that account alone something should be paid by the Tramways, but I do not agree to that. I do not think that you could in any fairness charge anything to the Tramways; but if you can get the completion of the metallic circuits done for £50,000, as I believe you can, that is a very different matter from £175,000, and at the worst it is only precipitating matters, because the metallic circuit must be adopted in Sydney for the telephones sooner or later.

2148. Whether there is an electric tram or not, you say that it must come? Whether there is an electric tram or not I say it must come, and I think that I simply echo the opinions of all the best electricians in this part of the world, in Europe, in England, and in America, when I say that it must come sooner or later. They have it in London, where there is no electric traction—they cannot get on without it—therefore, all that can be said about this is that it precipitates matters, and we have to carry it out a few years sooner than it otherwise would have to be carried out. If that is the case, it only means the interest on £50,000, if 50,000 is a fair estimate of the cost. It means (say) five years' interest at 4 per cent. on £50,000, and that would be only £10,000, and that £10,000, if it is to be charged to the tramways at all, should be divided over all the tramways as they become converted to electrical traction; and if to the cost of making the George-street tramway you add the cost of conversion, that bringing the amount up to (say) £500,000, you would only have to charge one-quarter of that to the George-street tramway, viz., £2,600. If there is any difficulty about voting that money, let it come out of the tramways, but no more should be charged.

2149. If it can be shown that in addition to having this metallic circuit for the telephone system it will also be necessary to have a complete metallic circuit for the tramway system as well—if it can be shown that both are necessary for insulation, or that the return of the electricity in connection with the traction must be equal to that in connection with the telephone to make those services complete, will that not add a certain amount to the cost of construction? But you cannot show that. What we shall do here is simply to make it as good as the Board of Trade regulations require in England.

2150. That will be by bonding the rails? Efficient bonding. You cannot make it equal to the other without insulation, and you cannot insulate the return.

H. Deane, Esq. 15 April, 1896.

2151. I am aware that your proposal is to so completely bond the rails as to make the return as perfect under those conditions as you can; but supposing after that has been done that great disturbance is caused to the telephonic wires, you will see that to provide a circuit for the telephonic wires will take at least five or six years;—what is to be done by the commercial class in the meantime with this telephonic disturbance? I should say that before the George-street tramway can run the Electric Telegraph Department can alter all the wires that will be affected by it; I think there will be ample time to do that.
2152. I will conclude for to-day by asking you whether you are prepared to take the responsibility of a letter which has been sent to the Committee signed by Mr. Elwell, the Electrical Engineer, in which he says:—

It having been brought under the notice of the Commissioners that certain statements appear in the *Sydney Morning Herald* of this date as having been given in evidence upon the proposed George and Harris Streets tramway by Mr. P. B. Walker, Secretary, Telegraph Service, to the effect that serious interference would be caused to the telegraph or telephone systems by the currents in the electric tramway wires, the Commissioners desire me to inform you that no such interference can occur except as a result of imperfect construction or maintenance of the electrical portion of the tramway plant, and that they would, consequently, take the responsibility of neutralising any such interference that might occur.

Will you accept the responsibility of that? No; it is not necessary.
2153. *Chairman.*] You refuse to accept that responsibility? I do not know why I should be asked to accept the responsibility.
2154. *Mr. Lee.*] You refuse, on the ground that all you can be held responsible for will be the proper construction and maintenance of the line? I have done more than that, if you will allow me to say so. I have endeavoured to point out that, in my opinion, the telephone system should have a metallic circuit applied to it, independently of the tramway, but that if it is reckoned that the tramways should be made at all responsible for this work there would only be a few thousand pounds to pay as their part of the cost; but as for undertaking any responsibility, in the case of there being any interference, to pay away £175,000 or £250,000 or £500,000, I absolutely decline.
2155. The electrical branch of the profession is really outside your office; the disturbance with the telephone system is nothing with which you have anything to do—a matter you could not properly be charged with? I do not consider we should be charged with it.
2156. Therefore, you could not be responsible for an undertaking of the character in question? No.

THURSDAY, 16 *APRIL*, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (Chairman).

The Hon. Frederick Thomas Humphery.	Charles Alfred Lee, Esq.
The Hon. Charles James Roberts, C.M.G.	John Lionel Fegan, Esq.
The Hon. William Joseph Trickett.	Thomas Henry Hassall, Esq.
Henry Clarke, Esq.	George Black, Esq.

Francis Augustus Wright, Esq.

The Committee further considered the proposed Electric Tramway from Circular Quay, Sydney, to the Redfern Railway Station; and also along Harris-street to the intersection of John-street.

James Ormiston Callender, Esq., Consulting Electrical Engineer, sworn, and examined:—

J. O. Callender, Esq. 16 April, 1896.

2157. *Chairman.*] What are you? I am a consulting electrical engineer, carrying on business in Sydney.
2158. What has been your experience? I have had sixteen years' practical experience in electrical engineering, chiefly in England, but for a short time in America. During the last five years I have been in Australia. I served my time in the shops of the Callender Cable Co., and afterwards in the testing-room of the company. Before that, I was manager of their outside works, and afterwards of their works in England, and later in New York.
2159. Did you carry out any work in England? No.
2160. Have you carried out any work here? I am now carrying out a large electric lighting contract in Queensland, and I hope to carry out another in Narrabri. I have done other electrical work in the Colony. For the first three years of my stay here I acted as agent for my firm; but during the last two years I have been doing purely consulting work.
2161. You have read the statement made to the Committee by Mr. P. B. Walker? Yes.
2162. Have you prepared another statement criticising it? Yes. It is as follows:—

After a careful perusal of Mr. Walker's statement on the subject of interference with the telephone system, I believe that Mr. Walker's evidence is, in the main, correct—that is, to the extent of saying that the adoption of the overhead trolley system of electric tramways, as now proposed by the Railway Commissioners, will involve the alteration of the telephone system in Sydney from a single-wire system, with earth return, to a system of complete metallic returns.

It would be possible to adopt the metallic return system on the lines affected by the proposed tramway, leaving the rest of the system as at present; but this would lead to certain difficulties in working the Exchange, and would cause delays in operating. Such a combination has been tried, but has not given completely satisfactory results. It is open to question whether this system would entirely do away with the disturbance caused by tramways—it certainly reduces it to a minimum, but, as far as present experience goes, does not entirely obviate it.

It may, therefore, be taken as an assured fact that the use of an electric tramway, with uninsulated return, will seriously disturb telephonic communication unless the telephones are connected on a closed metallic circuit.

This question was completely threshed out by the Joint Committee of the Houses of Lords and Commons in 1893, when both telephone and traction interests were fully represented, and the recommendation of that Committee was as follows:—"That it is not in the present state of electrical science to the interests of the public, to insist upon electrical tramways using an insulated return conductor, and that such insistance would retard the development of electric traction."

This decision, which was endorsed by Mr. Walker in the second Report of the Committee of the Postal Conference in 1894 (8 November), throws the responsibility of protecting telephone lines on the telephone companies, while at the same time very stringent regulations were drafted, making it obligatory on the tramway companies to take all possible precautions in the way of proper bonding of rails and insulation of overhead conductors. Any company, however, having observed these conditions is assumed to have used every possible means to prevent disturbance of telephone lines, and if such disturbance should still exist, the onus of counteracting it falls on the telephone companies.

The reason of this decision was that there existed then and now exist no practical means by which electric trams could be worked, other than the overhead trolley system, with uninsulated return, whereas the telephone companies can admittedly eliminate all disturbance by the use of metallic circuits; and, further, it was admitted that the use of such metallic circuits would materially improve the general working of a telephone system.

J. O. Callender, Esq.

16 April, 1896.

The Telephone Department in New South Wales has had the question of metallic circuits under their notice for several years back, and in 1894 manufacturers of cables were asked to obtain samples of suitable cables for such work.

In 1895 the Department commenced the construction of subways for telephone and telegraph wires, and up to date a large sum, about £30,000, has been expended on these subways. By this step the Department have committed themselves to the adoption of metallic circuits, as it is a well-known fact that underground wires cannot be used successfully on a telephone system except in conjunction with metallic returns. This is borne out by the fact that wherever underground wires are used for telephonic communication on a large scale in any part of the world, metallic circuits are invariably adopted.

The Telephone Department appear to have realised this, as they have recently placed an order for 12 miles of 48-conductor cable, made up in twenty-four pairs for metallic circuits. Such a cable will be practically useless unless a system of metallic circuits is adopted.

Thus, if the Department intend to use the new subways, they must employ metallic circuits; if they do not so intend, why were the subways built?

Dealing next with Mr. Walker's estimate of the cost of conversion of the existing system to a system of metallic returns, I find by Mr. Walker's statement that the total cost of the present exchange system has been £92,690 up to date, but that he estimates the cost of conversion at the enormous sum of £175,000 for the city, and £250,000 if the suburbs are included.

These figures appear incredible in view of the fact that the cost of converting the whole of the telephone system of London, embracing thirty exchanges and covering an area of 600 square miles, was, in 1894, estimated at £200,000. I have not had an opportunity of seeing the figures on which Mr. Walker bases his estimate, but have no hesitation in saying that the cost has been enormously over-estimated.

The chief work necessary for the conversion consists of the duplication of all wires. This will involve a certain number of new poles in addition to those at present erected. Of course the new subway now being completed will be utilised to carry all trunk wires, and thus relieve the main streets of a great number of wires.

There are, I understand, about 3,100 miles of telephone wires in Sydney and suburbs—2,000 of which are in the city. The whole of this wire could be duplicated at a cost of certainly not more than £10 per mile, making a total of £31,000, and the alterations to switchboard at the Exchange might bring the cost up to £40,000.

In confirmation of these figures—cable has recently been ordered for telephone work at a price under £3 10s. per wire per mile—the actual price being £150 per mile for 48-conductor cable.

If the work of conversion were vigorously pushed on with, I estimate that the entire conversion could be completed in about two years.

2163. Will you now take the statement which Mr. Walker has sent to the Committee this afternoon, and go through the items it contains, pointing out where you think he is in error? The first item in Mr. Walker's estimate is as follows:—

12,900 poles, averaging 40 feet in height, but many would be 46 feet and 50 feet, averaging at £10 each—£129,000.

A little earlier in his statement he has pointed out that there are at present in the city and suburbs 6,450 poles, and, as he estimates to require 12,900 poles to enable him to duplicate the existing wires, I presume he intends to discard the existing poles, though for what reason I cannot understand. It is true that in George-street and Pitt-street the poles are overloaded, but the Department have constructed a subway with the view of relieving these poles; the intention being, I understand, to remove all the trunk wires in George-street and Pitt-street from the poles, and to place them in the subways. I cannot see why more than 6,000 poles could possibly be required in the event of the duplication of the existing lines. The only poles overloaded are those in the busy parts of the city—in George, Pitt, and King Streets. Most of the rest of the poles could easily bear the weight of duplicating wires. Mr. Walker, however, assumes that it will be necessary to triplicate the poles. It must be common knowledge to members of the Committee that as soon as one gets out of the city proper, the poles only carry one or two or three wires each, and in those places could easily bear the duplication. There may be isolated cases where it would be necessary to duplicate the poles, but generally it would not be necessary. Then, in regard to the height of the poles, it will only be necessary to have a few 46-feet and 50-feet poles in the city, and, in my opinion, the use of the subways will relieve the existing poles so much that they will be able to do the work. That the poles required throughout will average 40 feet in height is impossible. The poles in the suburbs are certainly not 40 feet high. Their average height would be more nearly 25 feet, and such poles can be obtained from St. Mary's at 10s. per pole, delivered in Sydney.

2164. What would a pole cost to erect? Not more than £1, allowing for the painting. I do not dispute Mr. Walker's figures in regard to 46-feet poles, but I can get 25-feet poles delivered at the railway siding, Sydney, from St. Mary's, at 7s. 6d. each, dressed and charred at the feet. I am speaking with absolute certainty, because of tenders I had to get in connection with certain electric lighting work in the city.

2165. Could you erect these poles for another £1? Without the slightest doubt.

2166. *Mr. Wright.*] Including the cost of the arms and insulators? No; but I could erect the poles for £1.

2167. *Mr. Humphery.*] What would a pole cost, everything included? An average suburban pole does not carry more than from four to six cross-arms.

2168. *Mr. Wright.*] Take the average as five? Including insulators and everything, such a pole could be erected for £2. Mr. Walker's estimate of £10 each does not include the cost of insulators. The next item in his statement is—

3,150 miles of wire, including labour, erection, &c., £79,600.

That means about £25 per mile of wire. The wire used by the Telephone Department here is a galvanised wire—I think No. 12, but it may be a little larger. The Telegraph Department gets its wire for telegraphic purposes—and this wire is approximately the same size as the telephone wire—erected at about £4 16s. per mile. That is the cost of supplying the wire and of erecting it. The contracts are taken with great regularity at prices approximating £4 16s. a mile. I am absolutely at a loss to understand why Mr. Walker estimates the cost of similar wire at £25 per mile.

2169. *Chairman.*] You know that the wire which Mr. Walker estimates to cost £25 per mile is tendered for at £4 16s. per mile? Yes.

2170. You are making no mistake about this? No.

2171. Would you take a contract at that price? I should be delighted. The railway contracts for telegraph work are taken at about £4 16s. a mile. I admit that there is a certain amount of extra expense in city and suburban work; but I see nothing to justify the difference between £4 16s. and £25 per mile.

2172. Would £5 a mile be a full estimate for city work? I would estimate it at £10 including the additional poles required.

2173. Would £5 cover the cost of the wire and of placing it? I think so.

2174. That is in the city? Yes.

J. O. Callender, Esq.

16 April, 1896.

2175. You are speaking with the knowledge of that fact? Yes. The next item is—

Additional wiring required to provide for metallic circuits, 100 miles 25-core cable for repairs, emergencies, &c., £15,000.

I do not know what that means. Twenty-five core cable is no good for a metallic circuit; such cable must be made up in pairs. The core should be twenty-four or twenty-six. The next item is—

50 tons hard drawn copper wire, at £70 per ton, £3,500.

I presume that Mr. Walker means to substitute that wire for the iron wire at present in use, because he has already 3,150 miles of wire. If the existing wires are suitable for present requirements, they will necessarily be suitable if a metallic circuit is adopted. I am quite willing to accept Mr. Walker's statement that a great deal of the present wire is in an unsatisfactory condition, and may require renewal; but I do not see that that meets the present case.

2176. *Mr. Black.*] How many miles of copper wire are there in 50 tons? That depends upon the thickness of the wire. If No. 12 wire were used, the weight would be about 170 lb. to the mile, or 14 miles to the ton. Therefore, in 50 tons there would be 700 miles. Mr. Walker puts down £5,000 for unforeseen expenses. Upon that item I have no opinion. He also puts down £20,000 for a complete metallic multiple switchboard for 3,500 numbers. If it were necessary to put in a new switchboard and abandon the present one it would cost approximately that amount; but, speaking as an engineer, I say that it would not be a difficult matter—it would not be a matter that has not been done before, or that presents any great difficulty—to convert the present switchboard for use with a metallic circuit. The arrangement would involve a certain amount of complication and delay and interruption to traffic, but I am certain that the switchboard could be converted, and at a relatively small cost.

2177. *Chairman.*] The present switchboard can be converted, and, therefore, no new switchboard will be required? No; no new switchboard will be required.

2178. How would they work the telephone system during the conversion? The conversion would involve a certain amount of interruption, but under any circumstances, with a big system like ours, a certain amount of interruption would be inevitable. Further on in his statement Mr. Walker says:—

It is asserted by Mr. Deane that the alterations can be made for a metallic circuit for £50,000; this I entirely disagree with, because in the first place it will cost £20,000 for a multiple metallic switchboard, and if Mr. Deane can provide for the whole of the telephone, city and suburbs, now extant for the balance (£30,000) of his estimate, all I can say is that he would accomplish a feat unparalleled in the history of engineering.

Mr. Deane will only accomplish what has been done in a great many places. The conversion of the system in London did not cost more than £200,000.

2179. Has the conversion been made in London? Yes; the work was started about the end of 1893 and has been gone on with gradually ever since.

2180. *Mr. Humphery.*] By the National Telephone Company? Yes; up to the end of 1894 it had cost £100,000, and the whole work was estimated to cost £200,000.

2181. *Mr. Hassall.*] What are you doing now? I am a consulting electrical engineer on my own account entirely.

2182. Why did you desire to come here and give evidence? I saw Mr. Walker's statement, and I afterwards met Mr. Ewing and discussed the matter with him.

2183. You first say that Mr. Walker's evidence is in the main correct, and then you discuss it and say that you cannot understand it? I cannot understand his second statement. When I say that Mr. Walker's evidence is correct, I mean that it is correct in the main contention that the construction of the proposed electric tramway will involve the use of metallic circuits. On that point I fully agree with Mr. Walker.

2184. You agree with Mr. Walker that the overhead trolly system will to a great extent interfere with the telephone system? I do.

2185. And that some steps will have to be taken to obviate the difficulty? I do.

2186. What steps? I consider that the complete alteration of the telephone system from an earth return system to a metallic return system is necessary. Such a system is not only the most efficient but the only system by which the difficulty can be completely counteracted.

2187. But you doubt if such an alteration will remove all objections? If the metallic system is only partially adopted, the result may be unsatisfactory, but with the adoption of a complete system there could be no further difficulty.

2188. You say that the Telephone Department has had the question of metallic circuits under its notice, but has not operated on it yet? It may have adopted the system in one or two isolated cases, but I believe not.

2189. You say that metallic circuits are invariably adopted where subways are used? Yes.

2190. And that in using subways here we shall have to adopt them? Quite so.

2191. If the electric tramway is constructed the Department must of necessity adopt the system? Yes.

2192. Will its adoption necessitate a very large expenditure? Yes.

2193. But you challenge Mr. Walker's estimate of the cost? Yes.

2194. Do you think that he is not in a position to make a fairly correct estimate, considering the experience that he has had in the Department? It is hardly a fair question to ask me my opinion of Mr. Walker's abilities.

2195. It is startling to me to hear that you can get telegraph poles 25 ft. high delivered in Sydney for 7s. 6d., and erected for £1 each? I speak from personal knowledge.

2196. *Chairman.*] Can you satisfy the Committee upon the point? I can lay before the Committee a tender in which that price is offered.

2197. *Mr. Hassall.*] Have you had any experience of electric tramways? Yes; in England and in the United States.

2198. In what part of the United States? In the States there is practically only one system in use, and it is that system which it is proposed to adopt here. Cincinnati was the only city which at the time of my visit to America had any other system. The system proposed to be used here is practically universal in the United States, and may be described as an American system. It originated in the United States.

2199. Are you not aware that there are three systems in use in the United States to a fairly large extent? No.

J. O. Callender, Esq.

16 April, 1896.

2200. The overhead system, the accumulator system, and the conduit system? I know that there are many places where the conduit system has been tried. Such a tramway is being worked in Washington, and in a small way in Chicago; but in neither place can the system be pronounced a perfect success.
2201. Do you know any place where such a system can be pronounced successful; Yes; but only one—Buda-Pesth. There they have a conduit system over 3 miles in length which has been entirely successful. It involved a heavy outlay of capital at the start, and the conduit, instead of being in the middle of the track, where it is usually placed in cable systems, is under a side rail, with two conductors passing inside it and a collector.
2202. The main objection to that system is the expense of constructing the line? That is the first objection; but the main objection is the difficulty of drainage. The conditions at Buda-Pesth are favourable.
2203. Would they be more favourable there than here? I think that here they would be very unfavourable. The rainfall in Sydney is very heavy while it lasts, and there would be great difficulty in designing a mode of draining the conduit whereby rain water could be carried off before it reached the electric wires. I have seen the Ocean-street tramway conduit full and overflowing. I have seen that in King-street where the roadway dips, and just beyond the terminus at Ocean-street at the top of the hill. The wash of mud and water coming down Ocean-street completely filled the conduit.
2204. Have you had any experience of the accumulator system? Yes.
2205. Are there any strong objections to that system? I have been an advocate of accumulator traction to a certain extent; but in a busy town where the traffic is heavy the cost per mile is so great as to make it almost prohibitive. The accumulator system will run satisfactorily and give excellent results; but at a cost certainly 50 per cent. higher than that of the trolly car system.
2206. But there would be no interference with the telephones? That is so.
2207. Then the question arises whether it would be well to adopt the accumulator system in order to avoid the expense of altering the telephone system? I am not prepared to say that the first cost of the accumulator system would not very largely exceed the cost of an overhead trolly system, and that it would not exceed it by more than the cost of altering the telephone system. The cost of running the system per car mile, however, would greatly exceed the cost of running the overhead system.
2208. Can you give the Committee any idea as to the difference in cost between the cable and electric systems? Well, it depends so much upon the number of curves in the street.
2209. If the necessary space could be obtained for a power-house near the Railway Station, do you not think that the route of the proposed electric tramway would be a very good route for a cable tramway? Undoubtedly.
2210. Do you think that an electric tramway would be preferable to a cable tramway? Yes. I understand that this electric tramway is to form part of an electric system for the whole of Sydney.
2211. We do not know that. We are merely considering the advisableness of constructing a tramway from the Circular Quay to Harris-street? The route from the Circular Quay to the Railway Station would be a very favourable one for a cable tramway, because the traffic there is exceedingly heavy, and the street very straight. Along Harris-street, however, I think the traffic would be light, and in that case it might not pay to use the cable. A cable tramway can only pay where the population is dense and the traffic very heavy, the cars running at short intervals.
2212. Why is that? The initial expense of moving the cable forms such a large portion of the whole expense. As soon as a cable is moving, all the standing expenses are practically the same, whether there is one car being used or twenty.
2213. Cable tramways have been proved to be very successful where the traffic is heavy? Certainly.
2214. Do you think the cable system would possess any advantage over the electric system in George-street? No. On the other hand, I think that there would be certain disadvantages connected with it.
2215. Do you advocate the overhead system? Yes.
2216. Have you any knowledge of the compressed air system? I know the compressed air system only as a rival to electric systems. I have seen it in Paris, but I do not think that it is used to any large extent there, and I do not know any other places where it is used. It has been before the world for the last twenty years, and has made no headway. I know of no place in the United States or in England where it is used, and of no place in Europe except Paris. In Paris the trams are run partly by accumulators, partly by steam, and to a very large extent by horse traction. Judging from Mr. Selfe's evidence, the compressed air line has been extended since I saw it. I remember that the system was tried in Birmingham and abandoned.
2217. Do you know whether the system tried in Paris is successful? I know the Victor Popp system in Paris, but there the compressed air is used chiefly for motor purposes. I do know of it being used for traction purposes. The company has been extremely successful, and distributes compresed air just as the hydraulic company here distributes compressed water. In Paris they drive about 20,000 clocks by compressed air.
2218. Do you not think that the accumulator system might have been more in vogue in America if it had not been for the vested interests in the overhead system? I have no doubt that the vested interests in the overhead system have been detrimental to its success, but in England it has had a very fair trial. In Birmingham it has been tried on a large scale, and, I am sorry to add, with very unsatisfactory results.
2219. Was the system initiated in Birmingham by a company? Yes; by the Birmingham Tramways Company who control almost all the tramways in Birmingham. That company run part of their trams by horses, part by cable, and part by means of accumulators. They have made very strong efforts to introduce the overhead system, but the municipality will not allow them to erect the necessary poles.
2220. I presume that they wish to adopt the overhead system in order to obtain larger dividends? Undoubtedly.
2221. It was not that they had any objection to the accumulator system? I presume not, judging by the liberal treatment which they have given it. But the accumulator system involves the carriage of a large amount of dead weight. I gave the matter of accumulator traction very close attention about a year ago in connection with a proposal to run about twenty cars here.
2222. At that time the cost of material was very much higher than it is now? I do not think that the cost of the cells has been reduced by more than 5 per cent. since that time. Just before the time I am speaking of there was a reduction of about 15 per cent.

J. O. Callender, Esq.
16 April, 1896.

2223. But could not the system be adopted more cheaply now than it could have been three years ago? A little more cheaply; but while the cost of batteries might be a little less than it was, the cost of dynamos has increased 10 per cent. The whole of the English manufacturers have raised their prices 10 per cent.
2224. I understand that there has been a great reduction in the price of chloride cells, and that they are now constructed on a principle which makes them more lasting? I am not aware of that.
2225. *Mr. Fegan.*] Do you represent any company? No.
2226. I understand from you that the necessity of adopting the metallic return system was under the consideration of the Postal Department here in 1894;—have you any proof of that? In 1894 I was agent for the Callender Cable Company, and I was asked by Mr. Walker, who was then considering the question of metallic circuits, to obtain samples of the cable required for the purpose. Then, again, in 1893 and 1894 I was a member of the Postal Conference which sat in Sydney and Melbourne to draft rules and regulations for the erection of overhead wires, and when the question of metallic circuits came up, both Mr. Todd, of Adelaide, and Mr. Walker expressed themselves as convinced that it was only a question of a very short time when they must adopt metallic circuits.
2227. Do you know of any city in the world where, although they have no electric traction, they have altered their telephone system to the metallic return system? Well, I might instance London. There they have no electric railway except the South London line, which is underground. In connection with this matter, I would like to read to you the summary report of a Joint Committee of the House of Lords and the House of Commons which is contained in the *Electrician* of July 21, 1893.
2228. Strides have been made in the science of electricity since then? Undoubtedly.
2229. Up to that time there were very few electric trams in England? Practically none.
2230. Because they could not overcome the obstacles that then presented themselves? Their position with regard to any disturbance they might cause to telephone wires had not been defined, and they were uncertain what their liability was.
2231. Were there any scientific men on the Committee you speak of? No. But the Committee took the evidence of Sir Courtenay Boyle, K.C.B., Mr. Preece, Engineer-in-Chief and Electrician to the Post Office, Major Cardew, Electrical Adviser to the Board of Trade, and the Astronomer Royal. Counsel appeared before them on behalf of the National Telephone Company, the railway companies, various tramway companies, and the Postmaster-General was also represented, but not by counsel. The Committee agreed to the following resolutions in the nature of recommendations:—

1. The Committee, having regard to the evidence before them, are of opinion that it is not, in the present state of electrical science, to the interest of the public to insist upon electrical tramways using an insulated return conductor, and that such insistence would retard the development of electric traction.
2. The chief objections which have been urged before the Committee to an insulated return conductor are—first, the interference by leakage and induction with telephones; secondly, the interference by leakage and induction with railway signals; thirdly, the damage to systems of gas and water pipes by the action of leakage currents.
3. They are of opinion that the best known means of overcoming the first of these disturbances is by providing an insulated return conductor for the telephones, and they have the less hesitation in recommending this course, as the evidence shows that telephone construction is already tending in this direction, and that better results are secured to the public by the use of a twisted metallic circuit insulated entirely from the earth.
4. The second objection deserves serious consideration on account of the danger to the public; but the Committee are of opinion that the disturbance may be remedied at a comparatively small expense by the adoption of an insulated metallic return by the railway companies.
5. They consider that although electric tramways and electric railway companies should be allowed to use the wheels of carriages and the rails to complete the electric circuit, the currents should be produced and used in such a manner as to mitigate as far as is possible any injurious effect to telephone communication.
6. The Committee are of opinion that it is desirable in every way to facilitate the use of complete insulated metallic circuits for telephones, and for this end they recommend that statutory powers be granted enabling telephone undertakers to lay their wires underground.
7. The danger from fusion or electrolytic action appears to the Committee to have arisen from a faulty system of constructing electric tramways; and they are of opinion that it can be reduced by improved methods of construction so as to be practically negligible.
8. The Committee therefore recommend that the Board of Trade shall, in virtue of the powers to be conferred upon them by each Act or Order, make regulations to secure the best system of working electric tramways and railways, having regard to the expense involved in the carrying out of such regulations, and to the effect thereof upon the commercial prospects of the undertaking. The regulations to provide, *inter alia*:—
(*a*) That a return conductor, if in contact with the ground, shall be of such secretion and resistance as to have no difference of potential sufficient to set up injurious leakage currents in the earth.
(*b*) That, both with regard to the structure of the line and to the method of generation and use of the electrical current, everything shall be maintained up to the standard of the Board of Trade; but if the regulations are altered after the use of the electric power on the line has been sanctioned, the undertakers shall not be required to alter the structure or method of working the line to conform to the more recent regulations except for the public safety, or unless it shall be proved to the satisfaction of the Board of Trade that any system of metallic pipes or structures is being injured by the action of electricity escaping from the conductors, or for purposes other than public safety or injury to pipes or structures which the Board of Trade may think right, provided that the alterations do not in such last case cause substantial additional expenditure.
(*c*) That all such electrical tests shall be applied to the line by the undertakers as the Board of Trade may think necessary, and that a record of these tests shall be kept for the information of the Board of Trade.
(*d*) That the Board of Trade shall have all reasonable facilities for making any tests they may think necessary, in addition to those recorded by the undertakers, to enable them to ensure the maintenance of satisfactory conditions.
(9.) That the Committee regards with apprehension a large extension of the system of overhead wires in crowded centres.
(10.) It appears to the Committee to be just that undertakers proposing to use large currents should be required to give ample notice to those using small currents to enable them to protect themselves by insulation, and that with this view, and in reference to the clause agreed upon, a period of two years may fairly be allowed to telephone and telegraph companies from the date of passing any Act.

2232. You differ with Mr. Walker as to the cost of providing metallic circuits for the telephones;—you do not differ with him as to the necessity for the expenditure? No. There I probably go further than he does. I think that the metallic return system will be absolutely necessary, even if an electric tramway is not constructed; such a system becomes necessary directly you get a large number of telephones. It must be within the knowledge of gentlemen here that our telephone system has deteriorated during the last five years. The cross-talk has very much increased.
2233. Metallic circuits would remedy that? Certainly. There would then be no cross-talk.
2234. You say that the cost of providing metallic circuits would be about £30,000, while Mr. Walker says that it would be about £250,000;—that is an immense difference? It is; but in support of what

J. O. Callender, Esq. 16 April, 1896.

I have said may I quote from an article upon the National Telephone Co's. new exchange which appeared in the *Electrical Review* of the 23rd November, 1894:

The metropolitan system of the company consists of thirty exchanges, all joined together by junction wires to form one whole. Of these, ten exchanges are now working on the double-wire principle, and the remaining exchanges are being actively reconstructed and new and improved switchboards provided. It is expected that the whole metropolitan area, which covers upwards of 600 square miles, will, at a comparatively early date, be working on the metallic circuit principle, with new and most improved plant, and that when this work is completed London will be provided with a telephone system equal if not superior to that of any great city in the world. The cost to the company of this great work will probably be not far short of £200,000.

There they have thirty exchanges and close upon 20,000 subscribers.

2235. Do you know of any other cities which have changed their telephone system to the metallic circuit system? Yes; New York, Boston, and Chicago.

2236. Was that change brought about by the introduction of electric tramways? No. New York had no electric tramways when the change was made.

2237. Why did these cities adopt metallic circuits? In order to improve their telephone service. It was found practically impossible to continue working their large exchanges with it. I may add that an adjacent telegraph wire causes quite as serious a disturbance to a telephone wire as a tramway wire does.

2238. But the tramway wires do not interfere with the telegraph wires? No.

2239. *Chairman.*] Where telegraph and telephone wires run parallel, the interference of the telegraph wires with the telephone wires is very material? It is very serious indeed.

2240. Are not these wires running together in the streets now? Wherever they are running together the interruption is very serious.

2241. *Mr. Wright.*] Are they not running side by side now in every city in the world? No; they are not. I do not know where the telegraph lines are in Sydney; but if they are alongside the telephone wires, that helps to account for a good deal of the disturbance that now exists. In the city of London the telegraph wires are underground in iron-pipes, and the telephone wires run over the tops of the houses in all directions. I had occasion to speak to Hudson Bros., at Clyde, recently, but I could not get any communication at all owing to interruption by telegraph wires. I made inquiry about the matter, and they told me it was a constant thing. For a large part of the day the line is useless to them, because of the interruption caused by the telegraph wires.

2242. *Mr. Fegan.*] Have you with you the opinion of any scientists as to the necessity for metallic circuits? The matter has not been brought up since a conference which was held in England. I do not know whether the opinion of Mr. Edison will carry weight, but this is some evidence that he gave upon the question:—

In your opinion as an expert upon telephoning, is the grounded telephone the best system available to the telephone service, and if so, why, and if not, why? No; the best service is the metallic circuit method, not using the earth as a return; this prevents induction and interference of other wires, but is not universally used on account of the fact that the expense for wire is double, although it is used in Paris entirely.

Can the telephone hope to escape interference from natural or artificial electrical currents in the earth so long as it uses the grounded circuit? No; the telephone suffers more from its own self more than anything else I know of; what is said on one wire under certain conditions is heard on half a dozen other wires; the metallic circuit obviates this, and prevents what they call cross-talk.

2243. Do you mean that every complete telephonic service must have a metallic return? Yes.

2244. Do you think that Mr. Walker's evidence should deter us from recommending the electric tramway? I do not. I think that Mr. Walker has over-estimated the cost of altering the telephone system; but in any case the Telephone Department must adopt metallic circuits within a short time. By constructing conduits they have expressed their intention of doing so, because the subways will be useless if they do not adopt metallic circuits. The fact of their constructing subways shows that they have a *bona fide* intention to use metallic circuits, and that is further instanced by their purchasing cable of which only half the wires can be used with an ordinary system.

2245. Did you ever see a city of the magnitude of Sydney so poorly provided with means of transit? No.

2246. You think there is great necessity for providing better means of transit? Undoubtedly.

2247. In your opinion electric tramways are the best and most modern means of transit? Yes.

2248. And they are the most economical? Yes.

2249. The electric system is superior to the compressed-air system and to the cable, taking it as a whole? Yes.

2250. And of electric systems the overhead system is better than either the conduit or the accumulator system? Yes.

2251. In semi-tropical climates like this the conduit system becomes almost impossible? Purely from mechanical conditions; not from electrical conditions.

2252. In Buda Pesth the rain does not fall in torrents as it does here? No.

2253. *Mr. Wright.*] Have you been in Buda Pesth? No.

2254. Do you know its latitude? No.

2255. Do you know anything about its rainfall? I do not know what the yearly rainfall is there.

2256. Could you get a city more favourable for drainage than Sydney? I am not intimately acquainted with the drainage of Sydney.

2257. Is not Sydney naturally drained in almost every direction? Perhaps it is. I am strongly in favour of the conduit system if any means can be found of keeping the conduit clear from water.

2258. If a perfect system of drainage could be obtained, you think the conduit system would be the best? I think it is the ideal system.

2259. It is better than the overhead trolly system? Irrespective of the question of first cost, because the construction of the conduit is enormously expensive.

2260. Is not the expenditure reduced by using a conduit such as they have on the Ocean-street tramway? The conduit necessary would be similar to that on the Ocean-street tramway, and cost approximately the same.

2261. I understood you to say just now that poles 46 and 50 feet high could be obtained in Sydney for £1 each? No. I said that 25-ft. poles could be obtained at that price. I do not dispute Mr. Walker's estimate in regard to the price of 50-ft. poles.

2262. You are quite clear that you can have delivered in Sydney, dressed and charred, 25-ft. poles at 7s. 6d.? I am clear on the point.

2263. Have you ever bought them at that price? Yes; with a minimum of five inches diameter at the top.

J. O. Callender, Esq.
16 April, 1896.

2264. Am I right in saying that you estimate that 3,150 miles of wire would cost £31,000? Yes.
2265. How do you reconcile that with the statement that you are prepared to erect and find the wire at a little over £4 per mile? In the estimate of £4 a mile I have included the cost of additional poles should they be required.
2266. Then your first estimate was largely exaggerated? My estimate is an ample one to completely cover the cost. I said that £4 16s. is what the Telegraph Department pay per mile for the erection of telegraph lines, and I admitted that that cost would be increased in laying wires in the city.
2267. Will you kindly look at the evidence of Mr. W. E. I. Gaine, General Manager of the National Telephone Co., and of Mr. D. Sinclair, Engineer-in-Chief of that Company. Mr. Sinclair says that if they had to metallicise the 3,500 telephone wires in Liverpool the standards carrying the present wires would not be sufficient, and it would mean the sweeping down of the present system and the building up of a new system to carry twice as many wires? Mr. Sinclair's evidence was shown to be incorrect.
2268. Then he is not an authority? Yes. But he was a prejudiced party, and was making out as strong a case as he could for his company.
2269. Was Lord Kelvin a prejudiced party? No.
2270. You have said that telegraph wires create quite as much disturbance to telephone wires as electric tramway wires do; but this is Lord Kelvin's statement, that at Leeds "the disturbances were very severe, and the starting and the stopping of the tramcars could be heard perfectly. There was a humming sound, which he believed was due to the dynamo." The telegraph services in Sydney make no such disturbances as that? You might not be able to distinguish the telegraph disturbance, but I know that I have frequently had my conversation interrupted by telegraph disturbance.
2271. Do you insist that these representatives of the National Telephone Co. do not understand their profession, and that you do? Well, they were special pleaders.
2272. They were sworn witnesses? Well, subsequent facts have shown their evidence to be incorrect.
2273. At Liverpool have they now a metallic circuit? I believe so; but I am not in possession of definite information.
2274. Is there more than one telephone company in London? There is a new company which started out with metallic circuits.
2275. Has the National Telephone Co. converted its entire system? Yes.
2276. Is there not a Government system in London? The Government have their own private telephones, and have never used anything but metallic circuits.
2277. I understand that a metallic circuit gives perfect privacy? Yes.
2278. You say that the construction of tunnels by the Telegraph Department here is *prima facie* evidence that they intend to adopt metallic circuits. Will you adhere to that statement if Mr. Walker has distinctly sworn that he had no such intention? I say that the tunnels would be absolutely useless if there were no such intention, and I should say that it showed great incompetence on the part of Mr. Walker to have them constructed.
2279. But if Mr. Walker has sworn that would you believe him? I must accept his sworn statement.
2280. If he states that the wires are to be put in tunnels because the poles are at present overloaded, and that there is an increased demand for telephonic communication, would you believe his statement? I accept his statement.
2281. If he states that there is no difficulty about using these tunnels with an earth return system? Then I must dispute his opinion.
2282. *Chairman.*] You say that you cannot use a tunnel without adopting metallic circuits? I say that it is impossible to use underground wires to any large extent without adopting metallic circuits.
2283. *Mr. Wright.*] Did you investigate the accumulator system recently working in Sydney, at the instance of the Railway Commissioners? Yes; at that time I was agent for my company, and I also represented the Electrical Power Storage Co.
2284. Are you doing any work for the Railway Commissioners now, either as consulting engineer or as an agent? No. In no way of any kind.
2285. You are quite sure that this work can be carried out at a less cost than that estimated by Mr. Walker, and that it does not mean the abolition of the present system? Mr. Walker and myself are agreed as to the necessity of the alteration, but he says that it necessitates the abolition of the present system.
2286. Can you tell us what the copper wire would be used for? The only thing I can think of is for overhead wires to form a metallic return, but as Mr. Walker has provided for 3,150 miles of wire I cannot see what he wants it for.
2287. He says that the present wire is useless and will have to be thrown away, and he has therefore provided 3,150 miles of wire and will use the copper wire for the return? It is not necessary to use a different wire for the return.
2288. Here we have some very long circuits—to Ryde and Parramatta for instance? For long distances like that it may be necessary to use copper wire, but Mr. Walker has provided for 3,000 miles of it.
2289. Do you think that the item £5,000 for unforeseen expenses is unreasonable? Certainly not for a gross cost of £200,000. If the gross cost were about £40,000 it would be an undue proportion.
2290. You have had experience in the construction of electric wires? Yes, I have devoted the greater part of my time to the construction of overhead and underground wires. I was engaged in a cable factory making telegraph, telephone, and electric lighting wires.
2291. You are prepared to speak as a professional man on this subject? Yes. I am satisfied as to my capacity to speak.
2292. And you are satisfied that Mr. Walker's estimate is terribly excessive? Yes. The existing poles and wires could be used for all they are worth.
2293. You have said that irrespective of the construction of the electric tramway the telephone system of Sydney has now assumed such large proportions that a metallic return is necessary—that that has been the experience of all cities of a certain growth? Quite so.
2294. In a short time we shall be compelled to have the metallic system? Yes. Of course Mr. Walker may say that the present system is perfect.
2295. You do not? I have seen many worse systems, but this is not a perfect system; there are many interruptions which could be eliminated.

FRIDAY,

FRIDAY, 17 *APRIL*, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (Chairman).

The Hon. Frederick Thomas Humphery.	Charles Alfred Lee, Esq.
The Hon. Charles James Roberts, C.M.G.	John Lionel Fegan, Esq.
The Hon. William Joseph Trickett.	Thomas Henry Hassall, Esq.
Henry Clarke, Esq.	George Black, Esq.

Francis Augustus Wright, Esq.

The Committee further considered the proposed Electric Tramway from Circular Quay, Sydney, to the Redfern Railway Station; and also along Harris-street, to the intersection of John-street.

James Ormiston Callender, Esq., Consulting Electrical Engineer, sworn, and further examined:—

J. O. Callender, Esq. 17 April, 1896.

2296. *Mr. Roberts.*] Have you anything to add to your evidence of yesterday? Yes. I should like, if I may be allowed to do so, to put in a short statement in reply to the statement of cost furnished to the Committee by Mr. Walker yesterday. I should also like to read one or two original tenders in confirmation of the figures I stated yesterday, giving prices for the supply of poles. And first I should like to read the following extract from the *Government Gazette* of November, 1895:—

Tenders accepted—Rabone, Feez, & Co.

20 tons No. 12 galvanised iron wire	at	£12	15 10	per ton.
15,000 large insulators	at	0	0 6½	each.
15,000 small insulators with iron pin	at	0	0 7	each.

This is my estimate of the cost of duplicating the existing telephone wires—

3,150 miles No. 12—S.W.G. galvanised iron wire, weighing 150 lb. per mile = 211 tons, at £12 15s. 10d.	=	£2,699	0	10
Insulators averaging 50 per mile—				
157,500 insulators with pins at 7d.	=	5,010	8	4
Cross-arms 80,000 at 6d.	=	2,000	0	0
Labour—erecting wire, 3,150 miles at £2	=	6,250	0	0
Poles—Additional poles (erected)—				
500 50-foot poles in city at £10	=	5,000	0	0
2,000 35 ,, ,, ,, at £5	=	10,000	0	0
1,000 30 ,, ,, in suburbs.. at £2	=	2,000	0	0
		£32,959	9	2

I should also like to read the following letters:—

St. Mary's, 26 June, 1894.

We hereby agree to supply and deliver at Burwood Station 500 poles of the following dimensions, viz.:—30 feet long, 5 inches at top, and 25 feet long, 4 inches at top, to be of ironbark timber and subject to inspection, for the sum of—30 feet, 10s. per pole; 25 feet, 8s. per pole.

GARNER, TURNER, & Co.

H. H. Kingsbury & Co.,—

Dear Sirs, Mountain View, St. Mary's, 26 September, 1895.

I hereby propose to supply and erect all the poles required for the electric-light line from Clyde to Flemington in accordance with the specifications you supplied me with yesterday, and to complete the work to the satisfaction of the officer-in-charge at the following, viz., per pole—110 26-ft. I.B. poles 10 in. base 6 in., free of sap top, 15s., if three coats of paint 4s. extra, if sapwood to be removed throughout and pile to be dressed and painted, 35s.; 8 40-ft. I.B. poles (dressed), 114s.; struts at angles supplied and fitted, 5s. 6d., cross-arms, 6d.; running each No. 6 wire to support cable, 40s. per mile. The prices include supply of poles, struts, paint and painting, charring and tarring, fitting and erecting. All poles required of greater lengths, 6d. per foot run extra. Trusting that you may come out the successful tenderer.

Yours, &c.,
W. FLEMING.

H. H. Kingsbury & Co.—

Dear Sirs, Mountain View, St. Mary's, 26 September, 1895.

Yours to hand, *re* quote bush as well as dressed poles, also cross-arms. In reply to above, if ordinary bush poles of ironbark timber 26 ft. long, 10 in. base, and 6 in. small end, will be accepted for the work, I can supply you at 8s. each on rail, or delivered at Clyde, Auburn, and Flemington or Rookwood Railway Station at 9s. 6d. each. The 8 40-feets in the rough 1s. per foot run on trucks, or delivered at Flemington at 1s. 2d. per foot. I am sure you cannot get poles to pass inspection cheaper than above. You will notice that the prices submitted by me on the enclosed tender are for the whole of the work complete, except running cable, fitting lamps and hoodcaps, which will be extra. The whole of the work will not exceed, I should think, £160. This, of course, does not include material found by yourself and the Railway Commissioners.

Yours, &c.,
WM. FLEMING.

2297. *Mr. Lee.*] Are not 40-feet poles used by the Department? Forty-feet poles are used in the streets of the city, but not in the suburbs.

2298. Are poles as short as 40 feet ever used? Yes; I have seen poles which were certainly not more than 20 feet above the ground. In my estimate I have allowed for 50-feet poles in the city in some places, and for a number of 30-feet poles in other places, but in the suburban area I think a 25-feet pole would be high enough.

2299. *Mr. Wright.*] What is the length of pole now used? I am not prepared to make a definite statement on that subject, but I have seen a number of poles in the suburbs that are not more than 20 or 21 feet out of ground.

2300. What would be the difference in price between a 25-feet pole and a 30-feet pole? Five or 6s. The prices quoted in the second letter I quoted are very low. Mr. Fleming, I might mention, is now supplying the whole of the poles required for the electric-lighting contract at Flemington.

2301. *Mr. Roberts.*] Do you regard our telephone system as altogether unsatisfactory? I would not go to the length of saying that it is altogether unsatisfactory, but I think that it is capable of great improvements.

2302. I believe that Mr. Walker stated in evidence a few days ago that it would not be necessary to alter the present earth return system to a metallic circuit system for ten or fifteen years? I am perfectly certain that the present system will not be found satisfactory for so many years, and that within the next three or four years it is inevitable that it must be changed.

2303. To the metallic circuit system? Yes. When I say the change will be absolutely necessary within that time, I mean if you are going to maintain an efficient service.

J. O. Callender, Esq. 17 April, 1896.

2304. The subscribers would not submit to such an inefficient system as you think it must necessarily become, and the Department would be called upon to adopt metallic circuits even if we had no electric tramways? Yes.
2305. If the Government wish to give the subscribers what may be termed an efficient system the change should be made without delay? Certainly.
2306. You are certain that the change could be made at a cost not exceeding £40,000? Yes; assuming that Mr. Walker's figures as to the length of wire required are correct.
2307. Mr. Walker states that a new switchboard would cost £20,000, but you would retain the present switchboard;—have you any doubt as to the practicability of converting that switchboard? None whatever.
2308. Have you allowed for the cost of the work in your estimate? Yes; I have allowed £9,000, but I think that is more than the work would cost.
2309. You only contemplate such expenditure as would be absolutely necessary to bring about this conversion? Exactly.
2310. Mr Walker would commence *de novo*? Apparently he wishes to wipe out the present system entirely, and to start again from the beginning.
2311. Are you sure that the alteration could be completed within three years? I have no doubt that if I were given the opportunity I could complete it within two years. The duplication and alteration could be carried out with reasonable ease within that time. It would mean a good bit of work; but, if there was an earnest intention to get it done, two years would be long enough.
2312. How long has similar work taken in other cities? I am afraid that I could not supply you with that information.
2313. How do you arrive at the conclusion that it will take two years? There are 3,000 miles of wire to be erected, and in two years there are about 600 working days. That would leave 5 miles of wire to be erected each day, which would require only a very few men. There should be no difficulty in erecting 10 or 20 miles a day. Of course the arrangement of the work would require a certain amount of ingenuity to prevent disburbance; but the disturbance need not be very great, and when any particular section was finished alterations to correspond could be made at the switchboard.
2314. Would telephone communication be suspended during the alteration? It would be interfered with and disturbed, but not suspended.
2315. In your statement you confine yourself to a criticism of a statement put in by Mr. Walker? Yes. It appeared to me to contain the crucial point of the inquiry.
2316. Are you prepared to give an opinion upon the plans of the proposed tramway? I should be very pleased to give any information in my power in regard to it. With regard to the width of roadway, and so on, I do not think that my opinion is worth more than that of the ordinary citizen, but I can speak in regard to the electrical equipment.
2317. You have visited Chicago? Yes.
2318. Can you tell us what the cost per car-mile would be in a city like Chicago? No. When I was there the whole tramway system was in a state of conversion. They were converting cable trams to electric trams in some places, and in other places where they were running cable trams they had abolished the ordinary engines, and were moving the cable drums by means of electric motors. I have here a copy of a report by Mr. Walker, Mr. Smibert, of Melbourne, and Professor Brown, of New Zealand, on a proposed tramway for Dunedin, from which I should like to read the following extract:—

> We have already expressed the opinion that the proposed electric tramway would not, if proper precaution be taken, seriously affect the efficiency of the earth return telephone system, and it follows that we think it will be necessary to provide metallic circuits. Should this course under any circumstances become necessary, the wires could be placed either overhead or underground.

I was a member of a Committee of a Postal Conference which sat at Melbourne in 1894, and this document was laid upon the table for our information. It was in that way that it came under my notice.
2319. Are you in a position to give an opinion upon the estimate which appears on pages 5 and 6 of this evidence? I could give an opinion, but I do not think it would be worth much.
2320. I mean more particularly in regard to the electrical work? I have already carefully examined that estimate, and I think that the figures are very fair ones.
2321. *Chairman.*] You think that the estimate, apart from the permanent-way construction, is a very fair one? I think that the estimate of the cost of the electric equipment is very fair.
2322. *Mr. Roberts.*] Have you seen electric trams running in streets as narrow as George-street and where there is as large a traffic? I have seen them in streets nearly as narrow—in the town of Montreal, for instance.
2323. Do you think it would be wise to construct a tramway in such a crowded thoroughfare as George-street? Yes; and I am led to that opinion because of what I have seen of the tramway in Broadway, New York. There, if anything, the construction of a tramway has helped to improve the traffic. It divides the traffic into two lines instead of allowing it to wander all over the road.
2324. Have they a one-minute or a two-minutes service there? I could not say definitely, but I should not say that it was more than a one-minute service.
2325. If we had an electric tramway in George-street, with a one-minute or even with a two-minutes service, it would tend to diminish the traffic of the street? Yes; at any rate so far as 'buses and cabs are concerned. I should not think, however, that a one-minute service is likely to be required in the immediate future.
2326. A two-minutes service is contemplated;—that would sweep the street of passenger traffic? Yes, to a large extent.
2327. *Mr. Black.*] Is it a fact that, speaking broadly, telegraph wires are not affected by electric tram wires? They are not affected to anything like the same extent as telephone wires.
2328. That is because they carry a greater electric force than telephone wires carry? Speaking broadly, that is so.
2329. If it be true that the greater electric current affects the lesser, telegraph wires must exercise a prejudicial effect upon telephone wires? Yes.
2330. What is the difference in amperes between the force running on the telegraph wires, telephone wires, and electric-traction wires? Speaking broadly, the current for use on tramway wires may be measured in hundreds of amperes.

J. O. Callender, Esq. 17 April, 1896.

2331. An ampere being a unit of force? No, a unit of current. For telegraph work the current is a fraction of one ampere. It varies from one-tenth of an ampere to one ampere. For telephonic work it is measured by milliamperes, and is even less than that. Of course I am speaking on very broad lines.
2332. You would infer from Mr. Walker's estimate of cost that the telephone wires throughout the city are so bad as to require removal and replacing by new wires? Yes.
2333. If that is so, do you not think that it would be unfair to charge it as part of the cost of duplication? I do, decidedly.
2334. Would it be possible to do any of the work of alteration by night? I have not considered that view of the matter, but, speaking generally, I would say that it would not be advisable to do the work at night. I do not say that it could not be done at night.
2335. Supposing the present system of public lighting here were replaced by a system of electric lighting, would it affect the telephones? Not if the electric lighting system was properly designed. Electric light companies are prohibited from using earth returns.
2336. The disturbance to a telephone caused by an electric tram wire would much exceed any other form of disturbance? It depends upon conditions. I can conceive conditions under which the telegraphic disturbance might be quite as great; but, speaking broadly, the statement is correct.
2337. I suppose the circumstances you allude to include the propinquity of a large number of telegraph wires? Yes. Telegraph wires running parallel to telephone wires for any considerable distance affect the latter. The essential part of the disturbance by telegraph wires is caused by the parallel running of two separate wires. If the wires cross at right angles the disturbance is infinitesimal.
2338. I suppose that all great noises, though not after the same fashion, have a prejudicial effect upon the clear and effective use of the telephones? No. A pure noise does not affect the telephone, unless it is in actual proximity to the receiver.
2339. I meant a noise near either the transmitter or the receiver? A noise of that kind would affect the speaking only by overpowering the sound of the voice.
2340. Do not great vibrations have a prejudicial effect upon the receiver? An excessive vibration in a building might have a slight effect upon the telephone, though if it were a slow vibration it would probably improve the speaking. If it were a very rapid vibration it would probably cause a buzzing sound to be set up in the receiver, and would interfere with the speaking.
2341. Do you think that the construction of a city railway would cause such a vibration as would interfere with the transmission of telephone messages? You are not referring to an electric railway.
2342. No? I do not think it would interfere in the slightest degree.
2343. Neither by creating noise nor by creating vibration? I am certain that it would cause no interruption whatever due to vibration.
2344. Mr. W. H. Preece, Chief Engineer and Electrician to Her Majesty's General Post Office, has stated that among other disturbing things which interfere with the telephones of London are the Metropolitan and South London railways? The South London railway very seriously affects telephonic work in London.
2345. In what way? It is an electric railway.
2346. But why does Mr. Preece say that the Metropolitan railway interferes with the telephones? I can only assume that it is because of the large number of telegraph wires used in connection with the signalling. Mr. Preece went into the matter very thoroughly, however, and stated that he had traced a disturbance caused by the South London railway as far as Ipswich—a distance of about 60 miles.
2347. Could you, by adopting metallic circuits, so isolate an electric tramway that it would have no appreciable disturbing effect upon the telephones? Yes. If the tramway were constructed with a subterranean conduit, and two insulated conductors in the conduit, the disturbance to the telephone would be reduced to a minimum, and almost entirely abolished.
2348. That is the system in use in Buda Pesth? Yes.
2349. Could it be applied to the overhead system? It would be possible to apply it to the overhead system. It causes an extreme complication at points and junctions, and to my knowledge has only been used in one city in the world. It has not given such satisfactory results as to cause its adoption elsewhere.
2350. You think it would only be possible on a small line which had not many branches? Yes. At Cincinnati they have two overhead wires everywhere. That system has been in use for some years, but the experiment has not been repeated elsewhere, because it has not been found to have any compensating advantages.
2351. *Chairman.*] Except that the telephones require no protection? The telephone difficulty has been solved by the adoption of metallic circuits.
2352. *Mr. Black.*] Is the Cincinnati line run throughout on the span system? Entirely, I believe.
2353. Are there any branches on the Cincinnati line? Yes. It is a fairly extensive system.
2354. Did you say that it had proved a failure? No; but it has not proved so great a success as to induce other cities to adopt it.
2355. On the grounds of expense? Yes. It offers no appreciable advantages over the single trolly system.
2356. If it were decided not to construct an electric tramway in any part of the city or suburbs, would that, in your opinion, furnish sufficient reason for the continued use of an earth return telephone system? Emphatically not; though it might delay the alteration of the system.
2357. I suppose it would be fair to infer that the construction of an electric tramway in any part of the city or suburbs would interfere to an appreciable extent with the telephones? Yes.
2358. Are you in the habit of using the Sydney telephones? Yes.
2359. How does the Sydney telephone system compare in clearness of speaking and ease in sending and receiving messages with the systems in vogue in other places that you have visited? I have not been out of Sydney for three years; but in my opinion the service here is fairly rapid and quite up to the average as far as the attention of the operators is concerned. Connections are made quite as fast here as in other parts of the world; but the speaking is inferior to what it is in New York, though superior to what it was in London six years ago. Since that time, however, the London telephone system has been converted, and I have no recent acquaintance with it.
2360. It is fair to suppose that the London system has been very much improved by the adoption of metallic circuits? Yes.
2361. Do you think that if the Sydney telephones were much more indistinct anyone would use them? I do not know that I should; but I cannot answer for anyone else.

2362. The great increase in the number of telephones will make it necessary under any circumstances to attempt to improve the system in order to enable subscribers to get any advantage from it? Yes.
2363. You think that the adoption of metallic circuits is the only means of insuring privacy and secrecy together with clearness and distinctness? Yes.
2364. Even supposing Mr. Walker's figures are correct, do you not think that the cost of altering the system would be a fair charge upon those who use the telephones, because they would reap the benefit of any improvement? I do.
2365. Do you not think that it would be unfair to charge one branch of the Public Service with an expenditure incurred for the purpose of improving another branch? I think it would be very unfair to charge the travelling public, that is, practically the whole population of Sydney, with the cost of improving the telephone system, merely to benefit 2,000 or 3,000 subscribers.
2366. Is it not your opinion that in narrow roadways a rigid system compelling traffic to keep in a straight line is better than a system under which the traffic is almost entirely uncontrolled? Yes.
2367. Having seen various systems of electric traction in use, which do you prefer? That is a very broad question. If matters of cost were of no consideration, and if it were possible to adopt a perfect system of drainage, I should prefer the conduit system; but the cost of that system is very large, and it is extremely difficult to provide satisfactory drainage. I consider the conduit system the ideal system.
2368. Cost being a consideration, which system do you prefer? The overhead trolly system, using an uninsulated return.
2369. If metallic circuits were adopted in connection with the telephone system, would it be necessary to use return wires on the electric tramways? Insulated return wires.
2370. Yes? No. The main return would travel by means of the rails, they being bonded; but it is often found advisable to assist the rails by laying bare copper wire alongside them.
2371. Do you think that the bonding of the rails would be sufficient to provide a proper return? Yes; on a short line.
2372. But on a long line? No; because the cross sectional area of the rails would not be sufficiently large to carry the current back through the generators without considerable loss.
2373. In such cases you assist the rails by using copper wire? Yes.
2374. Where is that run? In some cases it is run overhead, in other cases between the rails underground, and in other cases under the footpaths. Of course the term "short distance" is a relative one. By it I mean one or two miles.
2375. The application of the metallic return system to the telephone system would be more expensive, would it not, than its application to the electric tramway system? Do you mean on the line under consideration, without regard to future lines.
2376. Yes? I should not like to say definitely.
2377. In England the tramway companies said that it would cost them a great deal to protect their system, but it would not cost the telephone people so much? No doubt with a complete system of electric tramways here it would cost more to protect the tramways than to protect the telephones; but I cannot say off-hand whether it would cost more to protect the George-street line than to protect the telephones.
2378. Are you inclined to believe that public safety and convenience demand some more scientific method of conveyance than we have at present? I think so.
2379. Having in view all the circumstances of the case, you would recommend an electric overhead tramway? I would.
2380. Is it your opinion that probable interference with the telephone system should not bar its construction? It is.
2381. One reason being that the adoption of metallic circuits is necessary to provide proper telephonic communication? Without the slightest doubt.
2382. Whether electric trams be constructed in Sydney or not, the growing indistinctness of telephonic communications here will in a few years call for an improvement by the adoption of metallic circuits? Yes.
2383. If an electric tramway should prove a success in George-street, is there anything to bar the extension of the system to other parts of the city? Nothing whatever.
2384. *Mr. Trickett.*] Do you agree with the expression of opinion contained in question and answer 1223? The ordinary telegraph wires are not affected by tram wires, but wires used for railway signalling have been affected by them.
2385. Then look at questions 1225–1229. From that evidence one would infer that, with perfect bonding of the tram lines, the chance of interfering with the telephones is eliminated; do you agree with that opinion? I do not.
2386. And your view is endorsed by eminent authorities in the old world? Yes.
2387. The following is a letter sent to the Committee the day before yesterday:—

> The Commissioners desire me to inform you that no interference with the telegraph or telephone wires can occur except as a result of imperfect construction or maintenance of the electrical portion of the tramway plant.

Do you agree with that? I do not.
2388. You entirely disagree with the opinion that the proper construction of the tramway plant will prevent interference with telephone wires? Yes.
2389. You said that the alteration of the telephone system will mean delay and interruption; will you explain that statement? It would be impossible to convert a large telephone system such as we have here without causing a certain amount of interruption to the daily business. It would be impossible to disconnect the earth connections and replace them with metallic circuits without interfering with the ordinary business of the Department, but I have no doubt that these interruptions would be reduced to a minimum.
2390. Would it be possible to work the system while the alteration is going on? Yes.
2391. Do you think that the opinion of Messrs. Gaine and Sinclair that it would be impossible to work the two systems together is erroneous? Instances of such working were given in the evidence taken before the Royal Commission which sat in London, and Mr. Walker has himself given such instances. He has pointed out the undesirableness of the arrangement, but he shows that it can be done. I agree with him as to the undesirableness of it, but, as part of a transition stage, there is not the same objections as if it were a permanent system.

J. O. Callender, Esq. 17 April, 1896.

2392. I would point out that in the extract you read from a report upon the Dunedin tramways Mr. Walker points out that any inconvenience could be avoided by the adoption of "proper precautions;"—might he not have had in his mind the adoption of metallic circuits? He does not indicate that he had any such thing in his thoughts. Besides, the adoption of metallic returns is a radical alteration, and I take it that Mr. Walker in using the words "proper precautions" was referring to the tramways.
2393. You do not infer that he intended the adoption of metallic returns? No. I had an opportunity of discussing the matter with Mr. Walker subsequent to his visit to New Zealand, but he did not raise the point at all.
2394. You have seen the report of the Commission consisting of Members of the House of Lords and the House of Commons which went into this question? Yes. I received the official report from Major Cardew immediately it was published.
2395. You endorse the opinion that metallic circuits are necessary to effectually prevent interference with telephone wires? Yes, to the fullest extent.
2396. Is the Military Road tramway a fair sample of a successful electric tramway? Well, that tramway has no engines of its own, the generators being driven by the cable engines. They are simply an adjunct to the cable engines, and under such circumstances there is hardly the same opportunity of obtaining economical results as if separate engines were used. Then, too, the overhead construction is by no means of the most modern type. The poles are ordinary bush poles, roughly dressed, to which brackets are affixed supporting the wires. The electrical part of the cars, however, may be taken as representing good modern practice. They have abandoned the electrical arrangement brought out for the Waverley line, and are using appliances of the most recent type. The electrical equipment of the cars may be taken as up to date, but the overhead-wire arrangements are not.
2397. *Mr. Wright.*] Would the use of wooden poles affect the current? I think not. At any rate not materially.
2398. *Mr. Trickett.*] There is no return circuit there? The rails form the return circuit.
2399. Are they bonded? I think not. They were not bonded originally, but they may have been bonded since. The permanent way was put down before an electric tramway was thought of, and I believe they avoided digging up the road and bonding the rails, for the sake of economy.
2400. You will not be surprised to hear in any case that there have been frequent complaints from the people at Manly Beach that the electric tram seriously disturbs their telephones? I should not, because I know that to be the case.
2401. Do you agree with Lord Kelvin's evidence on this point as it is quoted in the Appendix to Mr. Walker's statement? Yes.
2402. Have you seen flashes on the North Shore tramway at night? Yes.
2403. Do you agree with the opinion given in answer to Question 1330? No, I do not. I have had occasion to speak about the disturbance caused by this tramway myself.
2404. Have you been in Hobart recently? No.
2405. Are you aware that there they had the cross wires of the electric tramway attached to the same poles as the telegraph and telephone wires, but that they had to remove them because of the disturbance caused to the telephone wires? Yes. The matter was brought up at the Melbourne Conference by the Superintendent of Telegraphs from Tasmania, and he appended to the report of a Committee of the Conference a special statement in regard to the matter.
2406. The statement that tram wires have been put upon the same poles as telegraph and telephone wires, and that there has been no objection to the arrangement, is not correct? It is not, unless the telephone wires had metallic circuits.
2407. When were you last in America? About three and a half years ago.
2408. Had the question of interference with telephone wires by electric tram wires cropped up then? Yes.
2409. Was it agitating the public mind to any extent? No; but before the electric tram companies had carried out very much construction the telephone companies adopted metallic circuits. Although there were, and are still, a few companies using earth returns, the telephone companies generally have admitted the necessity for metallic circuits, and have adopted them without pressure.
2410. Your scientific opinion is that the only effectual way to prevent the electric tram wires from interfering with the electric telephone wires is to use metallic circuits for the telephone wires? Yes.
2411. *Mr. Humphery.*] Did you say that in Liverpool they have metallic circuits? No. I said that I had no information upon the point.
2412. You cannot say that the telephones in Liverpool are not working satisfactorily with earth returns? I cannot.
2413. If they are working satisfactorily is there any reason for disputing Mr. Walker's statement that our telephones will continue to work satisfactorily with earth returns if no electric tramways are constructed? If evidence can be brought to prove that the Liverpool telephones are working satisfactorily, on the earth return system, there is no reason to doubt that such an experience can be repeated.
2414. Are you prepared to express an opinion with regard to the matter? I do not believe that the telephones in Liverpool can be working satisfactorily on an earth return system if the number of subscribers is 3,500. The only matter I can speak of from my personal knowledge is that three years ago the speaking was distinctly inferior to what it is in Sydney.
2415. You said yesterday that up to 1894 600 square miles of telephones had been altered to the metallic return system;—would those be the National Telephone Company's wires referred to by Mr. Walker as being six times the length of the Post Office wires? I think that is probable.
2416. Are you aware that it is stated in the papers handed in by Mr. Walker that it would occupy several years to convert the lines of the National Telephone Company in London to the metallic circuit system? Yes.
2417. Then are you prepared to affirm that metallic circuits for all the wires were adopted by the National Telephone Company by the end of 1894? No. I stated that in 1894 the cost of converting the whole of the wires was estimated at £200,000. The work was at that time in progress.
2418. Can you say what progress has been made with it? No.
2419. Then Mr. Walker may be correct in the statement that the greater number of the London telephones have an earth return? Speaking of London, most of the wires to my personal knowledge have now metallic circuits.
2420. When did you leave London? About three years ago.

J. O. Callender, Esq. 17 April, 1896.

2421. At that time had the conversion been made? Yes, with regard to a great many of the wires; and the conversion of the rest was being pushed on with rapidly.
2422. That would be prior to the report of the Joint Committee of the House of Lords and the House of Commons? The report of the Joint Committee of the House of Lords and the House of Commons was made subsequent to that. It was stated before that Committee that £100,000 had already been spent by the National Telephone Co. in converting their wires. This is the evidence of Mr. W. E. L. Gaine on 20th June, 1893:—

In answer to Mr. Cripps, Q.C., who cross-examined on behalf of the electric traction interest, witness said Newcastle and Hull were examples of exchanges on metallic circuits. In those cases they charged a rent of £10 per annum to subscribers. In Liverpool also the rent was £10.

When you were working London on the earth system, what was the rental? £17 upon a five years' contract, and £20 on one year's contract.

Then you have not charged more where you have the metallic circuit return than where you have an earth circuit return? That is so.

Suppose in any district you had electric traction without perfect insulation, would not you say that a metallic circuit would be the best, and perhaps the only complete protection of the telephone? I should say complete protection would be afforded by perfect insulation of the traction. He had no hesitation in saying that if all their system were put on to metallic circuits, and there were no question of time, convenience, or cost, and that the reasonable precautions were taken by the tramway traction, probably there would be no disturbance. Asked if he thought there was any practicable method by which electric traction and telephones might be used in reasonable contiguity except by putting the telephones on the metallic circuits, witness said he would prefer that an electrician should answer that. In London the alterations had extended for practical purposes to the whole of the junction wire on the different exchanges, and some proportion of subscribers' wires had been replaced by cables; but a very considerable cost had yet to be met in the alteration of the switchboards. He could not give the cost up to the present time in really reliable figures, but he should think it was about £100,000.

2423. Was it Mr. Gaine who said that if the system were universally adopted the cost to the National Telephone Co. would be £2,000,000? Possibly.
2424. Can you explain the discrepancy? Well, the interests of the National Telephone Co. extend over the whole of England.
2425. The actual cost of conversion in London was £200,000, but the cost of converting the whole of the telephones throughout England might be, as stated by Mr. Gaine, £2,000,000? I do not understand how Mr. Gaine comes to that conclusion.
2426. But am I correct in quoting the statement as I have done? Yes; you have quoted it correctly, but I should like some further explanation of it.
2427. Can you tell us the number of telephones in London at the present time, approximately? Twenty thousand.
2428. If it cost £200,000 to provide metallic circuits for 20,000 telephones, we may infer that it would not cost anything like £215,000 to provide metallic circuits for the 2,050 telephones that would probably be affected by the George-street electric tram? I cannot conceive how it could.
2429. *Mr. Wright.*] I understand that you have had some experience in constructing the roadway for electric trams? I have never carried out any road construction, though I have been present on works carrying out electrical equipment when the road was being constructed by other contractors.
2430. The proposal before us is to lay the rails on solid concrete? It is the practice in England to do so. I recently received very full papers about the Dublin tramway, in which my attention was specially called to that fact.
2431. Do you think that £12,800 will pay for the electrical appliances requisite for the proposed tramway? I am quite satisfied that the machinery mentioned can be procured for the price stated in the estimate.

Alderman Charles Edward Jeanneret, sworn, and examined:—

Alderman C. E. Jeanneret. 17 April, 1896.

2432. *Chairman.*] You are an alderman of the City of Sydney? I am.
2433. You are acquainted with the proposal which this Committee is now considering? Yes.
2434. Can you inform us what the attitude of the Sydney Municipal Council is with regard to it? This particular proposal has received no consideration in the Municipal Council, either in full Council or in Committee. The matter was brought up by me as soon as it was decided by Parliament to make a reference to this Committee. I then said that it would be the duty of the Council to advocate the construction of the tramway, and an understanding was arrived at that a meeting should be held to discuss the matter when the thing was further advanced. Then, about a fortnight ago, after the close of a meeting at the Council, when many of the aldermen had left the room—including myself, Sir Wm. Manning, and others, who are strongly in favour of this scheme—the Mayor said, "I have received notice to attend and give evidence before the Public Works Committee with reference to the proposed electric tramway. I am very much opposed to it myself, because I consider that the system has been a failure wherever it has been tried. Is it your wish that I should give evidence?" Those present said, "Do as you like," and nothing more occurred. Yesterday the Mayor informed me, however, that in view of the importance of the question he would call a special meeting of the Council to consider it. I have been a member of the Council for ten years, and during nearly the whole of that time I have been agitating to get better means of communication to the city, and I have here a memorandum of what has been done by the Council in the matter. The Council have never lost sight of the desirableness of improving matters; but they have had no power to act, and the Government have been waiting for information from other parts of the world We felt, too, that any attempt to support private companies would be met with opposition by the Government, though draft Bills to enable companies to undertake the construction of cable and electric tramways have received the approval of the Council. These Bills, however, have come to nothing. This is a letter which I have received from the Town Clerk in regard to the action of the Council:—

Dear Sir,

I send you the enclosed particulars *re* the tramway proposals that have come under the Council's notice. The motions moved in Council have been principally in your name, and have been hampered by some amendment to postpone consideration.

Then follows this statement:—

Tramway Proposals.

December 18th, 1888.—G. Proudfoot made an offer of £3,000 per annum for privilege of constructing tramways in George-street from Circular Quay to Redfern. Reply:—Council had no power to accept.

March,

Alderman C. E. Jeanneret. 17 April, 1896.

March, 1889.—New South Wales Tramway Company's Bill considered, and clauses passed seriatim up to Schedule of Routes, then adjourned for three months. This company offered a proportion of profits after payment of interest upon capital.

April, 1889.—Council resolved to petition Parliament to empower the city and suburbs to lay down, or cause to be laid down, a system of tramways.

In October, 1889, Mr. Alderman Jeanneret moved that the Council approve the proposal of the Government to construct cable trams; consideration postponed.

November 7th, 1889.—Principle of the Sydney Tramway and Omnibus Company's Bill approved, subject to the details being considered in Committee. Council approved Bill finally in July, 1890.

May 6th, 1890.—G. Proudfoot increased his previous offer of £3,000 to £5,000.

May 27th, 1890.—David Proudfoot offered £30,000, and subsequently increased it to £60,000 per annum for the privilege of establishing an approved system of tramways. Council received the communication, but took no further action.

In January, 1892, Mr. Alderman Jeanneret moved a resolution urging speedy construction of tramways for the city and suburbs. The Council allowed the matter to stand over for future consideration.

The Government decided on the King to Ocean-street cable tram in 1892.

The Sydney Omnibus Company wished to construct a network of tramways in Sydney similar to that which they have in Melbourne, but the Council drove them so hard in the conditions that they imposed that they found they would not get very much out of it. The Council have all along been most desirous that the number of tramways in the City should be increased, and I believe that a tramway up George-street has for a long time found favour with them. The inhabitants of George-street, and I believe most of the aldermen, will support this proposal as strongly as they can, and more especially if arrangements can be come to with the Railway Commissioners whereby electric lights may be affixed to the tramway poles. Members of the Committee who have travelled know what an advantage it is to have lamps in the middle of the streets, and in point of fact we are about to place two lamps in the middle of George-street at the intersection of King-street—one opposite the Joint Stock Bank and the other opposite the English and Scottish Bank—the space between the tram lines being insufficient to enable us to place a lamp in the middle of the crossing.

2435. *Mr. Lee.*] An electric light on one of the proposed standards would be better than two gas lamps? Very much better. There are three great advantages obtained by having lamps down the middle of the street. By that arrangement one lamp serves the purpose of two, and throws the light under the awnings. At the present time in many places the pavements are in darkness because the existing lamps do not throw a light under the awnings. Then, again, such an arrangement will divide the traffic. Lastly, the lamp-posts will provide places of refuge for pedestrians crossing the thoroughfare when it is crowded with traffic.

2436. *Mr. Black.*] Do you know of any circumstances which would empower Mr. Ives to come here and speak on behalf of the City of Sydney in opposition to the proposed tramway? I do not understand that Mr. Ives did that.

2437. I do not say that he did; but do you know of any circumstances which would empower him to do it? No; there are no such circumstances.

2438. Are there any circumstances which would empower him to come and give evidence against the tramway on behalf of the City Council? I do not know who has communicated with Mr. Ives on the subject. I know that a deputation waited upon him to ask him to withdraw the opinion which he had expressed.

2439. So far from Mr. Ives being authorised to oppose the construction of this tramway, you know that he had an expression of opinion from the people of Sydney in favour of this construction? He had such an expression of opinion from a deputation.

2440. Had he at any time any authority to speak against the proposed tramway? Only his own opinion.

2441. He had no authority from the City Council? I have explained exactly what took place.

2442. Do you consider that he had authority? No. If I had been present and had heard Mr. Ives express an opinion against the construction of the proposed tramway I should have combated it instantly.

2443. Then he can have given no expression of opinion which would bind the aldermen? No. The aldermen did not give Mr. Ives any authority to express their opinion. I arranged with Mr. Ives yesterday to call a meeting on the subject, and I have no doubt that if the Railway Commissioners are willing to make some arrangement for electric lights in connection with the tramway, as I think they will, the majority of the aldermen will be in favour of its construction. There are, of course, certain conditions which we should like to make; for instance, the council would certainly object to the Commissioners making £10,000 a year profit out of the line, because they would consider that that profit was being made at the expense of the citizens.

TUESDAY, 21 *APRIL*, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (Chairman).

The Hon. Frederick Thomas Humphery.	Henry Clarke, Esq.
The Hon. John Davies, C.M.G.	Charles Alfred Lee, Esq.
The Hon. Charles James Roberts, C.M.G.	John Lionel Fegan, Esq.
The Hon. William Joseph Trickett.	Thomas Henry Hassall, Esq.

George Black, Esq.

The Committee further considered the proposed Electric Tramway from Circular Quay, Sydney, to the Redfern Railway Station; and also along Harris-street to the intersection of John-street.

Arthur Clement Frederick Webb, Esq., M.I.E.E., Consulting Electrical Engineer, sworn, and examined:—

A. C. F. Webb, Esq., M.I.E.E. 21 April, 1896.

2444. *Chairman.*] What are you? An electrical engineer.

2445. What experience have you had? About fifteen years.

2446. At what? At electrical engineering generally, including all branches, and I have also been a certain time in the telegraph service of this Colony.

2447. You feel yourself competent to express an opinion in regard to the estimates for a metallic circuit? Yes.

2448. Have you seen Mr. Walker's statement? Yes; I have it here before me—at least, an abstract of the details of cost.

2449.

A. C. F. Webb, Esq., M.I.E.E.
21 April, 1896.

2449. Have you considered them? Yes; I have considered them.
2450. Are you prepared to give us definite information in regard to them? Yes.
2451. *Mr. Fegan.*] You say that you have seen the evidence of Mr. Walker, more particularly in regard to the cost which he said would be entailed by the laying of a metallic circuit? Yes.
2452. He mentions £252,100; do you think that is accurate? It seems to me very excessive indeed.
2453. Have you any written statement which you wish to read? No; I have not. I had not time to prepare one.
2454. Take, for instance, the poles? I think the number of poles of the size mentioned is very excessive; but even assuming that that number of poles will be required, which I do not think would be necessary, the cost would not be anything like £10 apiece. £129,000 for poles alone is enormously in excess of what would be required.
2455. In your opinion, how much should that sum be reduced by? I think the first figure could be taken off easily, leaving £29,000. Of course I understand that the increased use of metallic circuits would not necessitate such an enormous number of extra poles. This calculation has apparently been based on the assumption that the number of poles in the city would have to be doubled, and that the existing poles would become valueless. £129,000 would very nearly cover the cost of that.
2456. Then there is that 3,150 miles of wire, including labour, erection, &c., £79,600—would you suggest a reduction in that? That certainly seems to me to be very much over-estimated.
2457. Have you any reasons for saying so? Yes, I have. A great deal of that would be for cable. I have reckoned up the cost, which is put down at a little over £20 per mile. The cost simply of bare wire would not come to half of that sum per mile. That is allowing nearly £20 per mile for wire, including labour and erection, and exclusive of poles. Laying perhaps one wire at a time, the cost might possibly come to that; but as the wires would be duplicated more or less all together—that is, the wires would be put up by the same gang of labourers, a number of wires being strung up at a time—that estimate can be reduced very much indeed. That may be taken to be Mr. Walker's estimate for putting up one single wire at a time, the duplication being with overhead wires, which would be very undesirable. The probability is that if the metallic circuit system were introduced, the majority of the wires would be put underground, and a very large number of them would be placed in the conduit that is being put down.
2458. And that would reduce considerably the number of poles estimated for? Very much indeed, because, of course, a very large number of lines could be taken along that conduit and removed from the overhead poles, and the labour of placing them in the subway would be infinitely less than that of placing them on the poles. Moreover, the cost would be largely reduced by using cables of twenty-five or fifty wires each, and the labour of placing in the conduit a cable of fifty or twenty-five wires is very little more than the labour of placing a single wire overhead. Therefore, the laying of the wires in the conduit will be very much less expensive than placing the wires on poles.
2459. So you would reduce that item by considerably over £50,000? Yes; that is, on the assumption that a great deal of that wiring would be placed underground. There would be no necessity to extend a subway of the present size throughout the whole district. Practically, the whole of the wires in London are underground. The system there adopted is simply that of cast-iron or wrought-iron pipes, as the case may be, laid under the footways, with a certain number of drawing-in boxes, and the wires are simply drawn into an ordinary iron pipe, which system has been found very efficient indeed. Of course, for a very large number of wires, especially wires used for electric lighting purposes, a conduit is necessary; but for the ordinary work of telegraphing, or telephoning, a conduit of that size is not by any means necessary, and a much cheaper system could be adopted.
2460. *Chairman.*] In your opinion is the present subway an extravagant thing, viewed simply as a carrier for telephones? Viewed simply as a carrier for telephones, I should say it is.
2461. Would they use it in London? In London simply an ordinary iron pipe is used.
2462. Therefore, such a subway would not have been built in London for telephones? Certainly not for telephones alone.
2463. *Mr. Fegan.*] They are massive pipes, are they not, in London, such as are used for water-pipes? An ordinary stand-pipe, usually of wrought or cast iron, of from 6 to 9 inches. There are no special details about it. The only point is, of course, that the pipes are so constructed and laid that water shall not get into them; or, if it does get in, that it shall drain away and not remain in them.
2464. Take the next item, "additional wiring required to provide for metallic circuits 100 miles, 25-core cable for repairs, emergencies, &c., £15,000"? I cannot understand altogether those two items being placed separately—I mean the item "3,150 miles of wire, including labour, erection, &c., £79,600," and then, additional wiring estimated to cost £15,000. Again, there is "50 tons hard drawn copper-wire at £70 per ton, £3,500." Those are the three separate items for wiring.
2465. Taking the whole estimate of £252,100, I understand that to be very excessive indeed, and you have given reasons why; there is another statement made by Mr. Deane, to the effect that £50,000 would cover all—do you think that is a near estimate? I should think that that was a very much nearer estimate than Mr. Walker's.
2466. I presume that you have gone into this question? Yes.
2467. Can you give us any estimates of your own? I have had but little time to go into the matter, but I have made rough estimates. Of course the matter depends rather on what the scheme is going to be; whether a majority of these wires are going to be left overhead and a complete metallic return erected, or whether they are all going underneath and metallic return cables are going to be used. Under the present system of using overhead wires, and using a very large number of the poles that are at present in use, and where there is a very large number of separate wires used in overhead cables, the cost should not much exceed £50,000, the rough estimate I have made, or, say, about £53,000.
2468. So that Mr. Deane's estimate is a fair estimate, considering all things? Yes; and the cost of placing the wires underground, considering that these alterations would be made, would not exceed that by a very large amount. There is another point I should like to draw the Committee's attention to. I am a telephone subscriber, and, of course, I appreciate the disturbances that are due to various inductive effects—cross-talking and telegraphic circuits, and so on—and there is no question that a complete metallic return is the proper system to have.
2469. And is necessary? Yes; for a complete system. This is shown by the fact that what are known as direct lines—that is, lines extending from one town to another, such as are used in England, all require to have a metallic circuit. Stockholm is generally considered to be the best telephone city in the world,

and

A. C. F. Webb, Esq., M.I.E.E. 21 April, 1896.

and there a complete metallic circuit is used throughout, and the English Post Office system started from the commencement with a metallic return, it being recognised that that gave the best service. It may not be the cheapest in the first instance, but it undoubtedly gives the best service.
2470. May I ask where you reside? At Edgecliffe.
2471. Therefore you are not near the North Shore tram? No, I am not.
2472. Yet I suppose you have to complain about the continual interference with the telephone wire? Yes, undoubtedly. Not, of course, so much there, but in speaking to other places—for instance, in speaking to some of the suburban lines. One I remember in particular was Hunter's Hill sub-exchange. In that case one could hear the telegraph instruments working, and an expert reader could read every message going through. Of course, there is unquestionably likely to be a certain amount of disturbance.
2473. The telegraph line does not interfere so much as the electric traction would? Well it is possible that it might do so quite as much, but certain precautions can be taken which will reduce perhaps the ordinary interference of the traction. The trouble is principally caused by irregularities of contact with the trolly.
2474. Would proper bonding get over that? That would overcome it to a certain extent. An electrical engineer, named Dr. Du Riche Preller, made some experiments, showing the difference in the disturbances on the telephone as caused by an ordinary trolly, such as is used at North Shore, and what is known as a sliding contact, somewhat after the type used in Hobart; and he showed that the sliding contact did not cause anything like the same amount of disturbance of the telephones as the trolly did, showing more particularly that it was due to the trolly not always keeping in contact with the wire. It is the variation of the electric motive force that causes the disturbances of the telephone.
2475. Then, your opinion is that with proper bonding, and with care in the construction of the tram-line, a great deal of the obstacles could be got over which are objected to in reference to electric traction? I certainly think so.
2476. I suppose you know that Mr. Walker strongly objects to this tram-line being constructed unless a metallic circuit is laid? No; I was not aware of that.
2477. Or, in other words, Mr. Walker points out that this line will not only materially interfere with, but also make the telephones almost useless, chiefly along the route in George-street, where the tramway is to be laid; and, according to your evidence, that can be got over by efficient bonding and care in the laying of the circuit? I do not say that that could be got over entirely. There will always be interference, but as doubtless you are aware, it has been held in the courts both in America and on the continent of Europe that the telephone authorities are to protect their own wires against the interference—that they have not the sole use of the earth as a return. I should also like to point out that the Telephone Department are now speaking of reducing fees on the 1st May, and I personally, as a telephone subscriber, would rather pay my present fee and have an efficient metallic circuit return than have a reduced fee. A very eminent authority on telephone work, Mr. A. R. Bennett, has stated, and has shown fairly conclusively by figures, that a double metallic circuit laid underground, with an exchange having as many as 1,000 subscribers, should be possible to be put down and maintained with a subscription of not more than £10 a year each. In Manchester the fee charged by the Mutual Telephone Company is only £5 a year, and they have a metallic circuit. Therefore, the cost should not be anything like so excessive as stated by Mr. Walker.
2478. The laying of a metallic circuit would get rid of all the interference that occurs at the present time? Yes; it is the only way of preventing outside interference altogether, and it should not only do away with the interference of the tramway, but also the cross talking, the interference of the telegraphs, and every other interference. Without it there might be interference with the electric light wires.
2479. Which very often interfere? Yes. I know that in connection with the railway telephone that comes by Penrith, when the electric light engine at Penrith is running, you cannot hear a word on that telephone; but if they used a metallic return, and the lines were laid close together, there should be no disturbance at all.
2480. You have seen the plans and also the proposals which are before the Committee in connection with the construction of this tram-line? No; I have not seen the plans. Of course I know the general proposals.
2481. I suppose you have had nothing to do with electric traction, so far as tram-lines are concerned? No.
2482. Were you employed in the Railway Department for some time? No.
2483. I thought you were the electrical engineer for the Railways and the Post Office for a considerable time? I was in the Post Office for three or four years as Mr. Cracknell's personal assistant and electrical adviser.
2484. You were not in the Railway Department then? No; but naturally, in common with other subjects, I have given this matter a great deal of attention.
2485. Have you seen any of the electric tram systems at work? Only here, principally, and the accumulator system that was put down at Sandhurst at one time.
2486. Was that successful? No; it had to be abandoned.
2487. On account of the expense, I suppose? Yes.
2488. I suppose that you have gone fully into the system of overhead-wires for electric traction? Yes.
2489. In your opinion, is that the best system that could be adopted? Certainly; I think it is the best system that could be adopted as an economical system. Of course an underground system—that is, with the wires underground—would be ideally very much better, but the mechanical difficulties in the way, more particularly in keeping the conductors free from leakage, are generally so great that up to the present it has been found very uneconomical.
2490. *Mr. Roberts.*] Do you think, irrespective of any proposal to construct an electric tramway, that the metallic circuit system should be at once introduced in connection with our telephone exchange? I think so, as soon as possible. It has undoubtedly proved itself to be the best system as regards subscribers.
2491. You regard the present system as unsatisfactory? I do. There are worse systems.
2492. I presume that you have considered Mr. Walker's report? I have only read a portion of his evidence, and what has appeared in the newspaper.
2493. You regard it as being really necessary that the metallic circuit system should be brought into operation? Distinctly so. 2494.

A. C. F. Webb, Esq., M.I.E.E. 21 April, 1896.

2494. More especially if this tramway be constructed? Yes.
2495. How soon do you think the metallic circuit system could be brought into operation? It could be done quickly at comparatively high expense, but to do the work economically it would perhaps take from one year and a half to two years. That, of course, would be doing it as economically as possible—using the present gangs of men employed by the Department. With special gangs it could be done in less time, but would cost more.
2496. I think you estimated that the work could be done for £53,000? I should say that it would take from one and a half to two years to do it under those circumstances; that is, of course, not counting the time that will have to elapse before getting the material here, but from the time the material was at hand.
2497. In your opinion, would a new switchboard be necessary in case we adopted the metallic circuit system? One of the advantages of what is known as the multiple switchboard, such as is used in the Post Office here, is that it can be converted, comparatively easily, to the metallic circuit system at a small amount of expense.
2498. I notice in Mr. Walker's estimate the item, "Complete metallic multiple switchboard for 3,500 numbers, £20,000";—may I ask, in the estimate you have prepared, how much you have allowed for alteration of the present switchboard? I allowed about £6,500 for conversion of the board and, practically, the exchange.
2499. You think that would answer all the purposes for some years to come? Oh, yes; I think that will quite do so.
2500. Are you acquainted at all with the erection of the metallic circuit system in London by the National Telephone Company? No.
2501. Can you give us any information as to cost? No.
2502. I think I am right in saying that that company put down a complete metallic circuit system? I remember an estimate being made in London, but I cannot remember at this moment what the figures were.
2503. I think I am right in saying that it was done over an area of 600 square miles for £200,000;—I thought that perhaps you could give us some information as to those figures? I remember a scheme being proposed, and an estimate being made about two years ago to cover the present system. It covered a number of sub-exchanges and a very large area in London, and, as far as I remember, the estimated cost was under £250,000.
2504. *Mr. Trickett.*] If it has been stated before this Committee that a return-circuit, from the wire which is to carry the electric power to drive the tramway, by means of the rails on which the tram is to be run being bonded closely together, would entirely do away with any interference with the telephone wires, do you agree with that proposition;—do you think that a return-circuit of that kind would effectually prevent the electric current on that driving-wire from interfering with the telephone wires? Not entirely.
2505. Would it remedy it sufficiently to prevent inconvenience to the public in the use of the telephone wires? I should think it doubtful.
2506. Would it remedy it as effectually as the metallic circuit of the telephone wires itself would? Certainly not.
2507. Then you do not agree with the proposition that I first stated—that that kind of circuit would effectually do away with the interference? No, certainly, it would not.
2508. Then I understand that you agree with Mr. Walker in his idea that the metallic circuit of the telephone wires is necessary for the perfect working of the telephone wires? Certainly.
2509. You only disagree with him with regard to the cost of carrying that out? Yes.
2510. *Mr. Clarke.*] Have you any idea how long it would take to bring this metallic circuit into operation? That would depend very largely on the amount of money allowed for it. It could be done very quickly at a greater cost, or it could be done, say, in one year and a half or two years at a comparatively small cost.
2511. But what arrangement could be made in the meantime to prevent interruption of the telephone wires, because we have evidence that it will be impossible for the telephone to work satisfactorily until we have a complete metallic circuit? That is so.
2512. Therefore I want to know whether you can give us any information as to what could be done in the meantime—during the completion of the erection of the metallic circuit? The only thing I would suggest would be that in the meantime, if the alteration cannot be effected by the time the tram will commence running, those wires which will be on the route of the tram should be attended to first.
2513. Would that obviate the difficulty of interruption of messages by telephone? That would obviate the difficulty with regard to those subscribers.
2514. I see in the evidence given before the Joint Committee of the House of Lords and the House of Commons in the matter of the National Telephone Co. *v.* the Leeds Tramway Co., that Mr. W. E. L. Gaine, general manager of the National Telephone Co. was asked:—

Supposing that electric traction of a similar character to that which is employed on the tramway at Leeds was sanctioned and used on the Liverpool tramways, would all these lines of wires be so disturbed that you would have to turn them into metallic circuits?

The answer to that was:—

Judging from the experience the company has at Leeds, undoubtedly that would be so. Those lines would be valueless for commercial purposes. I am particularly anxious to impress my views with regard to this on the Committee. Mr. Preece in his evidence yesterday was very strong. It appeared to me that the remedy of the Telephone Company was to duplicate their wires, but I doubt whether Mr. Preece or anybody else realised what that meant. This system has been built up for a number of years, and their 3,500 or 4,000 wires coming into the Liverpool Exchange had to come in all over the roofs for which switchboards, &c., had been put up. The great bulk of the switchboards of the country were single boards; it meant the taking out of those—an enormous work, and the re-erecting of the entire system; and he had no hesitation in saying that if the Leeds tramway were planted in the city of Liverpool to-morrow, Liverpool would be deprived of the telephone for at least five or six years. He would not undertake to re-duplicate the wires and re-arrange that system under that time.

2515. Do you agree with that witness as to the time it would take to complete this metallic circuit? Well, there is this to point out, too, that the board used there is of a different type from the board used here, which fact would necessitate a very great alteration in all the wires there. There is also the fact that there is about double the number of subscribers in Liverpool, which would necessarily increase the length of line, and probably make the distance it would go much greater.
2516. But are you aware that the population of Liverpool is about the same as that of the city of Sydney and suburbs? It is about the same, but the question is not so much one of population as the number of telephone subscribers.

A. C. F. Webb., Esq., M.I.E.E.

21 April, 1896.

2516½. Well, it says here, "3,500 or 4,000 wires"? That would mean about 4,000 subscribers, which would be very nearly double the number in Sydney.
2517. Do you believe in the overhead system of electric traction in preference to any other system? I believe in it as the most economical system at present. The mechanical difficulties with regard to the underground system are too much at present for us to overcome, more especially in regard to the question of water and drainage, which is the principal difficulty.
2518. I see from this report that Mr. D. Sinclair, engineer-in-chief of the National Telephone Co., was asked by Mr. Moulton if any change was ordered would it take any considerable time to make it, and the answer was—

> Taking the town of Liverpool, there were 3,500 telephone wires. If they had to metallicise those overhead, the standards which carry the present wires would not be sufficient, so that it would mean sweeping down the entire system and building up a new system to carry twice as many wires. Inasmuch as it is impossible to work an exchange partly on the single and partly on the double on any large scale, they would have to make the change all at once.

? I think that that statement is rather exaggerated.
2519. That is the evidence given, I believe, by a capable engineer, the same as the other was whose evidence I previously read;—you do not agree, then, with the evidence I have read? No; I do not agree with the statement that the whole of the system would have to be swept away.
2520. Well, according to what you have stated, you cannot give an answer to my previous question, as to how the present telephone system could be worked while these metallic circuits were being completed? I do not see any difficulty. In the first place I do not suppose that what interference there may be will be sufficient to entirely destroy communication, and in the second place it is quite feasible to utilise the circuits while conversion is going on.
2521. Well, we have it in evidence, I believe, from more than one witness who has been examined here, that it would be impossible to carry on the present telephonic system in Sydney and suburbs without having a complete metallic circuit? It would be impossible to carry it on satisfactorily. That is quite true.
2522. In that case, the public would be inconvenienced? The telephone-using public would—about 2,000 subscribers.
2523. *Mr. Lee.*] You substantiate the statements of previous electricians that the construction of this tramway in George-street will, unquestionably, materially disturb the telephonic system in Sydney and suburbs? Yes.
2524. You thoroughly endorse that? Yes.
2525. It would appear that the only way of obviating that difficulty would be by putting down what is known as a metallic return? Yes.
2526. Do you know of any other means by which this disturbance could be avoided? I do not know any other means by which all external disturbances could be prevented from occurring on the telephone wires.
2527. Are there any recent discoveries in the electrical world in the direction of dealing with this very serious difficulty, which not only crops up here, but must have made its appearance in every other part of the electrical world? The matter has cropped up frequently, and has been dealt with in the electrical papers, and the opinion is that metallic circuits are necessary independently of whether there is an electric tram or otherwise—that the metallic circuit system is the proper system to adopt in connection with the telephone system.
2528. In other words, if a perfect telephone system were laid in the first instance anywhere, then it would make possible the introduction of electric lighting, electric traction, or electricity in any other form, without interfering with that system—is that what you mean? Yes.
2529. You are of opinion then that a metallic circuit will have to be established in the city of Sydney, whether there is an electric tramway in the streets or not? Sooner or later, certainly.
2530. Is your reason for saying that, that the telephone system is so largely increasing, and that it has already reached such dimensions that it cannot be satisfactorily worked as an ordinary earth return? I think it reached that point some time ago.
2531. And, therefore, as it is likely to increase largely in the future, the time has arrived when a metallic circuit should be established altogether, irrespective of the construction of this electric tramway? Yes.
2532. You thoroughly agree with that? Yes. I thought that, before the question of an electric tramway down George-street came to my knowledge at all. It is borne in upon one every time one uses the telephone.
2533. Even supposing that this electric tramway is not constructed, and that there is no metallic return to the telephone wires, is it not quite within the range of possibility that the whole city may be lighted by electricity in a short time, which will necessitate a perfect net-work of wires throughout the city? Yes.
2534. Would that not be a very serious menace to the telephone system? It would probably be, very.
2535. Would not the introduction of the system of electric-lighting make it imperative to establish a metallic circuit for the telephone system? It would.
2536. Therefore, if we have to consider the question of traction at the present time, we must also consider the probability of the immediate introduction of a system of electric-lighting for the city? Yes.
2537. Which cannot be possible unless there is a telephone metallic circuit system? If an electric-lighting scheme, such as that suggested in a report to the City Council by Mr. E. C. Cracknell and Professor Threlfall, were brought into use at the present time without a metallic circuit, the telephones would probably be infinitely more interfered with than by an electric tramway in George-street.
2538. You are of opinion that the general lighting of the city of Sydney and suburbs with electricity would almost seriously interfere with the proper working of the telephones? I would not say that, entirely. It would depend very much on which system of electric-lighting was adopted. I should say that it might very seriously interfere, because in the scheme that was proposed—what is known as the alternating current—that is a system of currents alternating in direction—the alternating current would have a greater effect on the telephones than a direct current.
2539. The electric lighting wires are insulated are they not? Yes.
2540. But for all that there is a certain amount of leakage from them? There should not be.
2541. If the electric lighting wires were run conveniently to the telephone wires, would not the induction of electricity from the electric lighting wires to the telephone wires seriously interfere with the working of the telephone wires? It would distinctly do so. But what are termed "induction" and "leakage" are two very different things. The difference between the two things is this, that the wire may be perfectly

A. C. F. Webb, Esq., M.I.E.E. 21 April, 1896.

perfectly well insulated and there will be absolutely no leakage, whilst at the same time it has an inductive effect on any neighbouring wire. The insulation of the electric light wire may be as strong as you please, and it may be a considerable distance from the telephone wire; but still the effect on what we term "induction," which acts in the air space between, will act on that wire, no matter how strong the insulation, and will act through a considerable distance.

2542. Induction there will be, no matter how well the wire is insulated? Yes.

2543. Well, inasmuch as the electric lighting wire has to carry a much heavier charge of electricity than the telephone wire, the induction must be much greater? Distinctly so.

2544. Consequently the inference is that the telephone wires would be seriously interfered with? Yes; if the system of alternating currents, as proposed, were used.

2545. If the lighting of the city with electricity were undertaken it would be undertaken by the City Council, who would possibly by using that system render the Government telephone system inoperative without incurring any liability? They might easily.

2546. The question to consider at the present time is this: As that is a contingency that is likely to arise, and as electric traction will also interfere with the telephone system, in studying the question now of putting down electric traction in George-street, the matter of providing for a proper circuit for the telephone system must be considered? Yes.

2547. In your opinion the two questions are inseparable? Yes.

2548. And if the telephone system be now made perfect there will in future be no danger from any electric lighting or any other system that may be introduced;—is that your opinion? Yes.

2549. And, no matter what the cost may be, you think that so far as the systems are concerned, now is the time to consider both of them? Distinctly. I may add that at the time that report was prepared I was acting as Mr. Cracknell's assistant in drawing up the report. He considered at that time in conjunction with it the question of a metallic return, and he fully recognised, and often said so, that if that system were adopted, a metallic return to the telephones would also have to be adopted, and he quite contemplated then that the introduction of that system would hasten the adoption of a metallic return.

2550. *Mr. Humphery.*] When was the Sandhurst accumulator electric tramway abandoned? Very shortly after its inception. I think that it was put in in 1887 or 1888, and that it was abandoned about 1889.

2551. Do you know the reason for its abandonment? The reason was the very rapid depreciation of the accumulators themselves. They lasted such a small length of time that the expense of renewing them became prohibitive.

2552. Do you know whether it was properly constructed according to the knowledge possessed at that time? Yes, according to the knowledge possessed at that time.

2553. With regard to the electric lighting of the city—would the effect on the telephonic system be as disturbing as the effect of the electric tramway would be? It is quite possible that it might be infinitely more disturbing.

2554. In what way would it be more disturbing—because there would be the noise of the electric tramway? Well, that should not be heard in the telephone.

2555. Will you explain why the electric lighting of the city will cause a greater disturbance than the electric tram? The principal effect produced would be that of an induced current in the telephone.

2556. There would be a more powerful current travelling along the electric wire? The induced current would be in proportion to the pressure used, and the pressure used in the electric lighting system might be four times as much as that used in the tramway system, and what is known as the alternating current, which alternates in direction, would have a much greater effect on the telephone than a continuous or direct current, such as is used in the tramway system. Induction produced by a system of electric traction is principally due to the differences of electric motive force caused by small variations in the contact of the trolley or overhead conductor, and it might cause, perhaps, a variation of 200 units; but the variation caused by the high tension alternating system of supply might amount, perhaps, to 2,000. So the effect would be proportionately greater on the telephone.

2557. Are we to understand that if the electric lighting wires were carried along George-street, or parallel to George-street, the effect on the telephones would be as great as the electric tram would be? I say it might be very much greater.

2558. With regard to the overhead-trolly system, I suppose it is cheaper to construct than any other system of electric traction that you are aware of? Yes; distinctly.

2559. And is it simpler, both mechanically and electrically? Yes; it is simpler in working.

2560. And its service is equal to the service of the accumulator or conduit system? There is this difference, of course, that whereas under the accumulator system each tram is distinct in itself, under the cable, underground, or overhead electric system. the trams are all more or less dependent on one conductor and a breakdown of that would, perhaps, cause a stoppage of the whole service. That is the main difference between the systems. Otherwise the service, of course, has been proved in a number of cases to be equal to all requirements. In the oft-quoted city of Boston there are 1,000 electric cars running daily, and in a number of cities cable and other systems of tramway have been taken up, and the electric put in; the alteration being based on the experience obtained in other places.

2561. And, as a matter of fact, it has been ascertained that the cost of operating the overhead-trolly system is less than that of any other known system of electric traction? Yes.

Thomas Raw, Esq., Engineer, Government Architect's Branch, Department of Public Works, sworn, and examined:—

T. Raw, Esq. 21 April, 1896.

2562. *Chairman.*] What are you? An engineer.

2563. Where are you employed at present? In the Government Architect's Department.

2564. You deal with all the electrical work there? Yes; all the electric lighting and hydraulic work.

2565. What has been your previous experience? I was trained in the Consett Steel Works for seven years, and also in England, under Sir Wm. Armstrong's chief draftsman, and I was surveying twelve months in this colony on contract work; I have been eleven years in the Government Architect's Office.

2566. Are you competent to express an opinion in regard to any electrical question? I believe so. I have made a pretty good study of the subject. I was connected with what was, up to that date, one of the largest installations ever carried out by the Brush Co.; I was specially told off to watch it narrowly and to become thoroughly *au fait* with the matter so as to take charge of it eventually, and since then I have kept myself thoroughly up to date in all electrical matters.

2567.

T. Raw, Esq. 21 April, 1896.

2567. *Mr. Roberts.*] You know that it is contemplated to construct an electric tramway along George-street, and thence along Harris-street? Yes.
2568. You are acquainted with what is known as the overhead trolly system? Yes.
2569. Do you approve of that system for adoption on the proposed line? Yes, certainly. I see no objection to the overhead system. It is the cheapest to put up, in the first place, and the easiest to maintain afterwards—not necessarily more economical, but you can always see it and get at it.
2570. Do you think that the adoption of that system would interfere with the working of the telephone wires along the route? With a proper metallic return for the tram, it would not, or, at any rate, it would be so infinitesimal as to be almost inappreciable. You could scarcely discern it, notwithstanding that the telephone is the most sensitive instrument that has been invented or devised up to the present time.
2571. Have you seen Mr. Walker's statement? I do not think I have seen it.
2572. He said that it would be absolutely necessary to introduce what is known as the metallic circuit system if this overhead trolly system for the electric tramway were adopted;—do you agree with him that it would be absolutely necessary to have a metallic circuit? I do not agree with him that it would be absolutely necessary so far as the tram is concerned, but it is advisable in the interests of subscribers to the telephone, which is unsatisfactory at present. It is necessary to have a metallic return to prevent cross-talking and overhearing each other's remarks, but not on account of the tram. There are plenty of instances I could quote where they are using the telephone with the ordinary earth return, and by putting in good bonding and a good return conductor for the rails, no inconvenience whatever has been caused to those using the telephone. Neither have the subscribers complained, nor could anyone discern any disturbance, or certainly not more than the telegraphs cause at the present time.
2573. Then you do not think it absolutely necessary that a metallic circuit should be adopted? It is advisable, apart from the tramway altogether. It is not necessary on account of the tram—that is, if you have a good metallic conductor between the rails.
2574. I think I heard you say just now that you regarded the present telephone system as being unsatisfactory? Any telephone system with an ordinary earth return is bound to be unsatisfactory.
2575. Do you think that the time has arrived in Sydney when the metallic circuit system should be introduced in lieu of the earth system? Certainly. They are doing it in London, where they have no electric trams that I am aware of, and they have done it in New York, apart altogether from the electric trams.
2576. We will assume that the electric lighting were introduced—do you think that that would make it still more necessary for the numerous wires that would have to be laid down? I do not think that would have much to do with it, because electric lighting systems are provided with a properly-insulated metallic return. Interference can only be by induction, and that can only take place where the pressure is constantly varying, and in ordinary electric lighting work it is not constantly varying. For electric traction it is quite different. The current is either full on or full off, and that is the cause of induction in the telephone wires.
2577. So, if we introduce electric traction, you think it would be absolutely necessary to have a metallic circuit? For the tram, but not necessarily for the telephone. I do not think it would interfere to an appreciable extent, provided the telephone wires were 30 feet or 40 feet away.
2578. Are you not aware that there are great complaints at North Shore on account of the electric tramways there interfering with the working of the telephone? Yes. There have been great complaints, but, of course, that tramway was not laid down as I hope this one will be. In the first place, it was not laid down as an electric tramway, and in the second place the bonding was not made perfect then, although it may have been made so since, and the telephone wires were abnormally close to the tram-wire. Induction must take place if it is only a few feet away, but if it is 50 feet away I do not think anything could be noticed.
2579. Do you think that under the present earth system those complaints ought not to arise? I do not think that any ordinary subscriber would notice any more interference than he notices at the present time—that is, provided the tram is laid, as I am pretty sure it will be, properly, and with an efficient return. I understand there is to be an efficient return laid between the rails; if so, there need be no apprehension.
2580. Then, am I right in understanding that, irrespective of any electric traction or electric lighting, you think the time has arrived when a metallic circuit system should be introduced in connection with the telephones? Certainly, in the interest of the telephone subscribers. I think they are entitled to a metallic return to prevent cross-talking.
2581. In order to give them an efficient service? Exactly; so that each telephone shall have what you may call an individual system of its own.
2582. Have you gone into figures as to what would probably be the cost of introducing the metallic circuit system for the telephones? It would be very difficult to give an official estimate just on the vague information we have at our disposal. There are so many complications arising as to getting the wires in and out of buildings, and each individual telephone might be so peculiarly situated as to entail a lot of work; but so far as the mileage is concerned, it could be easily arrived at. I estimate the cost at from £30,000 to £40,000; that is, for what is called a perfect metallic return. We could use the Maclure system—that is, having one large wire as a common return for the whole of the telephones—but I am not prepared to recommend that system. It would get rid of any inductive effects from outside causes, but would not prevent cross-talking.
2583. Have you had a copy of the estimate formed by Mr. Walker? Yes; I had this handed to me a few minutes ago.
2584. But you have not had any opportunity to go into calculations? Only time to look at it; but I do not see the necessity for these 13,000 poles.
2585. Can you tell the Committee in detail how you arrive at your estimate of from £30,000 to £40,000, which you say would cover the cost of introducing the metallic circuit system into Sydney? I assume that we have a galvanised iron system—that is, I believe a No. 12 gauge, and it weighs, so far as I can tell, about 160 lb. a mile; but the galvanised iron would only be put up on the main poles, and would not apply to the branches into the buildings. That is more a matter of labour than of material. Mr. Walker estimates for 3,150 miles of wire. That must include all the little branches going from the main posts into the different buildings—the total length of the whole of the wiring from end to end, and not merely what we call the main wire, running across the posts. But this information is very difficult to get at. However,

T. Raw, Esq. 21 April, 1896.

However, we can get copper wire for about £2 15s. a mile, and for a metallic return that would require to be doubled. That would make the cost of it about £18,000. The same poles could be utilised, and the question then would be only a matter of labour.

2586. Are you in a position to say how many poles would be required, or whether Mr. Walker's estimate of 12,900 at £10 each is excessive? It is undoubtedly excessive. There are 6,450 poles already. He has evidently intended to wipe those out, and to put up two sets of poles. Whether he intends one for a go wire and the other for a return, I do not know.

2587. Can you tell us how many poles you provide for in your estimate? For about 600 additional large poles—40-feet or 50-feet poles, at about £9 or £10 each—that is, retaining the present system, but altering the space between the poles. For Oxford-street and other branches, 2,500 25-feet poles might be required. I do not think they are worth more than £2 10s. each complete.

2588. What other items have you in your estimate? I put down 3,150 miles of No. 11 wire at £6 per mile, and 180,000 insulators, which could be got, I think, for about 7d. each, and 85,000 cross-arms, which, I believe, could be got for 6d. each.

2589. Have you allowed anything for altering the switch-board, or do you provide for a new one? I have certainly not provided for a new switch-board, because I do not think it would be absolutely necessary to go in for a new switch-board. It might cost £800 or £900 to alter it.

2590. Mr. Walker has provided for a new switch-board, at a cost of £20,000;—do you regard that as being necessary? It is very desirable, but not necessary. In an ideal system it would be very desirable to have it—it is desirable to have as many luxuries as possible; but I do not regard it as being essential. In Sweden they have the metallic return system and the earth return system working together.

2591. Then, bearing in mind Mr. Walker's estimate of £252,100, which no doubt provides for the system commencing *de novo*, you do not think it is necessary to spend so much money on the work;—how much do you say the metallic circuit should cost? If I were a contractor I should be glad to contract for it at £40,000, and guarantee that there should be no complaints out of the ordinary character.

2592. That would include everything? I would be almost prepared to sweep away the existing system, barring the telephones themselves, and put up all the necessary wires for £45,000 or £50,000.

2593. At the outside, £50,000? I think so.

2594. In what time would you be prepared to carry out the alteration? I do not think we have sufficient telephonic mechanics to put on the work. It might take from two to three years. We are differently situated from what they are in England, where they can lay hands on 200 or 300 skilled men at a few days' notice. We should have to do what we could with the men we have.

WEDNESDAY, 22 APRIL, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (Chairman).

The Hon. Frederick Thomas Humphery.	Henry Clarke, Esq.
The Hon. John Davies, C.M.G.	Charles Alfred Lee, Esq.
The Hon. Charles James Roberts, C.M.G.	John Lionel Fegan, Esq.
The Hon. William Joseph Trickett.	Thomas Henry Hassall, Esq.

George Black, Esq.

The Committee further considered the proposed electric tramway from Circular Quay, Sydney, to the Redfern Railway Station; and also along Harris-street to the intersection of John-street.

Thomas Raw, Esq., Engineer, Government Architect's Branch, Department of Public Works, sworn, and further examined:—

T. Raw, Esq. 22 April, 1896.

2595. *Mr. Roberts.*] I think that when the Committee adjourned yesterday afternoon I had been asking you a few questions about the estimate of Mr. Walker, Secretary to the Electric Telegraph Department, when you stated that you thought Mr. Walker's estimate was unnecessarily high, and that you thought all the work that was requisite could be done at an expenditure of about £53,000? That is near enough. I did not say £53,000 exactly. You may say £50,000; of course £53,000 will suit me all the better.

2596. Have you any desire to alter those figures, or to add to the statement which you made yesterday afternoon? No; I do not see any occasion to do so.

2597. Can you tell the Committee in detail exactly how you make out that £50,000—what the various items are? Of course, with a system like this, with all its peculiar ramifications, it would be impossible, without having a plan of the city and the location of every subscriber's telephone, to give a detailed amount, but I can approximate it in this way. We can obtain a cable with forty-eight wires, which is equal to twenty-four circuits—that is, the go wire and the return wire can be purchased at the rate of £3 per lineal mile, from end to end, or, in other words, £150 per mile of cable, consisting of forty-eight strands; 6,300 miles, at £3, will be £18,900.

2598. Will you go through it line by line, showing exactly how you make out the estimate of £50,000? There are £18,900 for that additional cable. There are at present 3,150 miles of wiring. For a metallic return, of course, you must double that, and that means 6,300 miles. Now this in cable form—that is, copper wire, which is superior to galvanised iron—can be obtained at the rate of £3 per mile; that makes £18,900. I reckon that there are about 2,500 telephones within the city area. Those are outside figures. We will assume that it would take, say, £2 for each subscriber to make the connection between the distributing board and the telephone. That would amount, of course, to £5,000.

2599. Are you reckoning that a charge would be made to the subscribers for the altering of the system? I do not think so.

2600. I understood you to say so just now? No; I reckon there will be so many miles of wiring through the streets, and then I reckon it would cost £2 per telephone on the average to re-connect; that makes £5,000. I calculate on having fifty distributing boxes, which may be taken to cost £3 each; that makes £150. Then I take the erection of the main cables at £8,000.

T. Raw, Esq. 22 April, 1896.

2601. Does that include the poles? The poles are already there, and I see no reason why they should not be utilised.

2602. Would these poles carry the extra wire that would be necessary? Undoubtedly. So far as the poles themselves are concerned they are strong enough almost to carry a bridge. The difficulty of what they call overloading is this: they have, say, 100 wires on each pole, but by lengthening the cross-arms they, instead of having three wires on each side, could easily have four, five, or even six.

2603. Do you allow for that extra work in your estimate? It is all allowed for; that was allowed for in the other arrangement. I was going to reckon upon taking down the present poles and putting up steel tubular poles; and supposing there were 3,000 required in the city, at £5 apiece that would mean £15,000—that is, steel tubular poles, with slings or hangers sufficient to carry those cables.

2604. What does that bring your estimate up to? About £48,000. Then there will be some necessary alteration which ought to be made to the switchboard, and I reckon upon 5s. a subscriber. There are, say, 3,000 subscribers at 5s., and that makes only £750. I think I am quite within the mark in stating that it could all be done for £50,000.

2605. Would you have any objection to put it in writing? Certainly, I would put it in writing if desired. The estimates that I have given now are for an entirely different system to that they are working on now. They would have to dispense with the galvanised iron wire altogether, and to run a series of cables of copper wire to what I would call distributing centres; that is to say, from the exchange, say, up to King-street, there would be certain cables, to a distributing board from which all the subscribers within a reasonable area of that distributing board would have their connections made.

2606. Why do you suggest this alteration? Well, it would from an æsthetic point of view be an improvement, and it would certainly be better. The conductivity would be better. The speaking properties of the copper wire would be superior in every way.

2607. How much have you allowed for the switchboard—£7,000? Well; I consider that the alterations to the switchboard could be made at what we call 5s. a number, and assuming that there are 3,000 numbers that, at 5s., would be £750. They might perhaps say that it would be necessary to spend as many thousand pounds, but I think that £750 would make the necessary alteration.

2608. Does that bring the total amount up to £50,000? About £50,000.

2609. What is the exact sum for the alteration of the switchboard, instead of having a new switchboard; Mr. Walker has put down £20,000 for it; I want to know how much you intend to spend? A new switchboard might cost £20,000, but I think that the present switchboard might easily be adapted at an expenditure of £750, or £1,000 at the outside. It is impossible to tell, without actually seeing the switchboard, and ascertaining what alterations would be necessary.

2610. As you have not seen the switchboard, and had the same opportunity of fully inquiring into matters as the head of the Department has, I should imagine that it would be rather difficult for you to form a correct estimate? So far as making an accurate estimate is concerned, it is of course much more difficult for me to do so. But I have seen the switchboard, and am pretty well conversant with the way it is fitted up, and I think it could be easily adapted for the amount I have stated. It is one of those little matters that a man might spend a day over to get one connection exactly correct. It is impossible to say exactly what it would cost. It would have to be a day labour job.

2611. You have a full knowledge of the proposal before the Committee to construct an electric tramway along George-street? I think I have a pretty accurate idea, although I am not thoroughly conversant with all the details. I am afraid I have been under one misapprehension. I understood that there would be a copper return between the rails, but I have been informed that there is not to be. I think it is almost imperative, and, to back up the statements I made yesterday, it certainly would be imperative to put in a copper return. The expenditure is not only advisable, but almost necessary.

2612. In addition to the bonding of the rails? Undoubtedly, there ought to be a copper return.

2613. You think that would be absolutely necessary? Well, desirable. It is not absolutely necessary, because the Board of Trade does not insist upon it.

2614. What would be the advantages of it? There would be less liability to leakage from the rails.

2615. It is an important matter? Yes. Of course if the telephones were provided with metallic returns right through, the question of having a return between the rails would scarcely apply, because there could be no possibility of disturbance through earth currents. There are two disturbances; one is the disturbance caused by induction. If a current of electricity is set up in a wire there is at once an electro-magnetic field generated in the region surrounding that wire—that is to say, that during the time the voltage is acquiring its maximum difference of potential, there are concentric convolutions develop themselves and spread out to a certain distance, but not parallel, proportionate to the differences of potential. If any of those convolutions come in contact with another parallel wire induction immediately takes place in the latter.

2616. Therefore, to cure that you must have a sufficient space separating the disturbing element from the wire—space cures that? Yes; undoubtedly. I should like it to be understood that, even if each of the circuits had a complete metallic-return—complete in itself—induction would occur if they were within close proximity to each other, but only when the difference of potential was varying. If the current was constant, as it would be in electric-lighting work, no induction would take place; but in electric-traction work induction takes place owing to the voltage or the amperage suddenly diminishing and then suddenly regaining its original strength.

2617. From the trolly or from the wheels, or both? It is immaterial. There is a certain volume. What we call "volume" is amperage. If it is passing through a wire at a constant pressure or stream, no convolutions take place. It is only when the current is interrupted—suddenly cut off, as it would be by cutting the motor out of circuit—that the lines of force would begin to come back again. That would cause induction, and the moment the contact was re-formed, or the circuit re-made, induction would take place again.

2618. But sufficient space would cure it—what is that space, speaking in general terms? In the case under review, from 40 feet to 50 feet.

2619. Therefore, the telephone wires must, with the trolly system, be 40 feet away? Yes; it is advisable.

2620. Now, as to the earth circuit? The telegraph and telephone systems both have a common return through the earth. All the currents passing through from either the telegraph or the telephone return

to

to the original source—through the earth. They sometimes intermingle, and that is what is called earth current. The same in regard to the electric trams. The current, in passing through the motor and the rails, is liable to leak before reaching the generating station.

2621. Therefore, we have two matters to deal with—we require to have a metallic circuit to take away the difficulties that originate in the earth, and we require to have sufficient space intervening in order to prevent induction? That is correct.

2622. Will the metallic circuit prevent induction at all? Induction will take place to some extent even if you have the two systems, completely cut off from the earth.

2623. Therefore, you must have the space? It is necessary to have the space.

2624. The metallic circuit deals only with the earth leakage—it does not deal with induction at all? It does not deal with induction.

2625. Therefore, you must have a special space intervening in order to prevent induction? Yes; that is in electric traction, where the current is varying.

2626. Assuming a perfect metallic return for the telephones, is it your opinion that the telephones would still be affected by electric lighting, and by the trolley system on the electric tram? Not if the continuous current system were adopted, which I, of course, would be disposed to adopt in a city like this.

2627. Now, without regard to any system that might be adopted—metallic circuits or otherwise—for electric traction, would not a perfect metallic circuit for the telephones prevent any disturbance? Certainly it would, excepting from induction. So far as electric lighting is concerned, that would not affect the telephone in any way whatever, unless they adopted what is known as the alternating system. That is a system which is adopted for the sake of economy in first cost; but if I were to light the city of Sydney with electricity I should probably work on a high voltage, but on the continuous current system.

2628. What is the proper system of lighting the city with electricity? The continuous current system.

2629. Notwithstanding that the alternating system is cheaper? It is cheaper, but it is only adopted to convey the current for very long distances—for instance, if they were going to bring the current from the Colo River or the Grose Valley, or anywhere like that, they would probably adopt the alternating system.

2630. If within, say, 40 feet of the trolley wires, or within a similar distance from the alternating system of electric lighting, what becomes of the value of your metallic circuit if the disturbances are set up from induction? From induction disturbance would undoubtedly occur.

2631. Then in that case what is the value of your metallic circuit? It would be only of value so long as the tram did not happen to be working, or when the lights were out.

2632. In other words, it would not be a preventive of induction? It would not prevent induction.

2633. Is the position of the telephone wire, whether above or below the traction wire of a tram, material? No, it is not. The question is one of radius.

2634. What is the relative importance of induction and of disturbances caused by earth currents? Induction is a lesser evil, creating a humming sound, but not seriously inconveniencing those who use the telephone, and therefore having dealt by a metallic circuit with the main difficulty you can possibly afford to disregard the minor difficulty. A metallic circuit would completely get over any possibility of cross-talking or overhearing another person's message.

2635. Is there any control over the electric-lighting companies with regard to the system they should adopt? I do not think there is any control over them, but the system adopted by the present electric-lighting companies in Sydney will not interfere with the telephones in any way whatever.

2636. I should like to ask you a question or two about the necessary electric power to work this tramway;—are you aware that it is contemplated to obtain the necessary electric power from the existing power-station at Rushcutter's Bay? I understand they are going to make use of the building, but not of any of the present power.

2637. They intend to erect two extra engines, with a view of obtaining more power there;—the power that is already there is, I understand, to work an extension of the present cable system? Yes.

2638. But the building being there, and they being able to obtain the necessary power by the erection of these two other engines, do you think that is the best plan to adopt for obtaining the power for working these electric trams? If the tramway traction were to cease at George-street, I daresay it would be the best thing they could do, but in view of the probability of the system being extended into the western suburbs, I should certainly have been disposed to put up a new power-house somewhere in the neighbourhood of Darling Harbour.

2639. Why would you suggest Darling Harbour? Because it is the most central point at which they could get water for condensing purposes—not that that is of very much moment; but if the system were likely to be extended on a very large scale it would be very advantageous, I think, to erect an independent power-house somewhere in the neighbourhood of Darling Harbour, so that it would be more central, say, for Newtown, Leichhardt, Balmain, Forest Lodge, Glebe, Waterloo, Crown-street, Queen-street, and Moore Park trams.

2640. That would mean the erection of another power-house? Yes. But I do not know that that need necessarily cost very much money.

2641. The cost would be very much larger than that of using the present power-house at Rushcutter's Bay, would it not? Well, I understand that they are not proposing to utilise anything at Rushcutter's Bay other than the building itself—the floor space and the roofage—they are not proposing in any way to take any of the power from the existing engines; neither, as I understand, do they propose to take the steam from the existing boilers. They are going to put in two new boilers and three sets of engines and dynamos; and if they do that at Rushcutter's Bay, they might just as well put them at Darling Harbour at once.

2642. Would you recommend that it should be put at Darling Harbour at once? As an engineer, I think so.

2643. Do you, as an engineer, believe that it is possible to work a cable line in George-street from Rushcutter's Bay? I believe that no engineer would propose such a thing.

2644. Am I to understand that your only reason for saying that you would advise the erection of a new power-house at Darling Harbour is that it is quite possible that this electric-tram system may be extended to the whole of the western suburbs? Yes, certainly, with that object in view.

2645. If George and Harris Streets alone were being considered, you think it would be better to use the power-house at Rushcutter's Bay? Yes.

2646.

T. Raw, Esq. 22 April, 1896.

2646. You see no objection to that proposition? No objection at all to working it from Rushcutter's Bay; the distance is really nothing.

2647. Do you understand that it is intended to have accumulators or storage batteries at Redfern, with a view of utilising them in case of any accident, or for shunting purposes when the other cables cease to work the overhead system? Well, with regard to the accumulators, I am slightly at variance with the proposers. The accumulators, unless they were made very large, would practically be of no service in the case of a complete breakdown of the engines, unless a very large sum of money were expended in making those accumulators.

2648. Do you not think it is a wise provision to have them in reserve in case of a breakdown of the other system? Well, it would have to be a very temporary breakdown—not for more than a couple of hours—unless the accumulators were made so large that their cost would probably run into £10,000 or £12,000. I am not prepossessed in favour of accumulators, excepting on lines which are very long, or where they are running a service at some considerable intervals—say an eight, or nine, or ten minutes service; but in a line like George-street, where there would be so many cars always in circuit, the variations of load would, comparatively speaking. be very slight.

2649. Have you seen the estimate prepared by the Railway Construction Branch for the carrying out of this work? Yes, I think I did see it.

2650. There are two estimates—one for the roadway, while the other is really for outside electric work? I would assume those to be correct, for the matter is one that could be ascertained beyond all doubt. It is only a question of knowing the price of material and the distance. I am not prepared to express an opinion in detail, but I should be prepared to accept the estimate.

2651. Does it seem to you to be a fair estimate? I think it is rather under-estimated.

2652. What portion strikes you as being under-estimated? I should think that the main cables going from Rushcutter's Bay to Redfern would cost perhaps £8,000, and then there would be the overhead traction wires, the poles, and the fitting up, which I think would cost the balance. I should conclude from this estimate that there was no intention to put in a copper return between the rails, and I should like to point out that I think it is almost absolutely necessary.

2653. What amount do you think ought to be added to the estimate of Mr. Elwell? I should say about £2,000 for a return wire.

2654. Have you looked at the estimate for the roadway? I am not in a position to dispute those figures, or to attempt to correct them in any way, for the Railway Construction Branch know exactly what those matters would cost.

2655. Without having had time to check the figures, you think that, on the whole, that is a very fair estimate? Yes. I think the estimate is all right. It is shown in detail on page 5 of the evidence. They put down £6,300 for the main feeder and return. I guessed £8,000. Of course, I do not know the exact distance.

2656. Do you approve of the roadway that is specified for "the roadway consisting of grooved rails of 83 lb. to the yard, resting on the concrete base which carries the wood-blocking—below the rails in George-street it is proposed to deepen down and give 10 inches of concrete?" Yes; that is correct construction. That is what has been adopted in Birmingham, I think, and also in Glasgow and Dublin, if I remember rightly.

2657. That refers to the George-street portion of the line, but not to the Harris-street portion, which they propose to leave undisturbed;—do you think that is wise? Of course, the same cars would go over both roads, but there would not be the same amount of traffic.

2658. I suppose the traffic would not be so heavy in Harris-street? No.

2659. On that ground, perhaps, you would not think it necessary to make the same road in Harris-street as in George-street? No. Harris-street, certainly, would not require the same road as George-street.

2660. It is proposed altogether to spend a sum of £130,000;—did you notice that? Yes, I saw that.

2661. Having looked through the whole of the items of the proposed expenditure of £130,000, do you think that that is a fair estimate for the whole of the work? Yes; considering the way in which contracts are being let at the present time, I think that would be a very fair estimate.

2662. You think the work could be done for that money? Yes; I reckoned about £100 a chain for George-street, and £99 is put down here. I think it is a very fair estimate all through.

2663. Viewing the matter from all points, have you considered which mode of traction you would prefer—a cable tram or an electric tram? An electric tram, without question. You can adjust the speed of an electric tram to suit circumstances. There might be a slow-going dray in front of it, and you could crawl up behind; then you could get a clear run and make up time. You would also have your car more under control, whereas with the cable you would be limited to a certain fixed speed. You must go at whatever rate the cable is set at, or stop still altogether.

2664. Would an electric tram be less expensive to work than a cable tram? Yes, I think it would. In the case of a line like George-street it certainly would. If the country were very hilly, the cable, I think, would beat it up to certain limits. So much of the power of the engine is absorbed in hauling the cable without a car upon it that if it has a very light load the cable system is expensive to work; whereas with electric traction you only use power proportionate to the amount of work you are doing—that is to say, if you have no cars running you are not using any power.

2665. But it is a fair thing to assume that in the event of a tram-line being put down there would be plenty of work for it in George-street;—taking it for George-street alone, would you prefer a cable or an electric tram? An electric tram, certainly.

2666. You still adhere to the electric traction? Yes; I think a cable is only justifiable in a hilly country where the contour varies suddenly, and there are long heavy grades.

2667. *Mr. Humphery.*] With regard to the accumulators at Redfern, did you express the opinion just now that they are unnecessary? They are unnecessary.

2668. Are you aware that accumulators are used on the Military Road, North Shore? Yes; but in the case of the Military Road, North Shore, there is only one car running under ordinary circumstances, and the current is either all on or all off; consequently there would be a varied strain on the engine. When the motor was thrown out of circuit the load would be suddenly taken off the engine and it would be unable to take up the variations quickly enough. It is almost equivalent to an engine

T. Raw, Esq.
22 April, 1896.

engine which is dragging its maximum load. If the drawbar suddenly breaks the locomotive runs off; but, in a case like that of George-street, the variations could not possibly occur to the same extent; that is to say, it would be impossible for all the cars to be out of circuit at one and the same time.
2669. Might it not so occur with Harris-street? Well, it being a continuous circuit, Harris-street would be balanced to a certain extent by the constancy of George-street. Supposing there were twenty cars running down George-street, it would be impossible under ordinary conditions for those twenty cars to be all taking current at the same instant; during the time that some of the cars were running others would be stopping, or during the time that some were going up Brickfield Hill, taking all the current they could get, others would be going down without current. To strike a general average under ordinary working conditions, I think that the amount of current required would be fairly constant, and I do not think that accumulators would be of very much service.
2670. Although you have expressed the opinion that accumulators would be unnecessary at Redfern, you are of opinion that accumulators on the Military Road are an advantage? They are a distinct advantage on the Military Road. I admit that. They are quite an innovation.
2671. Are you aware if accumulators are used in the United States to any extent? I do not think so. I know they use them at Douglas, in the Isle of Man, and Dr. Hopkinson recommended the use, of them from Leeds to Kirkstall, and from Kirkstall to some outlying suburb, but the distance is about 7 miles, and it is a seven and a half minutes service. They would run that service with three cars, and with three cars in a journey of 7 miles, it is not only quite possible, but also very probable, that those three cars would all be taking current at one and the same time. Assuming that each of those cars would take 33 horse-power, it would be quite probable that at one particular instant 100 horse-power would be suddenly demanded, and it would be equally probable that 100 horse-power would be suddenly out of demand.
2672. For a long-distance electric tramway, the accumulators might, in your opinion, be necessary, but having regard to the fact that there would be about thirty cars used upon the proposed tramway, the accumulators are unnecessary;—is that so? They are unnecessary. But there is no great harm in using them.
2673. There may not be any great harm in using them, but are you aware there is considerable cost attached to their use? They have their advantages, but there are disadvantages connected with accumulators, and one disadvantage is that you cannot get out more than 75 or 80 per cent. of what you put in—that is to say, each cell requires two and a half volts to charge it, and you cannot possibly get more than two volts out of it; therefore, the waste is from 20 to 25 per cent. But against that, in the case of shunting, or a temporary breakdown, or an abnormal demand on some portion of the running, the accumulators might be of some slight advantage.
2674. Would the advantage compensate for the cost and the loss of energy? I do not know exactly what sized accumulators are going to be adopted. I have no idea what the cost will be. If they are going to use a voltage of 550 or 600 that would necessitate 300 cells; but, then, these cells might be made of any size—of thirty plates, or they might go up to 150 plates each. The cheapest price they could be obtained at would be £5 each, so I think there would be £1,500 down for accumulators.
2675. In your opinion, in connection with the George and Harris Streets tramway, that proposed expense might be saved? I think it might be saved.
2676. As to the proposal in connection with the electric tramway to use the power for lighting George-street, do you see any objection to that? No objection whatever.
2677. In speaking of the copper wire return between the rails, will you explain how the wire would be placed, and how you arrive at the cost of it? The smallest size that I would advise would be ½-inch rod, and a ½-inch rod weighs 770 lb. per 1,000 feet. The length of the line is about 6¼ miles. It would be better to have a copper wire between each pair of rails. This wire might cost £10 per 1,000 feet, and that would be a little over £200 per mile, and for 6¼ miles that would be, say, £1,500, including laying.
2678. Would that wire require protection in any way? I do not think so.
2679. Would you lay it in the earth or in a casing? I do not think it would require any particular protection, but there would be no harm in putting it in iron pipes underground.
2680. That would mean an additional expense, would it not? Well, in a large job like this the cost of the piping would be very small. It is only 6d. or 7d. a foot run, and that is not very much in a job of this size. I do not think it would require any particular protection. The copper wire might safely be laid between the rails, underneath the wood-blocking, or along the rails, or underneath the concrete, or the footpath, or anywhere else.
2681. Do you consider that it is absolutely necessary? It would be absolutely necessary in order to obviate any disturbance of the telephones where they still retain earth returns.
2682. Assuming that the telephones were supplied with metallic circuits, would this return copper wire be necessary? No; it would not be necessary.
2683. Are you aware whether metallic circuits or earth returns are used in connection with the Melbourne telephone system? I am not positive, but I should be inclined to believe that earth returns are still in use there. I cannot be definite upon that point.
2684. How long is it since you visited Melbourne? About two years ago, but I did not investigate that particular point.
2685. While there, did you ascertain whether the electric lighting interfered at all with the telephonic system? No; I did not go for any special object, but simply as a visitor.
2686. Have you not made it your business since then to ascertain? No; but I should be inclined to think that the electric lighting did not affect the telephones.
2687. Why do you speak so emphatically with regard to the non-effect of electric lighting on the telephone system? Because I know that the current, unless it be continually interrupted, cannot possibly cause induction.
2688. Would it not have been better to ascertain by inquiry whether, having the electric lighting in operation in the city, would or would not cause a disturbance of the telephonic system by earth return? It would be very easy to ascertain that.
2689. Can you ascertain that? Yes, I could find that out; but I think I may venture the opinion that the electric lighting does not interfere with the telephone.

T. Raw, Esq. 22 April, 1896.

2690. Is that consistent with the evidence that we have had as to the effect of electric lighting in the city upon the telephonic system? I think I have maintained right through that electric lighting would not affect the telephonic system.
2691. Unless it was an alternating system? Yes; but I do not suppose that they have the alternating system in Melbourne. They may have, and if they have it may affect the telephone.
2692. You mean that a proper electric light system in the city would have no effect whatever upon the telephonic system with an earth return? Certainly not. There can be no possible connection between the electric lighting system and the telephone with an earth return, for the simple reason that with the electric lighting system, it is not made to earth at any point whatever. An electric lighting system must of necessity have what you call a metallic return. In the electric lighting the negative wire is always of the same size as the positive wire, and they are always perfectly insulated from the earth, so that it can have no possible effect on the telephones.
2693. Then we may leave out of consideration altogether the effect of the electric lighting of the city on the telephonic system as it at present exists? I think so.
2694. With regard to the accumulators, could they be attached to the cars after the traction system was in operation? I understand that the cars under this system would be made merely strong enough to carry the passengers.
2695. They must be part of the original equipment? Yes.
2696. Can you tell the Committee whether the electric power that it is proposed to use for driving the trams will admit of being used for electric lighting purposes as well? Yes; that could be done, certainly.
2697. If it were found advantageous to place electric lamps on the top of the proposed standards in the middle of the street could the electric power that drives the trams be used for electric lighting purposes? Yes.
2698. I think you said just now that electric lighting required a steady flow of electricity through it to produce a light? That is correct.
2699. Well, inasmuch as electric traction will have an intermittent or broken current, how would that affect the lighting? I do not think it would be proposed to light from the traction wire.
2700. It is an important question in my mind at the present moment whether the same power could be used for that purpose? It could be used, but not satisfactorily.
2701. I mean by using the same wire? That could be done, for at present they light the cars, but I do not think it would be attempted.
2702. Do we understand that the proposal as at present before us would not provide for electric lamps if they were erected on the standards? I do not think so. I would not do it. It would have the effect of prejudicing the electric lighting in the eyes of everyone, for the simple reason that every time the motor was put either in or out of circuit the light would flicker and jump. Therefore, I would not propose it.
2703. In other words, it could not be done, because an intermittent light would be of no value for the city? I would never propose it.
2704. Any system of lighting, whether by gas or anything else, must be constant? Yes.
2705. And if the electric light were taken from the traction wire, it would be intermittent? Yes.
2706. And if it were thought well afterwards to erect lamps on those posts, electricity would have to be brought in by a separate wire? Yes; I should certainly propose that, for the reason that the light would be required long after the trams ceased to run.
2707. Do you think it is desirable to light the streets of the city with electricity? I think it would be a wise thing to do, and that is why I propose that the power-station should be at a central point like Darling Harbour, so that they could generate there all the electricity required for the lighting of the streets, Redfern Railway Station, the Eveleigh workshops and shunting-yards, letting it all come from one centre.
2708. Are you acquainted with the amount of power it is proposed to add to the power-house at Rushcutter's Bay to provide for this electric traction? Nothing further than I can gather from this evidence, viz., that they propose to enlarge the plant to a certain extent, but not very much.
2709. Would that power be enough to produce sufficient electricity for the electric lighting if there were a proper cable there to take it? Yes; but I do not think it would be proposed to light George-street from Rushcutter's Bay.
2710. I know it is not proposed to do it, but I want to know if it is a possibility within the four corners of the proposal? Of course, it is quite possible to light George-street from Rushcutter's Bay, but it would require a separate generating plant.
2711. And a separate cable? Certainly it would require separate cables.
2712. It could be brought either overhead or underground? Yes; either overhead or underground. It would be preferable underground, on account of the large cables that would have to be carried. The loss of voltage would be very great with an ordinary incandescent system.
2713. Supposing that the electric lighting cable ran along the same standards as the power for the traction wires, would there be induction to operate against the traction? It would not affect the traction in any way.
2714. You are very clear that we must not expect that we are going to derive the street lighting from this electric traction? Certainly; I am quite positive on that point.
2715. *Chairman.*] You expressed a definite opinion yesterday in regard to effective bonding in copper wire to prevent the telephones from being affected by the trolly system of tramway? Yes.
2716. Would you like to modify that opinion at all? No: I should like to emphasise it. I think I said that with well-bonded rails, with a good efficient copper return—say, $\frac{1}{2}$ inch or $\frac{5}{8}$ inch in diameter—the leakage would be so slight as not to materially interfere with the telephonic system as it at present exists.
2717. What does your opinion rest upon? I have two or three cases here.
2718. You have read the extracts, and I suppose you could epitomise them? The article was written by a great authority.
2719. What paper are you quoting from? The *Electrician* of 10th January, 1896—published in London on that date, but of course only just arrived here. It says that in the case of Geneva the telephone wires are for considerable distances run along the tramway in sections up to 660 yards, parallel with the line, and at distances in some cases not exceeding 3 feet, and all the telephones have earth returns. The same thing

thing applies at Basle, and also at Mulhouse. Those are two cities in Alsace. They have overhead telephone wires with earth return running for long distances parallel with the tramway. They are from 40 feet to 50 feet apart—that is, from the traction wire. They have had absolutely no trouble whatever with them. At Geneva they find that even at the public or private telephone stations in close proximity to the tramways, the disturbances are so insignificant as to be practically nil; an observation which is, moreover, confirmed by the fact that in neither of those towns has the working of the electric tramways given rise to any complaint whatever.

2720. Have they a metallic circuit there? Certainly not; they all have earth returns.

2721. What steps were taken in order to create a perfect return? With regard to the tram, the rails were bonded at the joints by copper wires fastened through and soldered to the web, and an uninsulated copper conductor was laid between the rails throughout the whole length of the line.

2721½. Is that an expensive process? No; I think I gave the price at about £1,500 to lay down a copper return in this particular case.

2722. For George and Harris Streets? Yes.

2723. All the steps necessary to place the system under consideration on exactly equal terms to those you have quoted could be carried out for £1,500? Yes. I am prepared to go perhaps a great deal further than I understand others have gone; that is to say, that this line could be so constructed, without any unreasonable expenditure of public money; that no interference, or no further interference would be caused to the present telephone system than exists at the present time, without bothering with metallic returns. There was another case—the Mont Saleve Electric Mountain Railway in Geneva. On this line, worked with a slide contact and an outside conductor rail, simple electrical bonding at the rail joints, with a separate return conductor, sufficed to stop the telephone and telegraphic disturbances at first experienced, and the doubling of the wires was dispensed with.

2724. You have seen the evidence given with regard to that point? I have seen some of the evidence.

2725. You have seen Lord Kelvin's opinion? Yes.

2726. Is he not one of the ablest electricians of the day? Yes, he is.

2727. The highest authority perhaps? He is certainly one of the highest authorities.

2728. His statement, made two or three years ago, is in direct antagonism to what you now inform us is the fact? I do not think it could be quite as antagonistic as that.

2729. Have you seen the evidence on page 93 of this inquiry and the following pages? Yes.

2730. Is that not antagonistic to the opinion you have now expressed—a considerable number of expressions of opinion from able men? Lord Kelvin's evidence was given on 23rd December, 1892, since which time there have been immense improvements made in the mode of maintaining a uniform contact between the trolly and the wire. There is no doubt that at that particular time the trolly gave a great deal of trouble, and Siemen's and Halske's aluminium sliding contact bar was adopted. That is a continuous sliding contact, and it is said to have completely got over the difficulty.

2730½. But the wheels lose contact too? Yes; the trolly system is inclined to lose contact, but they have so much improved it in the last eighteen months that you might almost call it a continuous contact.

2731. Was it held by the ablest electricians until quite recently that a metallic circuit was essential if electric traction were used? I believe that opinion was maintained.

2732. Have you seen anything that causes you to believe that that opinion has been altered? Well, the cases that I have quoted. It has been shown conclusively that by maintaining a good contact on the trolly wire, and with a good metallic return between the rails, no disturbance is caused to the telephone.

2733. And in support of that position you quote several cases? Geneva, Basle, Mulhouse, and Mont Saleve.

2734. Who writes the article? Du Riche Preller.

2735. What is his status? He is one of the greatest authorities that we have.

2736. Are you aware of the action that has been taken by the Electric Telegraph Department here with regard to subways? I have a citizen's knowledge—that is all—no official knowledge.

2737. Does the construction of a subway absolutely bind that Department to metallic circuits or not? Yes; that is, for successful working, it certainly does.

2738. The wires, being placed underground, must have metallic circuits? To be a success, certainly.

2739. Will the wires proposed to be placed in these tunnels be a failure without a metallic circuit? Not exactly a failure, but they would not be successful, and I do not think that they would put them in a subway without using a metallic return.

2740. Is there any city in the world where they have underground wires without having a metallic return? No, I do not think so; for anyone who would go to the expense of an underground tunnel would not stick at the cost of the return wire. I think I may safely say that it is absolutely necessary, and that it would be merely fooling with the thing to go to the expense of putting down a tunnel and putting in cables and then to spoil it by not making it perfect.

2741. Do you think then that the Department here is bound to put in a metallic circuit? I do not know what their intention is, but I think that if they do not put in metallic returns they will have a great deal of trouble. I would not like to go so far as to say they could not work the telephone without it.

2742. But you believe it would be defective? It would be unsatisfactory.

2743. And having incurred the large expense of the tunnel in the first instance, no wise Department would leave the work inefficient; it would be absurd—is that your idea? It would be absurd.

2744. Therefore we will have a metallic return here, anyhow? Yes; I think so.

2745. Do you think that in our telephone system we should have a metallic return? Certainly; in the interests of the subscribers we should have a metallic return. It is anything but satisfactory now. A metallic return should be laid down irrespective of any trams. If a tram had never been thought of, it ought to be done.

2746. In all or most large cities is there a metallic return? Yes; I do not think that any telephone company would now think of putting up telephones without including in their estimate the cost of metallic returns. London has no electric trams whatever, and there is a metallic return there, and Paris has a metallic return right through; so have Marseilles, Zurich, Boston, Glasgow, and every large town.

2747. You think that the change to a metallic return is sure to come here? It ought to.

2748. And, if that be so, it ought to come soon, to save expense? I do not know whether it would make much difference to the expense whether it was done this year or three years hence. The price of material and wages will not alter much.

T. Raw, Esq. 22 April, 1896.

2749. Have you again looked through your figures with regard to the statement you previously made in reference to Mr. Walker's estimate for a metallic return? Yes; and I think I am on safe ground in saying that we could make a very efficient metallic return quite up to date—no tinkering with the job at all—for the sum I have stated.
2750. How much was that? £40,000 I think I said.
2751. You have no desire to qualify that in any way? I do not see any occasion to depart from my original figures in any way.
2752. *Mr. Humphery.*] The telephone wires placed in the tunnel will be defective, whilst the wires above ground may continue to be efficient, if the former are not supplied with metallic returns? Yes; that is correct. Although the wires overhead might continue to be efficient, those underneath would not be so efficient; they are too near the earth.
2753. *Chairman.*] How long would it take to put this metallic return in, should the Committee consider it necessary? Provided the material were already to hand, and sufficient labour were available, it could be done in a comparatively short time.
2754. Say in two or three years? Two years would be the outside.

THURSDAY, 23 *APRIL*, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (Chairman).

The Hon. Frederick Thomas Humphery.	Charles Alfred Lee, Esq.
The Hon. John Davies, C.M.G.	John Lionel Fegan, Esq.
The Hon. Charles James Roberts, C.M.G.	Thomas Henry Hassall, Esq.
The Hon. William Joseph Trickett.	George Black, Esq.
Henry Clarke, Esq.	Francis Augustus Wright, Esq.

The Committee further considered the proposed Electric Tramway from Circular Quay, Sydney, to the Redfern Railway Station; and also along Harris-street to the intersection of John-street.

John Pope, Esq. (Messrs. Farmer & Co.), sworn, and examined:—

J. Pope, Esq. 23 April, 1896.

2755. *Chairman.*] What are you? A merchant, and member of the firm of Farmer & Co.
2756. *Mr. Black.*] How long have you been in business in Sydney? Forty years.
2757. You have, then, a fair knowledge of the requirements of the city and its traffic? I think I have.
2758. Do you think that the running of an electric tram in George-street would interfere with the business carried on in that thoroughfare? I do.
2759. Can you give the Committee any detailed reasons for thinking so? I think, from observation, that George-street, being comparatively only a narrow street until it comes up to the Town Hall, is almost inadequate even to the passenger traffic of the street by vehicles, independent of the heavy goods traffic which of necessity has now to be carried over it. It appears to me that in the past no regard has been paid to diverting the heavy traffic of the city, necessitated by the conveyance of merchandise from the wharfs and other places to the outlets of the city inland—that those necessities have not been considered as they should have been in the past. There is, more particularly in George-street and Pitt-street, a tremendous amount of traffic of heavy luggage and merchandise of all classes, as well as produce, and, what is worse, some of it is of a most offensive kind—I mean offensive in this sense, that I consider that a load of sheep skins or bullock skins or anything of that sort being carried along George-street at any time between 9 in the morning and 5 in the afternoon causes an offensive smell to anyone who gets near them. I have experienced it many times. I have travelled over almost all the world. I have been on every continent, and I believe that such an offensive thing would not be permitted in any city in the world except in this in some respects very well disposed city towards those who have the command of it.
2760. You think then that if a tramway were constructed in George-street it would interfere with business because it would add to the volume of traffic already there? If the same traffic remained there it would simply be a perfect block to traffic altogether.
2761. Have you never considered that the construction of this tramway might mean the substitution of one form of transit for another? I can see that it might be so. I can reasonably suppose that if the trams were there a smaller number of omnibuses would be required to compete with the traffic in the street; at the same time, I think that to put anything like a tramway in George-street would be almost an act of injustice to the mercantile people of Sydney who trade in George-street, as it was in Pitt-street some thirty years ago. I think it is nearly twenty-five or thirty years since we had a tramway in Pitt-street. It was very bad, and, as a resident in the street, I, with other gentlemen who took a great interest in the matter, tried to get that tramway removed, and we were sufficiently powerful in ourselves, in argument alone, without any other influence acting on the powers that were then in existence, to get that tramway taken up, because its removal was a matter of necessity to relieve the ordinary traffic of the street and give it more freedom.
2762. Is it not a fact that that tramway was so ill-constructed that it was almost impossible to drive a vehicle up and down the street—were not the rails raised above the surface of the thoroughfare? I think you may possibly be right in that, though I cannot remember it now; but, at all events, in my opinion, any vehicles that must command a certain amount of the street are objectionable in such thoroughfares as we have in Sydney.
2763. Do you not think that a very large proportion of the traffic in George-street is omnibus traffic? A large proportion is, but there are more cabs than omnibuses running.
2764. May you not at almost any hour of the day see three or four 'buses proceeding in one direction along George-street, sometimes two or three abreast? Possibly; I have seen two abreast many a time.
2765. Do you not think it would be an advantage to the traffic if, instead of two or three vehicles all running in one direction at one time, sometimes two abreast, and sometimes racing one another, that portion of the traffic in George-street which has to do with the carrying of passengers at low fares were confined to one part of the roadway? I scarcely think I have realised your question.

J. Pope, Esq. 23 April, 1896.

2766. Supposing you substituted for that form of transit which carries passengers at low fares in George-street, and which is carried on indiscriminately by numbers of vehicles, of which two are sometimes running abreast, a form of traffic which was always confined to one course, and could not deviate from it, do you not think that it would have a beneficial influence on the heavy traffic of the city, and leave more room for private vehicles and drays, which often takes up the width of the whole street? No; I do not think so. I think that the King-street cable tramway, as far as I have seen it, has been a very great obstruction to the ordinary vehicular traffic of that street, and is also more dangerous than any vehicles drawn by horses, or anything of that sort in the street. I further think that Oxford-street is another instance. It has shown to me most clearly that, ever since the tram was run up Oxford-street, it has been the most detrimental thing ever put there for the residents of the street, as well as being dangerous to the inhabitants generally.

2767. Of course we all have different experiences, but as one who drives a good deal about the city, I would rather drive in Oxford-street or Elizabeth-street than in George-street at any time? Well, if you are fond of slow driving it does not matter which street you are in. You cannot get along fast anywhere. I wanted to go to the Circular Quay yesterday, in order to go by boat to North Shore. I got into a cab somewhere in Market-street, near George-street, and thought that I should catch the 12·30 boat, but I got behind a four-horse trolly loaded with sheepskins, which I estimated at the rear was 8 feet wide, and until we had passed the General Post Office and were almost down to Hunter-street, my cab could not get from behind that load of sheepskins.

2768. Do you think that if there had been a tramway in George-street you would have been longer delayed behind the sheep-skins? I think the sheep-skins would have blocked the tram altogether. They certainly would have done so if they had been before the tram as they were before my cab. There were four horses drawing the load along, and they would not go fast.

2769. Do you not think that there should be some regulation of the traffic of the city which would attempt to graduate the traffic and shunt off the heavy loads of merchandise, such as you speak of, into some of the less frequented thoroughfares? I do think so, but at the same time I am perfectly sure that the present Transit Commission will never do it, and until the City Council get the command our streets will be hampered as they are now. I have no scruples in making that remark.

2770. Do you think that the tramway would interfere at all with the loading or unloading of goods in George-street? Undoubtedly. There are many concerns in George-street for which heavy merchandise has to be taken down lanes or openings to the warehouses, and if these loads had to go up on one side of the street and then to cross the tramway they would be delayed sometimes by the trams, and at other times the trams would be delayed by them. I think that more freedom should be given to the residents of the street rather than to block it by anything like a tramway where the street is so narrow as not to permit of a four-wheeled dray, with, we will say, two horses, turning, without having to cross the tramway. If they could turn without having to go to the other side of the street to do so it would be better.

2771. Do you not think that the tram-cars would have to respect the rights of vehicles to cross the road just as much as omnibuses do now? I understand that the tram-cars have to give way to other vehicles.

2772. Do you not think that that would get over the difficulty you speak of? No, I do not. I do not think you would find that the drivers of vehicles would at all consider the trams, especially if they knew the trams had to give way to them.

2773. If that were so, there would be no interference with private vehicles? No interference with private vehicles in that sense, but there is no doubt that the trams would create more traffic in the street; and it is my conviction that George-street is a most inadequate street to have added to it any vehicular traffic in the shape of a tramway.

2774. If the construction of the tramway should prove to mean only the substitution of one class of traffic for another, and if owing to the increased comfort for passenger traffic to be obtained in the trams as compared with the omnibuses, the omnibuses were to a very large extent driven away from George-street, do you think that there would be that interference with the business of the city which you fear? Yes; I think that the tramway would interfere with the business of the city, because the cabs must he very much considered. A George-street tramway would not take all the mercantile men of the city from some places to others to which they have occasion to go so frequently. Take my own case. Sometimes I start out in a cab in the morning, and I say to myself, "I have an hour's run to do." The first place I went to the other morning in a cab was Metcalfe's bond; next I went to the Exchange; then I had to go to Castlereagh-street, and then across to York-street. In going to such places I notice that the cab has considerable difficulty in getting along owing to the traffic of the streets, especially at crossings, where perhaps two or three vehicles have the lead of you, and you are ordered to stand. While sitting in my cab I see two omnibuses, two drays, and perhaps a four-wheeler go by, and I have to sit in my cab and wait, and say to myself, "My time, of course, is no object; all these interests must be served." It shows to me that the traffic of our streets is so immense at the present time that there is only one way out of the difficulty, in my opinion, and I do not hesitate to say that the Transit Commission should be done away with, and the matter of the regulating of the streets should be placed in the hands of the Municipal Council of Sydney. Then we should find that heavy loads of merchandise would be conveyed through streets like Clarence-street, Kent-street, and Sussex-street, where passenger traffic, not existing to any material extent, would not be interfered with by the conveyance of those goods.

2775. Do you not think that the difficulties and delay to which you object are inseparable from the traffic of any large city whose thoroughfares are contracted? Certainly they are.

2776. Do you not think that a city railway, which would carry goods to the water's edge, by lessening the amount of heavy traffic in the streets, would very largely obviate the now congested traffic in George and Pitt Streets? Yes, I do; and to the last day of my life, so far as I am able, I will advocate the extension of the railway to the Circular Quay, or at all events a horse-shoe railway round the city, by which passengers could come into or go round the city without having to change carriages. I go for a city railway, and I have no hesitation in saying that in any other city of the same magnitude or of half the importance of Sydney a railway would have been constructed many years ago. Why we are delayed in this matter I cannot understand, and I hope that this inquiry may lead to the railway being constructed.

2777. Do you think that this tramway would interfere with your own business? No; I look upon it as a public matter much more than a private one.

2778. Do you not think it is possible that it might benefit business in George-street? No.

J. Pope, Esq. 23 April, 1896.

2779. What are your reasons for not thinking so? Because there are ample means of transit for all the people who want to go to George-street now, and I do not see that this tramway would in any way benefit business in George-street. I think it would tend to lessen the rents and the values of property in George-street, if you were to put a tram there, and I think it would be a violation of all the good which former men in this Colony have effected in that thoroughfare if it were now taken for a tramway. Let us have a fair roadway. Take the case of London, where omnibuses, cabs, and other vehicles run all about the city, and the underground and other railways convey traffic from here and there to every other place, and the city of London goes on. The city of Sydney is situated to-day much as the city of London was forty years ago. London then simply wanted some means of diverting the passenger traffic of the streets which was too much, in addition to the merchandise traffic, a large amount of which pervaded the streets of London.

2780. We are considering Sydney? So we are; but Sydney is situated much the same as London was forty or fifty years ago, and the people there had to devise means of dealing with the traffic.

2781. Do you consider that the lessening of rent is an unmixed evil? It is for capitalists.

2782. I was looking at it from the standpoint of those who have to pay rent? I do not think you will get the rents much lower.

2783. Would you favour the construction of a single line of tramway up George-street with a return line down Pitt-street? Most certainly not.

2784. I am afraid that nothing but a flying-machine would suit you? Then you must fly by rail round Sydney in a horseshoe shape. There is not a doubt in my mind that as we are situated, nothing but a railway will be suitable for the city of Sydney. We have already one tramway which fortunately runs through streets where traffic is not very much interfered with by it.

2785. Do you not find any interference with businesses on account of the noise of the omnibuses? Oh dear no; especially in those streets where the Corporation have had the wood-blocks taken up and put close together. The noise is prevented by that means.

2786. Your business premises are rather favourably situated, are they not, they being a little back from the thoroughfare? I should be very sorry if I did not consider myself in the thoroughfare.

2787. But you have a colonnade between you and the thoroughfare? You mean in Pitt-street. We should not experience much inconvenience from noise in Pitt-street. It is a capital street now that it has been re-laid, and I am quite satisfied.

2788. Then, personally, you have no objection to the noise of the omnibuses? No.

2789. But you are well aware of it? Yes. I sit on one or two directorates at the north end of Pitt-street, where the noise is so great that at times we have to look at each other and wonder who is talking.

2790. Then, you do not take into consideration as an extenuating circumstance on behalf of the tramway that it would substitute an almost noiseless traffic for one that is excruciatingly noisy? I do not think the advantage is paramount to the inconvenience we should suffer.

2791. But is it not a circumstance that ought, with others, to be taken into consideration—anything that would lessen the noise of a great city? Anything that would lessen an evil ought to be taken into consideration.

2792. Do you not think that the noise of a great city has a great deal to do with public comfort and public health? I suppose it has; but very few people reside in the city now, I apprehend, compared with the numbers that formerly did.

2793. But if a man is engaged in the city ten or twelve hours a day, a continual disturbance must have some prejudicial effect on his nervous system, especially if he be not a very strong man? Then he should not live in a much frequented thoroughfare, or where there is much traffic.

2794. Supposing that he is an employee, and has to live in it? Well, we all have to submit to our fate. It is my fate to live in a thoroughfare where there is a great deal of noise and traffic, and I do not suffer any inconvenience therefrom.

2795. And you do not think, then, that there are are any others who are likely to suffer? There may be some, but I think they would be very much in the minority.

2796. *Mr. Davies.*] Are you of opinion that the electric tram would be a fair and reasonable substitute for a city railway? Not at all a substitute.

2797. Then you are entirely opposed to anything short of a railway? I am.

2798. You are one of those citizens, residents on the line, who for a number of years have taken a very active part in agitating for an extension of the line into the city? I am.

2799. And you have not altered your opinion? I have not.

2800. You see a still greater and more pressing necessity for the extension of the railway into the city than existed some years ago, when you first took up the agitation? I do.

2801. Do you favour an electric tram with overhead wires, and posts in the centre of the road and on the side walks, to carry the electric wires? I do not favour it—not in George-street, Sydney.

2802. Then if you are opposed to the electric tram, would you favour a steel wire cable tram, something of the same character as we have on the King-street-Ocean-street line? No; I should not favour any tramway in George-street, Sydney.

2803. Are you of opinion that the present 'bus traffic system is sufficient to meet the requirements of the travelling public between the Railway Station and Circular Quay? I do not think it is.

2804. You think that the railway is the only solution of the difficulty? I think that as our city is situated, the only policy to be adopted in the interests of the city of Sydney, its residents, and its mercantile accommodation, is to have a railway to the Circular Quay of a circular or horseshoe shape, by which the traffic could be taken round one way and back the other.

2805. I think you stated just now, in answer to Mr. Black, that the effect of laying down a double line of rails in Oxford-street has been to depreciate the value of property there? I think so. That has been my opinion for years.

2806. It was a very great business thoroughfare prior to the laying down of those rails? It was.

2807. And a great deal of the traffic that carried business to that street has been driven out of it? I think so.

2808. You regard George-street, especially some portions of it, as being too narrow for a double line of tramway? George-street in some places is very much too narrow.

2809. You know the width of the street immediately opposite your own property in George-street? Yes.

J. Pope, Esq.
23 April, 1896.

2810. Would it be fair to the tradespeople to lay down two lines of rails in a narrow portion of the street such as that opposite your own building? I do not think it would.
2811. If the tramway were constructed as proposed, do you think that it would relieve George-street of much of the present 'bus traffic? I have no doubt that it would take a considerable portion of the traffic which is now given to the 'buses. I feel sure that it would also relieve the street of some of the cabs that now run along it, but I do not think that the convenience of the public generally and city requirements would be met by a tramway along George-street, as compared with the present means of traffic by omnibuses and cabs, and especially if the heavy traffic were taken out of the street.
2812. If the 'buses are able to compete at the present time with ordinary trams running to the Railway Station and other points, the Commissioners charging a fare of 3d., and the 'bus proprietors charging only 2d., would it not be likely that the 'bus proprietors would continue to run their vehicles at a lower rate than that at which the Commissioners could run their trams? I should think they would be able to run at about the same rate.
2813. The only great relief we could get for the city would be by means of a railway to take goods to the water's edge, and to carry passengers and distribute them in all parts of the city? That is so.
2814. That is the only thing which you think would meet the requirements at the present time? That is my opinion. As the city of Sydney is now, we only want to remove the heavy traffic from the streets, and the present means of transit would be adequate independent of a tramway.
2815. Do you think the construction of an electric tramway would relieve the congested state of George-street, caused by the 'bus traffic? I do not.
2816. Do you believe that the tens of thousands of people who travel by rail daily would be satisfied with the substitution of an electric tramway along George-street in lieu of a railway? I should think it would be about equal. I think that the railway passengers as a rule would be satisfied to travel by tram, provided the tram set them down somewhere near where they wanted to go. Coming into town as I do a little before 9 o'clock in the morning, I see the omnibuses are all crowded—the people seem to take to them—and the trams are also very fairly supported. I do not know that the trams would take away all the 'bus traffic in George-street, but I think that they would undoubtedly interfere with the omnibus traffic in that particular street.
2817. *Mr. Trickett.*] I understand that you are strongly in favour of an extension of the railway into the city, and of the management of the street traffic being vested in the City Corporation? Those are two points undoubtedly which I have uppermost in my mind. I think nothing else will do really well for the city of Sydney, and tend to its future advancement other than the extension of the railway round the city and the removal of the heavy goods traffic from the principal streets, such as Pitt-street, George-street, and York-street.
2818. In advocating that the traffic should be under the control of the City Council, have you any precedent for that;—you have travelled a good deal—can you tell us what prevails in London with regard to the management of the street traffic? I scarcely know now.
2819. Is it not under the control of the Police? I am informed about London only by what I read in the *Times*, the *Citizen*, and other papers, and I do look a little bit at public matters in that way. I think that they have acted very wisely in London, and set us an example which is worthy of our copying. They have two circles of railways—the inner circle and the outer circle—which take nearly all the passenger traffic, whilst the streets are also relieved of the heavy traffic from the wharfs and docks very materially by those underground railways. Why cannot we do a similar thing here. In a smaller way we are situated similarly to London, and I believe that in the last few years two or three schemes have been brought forward for the extension of the railway round the city of Sydney, either one of which if carried out, would relieve us of much of the heavy traffic in the streets, and would be of immense advantage to passengers who desire to be landed anywhere near their places of business in the city.
2820. *Mr. Clarke.*] You seem to be entirely against the proposed system of electric tramways along George-street? I am.
2821. Either a single or a double line? Yes.
2822. I think you have already stated that it would obstruct all kinds of vehicular traffic? I consider so.
2823. And also be dangerous to passengers? In a measure I think it would.
2824. You think that at the present time there is sufficient accommodation for passengers without having this proposed tramway? Yes; providing you remove from George-street, Pitt-street, and York-street the heavy traffic of drays and trollies and other vehicles conveying merchandise and produce through those streets which might go through other streets than the three principal streets of the city.
2825. Unfortunately the Transit Commission have control only over licensed vehicles, and that being so I think you have already stated that the vehicular traffic ought to be under the control of the City Council? I regard as one of the means of benefiting the city of Sydney the transfer from the Transit Commission to the City Council of the whole and sole command of the streets as regards traffic of every kind. I do not believe that any other body could possibly look after it so well as the Municipal Council could.
2826. You have said that the traffic in London is quite different from that here, but you cannot say whether its control is in the hands of the London Municipal Council? I do not know—I have been too long away from London. I scarcely know the powers of the London County Council. At all events, London is the model city of the world, and nearly everyone who goes to it from this colony comes away with regret and, says, "There is something to learn in going to London; look at their cabs, vehicles, and other means of transit."
2827. It is many years since I was in London, but I saw then, and I believe it is still the case, that a policeman, by holding up his hand either one way or the other, could regulate the traffic at the junction of several streets, and there was not the slightest difficulty in his controlling the traffic; I noticed this particularly near the Royal Exchange? Yes; a policeman can stop any vehicle.
2828. I suppose you think that legislation would be necessary in order that a similar system might be carried out here? It is necessary to do something. We have been a suffering public for a long time, and I think that no time could possibly be more opportune than the present for altering the existing state of things, and by the expenditure of a reasonable amount of money adding immensely to the comfort of the travelling public in the city of Sydney, removing many dangers by the introduction of other means of transit than now exist, and generally advancing our city and colony by showing that we wish to go to the front and get a railway round the city. I am an advocate of that beyond anything else.

J. Pope, Esq. 23 April, 1896.

2829. Assuming that we had a railway from the Redfern Railway Station direct to the Circular Quay, or a circular railway, would that interfere with the earnings of an electric tram, should such be built in George-street;—would not the two lines compete? They might; but I think that all sensible people would use the railway if it took them anywhere near the places to which they desired to go.
2830. If this tramway is constructed in George-street, I believe the Commissioners intend that it shall run as a two-minutes service; if that were so, do you think that it would not obstruct the traffic by vehicles of all other kinds, and even pedestrians, inasmuch as it would be difficult to cross from one side of the street to the other in many cases without accident? Well, to me it seems almost an impossibility to entertain the idea of running tram-cars at intervals of two minutes along George-street, up and down.
2831. But I think that the Commissioners intend ultimately to have a one-minute, or perhaps a thirty-seconds service? Well, they might as well run the trams continuously, and keep on running round and round without any break.
2832. Would that be inconvenient to those who have no means of access to their back premises, or places where they can go down to load or unload goods? It would be very inconvenient to those of us who have to bring our heavy goods up George-street in order to get them into our warehouses.
2833. Of course those who have premises the same as you have would not be much inconvenienced—you having a frontage to three streets? Well, probably we should have about six drays at a time standing on our side of the street, and when the tram-cars were going up and down nothing else could pass them. In the case of Wright, Heaton, & Co., in Market-street, sometimes owing to the immense amount of merchandise that passed through their hands, I have known as many as six of their double-horse trollies standing loading up in Market-street, and if there had been a tram in Market-street it would have been impossible for anything but the tram to have gone to and fro.
2834. You are, no doubt, aware, as we are, that the telephone system is very convenient for merchants and others throughout the city? Yes.
2835. We have it in evidence that if this electric tramway were constructed along George-street it would interfere with the whole of the telephones not only in the city but also in the suburbs, and that to obviate that it would cost a considerable sum of money to lay down what is called a metallic circuit, and that it would take several years to complete that metallic circuit;—would that cause any inconvenience to the public? I do not feel competent to express an opinion upon that.
2836. Well, supposing it were necessary to have a metallic circuit laid down, and that the carrying out of that work would virtually be the means of stopping the use of the telephones altogether for some years, you would not believe in such a thing as that being done, would you? No, I should not. I know that with the present noises you may very frequently ring your telephone two, three, or four times without getting any response, and when you believe you are put on at the Telephone Exchange you cannot hear anything.
2837. And very often, I suppose, you can hear what other people are saying? Yes: I have heard other people's remarks frequently. I should be very sorry to reflect on our telephone service, though, because, especially in my own private house, I have experienced very great attention and have found the telephone service a very great convenience; and when you are speaking to someone not in the city of Sydney it is all right.
2838. Are you of opinion that it is not desirable to have an electric tramway in George-street at the present time? I am of opinion it should not be placed there.
2839. *Mr. Lee.*] You are simply against any system of tramways in the main streets of Sydney? I am.
2840. No matter what traction might be used? I know nothing about the Harris-street tramline.
2841. But I am speaking of the main streets? I am averse to the introduction of any more trams in them.
2842. And your reason is that you believe in a circular city railway and nothing else? I believe in that for the convenience of the general traffic of the city, and I also think it will be found a necessity, as I have said, to arrange better for the heavy merchandise and produce traffic of the city.
2843. Supposing that a circular city railway were constructed, and it were then found that the traffic was so congested in the city that it was necessary to have some means of traction by which it could be moved in a quicker and cheaper manner, would you still be opposed to the tramway system then? Yes; I think so; besides, I think that the circular railway would be sufficient for this comparatively small city.
2844. But supposing that in the course of years the city railway did not meet the requirements of the city, would you, under those conditions, be opposed to the tramway? Yes, I would, if it were proposed to lay down a double line of rails in George-street.
2845. Do you seriously entertain the opinion that the construction of the city railway would lessen the vehicular traffic in the streets to any large extent? I am perfectly sure it would.
2846. Is it not a fact that in the city of London the vehicular traffic in the streets has increased since the construction of the underground railway? Yes; because the population has increased from 2,500,000 to 5,000,000.
2847. And will not the population increase here also? If we have good luck it will.
2848. In London you have a case in point where the construction of underground railways has not relieved the streets of vehicular traffic? Well, if we provide for present necessities and for those of fifty years to come, we shall have done our duty, and I do not think that we should do that by putting tramways in our streets.
2849. *Mr. Hassall.*] I gather from your remarks that you are of opinion that a city railway and also a tramway along George-street would not be necessary for the requirements of the people? I think that the railway alone will do it, without the tram.
2850. And you are strongly of opinion that the railway should be constructed to provide any further means of communication between the outlying portions of the city and suburbs and the centre of it? I am.
2851. Do you unload any goods in George-street? Yes.
2852. What opinion have you formed in the event of a double line of tramway being constructed along George-street as to what inconvenience you would suffer even in the matter of loading or unloading? Unloading more particularly.
2853. What vehicles do you have your goods conveyed by? The merchandise from the ships is conveyed by Shortland and Sons' drays, whilst my own drays convey goods from my warehouses to the different wharfs.

J. Pope, Esq.
23 April, 1896.

2854. What is the average width of those drays? I suppose 6 feet 6 inches or 6 feet 8 inches.
2855. Are those drays loaded or unloaded standing sideways to the kerb or backed in? Backed in in many cases.
2856. With the horses' heads standing out in the street? Yes.
2857. Then, with a clear way of about 9 feet between the cars and the footpath, do you think any inconvenience would be caused? Yes. Sometimes we have, say, two or three tons of merchandise on a trolly, and if the lifts are not ready to receive the goods, we may keep a dray like that standing for an hour.
2858. And that must of necessity interfere materially with the traffic of the street? No one else could go along that side of the street if the tram was going along, unless immediately before or after the tram.
2859. And if the tram service were a continuous one, as it practically would be, that would be very inconvenient? I think so. I apprehend that difficulty would occur almost everywhere. Supposing, for instance, a landau with a pair of horses drew up outside Jones', the jeweller's, and that the people in the landau alighted from it to go into that shop, where would the landau be able to go? If it stood there, there would be no possibility of getting between it and the tram.
2860. Do you think that the traffic of the city is fairly well served by the Elizabeth-street tramway? Remarkably well served, so far as that tramway can do it.
2861. But the main traffic of the city running north and south, and that line of tramway running north and south, you do not have to go any great distance in traversing the cross streets in order to reach the tramway to go to any portion of the city or suburbs you desire to go to? Not for a great many; but I do not think that that tramway serves the western part of the city well—that is, George-street and beyond.
2862. You mean York and Clarence Streets? Sussex, Clarence, Kent, and York Streets, and up to George-street.
2863. Do you think that a city railway embracing that portion of the city, which a western scheme would naturally do, would answer all requirements? I do.
2864. And it would be a suicidal policy to construct both the railway and the tramway? I think so. I think that the railway would do all that Sydney would require of it for the next half century, and it would also force a great deal of the trade of the city of Sydney into the outskirts of Sydney. All the trade of London is not now done in Cheapside and St. Paul's Churchyard, as it used to be when I was a boy, or nearly all of it. Some of it has gone to the west end of London. The underground railway has taken it there. You can get your merchandise by rail to the west end of London almost as quickly as you can get it to St. Paul's Churchyard. Why should not Newtown, Petersham, and Balmain each become an immense place; indeed they must be in the future, and if you give them railway communication with all parts of Sydney the goods could be carried to them by rail.
2865. It has been pointed out that in the course of time the population of Sydney must naturally increase? I think so.
2866. And, consequently, you think a railway system would better suit the requirements of the people, increasing as they must in number, than this electric tramway down the main artery of the city? That is my opinion.
2867. We have had a good deal of evidence with reference to the interference with the telephone system that might occur, and it has been pointed out that the current being so much more powerful on the electric tramway it would materially interfere with the operations of the telephone;—as a business man, do you look upon the telephone as a necessity now? I look upon it as a necessity, but if its benefits are any more impaired than they are, by extra traffic in the streets of Sydney, the telephone will become almost useless for telephonic communication in the city.
2868. And I suppose you would rather be without the electric tram than without the telephone? Certainly.
2869. As a business man, you find the telephone is absolutely necessary to enable you to carry on your business? Absolutely necessary—so necessary that I am obliged to keep three telephones going.
2870. *Mr. Fegan.*] I believe that, in answer to Mr. Black, you said that you were one of a number of gentlemen who, by their strong arguments, were instrumental in getting the tram-line in Pitt-street pulled up? I said that I was one of those who advocated the removal of the tramway from Pitt-street.
2871. Can you give the Committee a description of that tram-line—how it was constructed, and what was the motive power? The rails were certainly not laid exactly level with the surface of the road as they are on the present tramways—they projected a little. That was no doubt a great mistake. I know of two very serious accidents that occurred in Pitt-street, not far from my business premises. In one instance, two ladies riding along in their carriage got on to the rail and one of the hind wheels of the carriage came off, the horses bolted, and the two ladies turned a somersault into the street very soon afterwards, because one of the wheels of the carriage came into contact with the raised tram-rails; but, apart from that, I really do think that the passengers who travelled by the tramway at that time were not more numerous than those who went by vehicles along George-street.
2872. But what was the traction? It was a horse tram.
2873. The horses used there were no better than any other horses? I do not think they were.
2874. Therefore those trams gave no greater facilities to passengers than any other kind of vehicle? I do not think they did.
2875. Do you not think that the day has gone by when a city like Sydney should be served by horse trams? A horse tram is perfectly out of the question.
2876. Do you know the estimated profit that would accrue to the Government from the construction of this tram-line? I have not the slightest idea.
2877. Do you think it would be a good speculation at the present time to return 10 per cent.? I could not say; I have never estimated what the returns might probably be.
2878. You would not be afraid of going into a business speculation if you were assured on the best authority that that business would return you 10 per cent. net profit? No; I should like a thing of that sort.
2879. And do you think that the Government ought not to go into a speculation of that description? Not if it is to be by putting down a tramway in George-street to the inconvenience and detriment of all persons connected with business in that street, as well as property-holders. I do not think the Government has any right whatever to interfere with our incomes in that way.
2880. Do you not think that the tramway will be better for business people? I feel certain that it will will not. It will ruin George-street.

J. Pope, Esq. 23 April, 1896.

2881. Has not Mark Foy's business considerably increased since the tramway was laid in Oxford-street? I belong to Farmer & Co., and I do not know anything about his business, any more than that it is popular.
2882. Has not the traffic in Oxford-street increased considerably since the tramway was laid there? Yes; I daresay traffic has increased there, but many good tradesmen have been ruined in Oxford-street.
2883. How were they ruined? I think because people were afraid of driving along Oxford-street. People who drove there and stopped for business found they could not do so with safety when the tram was there.
2884. Have you any evidence to show that? I have only statements; I know that Riley Bros.' business was comparatively ruined there.
2885. Riley Bros. were also at the corner of Bathurst and George Streets? They are there now, but they were not then.
2886. Are you sure they were ruined by the tram? I am not sure they were ruined, but Mr. Riley has told me over and over again, "Our Oxford-street business is of no use since they put the tram there."
2887. Have not men in George-street been ruined without the tram? Many of them, I think.
2888. You have seen men go up and men go down? I have.
2889. Some went into business with large capital and were beggars before many years had passed? I do not know that I can go very much into that. I could not call many to mind.
2890. But there have been such cases? There is no doubt of it.
2891. Therefore, you could not say that it was tram traction that ruined them? Not in George-street.
2892. Do you not think that it may be a misstatement to say that tram traction has ruined people in Oxford-street? Not as regards the few who have spoken to me about it.
2893. Have you stood in Oxford-street any length of time and watched the tram traffic? I have never had time to do so.
2894. But before a gentleman makes such a statement he should be sure that people are afraid of travelling in the trams? I do not know that they are afraid of travelling in the trams, but they fear that if they were to drive their vehicles in Oxford-street, and were to stop outside any establishment, their horses might take fright, and back into the tram as it was passing. I think that the trams interfere with the private traffic in the streets.
2895. If there were a convenient tram service passing your door every two minutes, do you think you would take a cab? Every day I should do so in order to go to the Redfern Railway Station. I do it now. I seldom go up in the tram.
2896. But you have not got that convenient tram now? No.
2897. But if as soon as you got out of your premises there was a tram going to the Redfern Railway Station, which would convey you at the utmost speed, even faster than a cab, would you prefer a cab to the tram? I always take a tram down from the station, because there is a certainty as to the time at which the trams run, but I always take a cab to the station, because there is uncertainty as to what time a tram will reach the station.
2898. If there were an accelerated tram service, and it were more comfortable, do you think it would supersede the old steam tram service by holding out greater inducements to passengers to travel by it? I hold that a cable tram would far exceed the old steam tram.
2899. That being so, do you not think that the greater portion of the people who now do their business in Castlereagh-street would make their purchases at Farmer's or Lassetter's, if there were trams passing those large establishments, instead of making their purchases in Castlereagh-street? Any persons of common sense would go to a house like Lassetter's, I think, to do their business, rather than do it in Castlereagh-street. I know of no concern in Castlereagh-street where they could buy with equal advantage. Perhaps it may be thought too much for me to say the same of my own concern, but I do not think that any one would buy in any other street than Pitt-street if they could get what they wanted at Farmer's; but I am not going for the advantages to my own business or to myself.
2900. Take the case of a woman hampered with three or four children, as some poor people unfortunately are, if they could get a tram which would take them to your door, do you not think they would purchase in the cheapest market? If they came to my door they would, and no mistake.
2901. If the tram went to your door, which it does not do at present, do you not think that would give greater facilities to people to purchase? I do. Any means of transit that would lead to any particular place of business must be of advantage to it.
2902. I heard you say in answer to Mr. Black that the laying of a cable tram in King-street has hurt business there? I think it has interfered with the comfort of the travelling public in King-street, other than those who go by the tram. I do not know that it has injured business there. King-street is one of those particularly happy streets in Sydney—No. 1 in my opinion—the business of which cannot be interfered with. The traffic is there, and the business is there.
2903. You have the same in George-street—the traffic is there and the business is there? Other kinds of business are done in George-street altogether. There is no heavy traffic in King-street.
2904. Do you not know that, prior to the laying of the cable tramway in King-street, there was a number of business premises closed in King-street? Yes; I remember empty shops there.
2905. Do you see any there now? I do not know that there are.
2906. Therefore that disposes of the argument that the tram has ruined business? I do not say it has ruined business in King-street. King-street is a business street only in a very small portion of it; most of the places there are offices.
2907. Another reason why you are against a tramway in George-street is because of the narrowness of that street? Yes.
2908. In your opinion, which is the narrowest portion of George-street? Well, I take that portion from Market-street to the Circular Quay as being too narrow for tramway purposes. The only portion which, in my opinion, is fit for a tramway, is from the Haymarket up to the Town Hall.
2909. I suppose there are other busy cities in the world as well as Sydney, whose municipal authorities have just as much consideration for the people as we have—for instance, in Havre, with a road width of 33 feet and 25 feet, there are two tramways which carry a considerable number of passengers, and if they can do it there cannot it be done here? But Havre is a small place.
2910. Well, Birmingham is not a small place? No.
2911. Larger than Sydney? It has a little larger population, I think. I came from Birmingham.
2912. Do you know the width of the streets where the tram-lines are laid in Birmingham;—did you see the tramways there? Yes; I have been on them.

J. Pope, Esq. 23 April, 1896.

2913. And do you think the streets are wider there where the trams run? Yes; excepting in one or two places. But the principal streets of Birmingham, such as New-street, have no trams in them. There are no trams in streets like Pitt-street or George-street.
2914. Have you been in New York? Yes.
2915. And have seen the tram traction there? Yes.
2916. Is New York a larger place than Sydney? Slightly.
2917. Larger than London, is it not? No. The trams in New York are overhead trams running level with the second storeys of many of the houses.
2918. How long is it since you were there? About eight years.
2919. The trams are run in the streets now;—in all those places the streets are not much wider, and in many cases not so wide as George-street? I think that is very likely, but where we have one street like George-street they have about six. If they block a street like George-street they have five others as good.
2920. What have we as good as George-street? Pitt-street is not so wide as George-street.
2921. It is better as a business centre? Yes; it is now.
2922. And you think a tramway will not improve George-street? I feel certain it will not.
2923. I suppose you know the proposed system? I have not studied it, because I am not at all in favour of it.
2924. Do you not think that the construction of this tram-line will dispense with a great deal of heavy traffic—that people will not use the cabs or other kinds of vehicles so frequently? I do not suppose they will.
2925. And do you not think that that will facilitate matters? No; not from a commercial point of view. It would suit a great many people. It would be very advantageous for people who wished to travel to the Circular Quay wharfs to go to Manly or Watson's Bay, or other places down the harbour; but if we had a railway, look how well the traffic could be served by it.
2926. What about the pick-up traffic—I mean those people going along George-street from one street to another;—do you not think that the tramway would be a great convenience to them? No; in my opinion it is not necessary for them.
2927. In answer to Mr. Hassall, you said that sometimes the drays have to stand outside your establishment for an hour? Yes.
2928. Do you think that if the City Council had charge of the traffic they would allow your vehicles to stand there an hour? No.
2929. Have you not Market-street in which to unload goods if you wish? That is the place I am speaking of.
2930. Therefore, they do not stand either in Pitt-street or George-street? Yes; the drays stand right outside in the street there. We back in to unload in Market-street.
2931. You have three entrances then—in George, Pitt, and Market Streets? In George-street we go in the entrance across the footpath, and take the horses right down into the basement by a sloping road. I have accommodation for ten two-horse trolleys in the basement.
2932. So that the tramway would not materially interfere with you? No; but as the men can unload only one trolley at a time, we have sometimes four or five trolleys out in the street.
2933. Do you think your drays would be allowed to stand there if the Council had charge of the traffic? I do not know; but there could be no other traffic than the tramway if the drays were all there at the same time.
2934. But I understand that you would prefer to place the whole of the traffic in the hands of the City Council? I say that I think that would be a better course than the one at present adopted of having it under the control of the Transit Commission, which has not power over the streets, but only over the traffic.
2935. You think that would be better for the purpose of facilitating traffic? I think so.
2936. And conducting it through the various streets, according to whether the streets were busy or not with pedestrians? Yes.
2937. I understood you to say that if this tram-line were constructed it would interfere with the speedy construction of the city railway? I am of opinion that it would.
2938. Have you gone into a calculation as to what would be the return to the Railway Commissioners from a city railway? No.
2939. Do you not think that it is highly necessary, before we advocate the construction of a line, that we should know whether it would pay those who constructed it? I think you must make the line first, and trust to its paying.
2940. Do you not think that that policy has been carried out too long in this country? No. It would not be with our present Commissioners and the circumstances we are now placed in. There is no doubt that they would make the fares adequate to the amount of interest on the amount outlayed, and it would be a very safe investment for the Government to extend the railway round the city of Sydney.
2941. Have you proved it would be a safe investment for the Government? I have proved it to my own mind, and I think that any man who has any idea of the value of money, and the common interest on money, and the use of it, must look upon the city railway as an enterprise that he would not hesitate to go into. If such a thing as city of Sydney railway debentures were put on the market they would be taken up sixfold.
2942. But before you would go into a speculation you would count the cost? A little more than I used to do.
2943. That is more than I dare say, but if you were to advocate something in your own business you would count the cost before hand? In some measure, although it is imperative for you to have a good deal of speculation and enterprise now before you can get on.
2944. And caution as well? Yes, and caution. The tramway might pay, but I say that no similar mileage of line would pay so well as the city railway extension.
2945. But if a speculation were shown to you from which 10 per cent. interest could be obtained it would be worth going in for? Not to the detriment of anything that would pay 20 per cent.
2946. But is not this electric tramway part of a system to join ultimately the railway system? I cannot bring myself to think that the tramway is a necessity so great that the interests of the city, and especially on a street like George-street should be imperilled by putting a tramway down in it. I think we have no street in the city of Sydney adequate for a tramway and to be always reasonably comfortable for its inhabitants, to say nothing of their safety; and this tramway would be to the convenience of a few and to the great detriment of the many, I think.
2947. So whether it is steam, electrical, or cable, you are against the construction of a tramway in George-street or Pitt-street? I am.

J. Pope, Esq. 23 April, 1896.

2948. *Mr. Roberts.*] You spoke about the congested traffic of George-street, more particularly what is known as the heavy traffic, and you suggested that it should be under the control of the City Council;—would you mind, as a man of long residence in the city, and of great business knowledge, telling the Committee what you think ought to be done with a view of relieving this traffic—what regulations you would suggest should be carried out? Any heavy traffic might be conveyed up and down Pitt-street up to 8 o'clock in the morning or after 10 o'clock at night, if necessary. The heavy traffic now allowed to go through the streets—more particularly George-street and Pitt-street—from Circular Quay or any of the wharfs to the Railway Station at any time between 8 o'clock in the morning and 10 o'clock at night ought not to be permitted, and I think that the Transit Commission, although the members of it may be well-intentioned, as doubtless they are, towards the general interests of the city and its residents, has never had any gentleman upon it who understood the inconvenience which the commercial community of the city experience in getting about the city to do their business when their vehicles are continually met by heavy drays and other similar vehicles. If these were all compelled to use the side streets between 8 o'clock in the morning and 10 o'clock at night, we should have much greater freedom. It wants a power to do this; I do not know what power could.

2949. What you mean is that, in going from Circular Quay to the Railway Station, a certain route should be laid down? I do; and that that route should not be along the two principal thoroughfares.

2950. Could you tell us what that route should be? I should take Sussex, Kent, and Clarence Streets, on that side. But the best means of transit would be a city railway.

2951. You will admit that it would be rather a difficult matter to lay down a hard and fast rule as to where drays and other vehicles should go? It would be.

2952. As a matter of fact, it would interfere with freedom in carrying on business? It would.

Philip Billingsley Walker, Esq., M.I.C.E., M.I.E.E., Secretary to the Electric Telegraph Department, sworn, and further examined:—

P. B. Walker, Esq., M.I.C.E., M.I.E.E. 23 April, 1896.

2953. *Chairman.*] You have had an opportunity of seeing the evidence that has been given in regard to your statement previously made? I have.

2954. Have you seen the evidence as far as we have gone? I have not got Mr. Raw's evidence, nor Mr. Webb's; I have Mr. Callender's evidence, and I should like to have a copy of the other gentlemen's evidence.

2955. You have seen Mr. Callender's evidence? Yes, I have; and I do not attach any importance to Mr. Callender's evidence, because he has had no practical experience in the construction of telephone works. He is merely an electric lighting engineer.

2956. Would you attach any importance to what Mr. Webb might say? No; he has had no practical experience in the construction of telephone works.

2957. Would you attach any importance to Mr. Raw's evidence? I do not know what experience he has had in connection with either telegraph or telephone lines; I have not heard of him in connection with their construction.

2958. Do you absolutely maintain your own figures? I maintain my own figures, and I can prove that Mr. Callender's evidence is erroneous.

2959. Do you desire to make any reference now to Mr. Callender's evidence? Yes. I desire to direct your attention to Question 2176, in which Mr. Callender says that No. 12 copper-wire would be 104 lb. to the mile, whereas it is really almost twice as much, it being 200 lb. to the mile, which, on his own estimate, would make a considerable difference. With regard to Question 2296, the tender price there quoted in "tenders accepted" is correct; that is to say, as regards galvanised-iron wire, insulators, and tins. The item of 3,150 miles of No. 12 wire, I desire to say is only the bare cost of the wire in the store in Sydney, and no carriage is allowed for it.

2960. Are the insulators, fifty per mile, sufficient? That is entirely wrong. Each pole in the city has 132 insulators on it, which would make 660 insulators to the mile, there being thirty poles to the mile, but that of course would not be the average.

2961. How many poles have you with 130 insulators on them? The number that I stated in my last estimate referred to the whole system.

2962. How many was that? Well, we have a very large number of them; I cannot tell you exactly at this moment, but his average is entirely wrong; it would give 1,960 to the mile in place of fifty.

2963. What is the largest number of insulators on any pole? One hundred and thirty-two.

2964. Can you tell us how many poles have the maximum number? I could not tell you exactly.

2965. What is the smallest number of insulators on any poles? Well, I suppose there would be one insulator on one pole in some cases, but that would be in the suburbs.

2966. What is a fair average of insulators? I should say 100 to 110.

2967. How many insulators have you in the whole of the telephone service? I could not tell you, but I can calculate it.

2968. Mr. Callender has got down 157,500 as being required;—is that number correct? I think it would take more than double that number.

2969. In addition to what you have already? In addition to what we have already; at all events, half as many again as he has calculated for.

2970. Can you tell us definitely how many insulators you propose to put up? I could give details of this. Mr. Callender simply calculates the insulators at 7d. each, and that is the cost in store in Sydney, without allowing anything for carriage.

2971. What about cross-arms 80,000?—Taking these at his own estimate, which I do not admit is correct, he has left out altogether the nuts and bolts.

2972. Will you tell us how many cross-arms there ought to be? There are twenty-two cross-arms on each pole, but I could not give you the number without counting the poles.

2973. Will you take his price for the cross-arms? Certainly not. The price that we are paying for cross-arms is 9d. for short ones and 2s. for long ones, averaging 1s. 6d. each; so in that instance there is a great discrepancy.

2974. The price of the bare cross-arms is 9d. and 2s.? Yes; and they all have to be bored with six holes

holes prior to being put on the post, and then painted. Taking his own figures for the cross-arms, he has left out the cost of 80,000 bolts and nuts. P. B. Walker, Esq., M.I.C.E., M.I.E.E. 23 April, 1896.

2975. What do you say they will cost? £1 per cwt., and it takes ½ cwt. per mile.

2976. Is it a fact that when the telephone wires are put in a subway it becomes essential to use a metallic circuit? Certainly not.

2977. In support of that attitude, what information can you furnish to the Committee? If a cable is put in a subway it will work just as well as it will if hung overhead in the streets. In the streets it is exposed to every kind of weather; if put in a subway it is protected. We have at present seven or eight circuits working across to North Shore, under the harbour, on a single wire, for telephone purposes, and if the cable works under the harbour where it has the pressure of the water on it, it will certainly work in a subway where it has no pressure whatever on it. In addition to that, I have proved that Mr. Callender's statement is simply imagination. We have worked a system of telephones in connection with the forts for a considerable time, underground, and we worked them very well. Of course the system had to be altered recently, in consequence of the effect of the cannon on the working of the telephones at the Heads, but that is the only reason why the metallic circuit had to be introduced.

2978. Do you know any places where the telephone wires are placed in a subway and there is no metallic circuit? I could not say. I know that in America there are some places where cables are worked underground.

2979. You emphatically deny that a metallic circuit is necessary? I emphatically deny it.

2980. The construction of the subway does not in any way bind your telephone service to a metallic circuit? No; it does not. I may say that the idea that the subway was started for the purpose of putting metallic circuits in is quite a mistake, for the subway system was started in 1885 by the late Mr. Cracknell, long before metallic returns were ever thought of. The first subway was constructed up Moore-street, and the system is being perpetuated now only for the purpose of getting rid of the overhead wire difficulty, because we find that we cannot possibly put any more wires on those poles with safety.

2981. Is a metallic return valuable in a telephone service? Of course it is valuable.

2982. Does it make it a more effective service? Certainly.

2983. Is your Sydney service complete or satisfactory at present? It is quite as complete as any other system of its kind.

2984. Would it be a better system if you had a metallic return? It would be a better system, but a more expensive one.

2985. Do you believe that eventually Sydney will require to have a metallic return? I do not believe that it will be required for the next twenty years. I said the next ten years, but on looking over the matter since, I do not believe that it will be required here for the next twenty years. Since the Committee brought this matter up I have been looking into the systems worked in other countries. I find that Berlin, in 1893, was working a very large system entirely on the earth circuit, the subscribers numbering 17,000; and it has not been altered since.

2986. Do you believe that in the future a metallic circuit will be adopted in Sydney? I do not believe that it would be put in for the next twenty years; it would not be necessary.

2987. What percentage is your telephone system paying now? Fifteen per cent. The cost was between £90,000 and £100,000; but, as I have said, it is rather difficult to get at the exact cost, and that is merely the approximate cost. It may have cost £40,000 or £50,000 more, because it was all mixed up with the telegraph business in the early days, and has only recently been separated.

2988. The telephones are paying 15 per cent.? Yes.

2989. Is that gross return or net return? That is net return, after allowing for everything.

2990. Do you think that you are giving your telephone subscribers a fair service? I think so. I think that the telephone system in Sydney will compare favourably with any telephone system in the world. I have had numerous proofs of this from gentlemen who have travelled all round the world.

2991. It would be a better telephone system if you had a metallic return? It would be a much better service as regards induction.

2992. Have you any knowledge of electric trams running in any city without interfering with the telephones? No; I have not.

2993. Do you believe that would be possible? I do not believe it would be possible to have electric traction wires without interfering with the telephone.

2994. If you were informed that by abandoning the trolly-wheel and having a sliding contact almost the whole of the difficulty in regard to the telephone service had been obviated, would you believe it? That may be a matter of opinion.

2995. If you found there were cities in which it was so? Where is there a city in which it is so.

FRIDAY, 24 *APRIL*, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (Chairman).

The Hon. Frederick Thomas Humphery.	Charles Alfred Lee, Esq.
The Hon. John Davies, C.M.G.	John Lionel Fegan, Esq.
The Hon. Charles James Roberts, C.M.G.	Thomas Henry Hassall, Esq.
The Hon. William Joseph Trickett.	George Black, Esq.
Henry Clarke, Esq.	Francis Augustus Wright, Esq.

The Committee further considered the proposed Electric Tramway from Circular Quay, Sydney, to the Redfern Railway Station; and also along Harris-street to the intersection of John-street.

P. B. Elwell, Esq., Electrical Engineer, Department of Railways, sworn, and further examined:—

2996. *Chairman.*] Do you desire to make any comment, from a professional standpoint, with regard to any of the evidence that has been given by other witnesses? I have read the evidence of Mr. J. O. Callender, given on the 16th and 17th inst., and regret that he did not make himself acquainted with the electrical details of the proposed tramway before expressing so decided an opinion upon the effect it would P. B. Elwell, Esq. 24 April, 1896.

P. B. Elwell, Esq. 24 April, 1896.

would have upon the telpehone system. Mr. Callender has apparently taken it for granted that the proposed tramway would be no improvement (electrically speaking) upon the line constructed three years ago at Leeds upon which the English experts based the opinions quoted in Mr. Walker's evidence, and, as the statements made by such authorities as Lord Kelvin and Dr. Hopkinson are not to be doubted, Mr. Callender could not well differ from them. But the electrical details of the proposed tramway are no more to be compared with that line at Leeds than with the Military Road line, constructed about the same time; consequently Mr. Callender's opinion, being based upon mistaken suppositions, is not of the value it might have been. The Board of Trade regulations, issued a year ago, provide for such conditions being observed in the construction and working of electric tramways as to very materially reduce the disturbance of telephone systems with earth returns. These conditions have been observed without difficulty or undue expense since these regulations were put into force, and in no case have I heard of any complaint. But, in regard to the George-street scheme, we have gone far beyond the Board of Trade rules in perfecting the electrical details; in fact, I am not cognisant of any tramway in the world with which it would compare in this respect. Consequently I feel justified in saying that the telephone system will not be materially affected by it. As regards metallic circuits for telephones, it is universally agreed that it is the only perfect system, and they appear to have been introduced without any special regard to electric tramways. For instance, Paris, London, Glasgow, Edinburgh, Newcastle, and Hull have no electric traction wires, whilst all have adopted the metallic circuit for their telephones. Although there are electric tramways in New York, they were certainly not the cause of the metallic circuit being adopted in that city—the latter having been in existence much longer. The Railway Commissioners were the first to adopt metallic circuits for telephones in this country, they having now about 200 miles in use. The alteration was necessitated by the introduction of quadruplex telegraphy by the Postmaster-General. The currents used in this system possess characteristics most favourable for disturbance of telephones, being both alternating and intermittent, and it was found practically impossible to use telephone lines running parallel with the quadruplex telegraph wires. However, the Commissioners, recognising the public utility of the improved telegraph system, did not suggest that the Postmaster-General should pay for metallic circuits on the railway telephones, but carried out the necessary alteration at their own expense, the result being most successful. The Corporation of Birmingham has recently decided to allow the introduction of the overhead wire, carried on poles in the centre of the street, for traction purposes, and I have heard of no action on the part of the telephone company, although I believe they still have earth circuits in that city.

2997. Are you sure that in Birmingham they have an earth return? They had when I was there; I have not heard of their altering it.

2998. How long ago was that? Last July.

2999. Then it is highly probable that they still have an earth return? Yes.

3000. You have just said that you feel justified in stating that the proposed tramway "will not materially affect" the telephones? Yes; I did say so.

3001. Why do you use that qualifying term? Because it must be a comparative.

3002. Will the tramway affect the telephones at all? Yes, for induction in one wire must affect another wire, and it is a question of degree; but the effect would be so small that it would be unnoticeable compared with the existing disturbances.

3003. You do not dispute the fact that it will affect them somewhat? Theoretically, it must do so.

3004. Much depends on the excellence of your works, and the distance of the telephone wires from them? Exactly.

3005. Was it universally acknowledged, or was it the uniform opinion three years ago, that the trolley system of tramways must affect the telephones? Yes, it was.

3006. Is that the opinion to-day? No.

3007. How has that alteration of opinion originated? The principal reason why the disturbance on the telephone wires has been reduced is that the return circuit for the electric trams has been perfected. That is the most important reason.

3008. By what alteration has the electric return been perfected? Three years ago it was generally considered that a copper wire, about $\frac{1}{4}$ inch in diameter, connecting the ends of the rails together, would be sufficient for all purposes. Since then it has been found that it was far more economical for the tramway companies to use a very much larger copper bond; in fact, the most economical size is a bond that will be equal in conductivity to the rail itself—just the same as if the rail were one continuous steel bar, and, although it has never yet been done to that degree, we intend doing it so in George-street.

3009. Increasing the size of the bar, and making more perfect contact, has provided a complete metallic return? Yes.

3010. Is there any other improvement—I suppose that we should look for improvement in the car, the running road, the overhead wire, and the trolley? Yes. Taking the overhead wire, the ordinary condition of trolley working is somewhat imperfect, and that produces a slight break in the current frequently, as the car runs, and every break in the current causes an induction in surrounding wires. That we intended to overcome either by not using a trolley at all, or by using a trolley and a sliding contact behind it; so that if the trolley left the line by one-sixteenth of an inch at any moment the sliding contact behind would still keep the circuit. By that means you can practically prevent any making and breaking of contact with the trolley wire.

3011. Now with regard to the car? In the motors on the car the controller has a great deal to do with the variation in current. The first controllers that were made were very jerky in action—there were not sufficient points of variation in them, and not only did it produce an uncomfortable motion in the starting of the car, but also induction on the surrounding wires. During the last twelve months only they have improved these controllers to a very great extent, and now the motion is perfectly smooth, so that the variation of current instead of being sudden is carried out gradually. There is another point, and that is in the generator at the station. Working with a single generator, as we do on the Military Road line, the smallest variation in the continuity of the current, caused by a slight imperfection in the commutator of the machine where the current is collected, causes an induction in the wires, and it is quite easy for anyone listening on the telephones running along the Military Road to know whether the commutator of the generator is in good order or not; and if there are complaints of noise on the Military Road, you may be pretty sure that the commutator of the generator has something to do with it, and requires attention.

P. B. Elwell, Esq. 24 April, 1896.

attention. It is only a small machine comparatively. In George-street we should use at least two large machines running together in such a manner that any slight imperfection of current on one would be balanced by the other, and so produce a continuous current. In addition to that, there would be a battery of accumulators at Redfern which would also take up any slight inequality of the current, and that would really produce a more continuous current than has ever been used on a tramway yet. There is another small point which is of some importance, and that is why we intended working the George-street line on what is called the three-wire system—say, a section between the Railway Station and the Town Hall would be worked by a positive current, and the section between the Town Hall and the Circular Quay by a negative current. Any imperfection in one current would tend to be neutralised by an imperfection in the other current, because, instead of both tending together to cause induction, they would tend to neutralise the induction caused by each other. I think those are all the points.

3012. The absence of good bonding or the use of one of the old trolley wheels or inferior carriages would create a disturbance on some of the telephones? Yes.

3013. In your previous examination you emphasised the question of the bonding; you mentioned, I think, that the cars were all first-class;—how is it, in that the whole question was apparently dominated by this sliding contact, or bow or show—call it what you see fit—that you did not emphasise that previously? I believe I did refer to the sliding contact in my evidence.

3014. You see it is really the bonding that, apparently, dominates the whole case, because if we had an ordinary trolley wheel, as the public know the trolley, and as it is used in most other places, the whole thing would break down from that perhaps—is that so? Yes; owing to a very bad contact, it might break down.

3015. You say that the cars, being smooth-running cars, the road being made perfect, as previously explained—properly bonded—there being a sliding contact for the overhead wire, and direct currents from Redfern, controlled to some extent by proper generators, this would make the thing absolutely safe? Yes. There is one point I did not mention, and that is the contact between the wheels and the rails, which is just as important as the contact between the collector and the overhead wire. In George-street, in fact in any streets in the city where there was continuous traffic, I do not anticipate any difficulty under that head, because the rails will be kept fairly clean by the passing of the cars. On the Military Road a car runs only every three-quarters of an hour or half-hour, and the sand and dust are blown upon the rails, and a bad contact is thus made.

3016. Has the *Electrician* of the 10th January, 1896, been brought under your notice? Yes.

3017. Have you seen an article on "Electric tramways and telephone disturbances," by Mr. Du Riche Preller? Yes.

3018. Do you agree with that, on general principles? Yes; he is quite correct in what he says, so far as good contact is concerned.

3019. Is he regarded as an authority in the electrical world? He writes a great deal; and he must have examined into nearly every system in Europe very carefully, I should say, judging from the way he describes them.

3020. Does the electrical world regard him as a pretty competent man, as a rule? Fairly competent.

3021. His opinion should carry some weight? Yes.

3022. Is it a fact that the perfecting of this sliding contact within the last year or two has minimised the difficulty with regard to telephones? There is no doubt that is so.

3023. If a telephone service cost £100,000 in the first instance, would it cost £200,000 to put in a metallic return for it? No; it would not.

3024. Supposing the service in the first instance cost £100,000, would it cost anything like £100,000 to put in a metallic return to it? I do not think it would.

3025. Supposing telephone wires are placed in a subway, does it then become essential, for efficient working, to put in a metallic return? Yes; it does.

3026. Why does it? Because the wires run in the cable so close together that the induction between them would be much worse in the subway than it is on the overhead lines. It might be overcome to a certain extent by modifying the cables—using only half the wires in the cables, and connecting the others together so as to neutralise the induction; but I would not like to say definitely how it could be done. Perfect insulation can be secured, but the very fact of the wires going so close together produces a magnetic effect on each other, and the only way to neutralise that, perhaps, is to have a double circuit.

3027. Do you believe that it will be essential, eventually, to use a metallic circuit for Sydney, whether you have electric traction or not? Certainly I do.

3028. Can you give us any information with regard to the telephones in subways in any part of the world? No. I did not go into the question of subways.

3029. Can you say whether they have metallic returns or not? I believe that, invariably, they have. I should be very surprised if there is any instance of telephone wires in subways without metallic returns.

3030. There is no doubt in your mind that all electricians would agree that, having placed the telephone wires in a subway, there should be a metallic return? Yes, I believe they would.

3031. Therefore, you infer from that, in that the Department in charge of telephones is making subways, it contemplated having a metallic return? Yes, I do.

3032. Will you briefly state your objection to the conduit system? First, on account of the great cost; secondly, the difficulty of drainage in a city with such gradients as Sydney; thirdly, on account of the break in the system, it being economically impossible to continue the conduit system into the suburbs.

3033. *Mr. Trickett.*] To-day we have received from Mr. Deane a document dated 22nd April, and written after conference with you—I suppose you are acquainted with the nature of that document? Yes.

3034. Would you mind giving us some explanation of this. When you were asked Question 1345—"Do you consider that [meaning the North Shore tramway] a satisfactory electric tramway now"? You said "Yes; it has been working very well for the last eighteen months," and at Question 1330 you say, "I have not heard recently of any complaints about the telephone wires being interfered with." In this document, for which you are responsible, you devote three pages to defects of and remedies for the electric tramway at North Shore;—would you explain how it is that the other day you spoke of the North Shore tramway as being a satisfactory electric tramway, and said that you had not heard of any complaints, and now you come in with a long document containing three pages of complaints and remedies? It is only a question of degree. All these causes of disturbance on the Military Road line do not prevent speaking along the line, but they certainly contribute to the difficulties of speaking.

3035. But do you not think that it would have been fairer to the Committee for you to have told us all these

P. B. Elwell, Esq. 24 April, 1896.

these three pages of objections the other day instead of now, we apparently having wasted days in taking evidence on a matter which is cleared up by your statement to-day? It was so difficult for me to select the details; but I made it clear, I thought, that any make or break in the current at any time, no matter whether in connection with the trolley-wire, the rails, or anything else, caused induction, and the point was to reduce it as much as possible.

3036. But I understood you to say then that you had completed the bonding of the rails? No; we had only done what we could with economy—that was, to connect the rails with the water-pipes. They have never been bonded. I am sorry I did not go into more detail, but I did not know it would be expected.

3037. At Question 1330 you say, "On the Manly road I originally arranged for the tram-wire to be carried on the same poles as the telegraph wires, thinking that it would look far better. This plan has been tried in the other cities since then, though it had not been carried out then, and it has been shown that there is no objection to it"—whereas we have it as a matter of fact on record that at the Telegraph Conference in Melbourne, held not long ago, the Superintendent of Telegraphs in Tasmania stated that the tram-wires there had been placed on the same poles as the telegraph and telephone wires, and they had to be removed because they interfered with the telegraph wires;—do not those two statements seem to conflict? Yes; but I do not think that that was the reason for their removal. I might mention that in Vancouver—where they have a very fair telegraph and telephone system on the earth circuit principle, they told me that they found no difficulty at all from having the telegraph wires on the same poles as the electric tramway wires, and that it seemed a sensible system to follow out.

3038. As regards one of the remedies to prevent the disturbance of telephones, Mr. Deane in this document says "the return conductor will be of a most perfect character known, the joints of the rails presenting no higher resistance to the passage of the current than the body of the rail. This has only as yet been achieved on a very few systems";—will you kindly tell us where are the systems where this jointing has been tried and found to be a success? In Cleveland, Buffalo, and Chicago.

3039. Those are the three places you refer to? Where I have seen the best bonding—the nearest approach to perfection.

3040. So we come back to the old thing—"the nearest approach";—you will admit that it is not perfect as a corrective? I think we can improve a little on it in George-street.

3041. Since you gave evidence before, Mr. Walker has produced letters stating that there were very many complaints with regard to the working of the telephone system to Manly Beach;—have you heard anything of complaints in that direction? I have not heard of any complaints since we connected the rails with the water-pipes and introduced the new generator at the cable-station, excepting that I have heard there are noises in the telephone when the commutator of the generator is in bad order. I have also heard from people who use the telephone that they do not consider the tramway causes any material inconvenience.

3042. If this Committee recommend, and if Parliament authorise, the construction of this proposed electric tramway, will you undertake to so perfectly construct the electrical portion of the tramay that you will neutralise any interference with the telephone wires? Yes, I will.

3043. You will undertake, as an electrical engineer, to neutralise in every way that effect, not by any dealing with the telephone wires, but by a perfect construction of the electrical portion of the tramway? Yes, I will, simply by a perfect construction of the electrical portion of the tramway.

3044. *Mr. Lee.*] Could the electric-traction wire be used for an electric-lighting wire? Yes,

3045. Could the electric-traction wire be utilised to light lamps on the top of the standard poles? Yes.

3046. Is not one of the conditions for electric-lighting a continuous and uninterrupted flow of electricity? No; it must be a constant potential—that is to say, a constant pressure of current.

3047. Well, inasmuch as with the trolley traction there would be makes and breaks—that is, having an intermittent power—would that not seriously interfere with the lighting? Not on the poles. It interferes slightly with the lighting in the cars, because they come under the influence of the make and break, but the lights on the poles would not come under that influence at all.

3048. Do you attach importance to that distinction? No; because by means of the good contact that we should obtain the lights in the cars would be just as good as if they were on the poles.

3049. You have no doubt that the light for the lamps could be obtained without any flickering? There is no doubt at all that perfect lighting might be obtained from the tramway current.

3050. There seems to be a difference of opinion on that point among other engineers? It all depends on the provision made for the constancy of potential—that is, the constancy of pressure on the mains.

3051. Under the system that you have proposed to the Committee, the lighting of the lamps on those standards will be easily possible? It should be perfectly steady—there should be no interruption.

3052. Will it require any increased power at the power-house? It depends on how much lighting is done, but in any case for lighting the line of route it would not be a material matter.

3053. It might be thought by the civic authorities that it would be desirable for you to light the streets of the city from the lamps on the top of those standards. If they arrived at that conclusion, would it be possible to do it with the system you are going to lay down? Yes, perfectly.

3054. Without any increased cost? It would mean only a few more pounds of coal burnt at the station.

3055. It would not mean any increased power at the power-house? Not materially. No extra plant would have to be put down.

3056. You say that the surplus power could be utilised for lighting purposes? Perfectly well.

3057. You are very clear on that point? Very clear.

3058. It is an important point with me, and I should like you to be very clear upon it;—have you thought it out? Yes; I have thought it out.

3059. And given it very fair consideration? Yes.

3060. And you unhesitatingly say that it could be done? Yes; it could be done.

3061. *Mr. Clarke.*] In answer to Mr. Trickett, you stated that you would undertake that no interference with the present telephones should arise from the construction of the proposed electric tramway? Yes.

3062. You are certain of that? Yes.

3063. And without metallic circuits? Yes, without metallic circuits.

3064. *Mr. Fegan.*] I think you gave us to understand, when you were here before, that we could never look for the North Sydney tram-line to be anything like perfect, seeing that it was not intended in the first place for electric traction? Yes; it would mean a heavy outlay—practically remaking the whole of the electrical work along the line.

3065.

3065. And that was a very cogent reason why it was not so successful as you would like it to be? Yes.
3066. But I suppose that if there were sufficient traffic to warrant the expenditure of a large sum of money you would be prepared to-morrow to make it as good as any tram-line running? Certainly I would. The question is purely one of expense.
3067. In reference to the poles which it is proposed to erect in George-street, is the drawing before the Committee a fair representation of one of them? Yes; it is a fair sample of the poles proposed to be used.
3068. Where do you propose to put those poles;—in the centre of the street? Yes.
3069. Do you not think that they would be dangerous to traffic? I have seen such poles in similar positions in different cities of the world, and they did not in any way appear to present difficulties to the traffic. On the contrary, they appeared to be conveniences.
3070. In what way? Mainly by dividing the traffic and forming refuge-places for people crossing the road.
3071. How many feet will a pole be from the car itself? The usual distance will be from 2 feet to 2 feet 6 inches. In Minneapolis the cars ran within about 6 inches of the poles, and in order to protect passengers in the cars from accident, through putting their heads out or doing anything of that sort, the windows would lower only about 6 inches on that side, and the passengers got out at the ends, whilst in open cars with cross-seats they had the wire lattice on that side of the car.
3072. So you prevent the people from getting out on the same side as the poles are? Yes; in any case.
3073. There is no fear of a person jumping out on the same side as the poles are? None at all.
3074. Do you know the Port Rush tramway in Ireland? Yes.
3075. Do you know that it is stopped at the present time? I believe it is stopped at the present time in order to undergo certain alterations required by the Board of Trade.
3076. It was constructed before the regulations of the Board of Trade were issued, was it not? Many years.
3077. The cars were open cars, and people could get out on whichever side they thought fit? Yes.
3078. Therefore, there were not sufficient precautions taken against accident or loss of life? No precautions were taken.
3079. People could jump out on the side where the poles were? There were no poles, but only an elevated rail, which they could trip over.
3080. But here you say you will have the side of the car enclosed so that passengers cannot get out on the side where the poles are, and that will prevent accidents? Yes; certainly.
3081. Why was it necessary to bring the Port Rush line into conformity with the regulations of the Board of Trade? It was altogether out of conformity with the regulations. The return rail was far below the requirements of the Board of Trade, and liable to electrolysis, corrosion of pipes, or anything of that sort.
3082. What brought the matter before the Board of Trade? I do not know.
3083. Is it not a fact that two men were killed there? There have been accidents from time to time. I remember the case of a horse drawing a cart and falling over the elevated rail. This occurred on a wet day. The man went to the horse to try to pull it from the rail by its hair; he got a shock, and the current knocked him nearly over. There have been several other similar accidents.
3084. And quite recently an English tourist was killed there owing to the unsafe condition of the tramway? I heard of a man falling against the rail and being stunned by the fall, and then, from lying on the rail, he was practically burnt. That, very likely, led to the Board of Trade stepping in.
3085. *Mr. Roberts.*] Do you regard it as a well-known fact that underground telephone wires cannot be so successful except in conjunction with metallic returns? Yes.
3085½. There is no metallic return in connection with the cable which is laid under the waters of the harbour from Sydney to North Sydney, and it is said that inasmuch as that cable works satisfactorily without a metallic return, therefore a metallic return for wires in a subway is not absolutely necessary;—is that a fair argument? The cases are not quite parallel.
3086. Would you be kind enough to explain in what way they differ? The cable across the harbour is comparatively short, and it has very few wires in it. The two things which cause induction are the distance the wires run close together, and the number of them in the cable—the more in the cable the greater the interference, and the greater the distance also the greater is the interference.
3087. *Mr. Wright.*] You stated, in reply to Mr. Trickett, I think, that whereas three years ago electric trams destroyed the utility of telephones unless they were provided with a metallic return, that is not now the fact, by reason of recent improvements in the construction of the tramways? Yes, that is so.
3088. Can you quote any authorities in support of that statement? In the evidence given before the Joint Committee of the House of Lords and the House of Commons they referred to the question of improvement in detail reducing the disturbance.
3089. But they distinctly say they do not think that anything short of a metallic circuit will be sufficient? It was so at that time. I think the best instances would be the cases of Bristol and Coventry. The systems there have been carried out under the Board of Trade Regulations, and it is reported that there is no disturbance of the telephones.
3090. Have the telephones there an earth return? Yes; an earth return in both cases, I believe.
3091. You know of no recognised authority in support of your statement? I cannot now quote one.
3092. *Mr. Lee.*] In the event of this electric tramway being constructed exactly on the lines of your proposal, and if after it is brought into operation it is found that it is contributing to the telephonic disturbance, would it then be possible to effect a remedy of the telephone service at a cost not exceeding the estimate that has been placed before us by Mr. Walker and other experts? Yes; if it were found that there was still a disturbance in the telephones, induction coils could be arranged on the tramway overhead wire, which, by acting against the induction of the wire, would neutralise the effect, and that would not entail any material expense.
3093. It would not be costly? No; it would not cost £200.
3094. But supposing that you had to go the whole length, and apply the metallic circuit to the telephone system after your tramway had been constructed, could it be done at the same cost then as before the tramway was constructed? Certainly; as far as I know, it could be done.
3095. Or, in other words, the construction of the tramway does not necessarily mean the permanent obstruction of the telephone? In no way.
3096. Supposing your own theory did not pan out exactly as you expect, you say, "I could get over that

P. B. Elwell, Esq. 24 April, 1896.

in two ways—one by these induction coils, and the other by applying metallic circuits to the telephone system, if necessary, at a cost no greater than it would be before"? That is so.

3097. *Chairman.*] Have you any objection to the poles which you propose to erect in the middle of the wider parts of George-street being done without, and the wires being suspended from poles erected on the kerb-line? No objection whatever.

3098. The scheme will be as efficient? Yes, in every way.

3099. Therefore it is possible to leave the street clear with the exception of the route taken by the tramway itself? Yes.

3100. It would be as clear as it would be if you had a conduit or a cable tramway? Just as clear.

3101. Would the poles along the kerb-line interfere with the fire brigade operations? No; I do not think so at all. The cross-wires would only be every 40 yards, and the height would clear all the fire-escapes and everything of that kind.

TUESDAY, 28 *APRIL*, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (Chairman).

The Hon. Frederick Thomas Humphery.	Charles Alfred Lee, Esq.
The Hon. John Davies, C.M.G.	John Lionel Fegan, Esq.
The Hon. Charles James Roberts, C.M.G.	Thomas Henry Hassall, Esq.
The Hon. William Joseph Trickett.	George Black, Esq.
Henry Clarke, Esq.	Francis Augustus Wright, Esq.

The Committee further considered the proposed Electric Tramway from Circular Quay, Sydney, to the Redfern Railway Station; and also along Harris-street to the intersection of John-street.

Philip Billingsley Walker, Esq., M.I.C.E., M.I.E.E., Secretary to the Electric Telegraph Department, sworn, and further examined:—

P. B. Walker, Esq., M.I.C.E., M.I.E.E. 28 April, 1896.

3102. *Mr. Humphery.*] You recollect the statement made by the Postmaster-General a few months ago as to the earnings of the telephones? I am not responsible for that.

3103. But you recollect the statement? I do.

3104. Who furnished the information? I did not.

3105. Then you cannot speak as to the accuracy or inaccuracy of the figures? No.

3106. Have you since prepared a statement as to the earnings of the telephone? I have not such a statement at the present moment; but I am having it made up; it is a very complicated matter. In the first place it is very hard to get at the cost of the system. It has been made up, I believe, to £108,000. I gave the amount as £92,000, but I believe it has been made up to £108,000.

3107. You think the approximate cost would be about £108,000? Yes.

3108. And what, approximately, would be the annual earnings? Somewhere about £28,000.

3109. About what proportion of that would be net? I could not say; I have not gone into that calculation.

3110. You cannot say approximately what the expenses are? I am unable to say; that matter is out of my Department; it is in the Accountant's Branch.

3111. When will the statement in the preparation of which you are engaged be completed? I daresay I could let you have it in a day or two—perhaps to-morrow.

3112. Have you had an opportunity to consider the evidence given before this Committee, more particularly your own statement as to the probable cost of providing a metallic circuit? I have prepared a statement, which, with the permission of the Committee, I will read to them. It is as follows:—

I have read Mr. Callender's evidence given before the Committee, and as he agrees with my views in regard to the necessity for the adoption of a metallic circuit if the overhead trolley system of electric tramway is adopted by the Railway Commissioners, there is no necessity for me to remark upon this portion of his evidence.

I entirely disagree with his estimate for the alteration of the telephone system, and I will show the Committee why his calculations are incorrect.

The reference to the report of the Committee of the House of Lords and Commons in 1893, and the Second Report of Committee to the Postal Conference in Melbourne, avers that the responsibility of protecting the telephones lines should be put upon the telephone companies, but there are no telephone companies in this Colony, and as the whole of the telegraphs and telephones belong to the Government, this does not therefore apply to the present case, because the cost, whether borne by the Postal Department or Railways, is entirely a Government one.

The sum given as £30,000, expended upon the tunnel system now under construction, is in excess, as the amount is under £20,000, and the Postal Department has in no way committed itself to the adoption of a metallic telephone circuit by this system, because the earth return cables can be used on the telephone system just as easily underground as overhead. As a matter of fact, the late military telephone system at the Heads was worked on a complete underground system, with an earth return circuit, which comprised the whole of the batteries at Middle Head and South Head, these being connected by two submarine cables across the harbour, and it was altered to a metallic system for the reasons already explained to the Committee. I have also been working a submarine cable of 4,000 yards by telephone from the Spit, Middle Harbour, to the powder-hulk, for the last eleven years, in conjunction with the overhead earth return system of North Sydney, and it always worked satisfactorily till the introduction of the electric tram on the Military Road.

There are also several other submarine cables connecting the North Sydney Telephone Exchange with the head office, and across the Parramatta River, connecting Hunter's Hill Exchange, as well as across the Spit, Middle Harbour, connecting Manly Exchange, and the aerial cables (a large number) attached to the overhead telephone wires throughout the city. A number of these aerial cables are over a mile in length, and have been working in all weathers, notwithstanding the fact that the sheathing of these cables has in no way been insulated from the earth; consequently, from an electrical standpoint, it would not make the slightest difference if the whole of them were put underground, as they could scarcely be more in contact with the earth than they are at present, and, mechanically, would be under more favourable conditions in the subways than when exposed on the poles.

It is asserted that wherever underground wires are used it is absolutely necessary to have metallic circuits, even though no electric traction wires were in use, but the latest opinion of Mr. Bennett, expressed in his book on the Telephone Systems on the Continent of Europe, published in 1895, describes the German Imperial telephone system as one of single wire and underground cables with earth return, and speaks of the Berlin Exchange (page 178), as "the largest in the world, connecting as it does some 25,000 connected instruments in the city itself, and 3,000 more in the suburban area." There are 142,269 kilometres of telephone wires (equal to upwards of 88,000 miles), and Mr. Bennett, on page 216, in speaking of the cables used by the German Government, of which he gives two illustrations, says:—"The copper resistance per kilometre is 31 ohms capacity, ·25 microfarads (microfarad being the unit of capacity), and insulation 250 megohms (megohm 1,000,000

1,000,000 ohms (the ohm being the unit of resistance). Mr. Clough has recently supplied several cables of this nature for use under the streets of Cologne, which are stated to show a capacity of ·75 microfarads per kilometre (kilometre ·621 mile). The results are said to be excellent. There is no overhearing between wire and wire, and a distance of 60 kilometres is said to have been spoken over. Each insulated conductor is wrapped in tinfoil, and four such conductors are twisted round an insulated copper wire, which is earthed when the cable is used for single circuits." It is therefore evident that the German telephone system, which is the largest in the world, proves conclusively that cables of moderate length are worked underground without the slightest difficulty, and can be worked just as easily in tunnels, iron pipes, or other conduits as on poles, as is now being done here and elsewhere in the whole of the Colonies, and my long practical experience convinces me that the gentlemen who have stated this cannot be done must be unacquainted with this fact, they having had no practical experience of telegraph or telephone engineering, their knowledge being principally confined to electric lighting or traction work.

Mr. Bennett, on (page 223) referring to Holland, states:—"The subscribers' lines in large towns are single, but the Netherlands Bell Company recognises the superiority of the metallic circuit, and some of its recently constructed exchanges have been fitted with it, as all future ones will also be. The Zutphen Company has adopted the metallic circuit, but the other concessionaries continue to run single wires." In Amsterdam there is a "considerable amount of underground work, the extent of which is growing rapidly." It is therefore evident that in Amsterdam, where there are 1,752 subscribers and a population of 426,914 inhabitants, that the greater portion of the telephone system is worked underground on cable with an earth return, and these are facts given by Mr. Bennett, who has recently studied all the continental telephone systems, and is therefore the latest authority on the subject.

At Zurich, where I spent a week in 1886, the subscribers' wires are generally single, with earth return, and there was a considerable amount of underground telephone wires in pipes. The number of subscribers is 2,769, with a population of 130,000, and since my visit electric traction has been introduced, but in this city, where they have electrical manufactories, and everything is very cheap, it has cost £1,600 per mile to put the telephone system under a metallic circuit which was rendered necessary owing to the introduction of electric trams, and has been shared between the Telephone and Tramway authorities.

It is therefore evident that it is not compulsory to use the cables in tunnels as metallic circuits, and the reason why the tunnels were commenced in Sydney is set forth in a paper laid before the Legislative Assembly, and ordered to be printed on the 30th March, 1892.

Mr. Callender states that the chief work necessary for the conversion of the telephone system consists of the duplication of the wires, which involves a certain number of new poles in addition to those already erected: but he overlooks the fact that he has made no provision for the largely increasing traffic, nor propounded any scheme for working the present system whilst the alterations are being carried out. No practical expert would ever attempt such an undertaking to alter a huge system without taking adequate steps to carry on the service in the meantime, as he would have the whole city about his ears in twenty-four hours, owing to the repeated interruptions to the business. Moreover, the present poles will not carry more wires or cables beyond the ordinary provision for increasing traffic on the present system of single wires, and if longer cross-arms were put up stronger poles would require to be erected. In speaking of the cable recently ordered for telephone work, Mr. Callender gives the price as £3 10s. per wire per mile, and the actual price at £150 per mile for the whole;—this is misleading. I would also point out that it would take two wires to each subscriber if used for metallic circuits; consequently, the cost per mile per circuit would be just nearly double what Mr. Callender puts down as per wire, viz., £6 9s. per mile.

The *Gazette* notice published on the 21st March, 1896, shows that Walter A. Noakes' tender was accepted at £155 per mile for the cable referred to, so that in this matter of 12 miles of cable, although the amount is given in the *Government Gazette* he makes an error of £60 in 12 miles of cable.

In response to Mr. Black's question (2176) as to how many miles of copper wire there are in 50 tons, Mr. Callender says, "If No. 12 were used the weight would be about 104 lb. to the mile, or 20 miles to the ton; therefore, in 50 tons there would be 1,000 miles." The *Government Gazette* of 23rd July, 1895 (notice now produced) shows that the Postal Department advertised for 20 tons of No. 12 (200 lb.) per mile H.D. copper wire, which gives a little over 11 miles to the ton, therefore, his calculation in regard to this is only 450 miles out, which would make a difference at the price accepted (£69 15s. per ton) for 25 tons short calculated, as per weight of £1,743; and it goes without saying that his estimate as to distance would only be covered half-way—a small item in Mr. Callender's estimation, and it is incredible to me how any expert could make such a misleading statement. At question (2195) he asserts he can get 25-feet poles delivered in Sydney for 7s. 6d. each, and put up for £1 each, but the class of pole he refers to is not one that could be used for city purposes. As a matter of fact we never use 25-feet poles for city purposes, except in a few cases, and such poles would be utterly useless except where the lines do not pass along a public thoroughfare. The poles that are chiefly used in the city are 40-feet, 46-feet, and 50-feet poles, and the prices for these poles average £10 each, though in individual cases they are shown in our books at £15, and in some cases £20 erected, as they are expensive to handle and cart, being so cumbersome, besides, the cost of erection varies very much, according to the sinking, which in many parts of the city is in hard rock, adding materially to the cost.

In response to question (2266) Mr. Callender states that the Postal and Telegraph Department pays £4 16s. per mile for the cost of wires and erection of telegraph lines, which is entirely erroneous. There is no record of any such contract within the last fifteen years for the supply of wire and erection of such a telegraph line.

As regards Mr. Callender's estimate of insulators, I estimate that sixty to the mile will be necessary for running the two wires for each subscriber under an entirely new system, making 189,000 insulators in place of 157,500. Then, again, he has made no allowance for cartage and breakages, and the actual price of the insulator is put down at the cost in store, which is not a fair estimate.

Eighty thousand cross-arms are estimated at 6d. each. Now we are actually paying 9d. each for short (2 ft. 3 in.,) and 2s. each for long (6-feet) tallowwood cross-arms bored, but these have to be painted, and they average all round 1s. 6d. each—80,000s., or £4,000 in excess of Mr. Callender's estimate.

There is also no provision made for 80,000 bolts and nuts to fix the cross-arms to the poles, which, at £1 per cwt. (the price now paid) would give a further deficit of £552 to be added, while there is painting also to be provided for.

Up to to-day we have upwards of 160 applications for new connections, and taking these at an average of 1 mile from the Exchange, that means 160 miles of either new wire or line, and within the last two months it will make over 200 miles added, on or at the average rate of 100 miles per month, and it is impossible to say how many more may be expected after the reduced rates come into operation on the 1st May.

It will be seen that Mr. Callender's estimate is not one given by an expert, fully acquainted with a large telegraphic and telephonic system, but his estimate is based upon a calculation for an electric light contract, such as at Flemington, an entirely erroneous basis that would lead to the gravest complications, and involve any contractor who adopted such an estimate in absolute ruin.

Looking at the German system, I do not see why there should be any necessity for altering the present telephone system throughout the city for the next twenty years, although I thought at first it might come in ten years, and by that time it could merge into a metallic circuit system, but it would have to come soon if traction wires were largely introduced at once.

I feel confident in making this assertion, because, looking at the present telephone system, as compared with the gigantic system in Berlin, which up to date comprises 28,000 telephone connections in the city and suburbs, and all working on an earth return, with both underground and overhead wires, clearly shows that a metallic circuit is not required except to provide for the traction wires.

I have already stated that I saw no objection to electric traction, proposed by the Railway Commissioners, as a traction service, and I repeat this in order that the Committee may understand that the expert evidence I am giving is only to prevent future trouble in regard to the telephone systems of the Colony from being seriously interfered with by electric traction wires unless the telephones are placed under a metallic circuit.

It is stated by Mr. Callender that there will be no difficulty whatever in converting the present switchboard into a metallic circuit one. This, no doubt, could be done, but in doing it what would you do with all the subscribers. You must provide for the traffic, and as there are some 40,000 calls daily, with increasing business, it would be absolutely impossible to carry out any such suggestion without completely duplicating the old system, because there are tens of thousands of connections attached to the board of such a nature that it would mean virtually shutting up the Exchange for several years; therefore, it is not merely the erection of 5 miles of wire per day that has to be considered. Mr. Callender says that 10 or 20 miles of wire per day could be erected, but this is quite out of the question in a city where only

P. B. Walker, Esq., M.I.C.E., M.I.E.E.

28 April, 1896.

a comparatively few trained men can be employed. Rapid work of this kind could only be done in country districts, where there is free scope, without existing complications, and large gangs of qualified line-men could be employed, were they suitable, which cannot be done in the city, as it would be absolutely necessary to have men on the work with expert foremen, otherwise it would lead to endless trouble, confusion, and stoppage of all business.

In the *Electrical Review* of the 23rd November, 1894, the National Telephone Company are stated to have opened their principal station in Lime-street, London, under a metallic circuit system, and their new switchboard is described as one of the latest designs of the Western Electric Company, known as the branching system, and is different to the older kinds of multiple boards, as the usual positions of the indicators and spring-jacks have been changed on the boards, instead of being below the jacks, immediately in front and within easy reach of the operator, the indicators are above the jacks, and out of the operator's reach. This company found it necessary to put in the new board at, I believe, a cost of £25,000, to accommodate 3,000 subscribers, and I look upon it as a convincing proof that my opinion is fully borne out that it is absolutely necessary in providing a metallic circuit, to first obtain a complete metallic switchboard, as I feel satisfied that this company, which has some of the smartest telephone men in London in its service, would not expend such a sum as this upon a new board if their other switchboards could have been converted for metallic circuits. Moreover, the electrical experts acting as their advisers would have been highly culpable if they had permitted their board of directors to adopt such a course; but, from all I can gather, the whole of the experts were unanimous in their opinion, showing clearly that such an expenditure was required in order to obtain the object in view, viz., a complete metallic telephone circuit without causing interruptions during the alterations.

I am sure that the Committee, as business men, will see the force of this statement. Mr. Callender, in Question (2333), thinks that it would be decidedly unfair to charge a part of the cost of duplication, but Dr. Preller, in his article in the *Electrician* of 10th January last, shows that the Traction Company and the Telephone in Zurich each bore half the cost, and I think it is clear that the decision of the Joint Committee of the House of Lords and Commons is not observed as a hard and fast rule, at all events, on the Continent; but, as already pointed out, the Government here will have to pay the whole cost, no matter how it may be divided between the two services.

The present system of telephones under the Postmaster-General's Department is certainly one of the best in the Australasian Colonies, and during the last three years has been greatly improved, as nearly all the old-fashioned Blake, Theiler, Berthon-Ader, and Crossley telephones have been weeded out, and the latest modern pattern of Hunning's and Ericson's telephones introduced, and I may say that I have seen most of the largest telephone exchanges in all parts of the world, and this Colony will compare favourably with any of them. In London, when I was there in 1886, the system then in use was not to be compared with the present service in Sydney. In New York they were then working a large number of the Blake and other inferior telephones, but I see that recently they have introduced 20,000 of Ericson's telephones from Sweden, which are among the most sensitive telephones in existence, and will, no doubt, be a great improvement on their present instruments.

Mr. Callender, in Question (2237), says that the telegraph wires caused quite as serious a disturbance to the telephone wires as a tramway. This is not my actual experience. although telegraph wires do no doubt affect the telephone, but not to such an extent as to prevent their working, because the current used upon an ordinary telegraph line only amounts to a few milliamperes, whereas the current employed on a traction system comprises hundreds of amperes, a fact in itself that proves clearly that there is no comparison between the interference of tramways and the interference of the telegraph with the telephone.

In Paris, Berlin, and Vienna, three of the largest cities on the continent which I visited, the telegraph and the telephone wires were running in a great many places parallel with each other, and the two systems are in juxtaposition and running so intricately together that it would be difficult to run one system overhead in a large city without the one being in close proximity to the other, but in many cases they are separated, though it cannot be done in all instances without incurring considerable extra expense.

The alteration to the telephone system of Sydney would not only affect 2,000 or 3,000 subscribers but would affect the whole telephone system of the city, including all trunk lines to the suburbs, because any induction or leakage from the main traction line would be perpetuated throughout the city, and though Mr. Raw has stated that a telephone wire 50 feet away from a traction line would not be affected by any induction or leakage from the traction line, I prefer, as an expert of nearly forty years' experience in these matters, to take the opinions of such experienced men as Lord Kelvin, Mr. Preece, and Dr. Hopkinson, who have given it as their opinion that the traction circuits affect telephones within a radius of 2 miles, and Mr. Raw's experience only extends, as well as Mr. Webb's, to electric light systems with a return circuit, and even that affects the telephones.

Mr. Deane, in his latest statement, understands that the alterations would only cost £50,000, and his opinion as an experienced engineer is certainly of more value than those of persons who have only had a knowledge of electric lighting, in addition to which he has recently inspected the largest systems of electric traction in existence all over the world, but he does not say positively that he gives this as his estimate of the cost I, therefore, take it that he must, judging from the evidence given, have been misled by these statements which have been made to him by the other gentlemen who have given evidence, and therefore I cannot accept his view as having the stamp of the result of his own personal investigation of the subject, and he shows the caution of a careful and experienced engineer as he is well aware like all experienced engineers that the great difficulty in carrying out works of this nature is to avoid a large bill of extras, which some engineers, through inexperience in dealing with great works, often plunge their employers into, and thereby ruin contractors, companies, and involve Governments in enormous expenditures, which by foresight in the first instance is to be avoided. In all my estimates in carrying out works I have done this, and it is a rare occurrence, in fact, I have no recollection of my estimate having been exceeded in the last thirty-eight years to any material extent.

I will now give a further detailed estimate, and I may here point out that I find in going over my figures again that I omitted to allow for the value of old wire, &c., when providing for new wire for complete metallic returns, so that the item of £79,600 will be reduced by this amount, or for 3,150 miles of wire at a little under £5—£15,644.

Details of Estimate.

12,900 poles, as follows:—2,500 from 46 to 50 feet in length, to be erected in city, at £10 each	£25,000	
10,000 poles, as follows:—40-feet lengths for connections with city and trunk lines, suburbs, at £10 each	100,000	
400 spare 46 to 50 feet poles for renewals and additions, at £10 each	4,000	
		£129,000
3,150 miles of H.D. copper wire (single), 200 lb. per mile, at £7 per mile, including cartage, &c., £22,050; doubling this for metallic circuits	£44,100	
193,500 insulators, at 9d. each, being at the rate of 15 per pole for 12,900 poles	7,256	
Labour for erection of 6,300 miles wire (metallic circuit for 3,150 miles) at £2 per mile	12,600	
		63,956
Additional wiring required to provide for extra metallic circuits 100 miles 25-pairs cable for repairs, emergencies, &c.		15,000
50 tons H.D. copper wire, at £70 per ton		3,500
Unforeseen expenses		5,000
Complete metallic multiple switchboard of 3,500 numbers		20,000
Total		£236,456

3113. Notwithstanding the evidence to the contrary of witnesses who have appeared before us, do you assert that the effect of the introduction of the electric tramway into George-street would involve the Government in an expenditure of nearly a quarter of a million of money in order to place the telephone system under a metallic circuit? That is my estimate—I do not say that it will cost that amount.

3114. Having summarised your estimate, will you point out where you differ from experts who have been examined as to the cost. Take the first item—poles. The evidence given to us is that instead of 12,900 poles being required, 600 poles only will be necessary. It is asserted that it would not be necessary to have a number of poles at a great distance from the telephone exchange similar to the number in its immediate

P. B. Walker, Esq., M.I.C.E., M.I.E.E.
28 April, 1896.

immediate vicinity;—do you think you would require the same description of poles for the suburbs which you would require for the city; and would you tell us whether many of the present poles could be used? That could not be done, because, in the first place, you would have to establish an entirely new system.
3115. But in the new system could you not make use of the existing poles? None of them could be used until the new system had been completed.
3116. What you mean to say is that the metallic circuit would involve new material throughout? Yes; there would be a complete new system.
3117. Therefore, so far as the completion of a metallic circuit is concerned, the whole of the existing system would be so much waste material? Yes; it would have to be used as old material.
3118. The course you suggest is the only course possible to provide a metallic circuit without a serious and long interruption to the telephone system? That is so.
3119. In one portion of your statement you say that otherwise there might be an interference lasting, perhaps, for several years;—will you explain that? Yes; it simply means that if you attempt to interfere with the present system there must be an interruption in the communication. Of course, if you established a complete new system in the first instance there would be no interruption of the present system. If you put other wires upon the present poles you will cross all your wires, and cause an interruption. Again, there would be the interference with the switchboard. You must get certain numbers off before you put other numbers on.
3120. In that respect, then, you think the suggestions which have been made to the Committee are quite impracticable? Any proposal to utilise the existing system would interfere with the working of the exchange, and for that reason it is impracticable.
3121. You consider it impracticable as involving a suspension of the telephone system? Quite so.
3122. You think the only way to introduce the metallic circuit without causing such a suspension would be to establish an entirely new system in the first instance; the existing system being used in the meantime? Yes; a new system has been put down in London in that way.
3123. You think the metallic circuit could not be introduced for a less expenditure than your estimate of £236,000? That is my opinion.
3124. With that expenditure there would be no suspension of the existing system? If the metallic circuit were carried out as I suggest, there would be no interference in any with the present telephone system.
3125. You think that any attempt to use the existing system in making the changes which have been suggested by experts would end in failure? Any attempt to tamper with the present system by way of converting it to a metallic circuit would seriously interfere with the business of the exchange.
3126. *Chairman.*] Your estimate of £236,000 would give us a completely new system under a metallic circuit? Yes.
3127. And with that expenditure there would be no suspension whatever of the present system? None whatever.
3128. That being so, what becomes of the telephone poles and wires at present in existence? They would have to be used up as old material.
3129. What is the value of the poles and wires now in existence? It is a difficult thing to estimate, because some of the wires have been up for twelve or fourteen years, and they have been so cut about by connections and inter-connections that when you came to deal with them after they had been pulled down I am afraid you would find that they would not be of much use.
3130. Therefore this sum of £236,000 carries with it the asset of your present service? Yes.
3131. *Mr. Humphery.*] Assuming the total cost of the existing system to have been, in round figures, £100,000, how comes it that you have estimated the cost of introducing a new system with a metallic circuit under more favourable conditions at more than double that sum? The better class of material I propose to use would account for the difference. It would give you a better service altogether.
3132. *Chairman.*] What is your opinion of the comparative merits, electrically, of copper and galvanised iron wires? There is no comparison between them. Copper is the superior wire, and is recommended by all the greatest experts; it is the best material for telephone work, overhead or underground.
3133. Supposing you were about to bring into existence the telephone service which you now have, and which you say has cost £109,000, what would be the cost? That I could not say. I have not estimated it. No modern expert would recommend the use of galvanised iron wire at the present time.
3134. *Mr. Lee.*] You are aware, I suppose, that the Electrical Engineer of the Department of Railways proposes now to add the slide contact system;—have you considered the question from that point of view? I understood the Committee were considering the trolley system. If the Committee were going to adopt a slide contact system it will cost a great deal more than the system which has been submitted to them.
3135. Would the slide contact system minimise the trouble in regard to the telephones? It might minimise the trouble, but it would not get rid of the difficulty altogether; in fact, experience has proved the contrary.
3136. Supposing this electric traction were laid down as proposed, taking every precaution to avoid interference with your telephone system, and it were afterwards discovered that there was a disturbance to the system, do you think the introduction of the induction coil repeaters make any difference? That is a problem which has to be worked out. There is no system of which I am aware that is worked on that principle. It would be an experiment, I should think, and in my opinion when you are dealing with a huge concern like a telephone exchange experiments are bad.
3137. Let me refer you to Mr. Elwell's answer to Question 3092? I do not agree with the answer to that question. There may, perhaps, be some modern experiment with which I am not acquainted.
3138. *Mr. Clarke.*] Do you regard Mr. Callender as a thoroughly competent electrician? He is an electric-light engineer.
3139. Do you think he understands the working of the telephones? He himself admits that he has had no experience in connection with telephone arrangements.
3140. He said the present switchboard could be made to answer with an expenditure of some £7,000 or £8,000, whereas you say it would cost about £20,000 to convert the board? I do not know how Mr. Callender arrives at such a conclusion.
3141. You do not think the present switchboard would answer? It could be converted, but it could not be done without interference with the traffic. It would take a considerable time to do it.

P. B. Walker, Esq., M.I.C.E., M.I.E.E. 28 April, 1896.

3142. Let me refer you to Mr. Elwell's reply to Question 3061? I do not know how Mr. Elwell arrives at that conclusion.
3143. You do not think it is correct? I do not think it is. I feel quite satisfied that no traction service could be put down without interfering with the telephone system. I do not think any electrical expert would give an opinion to the contrary.
3144. In the event of the Committee recommending the building of this tramway, the only means of avoiding the interference would be to establish an entirely new telephone system before the old one was interfered with? Yes; the only way to get over the difficulty is to have a complete metallic circuit.
3145. *Mr. Fegan.*] I noticed in your former evidence a number of letters from subscribers complaining of hindrances to the telephone system at Neutral Bay and other places;—I suppose you have a great many other letters of similar purport? I have several more.
3146. You had not any in connection with other branches of the telephone which are not disturbed by the Military Road tramway? We get various complaints of disturbance. I never received any complaint from Mr. Callender in regard to that matter. It has never come before me. Perhaps he complained on the telephone. If he did so, I am not aware of it.
3147. In giving your evidence the other day did you not make a mistake in reference to the number of insulators; according to your statement there would be something like 10,000,000? I spoke without allowing for the extension of more than a mile in the city, which would have a large number of insulators on the poles. As a matter of fact, the number of insulators would be something under 2,000,000.
3148. *Mr. Roberts.*] Do you regard the metallic circuit system as a perfect one? You could not have a more perfect system for a telephone service.
3149. If the metallic circuit were adopted at once, you think that all the complaints to which reference has been made as to the unsatisfactory character of the present system would disappear? If it could be adopted at once I am satisfied all the difficulties would disappear.
3150. Would you not then feel justified at the present moment in recommending the Government to adopt the metallic circuit system irrespective of the construction of the proposed tramway? I should not feel justified at the present time in making the recommendation. We have the fact that the German Government are at the present time working 28,000 telephones on the earth return system.
3151. Has not the London system been changed to a metallic circuit system? Yes; the whole of London is, I ascertained yesterday by cable, under a complete metallic circuit; but the telephone system there is largely in the hands of private companies, and they put in the metallic circuits because their subscribers were leaving them. In our case we have the reverse. We are being pushed by subscribers. They are coming in at the rate of four and five a day.
3152. Do you not think that subscribers in the city and suburbs should have a perfect system? I should be very glad indeed to see a metallic circuit established. It would save the Department a great deal of trouble; but it is a question of expense. I do not think the subscribers have a bad service at the present time. They have a service which answers all purposes, and that being so I would not feel justified in advising the Postmaster-General to adopt the metallic circuit.
3153. You have said that you thought the present system would answer all purposes for the next twenty years; but would it not be better policy to introduce the metallic circuit at once, instead of waiting until the subscribers were double or treble their present number—would it not be better to make the change now while the subscribers are comparatively few in number? It is a question of expense. I do not think I should be justified in recommending the alteration now, seeing that the present system answers all purposes.
3154. *Chairman.*] You assert that in the present state of electrical science it is impracticable to construct an electric tramway in George-street that will not affect the telephones? I am of that opinion.
3155. You have already mentioned an article under date 12th January, by Dr. Preller—I suppose you would regard him as a competent man? I believe him to be so.
3156. Does he not point out that the interference to which you refer has not taken place in cities where proper precautions have been taken? The cities to which he refers are only small ones, and in those cases they have had to adopt a metallic circuit. He refers to the case of Geneva. That is a mountain tramway—it is not the case of a tramway in a city.
3157. It is perfectly clear that he alludes to telephones in such towns as Geneva and Basle, because he deals in his article with the difficulty of finding a reason why the telephone works at Geneva and does not work in other towns similarly situated;—he points out in conclusion that a good slide contact system in conjunction with well constructed motors is less liable to affect telephones having earth returns than is the trolley system? It is less liable.
3158. The evidence you have given us from Lord Kelvin and others has been based upon the trouble caused by the trolley system? Yes.
3159. Therefore, it does not apply to the bow system of contact? I think it applies to all overhead systems.
3160. It appears that the ordinary trolley system has been altered in Geneva to a bow system, and Dr. Preller informs us that with the new contact the trouble is much lessened; Lord Kelvin was speaking of a state of things prior to the invention of the bow system? I quite see that; but it does no alter my opinion.
3161. Do you think the new system is calculated to minimise the trouble? It may minimise it; but no overhead traction system can be carried out without leakage in some shape or form, or without induction being forced through on to the telephone system.
3162. If Dr. Preller is of opinion that with a properly constructed tramway, using proper contact, telephones are not seriously affected, what would you say to that? I do not think that is Dr. Preller's opinion; and from his article it is very difficult to make out what he does mean.
3163. You say that prior to the introduction of the electric tramway on the Military Road all the telephones in the vicinity of the Spit worked satisfactorily? Yes.
3164. Do you assert that in those cities where the earth return system exists—cities such as Berlin—there is an absolutely satisfactory telephone service? I could not say that. I was in the city of Berlin in 1886, and I then looked at their telephone system. It appeared to be in good working order, but it has since grown rapidly. The system is perhaps not as satisfactory as the metallic circuit, but the German Government will not go to the expense of that system, and, inasmuch as our present system works fairly well, I could not at present recommend the Postmaster-General to go to that expense.
3165. You could not tell us definitely whether the cities you refer to as having earth returns have satisfactory telephone systems? I express no opinion except in general terms. I believe the earth returns are satisfactory, but in order to make the system thoroughly so it is desirable to have a metallic circuit.

3166. There is a metallic circuit system at Zurich which has cost £1,600 a mile;—taking that as your basis, what would such a system cost in Sydney? There is no comparison between the two places. P. B. Walker, Esq., M.I.C.E., M.I.E.E.
3167. How many miles would there be in Sydney? I could not now say exactly, as it has been added to considerably since my first evidence; but I have given it as 3,150 miles of wire. You must remember that everything is very cheap at Zurich, and there they simply bury the wires in the earth. 28 April, 1896.

Paul Bedford Elwell, Esq., Electrical Engineer, Department of Railways, sworn, and further examined:—

3168. *Chairman.*] You hand in a statement which you desire to have printed as an appendix to your evidence? Yes. [*Vide Appendix.*] P. B. Elwell, Esq.
3169. The slide contact system which you spoke of at the last meeting would be more costly than the trolley system you previously referred to? There would practically be no greater cost. 28 April, 1896.
3170. Would the wear and tear be greater? No; I think the wear and tear might, perhaps, be reduced.

Henry Deane, Esq., Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

3171. *Chairman.*] You hand in a statement with reference to the cost of conversion which you desire to have printed as an appendix to your evidence? Yes. [*Vide Appendix.*] H. Deane, Esq. 28 April, 1896.

THURSDAY, 30 *APRIL*, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (Chairman).

The Hon. Frederick Thomas Humphery.	Charles Alfred Lee, Esq.
The Hon. John Davies, C.M.G.	John Lionel Fegan, Esq.
The Hon. Charles James Roberts, C.M.G.	Thomas Henry Hassall, Esq.
The Hon. William Joseph Trickett.	George Black, Esq.
Henry Clarke, Esq.	Francis Augustus Wright, Esq.

The Committee further considered the proposed Electric Tramway from Circular Quay, Sydney, to the Redfern Railway Station; and also along Harris-street to the intersection of John-street.

Henry Deane, Esq., Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

3172. *Chairman.*] You have some further evidence to give in reference to the proposed electric tramway? Yes; I have a statement here, which I will read:— H. Deane, Esq. 30 April, 1896.

Mr. Walker, in his statement on page 2, says that "It is asserted that wherever underground wires are used, it is absolutely necessary to have metallic circuits, &c." I would say that this is correct if special cables are not used (anti induction with tin-foil covering), but the cables recently ordered by Mr. Walker are not of this type. Mr. Walker quotes from Bennett's book on the telephone systems of Europe, page 178, that "the Berlin Exchange is the largest in the world"; this is also correct, but on the same page Mr. Bennett says that the system proves unsatisfactory, and that the overhearing on some of the single wires is very pronounced. Mr. Walker further quotes from page 216, the specification for cables for the German Government, but omits to point out that these are special anti-induction cables, while, as already pointed out, Mr. Walker's specification for Sydney does not provide for cables of this type, but for those used on metallic circuit.

As it is, subscribers are crowding on in all parts of Germany, and the public money is being spent in connecting them in a manner which is already recognised nearly everywhere else—even in Servia, Bulgaria, and Roumania—as obsolete. In a few years more the machine will have become so huge and clumsy, and the trunk-line speaking so immeasurably inferior to that which will prevail in neighbouring States, that an entire reconstruction will have to be undertaken at enormous cost.

Again Mr. Walker quotes from page 223, the case of Amsterdam, but also omits to say that special anti-induction cables are used, and he should also have quoted from page 238, "It will be seen that the ultimate adoption of the metallic circuit is borne well in mind."

Mr. Walker quotes Zurich, and says that the metallic circuit has been introduced on account of electric tramways; this goes to show that it was not considered desirable to use earth return with underground telephone cables.

In the next paragraph Mr. Walker says, "It is, therefore, evident that it is not compulsory to use the cables in tunnels as metallic circuits," but from a careful study of Mr. Bennett's book it is found that wherever underground cables are used with earth return these cables are of special construction to make them anti-inductive by wrapping the individual wires in tin-foil, and also that hardly any work on this principle is now being undertaken, and all new work of any consequence is being done on the metallic return system.

Subscribers' wires are generally single, with earth return, but all trunks and many of the junction lines to parochial stations are metallic circuits, translators being employed for the connections between the two. It is pleasant to know, however, that the Swiss are alive to the inadequacy of the single-wire system as a permanent institution, and have decided to gradually supersede it everywhere by metallic circuits. A very earnest and creditable beginning has already been made at Zurich, and similar changes are to follow immediately at Berne, Geneva, and Lausanne.

Another quotation from Mr. Bennett's book, page 214, about the German telephone system, clearly shows what his opinion is on underground earth return: "Numerous types of cable have been tried, mostly insulated, with india-rubber or gutta-percha, served with metal foil for earthing. * * * * * The underground work, so far, is understood not to have been an unalloyed success, which is not surprising, when the plan usually followed has been to suppress one evil—overhearing—by exaggerating another—capacity. The growing importance of the trunk system will eventually force a resort to metallic circuits, and then the want of foresight which has prevailed will be deplored."

In the introduction to Mr. Bennett's book, page 29, the author says, "The service of a telephone exchange should be the first consideration. This opinion has always led the author to advocate the universal use of metallic circuits, without which privacy of conversation and speech undisturbed by strange noises, together with effective long-distance talking, is unattainable."

Mr. Walker, on page 7 of his evidence, again quotes the German system as a basis on which he estimates that it will not be necessary for the next twenty years to resort to metallic circuits in Sydney; but, as has already been shown by quoting from Mr. Bennett's book, the German system is not working satisfactorily, and appears to be about the least perfect, so far as the telephonic circuit is concerned, of any on the continent of Europe.

On page 11 of Mr. Walker's evidence he says, "Electric light systems, with return circuits, and even that affects the telephones." It will, therefore, be seen that metallic circuits will become necessary when the city is to be lighted by electricity, which will certainly not be delayed many more years.

With regard to the question of converting the switch-board now used in connection with earth return to metallic circuit, a quotation from Mr. Bennett's book, p. 335, will show that this can be done without interfering with the efficiency of the system.

Speaking of Stockholm, "He had at this period (1890) over 5,000 subscribers working in Stockholm alone. This service was as good as is compatible with single wires. But that was not enough, and the State had scarcely got its exchange in operation before the General Company began to convert its system to metallic circuit, section after section of the multiple switchboard at the central station being altered to meet the new requirements, communication between the two sets being kept up by means of translators, until in 1894 there was not a single wire left in Stockholm."

The

H. Deane, Esq.

30 April, 1896.

The Electrician, London, 24th September, 1886.—Electric induction between wire and wire, by W. H. Preece.

Discussion.

Professor Silvanus Thompson. . . . . They knew that a current in returning through the earth did not, as some people imagined, run straight along the ground underneath the wire, but spread out into a current sheet and flowed round in curves from one earth plate to the other, very much as the lines of force of a magnet curve round from pole to pole. The result of this was that if a neighbouring line, or even one many miles away, had its two ends put to earth anywhere on one of the curving lines of flow, a portion of the return current of the first line found its way through the second line. But this was not induction at all. A case occurred not long ago in a telephone installation, which he knew something about, in the North of Ireland, where the telephone wires were laid parallel to an electric tramway. The engineer of the line reported that it was hopeless to work it, there being such an amount of induction on the line that it kept on ringing the bell. But that could easily be obviated by putting in a return wire, which was the cure he suggested, and which was found to be perfectly satisfactory.

Mr. Traill said that in the remarks Professor Thompson had made about the electric tramway in Ireland he had no doubt that that gentleman referred to the Newry and Bessbrook electric tramway. He (the speaker) could cite another case, namely, that of the Giant's Causeway tramway, where they ran for 6 miles alongside the post office telegraph wire, which was distant only 28 feet from the conductor rail of the tramway, and where there were a very great variations in the current of the conductor rail, which was worked with heavy potentials, and yet during the few years that they had been working with the post office wire alongside of them, they had never had a single complaint of interference with the messages on the part of the post office. He mentioned this as an example where induced action did not take place to any appreciable extent upon a telegraph or telephone wire.

Mr. Preece, in reply, stated :—"The cure for these disturbances between telegraphs and telephones was as simple as possible, namely, to invariably use a metallic circuit. Why telephone companies had been so foolish as to exercise the false economy of depending upon single wires was one of those puzzling things which were not possible of explanation. In the post office, as soon as they were perfectly satisfied that induction was the main cause of the disturbances, they decided to use double wires, and they never used anything else anywhere. . . . He would use metallic circuits everywhere."

As regards the details of Mr. Walker's estimate, I should wish to make the following remarks :—

"Considering that the existing lines are carried on about 6,000 poles, and on the greater number of them there seems to be plenty of room for additional wires, I cannot see the necessity why provision should be made for 12,900 new poles, and I still hold that about 500 poles of the heavier type would cover all present requirements, especially as provision has already been made to take some wires underground.

"I cannot see the necessity to completely abolish the existing wiring, and by duplicating the wires in galvanised steel, the estimate can be reduced enormously, but, even if the new additional work were to be done in copper, only half the length, and wire of much less than half the weight per mile, would be more than sufficient; this would reduce the item of £44,000 down to about £10,000. Again, the number of insulators is not required, only sufficient for duplicating existing ones, with cost of labour and erection, will be necessary.

"In an estimate like this it seems altogether absurd to provide for spare poles, cables, and hard-drawn copper, for renewals, repairs, emergencies, &c., as these items have absolutely nothing to do with new work, and provision for further additions has no right to appear.

"I may further point out that, where a large number of wires is laid in close proximity, it has been found to be just as cheap to put them underground in cables as to erect them on poles."

I now give an abstract of details of telephone circuits in the principal countries and cities of the continent of Europe from A. R. Bennett's book on the telephone systems of the continent of Europe :—

Vienna ..... Single wire, earth return; is now in course of conversion to metallic circuit.
Belgium ..... Single wire with earth return; in course of conversion to metallic circuit; State ownership.
Bulgaria ..... All metallic circuits.
Denmark ..... Single wire, earth return; in course of conversion to metallic return; Copenhagen partly converted with underground mains.
Finland..... Partly earth return, and partly metallic.
France ..... Paris, metallic return; all Government lines have a metallic return.
Germany .. ... Single wire, earth return; result bad; in Berlin it is working very badly.
Holland ..... Part single wire, earth return, and part metallic return; Amsterdam, single wire, earth return, trunk lines metallic return cables.
Hungary ..... Single wire, earth return.
Italy..... Part single wire, earth return, part metallic return.
Norway ..... Single wire, earth return; Christiania, is in process of conversion; it is proposed to put in a latest type switchboard for 9,000 circuits, to cost £10,000.
Portugal ..... Single wire, earth return; no underground work.
Russia ..... Single wire, earth return; no underground work.
Servia ..... Metallic circuit.
Spain ..... Entirely metallic circuit.
Sweden ..... Entirely metallic circuit; Stockholm switchboard was the same as the one in Sydney, but has now been altered.
Switzerland... Single wire, earth return; is now in course of conversion to metallic circuit.

It is found that telephones are used most extensively in those places where service is good. Sweden is a notable example, the charges are low, metallic circuits are used, and all wires are underground. The system pays interest at 5½ per cent., and the charges are the lowest of any place :—

Stockholm ..... £5 11s. 1d. per annum.
Christiania ..... £4 3s. 11d. per annum.

3173. *Mr. Trickett.*] In regard to the extract which you have read from Bennett's book giving the opinion of Mr. Preece that the metallic circuit is apparently the only cure for interference with electrical action on the part of the tramway wires, how do you reconcile that with this statement, made in a letter by the Railway Commissioners, dated 15th April, 1896: "The Commissioners desire me to inform you that no interference with the telegraph or telephone wires can occur except as a result of imperfect construction or maintenance of the electrical portion of the tramway plant"? In the first place the extract which I read was from a statement by Mr. Preece, in the *Electrician*. The interference referred to by him was not tramway interference; it was interference in London from the telegraphs.

3174. Then you endorse the opinion given in that letter? No; I have had nothing to do with writing that letter.

3175. You do not endorse that opinion? I leave it to the electricians to decide. The whole subject of my remarks and the statements which I previously put in, have gone to show that our telephone system is imperfect, and that it requires completion independently of any electric traction.*

* Note (*on revision*) :—I wish to add the following extract from the *Engineering News and American Railway Journal* of 23rd January, 1896, to show the amount of traffic in the city end of Broadway, New York :—"The passenger and vehicle traffic upon Broadway, New York, has entered into the rapid transit investigations now in progress. Mr. S. E. De Witt testified that he had spent three days, at different points on Broadway, counting the vehicles and foot passengers. At a point between Twenty-first and Twenty-second Streets, between 7 a.m. and 7 p.m. of 14 December, he counted 6,510 passing vehicles, and 14,400 persons using the east sidewalk, and 53,807 passing on the western sidewalk. On 16 December he took his stand between Chambers and Vesey Streets; down town, between 11 a.m. and 7 p.m. he counted 5,150 vehicles, and between 7 a.m. and 7 p.m. 38,805 people passed down the east sidewalk, and 41,530 down the west. On 17 December he was between Fulton and John Streets, and for the twelve hours he counted 8,630 vehicles, and 59,360 people on the east walk, and 50,600 on the west. For the whole of Broadway thus counted, the general average would be about 634 vehicles and 7,183 people passing per hour."

Richard

Richard Threlfall, Esq., M.A., A.M.I.C.E., Professor of Physics, University of Sydney, sworn, and examined:—

R. Threlfall, Esq., M.A., A.M.I.C.E. April, 1896

3176. *Chairman.*] What are you? I am Professor of Physics at the Sydney University, and an Associate Member of the Institute of Civil Engineers.
3177. Have you a knowledge of the scheme that the Committee has under consideration in general terms? Yes.
3178. In your opinion is electricity the best power for traction purposes in the city? Undoubtedly.
3179. There are three systems known to the Committee—the accumulator, the conduit, and the overhead system; which is the best commercially? The overhead system, undoubtedly.
3180. Is it the most popular? Undoubtedly.
3181. We desire to know definitely from you how the telephones of the city are likely to be affected by the proposed electric traction? They are sure to be more or less adversely affected.
3182. We are given to understand that there are two ways in which they are affected—one by straight current, and the other by induction? Yes.
3183. Were we correctly informed that those are the two difficulties that we have to deal with? Yes.
3184. We have been further informed that by using the storage battery—by using the three-wire system, by balancing the load so as to make smooth running, the difficulty will be got over;—is that so? I do not think it will be got over; I think it will be reduced.
3185. Still the telephones would be prevented from working? I should not like to say that. I could not say without the detail consideration of the wiring, whether the disturbance would be sufficient to entirely prevent speaking on the telephones. It would be inimical to the telephones; it would interfere with them; but whether it would prevent them from being used or not is a thing which I could only be certain about after very detailed consideration.
3186. Although the best means known are used in the construction of the tramways to prevent either induction or straight currents it is certain that there will be some interference with the telephone? Absolutely certain, I think.
3187. Notwithstanding all the precautions that may be taken? Notwithstanding all the precautions that may be taken in the construction of the tramways.
3188. That is beyond doubt? I think so.
3189. The proposal of the Department is, first of all, efficient bonding of the rails; the rail being laid directly on concrete, a special form of trolley or bow, ensuring perfect contact between the tram wires and the rails and thorough methods of storage batteries in connection with the line, using the three-wire system, balancing the load as smoothly as possible, and the smooth running of the cars. Having taken all these precautions you still say that there will be some interference with the telephone? Yes.
3190. You are not prepared to say to what extent? I am not.
3191. It would be detrimental to the telephones? Of course.
3192. Do you know of any further steps that might be taken in connection with the construction of the tramways that would be likely to bring about better results than I have mentioned? Yes; by having a metallic return circuit.
3193. In regard to the construction of the tramway? Yes; you might have a metallic return circuit, but that would be undesirable from an engineering point of view.
3194. Do you recommend it? No, certainly not. It is very undesirable from a tramway construction point of view.
3195. Why? Because it very much complicates the working of the line. It complicates the points and the crossings. Two wires have to be brought into contact with every car, and it introduces a host of little difficulties.
3196. You would not recommend it? Certainly not; it is very much to be avoided. It would not be a remedy; it might be a mitigation.
3197. The methods proposed by the Department in regard to the construction of the tramway might lessen the difficulty with regard to telephones, but would not be entirely effective? I do not think it would be absolutely effective.
3198. Do you understand exactly what we mean by the bow contact? Some particularly good method of making contact between the car and the trolley-wire; but supposing you do that, you still have in the car contact between the commutator and the carbon brushes.
3199. Is there any way known to science by which electric traction on tramways can be prevented from interfering with telephones? I think not.
3200. Mr. Elwell says, "The ordinary condition of trolley working is somewhat imperfect, and that produces a slight break in the current frequently as the car runs, and every break in the current causes an induction of surrounding wires. That we intended to overcome either by not using a trolley at all, or by using a trolley and a sliding contact behind it; so that if the trolley left the line by one-sixteenth of an inch at any moment the sliding contact behind would still keep the circuit. By that means you can practically prevent any making and breaking of contact with the trolley-wires." Do you agree with that? I agree so far that it can be done; but I do not know how he means to do it.
3201. Do you believe it will be effective? I do, in regard to breaking the circuit at that point; but it does not get over the whole difficulty.
3202. With regard to the telephone, are you prepared to express an opinion on our system as compared with systems in other parts of the world? I think ours is a bad system.
3203. Why? Because everybody can hear what everybody else says for one thing.
3204. It destroys secrecy, and therefore prevents the system from being popular? Quite so.
3205. It therefore destroys its value commercially? Yes. In certain sections it is already interfered with by the tramways. Where I live I very often cannot speak through the telephone at all.
3206. How do you propose to prevent telephones from being affected by the electric trams? There is only one way in which it can be done, and that is by making what is known as a metallic return in connection with the telephone wire.
3207. There is only one way? Only one way.
3208. If this tram is made, and we desire to have an effective telephone service, that must be done? It must be done if you desire to have an effective service whether the tram is run or not.
3209. As our system grows, will the difficulties under which the earth-return system labours become more pronounced with the introduction of electric lighting? Of course. Electric lighting would influence the telephones nearly as much as the tramway—perhaps more in some places.

R. Threlfall, Esq., M.A., A.M.I.C.E.

30 April, 1896.

2310. What is the fate of earth returns, as far as you know, in all parts of the world;—are not most cities adopting the metallic return? I understand that the metallic return is being resorted to everywhere. I know of no case in which there is a large exchange in which it is not contemplated, or in which the metallic return has not been resorted to.

3211. It is being adopted everywhere people desire an efficient service? Yes.

3212. Has the adoption of this return popularised the telephone service much? I cannot say. It must increase its usefulness. It would increase the usefulness of the telephone for me if we had the metallic return, and I presume that it would do so for other people.

3213. How do the telegraphs affect the telephone? At the University, telegraph messages which have been transmitted can often be heard perfectly well, and any one able to read the Morse Alphabet could read the messages.

3214. Not only is the telephone not secret itself but it may divulge messages that have been forwarded on the telegraph line? If I could read the Morse system I could often sit at the telephone at the University and read telegraph messages all day.

3215. You say that no important city, with the exception of Berlin, tolerates the earth return system? As far as my information goes, it is a commonplace amongst electric engineers that a metallic return is sooner or later absolutely essential in all telephone systems.

3216. And it must come in Sydney? If it came in Sydney to-morrow I believe it would double or treble the usefulness of the telephones.

3217. And the number of subscribers, and therefore the profits? I presume so.

3218. Then your view is this—that it is essential that Sydney should have a metallic circuit in the interests of the telephone itself? Certainly.

3219. If the electric traction is adopted in Sydney that precipitates it? It may make it absolutely necessary—it will make it more desirable.

3220. You do not state definitely what the effect of electric traction would be on the telephones, but you say in general terms that it will affect them injuriously? I have no data on which to express a more definite opinion.

3221. Are you prepared to express an opinion upon Mr. Walker's estimate? It seems to me a very large estimate.

3222. Is there any portion of that system in regard to which you desire to express an opinion? The poles seem to be very expensive. £10 for each pole is a great deal. I had some experience as to the price of poles some years ago. I notice that £200 per mile is put down for copper wire, but that is for wire about the weight of that used for electrical lighting purposes. That is quite out of the question for telephones, and I should think it must be a mistake. The largest wire ever hung for telephones is No. 16 gauge. That is £65 to £66 per mile—not £200. It is not necessary to have it as thick as that for telephone purposes.

3223. How much is that item? The item should be reduced from £200 to £66—that is, about three to one.

3224. That is one item alone? That item ought to be about £7,000 instead of £22,000. It is about £14,000 too much. That is doubled for the metallic circuit, so that on the whole it is about £28,000 too much.

3225. You say, then, that this £44,000 ought to be about £16,000? One-third—about £15.000.

3226. You are sure about the wire? I am sure about it. It is an estimate of £7 per mile. The £44,000 can be reduced, roughly, to £15,000.

3227. About the cost of erection, you express no opinion? No; I have an opinion, but I would rather not express it.

3228. Supposing the telephone service to cost £100,000;—in your opinion what would it cost to put in the metallic circuit? I do not think it ought to cost more than half as much again. It ought to cost about £50,000 to alter it. You must get the poles; you have the instruments and half the wire.

3229. Could the old wire be used? Certainly; the wires on the circuit might require rearrangement, but it could certainly be utilised.

3230. If the Sydney system cost £100,000, in your opinion a metallic circuit would cost £50,000? I do not think it ought to cost as much. Of course work that has to be done whilst the system is in operation is always more expensive than when it is done at first.

3231. Would it be possible to keep the present system working to utilise the system which we have at present, and to convert it at the same time? Certainly; it has been done, I understand. I see no difficulty about it.

3232. Therefore the bringing in of a metallic circuit does not mean the abandoning of all the work that we have done already? Certainly not.

3233. In your opinion, would a new switchboard be necessary? Certainly it would. You might use the skeleton of the old one, but it would be required to be entirely reconstructed.

3234. Still there need be no cessation in the use of the present telephone service? No.

3235. You would use the old switchboard during the process of the alterations? I speak subject to correction, but I think that probably the best way would be to start erecting a new switchboard, and gradually to transfer from the old one to the new one; it would be most convenient to do that. As you built up the new one, take down the old one.

3236. As you introduce the metallic return service? Yes.

3237. Do you include the cost of the switchboard in the £50,000? Certainly; but I am only giving a general opinion on that point.

3238. It says in the estimate £20,000 for a complete metallic switchboard? It looks enormous, but I have not made an estimate.

3239. With regard to the estimate of £236,456 to put a metallic circuit on a system that has cost £108,000, what is your opinion? I cannot understand it. I have not made an estimate. I only give a general view of what the alterations will be in relation to the original system.

3240. You are aware that some subways are being carried out in the city for the purpose of placing telephone cables therein;—does that bind the Department to a metallic circuit? Yes, ultimately, undoubtedly.

3241. You say as an electrician that the subway binds the Department to the metallic return ultimately? Undoubtedly.

3242. You say that notwithstanding the fact that Mr. Walker says "no?" Notwithstanding anything.

3243. Will you explain why? Because you get your wires so close together that you get overhearing unless you have a metallic circuit.

3244.

R. Threlfall, Esq., M.A., A.M.I.C.E.

30 April, 1896.

3244. If you adopt the precaution of having the system of cables you can reduce the overhearing, but you cannot get entirely rid of it? You can never get rid of it until the wires are twisted together to form a complete metallic return.
3245. Immediately the cables are put in the subway, unless a metallic return is provided, the telephone service of Sydney will be materially affected? I think so. Something depends upon the length of the subway. It might not do the service much harm to go through a subway of 50 yards, but it might do a great deal of harm to go through one of a quarter of a mile.
3246. Are you aware of the operations in connection with the subway? I know that subways are being made but that is all.
3247. Wires underground placed in a tunnel must have a metallic return? That is my opinion. This so-called protected cable protects against one form of induction, which is not the only form, and in some cases not the most important form. There are two ways in which induction acts, and the protecting tinfoil only acts against one, the other being as active as ever; whether the one which is not guarded is or is not more important than the one which is guarded against depends upon the length of the circuit, the nearness of the wires, and a variety of other complicated things. Under some circumstances the so-called protection is protection, and under certain other circumstances it is not protection.
3248. Is it your opinion that Sydney must have a metallic circuit in order to obtain an efficient service, and that it will be precipitated because of the construction of the subways? Yes: that is my opinion. It is more necessary with the subway system than with the other.
3249. Have you been in Hobart lately? I was there at the beginning of last year.
3250. Did you see the electric trams there? I did.
3251. Do you regard them as satisfactory? I do not. The engines and the dynamos are good, but the permanent-way is horrible. I think they bought a lot of old rails for it; it is the worst permanent-way that I have ever seen.
3252. You think that interference with the telephones can be reduced to a minimum, but that electric traction will still have some effect upon the telephone? That is my belief.
3253. *Mr. Fegan.*] Where do you live? At Neutral Bay.
3254. *Chairman.*] What was the cause of the bad effect on the telephone? The cause of the leakage from the North Shore tramway. You could trace the progress of the car along the road just as well as if you were sitting in it.
3255. You regard the metallic return as absolutely necessary? I do. The longer you leave it the greater will be the cost of making the change. Supposing the money could be borrowed to-morrow as cheaply as you might expect to borrow it in two or three years' time it would be economical to commence work at once, because the bigger the concern gets the more expensive the operations would be in the long run.
3256. It is an intricate thing, requiring competent management? It is a matter requiring good engineering, no doubt.
3257. You regard it as an important work? Yes; I do.
3258. And one in which the State might make a heavy loss very easily? Undoubtedly, it is a delicate operation.
3259. And requires great competence? Yes; requiring a competent person.
3260. *Mr. Wright.*] Will the old wires stand twisting? If they are of good quality they ought not to have suffered much.
3261. Is there no danger of crystallisation? Iron does tend to crystallise, but it is the exception rather than the rule.
3262. In the metallic return I understand that two wires would be twisted round each other? That is in the cables, but on the poles they are arranged to cross each other at intervals.
3263. We have been informed that in consequence of the improvement in the electric tramway at North Shore the trouble in connection with the telephones has disappeared? That is not so.
3264. Was the service better prior to the construction of the electric tramway? I do not know.
3265. If the tramway were removed would it be satisfactory? You could speak through it, and you could hear what your neighbours were saying.
3266. *Chairman.*] What about pipes in the ground;—would it be affected by the electrolysis? It probably would be found necessary to take precautions as time goes on, or rather to keep a watch on the pipes. By the precautions which the Department propose to take the danger of interfering with the pipes is minimised, but still a watch should be kept on them.
3267. If the Committee recommend to Parliament the construction of this tramway, would you undertake to so perfectly construct the electrical portion of the tramway as to neutralise any interference with the telephone wires? No; I could not.
3268. Have you any knowledge of the engines at Rushcutter's Bay used in connection with the cable trams? I have never examined them.
3269. They are slow-speed long-stroke engines specially designed for cable work;—would they be suitable for electric traction? I see no reason why they should not.
3270. Do you think it would be wise to use the engines at present at Rushcutter's Bay for electric purposes? I do not know the engines. The Department ought to know all about them. The Railway Department may have some special reason for saying that those engines are unsuitable. The engines may be unsuitable in a way which I cannot imagine.
3271. Would you look into the matter and inform the Committee on the subject? Certainly.
3272. Would there be any objection to laying a feed-wire underground from Rushcutter's Bay to Redfern? No objection, except the awful expense.
3273. Would there be any objection to bringing it overhead? Not the least. If I were dictator it should go overhead. I would not dream of burying it, even if it did look a little bit ugly. You could take it along back streets. I would hang the wires. It is simply throwing good money away to bury them.
3274. Is there no danger? None.
3275. Do you think the three-wire system an important thing in itself? It effects a great saving in copper.
3276. You approve of it? Undoubtedly.
3277. Therefore it must be maintained? I think so.
3278. Do you regard the three-wire system material as to disturbances in the telephone? I do not think it would make much difference to the telephone. On the one hand you save copper, on the other you introduce a slight difficulty of regulations. I should not like to say off-hand whether it is desirable. It is a matter for a great deal of consideration. I have not had an opportunity of considering it.
3279. Have you had all the evidence? I have, but I have not had time to go through it.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

Electric Tramway from Circular Quay, Sydney, to the Redfern Railway Station; and also along Harris-street to the intersection of John-street.

APPENDIX.

A.

[*To Evidence of H. B. Lassetter, Esq.*]

NAMES OF BUSINESS PEOPLE IN GEORGE-STREET FAVOURABLE TO THE CONSTRUCTION OF THE PROPOSED TRAMWAY.

Sir, Sydney, 1 April, 1896.

With reference to the evidence given by me before you, I beg to call your attention to Question No. 912. I found that there were not twenty-seven shops empty in King-street, but only five. Of this number, two of them are situated one on each side of the door of the Opera House, which has been closed for some considerable time past. These shops were used as a refreshment shop and an oyster saloon, and would be patronised by those frequenting the theatre, consequently would not be reoccupied until the theatre opens again, as there would be little or no trade for them. The third shop is one at the corner of Kent and King Streets, formerly occupied by Hales & Cole, wholesale tea merchants, whose trade would not be affected by the cable tram. The fourth shop is one of a block of buildings put up by Mr. Solomons since the tram was started, No. 62. The fifth shop is No. 70, formerly occupied by the Austral Cycle Company, who have now moved to more commodious premises in George-street. They could not have been very much against the tramway down the centre of the street—narrow as is King-street—as they have now signed the petition in favour of an electric tramway along George-street from the Railway to Circular Quay. The only other shop vacant in King-street is one on the east side of George-street, this is No. 165, and was occupied as a small oyster saloon. I think you will agree with me that the inhabitants of King-street are showing they do not greatly disapprove of the tram, and I notice that now the wood pavements are being taken up in Pitt-street more 'buses travel through that thoroughfare than hitherto. I contend that a tramway controls the traffic and makes the various vehicles keep to their proper side of the road.

With regard to the petition mentioned by me in my answer to Question 819, I mentioned that the circular was only sent out at ten minutes to one o'clock, when most of the business people were at luncheon. I enclose herewith a petition containing a few more names, some of which are included in the previous one handed in by me. I would call your attention to the fact that business people having premises in the narrower part of George-street, Messrs. Perdriau & Co., Peate & Harcourt, Atcherley & Dawson, Holdsworth, Macpherson & Co., T. F. Wiesener, London Bank of Australia, Nicholson & Co., &c., have all signed it.

In my evidence I omitted to mention instances where tramways were conducted along streets narrower than George-street, and where the traffic varies from five to ten times as much, viz. :—

Borough Road, four lines of trams, commencing on the south side of London Bridge and proceeding to Woolwich, Peckham, Greenwich, and other suburbs.

Three lines of tramways converging on Westminster Bridge, one line going to Camberwell, one to Greenwich, and one to Brixton.

Double line of trams converging from Moorgate-street, Islington, and Camden Road.

I have, &c.,

The Chairman, Public Works Committee. H. B. LASSETTER.

---

27 March, 1896.

WE, the undersigned ratepayers, having business premises in George-street, are in favour of an electric tramway being laid from the Railway Station to the Circular Quay, *via* George-street.

[To Evidence of P. B. Walker, Esq., M.I.C.E., M.I.E.E.]

DETAILS OF COST OF INTRODUCING A METALLIC TELEPHONE SYSTEM IN THE CITY AND SUBURBS.

IN the city and suburbs there are at present 3,150 miles 45 chains of telephone wires, consisting of 215 miles of poles, or 6,450 poles altogether.

These poles are carrying 130 wires, besides cables containing 20, 25, and 50 wires, and the poles are so overloaded throughout the city, rendering it dangerous to place many more wires upon them, so that any additional work in connection with them now is of a risky as well as dangerous character, and it was this that necessitated the adoption of a subway system, but not for the express purpose of introducing a metallic telephone system.

My estimate of £250,000 is made up as follows :—

12,900 poles, averaging 40 feet in height, but many would be 46 and 50 feet, averaging, at £10 each	£129,000
3,150 miles of wire, including labour, erection, &c.	79,600
Additional wiring required to provide for metallic circuits 100 miles 25 pairs cable for repairs, emergencies, &c.	15,000
50 tons hard drawn copper wire, at £70 per ton	3,500
Unforeseen expenses	5,000
Complete metallic multiple switchboard for 3,500 numbers	20,000
Total	£252,100

During the month of March 51 miles 12 chains were added to the telephonic system of the city, and we have on hand now sufficient applications (60) which will cover nearly a hundred additional miles of wire when constructed ; and upon the reduced rates coming into operation on the 1st May it is impossible to estimate what further extensions may be required, therefore the Committee will see that the telephone system is rapidly growing into a gigantic undertaking which requires the most careful handling in order to protect the public interest.

It is asserted by Mr. Deane that the alterations can be made for a metallic circuit for £50,000. This I entirely disagree with, because in the first place it will cost £20,000 for a multiple metallic switchboard, and if Mr. Deane can provide for the whole of the telephone, city and suburbs, now extant for the balance (30,000) of his estimate, all I can say is that he would accomplish a feat unparallelled in the history of engineering.

Of course I can quite understand Mr. Deane's statement from his point of view ; he wishes, if possible, to have the electric tramway, and I should be very glad to see the tramway myself, but I am compelled as a matter of duty to point out what I consider is necessary for the protection of the telephone system.

It has been stated to the Committee that underground telephone systems do not work with overhead systems ; this is misleading, because in New York there are upwards of 20,000 miles of underground telephone cables, and about 100,000 miles of overhead telephone wires, so that this may be taken for what it is worth. The number of telephone connections between subscribers and exchanges in America on 1st January, 1893, was 600,000,000 ; and this has been stated by Mr. Preece in his report of trip to America.

P. B. WALKER,
16/4/96.

C.

[To Evidence of H. Deane, Esq.]

REMARKS ON MR. P. B. WALKER'S STATEMENT RESPECTING THE PROPOSED TRAMWAY.

Sir, 22 April, 1896.

I have the honor to inform you that I have conferred with Mr. Elwell on this subject, and the following are the conclusions arrived at, which I desire to place before the Public Works Committee.

I have, &c.,

The Secretary, Parliamentary Standing Committee on Public Works. H. DEANE.

Causes of Disturbance on the Telephone Lines by the Electric Tramway on the Military Road, and reasons why similar effects would not be produced by the operation of the proposed George and Harris Streets Line.

1. Continuous Current.—It is well-known that a continuous constant current, no matter of what quantity or pressure, passing through a conductor in the nearest proximity to a telephone line, has absolutely no inductive effect upon the latter, and cannot in any way affect the working of the telephone system.

An alternating current on the other hand, *i.e.*, a current reversing in direction many times per second, such as is used in the lighting of the Borough of Redfern, has the greatest inductive effect upon telephone lines running parallel with it ; but this may be neutralised by the lead and return wires of either system being placed equidistant from the line of the other system.

All electric tramways at the present time are worked by continuous currents.

2. Variations in the current on electric tramway wires cause inductive effects upon telephone lines running parallel with them in proportion to the intensity of the variations.

In the same way, similar variations in the return currents through the rails, or other conductor in contact with the earth, cause interference with the earth return of telephone wires in proportion to the quantity of current which is diverted from the tramway return conductor, and spreads over the earth owing to the resistance of the said conductor.

3. On the Military Road line there are several imperfections which contribute to cause induction on the telephone line running parallel with them, principally as follows :—

(*a*) The current from the generator is not absolutely continuous owing to its comparatively small size, and the fact of only one machine running. Two machines running in parallel tend to neutralise the inequalities of each other.

(*b*) There being normally only one car taking current at one time, the greatest inductive effect is created owing to the whole of the current in the line being started or stopped with every make or break of contact in the car. The greater the number of cars taking current at one time, the less would be the inductive effect from this cause.

(*c*) The sharp angles of the trolly-wire on the Military Road cause momentary breaks of contact, and the inductive effect of this is aggravated by the fact of so few cars taking current at the same time.

(*d*) The return conductor on the Military Road is imperfect, although better than was considered necessary three years ago, and this conduces towards disturbance of other and weaker earth currents.

(*e*) The rails on the Military Road are generally dry and very sandy, causing great variation in resistance between themselves and the car-wheels, and consequently, variation in the tramway current, aggravated again by so few cars taking current at one time. On lines of frequent service the rails preserve a much more favourable condition.

4. All the above-mentioned causes of disturbance would be eliminated in the case of the proposed George and Harris Streets lines owing to the following altered conditions :—

(*a*) The generators would be of large size, and it is intended to work two together normally.

(*b*) Twenty or more cars will be taking current at one time, so reducing the inductive effect in proportion caused by the turning on or off of the current on any one car.

(*c*) The overhead line will be of a greatly improved section suspended in such a manner that no irregularities can exist to produce variation in the contact with the trolly or collector on the cars.

(*d*) The return conductor will be of the most perfect character known, the joints of the rails presenting no higher resistance to the passage of the current than the body of the rail. This has only yet been achieved on a very few systems.

(*e*) The rails will be kept in the best condition for electrical contact with the car-wheels by the frequency of the service.

5. In addition to the above altered conditions, the proposed tramway will be operated in sections in such a manner that any inductive action on one section will tend to neutralise any that may be caused by an adjoining section.

Note.—In weighing the statements of Lord Kelvin, Sir Frederick Bramwell, and others, given in evidence by Mr. Walker, it must be borne in mind that (*a*) they were made three years ago, when electric traction was in a comparatively crude condition, (*b*) that they were largely the statements of expert witnesses retained by the National Telephone Company to push their interests, and, consequently, although the actual letter of their evidence may be absolutely correct, the spirit of it is strained as much as possible in their client's interests.

Mr. Elwell has no doubt but that the statement made in his letter of the 15th instant to the Chairman of the Committee would be endorsed by the highest authorities at the present time.

The present telephonic system is not satisfactory, as frequent interruptions and interferences occur.

No large system can be permanently satisfactory without metallic returns, and the absence of these is a block to the introduction of long-distance telephones.

Any extensive introduction of electric light on the alternative current principle will seriously interfere with the telephones when the earth is used for the return current. The Railway Commissioners have found their own telephones much affected at Redfern, and have had a good deal of expense through this cause.

If any improvement is to be made by adopting metallic returns it should be done at once, as, should it be deferred, the expense of alteration will be more than proportionally increased as the number of contributors increases.

A Joint Committee of the Houses of Lords and Commons, in 1893, decided that Electric Traction Companies should be expected to conform to the rules of the Board of Trade; but that this done, they had no further responsibility.

At a telegraph and telephone conference held in Melbourne eighteen months ago, on which Mr. Walker sat, it was decided that Electric Traction Companies should not be expected to provide insulated returns, and that some of the regulations of the Board of Trade should be relaxed.

With regard to cost, it is evident, I think, that Mr. Walker's estimate is excessive. The money expended on the present system, up to date, is, according to Mr. Walker, £92,000. Were telephones only now being introduced, the work could be carried out for a much smaller sum, as instruments and materials are cheaper, and there are no heavy royalties to pay. It is probable that a sum of £60,000 would cover the cost.

I do not see why the alterations required for metallic circuiting overhead should not be done for £50,000. Most of the poles will carry the additional wire.

The introduction of underground wires laid in subways with metallic circuit has already been contemplated, and the construction of subways has been commenced, and orders given for cables.

It may be said that the expenditure on a system with metallic returns is precipitated by the construction of the tramway; although from the above consideration it is clear, I think, that it is not so. Assuming the time to be five years, interest only could be charged to electric traction, and that to the whole system. That is to say,—£50,000 at 4 % for five years, £10,000 :—

George-street Tramway (capital cost), say	£130,000
Others, when converted to electricity	£370,000
	£500,000

The interest, £10,000, amounts to 2% on £500,000. The proportion for the George-street tramway is £2,600.

All the work necessary could be done before the completion of the tramway; in fact the complete conversion of the telephone system could be carried out before this time.

H. DEANE,
Engineer-in-Chief for Railway Construction,
22/4/96.

C1.

D.

[*To Evidence of P. B. Elwell, Esq.*]

NOTES ON EVIDENCE GIVEN BY CERTAIN WITNESSES IN THE INQUIRY RESPECTING THE PROPOSED TRAMWAY.

ON perusing Mr. P. B. Walker's evidence I am struck with a remarkable contrast between the statement of Mr. W. E. L. Gaine, general manager of the National Telephone Company, before the Parliamentary Committee in 1893, and the same gentleman's statement made at the National Company's Staff dinner on the 13th March last, the great experts of the day being present.

I take the following extracts for comparison :—

June, 1893—Arguing that cost of conversion to metallic circuit was prohibitive :—"The great bulk of the switchboards of the country were single boards; it meant the taking out of those—an enormous work, and the re-erecting of the entire system, and he had no hesitation in saying that if the Leeds tramway were planted in the city of Liverpool to-morrow, Liverpool would be deprived of the telephone for at least five or six years. He would not undertake to reduplicate the wires and rearrange the system under that time. Asked—'You have said nothing of the enormous cost; those switchboards are very expensive, are they not'? A switchboard for an exchange the size of the Liverpool Exchange would not be less than £20,000. That, of course, did not take into account the cost of way-leaves and ordinary repairs and maintenance. The Leeds tramway ran through one of the outskirts of Leeds, and it disturbed, comparatively speaking, only a few lines—twenty-six lines. Although they had only twenty-six lines disturbed in Leeds, the cost of putting them on to a small extra exchange was between £600 and £700. If this was carried out to its logical conclusion, and assuming that the traction were to be universal all over the country, he estimated that it would cost the company not very far from £2,000,000."

This refers solely to the cost of metallic circuits for about 80,000 subscribers.

March,

March, 1896—Speaking of improvements —"He desired to say that, in all the great towns of the kingdom, if the local authorities were prepared to give the company reasonable and adequate facilities (this refers to way leaves), the company on its part was prepared to place the whole service on the metallic circuit principle." (See *The Electrician*, March 20th, 1896.)

Where does the £2,000,000 for metallic circuit come in here? The total capital of the company, including purchase of patents, buying out competing companies, &c., only amounts to £1,734,000 and there is no talk of increasing it in the Company's annual report. The only city in which they appear to have done much so far in metallic circuits is London where there are no electric trams.

This points to two conclusions; first, that Mr. Gaine's statement of 1893 was enormously exaggerated; secondly, that no special regard is paid to those towns where there are electric tramways as far as metallic circuiting is concerned.

The Electrician, January 10th, 1896.—An important communication by Dr. du Riche Preller appears in this periodical on "Electric Tramways and Telephonic Disturbances." This article was shown to me just before I gave my evidence before the Committee last Friday, and I had not time to carefully examine it. *The Electrician* is the chief technical authority in electricity, and although I subscribe personally to it, the number in question has not reached me.

Dr. Preller gives some very interesting information, but if he had examined also into the best American tramway systems he would have seen that the trolly contact formed only one item in the requirements of a perfect electric tramway. Nevertheless Dr. Preller's article tends to confirm my statement that disturbances of telephones by electric tramways may be neutralised without introducing metallic circuits.

Mr. Webb's evidence.

The same remarks which I have already made upon Mr. Callender's evidence apply to that of Mr. Webb, namely, that if he had first made himself acquainted with the electrical details of the proposed scheme, his opinion would have been of more value as regards the effect of the tramway currents upon telephones.

Mr. Raw's Evidence.

I do not wish to criticise this unless the Committee places reliance upon Mr. Raw's statements as those of an electrical expert, in which case they might prove seriously misleading.

Telephone Systems in Bristol, Birmingham, Coventry, and other Towns where Electric Tramways exist.

I have searched the technical periodicals and made verbal inquiries without obtaining definite information as to whether the telephone systems of any of these towns have been converted to a metallic circuit. If it had been so, it is certain that the fact would be mentioned, and we can only infer that the old system of earth circuits is still in force in these towns and in all others where the National Telephone Company owns the system—especially in view of the extract above quoted from the general manager's speech of the 13th March last. Electric tramway troubles are not even referred to, either on that occasion or in the company's annual report.

Underground Telephone Cables and necessity for Metallic Circuits.

The following extracts from the evidence given by Mr. W. H. Preece, C.B, F.R.S., Electrician and Engineer-in-Chief of the Telegraph Department, and author of some of the best works on the subject of telephones, before the Parliamentary Committee on the Telephone Service, will, perhaps, throw a better light upon the present question than anything yet laid before this Committee They are taken from *The Electrician* of May 10th, 1895, not a year ago —

"The transmitter had passed through several stages of improvements, and had not yet approached perfection, for every day they were receiving suggestions for improvements. Those instruments were connected together with two wires, forming a metallic circuit, which wires were best twisted about each other. The use of one wire only made a defective system, led to innumerable troubles, caused imperfect speaking, and in fact was the principal cause of the great unpopularity of the telephone. In the Post-office they had always used the metallic circuit by means of the twin-wire system, but the introducers of the telephone system in England and America, for the sake of economy, used the single wire. The twin-wire system was being introduced rapidly into England; it was almost general in the United States, and over the Continent very largely.'

"Replying to the Chairman as to the comparative merits of underground and overhead wires, he said there was an advantage in having trunk wires overhead, and there was no disadvantage in having local wires underground. The reason was that an underground wire, like a cable, retarded the electric current; just like iron, it absorbed those minute electrical waves which enabled them to distinguish between one voice and another, and, in fact, it checked the speed of the current. It was not unlike speaking through a long speaking-tube when the voice became blurred at the entrance. Where they had the wires underground it spoiled the articulation and the individual identification. That was due to an electrical quality which might be called the capacity of the wire for retaining its discharge. They could measure the capacity of every wire, and knew how to reduce it, but they could not remove it altogether.

"The coating of the wires with paper had certainly good effects, and when applied to cables with a great number of wires it brought the price of the underground work so low that the difference between the underground work and the overhead virtually disappeared. It reduced the price per mile per circuit for a double circuit of line of pipes filled with conductors to £18, as against £15 or £16 overhead, but it was only when they carried a great number of wires that there was great economy. It really came to this · that while it was impossible to put underground wires where they had only six or eight or ten wires, owing to the price, when they came to 100 or 200 wires it was cheaper to go underground than over ground "

This clearly shows the necessity for metallic circuits in all large telephone systems, and that no one possessing any knowledge of the subject would go to the expense of laying cables underground without intending to adopt the metallic circuit. It would be making matters worse instead of better.

P. B. ELWELL,
28/4/96.

The Secretary, Parliamentary Standing Committee on Public Works.

D 1.

DISTURBANCE TO TELEPHONES BY ELECTRIC TRAMWAY CURRENTS.

Sir, New South Wales Government Railways, 4 May, 1896.

When last before the Committee I was asked if I could quote any authority in support of my assertion that it would be practicable to reduce the disturbing influences of the tramway currents upon the telephones to such an extent that the latter would not be materially affected in spite of the existing earth returns.

By the last mail from London I have the *Electrician*, of March 27th, containing an article on the subject by Dr. V. Wietlisbach, Director and Chief Engineer of the Swiss Telegraph Department.

Considering that the telephone system alone includes 37,500 miles of wire over the whole of Switzerland, and that electric power transmissions, tramways, and lighting installations are probably thicker in that country than in any other, Dr. Wietlisbach may be taken as a very high authority on this special subject; in fact, I know of no one in a better position to give an opinion.

After dwelling upon the various disturbing influences and their remedies, which are very fully considered, Dr. Wietlisbach, referring to the trolley or slide, goes on to say that "in some quarters great weight is further attached to the lubrication of the contact surface Be that as it may, the fact is attested and confirmed that some electric tramways produce in telephone lines only slight or moderate disturbances, which can easily be obviated or neutralised, whilst other electric tramways cause telephonic disturbances of so marked or violent a character that mere crossings of telephone lines having metallic returns and possessing a somewhat high capacity suffice to render telephonic communication extremely difficult. In such cases the only remedy is to bury the telephone lines which are in proximity to the tramway under ground. Having regard to the considerable expenditure which the laying of such cables involves, it would certainly be worth while to further investigate the causes of these telephonic disturbances which may presumably be obviated by very simple means.

As

As regards cost of construction, electric tramways which do not cause telephonic disturbances are in no way more complicated or more costly than tramways which do produce the noises referred to. It is even reasonable to presume that the wear and the cost of maintenance are less in the former than in the latter case."

I could not have desired a more complete support than the above of the conclusions I had already formed, after inspecting the principal electric tramway systems of the world; viz., that the more perfect the tramway construction the less is the disturbing effect on telephones with earth return, and that the tramway which causes practically no disturbance is also the most economical to work, quite apart from telephonic considerations.

I have, &c.,
P. B. ELWELL,
Electrical Engineer.

The Chairman, Parliamentary Standing Committee on Public Works.

E.

[To Evidence of R. Threlfall, Esq., M.A., A.M.I.C.E.]

SUITABLENESS OF ENGINES AT RUSHCUTTERS' BAY TRAM WORKS FOR GENERATING POWER FOR THE PROPOSED ELECTRIC TRAMWAY.

Hollowforth, Neutral Bay, April 30, 1896.

Dear Sir,

I was, as you know, commissioned this afternoon to examine the engines at the Rushcutters' Bay Tram Works, with a view to expressing an opinion as to their suitability for the generation of electric power for the proposed George-street tram-line.

After an interview with Mr. Deane, and with Mr. Elwell, I visited the works in company with the latter, and now beg leave to report as follows:—

(1.) The engines are well fitted to drive specially designed electric generators of a type now on the market, and the necessary alterations can be made at small cost.

(2.) I understand that both Mr. Deane and Mr. Elwell concur in this opinion, but they recommend the installation of new compound engine and dynamo sets worked from the existing boilers (which may be easily increased if necessary) in the first instance. Their reasons are before the Committee and I need not further allude to them.

I have, &c.,
RICHARD THRELFALL.

The Secretary, Parliamentary Standing Committee on Public Works.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

ELECTRIC TRAMWAY FROM CIRCULAR QUAY TO REDFERN RAILWAY STATION.

(PETITION FROM CERTAIN RESIDENTS OF THE CITY OF SYDNEY AND SURROUNDING BOROUGHS AGAINST.)

Received by the Legislative Assembly, 12 *August*, 1896.

To the Honorable the Speaker and Honorable Members of the Legislative Assembly of New South Wales.

The Petition of the undersigned Residents of the City of Sydney and surrounding Boroughs,—

RESPECTFULLY SHOWETH:—

1. That a proposal to construct a double line of tramway through George-street, the great artery of the traffic of Sydney, is fraught with danger to the progress of the city, inasmuch as it is mainly, your Petitioners believe, put forward to delay, and, if possible, to prevent the completion of the Railway system of the Colony, by the construction of the line from Redfern to the deep waters of Port Jackson.

2. That the enormous traffic in George-street will be further congested by the construction of the proposed tram-line, as it can in no way relieve the pressure of traffic, as the dwellers beyond Redfern will still have to make two journeys each way to reach the city from their homes and their homes from the city.

3. That the carriage of wool, hides, and tallow, as well as merchandise and heavy machinery, through the streets, which tends most to the congestion of the passenger traffic, should first be removed, and that can only be accomplished by a properly devised Railway system.

4. That the Redfern Railway Station is already connected with the north part and centre of the city by steam trams, and other means of conveyance for passengers are amply sufficient. Moreover, there is no need for the present, at least, for the construction of a tram-line in Harris-street.

5. That the width of George-street for the most part is so restricted that the space to be occupied by the proposed tram-lines will prove a serious interference with traffic, and will consequently be disastrous to the tradespeople and property-holders in that street, by diverting the present great traffic into other avenues.

6. That the use of electricity by the overhead wire system is one upon which electrical engineers are by no means in accord, except that in the conveying of an immense, and little understood, electric force through densely populated streets, through their centres or on brackets on their sides, is dangerous and unsightly.

Your Petitioners, therefore, pray that your Honorable House will reject the proposal, in favour of the construction, in the near future, of the line of railway from Redfern to the deep waters of Port Jackson.

And your Petitioners, as in duty bound, will ever pray.

NEW SOUTH WALES.

EXPENDITURE ON THE ROADS OF THE COLONY.

(RETURN RESPECTING.)

Printed under No. 19 *Report from Printing Committee*, 24 *September*, 1896.

RETURN to an *Order* of the Honorable the Legislative Assembly of New South Wales, dated 3rd September, 1896, That there be laid upon the Table of this House a Return showing,—

"(1.) The detailed amounts of special appropriations for the months of "July and August, 1896, for expenditure on the roads of the Colony.

"(2.) The total amount expended on the roads of the Colony for the "months of July and August, 1896.

"(3.) The moneys for the two months named expended upon the roads of "the Colony from appropriations for the year 1896-7."

(Mr. Lyne.)

Department of Public Works, Account Branch, 19 September, 1896.

RETURN showing Special Appropriations and Expenditure on the Roads of the Colony during the months of July and August, 1896, in pursuance with Mr. Lyne's motion of the 3rd instant.

		£ s. d.	£ s. d.	
*1.	A	5,362 7 7		
	B	30,725 7 10		
			36,087 15 5.	Special Appropriations. [*See* attached details.]
2.	Expenditure, July and August, on Roads ...		96,537 14 6	
3.	Expenditure on No. 1...		16,489 17 1	

* In addition to the above, and the ordinary Roads Maintenance, the Municipal Councils have been advised to proceed with expenditure to the extent of about 50 per cent. of the Annual Road Grants on Main Roads, and the Local Road Superintendents have been authorised to invite tenders for Road Contracts for 10 per cent. of their votes on last year's basis.

THOMAS R. STEEL,
Under Secretary and Commissioner for Roads. Accountant, Public Works.

1896.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

ROAD VOTES.

(INSTRUCTIONS ISSUED RESPECTING THE EXPENDITURE OF.)

Printed under No. 2 Report from Printing Committee, 28 May, 1896.

[*Laid upon the Table of the House in answer to Question No. 19 of 27th May, 1896.*]

Question.

(19.) ROAD VOTE:—MR. WOOD *asked* THE SECRETARY FOR PUBLIC WORKS,—

(1.) Is it a fact that instructions were issued in March last that one-third of the Road Votes at the disposal of the district officers should be reserved from expenditure?

(2.) Is it a fact that instructions have since been issued that no road contract is to be entered into after the 31st May of this year, thus preventing the expenditure of amounts reserved through the previous instructions of March?

(3.) Are all unexpended road balances written off on the 30th June—the end of the present financial year?

Answer.

[Important.]

CIRCULAR *re* ROAD VOTES.

Department of Public Works, Account Branch, 9 March, 1896.

THE Annual Revenue Votes for main and minor roads for all previous years are now closed, and withdrawn from your lists, leaving at your disposal only the Votes of 1895–6, and the special grants quoted on the copy of your liability statement to 31st December, 1895, sent to you by the Accountant, or since advised.

Attention has been drawn to the large balances still available, and to the necessity for their expenditure on all requisite works before the 30th June next, on which date all moneys not actually drawn from the Treasury by voucher will lapse, irrespective of existing liabilities on that date which will have to be provided for thereafter.

As a first step you will make an aggregate reserve of one-third of your total Votes and Grants, as the financial arrangements set forth in the Estimates of 1895–6 require the expenditure of that portion of the total Vote to be deferred for the present. This proportion of the Vote may be regarded by you as not available, but its apportionment amongst the various Votes and Grants of your district is left to your discretion, that is, you need not reserve one-third from each Vote, provided that the total reserve equals one-third of the total Votes and Grants; but the whole reserve must not be placed on one or two items.

You will then carefully revise your balances and liabilities, and will take such steps as will ensure that all requisite works are carried out and paid for before the 30th June, at the same time being most careful that due regard is given to economical and judicious expenditure.

To effect this the contracts must, of necessity, be let at once.

To further assist in dealing with the expenditure for the year, as far as possible in the year, I would direct you to obtain and submit vouchers for all services, especially of a miscellaneous nature, with the utmost promptitude.

R. R. P. HICKSON,
Under Secretary and Commissioner for Roads.

[Circular.]

Sir, Department of Public Works, Account Branch, 10 March, 1896.

The Minister having been advised as to the total expenditure up to date for the current financial year, and the balance available on the Vote for Roads and Bridges, has instructed me to direct you to at once invite tenders for all necessary works, and to urge on to completion all works now in progress, so that as far as possible all payments may be made before the 30th June.

The prompt rendering of vouchers for payment is also essential to meet the Minister's wishes. Should tenders be invited by you which will exceed amount available on any particular Vote the provision of the excess can be dealt with in the head office.

With respect to the reserve of one-third of the Votes which you have been instructed to make, he desires that you will at once submit proposals in a brief report suggesting the expenditure of the whole or any part of such reserve on the scheduled roads in your district, on such works as commend themselves to you as advisable and which can be completed by contract or day labour and paid for before the 30th June.

He further desires that you should inspect all roads within municipalities entitled to subsidies and submit vouchers for the payment of such amounts as the Councils may be entitled to, and in your intercourse with the municipal officers, that you will inform them that unless the subsidy is applied for and paid to the Council before the 30th June the amounts will not be longer available.

He specially desires that you should realise that as funds are available up to the 30th June for effecting all requisite works which can be completed, and paid for before that date, that you should take immediate action to ensure that result.

I would add that to enable me to report to the Minister each week as to the progress of the Roads and Bridges works the Accountant has been instructed to submit to me a weekly report thereon.

I have, &c.,
R. R. P. HICKSON,
Under Secretary and Commissioner for Roads.

The Resident Engineer.

[Important.] CIRCULAR—M.P. 96-1,585.

Department of Public Works, 27 April, 1896.

YOUR attention is directed to the circular just issued instructing you to give special consideration to the rendition of vouchers for payment before the 30th June.

The monthly wages vouchers of the Roads and Bridges maintenance men should be despatched from your office as early as possible after the 20th of each month. Any amendment which has to be made, owing to subsequent corrections as to time worked, can be adjusted by you when paying the men, or on the next pay-sheet.

The completion of contracts now in progress, and the payment of the accounts relating thereto, is at the present juncture of prime importance.

Municipal Councils have been advised by circular to communicate with you as to the payment of 1895-6 accounts. You will give their applications your best attention.

As any liabilities incurred for contracts let after this date will, to a large extent, create an indebtedness which must be met from next year's Votes, you are instructed that the date for the receipt of all tenders for works already authorised should be fixed so that the agreements will be completed not later than the 31st May, and that until advised that funds for 1896-7 are placed at your disposal, no further tenders are to be invited without special authority. Agreements or bonds for all contracts let should be promptly forwarded to the Accountant.

As far as possible, you should send in requisitions during May for all materials and supplies which it would be judicious to obtain for the ensuing three months. By this means the accounts will be dealt with in June, and the greater portion will be paid before the close of the financial year.

Any recommendations or reports you may have to make with respect to the Estimates and Votes of 1896-7 should be at once submitted.

In 1896-7 the quarterly liability statement will be dispensed with, the method of dealing with tender deposits will be revised, and new voucher registers, contract books, and ledgers will be introduced for general use. You will be further advised thereon and supplied with all information as soon as the books and forms are available.

ROB. HICKSON,
Under Secretary and Commissioner for Roads.

Resident Engineer for Roads and Bridges.

[Important.] CIRCULAR—M.P. 96-1,585.

Sir, Department of Public Works, Account Branch, 24 April, 1896.

The financial year ends on 30th June, 1896, and all balances on revenue votes existing on that date will be "Written Off," irrespective of the liabilities then existing, which must be charged to the Votes of the succeeding year.

In order that every claim against the Department may, as far as possible, be met from the current year's Votes, I have to request that, in the interim, you will immediately deal with and submit to this office all accounts which may be received by you. Advances on contracts should be made to the full extent to which contractors are entitled, and you should carefully inquire as to all outstanding claims for supplies and miscellaneous services, for which vouchers have not been received, and obtain the accounts whenever practicable.

The prompt renditicn of wages vouchers is also essential, especially at the latter end of June, as otherwise the Treasury may charge the vouchers to next year's Votes.

I have, &c.,
T. R. STEEL,
Accountant for Public Works.

Sydney: Charles Potter, Government Printer.—1896.

1896.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

BRIDGE TO CONNECT NORTH SHORE WITH SYDNEY.

(PETITION FROM SHIPOWNERS, WHARFOWNERS, SHIPPING AGENTS, &c., PRAYING THAT NO BRIDGE BE CONSTRUCTED UNLESS OF A CLEAR HEIGHT OF TWO HUNDRED FEET ABOVE HIGH-WATER MARK.)

Received by the Legislative Assembly, 20 *May*, 1896.

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The humble Petition of the undersigned shipowners, wharfowners, shipping agents, merchants, and others interested in commerce in the Colony of New South Wales,—

SHOWETH:—

1. That your Petitioners are informed that private Bills have been introduced into your Honorable House for the purpose of authorising William Kenwood and Benjamin Crispin Simpson, respectively, to construct a bridge across the harbour of Port Jackson, from the vicinity of Milson's Point to the city of Sydney.

2. That your Petitioners are informed, and believe, that in the construction of neither of the said bridges is it contemplated to allow a greater height for the passage of vessels than 150 feet above high-water mark.

3. That your Petitioners are informed, and believe, that in the construction of each of the said bridges it is proposed to have in the fairway of the harbour either one or more piers for the support of such bridge.

4. That both the New South Wales Government Dock and all the private docks in the harbour of Port Jackson, and also most of the wharves at which merchant vessels are berthed in the said harbour, including the wharves of the Railway Commissioners, are situate in that part of the said harbour which is above the site of the proposed bridges.

5. That a height of 150 feet, as above mentioned, would be inadequate for the free passage of a large number of the vessels which visit the harbour of Port Jackson, the masts of many of which vessels run to a height of 180 feet or thereabouts.

6. That the proposal to place a pier or piers in the fairway of this narrow part of the said harbour would be a serious obstruction and danger to navigation, particularly in the night-time, and when the tide is running strongly.

7. That the construction of any bridge of a height of not more than 150 feet above high-water mark, or with piers in the fairway of the said harbour, would operate prejudicially to the business and prospects of both the Government and private docks above mentioned, and would seriously injure the shipping and commerce of the port of Sydney and the Colony generally.

Your Petitioners therefore humbly pray that any Bill which your Honorable House shall sanction for the construction of any such bridge as above mentioned shall provide that such bridge shall have a clear height for the passage of vessels of 200 feet above high-water mark, and shall provide that no pier or other similar obstruction shall be placed in the fairway of the said harbour.

And your Petitioners, as in duty bound, will ever pray.

[*Here follow* 30 *signatures.*]

1896.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

BRIDGE TO CONNECT NORTH SYDNEY WITH SYDNEY.

(PETITION FROM CERTAIN RESIDENTS IN THE CITY OF SYDNEY AND ITS SUBURBS, AND IN THE BOROUGH OF NORTH SYDNEY AND ITS ENVIRONS, IN FAVOUR OF.)

Received by the Legislative Assembly, 21 *May*, 1896.

To the Honorable the Speaker and Members of the Legislative Assembly, in Parliament assembled.

The humble Petition of the undersigned residents in the City of Sydney and its suburbs, and in the Borough of North Sydney and its environs,—

SHOWETH:—

1. That your Petitioners are fully impressed with the urgent need that exists for establishing better communication and greater facility for traffic between Sydney and North Sydney than are available at present to meet the large and increasing requirements of your Petitioners and of the public generally, and that the need in question can only be met by the erection of a bridge and tramway between Sydney and North Sydney.

2. That your Petitioners have perused the notices inserted in the public press by William Kenwood, of Sydney, civil engineer, and a member of the Engineering Association of New South Wales, describing and defining the route of a high-level bridge, and of a tramway between Sydney and North Sydney, designed by him, in which said notices he intimates his intention of applying to your Honorable House for a private Bill, empowering him, his executors, administrators, and assigns to erect and maintain the said bridge, and to erect, maintain, and work the said tramway, and for other purposes in the said notices mentioned.

3. That your Petitioners have likewise perused the descriptions of the said proposed bridge and tramway, given from time to time in the public press, and the comments thereon, and are satisfied that the design and route of the bridge and tramway proposed to be erected and constructed by the said William Kenwood, and are of a comprehensive and practical character, and would be eminently suitable for the requirements of your Petitioners and the public; and your Petitioners are of opinion the erection and working of the said proposed bridge and tramway will be of a great public and local advantage.

Your Petitioners, therefore, humbly pray that your Honorable House will be pleased to receive, favourably consider, and pass the Bill so to be applied for by the said William Kenwood, empowering him, his executors, administrators, and assigns to erect, maintain, and work the said bridge and tramway respectively, and do all other works and things incidental thereto.

And your Petitioners, as in duty bound, will ever pray.

1896.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

THE DEPARTMENT OF PUBLIC WORKS.

(ANNUAL STATEMENT—1894-5.)

Printed under No. 10 *Report from Printing Committee,* 23 *July,* 1896.

The Under Secretary for Public Works and Commissioner for Roads to The Hon. James Henry Young, M.P., Secretary for Public Works.

Sir, The Department of Public Works, 30 June, 1896.

I do myself the honor to submit, for your information, the Statement of Works carried out by this Department from the 1st January, 1894, to the 30th June, 1895.

The last Report, which related to the period from the 1st January to 31st December, 1893, with supplementary information to 30th June, 1894, was published in September, 1894, and it was hoped by my predecessor that the next statement would be completed so as to permit of its being published still more nearly after the expiration of the period to which the information related; but owing to the entire reorganisation of the Department that afterwards took place, it was found impossible to carry this intention out, and to this cause is due the delay that has occurred in placing the present Report before you.

Since the last statement was published, the whole of the staff of the Department, as you are aware, has been reorganised, with the view of insuring more economical and efficient working, and as a part of this reorganisation the whole of the accounts of the various branches have been brought together under one Chief Accountant. To this position the late Chief Clerk, Mr. D. C. McLachlan, was appointed, and to his energy and ability is largely due the success that has attended the new arrangements.

When it is remembered that the expenditure of this Department is something like £2,000,000 per annum, and the number of contracts entered into between 5,000 and 6,000, the large amount of work involved in bringing together, under one head, the accounts of the various branches, and placing them on such a footing as to insure the prompt and satisfactory dealing with vouchers which number some 40,000 per annum, will be readily understood.

Other

Other important changes have also taken place since the last Report. Mr. C. W. Darley, M. Inst. C.E., who was formerly Engineer-in-Chief for Harbours and Rivers, was transferred to the position of President of the Metropolitan Board of Water Supply and Sewerage and Engineer-in-Chief for Metropolitan Sewerage Construction; and the Roads and Bridges, and Harbours and Rivers Branches, were placed under one engineering head, under the title of Engineer-in-Chief for Public Works, which position was conferred upon me. At the commencement of this year, the Act passed during the last Session of Parliament for the regulation of the Public Service came into force, and the late Under Secretary, Mr. J. Barling, who had been for more than thirty years connected with this Department was appointed one of the members of the Board formed under that Act. Shortly afterwards Mr. McLachlan, the Accountant, was also transferred to the position of Under Secretary to the Department of Mines. In consequence of these changes it was determined by the Public Service Board to appoint me as Under Secretary and Commissioner for Roads, Mr. Darley returning from the Water and Sewerage Board to succeed me as Engineer-in-Chief for Public Works. Mr. T. R. Steel was also appointed as Accountant in place of Mr. McLachlan. These arrangements came into effect in February last.

This explanation may perhaps appear somewhat superfluous, but it is necessary in order to show the altered conditions under which the reports of the branches are submitted.

The gross expenditure for the period covered by this Report amounted to £2,585,922 5s. 8d., of which £1,342,662 18s. 1d. was chargeable to Loans, and £1,243,259 7s. 7d. to Revenue. This expenditure was distributed as under :—

Head of Service.	Revenue.	Loans.	Total.
	£ s. d.	£ s. d.	£ s. d.
Establishment	111,452 11 7	.....	111,452 11 7
Railways and Tramways	.....	591,120 17 11	591,120 17 11

Government Architect	97,246 5 8	109,741 10 8	206,987 16 4
Roads and Bridges	797,592 9 6	33,061 13 3	830,654 2 9
Sewerage	5,347 18 9	236,340 3 10	241,688 2 7
TOTAL ... ... £	1,243,259 7 7	1,342,662 18 1	2,585,922 5 8

RAILWAY CONSTRUCTION BRANCH.

Appended will be found the Report of the Engineer-in-Chief for Railway Construction, which shows that since the last Report the following lines have been opened for traffic :—

Lismore to the Tweed.—The first section from Lismore to Mullumbimby, on the Brunswick, a length of 39 miles 24 chains, was opened on May 15th, 1894. The second section, from Mullumbimby to Murwillumbah, on the Tweed, a distance of 22 miles 25 chains, was opened on December 24th, 1894.

In connection with this railway a line of rails has been laid from Murwillumbah to the Colonial Sugar Company's Mill, at Condong, a distance of 2½ miles, for the accommodation of the sugar-cane traffic, the route taken being that which will be ultimately adopted if a junction is made with the Queensland railway system at the Tweed Heads.

The

The total cost of the line, including permanent-way materials and all charges except land compensation, amounts to £795,664 13s. 5d. This includes a length of 1½ mile of line at the Lismore end, and a bridge over Leycester Creek, which was not included in the original recommendation of the Parliamentary Standing Committee on Public Works, but was adopted for the purpose of obtaining a better site for the starting point at Lismore, also the extension to the Condong Mill. The line has been an expensive one to construct, the earthworks throughout having been very heavy in character, the length between Murwillumbah and Mullumbimby especially so. There are also eight tunnels of an aggregate length of 1,652 yards, and these are all lined with concrete. Several steel bridges over creeks are also included in the work, the cost of which has been considerable.

The suburban line from Marrickville to the Burwood Road has also been opened for traffic. The length is 5 miles 4 chains, the line being a double one throughout, and the total cost to date amounts to £191,835 8s. 3d., including land and compensation. These figures may, however, be somewhat increased, as a final settlement of all accounts has not yet been made.

As explained in the previous Report the cost of this line was increased considerably beyond the original estimate owing to the improved accommodation provided at the stations upon the suggestion of the Railway Commissioners, and to the number and width of overbridges erected to meet the requirements of persons whose land has been resumed, and also of the local municipal authorities.

Since January, 1894, the following railway proposals have been under the consideration of the Public Works Committee, and plans, estimates, and other information in connection therewith have been supplied by the Railway Construction Branch, viz. :—Line from Narrabri to Moree; deviation to avoid the Great Zigzag on the Great Western Railway; lines from Temora to Wyalong, Jerilderie to Berrigan, and Parkes to Condobolin.

Acts authorising the construction of the following lines have been passed by Parliament, viz. :—Narrabri to Moree, Jerilderie to Berrigan, and Parkes to Condobolin.

Railway Surveys.

A considerable amount of survey work has been carried out, details of which are given in Mr. Deane's report. Trial surveys have been made of several suggested new lines. A good deal of work was also undertaken for the purpose of improving previous surveys in the direction of economy, and with the view of obtaining better grades.

Tramways.

The following tramways have been completed and opened for traffic :—

	Length.	Cost.	Opened for traffic.
King-street to Ocean-street Cable Tramway	2 miles 32 chains, D track	£174,603 10s. 7d.	19 Sept., 1894.
Extension, Newcastle to Merewether ...	2 „ 28 „ S „	15,464 ...	19 April, 1894.
„ „ „ Tighe's Hill ...	2 „ 23 „ S „	18,787 ...	19 „ 1894.
„ Bondi Aquarium to the Beach...	40 „ D „	12,718 ...	19 Feb., 1894.

Surveys were made and reported prepared in connection with several proposed new lines, but so far as actual construction is concerned no further work was entered upon. The question as to the adoption of electricity as a motive power in connection with the existing main tramway system, and for new lines, has been under consideration, and this perhaps has had the effect of causing a temporary stoppage in our tramway construction work.

During

During the year 1894, Mr. Deane paid a visit to Europe and America, and the opportunity was taken by the Minister to commission him to obtain information on the subject of the construction of light railways, and also with regard to electric and other tramways, both of which questions are of very considerable interest to this Colony. The reports furnished by Mr. Deane are of such importance and value that I deem it advisable to attach them as appendices to this Report.

Harbours and Rivers.

Mr. Darley, the Engineer-in-Chief for Public Works, in his report deals with the work of his branch under the various headings into which it is divided. They are as follows:—Water Supply, Dredging, Improvement of the Harbours and Rivers, Flood Protection, Reclamation, and Sewerage.

The sum of £105,599 0s. 7d. has been expended during the period covered by the Report on water-supply works, nearly the whole of which was in respect of country towns. Works were completed, or in course of construction, at Moss Vale, Dubbo, Nowra, Jerilderie, Nyngan, Parkes, Coonamble, Junee, Lithgow, and Armidale.

Whilst on this subject, I am glad to be able to point to the fact that the administration of these country towns water supplies is now on a much more satisfactory basis than it has been for years past. There can be no doubt that in the case of the earlier works carried out, the municipalities did not sufficiently consider the responsibilities and liabilities they were undertaking, and, in addition, the original Act, under the authority of which these works were constructed, provided that the debts should be repaid to the Government within a period of twenty-eight years. This, however, was found to be quite unworkable, and an amending Act has been passed extending this period to 100 years, which reduces the annual charge on the councils for interest and sinking fund payments to £3·6160 per cent. per annum. The administration of the works by the municipal bodies has been very rigidly inquired into, and in certain cases, where the necessity for such has been shown to exist, a remission of part of the debt has been made in order to bring it within the ability of the councils to meet the annual charges. As a result the liabilities of the municipalities to the Government are now being fairly well met, and I trust that very little trouble will be experienced on this account in the future.

Improvement of Harbours and Rivers.

The expenditure under this head (exclusive of dredging) has been £213,513 5s. 5d. Good progress has been made with the works at the Richmond and Clarence River entrances, the schemes for which were fully described in the last Report.

At the Richmond the South Breakwater was extended 626 feet, and the Northern Training-wall completed, enclosing an area of 63 acres, which it is proposed to reclaim. The North Breakwater, which has been repaired and made up, is now 1,678 feet in length. Up to the 30th June, 1895, 347,842 tons of stone had been deposited at a cost of 4/5 per ton.

At the entrance to the Clarence the South Training-wall was extended to a length of 11,067 feet. At the North Training-wall the old structures were removed to low water, and 1,346 feet of new wall built.

Works for the improvement of the entrance to the Tweed River have also been carried out, the result of which has been very satisfactory.

The

The "No. 5" wall was extended 4,869 feet, and Nos. 2 and 3 walls were commenced and carried out to a length of 3,800 and 3,000 feet respectively.

Steady progress has been made with the Breakwater at Trial Bay, in connection with the Harbour of Refuge which is in course of construction at that place. The Breakwater was repaired and made up, and 90½ feet added to it.

The improvement of Newcastle Harbour is being steadily proceeded with. The Lightship Rocks were removed to a depth of 24 feet below low water, and the Wool Berths at the Queen's Wharf, also rock, were deepened. A channel, 100 feet wide, was excavated to a depth of 25 feet from low water at the entrance to the new basin, and additions were made to the wharfage accommodation.

At Sydney, besides general repairs, new wharfs at Woolloomooloo Bay and Circular Quay, totalling 919 feet, were constructed or nearly completed. New wharfs have been erected at Wagonga and Narooma on the south coast, and repairs and extensions of existing wharfs have been carried out.

Naval Station, Garden Island.

Additional works have been carried out at the Naval Station, Garden Island, for the service of the Admiralty authorities. These included five two-storied houses for storemen and warrant officers; the erection and furnishing of a complete suite of offices; timber store, spar shed, receiving shed, and a store for inflammables. A coal store, capable of taking 2,500 tons of coal, was also in progress. The total expenditure was £47,451 17s. 1d.

Docking Establishment.

During the eighteen months 196 vessels, having a tonnage of 159,587 tons, were docked. A considerable quantity of repairing and construction work was also carried out at the workshops.

Dredging.

The total expenditure on the Dredge Service was £231,935 6s. The quantity of material dredged was 9,808,706 tons, at a cost which compares very favourably with similar work in other parts of the world. On this point of comparative cost the Superintendent of Dredges gives some very interesting information in his report. Excellent work continues to be done by the sand-pump dredges, the introduction of which, as Mr. Darley points out, has reduced the average cost per ton by nearly 50 per cent. Two more of the grab dredges, viz., the "Sigma" and the "Rho," have been converted into dredges of this type.

FLOOD PROTECTION.

Some very valuable work has been carried out in different parts of the Colony in connection with flood prevention, full particulars of which are given in Mr. Darley's report. The danger from floods on our coastal rivers is a constantly-recurring one, and a considerable expenditure on this account is always necessary.

SEWERAGE.

The Sewerage Works are dealt with this time in Mr. Darley's report. The total expenditure was £241,688 2s. 7d., the greater part of which was spent on the works for the metropolis. The complete scheme for the City of Sydney is being steadily carried forward to completion. The works for the Western Suburbs have now

now been for some time in hand. The outfall sewer for that district, which runs on to the Sewage Farm at Botany, has been finished; the main carrier through the farm is well advanced; and on the completion of the eastern branch and sub-mains, which are also well advanced, the reticulation of a considerable portion of Marrickville, Petersham, and Leichhardt, comprising a thickly-populated area of 1,600 acres, will become possible.

The first section of the main northern sewer is in hand, and further sections, extending into Annandale and Balmain, will, before long, be started. Good progress is being made with the sewerage of North Sydney, which is now becoming a largely-populated district.

Reference has been made in previous reports to the splendid results as regards the public health which have followed upon the construction of the sewerage works for Sydney. With the further reticulation which is being carried out, and the extension of the system to the more remote suburbs, the benefits of the scheme are being still more widely distributed.

Roads and Bridges.

As will be seen by the summary before given the expenditure during the eighteen months on roads and bridges works was £830,654 2s. 9d., of which £797,592 9s. 6d. was provided from the Consolidated Revenue and £33,061 13s. 3d. from Loans. This expenditure, as Mr. Scarr, the Principal Assistant Engineer, points out, is considerably less than the rate for the previous twelve months, which is chiefly due to the fact that the conditions have been favourable for road-making, no floods of any consequence—such as often entail heavy expenditure upon the Department—having occurred. The strictest economy has also been practised, and the cost of maintenance reduced to the lowest limit compatible with efficiency.

The figures given in the tabulated statement attached to the Principal Assistant Engineer's report shows that there are 36,070 miles 26 chains of roads under the direct or indirect charge of the Department, of which 24,090 miles 38 chains are cleared, formed, or metalled roads, and 11,979 miles 68 chains simply bush tracks. There are 2,675 bridges of 20 feet span and over, which have a total length of 47 miles 59½ chains; and 28,587 culverts having a total length of 79 miles 77¼ chains, and also 12,383 causeways.

During the period under review 909 miles 48 chains of new roads were formed, metalled, or otherwise improved, and 90 bridges were erected, having a total length of 15,150 feet, the most important being the bridge over the George's River, at Liverpool, 450 feet long; Tarraganda Bridge, Bega River, 1,106 feet long; and the Tocumwal Bridge over the Murray River, a lattice girder on cylinder piers, with a total length of 334 feet, and a steel lift span of 58 feet to admit of steamers passing through the bridge.

Culverts were also constructed having a total length of 1 mile 20 chains, and causeways amounting to a total length of 7 miles 38½ chains.

The average number of men employed was 5,640—1,446 directly by the Department and 4,194 by the contractors.

There are 98 punts, 2 steam-launches, 1 horse-boat, and 187 other boats in use in connection with the ferry service.

The

The Principal Assistant Engineer again draws attention to the necessity for legislative action on the subject of the regulation of the width of tyres of vehicles carrying heavy loads upon the country roads. Owing to the lax state of the law in this respect serious injury is being done to our roads in many parts of the interior, and a heavy expenditure is entailed upon the Department for the extra cost of maintenance thereby caused. It is to be hoped that the necessary remedial legislation will before long be carried into effect.

Mr. Scarr also refers to the increasing competition in carriage of goods by road with the railways, which has entailed much extra expense in the maintenance of several of the main roads of the Colony, and to the rather perplexing question this raises as to how far the Government are justified in expending large sums on the maintenance of roads which are used extensively to enable carriers of goods by road to successfully compete with the Government railways. There is no doubt that in dealing with projected new roads in the future this is a feature that will have to be carefully considered.

Government Architect's Branch.

Mr. Vernon's report shows that during the eighteen months ending 30th June, 1895, an amount of £192,109 7s. 7d. has been expended in the erection and completion of new public buildings, and in repairing, furnishing, and improving existing ones, and also in other miscellaneous services connected therewith.

This expenditure has been incurred in connection with 630 buildings, of which nine have been completed or erected entirely within the period named.

The principal buildings completed were as follows :—

	Total cost. £	s.	d.
Sydney Hospital	80,810	16	9
Additions, &c., to the Royal Mint	6,686	9	5
Regent-street Lock-up	3,495	1	7
New wing, Gladesville Asylum	11,003	2	4
Post and Telegraph Office, Newtown	4,905	11	3
Additions, Newington Asylum...	4,235	1	4
Additions to Rydalmere Hospital for Insane...	15,335	13	11
Additional pavilions, Rookwood Benevolent Asylum ...	5,038	13	2
Lands Office, Moree	3,384	17	0

The expenditure of this branch is smaller than that of previous years, which is due to the fact that a policy of the strictest retrenchment and economy has been followed, and the erection of no new buildings has been undertaken, except where absolutely necessary for the proper performance of the Public Service.

It is, however, to be noted that, owing to the depressed condition of the building trade, the work has been done at a greatly reduced cost, amounting to probably 25 per cent., and therefore the expenditure covers a comparatively greater amount of work as compared with previous years.

The total number of buildings under the charge of the Government Architect is 947, upon which, including sites, Mr. Vernon has placed a valuation of £9,410,622. This valuation, however, was made some time ago, and as real property in the Colony has since become somewhat depreciated in value, these figures must be taken as subject to modification.

The

The Government Architect again draws attention to the inadequacy of the votes which are placed at his disposal for the maintenance and repair of existing buildings. He points out that depreciation takes place at the rate of at least 1·25 per cent. per annum, giving the average life of a building at about ninety years, while the sum voted at present represents only ·37 per cent. When it is taken into consideration that this percentage has to cover, not only annual repairs, but numerous minor improvements and additions, it will be seen that the sums provided are much less than is required to keep the buildings in a state of efficiency, and many must necessarily remain without proper attention. It is to be hoped, therefore, that Parliament will see its way to make more liberal provision under this head.

A commencement has been made with the scheme for the erection of an extensive hospital for the insane at the site purchased for the purpose, at Kenmore, near Goulburn. The sum of £17,245 has been expended in the partial erection of the administrative buildings, in order to temporarily accommodate patients pending the erection of the patients wards. This step has been unfortunately necessary owing to the increase in the number of insane persons and the insufficiency of the accommodation at the existing asylums.

Land Valuation.

The Report of the Land Valuer shows that from 1st January, 1894, to 30th June, 1894, claims were dealt with, and valuations and estimates made as follows :—

	£	s.	d.
Claims for land for railway and tramway purposes ...	15,174	17	2
Other purposes	122,153	5	1
Total	£137,328	2	3
Valuations of resumptions for railway and tramway purposes	32,169	4	7
Other purposes	42,722	13	2
	£74,891	17	9
Estimates of value of proposed resumptions	£1,338,313	8	4

In the last report reference was made of the fact that owing to the illness of the Lands Valuer, Mr. J. B. Thompson, Mr. T. F. Waller had been appointed to carry out the duties of the office. I am glad to say, however, that Mr. Thompson has since recovered, and he has been reappointed to his old position. He resumed duty on the 1st January, 1895.

Water and Sewerage Boards.

In the last report reference was made to the work of the Water and Sewerage Boards of the Metropolis and the Hunter River Districts, both of which are affiliated to this Department. The report of the Metropolitan Board for 1894, which has been laid before Parliament, contains some very interesting information, from which is taken the following figures :—

The average consumption of water per estimated head of population supplied was 34·23 gallons, as against 32·12 for the previous year. The average daily supply was 13,739,000 gallons, and the estimated population supplied was 401,380. During the year over 46½ miles of new mains were laid and 976 ball hydrants fixed, making the total length of mains laid in the city and suburbs, exclusive of trunk mains, 792 miles, with 1,451 screw-down hydrants and 15,208 ball hydrants. There

There were 18·35 miles of sewers laid by the Board during 1894, and 1·27 by the Government and transferred to the Board, making a total of sewers laid of 201·95 miles. There were also storm-water drains under the Board's control amounting to 9·82 miles. The number of houses connected with the sewers during year was 3,903, making a total of 39,965.

The capital debt of the Board stood at £5,185,734, the revenue received was £254,301, which, after deducting working expenses, returned in interest 3·60 per cent. on the capital, as against 3·66 for the previous year.

The working of the Board continues to be in every way satisfactory, and there can be no question that in the management of the important matters of water supply and sewerage Sydney furnished an example which might well be copied by many older cities.

The Hunter River Board have not presented any report of their working for the period under review, so I am unable to give any particulars in this report.

Since the last Report was published, the business in connection with water conservation, which at that time was dealt with by this Department, has been transferred to the Department of Mines, and any information on that subject must, therefore, be sought in the report of the Department named.

In concluding this Report, I would point out that it has only been possible for me to make reference to the most important of our works, and that there is much interesting information to be found in the reports of the various branches which will, I am sure, repay perusal.

ROBT. HICKSON, M. Inst. C.E.,
Under Secretary for Public Works and Commissioner for Roads.

Railways and Tramways.

(I.)

REPORT OF THE ENGINEER-IN-CHIEF FOR RAILWAYS.

The Department of Public Works,
Railway Construction Branch, 1 July, 1895.

Sir,

I have the honor to make the following report for the period commencing January 1st, 1894, and terminating 30th June, 1895:—

RAILWAYS.

During this period the Lismore to the Tweed Railway was opened for traffic in two sections—the first from Lismore to Mullumbimby, on the Brunswick, a length of 39 miles 24 chains, on May 15th, 1894, and the remainder from Mullumbimby to Murwillumbah, on the Tweed, 22 miles 35 chains long, on December 24th, 1894.

The maintenance of both sections has been taken over by the Railway Commissioners.

In connection with this railway a line of rails has been laid from Murwillumbah to the Colonial Sugar Company's mill, at Condong, a distance of 2½ miles, for the accommodation of the cane traffic. The route taken is that which will be ultimately adopted if a junction is made with the Queensland railway system at the Tweed Heads.

The following is a description of the works:—

Lismore to The Tweed Railway.

The line commences at Lismore, on the right bank of the north arm of the Richmond River, it crosses Leycester Creek near its junction with Wilson's Creek; thence with a general north-easterly direction passes through the village of Bexhill, crosses Cooper's, Wilson's, Pearce's, and Byron Creeks, till it reaches Byron Bay, where a station is provided, and also a connection by rail with the jetty. From Byron Bay the line proceeds north-westerly to Mullumbimby, on the southern bank of the Brunswick River, which it crosses; thence, following a north-easterly direction, crosses the north arm of the same river, passes through Burringbar, and after crossing Burringbar Creek three times and Dunbible Creek twice, reaches the southern bank of the Tweed River opposite the township of Murwillumbah.

The earthworks throughout are heavy in character, the length between Mullumbimby and Murwillumbah being especially so.

There are eight tunnels of an aggregate length of 1,652 yards, and these are all lined with concrete.

Much of the country passed through is subject to heavy rainfall and consequent floods, so that a large number of culverts and bridges had to be provided. The smaller openings are chiefly of timber, which in some cases form viaducts of considerable length. The principal creeks are spanned by steel bridges, and these are as follows:—

Leycester Creek.—Three 120-foot steel-trussed spans, and two spans of 42 feet, with plate-girders.
Cooper's Creek.—One 120-foot steel-trussed span.
Wilson's Creek.—One 120-foot steel-trussed span, with two plate-girder spans of 20 feet each in addition.
Pearce's Creek.—One 120-foot steel-trussed span.
Brunswick River.—Four 66-foot steel spans.
Burringbar, first and third crossings.—One span of 66 feet at each place.
Do second crossing.—Two 42-foot spans.
Dunbible Creek, first crossing.—One 66-foot steel span.
Do second crossing.—One 120-foot steel span.

The girders, with the exception of the abutments at Leycester and Wilson's Creeks, rest on cast-iron cylinders filled with concrete. The abutments mentioned are of concrete.

Gates have been dispensed with at the public road level crossings, and steel grids have been laid down to protect the line from the straying of stock.

The ruling grade is 1 in 50, and of this there is an aggregate length of over 6 miles.

The permanent way of the main line is laid with 71½-lb. steel flat-bottomed rails fixed to sleepers 8 feet by 9 inches by 4½ inches, mostly of ironbark timber. In the sidings old iron rails have been used.

Station buildings have been provided at Lismore, Woodlawn, Bexhill, Mayfield, Laureldale, Booyong, Birra-Burra, Granuaille, Byron Bay, Tyagarah, Mullumbimby, Billinudgel, Mooball, Burringbar, Dunbible, and Murwillumbah. Local timber has been largely used in their construction.

The usual practice of making high platforms has been abandoned. Passenger-landings near the level of the rails have been adopted, and cars similar to those in use on the suburban lines, with additional steps at the end, are being used.

At Lismore a timber wharf, 100 feet long, has been erected on the river bank, and is connected with the station-yard by a line of rails.

At Lismore, Byron Bay, and Murwillumbah wrought-iron circular engine-tanks, of 20,000 gallons capacity, built on brick towers, have been erected. The water supply at Lismore is taken from the town service. At Byron Bay water has been obtained by sinking a well in the sand, and is thence pumped into the engine-tank. At Murwillumbah there is an excavated pit of 1,429,300 gallons capacity to catch the rain water.

The works have been let by contract in the following manner:—

Contract No. 1, erection of steel bridges over Leycester and Wilson's Creeks, to Messrs. Crosbie, Marquand, & Co. Total payments £22,268 5s. 11d.
Contract No. 2, for 16 miles of line, including erection of steel bridges over Cooper's and Pearce's Creeks, to Messrs. Kerle and Kerle. Total payments, £198,125 18s. 3d.

Contract

Contract No. 3, from the end of No. 2 to Mullumbimby, 23 miles 24 chains in length, to Mr. Martin Danaher. Total payments, £171,445 12s. 3d.

Contract No. 4, for the remainder of the line to Murwillumbah, 22 miles 35 chains in length, to Messrs. Willcocks and Firth, who also completed the extension to the Condong Mill. Total payments amounted to £332,022 11s. 6d.

Contract No. 5, for the erection of station buildings at Lismore, Woodlawn, Bexhill, Mayfield, Laureldale, and Booyong, to Mr. A. D. Scouller. Total payments, £5,139 14s. 7d.

Contract No. 6, for the erection of station buildings at Binna Burra, Granuaille, Byron Bay, Tyagarah, and Mullumbimby, to Mr. W. Mitchell. Total payments, £3,849 12s. 7d.

Contract No. 7, for the erection of station buildings at Billinudgel, Mooball, Burringbar, Dunbible, and Murwillumbah, to Mr. F. Lemm. Total payments made, £2,802 12s. 2d.

Contract No. 8, for the supply and erection of engine-tank at Murwillumbah, to Messrs. G. and C. Hoskins. Total payments, £316 16s. 2d.

Contract No. 9, for the supply and erection of pumping machinery for Murwillumbah, to Mr. J. S. Rogers. Total payments, £303 14s. 11d.

The total cost of the line, including permanent way, material, and all charges, excepting land and compensation, is £795,664 13s. 5d. This includes a length of 1½ miles of line at the Lismore end and a bridge over Leycester Creek, which was not included in the original recommendation of the Parliamentary Standing Committee on Public Works, but was adopted for the purpose of obtaining a better site for the starting point at Lismore, also the extension to the Condong Mill.

The payments for land resumption and accessory charges have amounted to £34,994 4s. 7d., and will probably be further increased by about £2,000.

Marrickville to Burwood Road Railway.

The works on this railway have been completed and the line opened for traffic.

The contractors having refused to take up the maintenance, this is now being carried on by the Railway Commissioners.

The line leaves the Illawarra line at Sydenham station (previously called Marrickville), 3¼ miles from Sydney, passes through Canterbury, and crosses Cook's River at the same place, and terminates at Burwood Road, Belmore.

The total length is 5 miles 4 chains, and the works are for a double line throughout.

The earthworks are somewhat heavy in character, in consequence partly of the nature of the country and partly as the result of a grade of 1 in 100 being adopted as the ruling grade.

The principal bridges are of iron and steel, and are as follows:—

Over the projected storm-water channel at Marrickville flats, two 30-foot wrought iron spans.

At Terrace Road and Wairoa-street steel bridges are provided, with spans of 30 feet each, resting on brick piers and abutments.

At Cook's River there are four spans of 60 feet. These consist of four lines of plate girders under the road. The abutments are of brick and the piers of cast iron filled with concrete.

Numerous overbridges for public and private purposes have been erected. These for the most part consist of timber superstructures resting on brick piers. But Canterbury Road, Canterbury, is carried over the railway on brick skew arches, with stone skewbacks, facings, and parapets.

Stations are provided at Illawarra Road (Marrickville), Wardell Road, Fernhill, Canterbury, Campsie, and Belmore. These have island platforms, and in the case of Marrickville, Canterbury, and Belmore buildings ornamental in design but economical in construction have been erected.

At Canterbury Station, in addition to the usual accommodation, a long platform and carriage dock with appropriate sidings, to meet the traffic requirements for race meetings at the Canterbury Racecourse, which is in the immediate vicinity, have been provided.

The permanent way consists of 71½-lb. steel flat-bottomed rails, laid on sleepers 8 ft. x 9 in. x 4½ in., with 6 in. of sandstone bottom ballast and blue metal top ballast.

The works were let in the following contracts:—

Contract No. 1, for the principal works, to Messrs. Proudfoot and Fletcher. Total payments to date, £84,097 18s. 2d.

Contracts Nos. 2 and 3, for erection of station buildings at Marrickville, Fernhill, Canterbury, and Belmore, to J. J. Scouller & Co. Total payments, £5,801 2s. 10d.

Contract No. 4, for the erection of waiting-shed, ticket office, and stairs from platform to overbridge at Wardell Road and Campsie, to John Cameron. Total payments, £239 6s. 8d.

Contract No. 5, for the erection of station-master's house, Canterbury, to F. L. Lemm, jun. Total payments, £476 7s. 11d.

The works on this line have been largely increased, owing to the improved accommodation at the stations, and to the number and width of overbridges to meet the requirements of persons whose land has been resumed and also of the local municipal authorities.

Narrabri to Moree Railway.

The working drawings have been completed, and tenders were called for the construction of this line on May 7th, 1895.

The delay in accepting the tender was occasioned by an application of a majority of the townspeople of Narrabri to have the line deviated, so that the new station might be nearer to the centre of the town.

All the sleepers required for this line have been supplied under contract by the Sleeper-getters' Association, and delivered at Narrabri old station.

The amount of the estimate and vote for this line is £153,000, and this amount has been appropriated from the old vote of 1884.

Since January, 1894, the following railway proposals have been under the consideration of the Public Works Committee, and plans, estimates, and information of various sorts connected with these inquiries have been prepared and supplied by this Branch:—Narrabri to Moree, deviation to avoid Great Zig-zag, Temora to Wyalong (two occasions), Jerilderie to Berrigan, Parkes to Condobolin.

Acts authorising the construction of the Narrabri-Moree, Jerilderie-Berrigan, and Parkes-Condobolin lines have been passed by both Houses.

Permanent Surveys.

Glen Innes to Inverell.

The amended permanent survey of this line was commenced in March, 1894, and is now nearly completed. Trial holes are being put down for the purpose of ascertaining the nature of the excavation in the cuttings.

Narrabri to Moree.

The amended permanent survey, inclusive of sidewidths, was commenced in February, 1894, and completed in October. The total length is 63 miles 9 chains.

As already mentioned working plans, sections, &c., have also been prepared and tenders called for construction.

Temora and Wyalong.

The permanent survey of this proposed extension, including sidewidths, was made in 1894. In March, 1895, I inspected the road, and, on my recommendation, the Minister approved of certain deviations which are now being surveyed. The estimate for this line, which has been considered by the Public Works Committee, is £2,300 per mile. The total length is about 40 miles.

Jerilderie to Berrigan.

The permanent survey of this authorised line, including an alteration of the first six miles at Jerilderie, was completed early in June, 1895. Length, exclusive of deviation, 21 miles 10 chains.

At the end of June, 1895, two deviations to meet the wishes of some of the land-owners along the line were approved, and are now being permanently staked.

Locksley Deviation.

The permanent survey of this deviation to cut out the 1 in 33 gradients was commenced in April, 1895, and finished in June. Length, 4 miles 46 chains. The preparation of the working plan, section, &c., is in hand.

Bexhill to Cooper's Creek.

A private line on a 4-ft. 8½-in. gauge has been permanently staked for the landowners along the route. Length, 5 miles 74 chains.

Byangum to M'Kenzie's Crossing.

This 2-foot gauge horse-traction line, which the residents of the district propose to construct, has been permanently staked. Length, 4 miles 52 chains.

Tweed River to Terranora.

The permanent survey of this 3-foot gauge horse-traction line, inclusive of two branches, proposed to be constructed by the land-owners along the route, 1 mile of which was surveyed last year, has been completed. This line junctions with Mr. J. Cowan's wire rope tramway. Length, 3 miles 70 chains.

Tweed River to Dungay Creek.

A private line on a 3-foot gauge, for horse-traction, has been staked for the landowners along this route. Length, 2 miles 40 chains.

Trial Surveys.

Bourke to the Queensland Border.

A trial survey of an extension from Bourke to the Queensland Border, *via* Mungunyah and Wapweela, intermediate to those from Bourke to Barringun, and from Bourke to Hungerford, has been completed. Length, 63 miles 32 chains.

A trial survey of a modification of the original line, between Bourke and North Bourke, at the crossing of the Darling River, has been made. Length, 2 miles 40 chains.

Moree to Inverell.

The exploration of this line, about 100 miles in length, was made in 1894, and the trial survey commenced.

It is now with the exception of two small portions complete. These are at Warialda, where a new deviation is being investigated, and at Inverell where a modification of the location of the line is necessary, so as to allow of a better crossing of the river, in the event of the line being extended.

Tamworth to Barraba, *via* Manilla.

A trial survey has been made, starting from Tamworth, on the G. N. Railway, through Manilla to Barraba. Length, about 57 miles.

Forbes to Condobolin.

The trial survey of an alternative route, direct from Forbes station, to junction with the Parkes to Condobolin line at Goobang Creek, has been completed. Length, 5½ miles.

Parkes to Condobolin.

The survey of a new and more direct route for this line, showing great improvements in the matter of economy and grades is nearly completed. Plans have been prepared and laid before the Public Works Committee who reported favourably on the line, and the construction has since been authorised by Parliament. The estimate is £2,100 per mile.

Barmedman to Hillston, *via* Cargelligo.

The trial survey of an alternative route, *via* Cargelligo, in substitution of the direct line, *via* Rankin's Springs, has been completed. Length, 159 miles 40 chains. A deviation north of the Lachlan River, 11½ miles in length, has also been surveyed.

Pearce's Creek to Ballina, *via* Teven.

This line, the trial survey of which was commenced early in 1893, and its completion postponed on account of more urgent work in the Tweed River district, has been completed. Length, 7 miles 40 chains.

Lismore to The Tweed. Railway Feeder No. 6.

A trial survey of this short branch feeder has been completed. Length, 2 miles 30 chains.

Lismore to The Tweed. Railway Feeder No. 7.

The preliminary survey of a portion of this proposed branch feeder was carried out, when, on account of the excessively heavy earthworks for this class of line, it was abandoned.

Lismore to The Tweed. Railway Feeder No. 8.

The completion of the surveys of this proposed branch line, length 2 miles 10 chains, finishes the series authorised to date.

Deviations to avoid the Great Zig Zag.

Various explorations have been made and trial lines run with a view of selecting the best route. The field work is very nearly complete. The country is extremely rough, the surveyors have daily to surmount precipices and cross deep ravines, and the work is necessarily laborious and slow.

The following explorations have been made:—

Guyra to South Grafton, *via* the Orara Valley.

The exploration of an alternative line, from Bobo Creek up the Orara Valley, to a portion of the Guyra to South Grafton trial survey, *via* Nana Creek, has been made. Length, 40 miles. The trial survey had just been commenced when the survey parties were recalled.

Coff's Harbour to Glenrigh.

This is an exploration of an alternative line, to a portion of the North Coast route, West Maitland to South Grafton, from Coff's Harbour to a junction with the explored route, Guyra to South Grafton, *via* the Orara Valley, mentioned above. Length, 9 miles.

Edgeroi to Collarindabri.

An exploration has been made of a branch line, from Edgeroi, on the Narrabri to Moree line, to Collarindabri, passing near Millie. Length, 80 miles.

Narrabri to Collarindabri.

An exploration has been made of an alternative line, direct from Narrabri. Length, 90 miles

Narrabri to Merkadool.

The exploration of a route *via* Wee Waa, to tap the Barwon River, has been made to Merkadool, a few miles south of Collarindabri. Length, 100 miles.

Goulburn to Crookwell.

A trial survey of deviations, aggregating 30 miles in length, improving portions of the permanently-staked line has been completed. Total length 35 miles 42 chains.

Lismore to Nimbin.

An exploration of this proposed private line has been made. Length, 29 miles.

Mayfield to Eureka.

The exploration of a similar line to the one referred to in the preceding paragraph has been carried out. Length, 7 miles.

Woodlawn to Dorrobbee.

An exploration of a proposed private line has been made from Woodlawn, on the Lismore to the Tweed Railway, to Dorrobbee. Length, 7 miles.

Woodlawn to Cooper's Creek West.

An exploration has been made of a proposed private line, from a point near the terminus of the Woodlawn to Dorrobbee exploration mentioned in the preceding paragraph, to Cooper's Creek West. Length, 6 miles.

Pearce's Creek to Ballina, *via* Chillcott's Range.

The exploration of an alternative route, to a portion of the trial survey, has been made, *via* Chillcott's Range. Length, 7 miles 40 chains.

Wilcannia to Tibooburra and Wampah.

An exploration has been made to connect Wilcannia, on the Darling River, with Wampah, on the Queensland Border, passing through Tibooburra. Length, 200 miles.

Hilltop to Mittagong.

A further exploration has been made with the object of cutting out the heavy grades against the up traffic. Length, 7 miles 60 chains.

Coolaman to Warri.

An exploration of an alternative line to that from Coolaman to Mandamah (Broken Dam) has been made to Warri. Length, 36 miles.

Condobolin to Cargelligo.

An exploration has been made between the above places. Length, 55 miles.

Liverpool to Bringelly and Mulgoa.

A further inspection and exploration of this route has been made principally to collect statistics as to the increase of settlement, &c.

Wyalong to Cargelligo, *via* Ungarie (late Wollongough).

An exploration has been made of a proposed route *via* Ungarie (late Wollongough) as an alternative line to the direct trial survey. Length, 80 miles.

Zig-zag Deviation, *via* Hartley.

At the request of the Hartley Progress Association, an exploration of a route passing near Hartley was authorised, and has been made. Length, 18 miles 40 chains.

Drafting.

A considerable amount of drafting and other work including the preparation of wall-maps, plans, tions, compilations of lithographs, &c., has been done for the Public Works Committee in connection w h the following projected railways:—

Bourke to Barringun,
Jerilderie to Berrigan,
Narrabri to Moree,
Temora to Wyalong,
Deviations to avoid Zig-zag,
Parkes to Condobolin,
Byerock to Brewarrina,
Nevertire to Warren,

as well as the revision of the Colony maps of New South Wales and Victoria, and the preparation of a railway map of the southern portion of Queensland.

Two very large maps of the city and suburbs of Sydney, showing the routes selected by the Royal Commission for final decision, were prepared for the use of the Minister for Public Works in connection with a deputation to urge the construction of the City Extension Railway.

The working plans, sections, and diagram plans of the following private lines have been prepared, and copies, accompanied by duplicate curve books and estimates, have been forwarded for transmission to the promoters:—

Tweed River to Duranbah, Parts 1 and 2, and Horse Branch.
Tweed River to Terranora, Parts 1, 2, and 3.
Tweed River to Dungay Creek, Parts 1 and 2.
Byangum to M'Kenzie's Crossing.

Progress has been made with the working plans and sections, also proclaimed plans, &c., of the following permanently-staked lines:—

Temora to Wyalong.
Glen Innes to Inverell.

The general office work in connection with some of the trial surveys, &c., is in a backward state, on account of the pressure of other work, and the smallness of the staff, through retrenchments during the year 1894, which resulted in the services of twelve officers being dispensed with.

TRAMWAYS.

The following Tramways have been completed and opened for traffic:—

Name of Tramway.	Distance.	Total Length, Single Track.	Date Opened for Traffic.
	Mls. chs.	Mls. chs.	
King-street to Ocean-street Cable Tramway	2 32	4 69	19th September, 1894.
Extension, Newcastle to Merewether	2 28	2 48	19th April, ,,
Extension, Newcastle to Tighe's Hill	2 23	2 40	19th April, ,,
Extension, Bondi Aquarium	0 40	1 21	19th February, ,,

Surveys have been made, and reports prepared, on the following proposed extensions:—

Extension to the Spit, Middle Harbour, alternative route ... ... Permanent Survey.
Branch Line, Rushcutters' Bay to Paddington (from Ocean-street Cable) ,, ,,
Extension to Randwick and Kensington Racecourses ... ... Trial Survey.
Tramway Atlas Co.'s Wharf to Field of Mars, *via* Hunter's Hill ... ,, ,,
Extension, Balmain to Drummoyne ... ... Report.
Extension, Balmain to the Field of Mars, *via* Drummoyne ... ... ,,
Extension, Military Road to Mosman's Bay ... ... ,,

Newcastle to Merewether.

This extension was completed and opened for traffic on the 19th April, 1894; the contractors were Messrs. Walters and Smith. This line should have been opened some time previous to the above date, but owing to the continued subsidences in Melville-street and at the terminus the opening of the line for traffic was delayed.

The cost of this extension, which is 2 miles 28 chains in length, single track, was £15,464.

Newcastle to Tighe's Hill.

Mr. S. F. Stokes, the contractor for this extension, had the line completed and ready for opening at the end of 1893, but owing to the non-completion of the new terminal arrangements in Newcastle the opening was delayed until the 19th April. The cost of this line, which is 2 miles 23 chains in length, single track, was £18,787, of which the sum of £2,100 was contributed by the Roads and Bridges Department for the combined road and tramway bridge over Tighe's Creek.

Extension, Bondi Aquarium to the Beach.

By Ministerial instructions, this work was carried out by day-labour under departmental supervision, and was completed and opened for traffic on the 19th February; the total cost of works being £12,718; length of line, 40 chains, double track.

King-street to Ocean-street Cable Tramway.

All the contracts in connection with the construction of this tramway were completed by the end of the year 1894, but final measurements in connection with contracts 3 and 5 were not completed.

The line was opened for traffic on the 19th September, 1894.

The following contracts were entered into:—

Contract No. 1—Supply of slot beams, guide bars, and fish-plates, was given to Mr. W. Sandford, of the Esk Bank Ironworks, Lithgow, and completed by the 17th November, 1893.

Contract No. 2—Supply and manufacture of wrought and cast ironwork.—The contractors, Messrs. Souter and Martin, completed their contract on the 6th June, 1894.

Contract No. 3—Construction of permanent way.—Mr. Justin M'Sweeney successfully carried out this contract, and the whole of the works were completed by the end of June, 1894.

Contract No. 4—Power plant and driving gear.—Messrs. Hudson Bros. (Limited) had the plant in running order early in September, 1894, when they entered upon their three months term of maintenance.

Contract No. 5—Power and car house.—Mr. Thos. Clark completed his contract by the end of September, 1894. Work in connection with this contract was seriously delayed, owing to some of the materials which had to be imported not coming to hand. This retarded the completion of the whole of the works by some five months.

Contract No. 6—Supply of steel cable tramway ropes.—Messrs. Noyes Bros. completed their contract during July, 1894, the ropes being delivered wound on reels in the cable storage shed, Rushcutters' Bay.

Contract No. 7—Erection of caretaker's cottage, Rushcutters' Bay.—Mr. G. Brewer completed this contract in December, 1893.

Contract No. 8—Manufacture and supply of points or crossings.—Mr. Justin M'Sweeney completed this contract early in August, 1894, the whole of the permanent way being then ready for threading the cables.

The following is a description of power plant:—The main engines consist of two sets of horizontal, compound, surface condensing corliss engines, each connected to the driving shaft by wedge couplings. Diameter of cylinders 24 and 45 inches, length of stroke 5 feet 6 inches, working at a speed of 56 revolutions per minute, with a boiler pressure of 120 lb. per square inch; they are rated to develop 750 indicated horse-power, but can be worked upon an emergency to 1,000 I.H.P. Cranks and crank shafts are of steel 14 inches diameter in bearings, swelled to 16 inches in centre to carry fly wheel, which is 21 feet 6 inches in diameter. Valve

Valve gear is of the corliss type, so arranged that engines may be run either way, a hand reversing gear being provided. The governor is of the "Porter" type high speed, and is driven by gearing from main shaft. On the driving shaft are fixed two rope sheaves 7 feet diameter, each of which drives a rope sheave 21 feet diameter, having 18 grooves for 2 inch cotton ropes.

Running on the same shafts as the large pulleys, are the differential cable driving drums, two 12 feet diameter, and two 14 feet diameter of the "Walker" type. Steam is supplied by three horizontal externally fired tribular steel boilers, each 7 feet diameter, and 16 feet long, with a grate area of 33 square feet, and a total heating surface of 1,328 square feet each.

The power and car house is situated at Rushcutters' Bay; all external walls are of double pressed facing bricks, with dressings in Terra Cotta. The interior of the engine-room is finished with a dado of white enamelled bricks 6 feet high, the rest of the walls being Keen's cement.

The main buildings consist of engine-room 194 feet 6 inches, by 99 feet 6 inches; car-house 196 feet, by 87 feet; and boiler-house, at rear of engine-room, 59 feet by 45 feet; while offices, reading-room, lavatories, and other necessary conveniences are provided.

The height of the chimney, which is built of brick, in cement, is 180 feet from boiler-house floor, and that of the tower at the entrance, is 80 feet from street level.

It may be interesting here to note, that 350 original drawings were prepared by the office staff, in connection with the construction of this tramway.

During the year 1894 I obtained lengthened leave of absence from the duties of office, and, as I intended visiting Europe and America, Mr. W. J. Lyne, then Minister for Works, commissioned me to investigate the subject of light railways and electric tramways.

I left Sydney on May 18th, by the s.s. "Mariposa," for San Francisco, and returned *via* the Suez Canal, arriving in Melbourne by the s.s. "Himalaya" on December 16th, leaving for Sydney per express next day. As my leave extended to the end of the year, I took up my duties again on January 2nd.

Mr. T. R. Firth, M. Inst. C.E., was appointed acting Engineer-in-Chief during my absence.

Reports in connection with my trip have been furnished by me as follows:—

"Preliminary Report."	Ordered by the Legislative Assembly to be printed on		19th March, 1895.
"Railways."	do	do	1st May, 1895.
"Electric and other Tramways."	do	do	15th May, 1895.

H. DEANE.

(II.)

STATEMENT of expenditure on account of the under-mentioned Railways from the 1st January, 1894, to 30th June, 1895.

Head of Service.	Amount.			Head of Service.	Amount.		
	£	s.	d.		£	s.	d.

Harbours and Rivers and Water Supply.

(IV.)

REPORT OF THE ENGINEER-IN-CHIEF FOR PUBLIC WORKS.

I FORWARD herewith for the Minister's information reports from the Principal Assistant Engineers, dealing with Harbours and Rivers, Water Supply, and Sewerage Construction, together with statistical returns showing the expenditure on all the works completed or in progress.

Owing to the fact that the financial year now terminates in June instead of December, the period covered by the reports extends from 1st January, 1894 to 30th June, 1895, and their presentation has been somewhat delayed by the departmental changes, which took place shortly before the latter date.

It will be seen from the returns that the total expenditure for the eighteen months in the branches covered by this report was £843,591 17s. 1d.

Water Supply.

Of this sum, £105,599 0s. 7d. were absorbed by Water Supply works, the very large proportion (£99,125 15s. 1d.) being expended in country towns. Works were completed or in course of construction in Moss Vale, Dubbo, Nowra, Jerilderie, Nyngan, Parkes, Coonamble, Junee, Lithgow, and Armidale.

These ten towns have a total population of about 23,750, and as the schemes will have a capacity of about 3,284,000 gallons per day, or 96 gallons per head, it will be seen that an ample margin for a very considerable increase in population has been allowed.

In addition to these, schemes are in contemplation for the supply of Tamworth, Wellington, Gundagai, and Ballina, and a covered reservoir is about to be erected at the Centennial Park, which will have a capacity of 17½ million gallons.

Dredging.

The cost of the "Dredge Service" was £231,935 6s., of which £142,606 9s. 11d. were expended on excavation of silt, £13,221 19s. 10d. on landing silt and forming ground, £71,772 12s. 2d. on reclamation, dredging, and resumption of land, and the balance in providing new dredging plant and punts, and the conversion and repair of the old.

The quantity of material dredged was 9,808,706 tons, and it will be seen from the reports that the cost per ton compares very favourably with that of similar work in England, America, and the Continent of Europe, where labour is much cheaper, and the cost of repairs less.

The introduction of sand-pump dredging has been fully justified by results, the average cost per ton having been reduced nearly 50 per cent. The "Sigma" and "Rho" have been converted from grab to sand pump dredges, to enable the department to further extend this method where conditions permit.

The Newcastle Harbour, which suffered seriously from the vast accumulation of silt brought down by the floods of 1893, was again deepened in the following year, and is now in a satisfactory condition.

General Improvement of Harbours and Rivers.

An expenditure of £213,513 5s. 5d. has been incurred in the general improvement (other than dredging) of harbours and rivers. The most important works carried out are those on the Tweed River, Richmond River entrance, and Clarence River Heads.

At the Tweed, No. 5 wall was extended 4,869 feet, and Nos. 2 and 3 walls were commenced, 3,800 feet and 3,000 feet respectively being carried out with excellent results. The quantity of stone used was 67,195 tons, deposited at a cost of 2/0.23d. per ton.

The improvement works at the entrance of the Richmond River have progressed steadily. The south breakwater was extended 626 feet, and the northern training wall completed, enclosing an area of 63 acres, which it is proposed to reclaim.

The north breakwater, which has been repaired and made up, is now 1,678 feet in length.

The weight of stone used in the whole of the walls to 30th June was 347,842 tons, nearly one-third of which was deposited during the 18 months under review. The cost per ton was 4s. 5d.

At the Clarence River entrance, the south training wall was entended to a length of 11,067 feet, while at the north training wall the old structures were removed to low water, and 1,346 feet of new wall built.

The Court-house Rocks at Maclean have been removed, so as to give to 13 feet at low water.

Works of some magnitude have also been carried out at the entrance of the Bellinger River and at Trial Bay. At the former the wall has been extended 600 feet, and at the latter the breakwater was repaired and made up, and 90½ feet added to it.

In the Newcastle Harbour the lightship rocks were removed to 24 feet below low water, and the wool berths at the Queen's Wharf, also rock, were deepened. A channel, 100 feet wide, was excavated to a depth of 25 feet from low water at the entrance to the new basin, and additions made to the wharfage accommodation.

At Sydney general repairs were carried out on numerous wharfs, and new wharfs, totalling 919 feet in length, were constructed or nearly completed at Woolloomooloo Bay and Circular Quay.

The shoal off Shark Point was deepened to 28 feet below low water, 2,586 tons of rock being removed, and the rock-level was also lowered at Circular Quay, Pyrmont, and Garden Island Wharfs.

On the Garden Island Naval Station five two-storied houses for storemen and warrant-officers, and a complete suite of offices were erected and furnished. A timber store, spar shed, receiving shed, two shelters, and a store for inflammables were also erected; while a coal store, capable of holding 2,500 tons, and a dressing shed for the baths, were in progress.

The total expenditure was £47,451 17s. 1d.

On

On Spectacle Island two new magazines, 53 ft. x 27 ft., and 23 ft. x 20 ft., respectively, and minor buildings, were added.

A very considerable quantity of repairing and construction was done at the workshops on Cockatoo Island. They have proved themselves invaluable, especially to the Dredge Service, through the efficiency and despatch with which urgent repairs can be carried out.

At the Fitzroy and Sutherland Docks 196 vessels, having a tonnage of 159,587 tons, were docked during the eighteen months. The expenses were £4,054 2s. 11d., and the receipts £5,185 0s. 4d.

At Shea's Creek 353,514 cubic yards of material have been excavated from the canal north of Ricketty-street, and used for raising Crown land in that locality.

Cook's River has been deepened at the entrance to Shea's and Muddy Creeks, and Muddy Creek Canal was extended towards Beatie-street.

On the South Coast new wharfs have been erected at Wagonga and Narooma, and repairs and extensions have been carried out at Eden, Bermagui, Tathra, Nelligen, Mangrove Creek, and Nowra Wharfs, and Kiama Jetty.

In the North-west, 50 miles of the Darling River, between Walgett and Brewarrina, have been cleared of snags.

Flood Protection.

A very considerable amount of valuable work has been done in connection with flood protection in various parts of the Colony.

In the North Coast district, German Creek has been cleared, and the farms drained, the farmers paying a moiety of the cost. The Evans River has been widened at the Iron Gates, in order to enable it to carry off portion of the flood-waters from the Richmond River.

On the Clarence River, the flood embankment at Great Marlow levee has been repaired and strengthened, and the Ulster Lodge embankment and Alumny Creek dam have been constructed to protect Grafton from flood.

On the Macleay River a concrete dam was constructed at Clybucca Creek, to protect the farms from the backing up of salt water from the river.

On the Hunter River considerable expenditure was incurred in protecting with fascines and stone —the Horse-Shoe Bend—West Maitland. The High-street embankment was also repaired, and a dam above the town, which had been washed away, was replaced. The West Maitland levees were repaired by the Council, and the Oakhampton levees by the farmers, the Government paying a moiety of the cost in each case. The Government also contributed towards the cost of repair of protection works at East Maitland and Bolwarra.

Reclamation.

Reclamation of Crown land has been carried out in several places. At Stockton the training-wall was extended 1,600 feet, and 12 acres were reclaimed. Eighteen acres at the north end of Bullock Island were reclaimed from ballast discharged by vessels visiting the port.

Reclamation has also taken place at Shea's Creek, Lord's, and Bonnie Doon on Cook's River, and at Long Cove Creek, Rozelle Bay, Parramatta River, and other places in Port Jackson.

Sewerage.

An expenditure of £241,688 2s. 7d. took place on the sewerage and drainage of Sydney and country towns. In connection with the Western Suburbs sewerage—the importance of having the main outfall to Botany sewage farm completed has been steadily kept in view, as, without it, the rapid construction of the sub-mains was useless.

The outfall sewer itself has now been finished—and the main carrier through the farm is well advanced, so that on the completion of the eastern branch and sub-mains, which are also well advanced, the reticulation of a considerable portion of Marrickville, Petersham, and Leichhardt, comprising 1,600 acres of thickly populated areas, will become possible.

The drainage of the lowlying areas at Marrickville, 1,300 acres in extent, which will be raised and discharged into this branch, has not yet been commenced, but the survey and designs are ready for inviting tenders.

The first section of the main northern sewer which embraces the aqueducts across Johnstone's and White's Creeks, is in hand, and contract drawings are being prepared for the further sections into Annandale and Balmain.

The main outfall for the North Sydney sewerage has, with its branches, been completed from Long Bay to Mount-street, and the remainder is well advanced. The Blue's Point and Kirribilli Point branches have not yet been undertaken.

The sewerage of the Holterman Estate—and the district in the vicinity of Berry and M'Laren streets—comprising nearly 3½ miles of reticulation, has been completed, existing temporary outfalls having been utilised pending the completion of the permanent works at Long Bay.

A scheme for the drainage of Mosman was prepared, but no steps have as yet been taken for its inauguration.

The drainage of the Necropolis at Rookwood has been completed, the main drain discharging into Haslem's Creek, well clear of all populated areas, and in a good tide way.

At Parramatta no material advance has been made in the adoption of a scheme ; four alternative designs were, however prepared, in order that the comparative cost of various methods of disposal could be determined. No. 2 Scheme, designed on the partially separate system, and providing for the disposal of the effluent on the sewage farm, is favoured by the Department as the most economical, but the construction is in abeyance, pending a settlement with the council of the questions of the assessment of Government property and the control of the works after completion.

A storm-water channel was constructed at Clay Cliff Creek, and the Brickfield Creek Channel was extended.

In the Newcastle district, storm-water channels for the drainage of the Pasturage Reserve, and of Plattsburg and Wallsend are in progress, the work being carried out on the butty-gang system. The construction of the former, which varies in width from 60 feet to 110 feet, will involve the erection of six new bridges, which will be let by contract.

The

The serious difficulty for so long experienced at the Sandgate Cemetery by the existence of a water-bearing strata within a few inches of the surface has been quite overcome by the system of drainage carried out.

Storm-water channels at Rushcutter's Bay, Homebush Creek, Iron Cove Creek, Long Cove Creek, and Easton Park, Balmain, have been carried out or are in progress, while designs for others are in preparation.

Since the close of the financial year, most of the works enumerated have been considerably advanced. and a complete statement of their progress will be submitted as soon after the 1st July as possible.

C. W. DARLEY,
Engineer-in-Chief for Public Works.

(V.)

REPORT OF THE PRINCIPAL ASSISTANT ENGINEER FOR HARBOURS AND RIVERS.

I FORWARD herewith, for the Engineer-in-Chief's information, my report on the principal works carried out by this branch during the year 1894 and the first six months of 1895.

The usual classification is adopted, viz.:—

(*a*) Works for the Improvement, Maintenance, and Convenience of Navigation;
(*b*) Water Supply (gravitation or pumping);
(*c*) Works not comprised under the above heads;

dealing first with (*a*), and commencing at the northern boundary of the Colony.

H. R. CARLETON,
Principal Assistant Engineer, Harbours and Rivers.

12/10/95.

(*a*) North Coast District.

Tweed River.

Work was resumed on these works in June, 1894, and a total of 67,195 tons of stone deposited at a cost of 2s. 0·23d. per ton, extending the various walls 11,369 ft.

The total length of these walls is now 20,379 ft., with an output of 134,305 tons of stone, which cost 2s. 1·5d. per ton.

No. 5 wall was extended 4,869 ft., with an output of 38,273 tons, the total length of wall being now 14,239 ft. for 105,383 tons of stone.

No. 2 wall, commenced in August, 1894, was constructed for a length of 3,800 ft. with 8,418 tons of stone.

No. 3 wall, also commenced August, 1894, was constructed for a length of 3,000 feet with 20,504 tons of stone.

This work was done by day-labour, the stone having been procured from the quarry at Cave Point, and deposited on the No. 5 wall by trucks, and on the Nos. 2 and 3 by punts. The effect on the channel has been very beneficial.

Lavender Creek was cleared on two occasions, viz., in January, 1894, and June, 1895.

Snagging was done in Murdering Creek, and sundry repairs to wharfs were effected.

Byron Bay.

The narrow gauge railway on jetty was taken up and replaced with 70-lb. rails, 4ft. 8½ in. gauge. This, with repairs to jetty, replacing piles, repairing crane, boiler, and engine, and overhauling the moorings on two occasions, entailed an expenditure of £895.

Richmond River.

Improvement Works at Entrance.

South Breakwater.—This work was resumed in October, 1894 (nothing having been done since September, 1893), and 31,382 tons of stone were tipped, extending the breakwater 626 feet. The total is now 4,689 feet, for an output of 83,233 tons. A wharf and 20-ton crane were erected during June, 1895, to allow of larger stone being used in this breakwater in consequence of the tip-head having now reached a more exposed position. The wharf and erection of crane cost £837.

Northern Training Bank.—This work was completed in August, 1894, 37,697 tons of stone having been deposited during the year at a cost of £9,189, extending the wall 3,214 feet. This wall encloses an area of 63 acres below high-water mark, which is available for reclamation by a sand pump dredge when one can be spared.

North Breakwater.—Work on this breakwater was resumed in August, 1894, when arrangements were completed for bringing stone from Riley's Hill, the Pilot Point quarry having been abandoned. The whole of the stone deposited, 27,243 tons, was used to make the road to the breakwater good, and to repair and make up the breakwater, The cost was £7,416. The total length of this breakwater is 1,678 feet, with an output of 187,314 tons.

North Creek Guide Wall.—No. 1: This work was completed in May, 1894, 7,274 tons of stone being deposited, at a cost of £1,535. Nos. 2 and 3: From August to October, 1894, 4,633 tons of stone were placed in these walls, at a cost of £774.

Riley Hill Quarry.—92,485 tons of stone have been sent away since January, 1894, at a cost of 2s. 9·8d., making an output since the opening of the quarry of 164,103 tons, at 3s. 5·1d. The total stone delivered in all the walls from January, 1894, to June, 1895, was 108,229 tons, at a total cost of 4s. 9·8d. per ton, and the stone used from the commencement has been 347,842 tons, at an average cost of 4s. 5d. per ton. The stone still continues to prove of excellent quality and suitable for the work. All this work was done by day-labour.

North Creek Canal.—The dredge "Alcides" commenced work at the south end in December, 1894, and cut a channel 2,130 feet long, 60 feet wide, and 8 feet deep. The grab dredge "Delta" commenced at the north end, and cut a channel 2,200 feet long, 32 feet wide, and 5 feet deep. The material excavated

excavated was deposited on the banks. In addition to the dredging, a gang of men were employed excavating where the roots and stumps would have proved a serious obstruction to the dredges. They removed 5,528 cubic yards at a cost of 12·54d. per cubic yard, being slightly in excess of the cost of dredging.

Basin or Dock for Punts at Ballina.—This dock was completed, the sides being lined with stone from Riley's Hill quarry. The cost of the work, exclusive of dredging, was £442.

Wharfs at Wyrallah and Broadwater.

Contracts were let for these wharfs, and some of the piles driven.

Various small repairs to wharfs, jetties, &c., were also carried out.

Snagging has been done at the following places at the cost set opposite them:—

Locality.	Cost. £	s.	d.
South Arm	1,167	8	0
Bungawalbin Creek	209	15	5
North Arm	519	13	10
Emigrant Creek	22	13	10
Leycester Creek	283	6	2
Dungarubba Creek	229	0	0
Bingal Creek	198	14	5
Wilson's Creek	644	7	4
Terrania Creek	427	10	1
	£3,702	9	1

Clarence River District.

Clarence River Heads Improvements.

South Training Wall and Breakwater.—The training wall was extended 6,867 feet with 151,232 tons of stone. The total length is now 11,067 feet, 210,343 tons of stone having been used. The result of this work has been very satisfactory, there being now 30 feet of water alongside and ahead of this wall. The work of repairing the breakwater was begun in 1894, and 9,319 tons of stone were put in, but the repairs are not yet finished to the tip head where completed in 1890. The above work was done by contract, and cost £35,193.

North Training Wall.—The work of removing the old walls to low water and depositing the stone in the north training bank was begun by day labour in August, 1894, and 25,096 tons were lifted and placed in new wall at a cost, including preliminary work, of £3,057. 1,346 feet of new wall was built.

Removal of Court-house Rocks at Maclean to 13 feet at Low Water.—Operations were begun in November, 1894, and 4,585 tons of stone were removed at a cost, exclusive of lifting by grab dredge "Omega," of £1,115. The stone has been used for reclaiming a portion of the river frontage at Maclean by the Municipal Council.

Repairs to Wharfs.—Sundry repairs to wharfs were carried out at a cost, by day labour, of £631, and, by contract, of £275.

Woolgoolga Bay.

A cottage for the wharfinger was erected at a cost of £307.

A signal-mast was erected, costing £69, and repairs to jetty and crane were carried out at a cost of £70.

Macleay River District.

Coff's Harbour.

A cottage for wharfinger was erected at a cost of £364 and a flagstaff, £87. Engine and boiler on jetty were also repaired.

Bellinger River.

Training Wall at Entrance.—600 feet of this wall was constructed; 28,603 tons of stone having been deposited. This work is being carried out by contract at a cost of £5,618, and is having a very beneficial effect on the water in the channel. Mooring piles were driven alongside the wall at a cost of £52.

A wharf at Cahill's was constructed at a cost of £143.

Fernmount, Bellinger Heads, and Raleigh wharfs were repaired.

Nambucca River.

A wharf was constructed at Walsh's, Taylor's Arm, at a cost of £59.

Macleay River.

A wharf and shed were constructed at East Fredericton at a cost of £314. An extension was made on the Commandant Hill wharf at a cost of £136; wharf at Seven Oaks was erected, costing £188. An extension to Central Kempsey wharf. Additions to Kinchela passenger wharf and approach to Nelson's wharf were also constructed.

Trial Bay Harbour Works.

34,228 tons of stone were deposited in the breakwater, which was extended 90½ feet. The heavy weather in January, 1895, caused a settlement of 44 feet of the tip head, which accounts for the slow progress made. The cost of the stone was 2s. 10·82d. per ton. The total length of breakwater is now 487½ feet.

In addition to the breakwater works, the prison buildings, quarters, &c., have been kept in repair.

Newcastle District.

Port Macquarie.

The work of protecting a portion of the foreshore from the Government wharf seawards was completed at a cost of £39.

Manning

Manning River.

North Training Wall.—A contract for this work was let and work started in March, 1895, and the contractor laid down a railway from the quarry at Crowdy Head, a little over 4 miles, and opened up the quarry by June 15th, when the first stone was tipped. The output to the end of June was 512 tons.

Wingham wharf was repaired, by replacing some of the piles, at a cost of £134.

Cundletown wharf was extended 10 feet into the river at a cost of £302.

Croki wharf was redecked at a cost of £74.

Port Stephens.

The Myall River, between Bullahdelah and Broadwater, was snagged at a cost of £58. The channels, from Myall Point to Bungwall and from Schnapper Island to the mouth of the Karuah, were marked at a cost of £50. A contract was let for repairs to Booral wharf, but the work was not completed.

Newcastle Harbour.

Removing Lightship Rocks.

This work was completed in March, 1895, the rock being excavated to 24 feet below low water to 100 feet south of the line of fairway. The rock was broken up and lifted by the rock breaker "Poseidon," and the cost, January, 1894, to June, 1895, was £3,196.

Deepening Wool-berths.

In March, 1895, the "Poseidon" started work in front of Dalgety's and Gibbs, Bright, & Co.'s woolsheds at the Queen's Wharf, and up to the end of June has crushed an area of 430 ft. x 70 ft. and an average of 2 feet deep. The cost, which included a general overhaul, was £265.

Removing Rock at entrance to New Basin.

This channel is being excavated 100 feet wide, to a depth of 25 feet at low water. Rock removed, 13,680 tons, at a cost of £3,146.

A new ballast jetty was erected, and another lengthened, at a cost of £508.

A ballast jetty and four dolphins were constructed at Stockton at a cost of £945.

A portion of the Queen's Wharf, damaged by the s.s. "Crown of Arragon," was reconstructed at a cost of £302. Stockton boat harbour was repaired at a cost of £62.

The pumping station in connection with the hydraulic cranes and the electric lighting plant at Bullock Island, which were erected and worked by this Department from 1877 till the beginning of June, 1895, were then handed over to the Railway Commissioners.

A survey of the entrance to Newcastle Harbour in connection with the proposed improvements was made at a cost of £323.

In addition to the above-mentioned works, the Newcastle office supervised the contract for the construction of the valves, hydrants, &c., required for the country towns water supplies; £2,986 worth of valves, &c., were tested and passed during the year. Boilers and engines for Jerilderie water supply and two portable boilers for Trial Bay were also constructed under the supervision of this office. All the coal used on dredges, tugs, and works in the northern rivers was purchased and shipped. A large amount of work in connection with repairs to dredges, tugs, and punts was carried out in the workshops at Bullock Island.

Sydney and South Coast District.

Nepean River.

This river was cleared of snags for 2½ miles above the railway bridge. A reef of rocks 1½ mile above the bridge was also removed. These works cost £876.

Sydney Harbour.

The four-fathom shoal off Shark Point was deepened to 28 feet. The rock removed was 2,586 tons, costing £2,517.

The south-eastern corner of Circular Quay was deepened by the removal of 1,260 tons of silt and 1,050 tons of rock.

Further deepening of the berths at the eastern and western piers of Pyrmont wharf was carried out, 1,632 tons of rock, clay, &c., being removed.

A wharf approach and office for wharfinger were erected at White Bay, Balmain, at a cost of £1,495.

The following wharfs were repaired:—Blackwattle Bay, Double Bay, Clark Island, and Watson's Bay.

Landings for dredge service tugs and punts were constructed at Darling Island.

Repairs were also carried out to Norddeutscher-Lloyd wharf and shed, Neutral and Mosman's Bay waiting-room, Manly Co-operative Ferry Company's shed, Orient S.N. Company's wharf, and Messageries Maritimes Company's wharf.

Woolloomooloo Bay Wharfs.—A portion of the new wharf 50 feet long, known as No. 2 berth, was constructed on the eastern side, and a retaining wall was erected along the back, and 5,173 tons of earth filling were deposited behind it free of cost. Piles for the back rows of new berths were also driven for a length of 400 feet.

Circular Quay, Western Side.—The old wharf in front of the Naval stores, the shed on old No. 1 jetty, and 150 feet of the Norddeutscher-Lloyd Company's shed were removed, and the useful material stored. 24,939 tons of filling has been deposited at the back of wharf site free of cost. 518 cubic yards of masonry retaining wall has also been built. A timber wharf, 409 feet long, at No. 3 or northern berth, was completed in February, 1895, costing £6,856. No. 1 berth, 460 feet long, was commenced in March, 1895, and is now nearly completed; cost to date, £4,494. 799 tons of rock, clay, &c., was removed from the front of No. 3 berth.

Parramatta River.

The fascine embankment and flood-gates at Parramatta were repaired; wharfs at Rydalmere, Newington, Dundas, Ryde, Ermington, Cabarita, Abbotsford, and Cockatoo Island were repaired, and a boat landing added to Rydalmere wharf.

Shea's

Shea's Creek Canal.

This work was recommenced in January, 1894, after a stoppage of about six months. A railway line was constructed in April, and worked with horses till November, when a locomotive was purchased. The whole of the low-lying ground belonging to the Government north of Rickety-street on the western side has been raised to formation level. The quantity of material excavated was 353,514 cubic yards from the portion of canal above Rickety-street, both in making the canal 10 feet deep and reducing the banks to formation level. A drain was cut to divert the creek water, and the excavation below water level was removed dry, the soakage being removed by pumping.

The work was considerably delayed by the action brought by Mr. McNamara against the Department.

An embankment and drain have been constructed round the resumed land below Rickety-street.

Cook's River.

The dredge "Omicron" has been employed cutting a channel across Cook's River at the mouth of Shea's Creek, and deepening the entrance to Muddy Creek. The silt having been landed at Lord's and Bonnie Doon.

Muddy Creek Canal.

This work is being extended towards Bestic-street. The channel has been excavated to 4 feet below low water, the work having been done dry by diverting the creek water and pumping out the soakage. Fascine banks have been constructed on each side of the extension.

1,782 rods of wire fencing have been erected on the boundaries of the Government land, and for the purpose of protecting the grassed slopes.

Wharf at Wagonga.

A wharf and shed were constructed at Wagonga.

Wharf at Narooma.

A wharf was constructed at Narooma, and 2-ton hand crane erected on it.

Repairs were carried out to Shellharbour Breakwater, Bermagui Wharf, Tathra Wharf, Nelligen Wharf, boat landing Mangrove Creek Wharf, Nowra Wharf, and Kiama Harbour Jetty.

Wharf at Eden, Twofold Bay.

280 feet of this jetty was reconstructed and a double line of rails laid along the whole length, at a cost of £1,430 to date.

Darling River.

Fifty miles of this river was cleared of snags between Walgett and Brewarrina.

Fitzroy Dock Establishment, Cockatoo Island.

The following is a list of work carried out:—	£	s.	d.
General repairs to dredge plant	33,866	10	0
New launch for dredge service	3,600	19	4
New buckets for "Poseidon"	248	7	1
15-ton floating crane—Repairs	336	13	10
5-ton do do	199	18	10
Woodwork, &c., for Head Office	359	17	7
Byron Bay Jetty—New boiler	147	7	5
Docking H.M. Ships	2,499	7	11
Do Merchant Ships	384	6	11
Offal barge—Repairs	331	19	2
N.T.S. "Sobraon"—General repairs	1,022	18	0
Torpedo boat "Acheron"—Repairs	256	7	8
Richmond River Improvement—Two new punts, repairs to locomotive, punts, &c.	3,201	2	0
Trial Bay Works—General repairs	264	16	11
Shea's Creek Works—Repairs to locomotive, &c.	85	1	6
Reclamation Works—Making pipes, punts, &c., and repairs	2,257	7	11
Garden Island—New steel boiler, anchor and torpedo racks, 9 trolleys, hoisting engine and traversing gear, torpedo test tank, jigger hoists, &c.	1,545	0	4
Spectacle Island—Magazine, &c.	169	3	9
Centennial Park Reservoir—Concrete test, &c.	105	19	6
Wollongong punts—Repairs	534	17	6
Wharf Pontoons—Repairs	93	13	3
Steam Launch "Leila"—Wages and repairs	941	15	9
Darling Harbour Wharf and Island	460	11	6
Water Supplies—Stand-pipes, &c.	255	10	11
S.S. "Golden Fleece" (Mines Department)	103	1	6
Sundry small works	1,436	9	5
	£54,709	5	6

STATEMENT of Vessels docked in the Fitzroy and Sutherland Docks from January, 1894, to June, 1895

	Sutherland Dock.	Fitzroy Dock.	Total.
Number of vessels	84	112	196
Tonnage	115,717 tons.	43,870 tons.	159,587 tons.
Actual expenses	£3,070 11s. 7d.	£983 11s. 4d.	£4,054 2s. 11d.
Amount received	£4,067 17s. 8d.	£1,117 2s. 8d.	£5,185 0s. 4d.

(*b*) Water Supply.

Moss Vale.—This scheme, consisting of a concrete dam across the Wingecarribee River, forming a storage reservoir from which the water is pumped 1½ miles to a service reservoir commanding the town, was completed with the exception of a stone apron to the weir, now in hand. The population is about 1,300, and the scheme will supply 214,000 gallons per day.

Dubbo.—These works were completed. Naturally filtered water is pumped from a large well to a reservoir close to the town and distributed in the usual manner. The population is about 4,300, and 300,000 gallons per day can be supplied.

Nowra.—These gravitation works, which embrace a concrete weir across Good Dog Creek, from which the water is conveyed 7½ miles to a service reservoir commanding the town, were completed. The population is about 2,150, and the capacity of the scheme 330,000 gallons per day.

Jerilderie.—This scheme was completed. The water, impounded by a timber and earthwork weir across the Billabong Creek, is pumped into an elevated tank in the town and thence distributed. The population is about 700. 165,000 gallons of water can be supplied daily.

Nyngan.—These works, consisting of a timber and earth dam across the Bogan River, from which the water is pumped 2 miles to an elevated tank in the town and distributed, were completed. Population, about 1,100. Capacity of supply, 165,000 gallons per day.

Parkes.—These works, which consist of a well close to the Goobang Creek, from which the water is pumped 2 miles to a reservoir in the town and thence distributed, were completed; but an exceptionally dry season having proved that, in order to provide against droughts, it will be necessary to increase the filtration area by sinking deeper and by a horizontal drive These works are being proceeded with. Population, 2,800. Capacity of pumps, 240,000 gallons per day.

Coonamble.—The town will be supplied from the artesian bore, the water from which will be cooled and aerated by spraying into an elevated tank, from which it will be distributed. The works are nearly completed. Population, 1,200.

Junee.—The works in connection with this gravitation scheme are approaching completion. They consist of a storage reservoir formed by a concrete dam across the Bethungra Creek, from which the water is conveyed in pipes to a service reservoir commanding the town. The length of main pipe is about 20 miles, and its discharging capacity 350,000 gallons per day The population is 2,000.

Lithgow.—This is a gravitation scheme, and is nearly completed. A curved concrete dam is constructed across Farmer's Creek, about 3½ miles from the town to which the water is conveyed direct. Capacity of main pipe, about 800,000 gallons per day. Population, 4,200.

Armidale.—These works, which consist of a storage reservoir, formed by a concrete dam across Dumaresq Creek, whence the water will be brought by a main 8 miles long to a service reservoir in the town. Population, 4,000. Discharge of main, about 520,000 gallons per day.

Tamworth.—This was intended to have been a pumping scheme, but surveys are being made for a proposed gravitation supply, which will probably be carried out. The pipes necessary for the reticulation have been provided.

Supplies for Wellington, Gundagai, and Ballina have also been under consideration.

Plans were got out for a reservoir for Sydney, in the Centennial Park, to take the place of the Paddington Reservoir, with the object of having a supply in the city in case of an accident to the canal or mains. It is to hold 17½ million gallons, and to be constructed of brick with coke concrete roof.

Hunter River District Water Supply.

Repairs to Intake Works.—The river bank and the end of tunnel, which were washed away during the 1893 flood, were repaired. The bank was made up with fascine work, and a new tunnel-face with concrete foundation constructed. Piles were driven to carry the suction-pipes out to the original staging in the river. Cost, £641.

Duplicate Suction-pipe.—A duplicate suction-pipe is being laid from the river to the pumping station. Up to 30th June all the pipes were delivered, and 800 feet of the main laid. Expenditure to date was £2,319.

Country Towns Water Supplies—Expenditure from 1st January, 1894, to 30th June, 1895.

	£	s.	d.
Armidale	20,587	19	4
Balranald	19	2	5
Ballina	209	11	5
Bathurst	20	3	5
Coonamble	3,783	2	5
Dubbo	2,252	10	9
Deniliquin	912	5	9
Forbes	11	5	6
Goulburn	348	11	10
Gundagai	69	19	9
Hunter River District water supply	2,258	2	4
Jerilderie	2,757	4	2
Junee	29,669	0	8
Lismore	825	17	11
Lithgow	6,925	7	10
Moss Vale	4,338	11	3
Moama	562	8	3
Manly	3,262	7	3
Nyngan	4,997	1	6
Nowra	2,134	16	1
Orange	4	19	4
Parkes	1,266	1	0
Richmond	770	0	9
Tamworth	10,874	3	10
Wentworth	19	14	2
Wellington	9	18	3
	£98,885	7	2

(*c*) Works not included under (*a*) or (*b*).

Richmond River.

Clearing and Draining German Creek.—This work consisted of clearing the creek and the excavation of a drain 110 chains long, for the purpose of draining the adjacent farms. The cost was £152, half of which is to be repaid by the farmers interested in three yearly instalments.

Widening and Deepening Evans River at Iron Gates.—This work consists in widening the channel for a length of 750 feet to a bottom width of 250 feet, at a depth of 3 feet below low water, for the purpose of carrying off a portion of the flood waters of the Richmond River. The cost of the work done to 30th June was £536.

Clarence River District.

Great Marlow Levee, Clarence River.—This work consisted in repairing and strengthening flood embankment on the left bank of river, opposite Elizabeth Island. The cost was £2,893, which included 20,000 cubic yards of an additional earthwork, and fascines and the protection, about 400 feet lineal, of river bank, with a stone dyke and fascines.

Ulster Lodge Embankment.—This consists of two earthwork dams to protect Grafton from flood. They are carried up to the 24-feet flood level, and cost £425.

Alumny Creek Dam.—This is an earthwork dam and roadway, constructed to protect Grafton from flood. It cost £889.

Macleay River District.—A concrete dam was constructed at Clybucca Creek, at a cost of £393, for the protection of the farms against the backing-up of salt water from the river.

Newcastle District.

Hunter River Flood Protection.—The work of repairing with fascines and stone the river bank at Horseshoe Bend, West Maitland, which had been washed away by the March, 1893, flood, was satisfactorily completed. The amount expended, January, 1894, to 30th June, 1895, was £5,708, the total cost of the work being £8,707. High-street embankment was repaired after the February, 1895, flood, by repuddling at each side of the timber; work cost £110. A dam was constructed at Cummins', above West Maitland, in place of one washed away by the 1895 flood, at a cost of £356. The West Maitland levees were repaired by the local Council, at a cost of £443; the Department contributed a moiety. The Oakhampton levees were repaired by the farmers interested, on similar terms. The Department contributed £51 towards the repairs to embankment at East Maitland, the work being carried out by the Council. Extensive repairs were effected to the Bolwarra levees by the land owners, at a cost of £1,817, towards which the Government contributed £500.

Clearing Wallis Creek.—The work of removing logs and other obstructions from Wallis Creek was commenced, and good progress made, in June, 1895. Sixty men were employed, and £84 expended. This work is required for sanitary purposes and for the better escape of water in flood time.

Reclamation Works, Stockton.—The training wall was extended 1,600 feet, with 14,148 tons of stone ballast and 1,561 tons of clay deposited by lighters. Total cost, £1,324. About 12 acres were reclaimed.

Reclamation, North End Bullock Island.—101,402 tons of ballast was discharged at the Ballast Jetties from 250 vessels, averaging 637 tons per vessel. This ballast was used for reclaiming Government land, about 18 acres having been reclaimed. Cost, £1,343.

Eight pontoons, for reclamation work, were constructed at a cost of £522.

Surveys for flood outlets on the Hunter River were carried out at a cost of £403.

About 19 acres were reclaimed at north end of new basin, Bullock Island, and at back of hydraulic engine-house.

Naval Station, Garden Island.

Naval and Victualling Stores.—These buildings were completed early in 1894, and were fitted up at a cost of £2,445.

Houses for Storemen and Warrant-Officers.—Five two-storied houses were erected in blocks of two and three together of brick, faced with white pressed bricks with sandstone dressings, the cost being £3,167.

Office Buildings for Officers.—This is a two-storied building of brick, faced with white pressed bricks and sandstone dressings, roofed with tiles, containing 13 rooms, and has a clock turret terminating in a stone dome 64 feet from the ground. In the turret is an eight-day clock fitted with striking gear. It has 4 dials, 4 ft. 6 in. diameter, 45 feet from the ground, and is to be illuminated with electric light. The cost of building was £5,463 and of the clock £244.

Additional Offices.—An additional block of offices containing four rooms was also erected of red brick and roofed with red tiles, at a cost of £668. The offices were furnished and fitted with a micro-telephonette installation, at a total cost of £583. Wrought-iron gates and grilles were fitted to 13 openings in paint and coal stores, at a cost of £155. A timber store, spar shed, and anchor racks were erected at a cost of about £500. A receiving shed 100 ft. x 30 ft., and two shelters on the wharfs, were erected at a cost of £618.

Store for Inflammables.—A store 65 ft. x 32 ft. of red brick with stone dressings was erected, the floor is paved with Val de Travers asphalt. The cost was £833.

Coal Stores.—A contract was let for the erection of stores to hold 2,500 tons of coal, the building is of red brick with stone dressings and floor of concrete. The price is £1,997, but the work is not yet completed.

Dressing sheds to swimming baths are being erected by contract at a cost of £353. The baths were deepened and foundation put in for retaining wall by day labour.

180 tons of rock were removed from front of wharf, making the depth at low water 28 feet nearly.

Spectacle Island.

New Magazines.—An ammunition store 53 ft. x 27 ft. and a dry gun cotton store 23 ft. x 20 ft. of red brick with stone dressings, paved with Val de Travers asphalt laid on concrete, were erected at a cost of £1,125.

Furnishing offices, new laundry building, workshops for armour, and new fencing, and sundry repairs to quarters were carried out at a cost of £596.

Six new lightning conductors were placed on the various buildings, and sundry alterations and repairs were done to the quick-firing magazine at a cost of £138.

Repairs

Repairs to dockmaster's residence, Cockatoo, and engine drivers cottage were carried out for £75.

Site of drill hall at Fort Macquarie was enclosed with á 6-foot picket fence.

A waiting room with parcel office for the use of H. M. Navy was erected near the Man of War Steps at a cost of £380. The building is of wood with tiled roof.

A shelter for licensed watermen was erected at Fort Macquarie of wood on brick and concrete foundations, roofed with tiles, costing £295.

Reclamations in Sydney District.

	£	s.	d.
Long Cove	5,629	1	9
Rozelle Bay	2,131	0	9
Neutral Bay and Careening Cove	487	0	0
Tarban Creek	185	0	0
Homebush Bay	1,821	0	0
Callan Park	311	0	0
Doll's Point	53	0	0
Clarke Island	249	0	0

Work was done at each of the abovementioned reclamations, building retaining walls, landing slit, &c., at the cost set down opposite each, in addition to the cost of work done by suction pump dredges.

Surveys, Soundings, and Borings.

Complete surveys were made of Clarke Island, Pitt Town Bottoms, Part of White Bay, Spectacle Island, the Clarence River, for a length of 3 miles including Freeburn Island, and for one and a half miles above and below the town of Lawrence; Newcastle Harbour, from Stockton to Fullarton Cove, Bellambi Haven, Port Kembla, part of Point Perpendicular at Jervis Bay, Man of War Steps at Farm Cove, part of Long Cove, and sixteen wharf surveys in the Sydney district. The resumed land at Shea's Creek was permanently marked as well as the land resumed for obelisks at Vaucluse, and the land required for Rozelle Bay reclamation.

Borings were taken at Tamworth and Parkes, on proposed sites for wells for water supplies, at Marrickville and Tempe, in connection with the proposed Marrickville drainage scheme, at the west side Circular Quay, and at White Bay in connection with proposed new wharfs, and at Careening Cove and Neutral Bay in connection with law suits at those places.

One hundred and eighty-one cases of application for leave to reclaim and for special leases were examined and reported on; soundings and borings for the purpose of laying down reclamation limit lines were taken at Darling Point, Macleay Point, Rushcutters Bay, Double Bay, Camp Cove, South Head, Watson's Bay, Parsley Bay, Vaucluse Bay, Bottle and Glass Point, Shark Beach, Berry's Bay, and Drummoyne, representing a coast line of 7 miles.

H. R. CARLETON,
Principal Assistant Engineer, Harbours and Rivers.

REPORT OF THE ENGINEER-IN-CHIEF FOR HARBOURS AND RIVERS.

Dredging Operations.

I have the honor to forward herewith the Annual Report on our dredging operations.

The Superintendent's report deals so exhaustively with the subject that it is unnecessary for me to go into any detail.

The plant at present under the control of this Department consists of:—

4 double ladder dredges.

10 single do.

1 Von Schmidt type of revolving cutter sand-pump dredge on a pontoon.

3 Dutch type of suction dredges with self-contained hoppers and screw propellers.

4 Dutch type suction dredges on pontoons for stationary work.

19 grab dredges.

27 tug boats of all kinds.

Five of the dredges and three of the tugs have been laid up during the year.

Since the introduction of the sand-pump dredges, the total yearly output has largely increased, with a very marked corresponding decrease in the average cost per ton. We now have five years' experience of the use of this class of dredge, and during that period the total amount of silt raised by all our dredges amounts to over 28,750,000 tons, or more than was raised on the thirteen previous years.

During the last five years the average cost per ton has been 4·085d., whereas the previous average cost amounted to 8·219d. per ton, which alone shows the advantage gained by the introduction of this class of plant.

The Minister having authorised me to convert two of the larger grab dredges into sand-pumps, arrangements are now being made for carrying this into effect. The two dredges in question, known as the "Sigma" and the "Rho," have large roomy iron punts which we built at the Fitzroy Dock; I propose placing small pumps on them of the Von Schmidt type, with 15″ suction and discharge pipes; the grab crane will be retained on one end of the punt for dredging stiff material and lifting snags and logs from rivers. These small dredges will be used chiefly for up river work, working in places where the silt can be discharged direct from the pipes.

The comparison which the Superintendent has drawn up between the cost of dredging in this Colony and in various English ports, in favour of the former, is interesting and instructive, seeing that here we pay higher wages and that repairs generally should be more costly. There are but two ways of accounting for this remarkable result: first, some of our cheapest work is done by dredges working two or more shifts, as pointed out by the Superintendent; secondly, that we employ experienced practical engineers to take charge of our dredges, instead of putting them in charge of sailors, as is very frequently the case. I have not the least doubt that in adopting this system we save a very large expenditure in annual repairs—on the principle that a "stitch in time saves nine" an experienced engineer can see at once when any portion of the plant requires attention, and carries out the repairs, often with his own staff, without stopping the plant if possible, or for as short a time as is necessary; whereas, when a sailor is in charge, he runs the plant as long as possible, until there is a general breakdown and the plant has to go to dock for an extensive overhaul and repairs. This is the only way to account for the fact that only from 15 to 30 per cent. of our expenditure is for repairs, while at the Tyne and Aberdeen repairs amount to 59 and 54 per cent. respectively. On the hopper type of self-propelling suction dredges we have a sailing-master in charge, this being necessary, as these vessels are often employed in a seaway loading the hopper and conveying the silt out to sea to discharge; but in this case there is a first-class certificated engineer in charge of the machinery, including both the engines and dredging machinery, the master simply having charge of the deck and navigating his vessel.

The most important work we have in hand is that at Newcastle, where the harbour was seriously injured by a vast accumulation of silt left during the heavy floods of 1893. By keeping four large dredges constantly at work in the harbour—one of them working three shifts, and one two shifts, making them practically equal to seven dredges—I am glad to say the lost ground has been gained and deep water again prevails in the most important channels within the harbour.

The working of the service has been satisfactory and harmonious, and we have had no serious collision or loss to our plant during the year.

C. W. DARLEY, M.Inst.C.E.,
Engineer-in-Chief, Harbours and Rivers.

REPORT

REPORT OF THE SUPERINTENDING ENGINEER OF DREDGES.

The Engineer-in-Chief for Harbours and Rivers,—

Department of Public Works,
Harbours and Rivers Branch, Sydney, 7 February, 1895.

Sir,

Herewith I beg to submit a detailed statement of work performed by the dredging-plant of the Department during the past year:—

Before particularising the operations at the different ports and rivers, I have thought it desirable, in justice alike to yourself and the dredge service, to compare, briefly, the cost of work in New South Wales with dredging work performed, under like conditions, in Europe and America—countries where cheap labour obtains, and where the eight-hours system does not, as in this Colony, curtail a day's work.

Hitherto statistics of dredging have been of such a meagre description that data upon which to have based a comparison was not obtainable; but this want exists no longer, Mr. Wheeler, M. Inst. C.E., in his work on "Tidal Rivers," published in 1893, having compiled records of the least costly dredging hitherto carried out in England, Scotland, the United States, France, and Germany. Of all the instances quoted by Mr. Wheeler, from the different countries just named, the lowest record of work at ladder and bucket dredging is that of the "Tees," where an average for lifting and transporting is given of 2·773d. per ton; but how this is arrived at is not very clear, the cost for 1890 being given as 3·386d., of 1891 as 3·11d., and of 1892 as 7d.

The next lowest quotation comes from "Newcastle-upon-Tyne," where a year's dredging costs 3·39d. per ton, divided thus—Dredging, 1·85d.; conveying, 1·45d.

Turning now to kindred work performed in New South Wales, we find the dredge "Newcastle" lifting in one year 1,193,045 tons of silt, at a cost of 2·378d. per ton, divided thus—Dredging, 1·609d.; conveying, 0·769d.; being 15 per cent. less than the best cited work on the "Tees" and 33 per cent. less than the cheapest dredging on the "Tyne." I have specially separated the dredging from the towing cost, lest it might be urged that the distance towed was greater in one case than the other, and it will be seen that for lifting alone colonial work is still the lowest.

And with reference to suction dredging, the merit of cheapest work belongs also to New South Wales. Mr. Wheeler cites "Dunkirk" pumping as the lowest, the figures being 1·5d. per ton; the "Danube" work next, at 1·825d.; the New South Wales suction dredge "Juno's" work for a year (1892) is 1·484d. per ton, and for 1891, 1·406d.

In explanation of the economical results arrived at, notwithstanding the eight-hours system and comparatively high wages, it may be noted that in the largest ladder dredges double and treble shifts are employed, one dredge thus doing the work of two or three under one controlling officer, who is an engineer experienced in preventing accidents and capable of having repairs quickly carried out, thus minimising stoppages, which are always chief factors in expensive work. The Dredge Regulations of 1880, which are rigidly adhered to, have cheapened work by preventing the service being burdened with unsuitable employees.

Ladder Dredges at Newcastle.

In the month of April a fire broke out at night on the dredge "Hunter," laid up for repairs, and the port for some time lost the services of a dredge, but this was almost compensated for by the excellent year's work performed by the "Newcastle" and by the exceptionally deep dredging of the "Samson," sent to replace the "Hunter" on completion of the latter dredge's repairs.

Dredge "Newcastle," working two shifts, and for part of the year three, lifted 1,193,045 tons silt, at cost of 1·609d. per ton.

Newcastle Harbour at the end of 1894 was in a comparatively satisfactory state, due, however, as much to the respite from floods as to the work of the dredges.

The "Hunter" dredged 85,030 tons, at 4·551d., and the "Samson" 376,650 tons, at 2·355d. The "Hunter" and "Samson" only worked for portions of the year, the former for twelve weeks with one shift, and the latter for twenty weeks with two shifts.

At the present time the outlook for 1895, owing to the prospect of more floods, is not cheering for shipmasters. However, it is satisfactory to know that the dredging appliances now at work in the harbour represent dredging at the rate of three million tons per year. Repairs after the fire increased the cost of the "Hunter's" work.

The ladder dredge "Vulcan" worked during the early part of the year at the upper end of Newcastle Harbour, and afterwards was sent up the Hunter River to deepen the lower flats, the sand-pump "Dorus" simultaneously being withdrawn from the river to carry on reclamation work at Scott's Point, Stockton.

Dredge "Vulcan," working in Newcastle, lifted 107,250 tons, and on the Hunter River, 123,900 tons, at a cost of 3·202d. per ton.

Ladder Dredges at Sydney.

The Estimates for 1894, showing a decrease of £31,068 upon those of the preceding year, were based upon the presumption that the ladder-dredges "Sampson," "Charon," "Archimedes," and other vessels would not work; but early in 1894 it was determined that the dredges named should be commissioned.

The "Sydney," working in various parts of Sydney Harbour, dredged 318,080 tons of silt, at a cost of 3·579d. per ton.

The "Samson" was accordingly put to work in Woolloomooloo Bay in February, and continued dredging in Sydney until when, owing to the great length of her ladders, it was decided to send her to Newcastle to take the place of the "Hunter." The cost of the dredge "Sydney's" work is high compared with the rate of 1893, owing to the plant having undergone the first extensive overhaul since the dredge was built six years ago. The "Sydney" was employed deepening Darling Harbour to enable the large mail steamers to load at the new jetties, improving Woolloomooloo Bay, and deepening White Bay preparatory to the new wharf being built there. The "Samson" was employed at Woolloomooloo Bay and at the approach to the Long Cove Canal, and the "Hunter" at deepening Neutral Bay and Careening Cove, the silt being used for reclamation purposes by pumping at Rozelle Bay.

The "Samson" worked from February to June, lifting 132,630 tons, at a cost of 2·355d. per ton.

The "Hunter" worked from July to December, lifting 168,695 tons, at a cost of 4·551d. per ton.

Ladder

Ladder Dredges at other Ports.

"Ulysses" lifted 234,200 tons of shingle, at a cost of 2·539d. per ton.

At the Manning River the "Ulysses" has been throughout the year improving the up river channels chiefly between Taree and Wingham. The record, both as regards cost and quantity, compares favourably with the work of the preceding year.

"Minos" dredged 171,540 tons sand and shingle; cost per ton, 3·632d.

Early in 1894 the "Minos" was sent to the Clarence River to work at the main channel near Grafton (instead of the grab-dredge "Alpha"); the dredging at this place occupied the remainder of the year. The expense of removing the dredge from Lake Macquarie to the Clarence increased the cost of the work.

Dredge "Fitzroy" lifted 245,310 tons shingle and sand, at a cost of 2·614d. per ton.

Throughout the year dredging has been vigorously proceeded with at the Macleay River, with the view of opening up the ocean steamer trade again with Kempsey. The ladder dredge "Fitzroy" was engaged all the year at and below Kempsey, while the sand-pump "Alesus" dealt with the long flats at Fisherman's Channel, Shark Island, and Long Reach. Communication with Kempsey will be restored next month.

Dredge "Alcides" lifted 166,340 tons, costing 3·300d. per ton.

The dredge "Alcides" worked at the Richmond River at Pimlico and Wardell Flats, and at the south training wall until December, when the new canal at Fishery Creek was started with.

Dredge "Charon" dredged 113,760 tons of sand, at a cost of 4·865d. per ton.

The small ladder-dredge "Charon" was put in commission in February, and was sent to Port Hacking to deepen the channel between the Deer Park and Audley, but was withdrawn temporarily from the district, and was sent to complete the unfinished channel, started during the preceding year, at Brooklyn, and left incomplete at the time of general retrenchment in July, 1893.

Dredge "Archimedes" lifted 65,370 tons, at a cost of 8·203d. per ton.

In February the small dredge "Archimedes" was commissioned and sent to Moruya to attempt to effect some improvement near the bar. Some good was done, as a small coasting steamer (finally lost on the bar) was enabled to make weekly trips. The cost of the work was very high, owing to the delays due to rough water, and the fact that towing cannot be carried on except when the tide is up.

Sand-pumps.

"Neptune," at ClydeBar, Ulladulla, and Anandale, lifted 249,000 tons of varied material at a cost including alterations to suction pipe, of 3·434d. per ton. Of the above-named quantity 80,700 tons were dumped at sea.

The sand-pump "Neptune" at the beginning of the year was working on the Clyde Bar, the experiment proving most unsatisfactory, owing to the material operated upon not being sand, and the vessel not being able to cut her way through the shallow bank, this was aggravated by the surge of the sea breaking the pipe. The "Neptune" was brought to Sydney, and the suction pipe was altered so as to project beyond the bow of the vessel. On resuming work no difficulty was experienced, the bar being deepened and navigation much improved. Deepening inside the bar has still to be carried on, but this will probably be done by a ladder-dredge. Ulladulla Harbour was deepened by the "Neptune" on the return journey to Sydney, and in August reclamation work was started at Glebe Point, where most satisfactory progress is being made in filling up the insanitary bay between the Glebe and Annandale, the material pumped is towed to the "Neptune" from ladder and grab dredges, and dumped alongside the pump instead of as before being taken out to sea.

"Groper" cut, pumped, and deposited on land 428,175 tons at a cost of 1·942d. per ton.

The Von Schmidt dredge "Groper" has been working at deepening and reclamation work at Callan Park and Long Cove. The dredge cut its way through about half a mile of the canal, pumping the material on to the north side, giving most satisfactory evidence of being able to deal with stiff clay and soft rock, as well as with silt.

"Juno" pumped 238,400 tons of silt and sand at a cost of 3·043d. per ton. 174,700 tons of this quantity were dumped at sea.

The sand-pump "Juno," from January to October, was employed filling her own hopper in the outer harbour, Newcastle, and depositing the silt, so lifted, at sea. Subsequently reclamation work behind the dyke was resumed, the sand being discharged on to Bullock Island.

Sand-pump "Dorus" pumped 289,400 tons at a cost of 1·973d. per ton.

The sand-pump "Dorus" during the first half of the year was employed making a channel at Eales' Flats on the Hunter River, the material being deposited on a shallow bank north of the cutting. Later on work was started at Scott's Point, Stockton, where reclamation is now being proceeded with.

Sand-pump "Alesus," working on the Macleay, pumped 485,300 tons of sand at a cost of 1·975d. per ton.

In a previous paragraph recording the deepening operations on the Macleay River, the work of the sand-pump "Alesus" was referred to, that dredge having deepened three of the long flats at the lower part of the river and at Long Reach. The "Alesus" is now at Seven Oaks Flat, and it has been approved that, on the completion of it, work be resumed on the Nambucca River. During the time the "Alesus" has been on the Macleay double shifts have been employed.

"Dictys" pumped 337,500 tons of sand, cost 1·847d. per ton.

The "Dictys" has been employed at the Richmond River Heads chiefly in connection with the Harbour Improvement Works. Occasionally, as it became necessary, sixteen hours work per day was performed. An attempt was made to work in rough water, but this type of sand-pump not being well adapted for such dredging, the experiment was not a success.

Grab-Dredges.

"Alpha" lifted 31,950 tons at 6·858d. per ton.

This dredge was removed early last year from the Clarence to Tweed River, where the deepening of Dunbible Creek has been carried out.

"Beta" lifted 32,850 tons at 6·034d. per ton.

Worked at South Forster, Cockatoo Island, Darawank, and the main channel, Cape Hawke.

"Gamma" lifted 32,700 tons at 9·250d. per ton.

Was principally employed at Bain's Falls, Wauchope, Red Bank, Ennis Flat, and Andrews Falls, Hastings River. During the year the whole plant received a thorough overhaul.

"Delta" lifted 35,340 tons, at 6·396d. per ton.

Worked at the Hunter River, Raymond Terrace, Newcastle, and Lake Macquarie. The expense of removal to and from Lake Macquarie has increased the cost of the year's work.

"Zeta" lifted 13,237 tons, at 12·369d. per ton.

Removed obstructions in Teven Creek, Richmond River; the material met with was unfavourable to cheap work.

Deepened

"Eta" lifted 41,170 tons, t 4 870d. per ton. Deepened at Tea Tables; Main Channel, John's River; entrance Queen's Lake, Camden Haven.

"Theta" lifted 47,855 tons, at 3·404d. per ton. Dredged principally at North Arm, Martin's Point, and Eatonsville Falls, Clarence River.

'Iota" lifted 35,386 tons, at 4·771d. per ton. Dredged on Main River and Taylor's Arm, Nambucca River.

"Kappa" lifted 52,855 tons, at 4 112d. per ton. Deepened at Long Cove, Callan Park, and various sewers, Balmain and Sydney.

"Nu" lifted 5,335 tons, at 35·040d. per ton. Lifted blasted material at Pyrmont Jetties and Steel Point.

"Sigma" lifted 68,235 tons, at 2·749d. per ton. Dredged at Brasswater, Shark's Hole, and Lower Myall, near Tea Gardens.

"Tau" lifted 36,357 tons, at 4·890d. per ton. Worked at South Arm, Wardell, and Bingall Creek, Richmond River.

"Omicron" lifted 37,386 tons, at 4·565d. per ton. At Shea's Creek, Cook's River.

"Rho" lifted 13,035 tons, at 16·286d per ton. Lifting blasted rock, at Newcastle principally.

"Pi" lifted 21,580 tons, at 9 679d. per ton. At Moruya and Wagonga Rivers; at latter place navigation has been opened to the new wharf.

"Chi" lifted 83,080 tons, at 3·430d. per ton. At South Arm, Back Creek, and between Fernmount and Boat Harbour. Two shifts have been employed for six months.

"Omega" lifted 835 tons, at 110·240d. per ton. Was hired at Wollongong, and on return to Sydney, late in the year, was overhauled and towed to the Clarence, where the dredge is now engaged lifting blasted rock.

After the collision with the "Time" the steam hopper "Castor" was towed to Sydney, but owing to want of funds no repairs were effected for some time. During 1894 the hull was lengthened 17 feet, with the view of ultimately adding a sand-pump. Very considerable improvements were effected in the vessel's general arrangements, among others telescoping the funnel and arranging to lift it by steam and lower it when passing under bridges to reclamation sites.

Additional towing power being required, a new iron tug has been laid down at the Fitzroy Dock Works. The dimensions are 90 feet by 18 feet beam, with fine lines. Engines of 240 indicated horse-power will be fitted, and as the boiler will be worked under forced draft good results may be looked for.

I look forward with much satisfaction to the proposed conversion of grab-dredges into sand-pumps, reserving the power to use either grab or pump as occasion requires on the same hull. The dual arrangement will be of the greatest possible advantage at such places as the Myall, Cape Hawke, the Hastings, the Nambucca, the Bellinger, and Moruya.

I have, &c.,
A. B. PORTUS.

COMPARATIVE cost of Dredging in Europe and New South Wales.

Europe	Pence	New South Wales	Pence
Clyde—Work by ladder dredge (capable of lifting 500 tons per hour)—		Newcastle—Work by stationary ladder dredge (capable of lifting 500 tons per hour)—	
Dredging soft material at per ton	2 06	Dredging soft material, at per ton	1 609
Conveying to Loch Long (7 miles) at per ton	2 00	Conveying to sea (3 miles) at per ton	0 769
Total .	4 06	Total .	2 378
		Sydney—Work by ladder dredge (capable of lifting 500 tons per hour)—	
About 2,000,000 tons are dredged annually ; the actual quantity in 1892 was 2,158,628 tons		Dredging sand, mud, and clay, at per ton	2 069
		Conveying to sea (10 miles) at per ton	1 853
For the year 1890 the cost per ton was	4 60	Total	3 922
		The cost includes detention caused by rough sea In 1894 the quantity dredged in Newcastle was 2,153,920 tons (of which 12,035 tons was specially hard material), the cost of dredging and depositing being on the average at per ton	2 959
Suction dredges—		Suction dredges—	
Writing in 1893 of the rate at which suction dredging had been carried out at Dunkirk, Mr. Wheeler, M Inst C E, says —The cost of pumping up sand and conveying it through long floating pipes on to the land is per ton	1 50	* The "Juno," at Newcastle, in one year (1892) lifted and put ashore 554,600 tons, at per ton	1 484
		And in 1891, 604,608 ,, ,,	1 406
		The "Actor," at Tweed River, in one year lifted and put ashore 484,800 tons, at per ton	1 685

* In 1893 and 1894 the "Juno" was only partially employed pumping on shore.

(VIII.)

MINUTE PAPER.

SUPPLEMENTARY REPORT ON DREDGING.

Department of Public Works, Engineer-in-Chief's Office, Sydney, 14 October, 1895.

HEREWITH I beg to submit a statement showing the work performed by the ladder and grab dredges and sand-pumps for six months of 1895, viz., from 1st January to 30th June, by which it will be seen that there is an increase over the output of half of the work of 1894. The cessation of Hunter River floods has enabled the Newcastle dredges to make satisfactory progress with the harbour deepening at that port, and the sand-pumps are steadily pursuing reclamation work at Stockton and Bullock Island. At the latter place the large sand-pump "Jupiter" is being fitted with two distinct 20-inch discharge-pipes, to enable both of the dredge sand-pumps to work simultaneously. The "Jupiter" was intended for working at the Clarence River Heads, but the scour from the guide walls at that port is so successful that the services of the "Jupiter" are no longer required, and the vessel has been, therefore, temporarily withdrawn for the urgent work at Newcastle.

In Sydney Harbour the Von Schmidt dredge "Groper" has reclaimed nearly all the Government land on each side of the new canal at Long Cove, and is now being slightly altered to take advantage of the wider passage under Glebe Island Bridge, which the Engineer-in-Chief has designed to enable this large dredge to carry out the Rozelle Bay reclamation beyond Gordon-street. The sand-pump "Juno" is making good headway in filling up the extensive enclosed area between Glebe Point and Annandale. The "Neptune" was engagedwith this work, but was withdrawn and sent to deepen the Clyde bar.

Neither of the sand-pumps at the Richmond or the Nambucca have worked to advantage during the past six months, the "Dictys" having to be sent to the Richmond Crossing, where full work is not practicable, and the "Alesus" having to be brought round from the Macleay to the Nambucca. At the Tweed, the pump "Actor" has been employed at the up-river channels.

The grab-dredge "Sigma" has been lengthened 20 feet, and is now being fitted with compound engines, boiler, and pump. The "Rho" is being similarly treated. Attention was drawn in the last report (February, 1895) to the advantages to be looked for from these alterations, and it is only necessary to say in addition thereto, that with the altered vessels the silt will be deposited out of harm's way, and that while the average cost of lifting material with grabs, exclusive of those lifting rock, has averaged 4⅓d. per ton, the estimated cost by pumping is 2¼d. per ton.

A channel suitable for large steamers engaged in the cattle trade to England has been made by the dredge "Hunter" to enable live stock for England to be shipped at the new jetty recently erected at the White Bay reclaimed land. The dredge "Sydney" has been chiefly employed deepening in Darling Harbour.

Good progress is being made with the Fishery Creek Canal, near Ballina, to enable the cane-punts to be brought through in smooth water from the North Creek to the main river. The ladder-dredge "Alcides" and the grab "Zeta" are employed at this work. The "Alcides" and "Minos" have been so fitted as to admit of the silt raised being flushed on shore through pipes, while the ladder-dredge "Fitzroy," at the Macleay, is being supplied with very powerful pumps to convey the material lifted through pipes on pontoons to a considerable distance. The new tug "Galatea," built at Fitzroy Dock, is working, and promises to be a most useful steamer. The "Little Nell" and "Achilles" have been altered and improved, and the "Ajax" is now out of commission, the towing being done by the inexpensively worked steamer "Cyclops." All the plant is being kept in good order.

A. B. PORTUS.

(IX.)

REPORT BY THE PRINCIPAL ASSISTANT ENGINEER FOR COUNTRY TOWNS WATER SUPPLY AND SEWERAGE.

REPORT EIGHTEEN MONTHS, ENDING 30TH JUNE, 1895.

Western Suburbs Sewerage.

THE terminal section of the main outfall sewer has been completed, consisting of a triplicate 6-foot diameter circular sewer, carried upon segmental arches, having a span of 24 feet. This section extends across low-lying ground for a length of 28·75 chains, and reaches within the boundaries of the sewage farm.

In continuation of the above, the main carrier is now in course of construction across the sewage farm. The carrier, 40 chains in length, consists of an open composite trough, carried upon segmental concrete arches, having a span of 50 feet. The trough is constructed of concrete and wrought-iron, the wrought-iron being so distributed throughout the concrete as to aid the tensile strength. At intervals throughout the whole structure expansion joints of val de travers are provided to minimise the effect of varying temperature.

For the crossing of Muddy Creek a flume of wrought-iron has been provided. This is the first work of the kind undertaken in the Colony.

The aqueducts crossing Cook's River and Wolli Creek have been completed. These works consist of a triplicate 6-feet diameter wrought-iron sewer, carried upon segmental brick arches of 27 feet 6 inches span. The crossing of the water-ways is effected by two iron lattice girder bridges, of two 80-foot spans each. The centre piers are formed of cast-iron cylinders sunk in the usual way, the foundations of rock being reached at from 20 to 60 feet. The sewer is at present in duplicate, the triplicate efficiency not being required yet.

The main eastern branch and sub-mains, from the junction with the main outfall at Premier-street to Stanmore Road, is in course of construction and nearing completion. This section embraces a total length of 2 miles 8 chains of sewer, ranging in size from 6 ft. 8 in., by 5 ft. 8 in., to 3 ft. 3 in. by 2 ft. 2 in. In conjunction with this, portions of the western and northern branches, amounting in all to 16 chains of sewer, were also completed.

The continuation of the main eastern branch up to and along Parramatta Road is now in course of construction, and is making good progress. This section embraces a total length of 2 miles 59 chains of sewer, ranging in size from 4 ft. 6 in. by 3 ft. 6 in. to 12 in. diameter.

The Camden-street sub-main, a branch of the main eastern branch, is now in course of construction and nearing completion, embracing a total length of 1 mile 12 chains, of 3 ft. 3 in. by 2 ft. 2 in. sewer.

Thus the whole length of the main outfall is now completed. The arterial system of the main eastern branch is all in hand and nearing completion, with the exception of the low-level scheme for the drainage of Marrickville and St. Peters. For the latter, surveys and drawings have been made, the drainage area being 1,300 acres.

The completion of the current contracts on the eastern main branch system will enable the drainage of an area of 1,600 acres in the municipalities of Leichhardt, Petersham, and Marrickville.

For the drainage of the western suburbs surveys were made as follows :—

Deviation at crossing of Burwood Railway and re-indentification of original survey as far as the Canterbury branch. Survey of the northern branch, from Premier-street to New Canterbury Road; also a survey of a deviation from this sewer as originally laid down. In connection with the storm-water drainage, a survey was made of the Albert Road and Blanche-street branches of Homebush Creek storm-water channel; Beckett's Creek, Granville; and Shea's Creek, from M'Evoy-street to Baptist-street. Levels were taken on the more recent resumption at the Botany sewage farm for the preparation of a contour plan. A survey was made of Rockdale Creek, and contours were taken at Fivedock and Drummoyne.

Northern Main Sewer.

Contract drawings have been prepared and tenders invited for the construction of the aqueducts across Johnstone's and White's Creeks, and the portion of sewer in tunnel between them, comprising a length of 58·75 chains of sewer.

Estimates were made of the cost of extending the main northern sewer into Annandale and Balmain, a total length of 4½ miles of main sewer and branches, ranging in size from 4 ft. 6 in. by 3 ft. 6 in. to 9 in. in diameter.

Contract drawings were prepared for the Bay-street overflow sewer, a length of 60 chains, to the waters of Darling Harbour.

The contract drawings for the low-level scheme for the drainage of Double Bay have been completed and specification prepared.

In connection with the northern main sewer surveys were made for the drainage of the eastern slopes of Randwick and Waverley.

Southern Main Sewer.

Preliminary surveys were made for a line of sewer from the main outfall to drain Kensington Estate and parts of Waverley and Randwick.

Darling

Darling Harbour.

In connection with the proposed reclamation surveys were made and plans, drawings, and an estimate prepared of the probable cost of continuing the sewer and drains through the reclamation to the waters of the harbour.

North Shore Sewerage.

A portion of the main outfall sewer, from a point near the outlet at Long Bay, Middle Harbour, to Mount-street, together with branches, amounting in all to a length of 1 mile 25 chains, has been completed.

The continuation of the above towards the waters of Port Jackson, a further length of 1 mile, is now in course of construction and nearing completion, leaving, therefore, only the Blue's Point branch and the Kirribilli Point branch to complete the main arterial system.

Contract drawings have been prepared for the outlet works at Middle Harbour; the scheme adopted for the disposal of the sewage being based upon the intermittent filtration system, in which the solid matter is precipitated in settling tanks, and the lighter fluid allowed to flow off and filter through sand-beds, used in rotation; the solid matter being drawn off and carried to sea in punts.

The sewerage of the district known as the Holterman Estate has been completed, and is ready for connecting with the main outfall sewer as soon as the outlet works shall have been completed. This system consists of 2 miles 44 chains of 9-in. pipe-sewer, and 74 concrete manholes. The sewage is at present temporarily flowing into the waters of Port Jackson.

The sewerage of the district in the vicinity of Berry and M'Laren Strects has been completed, and is ready for connecting with the main outfall sewer. This system consists of 66 chains of 9-in. pipe-sewer and 34 concrete manholes. The sewage is at present temporarily flowing into the waters of Port Jackson.

In connection with the drainage of North Sydney surveys were made for the case Loxton *v.* Lyne at Neutral Bay; extension of the main outfall sewer to Milson's Point, with branches, Lavender and Blue-street sub-mains. Cross-sections were also made of the head of Willoughby Bay for the preparation of plans of outlet works, and the district to the north of Ernest-street was contoured.

Mosman.

A scheme was outlined, and an estimate made of the cost of the sewerage of the southern slopes of Mosman.

Necropolis Drainage.

The greater part of this work has been completed, and the final section is now in course of construction and nearing completion. The scheme consists of a main drain (which discharges into Haslam Creek) ranging in size from 3 ft. 3 in. by 2 ft. 2 in. oviform to 21-in. circular pipe-drain. Two branches, extending to the northern and western boundaries of the cemetery, receive the soakage from 6-in. diameter agricultural drains, laid along the boundaries of the cemetery, at a depth averaging a little over 6 feet.

Parramatta Drainage.

A section of Clay Cliff Creek storm-water channel 33 chains long, consisting of an open concrete drain, and an earth channel, ranging in size from 9 ft. 2 in. by 5 ft. 6 in. to 12 ft. 4 in. by 5 ft. 6 in., has been completed.

A second section of the Brickfield Creek storm-water channel is now in course of construction. This section consists of 6·21 chains of open and covered concrete channel, 10 ft. 6 in. by 6 ft. deep; and 10·8 chains of 24-in. diameter pipe-sewer.

The question of the sewerage of Parramatta was re-opened with the view to devising a scheme that would be less costly than the one previously submitted to the Parliamentary Standing Committee, and at the same time meet the present requirements. Estimates were prepared for dealing with the sewage by four different methods, as follows:—

1. A scheme, based upon the partially separate system, with sewage disposal works at Clay Cliff Creek.
2. The same system with sewage farm in lieu of disposal works.
3. Separate system with disposal works at Clay Cliff Creek.
4. Separate system with sewage treated on the farm.

In order that the question might be fully investigated it was necessary to perform a large amount of preliminary survey work, and also to prepare seventeen sheets of drawings. The proposals embrace 2 miles 62½ chains of main sewer, ranging in size from 18 inches to 9 inches in diameter; and 12 miles 23·6 chains of 9-inch reticulation sewers. Scheme No. 2 having been recommended by the Department as the most economical, the question now stands over pending a satisfactory agreement between the Government and the Parramatta Council—1st, as to the assessment of Government property, and, 2nd, with regard to the control of the works when completed.

At Parramatta surveys were made for the following:—Vallack's Creek storm-water channel; sewerage scheme of the town, including cross-section at the site of the farm; and Brickfield Creek storm-water channel.

Newcastle and Suburbs.

Estimates were made of the probable cost of the following storm-water drains:—Plattsburg and Wallsend, Pasturage Reserve, and Cottage Creek.

Plattsburg and Wallsend Drainage.

The Plattsburg and Wallsend storm-water channel for a length of 51·3 chains, consisting partly of an open concrete channel and partly of an open cutting, is in course of construction by day labour on the butty-gang system; 9,525 cubic yards of material having been excavated, at a cost of £604 14s. 7d. The construction of this channel necessitates the erection of several small wooden bridges and alterations to existing ones.

Pasturage

Pasturage Reserve Drainage.

The main outlet channel, a length of 1 mile 76 chains of open cutting, increasing in width from 60 feet at the upper end to 110 feet at the outlet into Throsby's Creek, is also in course of construction on the butty-gang system. The conditions of the country through which this drain runs necessitates the construction of two water cushion drops, to bring the water to the level of Throsby's Creek without permitting a destructive velocity; 41·652 cubic yards of material have already been removed at an expenditure of £2,608 12s. 11d. The opening of this drain necessitates the erection of six new bridges, including the viaduct of the Great Northern Railway (the present waterway of which is insufficient), and, in addition, alterations to Co-operative Coal Company's railway bridge. This class of work will be let by contract, tenders having been already called for the bridge at Broadmeadow Road.

Sandgate Cemetery.

The drainage of Sandgate cemetery is now completed, and giving entire satisfaction. This drain consists of 12·5 chains of 18-inch diameter pipes, and 18 chains of 12-inch diameter pipes, perforated to receive the soakage, and surrounded by broken stone of graduated gauge, to prevent the influx of sand.

Surveys.

Surveys were made in connection with the Plattsburg and Wallsend drainage, Cottage Creek stormwater.

Iron Cove Creek—two sections of concrete sewer, in all 71·91 chains in length, from 7 ft. 10 in. by 6 ft. elliptical to 3 ft. 2 in. circular.

Macdonaldtown Park, 13·44 chains of concrete sewer, 8 ft. 1 in. by 6 ft. elliptical to 24-in. pipe.

Randwick Road, near Kensington, 6·82 chains of circular concrete sewer, 5 ft. 6 in. diameter.

Stanmore Road, 4 chains of concrete circular sewer, 3 ft. diameter.

Long Cove Creek, second division, 42·56 chains of concrete sewer, from 8 ft. 11 in. by 6 ft. elliptical to 4 ft. 7 in. circular.

The following storm-water drains are in course of construction :—

Rushcutters' Bay and Point Piper Road, 72·63 chains of open and covered concrete channel, from 14 ft. 6 in. by 4 ft. 4 in. open to 3 ft. diameter circular.

Homebush Creek, 67·17 chains of covered concrete sewer, from 8 ft. 4 in. by 6 ft. to 4 ft. circular.

Iron Cove Creek, 64·25 chains of concrete circular sewer, from 3 ft. 2 in. to 3 ft.

Culvert under Beach-street, Coogee, 1 51 chains long.

Easton Park, Balmain, 6¼ chains, 2 ft. 6 in. diameter concrete sewer.

Surveys have been made, and drawings prepared, of the following storm-water drains :—

White's Creek, 38 chains of circular concrete sewer, from 4 ft. 8 in. to 3 ft. diameter.

Saltwater Creek, 35·73 chains of concrete and pipe sewer, from 4 ft. 4 in. to 9 in. diameter.

Alteration to Cottage Creek sewer, Abattoir Road, Balmain.

Channel and the Pasturage reserve drainage.

Narrandera Drainage.

Drawings were made and an estimate prepared of the cost of constructing a storm-water channel 47 chains long, from a point 5 chains above east to the creek. This drain consists of an open concrete channel from 6 to 8 feet wide and 4 feet deep, discharging into an open cutting which conducts the stormwater to the creek.

Nowra Drainage.

Surveys were made for the drainage of Worrigee Swamp, and an estimate made of its probable cost.

Orange Drainage.

A survey was made for a storm-water drain at Blackman's Creek.

Liverpool Drainage.

Preliminary surveys were made with a view to preparing a sewerage scheme for the town.

Maitland Drainage.

Preliminary surveys were made with the view to preparing a sewerage scheme for the town.

Storm-water Drains.

The following storm-water drains were completed within the Metropolitan area :—

Easton Park, Balmain, 8½ chains of concrete and pipe sewer, from 3 ft. 3 in. to 18 in. diameter.

Long Cove Creek, Henson-street Branch, 13·77 chains of pipe sewer, from 21 in. to 12 in. diameter.

Baptist-street, concrete sewer 37 chains long, from 9 ft. 1 in. by 6 ft. to 4 ft. 6 in. by 3 ft. 6 in. elliptical.

J. DAVIS,
Principal Assistant Engineer, Country Towns Water Supply and Sewerage.
The Engineer-in Chief for Public Works.

Roads and Bridges.

(X.)

REPORT OF THE PRINCIPAL ASSISTANT ENGINEER.

Sydney, 2 July, 1896.

I HAVE the honor to present for the Minister's information a report upon the work carried out by this branch for the eighteen months ending 30th June, 1895, together with tabulated statements of the expenditure for that period, the lengths of roads and bridges of various classes directly or indirectly under the charge of the Department, and other statistical information.

From these returns it will be seen that the expenditure on roads and bridges, including balances from 1893 votes, was £830,654 2s. 9d. Of this sum £797,592 9s. 6d. was derived from Consolidated Revenue, and £33,061 13s. 3d. from Loans.

These figures, it is pointed out, are for a period of eighteen months, so that an exact comparison with the figures given in last report cannot be made. Taking the average, however, the expenditure from 1st January, 1894, to 30th June, 1895, equals £553,769 8s. 6d. per annum, or a decrease on the expenditure for 1893 of £152,793 13s. 2d. per annum.

This reduction may be chiefly accounted for by the fact of this period of eighteen months having been generally favourable for road-making, and no floods of consequence having occurred; also, that expenditure has, with a view to economy, been restricted within the limits of most urgent requirements, and the cost of maintenance of roads reduced to the lowest possible limit compatible with efficiency.

The expenditure on roads, &c., from Revenue fell £261,883 19s. 6d. short of the sum made available by Parliament; this was carried forward. A sum of £122,020 19s. 10d. remained unexpended from Loan Votes, and was also carried forward.

Since last report considerable changes have taken place in the arrangement of the officers. The office of Divisional Engineer has been abolished, and this has necessitated a rearrangement of the staff. Mr. E. M. Allman, formerly in charge of the North-eastern Division, has been brought to Head Office, and is now styled Assistant Engineer. Mr. J. A. Rossbach, formerly Resident Engineer at Maitland, has also been brought to Head Office as Assistant Engineer. The other Divisional Engineers have been placed in charge of districts, and take the title of District Engineers. Mr. W. J. Hanna remains at Wagga Wagga, Mr. R. E. Jones at Muswellbrook, Mr. Stilwell has been removed to Orange, and Mr. W. A. Smith to St. Leonards.

Several resident engineers and assistants have been retired, which, with other minor alterations, has effected a considerable saving in the administration of the Department.

This new arrangement has effected a very marked improvement in carrying on the business of the Department, simplifying the mode of procedure and generally expediting work.

The ferries leased were 43 in number. Forty-two ferries were subsidised, and 9 were worked by the Department. The total revenue from all sources under this head was £7,750 3s. 3d.—while the cost of working was about £19,764.

With reference to the working of the Roads and Bridges Branch generally, I would again draw attention to the question of river bank protection as being worthy of special consideration. This matter was fully dealt with in last report. Since then, a little has been done in the way of Protective works, but the necessity for a general scheme of river protection under which the landowners will be compelled to bear part of the cost is as urgent as ever.

In this connection, reference might again be made to the custom of owners cutting drains across reserve roads in order to relieve their properties of flood water. Several cases of this kind have been taken into Court, and the prosecutions have been successful. It is hoped that this action may have some effect in putting a stop to a practice of the evil effects of which the Department has had many costly illustrations.

The regulation of the width of tires is an old question, but one which should again be referred to as requiring legislative action. With weights up to 15 tons on 3-inch tires, it may be seen how impossible it is to provide a road surface capable of satisfactory and economical maintenance. The result is serious injury to our roads, inland and coastal, entailing much more cost in their maintenance.

In this connection, an important matter which calls for attention is the increasing road competition with our railways.

This has been particularly conspicuous during 1894 and 1895, and as a result much extra expense has been entailed in the maintenance of several of our main roads; culverts that might have carried ordinary traffic for years, having had to be renewed or extensively repaired, and the roads otherwise having been extensively damaged.

It seems unreasonable to expect the Government to spend large sums of money on roads to injure their own property—the railways—and in dealing with projected roads, one of the first questions to be answered should be, whether they are likely to compete with or be feeders to the existing railways.

During 1894, an expenditure of £10,000 on relief works for the unemployed in the Metropolitan Division was authorised. This money was expended in reducing steep grades on many of the roads and metalling roads in important localities.

In carrying out these relief works, the co-operative or butty-gang system was adopted and had a fair trial. The whole of the work done was let to small gangs at prices based on departmental estimates, and although 380 men were employed in small gangs, averaging from ten to twenty-five men, the whole experiment, as far as the men were concerned, was a failure. The

The system in theory is very good, and under a capable leader, hard-working and competent men, should not only make wages but have in addition what would otherwise be the contractor's profit. Experience has shown, however, that in most cases in choosing their ganger the men have made an unwise selection, and his authority has been practically nil. Further, that in almost every gang there have been so many loafers that the average earnings of the workers have been reduced by 20 per cent. This system has been tried in other parts of the Colony with similar results.

Summarising the figures given in the tabulated statement attached, it will be seen that there are 36,070 miles 26 chains of roads under the direct or indirect charge of the Department. Of that length 26,180 miles 11 chains are on schedule, 8,950 miles 49½ chains are unclassified, and 939 miles 45½ chains are subsidised. Of the total length 11,979 miles 68 chains are bush tracks practically untouched, leaving 24,090 miles 38 chains of cleared, formed, or metalled roads.

* There are 2,675 bridges in the Colony, having 7,404 spans and a total length of 252,082 feet, or 47 miles 59½ chains. The culverts number 28,587, and have a total length of 79 miles 77¼ chains, and there are 12,383 causeways, measuring together 56 miles 17·15 chains.

There are 98 punts, 2 steam launches, 1 horse boat, and 187 other boats in use.

During the eighteen months 909 miles 48 chains of new roads were formed, metalled, or otherwise improved, and 1 mile 20 chains of culverts and 7 miles 38½ chains of causeways constructed.

The bridges erected are referred to further on.

The average number of men employed was 5,640—1,446 directly by the Department and 4,194 by contractors.

The distance travelled by the district officers and their assistants in the execution of their duties was 611,026 miles, 493,310 miles being by road and 117,716 miles by rail.

The Assistant Engineer for Bridges reports that 90 bridges were erected during the eighteen months ending 30th June, 1895, or were in course of erection at end of June, at a cost of £155,514.

The total length of these structures is 15,150 feet, the most important of those opened for traffic being Liverpool Bridge, George's River, 450 feet long, having five truss spans of 90 feet each; Tarraganda Bridge, Bega River, 1,106 feet long, having five truss spans of 90 feet each, and the remainder, beam spans; Tocumwal Bridge, over the Murray River, a lattice girder on cylinder piers, having a total length of 334 feet, and a steel lift span of 58 feet, to admit of steamers passing through the bridge.

The largest bridges in progress were the Wagga Wagga (Murrumbidgee River), 641 feet long; Inverell (M'Intyre River), 440 feet long; and Wilcannia (Darling River), 299 feet long. The two former have timber superstructures, supported upon iron cylinder piers, and have each three spans of 110 feet, the carriage-way being 24 ft. 4 in. wide, with one footway 4 ft. 6 in. wide. It will be seen, therefore, that the deck area is very great, being no less than 3,165 feet per span. The Wilcannia Bridge is an iron and steel structure, with lift span similar to the Tocumwal Bridge, referred to above.

Extensive repairs were also carried out to a large number of bridges.

884 tons of ironwork, manufactured in the Colony, were used in the Branch during the eighteen months, besides 130,095 cubic feet of timber for superstructure and 12,755 lineal feet of piling.

One of the most important matters in connection with the work done has been the introduction of the new form of truss referred to in last report, which is proving to be cheaper in construction, and promises to lessen the cost of maintenance. The through deck principle used in it, and the absence of heart timber in the trusses, are both great advantages over the old system, and the comparative ease with which the several timbers can be replaced should effect an important saving in future repairs.

Great attention has been paid to the selection of the timber used in the construction of new bridges, and it is confidently expected that this will result in the increased life of the structures.

PERCY SCARR,
Principal Assistant Engineer, Roads.

---

* A new classification has been adopted with regard to bridges and culverts. In this report, where bridges are mentioned, structures of 20 feet span and over are meant. All structures under 20 feet span are referred to as culverts.

(XI.)

REPORT OF THE ASSISTANT ENGINEER FOR BRIDGES.

To the Engineer-in-Chief for Public Works,—

Sir,

I have the honor to place before you the report of work done in this Sub-branch of the Department in the erection and repairs of iron, composite, timber truss, timber beam, and suspension bridges during the eighteen months ending 30th June, 1895, and I attach Appendices (marked A to E) giving a quantity of information in connection with the work done.

The salient points in connection with the work done have been the introduction of the new form of truss, designed under your instructions for spans of 70, 90, and 110 feet, and the very large and important repairs which have been carried out to existing structures.

With regard to the new form of truss, I am glad to report that it is cheaper in construction and promises well to lessen the cost of maintenance. The through deck principle used in it, and the absence of heart timber in the trusses are both great advantages over the old system, and the comparative ease with which the several timbers can be replaced should effect an important saving in future repairs.

As a comparison of the cost per foot run of the new and old system of truss, I find that about 1,800 running feet of truss bridge—new system—cost almost exactly £8 per foot run, while 1,200 running feet of truss bridge—old system—cost £9 5s. per foot run, a very satisfactory comparison.

Great attention has been paid to the selection of the timber, and I feel confident that the benefit of this care will be shown by the increased life of the structures recently built.

As to the repairs, they have been very extensive (notably at Pyrmont and Glebe Island Bridges, Singleton Bridge, Denison Bridge, Bathurst, and North Bourke Bridge), many timber bridges built from twenty to thirty years ago having needed a great deal of attention.

I do not think it necessary to comment in detail on the work carried out, as very full particulars are given in the appendices herewith, and you have personally inspected the works from time to time.

The officers employed continue to give me every satisfaction, and, as a result of organisation and increasing experience in their special work, can be relied on to render good service to the Department.

General.

The number of bridges in course of construction under my control during the eighteen months was twenty-five, estimated to cost, when completed, £118,473 16s. 3d. Of these three are wholly of iron, having a total length of iron bridgework of 691 feet; the remaining structures are timber, composite, and suspension, having a total length of 7,322 feet, making a gross total of 8,013 feet of bridgework, in approach to which 4,040 lineal yards of roadway have been constructed. Extensive repairs have also been carried out on twenty-five bridges, at a total cost of £30,151 6s. 9d. During the eighteen months several important bridges have been opened for public traffic.

The following lists give:—1st, those bridges completed during the eighteen months and opened for traffic; 2nd, those in progress and approximate date of completion; and 3rd, repairs to bridges completed and in hand. For more detailed information see Appendix "A."

No. 1 List.

Bridge.	River.	Cost.	Class.	Opened for traffic.

Wellington	Macquarie	698 0 0	,,	7 Dec., 1894.
Windsor	Hawkesbury	3,250 0 0	Iron girder	June, 1896.
		£147,070 2 7		

Ironwork.

Appendix "C" shows the quantity of ironwork inspected during the eighteen months, amounting to some 884 tons, valued at £17,645, manufactured in the Colony, out of which 410 tons were manufactured from imported material.

Timber.

Appendix "D" shows the quantity of timber inspected during the eighteen months, and represents practically the whole of the timber which passed through Sydney and Newcastle for the use of the Roads and Bridges Branch of the Department.

It will be seen from the totals that this is an important item, amounting to no less than 130,095 cubic feet of selected ironbark for truss and girder work, and tallow-wood, &c., for flooring, and 12,755 lineal feet of ironbark for piles.

Borings.

The boring gang was occupied for a portion of the eighteen months only in making trial borings in connection with the preparation of estimates for Pyrmont and Glebe Island Bridges for submission to the Public Works Committee, and for several bridges in contemplation. The depth of borings was 2,185 lineal feet; for cost of same, see Appendix "E."

Expenditure.

Appendix "B" shows the expenditure for the eighteen months in detail.

The total sum paid upon works in progress amounted to £79,873 11s. 7d. In addition to this expenditure, vouchers amounting to £50,937 8s. 9d., for smaller bridges, have been received from the Divisional Engineers for the six divisions of the Colony to be technically examined and entered against the respective works.

Salaries.

The staff employed in connection with this Sub-branch of the Department consists of twenty officers in the field and four in the office. The salaries paid are 9½ per cent. on the actual expenditure for the eighteen months. It must be distinctly understood that the percentage given is calculated upon the net sum paid on account of works in progress, no account having been taken of the time spent in examining vouchers, amounting to £50,937 8s. 9d., for bridges not under my immediate control, nor of the time occupied in arriving at settlements in cases where disputes have arisen on these contracts, or in general work or special reports.

E. M. deBURGH,
Assistant Engineer for Bridges, 23/9/95.

Engineer-in-Chief for Public Works.

Government Architect's Branch.

(XIV.)

REPORT OF THE GOVERNMENT ARCHITECT.

Sydney, 10 January, 1896.

I have the honor to present my report upon the work carried out in this Branch for the 18 months ending 30th June, 1895, in the erection and completion of new public buildings, and in repairing and furnishing and improving existing ones, and also in carrying out other miscellaneous services.

The expenditure is detailed in the Schedule attached, and, as compared with that of the previous years 1893–4, is as follows :—

	1894–5 (18 months).			1893–4.		
	£	s.	d.	£	s.	d.
*Buildings and Services	192,109	7	7	215,395	19	8
*Furniture...	14,878	8	9	6,751	16	9
Officers' expenses, including Travelling and Contingencies	23,607	16	3	17,175	11	3

This expenditure has been incurred in connection with 630 buildings, of which nine are buildings completed or entirely erected within the period.

Uniform care has been exercised in dealing with these several expenditures, and notwithstanding that during the period considerable alterations have been effected in the office management, and the "General Conditions of Contract" entirely revised, no litigation has taken place, but, on the contrary, proper settlements have in all cases been arrived at.

The amount expended, it will be seen, is considerably smaller than that of previous years, and this is accounted for by the fact that the Government has, during the period under review, pursued a policy of the strictest retrenchment and economy, so that the erection of no new building was undertaken except where absolutely necessary for the proper performance of the Public Service, a large number of schemes already more or less dealt with in the office being postponed until the circumstances of the Colony altered for the better.

In addition to these, it may be noted that owing to the generally depressed condition of the building trade work was done at greatly reduced cost, amounting to as much, probably, as 25 per cent., and therefore the expenditure covers a comparatively greater amount of work than that done in previous years.

The following buildings and works of importance have been completed during the period :—

Building.	Work.	Amount.		
		£	s.	d.
Royal Mint	Renovations, additions	6,686	9	5
Ordnance Department		1,900	17	0
Regent-street Lockup	Erection	3,495	1	7
Sydney Hospital	Completion	80,810	16	9
Gladesville Hospital for Insane	New wing, &c.	11,003	2	4
Coast Hospital, Little Bay	Additions, &c.	1,994	15	10
Newtown Post and Telegraph Office	Erection	4,905	11	3
Newington Asylum	Additions	4,235	1	4
Parramatta Hospital for Insane	Additions	2,800	2	6
Rydalmere Hospital for Insane	Additions	15,335	13	11
Parramatta Gaol	Additions	1,712	11	6
Rookwood Benevolent Asylum	Additional pavilions	5,038	13	2
Bathurst Gaol	Additions	1,594	9	1
Corowa Police Quarters, &c.	Erection	2,364	16	3
Liverpool Lockup	Erection	1,387	6	0
Maitland Gaol	Additions	1,267	5	9
Macksville Court and Watch House	Erection	2,400	1	2
Moree Lands Office	Erection	3,384	17	0
Newcastle Boatmen's Cottages	Erection	3,688	13	4
Newcastle Hospital for Insane	Additions	917	12	7
Parkes Post and Telegraph Office	Additions	1,257	6	3

* Of the above amount £93,059 2s. 8d. was paid from Consolidated Revenue, and £113,928 13s. 8d. from Loan Votes.

I attached to the Annual Report of 1892 a complete schedule to date of the buildings in charge of this branch, setting forth the estimated value of the sites and the actual cost of erection, or where this is not possible, the estimated value of the buildings. Correcting this schedule to date of the period of the present report the results are as follows :—

List as per Return 1893–4...	£8,248,211
Do 1894–5...	162,411
Total...	£9,410,622
Total number of buildings and establishments	947

The above is, of course, exclusive of the considerable sums that are annually expended on minor additions and improvements and general repairs, which are all disbursed from Revenue.

Since this Schedule was originally prepared, it is well known that real property in the Colony has suffered a most serious depreciation, and, therefore, the above figures must not be taken as any guide to present values.

I am able to report that the country buildings are being gradually brought up into a better state of repair, but I would again invite attention to the inadequacy of the Service Votes which are appropriated for this purpose. In the report of 1893 I ventured to show the great diminution in the amount voted, the same decreasing from £82,000 in 1889 to £27,400 in 1893, the amount voted for the period covered by this report being £46,000, or £30,666 per annum.

Allowing £8,250,000 as the capital cost of the buildings new, it may be taken that depreciation takes place at the rate of at least 1·25 per annum, giving the average life of a building at about ninety years. The sum at my disposal, namely £30,666, represents ·37 per cent. only, and when it is taken into consideration that this percentage has to cover not only annual repairs, but numerous minor improvements and additions, it will be seen that the service is to a degree below the point of efficiency.

To put this matter in another way—the average sum available to be expended under these heads on each building amounts to £32 7s. 8d., and it must be recollected that not only is a small country post office included, but such large establishments as Callan Park Hospital for the Insane, Parliament House, Government House, &c. It is, therefore, apparent that many buildings must necessarily remain year after year without proper attention.

I have before stated that a large portion of this sum has been appropriated from perpetual loans to meet the capital cost of these buildings, and it is a matter for serious consideration, therefore, whether a larger percentage on this amount should not be expended upon the buildings; otherwise, the value of the security must be yearly diminishing.

The important buildings of the Sydney Hospital have been erected at a cost of £80,810 16s 9d., so far as the second and completing portion is concerned, under the supervision of Mr. J. Kirkpatrick.

A commencement was made with the scheme for the erection of the Kenmore Hospital for the Insane, and the sum of £17,245 expended in the partial erection of the Administrative Buildings which it is intended shall temporarily accommodate patients, pending the erection of the patients' wards.

In July, 1894, a fire occurred in the roof of the Public Works Offices, doing damage to the extent of about £1,100, and in considering the rebuilding that became necessary, the Minister thought it advisable to add an extensive mansard roof and central dome, thus giving a large amount of additional accommodation, and adding considerably to the architectural completeness of the building. After deliberation he deemed it desirable to depart, in this case, from the usual method of inviting tenders on public competition, and instructed that the work should be carried out by the direct employment of workmen, and the purchase of the necessary plant and material.

Towards the end of 1894 the Government saw its way to institute a season of greater activity, and the erection of many buildings in the country, which had previously been deferred for reasons already given, it was now found desirable to proceed with, accordingly Parliament voted in December the sum of £136,635 towards that object, and I then received instructions from the Minister to proceed with the preparation of the plans and the inviting of tenders for upwards of eighty-three buildings distributed in different parts of the country.

The staff was then much reduced, and it became necessary to engage a number of temporary draftsmen. With the Minister's permission I instituted a competitive examination, with the result that out of 72 applicants for employment 50 underwent the test examination. This enabled me on merit alone to recommend the engagement of the six draftsmen required, and the result has proved satisfactory.

During the period covered by this report it was found that the number of private buildings rented by the various Government Departments was entailing a very large and increasing annual rental, and steps were taken to see what could possibly be done in rearrangement of the Government Departments, so that as the various outside leases fell in, these could be more fully occupied, and the rented premises given up.

As opportunities occurred, therefore, arrangements were made, which I am confident will show eventually that very large savings have been effected, in addition to greater efficiency and centralisation of the Government Offices generally.

In January last a Royal Commission to inquire into the Civil Service was sitting, and I was called upon to give evidence before it, both as regards the duties and salaries of the various officers, the general organisation of the office, and the procedure relative to the erection of new public buildings. My evidence will be found in the report of the Commission issued 8th April, 1895.

The Professional Staff at the end of the period reported on (with the exception of the employment of the temporary draftsmen already referred to) consists of the same personnel as during the previous year and at the same salaries.

The

The Clerical Staff underwent considerable alteration consequent on the re-organisation of the Clerical and Accountancy Branches of the Public Works Department generally. This change involved the retirement of two officers of long standing and of proved zeal and ability, Mr. G. B. Stack, accountant, on twelve months' leave of absence, at the expiration of which period he will have completed 33 years and three months in the Service, and Mr. L. J. Marks, record clerk, on nine months' leave of absence, at the expiration of which period he will have completed twenty-five years and three months service, also the transfer of all other officers (including Mr. S. Steel, Chief Clerk) to the Public Works Establishment, with the exception of Mr. Forsythe, Secretary, Mr. Cooper, Shorthand-writer and Correspondence-clerk, and two Specification Clerks, without whom it would have been impossible to have conducted the clerical work pertaining to the professional side of the office.

The staff at the close of June, 1895, was as follows :—

Government Architect
Principal Assistant Architect
2 Assistant Architects
3 „ „ (acting)
Building Surveyor
Sanitary Engineer
6 District Inspectors
5 Draftsmen
9 Draftsmen (temporarily engaged)
11 Clerks of Works
Plan-mounter, &c.
Secretary
Shorthand and Correspondence Clerk
2 Specification Clerks
(Chief Clerk and 7 Clerks transferred during period).

The total office expenses, including contingencies, travelling expenses, &c., amount to £23,607 16s. 3d., of which the sum of £4,430 7s. 1d. was provided for in the Clerical Division of the Public Works Department.

No staff appointments were made during the period.

In former reports I have endeavoured, as correctly as possible, to give approximate statements as to the percentage costs on the expenditure under the following heads :—

Professional,
Superintendence of Works,
Clerical,
Contingencies, travelling expenses, &c.,

but, inasmuch as a large amount of office work, particularly in the Professional Branch, has been constantly performed, which has no reference to expenditure whatever, it has always been somewhat difficult to ascertain the percentage with an absolute degree of accuracy.

A return was asked for in the House for the expenditure and cost of carrying out works during the twelve months ending August 31st, 1894—a period in which, it must be observed, the strictest economy was being exercised, and the money expended was devoted almost entirely to general repairs and small additions on buildings scattered throughout the Colony, in which the maximum of services were required for the minimum of result. Under these somewhat disadvantageous circumstances, the return came out as follows :—

Professional	2·50 per cent.
Superintendence	2·50 „
Clerical	1·50 „
Contingencies	1·00 „

The above rate is the average taken over works of every character, including a small repairing contract for £25 in a country township, perhaps 500 miles from Sydney, as well as on the larger works near the city, amounting, as in the case of additions to the Hospital for the Insane, Rydalmere, to £15,000.

In conclusion, I have again great pleasure in bearing testimony to the zeal, skill, and industry displayed throughout the whole of the period by the staff under my direction.

(XV.)

RETURN of Public Works carried on by Government Architect from 1st January, 1894, to 30th June, 1895.

Land Valuation Branch.

(XVI.)

REPORT OF THE GOVERNMENT LAND VALUER.

Sydney, 26 November, 1895.

I HAVE the honor to furnish a return relating to services under this Branch from the 1st January, 1894 to the 30th June, 1895.

During that period the following claims, valuations, and estimates were made.

1. Claims for land for Railway and Tramway purposes	£15,174	17	2
Other purposes	122,153	5	1
	£137,328	2	3
2. Valuations of Resumptions for Railway and Tramway purposes	£32,169	4	7
Other purposes	42,722	13	2
	£74,891	17	9
3. Estimates of Value of proposed Resumptions	£1,338,313	8	4

4. Report upon the Shea's Creek Works (no report herewith).

J. B. THOMPSON,
Land Valuer.

The Under Secretary for Works.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

ELEVENTH GENERAL REPORT.

To His Excellency the Right Honorable HENRY ROBERT, VISCOUNT HAMPDEN, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies.

MAY IT PLEASE YOUR EXCELLENCY,—

The Parliamentary Standing Committee on Public Works, appointed during the last Session of Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, and the Public Works (Committees' Remuneration) Act of 1889, 53 Vic. No. 11, have the honor to submit, in accordance with clause 8 of the Public Works Act, the following General Report of their proceedings:—

Appointment of the Committee.

1. The Committee—the sixth since the passing of the Public Works Act—were appointed on the 11th December, 1895, and held their first meeting on 12th December. Thomas Thomson Ewing, Esquire, was elected to the position of Chairman.

Decease of a member of the Committee.

2. Shortly after the appointment of the Committee a vacancy was caused in consequence of the death of Angus Cameron, Esquire. On the motion of Mr. Humphery, seconded by Mr. Davies, the following resolution was passed unanimously:—"That the members of the Committee, in recording a vacancy by reason of the decease of Mr. Angus Cameron, M.L.A., desire to express their sense of the loss sustained by Mr. Cameron's death, and also to convey to his family deep sympathy with them in their sudden bereavement." Mr. Cameron's seat on the Committee has not been filled, Parliament having continued in recess since his demise.

Death of Sir Henry Parkes, G.C.M.G.

3. On the occasion of the funeral of the late Sir Henry Parkes, G.C.M.G., the Committee adjourned their meeting as a mark of respect to the deceased statesman, who was the author of the Public Works Act of 1888. The following resolution was, on the motion of Mr. Trickett, seconded by Mr. Davies, passed unanimously, and subsequently recorded in the Committee's Minutes of Proceedings:—(1.) "That the members of the Parliamentary Standing Committee on Public Works desire to express their sincere regret at the decease of the late Sir Henry Parkes, G.C.M.G., and also to convey to Lady Parkes and family deep sympathy in their bereavement." (2.) "That a copy of the foregoing resolution be forwarded to Lady Parkes."

Works referred to the Committee by the Legislative Assembly.

4. The following proposed works have been referred to the Committee by the Legislative Assembly for inquiry and report:—

	Estimated Cost.
Deviation at Locksley, Great Western Railway ...	£47,500
Water Supply for the Town of Tamworth	32,824
Railway from Nevertire to Warren (without land resumption)	32,730
Railway from Tamworth to Manilla (without land resumption)	72,150
Electric Tramway from Circular Quay, Sydney, to the Redfern Railway Station; and also along Harris-street to the intersection of John-street	130,500
Erection of Buildings at Rookwood for Infirm and Destitute Persons (including sewage, not provided for in the Departmental estimate, £9,935) ...	118,285
Additions to the Treasury Building	22,500
Construction of Locks and Weirs on the River Darling	121,100
Total	£577,589

The Committee's recommendations.

5. Of the eight works referred to them by the Legislative Assembly, the Committee have completed their inquiries with regard to four, upon which the following action has been taken :—

(1.) Deviation at Locksley, Great Western Railway.—The Deviation at Locksley, on the Great Western Railway, 129 miles 65 chains from Sydney—recommended by the Railway Commissioners in accordance with their policy of reducing grades with a view to greater convenience and economy in the working of the railway traffic—was regarded by the Committee as a necessary work, and one that should be carried out with as little delay as possible.

(2.) Water Supply for the Town of Tamworth.—With regard to the proposed Water Supply for the Town of Tamworth, the Committee approved of the main work, but suggested certain alterations. The proposal, as submitted by the Department, limited the capacity of the storage reservoir to 35,000,000 gallons, but the Committee deemed it expedient to recommend that the reservoir be made sufficiently large to impound 50,000,000 gallons of water. The Committee also recommended that an area of not less than 50 acres be resumed at the site of the proposed storage reservoir; that the Crown lands within the catchment area of the proposed water supply should be at once reserved; and that the Department of Lands, in measuring lands held under conditional lease, should exercise its power and excise such portions of land as may be required for the present or future storage of water.

(3.) Electric Tramway from Circular Quay, Sydney, to the Redfern Railway Station; and also along Harris-street to the intersection of John-street.—The Committee affirmed the expediency of carrying out this proposed work, considering that the probable passenger traffic fully justifies its construction.

(4.) Erection of Buildings at Rookwood for Infirm and Destitute Persons.—Under the Departmental proposal it was intended to locate in one central establishment at Rookwood, at a cost, including sewerage, of £118,285, the whole of the occupants of the Benevolent Asylums situated at Liverpool, Glenfield, and in George and Macquarie Streets, Parramatta. The Committee recommended that the inmates of the Asylums in Macquarie, George, and Harris Streets, Parramatta, be removed as speedily as possible, that the healthy destitute be housed at Rookwood and Liverpool; and that the chronic and acute sick be housed on available Crown lands near Campbelltown, on a site selected by the Committee. The principal facts which served to guide the Committee in arriving at their decision were the unsuitableness of the site at Rookwood, the possibility of contaminating the Sydney water supply, and the small outlay necessary to make the Liverpool Asylum fit to accommodate a proportion of the aged poor. Had the Committee not been influenced by the existence at Rookwood of housing accommodation for some 500 people, they would have rejected the Departmental proposal in its entirety. The estimated cost of the scheme recommended by the Committee, which makes provision for the treatment of 3,000 infirm and destitute persons, amounts to £62,900; the cost of the Departmental scheme for accommodating 3,300 persons, including sewage, was estimated at £118,285, showing a saving of £55,385 if the Committee's recommendations be adopted.

Other proposed works before the Committee.

6. In regard to three other proposed works, the Committee have carried their investigations as far as possible with a view to reporting to Parliament. They are :—

(1.) Railway from Nevertire to Warren.
(2.) Railway from Tamworth to Manilla.
(3.) Additions to the Treasury Building.

(1.) Railway from Nevertire to Warren.—The inquiry into this proposed railway is almost completed, and the Committee's Report will be ready for presentation to the Legislative Assembly within a few days.

(2.) Railway from Tamworth to Manilla.—The Committee have concluded their investigation into this proposed work. The route as submitted to them necessitated the expenditure of a considerable sum of money for land resumption and severance. In view of this circumstance the Sectional Committee selected a new route which, if adopted, will, it is believed, render such outlay for land resumption and severance unnecessary. The plans with regard to the exact location of the suggested deviation are not yet to hand, further surveys being necessary. On receipt of this information the Committee will submit their Report to the Legislative Assembly.

(3.) Additions to the Treasury Building.—With regard to this proposed work the inquiry is nearly completed. The Report would have been submitted on the assembling of Parliament had the Committee been able to obtain some requisite information from the Public Service Board. Directly this information is forthcoming the Committee will report to the Legislative Assembly.

Work not inquired into.

7. The only work not inquired into by the Committee is the—

Construction of six Locks and Weirs on the River Darling, from Stony Point to Brewarrina, the estimated cost of which is stated at £121,100.

It is intended to proceed with this inquiry at an early date.

Summary of the work of all the Committees appointed under the Act.

8. The six Committees appointed under the Act have had seventy-four works referred to them (six of them twice, and one of them referred and subsequently withdrawn by resolution of the Legislative Assembly), estimated by the Department of Public Works to cost, allowing for the second references, £12,409,720. Of these, they have passed twenty-five as submitted to them, and twenty-three with modifications, and they have negatived twenty-one. One, after being partly considered, was withdrawn from the Committee to whom it had been referred by resolution of the Legislative Assembly, to be afterwards resubmitted in a more complete form. In connection with these seventy-four works the difference between the Departmental estimates of cost and the cost shown in the Committees' recommendations represents a reduction amounting to £3,660,627.

Returns containing a record of the Committees' inquiries, and the present Committee's Minutes of Proceedings.

9. Attached to this Report, and completed to the present date, are the returns which have been published with previous General Reports, and which contain a record of the whole of the works inquired into by the present Committee and by previous Committees that have been appointed under the "Public Works Act"; and also a copy of the Committee's Minutes of Proceedings.

THOS. EWING,
Chairman.

Office of the Parliamentary Standing Committee on Public Works,
Sydney, 8 May, 1896.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

RECORD OF INQUIRIES.

LIST of Proposed Public Works inquired into by the several Committees, with the results of their inquiries, from 27 August, 1888, the date of the first sitting of the first Committee appointed under the Act, to 8 May, 1896.

Date of inquiry.	Proposed Work.	Expenditure proposed by the Government.	Expenditure recommended by the Committee.	Amount in excess of that proposed.	Amount in reduction of that proposed.	Remarks.
1888.		£	£	£	£	
4 Sept. to 22 Oct.	Improvements to the Circular Quay.	120,000	125,000	5,000	.....	The Committee recommended an alteration in the plan of these improvements, by which the total estimated cost would be increased to £125,000.
26 Sept. to 22 Oct.	Storage reservoir at Potts' Hill, and second line of pipes to Crown-street.	120,000 / 165,000	285,000	.....	.....	Recommended as proposed.
13 Sept. to 22 Oct.	New Central Police Court	48,000	48,000	.....	....	Recommended as proposed.
4 Oct. to 22 Oct.	Drainage works, Manly...	34,114	22,000	.....	12,114	The Committee recommended the adoption of a modified plan of these drainage works, by which the total estimated cost would not exceed £22,000.
10 Oct. to 22 Oct.	Drainage works, North Shore.	77,062	107,000	29,938	.....	The Committee recommended the adoption of the complete scheme proposed in relation to this work, and the estimated cost of which, as shown by the evidence, is £107,000.
31 Aug. to 22 Oct.	Harbour improvements at Newcastle.	112,000	112,000	.....	... .	Recommended as proposed.
19 Sept. to 22 Oct.	Wharfage acccommodation, Woolloomooloo Bay.	42,000	.....	.....	42,000	The Committee were of opinion that the proposed expenditure was not justified either by the requirements in connection with the wharfage accommodation of the port, or by the nature of the proposal if regarded as a scheme for the improvement of a very valuable Government property.
16 Nov. to 1889. 11 Jan.	Bridge at the Spit, Middle Harbour.	62,000	.....	.....	62,000	The Committee decided that the proposed expenditure was not justified by the evidence, and that a steam-punt would meet the requirements of the district in the vicinity of the proposed work for some years to come.
1888. 7 Dec. to 1889. 27 Aug.	Drainage works for the Western Suburbs.	830,304	830,304	.....	....	Recommended as proposed.
26 June to 30 Sept.	Improvements to the entrance of the Richmond River.	326,000	326,000	.....	.....	The Committee recommended that the proposed works be carried out in a certain order, so that the results from the works first constructed might be ascertained before others were proceeded with.
9 Oct. to 11 Dec.	Railway to connect North Shore Railway with Port Jackson, at Milson's Point.*	262,000	.....	.....	262,000	The Committee considered, for various reasons stated in their report on the subject, that the work as proposed should not be carried out.
29 Aug. to 12 Dec.	Railway from Culcairn to Corowa.	197,300 (or £4,184 per mile.)	164,500 (or £3,500 per mile.)	.....	32,800	The Committee were of opinion that this line should be constructed at a cost not exceeding £3,500 per mile.
22 Aug. to 19 Dec.	Railway from Goulburn to Crookwell.	198,300 (or £5,984 per mile.)	148,500 (or £4,500 per mile.)	.....	49,800	The Committee considered that the cost of this railway should not exceed £4,500 per mile, and that a saving should also be effected by utilizing a certain portion of the present main line instead of taking the proposed railway through a part of the city of Goulburn.
1890. 22 Jan. to 6 Feb.	Dredge and plant for Sydney Harbour.	30,000	.....	.....	30,000	The evidence showed that this class of dredge was not required.
1889. 25 Sept. to 1890. 18 Feb.	Railway from Nyngan to Cobar.	207,360	207,360	.....	... .	The Committee recommended the construction of this railway as part of a line which should be extended to Wilcannia and Broken Hill.
14 Jan. to 11 Feb.	Offices for the Board of Water Supply and Sewerage.	50,000	50,000	.....	.....	Recommended as proposed.
14 Jan. to 6 Feb.	Reticulation of the Western Suburbs Drainage Scheme.	713,592	713,592	.....	.....	Recommended as proposed.
14 Jan. to 11 Feb.	Extension of Sydney Water Supply to Southern Suburbs — Hurstville and Rockdale.	66,000	.....	.....	66,000	This expenditure was rendered unnecessary by reason of a temporary water-supply scheme being sufficient to meet requirements for some years.
19 Nov. to 2 April.	Railway from Marrickville to the Burwood Road.	90,250	90,250	.....	.....	Recommended as proposed.
	Carried forward.....£	3,751,282	3,229,506	34,938	556,714	

LIST of Proposed Public Works inquired into by the Committee, &c.—*continued.*

Date of inquiry.	Proposed Work.	Expenditure proposed by the Government.	Expenditure recommended by the Committee.	Amount in excess of that proposed.	Amount in reduction of that proposed.	Remarks.
		£	£	£	£	
	Brought forward ...£	3,751,282	3,229,506	34,938	556,714	
1890. 23 Oct. to 24 April.	Improvements to the entrance of the Clarence River.	580,900	211,900	.....	369,000	In this case the Committee recommended the construction of only a portion of the works proposed, as they were of opinion that when this portion had been constructed it might be found that the remainder would not be required.
31 Oct. to 15 April.	Breakwater at Byron Bay.	241,723	241,723	.....	.. ..	The original estimate for this work was £162,000; the increase was due to a difficulty in obtaining stone.
4 Dec. to 24 April.	Railway from Kiama to Nowra.	381,390	381,390	.....	.....	In this case there was an original estimate of £441,663. The reduction was due to an amended estimate made by the Acting Engineer-in-Chief for Railways since the railway was referred to the Committee.
12 Nov. to 24 April.	Railway from Grafton to the Tweed.	1,728,100	800,000	.....	928,100	The Committee recommended that this railway should be constructed from Lismore to Murwillumbah, instead of from Grafton to Murwillumbah, the Committee's recommendation involving a length of about 60½ miles as compared with 140 miles 76 chains, the length of the line as referred to them by the Legislative Assembly.
15 Jan. to 24 April.	Railway from Cootamundra to Temora.	138,000 (or £3,656 per mile.)	125,400 (or £3,300 per mile.)	.....	12,600	The Committee considered that the cost of constructing this railway should not exceed £3,300 per mile.
23 Jan. to 24 April	Railway from Moss Vale to Robertson.	84,900	.....	.....	84,900	The Committee negatived this proposal because they considered another route, described in their report, was preferable.
23 Jan. to 25 Mar.	Railway from Mudgee to Gulgong.	109,330	.....	.....	109,330	The Committee decided against this work, on the ground that any extension of the Mudgee Railway should form part of a more comprehensive proposal, the consideration of which should be deferred until after the suggestion for the connection of the Northern and Western systems, by a line between Dubbo and Werris Creek, has been dealt with.
12 Feb. to 24 April.	Bridge over Tarban Creek, Parramatta River.	26,000	.....	....	26,000	The Committee considered this bridge to be unnecessary.
20 Feb. to 15 April.	Bridge over the Hunter River, at Jerry's Plains.	20,000	....	.. ..	20,000	The Committee considered that a less expensive bridge would be sufficient to meet requirements.
25 Feb. to 24 April	Bridge to connect Bullock Island with the mainland at Newcastle.	33,000	.. ..	.....	33,000	The Committee considered that this proposed expenditure was premature, pending certain reclamation works.
12 Feb. to 21 May.	Iron Bridge at Cowra ...	26,537	26,537	.....	.....	The original proposal represented an expenditure of £69,971, which amount was afterwards reduced to £26,537, as the result of a revision of the system of bridge-building in the Colony.
22 Jan. to 21 May.	Railway from Molong to Parkes and Forbes.	433,000	433,000	..... .	..... .	Recommended as proposed.
28 May to 8 July.	Hospital for the Insane upon the Kenmore Estate, near Goulburn.*	120,000	.....	.....	120,000	This proposed work, after being partly considered, was withdrawn from the Committee by resolution of the Assembly.
28 May to 21 Aug.	Railway to connect the North Shore Railway with the deep waters of Port Jackson, at Milson's Point.* (Second Reference).	231,156	231,156	.....	.....	This proposal was before the Committee on a previous occasion (estimated cost, £262,000), when it was negatived; but having been referred to the Committee for further consideration, and circumstances appearing in the second inquiry which justified the construction of the railway, the Committee approved of the proposed work.
10 Dec. to 13 May, 1891.	Hospital Buildings, Macquarie-street.	140,000	56,000	.....	84,000	In this case, two sets of plans for the buildings were submitted to the Committee, one representing a design that was estimated to cost £140,000, and the other a design to cost £56,000, and the Committee approved of the latter.
1891. 11 Feb. to 25 Mar.	College for the Training of Teachers of Public Schools.	37,500	37,500	.....	.. ..	Recommended as proposed.
1 Feb. to 21 April.	Extension of the Kiama to Nowra Railway into the town of Nowra.	75,000	75,000	.....	.....	Recommended as proposed.
24 Feb. to 14 May.	Railway from Cobar to Cockburn.	1,168,000	1,018,000	.....	150,000	The Committee recommended the construction of this railway as far as Broken Hill only, which would reduce the proposed expenditure by £150,000.
22 Jan., 1890, to 19 May, 1891.	Cable Tramway from King-st., *via* William-street, to Ocean-street.	80,000	80,000	.....	....	Recommended as proposed.
25 Nov., 1890, to 3 June, 1891.	Cable Tramway. through George, Pitt, and Harris Streets, Sydney.	120,000	....	.....	120,000	The Committee considered that it was not expedient at present, for reasons stated in their report, that this tramway should be constructed.
	Carried forward ..... £	9,525,818	6,947,112	34,938	2,613,644	

LIST of Proposed Public Works inquired into by the Committee, &c.—*continued.*

Date of inquiry.	Proposed Work.	Expenditure proposed by the Government.	Expenditure recommended by the Committee.	Amount in excess of that proposed.	Amount in reduction of that proposed.	Remarks.
		£	£	£	£	
1892.	Brought forward .. £	9,525,818	6,947,112	34,938	2,613,644	
5 May to 2 June.	Improvements at Darling Island.	142,000	.....	.....	142,000	The Committee considered that the proposed works might be postponed for the present without inconvenience, and that a more suitable design might be submitted.
7 June to 12 July.	Stormwater sewers discharging into Johnstone's Bay.	51,352	51,352	.....	....	Recommended as proposed.
15 June to 4 Aug.	Reservoir at Centennial Park for Sydney Water Supply.	83,000	83,000	.....	.....	Recommended with an alteration of site.
14 July to 24 Aug.	Water Supply for Wollongong and the surrounding districts.	66,000	30,000	.....	36,000	The Committee found that the Water Supply proposed for the surrounding districts was not needed, and that the estimate of cost for supplying Wollongong might be reduced to £30,000.
28 July to 24 Aug.	Second pipe-line from Walka to Buttai, for Hunter River District Water Supply.	50,000	50,000	.....	.....	Recommended as proposed.
26 July to 9 Aug.	Sewerage works at Cottage Creek.	25,000	13,000	.....	12,000	The amount of £25,000 provided for a covered sewer; but the Committee found that a cover was not necessary at present, and that by constructing an open sewer the cost could be reduced by £12,000.
21 April, 1891, to 27 May, 1892.	Railway from Glen Innes to Inverell.*	427,400	.....	.....	427,400	The evidence in this case showed that the estimated cost of constructing the railway was excessive, and indicated the probability of a serious annual loss in the working of the line. In addition to this, the Committee were not as fully informed as desirable with regard to connecting Inverell not only with the Great Northern Railway but with the coast, a matter of considerable importance in the inquiry.
31 May to 18 Aug.	Railway from Jerilderie to Deniliquin.	148,000	....	.. ..	148,000	The Committee were of opinion that the consideration of this proposed work should be postponed until it should be determined by Parliament as a matter of public policy to purchase the Deniliquin to Moama Railway.
12 July to 24 Aug.	Lunatic Asylum at Kenmore, near Goulburn.* (Second Reference).	150,000	150,000	.....	.....	Recommended as proposed.
14 June to 28 Sept.	Railway from Grafton to Lismore.	662,000 (or £8,000 per mile.)	108,000 (or £6,000 per mile.)	.....	554,000	The Committee decided that, for the present, only the Lismore to Casino section of the proposed railway should be constructed, that the cost should not exceed £6,000 per mile, and that the betterment principle be applied to the land to be served by the proposed line.
10 July to 26 Oct.	Railway from Eden to Bega.	564,000 (or £15,350 per mile.)	.....	.....	564,000	The Committee considered that the present resources of the district did not warrant the construction of such an expensive line, but they were of opinion that a cheaply constructed railway might be favorably considered.
22 June to 4 Oct.	Sewerage Works for Parramatta.*	75,926	.....	.....	75,926	The Committee were of opinion that the sewage farm included in the scheme was too small for the purpose, and that the sewage should be dealt with by precipitation and filtration or other effective modern process at a proposed pumping station at Clay Cliff Creek.
12 Oct. to 21 Dec.	Water Supply for Tamworth.	22,500	22,500	.....	.....	Recommended as proposed, with a provision as to the quantity of water obtainable, and the resumption of land surrounding the well in the drift forming the source of supply.
14 Sept. to 16 Nov.	Water Supply for Lithgow	15,000	15,000	.....	.....	Recommended as proposed.
15 Sept. to 16 Nov.	Water Supply for Armidale.	43,500	43,500	.....	.....	Recommended as proposed.
17 Nov. to 10 Jan. 1893.	Railway from Glen Innes to Inverell.* (Second Reference).	421,400 (or £7,975 per mile).	369,862 (or £7,000 per mile).	.....	51,538	The Committee considered it expedient this railway should be constructed, provided that the cost did not exceed £7,000 per mile, that special local rates were charged until the railway paid working expenses and interest on cost of construction, and that the betterment principle was applied to the land served by the railway.
14 Feb. to 8 Mar.	Waterworks for the town of Junee.	45,000	45,000	.....	.....	The Committee recommended that these works should be carried out, conditionally upon the Railway Commissioners undertaking to enter into an agreement for a period of not less than ten years to pay a minimum of £1,900 per annum for water supplied for railway purposes at Junee and Bethungra.
14 Nov., 1893, to 11 Jan., 1894.	Railway from Narrabri to Moree.	153,000	153,000	.....	.....	Recommended as proposed, with the condition that the work be not undertaken until a Betterment Act is passed.
	Carried forward.....£	12,670,896	8,081,326	34,938	4,624,508

1894.	Brought forward ...£	12,670,896	8,081,326	34,938	4,624,508	
7 Feb. to 22 Mar.	Sewerage Works for Parramatta.* (Second reference.)	75,926	.....	.....	75,926	The Committee decided that it was not expedient the proposed works should be carried out, for the reasons that the scheme had not been adequately considered, and that, according to the evidence, Parramatta was neither willing nor able to pay the rate necessary to provide the interest on the expenditure, and did not want the proposed works.
6 Mar. to 16 April.	Deviation to avoid the Lithgow Zigzag.	181,072	.....	... .	181,072	The Committee were of opinion that as the professional evidence, as well as much of the evidence generally, indicated that the proposed deviation was not a matter of urgency it was not expedient the work should be carried out.
9 April, to 22 May.	Railway from Temora to Wyalong.*	104,430	.....	.....	104,430	The Committee were of opinion that the decision upon the proposal should be deferred for six months.
11 April, to 20 June.	Removal of Pyrmont and Glebe Island Bridges.*	296,500	.....	.....	296,500	The Committee recommended that when renewal becomes necessary the existing bridges at Darling Harbour and Glebe Island should be replaced by timber structures of a kind specified in their report, which report, however, in consequence of the sudden dissolution of Parliament was not presented to the Legislative Assembly.
3 Oct. to 14 Nov.	Removal of Pyrmont and Glebe Island Bridges.* (Second reference.)	296,500	82,500	.....	214,000	The Committee recommended that the Pyrmont Bridge be replaced by a timber bridge with steel span, to cost £82,500, and decided that the Glebe Island Bridge did not at present require renewal.
19 Dec. to 27 Feb., 1895.	Railway from Jerilderie to Berrigan.	43,543	43,543	.....	... .	The construction of this railway was recommended, with the condition that the estimated cost, £2,000 per mile, should include goods and grain sheds, engineering charges, and all contingencies.
7 Mar. to 10 May.	Railway from Parkes to Condobolin.	127,000	127,000	....	.....	In this inquiry the Committee, while considering it expedient the railway should be constructed, resolved that the cost should not exceed £2,100 per mile, including the cost of land resumptions.
17 May to 28 June.	Railway from Temora to Wyalong.* (Second reference.)	92,000	.....	... .	92,000	The Committee, in deciding against this proposed work, were of opinion that at the present time there is no justification for its construction, and the prospects of Wyalong's future are not such as to lead them to conclude that the line should be built in anticipation of what may be the condition of the gold-field and the district some years hence.
20 Mar. to 7 May.	Harbour Improvements at Newcastle.	141,000	141,000	.....	.....	In this inquiry the Committee recommended a modification of the works proposed by the Department and an additional work, the cost of the works as recommended by the Committee being about the same as that of the works proposed by the Department.
26 June, to 4 July.	Tramway from Woolwich to the Field of Mars Common.*	19,300	....	.....	19,300	This proposed work was referred to the Fifth Committee who, at the termination of their existence, had inquired partly into it. A motion in the Legislative Assembly to refer the proposal to the Sixth Committee was, however, negatived on 11 December, 1895.
12 Dec. to 14 Dec.	Deviation at Locksley, Great Western Railway.	47,500	47,500	.....	.....	The Committee considered this work to be an urgent and necessary one, and recommended that it be carried out without delay.
17 Dec. to 24 Jan. 1896.	Water Supply for the Town of Tamworth.	32,824	32,824	....	.....	The Committee recommended that this work be carried out, with the proviso that the capacity of the storage reservoir be increased from 35,000,000 to 50,000,000 gallons.
18 Mar. to 8 May.	Electric Tramway from Circular Quay, Sydney, to the Redfern Railway Station; and also along Harris-street to the intersection of John-street.	130,500	130,500	....	.....	Recommended as proposed.
	Carried forward.....£	14,258,991	8,686,193	34,938	5,607,736	

LIST of Proposed Public Works inquired into by the Committee, &c.—*continued.*

Date of Inquiry.	Proposed Work.	Expenditure proposed by the Government.	Expenditure recommended by the Committee.	Amount in excess of that proposed.	Amount in reduction of that proposed.	Remarks.

21 Jan. to 10 Mar.	Erection of Buildings at Rookwood for Infirm and Destitute Persons.	118,285	62,900	.....	55,385	The Committee decided that it was not expedient the proposed works should be carried out, deeming it inadvisable, for reasons stated in their Report, to concentrate the infirm and destitute at Rookwood. The Government estimate for the proposed buildings was £108,350 without, and £118,285 with, provision for sewage. The Committee recommended that the inmates of the Parramatta Asylums be removed, the healthy patients being housed at Rookwood and Liverpool, provision for the chronic and acute sick to be made on Crown lands near Campbelltown.
	£	14,377,276	8,749,093	34,938	5,663,121	

* The proposed works marked with an asterisk have been twice referred to the Committee, and in one case—that of the proposed Tramway from Woolwich to the Field of Mars Common—referred and then subsequently withdrawn, and together, as first referred, represent an estimated expenditure of £1,305,556, by which amount the total expenditure proposed by the Government and the amount in reduction of that proposed expenditure as shown by the result of the Committee's inquiries should be reduced. A further reduction should be made of £662,000, the proposed expenditure on the railway from Grafton to Lismore, that line being part of the railway originally proposed from Grafton to the Tweed. With these reductions the total expenditure proposed by the Government is £12,409,720, and the saving effected by the Committee, allowing for the £34,938 excess, £3,660,627.

Drainage Works for the Western Suburbs.	23 ,, ...	7 December	.. ..	.....	Inquiry completed by Third Committee.	,, ,,	,, ,,	,, ,,

THIRD COMMITTEE—FROM 7 JUNE, 1889, TO 6 JUNE, 1891.

MEMBERS OF THE COMMITTEE.

LEGISLATIVE COUNCIL.

* The Honorable JOHN LACKEY, Chairman.
The Honorable ANDREW GARRAN.
* The Honorable JAMES WATSON.
The Honorable FREDERICK THOMAS HUMPHERY.
The Honorable WILLIAM JOSEPH TRICKETT.
* The Honorable GEORGE HENRY COX.

LEGISLATIVE ASSEMBLY.

* JOSEPH PALMER ABBOTT, Esquire, Chairman.
* JACOB GARRARD, Esquire, Vice-Chairman.
HENRY COPELAND, Esquire.
JAMES EBENEZER TONKIN, Esquire.
WILLIAM SPRINGTHORPE DOWEL, Esquire.
* JOHN SUTHERLAND, Esquire.
EDWARD WILLIAM O'SULLIVAN, Esquire.
* JOHN HURLEY, Esquire.
* CHARLES ALFRED LEE, Esquire.
* WILLIAM MCCOURT, Esquire.
* JAMES PATRICK GARVAN, Esquire.

[* Shortly after the first meeting of the third Committee, John Sutherland, Esquire, died, and his place was filled by the appointment of Charles Alfred Lee, Esquire. Subsequently the Honorable James Watson resigned his seat on the Committee, and the Honorable George Henry Cox was appointed in his place. On 22nd October, 1890, Mr. Joseph Palmer Abbott, having been appointed Speaker of the Legislative Assembly, resigned his position as Chairman and member of the Committee. The Honorable John Lackey, who at that time was Vice-Chairman of the Committee, was appointed Chairman in Mr. Abbott's place, and Mr. Jacob Garrard was chosen as Vice-Chairman. Mr. William McCourt was appointed a member of the Committee on 16th July, 1890, in the place of Mr. John Hurley, whose seat became vacant by reason of his resignation from the Legislative Assembly; and Mr. James Patrick Garvan was appointed a member on the 6th November, 1890, in the room of Mr. Joseph Palmer Abbott.]

Proposed Work.	Date of reference to Committee.	Date upon which inquiry was opened.	Date upon which Sectional Committee was appointed.	Date of Sectional Committee's Report.	Date of Committee's Report.	Statement of Committee's recommendation.	How dealt with by Parliament.	Date of Parliamentary action.
Dredge and Plant for Sydney Harbour.	23 July, 1888	22 Jan., 1890	... .	....	6 Feb., 1890	The evidence showed that this class of dredge was not required.	Not dealt with.	....
Improvements to the Entrance of the Richmond River.	23 ,, ,,	26 June, 1889	.....	.....	30 Sept., 1889	The Committee recommended that the proposed works should be carried out in a certain order, so that the results from the works first constructed might be ascertained before others were proceeded with.	Passed.	Legislative Assembly—23 July, 1890—Bill read third time. Legislative Council—28 Aug., 1890—Bill read third time; 3Sept., 1890—Assent reported.
Improvements to the Entrance of the Clarence River.	23 ,, ,,	23 Oct., ,,	14 Nov., 1889	28 Jan., 1890	2 April, 1890	In this case the Committee recommended the construction of only a portion of the works proposed, as they were of opinion that when this portion had been constructed it might be found that the remainder would not be required.	Passed.	Legislative Assembly—23 July, 1890—Bill read third time. Legislative Council—17 Sept., 1890—Bill read third time; 1 Oct., 1890—Assent reported.
Drainage Works for the Western Suburbs.	23 ,, ,,	7 Dec., 1888	.....	.....	27 Aug., 1889	Recommended as proposed.	Passed.	Legislative Assembly—26 Sept., 1889—Bill read third time. Legislative Council—26 Sept., 1889—Bill read third time; 30 Sept., 1889—Assent reported.

THIRD COMMITTEE—*continued.*

Proposed Work.	Date of reference to Committee.	Date upon which inquiry was opened.	Date upon which Sectional Committee was appointed.	Date of Sectional Committee's Report.	Date of Committee's Report.	Statement of Committee's recommendation.	How dealt with by Parliament.	Date of Parliamentary action.
Railway from Goulburn to Crookwell.	31 July, 1889	22 Aug., 1889	29 Aug., 1889	17 Sept., 1889	19 Dec., 1889	The Committee considered that the cost of this railway should not exceed £4,500 per mile, and that a saving should also be effected by utilizing a certain portion of the present main line instead of taking the propcsed railway through a part of the city of Goulburn.	Negatived by the Legislative Council.	Legislative Assembly—25 Sept., 1895—Bill read third time. Legislative Council—12 Nov., 1895—Second reading resolved in the negative.
Railway from Nyngan to Cobar	1 Aug., ,,	25 Sept., ,,	24 Sept., ,,	31 Oct., ,,	18 Feb., 1890	The Committee recommended the construction of this railway as part of a line which should be extended to Wilcannia and Broken Hill.	Passed.	Legislative Assembly—10 July, 1890—Bill read third time. Legislative Council—17 July, 1890—Bill read third time; 23 July, 1890—Assent reported.
Railway from Kiama to Nowra	1 ,, ,,	4 Dec., ,,	14 Jan., 1890	30 Jan., 1890	22 April, ,,	In this case there was an original estimate of £441,663. The amount recommended by the Committee was £381,390. The reduction was due to an amended estimate made by the Acting Engineer-in-Chief for Railways after the railway was referred to the Committee.	Passed.	Legislative Assembly—10 July, 1890—Bill read third time. Legislative Council—7 Aug., 1890—Bill read third time; 13 Aug., 1890—Assent reported.
Railway from Marrickville to the Burwood Road.	1 ,, ,,	19 Nov., ,,	....	.....	2 ,, ,,	Recommended as proposed.	Passed.	Legislative Assembly—11 Dec., 1890—Bill read third time. Legislative Council—18 Dec., 1890—Bill read third time; 19 May, 1891—Assent reported.
Railway from Culcairn to Corowa.	6 ,, ,,	29 Aug., ,,	29 Aug., 1889	11 Sept., 1889	12 Dec., 1889	The Committee were of opinion that this line should be constructed at a cost not exceeding £3,500 per mile.	Passed.	Legislative Assembly—10 July, 1890—Bill read third time. Legislative Council—31 July, 1890—Bill read third time; 6 Aug., 1890—Assent reported.
Breakwater at Byron Bay	6 ,, ,,	31 Oct., ,,	14 Nov., ,,	28 Jan., 1890	15 April, 1890	The original estimate for this work was £162,000. The estimate placed before the Committee, which they adopted in their recommendation, was £241,723. The increase was due to a difficulty in obtaining stone.	Negatived by the Legislative Council.	Legislative Assembly—17 July, 1890—Bill read third time. Legislative Council—15 Oct., 1890—Bill negatived in Council on motion, "That it be read the second time this day six months."
Railway to connect North Shore Railway with Port Jackson, at Milson's Point.	7 ,, ,,	9 ,, ,,	.....	... .	11 Dec., 1889	The Committee considered, for various reasons stated in their report on the subject, that the work as proposed should not be carried out.	See second reference.	See second reference.
Railway from Grafton to the Tweed.	27 Sept., ,,	12 Nov., ,,	14 Nov., ,,	28 Jan., ,,	15 April, 1890	The Committee recommended that this railway should be constructed from Lismore to Murwillumbah, instead of from Grafton to Murwillumbah, the Committee's recommendation involving a length of about 60½ miles as compared with 140 miles 76 chains, the length of the line as referred to them by the Legislative Assembly.	Passed.	Legislative Assembly—17 July, 1890—Bill (Lismore to the Tweed Railway Bill) read third time. Legislative Council—10 Sept., 1890—Bill read third time; 24 Sept., 1890—Assent reported.
Railway from Cootamundra to Temora.	27 ,, ,,	15 Jan., 1890	16 Jan., 1890	11 Feb., ,,	23 ,, ,,	The Committee considered that the cost of constructing this railway should not exceed £3,300 per mile.	Passed.	Legislative Assembly—23 July, 1890—Bill read third time. Legislative Council—17 Sept., 1890—Bill read third time; 1 Oct., 1890—Assent reported.

THIRD COMMITTEE—*continued.*

Proposed Work.	Date of reference to Committee.	Date upon which inquiry was opened.	Date upon which Sectional Committee was appointed.	Date of Sectional Committee's Report.	Date of Committee's Report.	Statement of Committee's recommendation.	How dealt with by Parliament.	Date of Parliamentary action.
Railway from Mudgee to Gulgong.	27 Sept., 1889	23 Jan., 1890	12 Mar., 1890	26 Mar., 1890	6 May, 1890	The Committee decided against this work on the ground that any extension of the Mudgee Railway should form part of a more comprehensive proposal, the consideration of which should be deferred until after the suggestion for the connection of the Northern and Western systems, by a line between Dubbo and Werris Creek, had been dealt with.	Not dealt with.	....
Railway from Moss Vale to Robertson.	1 Oct., ,,	23 ,, ,,	30 Jan., ,,	12 Feb., ,,	29 April, ,,	The Committee negatived this proposal because they considered another route, described in their report, was preferable.	,,	....
Railway from Molong to Parkes and Forbes.	1 ,, ,,	22 ,, ,,	12 Feb., ,,	19 Mar., ,,	21 May, ,,	Recommended as proposed.	Passed.	Legislative Assembly—23 July, 1890—Bill read third time. Legislative Council—21 Aug., 1890—Bill read third time; 27 Aug., 1890—Assent reported.
Bridge over Tarban Creek, Parramatta River.	1 ,, ,,	12 Feb., ,,	.....	....	15 April, ,,	The Committee considered this bridge to be unnecessary.	Not dealt with.	....
Bridge over the Hunter River, at Jerry's Plains.	1 ,, ,,	20 ,, ,,	4 Mar.,	'1 Mar., ,,	15 ,, ,,	The Committee considered that a less expensive bridge would be sufficient to meet requirements.	,, ,,	.. ..
Bridge to connect Bullock Island with the Mainland at Newcastle.	1 ,, ,,	25 ,, ,,	4 ,, ,,	11 ,, ,,	29 ,,, ,,	The Committee considered that this proposed expenditure was premature, pending the carrying out of certain reclamation works.	,, ,,	... .
Iron Bridge at Cowra	1 ,, ,,	12 ,, ,	18 Feb., ,,	19 ,, ,,	21 May, ,,	The original proposal represented an expenditure of £69,971, which amount was afterwards reduced to £26,537, as the result of a revision of the system of bridge-building in the Colony, and the construction of the bridge at the reduced cost was recommended by the Committee.	Passed.	Legislative Assembly—23 July, 1890—Bill read third time. Legislative Council—21 Aug., 1890—Bill read third time; 27 Aug., 1890—Assent reported.
Hospital for the Insane upon the Kenmore Estate, near Goulburn.	1 ,, ,,	28 May, ,,	.....	.....	Inquiry not completed.	This proposed work, after being partly considered, was withdrawn from the Committee by resolution of the Assembly.	Rescinded.	Legislative Assembly—2 July, 1890—Resolution passed rescinding previous resolution referring proposed work to the Committee.
Offices for Board of Water Supply and Sewerage.	1 ,, ,,	14 Jan., ,,	.....	.....	11 Feb., 1890	Recommended as proposed.	Passed.	Legislative Assembly—7 Nov., 1890—Bill read third time. Legislative Council—20 Nov., 1890—Bill read third time; 27 Nov., 1890—Assent reported.
Reticulation of Western Suburbs Drainage Scheme.	1 ,, ,,	14 ,, ,,	.....	.....	6 , ,,	,, ,,	,,	Legislative Assembly—23 July, 1890—Bill read third time. Legislative Council—24 Sept., 1890—Bill read third time; 8 Oct., 1890—Assent reported.

THIRD COMMITTEE—*continued.*

Proposed Work	Date of reference to Committee.	Date upon which inquiry was opened.	Date upon which Sectional Committee was appointed.	Date of Sectional Committee's Report.	Date of Committee's Report.	Statement of Committee's recommendation.	How dealt with by Parliament.	Date of Parliamentary action.
Extension of Sydney Water Supply to Southern Suburbs —Hurstville, Rockdale.	1 Oct., 1889	14 Jan., 1890	.....	.....	11 Feb., 1890	This expenditure was rendered unnecessary by reason of a temporary water-supply scheme being sufficient to meet requirements for some years.	Not dealt with.	.....
Cable Tramway from King-street, *via* William-street, to Ocean-street.	,, ,,	22 ,, ,,	.....	.....	2 June, 1891	Recommended as proposed.	Passed.	Legislative Assembly—8 March, 1892—Bill read third time. Legislative Council—10 March, 1892—Bill read third time; 17 March, 1892—Assent reported.
Cable Tramway through George, Pitt, and Harris Streets, Sydney	1 ,, ,,	25 Nov. ,,	.....	.....	4 ,, ,,	The Committee considered that it was not expedient, for reasons stated in their report, that this tramway should be constructed.	Not dealt with.	.....
Railway to connect North Shore Railway with the deep waters of Port Jackson, at Milson's Point (second reference).	8 May, 1890	28 May, ,,	.....	.....	21 Aug., 1890	This proposal was before the Committee on a previous occasion when it was negatived; but having been referred to the Committee for further consideration, and circumstances appearing in the second inquiry which justified the construction of the railway, the Committee approved of the proposed work.	Passed.	Legislative Assembly—12 Nov., 1890—Bill read third time. Legislative Council—20 Nov., 1890—Bill read third time; 27 Nov., 1890—Assent reported.
College for the Training of Teachers of Public Schools.	21 Nov., ,,	11 Feb., 1891	.....	.....	19 Mar., 1891	Recommended as proposed.	Not dealt with.	.....
Hospital Buildings, Macquarie-street.	3 Dec., ,,	10 Dec., 1890	.....	.....	12 May, ,,	In this case two sets of plans for the buildings were submitted to the Committee, one representing a design that was estimated to cost £140,000, and the other a design to cost £56,000, and the Committee approved of the latter.	Passed.	Legislative Assembly—9 March, 1892—Bill read third time. Legislative Council—17 March, 1892—Bill read third time; 29 March, 1892—Assent reported.
Railway from Cobar to Cockburn.	19 ,, ,,	24 Feb., 1891	.....	.....	14 ,, ,,	The Committee recommended the construction of this railway as far as Broken Hill only, thereby reducing the proposed expenditure (£1,168,000) by £150,000.	.....	Legislative Assembly—25 June, 1895—Motion to go into Committee to bring in a Bill.
Railway from Glen Innes to Inverell.	19 ,, ,,	21 April, ,,	23 April, 1891	2 June, 1891	See Fourth Committee.	See Fourth Committee.	See Fourth Committee.	.....
Extension of the Kiama to Nowra Railway into the town of Nowra.	19 ,, ,,	19 Feb., ,,	.....	.....	21 April, 1891	Recommended as proposed.	Not dealt with.	.....

FOURTH COMMITTEE—FROM 31 MARCH, 1892, TO 25 JUNE, 1894.

MEMBERS OF THE COMMITTEE.

LEGISLATIVE COUNCIL.

The Honorable WILLIAM HENRY SUTTOR, Vice-Chairman.
The Honorable JAMES HOSKINS.
The Honorable FREDERICK THOMAS HUMPHERY.
* The Honorable ANDREW GARRAN, LL.D.
The Honorable JOHN DAVIES, C.M.G.
* The Honorable WILLIAM JOSEPH TRICKETT.

LEGISLATIVE ASSEMBLY.

JACOB GARRARD, Esquire, Chairman.
THOMAS THOMSON EWING, Esquire.
WILLIAM CHANDOS WALL, Esquire.
WILLIAM MCCOURT, Esquire.
JOHN CASH NEILD, Esquire.
EDWARD WILLIAM O'SULLIVAN, Esquire.
CHARLES COLLINS, Esquire.
HENRY DAWSON, Esquire.

* The Honorable Andrew Garran, LL.D., on 5th October, 1892, resigned his seat as a member of the Committee, and on 12th October, 1892, the Honorable William Joseph Trickett was appointed to fill the vacancy.]

Proposed Work	Date of reference to Committee.	Date upon which inquiry was opened.	Date upon which Sectional Committee was appointed.	Date of Sectional Committee's Report.	Date of Committee's Report.	Statement of Committee's recommendation.	How dealt with by Parliament.	Date of Parliamentary action.
Improvements at Darling Island	29 Mar., 1892	5 May, 1892	....	.....	2 June, 1892	The Committee considered that the proposed works might be postponed for the present without inconvenience, and that a more suitable design might be submitted.	Not dealt with.	....
Water Supply for Tamworth...	29 ,, ,,	12 Oct., ,,	12 Oct., 1892	15 Nov., 1892	21 Dec., ,,	Recommended as proposed with a provision as to the quantity of water obtainable, and the resumption of land surrounding the well in the drift forming the source of supply.	Passed.	Legislative Assembly—29 May, 1894—Bill read third time. Legislative Council—31 May, 1894—Bill read third time; 5 June, 1894—Assent reported.
Storm-water Sewers discharging into Johnstone's Bay.	29 ,, ,,	7 June, ,,	.....	....	12 July, ,,	Recommended as proposed.	,,	Legislative Assembly—7 June, 1894—Bill read third time. Legislative Council—7 June, 1894—Bill read second time and passed through all stages; 7 Aug., 1894—Assent reported.
Reservoir at Centennial Park for Sydney Water Supply.	29 ,, ,,	15 ,, ,,	.....	....		Recommended with an alteration of site.	,,	Legislative Assembly—20 Dec., 1894—Bill read thir time. Legislative Council—21 Dec., 1894—Bill rea third time; 26 Feb., 1895—Assent reported.
Water Supply for Wollongong and the Surrounding Districts.	29 ,, ,,	14 July, ,,	.....	.....	4 Aug., ,, 24 ,, ,,	The Committee found that the Water Supply proposed for the surrounding districts was not needed, and that the estimate of cost for supplying Wollongong might be reduced to £30,000.	Not dealt with.	....
Second Pipe-line from Walka to Buttai, for Hunter River District Water Supply.	29 ,, ,,	28 ,, ,,	....	.....	16 ,, ,,	Recommended as proposed.	.. ..	Legislative Assembly—2 Oct., 1895—Bill read thir time. Legislative Council—12 Nov., 1895—Bill read third time; 9 Nov., 1895—Assent reported.
Sewerage Works at Cottage Creek.	29 ,, ,,	26 ,, ,,	.. ..	.....	9 ,, ,,	The estimated cost of this work was £25,000, which provided for a covered sewer; but the Committee found that a cover was not necessary, and that by constructing an open sewer the cost could be reduced by £12,000.	Passed.	Legislative Assembly—2 May, 1895—Bill read third time. Legislative Council—30 May, 1895—Bill read third time; 25 June, 1895—Assent reported.
Water Supply for Lithgow ..	29 ,, ,,	14 Sept., ,,	22 Oct., ,,	24 Oct., ,,	16 Nov., ,,	Recommended as proposed.	,,	Legislative Assembly—5 April, 1894—Bill read third time. Legislative Council—18 April, 1894—Bill read third time; 1 May, 1894—Assent reported.
Sewerage Works for Parramatta	29 ,, ,,	22 June, ,,	.....	....	4 Oct., ,,	The construction of this work the Committee did not recommend, as they were of opinion that the sewage farm included in the scheme was too small for the purpose, and that the sewage should be dealt with by precipitation and filtration, or other effective modern process, at a proposed pumping station at Clay Cliff Creek.	Not dealt with.	....

FOURTH COMMITTEE—*continued.*

Proposed Work.	Date of reference to Committee.	Date upon which inquiry was opened.	Date upon which Sectional Committee was appointed.	Date of Sectional Committee's Report.	Date of Committee's Report.	Statement of Committee's recommendation.	How dealt with by Parliament.	Date of Parliamentary action.
Water Supply for Armidale ...	29 Mar., 1892	15 Sept., 1892	12 Oct., 1892	20 Oct., 1892	16 Nov., 1892	Recommended as proposed.	Passed.	Legislative Assembly—22 May, 1894—Bill read third time. Legislative Council—31 May, 1894—Bill read third time; 5 June, 1894—Assent reported.
Railway from Eden to Bega ...	29 ,, ,,	10 July, ,,	11 Aug., ,,	7 Sept., ,,	26 Oct., ,,	The Committee considered that the resources of the district did not warrant the construction of such an expensive line, but they were of opinion that a cheaply constructed railway might be favourably considered.	Not dealt with.	.....
Railway from Grafton to Lismore.	29 ,, ,,	14 June, ,,	15 June, ,,	10 Aug., ,,	28 Sept., ,,	The Committee decided that, for the present, only the Lismore to Casino section of the proposed railway should be constructed, that the cost should not exceed £6,000 per mile, and that the betterment principle be applied to the land to be served by the proposed line.	,, ,,	.....
Railway from Glen Innes to Inverell.	29 ,, ,,	6 April, ,,	23 April, 1891 (See Third Committee.)	2 June, 1891 (See Third Committee.)	27 May, ,,	The evidence in this case, which was partly inquired into by the Third Committee and partly by the Fourth Committee, showed that the estimated cost of constructing the railway was excessive, and indicated the probability of a serious annual loss in the working of the line. In addition to this, the Committee were not as fully informed as desirable with regard to connecting Inverell not only with the Great Northern Railway but with the coast, a matter of considerable importance in the inquiry. The Committee therefore did not recommend that the railway should be constructed.	See second reference.	.....
Railway from Jerilderie to Deniliquin.	29 ,, ,,	31 May, ,,	2 June, 1892	23 June, 1892	18 Aug., ,,	The Committee were of opinion that the consideration of this proposed work should be postponed until it should be determined by Parliament as a matter of public policy to purchase the Deniliquin to Moama Railway.	Not dealt with.	.....
Lunatic Asylum at Kenmore, near Goulburn (second reference).	31 ,, ,,	12 July, ,,	.....	.....	24 ,, ,,	Recommended as proposed.	Passed.	Legislative Assembly—18 October, 1894—Bill read third time. Legislative Council—1 November, 1894 Bill read third time; 14 November, 1894—Assent reported.
Railway from Glen Innes to Inverell (second reference).	27 Oct., ,,	17 Nov., ,,	23 Nov., ,,	13 Dec., ,,	10 Jan., 1893	The Committee considered it expedient this railway should be constructed, provided that the cost did not exceed £7,000 per mile, that special local rates were charged until the railway paid working expenses and interest on cost of construction, and that the betterment principle was applied to the land served by the railway.	Negatived.	Legislative Assembly—18 April, 1894—Bill read third time. Legislative Council—7 June 1894—Bill negatived on motion for second reading.
Waterworks for the town of Junee.	2 Feb., 1893	14 Feb., 1893	15 Feb., 1893	28 Feb., 1893	14 Mar., ,,	The Committee recommended that the proposed works should be carried out, conditionally on the Railway Commissioners entering into an agreement for a period of not less than ten years to pay a minimum of £1,900 per annum for water supplied for railway purposes at Junee and Bethungra.	Passed.	Legislative Assembly—4 April, 1894—Bill read third time. Legislative Council—18 April, 1894—Bill read third time; 1 May, 1894—Assent reported.

FOURTH COMMITTEE—*continued.*

Proposed Work.	Date of reference to Committee.	Date upon which inquiry was opened.	Date upon which Sectional Committee was appointed.	Date of Sectional Committee's Report.	Date of Committee's Report.	Statement of Committee's recommendation.	How dealt with by Parliament.	Date of Parliamentary action.
Railway from Narrabri to Moree.	1 Nov., 1893	14 Nov., 1893	15 Nov., 1893	5 Dec., 1893	12 Jan., 1894	Recommended as proposed, with the condition that the work be not undertaken until a Betterment Act is passed.	Passed.	Legislative Assembly—20 March, 1895—Bill read third time. Legislative Council—4 April, 1895—Bill read third time; 23 April—Assent reported.
Sewerage Works for Parramatta (second reference).	1 Feb., 1894	7 Feb., 1894	.. ..	.....	22 Mar., ,,	The Committee decided that it was not expedient the proposed works should be carried out, for the reasons that the scheme had not been adequately considered, and that, according to the evidence, Parramatta was neither willing nor able to pay the rate necessary to provide the interest on the expenditure, and did not want the proposed works.	Not dealt with.	....
Deviation to avoid the Lithgow Zigzag.	25 Jan., ,,	6 Mar., ,,	.....	.....	16 April, ,,	The Committee were of opinion that as the professional evidence, as well as much of the evidence generally, indicated that the proposed deviation was not a matter of urgency, it was not expedient the work should be carried out.	,, ,,	....
Railway from Temora to Wyalong.	29 Mar., ,,	9 April, ,,	9 April, 1894	24 April, 1894	28 May, ,,	The Committee were of opinion that owing to the uncertainty of the permanence of the Wyalong goldfield, the decision upon the proposed Railway should be deferred for six months.	See Fifth Committee.	....
Removal of Pyrmont and Glebe Island Bridges.	25 Jan., ,,	11 ,, ,,	.....	....	25 June, ,,	The Committee negatived the Departmental scheme, but recommended that when renewal becomes necessary the existing bridges at Darling Harbour and Glebe Island should be replaced by timber structures of a kind specified in their report, which report, however, in consequence of the sudden dissolution of Parliament was not presented to the Legislative Assembly.	,, ,,	.....

FIFTH COMMITTEE—FROM 19 SEPTEMBER, 1894, TO 5 JULY, 1895.

MEMBERS OF THE COMMITTEE.

LEGISLATIVE COUNCIL.

The Honorable FREDERICK THOMAS HUMPHERY, Vice-Chairman.
The Honorable WILLIAM JOSEPH TRICKETT.
The Honorable JAMES HOSKINS.
The Honorable JOHN DAVIES, C.M.G.
The Honorable CHARLES JAMES ROBERTS, C.M.G.

LEGISLATIVE ASSEMBLY.

* VARNEY PARKES, Esquire, Chairman.
* THOMAS THOMSON EWING, Esquire, Chairman.
JAMES HAYES, Esquire.
ROBERT HENRY LEVIEN, Esquire.
JOHN MOORE CHANTER, Esquire.
CHARLES ALFRED LEE, Esquire.
JAMES GORMLY, Esquire.
EDMUND WILLIAM MOLESWORTH, Esquire.

* On 15th November, 1894, Varney Parkes, Esquire, resigned his seat on the Committee, and on 20th November, 1894, Thomas Thomson Ewing, Esquire, was elected Chairman.

Proposed Work.	Date of reference to Committee.	Date upon which inquiry was opened.	Date upon which Sectional Committee was appointed.	Date of Sectional Committee's Report.	Date of Committee's Report.	Statement of Committee's recommendation.	How dealt with by Parliament.	Date of Parliamentary action.
Removal of Pyrmont and Glebe Island Bridges (second reference).	27 Sept., 1894	3 Oct., 1894	.....	.....	21 Nov., 1894	The Committee recommended that the Pyrmont Bridge be replaced by a timber bridge, with steel span, to cost £82,500; the Glebe Island Bridge, they decided, did not at present require renewal.	.....	Legislative Assembly—8 May, 1895—Motion in Committee to bring in a Bill.
Railway from Jerilderie to Berrigan.	18 Dec., ,,	19 Dec., ,,	8 Jan., 1895	22 Jan., 1895	28 Feb., 1895	The construction of this railway was recommended, with the condition that the estimated cost, £2,000 per mile, should include goods and grain sheds, engineering charges, and all contingencies.	Passed.	Legislative Assembly—7 May, 1895—Bill read third time. Legislative Council—12 June, 1895—Bill read third time; 25 June, 1895—Assent reported.
Railway from Parkes to Condobolin.	6 Mar., 1895	7 Mar., 1895	19 Mar., ,,	3 April, ,,	21 May, ,,	In this inquiry the Committee, while considering it expedient the railway should be constructed, resolved that the cost should not exceed £2,100 per mile, including the cost of land resumption.	,,	Legislative Assembly—27 June, 1895—Bil read third time. Legislative Council—3 July, 1895—Bill read third time; 14 August, 1895—Assent reported.
Railway from Temora to Wyalong (second reference).	7 ,, ,,	17 May ,,	5 June, ,,	19 June, ,,	27 June, ,,	The Committee negatived this proposed work, being of opinion that at the present time there is no justification for the construction of this railway, and that the prospects of Wyalong's future are not such as to lead them to conclude that the line should be built in anticipation of what may be the condition of the goldfield and the district some years hence.	Not dealt with.	....
Harbour Improvements at Newcastle.	14 ,, ,,	20 Mar. ,,	28 Mar., ,,	9 April, ,,	16 May, ,,	In this inquiry the Committee recommended a modification of the works proposed by the Department and an additional work, the cost of the works as recommended by the Committee being about the same as that of the works proposed by the Department.	Passed.	Legislative Assembly—17 September, 1895—Bill read third time. Legislative Council—6 November, 1895—Bill read third time; 13 November, 1895—Assent reported.
ramway from Woolwich to the Field of Mars Common.	20 June, ,,	25 June ,,	.....	....	Inquiry not completed.	.. ..	Withdrawn.	Motion to refer work to Sixth Committee negatived—11 December, 1895.

SIXTH COMMITTEE—FROM 11 DECEMBER, 1895.

MEMBERS OF THE COMMITTEE.

LEGISLATIVE COUNCIL.

The Honorable FREDERICK THOMAS HUMPHERY, Vice-Chairman.
The Honorable JOHN DAVIES, C.M.G.
The Honorable JAMES HOSKINS.
The Honorable CHARLES JAMES ROBERTS, C.M.G.
The Honorable WILLIAM JOSEPH TRICKETT.

LEGISLATIVE ASSEMBLY.

THOMAS THOMSON EWING, Esquire, Chairman.
HENRY CLARKE, Esquire.
CHARLES ALFRED LEE, Esquire.
JOHN LIONEL FEGAN, Esquire.
* ANGUS CAMERON, Esquire.
THOMAS HENRY HASSALL, Esquire.
GEORGE BLACK, Esquire.
FRANCIS AUGUSTUS WRIGHT, Esquire.

* Soon after the appointment of the Committee a vacancy was caused by the decease of Angus Cameron, Esquire. Mr. Cameron's seat has not been filled, Parliament having continued in recess since his demise.

Proposed Work.	Date of reference to Committee.	Date upon which inquiry was opened.	Date upon which Sectional Committee was appointed.	Date of Sectional Committee's Report.	Date of Committee's Report.	Statement of Committee's recommendation.	How dealt with by Parliament.	Date of Parliamentary action.
Deviation at Locksley, Great Western Railway.	11 Dec., 1895	12 Dec., 1895	13 Dec., 1895	14 Dec., 1895	17 Dec., 1895	Recommended as proposed	Passed.	Legislative Assembly—17 December, 1895—Bill passed through all its stages. Legislative Council—18 December, 1895—Bill passed through all its stages.
Water Supply for the Town of Tamworth.	11 Dec., 1895	17 Dec., 1895	8 Jan., 1896	16 Jan., 1896	30 Jan., 1896	The Committee recommended that the proposed work should be carried out, with the proviso that the capacity of the storage reservoir be increased from 35,000,000 to 50,000,000 gallons.	.....	.....
Railway from Nevertire to Warren.	11 ,, ,,	21 April, 1896	6 May, 1896	.....	.....	.....	.....	....
Railway from Tamworth to Manilla.	11 ,, ,,	20 Feb., ,,	17 Mar., 1896	31 Mar., 1896	.....	.....	.....	....

SIXTH COMMITTEE—*continued.*

Proposed Work.	Date of reference to Committee.	Date upon which inquiry was opened.	Date upon which Sectional Committee was appointed.	Date of Sectional Committee's Report.	Date of Committee's Report.	Statement of Committee's recommendation.	How dealt with by Parliament.	Date of Parliamentary action.
Electric Tramway from Circular Quay, Sydney, to the Redfern Railway Station; and also along Harris-street to the intersection of John-street.	11 Dec., 1895	18 Mar., 1896	.....	.....	8 May, 1896	Recommended as proposed	.....	.....
Erection of Buildings at Rookwood for Infirm and Destitute Persons.	11 ,, ,,	21 Jan., ,,	....	.....	13 Mar., 1896	In this case the Committee deemed it inexpedient that the proposed buildings should be erected, but they recommended that the inmates of the Asylums in Macquarie, George, and Harris Streets, Parramatta, be removed as speedily as possible, and that the healthy destitute be housed at Rookwood and Liverpool; and further that suitable accommodation be provided near Campbelltown on available Crown lands for the chronic and acute sick.	.....	.....
Additions to the Treasury Building.	18 ,, ,,	9 ,, ,,	.....	.....	.....	....		
Construction of Locks and Weirs on the River Darling.	19 ,, ,,	.....	.....	.....	.....	....	.....	....

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF PROCEEDINGS.

THURSDAY, 12 *DECEMBER*, 1895.

THE SIXTH COMMITTEE appointed under the Public Works Act of 1888, the Public Works Act Amendment Act of 1889, and the Public Works (Committees' Remuneration) Act of 1889, met in the Committee's Board Room at half-past 1 o'clock p.m.

MEMBERS PRESENT:—

The Hon. Frederick Thomas Humphery,
The Hon. John Davies, C.M.G.,
The Hon. James Hoskins,
The Hon. Charles James Roberts, C.M.G.,
The Hon. William Joseph Trickett,
Henry Clarke, Esq.,
Charles Alfred Lee, Esq.,
John Lionel Fegan, Esq.,
Thomas Thomson Ewing, Esq.,
Angus Cameron, Esq.,
Thomas Henry Hassall, Esq.,
George Black, Esq.,
Francis Augustus Wright, Esq.

On the motion of Mr. Davies, seconded by Mr. Lee, it was resolved,—"That Mr. Humphery take the chair until a Chairman be elected."

The Secretary produced a supplement to the *Government Gazette*, dated Thursday, 12 December, 1895, containing a notification of the appointment of the Committee, and reported that all the members of the Committee had made the declaration necessary, under the sixth clause of the Public Works Act, to be made by members prior to their entering upon the duties of their office, or sitting at any meeting of the Committee.

The Committee then proceeded to elect a Chairman and a Vice-Chairman.

Mr. Clarke moved,—"That Thomas Thomson Ewing, Esq., be appointed Chairman of the Committee."

The motion was seconded by Mr. Trickett, and passed.

Mr. Ewing thereupon took the chair.

Mr. Davies moved,—"That the Honorable Frederick Thomas Humphery be appointed Vice-Chairman of the Committee."

The motion was seconded by Mr. Hassall, and passed.

Mr. Davies moved,—"That unless otherwise ordered the Committee meet at 2 o'clock p.m., and that Friday be a sitting day."

The motion was seconded by Mr. Lee, and passed.

The Secretary read from the Votes and Proceedings of the Legislative Assembly of 11 December, 1895, a list of works referred to the Committee for consideration and report, and the Committee deliberated as to the order in which the proposed works should be taken.

The Committee proceeded to consider the proposed Deviation at Locksley, Great Western Railway.

Hugh McLachlan, Esq., Secretary to the Railway Commissioners, and Henry Deane, Esq., Engineer-in-Chief, Railway Construction Branch, Department of Public Works, were sworn, and examined.

The Committee adjourned at 12 minutes past 4, until 2 o'clock p.m. on Friday, the following day.

FRIDAY, 13 *DECEMBER*, 1895.

The Committee met at 2 p.m.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.

The Hon. Frederick Thomas Humphery,
The Hon. John Davies, C.M.G.,
The Hon. James Hoskins,
The Hon. Charles James Roberts, C.M.G.,
The Hon. William Joseph Trickett,
Henry Clarke, Esq.,
Charles Alfred Lee, Esq.,
John Lionel Fegan, Esq.,
Angus Cameron, Esq.,
Thomas Henry Hassall, Esq.,
George Black, Esq.,
Francis Augustus Wright, Esq.

The minutes of the previous meeting were read, and confirmed.

The Secretary read the following correspondence:—

Letter from the Clerk of the Legislative Assembly, informing the Committee of the passing by the Legislative Assembly of resolutions referring to the Committee for consideration and report the following proposed public works:—

Deviation at Locksley, on the Great Western Line of Railway.

Works of Water Supply for the Town of Tamworth.

A line of railway from Nevertire to Warren.

A line of railway from Tamworth to Manilla.

A line of electric tramway from Circular Quay, Sydney, to the Redfern Railway Station; and also along Harris-street to the intersection of John-street, and buildings at Rookwood for the accommodation of infirm and destitute persons in place of the buildings now used for such purpose at Parramatta, Liverpool, and elsewhere.

The correspondence was received.

The following accounts were passed for payment:—

	£	s.	d.
Williams and Cook (*Wyalong News*)	0	14	0
Crowley and Co. (*Wyalong Star*)...	1	1	0
James Meehan (*Temora Independent*)	1	8	0
Tucker, Thompson, and Eipper (*Maitland Mercury*)	2	17	9
Total...	£6	0	9

Mr. Davies moved,—"That Mr. Ewing, Mr. Trickett, Mr. Cameron, and Mr. Hassall be appointed a Sectional Committee to inspect and report with reference to the proposed Deviation at Locksley, Great Western Railway."

The motion was seconded by Mr. Wright, and passed.

Mr. Davies moved,—"That the Committee meet to-morrow (Saturday) from 10 a.m. to 12 noon, and on Monday at the usual hour."

The motion was seconded by Mr. Lee, and passed.

The Committee further considered the proposed Deviation at Locksley, Great Western Railway.

Henry Deane, Esq., Engineer-in-Chief, Railway Construction Branch, Department of Public Works, was sworn, and further examined.

Harry Richardson, Esq., Outdoor Superintendent, Traffic Branch, and Edward Andrew Loughry, Esq., Outdoor Locomotive Superintendent, Department of Railways, were sworn, and examined.

The Committee adjourned at 10 minutes past 4, until 10 o'clock a.m. on Saturday, the following day.

SATURDAY, 14 *DECEMBER*, 1895.

The Committee met at 10 a.m.

MEMBERS PRESENT:—

The Hon. Frederick Thomas Humphery, Vice-Chairman.

The Hon. John Davies, C.M.G.,	Charles Alfred Lee, Esq.,
The Hon. James Hoskins,	John Lionel Fegan, Esq.,
The Hon. Charles James Roberts, C.M.G.,	George Black, Esq.,
Henry Clarke, Esq.,	Francis Augustus Wright, Esq.

The minutes of the previous meeting were read, and confirmed.

The Committee further considered the proposed Deviation at Locksley, Great Western Railway.

Hugh McLachlan, Esq., Secretary to the Railway Commissioners, was sworn, and further examined.

John Vernon, Esq., Estate and Property Agent, and William Thow, Esq., Chief Mechanical Engineer, Department of Railways, were sworn, and examined.

Mr. Clarke gave notice that he would move at the next meeting of the Committee,—"That the Committee proceed to consider the evidence on the proposed Deviation at Locksley, Great Western Railway, with a view to reporting on the subject to the Legislative Assembly."

The Committee adjourned at half-past 11, until 2 o'clock p.m. on Monday, 16th December.

MONDAY, 16 *DECEMBER*, 1895.

The Committee met at 2 p.m.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.

The Hon. Frederick Thomas Humphery,	Charles Alfred Lee, Esq.,
The Hon. John Davies, C.M.G.,	John Lionel Fegan, Esq.,
The Hon. James Hoskins,	Angus Cameron, Esq.,
The Hon. Charles James Roberts, C.M.G.,	Thomas Henry Hassall, Esq.,
The Hon. William Joseph Trickett,	George Black, Esq.,
Henry Clarke, Esq.,	Francis Augustus Wright, Esq.

The minutes of the previous meeting were read, and confirmed.

Mr. Ewing, as Chairman of the Sectional Committee appointed with reference to the proposed Deviation at Locksley, Great Western Railway, brought up the report of the Sectional Committee and moved that it be received and printed with the minutes of evidence taken by the Sectional Committee.

The motion was seconded by Mr. Trickett, and passed.

The Committee further considered the proposed Deviation at Locksley, Great Western Railway.

Mr. Clarke moved,—"That the Committee proceed to consider the evidence on the proposed Deviation at Locksley, Great Western Railway, with a view to reporting on the subject to the Legislative Assembly."

The motion was seconded by Mr. Davies, and passed.

Mr. Clarke moved,—"That, in the opinion of the Committee, it is expedient the proposed Deviation at Locksley, Great Western Railway, as referred to the Committee by the Legislative Assembly, be carried out."

The motion was seconded by Mr. Davies, and passed.

Mr.

Mr. Humphery moved,—"That the Committee, at its rising on Friday, 20th instant, adjourn until Tuesday, 7th January, 1896."

The motion was seconded by Mr. Lee, and passed on the following division:—

Ayes, 8.	Noes, 4.
Mr. Ewing,	Mr. Roberts,
Mr. Humphery,	Mr. Hassall,
Mr. Davies,	Mr. Black,
Mr. Hoskins,	Mr. Wright.
Mr. Trickett,	
Mr. Clarke,	
Mr. Lee,	
Mr. Fegan.	

The Committee adjourned at half-past 3, until 2 o'clock p.m. on Tuesday, the following day.

TUESDAY, 17 DECEMBER, 1895.

The Committee met at 2 p.m.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.

The Hon. Frederick Thomas Humphery,	Charles Alfred Lee, Esq.,
The Hon. John Davies, C.M.G.,	John Lionel Fegan, Esq.,
The Hon. James Hoskins,	Angus Cameron, Esq.,
The Hon. Charles James Roberts, C.M.G.,	Thomas Henry Hassall, Esq.,
The Hon. William Joseph Trickett,	George Black, Esq.,
Henry Clarke, Esq.,	Francis Augustus Wright, Esq.

The minutes of the previous meeting were read, and confirmed.

The following account was passed for payment:—

Arthur Hurley, travelling expenses accompanying Sectional Committee on proposed Deviation at Locksley, Great Western Railway £0 17 1

The Committee proceeded to consider their Report to the Legislative Assembly on the proposed Deviation at Locksley, Great Western Railway.

The preamble, and clauses 1 to 3 were passed.

Clause 4.—Reasons for the proposed work.

Mr. Wright moved,—"That the clause be amended by the omission of the words 'increased one-third,' with a view to the insertion in their place of the words 'very largely increased.'"

The Committee divided upon the question, "That the words proposed to be omitted be so omitted"—

Ayes, 8.	Noes, 5.
Mr. Humphery,	Mr. Ewing,
Mr. Davies,	Mr. Clarke,
Mr. Hoskins,	Mr. Lee,
Mr. Roberts,	Mr. Fegan,
Mr. Trickett,	Mr. Black.
Mr. Cameron,	
Mr. Hassall,	
Mr. Wright.	

The insertion of the words 'very largely increased" was then agreed to, and the clause, as amended, was passed.

Clauses 5 and 6 were passed.

Clause 7.—The decision of the Committee.

Mr. Davies moved,—"That the clause be amended by the insertion after the word 'possible' of the words, 'at a cost not exceeding £47,000, including land resumptions.'"

The amendment was negatived on the following division, upon the question, "That the words proposed to be inserted be so inserted":—

Ayes, 6.	Noes, 7.
Mr. Humphery,	Mr. Ewing,
Mr. Davies,	Mr. Hoskins,
Mr. Roberts,	Mr. Trickett,
Mr. Cameron,	Mr. Clarke,
Mr. Black,	Mr. Lee,
Mr. Wright.	Mr. Fegan,
	Mr. Hassall.

The clause was then passed.

The Report was adopted, and the Chairman was authorised to sign it for presentation to the Legislative Assembly.

The Committee proceeded to consider the proposed Water Supply for the Town of Tamworth.

Joseph Barling, Esq., Under Secretary for Public Works, was sworn, and examined.

The Committee adjourned at 3 minutes past 4, until 2 o'clock p.m. on Wednesday, the following day.

Mr.

Mr. Ewing, as Chairman of the Sectional Committee appointed to inspect, take evidence, and report with reference to the proposed Water Supply for the Town of Tamworth, brought up the report of the Sectional Committee, and moved, that it be received and printed with the minutes of evidence taken before the Sectional Committee.

The motion was seconded by Mr. Davies, and passed.

The report was then read by the Secretary.

The Committee further considered the proposed Water Supply for the Town of Tamworth.

Hugh Giffen M'Kinney, Esq., Chief Engineer, Water Conservation Branch, Department of Mines, was sworn, and examined.

The Committee further considered the proposed Additions to the Treasury Building.

The Secretary read a memorandum to the Under Secretary for Finance and Trade from Mr. N. Lockyer, Receiver, Revenue Branch, Treasury, on the "proposed transfer of the Land Accounts from the Treasury to the Lands Department."

The document was received.

Mr. Davies moved,—"That the further consideration of the proposed Additions to the Treasury Building be postponed."

The motion was seconded by Mr. Hassall, and passed.

Mr. Humphery gave notice that he would move at the next meeting of the Committee,—"That the Committee proceed to consider the evidence on the proposed Water Supply for the Town of Tamworth, with a view to reporting on the subject to the Legislative Assembly."

The Committee adjourned at half-past 3, until 2 o'clock p.m. on Friday, the following day.

FRIDAY, 17 *JANUARY*, 1896.

The Committee met at 2 p.m.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.

The Hon. Frederick Thomas Humphery,	Charles Alfred Lee, Esq.,
The Hon. John Davies, C.M.G.,	John Lionel Fegan, Esq.,
The Hon. James Hoskins,	Angus Cameron, Esq.,
The Hon. William Joseph Trickett,	Thomas Henry Hassall, Esq.,
Henry Clarke, Esq.,	George Black, Esq.,

Francis Augustus Wright, Esq.

The minutes of the previous meeting were read, and confirmed.

The Secretary read the following correspondence:—

Statements from John Riely and James Dwyer, of Moonbi, with reference to the proposed Water Supply for the Town of Tamworth.

The correspondence was received.

The Committee further considered the proposed Water Supply for the Town of Tamworth.

Joseph Davis, Esq., Principal Assistant Engineer for Country Towns Water Supply and Sewerage, Department of Public Works, was sworn, and further examined.

Mr. Humphery moved,—"That the Committee proceed to consider the evidence on the proposed Water Supply for the Town of Tamworth, with a view to reporting on the subject to the Legislative Assembly."

The motion was seconded by Mr. Wright, and passed.

Mr. Humphery moved,—"That the Committee consider it expedient that the proposed Water Supply for the Town of Tamworth, referred to the Committee by the Legislative Assembly, should be carried out, but they recommend that the capacity of the storage reservoir should be increased from 35,000,000 to 50,000,000 gallons."

Mr. Davies seconded the motion.

Mr. Lee moved,—"That the motion be amended by the addition of the words 'and the capacity of the service reservoir to 1,000,000 gallons.'"

Mr. Trickett seconded the amendment.

Mr. Cameron moved,—"That the debate on the motion and amendment be adjourned until Thursday, 23rd instant, in order that the evidence taken before the Sectional Committee with reference to the proposed Water Supply for the Town of Tamworth may be printed."

The motion for the adjournment of the debate was seconded by Mr. Wright, and passed, on the following division:—

Ayes, 8.	Noes, 3.
Mr. Ewing,	Mr. Hoskins,
Mr. Humphery,	Mr. Clarke,
Mr. Trickett,	Mr. Fegan.
Mr. Lee,	
Mr. Cameron,	
Mr. Hassall,	
Mr. Black,	
Mr. Wright,	

The Committee adjourned at 5 minutes to 4, until 2 o'clock p.m. on Tuesday, 21 January.

TUESDAY,

TUESDAY, 21 *JANUARY*, 1896.

The Committee met at 2 p.m.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.

The Hon. Frederick Thomas Humphery,	Charles Alfred Lee, Esq.,
The Hon. John Davies, C.M.G.,	John Lionel Fegan, Esq.,
The Hon. James Hoskins,	Angus Cameron, Esq.,
Henry Clarke, Esq.,	George Black, Esq.,

Francis Augustus Wright, Esq.

The minutes of the previous meeting were read, and confirmed.

The Secretary read the following correspondence:—

Letter from Mr. T. H. Hassall, M.P., requesting that his attendance at the meetings of the Committee for the present week be excused in consequence of family bereavement.

The correspondence was received.

The following account was passed for payment:—

B. H. Friend, shorthand writer, accompanying Sectional Committee on proposed Water Supply for the Town of Tamworth, conveyance, £1 1s. 6d.

The Chairman informed the Committee that the Secretary had accepted the position of Secretary to the Public Service Board, and, therefore, must resign the Secretaryship of the Committee.

Mr. Humphery moved,—"That the members of this Committee place on record their appreciation of the valuable services rendered by Mr. Charles Lyne, who will vacate the position of Secretary, having received a similar appointment to the Public Service Board."

The motion was seconded by Mr. Davies, and passed.

The Committee proceeded to consider the proposed erection of Buildings at Rookwood for Infirm and Destitute Persons.

Walter Liberty Vernon, Esq., Government Architect, was sworn, and examined.

The Committee adjourned at 15 minutes past 4, until half-past 1 o'clock p.m. on Wednesday, the following day.

WEDNESDAY, 22 *JANUARY*, 1896.

The Committee met at the Redfern Railway Station at 1·30 p.m., and proceeded by train to Parramatta.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.

The Hon. Frederick Thomas Humphery,	Charles Alfred Lee, Esq.,
The Hon. John Davies, C.M.G.,	John Lionel Fegan, Esq.,
The Hon. James Hoskins,	Angus Cameron, Esq.,
Henry Clarke, Esq.,	George Black, Esq.,

Francis Augustus Wright, Esq.

The minutes of the previous meeting were read, and confirmed.

Accompanied by Mr. W. L. Vernon, Government Architect, and Mr. A. W. Green, Secretary to Charitable Institutions, the Committee then proceeded by vehicle to the Government Asylums at Macquarie-street and George-street, Parramatta, where they made a thorough inspection of these institutions and the accommodation provided for Infirm and Destitute Persons.

The Committee adjourned at 4·25 p.m.

THURSDAY, 23 *JANUARY*, 1896.

The Committee met at 2 p.m.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.

The Hon. John Davies, C.M.G.,	John Lionel Fegan, Esq.,
The Hon. James Hoskins,	Angus Cameron, Esq.,
Henry Clarke, Esq.,	George Black, Esq.,
Charles Alfred Lee, Esq.,	Francis Augustus Wright, Esq.

The minutes of the previous meeting were read, and confirmed.

The following account was passed for payment:—

John Sands, Sydney and Suburban Directory, 1896, for office use, £1.

The Committee accompanied by Mr. W. L. Vernon, Government Architect, and Mr. A. W. Green, Secretary to Charitable Institutions, then proceeded by tram to Randwick and inspected the Asylum at that place, and the Hospital and Reception House in connection therewith, in relation to their inquiry respecting the proposed Erection of Buildings at Rookwood for Infirm and Destitute Persons.

FRIDAY,

FRIDAY, 24 *JANUARY*, 1896.

The Committee met at 2 p.m.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.

The Hon. Frederick Thomas Humphery,	Charles Alfred Lee, Esq.,
The Hon. John Davies, C.M.G.,	John Lionel Fegan, Esq.,
The Hon James Hoskins,	George Black, Esq.,
Henry Clarke, Esq.,	Francis Augustus Wright, Esq.

The minutes of the previous meeting were read, and confirmed.

The Acting Secretary read the following correspondence:—

Letter from Mr. R. H. Maund, applying for the position of Secretary to the Committee.

Letter from Mr. F. B. Gipps, C.E., with reference to his evidence in the Committee's inquiry respecting the proposed Water Supply for the Town of Tamworth.

The correspondence was received.

The following account was passed for payment:—

C. O. Lamb—Hire of vehicle in connection with the Committee's visit of inspection to the asylums at Macquarie-street and George-street, Parramatta... ... £1 5 0

The Committee further considered the proposed Water Supply for the Town of Tamworth.

Joseph Davis, Esq., Principal Assistant Engineer for Country Towns Water Supply and Sewerage, was sworn, and further examined.

The adjourned debate upon Mr. Humphery's motion,—"That the Committee consider it expedient that the proposed Water Supply for the Town of Tamworth, referred to the Committee by the Legislative Assembly, be carried out, but they recommend that the capacity of the storage reservoir should be increased from 35,000,000 to 50,000,000 gallons"—upon which Mr. Lee had moved as an amendment,—"That the motion be amended by the addition of the words 'and the capacity of the service reservoir to 1,000,000 gallons,'" was resumed.

Upon the question,—"That the motion be amended by the addition of the words 'and the capacity of the service reservoir to 1,000,000 gallons,'" the Committee divided as follows:—

Ayes, 4.	Noes, 5.
Mr. Davies,	Mr. Ewing,
Mr. Hoskins,	Mr. Humphery,
Mr. Clarke,	Mr. Fegan,
Mr. Lee,	Mr. Black,
	Mr. Wright.

The motion was then passed.

The Committee adjourned at 4 o'clock until 2 o'clock p.m. on Tuesday, 28th January.

TUESDAY, 28 *JANUARY*, 1896.

The Committee met at 2 p.m.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.

The Hon. Frederick Thomas Humphery,	Henry Clarke, Esq.,
The Hon. John Davies, C.M.G.,	John Lionel Fegan, Esq.,
The Hon. James Hoskins,	Thomas Henry Hassall, Esq.

The minutes of the previous meeting were read, and confirmed.

A telegram was received from the Hon. W. J. Trickett, expressing his grief at the death of Mr. Angus Cameron, M.P.

Mr. Humphery moved,—"That the members of the Committee in recording a vacancy by reason of the decease of Mr. Angus Cameron, M.L.A., desire to express their sense of the loss sustained by Mr. Cameron's death, and also to convey to his family deep sympathy with them in their sudden bereavement."

Mr. Davies seconded the motion, and it was passed unanimously.

The Committee further considered the proposed additions to the Treasury Building.

Edward Alexander Rennie, Esq., Auditor General, and William Henry Capper, Esq., Officer-in-charge of the Sales Division, Department of Lands, were sworn, and examined.

The Committee adjourned at 4 o'clock, until half-past 1 o'clock p.m. on Wednesday, the following day, at the Redfern Railway Station.

WEDNESDAY, 29 *JANUARY* 1896.

The Committee met at 1·30 p.m. at the Redfern Railway Station, and proceeded by train to Rookwood.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.

The Hon. Frederick Thomas Humphery,	Charles Alfred Lee, Esq.,
The Hon. John Davies, C.M.G.,	John Lionel Fegan, Esq.,
The Hon. James Hoskins,	Thomas Henry Hassall, Esq.,
Henry Clarke, Esq.,	George Black, Esq.,

Francis Augustus Wright, Esq.

The minutes of the previous meeting were read, and confirmed.

The Chairman informed the Committee that through the removal of Mr. Charles Lyne, the late Secretary, and Mr. J. W. Holliman, Acting Secretary to the Committee, it was necessary some fresh arrangements should be made in connection with the staff. After

After discussion it was decided to recommend that Mr. Walter D. White should be appointed temporarily as Secretary, pending the reorganisation of the service to be carried out by the Public Service Board, and in view of the additional work and responsibility which will devolve upon Mr. O'Meagher his salary should be increased from £200 to £250 per annum, and that the Committee's recommendation be communicated to the Public Service Board.

Accompanied by Mr. W. L. Vernon, Government Architect, and Mr. A. W. Green, Secretary to Charitable Institutions, the Committee then inspected the various buildings erected on the site at Rookwood, purchased by the Government; the irrigation system in connection with the cultivation and supply of fruit and vegetables for the inmates, and the site of the proposed new buildings; and by the aid of plans, which were explained by the Government Architect, made themselves acquainted with the additional accommodation to be provided there. Thence they proceeded by vehicles to the Potts' Hill Reservoir, from which the supply of water for the asylums at Rookwood is obtained. *En route* a careful inspection of the surrounding country was made in regard to the suitableness of the locality for the concentration of the several institutions for infirm and destitute persons. The Committee also acquainted themselves with the system at present in operation there for the disposal of sewage, and the possibility of its more effectual treatment in the future.

THURSDAY, 30 *JANUARY*, 1896.

The Committee met at 2 p.m.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.

The Hon. Frederick Thomas Humphery,	Charles Alfred Lee, Esq.,
The Hon. John Davies, C.M.G.,	John Lionel Fegan, Esq.,
The Hon. James Hoskins,	Thomas Henry Hassall, Esq.,
Henry Clarke, Esq.,	George Black, Esq.,

Francis Augustus Wright, Esq.

The minutes of the previous meeting were read, and confirmed.

The Committee proceeded to consider their Report to the Legislative Assembly on the proposed Water Supply for the Town of Tamworth.

The Report was adopted, and the Chairman was authorised to sign it for presentation to the Legislative Assembly.

The Committee adjourned at 4 o'clock, until 12 o'clock noon on Friday, the following day.

FRIDAY, 31 *JANUARY*, 1896.

The Committee met at 12 noon.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.

The Hon. Frederick Thomas Humphery,	Charles Alfred Lee, Esq.,
The Hon. John Davies, C.M.G.,	John Lionel Fegan, Esq.,
The Hon. James Hoskins,	Thomas Henry Hassall, Esq.,

FRIDAY, 14 *FEBRUARY*, 1896.

The Committee met at 2 p.m.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.

The Hon. Frederick Thomas Humphery,	Charles Alfred Lee, Esq.,
The Hon. John Davies, C.M.G.,	John Lionel Fegan, Esq.,
The Hon. James Hoskins,	Thomas Henry Hassall, Esq.,
Henry Clarke, Esq.,	George Black, Esq.,

Francis Augustus Wright, Esq.

The minutes of the previous meeting were read, and confirmed.

The Secretary read the following correspondence:—

Letter from the Under Secretary, Department of Lands, stating that the Committee's letter of the 17th ult., recommending that the present Crown lands within the catchment area of the proposed Water Supply for the Town of Tamworth be at once reserved, had been referred to the District Surveyor, at Tamworth, for report.

The correspondence was received.

The Committee further considered the proposed Erection of Buildings at Rookwood for Infirm and Destitute Persons.

James Burt, Esq., Draftsman-in-charge, Information Bureau, Department of Lands; Cecil West Darley, Esq., President, Board of Water Supply and Sewerage; and the Hon. Sir Arthur Renwick, M.D., M.L.C., President, State Children's Relief Board, were sworn, and examined.

The Committee adjourned at 4 o'clock, until 2 o'clock p.m., on Tuesday, 18th February.

TUESDAY,

TUESDAY, 18 *FEBRUARY*, 1896.

The Committee met at 2 p.m.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.

The Hon. Frederick Thomas Humphery,	Charles Alfred Lee, Esq.,
The Hon. John Davies, C.M.G.,	John Lionel Fegan, Esq.,
The Hon. James Hoskins,	Thomas Henry Hassall, Esq.,
Henry Clarke, Esq.,	George Black, Esq.,

Francis Augustus Wright, Esq.

The minutes of the previous meeting were read, and confirmed.

The Secretary read the following correspondence:—

Letter from Mr. Sydney Maxted, Director of Government Asylums for the Infirm and Destitute, forwarding a further medical certificate of his inability to attend before the Committee and give evidence with reference to the proposed Erection of Buildings at Rookwood for Infirm and Destitute Persons.

The correspondence was received.

The Chairman reported that, in company with Dr. J. Ashburton Thompson, Deputy Medical Adviser to the Government, and Mr. Surveyor Scrivener, Department of Lands, he had visited Campbelltown on Saturday, 15th inst., and inspected a portion of Crown land, distant some 2 miles from the Campbelltown Railway Station, which it was thought might serve as a site for a hospital for the treatment of sick poor, in connection with the Committee's inquiry respecting the proposed Erection of Buildings at Rookwood for Infirm and Destitute Persons.

The Committee further considered the proposed Erection of Buildings at Rookwood for Infirm and Destitute Persons.

Charles Robert Scrivener, Esq., Staff Surveyor, Department of Lands, and Joseph Davis, Esq., M.I.C.E., Principal Assistant Engineer for Country Towns Water Supply and Sewerage, Department of Public Works, were sworn, and examined.

The Committee adjourned at 10 minutes past 4, until 2 o'clock p.m. on Wednesday, the following day.

WEDNESDAY, 19 *FEBRUARY*, 1896.

The Committee met at 2 p.m.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.

The Hon. Frederick Thomas Humphery,	Charles Alfred Lee, Esq.,
The Hon. John Davies, C.M.G.,	John Lionel Fegan, Esq.,
The Hon. James Hoskins,	Thomas Henry Hassall, Esq.,
Henry Clarke, Esq.,	George Black, Esq.,

Francis Augustus Wright, Esq.

The minutes of the previous meeting were read, and confirmed.

The Secretary read the following correspondence:—

Letter from the Council Clerk of the Borough of Liverpool, informing the Committee that the inhabitants of that town were averse to the Liverpool Asylum being converted into a hospital for the treatment of contagious diseases, and stating that certain members of the Liverpool Borough Council desired to give evidence before the Committee respecting the subject.

The correspondence was received, and the Secretary was instructed to inform the Council Clerk that the Committee would take the evidence of two witnesses on the subject on Friday, 21st instant.

The Committee further considered the proposed Erection of Buildings at Rookwood for Infirm and Destitute Persons.

Critchett Walker, Esq., C.M.G., Principal Under Secretary, was sworn, and examined.

The Committee adjourned at 45 minutes past 3, until 2 o'clock p.m., on Thursday, the following day.

THURSDAY, 20 *FEBRUARY*, 1896.

The Committee met at 2 p.m.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.

The Hon. Frederick Thomas Humphery,	Charles Alfred Lee, Esq.,
The Hon. John Davies, C.M.G.,	Thomas Henry Hassall, Esq.,
The Hon. James Hoskins,	George Black, Esq.,
Henry Clarke, Esq.,	Francis Augustus Wright, Esq.

The minutes of the previous meeting were read, and confirmed.

The Secretary read the following correspondence:—

Telegram from the Council Clerk, Borough of Liverpool, requesting the Committee to defer the examination of the witnesses desirous of giving evidence before the Committee until Monday, 24th instant.

The correspondence was received, and the Secretary was instructed to reply, stating the Committee would be prepared to hear the evidence of the witnesses in question on the afternoon of Tuesday, 25th instant.

The Committee proceeded to consider the proposed Railway from Tamworth to Manilla.

Henry Deane, Esq., Engineer-in-Chief, Railway Construction Branch, Department of Public Works, was sworn, and examined.

The Committee adjourned at 10 minutes past 4, until 2 o'clock p.m. on Friday, the following day.

FRIDAY,

FRIDAY, 21 *FEBRUARY*, 1896.

The Committee met at 2 p.m.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.

The Hon. Frederick Thomas Humphery,	Charles Alfred Lee, Esq.,
The Hon. John Davies, C.M.G.,	John Lionel Fegan, Esq.,
The Hon. James Hoskins,	Thomas Henry Hassall, Esq.,
The Hon. William Joseph Trickett,	George Black, Esq.,
Henry Clarke, Esq.,	Francis Augustus Wright, Esq.

The minutes of the previous meeting were read, and confirmed.

The Committee further considered the proposed Railway from Tamworth to Manilla.

Hugh McLachlan, Esq., Secretary to the Railway Commissioners, and John Harper, Esq., Goods Superintendent, Department of Railways, were sworn, and examined.

Mr. Lee gave notice that he would move at the next meeting of the Committee:—"That prior to a Sectional Committee visiting the district to inquire into the proposed Tamworth to Manilla Railway, the owners of the land along the surveyed route be communicated with, in order to ascertain if they are willing to give the land required free of cost, the Government bearing all legal expenses in transferring same."

The Committee adjourned at 5 minutes past 4, until 2 o'clock p.m., on Tuesday, the 25th instant.

TUESDAY, 25 *FEBRUARY*, 1896.

The Committee met at 2 p.m.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.

The Hon. Frederick Thomas Humphery,	Charles Alfred Lee, Esq.,
The Hon. John Davies, C.M.G.,	John Lionel Fegan, Esq.,
The Hon. James Hoskins,	Thomas Henry Hassall, Esq.,
The Hon. William Joseph Trickett,	George Black, Esq.,
Henry Clarke, Esq.,	Francis Augustus Wright, Esq.

The minutes of the previous meeting were read, and confirmed.

The Secretary read the following correspondence:—

Letter from the Secretary to the Railway Commissioners with regard to land required for railway purposes, in connection with the Committee's inquiry into the proposed Railway from Tamworth to Manilla.

Paper from Mr. C. Stuart, Enmore.

The correspondence was received.

Mr. Lee's notice of motion respecting the land required for the proposed Railway from Tamworth to Manilla, and an amendment thereon by Mr. Fegan, were postponed.

The Committee further considered the proposed Erection of Buildings at Rookwood for Infirm and Destitute Persons.

John Cole, Esq., Alderman, Borough of Liverpool, Frederick Chapman, Esq., Mayor of Liverpool, and Pollard Smith, Esq., Alderman, Borough of Liverpool, were sworn, and examined.

The Committee adjourned at 9 minutes past 4, until 2 o'clock p.m. on Wednesday, the following day.

WEDNESDAY, 26 *FEBRUARY*, 1896.

The Committee met at 2 p.m.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.

The Hon. Frederick Thomas Humphery,	Charles Alfred Lee, Esq.,
The Hon. John Davies, C.M.G.,	John Lionel Fegan, Esq.,
The Hon. James Hoskins,	Thomas Henry Hassall, Esq.,
The Hon. William Joseph Trickett,	George Black, Esq.,
Henry Clarke, Esq.,	Francis Augustus Wright, Esq,

The minutes of the previous meeting were read, and confirmed.

The Secretary read the following correspondence:—

Statement forwarded by Mr. Sydney Maxted, Director of Government Asylums, respecting the proposed Erection of Buildings at Rookwood for Infirm and Destitute Persons.

The correspondence was received.

The Committee further considered the proposed Erection of Buildings at Rookwood for Infirm and Destitute Persons.

The Secretary read the statement forwarded by Mr. Maxted, Director of Government Asylums, having reference to the proposed Erection of Buildings at Rookwood for Infirm and Destitute Persons.

It was ordered that the statement be printed.

Alfred William Green, Esq., Secretary to Charitable Institutions, was sworn, and examined.

The Committee further considered the proposed Railway from Tamworth to Manilla.

Arthur James Stopps, Esq., Acting Chief Draftsman, Department of Lands, was sworn, and examined.

The Committee adjourned at 5 minutes to 4, until 2 o'clock p.m. on Thursday, the following day.

THURSDAY,

THURSDAY, 27 FEBRUARY, 1896.

The Committee met at 2 p.m.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.

The Hon. Frederick Thomas Humphery,	Charles Alfred Lee, Esq.,
The Hon. John Davies, C.M.G.,	John Lionel Fegan, Esq.,
The Hon. James Hoskins,	Thomas Henry Hassall, Esq.,
The Hon. William Joseph Trickett,	George Black, Esq.,
Henry Clarke, Esq.,	Francis Augustus Wright, Esq.

The minutes of the previous meeting were read, and confirmed.

The Committee further considered the proposed Railway from Tamworth to Manilla.

Charles William Jenkins, Esq., Resident Engineer, Department of Public Works, Tamworth, was sworn, and examined.

Arthur James Stopps, Esq., Acting Chief Draftsman, Department of Lands, was sworn, and further examined.

The Committee adjourned at 8 minutes to 4, until half-past 9 o'clock a.m. on Friday, the following day, at the Redfern Railway Station.

FRIDAY, 28 FEBRUARY, 1896.

The Committee met at 9·30 a.m., at the Redfern Railway Station, and proceeded by train to Leumeah.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.

The Hon. Frederick Thomas Humphery,	Charles Alfred Lee, Esq.,
The Hon. John Davies, C.M.G.,	John Lionel Fegan, Esq.,
The Hon. James Hoskins,	Thomas Henry Hassall, Esq.,
The Hon. William Joseph Trickett,	George Black, Esq.,
Henry Clarke, Esq.,	Francis Augustus Wright, Esq.

The minutes of the previous meeting were read, and confirmed.

The Committee, accompanied by Mr. E. B. Price, M. Inst. C.E., Assistant Engineer, Department of Public Works, and Mr. C. R. Scrivener, Surveyor, Department of Lands, then inspected a portion of the land available for homestead selection, distant about one mile and a half from Campbelltown, which it was thought might possibly be utilised as sites for hospitals in connection with the Committee's inquiry into the proposed Erection of Buildings at Rookwood for Infirm and Destitute Persons. A close inspection was made of the sites deemed suitable for building and for the effective treatment of sewage. The Committee likewise satisfied themselves as to the possibility of obtaining a permanent water supply from George's River.

TUESDAY, 3 MARCH, 1896.

The Committee met at 2 p.m.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.

The Hon. Frederick Thomas Humphery,	Charles Alfred Lee, Esq.,
The Hon. John Davies, C.M.G.,	John Lionel Fegan, Esq.,
The Hon. James Hoskins,	Thomas Henry Hassall, Esq.,
The Hon. William Joseph Trickett,	George Black, Esq.,

Francis Augustus Wright, Esq.

The minutes of the previous meeting were read, and confirmed.

The Secretary read the following correspondence:—

Statement by Mr. Charles R. Scrivener respecting the Government Asylum at Liverpool; further statement by Mr. Charles R. Scrivener respecting the Government Asylum at Liverpool, showing the buildings within 300 and 500 yards respectively of the Asylum walls in connection with the Committee's inquiry into the proposed Erection of Buildings at Rookwood for Infirm and Destitute Persons.

Letter from Alderman F. Chapman, Mayor of Liverpool, forwarding tracing showing residences within a given radius of the Asylum walls, in connection with the Committee's inquiry into the proposed Erection of Buildings at Rookwood for Infirm and Destitute Persons.

Letter from Mr. Henry Deane, Engineer-in-Chief for Railway Construction, giving particulars respecting the approximate areas of Crown and alienated lands required for railway purposes, in connection with the Committee's inquiry into the proposed Railway from Tamworth to Manilla.

The correspondence was received.

The following account was passed for payment:—

Thomas Gamble (Campbelltown)—Hire of vehicles in connection with the Committee's visit of inspection to certain lands in the vicinity of Campbelltown, in connection with the Committee's inquiry respecting the proposed Erection of Buildings at Rookwood for Infirm and Destitute Persons ... £3 3 0

The Committee further considered the proposed Erection of Buildings at Rookwood for Infirm and Destitute Persons.

Thomas Whitford Taylor, Esq., auctioneer, Liverpool, and Sydney Maxted, Esq., Director of Government Asylums, were sworn, and examined.

The Committee adjourned at 2 minutes past 4 until 2 o'clock p.m. on Wednesday, the following day.

WEDNESDAY,

WEDNESDAY, 4 MARCH, 1896.

The Committee met at 2 p.m.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.

The Hon. Frederick Thomas Humphery,	Charles Alfred Lee, Esq.,
The Hon. John Davies, C.M.G.,	John Lionel Fegan, Esq.,
The Hon. James Hoskins,	Thomas Henry Hassall, Esq.,
The Hon. William Joseph Trickett,	George Black, Esq.,

Francis Augustus Wright, Esq.

The minutes of the previous meeting were read, and confirmed.

The Secretary read the following correspondence:—

Letter from Mr. S. W. Moore, M.P., with reference to the Committee's inquiry into the proposed Railway from Tamworth to Manilla.

The correspondence was received.

The Committee further considered the proposed Erection of Buildings at Rookwood for Infirm and Destitute Persons.

Sydney Maxted, Esq., Director of Government Asylums, was sworn, and further examined.

The Committee adjourned at 2 minutes past 4, until 2 o'clock p.m. on Thursday, the following day.

THURSDAY, 5 MARCH, 1896.

The Committee met at 2 p.m.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.

The Hon. Frederick Thomas Humphery,	Charles Alfred Lee, Esq.,
The Hon. John Davies, C.M.G.,	John Lionel Fegan, Esq.,
The Hon. James Hoskins,	Thomas Henry Hassall, Esq.,
The Hon. William Joseph Trickett,	George Black, Esq.,

Francis Augustus Wright, Esq.

The minutes of the previous meeting were read, and confirmed.

The following account was passed for payment:—

George Baumann—Expenses in connection with Committee's visit of inspection to certain lands in the vicinity of Campbelltown, in relation to their inquiry respecting the proposed Erection of Buildings at Rookwood for Infirm and Destitute Persons £3 7 6

The Committee further considered the proposed Erection of Buildings at Rookwood for Infirm and Destitute Persons.

Sydney Maxted, Esq., Director of Government Asylums, was sworn, and further examined.

The Committee adjourned at 17 minutes past 4, until 2 o'clock p.m. on Friday, the following day.

FRIDAY, 6 MARCH, 1896.

The Committee met at 2 p.m.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.

The Hon. Frederick Thomas Humphery,	Charles Alfred Lee, Esq.,
The Hon. John Davies, C.M.G.,	John Lionel Fegan, Esq.,
The Hon. James Hoskins,	Thomas Henry Hassall, Esq.,
The Hon. William Joseph Trickett,	George Black, Esq.,

Francis Augustus Wright, Esq.

The minutes of the previous meeting were read, and confirmed.

The Secretary read the following correspondence:—

Letter from Dr. W. Odillo Maher, Visiting Ophthalmic Surgeon to Government Asylums, offering to give evidence in connection with the Committee's inquiry into the proposed Erection of Buildings at Rookwood for Infirm and Destitute Persons.

The correspondence was received.

The Committee further considered the proposed Erection of Buildings at Rookwood for Infirm and Destitute Persons.

Edward Bellingham Price, Esq., Assistant Engineer, Department of Public Works, was sworn, and examined.

Sydney Maxted, Esq., Director of Government Asylums, was sworn, and further examined.

The Committee adjourned at 10 minutes past 4, until 2 o'clock p.m. on Tuesday, the 10th March.

TUESDAY, 10 *MARCH*, 1896.

The Committee met at 2 p.m.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.

The Hon. Frederick Thomas Humphery,	Charles Alfred Lee, Esq.,
The Hon. John Davies, C.M.G.,	John Lionel Fegan, Esq.,
The Hon. James Hoskins,	Thomas Henry Hassall, Esq.,
The Hon. William Joseph Trickett,	George Black, Esq.,
Henry Clarke, Esq.,	Francis Augustus Wright, Esq.

The minutes of the previous meeting were read, and confirmed.

The Committee further considered the proposed Erection of Buildings at Rookwood for Infirm and Destitute Persons.

William Odillo Maher, Esq., M.D., Visiting Ophthalmic Surgeon to Government Asylums, was sworn, and examined.

Walter Liberty Vernon, Esq., Government Architect, was sworn, and further examined.

Mr. Wright moved,—"That the Committee proceed to consider the evidence on the proposed Erection of Buildings at Rookwood for Infirm and Destitute Persons, with a view to reporting on the subject to the Legislative Assembly."

The motion was seconded by Mr. Trickett, and passed.

Mr. Wright moved,—"That, in the opinion of the Committee, it is not expedient that the proposed Erection of Buildings at Rookwood for Infirm and Destitute Persons, at a cost of £108,350, exclusive of sewerage, as referred to the Committee by the Legislative Assembly, be carried out; but the Committee recommend that all inmates of the Asylums in Macquarie, George, and Harris Streets, Parramatta, be removed as speedily as possible, and that the healthy destitute be housed at Liverpool and Rookwood; and, further, that suitable accommodation be provided near Campbelltown, on available Crown lands, for the chronic and acute sick."

The motion was seconded by Mr. Lee, and passed.

The Committee adjourned at 2 minutes past 4, until 2 o'clock p.m. on Wednesday, the following day.

WEDNESDAY, 11 *MARCH*, 1896.

The Committee met at 2 p.m.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.

The Hon. Frederick Thomas Humphery,	Charles Alfred Lee, Esq.,
The Hon. John Davies, C.M.G.,	John Lionel Fegan, Esq.,
The Hon. James Hoskins,	Thomas Henry Hassall, Esq.,
The Hon. William Joseph Trickett,	George Black, Esq.,
Henry Clarke, Esq.,	Francis Augustus Wright, Esq.

The minutes of the previous meeting were read, and confirmed.

The Committee proceeded to consider their Report to the Legislative Assembly on the proposed Erection of Buildings at Rookwood for Infirm and Destitute Persons.

The preamble and clauses 1 to 6 were passed.

Clause 7—Opinion of Liverpool residents.

Mr. Lee moved,—"That the clause be omitted."

The amendment was seconded by Mr. Hoskins, and negatived on the following division:—

Ayes, 2.	Noes, 8.
Mr. Hoskins,	Mr. Ewing,
Mr. Lee.	Mr. Humphery,
	Mr. Davies,
	Mr. Clarke,
	Mr. Fegan,
	Mr. Hassall,
	Mr. Black,
	Mr. Wright.

The clause was then passed on the following division:—

Ayes, 8.	Noes, 2.
Mr. Ewing,	Mr. Hoskins,
Mr. Humphery,	Mr. Lee.
Mr. Davies,	
Mr. Clarke,	
Mr. Fegan,	
Mr. Hassall,	
Mr. Black,	
Mr. Wright.	

Clause 8 was passed.

The Committee adjourned at 4 o'clock, until 2 o'clock p.m. on Thursday, the following day.

THURSDAY,

THURSDAY, 12 *MARCH*, 1896.

The Committee met at 2 p.m.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.

The Hon. Frederick Thomas Humphery,	Charles Alfred Lee, Esq.,
The Hon. John Davies, C.M.G.,	John Lionel Fegan, Esq.,
The Hon. James Hoskins,	Thomas Henry Hassall, Esq.,
The Hon. William Joseph Trickett,	George Black, Esq.,
Henry Clarke, Esq.,	Francis Augustus Wright, Esq.

The minutes of the previous meeting were read, and confirmed.

The Secretary read the following correspondence:—

Letter from the Under Secretary, Department of Lands, informing the Committee that the Honorable the Secretary for Lands had approved of the withdrawal from sale of a portion of Homestead Selection Area No. 75, at Campbelltown, recommended by the Committee as a suitable site for the erection of buildings for indigent poor, in connection with their inquiry respecting the proposed Erection of Buildings at Rookwood for Infirm and Destitute Persons.

The correspondence was received.

The Committee further considered their Report to the Legislative Assembly on the proposed Erection of Buildings at Rookwood for Infirm and Destitute Persons.

Clauses 9 and 10 were passed.

Clause 11—The site chosen by the Department at Rookwood.

Mr. Humphery moved,—"That the clause be amended by the omission from sub-section (v) of the words 'to which must be added an annual charge of £1,064 for working expenses.'"

The amendment was seconded by Mr. Black, and negatived on the following division upon the question,—"That the words proposed to be omitted stand part of the clause."

Ayes, 8.	Noes, 3.
Mr. Ewing,	Mr. Humphery,
Mr. Davies,	Mr. Hoskins,
Mr. Trickett,	Mr. Black.
Mr. Clarke,	
Mr. Lee,	
Mr. Fegan,	
Mr. Hassall,	
Mr. Wright.	

The clause was passed on the following division:—

Ayes, 8.	Noes, 3.
Mr. Ewing,	Mr. Humphery,
Mr. Davies,	Mr. Hoskins,
Mr. Trickett,	Mr. Black.
Mr. Clarke,	
Mr. Lee,	
Mr. Fegan,	
Mr. Hassall,	
Mr. Wright.	

Clause 12 was passed.

Clause 13—The policy of centralization further considered.

Mr. Humphery moved,—"That the clause be amended by the omission of sub-section (II)."

The motion was seconded by Mr. Trickett, and negatived on the following division upon the question,—"That the words proposed to be omitted stand part of the clause."

Ayes, 9.	Noes. 2.
Mr. Ewing,	Mr. Humphery,
Mr. Davies,	Mr. Trickett.
Mr. Hoskins,	
Mr. Clark,	
Mr. Lee,	
Mr. Fegan,	
Mr. Hassall,	
Mr. Black,	
Mr. Wright.	

The clause was passed on the following division:—

Ayes, 9.	Noes, 2.
Mr. Ewing,	Mr. Humphery,
Mr. Davies,	Mr. Trickett.
Mr. Hoskins,	
Mr. Clarke,	
Mr. Lee,	
Mr. Fegan,	
Mr. Hassall,	
Mr. Black,	
Mr. Wright.	

Clauses 14 to 17 were passed, and the further consideration of the Report was postponed until the following day.

Mr. Lee's notice of motion, with reference to owners of land along the surveyed route of the proposed Railway from Tamworth to Manilla conveying such land free of cost to the Government, was (with consent) withdrawn.

The Committee adjourned at half-past 4, until 2 o'clock p.m. on Friday, the following day.

FRIDAY,

FRIDAY, 13 *MARCH*, 1896.

The Committee met at 2 p.m.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.

The Hon. Frederick Thomas Humphery,	Henry Clarke, Esq.,
The Hon. John Davies, C.M.G.,	John Lionel Fegan, Esq.,
The Hon. James Hoskins.	Thomas Henry Hassall, Esq.,
The Hon. William Joseph Trickett,	George Black, Esq.,

Francis Augustus Wright, Esq.

The minutes of the previous meeting were read, and confirmed.

The Committee further considered their Report to the Legislative Assembly on the proposed Erection of Buildings at Rookwood for Infirm and Destitute Persons.

Clause 18.—Cost of scheme approved by Committee—was passed.

The Report was adopted, and the Chairman was authorised to sign it for presentation to the Legislative Assembly.

Mr. Black gave notice that he would move at the next meeting of the Committee:—"That a Sectional Committee, consisting of Mr. Humphery, Mr. Trickett, Mr. Lee, Mr. Fegan, and Mr. Black, be appointed to inspect, take evidence, and report with reference to the proposed Railway from Tamworth to Manilla."

The Committee adjourned at 4 o'clock, until 2 o'clock p.m. on Tuesday, 17 March.

TUESDAY, 17 *MARCH*, 1896.

The Committee met at 2 p.m.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.

The Hon. Frederick Thomas Humphery,	Henry Clarke, Esq.,
The Hon. John Davies, C.M.G.,	Charles Alfred Lee, Esq.,
The Hon. James Hoskins,	John Lionel Fegan, Esq.,
The Hon. Charles James Roberts, C.M.G.,	Thomas Henry Hassall, Esq.,
The Hon. William Joseph Trickett,	George Black, Esq.,

Francis Augustus Wright, Esq.

The minutes of the previous meeting were read, and confirmed.

The Secretary read the following correspondence:—

Letter from the Under Secretary, Department of Lands, forwarding a map of the county of Darling, containing information required in connection with the Committee's inquiry respecting the proposed Railway from Tamworth to Manilla.

The correspondence was received.

Mr. Black moved,—"That a Sectional Committee, consisting of Mr. Ewing, Mr. Roberts, Mr. Fegan, and Mr. Black, be appointed to inspect, take evidence, and report with reference to the proposed Railway from Tamworth to Manilla."

The motion was seconded by Mr. Davies, and passed.

The Committee further considered the proposed Railway from Tamworth to Manilla.

John Harper, Esq., Goods Superintendent, Department of Railways, was sworn, and further examined.

The Committee proceeded to consider the proposed Electric Tramway from Circular Quay, Sydney, to the Redfern Railway Station; and also along Harris-street to the intersection of John-street.

Hugh M'Lachlan, Esq., Secretary to the Railway Commissioners, was sworn, and examined.

The Committee adjourned at 35 minutes past 3, until 2 o'clock p.m. on Wednesday, the following day.

WEDNESDAY, 18 *MARCH*, 1896.

The Committee met at 2 p.m.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.

The Hon. Frederick Thomas Humphery,	Charles Alfred Lee, Esq.,
The Hon. John Davies, C.M.G.,	John Lionel Fegan, Esq.,
The Hon. Charles James Roberts, C.M.G.,	Thomas Henry Hassall, Esq.,
The Hon. William Joseph Trickett,	George Black, Esq.,
Henry Clarke, Esq.,	Francis Augustus Wright, Esq.

The minutes of the previous meeting were read, and confirmed.

The Secretary read the following correspondence:—

Letter from Mr. John Musson, C.E., on the subject of the utilization of railway embankments as dams for the storage of water, in connection with the Committee's inquiry respecting the proposed Railway from Tamworth to Manilla.

Letter from Mr. S. Maxted, with reference to his evidence in the Committee's inquiry respecting the proposed Erection of Buildings at Rookwood for Infirm and Destitute persons.

The correspondence was received.

The Committee further considered the proposed Electric Tramway from Circular Quay, Sydney, to the Redfern Railway Station; and also along Harris-street, to the intersection of John-street.

Henry Deane, Esq., Engineer-in-Chief, Railway Construction Branch, Department of Public Works, was sworn, and examined.

Philip Billingsley Walker, Esq., Secretary to the Electric Telegraph Department; Paul Bedford Elwell, Esq., Electrical Engineer, Department of Railways; and Henry Deane, Esq., Engineer-in-Chief, Railway Construction Branch, Department of Public Works, were sworn, and further examined.

Mr. Trickett's notice of motion for the consideration of the evidence on the proposed Electric Tramway from Circular Quay, Sydney, to the Redfern Railway Station; and also along Harris-street to the intersection of John-street, was postponed.

The Committee adjourned at half-past 4, until 2 o'clock p.m. on Wednesday, the following day.

WEDNESDAY, 29 *APRIL*, 1896.

The Committee met at 2 p.m.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.

The Hon. Frederick Thomas Humphery,	Charles Alfred Lee, Esq.,
The Hon. John Davies, C.M.G.,	John Lionel Fegan, Esq.,
The Hon. Charles James Roberts, C.M.G.,	Thomas Henry Hassall, Esq.,
The Hon. William Joseph Trickett,	George Black, Esq.,
Henry Clarke, Esq.,	Francis Augustus Wright, Esq.

The minutes of the previous meeting were read and confirmed, after which the Committee, in consequence of the death of the late Sir Henry Parkes, G.C.M.G., adjourned until 2 o'clock p.m., on Thursday, the following day.

THURSDAY, 30 *APRIL*, 1896.

The Committee met at 2 p.m.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.

The Hon. Frederick Thomas Humphery,	Charles Alfred Lee, Esq.,
The Hon. John Davies, C.M.G.,	John Lionel Fegan, Esq.,
The Hon. Charles James Roberts, C.M.G.,	Thomas Henry Hassall, Esq.,
The Hon. William Joseph Trickett,	George Black, Esq.,
Henry Clarke, Esq.,	Francis Augustus Wright, Esq.

The minutes of the previous meeting were read, and confirmed.

Mr. Trickett moved,—"(1) That the Members of the Parliamentary Standing Committee on Public Works desire to express their sincere regret at the decease of the late Sir Henry Parkes, G.C.M.G., and also to convey to Lady Parkes and family deep sympathy in their bereavement. (2) That a copy of the foregoing resolution be forwarded to Lady Parkes."

The motion was seconded by Mr. Davies, and passed.

The Secretary read the following correspondence:—

Letter from Mr. P. B. Walker, Secretary to the Electric Telegraph Department, enclosing a copy of a cablegram received from Mr. R. Henry, Hobart, and formerly head of the Telegraph Service in Tasmania, with respect to interference caused by electric trams, to the telephones at Hobart.

The correspondence was received.

The Committee further considered the proposed Electric Tramway from Circular Quay, Sydney, to the Redfern Railway Station; and also along Harris-street to the intersection of John-street.

Henry Deane, Esq., Engineer-in-Chief, Railway Construction Branch, Department of Public Works, was sworn, and further examined.

Richard Threlfall, Esq., A.M.I.C.E., Professor of Physics, University of Sydney, was sworn, and examined.

The Committee further considered the proposed Railway from Nevertire to Warren.

John Harper, Esq., Goods Superintendent, Department of Railways, was sworn, and examined.

The Committee adjourned at 5 minutes past 4, until 2 o'clock p.m. on Friday, the following day.

FRIDAY,

FRIDAY, 1 *MAY*, 1896.

The Committee met at 2 p.m.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.

The Hon. Frederick Thomas Humphery,	Charles Alfred Lee, Esq.,
The Hon. John Davies, C.M.G.,	John Lionel Fegan, Esq.,
The Hon. Charles James Roberts, C.M.G.,	Thomas Henry Hassall, Esq.,
The Hon. William Joseph Trickett,	George Black, Esq.,
Henry Clarke, Esq.,	Francis Augustus Wright, Esq.

The minutes of the previous meeting were read, and confirmed.

The Secretary read the following correspondence:—

Letter from Professor Threlfall, with respect to the suitableness of the engines at the Rushcutter's Bay Tramway Power Station, for the generation of electric power in connection with the proposed Electric Tramway through George-street.

The correspondence was received, and it was ordered that the letter be printed as an appendix to the evidence given by Professor Threlfall in the Committee's inquiry into the proposed Electric Tramway from Circular Quay, Sydney, to the Redfern Railway Station; and also along Harris-street to the intersection of John-street.

Mr. Trickett moved,—"That the Committee proceed to consider the evidence on the proposed Electric Tramway from Circular Quay, Sydney, to the Redfern Railway Station; and also along Harris-street to the intersection of John-street, with a view to reporting on the subject to the Legislative Assembly."

The motion was seconded by Mr. Davies, and passed.

Mr. Trickett moved,—"That, in the opinion of the Committee, it is expedient the proposed Electric Tramway from Circular Quay, Sydney, to the Redfern Railway Station; and also along Harris-street to the intersection of John-street, as referred to the Committee by the Legislative Assembly, be carried out."

Mr. Lee seconded the motion.

Mr. Humphery moved,—"That the motion be amended by the omission of all the words after the word 'Station.'"

Mr. Wright seconded the amendment.

The debate upon the motion and amendment was adjourned until Wednesday, 6th May.

The Committee adjourned at 15 minutes past 4, until 2 o'clock p.m. on Tuesday, 5th May.

TUESDAY, 5 *MAY*, 1896.

The Committee met at 2 p.m.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.

The Hon. Frederick Thomas Humphery,	Henry Clarke, Esq.,
The Hon. John Davies, C.M.G.,	Charles Alfred Lee, Esq.,
The Hon. Charles James Roberts, C.M.G.,	John Lionel Fegan, Esq.,
The Hon. William Joseph Trickett,	Thomas Henry Hassall, Esq.

The minutes of the previous meeting were read, and confirmed.

The Secretary read the following correspondence:—

Letter from Mr. E. Ambrose, Parramatta, with reference to light tramways and railways, and a letter from Mr. P. B. Elwell, Electrical Engineer, Department of Railways, respecting disturbing influences of tramway currents upon telephones in relation to the Committee's inquiry into the proposed Electric Tramway from Circular Quay, Sydney, to the Redfern Railway Station; and also along Harris-street to the intersection of John-street.

The correspondence was received, and it was ordered that Mr. Elwell's letter be printed as an appendix to the evidence given by him in the inquiry into the proposed Tramway from Circular Quay, Sydney, to the Redfern Railway Station; and also along Harris-street to the intersection of John-street.

Mr. C. J. Roberts gave notice that he would move at the next meeting of the Committee,—"That a Sectional Committee, consisting of Mr. Trickett, Mr. Fegan, Mr. Hassall, and Mr. Wright be appointed to inspect, take evidence, and report with reference to the proposed Railway from Nevertire to Warren."

The following account was passed for payment:—

	£	s.	d.
Messrs. Troy & Co., typewriter agents, 71 Elizabeth-street, City, purchase of Densmore Typewriter for use in the office of the Committee	20	18	0

The Committee further considered the proposed Railway from Nevertire to Warren.

Henry Deane, Esq., Engineer-in-Chief, Railway Construction Branch, Department of Public Works, was sworn, and further examined, and Hugh McLachlan, Esq., Secretary to the Railway Commissioners, was sworn, and examined.

The Committee adjourned at 5 minutes to 4, until 2 o'clock p.m. on Wednesday, the following day.

WEDNESDAY,

WEDNESDAY, 6 MAY, 1896.

The Committee met at 2 p.m.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.

The Hon. Frederick Thomas Humphery,	Charles Alfred Lee, Esq.
The Hon. John Davies, C.M.G.,	John Lionel Fegan, Esq..
The Hon. Charles James Roberts, C.M.G.,	Thomas Henry Hassall, Esq.,
The Hon. William Joseph Trickett,	George Black, Esq.,
Henry Clarke, Esq.,	Francis Augustus Wright, Esq.

The minutes of the previous meeting were read, and confirmed.

The Secretary read the following correspondence:—

Letter from Mr. John Musson, forwarding plan explanatory of a deviation suggested by him when under examination during the Committee's inquiry into the proposed Electric Tramway from Circular Quay, Sydney, to the Redfern Railway Station; and also along Harris-street to the intersection of John-street.

Letter from Mr. W. Neilley forwarding copy of a petition against the proposed Electric Tramway from Circular Quay, Sydney, to the Redfern Railway Station; and also along Harris-street to the intersection of John-street.

Letter, with map accompanying, from Mr. H. T. Williamson, with reference to a locomotive suited to street traction in connection with the Committee's inquiry into the proposed Electric Tramway from Circular Quay, Sydney, to the Redfern Railway Station; and also along Harris-street to the intersection of John-street.

The correspondence was received.

Mr. C. J. Roberts moved,—"That a Sectional Committee, consisting of Mr. Trickett, Mr. Fegan, Mr. Hassall, and Mr. Wright, be appointed to inspect, take evidence, and report with reference to the proposed Railway from Nevertire to Warren."

The motion was seconded by Mr. Lee, and passed.

The Committee further considered the proposed Electric Tramway from Circular Quay, Sydney, to the Redfern Railway Station; and also along Harris-street to the intersection of John-street.

The adjourned debate upon Mr. Trickett's motion,—"That in the opinion of the Committee it is expedient the proposed Electric Tramway from Circular Quay, Sydney, to the Redfern Railway Station; and also along Harris-street to the intersection of John-street, as referred to the Committee by the Legislative Assembly, be carried out;" upon which Mr. Humphery had moved, as an amendment,—"That the motion be amended by the omission of all the words after the word 'Station,'"—was resumed.

Upon the question "That the words proposed to be omitted stand part of the motion," the Committee divided as follows:—

Ayes, 6.	Noes, 5.
Mr. Ewing,	Mr. Humphery,
Mr. Roberts,	Mr. Davies,
Mr. Trickett,	Mr. Clarke,
Mr. Lee,	Mr. Hassall,
Mr. Fegan,	Mr. Wright.
Mr. Black.	

The amendment was therefore negatived.

The motion was then passed on the following division:—

Ayes, 6.	Noes, 5.
Mr. Ewing,	Mr. Humphery,
Mr. Roberts,	Mr. Davies,
Mr. Trickett,	Mr. Clarke,
Mr. Lee,	Mr. Hassall,
Mr. Fegan,	Mr. Wright.
Mr. Black.	

The Committee adjourned at a quarter past 4, until 2 o'clock p.m. on Thursday, the following day.

THURSDAY, 7 MAY, 1896.

The Committee met at 2 p.m.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.

The Hon. Frederick Thomas Humphery,	Charles Alfred Lee, Esq.,
The Hon. John Davies, C.M.G.,	John Lionel Fegan, Esq..
The Hon. Charles James Roberts, C.M.G.,	Thomas Henry Hassall, Esq.,
The Hon. William Joseph Trickett,	George Black, Esq.,
Henry Clarke, Esq.,	Francis Augustus Wright, Esq.

The minutes of the previous meeting were read, and confirmed.

The Committee proceeded to consider their Report to the Legislative Assembly on the proposed Electric Tramway from Circular Quay, Sydney, to the Redfern Railway Station; and also along Harris-street to the intersection of John-street.

Clauses 1 to 6 were passed.

Clause 7—Need for tram service—was omitted.

Clauses 8 and 9 were passed.

Clause 10.—The City Railway.

Mr.

Mr. Black moved,—"That the clause be amended by the omission, after the word 'delayed,' in line 3, of the words 'The Mayor of Sydney is of this opinion, and for this main reason is opposed to the scheme.'"

The amendment was seconded by Mr. Trickett, and passed on the following division upon the question,—"That the words proposed to be omitted stand part of the clause":—

Ayes, 4.	Noes, 7.
Mr. Davies,	Mr. Ewing,
Mr. Clarke,	Mr. Humphery,
Mr. Hassall,	Mr. Roberts,
Mr. Wright.	Mr. Trickett,
	Mr. Lee,
	Mr. Fegan,
	Mr. Black.

The clause, as amended, was then passed.

Clauses 11 to 21 were passed.

The Committee adjourned at half-past 4, until 2 o'clock p.m. on Friday, the following day.

FRIDAY, 8 *MAY*, 1896.

The Committee met at 2 p.m.

MEMBERS PRESENT:

Thomas Thomson Ewing, Esq., Chairman.

The Hon. Frederick Thomas Humphery,	Charles Alfred Lee, Esq.,
The Hon. John Davies, C.M.G.	John Lionel Fegan, Esq.,
The Hon. Charles James Roberts, C.M.G.,	Thomas Henry Hassall, Esq.,
The Hon. William Joseph Trickett,	George Black, Esq.,
Henry Clarke, Esq.,	Francis Augustus Wright, Esq.,

The minutes of the previous meeting were read, and confirmed.

The Committee further considered their Report to the Legislative Assembly on the proposed Electric Tramway from Circular Quay, Sydney, to the Redfern Railway Station; and also along Harris-street to the intirsection of John-street.

Clause 22—Cost of conversion—was passed.

Clause 23—Conflicting nature of evidence.

Mr. Davies moved,—"That the clause be omitted."

The amendment was seconded by Mr. Clarke, and passed on the following division:—

Ayes, 8.	Noes, 3.
Mr. Humphery,	Mr. Ewing,
Mr. Davies,	Mr. Hassall,
Mr. Roberts,	Mr. Wright.
Mr. Trickett,	
Mr. Clarke,	
Mr. Lee,	
Mr. Fegan,	
Mr. Black.	

Clause 24—Importance of works necessitates experienced supervision—was negatived on the following division upon the question,—"That clause 24 stand clause 24 of the Report."

Ayes, 4.	Noes, 7.
Mr. Ewing,	Mr. Humphery,
Mr. Clarke,	Mr. Davies,
Mr. Hassall,	Mr. Roberts,
Mr. Wright.	Mr. Trickett,
	Mr. Lee,
	Mr. Fegan,
	Mr. Black.

The clause was therefore omitted.

Clause 25—Construction of tramway—was omitted.

Clause 26—Danger to pipes, &c.—was omitted.

Clauses 27 and 28 were passed.

The Report was adopted on the following division:—

Ayes, 7.	Noes, 4.
Mr. Ewing,	Mr. Davies,
Mr. Humphery,	Mr. Clarke,
Mr. Roberts,	Mr. Hassall,
Mr. Trickett,	Mr. Wright.
Mr. Lee,	
Mr. Fegan,	
Mr. Black,	

The Committee proceeded to consider their Eleventh General Report to His Excellency the Governor.

The Report was adopted, and the Chairman was authorised to sign it for presentation to His Excellency the Governor.

The Committee adjourned at 4 o'clock, until 2 o'clock p.m. on Tuesday, 12th May.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

SECTIONAL COMMITTEE.

Deviation at Locksley, Great Western Railway.

MINUTES OF PROCEEDINGS.

MINUTES of the Proceedings of the Sectional Committee of the Parliamentary Standing Committee on Public Works, appointed on 13th December, 1895, to inspect, take evidence, and report with reference to the proposed Deviation at Locksley, Great Western Railway.

SATURDAY, 14 *DECEMBER*, 1895.

The Sectional Committee, consisting of T. T. Ewing, Esq., Chairman, The Hon. W. J. Trickett, A. Cameron, Esq., and T. H. Hassall, Esq., accompanied by Mr. Engineer Wickham, Railway Construction Branch, left Sydney by train this morning, and on arriving at Locksley took vehicles and were driven along the route of the proposed deviation, noting particularly on the way a site at the intersection of the O'Connell-Locksley road with the new deviation, which a deputation from O'Connell pointed out as being most suitable for a new platform. The Sectional Committee then drove to O'Connell, and from there along the road to Brewongle, where the evidence of Mr. Joseph Alexander Heylin, farmer and grazier, was taken, and returning to Tarana considered their report. The Sectional Committee left the same night for Sydney, which was reached on the morning of the 15th.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

SECTIONAL COMMITTEE.

Water Supply for the Town of Tamworth.

MINUTES OF PROCEEDINGS.

MINUTES of the Proceedings of the Sectional Committee of the Parliamentary Standing Committee on Public Works, appointed on 8th January, 1896, to inspect, take evidence, and report with reference to the proposed Water Supply for the Town of Tamworth.

The Sectional Committee left Sydney at 6·15 p.m., on Friday, 10th January, arrived at Tamworth, at 4 a.m., on Saturday, 11th January, and opened their inquiry at 9·30 a.m.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq.,	Charles Alfred Lee, Esq.,
The Hon. John Davies, C.M.G.,	John Lionel Fegan, Esq.,

Francis Augustus Wright, Esq.

It was resolved, on the motion of Mr. Lee, seconded by Mr. Davies,—"That Thomas Thomson Ewing, Esq., be Chairman of the Sectional Committee."

The Sectional Committee adjourned at 9·40 a.m. until 11 a.m.

SATURDAY, 11 *JANUARY*, 1896.

The Sectional Committee met at the Court-house, Tamworth, at 11 a.m.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.

The Hon. John Davies, C.M.G.,	John Lionel Fegan, Esq.,
Charles Alfred Lee, Esq.,	Francis Augustus Wright, Esq.

The minutes of the previous meeting were read, and confirmed.

The Sectional Committee proceeded to consider the proposed Water Supply for the Town of Tamworth.

Mr. Charles Jeffries Britten, Mayor of Tamworth, and Mr. William Joseph Smith, alderman, were sworn, and examined.

Mr. Charles Jeffries Britten, Mayor of Tamworth, was sworn, and further examined.

The Sectional Committee adjourned at 1·10 p.m.

MONDAY,

57

MONDAY, 13 *JANUARY*, 1896.

The Sectional Committee met at the "Imperial Hotel," Tamworth, at 7·30 a.m.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.

The Hon. John Davies, C.M.G., | John Lionel Fegan, Esq.,
Charles Alfred Lee, Esq., | Francis Augustus Wright, Esq.

The minutes of the previous meeting were read, and confirmed.

The Sectional Committee, at 7·45 a.m., accompanied by J. Davis, Esq., Principal Assistant Engineer, Country Towns Water Supply and Sewerage, proceeded to inspect the pipe-line, service, and storage reservoirs, and the catchment area of the proposed Water Supply.

The Sectional Committee returned to Tamworth at 6 p.m., and at 6·15 p.m. adjourned until the following day.

TUESDAY, 14 *JANUARY*, 1896.

The Sectional Committee met at the "Imperial Hotel," Tamworth, at 8 a.m.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.

The Hon. John Davies, C.M G., | John Lionel Fegan, Esq.,
Charles Alfred Lee, Esq., | Francis Augustus Wright, Esq.

The minutes of the previous meeting were read, and confirmed.

The Sectional Committee, at 8·15 a.m., accompanied by J. Davis, Esq., Principal Assistant Engineer, Country Towns Water Supply and Sewerage, proceeded to inspect the main features of the scheme of Water Supply put forward by Mr. Gipps, C.E.

The Sectional Committee returned to Tamworth at 5·30 p.m., and adjourned at 5·45 p.m.

The Sectional Committee met at the "Imperial Hotel," Tamworth, at 8·30 p.m.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.

The Hon. John Davies, C.M.G., | John Lionel Fegan, Esq.,
Charles Alfred Lee, Esq., | Francis Augustus Wright, Esq.

The minutes of the previous meeting were read, and confirmed.

The Sectional Committee considered their Report.

The Sectional Committee then adjourned.

WEDNESDAY, 15 *JANUARY*, 1896.

The Sectional Committee met at the Court House, Tamworth, at 9 a.m.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.

The Hon. John Davies, C.M.G., | Charles Alfred Lee, Esq.,
John Lionel Fegan, Esq.,

The minutes of the previous meeting were read, and confirmed.

The Sectional Committee further considered the proposed Water Supply for the Town of Tamworth.

Mr. Frederick Poate, District Surveyor, Mr. James Lambert, alderman, and Mr. Edward Cooper, Tamworth, were sworn, and examined.

Mr. Charles Jeffries Britten, Mayor of Tamworth, was sworn, and further examined.

The Sectional Committee adjourned at 10·45 a.m.

THURSDAY, 16 *JANUARY*, 1896.

The Sectional Committee met at the Department of Public Works, at 10 a.m.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.

The Hon. John Davies, C.M.G., | John Lionel Fegan, Esq.,
Charles Alfred Lee, Esq., | Francis Augustus Wright, Esq.

The minutes of the previous meeting were read, and confirmed.

The Sectional Committee further considered the proposed Water Supply for the Town of Tamworth.

The Chairman submitted a Draft Report, which was read.

It was resolved upon the motion of Mr. Davies, seconded by Mr. Lee,—"That the report be adopted."

The Sectional Committee adjourned at 11 a.m.

58

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

SECTIONAL COMMITTEE.

Railway from Tamworth to Manilla.

MINUTES OF PROCEEDINGS.

MINUTES of the Proceedings of the Sectional Committee of the Parliamentary Standing Committee on Public Works, appointed on Tuesday, 17th March, 1896, to inspect, take evidence, and report with reference to the proposed Railway from Tamworth to Manilla.

The Sectional Committee left Sydney by the 6·15 p.m. train on Friday, 20th March, and arrived at Tamworth at 3·40 a.m. the following day.

The Sectional Committee met at the "Royal Hotel," Tamworth, at 10 a.m.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., | John Lionel Fegan, Esq.,
The Hon. Charles James Roberts, C.M.G., | George Black, Esq.

On the motion of Mr. Roberts, seconded by Mr. Fegan, it was resolved,—"That Mr. T. T. Ewing be the Chairman of the Sectional Committee."

The Sectional Committee accompanied by Mr. G. L. Wilkins, surveyor, Railway Construction Branch, Department of Public Works, and Mr. C. W. Jenkins, district engineer, Roads and Bridges Branch, Department of Public Works, left Tamworth for Manilla, at 11 a.m., and inspected the route of the proposed railway.

The Sectional Committee arrived at Manilla at 6 p.m.

MONDAY, 23 *MARCH*, 1896.

The Sectional Committee met at the Court-house, Manilla, at 10 a.m.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.
The Hon. Charles James Roberts, C.M.G., | John Lionel Fegan, Esq.,
George Black, Esq.

The minutes of the previous meeting were read, and confirmed.

The Sectional Committee proceeded to consider the proposed Railway from Tamworth to Manilla.

The following witnesses were sworn, and examined:—Messrs. Charles Baldwin, grazier, Durham Court, Manilla; Edwin Oliver Watt, mine proprietor, Crow Mountain; Edward Bowman, farmer, Upper Manilla; Thomas Bowen, builder and contractor, Manilla; John Barling, grazier, Upper Manilla; Michael Francis M'Keown, farmer, Mountain View, Manilla; and Leonard Bailey, farmer, carrier, and produce dealer, Manilla.

The Sectional Committee adjourned at 1 p.m. until 2 p.m., when Messrs. Alexander Rogers, grazier, Attunga; and Alfred Horatio Sampson, farmer, Upper Manilla, were sworn, and examined.

At 3 p.m. the Sectional Committee adjourned until 10 a.m. the following day, and subsequently proceeded 10 miles towards Keepit and inspected the country between there and Baldwin's Mountain, returning to Manilla at 6·30 p.m.

TUESDAY, 24 *MARCH*, 1896.

The Sectional Committee met at the Court-house, Manilla, at 10 a.m.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.
The Hon. Charles James Roberts, C.M.G., | John Lionel Fegan, Esq.,
George Black, Esq.

The minutes of the previous meeting were read, and confirmed.

The Sectional Committee further considered the proposed Railway from Tamworth to Manilla.

The following witnesses were sworn, and examined:—Messrs. W. J. L. Kyle, post and telegraph master, Manilla; Alfred Stafford, store manager, Manilla; William Hill, grazier and farmer, Upper Manilla; John Fitzgerald Finn, licensed surveyor, land district of Tamworth; and Andrew George Gardiner, farmer and grazier, Manilla.

The Sectional Committee adjourned at 12·30 p.m., and subsequently inspected the proposed station ground and the route towards Tamworth with a view to a deviation.

WEDNESDAY, 25 *MARCH*, 1896.

The Sectional Committee met at the "Royal Hotel," Manilla, at 10 a.m.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.
The Hon. Charles James Roberts, C.M.G., | John Lionel Fegan, Esq.,
George Black, Esq.

The minutes of the previous meeting were read, and confirmed.

The Sectional Committee left Manilla at 10·30 a.m. for Barraba, 4 miles from Manilla.

The Sectional Committee left the main road and made an inspection of the country in the vicinity of Manilla station, and on the eastern side of Manilla Creek, reaching Barraba at 5·30 p.m.

The

The Sectional Committee again met at the Court-house, Barraba, at 8 p.m., and further considered the proposed railway from Tamworth to Manilla.

The following witnesses were sworn, and examined:—Messrs. William Henry Reynolds, mine manager, Gulf Creek; Horace Hamilton Dawson, manager, Commercial Bank, Barraba; Daniel Capel, grazier, Piedmont; and Bernard Finkernagel, storekeeper, Barraba.

The Sectional Committee adjourned at 10·10 p.m.

THURSDAY, 26 *MARCH*, 1896.

The Sectional Committee met at the Court-house, Barraba, at 9·30 a.m.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.

The Hon. Charles James Roberts, C.M.G., | John Lionel Fegan, Esq.,
George Black, Esq.

The minutes of the previous meeting were read, and confirmed.

The Sectional Committee further considered the proposed railway from Tamworth to Manilla.

The following witnesses were sworn, and examined:—Messrs. Sylvester Joseph Lillis, grazier, Barraba Creek; James Waddell, Bingera; James Edward Ethridge, Horton River; and Edwin Blaxland, Horton River.

The Sectional Committee adjourned, and subsequently proceeded to Manilla, which was reached at 6 p.m.

FRIDAY, 27 *MARCH*, 1896.

The Sectional Committee met at the "Royal Hotel," Manilla, at 10·30 a.m.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.

The Hon. Charles James Roberts, C.M.G., | John Lionel Fegan, Esq.,
George Black, Esq.

The minutes of the previous meeting were read, and confirmed.

The Sectional Committee left Manilla for Tamworth at 11·15 a.m., and inspected the proposed station site, arriving at Tamworth at 5 p.m.

At Tamworth the Sectional Committee inspected that portion of the proposed line passing through the allotments within the municipal boundary.

SATURDAY, 28 *MARCH*, 1896.

The Sectional Committee met at the "Imperial Hotel," Tamworth, at 10·30 a.m.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.

The Hon. Charles James Roberts, C.M.G., | John Lionel Fegan, Esq.,
George Black, Esq.

The minutes of the previous meeting were read, and confirmed.

The Sectional Committee further considered the proposed Railway from Tamworth to Manilla.

The following witnesses were sworn, and examined:—Messrs. Charles William Jenkins, district engineer, Tamworth; William Darley Dow, stock inspector, Tamworth; and Alexander Christopher M'Leod, auctioneer, Tamworth.

The Sectional Committee left Tamworth at 1·15 p.m., and arrived at Newcastle at 7·30 p.m., and subsequently considered their report.

MONDAY, 29 *MARCH*, 1896.

The Sectional Committee met at the "Great Northern Hotel," Newcastle, at 8·30 a.m.

MEMBERS PRESENT:—

Thomas Thomson Ewing, Esq., Chairman.

The Hon. Charles James Roberts, C.M.G., | John Lionel Fegan, Esq.,
George Black, Esq.

The minutes of the previous meeting were read, and confirmed.

The Sectional Committee further considered the proposed Railway from Tamworth to Manilla.

Mr. Rudolph Langer was sworn, and examined.

Mr. Fegan moved, and Mr. Roberts seconded,—"That the Chairman be authorised to sign the report of the Sectional Committee, and present the same to the main Committee," which was agreed to.

The Sectional Committee left Newcastle at 9·10 a.m., and arrived in Sydney at 1 p.m.

GENERAL INDEX.

LIST OF WITNESSES.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

ADDITIONS TO THE TREASURY BUILDING.

REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the first Session of the present Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, and the Public Works (Committees' Remuneration) Act of 1889, 53 Vic. No. 11, to whom was referred the duty of considering and reporting upon "the expediency of carrying out Additions to the Treasury Building, Macquarie-street, Sydney," have, after due inquiry, resolved that it is expedient the proposed Additions be carried out; and, in accordance with the provision of sub-section (IV) of clause 13 of the Public Works Act, report their resolution to the Legislative Assembly:—

Reference to the Committee.

1. The following extract from Votes and Proceedings of the Legislative Assembly, 18 December, 1895, will serve to show the Parliamentary action taken in the matter of the proposed Additions to the Treasury Building:—"Mr. Young moved, pursuant to Notice, 'That it be referred to the Parliamentary Standing Committee on Public Works to consider and report on the expediency of carrying out Additions to the Treasury Building, Macquarie-street, Sydney.' Question put and passed."

Present state of offices.

2. According to the evidence of the Under Secretary for Finance and Trade, the accommodation at the Treasury is totally insufficient for present requirements. That officer placed a statement before the Committee, in which it is pointed out that the Receiving, Pay, and Account Offices are unsuitable for the work now carried out therein. In the Receiving Office are kept over 200,000 accounts with Crown leaseholders and purchasers of land. The Conditional Purchase Room, a frail and unsuitable structure, holds some 210 ledgers, representing transactions in connection with 150,000 conditional purchases, and a total indebtedness to the State of over £13,500,000. In the Lease Room are sixty-seven ledgers and other books of account, representing 34,000 leases; while in the main room are 15,000 accounts, also with landholders. In the Pay Branch the accommodation for the public and the officers is altogether inadequate. The Account Branch is in a most unsuitable building, being almost unbearable in hot weather. The number of officers employed in each branch is as follows:—Correspondence Branch, 6; Record Branch, 6; Paymaster's Branch, 9; Receiver's Branch, 32; Accountant's Branch, 20; Examiner's Branch, 5.

The proposed Additions.

3. The proposal before the Committee is to erect entirely new accommodation for the Conditional Purchase and the Conditional Lease Branches, as well as for the public. The northern building is therefore designed to meet these requirements, and to contain proper desk space of 542 feet, with a net area of 3,000 feet. It is proposed to so construct as to give security against fire, and to include a gallery in which the Conditional Lease Ledgers can be used, and the officers of the Receiver accommodated while the second portion of the scheme is being erected. The second portion of the scheme, to cover the site between the new Strong Room and the existing building, is to provide accommodation for the Receiver and the public, also for the Accountant. The complete scheme will provide 15,250 super. feet, as against

8,674

8,674 super. feet present floor space. The floor space per officer will therefore be 136 feet super., as compared with 146 feet super., the average accommodation for officers in the Mines, Lands, and Works Departments. The Strong Room accommodation should not, however, be calculated only with regard to the number of officers engaged, but, as shown above, by the number of ledgers in use. The rooms designed are all large, so that each branch can be accommodated in separate apartments. The portion of the existing building to be vacated by the Receiver, it is proposed should be remodelled and occupied by the Paymaster. The Bridge-street elevation will remain unaltered, and it is intended to utilise the existing building, with its good stone front and substantial external wall, as a starting-point for the design of the whole, so that necessarily the Additions will, as far as possible, be erected in stone.

Estimated cost.

4. The cost of the works is estimated at £21,500, viz. :—Strong Room, including the extra cost of building in fire-proof materials, £9,000; second portion, £9,500; fire-proof shutters, &c., £3,000. Funds are already available from Loan Votes for carrying out the work.

The Committee's inquiry.

5. The Committee have had before them the following witnesses :—The Under Secretary for Finance and Trade, who was examined respecting the accommodation at the Treasury Building, and also the proposed alterations; the Government Architect, who prepared the plans and specifications for the carrying out of the Additions; the Auditor-General; the Clerk-in-Charge of the Sales Division, Department of Lands; and the Secretary to the Public Service Board.

Necessity for the proposed work.

6. The proposed Additions to the Treasury Building are regarded as being absolutely necessary—

(1) In the interest of the general public.
(2) For the due safety of valuable Public Records.
(3) For the proper accommodation of the Departmental officers.

Decision of the Committee.

7. The Committee have unanimously affirmed the expediency of carrying out the proposed Additions.

Resolution of the Committee.

8. The following extract from the Committee's Minutes of Proceedings of Wednesday, 15th July, will show the resolution arrived at by the Committee :—

"Mr. Fegan moved—

'That, in the opinion of the Committee, it is expedient the proposed Additions to the Treasury Building, as referred to the Committee by the Legislative Assembly, be carried out.'

"The motion was seconded by Mr. Wright, and passed."

THOS. EWING,
Chairman.

Office of the Parliamentary Standing Committee on Public Works,
Sydney, 17 July, 1896.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

ADDITIONS TO THE TREASURY BUILDING.

THURSDAY, 9 *JANUARY*, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (Chairman).

The Hon. Frederick Thomas Humphery.	Charles Alfred Lee, Esq.
The Hon. John Davies, C.M.G.	John Lionel Fegan, Esq.
The Hon. James Hoskins.	Angus Cameron, Esq.
The Hon. William Joseph Trickett.	Thomas Henry Hassall, Esq.
Henry Clarke, Esq.	Francis Augustus Wright, Esq.

The Committee proceeded to consider the proposed Additions to the Treasury Building.

Francis Kirkpatrick, Esq., Under Secretary for Finance and Trade, sworn, and examined:—

F. Kirkpatrick, Esq. 9 Jan., 1896.

1. *Chairman.*] You desire to make a statement to the Committee showing the accommodation at the Treasury, and also the proposed alterations? Yes. It is as follows:—

Treasury.—Accommodation and Staff.

First Floor.

Rooms for the Colonial Treasurer. Room for the Under Secretary. Two waiting rooms.

Correspondence Branch.—Room 1, 17 ft. x 12 ft.—Clerk of Correspondence. Room 2, 18 ft. x 12 ft.—1 clerk (Funded Stock). Room 3, 23 ft. x 13 ft.—4 clerks. (Includes accommodation for records.)

Record Branch.—Room 1, 15 ft. x 14 ft.—Registrar. Room 2, 21 ft. x 14 ft.—5 clerks. (Includes accommodation for records.)

Ground Floor.

Paymaster's Branch.—Room 1, 15 ft. x 27 ft.—3 clerks; this includes accommodation for public. Room 2, 23 ft. x 12 ft.—5 clerks. Room 3, 13 ft. x 12 ft.—Paymaster.

Receiver's Branch.—Room 1, 36 ft. x 25 ft.—Chief Receiving Office, 14 clerks. Room 2, 72 ft. x 20 ft.—Conditional Purchase Room, 13 clerks. Room 3, 17 ft. x 14 ft.—Lease Room, 4 clerks. Room 4, 19 ft. x 13 ft.—Receiver.

Accountant's Branch.—Room 1, 18 ft. x 24 ft.—5 clerks, sometimes 6. Room 2, 18 ft. x 19 ft.—Accountant and 2 clerks. Room 3, 18 ft. x 43 ft.—11 clerks. Room 4, 18 ft. x 8 ft.—1 clerk.

Examiner's Branch.—Room, 24 ft. x 18 ft.—Examiner and 4 clerks.

Proposed alterations to Treasury.

The proposed alterations are mainly for the purpose of giving better accommodation to the Account, Receiving, and Pay offices.

1. *The Receiving Office.*—There are kept here over 200,000 accounts with Crown leaseholders and purchasers of land. In the Conditional Purchase room—a frail and temporary building, liable to considerable risk by fire—there are 210 ledgers, representing 150,000 conditional purchasers, and a total indebtedness to the Crown of over £13,500,000.

In the Lease room, there are sixty-seven ledgers and other books of account, representing 34,000 leases; while in the main room, in addition to the general business of licensing and other miscellaneous matters, there are 15,000 accounts, also with land-holders. Of more importance than the inadequate accommodation in the office is the constant danger and almost irreparable loss which would result by fire.

2. *The Pay Branch.*—The accommodation for the public is but 22 ft. x 6 ft., hardly sufficient for twenty people. It is no uncommon occurrence to find sixty people at one time crowded in this space. The accommodation for the clerks is wretched, and is in close proximity to the latrines, &c.

3. *Account Branch.*—This is a most unsuitable building, but 18 feet wide, divided into four rooms; the ceilings are 10 feet high. It is almost unbearable in hot weather. At one end it is above the kitchen of the housekeeper; and at the centre it is over five filled-up and now unused cesspits.

The additions comprise a new receiving office and a strong-room for the Land Account ledgers. It is proposed to shift the Paymaster and staff to the present Receiving Office, and temporarily accommodate the Accountant and staff in the iron room now occupied by the Conditional Purchase staff, until better and more permanent accommodation is provided.

F. Kirkpatrick, Esq. 9 Jan., 1896.

If the proposed additions are carried out the temporary buildings will be at once pulled down. With regard to the conditional purchase records, I should like to mention that they are the only perfect records of the conditional purchasers' accounts in existence, and I may add to my observations in regard to the crowding which sometimes takes place at the Treasury, that I have at times seen thirty or forty persons waiting outside unable to get in to transact their business. I think the statement I have read affords my main reasons for advocating these additions. The temporary buildings are very unsafe, and there is very little accommodation for the public, and the accommodation for the clerks is altogether inadequate.

2. *Mr. Trickett.*] What is the estimated cost of the new building? I believe the strong-room is to cost £9,000, and the other room £13,500, making a total of £22,500.
3. Is it proposed to pull the old building down? No; only the temporary portion—the wooden portion which was erected temporarily.
4. Have you been in conference with Mr. Vernon about the arrangement of the building? Yes.
5. I have often wondered why in public offices the clerks are not located as they are in the case of some of our large financial institutions; there you see a number of clerks in one large room where they are under the eye of the head of the Department? That idea is being carried out in the proposed Department. The head of the Receiving branch, for instance, will be able to oversee the whole of his branch.
6. You think that is a desirable plan to carry out? Yes; it is proposed, when the old buildings are pulled down, to remove the Accountant and staff to a room upstairs in the additional building. The Chief Accountant will then be able to properly supervise the whole of his staff.
7. The buildings are to be constructed then upon more modern ideas? Undoubtedly.
8. Has the staff in the Treasury increased largely of late? It has increased, but not of late. There is not sufficient accommodation in the Treasury for the inspecting staff. They are in a house in Richmond Terrace.
9. Can you give us any information as to the increase of the staff within the last three years? I do not think there has been any increase within the last three years. There may have been a few temporary clerks appointed on special work, but I do not think there have been any permanent appointments during the last three years unless to fill vacancies.
10. Were there many appointments during the preceding three years? I do not think there were.
11. What is the number of the present Treasury staff? About eighty.
12. You are forced to the conclusion that the present accommodation is utterly inadequate for the staff and for the public? Yes.
13. I believe this has been a matter of public complaint for some time? Yes.
14. Can you tell us whether it is intended to increase the staff? No—not to my knowledge.
15. This proposal is not made in view of any proposed increase to the staff, but is intended to carry out present requirements? Yes, and to afford the necessary accommodation to the public.
16. I see £9,000 is to be expended upon the strong-room;—is that necessary? Yes.
17. What will it be used for? For auction sale and conditional purchase registers. I may say that these show the whole of the monetary transactions in connection with each purchase, together with the balances due to the Crown. If they were destroyed the Treasury would be placed in great difficulties.
18. How are they kept at present? In a temporary building I am sorry to say.
19. Not in a strong-room? No.
20. What will be about the size of the strong-room? It will be a large chamber with galleries.
21. On looking at the recent report of the Civil Service Commission, I find it is stated that it is worth consideration as to whether the money dealings with the conditional purchasers should not be attached to the Lands Department;—what do you think of that proposal? I think it would be a great mistake to take these dealings away from the Treasury. People come there and expect to receive information as to the state of their balances. We are asked every day what are the balances upon certain conditional purchases so that they may be paid.
22. The Commission regard it as an inconvenience to the public that they should have to go to the Lands Department for one dealing in connection with their land and to another building for another dealing or for other information;—do you not think it would be well to establish a branch of your office in the Lands Department? No; I think we should have the controlling supervision. It would be a mistake to split up the Treasury.
23. But all through the country money is received through the local land agents in the same building in which they carry out other land transactions? They receive the money on our behalf, and remit it to us.
24. Then why could you not have Treasury officials at the Lands Department in Sydney? There would be a divided responsibility, and we believe it would not be so convenient to the public.
25. The officers would only be divided from you by the eighth of a mile of space between the Departments? We could not possibly have the same control and supervision over them in the Lands Department as we have in the Treasury, and it would be extremely inconvenient to pay money into the Lands Department when it would all have to be collected by the Treasury.
26. Does it not seem to you rather inconvenient that owing to the separation of the two Departments, persons should have to run from one to the other? That is the very thing which I am contending should be avoided. We can give persons the information they require now. We could not give them that information if the Lands Department kept the books. So far no complaints on the part of the public have been made.
27. Why could you not give them the information if you had an office there? There would be serious difficulties in the way.
28. Will you explain what the process is in dealing with moneys received from conditional purchasers—that is as to its receipt, application, and audit? When the money comes to us from the Crown Lands Agents, it is put to the credit of the various accounts concerned.
29. Are there not two sets of books, one kept at the Treasury, and the other at the Lands Department? Not that I am aware of. I only know of two sets, so far as the collection of Revenue is concerned. One is kept at the Treasury, and the other at the Audit Office.
30. You do not deal with any matters in your office in connection with the transfer of lands? We note each transfer.
31. Supposing a man comes to you and pays a certain amount of money, and then wants to deal with his land—supposing he pays his balance—he has then to run off to another office to get the title? We can

give

F. Kirkpatrick, Esq. 9 Jan., 1896.

give him a certificate under the 99th section of the Real Property Act that the balance has been paid. He has also to obtain a certificate from the Lands Department that the conditions as to residence, &c., have been fulfilled, but application need only be made to the one Department for both these certificates.

32. Then you do not think it would simplify money matters, to have money transactions in connection with conditional purchases dealt with at the Lands Department? I do not think it would.

33. You say that one of the two sets of books is kept at the Audit office? Yes.

34. What books are they at the Audit office? Registers for the purposes of audit, but they do not show the names of the holders. They get all our vouchers which are sent to them under the Audit Act.

35. One would think that it would be better to have the Audit office in the same building as the Treasury? I think not.

36. Would it not be better to have the two Departments under the same roof? I think not.

37. Has there been any conflict between your Department and the Department of Lands in reference to land matters? No; I do not think there has been any conflict. There may have been a difference of opinion.

38. Has it been of such a character as to involve any public inconvenience? Certainly not.

39. Is it of frequent occurrence? No.

40. It would only arise in exceptional cases? Yes; of course, the Secretary for Lands has full control.

41. Were you aware of the existence of the paragraph to which I referred in the report of the Civil Service Commission? Yes, I read it.

42. Were you asked about the matter when the Civil Service Commission was sitting? Not as far as I can remember.

43. Has an elevation of the proposed building been prepared? Yes.

44. Has it been submitted to you and approved of by you? Yes; by the Minister and by myself.

45. As far as the plan indicates there does not appear to be any undue interference with the present tramway lines by the proposed alterations? No.

46. It is a peculiarly shaped building, is it not? It is part of a plan to be hereafter worked out in one large building.

47. The present elevation or block plan is so designed as to be capable of further enlargement if necessary? Yes.

48. In which direction would that enlargement go? I think the building would be extended down Bridge-street; but the buildings now planned would meet the Treasury requirements as far as they can be foreseen for many years. The conditional purchase room was put up in 1880, fifteen years ago. It is constructed of wood and galvanised iron.

49. It has answered the purpose for fifteen years? Yes; but the trams have not been running alongside of it the whole of that time,

50. Do you not think the proximity of this important building to the tramway line is rather a disadvantage? It is a very great danger.

51. So far as the present temporary buildings are concerned? Yes.

52. Is it not a disadvantage by reason of the noise? More so by reason of the dirt, than anything else.

53. Will not that inconvenience still obtain when you get the new building? Not to so great an extent as it does now, because the temporary buildings are so close to the tramline.

54. *Mr. Cameron.*] Do you find that the work of the Treasury is impeded, or that the employees are annoyed by the noise of the trams? They do not notice it now.

55. *Mr. Trickett.*] When you get a substantial stone building that trouble will be greatly reduced? Yes; we shall be further away from the tram line.

56. The thicker walls will take away the noise to a certain degree? Yes.

57. Do you look upon this work as an absolute necessity in the interests of the employees, as well as in the public interest? Yes.

58. I believe that on certain days the little room in Macquarie-street—the little pay-room—is absolutely packed by people who have the greatest difficulty in getting in or out? Yes; at times they cannot get out by the way they come in. We have to open a little door at the end of the room, and let them out by another door.

59. That has been a great public grievance? Yes.

60. There is no way of curing it, and of meeting the other existing requirements, except by enlarging the building, as indicated by this plan? I do not think there is any other way.

61. *Mr. Lee.*] I understand it has been the policy of various Governments, in years past, to transact the monetary portion of their land business at the Treasury? Yes.

62. All the records of the Colony, so far as the lands are concerned, are at the Treasury? Yes; all the records of the monetary transactions.

63. You say they are now kept in a temporary building? Yes; all the conditional purchase registers.

64. What would be the result to the selectors of this country if the books containing the records of their transactions were destroyed? It would result in great confusion and annoyance.

65. Would it not involve an amount of confusion which could not be put straight? It would involve terrible confusion. I do not know that it could not be put straight eventually; but things would not be as they are now.

66. That is a strong reason why there should be a substantial strong room in which to keep these records? Yes.

67. And there is no better place to make this strong room than at the Treasury? No.

68. If the monetary portion of the land business were transacted at the Lands Department, would it not be necessary to put up a strong room there? They have a strong room there, but they required it for their own purposes.

69. But the constant removal of the ledgers would involve an enormous amount of manual labour? Yes.

70. Your proposal is to have a strong room so constructed that the clerks will be able to make use of the books in the ordinary way? Yes.

71. In addition to this, the requirements of the country have outgrown the accommodation of the Treasury building? Yes.

72. As regards this proposal of the Commission that the monetary business of the Lands Department should be carried out in that Department, and not at the Treasury, is it not held to be one of the first principles

F. Kirkpatrick, Esq.

9 Jan., 1896.

principles of government that as few persons as possible should handle the money of the State? Yes.
73. Consequently that is a strong reason for the existence of a State Treasury. It is intended to be the sole depository of State money? Yes.
74. It should be, as far as possible, the sole collector? Yes.
75. At the present moment no other Department collects any moneys except by way of fees? Of course there are Land officers throughout the country who are Treasury officers for the purpose of collecting revenue.
76. That would be in the country districts for the convenience of the people? Yes.
77. I am speaking of the various Departments in the city. Nothing but fees would be collected by them? The Customs Department collect their dues, and the Railway authorities collect their receipts, and pay the amounts over to the Treasury.
78. If it were necessary to have a branch of the Treasury to conduct business in the Lands Department, would it not be equally necessary to have a branch in the Mines Department? It might be equally necessary, but it would be inconvenient. The Mines Department does not collect much revenue beyond the Regulation Fees in Sydney.
79. Would not the existence of the various branches lead to immense inconvenience and delay? It would.
80. Apart from the fact that you are the permanent head of the Treasury Department, can you offer any suggestion by which the revenue of the country could be collected in an easier and safer manner than at present? No; I think everything is done in the best and safest manner. I think the present arrangement is as advantageous as it is possible for it to be, but we are always endeavouring to improve the methods.
81. As a matter of principle, you hold that the Treasury should be the sole depository of the records of the monetary transactions of the State in connection with land and other matters? Yes.
82. *Mr. Clarke.*] I presume there would be considerable inconvenience attaching to the carrying out of the suggestions of the Civil Service Commission for the establishment of a branch of the Treasury in the Lands Department? There would be very great inconvenience.
83. Can you receive any money from the sale of land without authority being sent to you from the Lands Department stating how much is to be paid? We are advised in the first instance of all sales. No reference is necessary to the Lands Department after that, unless application is received for some special concession, or in cases where forfeiture has been incurred.
84. But you could not receive any money in respect of land unless you had authority from the Lands Department? We could put the money in suspense until we got the details. We receive statements from the Land Agents showing the details—showing the price of the land and deposit money.
85. After the first record in the Treasury, there is no necessity to refer to the Lands Department? Not if the money is paid within the proper time.
86. Who sends the notices if the payments are in arrears? The Lands Department are advised once a year by the Treasury of all selections in arrear, and that Department after investigation communicates with the selector.
87. As to the present Receiving Branch of the Treasury, are not all the various clerks under the supervision of the head of that Department? They are under his supervision, but he cannot see them all.
88. They are not in separate rooms? Yes, in three rooms.
89. You will have a similar plan in the proposed new building? In the new bullding the head of the Branch will be able to see, not only one or two of the clerks under him, but all of them. It is intended to bring that arrangement into existence as far as possible.
90. Would it not be better to wait a little longer, and have an entirely new building? I think it would be very dangerous to wait.
91. You are having regard to the present character of the building, and the necessity for having the conditional purchase records kept in a place of safety? I am also considering the convenience of the general public, who, at times, have to suffer extremely when they visit the Treasury, owing to the want of accommodation.
92. *Mr. Fegan.*] When did you first discover the necessity for these alterations? They have been under consideration for a great number of years.
93. Have you represented to the Government the necessity for a more secure building? Yes. The first duty I have felt incumbent upon me when a new Treasurer has taken office has been to take him round the building, especially the conditional purchase room, and to show him the condition of matters.
94. The fear of fire has been in your mind for some years? Yes.
95. Have you any books in your office in connection with the Department of Mines? Yes. We keep accounts with lessees of mineral and gold leases, tanks and wells, &c., &c
96. Did the Civil Service Commission recommend any reduction in the staff of your Department? Not that I am aware of. I do not think they had sufficient time at their disposal to enable them to inquire into the duties of the various officers.

FRIDAY,

FRIDAY, 10 *JANUARY*, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (Chairman).

The Hon. Frederick Thomas Humphery.	Charles Alfred Lee, Esq.
The Hon. John Davies, C.M.G.	John Lionel Fegan, Esq.
The Hon. James Hoskins.	Angus Cameron, Esq.
The Hon. William Joseph Trickett.	Thomas Henry Hassall, Esq.
Henry Clarke, Esq.,	Francis Augustus Wright, Esq.

The Committee further considered the proposed Additions to the Treasury Building.

Francis Kirkpatrick, Esq., Under Secretary for Finance and Trade, sworn, and further examined:—

F. Kirkpatrick, Esq. 10 Jan., 1896.

97. *Chairman.*] You have some further evidence to give? Perhaps I may be allowed to make a little statement by way of explanation. Speaking of the conditional purchase ledgers yesterday, I said there were two complete sets. I meant with reference to the accounts. There is a complete set at the Treasury, and each Crown Lands Agent keeps the accounts with the conditional purchasers in his district. There is a record of these purchases at the Lands Department, but solely for the purposes of title. The registers at the Audit Office are, as stated by the Auditor-General, mere instruments for the purposes of audit.

98. In the books of how many Departments is this information contained? I am not aware that the information as given in the Treasury books is contained in the books of any other Department. The Audit Office has much the same information, with the exception that they do not give the names of the holders of land.

99. Would the holders of the land be identified by number? It would not, I think, be a safe means.

100. Would not the books in the Audit Office enable the Department of Lands to ascertain the balance owing by conditional purchasers? I doubt it.

101. In point of fact, all the information necessary in connection with every conditional purchase could be obtained elsewhere than in the Treasury? Yes; from the Land Agent's books.

102. If your books were destroyed by fire the information contained in those books could be obtained in the Audit Office and the Lands Office? Yes. When I said that a fire would be disastrous, I did not mean with respect to the conditional purchase registers alone, but referred to all the records. Then there is another point which I would refer to. That is in reference to the information about the selectors. The question was asked which Department notified the selector of his arrears. I find that the practice is for the Treasury to report the matter to the Lands Department, which Department issues circulars to the selectors.

103. *Mr. Hassall.*] How many officers have you in the Treasury Department? About seventy-five or seventy-six in the building, and there are six outside, for whom we have not accommodation.

104. And you contend, as head of that Department, that the accommodation provided is totally insufficient to enable you to carry on the business of the Department with any degree of comfort or efficiency? I do undoubtedly.

105. You also complain that there are valuable Government documents stored in that building which are liable to be destroyed at any time, because you have no safe place in which to deposit them? Yes.

106. In the event of fire nothing could save them? No.

107. The building in which those valuable documents are at present is of so flimsy a nature that in the event of a fire the probability is that all those buildings would be consumed? I am afraid so.

108. Are there not other documents there besides documents having reference to conditional purchases? Yes.

109. There are documents besides those connected with the Lands Department; and if those documents were destroyed could they be replaced? Yes; some could be, but it would be at very great labour and expense. It would be utterly impossible to replace others.

110. They date so far back that you are doubtful whether any duplicate records exist? I believe they exist in some cases, but not in others—notably those relating to quit rents.

111. But if those documents did happen to be destroyed in the Treasury building, the country would suffer very great loss and expense in replacing them? Yes.

112. Are you of opinion that the proposed extension will give you ample accommodation for carrying on the operations of the Treasury? Yes; I have gone over it with the Receiver and the Accountant, and I think it will give us ample accommodation for many years to come. It is possible that the business of the Funded Stock may largely increase, as I believe it will, and it may cause some modification of present ideas, but even then it will give sufficient accommodation for many years.

113. And in the event of a number of officers being transferred if any change should take place in connection with the land documents, how many officers would you use? I suppose they would take eight or ten; I could not say.

114. They would take from the Treasury eight or ten officers now employed in dealing with land matters? Yes; but I think the Receiver will be better able to speak on that subject than I am. The business of the Treasury is so varied and extensive that no one person knows all the details. I know the general working of the Department, but the heads of the branches know better than I do the details of the working of each particular branch.

115. In the event of ten or twelve officers being transferred from your Department to the Lands Department, are you of opinion that increased accommodation would still be necessary to enable you to carry on the business of the Treasury? Yes; and to afford accommodation to the public.

116. And in all probability the operations of the Treasury will increase, more particularly in connection with the Funded Stock? I believe so. The sales are very few now on account of the premium required, but by-and-bye it will come to be a large business, I have no doubt, and will necessitate much greater accommodation than can now be afforded.

F. Kirkpatrick, Esq. 10 Jan., 1896.

117. Therefore, in your opinion as Head of that Department, it is absolutely necessary that some additional accommodation should be provided? It is absolutely necessary.
118. The present accommodation is of a totally unsatisfactory character, and to a certain extent detrimental to health? It is undoubtedly. The accommodation for the public in the paying branch is very bad.
119. *Mr. Cameron.*] You said that you had 147,000 accounts for conditional purchases, and 210,000 other accounts passed through the office;—does that 210,000 include the 147,000? I think there are 250 ledgers containing 210,000 accounts.
120. It seems that the efficacy of your Department suffers through the mode in which these documents have to go through other offices;—for instance, you have some connection with the Audit Office, have you not? No; I do not know of any, beyond that for audit purposes.
121. What did you mean in speaking of other Departments gathering your accounts? The Mines Department would receive the collections of the Mining Registrars instead of their being paid direct to the Treasury if the recommendation of the late commission was carried out.
122. What do you complain of? I do not complain.
123. You do not suggest that that system should be altered? No; we do not consider that the system should be altered.
124. I understood you to say that you were deprived of the opportunity of exercising supervision over other Departments? No; what I meant was that we should be if certain changes were carried out.
125. And you are of opinion that the efficient working of your Department would be facilitated if you get the proposed alterations which have been submitted to the Committee? Undoubtedly.
126. Have you been consulted in reference to them? Yes; I have gone all through them with the Architect or his officers.
127. *Mr. Wright.*] Do you think the present site as suitable a one as you could have for the Treasury? Yes; but for the annoyance occasioned by the tram traffic.
128. In making the alteration, I suppose the old building would have to be gutted and remodelled altogether? No; I do not think it is intended to touch the old building, except to take down the temporary accommodation that has been provided by the erection of frail structures.
129. Do you consider the present building will be suitable if the temporary buildings are removed? Yes; but it would be much better if we had not the tram lines there.
130. Is the site as suitable as it might be? I do not know of any better site.
131. When the temporary buildings are removed will the building then be a proper one to carry on your work in? Yes; for a time the new buildings will be suitable.
132. As a matter of fact, the entire office should be a new building? I would not advocate it.
133. If you had the designing of the building would you have any portion of the present buildings included in it? I do not think it would be right to abandon the old building.
134. You do not think that site the best? It is, except for the tramways.
135. There is a vacant piece of ground in the immediate vicinity where a building could be erected—the corner between Young-street and Phillip-street? I do not see that any advantage would be gained by changing the site.
136. With regard to this matter that Mr. Lockyer refers to, I understand that there is no change contemplated in the system of working the Treasury? No; it was a recommendation by the Commission, but it was not carried out.
137. It was never contemplated? No; but the Minister saw Mr. Lockyer's paper on the subject.
138. Is there any reason to believe that the Minister contemplated any change? No; I believe he did not.
139. You think that your present system is perfect as regards collecting the revenue of the country? It is not perfect, but it is a great improvement on what formerly obtained. We are endeavouring to make it as perfect as circumstances and material will permit.
140. There is no desire to change it, and no change is contemplated? None whatever.
141. And if you get the proposed additions to the Treasury, that is pretty well all you will require? Yes; for many years to come.
142. *Mr. Hoskins.*] I am not quite satisfied with the reply you gave to Mr. Hassall about the papers in your Department;—supposing it was determined that the Treasury should have nothing to do with land at all, would the building then be sufficient for the protection of papers connected with Treasury business only? No. The present accommodation is very bad. The rooms are not at all suitable. They are unhealthy, and not sufficiently protected from the risk of fire.
143. Is it your opinion that if the land business is taken away from the Treasury the buildings will be sufficient to prevent the destruction of papers belonging to the Treasury Department proper? No; there is a great element of danger in the trams running alongside of the temporary buildings.
144. But have you no strong-rooms in the Treasury at present? We have a vault, but we could not take the books up and down stairs, and even if that were possible the vault is most unsuitable.
145. Has it been the case ever since the Treasury buildings have existed, that the books and cash have not been taken out of the office and deposited in the strong-room at nights? The cash is deposited in the Bank every evening. The funded stock and other principal books are put into the safe. But it is impossible to do this with the land registers. There are so many of them, and they have to remain on the desks.
146. Then danger to the records in the Treasury might be brought about by the accumulation of papers connected with the Department of Lands? There is no great accumulation of such papers, and the risk of fire referred to arises rather from other sources.
147. Have you never made application to the Treasurers of different Governments to have a strong-room built in which the principal records of the Department could be put at night? What is now proposed is the outcome of such an application as you refer to.
148. Has not that been brought about by the accumulation of papers in the Treasury connected with the alienation of lands? No; all the vouchers are sent to the Auditor-General in connection with such receipts.
149. They have never had a proper secure room in the Treasury even before the Lands business accumulated? Never.
150. Did I understand you to say yesterday, that the Treasury Department received a notification from the Crown Lands Agents in the country of the payment of moneys on account of lands, and the business goes

F. Kirkpatrick, Esq.
10 Jan., 1896.

goes through the Treasury and the Land Agents in the country, but that any persons coming to Sydney to pay for Crown lands or balances of purchase-money would go to the Treasury and pay the money without reference to the Lands Department? Certainly.

151. If a private individual comes to Sydney and desires to pay the balance of his purchase-money for land or for improvement purchases, does he not first go to the Lands Department to get a notation on the papers, then take it to the Treasury, where the money is received? No; we receive the money and deal with it at once.

152. *Mr. Humphery.*] Assuming that the recommendations to which you refer as having been made by the Royal Commission were carried out, what difference would it make in the number of officers under your control in the Treasury? I really could not answer the question definitely, but there might probably be a difference of ten or more.

153. That would leave how many? Sixty-five, or thereabouts, in the old building.

154. Would the site proposed for the Mines Department be suitable for the Treasury? I do not know the site to which you refer.

155. It is opposite this building? I think we would rather retain our present site.

156. Apart from any sentiment connected with the present site, and taking a practical view of the requirements of the city, and this vast business carried on at the Treasury, would not the site selected for the Mines Department be suitable for the Treasury? Not so suitable as the present site if the tramways were removed.

157. Would not the site for the Mines Department be more suitable? No; I think not.

158. *Mr. Cameron.*] Do you hear any loud complaints about the trams from those whose business takes them to the Treasury? It is possible that people have complained.

159. It has not reached your ears? I have heard of it.

160. *Mr. Humphery.*] How many frontages are there to the site proposed for the Mines Department? There are two, I know. If the space occupied by the terrace be utilised, there would be three.

161. With three frontages, do you think the objection referred to would exist? I think that even with three frontages the Treasury site is better situated both for the public and for the Department.

162. *Mr. Davies.*] In the event of the Lands Department taking over the control of the revenue derived from the lands, would that so relieve your Department as to obviate the necessity for this increased accommodation? No; I do not think it would.

163. What is the total amount under the head of land revenue received in your Department from all sources? I could not speak decidedly unless I referred to the books. I think it is over £1,000,000.

164. What is the total revenue received through the Treasury during the year? Over £9,000,000.

165. And only one-ninth of that is paid by the Lands Department? I thought you meant revenue exclusive of land sales.

166. The total revenue from sales, conditional purchases, rents, and everything? It is a little over £2,000,000.

167. And you say that only eight or nine officers do all the business connected with the revenue of £3,000,000 from the land? No. The officers of the branch help each other. They all work together. The full strength of the Revenue Branch is frequently necessary to cope with the land business.

168. I think you said that if the conditional purchase registers were transferred to the Lands Department eight or ten clerks would be transferred with them? I could not speak decidedly on that point.

169. For the collection of the land revenue would it be necessary to have more than eight or nine employees from the Treasury? I could not say.

170. Supposing you split up the Department, and a large portion of the revenue now collected by the Treasury were collected by the Lands Department on the one hand and by the Mines Department on the other, would not that relieve your Department of a very large amount of officialism? It would to a certain extent.

171. You would have to keep up the same staff? Yes; with the exception of the officers who might be taken from the Receiving Branch.

172. Do you advocate that the financial transactions of the Government should be done absolutely by the Treasury, or by the several Departments? By the Treasury, as at present, the risk being much less.

173. You find that the present system works well? Yes.

174. Has it worked well in the past? Yes.

175. To your great satisfaction? There have never been any frauds in the Treasury.

176. Then, from your long experience of the Treasury, you would not favour a change such as that proposed by the Civil Service Commission? I would not.

177. On what grounds? On the grounds of general economy and efficiency.

178. Do you think there would be greater efficiency in the Treasury than in the Lands Department? I think so; the men being trained to the business.

179. If you transferred the men to the Lands Department would they not still know the business? Yes; but we could not be responsible for people once they went to another Department. We are responsible now, and the work is well done.

180. Would the work be more economically managed if managed by the Lands Department direct, independent of the Treasury? I do not think it would.

181. Can you tell the Committee the percentage of cost of the collection of the land revenue from all sources? I could not.

182. Your primary object in coming before the Committee is to get better accommodation for the officers of your Department? Yes; and for the public.

183. Although the land revenue might be collected in another way, you would still require this additional accommodation? Yes.

184. Have you suggested to the Colonial Architect, or has he suggested, that an additional story should be put upon the present building. That has been talked of; but I do not think it ever went beyond the mere statement that it might be advisable.

185. If an additional story were put upon the present buildings, would it not give better accommodation than you are likely to get from the carrying out of the proposed additions? No; it would not give us a strong-room.

F. Kirkpatrick, Esq. 10 Jan., 1896.

186. You have had no estimate from the Architect of the cost of an additional story? No; there was a question as to whether the walls would bear an additional story, but I think it never went so far as an estimate.
187. No doubt was expressed as to the capability of the building to carry another story? No.
188. Would not that give you a very large additional accommodation? It would not give us a strong-room, which we are anxious about.
189. Supposing that an additional story were put on and a strong-room—a fire-proof room—were built, would there not then be sufficient accommodation for all purposes? I do not think that matter has been fully gone into. I think it would not give such accommodation as the plan now proposed.
190. Your temporary building at the back gives accommodation for eight or ten clerks; would it not give more accommodation if an additional story were erected? It is intended to take down the old Account Branch, in addition to that temporary structure, and we accommodate seventeen or eighteen clerks there as well as in the Conditional Purchase Branch.
191. In the temporary building where the conditional purchase business is at present done, has there at any time been an alarm of fire? No.
192. But at the Treasury buildings there has been an alarm of fire? There was a slight outbreak in the housekeeper's quarters a long time ago.
193. What is the balance owing by conditional purchasers? Over £13,000,000.
194. Then, in the event of a fire taking place and the books being destroyed, how would you get at the records? The Auditor-General keeps an abbreviated account, and the Land Agents throughout the Colony have registers.
195. If the Lands Department takes up that particular portion of the Treasury work, have they got accommodation for the books? I could not answer that question.
196. Is it the principal object of your Department to get security provided by the erection of a strong-room for these books and other valuable documents? That is one thing, but we require as well accommodation for the staff and the public.
197. In your proposal you suggest the transfer of the portion of the building where the payments are made, and reversing the order of things? We would transfer the Pay Branch to the Receiving Branch, and the Receiver would go into the new premises.
198. What do you propose to do with the present part of the building where they receive payments? That would be utilised in other ways.
199. In what ways? It would form part of the new Receiving Branch. The Receiving Branch will be over the yard, and will adjoin the strong-room.
200. Have you made yourself thoroughly familiar with the proposal now before the Committee? Yes.
201. Do you believe that the accommodation you seek will be provided by carrying out this proposal? Yes; I firmly believe it will.
202. Would you favour the erection of an additional story upon the main building as well as upon the proposed new building? There would be no necessity for that for many years to come. It might destroy the appearance of the building to put another story upon it.
203. You have had no report from the Architect upon the subject? No.
204. *Mr. Lee.*] If a new site were selected it would necessitate the erection of an entirely new building? Undoubtedly.
205. Whereas at present you propose to utilise the present building as far as possible? Yes.
206. Do you concur in the following, which I will quote from the report of the Royal Commission:—"While dealing with the Treasury Department, we deem it necessary to point out that the building is altogether unsuitable for the proper carrying out of the work of so large and important a branch of the Service. The want of convenient arrangement is so manifest that we think only one course should be followed, and that is, to demolish the interior and build better lighted and more convenient rooms"? That is rather sweeping. We can utilise the interior of the building to great advantage.
207. Do you concur in it? I do as far as it condemns the existing arrangements, but I do not agree with the proposal to demolish the building.
208. You would demolish that portion of the building which renders the working of the Department difficult? Yes; and unhealthy.

TUESDAY, 14 *JANUARY*, 1896.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

The Hon. JAMES HOSKINS.	ANGUS CAMERON, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	THOMAS HENRY HASSALL, Esq.
HENRY CLARKE, Esq.	GEORGE BLACK, Esq.

The Committee further considered the proposed Additions to the Treasury Building.

Walter Liberty Vernon, Esq., Government Architect, sworn, and examined:—

W. L. Vernon, Esq. 14 Jan., 1896.

209. *Vice-Chairman.*] Have you prepared plans showing the proposed alterations to the Treasury building? I have. They are displayed before you now.
210. Will you explain the plans? The plans show such of the existing buildings as are unsuitable for the accommodation of the Treasury staff, and those which should be removed for others to be built to take their place. The building coloured blue on the map is a new fire-proof room, in which will be placed the books and ledgers belonging to the Receiver's office (a portion condemned), and will contain the first portion of the proposed new accommodation. The second portion, coloured pink on the plan, represents the accommodation to be provided for the Receiver and his staff. The plan shows the fire-proof room which

W. L. Vernon, Esq. 14 Jan., 1896.

which is to be erected on the site of the present Accountant's offices, which are also condemned from a sanitary point of view and from want of accommodation, and this portion of the new buildings contains an upper floor, to which the Accountant will be removed. The premises now held by the Receiver in the permanent portion of the building will then be occupied by the Pay Branch, coloured grey on the plan, which will be disturbed by the scheme proposed. The portion shown in white will not be interfered with. There are lavatories on the white space which will remain. The two new portions, coloured blue and pink, are so designed as to form, with the permanent portion of the present building, coloured grey, the nucleus of a complete building, which will be extended as necessity requires as far as Phillip-street.

211. What will be the floor-space provided when you have built on the portion coloured blue and pink? The floor-space to be provided on the portions coloured blue and pink will be 9,500 superficial feet—the addition, and that with the two floors in the existing permanent buildings, coloured grey, which amounts to 5,700 feet, will give a total floor-space of 15,250 feet. The present floor-space is 8,674 feet, inclusive of the buildings which are to be demolished, and that leaves a net floor-space in the existing building available for future purposes of 5,700 feet. Taking the floor-space for the officers at present, we have an average of about 66 superficial feet per officer. The proposal is to give them 136 superficial feet floor space per officer. I have prepared a return of the floor-space in some of the other Government offices, and the average for the Lands Department, the Mines, the Public Works, the Railway Commissioners, and the Colonial Secretary's Department, is 146 feet 6 inches for each individual clerk. I must explain that 146 feet per officer includes naturally a larger average for the draftsmen who are at work in the Lands, Mines, and Works Departments, so that the average for the clerical officers would be somewhat less than 146 feet, more nearly assimilating to the 136 feet that we propose in these new Treasury buildings. A draftsman often requires a large table. Then, with regard to the ledgers in connection with conditional purchases and conditional leases, the number of ledgers in connection with conditional purchases is at present 210, and they occupy a desk-space of about 390 lineal feet. Those desks are not very convenient, because they are all lengths and sizes, and consequently there is a certain amount of waste. For each ledger a space of 22¼ inches is provided. A ledger when opened requires 2 ft. 6 in., and the proposal now before the Committee provides a space of 2 ft. 7 in. for each of these 210 ledgers in desk-space, so that the ledgers can be opened within their own space, and used there and nowhere else. The necessity for these conditions was impressed upon me very strongly by the Under Secretary for Finance and Trade. The same applies also to the ledgers in connection with the conditional leases, and it is proproposed to place these in the upper gallery of the strong-room, keeping the whole of the ground-floor for conditional purchase ledgers. It is really a fire-proof office which will be occupied by the clerks using these ledgers.

212. *Mr. Cameron.*] A room in which the officers can carry on their work daily? Yes; in other words it is a large office built with fire-proof material. The present public lobby in connection with the Receiver's Branch has 310 superficial feet, but the present scheme will provide 564 feet. It will also give the Pay Branch, which now has a lobby of only 110 superficial feet, 310 feet. That is the accommodation of the present Receiver's lobby to which it is to be removed.

213. *Vice-Chairman.*] What will be the probable cost? It is proposed to utilise the existing building with its good stone front and substantial external wall to form a starting point for the design of the whole, so that necessarily the building will be erected in stone.

214. Do you mean the elevation from Macquarie-street? The elevation from Macquarie-street, and also the elevation facing the harbour, and the fire-proof room facing the harbour and the Quay, because that room will be so prominent an object to all round the Quay that we must necessarily study it. Whilst using stone I have kept it absolutely plain, with the cornice carried round the summit of the building. At some future day the Government may continue the parapet of the new building round the existing portion in Macquarie-street and in Bridge-street, which will make the building symmetrical in appearance. The construction of the fire-proof room is entirely non-inflammable in the character of the material. The ground-floor is to be built of concrete on iron girders and columns, and wood-blocked in the concrete. That is in order to give the clerks a proper foothold and reasonable comfort on the fire-proof floor, and at the same time, although there will be wood-blocking, there will be no fear of any fire.

215. You have said that the present walls could be used in any future extension of the building? The present external walls.

216. Would those external walls carry two or three additional stories? They would; they are strong enough to carry two, but there are many reasons why it should not be done.

217. Would you specify those reasons? The question was closely considered whether the existing permanent building could not be raised by one or more stories to provide the necessary accommodation. But it was found that, although the external walls were of sufficient stability, the internal portion was designed in so cramped and awkward a manner as to make it inadvisable to perpetuate those sub-divisions in the higher stories. Another reason was that the whole area of the existing building is 2,840 feet; whereas the strong-room alone requires 3,000 feet, making no allowance for staircases or any approach whatever. The inconvenience also of taking the public up two or three stories into those large public lobbies also seemed fatal to the idea of raising additional stories, and, lastly, the existing building stands on the highest corner of the site which falls very rapidly down Bridge-street, and equally so down Macquarie-street, so that to erect additional stories on the highest corner would involve at some future day the carrying of the other extensions to a very great height indeed, and it would be very unsatisfactory in appearance.

218. To bring it on a level with Macquarie-street? Yes; it is far better to keep them down and to build on the lower level than to pile the buildings on to the upper corner of the site. I think there is a difference of something like 30 feet between the corner of Bridge and Macquarie Streets and the corner of Phillip-street.

219. What will the proposed buildings cost? I estimate the cost of the portion coloured blue on the plan at £9,000, and the portion coloured pink also at £9,000, leaving about £3,000 for fire-proof shutters for the whole of the windows of this large fire-proof room, and if possible towards the permanent internal colonade of the future building.

220. That would make £21,000? That would make £21,500.

221. What would be a fair amount to add to that for supervision? Our works cost 2½ per cent. for professional charges, and a little under 2½ per cent. for supervision. In this case the cost of supervision will not be much, because it will be so handy. The cost will be somewhat under 5 per cent., including the Clerk of Works.

222.

W. L. Vernon, Esq. 14 Jan., 1896.

222. Making the total cost, everything included, about how much? About £22,000. The plan marked "Elevation of building when complete" shows the Macquarie-street frontage. The Bridge-street elevation will remain unaltered. Provision has already been made from loans in 1891 and 1895 for £9,000, and the year 1895 to 1896 for £13,500.
223. *Mr. Cameron.*] That leaves you a margin? Yes; of about £500.
224. *Mr. Clarke.*] I understand that it is proposed to erect a building for the Mines Department on a site near the Treasury? Yes; the money was voted by the last Parliament.
225. Could any portion of that site be utilised by the Treasury Department? It would not accommodate both Departments, but it would accommodate either of them.
226. There seems to be a very large space fronting Macquarie-street. Supposing a building were erected with additional stories? It would accommodate both Departments then, but whether it would be a proper thing to do I do not know. One Department would be so far from the street.
227. If additional stories could be erected for the Mines Department, would that not be a more suitable site than the present one? It is a good site, but I do not think it is equal to the present site for a public building; but that is a matter of taste.
228. I understood from some evidence given by the Under Secretary that there is considerable danger to people from crossing the tramway to get to the Treasury? The same that there is in getting to the Colonial Secretary's or the Works Department—not more. It is, I admit, a very dangerous crossing, and I think that some day there will be an accident there.
229. If we can have the Mines Department and the Treasury in the same building on that site, would not the danger be considerably lessened? Possibly it would be slightly; but I am of opinion that the best remedy is to remove the trams from that particular place.
230. I suppose you are aware that the principal traffic to the Treasury comes from George-street and Bridge-street? I do not know; the Treasury has a deal of business with the Colonial Secretary's Department, Works Department, and the Railway Commissioners, and they are all on the upper side of the Tramway.
231. I am referring to the general public, who do all come now by Macquarie-street? No; the majority of the public would cross the tram line.
232. If a building were erected on the site which I have indicated, would it not give more space for the tramways? Of course; I speak now not as an engineer, but I should say that the present tramway terminus is one of the most awkward I have ever seen or could ever conceive. The tramway has to approach at an acute angle, and the plan shows that the land is cut across diagonally by the tramway in the most wasteful manner possible. I do not think that any piece of land in Sydney has ever been wasted like that Treasury site by the tramways.
233. But unfortunately there is no other way of extending them? Yes; they could go down to Fort Macquarie.
234. The new buildings are supposed to cost about £20,000? About £22,000.
235. Could you tell us what the cost of the new Treasury buildings would be if they were erected on the site to which I have referred? The cost of the building operations would be comparatively the same, because it would be the same class of buildings. Taking the cost at £22,000 we should have to add the cost of the Ministerial portion, which already exists on the present site, and probably the building would cost £45,000 or £50,000. The Colonial Secretary's and the Works Department cost £196,000.
236. Does that include the present additions? Yes.
237. The books not used in the fire-proof room, but in other parts of the Treasury, will have to be put in the safes at night? Yes.
238. The whole of the books will not be in that room? No.
239. I understand that the strong-room in the base of the building is not used? It is of very small dimensions, and I think that they keep their books in separate iron safes.
240. Could they not keep all their books in safes? Not the conditional purchase ledgers; they are too bulky.
241. *Mr. Hassall.*] Do you think it is practicable that any portion of the work done at the Treasury could be done in other Departments? No; there is no room.
242. I ask this question because you stated that the average floor-space in the other public buildings per individual is 146 feet, whilst the clerks in the Treasury have only 63 feet per individual? The clerks in the Treasury are working under great disadvantages. There is no available space in the other public buildings to accommodate Treasury officers, and during the last eighteen months or two years every private building held by the Government has been given up when the lease expired. The consequence is that the public buildings are full.
243. And in your opinion it is absolutely necessary that there should be some additional accommodation provided, not only for the officers of the Treasury, but also for the public who have to do business there? I think so, and, as regards security from fire, I am certain of it.
244. Of course there are valuable documents in that temporary building at the Treasury which would be consumed if a fire broke out? Very easily.
245. Are the materials of which that building is constructed of an inflammable nature? Absolutely so.
246. And you are of opinion that if a fire broke out it would be almost impossible to save those documents? I do not think it would be possible. The building stands isolated. It is on legs, so that a wind could get into every portion of it.
247. You say that the space for each ledger at present is 22¼ inches? Yes.
248. So that it is not possible to open more than one ledger at a time? They have to fold over each other, and great trouble is experienced—the binding of the books breaking, and officers interfering with each other in getting at their ledgers.
249. And great inconvenience is suffered? Very great.
250. And your proposed alteration would provide ample room? I give 1 inch between every two ledgers.
251. The desk-space that you propose will be provided in the strong-room? Yes.
252. So there will be no necessity to remove the ledgers? No.
253. *Mr. Cameron.*] Have you got with you the specifications of these proposed additions? No. I have specifications prepared of the portion coloured blue, but not for the whole of the building.

W. L. Vernon, Esq. 14 Jan., 1896.

254. Do you not think it will be almost necessary, before we can arrive at the conclusion as to whether the building should be approved of, that the Committee should see the specifications? I can get the specifications of the first portion.
255. It is almost impossible for us to arrive at a conclusion as to the proposed expenditure unless we have the specifications as well as the plans? The specifications are purely technical, having reference to the material. They do not go into the merits of the scheme.
256. But they would enable us to form an idea whether the estimated expenditure is correct or otherwise? I will send for the specifications. The reason why the specifications for the whole of the buildings were not prepared was that it is necessary to build the portion coloured blue on the plans before the pink portion can be commenced at all, and it was anticipated that one work would be twelve months ahead of the other.
257. The work which will be proceeded with first will be the new strong-rooms for the conditional purchase ledgers? Yes; that will be constructed out of stone, concrete, and iron.
258. The stone that you use in the majority of the public buildings you get from the Pyrmont quarries? Yes; a good proportion of it, but not all.
259. Has not later experience shown that we have other stone that is equally durable, equally handy to work, and at as fair a price? I do not think so. There are other stones of first-class quality, but I think some of the Pyrmont stone is the best.
260. Have you not used other stone in connection with buildings? The building that we are in now has stone in it from two or three different quarries.
261. And the addition to the Supreme Court in St. James Road is made of stone not from the Pyrmont quarries? Yes.
262. It is a whiter stone? Yes. The best Pyrmont stone is of finer grain, and is less costly to work. Although the Pyrmont stone may be more costly at first, the general result is that it is as cheap, if not cheaper, than any other, and we think better.
263. Do you not think we have been in the habit of wedding ourselves to Pyrmont stone to the exclusion of other stones which might be used with advantage? That is difficult to answer.
264. Is it not a fact that similar stone to which I allude has been used in some of the finest buildings in Sydney, such as the Equitable Buildings? Yes. The tower of the Lands Office is not built of Pyrmont stone.
265. Have you at any time heard complaints from the proprietors of other quarries that they have been excluded, undue preference being given to the Pyrmont stone? I have had complaints from unsuccessful tenderers, but from no others to my knowledge.
266. You have an intimate knowledge of the stone obtained in the eastern quarries—Phippard's, Fitzgerald's, Smith and Pringle's, and others? There are quarries at Bondi, Waverley, Randwick, on the Illawarra line, and at the Glebe.
267. Do you not think there is a fair field for utilising the stone of those quarries in our public works? Certainly.
268. Is it not a fact that by far the larger portion of the stones used of late years by the Government has come from the quarries of one Mr. Saunders? No; I do not think so. I have not many Sydney contracts on hand just now, but I am speaking correctly when I say that we have not a single Pyrmont quarry contract on hand; but we have several for other stones. I am using Pyrmont stone in connection with the Government Printing Office, a work which I am carrying out on the day-labour system.
269. Have you at any time during your occupancy of your present office had reports from your officers as to the durabillity of stone other than that from the Prymont quarries? I think so.
270. Have those reports presented those other stones in anything like a favourable light? Yes; and we are constantly using them.
271. But was it not the practice up till recently for the Works Department, when its specifications were prepared for Government buildings, to specify that the stone should be the best Pyrmont stone? It was the practice, but during the last four or five years it has been discontinued, with regard not only to stone but everything else, and no names are allowed to be given in specifications at all.
272. Would you mind telling the Committee what is the course pursued by the Department in selecting stone? Taking the Government Printing Office as an instance, tenders were in that case called for the supply of stone to be worked up by the Government—the tenderer to state the cost of the stone, a specimen as regards quality to be submitted, the tenderers also to state what facilities they gave in their quarries. This was advertised in the *Gazette*, and the result was that eight or nine tenders were received from various quarries in Sydney. It is found that the decision as to which stone was the cheapest did not depend upon the absolute price quoted, but upon the quality of the stone and its cost of working, and also upon the facilities given to the Government for working the stone in the contractor's quarries. The matter was gone into by the Reference Board in connection with the Public Works Department, who made a very close investigation, and got evidence from the different places, and made their recommendation to the Minister accordingly.
273. Am I to understand, with regard to the facilities for working the stone in the quarries, that that means the preparation of the stone before it is removed to the building? It consists in providing sheds for working in, overhead travellers, crabs, cranes, and anything else which may be of use in working the stone.
274. So that the use of cranes overhead, sheds, and other appliances for working the stone is made a consideration by the Board of Reference when recommending any tenders for acceptance? No. But in the case of the Government Printing Office it was, and very necessarily so too.
275. Was that the only case in which it was done? It was done in the case of the additions to the Public Works buildings. These are the only two cases which I have had to deal with in that way.
276. Does the approval of the stone to be used in public buildings rest with you? It should do.
277. Then is your decision subject to revision by the Board of Reference? Not in a matter of that kind; it is subject, of course, to the approval of the Minister.
278. But the Board of Reference recommends in such cases? The Board of Reference does not go into matters in connection with the carrying out of any work, only the preliminary arrangements.
279. Supposing that two competing quarry proprietors tendered for the supply of stone for this work, and you recommended that the tender of Mr. A. be accepted, would this come before the Board of Reference before it was absolutely approved of? Not necessarily.

W. L. Vernon, Esq. 4 Jan., 1896.

280. But as a usual thing do not such matters come before them? No. That is left with the Engineer or the Architect, who must use his judgment as to which is the best material. But in a case of this kind, where a large amount of material is involved, I should certainly get the advice of the Board of Reference as to what course I should take.
281. The work now going on at the Government Printing Office is being conducted on the day-labour system? Yes.
282. Under the supervision of your officers? Yes.
283. That is almost a new departure? It is as regards works of any size.
284. That is the result, not of any action of yours, but of Ministerial action? Yes.
285. Which system would you recommend to the Committee as the most efficient in the public interest—the contract system or the day-labour system? I should prefer to call for tenders, but not in the open market. I should prefer to have had a list of *bonâ fide* contractors, and to let them tender.
286. Your experience shows that it is better to deal with a man who has proved himself a well-qualified contractor than to carry out work by day labour? Yes; then I can put all the responsibility upon one responsible man. With day labour it is not quite so easy to do that. As you have raised a question of day-work, I should like to say that so far it has answered the purpose for which it was intended extremely well. We necessarily have the best work in carrying out the day-work system, and we have been fortunate enough to get a good set of workmen. Beyond that, it has been an immense amount of trouble and anxiety to carry it out.
287. It has transformed your Department into a sort of labour bureau? I do not mind that, but the responsibility is too great for us to have many of these jobs.
288. Does it not add considerably to the cost of supervision? I think so.
289. You require more clerks of works and foremen? I require a foreman, which the contractor would perhaps require too. It undoubtedly gives the officer a great deal more work, and brings us into dealing with money matters, which I do not care to have to deal with at all.
290. I suppose you have never had any trouble in carrying out the work submitted to you, so far as obtaining fair competition from a decent class of contractors was concerned? Unfortunately, since times have got so bad, and the building-contractors' business has become so demoralised, we are subject to receiving tenders from anyone who likes to send a tender in.
291. But you have a certain number of men, recognised builders and contractors, who are capable of carrying out any work? Certainly.
292. Your difficulty is in dealing with a man who has tendered too low? Yes; and it prevents good men from tendering.
293. Is it not a fact that there is a parcel of small contractors who have been in the habit of tendering for public works at prices at which you knew they could not honestly carry out the contract? Yes; every day.
294. Would you recommend that the advice of the Government Architect, or of the head of the Department, should be taken by the Minister before these tenders are accepted;—that in all cases the absolute acceptance of the lowest tender is not a good principle? Unless the Government could establish some arrangement by which contractors who have proved themselves capable of carrying out works properly were put into a list and allowed to tender, then, of course, we would naturally take the lowest tenderer; but until some discrimination is shown in admitting men to tender there will always be a great difficulty in getting work done properly. Not long ago I let a small contract to a bookmaker. I think he never went near the job once, but he made a little profit out of it. That was an absolutely wrong thing, but I had no power but to recommend the acceptance of his tender because it was the lowest.
295. Was not that a case in which the functions of the Board of Reference should have been exercised? No.
296. What are the functions of the Board of Reference? There are a great many points in connection with tenders which the Board of Reference must take up, and the Board often has to determine by close investigation which is the lowest tender, but unless there is something against a man in the shape of dishonesty or failure to carry out a former contract, the Board would not pass him over; if they did, the Minister would not under the present system.
297. Who are the members of the Board? The Engineer-in-Chief for Public Works, the Engineer-in-Chief for Railway Construction, the Under Secretary for Public Works, the President of the Water and Sewerage Board, and myself.
298. You have been compelled to accept the lowest tender when you knew that the tenderer could not carry out the work at the price? Yes.
299. In a case of that sort would not the Board call the attention of the Minister to the fact? We do so in a very clear case, but in others, although we may have a very strong opinion of our own, there may be no alternative but to recommend the Minister to accept the lowest tender.
300. Do you take a guarantee in the shape of a cash deposit? We do, unless the tender is below a certain amount.
301. What is the limit? The limit is £150.
302. Does the amount of the guarantee rise in proportion to the work tendered for? We take from the contractor such deposit, equal to 5 per cent. of the amount of his contract in the first instance, and then on his commencing his work we deduct a graduated sum from his payments until it rises to another 5 per cent., so that in the course of time we have 10 per cent. on the contract in hand, and that is not disbursed until the work is finished. We have a large number of small contracts under £150, but it is considered rather hard on men of small means to force them to pay a deposit, and in those cases we do not enforce any cash security.
303. Is it not a fact that tenders were called for the work at the Government Printing Office, and that a number were received by the Department? Yes.
304. Were they far over the estimate when they came in? No; I recommended the acceptance of the lowest tender, and I think the Board did.
305. That recommendation was afterwards overridden in favour of the present system? We had instructions not to accept a tender, but to carry out the work by day labour.
306. Was that after the contractor had been notified? No; that would have been an acceptance.
307. Does it not seem rather hard to ask contractors to waste a large amount of time, and in some instances to go to great expense, to make up an estimate, and then to coolly adopt another system? I take all the care that I can not to give contractors unnecessary trouble.

W. L. Vernon, Esq.

14 Jan., 1896.

308. But, as a matter of fact, it does give a large amount of trouble? In exceptional cases like that it does.
309. Have you heard that, owing to what the Government did in that case, the same course has been pursued by private companies? I should be sorry to find that it would have that effect, because it was a very wrong thing to do.
310. Can you tell us what was the amount of the lowest tender for the Government Printing Office? It was about £10,000.
311. As the work is progressing at present, will it be carried out under or for that amount? I am assured by my officers and my own observation that it will. We are taking every care that it shall be.
312. I suppose you admit that it costs your Department a larger amount for supervision under this system than under the other? No; not more, except that we pay a foreman of the work directly. Of course, if the work was built by contract, we should not. I have one extra man in the office, and I think we give him about £3 10s. a week.
313. It is costing you about £300 a year more? Possibly.
314. Do you propose to use in the whole of this structure hardwood timber? We do not use hardwood for the constructional portion of the work, such as joists and rafters.
315. Is it not becoming the practice to substitute Oregon timber for hardwood, as being cheaper and lighter for the walls? That has been the case for many years. In some cases you cannot use Colonial hardwood.
316. As a matter of fact, are not Colonial hardwoods liable to shrink? Yes, and to warp—some, but not all.
317. Is it not a fact that as soon as you take a shaving off blackbutt it shrinks? Yes.
318. And the consequence is that it tears away the skirting from the floors and the walls? Quite true.
319. Would it not be better in such cases to use lighter timber? No. In a building like this we put what are called double claws, and by that means we can reduce the scantling, and, therefore, reduce the shrinkage.
320. How do you propose to cover the roof of this building? We shall put concrete on the fire-proof room.
321. I am speaking of the building shown in pink? That will be all concrete.
322. What is the idea of that? Because it is a permanent public building, and where we can use solid material we use it in preference to anything else.
323. What is your concrete composed of? Some of bluestone, some of coke.
324. Have you tried a concrete roof upon any other public building? Yes. We have it on the late additions to the Public Works Department.
325. You are not having a slate roof? No.
326. What is the objection? It is to be fire-proof.
327. You told Mr. Hassall that the girders were to be of iron? Yes.
328. Do you think that ironbark girders in the case of fire are safer? Ironbark girders are a splendid substance, but you cannot use them everywhere, and you could not construct a fire-proof floor, except very clumsily, with ironbark girders, because you would require such big scantling.
329. Is it not safer than iron where a fire takes place, and water is played on it? In some respects it is.
330. Ironbark will last for nearly all time? No; unfortunately, the white ants get into it.
331. *Mr. Black.*] I think you said that the elevation of the present building was about 30 feet higher at one extremity than at the other? Yes. I think the pavement at the corner of Macquarie-street is 30 feet higher than in Phillip-street.
332. And between the two extremities in Macquarie-street there is a fall of 15 feet? No; about 8 feet.
333. Then, if you added other stories at the top of the present building, you would require to add about two stories between Phillip-street and Macquarie-street? Yes.
334. If you added four stories on the corner of Macquarie-street you would require to have six or seven stories on the building on the Phillip-street side? Yes.
335. Seeing that there is to be a reduction of the work carried on in the Custom House, would there not be sufficient space saved there to give room for some of the work of the Treasury to be done at the Custom House? I can only tell from papers that come to me from the other offices. The other day I received a requisition from the Custom House people to build another wing at the back of their building.
336. I believe that the operations in connection with the Land and Income Taxes are to be carried on there? Yes.
337. This fire-proof room is on the ground-floor? There is a space underneath; there is a great fall from Macquarie-street down towards the tram.
338. What duties will be carried on in the room above the fire-proof building? There will be nothing over it; it runs the whole height of the building, and it will have a gallery so arranged that one officer can see all the clerks in the place.
339. With regard to the danger from the trams if the office were removed to the other side of the tram-line;—if that minimised the danger to people coming from the west, would it not increase the danger to people coming from the east? It would, naturally.
340. It would not affect the general traffic at all in any case? Not appreciably. The isolation of the strong-room would not be so complete as it would on the present site.
341. With regard to the matter of day-labour, is it proposed to carry out the proposed alterations by day-labour in this case;—I suppose that could be done with the tools now being used at the Government Printing Office? We have had to get a certain amount of plant which would be available.
342. And in the event of no more Government works being carried out by the day-labour system that plant would be useless? We should have to sell it—it consists of cranes principally.
343. You have told Mr. Cameron that as far as you know the only increased expense in regard to the works at the Government Printing Office on the day-labour system is the hiring of one supervisor, whose salary, at the outside, is not more than £300 a year? I have a clerk in the office and a working foreman on the work; but we have more responsibility in the office.
344. Do you think that that salary is representative of the profit which would have been made if the work had been carried out by contract? In ordinary times the contractor would be entitled to a profit of 10 per cent. or 15 per cent., but in these times contractors, I am afraid, are making no money at all.
345. What was the amount of the contract? About £10,000.

W. L. Vernon, Esq. 14 Jan., 1896.

346. So that, estimating the profits at 10 per cent., the contractor would have gained £1,000;—therefore, deducting from that supposititious profit the £300 or £400 extra cost to the Department, it leaves a saving to the Department of several hundred pounds? I think that in this particular case the Minister did a wise thing, because we are carrying on the whole work without disturbing any one workman in the Government Printing Office.

347. *Mr. Cameron.*] Supposing a contract had been let, could you not have made an arrangement for the contractor to do without disturbing the workmen? We should bind him tightly in every way; but we could not forsee everything, and I am afraid we should have had some claims.

348. *Mr. Black.*] You prefer the contract system to the day-labour system, because you can fix the responsibility upon one man? Yes.

349. Is it not a fact that the contractors have managed to evade their responsibilities? Not if we could help it.

350. But is it not possible that work may be scamped through the negligence of Government officials, and bad material put in? I am afraid that is too apathetical a question for me to answer.

351. Have you heard of green material, in the shape of doors and windows, being fixed into schools in school contracts, and of the doors and windows shrinking and the roofs letting in water? I do not know of any special case.

352. *Mr. Cameron.*] In this case are not the Government obtaining supplies of materials from contractors? Yes.

353. *Mr. Black.*] But if the Government carried out their own works could they not find means of obtaining material without the intervention of other parties? It would be very difficult.

354. Are not the sources from which contractors obtain material just as open to the Government as to the contractors;—are not the forests and quarries of the country more open to the Government than to any private individual? Certainly; the Government have a large amount of Crown lands which they can utilise, but they provide but a small portion of the requirements of a building. There is an enormous number of items which are to be made or imported.

355. Have you not heard complaints from the people of Balmain and Redfern in regard to their school-buildings? I have nothing to do with schools.

356. Have you not heard of cases in which small contractors have received full payment and left the country without paying their workmen? Officially I do not know of any such case. Every day I am dealing with cases in which contractors have not made all their payments. To some extent it is our duty to see that they are made.

357. *Mr. Cameron.*] Your officers interfere to see that the men are paid? No. When we get orders to pay merchants and others we have to be very careful how we go to work. The Minister has on several occasions, when wages were not paid, ordered that they should be a first charge on the balance due to the contractor.

358. *Mr. Black.*] Supposing that the contractor has been fully paid, and he deceives his men and leaves the country without paying them, the Government could not be expected to pay those men? No.

359. *Mr. Cameron.*] But you never pay them up fully before the work is completd? No; we always keep some money back for a reasonable time.

360. *Mr. Black.*] With regard to the question of day-labour, I suppose there is a considerable amount of expense in calling for tenders and examining them? No. There is a little advertising, but it is very small; it is in the *Gazette* principally.

361. Do you not advertise in the country papers? To a very slight extent to what was done formerly.

362. You have been asked whether it was not a fact that private people were now following the example of the Government, and doing their work by day-labour? I think I heard of a case, but I cannot recall it to mind. People do call for tenders to see what works will cost. It is a very improper thing to do.

363. *Mr. Hoskins.*] Can you say whether there is sufficient space on this site to enable two buildings to be erected for the Treasury and the Mines Department? I think you could get the accommodation by going upwards, but you would have to go very high, and you would not get it at a moderate elevation.

364. They have eighty clerks in the Treasury? They have 161 in the Mines Department.

365. There would be sufficient room if the building was made higher than the Treasury building is now? I suppose it is possible, but I do uot think it would be advisable.

366. Your estimate is for a building with a stone front? Yes.

367. What would be the difference between the cost of a building with a stone front and a brick building? The difference between plain stone and double-pressed bricks is very small.

368. If the building were carried out as you propose, do you not think there would be great danger owing to the proximity of the trams? I think there would be great inconvenience, but I look upon it as only temporary. Every time they open the windows from the Treasury they are inundated with a dust from the motors, but I think that difficulty will be lessened by the new building.

369. Will there not be danger of fire from having the trams so close to the building? There is some force in that, as the locomotives are always firing up there.

370. You stated that the floor-space allowed for each clerk in the Government buildings except the Treasury is 146 feet;—is not that an unusually large area? I do not think so. In the banks I think you will find there is more, but it is larger than the space allowed in merchants' offices.

371. Is it not a fact that in the Public Works buildings and other large Government institutions clerks of no great standing in the Department have separate rooms, thus preventing supervision? That is so.

372. Could you not design such buildings so that there would be more effectual supervision over the clerks? Yes.

373. That would economise floor-space? It would. In preparing that sketch for the Mines Department I pointed out in my report that it is essential that each branch should be in one room only, and by that means floor-space would be economised. In practice, however, I find that however large the rooms are, partitions begin to rise up in all parts.

374. Has not that practice caused the buildings to be much larger than they need have been? Yes, I think it has; and it has lessened the supervision. We are trying to avoid all that in these new buildings.

WEDNESDAY,

WEDNESDAY, 15 *JANUARY*, 1896.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

The Hon. JAMES HOSKINS.	ANGUS CAMERON, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	THOMAS HENRY HASSALL, Esq
HENRY CLARKE, Esq.	GEORGE BLACK, Esq.

The Committee further considered the proposed Additions to the Treasury Building.

Walter Liberty Vernon, Esq., Government Architect, sworn, and further examined :—

W. L. Vernon, Esq. 15 Jan., 1896.

375. *Vice-Chairman*,] I believe you have some papers to submit? I was asked to submit two or three papers yesterday, and I put them in now. The first is a plan of the lands in Bridge and Phillip Streets, on which it is intended to erect the Mines Office, and on which are the present Local Government Board Offices.

376. Will you state the different frontages which will be occupied by the proposed new building? The frontage of the new Mines Office to Bridge-street will be 113 ft. 6 in., and to Phillip-street 105 feet.

377. Will you state the superficial area that would be occupied by the Department? It is 10,250 feet. That includes an area in the centre—the staircases, and corridors. It is not all actual office accommodation.

378. Can you say how much of the 10,000 feet will be appropriated by the officers on each floor? 4,568 feet of office space on the upper floor.

379. What about the other 6,000 feet? The whole site is 10,250.

380. But what use will be made of the difference between 4,000 and 10,000 feet? A portion is taken up by the central area, and there is another percentage for corridors, thickness of the walls, lavatories, staircases, lifts, and areas.

381. Would it not be possible to utilise any portion of that 6,000 feet for office accommodation? We are doing the best we can to do so on our sketched plans. I know that the difference on paper looks a great deal, but as it happens it is a most economical plan as regards corridors—one of the best that we have had to deal with. There is a very great difference between the area of a site and the area that you can use in a case of this kind.

382. I dare say you have observed the different banks in the city? Yes. In the banks most of the space available is used for office accommodation, provision being made for a large central office. The banking chamber is direct from the street, and there is no waste, but the back premises of the bank will show the same percentage of waste or of unoccupied space that you will find in this building.

383. Is there any reason why the Treasury should not be designed upon a somewhat similar plan to that pursued in banking establishments? The Treasury buildings will have a much larger percentage of office floor-space than the Mines Department. In the Treasury you are getting a more economical building in that respect than would be in the Mines.

384. How many storeys will there be in the proposed buildings in the Mines Department? Four, including the basement.

385. And what will the total cost be? £18,500.

386. What material do you propose to use? It is intended to use plain stone, but I think it is most likely that it will be brick and stone.

387. Do you propose to use stone in the front elevation? If I can—rough-faced stone.

388. Have you estimated for stone or for brick? I have estimated for brick.

389. Assuming that you use stone, what will be the difference in cost? I hope there will be no difference. The estimate was made some time ago, but I think it possible that I may obtain a tender for stone at my former estimate for brick.

390. *Mr. Trickett.*] Have you any other document to put in? I was asked yesterday the cost of the plant used in connection with the Government Printing Office, and for a schedule of the wages paid there. The plant which we have had to purchase cost £312, to which I must add the cost of a temporary workshop, £150; the loan of a steam crane from the Harbours and Rivers Department, which I have not valued at all; £215 worth of lead and iron for weighting the cranes, which, of course, is only money held in suspense. It is not a purchase. All these added together make a total of £677, of which £215 is recoverable any day from the metal merchants. The schedule of wages is as follows :—Foreman, 15s. per diem; assistant foreman, 12s. per diem; carpenters, 9s. per diem; bricklayers, 10s. per diem; masons, 10s. per diem; foreman mason, 11s. per diem; plumbers, 10s. per day; foreman plumber, 11s. per diem; painters, 9s. per diem; crane driver, 9s. per diem; slaters, 10s. per diem; labourers (while hod-carrying), 8s. per diem; labourers, 7s. per diem.

391. How do they compare with the current rate in the labour market? As far as we can ascertain they are rather high.

392. Who fixed the rate of wages, yourself or the Minister? I fixed the rate with the Minister's approval. My instructions were to pay good wages to good men.

393. To these items you have to add the cost of clerical assistance in your own Department? Yes. I have one extra man at £3 10s. a week.

394. How does this system of carrying on the work at the Printing Office compare as to time with the way it would be done by tender? I do not think that I save time by daywork as compared with what could be done by a good contractor, but as regards a second-class contractor, I consider that we are doing the work more quickly. I can command materials at any moment, and I know that many contractors cannot.

395. How long has this job been in hand? Between three and four months; it is about a twelve months' job.

396. I suppose it is necessarily a little longer by reason of its being an alteration job? Yes; we have to work at a great disadvantage to save the Government Printer; we are dropping columns through two floors down between his machines, and we are not interfering with his men. That all means time.

397. *Mr. Cameron.*] Do not you think that there are plenty contractors in the country who could carry out that work with the same regard to care and safety under your directions? Undoubtedly there are some contractors who could do it.

398.

W. L. Vernon, Esq. 15 Jan., 1896.

398. *Mr. Trickett.*] Coming to this Treasury work, is not the alteration of a building always unsatisfactory and expensive? Not always; it is in many cases.

399. In this particular case, do not you think, after all, that it is almost an undesirable way to tackle a great public building to alter it in the way proposed;—would it not be better to have a new building? In this case I hardly think so.

400. Will you tell us why? Because we are not touching the permanent original building at all. We are adding to it two large additions on vacant ground. We are not destroying what really is a handsome building. It has certain defects inside which may have to be altered at some future day, but it is not like many buildings in Sydney, which could not be touched without pulling it down over your heads.

401. How many rooms will there be in the building when it is altered? I will put in now a plan of the complete building, which was asked for yesterday. (*Vide Appendix.*)

402. According to a memorandum handed in by Mr. Kirkpatrick, there are twenty-three rooms in the present building;—will you tell the Committee how many rooms there will be when the proposed additions have been made? When the new building is completed there will be only fourteen rooms—five on the ground floor and the remainder on the first floor, with a much larger floor-space, of course.

403. And in every way more convenient? Yes.

404. You hand in plans showing what the building will be when the proposed alterations are carried out? Yes.

405. The estimated cost is £22,500;—does not that seem a rather large sum compared with the £18,000, which you think will be sufficient to erect a Mines Department and the Local Government Offices, which are to have four storeys and a basement? No; not when one considers the difference between the two buildings.

406. What is the difference? There is the fire-proof room in the Treasury, which has, of course, the same architectural front towards Macquarie-street that the present building has, and also the very high facades and the fire-proof construction throughout, including the iron gallery and concrete roof. That must necessarily cost a great deal more than a building with smaller spans, with wooden floors and an ordinary slate roof.

407. I suppose that the ceiling of the fire-proof room will be a heavy item? It will.

408. Will you detail its construction? I cannot give you the scantling. It consists of a series of longitudinal girders crossing the area of the roof, and a number of iron columns going from the bottom to the top, carrying a gallery.

409. And those will be sustained by concrete piers? They are all concrete piers on the base. Those longitudinal girders are crossed again by smaller girders, and from joist to joist is carried a concrete arch, covered with ashphalt.

410. It will not be a flat ceiling? No; I propose to show the whole of the structure, not to hide any of it at all.

411. Is that the most modern way of constructing fire-proof ceilings? The present mode is not to put in any false ceiling, or any woodwork, but to let the construction show for what it is worth. The gallery floor is constructed in a precisely similar way, and also the ground floor. The windows will have iron frames, and it is proposed to have iron shutters, possibly with hydraulic motive-power. We have made provision for something of the kind, to simultaneously close the whole of them every night.

412. These iron shutters are very heavy items? Yes; I have provided the difference between £18,000 and £22,000 to cover it.

413. Then the shutters will cost £2,000 or £3,000? I think not quite £2,000.

414. *Mr. Cameron.*] Can these be manufactured in the Colony? Yes. We have had a strong-room at the Lands Office fitted up entirely with steel fittings—the very large building.

415. *Mr. Trickett.*] Will a room of that kind be sufficient to provide ventilation for the clerks?' Yes; and it contains such a large cubic space of fresh air that that alone will be a guarantee, and in addition to that we have the windows.

416. What will be the height of the ceiling? The ground floor is 18 ft. 1½ in., and the second floor about 19 feet—that is, the gallery.

417. Will the room be 37 feet high? It will be close upon 40 feet high.

418. How wide would the galleries be? From 12 to 18 feet—they vary.

419. Then this strong-room or office will be the whole height of the building? Yes; the room is 60 feet by 52 feet in area.

420. Would it not be rather inconvenient for all those ledgers to be kept upstairs when the public, who require information, will be at the counter down below? I understand that it is proposed by the Under Secretary to only temporarily occupy the gallery with the conditional lease ledgers, and when the second portion of the building is constructed to bring the Accounts Branch on to the first floor, and to allow its expansion into the gallery. The whole of the ledgers will be on the ground floor then.

421. Have you been in communication with the tramway authorities at all as to the future working of the tramway system, and whether it is likely to be kept in its present place? Sometime since I recommended that communication should be made to them, but that was in reference to the very dangerous way in which the coal and coke were stored at that time, and I also pointed out to the Under Secretary for Finance and Trade that no opportunity should be lost of endeavouring to get the Commissioners to make some alteration altogether, because I understood from him that the tramway was only on that piece of ground on sufferance.

422. Would it not be very desirable to get the tramway depot removed from there? Undoubtedly.

423. We were told by the Under Secretary that they are afraid to open the windows on account of the dust and smoke, and the same objection will exist with regard to the new building? Yes; I have here a report of my own written in 1894 upon this matter. In that report I said:

> In dealing with this matter comprehensively a very great stumbling block presents itself through the position taken up by the tramway terminus, which cuts the land intended for Treasury purposes into two angular portions, and so obliquely as to quite prevent a reasonable scheme being carried out. It is extremely desirable, from the point of view of an economical and properly-arranged Treasury building, that some definite understanding should be come to with the Railway Commissioners as to the entire removal of the terminus in question.

That report seems to have gone to the Treasury, and Mr. Kirkpatrick put this minute on it:

> Before sending on these papers perhaps I should communicate with the Secretary to the Railway Commissioners especting the necessity for the removal of the coke store in Bridge-street.

Mr.

Mr. Lyne, who was then Minister for Works, wrote on the report, the words "Carry out at once."
424. *Vice-Chairman.*] Nothing has been done from that time? There has been constant communication, and several schemes have been proposed.
425. *Mr. Trickett.*] Has the coke store been removed? It has been roofed over, and the coke is now brought in bags instead of being brought loose as it was formerly.
426. Will you have any windows facing the tramway terminus in the new building? We shall have eight windows—four on each floor.
427. Is that not rather a weak point in your scheme? Not necessarily, because those windows having iron frames, there would be no occasion to open them. For the sake of appearances outside I was bound to break up that large wall, and also to distribute the light equally in the room.
428. So that these windows can be used for light; but you would have sufficient ventilation without opening them? Quite so.
429. I suppose you have not been consulted generally by the Government as to the whole of the public buildings and the places available for public purposes? From time to time I have been instructed to report upon the subject for one Department or another, but not as a whole.
430. Have you gone into the matter sufficiently to be able to say that there is not at present in any large public buildings such as the Lands Office sufficient available space for Treasury purposes? At present there is not.
431. Have you been consulted at all with regard to the utilising of that fine block of land occupied by the Public Instruction Department? I have not.
432. Those are very old buildings are they not? Yes; some of the oldest in Sydney.
433. I suppose for you to give us an opinion as to the possibility of utilising the Treasury buildings for the Public Instruction Department, and the erection on the site of the Public Instruction Department of a fine building for the Mines Department, the Local Government Department and the Treasury, would require some time? It would necessarily.
434. Does not that strike you as a very fine site for a good public building? It does. There is only one defect, and that is the steepness of Bent-street, otherwise it is an admirable site.
435. That objection applies to these other sites? Yes; to nearly all of them.
436. You say that the building which is to be used for the Mines and Local Government Department will consist of four storeys? Yes.
437. That will be a very large building, will it not? Owing to the very rapid fall of the ground in Bridge-street, one story can be obtained in the fall of the road itself; therefore, from Phillip-street the building will have the appearance of only three storeys, but from Bridge-street four storeys. I might perhaps explain that the requisition for space given me by the Mines Department gave a superficial area of 134 feet per officer; but I consider that I have got them all the room that they can reasonably ask for at the rate of 114 feet per officer, and that is done by putting each branch in one room only.
438. Will you tell us how many clerks you were instructed to provide for in the Mines Department? The instructions did not state the number of clerks. But some time ago I was instructed to ascertain if the Mines Department could be accommodated temporarily in the Lands Office. I then made a room to room examination of the Mines Department, and I found that there were 161 officials employed there.
439. Looking at the necessities of the case, do you think that the proposal now before the Committee is the best for carrying out the improvements required? I am of that opinion, and it has taken from the beginning of 1894 to arrive at it. It has been arrived at through a long series of plans of every description, in which endeavours have been made to get additional accommodation in all ways. This is the result of a large number of different designs.
440. But all the inquiries have been directed to one thing; that is the alteration of the present building? Yes; I never contemplated the removal of the Treasury from that building.
441. *Mr. Hoskins.*] Has the money for the new building for the Mines Department been voted by Parliament? Yes; quite recently.
442. Were you instructed to prepare plans for the building for the Mines Department, and also for the Local Government Department? No; not for the Local Government Department.
443. Do you intend to adhere to the statement that you made to Mr. Trickett, that in the erection of the Mines Department there would not be such a large number of offices as there is in the old building, but large rooms in which clerks would be employed under proper supervision? That is the scheme which I have strongly recommended, and the sketch plans were based on that recommendation.
444. Has it received the approval of the Minister? It is now before the Minister for Mines and his officers for their approval.
445. Your object in making a design of that kind for large rooms is to give efficient supervision, and at the same time a sufficient amount of space for the clerks? Yes; in reporting upon this preliminary in July last year I said this:—

> It will be necessary for the sake of economy to inaugurate arrangements by which branches and sub-branches will accommodate themselves each in one room of sufficient area, and not in a series of small separate rooms as has hitherto been the custom.

446. *Vice-Chairman.*] Do you know how many officers at present occupy the Public Instruction Department? I do not.
447. Have you been through the building? I have only visited the Under Secretary and the Minister.
448. Would not that be an admirable site for the Treasury and also for other Departments? It would be an admirable site, but one ought to see the thing on paper before giving an opinion.
449. Have you any idea of the land available there? I think the area is about the same as that of the Lands Department. It will be a little shorter in the Bent-street frontage.
450. Would not that be free from the objection with regard to the trams? It would.
451. Would it be as convenient for the public? Equally.
452. Would it not be more convenient? It is nearer to the centre of the city, but it is not nearer to some of the other Departments, which have constant communication with the Treasury.
453. In estimating the cost of the Mines Department, did you take into consideration that you would have to provide accommodation for 161 officers? I did.
454. And you propose to provide a new building with a stone exterior to accommodate 161 officials? I hope so; I will not say for certain.

W. L. Vernon, Esq. 15 Jan., 1896.

455. At a cost of £18,500; and the alterations to the Treasury where the whole staff does not exceed eighty individuals will cost £22,500? That is so; it is a different class of building.
456. Cannot the two Departments be combined at a less cost than the two sums and sufficient accommodation provided? No; in dealing with the Treasury extension the accommodation of the Treasurer and the Ministerial Branch has not been considered. In putting up an entirely new building, you would have to provide accommodation which is already contained in the permanent building.
457. You said you would require 15,000 feet of floor-space for the Treasury? We are providing 15,000 feet in the alterations.
458. I think you said altogether? Then I ought to correct myself. What I intended to say was that the floor-space secured by the alterations, and including the alterations of the floor-space in connection with the Correspondence Department. The Treasurer and the Under Secretary do not come into the calculation at all.
459. Can you say what will be the total floor-space available in the Treasury with the alterations? I should have to calculate it.
460. What floor-space have you provided for the 161 officials connected with the Mines Department? 18,273 feet. Of course that is subject to the approval of the Minister for Mines.
461. If you provide 18,000 feet for the Mines Department with 161 officers, will it be necessary to provide more than that for half the number of officials in the Treasury? It will be necessary to provide more, because I could not consider the superficial contents of the fire-proof room, so far as the officers were concerned. I had to consider the room for the ledgers.
462. What space have you provided for each individual in the Mines Department? 114 feet.
463. What space in the Treasury? 136 feet per individual. I cannot reckon the floor-space in the Treasury per officer. I reckon it upon the desk-space, and that has thrown me out of my calculations altogether; but it is absolutely necessary that it should be done.
464. Do you think that if you had the design of a building suitable for the Treasury and the Mines Department, you could design a building which would be in every way more suitable and less costly than the carrying out of the two proposals before us? I do not think I could get the two on the ground coloured pink on the plan except the Local Government Board offices site was included.
465. Taking into consideration the whole site, assuming the whole site to be available? Then I must provide for a complete Treasury, a complete Mines Department, and a complete Local Government Board office.
466. With an approach or entrance in Elizabeth-street? I hardly like to give an opinion upon it at the present time; it is a big thing to do. It would be possible to get the three on to that site by putting one on the top of another, but it might not suit public business.
467. Do you not think that the ground occupied by the Public Instruction Department might not be made available for the Public Instruction Department, the Mines Department, and the Treasury? I could not say.
468. You have not considered that? I have not.
469. All that you have considered in connection with the proposal now before the Committee, I presume, is an alteration of the Treasury buildings to provide fire-proof offices? Yes; and additional accommodation for some of the other officers, better accommodation for the accountants and for the public. I should like to point out that in constructing the new fire-proof room it is necessary not to interfere with the accountant's branch in their temporary building. This condition fixed the size of the extension and the second portion of the scheme, into which the receiver, the public, and the accountant will eventually go. I give that as a reason why the receiver's room is of that particular dimension.
470. *Mr. Clarke.*] If the building now used in Young-street for the electoral offices were taken down would that give a sufficient area for a building for the Mines Department and also for the Treasury? I think it would.
471. Do you know the total frontage? The frontages vary. In Elizabeth-street it is 86 feet; in Bridge-street, 190 feet; in Phillip-street, 159 feet, with practically light on all sides.
472. Could the portion in Elizabeth-street be utilised for Electoral Offices or Local Government offices, and the other portions in Phillip, Bridge, and Young Streets, used for the Mines Department and the Treasury? It is a little difficult to say offhand. For the Treasury, I must give a large floor-space to the fire-proof room, and that takes it out of the category of ordinary buildings.
473. Can you give any idea of the probable cost of new Treasury buildings on the portion of the land I speak of? Not unless I could scheme something on paper first.
474. It has been stated that there are only eighty officers in the Treasury, and that there is double that number in the Mines Department, and the cost of the Mines Department is to be £18,500? Yes.
475. If there are not so many officers in the Treasury to start with how can the cost of the building be greater than the cost of the building for the Mines Department? The Under Secretary states that there are to be eight or ten officers in the strong-room, but he forgot to mention emergencies—occasions when he has to employ a larger number? I have provided for twenty-five officers for that room. I daresay that in the Mines Department there are a number of officers in that 161 who only partly use their offices, being employed a great deal out of doors, and who do not require so much accommodation.
476. You have stated that the site of the Public Instruction Department would be a good site? It is a very good site for any public building.
477. In the event of the Public Instruction Department being removed, would the Treasury buildings accommodate the staff of that Department? I should think not, but I do not know the internal arrangements of the Public Instruction Department. I do not think that the present offices in the Treasury buildings are fit for anybody.
478. *Mr. Hassall.*] If the officers of the Mines Department are removed from the Lands Department, will not that leave a large space in the Lands Department available for any other Department? It would. I believe that that question was gone into, but I have no official knowledge of it. The same difficulty presents itself there with regard to the fire-proof room for the ledgers. They have a large strong-room in the Lands Office, but it is almost filled up with Lands Office records.
479. Will it not be possible to erect buildings that would answer all the requirements of the Treasury and the Mines Department, and probably the Public Instruction Department, at a lesser cost than the two buildings which it is now proposed to erect, which total £41,000? I do not think it is possible.

480. You think that the proposal to make these additions to the Treasury building, and to erect a new building for the Mines Department, is the most economical? As far as the Treasury buildings are concerned, I think it most economical; as for the Mines Department, I do not know why they are going there. I simply had instructions to provide a building for them. W. L. Vernon, Esq. 15 Jan., 1896.

481. This Committee would like to know whether it would not be possible to save the expenditure of portion of these two sums of money and still provide accommodation for the Departments themselves? Some time ago, prior to the Mines Department going to the Lands Office, I was called in as between three Ministers—the Minister for Works, the Minister for Mines, and the Minister for Lands—to draw up a scheme by which the Mines Department could go into the Lands Office. The Mines Department is now cut up into several portions. They are renting premises from Gibbs, Bright, & Co. Some of them are in the old naval stores, and I think some are in the domain. I was instructed to prepare a scheme to put the two Departments into the same building. I did propose one, after an immense amount of trouble to get them both into one building, but it meant such an upheaval that nothing came of it.

482. In your opinion the proposed alterations to the Treasury are the most suitable and economical that can be devised at present? Yes.

483. *Vice-Chairman.*] Could you not make provision in one of these new buildings which you propose to erect for the Audit Department? I could; it would be very suitable to put it in the Treasury Department.

484. Do you know what accommodation would be required for the officers of the Audit Department? I do not. With regard to the return moved for by Mr. Black some time ago, I may mention that a saving of something like £3,500 a year has been made by the Works Department by dispensing with its outside offices.

485. *Mr. Cameron.*] If these alterations were carried out, and it was found desirable to bring the Audit Department within easier range of the Treasury, would you have space enough to do it? I think so, because there is all that vacant portion coloured green on the plan.

486. *Vice-Chairman.*] Do you not think it would be much cheaper to provide in one spacious building for two or three Departments instead of putting up separate buildings for each? I think it would. It would be more convenient to the public if one could begin *de novo*, but in this case I think the Treasury buildings have gone too far.

487. Would it not be more convenient to the public to have the Mines Department, the Treasury, and the Audit Office all together under one roof? I think it would be.

488. Could not that be accomplished on either of the sites to which your attention has been drawn by the Committee; that is to say, the site in Bridge-street and Elizabeth-street and the one occupied by the Public Instruction Department? I am not prepared to say without considering it.

489. Perhaps you will give the matter consideration, and before we close the inquiry communicate your views to the Committee? It means a great deal of work, and will occupy considerable time. I shall have to go into a great many particulars to ascertain what can be done.

490. *Mr. Cameron.*] I understand that it is reported in one of the papers this morning that in your evidence yesterday you favoured the day-work system as against the contract system; was that so? No; that report in the paper is incorrect in almost all respects.

491. *Mr. Hassall.*] Do you not think it would be possible to elaborate a scheme whereby all the public offices might be placed in juxtaposition to each other, so as to enable the public to transact their business without having to run all over the place. Starting with the Lands Office, could we not utilise the space occupied by the Public Instruction Department and the space at the corner between Bridge and Phillip Streets, so that we could have the public offices practically all together? I think the scheme is an admirable one. No doubt all the Government Departments could be brought into close connection with one another, except the Post Office, and the Crown Law Office which must be in connection with the Courts.

TUESDAY, 28 JANUARY, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (Chairman).

The Hon. Frederick Thomas Humphery.	Henry Clarke, Esq.
The Hon. John Davies, C.M.G.	John Lionel Fegan, Esq.
The Hon. James Hoskins.	Thomas Henry Hassall, Esq.

The Committee further considered the proposed Additions to the Treasury Building.

Edward Alexander Rennie, Esq., Auditor-General, sworn, and examined:—

492. *Mr. Humphery.*] Have you seen the plans that are now before the Committee in connection with the proposed alterations to the Treasury? I have not. E. A. Rennie, Esq. 28 Jan., 1896.

493. Then you have had no opportunity of ascertaining the proposed increased accommodation? No.

494. Can you tell me what the position of your Branch is with regard to the premises which you now occupy? The premises of the Audit Office are not altogether suitable, but we have made them so as far as possible.

495. You hold them upon a long lease? The lease will expire in February, 1897.

496. What is the rent? We are paying £1,000 a year. We occupy two houses, and we pay £500 a year for each house.

497. And the taxes, I suppose? Yes.

498. Is there any reason why the Audit Office should not be placed in the same building as the Treasury? Personally, I should not like it. When the Audit Office formed part of the Treasury buildings it was a source of great inconvenience and to some extent of annoyance because the clerks of the two Departments were continually running into each other's offices interfering with what I consider the distinct business of each.

499. Was that attributable to the unsuitableness of the building to accommodate the officers of both Departments? The present Treasury building was at first constructed to provide for both, but there was

E. A. Rennie, Esq. 28 Jan., 1896.

a dividing wall between the Treasury portion and the Audit Department. There was no communication between the two inside, but the two Departments were so close together that the clerks were always running round to the Treasury.

500. Even if the buildings were entirely separate, if the two Departments were in two adjoining buildings, you think it would be objectionable to have the Audit Office so close as that to the Treasury? Yes. And I may say that when I first went to the Audit Office, 50 years ago, the Audit Department was immediately over the Treasury, in an old building which has been pulled down. When that building was pulled down prior to the erection of the present Treasury buildings, the Treasury and the Audit Department rented two separate buildings, one in Charlotte-place and the other in Jamieson-street. We only came together again when the present Treasury building was completed.

501. You would be quite satisfied as long as you were separated by a street, but you would not like to be next door to the Treasury? I should not like to be next door to the Treasury; but if there was a strict check against close intercourse between the two Departments it might be alright.

502. With provision that there should be no intercourse between the two Departments, you think that the Treasury and the Audit Department might occupy the same building? I should not like it so well as being in a separate building, away from the Treasury, but if it was desirable that the two should be under the same roof we ought to have a distinct separation of them. There should be no communication between the two Departments.

503. I suppose that could be arranged by a regulation, could it not? Yes; as Auditor-General I could prohibit my clerks from going into the Treasury,—in fact, I have done so to a large extent.

504. If you are paying a thousand a year for rent, that is 4 per cent. on £25,000? Yes.

505. Do you not think that for less than £25,000 the accommodation which you need could be provided in the Treasury buildings? I am not prepared to say what amount would be required.

506. How many officers are there on your staff? About forty now; I reduced them during last year by six.

507. Then assuming that ample provision could be made for your staff in the Treasury buildings, with precautions against intercourse between the two Departments, you would see no objection to both branches occupying one building? I should be prepared to do so.

508. We have had some information with regard to the books which are kept in the Treasury, and the necessity to provide a strong-room for their accommodation;—would it be necessary to provide a strong-room for your Department? I can only say that my records, in my opinion, are more valuable than those in the Treasury, for there is a great deal in my records that could not possibly be replaced, whereas if the Treasury books were destroyed there would be ample means of restoring the information.*

509. Then your evidence is that there is no information contained in the Treasury which could not be supplied by your Department and other Departments of the Public Service? Quite so. Perhaps I might mention that one of the chief controversies between the Treasury and myself is as to the books for registering conditional purchases. They say, and I know it is a fact, that they have upwards of 200 of these registers occupying a large space, but my registers contain all the same information that they do, except the names of the holders of the conditional purchases. All those books are now reduced to twenty-five, and that provides for registering for the next three years, and all those books are contained in a room 20 feet square.

510. Is this your evidence: that the information contained in the 200 books in the Treasury is also contained in twenty-five books in the Audit Office? Yes; except as to the names of the selectors.

511. Then the names of the selectors are represented by numbers? Yes.

512. And how do you identify the owner with the number? I do not need to know the owner. It is the selection that is liable for the interest and the instalments.

513. But where is the number associated with the name? That is all in the Land Agents' registers in the country districts. I say it is perfectly useless to transcribe all that information into the registers of the Treasury. The connection between the numbers of the conditional purchasers and the owners is all contained in the Land Agents' registers in the different Land Agents' offices, and more than that the vouchers which the Land Agents send with their remittances to the Treasury contain the numbers and the names, and those vouchers are all filed in my office.

514. So that seeing the number of the selection in one of your registers would enable you to immediately refer to a document in the office which would give you the name and all information connected with the selection? Yes. That is quite right. I may just as well say that the name of the holder, the interest being paid only once a year, about March, may have been changed half-a-dozen times. I can only go by the last voucher which the Land Agent sends with his remittance to the Treasury. The Lands Office is the place where the latest information can be got.

515. Are all dealings with selections recorded in the Lands Office? Yes. They have a complete history of all the land selections throughout the country.

516. Is a similar record kept in the Treasury? They record all the names, and those names that are not got by them are got from the Lands Department.

517. Therefore, the information contained in the books of the Treasury is obtained from the Lands Department? Yes.

518. And that information would be accessible if you required it? Yes.

519. And all the local Land Agents have similar information to that which is recorded in the principal office? Yes. And they have more, because the great bulk of the instalments and interest is paid to the Land Agents in the different districts.

520. Does the Lands Office in Sydney receive from the Land Agents throughout the country all the information that is contained in the local offices? I do not think that the Land Agents report to the Lands Office the sums that they receive and pay in; I think they do not, but, at all events, the information is there. That is the prime source of all information in regard to transactions between the Government and the free selectors.

521. Have you any fire-proof room? No.

522. Do you not think it is necessary to have some safe room in which to keep your records? I should be very glad of it, but the question has never come before me in any serious shape. The discussion about the books and the fire-proof room led me to consider that if I had a fire-proof room to keep the twenty-five registers in it would be all the better in case of any accident, and I may say the same with regard to our lease registers, a different set of books altogether. That is to say, registers of the land rentals.

523.

* NOTE (*on revision*):—I wish it to be understood that my answer refers only to Treasury record books of receipts and payments, and not to documents and papers peculiar to the Treasury Department.

E. A. Rennie, Esq. 28 Jan., 1896.

523. Registers of the pastoral leases? All the land rentals, pastoral, occupation licenses, and everything; they are contained in about twenty volumes, all in a room about the same size as the other which I have mentioned, and they are managed by one clerk.
524. If it is necessary to provide a fire-proof room as in the Treasury, it should be equally necessary to provide a similar room in your Department, should it not? I think more so.
525. How many officers have you engaged upon the conditional purchase registers? The great bulk of the work happens to take place about March, April, and May; during that period I should put on the registers perhaps five or six clerks. The whole work connected with the conditional purchase registers would occupy the time and labour of one clerk for twelve months.
526. Can you explain how it becomes necessary to use 200 registers in the Treasury whilst you use only twenty-five? Well, I apprehend the reason is that they are obliged to spread their accounts over so large a space to provide for inserting the name. That is the only thing I know of about that. The earlier registers which the Treasury now keep were very much in the same form as mine used to be. Lately I got rid of thirty or forty of these old registers, and reduced the number to eight.
527. Do you definitely state that the whole of the information contained in the registers used in the Treasury, with the exception of the names, is contained in the twenty-five registers in use in the Audit Department? I know that that is the main difference between the Treasury registers and mine, but I should not like to say that all that they have inscribed in those books at the Treasury is to be found in mine.
528. Do your twenty-five registers contain all the information, whether in a condensed form or not, that is contained in the 200 registers in use in the Treasury? I should say that they do. We might illustrate it in this way: Supposing a conditional purchase to have been taken up twenty-five years ago; that is entered in the Treasury by name as well as by number, with the area and the annual rate of instalment. These condensed registers of mine, the thirty-eight which I said just now were reduced to eight, run up to the year 1876. The new registers instead of re-entering all that occurred before simply show in the first column the amount paid up to a certain date.
529. Your books contain all the information about payments? By the records in my Department I can tell the position of every conditional purchase account.
530. *Mr. Davies.*] What is the total amount of the balances due from conditional purchases at the present time? I could not tell you.
531. Could you not obtain the amount from the documents in your office? Certainly.
532. How long would it take you to obtain that statement? I should not like to say. There are 150,000 accounts. I could make up the amount due at the present time, and I could also compute the amount that would be due supposing that the payment of instalments were to run on for the full period of twenty-five years.
533. Perhaps you will be kind enough to do that? It would occupy some time, and my strength is not sufficient for it.
534. Before this inquiry is closed, could you do it? It would be a very long process.
535. *Chairman.*] It is in existence, is it not? I believe the Treasury have it.
536. *Mr. Davies.*] I want to verify a statement of that kind made by the Treasury Department. Supposing the Treasury records were burnt, could the information be obtained? It could be made up from my records to-morrow.
537. Do you destroy the records at any time? Some of the vouchers have quite recently been destroyed—the vouchers up to 1884, land vouchers excepted.
538. The records for the most recent dates that you have destroyed were up to 1884? Yes; the registers and books are not destroyed. My records run back to the very beginning of the office.
539. I presume that you are compelled to destroy the vouchers in order to provide space? Yes.
540. It has been the practice to destroy them after a number of years? Yes. When we shifted out of Castlereagh-street, I destroyed a very large number, going as far back as 1825. We found that they were never referred to, and that there was no reason to keep them.
541. I presume that the vouchers you speak of were destroyed under your own personal supervision? Not my own personal supervision. The first lot was sold to the paper-mills, and the last portion, quite recently, was sent to Cockatoo Island to be destroyed in the furnace there.
542. I suppose that most of the documents are brought under your notice before being destroyed? No. I give directions as to which are to be preserved and which are not.
543. In connection with your present offices, have you ample room for the conduct of your business? I would not say that we have ample room; it is the accumulation of records that requires space more than anything.
544. And you have made room by destroying them? Yes; but we keep about ten years' documents on hand.
545. Would it not be more in accord with the requirements of your Department if suitable offices were constructed, with a strong-room and every provision for the safety of the documents? Yes. One disadvantage of the present offices—in fact, of nearly all the public offices—is the multiplication of small rooms. We want large rooms where a large proportion of the clerks can be brought under the supervision of the head.
546. You believe that if proper offices were erected, where you could have a number of clerks, there would be greater economy and greater efficiency? No doubt.
547. In view of that fact, would you favour the erection of large Treasury buildings providing the accommodation which would be necessary for your Department, distinctly apart from the Treasury, although under the same roof? I should like an office built expressly to suit my purposes. I may as well say that, as time progresses, it is not at all unlikely that the work will be reduced. Certain arrangements may be made which would have the effect of reducing my work and reducing the number of my clerks, and also the space necessary. I have long felt that we have a larger establishment than the public may consider necessary for audit purposes.
548. Have you indicated the sort of reform which might be brought about? Only in a desultory way, in evidence before the Civil Service Commission.
549. You quite contemplate a change of that kind? Yes; I have no doubt that a considerable amount of difference in the work, at any rate, could be made.
550. Your Department is altogether distinct from the Treasury? Quite. We are quite independent of the

E. A. Rennie, Esq. 28 Jan., 1896.

the Treasury, and that is one reason why I do not want to be too close to them. They have no right to come and interfere, and say, "You shall do this, or that." I have the Act to guide me.
551. The Audit Act is your charter? Yes.
552. *Mr. Fegan.*] I understand that you would have no objection to your Department being at the Treasury, but you do not wish your officers to have intercourse with the officers of the Treasury Department? There should not be too close an intercourse between them.
553. What is your reason for that objection? Well; it is a very old objection—that auditors and accountants are more likely to drift into mutual advisers than to be mutual checkers.
554. I understand you to say that strict intercourse would cause a suspicion as to the competent working of the Department? There has been unsatisfactory feeling about it.
555. How many rooms are there in the two offices that you have now? I could not say just at once.
556. Are all the rooms occupied? They are.
557. Do you find any inconvenience from being away from the other public offices? Not the slightest.
558. I suppose you have nothing whatever to do with the public? No.
559. That being so, it makes your business different from that of the other public offices? Quite so.
560. Have you heard of any complaints being made as to the necessity for more accommodation in the Treasury? I cannot say that I have, except from themselves.
561. How many clerks have you under you? About forty. I think the Treasury has double that number.
562. I suppose the work of your Department is extending every year? During the last two or three years it has not been so heavy. I think that is owing to the limitation of expenditure.
563. I suppose that at one time you had to deal with the Railway accounts? I have to deal with the Railway accounts now, just the same as the accounts of any other Department.
564. Since the Commissioners came into office? Just the same.
565. I understood you to say that it was useless for the Treasury Department to transcribe certain information because it could all be obtained elsewhere? I say it is useless.
566. Therefore it would not be a national calamity if a fire took place and destroyed the Treasury books? Certainly not.
567. Information could be got at your office at a very little expense? Yes; and if anything should be found wanting in my Department it can be got from the Land Agents.
568. Do you think from your knowledge of the various Departments that room could be found in some of the other offices for these Treasury books? It has been my opinion for years that if those books are kept at all they should be kept in the Lands Office.
569. You think that those books in connection with the lands should be at the Lands Office—not at the Treasury? Certainly. I hold that the Secretary for Lands is the landlord for the Crown, and he ought to have all the information there that a landlord should have.
570. Do you know whether, in the Lands Office, they have books similar to those kept at the Treasury? I think not. I am pretty certain that they do not keep registers of conditional purchases the same as the Treasury, because the Land Agents are officers of the Lands Department, and all the information is in possession of those Agents throughout the country.
571. Are those Land Agents supervised by Treasury officials? Treasury inspectors go round now and again and inspect the different offices.
572. Therefore, they are really under the Treasury, to a certain extent? Yes; but they are officers of the Lands Department nevertheless.
573. It appears that they are officers of the Lands Department and officers of the Treasury? They become officers of the Treasury because they are the Agents of the Lands Department for collecting the money, that is, public accountants under clause 1 of the Audit Act of 1870.
574. Do you think it would inconvenience the selectors if the books were removed from the Treasury to the Lands Office? No, I do not see how it could, except that now a banker or an agent in Sydney, gets instructions from a selector in the country, to come and pay over his money at the Treasury counter; but I hold distinctly that it is a mistake that the payment of these moneys should be optional either at the country office or at the Treasury. It ought all to be paid at one place. It will simplify matters immensely.
575. You would make it necessary that the money should be paid into a certain office in the district where the selector has his run? I think that would be better.
576. You think that would do away with a great deal of work? A great deal. The Treasury have to make an abstract of the money which they receive over the counter, and send it for inscription in the country offices. That is an absurd proceeding.
577. I suppose that the Lands Department is not responsible altogether for the payment of this money to the Treasury? No, I cannot say that they are. Under a proper arrangement the Land Agents ought to collect the money for the Lands Department.
578. And only deal with the Lands Department? Yes.
579. And they should have nothing to do with the Treasury? Only in making remittances of the money which might be done through the Lands Department.
580. Do you think that would economise time and office room? That is my opinion.
581. *Mr. Clarke.*] You said that the names of the selectors are not in your Department, only the numbers? That is in my registers; but I have all that information on the vouchers.
582. You approve of the selectors' balances being paid at the Lands Department instead of at the Treasury? I think that is the better way.
583. In that case would not the Lands Department have to send the money to the Treasury then? Ultimately all money must go into the public account, whether at the Treasury or at the Bank.
584. Would not that cause more trouble to the public? I do not think so.
585. What reason do you give why the money should be paid to the Lands Department instead of to the Treasury? Simply that I hold that the Lands Department represents the Crown and it ought to collect and account for all moneys derived from land.
586. Then how would you manage with the money received from the country from the various lands offices? They could be sent to the head office in Sydney just the same as they are now sent to the Treasury.

587.

E. A. Rennie, Esq. 28 Jan., 1896.

587. Is not all revenue paid into the Treasury? It all comes to the Treasury in some shape or form ultimately. There are about 3,000 schools throughout the country, and all the money from those schools is sent down to the Public Instruction Department, and that Department pays it over in one sum to the Treasury monthly.
588. As a rule is not the money from other sources, such as publicans' licenses, paid into the Treasury? That is a special thing. The customs duties are all paid into the Bank, the money not going into the Treasury at all, and the money from the railways is paid into the Bank, but it all goes into the public account.
589. Are those accounts audited by you? Yes; all vouchers for both revenue and expenditure come under my notice.
590. Do you not think it would be advisable to have the Treasury and your Department under the same roof, or contiguous to each other? I prefer to have them separate, but if they were placed under one roof they ought to be kept separate by a dividing wall and such regulations as would render my work entirely independent of other Departments.
591. You say that the Department pays £1,000 a year for the premises which you now occupy? Yes; we are trying to get that reduced.
592. Would it not be a saving to the public to have a building erected to accommodate both your Department and the Treasury so as not to be paying rent? Certainly.
593. You advocate larger rooms? Yes.
594. That is in order to have the various officials brought under better supervision? Yes.
595. That I presume would be another reason why you should not be renting buildings? Quite so.
596. *Mr. Hassall.*] Is it not a fact that many of the selectors' balances are paid to the local Land Agents? A large proportion of them. I can give you the figures. The amount credited at the Treasury during 1894 for instalments on conditional purchases was £819,000. Of that amount only £113,000 was paid over the counter.
597. That is about one-eighth? Yes, about that; and £76,000 of that £113,000 was paid in March, and I believe that the great bulk of it was paid over by the Banks.
598. The Land Agents collect the most of the money and remit it to the Treasury? Yes, with vouchers, and the vouchers come to me for audit.
599. Do you not think it possible that all the transactions connected with the lands might just as well be confined to the Lands Department, so as to save the Treasury clerks from having to occupy time in dealing with these unpaid balances? That is my opinion.
600. You are of opinion that a great saving could be effected by these payments being made to the Lands Department? Yes. In connection with that I may mention that the amount credited during 1894 for interest on selections under the Act of 1861 was £84,000; and of that amount £7,600 only was paid at the Treasury, and I say it is useless to transcribe it into their books.
601. You think it is a sort of labour that could be dispensed with? I do.
602. You say that you destroyed all the vouchers dating up to 1884? Yes, land vouchers excepted.
603. You have a record of all vouchers since that date? Yes.
604. You say that a great deal of room is taken up by storing records? Yes.
605. Is it absolutely essential that those records should be kept in your Department? We are constantly having to refer to them; if we had to go all over the place to turn them up it would occupy a great deal of time.
606. Supposing a large room was available in the Lands Office, and the records were kept there with a clerk or two in attendance, and communication established by telephone? There would be considerable inconvenience in connection wtth that arrangement.
607. Do you think you could erect a building for £25,000 more suitable to your requirements than the one which you are now paying £1,000 a year for? I should say that £25,000 would build us a palace. I think £10,000 would be ample to build an office for our requirements. If you were to build a new office for the Treasury, and give me the old Treasury buildings, they would suit me with a little alteration.
608. I suppose you would require a strong-room? We should be better for it, though we have never realised the necessity for a fire-proof room, never having had any accidents.
609. In the event of your documents being destroyed could you replace them? Many of them we could not, especially the documents relating to expenditure. We have a considerable number of these which we call ledgers, but they are really catalogues of payments and of vouchers. They run back as far as 1830, but they are all in sequence, and give a complete history of the expenditure.
610. Have you no strong-room at all? No. We have a small safe, but it is not for that purpose. If these ledgers were destroyed a very large amount of useful information could not be replaced.
611. In the event of your office being established in a new building erected for the Treasury, I presume that the strong-room would suit your requirements as well as theirs? Yes. The present Treasury buildings have a large vault where they have stowed away all their old records. If that were converted into a fire-proof room it would be useful.
612. In your opinion a large saving might be effected by the Lands Department transacting all the business in connection with the land through its various country offices instead of the Treasury dealing with money matters as they do at present? I think so. A very large amount of correspondence which is useless might be saved.
613. *Mr. Hoskins.*] Did you ever represent to any Minister the propriety of having a fire-proof room erected in a building which you occupied or were going to occupy, so that you could store these twenty-five registers of conditional purchases? I have not.
614. Do you not think there ought to be a fire-proof room in your establishment? I think it would be desirable now that we have got these new registers.
615. You have stated that you have official documents which if burnt could not be replaced. Do you not think that as a matter of precaution you ought to have a fire-proof room? I should be very glad to have one, but it has never occurred to me to represent it. The question never came up.
616. It is proposed to spend a large sum of money in erecting a fire-proof room to prevent the registers of the Treasury from being destroyed. Do you not think there is a necessity for the same thing at the Audit Office? If the registers of the Treasury were destroyed I think I may say with all certainty that the information necessary for almost any purpose could be got from either our Department or the Lands Department.

E. A. Rennie, Esq. 28 Jan., 1896.

617. Does that not show the necessity for the Audit Department having a fire-proof room to keep their records in? I admit that.
618. Do not you think it would be an advantage if a large building was erected on the vacant land opposite the Works Department to accommodate the Treasury, the Audit Department, and the Mines Department? It is just possible that it might be a great convenience, but I am not prepared to say how far it would be advantageous to have the Departments all together in that way.
619. Supposing some people came from the country and had to go to the Treasury, they would have to go some distance from there to get to other Departments, would it not be a convenience to have them altogether? Yes. I may mention that at the time when I was appointed Auditor-General there was a question about extending the present Lands Office buildings and the recent wing was begun and steps were taken to complete it by the Ministry of Sir Alexander Stuart, and I understood from him that that wing was intended to provide accommodation for my Department.
620. But you have never yet been informed that it was available? No; but it was pretty well understood that that new wing was to provide accommodation for my Department.
621. What use has it been put to? I think it is now occupied by the Mines Department.
622. If they built a new Mines Office would not that be available? I believe so.
623. In about a year the lease of the building which you now occupy will terminate? Yes.
624. Have you ever thought what should be done after that? I was prepared to recommend that the lease be extended for a few years if we could obtain favourable terms from the landlord.
625. Seeing that you have important registers do you not think that a fire-proof room is necessary? I certainly think we ought to have it. If a fire-proof room were provided we could continue to occupy our present premises if the room was not too far away.
626. Did it ever occur to you that having three parties dealing with land matters—the local Land Agent, the Lands Department, and the Treasury—is really unnecessary, should not two suffice? The Land Agents and the Lands Department are one.
627. If the business were all transacted by that Department and the Audit Office would that not be enough? It would be quite enough.
628. Do you not think the proposed additions to the Treasury to house the Lands Office portion of their business unnecessary? I do.

William Henry Capper, Esq., Clerk-in-charge, Sales Division, Department of Lands, sworn, and examined:—

W. H. Capper, Esq. 28 Jan., 1896.

629. *Chairman.*] What are you? I am Clerk-in-charge of the Sales Division of the Lands Department.
630. Can you give a statement as to how you manage your conditional purchase affairs—the leases and the conditional purchases? Yes.
631. Can you tell us the routine? The routine in regard to an application for a conditional purchase or conditional lease, is this: An application is lodged with the local Land Agent in the district in which the land is situated. The application is received by the Land Agent with a deposit. The Land Agent sends the application to the Chairman of the Local Land Board. The money is sent to the Treasury. The principal work takes place in the Local Land Board Office. The application is of course submitted to the District Surveyor, and if the land applied for is measured he simply reports it, and if it is available the application is returned to the Chairman of the Local Land Board, and within a certain time it is brought before the Board for confirmation or disallowance. If the land is unmeasured of course instructions are issued to the measuring surveyor. The measuring surveyor measures it, prepares his plans, and sends them to the District Surveyor, who then sends the application to the Chairman of the Local Land Board. With regard to the collection of revenue that is in the hands of the local Land Agent: The purchasers of land pay their money to the local Land Agent or to the Treasury. It is convenient for many living in Sydney, and for companies, whose offices are in Sydney, to pay direct to the Treasury. When that is done the Treasury informs the local Land Agent so that they may have their books brought up to date. We have no record of the payment in our Department beyond the payment of the deposit in regard to conditional purchases.
632. The basis of the Treasury's information is the Land Agent's office? Yes, his vouchers.
633. Have you in your office a duplicate of the district officer's statements? No. We have no statement but the yearly statements that we get from the Treasury. The annual statements of those who have not paid in regard to their conditional purchases. Then we take steps to collect those overdue payments. In our efforts to collect the money we have to refer to the Treasury to find out whether any of the defaulters have paid. Of course we could refer to the Land Agent, but as the Treasury is so close we find it more convenient to consult the Treasury. Besides these conditional purchase accounts there are auction sale accounts, and various others which are kept at the Treasury after going through the Land Agents' books. Pastoral lease accounts are paid direct to the Treasury as required by regulation 266 under the Crown Lands Acts. In the conditional lease cases all accounts have for their basis the Land Agents' books.
634. If you wanted a statement as to how a conditional purchase stood you would have to send to the Treasury? We have no record of payments in the Land Office, but the Land Agent knows exactly how the payment stands.
635. The Land Agent deals with the Treasury in regard to all money matters? Yes.
636. And virtually he is an officer of the Treasury Department in regard to money matters? He is a public accountant, and consequently is subject to periodical inspection by the Treasury inspectors.
637. Have you an opinion as to whether it would be better to manage the accounts from the Lands Office? I have really not formed an opinion.
638. You have no opinion as to what would be a proper policy? I have not. We used to keep accounts in connection with pre-leases in the Department. When I took over the Sales Division, auction accounts were kept in that division, and it appeared an anomaly for us to keep accounts of auction sales only and not to have accounts of the other transactions. I therefore brought the matter under notice, and the business was transferred to the Treasury.
639. What information do your local officers send to the Auditor-General? They have to send attested accounts to the Auditor-General.

W. H. Capper, Esq. 28 Jan., 1896.

640. Are they as full as the statements that go to the Treasury? Yes.
641. Could all the information to be found at the Treasury be also found at the Auditor-General's Office? I do not know.
642. Do you not know what the Land Agents send? Yes—all particulars with regard to payments. They send vouchers to the Treasury each week.
643. Do they send the same information to the Auditor-General that they send to the Treasury? No. The Auditor-General receives the Land Agents' vouchers from the Treasury after the money has been credited by that Department. He also receives attested quarterly accounts direct from the Land Agent. I hand in a detailed account of the different collections by the Land Agents.

WEDNESDAY, 15 *JULY*, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (Chairman).

The Hon. Frederick Thomas Humphery.	Charles Alfred Lee, Esq.
The Hon. Charles James Roberts, C.M.G.	John Lionel Fegan, Esq.
The Hon. William Joseph Trickett.	Thomas Henry Hassall, Esq.
The Hon. Daniel O'Connor.	Francis Augustus Wright, Esq.
Henry Clarke, Esq.	Frank Farnell, Esq.

The Committee further considered the proposed Additions to the Treasury Building.

Charles Lyne, Esq., Secretary to the Public Service Board, sworn, and examined:—

C. Lyne, Esq. 15 July, 1896.

644. *Chairman.*] Have you a statement to lay before the Committee? Yes.

The Public Service Board do not at present propose to make any reduction in the number of officers in the Treasury, nor any alteration in the work which is now being carried on there.

For the present therefore the accommodation needed is that which is required for the number of officers now employed.

With regard to the accommodation which exists for the Accountant's branch of the Department, the Board think that alterations are necessary—that better accommodation should be provided; but with respect to the room in which the conditional purchase registers and staff are located, they cannot now say anything, as, for the present, they do not propose to make any change in regard to the work done there or the staff doing it.

When the Board have an opportunity for again inspecting the Departments, some changes may or may not be made in respect of certain work now being done in the Treasury, but should alterations be made in the future it is not likely that the staff of the Treasury will be reduced in number from what it is at present.

The Board are of opinion that while the conditional purchase and other registers are kept in the Treasury, a properly-fitted strong room should be provided, and in all probability a room of this kind will be a very desirable addition to the Treasury, whatever may be done in the future.

645. *Mr. Humphery.*] Have the Public Service Board considered the plans of the proposed alterations? No, they have not considered the plans. I do not think they would consider that to be a matter for them to look into.
646. They have not given any consideration then to the proposed alterations in connection with the accommodation to be afforded to the staff which it is proposed to retain? Not in connection with the plans, so far as my knowledge goes.
647. *Mr. Wright.*] I suppose they think that the consideration of the plans is a matter that properly appertains to the Treasury officers? I have no doubt the subject has been mentioned to them in connection with the Treasury Department.

Sydney: Charles Potter, Government Printer.—1896.

1896.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

PARTICULARS OF EXPENDITURE ON PUBLIC WORKS.

(RETURN RESPECTING.)

Printed under No. 19 *Report from Printing Committee*, 24 *September*, 1896.

RETURN to an *Order* made by the Honorable the Legislative Assembly of New South Wales, dated 2nd July, 1896, That there be laid upon the Table of this House, a Return showing,—

"(1.) The particulars of all public works over £5,000 initiated and "completed during the term of office of the present Administration.

"(2.) The total expenditure thereon—(*a*) from Loan Votes; (*b*) from "Revenue.

"(3.) The particulars of all public works now in course of construction "over and above the sum of £5,000, giving the nature of the work and "probable cost, as per contract.

"(4.) In what manner will this expenditure be distributed—(*a*) as to "Loan Votes; (*b*) as to Revenue."

(*Mr. W. H. B. Piddington.*)

RETURN showing (1) particulars of Public Works over £5,000 initiated and completed during the term of office of the present Administration; (2) total expenditure thereon, payable from Loan and Revenue Votes:—

THOMAS R. STEEL,
Accountant

Sydney: Charles Potter, Government Printer.—1896.

[3d.]

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

THE ANNUAL REPORT

OF

THE POSTMASTER-GENERAL,

FOR THE YEAR

1895.

Printed under No. 12 *Report from Printing Committee* 6 *August*, 1896.

SYDNEY: CHARLES POTTER, GOVERNMENT PRINTER, PHILLIP STREET.

1896.

[2*s.* 3*d.*] *104—*a*

[1,060 copies—Approximate Cost of Printing (labour and material), £124 2s. 6d.]

THE POSTMASTER-GENERAL TO HIS EXCELLENCY THE GOVERNOR.

ANNUAL REPORT FOR THE YEAR 1895 ON THE POST OFFICE, MONEY ORDER OFFICE, GOVERNMENT SAVINGS BANK, AND ELECTRIC TELEGRAPH DEPARTMENT.

MY LORD,

I have the honor to transmit to your Excellency the Annual Report for the year 1895 on the Department under my ministerial control.

REVENUE AND EXPENDITURE.

The following Statement shows the Revenue and Expenditure for the year 1895, as compared with 1894:—

The following are the items of expenditure paid from Votes under the control of other Ministers:—

	1894.	1895.
Stores and stationery	£4,942 6 3	£3,932 13 9
Repairs and additions to buildings	3,673 18 6	5,297 1 7
Furniture (including carriage)...	96 4 1	116 9 5
Printing, bookbinding, *Gazette* advertisements, *Gazettes*, &c..	13,855 0 1	10,535 10 3
Printing postage-stamps	4,833 14 10	4,814 16 8
Do postal notes	221 5 6	329 16 9
Municipal and other rates	2,487 1 11	2,428 14 9
Postage	722 3 10	780 0 0*
Advertising in newspapers	524 13 0	352 0 7
Fuel and light	2,628 2 0	2,311 12 5
Total	£33,984 10 0	£30,898 16 2

*Estimated.

The interest on the cost of construction of Electric Telegraph Lines is estimated at £33,615, and the interest on the cost of buildings owned by the Government, and used as Post and Telegraph Offices in various parts of the Colony, is estimated at £31,366.

Adding the expenditure on account of the services of the Postmaster-General from the Votes of other Departments, and the interest on the cost of buildings and construction of telegraph lines, the expenditure properly chargeable to the Department under my control for the year 1895 was £987,778 11s. 5d., or £211,253 5s. 6d. in excess of the revenue for the same period.

Intercolonial Postal and Telegraphic Conferences.

A Postal and Telegraphic Conference, attended by the following representatives, was held at Hobart in February, 1895:—

New South Wales:	The Hon. Joseph Cook, M.P., Postmaster-General. S. H. Lambton, Esq., J.P., Deputy Postmaster-General.
Victoria:	The Hon. John Gavan Duffy, M.P., Postmaster-General. James Smibert, Esq., Deputy Postmaster-General.
South Australia:	The Hon. J. A. Cockburn, M.D., M.P., Minister of Education, &c., &c. Sir Charles Todd, K.C.M.G., Postmaster-General.
Queensland:	The Hon. A. J. Thynne, M.L.C., Postmaster-General. Jno. M'Donnell, Esq., Under Secretary to the Post and Telegraph Department and Superintendent of Electric Telegraphs.
Western Australia:	Sir John Forrest, Premier.
Tasmania:	The Hon. P. O. Fysh, M.H.A., Treasurer and Postmaster-General. H. V. Bayly, Esq., Secretary to the Post Office.
New Zealand:	The Hon. J. G. Ward, M.H.R., Treasurer, Postmaster-General, and Electric Telegraph Commissioner. Wm. Gray, Esq., Secretary to the Post and Telegraph Department.

A full report of the proceedings of this Conference has already been laid before Parliament, and as the principal recommendations were quoted in my last Report, it is unnecessary to repeat them here.

Although the matter really relates to the record of proceedings of the year 1896, I may mention that a special Ministerial Postal and Telegraphic Conference was held at Sydney on the 17th, 18th, and 20th January, 1896, when the various Australasian Colonies were represented as follows:—

New South Wales:	Hon. Joseph Cook, M.P., Postmaster-General, New South Wales, who acted as President of this Conference.
New Zealand:	Hon. W. P. Reeves, New Zealand.
Queensland:	Hon. A. J. Thynne, M.L.C., Postmaster-General, Queensland.
South Australia: *Tasmania:*	Hon. J. A. Cockburn, M.D., M.P., Minister for Education and Agriculture, South Australia.
Victoria:	Hon. J. Gavan Duffy, M.P., Postmaster-General, Victoria.

The

The subjects that received consideration were the proposed cable communication across the Pacific Ocean to America, and the proceedings connected with the invitation for tenders for the new contract for the Federal Mail Service to Europe, *viâ* Suez.

In regard to the proposed Pacific Cable, the Honorable Sir Saul Samuel, K.C.M.G., C.B., Agent-General for the Colony of New South Wales, and the Honorable Duncan Gillies, Agent-General for the Colony of Victoria, were nominated as representatives of the Australasian Colonies on the Commission to be appointed by the Imperial Government for the purpose of fully considering the subject. These Representatives, on all important points, will consult the Agents-General for the other Australasian Colonies; and it has been provided that any scheme submitted by this Commission shall be subject to the approval of the Governments of the respective Australasian Colonies.

The conditions of tender for the new contract for the Federal Mail Service have received a large amount of attention (necessarily of a confidential character), not only at the Ministerial Conference, but by means of correspondence both before and after that event. A report of the proceedings of this Conference having recently been laid before Parliament, it is not needful to make further allusion to it in this Report.

Inland Service.

The new postal routes opened during the year 1895, as shown in the annexed return, amounted to 1,086 miles, viz.:—

Postal Line	No of times per week
In the Western Country	
From Canoblas to Towac	2
Cowra to Binnie Creek	2
Cugong to Cugong Diggings	4
Freeman's Reach to Bull Ridge	3
Galston to Arcadia	3
Genanagie to Peak Hill	2
Gentleman's Halt to Lower Mangrove	2
Gulgamree to Bocoble	2
Lawnsdale to Bullock Creek	2
Megalong to Cullubumbung	2
Merindee to Twelve mile	2
Millthorpe Forest Reefs Mail Line (point on) to Lower Forest	3
Murrumbidgerie to Eulomogo	6
Myall Plains to Tenandra	1
Riverstone to The Vineyard	3
Roto Hotel to Davittsdale	1
Rouse Hill to Annangrove	2
St Mary's to The Grange	3
Shooter's Hill to Mount Werong	1
Tarana to Mountain Home	2
Toogong to Canowindra	1
Trunkey Creek to Colo Creek	3
Walmer to Bournewood	2
In the Southern Country	
From Baker's Mail Change (on Wentworth-Wilcannia line) to New House	1
Bega to Angledale	2
Bellawongarah to Kangaroo Valley (re established)	3
Bulga Creek Junction to Yarralumla	3
Bungendore to Bywong	2
Denliquin to W Watson's (Thurgoona)	1
French Park to Ferrier's	3
Fullerton to Hadley	2
Greenwich Park to Carlungie	3
Guildford to Granville	6
Gwynne to Murrulebale	2
Hulston to Mount Ida	1
Jinden to Snowball	3
Meragle to Lobb's Hole	1
Middle Adelong to Batlow	1
Moonbah to Ingebyra	1
Neimer to Koondrook	1
Old Junee to Winchendon Vale	2
Rosedale to Yaouk	1
Springdale Railway Station to Receiving Office	6
Tareena to Cal Lal	2
In the Southern Country—continued.	
From Temora to Mimosa	2
Tocumwal to Berrigan	2
Tooma to Toolong	1
Walla Walla Station to Post Office, Walla Walla	3
Woodhill to Wattamolla	3
Yarrara to Copabella	2
Young to Wombat (re-established)	3
In the Northern Country.	
From Ashford to Walker's Store	1
Barraba to W Spencer's	1
Brierfield to Bowraville	2
Brunswick to Billinudgel	6
Burrilda Station (near Millie) to Myanblar	1
Casino to Murragang	2
Cedar Party Creek to Killabakh Creek	2
Cessnock to Mount View	2
Charlestown to Warner's Bay	2
Cobbadah to Stormont	1
Coff's Harbour to Kargingi School	2
Dorrigo to Tyringham	1
Euwylong to Medowie	3
Kendall to Lorne	once or oftener daily
Lismore to Mangargool	6
Lowry (Abbott's) to Cain's	1
Marlee to Bobin	2
Millera Station to Nicholson's Creek	2
Mogil Mogil to Cambo Cambo	2
Mullumbimby Railway Station to Post Office	3
Murwillumbah to Railway Station, South Murwillumbah	3
Nelson's Plains to Mount Kenwary	6
New Angledool to Weetalibah	2
Orabah to Linton	1
Pine Vale to Kerronga	1
Taylors Arm to Burrapine	1
The Esk to McCauley's Lead	2
Tuncurry Wharf to Post Office	2
Tweed Heads to Bilambil	2
Upper Copmanhurst to Cangai	1
Upper Manilla to Crow Mountain	1
Upper Tooloom to Pretty Gully	1
Wangat to Whispering Gully	1
West Maitland to East Greta	6
Suburban	
From Bankstown to East Hills	3

The postal routes abolished, amounting to 629 miles, are shown in the following return :—

Postal Line.	No. of times per week.
Western Roads.	
Between Bullock Creek and Loobey's	2
Medcalf's Mail Change and Fifield	2
Pier Pier and Carinda	1
Rockley and Triangle Flat	3
Wellington and Bournewood	1
Southern Roads.	
Between Barratta Mail Change and Rhyola	1
Bullenbong and Ferrier's	3
Gerogery and Walla Walla Station	2
Guildford Railway Station and Post Office	6
Jindera and Walla Walla	1
Kangaroo Valley and Wattamolla	2
Little Billabong and Carabost	3
Liverpool and Bonnyrigg	4
Luddenham and Badgery's Creek	3
Nadjingomar and Croker's Mint	2
Wolumla and Mogilla	6
Northern Roads.	
Between Bald Nob and Vindin's	1
Bangalow and Brunswick	3
Burrilda Station (near Millie) and Bulyeroi Hotel.	2
Fernmount and East Raleigh	2
Lamb's Creek and Elderslie	2
Lehane's (near Narrabri) and Boolcarroll Station.	2
Merriwinebone (near Collarenebri) and Myanblar.	1
Mogil Mogil and Caidmurra Station	1
Murragang and Lawrence	2
Murwillumbah-Brunswick Line (point on) and Upper Pocket.	2
New Angledool and Bangate	2
North Pimlico and German Creek	3
Spring Vale and Nashan	2

Increased communication on existing lines was afforded as follows :—

Postal Line.	No. of times per week.	
	From	To
Western Roads.		
Between Blayney and Brown's Creek	3	6
Cobar Railway Station and Post Office.	3	6
Condobolin and Trundle	1	2
Condobolin and Vermont Hill	1	2
Kurrajong and Comleroy Road	4	6
Manildra Railway Station and Post Office.	2	4
Nevertire and Warren	6	12
Nymagee and Gilgunnia	1	2
Southern Roads.		
Between Bemboka and Mogilla	2	3
Boro and Mayfield	2	3
Dalton and Bevendale	1	2
Gundaroo and Tallagandra	2	3
Major's Creek and Krawarree	1	2
The Rock and French Park	2	3
Northern Roads.		
Between Armidale and Hillgrove	6	12
Bandon Grove and Wangat	1	2
Cessnock and Mount View	2	3
Chatsworth Island and Woodburn	4	8
Dundee and Fladbury	2	3
Glendon and Cain's	1	2
Gresford and Allynbrook	3	6
Gresford and Lostock	3	6
Guyra and Tenterden	1	2
Limeburner's Creek and Hawke's Nest.	2	3
Moonan Brook and Berry Station	1	2
Myall Vale Hotel (near Narrabri) and Boolcarroll Station.	1	2

The Rock and Bullenbong	3	2
Tocumwal and Deniliquin	4	2
Northern Roads.		
Between Boolcarroll Station (near Narrabri) and Nowley Station.	3	2
Bulyeroi Hotel (near Narrabri) and Merriwinebone.	3	2
Collarenebri and Mogil Mogil	3	2
Glennie's Creek and Goorangoola	3	2
Narrabri and Myall Vale Hotel	3	2
Wyee and Noraville	3	1
Suburban Road.		
Between Rookwood and Upper Bankstown	18	12

The extent of postal route traversed in the Colony up to the 31st December, 1895, was 33,693 miles, as compared with 33,064 miles traversed in 1894—

	1894.	1895.
On horseback	10,260 miles	10,675 miles.
By coach	19,331 „	19,545 „
By railway	2,581 „	2,581 „
By tramway	68 „	68 „
By steamer	824 „	824 „

The number of miles travelled in the year 1895 was 9,338,000, being an increase of 498,000 on the mileage of the previous year.

There was no extension of mail route by railway during 1895.

The number of Post Offices established was 36, viz.:—Barham, Beecroft, Berremangra, Billinudgel, Bredbo, Bullagreen, Bull Ridge, Buxton, Bywong, Cal Lal, Colo Creek, Cordeaux, Courabyra, Cowra Creek, Cuddell Siding, Dorrigo, East Greta, Gulgamree, Guy Fawkes, Kybean, Lindfield, Little Bendigo, Lower Southgate, Meranburn, Mount Drysdale, Narrow Plains, One Tree, Pitt Town Co-operative Settlement, Savernake, Southdown, Uralgurra, Vermont Hill, Walbundrie Reefs, Wood's Reef, Woy Woy, and Yarrara.

The Post Office at Wee Jasper was re-established.

The number of Post Offices discontinued was 12, viz.:—Bonnyrigg, Forest Road, Iron Cove Bridge, Meranburn, Moore Creek, Mount Browne, Nangar, Nashan, The Pocket, Wanstead, Willanthry, and Yarralumla.

It was found desirable to change the designations of the following Post Offices, viz.:—Kyle to Cocumbark, Legislative Assembly to Parliament House, Meroe to Bullarah, Murundah to Morundah, Oaks to The Oaks, Stanmore Road to Enmore, and Yambla to Table Top.

In the Appendix will be found a list of the 1,470 Post Offices in the Colony on the 31st December, 1895. In addition to these, there are 3 Travelling Post Offices, which run between Sydney and the northern border of the Colony at Jennings, between Sydney and Albury on the southern border, and between Sydney and Dubbo in the west. Appendix A.

197 changes of Postmasters occurred during the year.

Receiving Offices were established at the following places:—Angledale, Annangrove, Apple-tree Flat, Arable, Backwater, Bilambil, Bindogandi Station, Bobin, Boona Tank, Boppy Mountain, Burrapine, Cangai, Central Tilba, Clare, Colinroobie, Coramba Battery, Crow Mountain, Cugong, Cullubumbung, Eulomogo, Galore Park, Gillenbine, Grass Hut, Greenwood, Gulf Creek, Gwynne, Hadley, Hannah Bay, Huon, Ingebyra, Karangi, Killabakh Creek, Kinross, Linton, Lobb's Hole, Lockwood, Looby's, Lorne, Lower Forest, Mangargool, Medowie, Mimosa, Missabotti, Moonan Flat, Mountain Home, Mount Kenwary, Mount View, Mount Wayo, Mount Werong, Murrulebale, Neimer, Pera Bore, Platina, Pleasant Valley, Quinburra, Rockton, Sawyer's Gully, Snowball, South Clifton, Spring Dale, Stanwell Park, Summervale, Tenterden, The Esk, The Vineyard, The Weir, Toolong, Towac, Turrawan, Twelve Mile, Upper Galston, Walbundrie Reefs, Walker's Hill, Wanstead, Wantiool, Warner's Bay, Whipstick, Winchendon Vale, Wyan, Wyndella, Yalbraith, Yallaroi, Yaouk, Yarralumla, and Yarrangobilly.

Receiving Offices were re-established at Bocoble, Borambil, Myall Plains, and Tallewang.

The names of the following Receiving Offices were changed, viz.:—Bindogandi Station to Cookamidgera, Bullock Creek to Tullamore, Bygalorie to Forest Vale, Chidowla to Nanangroe, Cooper's Creek to Corndale, No. 1 to Number One, and Upper Galston to Arcadia.

The Receiving Offices at the following places were converted into Post Offices, viz.:—Beecroft, Berremangra, Bredbo, Bullagreen, Buxton, Bywong, Cordeaux, Cowra Creek, Dorrigo, Gulgamree, Guy Fawkes, Kybean, Lower Southgate, Meranburn Railway Platform (under the name of Meranburn), Mount Billagoe (under the name of Mount Drysdale), One Tree, Pitt Town Co-operative Settlement, Savernake, Upper Tumberumba (under the name of Courabyra), Uralgurra, Walbundrie Reefs, Walker's Hill (under the name of Vermont Hill), Wood's Reef, Woy Woy, and Yarrara.

The

The Receiving Offices at the following places were discontinued, viz.:—Bonnie Doon, Buckenbour Creek, Croker's Mint, Jinden, Mount Sherwood, Orabah, Rhyola, South Codrington, Toolong, Tuggranong, Upper Pocket, and Upper Quinburra.

Appendix B. In the Appendix will be found a list of the Receiving Offices in existence at the close of the year, 502 in number.

Appendix A. Appendix A contains a return of the Government Buildings for the transaction of the Postal, Money Order, Savings Bank, and Telegraph business, and particulars of the premises rented or otherwise provided for the purpose. Government Buildings at the following places were completed and occupied during the year 1895, viz.:—Adamstown, Albion Park, Bateman's Bay, Brushgrove, Enmore, Millthorpe, Rozelle, and South Woodburn.

During the year 1895, 6 pillar letter-receivers were removed to different sites, and 1 was withdrawn; 42 small iron letter-receivers were placed, 6 were removed to new sites, and 2 were withdrawn. One galvanised iron and 3 wooden newspaper-receivers were erected.

On the 31st December the number of letter-receivers erected in the Colony (both large and small) was 1,192, and the number of newspaper-receivers, 25.

The number of licenses for the sale of postage-stamps issued in 1895 to persons other than postmasters or receiving-office-keepers was 125, the number transferred 46, and the number cancelled, 31.

On the 31st December, 1895, the number of locked private letter-boxes let at the General Post Office was 1,249, besides 76 allotted to Public Departments, for which no fees are paid.

The system is now in operation at the following offices, viz.:—Adelong, Albury, Armidale, Ashfield, Ballina, Balmain, Balranald, Bathurst, Bega, Bingara, Bombala, Bourke, Bowral, Braidwood, Broken Hill, Burwood, Casino, Cobar, Condobolin, Cooma, Coonamble, Cootamundra, Coraki, Cowra, Deniliquin, Dubbo, East Maitland, Emmaville, Forbes, George-street North, Glen Innes, Goulburn, Grafton, Granville, Grenfell, Gulgong, Gunnedah, Hay, Haymarket, Hillgrove, Hillston, Inverell, Jerilderie, Junee, Kempsey, Kiama, King-street, Lismore, Maclean, Manly, Marrickville, Moree, Moruya, Moss Vale, Mount Victoria, Mudgee, Murwillumbah, Muswellbrook, Narrabri, Narrandera, Newcastle, Newtown, North Sydney, Nymagee, Orange, Pambula, Park-street, Parramatta, Queanbeyan, Rozelle, Silverton, Singleton, Tamworth, Taree, Temora, Tenterfield, Uralla, Urana, Wagga Wagga, Walgett, Wentworth, West Maitland, Wilcannia, Wollongong, West Wyalong, Wyalong, and Young.

Six private posting-boxes have been constructed on private premises for the use and at the expense of the occupants, under the system introduced in August, 1886. The fee charged for the clearance of these boxes varies from £3 to £5 per annum, according to the daily number of clearances effected.

Five additional letter-carriers were appointed during 1895. The total number of these officials employed on the 31st December was 468, of whom 99 were attached to the Head Office, the remainder being distributed throughout the Colony, as indi-

Appendix A. cated in the Appendix.

The number of persons employed in connection with the Postal and Electric Telegraph Department for the year 1895 was as follows:—1 Postmaster-General, 1 Deputy Postmaster-General, 1 Secretary of the Postal Service, 1 Secretary of the Telegraph Service, 1 Chief Accountant and Controller, Money Order Office and Government Savings Bank.

Ministerial Division.—1 chief inspector, 8 inspectors, 3 senior clerks, 1 Inspector for irregularity and missing and dead-letter branch, 44 clerks, 1 clerk in charge of stores, 3 extra clerks, 7 temporary clerks, 1 relieving officer, 10 indoor messengers, 1 assistant storekeeper, 6 assistants in store, 1 storeman, 1 mechanic, 1 carpenter, 1 caretaker, 1 assistant caretaker, 1 office keeper, 1 tower attendant, 1 detective, 4 constables, 5 cleaners, 15 female servants, 1 manager of stables, 1 farrier, 1 striker and assistant, 8 grooms, 1 foreman of mail-cart drivers, 12 mail-cart drivers, 3 lift attendants.

Telephone Branch.—1 manager, 1 mechanician, 20 fitters, 1 exchange foreman, 1 line foreman, 6 monitors, 52 switch attendants, 1 junior assistant, 1 messenger.

Electric Light Branch.—1 chief engineer, 4 engineers, 9 assistant engineers, 3 assistants.

Branch, Suburban, and Country Offices.—1,470 postmasters (424 official, 1,046 non-official), 8 telegraph station masters, 117 postal assistants, 112 junior postal assistants, 104 temporary postal assistants, 291 operators, 75 junior operators, 26 temporary station masters and telephone operators, 18 mail-guards, 2 stampers and sorters, 182 letter-carriers, 177 junior letter-carriers, 10 temporary letter-carriers, 49 mail-boys, 375 telegraph messengers, 10 cadets, 43 switch attendants, 2 telephone fitters, 3 batterymen, 46 line-repairers, 6 temporary construction overseers, 69 labourers, 502 receiving office keepers.

Total, Head Office	1,277
„ Branch, Suburban, and Country Offices ...	3,697
„ Number of Mail Contractors	809
„ „ Porters	89
Total number of persons employed	5,872

These may be subdivided into—

Persons whose whole time is occupied in the service;	Principal officers	42	
	Clerks	271	
	Post and telegraph masters	432	
	Assistants at Post Offices	308	
	Operators	581	
	Subordinate officials	1,741	
and			3,375
Persons whose time is only partially employed in the service.	Sub or non-official postmasters and Receiving Office-keepers	1,548	
	Assistants to non-official postmasters and other subordinate officials	51	
	Mail contractors and mail porters	898	
			2,497
Total			5,872

Twenty-one deaths occurred, viz.:—J. J. Mooney, clerk, Money Order and Government Savings Bank Division; R. E. Done, post and telegraph master, Macksville; W. T. Long, post and telegraph master, Albion Park; M. H. Lynch, post and telegraph master, Walgett; W. T. Taylor, assistant, Burwood; F. J. Morath, operator, Bourke; J. J. M'Grath, operator, Coonabarabran; F. W. Gamble, junior operator; P. W. Quin, junior assistant, Cobar; S. Porter, letter-sorter; T. Breen and E. Ireland, stampers and sorters; E. F. M'Encroe, assistant, Parcel Post Branch; J. W. Little, letter-carrier; G. R. Moss, junior letter-carrier; V. Watters, mail-boy, Manly; J. Lawson, F. A. Morrison, J. W. Mellor, and J. J. Telfer, telegraph messengers; and W. W. Gallie, engineer, Electric Light Branch.

Forty-

Forty-six resignations took place, and the services of six officials no longer required were dispensed with.

Eleven officers retired from the service, viz. :—R. H. Hipsley, assistant manager, Telegraphs; G. A. Kopsch, chief mechanician; F. Mackel, post and telegraph master, Park-street; P. Mackel, post and telegraph master, Wollongong; J. Kirwan, post and telegraph master, Cooma; R. A. Thomson, post and telegraph master, Taralga; and J. Skehan, letter-carrier, Newtown, who were allowed pensions under the Civil Service Act; R. Morrison, assistant, Albury, and G. A. Wright, clerk, Money Order and Government Savings Bank Division, who were allowed gratuities under the same Act; and J. Reynolds, extra clerk, and P. Plesner, messenger, who, not being contributors to the Superannuation Account, were granted gratuities from the Consolidated Revenue.

The removals from the service numbered twenty. Seven of these—a temporary clerk, three junior letter-carriers, a mail-boy, and two telegraph messengers—received sentences of imprisonment for terms varying from six to eighteen months for stealing letters. Four others—a post and telegraph master, an assistant, and two operators—received sentences of imprisonment for two years, twelve months, three years and seven months, and six months, respectively, for embezzlement. The remainder were dismissed for the following offences :—A post and telegraph master for absconding; a temporary clerk and a junior letter-carrier for drunkenness; two telegraph messengers for absence without leave; a junior letter-carrier for secreting and detaining letters; a letter-carrier for failing to satisfactorily account for three letters which should have passed through his hands; and a junior letter-carrier and a telegraph messenger for unsatisfactory conduct.

The Postal Inspectors in 1895 travelled a distance of 51,324 miles, and inspected the postal route appertaining thereto, visiting 780 offices, 243 of which were visited more than once during the year.

From the 1st January, 1895, Preston's and Ingleburn, in the neighbourhood of Liverpool, were included amongst the places in the Metropolitan district, between which letters are transmissible at the 1d. per ½ oz. rate of postage.

In October the town rate of postage (1d. per ½ oz.) was extended to letters circulating within a radius of 13 miles of Muswellbrook.

Under the Land and Income Tax Assessment Act, passed during the last session of Parliament, the Post Office is required to carry and register free of charge all returns required to be furnished under that Act. This means a further addition to those services the postal department already performs for the community that do not show any income against the increased expenditure involved.

In October the rule prohibiting the enclosure of articles in newspapers was relaxed, so as to allow of paper patterns referred to or described in a newspaper, passing through the post under cover, with such newspaper, provided Packet rate of Postage applicable to the enclosure be paid, and that it bear an endorsement stating that "the special sanction of the Postmaster-General has been duly obtained."

Arrangements have been made for the transmission by post of catalogues, reports of societies, and other such matter, if printed and published in book form, and containing no writing whatever, to and from places within New South Wales, and between this, and the other Australasian Colonies, at "Book" rate of postage, namely 1d. per 4 oz., or fraction thereof, with a minimum charge of ½d. for the first 2 oz., in the case of packets for delivery within the Colony.

Foreign Service.

In my report for 1894 it was mentioned that arrangements had been made for the extension for twelve months, from the 31st January, 1895, of the two contracts respectively with the Peninsular and Oriental, and Orient Steam Navigation Companies, for the Federal Mail Service to Europe, *via* Suez, and that correspondence has since taken place between the Imperial authorities and the Australasian Governments, on the subject of a further extension of the contracts to the 31st January, 1898, subject to certain concessions on the part of the companies.

This further extension was subsequently agreed to, the companies undertaking that their vessels should, after the 31st January, 1896, call at Colombo on every outward and homeward voyage, thus securing a regular weekly connection between

Australia

Australia and India, the Straits Settlements, and China. The companies also agreed to relinquish the special payment of twopence a pound, which they had previously received, for the conveyance of parcels to and from Australia.

The arrangement made with the New Zealand Government in 1892 for the conveyance of mails, once every four weeks, to and from Sydney and San Francisco, *via* Auckland, by contract packets of the Union Steamship Company of New Zealand, for the sum of £4,000 per annum, has been renewed for a further period, expiring in November, 1896.

The agreement with Mr. James Huddart for a monthly steam service between Sydney and Vancouver, in the Colony of British Columbia, which expired on the 25th May, 1896, has been renewed for a further period of three years from that date. The subsidy payable is at the rate of £10,000 per annum, and it is provided that the duration of the voyage each way shall not exceed twenty-one days, including one day's detention at Honolulu, and that for every complete period of twenty-four hours, by which the time actually occupied in the conveyance of the mails shall exeeed that limit, the sum of £30 may be deducted from the subsidy payable to the Contractor.

The text of the new agreement will be found in the Appendix. Appendix C.

In August, 1890, a convention was entered into between the British and French Governments respecting postal communications. After some correspondence between this Colony and the Imperial Authorities on the subject of New South Wales adhering to the convention, (a copy of which, together with the correspondence, was presented to Parliament on the 21st March, 1895) the adhesion of the Colony, subject to certain exceptions and modifications, was notified to the Imperial Government in July, 1894.

The Mail Service performed by the Peninsular and Oriental Steam Navigation Company during the year 1895 was as follows :—

Received.

				1,045	0	0
Estimated net cost to the Colony				£9,040	12	11
The estimated net cost for 1894 was				£7,845	12	0

Parcel Post.

A direct exchange of postal parcels has been established between this Colony and Canada, at the rate of one shilling per lb., the terms and conditions as to size and weight being similar to those applicable to the parcel post with the United Kingdom. The parcel post has also been extended to Fiji and the Colony of Straits Settlements, the rate in the former case being the same as on intercolonial parcels, viz.—8d. for the first lb., and 6d. for each additional lb.; and in the latter 1s. per lb.; likewise to the French possessions of St. Pierre and Miquelon, *viâ* the United Kingdom and Canada.

Parcels may now be forwarded through the medium of the Egyptian Post Office to Cyprus, East Coast of Africa (German possessions), Greece, Eritrea (Italian Colony), Montenegro, Seychelles, and Turkey.

The limit of weight of parcels forwarded *viâ* the United Kingdom to France, Italy, Germany, Denmark, Austria-Hungary, Switzerland, Turkey, and certain other countries, has been increased from 7 to 11 lb.

Revised rates of postage have been introduced in connection with parcels forwarded *viâ* the United Kingdom to Austria-Hungary, Bosnia, Bulgaria, Chili, Cameroons, Denmark, Germany, German East Africa, Italy, Montenegro, Morocco, Philippoplis, Roumania, Servia, Switzerland, Togo, and Uruguay.

Copies of the Parcel Post Agreement concluded in March, 1895, with the Colony of Straits Settlements, and of an amended agreement in respect of certain provisions of the Parcel Post Arrangement with India will be found in the Appendix. Appendix D. Appendix E.

Letters, Letter Cards, Post Cards, Packets, Newspapers, and Parcels posted and received in the Colony during 1895 as compared with 1894.

* The number of articles exempt from postage other than newspapers being comparatively small, a separate account has not been kept of them, and they are, therefore, included under the head of articles subject to postage.

NOTE.—With the exception of Registered Articles and Parcels (in regard to which the actual figures are given) the above figures are calculated on the basis of returns furnished by Postmasters during two months of the year, and therefore can only be accepted as approximate.

Dead Letter Branch.

The following return shows the number of Letters, Post Cards, and Packets dealt with in this Branch, either by the return to writers, discovery of persons addressed, or otherwise, during the year 1895 :—

	Letters.	Post Cards.	Packets.
Inland.			
Returned to writers, delivered, &c.	169,602	978	34 361
Destroyed in accordance with Section 32 of 31 Vic. No. 4	36,735	120	1,904
Intercolonial.			
Originally addressed to other Colonies :—			
Returned to writers, or otherwise disposed of	27,997	231	27,411
Destroyed in accordance with Section 32 of 31 Vic. No. 4	17,547	75	4,784
Returned to other Colonies as unclaimed	20,065	576	3,773
Foreign.			
Originally addressed to other Countries :—			
Returned to writers, or otherwise disposed of	6,256	16	5,641
Destroyed in accordance with Section 32 of 31 Vic. No. 4	1,866	4	2,112
Returned to other Countries as unclaimed	9,485	195	2,480
Total number dealt with	289,553	2,195	82,466

Included in the above return were 5,225 registered letters which originated in New South Wales, and which, upon being opened to obtain address prior to return to the senders, were found to contain, besides correspondence and valuable enclosures, such as gold and silver watches, gold rings, brooches, earrings, &c., the sum of £2,385 18s. 10d. in coin, notes, cheques, &c. In 1,070 unregistered letters were found valuable enclosures, representing £2,385 6s. 4d.

530 registered letters originated in places beyond the Colony, and were returned unopened, as follows :—152 to London, 197 to other countries, and 181 to other Colonies.

An average of 91 insufficiently-addressed letters and packets were forwarded daily to the Dead Letter Office for treatment; the addresses of a large proportion were corrected and the letters forwarded. The remainder were returned to the writers, or otherwise dealt with, as required by the Postage Acts.

Of 352 articles containing clothing, merchandise, jewellery, &c., received with the addresses torn off, postage refused, &c., 50 only were applied for and delivered. The articles not otherwise disposed of are sold in accordance with legislation, and the proceeds paid into the Consolidated Revenue.

1,010 Chinese letters imperfectly addressed were forwarded to the intended addresses through the assistance of the Chinese interpreter.

162 letters were posted without addresses, 117 of which (including 26 containing valuable enclosures) were returned to the writers, the remainder bearing no indication of the sender. As an illustration of the carelessness exhibited at times on the part of the public it may be mentioned that four of these unaddressed letters were consigned to pillar-boxes in registered envelopes, and were found to contain £36 15s. 8d. in notes and postage stamps. In each case, fortunately, no difficulty was experienced in returning the letter to the sender.

It is estimated that 136,205 unclaimed newspapers found their way to this Branch during the year. These were disposed of in accordance with the regulations.

About ·402 per cent. of the total number of letters posted in the Colony during 1895 were unclaimed.

Delivery by Letter-carriers.

The number of letters, &c., delivered by the Letter-carriers attached to the head office during the years 1894 and 1895 was as follows :—

	1894.	1895.
Unregistered letters	8,535,589	8,783,948
Registered letters	79,723	77,349
Books, &c.	160,316	166,212
Newspapers	1,458,194	1,482,604

Registration Branch.

The number of Registered Letters which passed through the General Post Office in 1895 was 683,898, against 637,674 in 1894, the increase in number being 46,224.

Mails Received and Despatched.

The following return shows the number of Mails received at and despatched from the General Post Office during the years 1894 and 1895.

Year.	Received.		Despatched.		Total number of Mails which passed through the office.
	Inland.	Foreign.	Inland.	Foreign.	
1894	226,475	26,032	214,375	11,301	478,183

Increase	3,284	189	2,577	....	5,679
Decrease	.....	.....	.....	371	.....

Record Branch.

The number of written communications received from the public during 1895, intimating changes of address, or requesting letters, &c., to be forwarded, was 26,463, against 26,862 in 1894.

The number of communications addressed to the Department relating to the extension and improvement of the service, to irregularities connected with the performance of mail contracts, and to the transmission of letters, telegrams, &c., and recorded in the year 1895, was 47,704, against 46,115 in 1894.

Postage Stamps, Stamped Envelopes, &c.

The following return shows the number, description, and value of Postage Stamps, &c., issued at the General Post Office during the years 1894 and 1895 :—

The use of " O.S." stamps for official correspondence was discontinued from the 1st January, 1895, when provision was made for its transmission by post unstamped, in covers bearing a special endorsement, and under conditions to prevent abuse.

The 5d. impressed stamp for envelopes was, in May, withdrawn from use.

In July an improved 1½d. post-card was introduced, the new differing from the old pattern in the manner in which the figures of value are represented in the stamp, and by the addition of the words " Penny Half-penny," in a tablet below the central circle.

Private cards of a prescribed size, bearing adhesive stamps, have been admitted to circulation within New South Wales, and between this and the other Australasian colonies, on the same conditions as are applicable to official post-cards.

The discount allowed to licensed vendors of postage stamps was, from the 1st January, 1895, reduced from 2½ to 1¼ per centum, and it was made a condition of the continuance of the licenses then existing, as well as of those subsequently granted, that the vendors should sign an agreement undertaking not to procure postage stamps for sale to the public from any other source than the General Post Office, or from a postmaster specially authorised to supply them.

Inland Mail Conveyance.

In the year 1895 the average cost per mile of the Inland Mail Conveyance was about 4⅓d., against 4¾d., the price per mile paid during the previous year.

The number of contracts in existence on the 31st December, 1895, for the conveyance of inland mails was 930, and the number of mail services in respect of which no formal contracts were executed, 279.

Money Orders.

Money Order Offices were established during the year 1895 at the following places, viz., Balmoral, Ganmain, Geurie, Harrington, Mandurama, Manildra, Mount Drysdale, Parliament House, Reefton, Ungarie, and White Cliffs.

The offices at Meranburn and Willanthry were abolished, and the name of the office at Stanmore Road was changed to Enmore.

The number of Money Order Offices in the Colony on 31st December, 1895, was 624.

The number of money orders issued was 406,235 (exclusive of 4,030 certificates of transfer used by Postmasters in connection with transmitting fees for private letter-boxes, &c., &c.), and the value £1,269,200, against 431,417 of the value of £1,315,637, the difference showing a decrease of 25,182 in the number, and £46,437 in the amount, as compared with 1894.

The number of money orders paid was 380,292, and the value £1,247,235, against 393,985 of the value of £1,257,922 in 1894, being a decrease of 13,693 in the number and £10,687 in the amount.

The amount of revenue received as commission on money orders issued was £14,863 0s. 6d., being £964 12s. 6d. less than the amount collected in 1894. This is to be accounted for by the increased use of postal notes.

Appendix F. A comparative return showing the various countries where the money orders issued in New South Wales were made payable, and also the money order issues of other countries payable in New South Wales, will be found in the Appendix.

Appendix A. In the information contained in Appendix A will be found a detailed statement of the business transacted and revenue collected at each office in the Colony.

Appendix G. A convention (the text of which is given in the Appendix), for regulating the interchange of money orders between New South Wales and the Colony of Cape of Good Hope, was brought into operation on the 1st January, 1895. The Appendix

Appendix H. also contains a copy of an amended agreement in respect of Articles 22 and 25 of the money order arrangement with India.

From the 1st January, 1895, the maximum amount of a single money order between New South Wales and Germany was increased from £10 to £20 (400 marks).

Postal Notes.

During the year 1895, 718,367 postal notes, of the value of £258,182 7s., were supplied to Postmasters for sale to the public; of these, 665,974 were issued and paid in New South Wales, having a value (with stamps affixed) of £243,188 0s. 3d.; 33,029 notes, value £13,361 3s. 7d., of other Colonies were also paid, making a grand total of 699,003, of the value of £256,549 3s. 10d., paid in New South Wales.

The number of notes issued in this Colony and paid in other Colonies was 44,735, of the value of £16,368 18s. 10d. (including postage stamps to the value of £141 3s. 4d. affixed thereto).

The amount of revenue collected as poundage was £6,316 12s. 4d., an increase of £2,438 19s. as compared with 1894. It should, however, be mentioned that the larger use of postal notes has, to a limited extent, diminished the business in money orders.

The following table contains particulars of the postal notes paid in New South Wales during the year 1895 :—

Issuing Colony.	Denomination of Notes.														Total Number.	Value of Stamps affixed.	Total value of Notes and Stamps.

In November a postal note of the value of 2s., subject to a charge of 1d. for poundage, was introduced.

Government Savings Bank.

The following branches were opened during the year 1895, viz.:—Broke, Buckley's Crossing-place, Come-by-Chance, Exeter, Geurie, Glencoe, Grong Grong Railway Station, Harrington, Hornsby Junction, Jenolan Caves, Kendall, Manildra, Mount Drysdale, Taralga, Tarcutta, Teralba, Tomingley, Ungarie, and Wyrallah.

Two branches were closed, viz.:—Meranburn and Willanthry.

During the year 42,276 new accounts were opened and 33,368 accounts were closed. The number of accounts remaining open at the close of the year was 131,703.

The number of deposits received was 296,356, and the amount £2,194,133 15s. 10d., being an increase of 1,963 in the number and £33,523 6s. 10d. in the amount on the business of the previous year. The interest added to depositors' accounts was £128,640 10s. 9d.

The number of withdrawals was 190,606, and the amount £1,834,999 19s. 8d., being an increase of 6,697 in the number and a decrease of £45,854 12s. 1d. in the amount on the business of the previous year.

The balance at the credit of depositors at the close of the year was £4,121,699 19s. 6d., being an increase of £487,774 16s. 11d. on the previous year.

The average amount of each deposit was £7 8s. 0¾d., and of each withdrawal £9 12s. 6½d.

The average balance at the credit of each depositor at the close of the year was £31 5s. 10¾d.

The following return will show the annual progress of the Government Savings Bank system from 1st January, 1886, to 31st December, 1895:—

Year.	Number of Deposits.	Interest added to Depositors' Accounts.	Amount of Deposits.	Number of Withdrawals.	Amount of Withdrawals.	Balance at Credit of Depositors.
		£ s. d.	£ s. d.		£ s. d.	£ s. d.

Less wire dismantled				24 20	
Actual increase				714 33	
				£	8,909 6 6

The total cost of the whole extent of Telegraphic communication in the Colony on 31st December, 1895—28,799 miles 35 chains—was £840,380 5s. 10d.

Telegraph offices were opened at Hamilton, Tilba Tilba, and Tomingley (in lieu of the Telephone offices previously existing there), Cal Lal, Goulburn Railway Station, Junee Railway Station, Mittagong Railway Station, Ungarie, Waroo, and Wagga Wagga Railway Station. The offices at Brogan's Creek, Forbes Railway Station, and Nundah, were closed.

The names of the public Telephone Offices opened and closed are given under the heading of Telephone Branch.

The following Return shows the extent of line and wire in use, and the number of offices in existence on the 31st December, 1895 ; also the number and value of telegrams which passed over the lines during the year :—

Length of Line and Wire.

Miles of line	12,316
Miles of wire	28,799
Number of Offices*	834

* Includes 172 Public Telephone Offices and 215 Railway Telegraph and Telephone Offices.

			Messages which passed over N.S.W. lines from and to places outside the Colony (comprising New Zealand, New Caledonia, and Queensland business with places beyond N.S.W.).	113,350	79,020 4 2	6,642 7 1
				2,269,505	279,113 3 2	145,901 7 10

From the 1st April the reduced rate of 6d. for the first ten words chargeable on telegrams passing between East and West Maitland, Morpeth, and Hinton was extended to messages transmitted between these places and Largs and Woodville. A similar charge was in November applied to messages passing between Nowra and Bomaderry Railway Station. Amended regulations have been introduced, providing for a more satisfactory arrangement in regard to payment of the cost of "reply paid" telegrams; for the registration, for a short period, of code addresses for foreign telegrams on payment of a fee of 2s. 6d., and for a reduced porterage charge, within the Metropolitan district, on telegrams for delivery beyond 1 mile from a telegraph office.

The following return shows the amounts paid by each of the Colonies in connection with cable subsidies and guarantees during the year ended 30th April, 1896 :—

Colony.	Population on 5 April, 1891.	Contribution to—			Total Contribution.
		Duplicate Cable Subsidy between Port Darwin and Banjowangie.	Tasmanian Cable Subsidy.	New Zealand Guarantee.	
		£ s. d.	£ s. d.	£ s. d.	£ s. d.
Victoria	1,140,405	13,245 13 11	1,717 0 8	1,320 16 9	16,283 11 4
New South Wales	1,132,234	13,150 15 10	1,704 14 8	1,311 7 6	16,166 18 0
New Zealand	620,030	.....	.....	718 2 7	718 2 7
South Australia	320,431	3,721 15 6	482 9 1	371 2 7	4,575 7 2
Tasmania	146,667	1,703 10 6	220 16 6	169 17 5	2,094 4 5
Western Australia	49,782	578 4 3	74 19 1	57 13 2	710 16 6
Totals	3,409,549	32,400 0 0	4,200 0 0	3,949 0 0	40,549 0 0

The receipts by the Cable Company and by the South Australian Government in respect of the Australasian traffic being in excess of the amounts guaranteed (£227,000 and £37,552 respectively), in connection with the reduced rates the Colonies were not called upon to contribute anything towards these guarantees for the twelve months ended 30th April, 1896.

The following Statement shows the Australasian Telegraph business transacted with Europe and the East during the year 1895 :—

Colony.	Forwarded.		Received.		Total.

Telephone Branch.

During the year ended 31st December, 1895, there were added to the number of subscribers :—

To the Central Exchange	258
„ Branch Suburban Exchanges	188
„ Country Exchanges	21
Total	467

The following return shows the number of lines connected with the telephone system at the close of the year :—

Exchanges.	No. of Lines.
Central, Sydney	1,981
Branch, Suburban	667
Country	240
Telephone Bureaux	14
Extension Lines—City and Suburbs	530
„ „ Country	17
Private Lines—City and Suburbs...	237
„ „ Country	126
Total...	3,812
Total number of Telephones in use	4,096

The length of lines opened during the year was 593 miles and 39 chains, the cost of construction being £6,679 11s. 7d.

In addition to the central exchange at the General Post Office, exchanges are now open in the following Suburbs :—Ashfield, Balmain, Burwood, Edgecliff, Hunter's Hill, Manly, Newtown, North Sydney, Parramatta, Petersham, Randwick, and Waverley; and at Broken Hill, Goulburn, Newcastle, Wagga Wagga, and West Maitland in the country.

Telephone Bureaux for the use of the Public, on payment of a small fee, are now open at the General Post Office, Sydney, Abattoirs, Ashfield, Balmain, Burwood, Edgecliff, Hunter's Hill, Manly, Newtown, North Sydney, Parramatta, Petersham, Randwick, and Waverley.

Public Telephone Offices were established during the year at Clunes, Gabo Island, and Gongolgon (in lieu of the telegraph offices previously existing there), Bomaderry Railway Station, Carinda, Daysdale, Lilyfield, Lindfield, Lowesdale, Murrayville, Sans Souci, Sackville Reach, Turramurra, and Wahroonga.

Construction of Tunnels in the City of Sydney.

Owing to the increase in the number, and the congested condition of telegraphic and telephonic overhead wires throughout the city of Sydney, and more especially in the vicinity of the General Post Office, it has been found necessary to undertake the construction of tunnels for the conveyance of wires underground along the principal streets. A main subway is being constructed in a southerly direction from the General Post Office along Pitt-street to the Railway Station. In a northerly direction from the General Post Office towards the Sydney Exchange, in Bridge-street, a subway has been completed, and one has also been constructed from the General Post Office, in a westerly direction, to the junction of Clarence and Barrack Streets. The principal part of this work has been accomplished, and is still proceeding, by means of day labour under careful supervision.

Electric Light Branch.

During the year the electric light installation at Circular Quay, Parliament House, Cowper's Wharf, General Post Office, and the Jenolan Caves worked satisfactorily, the lights, with two exceptions, having been well maintained. The following are the exceptions referred to :—

On 29th October, a lorry collided with one of the Circular Quay arc lamp poles, causing the lamp to fall and break the circuit. This accident delayed the lighting of the Quay for three hours.

On

On 26th November, at 3.20 a.m., the lighting of Cowper's Wharf was stopped for 45 minutes, due to a flaw in the Commutator.

At the Circular Quay and Government House grounds it was found necessary, owing to decay, to remove nine arc light poles, and to erect new ones in their places.

The Government House grounds arc lights were worked on several occasions from the Circular Quay plant. In addition to the new poles erected in these grounds, new swinging and fixed iron brackets have been erected in place of the wooden arms formerly used for suspending the arc lamps.

During the year the Man-of-War waiting-room was fitted with three 25-candle power 10 ampère Series-Bernstein Lamps, and connected with Circular Quay circuit.

The Parliament House electric light and bells were extended to the Under Secretaries', Chairman of Committees', and other rooms.

The electric accumulators, mention of which was made in my previous report, having become so worn as to be unfit for use, have had to be dispensed with.

The tender of Messrs. Siemens Bros. has been accepted for the supply and erection of a new steam plant, consisting of a combined Willans engine of 60-h.p., and Siemens' dynamo of 30 kilowatt capacity, to take the place of the accumulators, and also to drive the rope hoists, pneumatic lathe, &c.

The hydraulic lifts in connection with the General Post Office and the Departmental stores in Lower George-street have been maintained in good working order throughout the year. The mail lift has been fitted with two extra guides and a new floor; and the main passenger lift with a new starting valve. The latter improvement has resulted in a saving of £63 per annum in water rates, as compared with the previous year.

In May the electric light was installed at the Post and Telegraph Office, Redfern, the current being supplied by the Redfern Borough Council from their central station. This installation has twelve incandescent lamps, and in addition to the saving effected in the cost of lighting, it has given greater satisfaction than the gas previously used.

Judging by the slightly improved revenue shown on the first page of this Report it seems apparent that a betterment of the commercial condition of the Colony took place in the year under review, and I earnestly hope that this improvement will continue.

I have the honor to be,

My Lord,

Your Lordship's most obedient servant,

JOSEPH COOK,

Postmaster-General.

Postal and Electric Telegraph Department,

General Post Office, Sydney, 16 July, 1896.

APPENDIX A.

RETURN showing names of Post and Telegraph Offices, number of Letters posted, Telegrams transmitted, Postal Notes paid, Money Orders issued and paid, Savings Bank Deposits and Withdrawals, Revenue received from each Office, Salaries and Allowances paid, and arrangements regarding premises during the year 1895.

APPENDIX C.

ARTICLES OF AGREEMENT made and entered into this 22nd day of January, in the year of our Lord, 1896 between the Honorable Joseph Cook, Postmaster General for the Colony of New South Wales (hereinafter called the Postmaster General, in which expression his successors in office, the Postmaster General for the time being, are respectively intended to be included) on behalf of the Government of New South Wales, and not so as to incur or come under any personal liability in respect to these presents, of the first part, and James Huddart, of the City of London, in England, shipowner (hereinafter called contractor, which expression shall be deemed to include the heirs, executors, administrators, and permitted assigns of the said James Huddart, when the context so requires or admits) of the other part, witnesseth that for and in consideration of the covenants and agreements hereinafter contained on the part of the Postmaster General, the contractor for himself, his heirs, executors, and administrators, doth covenant and agree with and to the Postmaster General and his successors in manner and form and to the effect following, that is to say—

1. To maintain monthly steam ship service.

1. That he, the contractor, will provide, establish, and during the period of three years, calculated as and from the 25th day of May, 1896, maintain, continue, and carry on, in the manner hereinafter set forth, a regular steamship service between the City of Sydney, in the Colony of New South Wales, and the City of Vancouver, in the province of British Columbia, calling at Honolulu in the Sandwich Islands, and at the outer wharf in the City of Victoria, in the said province, on both outward and homeward voyages from Sydney to Vancouver, and from Vancouver to Sydney, and such service shall, as far as practicable, make connection at Sydney with all local lines of steamships running between Sydney and other ports in Australia and New Zealand.

2. Steamships to be provided.

2. The two steamships "Miowera" and "Warrimoo" shall be regularly and continuously employed in the said service, each of which steamship is hereby warranted to be in length not less than 340 feet, in breadth not less than 42 feet, and in depth not less than 25 feet 2 inches, of a gross tonnage not less than 3,300 tons, and capable of an average speed of not less than 15½ knots per hour. Each of the said steamships is further warranted to have the most approved triple expansion machinery, refrigerators for the ship's use, duplicate electric light engines, special ventilation for tropical voyages, ample saloon and cabin accommodation for at least 130 passengers, and to be provided with every comfort and convenience that is to be found in the best Atlantic liners of its size. Each of the said steamships is further warranted to be of the highest class at Lloyds, and to have a present London Board of Trade Certificate, and each of the said steamships shall, during the continuance of this contract, be at all times tight, sound, staunch, and strong, and well and sufficiently manned, victualled, and equipped, and in every respect seaworthy, and shall further at all times during the continuance of this contract retain the qualifications and class which it is hereinbefore warranted to possess.

3. Duration of voyage.

3. The round trip for each of the said steamships shall begin and end at Sydney aforesaid, and the first voyage in performance of this contract shall commence and be made from Sydney aforesaid on the 25th day of May now next. The period of each voyage from Sydney to Vancouver and from Vancouver to Sydney shall not exceed twenty-one days (calculated as to the voyage from Sydney to Vancouver from the date of leaving the port of Sydney aforesaid up to the time of the acceptance of a pilot at British Columbia, and as to the voyage from Vancouver to Sydney from the date of the discharge of the pilot at British Columbia to the date of the arrival at the port of Sydney) including one day's detention at Honolulu on each voyage, both outward and homeward; but it is expressly agreed and understood that in the event of the said steamers calling at Brisbane or Fiji, as hereinafter provided for, a further period of thirty-six hours is to be allowed for the time spent in calling at each port on both inward and outward voyages. The said service shall be monthly, and the said steamers shall leave the said ports of Sydney and Vancouver on the days and at the times to be from time to time appointed for that purpose by the Postmaster General after consultation with the Canadian Postmaster, alternately arriving at Vancouver and at Sydney at intervals of not more than one month after the date of the arrival of the steamship leaving Sydney on the 25th day of May next, as hereinbefore provided, at Vancouver on its said first voyage in the performance of this contract. Each voyage shall be deemed to commence so soon after the completion of the embarkation of the mails intended to be thereby conveyed as, having regard to practical considerations, the anchor of such vessel can be weighed, or the vessel can be loosed from its moorings, and each such voyage shall be deemed to be completed when the vessel has arrived and been anchored or moored at some position in the port of destination from which the mails can be conveniently disembarked,

disembarked, and the times of the commencement and completion of every voyage shall be ascertained and recorded by officers of the Postmaster-General, in pursuance of arrangements to be from time to time made by him for such purpose, and the decision of the Postmaster-General as to all questions relating to any such times or periods shall be final and conclusive.

4. Not to call at United States.

4. The said steamships shall not during the continuance of this contract call at any port in the United States of America.

5. Carriage of freight and passengers.

5. The said steamships shall each, according to its capacity, carry both outward and homeward all the freights and passengers which may be reasonably offered and obtained, and at tariff rates, both as to passengers and freights, which shall be approved by the Governor of New South Wales, with the advice of the Executive Council of the said Colony, and after consultation with and approval of the Canadian Executive body.

6. Preference to New South Wales.

6. No discrimination shall be made as regards tariff rates for either freights or passengers in any manner, directly or indirectly, against any New South Wales port, or against the New South Wales Government Railways, or against any New South Wales merchant or shipper; but New South Wales merchants or shippers shall at all times have preference for the carriage of their goods over other merchants and shippers, as far as regards the Australian connection. But in the event of a subsidy from Queensland or other colony being received, space shall be provided *pro rata* to the respective subsidies.

7. Carriage of mails.

7. During the continuance of this contract the said steamships shall, at the cost and the expense of the said contractor, receive and carry on each and every voyage all such mails as shall or may be tendered for conveyance to the said steamships, or to the masters or any officers on board of the same at the port of Sydney aforesaid, by or on behalf or under the direction of the Postmaster-General for the time being, his officers, agents, or servants, and shall deliver such mails at their proper ports of destination, upon the sailing route of the said steamships, as herein indicated; and, in order to the due and proper performance of this covenant, the said steamships shall each be provided with sufficient and convenient accommodation and protection for all such mails, to the satisfaction of the Postmaster-General for the time being; and the said contractor shall further take all reasonable and necessary precautions for the protection of such mails while upon the said steamships from loss, damage, or injury in any way, and he and they shall be responsible for any loss or damage thereto caused by negligence or want of proper care or accommodation on the part of the said contractor or his or their agents or servants, or on the part of the officers or employees or crew on board the said steamships; and in this connection it is specially covenanted and agreed by the contractor that this contract shall be subject to the steamships to be employed in carrying the mails thereunder not having on board in the pay of the contractor any coloured labour.

8. Accommodation on board.

8. The contractor shall provide, to the satisfaction of the Postmaster-General, all necessary and suitable accommodation, including lights, for the purpose of sorting and making up the mails on board the several vessels employed under this contract, and on being required to do so by the Postmaster-General shall at his or their own cost erect or set apart in each of the said vessels on the spar deck, a separate and convenient room for such purposes, and all the furniture, lamps, fittings, and other conveniences in and about such room, shall be from time to time cleansed and kept in repair and the oil for the lamps supplied by the servants and at the cost of the contractor. The master or commander of each of the said vessels shall also, if required, provide assistance for conveying the mails between the mail room and the sorting room, and also render such other assistance as may from time to time be needed without charge.

9. Master to take charge, if required.

9. If the Postmaster-General shall think fit to entrust the charge and custody of the mails to the master or commander of any vessel to be employed under this contract, and in all cases where the officer or other person appointed to have charge of the mail shall be absent to the knowledge of the master or commander of such vessel such master or commander shall without any charge take due care of, and the contractor shall be responsible for, the receipt, safe custody, and delivery of the said mail at the several appointed places on shore in the respective ports, as part of the services hereby contracted to be rendered. The master or commander shall also make the usual Post Office declaration and furnish such journal returns and other information and perform such other services as the Postmaster-General or his officers shall from time to time reasonably require.

10. To obey directions.

10. The contractor and all commanding and other officers in charge of the vessels employed under this contract shall at all times punctually attend to the orders and directions of the Postmaster-General, or his officers or agents, as to the mode, time, and place of landing, transhipping, delivering, and receiving the mails, subject to the special provisions herein contained, and so far as such orders and directions are reasonable and consistent with the safety of the vessels.

11. Passenger accommodation for the officers of the Post Office.

11. The contractor shall provide suitable first-class accommodation, including a cabin or state-room, for the exclusive use of a mail officer or agent of the Postmaster-General and for one assistant on board each of the vessels employed under this contract who shall be at liberty to use such accommodation as may be required for the performance of their duties, and such officers or agents and assistants shall be victualled by the contractor as chief cabin passengers without charge either for their passage or victualling, and whilst the vessel stays at any port excepting the ports of Sydney and Vancouver to and from which the mails are conveyed, such officers, agents, and assistants shall be allowed to remain on board and shall be victualled as aforesaid.

12. Mail officer to have full authority.

12. Every such mail officer or agent and assistant shall be recognised and treated by the contractor, his officers, and agents as the agents of the Postmaster-General, and as having full authority in all cases to require a due and strict performance of this contract. Provided that no such agent, officer, or assistant shall have power to control or interfere with any master, commander, or officer in the performance of his duty, and every such agent, officer, and assistant shall be subject to all general orders issued by the master or commander for the good order, health, and comfort of the passengers and crew and the safety of the said vessels.

13. Conveyance of mails at ports.

13. The expense of conveying mails to and from the said steamships or vessels from or to the post-offices at the terminal ports of the several voyages or at the ports at which the said vessels call *en route* shall be borne by the contractor.

14. Power to Postmaster-General to delay sailing.

14. The Postmaster-General shall, in case of need and for the purpose of duly forwarding such mails as may required, have the right to delay the sailing of any of the said steamships for the space of twenty-four hours.

15. Definition of mails.

15. The expression "mails," for the purpose of this contract, shall be deemed to mean and include all boxes, bags, or packets of letters, post-cards, newspapers, parcels, books, or printed paper, and all other articles which under the Post Office Act or Acts and Postal Regulations for the time being in force are transmissible by post in New South Wales without regard to place either of origin or destination, and also all empty bags, empty boxes, and other receptacles, stores, and articles used or to be used in carrying on the Post Office service, or which shall ordinarily be sent by or to or from the Post Office.

16. Not to carry other letters.

16. The said Contractor shall not, nor shall the master or officers of any of the said steamships, receive or permit to be received on board of either of such steamships at any New South Wales port any letters for conveyance other than those contained in Her Majesty's mails, or which are or may be privileged by the law, nor the mails of any other country except such as may be specified by the Postmaster-General for the time being, and the said contractor shall in all respects be subject to all the postal laws of New South Wales and all the regulations lawfully made thereunder.

17. Nitro-glycerine &c. not to be carried.

17. The contractor shall not convey in any steamship employed by him under this contract any nitro-glycerine or any other article which shall have been proclaimed as an explosive or explosive substance, or shall have been legally declared specially dangerous, or shall be so declared by the Postmaster-General by notice in writing.

18. Not to assign.

18. This contract shall not nor shall any right or interest therein be assigned, underlet, or otherwise disposed of without the consent in writing of the Postmaster-General to such assignment having been first obtained, provided, however, that if such proposed assignment is to be to a joint stock company, of which the contractor shall be a stockholder, such consent as aforesaid shall not be required.

19. The said contractor shall from time to time furnish to the Postmaster-General full and complete copies of the manifests of the cargoes and lists of the passengers carried by each of the said steamships on its outward and its homeward voyages, certified by the proper Customs officials, and also such other documents, information, and evidence as may be reasonably required by the Postmaster-General to show the volume, extent, and value of the trade carried on by the said steamships, and such other Customs certificates, documents, and evidence as may be necessary or as may be reasonably required by the Postmaster-General to prove the performance of the service herein contracted for, and to enable the Postmaster-General to judge as to whether this contract is being properly and faithfully carried out and performed, and the furnishing of such certificates, documents, information, and evidence as hereinbefore specified shall be a condition precedent to the due payment of the subsidy hereinafter provided or any portion thereof. 19. To furnish copies of manifests.

20. And the said Postmaster-General for himself and his successors covenants to and with the said contractor that he and they well and faithfully performing all and every the covenants, agreements, and stipulations hereinbefore on his and their part set forth and contained, he the Postmaster-General will well and truly pay or cause to be paid to him or them during the continuance of this contract a subsidy of eight hundred and thirty-three pounds six shillings and eightpence sterling for each and every round trip performed by each of the said steamships in accordance with the intention of these presents payable in New South Wales, the first subsidy for the first round trip to be payable and paid within ten days after the arrival of the first of the said steamships from Vancouver in the performance of this contract, and the remaining subsidies to be payable and paid respectively within ten days after the succeeding arrivals of the said steamships at Sydney in the performance of this contract, the subsidy in respect of the last round voyage to be performed in pursuance of this contract not to become payable however until such round voyage shall have been satisfactorily completed, provided, however, that no amount or instalments of subsidy shall be payable at any time unless it appears to the satisfaction of the Postmaster-General that up to the time of such payment there has been no breach on the part of the said contractor of any of the covenants, provisions, or stipulations of this contract. 20. Covenant for payment of subsidy.

21. If at any time or times the mails required to be conveyed by the contractor under this agreement between Sydney and Vancouver shall not be conveyed from Sydney to Vancouver or from Vancouver to Sydney within the respective periods of transit hereinbefore prescribed in that behalf; then, and so often as the same shall happen, there shall be deducted from the subsidy which, but for this provision, would be payable to the contractor, a sum of £30 for every complete period of twenty-four hours by which the time actually occupied in the conveyance of such mails from Sydney to Vancouver or from Vancouver to Sydney, as the case may be, shall have exceeded the period of transit hereinbefore prescribed in that behalf. Provided always, that no deductions shall be made from the said subsidy by reason of any such default or failure as in this clause mentioned which may be proved to the satisfaction of the Postmaster-General to have arisen wholly or in part from any cause or causes altogether beyond the control of the contractor. 21. Deduction for delay.

22. Each of the deductions hereinbefore mentioned and hereby agreed to be made, shall be made, and the subsidy be reduced accordingly, although no damage or loss shall have been sustained by reason of, or in connection with, such default, and (except in such cases as in the last preceding clause hereof expressly provided) from whatever cause or causes any such failure or default shall have arisen; and no such deduction shall in any case be deemed to be a penalty, or in the nature of a penalty, and the payment by the Postmaster-General of what shall from time to time remain due in respect of the said subsidy after making any such deductions as aforesaid, shall in no case prejudice the right of the Postmaster-General to treat the failure of the contractor to provide an appropriate vessel at any appointed place or time, or to perform any service at or within the appointed period, as a breach of this contract. 22. The deductions not to be penalty.

23. This contract shall remain in force until thirty-six round voyages have been performed according to the true intention of these presents, provided that the Postmaster-General shall have the right at any time, by notice in writing under his hand, to determine this contract, and every matter and thing herein contained, if it shall appear to him that there has been any material breach on the part of the said contractor of any of the covenants, stipulations, agreements, or provisions herein contained and entered into on the part of the said contractor; and it is hereby declared and agreed that the Postmaster-General shall at all times be the sole and final judge as to whether there has been any such breach, and his determination shall be final and conclusive. 23. Duration of contract.

24. Provided, however, and it is the true intent and meaning of these presents that if the said steamships, or either of them, or any steamship replacing either of such steamships under this proviso, shall be, by the perils of the sea or other unavoidable casualty, lost, destroyed, or temporarily disabled from performing their voyages according to the true intent and meaning of the agreements, stipulations, and provisions herein contained, such loss or disability shall not be deemed to be a breach of these presents or any matter or thing herein contained; but the said contractor shall in such case, as soon as reasonably may be, having regard to the circumstances, replace the said steamship so lost or destroyed by another of equal class, speed, equipment, character, and capacity, to the satisfaction and approval of the Postmaster-General, or to the like satisfaction and approval repair the damage done, in case the said steamship has been only temporarily disabled, and continue the said service herein contracted for with such substituted or repaired steamship with as little loss of time as possible under all the circumstances. Provided always, that there shall be no payment of any subsidy in respect of any voyage not actually and fully performed. Provided further, that the Postmaster-General shall be the sole and only judge, and have the final right of determination as to whether any suspension or temporary discontinuance of, or delay in, the said regular monthly service has been actually caused by the perils of the sea or other unavoidable casualties within the meaning of this proviso, and his finding and determination thereon shall be conclusive. 24. Proviso for replacing steamers disabled.

25. All notices or directions which the Postmaster-General, his officers, agents, or others are hereby authorised to give to the contractor, his officers, servants, or agents, other than any notice of the termination of this contract, may, at the option of the Postmaster-General, his officers, agents, or others, either be delivered or sent by post to the master of any of the said vessels, or any other officer or agent of the contractor in the charge or management of any vessel employed in the performance of this contract, or left for the contractor at or sent by post to the contractor's agents office or house of business in Sydney or any other place, and any notices or directions so given, left or sent by post, shall be binding on the contractor. Provided always that any notice of termination of this contract shall be left for the contractor at the office or last known office of his agents in Sydney, or sent by post to such office. 25. Notices.

In witness whereof, The Honorable Joseph Cook, the Postmaster-General for the Colony of New South Wales, has hereunto set and affixed his hand and seal as such Postmaster-General, and the said James Huddart has hereunto set and affixed his hand and seal the day and year first herein written.

Signed, sealed, and delivered by the said The Honorable Joseph Cook, in the presence of,— } JOSEPH COOK. [L.S.]

S. H. LAMBTON,
Deputy Postmaster-General.

Signed, sealed, and delivered by Robert Grayson, as the Attorney of and in the name and on behalf of the abovenamed James Huddart, in the presence of,— } ROB. GRAYSON, Attorney for JAMES HUDDART. [L.S.]

A. E. KENDALL.

APPENDIX D.

APPENDIX D.

CONVENTION for the Exchange of Parcel Mails between the Colony of New South Wales on the one side and the Colony of Straits Settlements on the other.

1. The parties to this Convention are the Colonies of New South Wales and Straits Settlements. The offices of exchange for parcel mails shall be Sydney and Singapore. Parcel mails shall, for the present, be forwarded by the fortnightly steamers of the Peninsular and Oriental Company only.

2. New South Wales may forward parcels addressed to Singapore, and Singapore may forward parcels addressed to any post town in New South Wales, enumerated on the schedule attached. Such parcels shall be delivered without charge to the addressees, except for Customs duties on dutiable articles in New South Wales.

3. In all matters of detail connected with the exchange of parcels, the rules governing the exchange of parcels between the Colony concerned and the London office shall be followed as far as possible. The maximum dimensions of parcels shall be 3 feet 6 inches in length, or 6 feet in length and girth combined. The maximum weight of any parcel shall be eleven (11) pounds.

4. New South Wales shall communicate to the Colony of Straits Settlements the inland rates which must be credited to such Colony on parcels despatched to it from Singapore, as well as a statement of any special details necessary to be observed in the exchange of parcels with such Colony.

5. Each parcel mail shall be accompanied by a parcel bill similar in form to that used in exchange with the London office. The despatching office will be liable to pay—

1. If the Colony of New South Wales—

   (*a*) A sea rate of 4d. per pound on the net weight of parcels despatched.
   (*b*) An inland rate of 4d. per pound computed parcel by parcel to Singapore.

2. If the Colony of Straits Settlements—

   (*a*) The above sea rate of 4d. per pound.
   (*b*) An inland rate of 4d. per pound computed parcel by parcel to New South Wales.

6. The above sea rates of 4d. per pound will be defrayed by the London office, and the Colonies concerned will therefore credit that office with the rate named.

7. The Convention shall come into force on the 1st May, 1895.

Signed in duplicate, at Sydney, this 15th day of March, 1895.

JOSEPH COOK,
Postmaster-General.

Signed at Singapore this 21st day of January, 1895.

H. A. O'BRIEN,
Postmaster-General.

APPENDIX E.

AMENDMENT of the Arrangement for an Exchange of Parcels between the Post Office of India and the Post Office of New South Wales.

WE, the undersigned, duly authorized by our respective Governments, being desirous of applying to the exchange of postal parcels between India and New South Wales the union principle of making a charge in the case of undelivered parcels returned to the office of the country of origin, also with the object of setting forth the procedure to be adopted in regard to mis-sent parcels, and for other purposes, have agreed to cancel Article 11 and the last clause of Article 12 of the arrangement for the exchange of parcels referred to, concluded at Sydney on the 6th June, and at Simla on the 19th July, 1892, and to substitute the following in lieu thereof :—

Mis-sent parcels are forwarded to their destination by the most direct route at the disposal of the office retransmitting them. When this retransmission involves the return of the parcels to the office of origin the amounts credited in the invoice of that office are cancelled, and the retransmitting office of exchange delivers these articles to the corresponding office, simply recording them on the invoice, after having called attention to the error by means of a verification certificate. In other cases, and if the amount credited to the retransmitting office is insufficient to cover the expenses of retransmission which it has to defray, it recovers the difference by raising the amount entered to its credit in the invoice of the despatching office of exchange. The reason for this rectification is notified to the said office by means of a verification certificate. Postal parcels redirected in consequence of the removal of the addressees from one country to the other, or to another country to which postal parcels can be sent from India or New South Wales, as the case may be, are subjected by the delivering office to a charge to be paid by the addressees, representing the quota due to this latter office, to the redirecting office, and to each intermediary office, if there be any. The redirecting office credits itself with its quota by charging it to the intermediary office, or to the office of the new destination. But if the amount chargeable for the further conveyance of a redirected parcel is paid at the time of its redirection, the parcel is dealt with as if it had been addressed direct from the retransmitting country to the country of destination, and delivered without any postal charge to the addressee.

The senders of parcels which cannot be delivered shall be consulted as to the manner in which they wish to dispose of them. Communications on the subject shall be exchanged direct between the two offices of exchange. If within six months after the despatch of a letter of inquiry the office of destination has not received adequate instructions, the parcel will be returned to the office of origin. The parcel should also be returned if its delivery at a new address cannot be effected. Articles liable to deterioration or corruption may, however, be sold immediately, without previous notice or judicial formality, for the benefit of the right party. An account of the sale is drawn up.

Parcels which have to be returned to the sender are entered in the invoice with the addition of the word "Returned" in the column for remarks. They are dealt with and taxed like articles redirected in consequence of the removal of the addressees.

Parcels which cannot be delivered, returned to the sender, or otherwise disposed of, are sent back to the country of origin for disposal. Such parcels are entered in the invoice with the addition of the word "Returned" in the column for observations; and the redirecting country takes credit for the amount due to it as in the case of parcels redirected in consequence of the removal of the addressees.

Any parcel, the addressee of which has left for a country to which postal parcels cannot be forwarded from India or New South Wales, as the case may be, is dealt with as undeliverable.

If one of the prohibitions provided for in Article 6 is brought to light in the course of post, the parcel is without other formality returned to the despatching office in the manner provided for in the first paragraph of the present article.

This amended arrangement shall be brought into operation as from the 1st April, 1895.

Done in duplicate, and signed at Sydney, the 8th March, 1895; and at Simla, the 9th April, 1895.

JOSEPH COOK,
Postmaster-General of New South Wales.

H. M. KISCH,
Offg. Director-General of the Post Office of India.

APPENDIX G.

Money Order Convention between the Colony of the Cape of Good Hope and the Colony of New South Wales.

The Governor of the Colony of the Cape of Good Hope and the Governor of the Colony of New South Wales being desirous of regulating the system of exchange of money orders between the two colonies have agreed on behalf of their respective Governments upon the following articles :—

Article 1.

There shall be a regular exchange of money orders between the two colonies. The maximum amount for which a money order may be drawn in the Cape Colony upon the Colony of New South Wales, and the maximum amount for which a money order may be drawn in the Colony of New South Wales upon the Cape Colony shall be £10 sterling.

No money order shall include a fractional part of one penny.

Article 2.

The Government of the Cape Colony shall have power to fix the rates of commission on all money orders issued in the Cape Colony, and the Government of the Colony of New South Wales shall have the same power in regard to all money orders issued in the Colony of New South Wales.

Each office shall communicate to the other its tariff of charges or rates of commission which shall be established under this Convention and these rates shall, in all cases, be payable in advance by the remitter, and shall not be repayable.

It is understood, moreover, that each office is authorised to suspend temporarily the exchange of money orders in case any circumstance should give rise to abuses or cause detriment to the postal revenue.

Article 3.

Each colony shall keep the commission on all money orders issued within its jurisdiction, but shall pay to the other colony three-quarters per centum on the amount of such orders.

Article 4.

With the following exceptions, no money order shall be issued unless the applicant furnish in full the surname and at least the initial of one christian name, both of the remitter and the payee, together with the address of the remitter for entry in the "issuing" journal, so that if necessary, he may be traced. If the remitter or payee be a Peer, or a Bishop, his ordinary title shall be sufficient ; if a firm, its usual designation.

Article 5.

Every money order and advice shall be drawn on the authorised form set forth in the schedule herewith annexed marked "A."

Article 6.

All payments for money orders, whether by the public to the Post Office, or by the Post Office to the public, shall be made in sterling money.

Article 7.

Before payment is made of any money order issued under this Convention, the signature of the payee shall be affixed to the order in the place provided for the purpose.

If the payee be unable to write, he shall sign the receipt by making his mark in the presence of a witness who should not, if possible, be a person connected with the Post Office, and such witness shall sign his name in attestation of such mark and payment.

In other respects, the payment of orders shall be subject to the regulations which govern the payment of "inland" orders of the colony on which they are drawn. The paid orders shall remain in the possession of the colony of payment.

Article 8.

When the payee of a money order desires to receive payment at a post office in the colony on which the order was issued other than that upon which the order was originally drawn, the transfer shall be permitted, provided the order be duly signed and sent to the postmaster of the office on which it was drawn.

In such a case, a new order shall be issued by the postmaster of that office, who will deduct from the amount thereof a commission at the rate chargeable under the regulations for the time being of the colony upon which the order was drawn.

Article 9.

Duplicate orders shall only be issued by the Postal Administration of the colony on which the original orders were drawn, and in conformity with the regulations established or to be established in that colony.

Article 10.

On the receipt of an application for the stoppage of payment of a money order, instructions will be given to stop payment.

Article 11.

Errors in the name of the remitter, or of the payee, or in the amount of an order may be corrected by the Post Office of the colony in which the order was issued.

Article 12.

Repayment of orders to remitters shall not be made until an authorisation for such re-payment shall first have been obtained by the colony of issue from the colony upon which such orders were drawn, and the amount of the repaid orders shall be duly credited to the former colony in the accounts. It is the province of each Postal Administration to determine the manner in which re-payment to the remitters is to be made.

Article 13.

Payment of an order must be obtained before the end of twelve calendar months after that in which it was drawn ; for instance, if drawn in January, and not paid before the end of the following January, all claim to the order will be forfeited, unless under exceptional circumstances, the Postmaster-General of the colony in which the order was issued, shall think proper to authorise its renewal. Orders which shall become void, and the sums accruing therefrom shall be at the disposal of the country of origin.

The Post Office of the Cape Colony shall, therefore, enter to the credit of the Colony of New South Wales in the quarterly account all money orders entered on the lists received from the Colony of New South Wales, which remain unpaid at the end of the period specified. In like manner, the Post Office of the Colony of New South Wales shall enter to the credit of the Cape Colony all money orders entered on the lists received from the latter colony, which shall under the terms of the Article become void.

Article 14.

After once paying a money order, by whomsoever presented, the colony of payment shall not be liable for any further claim.

Article

Article 15.

The service of the postal money order system between the two Colonies shall be performed through the agency of offices of exchange. On the part of the Cape Colony the office of exchange shall be Cape Town, and on the part of the Colony of New South Wales, Sydney.

Article 16.

Orders shall be drawn only on the authorised Money Order Offices of the respective Colonies, and each Postal Administration shall furnish to the other a list of such offices and shall from time to time notify any addition to or changes in such list.

Article 17.

The advices of all orders drawn upon the Colony of New South Wales by Offices in the Cape Colony, and *vice versa*, shall be sent by the office of issue to the office of exchange in the Colony in which the orders are drawn, where the particulars and amount of the orders shall be entered by such office upon a list similar to that set forth in schedule "B," which list, together with the advices, shall be transmitted by first post to the office of exchange in the Colony upon which the orders are drawn.

The advices shall on receipt at the latter office of exchange be compared with the entries on the list, stamped with the dated stamp, and sent forward without delay to the offices of payment.

Article 18.

A duplicate copy of each list of advices shall be sent to the office of exchange in the Colony of payment by the first mail after the despatch of the original list.

Artlcle 19.

The original list shall form the basis of account between the two Colonies.

Article 20.

The Colony of the Cape of Good Hope shall render to the Colony of New South Wales a quarterly statement of account, and if the balance be in favour of the Colony of New South Wales, the amount of such balance shall be paid in London by the Agent General of the Cape of Good Hope, to the order of the Controller of the Money Order Office of the Colony of New South Wales.

If, on the other hand, the balance be in favour of the Cape Colony, the amount shall be paid to the Agent General of the Colony of the Cape of Good Hope, in London. These accounts shall be in accordance with the forms set forth in schedules "C" and "D" to this Convention.

Article 21.

The Money Order Office of payment in each Colony shall not pay any order unless the relative advice has previously been received, and unless both order and advice bear the dated stamp of the office of issue.

Article 22.

The postal administration in each Colony shall be authorised to adopt any addition rules, if not repugnant to the foregoing for the greater security against fraud, or for the better working of the system generally. All such additional rules, however, shall be communicated to the Post Office of the other Colony.

Article 23.

This Convention shall take effect upon the 1st day of January, 1895, and shall continue in force until twelve months after either of the contracting parties shall have notified to the other its intention to terminate it.

Given under my hand and the Public Seal of the Colony of the Cape of Good Hope, at Cape Town, on the 12th day of February, 1895.

[Seal.] HENRY B. LOCH,
Governor.

Given under my hand and the Great Seal of the Colony of New South Wales, at Sydney, on the 4th day of April, 1895.

[Seal.] FREDK. M. DARLEY,
Lieutenant-Governor.

By His Excellency's Command,
JAMES N. BRUNKER.

APPENDIX H.

AMENDMENT of Articles 22 and 25 in arrangement respecting the interchange of money orders between New South Wales and India.

WE, the undersigned, being duly authorised by our respective Governments, have agreed to replace Articles 22 and 25 of the arrangement concluded in 1881, for the interchange of money orders between the Post Office of New South Wales and the Post Office of India, by the following articles :—

Article 22.—As soon as the New South Wales Office of Exchange shall have received from India all the lists bearing dates in any month, these lists as well as the New South Wales lists bearing dates in the same month shall be made the subject of a monthly account in the annexed form "B."

Article 25.—A copy of the account mentioned in Article 22 shall be forwarded to the Indian office of exchange, with payment by bill of exchange on London, if the balance be in favour of India, and for payment by bill of exchange on Sydney if the balance be in favour of New South Wales.

The above provisions shall be brought into operation as from the 1st July, 1894.

Done in duplicate and signed at Sydney, the 9th day of July, 1894, and at Simla, the 1st September, 1894.

JOHN KIDD,
Postmaster General, New South Wales.
H. M. KISCH,
Officiating Director General of the Post Office of India.

MONTHLY account of money order exchanges between New South Wales and India, prepared by the New South Wales office of exchange for the month of 189 .

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

POSTAL AND TELEGRAPHIC CONFERENCE.

(REPORT OF THE DELEGATES TO THE INTERCOLONIAL CONFERENCE, HELD IN SYDNEY IN JANUARY, 1896)

Printed under No. 1 *Report from Printing Committee,* 21 *May,* 1896.

President :—The Honorable JOSEPH COOK, M.P., of New South Wales.

Each of the seven Colonies of Australasia was represented.

The Conference sat on the 17th, 18th, and 20th January, 1896.

The following resolutions were adopted, viz. :—

RELATING TO THE PROPOSED PACIFIC CABLE.

1. That, in the opinion of this Conference, the Pacific cable should be constructed and owned jointly by the various Governments interested.
2. That, in the opinion of this Conference, the landing places of such cable should be only upon territory belonging to or under the control of the British Empire.
3. That, in the opinion of this Conference, the cost of its construction, working, and maintenance be borne in the following proportions, namely :—Great Britain, one-third; the Dominion of Canada, one-third; and the contributing Australasian Colonies, one-third.
4. That, in the opinion of this Conference, the route from Fiji to Australia be *via* Norfolk Island, thence bifurcating to the nearest convenient landing places in the north of New Zealand and Moreton Bay respectively.
5. That, in the opinion of this Conference, it is highly desirable that South Australia join the other Colonies in the Pacific cable project, and having regard to their vested interests in the transcontinental line, Dr. Cockburn be invited to make a proposition, embodying the terms on which the South Australian Government would be prepared to join the other Colonies in the said project.

The Hon. Dr. Cockburn intimated the following as the proposal of the South Australian Government, viz. :—South Australia is willing to join in the project provided that a guarantee, either from the contributing Colonies alone, or jointly with the Imperial Government, be given, that the financial position of South Australia, as regards the Port Darwin line be maintained on the basis of the average of the last five years.

The Hon. Mr. Reeves stated that he had received a cable from the Hon. Mr. Ward with regard to the terms on which New Zealand would come in as a contributing Colony to the effect that of course it would be very disadvantageous to New Zealand to come in on an equally responsible footing with the other three Colonies; at the same time, Mr. Ward would be prepared to give way and do so, annexing, however, the stipulation that Victoria and New South Wales should join with New Zealand in facing any possible loss on the present cable,

6.

6. That, in the opinion of this Conference, the Colonies joining contribute equally to the undertaking.

(The Hon. Dr. Cockburn and the Hon. Mr. Reeves refrained from voting on the above.)

7. That, in the opinion of this Conference, in consideration of South Australia joining with the other contributing Colonies in the Pacific Cable project, they would be willing, jointly with Great Britain, to guarantee that Colony against further loss in connection with their transcontinental line in consequence of the construction of the new cable.

8. That, in the opinion of this Conference, Sir Saul Samuel, K.C.M.G., C.B., and the Hon. Duncan Gillies be nominated as representatives of the Australasian Colonies on the Commission in connection with the Pacific Cable, and that they be requested to consult on all important points the Agents-General for the Australasian Colonies.*

9. That, in the opinion of this Conference, it be a recommendation to the Governments represented at this Conference to forward the foregoing resolutions to the Australasian Commissioners.

RELATING TO THE PROPOSED NEW FEDERAL MAIL SERVICE.

10. This Conference, having considered the reply of the London office to the stipulation of the Hobart Conference with regard to the manning of the mail-boats by white instead of coloured labour, recognises fully the force of the reason given by the Imperial Government against insisting on the exclusion of coloured labour, viz., the necessity of discriminating between various classes of British subjects, but in reply would respectfully point out that by some steamship companies the labour of the contributing Colonies is excluded from employment, and an invidious preference given to the labour of countries which do not contribute to the maintenance of the service. No injustice would thus be done by the stipulation that the labour of the countries subsidising the service only should be employed. And therefore this Conference is of opinion that the mails to and from Australia and Great Britain should be carried by ships manned with white crews only. The Conference concurs with the London office in the other points raised in connection with the new mail tenders.

It was arranged that the President should communicate the above by cable to the London Post Office.†

Appended to this Report will be found:—

Minutes of Proceedings of the Conference.

Memo. showing the present position of the Federal Mail Service matter.

* NOTE.—On page 21 will be found the nature of the instructions cabled to London. It will be seen that it has been provided that any scheme submitted by the Pacific Cable Commission shall be subject to the approval of the Governments of the respective Australasian Colonies.

† NOTE.—Subsequent telegraphic communications between the Postmaster-General of New South Wales (acting as President of the Intercolonial Postal and Telegraphic Conference) and the Postmaster-General, London, will be found on page 21.

POSTAL AND TELEGRAPHIC CONFERENCE.

MINUTES OF PROCEEDINGS.

FRIDAY, 17 *JANUARY*, 1896.

THE Conference was opened at the General Post Office, Sydney, at 2·30 p.m., when the undermentioned gentlemen, representing the Colonies indicated herein, were present, viz.:—

New Zealand:	Hon. W. P. REEVES, New Zealand.
Queensland:	Hon. A. J. THYNNE, M.L.C., Postmaster-General, Queensland.
South Australia: } *Tasmania:*	Hon. J. A. COCKBURN, M.D., M.P., Minister for Education and Agriculture, South Australia.
Victoria:	Hon. J. GAVAN DUFFY, M.P., Postmaster-General, Victoria.
New South Wales:	Hon. JOSEPH COOK, M.P., Postmaster-General, New South Wales.

Moved by the Hon. J. GAVAN DUFFY, and seconded by the Hon. Mr. THYNNE,—"That the Hon. Joseph Cook, M.P., be President of this Conference." Carried.

The Hon. Mr. Cook thanked the representatives for the honor conferred.

It was determined, without formal motion, that the Conference being of a somewhat confidential character, it was not expedient that the Press should be present.

Moved by the Hon. Mr. THYNNE, M.P., and seconded by the Hon. Mr. REEVES,—"That Mr. James Dalgarno perform the duties of Secretary to this Conference." Carried.

The Hon. Mr. COOK laid before the Conference the following telegram, dated 16th January, that had been received from the Hon. the Premier of Western Australia, *re* the appointment of Dr. Cockburn as representative of Western Australia, viz.:—

"This Government has appointed Dr. Cockburn to represent this Colony at the Postal Conference on two points: First, the Pacific cable question to the following extent, viz., that we are in favour of one Commissioner being appointed to represent South Australia and West Australia. Second, to give this Colony's vote in favour of the views expressed by me at the Hobart Conference, which were to the effect that this Government supports the Imperial Government in regard to coloured labour and cold storage as applied to mail steamers. Please communicate this telegram to the Postal Conference.

JNO. FORREST, Premier."

The Hon. Mr. COCKBURN intimated that he had also been requested to represent Tasmania.

The PRESIDENT opened the Conference in a brief address, indicating the order of business, which placed the Pacific cable matter as the first to be considered, to be followed by the question of the Federal Mail Service.

PROPOSED PACIFIC CABLE.

After a lengthy discussion the following resolutions were arrived at:—

(1.) Moved by the Hon. Mr. GAVAN DUFFY, and seconded by the Hon. Mr. THYNNE,—"That in the opinion of this Conference the Pacific Cable should be constructed and owned jointly by the various Governments interested." Carried unanimously.

(2.) Moved by the Hon. Mr. REEVES, and seconded by the Hon. Mr. THYNNE,—"That in the opinion of this Conference the landing places of such cable should be only upon territory belonging to or under the control of the British Empire." Carried unanimously.

(3.) Moved by the Hon. Mr. THYNNE, and seconded by the Hon. Mr. GAVAN DUFFY,—"That in the opinion of this Conference the cost of its construction, working, and maintenance be borne in the following proportions, namely:—Great Britain, one-third; the Dominion of Canada, one-third; and the contributing Australasian Colonies, one-third." Carried.

(4.) Moved by the Hon. Mr. GAVAN DUFFY, and seconded by the Hon. Mr. COOK,—"That in the opinion of this Conference the route from Fiji to Australia be to Norfolk Island, thence bifurcating to the nearest convenient landing places in the north of New Zealand and Moreton Bay, respectively." Carried unanimously.

(5.) Moved by the Hon. Mr. COOK, and seconded by the Hon. Mr. DUFFY,—"That in the opinion of this Conference it is highly desirable that South Australia join the other Colonies in the Pacific Cable project; and having regard to their vested interests in the transcontinental line, Dr. Cockburn be invited to make a proposition embodying the terms on which the South Australian Government would be prepared to join the other Colonies in the said project." Carried.

The Conference adjourned at 6·15 p.m. to the following day (Saturday), at 9·30 a.m.

JAMES DALGARNO,
Secretary to Conference.

JOSEPH COOK,
President.

SATURDAY,

SATURDAY, 18 *JANUARY*, 1896.

THE Conference met at 9·30 a.m.

Present:—

New Zealand: Hon. W. P. REEVES, New Zealand.
Queensland: Hon. A. J. THYNNE, M.L.C., Postmaster-General, Queensland.
South Australia: / *Tasmania:* Hon. J. A. COCKBURN, M.D., M.P., Minister for Education and Agriculture, South Australia.
Victoria: Hon. J. GAVAN DUFFY, Postmaster-General, Victoria.
New South Wales: Hon. JOSEPH COOK, M.P., Postmaster-General, New South Wales.

Minutes of yesterday confirmed.

The Hon. Dr. COCKBURN made the following statement with reference to the resolution No. 5 *re* Pacific Cable, viz.:—"South Australia is willing to join in the project provided that a guarantee, either from the contributing Colonies alone or jointly with the Imperial Government, be given that the financial position of South Australia as regards the Port Darwin line be maintained on the basis of the average of the last five years."

The Hon. Mr. REEVES stated that he had cabled to the Hon. Mr. Ward yesterday, as he had promised, with regard to the terms on which New Zealand would come in as a contributing Colony, and that a reply had been received to the effect that, of course, it would be very disadvantageous to New Zealand to come in on an equally responsible footing with the other three Colonies. At the same time, Mr. Ward would be prepared to give way, and do so, annexing, however, the stipulation that Victoria and New South Wales should join with New Zealand in facing any possible loss on the present cable.

(6.) Moved by the Hon. J. GAVAN DUFFY, and seconded by the Hon. Mr. THYNNE,—"That, in the opinion of this Conference, the Colonies joining contribute equally to the undertaking." Carried; the Hon. Dr. Cockburn and the Hon. Mr. Reeves refraining from voting.

(7.) Moved by the Hon. Mr. COOK, and seconded by the Hon. Mr. J. GAVAN DUFFY,—"That, in the opinion of this Conference, in consideration of South Australia joining with the other contributing Colonies in the Pacific cable project, they would be willing, jointly with Great Britain, to guarantee that Colony against further loss in connection with their transcontinental line in consequence of the construction of the new cable." Carried.

(8.) Moved by the Hon. Mr. THYNNE, and seconded by the Hon. Mr. REEVES,—"That, in the opinion of this Conference, the Earl of Jersey and Sir Edwyn Dawes be appointed on the proposed Commission as the representatives of the Australasian Colonies." Resolved in the negative.

Hon. Dr. COCKBURN moved,—"That a third representative be nominated to represent the special interests of the Western Colonies," but there being no support,—

The Hon. Mr. J. GAVAN DUFFY moved, and the Hon. JOSEPH COOK seconded,—"That, in the opinion of this Conference, Sir Saul Samuel, K.C.M.G., C.B., and the Hon. Duncan Gillies be nominated as representatives of the Australasian Colonies on the Commission in connection with the Pacific Cable, and that they be requested to consult on all important points the Agents-General for the Australasian Colonies." Carried.

(9.) The Hon. Mr. REEVES moved, and the Hon. Mr. THYNNE seconded,—"That, in the opinion of this Conference, it be a recommendation to the Governments represented at this Conference to forward the foregoing resolutions to the Australasian Commissioners." Carried.

The Conference adjourned at about 12·45 p.m. to Monday next.

JAMES DALGARNO,
Secretary to Conference.

JOSEPH COOK,
President.

MONDAY, 20 *JANUARY*, 1896.

THE Conference met at 11 a.m.

Present:—

Queensland: Hon. A. J. THYNNE, M.L.C., Postmaster-General, Queensland.
South Australia: / *Tasmania:* Hon. J. A. COCKBURN, M.D., M.P., Minister for Education and Agriculture, South Australia.
Victoria: Hon. J. GAVAN DUFFY, Postmaster-General, Victoria.
New South Wales: Hon. JOSEPH COOK, M.P., Postmaster-General, New South Wales.

Minutes of Saturday confirmed.

FEDERAL MAIL SERVICE.

The PRESIDENT laid a* memo. on the table, *re* the Federal Mail Service, and explained the present position of the matter, showing that the main questions of the disagreement with the British Post Office to be considered and determined were,—

1. Question of coloured labour,
2. Question of cold storage;

also a minor difference on the subject of the amounts in the compensation to be paid by contractors for loss of parcels or registered packets. Moved

* Appendix.

Moved by the Hon. J. COOK, and seconded by Hon. J. GAVAN DUFFY,—

"10. This Conference, having considered the reply of the London office to the stipulation of the Hobart Conference, with regard to the manning of the mail boats by white instead of coloured labour, recognises fully the force of the reason given by the Imperial Government against insisting on the exclusion of coloured labour, viz., the necessity of discriminating between various classes of British subjects, but, in reply, would respectfully point out that by some steamship companies the labour of the contributing colonies is excluded from employment, and an invidious preference given to the labour of countries which do not contribute to the maintenance of the service. No injustice would thus be done by the stipulation that the labour of the countries subsidising the service only should be employed. And, therefore, this Conference is of opinion that the mails to and from Australia and Great Britain should be carried by ships manned with white crews only."

The Conference concurred with London Office in the other points raised in connection with the new mail tenders.

It was arranged that the President should communicate the above by cable to the London Post Office.

The Hon. A. J. THYNNE moved, and the Hon. Dr. COCKBURN seconded, a vote of thanks to the Hon. Joseph Cook for the able manner in which he had presided over the proceedings of the Conference, and for his hospitality and kindness during the stay of the Delegates in Sydney. Carried by acclamation.

The Hon. JOSEPH COOK returned thanks for the compliment paid him.

The Hon. J. GAVAN DUFFY proposed, and the Hon. A. J. THYNNE seconded, a vote of thanks to Mr. James Dalgarno for his efficient services as Secretary to the Conference. Carried by acclamation.

Mr. DALGARNO acknowledged the compliment.

The Conference adjourned.

JAMES DALGARNO,
Secretary to Conference.

JOSEPH COOK,
President.

The Conference finally met on Tuesday, 21st January, 1896, when minutes of the previous meeting were read and confirmed. The Draft Report of the Conference was submitted, revised, and signed by the Delegates, the Hon. Mr. Cook intimating that he had been asked to sign on behalf of the Hon. Mr. Reeves, for New Zealand.

APPENDIX.

FEDERAL MAIL SERVICE.

Memorandum showing present position.

ON the 21st May, 1895, the Minister for Education, Adelaide, forwarded a copy of a communication from the London Post Office, dated 29th March, 1895, relating to the Federal Mail Service, and with it a draft form of tender and proposed conditions for the new contract. This was dealt with at a Conference held at Adelaide in July, 1895, and, as a result, Adelaide Office addressed a communication to London, dated 24th September, 1895, conveying the decision of the Contracting Colonies in respect to the Federal Mail Service.

The alterations which the Contracting Colonies sought are indicated in the copy of letter dated 24th September, 1895, addressed to London Post Office by the Adelaide Post Office.

On the 6th January, 1896, the following telegram was received from the Adelaide Postal Department, viz.:—

Have just received the following telegram from London:—"With every desire meet wishes colonies interested. Her Majesty's Government regret that, after careful consideration, they feel unable invite tenders for service, including cold storage, or excluding coloured labour. Reasons for this decision follow by post. Following conditions agreed to:—1st. English port departure, arrival. 2nd. Other countries' sea postage deducted from subsidy, also fines. 3rd. Balance payable ratio nineteen to fifteen. 4th. Tender form amend as suggested, except amounts in compensation clause.* Letter with supply amended forms next mail. Proposed advertise service next month. Will telegraph latest date for accepting tenders. Please telegraph acquiescence."

---

* The suggestion of Adelaide Conference was that the amount of compensation to be paid by contractors for lost parcels should be increased from £1 to £3 per parcel, and from £2 to £5 per registered postal packet, it being thought that the larger amounts were only reasonable. London Office dissents.

Ministerial Conference on Pacific Cable Matters, &c., 1896.

REPORT OF THE PROCEEDINGS.

FRIDAY, 17 *JANUARY*, 1896.

THE PRESIDENT, the Hon. Joseph Cook, thanked the delegates for electing him to preside over their small but very important gathering, and said he was glad to welcome the representatives of the other Colonies, and felt that the measures adopted at other Intercolonial Conferences rendered it unnecessary for him to occupy any time in explaining the action up to the present on the matters they had to consider. They had two very important subjects to engage their attention: the proposals in regard to the Pacific cable, and the action of the Imperial Government in regard to the tenders for the new contract for the Federal Mail Service. He felt sure all the representatives were animated by the desire to equitably adjust the respective intercolonial difficulties that have hitherto stood in the way of giving effect to the accomplishment of the long talked of Pacific cable. The whole question of the relationship of the Western Colonies to the scheme would doubtless come on for discussion, and would be dealt with in that federal spirit which was animating most of our Australasian national endeavours at the present time. He then proceeded to allude to the various routes which had been suggested, and thus opened the subject of the Pacific cable for discussion by the representatives. This discussion throughout the proceedings was of quite a conversational character, and the shorthand notes thereof are for the most part, therefore, but an outline of all that was said.

The Delegates conversed upon the proposed Pacific Cable Question in all its aspects, which led to the determination to formulate resolutions for the information and guidance of the gentlemen who may be appointed to represent the colonies on the proposed Imperial Commission. The first of these resolutions was submitted by the Hon. J. GAVAN DUFFY, and seconded by the Hon. Mr. THYNNE:—

(1.) "That in the opinion of this Conference the Pacific cable should be constructed and owned jointly by the various Governments interested."

The Hon. Dr. COCKBURN remarked: If you are appointing a Commission to inquire into this matter and make recommendations, is it not a mistake to bind them down too closely? You tell them they can only recommend in one direction in the matter of the construction of the cable: are they not, being on the spot and in touch with the latest information, likely to be able to do better service by being left with a freer hand? You say they must confine their inquiries only as regards a cable to be constructed by Government enterprise.

The Hon. Mr. THYNNE: I think we should endeavour to do away with all points of local conflicting interests, so that our representatives on the Commission will be able to state that such and such is what Australasia desires. Let Australasia speak with one voice in the matter. Of course we have not the power to dictate to the whole Commission, and we certainly have not yet all the knowledge which they are expected to gather; but it would facilitate the work of the Commission if our representatives were clearly informed of the wishes of the combined colonies, with whom it now rests to compromise among themselves all points of difference. I think considerable weight would be attached by the Commission to our opinion on those points on which we are in unity, or on which we can agree.

The Hon. Dr. COCKBURN: Does not the whole question of what we should prefer depend upon the terms on which we can get it? Mr. Sandford Fleming was at first in favour of the cable being constructed by private enterprise, but he found on inquiry that it was more likely to be successful by being taken up by the Governments. Now, he is in favour of its being done by Government.

The Hon. Mr. COOK: It seems to me that there are four or five points. First of all, whether it is to be a Government scheme or a private one. Second, as to the proportion of cost among the colonies. Third, as to the route. Fourth, the special aspect of the matter relating to South and Western Australia. Fifth, the question of representation. I think we should take these points *seriatim*.

Resolution (1) was carried unanimously.

The Hon. Mr. REEVES moved, and the Hon. Mr. THYNNE seconded:—

"That in the opinion of this Conference the landing places of such cable should be only upon territory belonging to or under the control of the British Empire." Carried unanimously.

The Hon. Mr. THYNNE moved, and the Hon. Mr. GAVAN DUFFY seconded:—

"That, in the opinion of this Conference, the cost of its construction, working, and maintenance be borne in the following proportions, namely:—Great Britain, one-third; the Dominion of Canada, one-third; and the contributing Australasian Colonies, one-third." Carried.

It being generally agreed that the cable should follow as direct a track as possible from Vancouver to Fiji, *via* Fanning Island, the discussion then took up the various proposals for the route from Fiji to Australasia, those demanding most attention being the proposal for the route direct from Fiji to Queensland, and the proposal for the route to be from Fiji to New Zealand, and thence to Queensland. It was suggested by the Hon. Mr. Cook that to meet the local differences of Queensland and New Zealand the cable should come on from Fiji to Norfolk Island, and there bifurcate to Moreton Bay on the one hand and to the northern part of New Zealand on the other hand. The merits of the various routes were talked over with the aid of maps.

The

The Hon. Mr. REEVES said New Zealand could not accept the suggestion that the cable should go simply to Queensland, New Zealand being left out. He must represent that to the Conference. If reference was made to the report of the Wellington Conference it would be seen that a resolution was passed on the question of route, which clearly suggested that the route should be from Queensland to Auckland, thence to Fiji, or from somewhere on the coast of New Zealand to the north of Auckland to Fiji.

The Hon. Mr. THYNNE objected to the Wellington Conference resolution so far as Queensland was concerned. It was not accepted by the Queensland Government.

The Hon. Mr. COOK: What is your objection, Mr. Thynne, to this Fiji to Auckland and Auckland to Brisbane suggestion?

The Hon. Mr. THYNNE: There are several objections to it. It was, in the first place, very much further, and involved some 600 or 700 miles of cable more than was required.

The Hon. Mr. REEVES: We submit, of course, that the very trifling increase of distance caused by passing to us in going from Fiji to Brisbane is absolutely no injury to Queensland. We submit that, there being no injury to Queensland, the interests of New Zealand should be conserved on a point we take to be of vital importance to us. (After some further remarks.) Well, we much prefer that route.

The Hon. Mr. COOK: North Cape, in New Zealand?

The Hon. Mr. REEVES: No; the most convenient landing place north of Auckland. Perhaps it will not be the North Cape. It is not desired to leave Queensland out at all. The cable could go from New Zealand to Brisbane by as short a route, but by going to Brisbane direct it simply leaves New Zealand out altogether. Why leave us out, when by taking us in you can be equally well served?

Further desultory conversation ensued, and the Hon. Mr. THYNNE said he would like to have certain figures verified, as they differed very considerably from the information given by his papers.

The Hon. Mr. REEVES said one difference might be explained by a misunderstanding that had arisen. People talked about the distance from Fiji to Auckland, but it was not going to Auckland, but to some place north; that would probably mean a difference of some 200 miles.

Mr. P. B. Walker, being called in, explained that the slack had been allowed for in some calculations, and much greater percentage in some cases than in others. Moreover, he did not take the figures as at all correct on some of the papers. One engineer allowed 20 per cent. for slack: Mr. Walker only allowed 10 per cent., which he thought ample. Only 6 per cent. slack was used on the New Caledonia line. Mr. Fleming's estimate of 20 per cent. was altogether too much: no cable engineer would think of putting so great an excess as that on a cable, unless it was very deep sea. It might be a mistake on the right side, but it was unnecessary, as 10 per cent. was ample; and seldom more than 7½ per cent. was used on the Atlantic cables, which were in very deep water. Mr. Walker explained the reason of a deviation in the case of the New Caledonia-Fiji route was to escape a very deep hole to the north-west of New Caledonia, and the probable damage that would be occasioned to the laying machinery in this deep water.

The Hon. Mr. COOK: I think we had better settle to take Norfolk Island as the point of bifurcation.

The Hon. Mr. REEVES: The object in accepting a compromise is generally to have a friendly settlement of a difficulty; would it be a friendly settlement? If the majority of the Conference want to settle it so, under the circumstances I will not contest the matter. I think my Government would, when I explain the matter, stand by me in accepting the position.

The Hon. Mr. THYNNE: On behalf of Queensland I am very well satisfied with the compromise proposed. I think it is the best route yet suggested, and will probably cost less than the direct line from Fiji to Queensland.

The Hon. Mr. COOK: Very well. Perhaps it would be as well for it to be moved and seconded by two of the other Colonies.

The resolution was read: "That the route from Fiji to Australia be to Norfolk Island, thence bifurcating to the nearest convenient landing place in the north of New Zealand and Moreton Bay."

The Hon. Dr. COCKBURN thought the proposition a fair one; at the same time, he deemed it a mistake to fix these details—it would only be hampering the Commissioners. Here they had figures at variance, which the Commissioners would be able to have correct and would know more about, and altogether he thought it would be better to leave the Commission untrammelled, as they would have better data to work upon.

The Hon. Mr. GAVAN DUFFY moved, and the Hon. J. COOK seconded:—

"That in the opinion of this Conference the route from Fiji to Australia be to Norfolk Island, thence bifurcating to the nearest convenient landing places in the north of New Zealand and Moreton Bay respectively." Carried unanimously.

The Hon. Mr. COOK: Now as to the apportionment of cost between the Colonies. There has been an understanding that the Colonies should take equal responsibilities in this matter.

The Hon. Mr. REEVES: Well, personally, so far as my judgment goes, I take that view too, but I am absolutely without any communication from Mr. Ward or from my Government as to their views.

The Hon. Mr. DUFFY: I should think New Zealand would take a little more than her proportion, as she has no extra expense.

The Hon. Dr. COCKBURN: Until we get some idea what the cost is expected to be, it is only making difficulties trying to apportion the shares.

The Hon. Mr. COOK: I do not think so.

The Hon. Mr. REEVES: I am rather inclined to take Dr. Cockburn's view.

The Hon. Dr. COCKBURN: It practically precludes three Colonies from coming in; Tasmania could not come in on that basis.

The Hon. Mr. COOK: I do not see myself, I candidly confess, how Tasmania and Western Australia could ever come in.

The Hon. Dr. COCKBURN: South Australia could hardly be expected to be an equal contributor, the advantages she would get would be ——

The Hon. Mr. COOK: 15d. or 18d. a word reduction on messages. What does it cost you now to get to London?

The

The Hon. Dr. COCKBURN: I think it is 4s. 9d.

The Hon. Mr. COOK: Is it nothing to get through possibly for 3s. 2d.? You are seeing no advantages at all. I am trying to show that a 3s. 2d. instead of a 4s. 9d. rate would be worth while.

The Hon. Dr. COCKBURN: Of course, our telegrams would still go the other way—it is shorter.

The Hon. Mr. COOK: Would they? And you would pay 4s. 9d. in preference to 3s. 2d.?

The Hon. Mr. DUFFY: What do you say, Mr. Reeves, would your Government agree to come in on equal terms with the other three Colonies?

The Hon. Mr. REEVES: I scarcely feel warranted in speaking in their name on the question to-day. I thought it only right to explain my position. There is no desire on my part to hang back. I recognise that if this is to be gone into, it must be in a fairly broad spirit. Might I suggest that we meet to-morrow morning, and it be postponed till then. I could cable to Mr. Ward now. I understand that the proposal of the three contributing Colonies is that the four contracting Colonies come in on an equal footing, equal responsibility?

The Hon. Mr. DUFFY: There is another little subsidiary point as to the local land charges; we must come to some equitable arrangement—it does not effect New Zealand, I suppose?

The Hon. Mr. THYNNE proposed that there should be fixed the same charge to Brisbane as to Melbourne, say 2d. or 3d. a word; let all the Colonies pay alike, pool the amount, and divide it, that is a fair way of doing it.

The Hon. Mr. COOK: Yes, that is fair.

The Hon. Dr. COCKBURN: Of course, the position of South Australia is well known and recognised in this matter. At all former Conferences, South Australia has abstained from taking part in or voting on the question of the Pacific cable; on the other hand she has no desire or intention of departing from the traditions that have always guided her, and she will continue to do her utmost in the interests of international telegraphy, and she looks to the friendly feeling of the neighbouring Colonies that her services in the past will not be made the cause of her suffering unduly in the future. Of course, the facts of the construction of the transcontinental line are well known. It was constructed in 1872 by South Australia, at a time when there was no prospect whatever of the revenue meeting expenditure. I suppose but for that step on her part, for the enterprise she then showed, telegraphic communication would have been delayed many years. She constructed the line, worked it at great expense, and for many years at great loss, and she has reason, from the expressions of friendliness which have always been given by delegates at previous Conferences, to believe that she will not appeal in vain to the sense of justice and kindly feeling of her neighbours. Should this line be constructed, she expects that she will not be left with an unprofitable line on her hands. Of course she feels that to put her interests forward in any way to oppose or prevent the extension of telegraphic communication would be unworthy; she has no intention of doing that; on the contrary, she would like to assist. Of course, whether she could do so or not would entirely depend on the attitude of her neighbours. She has been given reason to believe that other Colonies would favourably entertain a proposal, in the event of the Pacific cable being constructed, either to take over the existing transcontinental line as a federal undertaking, or to give her some guarantee that the revenue derived from her present line would not be unduly destroyed by the Pacific line. Either of these results would be satisfactory to South Australia. The question of South Australia contributing has not been discussed hitherto, and we have always been looked upon as exempt, but we would prefer—I believe my colleagues would—that we should take portion in this undertaking; but this is a new phase of the question.

The Hon. Mr. THYNNE: The way in which we look at the question is this: Assuming that the Pacific cable is actually accomplished (and will be within the next three or four years), it will be to our interest in Queensland—and the same with New South Wales and Victoria, and, I hope, New Zealand—to have an alternative route by the eastern line available for us; and for that reason I think that those Colonies, under the circumstances, would be doing right to make such provision as will keep the way open for connection with the eastern cables. What the extent or amount of the charge which the other Colonies would be expected to bear is a matter we are not able to discuss at present. I think that the interest we have is sufficient to justify us in coming to an equitable arrangement. Mr. Playford, at the Ottawa Conference, stated the position of South Australia practically in the same words as Dr. Cockburn has. We should like to see South Australia come in as a contributing Colony with New Zealand and ourselves, even though it may be on a lower basis of contribution than we should pay. Some fair allowance should be made for the advantages derived from the existence of the South Australian overland line. At our first meeting I proposed that the four contracting Colonies should settle all questions of local or conflicting interest between themselves, and then approach South Australia and say: "We have arranged for this cable, on what terms will you come in with us?" as a preliminary. It may still be necessary that this be done before we can come to a definite arrangement.

The Hon. Mr. COOK: The guarantee to South Australia is purely a contingent one.

The Hon. Mr. REEVES: I should be prepared, Sir, I think, to go this far: that, recognising the services of South Australia, and how desirable it is that they should come in, the South Australian Government be invited to make, as it were, an offer what they think they ought to get to come in.

The Hon. Mr. COOK: I think that offer is now made in a formal way by Dr. Cockburn.

The Hon. Mr. REEVES: He said it had not been properly considered by his Cabinet—it has not been discussed by our Cabinet either.

The Hon. Mr. COOK: It has always been considered that Mr. Ward would be favourable to this view.

The Hon. Dr. COCKBURN: The attitude of South Australia was not only discussed at the New Zealand Conference, but it was distinctly understood in Committee, that in the event of the Pacific cable being constructed, one of two things should be done—either the line should be taken over, or a guarantee given to South Australia.

The Hon. Mr. THYNNE: Surely your Colony would not be prepared to hand over the line?

The Hon. Dr. COCKBURN: No; we might be a federated Australia.

The Hon. Mr. REEVES: I think the guarantee would be the better form.

Some conversation took place as to what had been said at the New Zealand Conference, the Hon. Dr. Cockburn having confidence that such an understanding had been expressed.

The Hon. Mr. COOK: We might leave the matter where it is for the present. Dr. Cockburn could consult with his Premier.

The

The Hon. Dr. COCKBURN thought he could hardly do so in so short a time.

The Hon. Mr. THYNNE thought some provision should be made that no landing-place be afforded by any of the Colonies to any foreign or competing undertaking.

The Hon. Mr. COOK: That is already provided.

The Hon. Mr. DUFFY: There is one little matter—if we construct the cable, will it be necessary to state that in our opinion it ought to be under Imperial guarantee?

The Hon. Mr. COOK: I do not think there can be any question as to that.

The Hon. Dr. COCKBURN suggested that it would help to get at the object in view if the Conference placed on record its views as to his Colony's attitude.

The Hon. Mr. COOK: Supposing we say that it is desirable that South Australia should come in, and (you, representing her here, having expressed the desirability of joining) ask you to state your proposition on behalf of your Government, as to the terms on which you would be prepared to come in?

The Hon. Dr. COCKBURN: Supposing you put it, "It is the desire of this Conference that South Australia should co-operate with the Colonies in obtaining this cable; and that, in the opinion of this Conference, in the event of the Pacific cable being constructed, either the Port Darwin line should be taken over, or"——

The Hon. Mr. DUFFY: Do you mean constructed by the four contracting Colonies?

The Hon. Dr. COCKBURN was not in favour of each Colony bearing the same amount of cost. In all co-operative work, he thought, the contributions should be on the basis of population.

The Hon. Mr. COOK: You see how you will hit us. Our inequality of population makes us take an entirely different view. We say we are outsiders, practically speaking, in this matter. We think a fair thing would be to let us off at least with an equal payment.

The Hon. Dr. COCKBURN: It would prejudice our chance of coming in very much——

The Hon. Mr. DUFFY: You certainly should come in on equal terms; you get greater consideration than any of the Colonies. Others would say, "We get nothing at all, and here is South Australia getting all this consideration."

The Hon. Dr. COCKBURN: No Colony is in the same position as South Australia; no Colony has had the same loss. Expecting us to come in equally is tantamount to saying that South Australia should not look for any consideration or generosity at all.

The Hon. Mr. DUFFY: Well, the reciprocity should not be all on one side.

The Hon. Mr. COOK: If you take up the attitude of stopping outside, our obligation to you ceases that moment. If you are not coming in, there is no obligation regarding your line.

The Hon. Dr. COCKBURN: I do not think that.

The Hon. Mr. COOK: I think so.

The Hon. Dr. COCKBURN: We did not construct the line specially for the benefit of our own Colony; all mutually profited by it.

The Hon. Mr. COOK: I don't think you had an idea outside.

The Hon. Dr. COCKBURN: But there are such ideas.

The Hon. Mr. THYNNE: Do you know what the history really is? There was an arrangement made to carry a line across to the Gulf of Carpentaria from the East Coast of Queensland to meet the Eastern Company's cables. The Company's representatives were intercepted at Adelaide, where the Government induced them to alter their scheme by laying the cable to Port Darwin, which was to be connected with Adelaide by the South Australian overland line. The Company thereupon broke their bargain with Queensland. Queensland constructed its own line right across to Normanton at very great expense, and South Australia thought it was doing a good thing for itself. They induced the Company to break their contract with us, and took upon themselves, the burden of this overland line. That is the history.

The Hon. Dr. COCKBURN: These secret histories are all very interesting, but one does not know how much there is in them. I have not heard that one before. Quite apart from that, stands the fact that South Australia has for twenty-four years had this work constructed and carried on, and it has been recognised that it is of intercolonial importance and that South Australia is entitled to the goodwill, and something more, of her neighbours on account of her enterprise. At previous interchanges of opinion between the Colonies it was recognised on all hands that South Australia would not be expected to contribute.

The Hon. Mr. COOK: One thing should be set against another. It is recognised that your isolated position has perhaps justified you in standing out—therefore no proposal to stand in with South Australia or anything of the kind has ever been made.

The Hon. Dr. COCKBURN: In New Zealand, and in the debates there, it has been stated by the other Colonies that in the event of the Pacific cable being constructed, South Australia could not be expected to contribute. Still, although that was the understanding, it was freely expressed in Committee that in the event of the cable being laid, the other Colonies would either compensate South Australia for the construction of her transcontinental line, or guarantee that her receipts would not be materially diminished.

The Hon. Mr. COOK doubted it; if in committee, it was not reported. But you will find that the statement that South Australia could not be expected to contribute *was* reported.

The Hon. Mr. THYNNE: The other colonies had to look to the future, and all they should ask South Australia to do was to keep the land line open to them as an alternative route.

The Hon. Mr. COOK: On condition they join us.

The Hon. Dr. COCKBURN: You will make it easier if you do not absolutely make that condition. We have to consider the attitude of the people of South Australia in this matter. If a resolution were carried such as I have indicated, it would go a long way towards causing the people of South Australia to view this project more favourably than they have hitherto done, and I have very little doubt that South Australia would contribute. It would come to just the same thing.

The Hon. Mr. COOK: I think in the discussion of these matters it would be better not to go into a strict analysis of rights on either side.

The Hon. Dr. COCKBURN continued he would suggest that the resolution be passed in the form he had indicated, and he would say that under the circumstances he would do his utmost to persuade his Colony to contribute towards the construction of the line.

At this point the Hon. Dr. COCKBURN found the passage in the New Zealand Conference Report which he had been looking for, which he passed on to the President to read, and conversation took place as to how far any expression had been given in Committee to the opinion that, in the event of the Pacific cable being constructed, South Australia should be compensated. The

The Hon. Mr. COOK: Since there is no record of it, I think we had better take the case on its merits.

The Hon. Dr. COCKBURN: I only raised the point because Mr. Reeves was speculating on the views of Mr. Ward.

The Hon. Mr. COOK then drafted the following resolution:—

"That, in the opinion of this Conference, it is highly desirable that South Australia join the other colonies in the Pacific cable project, and, having regard to their vested interests in the transcontinental line, Dr. Cockburn be invited to make a proposition on behalf of his Government embodying the terms on which they will be prepared to join the other colonies in the Pacific cable."

The resolution was put, when

The Hon. Mr. REEVES said: I should prefer "the South Australian Government be invited to state the terms." I think it should come from the Government.

The Hon. Dr. COCKBURN: How would it do to have a general resolution of this kind:—

"In the event of the Pacific cable being constructed, and South Australia becoming one"—[Mr. DUFFY interpolated something]—"that the Conference agrees either to take over the line or give a guarantee."?

The Hon. Mr. REEVES said the resolution should be a definite one. It is a subject of considerable importance to the various Governments, and before they can make up their minds they must have details which we have not got.

The Hon. Mr. COOK: If Dr. Cockburn made a proposition we would not come to any definite decision with regard to details, but only lay down an equitable principle in proper language.

The Hon. Mr. REEVES: There is this difficulty in taking the general principle: when once you get into any kind of details, such as taking over the line or giving a guarantee of revenue, though they are broad and simple ones, they take you away from the general principle. It would be a question whether my Government could go into that without more information before it. We should want to know what we are called upon to guarantee.

The Hon. Mr. DUFFY: We ask Dr. Cockburn to make a proposition. Then we should get further details, particulars of expenses, &c., and then give an answer.

The Hon. Dr. COCKBURN: If the resolution is carried in that form, it will make my task in persuading the Colony to join in more difficult.

The Hon. Mr. COOK: Asking you to name your own terms make it more difficult?

The Hon. Dr. COCKBURN: Yes; it would look as if the Colonies are not occupying as friendly an attitude as our people anticipated. South Australia has always been under the impression that the other Colonies would, quite apart from her joining in this cable, consider her position, and, in the event of the Pacific cable being constructed, would guarantee her against loss. We have always been under the impression that the other Colonies would do that unconditionally. If not, and they would only do it as part of a condition, it would make it much more difficult for me to put it before them. Did not Lord Jersey say something in his Ottawa Report? Give me a few moments to look it up. (Pause.) Mr. Playford says if the cable is to be subsidised our position is to be taken into consideration. He was not going to stand in the way.

The Hon. Mr. COOK: That is precisely the proposition we are making now, in other words. Mr. Playford said he would not stand in the way if the peculiar circumstances of his Colony were taken into consideration. We say now, "come in with us and we will stand in with you."

The Hon. Mr. THYNNE: The making good any loss consequent on the construction of the new cable was what Mr. Playford meant, as I think he was generally understood. If there is any falling-off by reason of the new cable, South Australia should be assisted in some way if she comes in.

The Hon. Dr. COCKBURN: As I stated, South Australia is desirous to come in, though it was formerly understood that she would not be expected to contribute; at the same time, I desire to have some earnest that her position would be considered, and it would be easier for me to get consent to contribute if a proposition were made in the direction that the Colonies would be willing to make this concession to South Australia. Only I prefer that that proposition should come first and my statement afterwards.

The Hon. Mr. COOK: We say here, we want you in and ask you to state your terms.

The Hon. Dr. COCKBURN: Well, then, is the Conference willing that an opinion should be expressed that in the event of South Australia coming in, the guarantee would be given?

The Hon. Mr. DUFFY: We are willing enough to give it if it means, in a business point of view, a reasonable thing. It is not a question of making anything out of the transaction, but of not losing too much, for the present condition of our finances will not allow it. If it is shown to be likely to amount to a reasonable sum, I would have no hesitation in recommending my Government to do it.

The Hon. Mr. COOK: Let me understand you. I would not ask our Treasurer to pay this amount irrespective of the other project. Whatever is paid here will be part of the project.

The Hon. Mr. DUFFY: We will lose *something*, certainly. (Long pause.)

The Hon. Mr. COOK: I think if we pass this and telegraph it over——

The Hon. Dr. COCKBURN could not see any good object to be gained.

The Hon. Mr. COOK: We make no stipulation.

The Hon. Dr. COCKBURN: It means this, an outsider would say: "the idea that South Australia has always had with regard to the attitude of the other Colonies towards her transcontinental line is a myth;" that they are only prepared to consider her interests if advantageous terms can be made for the future. That is the way I should read it.

The Hon. Mr. COOK quoting: "Having regard to their vested interests in the transcontinental line." Can that be interpreted in that way?

The Hon. Mr. REEVES: I do not feel inclined to force (using the word only in an amiable sense) Dr. Cockburn's decision by repeated argument or hurrying at this moment. It seems to me absolutely inevitable that South Australia must come in, and it will be to her advantage. If her representative feels doubtful on the point, I do not feel disposed to urge it.

The Hon. Dr. COCKBURN: I have already stated that South Australia desires to come in.

The Hon. Mr. COOK: Then where is the trouble?

The Hon. Mr. REEVES: Of course it must be a question of terms.

The Hon. Mr. Cook: It looks like this—is not this Dr. Cockburn's attitude—supposing his Government decline to come in, he wants an expression of opinion that we are still prepared to give South Australia something?

The Hon. Dr. Cockburn: No; because I said if the resolution is carried I would pledge myself so far as possible, that is, my Government, to come in.

The Hon. Mr. Cook: I am strongly of opinion that if the matter goes over, and the other four colonies go into the project, it would be very difficult for you to come in afterwards.

The Hon. Dr. Cockburn: If it is carried, what is your intention?

The Hon. Mr. Cook: It is expressing our wish that you should come in.

The Hon. Dr. Cockburn: On this being carried, I say that the condition on which South Australia would come in would be that her hopes in the past as regards the attitudes of the other Colonies would be realised; that is, they agree either to guarantee——

The Hon. Mr. Cook: You see the position; you have something to part with; surely you can say what you value it at. Until we know what your idea is about it it is useless for us to make a proposition.

The Hon. Dr. Cockburn: When will this proposition be made?

The Hon. Mr. Cook: I candidly confess I do not think it ought to take many hours to fix a broad proposition, which would serve as a basis for discussion. (Long pause.)

The Hon. Dr. Cockburn: Well, would this be an acceptable proposition—that a guarantee should be given to South Australia that when the Pacific line is constructed, her receipts from her line would not be allowed to fall below the average (say) of the last five years?

The Hon. Mr. Duffy: We would like to know what that is: we could not bind our Governments without.

The Hon. Dr. Cockburn: Yet you are asking me to bind mine. (No, no.) You can never know when you give a guarantee what you are pledging the Colony to; you don't know whether there will be a loss, or how much.

The Hon. Mr. Cook: Supposing you have——You have been making at least 5 per cent. on your line——.

The Hon. Dr. Cockburn: The returns this year have certainly been better.

The Hon. Mr. Cook: You are making between 5 and 6 per cent.——

The Hon. Dr. Cockburn: No; there have been only two years when there has not been a dead loss.

The Hon. Mr. Cook: Oh yes, I say you are. Can you expect us, if that line has reached paying point, and there is a prospect of its continuing to pay 5 per cent., to guarantee that percentage if we can get money at 3 per cent. Would not the point of equity be reached if you had a guarantee of current interest?

The Hon. Mr. Thynne: I think at the present time that is more than any of the Colonies would be prepared to do on the outlay. It could not possibly be considered worth anything like that.

The Hon. Mr. Cook: I am speaking of the valuation, whatever that may be——

The Hon. Mr. Thynne: I think his suggestion was, that the revenue has been so much during the last five years—would we guarantee to South Australia that she shall lose nothing of that traffic? That is, guarantee that her revenue shall not be reduced.

The Hon. Mr. Cook: I say it would not be fair to guarantee that return. With less business the expenses would be less also. If present revenue were guaranteed and the expenses decreased, a handsome profit would result. That would not be fair. We only want to prevent a greater actual loss.

The Hon. Dr. Cockburn: There have been two years in which there has not been an absolute loss, taking interest and working expenses into account—this year, and another year some time back.

The Hon. Mr. Cook: Averaging the years, you want to be guaranteed against loss; that point is reached when you get current interest.

The Hon. Dr. Cockburn: Current interest would hardly do; we should want interest and working expenses.

The Hon. Mr. Cook: I am speaking of the net returns; the interest on the loan should be guaranteed.

The Hon. Mr. Duffy: And working expenses.

The Hon. Mr. Cook: What do you mean by the two years' return. Gross monetary return?

The Hon. Dr. Cockburn: I say that, except for two years, taking the interest on the line and working expenses as our expenditure, and the revenue from the line as our receipts, in every case the expenditure and interest have exceeded the receipts of the line.

The Hon. Mr. Cook: And now the return is 5½ per cent.?

The Hon. Dr. Cockburn: For this year only. We only ask for a guarantee of the average for five years, which would not give that return. I throw in three lean years and two fat years. We don't want to make a loss.

The Hon. Mr. Thynne: The cable traffic at the present time all goes over this line, it is the only business our cable would affect, and some assurance is wanted that the amount of her receipts from this cable traffic shall not be reduced.

The Hon. Mr. Cook: No, that is what I say would not be a fair basis. Supposing a certain amount of business is now done: in future expenses will be very much reduced, and if they are making 5 per cent. now and the present receipts are guaranteed, it might mean 7 or 8 per cent. on the undertaking. All they want guaranteed is that they will not lose. That is reached when the working expenses are paid, depreciation accounted for, and interest provided. To calculate on the same receipts as now would be absolutely unfair: that would put their profit up considerably.

The Hon. Mr. Thynne: I don't propose they should always be guaranteed the same general receipts. We should have to find out their cable traffic and calculate on that.

The Hon. Mr. Cook: It seems to me it is a simple matter. Pay the expenses of working the line, and pay current interest on it.

The Hon. Dr. Cockburn: Last year, our revenue was £43,926; working expenses, £18,280; annual interest on loans, £24,703; making a total of £42,983. Showing a gain, but in other years (which Dr. Cockburn gave) there had been losses in some cases up to £12,000 and £14,000.

The Hon. Mr. Duffy: What interest do you pay? It must be very high.

The Hon. Mr. Reeves calculated it must be more than 4½ or 4¾ per cent.

The Hon. Mr. Cook: It would be better to take it over and get the money at 2½ per cent.

Some-

Some conversation ensued which it was impossible to catch, Dr. Cockburn referring to some papers mentioned the sum of £332,000—"exclusive of guarantee"—"in round figures, £32,940"—&c. Mr. Cook asked something concerning a guarantee. Mr. Reeves asked the total loss on the last five years, &c.

The Hon. Dr. COCKBURN continued: Well now, is this proposition intended to stand as "Dr. Cockburn," or "the South Australian Government": and what terms do you expect me to state? I have already suggested that you guarantee us on something like our present basis for the last five years. I think that is a fair thing. We want to feel assured that the Pacific cable will not land us in a bigger loss than the average loss for the last five years.

The Hon. Mr. COOK: With the option of taking it over?

The Hon. Dr. COCKBURN: I would like to consult my colleagues before saying that. It is a big question, and I would not like to say that right out. You see, it is a question of policy, as a portion of the line belongs to our local telegraph system, and it might lead to complications.

The Hon. Mr. COOK: Can you tell us how much of it belongs to your telegraph system? *You* may consider your proposition in regard to this line a very handsome one; here is part of it, the main trunk of your telegraph system, and you are proposing to add to it the cable receipts of other colonies.

The Hon. Dr. COCKBURN: Yes, but there is very small local traffic.

The Hon. Mr. COOK: It would have to be there if there were not the cable line to carry the traffic.

The Hon. Dr. COCKBURN: But not maintained on anything like its present scale.

The Hon. Mr. COOK: It was constructed originally to open up your country?

The Hon. Dr. COCKBURN: I hardly think the Northern Territory existed in name twenty-four years ago—at any rate, there was little settlement there.

The Hon. Mr. COOK: Well, gentlemen, what do you say?

The Hon. Mr. DUFFY: Where are we exactly? Suppose we do not do anything until Dr. Cockburn gives us in the morning a formal statement what he is prepared to do?

The Hon. Mr. REEVES: I feel the position of New Zealand a little difficult. Of course, I am perfectly prepared to go as far as voting for a general resolution that an equitable concession be granted to South Australia. I think she is entitled to it; but if we are to go and pin ourselves to specific details here, and recommend our Governments (Mr. COOK: "*That* pins us."), and if there is to be a reservation as to the terms on which South Australia comes in (and we have an intimation from her delegate that she is not likely to come in on equal terms, even after we have made this proposition), then the question must be seriously considered. I have no objection to vote for the general resolution, that some equitable concession should be given. But at the present stage, I am not prepared to say how much further I will go after what we have heard.

The Hon. Dr. COCKBURN: Has the question of the basis of contribution been discussed before? You must acknowledge it is a new departure.

The Hon. Mr. COOK: It is that point of it which is the inducement to us to turn to you.

The Hon. Mr. DUFFY: Of course, if it is going to be a success, it does not matter.

The Hon. Mr. COOK: Read the resolution,—

> "That in the opinion of this Conference it is highly desirable that South Australia join the other Colonies in the Pacific cable project, and having regard to their vested interests in the transcontinental line, Dr. Cockburn be invited to make a proposition embodying the terms on which the South Australian Government would be prepared to join the other Colonies in the said project."

The Hon. Mr. REEVES: I am prepared to support that. Messrs. Thynne and Duffy voted, "aye." Dr. Cockburn did not vote. The resolution was *carried*.

On the question of proceeding with further business, Mr. REEVES said the question of appointment of delegates might lead to some lengthy discussion, and after an opinion had been given against any information being supplied to the Press, the Conference adjourned at 6·15 p.m.

SATURDAY, 18 *JANUARY*, 1896.

The Hon. Mr. Cook took the chair at 10 a.m. On the minutes being read by the Secretary,—

The Hon. Mr. DUFFY said: Do we want that telegram in the minutes from Sir John Forrest?

The Hon. Dr. COCKBURN: I seconded the resolution with regard to the route, but then, and on other occasions, I expressed the opinion that when you are appointing the Commissioners it was not desirable to tie their hands. I should like that entered also.

The Hon. Mr. DUFFY: You seconded it as a matter of courtesy.

The Hon. Mr. COOK: Put my name to it instead; it is my suggestion. (The delegates agreed to the alteration.)

The Hon. Dr. COCKBURN: And is this not a little stronger than you intended? (Understood to refer to the route.) It was understood we made suggestions: these are rather directions.

The Hon. Mr. DUFFY: I understood the whole thing was only an expression of opinion.

The Hon. Dr. COCKBURN: Still it ties down the representatives.

The Hon. Mr. THYNNE: This will be a record; it is only "in the opinion of the Conference." I suggest that we add these words to each one.

The Hon. Mr. COOK: It is only an expression of our opinion.

The Hon. Dr. COCKBURN: Yes, with the information we have at hand; but the Commission will have much further information, later and more complete.

The Hon. Mr. THYNNE: We want the Commission in England to have the ground clear from all conflicting local interests. We ought to settle our differences here as far as possible, leaving the Commission to understand that these are the compromises the Colonies make between themselves.

The Hon. Mr. COOK: There is plenty for the Commission to do in adjusting international differences.

The Hon. Mr. DUFFY: These are only suggestions that embody our ideas up to date: we do not bind them down at all.

The Hon. Mr. THYNNE: We are in a different position from Canada and Great Britain, who can each say to their representatives, "These are our views;" but we are a number of different Governments meeting together with a view to coming to an understanding.

The Hon. Mr. COOK: I thought we discussed that before.

The Hon. Dr. COCKBURN: All right.

The PRESIDENT indicated that they had adjourned the previous day on the understanding that Dr. Cockburn would submit an offer from his Government *re* joining in the cable. The

The Hon. Dr. COCKBURN: I am prepared to say that South Australia will be willing to join in the undertaking or project provided that she is guaranteed either from the Colonies interested alone, or jointly with the Imperial Government, that she will not be placed in a worse position by the rival route.

The Hon. Mr. DUFFY: Will you formulate that in writing?

The Hon. Mr. COOK: I see difficulties in the way of saying that the receipts will be maintained on the basis of the last five years; if half the business is taken away, the working expenses will not be the same.

The Hon. Dr. COCKBURN read the statement which he had put in writing, and which appears in the minutes:—

> South Australia is willing to join in the project provided that a guarantee, either from the contributing Colonies alone, or jointly with the Imperial Government, be given, that the financial position of South Australia as regards the Port Darwin line be maintained on the basis of the average of the last five years.

That will provide that if there is any falling off in the working expenses, that will be taken into account. We do not want to be placed in a better position; it never struck me that it could be open to that interpretation.

The Hon. Mr. COOK: I have drafted a resolution on the offer of Dr. Cockburn:—

> In consideration of South Australia joining equally with the others in the Pacific cable project, they will be prepared with other countries interested, namely, Great Britain and Canada, to guarantee that Colony against actual loss in connection with their transcontinental line.

The Hon. Dr. COCKBURN: You cannot expect Canada to contribute.

The Hon. Mr. DUFFY: Great Britain.

The Hon. Mr. THYNNE: My idea is that we ought to keep that as a local matter.

The Hon. Mr. COOK: I do not think so. I do not think the Imperial Government will make any bones about it at all, nor will Canada.

The Hon. Mr. REEVES: I do not think I would suggest putting in Canada; if there were any question, for example, of Canada having a line with Europe on which there might be a loss, we should certainly object to guarantee anything there, and the position is rather similar. I think the Imperial Government should help, though I do not know whether it will. I understand they have expressed some opinion that they would not be prepared to join in any schemes of compensation.

The Hon. Mr. COOK: I do not think Canada would make the slightest demur. It would be a matter of deliberation between the three countries. I do not see that we should do any harm in asking for it.

The Hon. Mr. DUFFY: Leave out Canada, as that seems to be the opinion of the delegates.

The Hon. Mr. COOK: Very well; I think you are making a mistake. I think Canada would join us more readily than you think; in fact, I am sure she would. Well, I am prepared to move that.

The Hon. Dr. COCKBURN: None of us want to make things appear other than they are. Of course, I am here representing South Australia, and I speak with all the force that a representative can—but not with more force than that—and, I think, this motion, No. 5 of yesterday, would make it appear more than that. I think it better to say "the representative of South Australia be invited to make a proposition embodying the terms on which South Australia would join." I think that makes it appear that I bind myself and my reputation; but that is all I can do. I cannot give occasion for a law-suit. It makes it appear a little more than it really is. The general opinion was that South Australia should be indemnified against further loss; it never meant against loss in the past; I do not want to strain that to my own advantage. Why go away from the present basis in giving the guarantee? Of course, this is an exceptional year; last year there was a big loss.

The Hon. Mr. REEVES: There will be a loss of £8,000 or £9,000 a year when the other cable is constructed, possibly £12,000 a year. It may possibly be £2,000 a year for each of the Colonies.

The Hon. Dr. COCKBURN: Let us place our difficulties before one another. I think we had better have a discussion on this question of equal subsidies. I see a great difficulty. Let the Colonies primarily interested in this cable make any arrangement they like; but to lay down as a principle, touching the contributing Colonies generally, that subsidies are to be equal, and not proportionate to population, is a departure from every understanding that has hitherto obtained in the way of jointly bearing cost, and it appears to me will stand very much in the way of all future federal undertakings.

The Hon. Mr. DUFFY: This is not a guarantee.

The Hon. Dr. COCKBURN: It is practically the same thing as entering into any joint undertaking, and what is the index of the capacity of any Colony in bearing any burden, whether guarantee, or subsidy? It is its population, and all our arrangements have been on that basis; and it would be a very dangerous thing, and prejudicial to any further undertakings, if, when any federal action is mooted, you start with a discussion whether the contribution is to be per Colony or per head of population. The Federal Council contribution was based on the same understanding, and, in the matter of the subsidy to the Australian Squadron, it went without saying that contributions should be on the basis of population.

The Hon. Mr. COOK: May I remind you that you always argued in an exactly contrary way at federal conferences? You are now arguing for unification. Ours is the truly federal proposition.

The Hon. Mr. DUFFY: Do you pay the Imperial Government and Canada on the same population basis?

The Hon. Dr. COCKBURN: I am talking of what has been done in the past, and is likely to be done in the future.

The Hon. Mr. COOK: I have no hesitation in saying that South and Western Australia, when this cable is constructed, will derive a great deal of benefit from it, because, for the first time, the gold-fields of Western Australia will be put into direct and cheap connection with America.

The Hon. Dr. COCKBURN: That is a statement; I wish I could see it in that light. However, we are not arguing that point. I am simply arguing that this idea of contributing on a population basis has hitherto been always recognised and understood, and any departure from it will stand in the road of federal undertakings in future. It is easy to see that if an example is once set the question will always be raised, on what principle are the Colonies coming into partnership—as Colonies, or on the number of population?

The Hon. Mr. COOK: It is a point we often do raise, and have to go under. Witness the Federal Senate. Besides, it could be quoted against South Australia that the other Colonies have been specially generous to her.

The Hon. Dr. COCKBURN: Well, it appears to me that this raises difficulties which will be found to be great impediments in the future, and surely the idea is not that by laying a new cable the concert of Australia in telegraphic affairs is to be destroyed. I presume the Pacific cable will be looked to as serving jointly the interests of all Australasia, and that all the Colonies would like to have a share, but if it is understood that Tasmania, for example, was to join equally with the other Colonies, you set down a principle which at once and for ever debars her taking any possible part in such an undertaking. And I do not think this should be done.

The Hon. Mr. COOK: I tell you what; we will leave out this question of the transcontinental line—that is your own affair. Let us start free of it, and then we might agree to the population basis.

The Hon. Dr. COCKBURN: My argument is that in all these matters Australia should be one—not divided in interest. Then, is it not a mistake to lay down a principle which for ever precludes the possibility of their being one? Our case is a special one, but that does not entitle us to less consideration.

The Hon. Mr. COOK: It does not govern future action at all, if it is to be a special one.

The Hon. Dr. COCKBURN: I am not talking on behalf merely of South Australia, but of all the other Colonies.

The Hon. Mr. COOK: If it is a special matter it does not govern future action at all.

The Hon. Dr. COCKBURN: But it is a precedent as to the manner in which other Colonies are to join in action.

The Hon. Mr. REEVES: I think it is *apropos* of this that I ought to tell the Conference of a communication I got from my Government this morning. I cabled to Mr. Ward yesterday, as I said I would, with regard to the terms on which New Zealand could come in as a contributing Colony. He replies that of course it would be very disadvantageous to us to come in on an equally responsible footing with the other three Colonies; at the same time he would be prepared to give way, and do so, annexing, however, the stipulation that Victoria and New South Wales should join with us in facing any possible loss on the present cable.

The Hon. Mr. DUFFY: Thank you.

The Hon. Mr. COOK: It would not take us—me at any rate—very long to decide that matter.

The Hon. Dr. COCKBURN: You are making tremendous difficulties.

The Hon. Mr. DUFFY: There is no chance of Victoria coming in at all, unless on an equally responsible basis. (Long pause.)

The Hon. Mr. COOK: Well, that raises the whole question again.

The Hon. Dr. COCKBURN: It is the largest question that has ever been raised in any federal undertaking.

The Hon. Mr. REEVES: I did not know what communications passed between the three gentlemen, or any representative of theirs, who met in Sydney and our Government in regard to this Conference, but when I left, Mr. Ward did not think this would come up, so he naturally sent me here without any information on the point. He told me distinctly the Conference was going to discuss two points: the cable route and the appointment of delegates. I came really expecting that the Conference would address itself to these two points, not on this contribution matter. I wired last night to Mr. Ward. That is how the matter stands.

The Hon. Mr. COOK: We stand in this position. Both Victoria and New South Wales came into this project, not because there was any intense feeling throughout the community that we ought to, or to gain any pressing commercial advantages. In that respect we are different from both Queensland and New Zealand. We came in without stipulation or reservation of any kind, and I do not see that the Colonies more directly interested should raise all these objections, trying to saddle the two older Colonies who are coming in purely on federal lines, for international purposes, with unequal responsibilities. I think we ought to meet fairly.

The Hon. Mr. DUFFY: My Government will have the same difficulty in this matter. We do not care two straws whether the cable is constructed or not, we come into it with a patriotic sentiment and a federal idea. It may benefit the whole of Australia, but we have a very fair cable service at present, efficiently conducted and not much too dear. Nevertheless, we are willing to come into this project on a fair basis, that is an equal one. Dr. Cockburn mentions Tasmania—well, it might fairly be made an exception, it is a little place outside Australia altogether, its telegrams are of little value—a few hundreds of pounds—so I think we might make it a negligible quantity altogether. But as far as the grown-up Colonies are concerned, it should be a *sine qua non* that they should enter on equal terms. We are entering on a large commercial and industrial undertaking, which we hope will be a success. We do not speak to Great Britain and Canada about a population basis, but of equal shares. I think we might fairly say, as Queensland has generously waived any claim to the idea of a population basis, and has offered to take her fair burden the same as the other Colonies, that South Australia should take the same view. I never dreamed New Zealand would want anything else; we are making her special concessions on account of her geographical position, but we never dreamed she would hesitate about coming in on equal terms. Dr. Cockburn's position is difficult, but I hope, as we are meeting here to deal with the matter fairly, and let us say generously, that he will see his way to see with us in the matter. It should not, and need not, form a precedent. (Dr. COCKBURN: That is always said, "it will not form a precedent.") Victoria has had little consideration in the past, and I think we are entitled in these days to a little fair play. Let some of the other Colonies help us a little bit.

The Hon. Dr. COCKBURN: I do not want the impression to gain either here or anywhere else that any difficulties are being raised by me, or any attempt being made to saddle the larger Colonies with anything unforeseen. It appears to me that it is the other way, this is something altogether new: it is not raised by South Australia or New Zealand, but by others, and it is altogether new to us, and it must be confessed that nothing of this sort has ever been mentioned directly or indirectly at any previous conferences, on this subject. I do not know whether it was mentioned, or even hinted at, in Canada.

The Hon. Mr. THYNNE: I do not think any discussion ever took place between the representatives of the Colonies as to any question of proportion. Perhaps Dr. Cockburn will allow me to say that this matter has come up in one or two different forms. In the first place, my Premier, Mr. Nelson, after thoroughly investigating all the information he could get about the Pacific cable, went so far as to advise his own Parliament that if the other Colonies did not co-operate, to take the responsibility of the whole third. (Dr. COCKBURN: The whole third?) Yes; and when we came to discuss the matter privately with Mr. Duffy and Mr. Cook, I stated on behalf of Queensland that we were prepared to take any reasonable part

of

of the risk which they thought it a fair thing for us to take. Queensland has said it, and I expected New Zealand also would say that they are prepared to take their equal share with the other Colonies, and that is the reason why New South Wales and Victoria have taken up the matter so satisfactorily. If it had not been for that it would probably have been left for New Zealand and Queensland possibly to endeavour to get the cable constructed. Now four of the Colonies have combined to bring this matter before the Imperial Government, and have got a fairly satisfactory reply, and the present stage having been reached it is desirable that the Commissioners to be appointed for the Colonies should represent, if possible, the whole of Australasia. If the western Colonies do not see their way to come into it, the others will have to take their part and wait until those standing out intimate their willingness to co-operate. As to the amount of responsibility, what is it? The most extravagant calculation of the outlay is somewhere about £125,000 a year—principal, interest, and working expenses; of which it is proposed that 40 odd thousand be apportioned to Great Britain, the same to Canada, and the same to Australasia. And what is South Australia's share? The maximum would be £8,000 a year each, out of which come the share of the receipts from the cable. What is there to be afraid of? What is there in that little item for South Australia, Western Australia, and Tasmania to object to?

The Hon. Mr. REEVES: There is this, that I must respect the intimation of opinion from my Postmaster-General. I think it is a little unfortunate that we do not seem to have been prepared in all the Colonies to discuss this question at this Conference. I agree to a large extent with what Mr. Thynne has said, that the prospects of loss, of substantial loss, are comparatively remote. The standard of negotiation must be that of friendly settlement, a little give and take. But the position is, that my Government at this moment does not seem to be prepared to swallow the principle of equal responsibilities without some kind of *quid pro quo*, which Victoria and New South Wales do not seem inclined to grant.

The Hon. Mr. COOK: I do not, I say candidly. We give you the connections, and you take equal responsibilities.

The Hon. Dr. COCKBURN: I am placed in an unfortunate position. This is still more new to me. Like Mr. Reeves, I came here with certain indications as to the matters we were to discuss, but I wish I had known as much as the other Colonies appear to have been in a position to know. You place South Australia, and probably also New Zealand, in a very difficult position in inviting our attendance here to discuss certain questions which have been discussed before on a certain understanding, and then raising a question which has never been discussed publicly before, and it seems to me that it is placing my Colony at a disadvantage

The Hon. Mr. COOK: Allow me to say that, wherever the idea has come from, we have always had an idea that New Zealand would willingly take an equal responsibility in this matter. I cannot say where it has come from, but there has always been that opinion.

The Hon. Dr. COCKBURN: There may have been communications from New Zealand (Mr. REEVES: "No!"), but there have been none from South Australia to that effect. It has always been recognised that the reason that Mr. Playford did not attend that deputation in England was because South Australia did not see that this was a matter necessitating the appointment of a Commission, and that was solely for the appointment of a Commission. I am sorry I have not been placed by my colleagues in possession of information on a question of this sort, which comes so completely new to me. Put yourselves in our position—the matter is not new to you; you have discussed it before, and possibly you cannot understand the difficulty and dilemma in which a person altogether ignorant of what has preceded is placed.

The Hon. Mr. COOK: We make every allowance for you; it is New Zealand we are surprised at. I told my Government repeatedly that the other Colonies respectively were willing to take equal shares in the scheme.

The Hon. Mr. REEVES: You will understand, while I regret that any obstacle should arise, I cannot take up an apologetic position on behalf of my Government, and do not do so, for I am totally unaware that any indication has ever been given by them that they would come in on your basis. I know nothing of the kind.

The Hon. Dr. COCKBURN: We all want to see business done; cannot we leave it open?

The Hon. Mr. THYNNE: If we leave this matter unsettled now, we may as well not do anything at all. If we cannot give some information to our Commissioners on this point, then you shift to London the whole burden of investigation, for one of the functions of that Commission will be the question of the apportionment of cost, and why should we refer to the Commissioners questions we ought to settle among ourselves? It means shunting the thing back here again, to be kicked about like a football, then another debate at a table like this two or three years hence. One of the functions of this Commission will be to prepare a Bill, to pass through all the different Parliaments, giving authority for entering into the liability necessary, and unless we give them our draft instructions, it would mean that the Commissioners in London would have to be continually cabling out to the different Colonies over questions, just in the way, perhaps, that South Australia and New Zealand will have to do now.

The Hon. Mr. REEVES: So the Commissioners will, surely; we are not binding our Governments over this. It will entirely depend upon the extent to which the proceedings of this Conference are ratified by the Governments.

The Hon. Dr. COCKBURN: We want to know more. The act of the Commissioners does not bind the Governments. If we were conversant with all the conditions, and able to take absolutely definite lines, the Commission would be a superfluity.

The Hon. Mr. DUFFY: We must see some *primâ facie* chance of your joining in.

The Hon. Mr. REEVES: I think there is a *primâ facie* chance. If we are not in accord on every point here, it does not mean that we shall never be so. I cannot believe it is impossible for four Governments to settle this question of the basis of contribution. I think they will say it will be possible, rather than see a magnificent project like this ruined. This question takes me absolutely by surprise, and I tell you frankly I had no instructions on it.

The Hon. Dr. COCKBURN: We should make each step such as may form a basis for future operations. Do not despair because the common ground does not embrace everything at once. Let the Colonies who are agreed together express their opinion.

The Hon. Mr. COOK: That simply means waiving all this, then?

The Hon. Dr. COCKBURN: I am talking of that particular point.

The Hon. Mr. COOK: That point is the main point.

The Hon. Dr. COCKBURN: It does not necessarily involve all.

The Hon. Mr. COOK: Yes, it does.

The Hon. Mr. DUFFY: The word "equal" occurs.

The Hon. Dr. COCKBURN: I have come here to discuss and act on behalf of my Government in certain things; but no representative can act in respect of new things altogether. I do not say what the attitude of South Australia will be on this subject, but it is one which ——

The Hon. Mr. COOK: Your case is not the serious one—New Zealand's is the serious one; it is an attitude which I confess I did not expect would be assumed.

The Hon. Mr. REEVES: Well, as I was saying, the coming up of the whole question took me by surprise.

The Hon. Dr. COCKBURN: Why not record that the Colonies of New South Wales, Victoria, and Queensland are of opinion that the contributions should be equal from the various Colonies, and that the delegates of New Zealand and South Australia, not having previously considered the question, did not concur?

The Hon. Mr. REEVES: And we ask that our Governments be allowed a further opportunity of considering?

The Hon. Dr. COCKBURN: We want to consider. We know Victoria is behaving in a very generous manner unquestionably, so is New South Wales—she is more interested than Victoria, but not so much as Queensland.

The Hon. Mr. DUFFY: We do not blame you at all; we blame New Zealand. I understood Mr. Ward agreed to join equally in the project.

The Hon. Dr. COCKBURN: Do not let it appear that Mr. Ward is absolutely hostile to this.

The Hon. Mr. COOK: It is no use talking unless there can be some fair dealing. We come back to the old position, and will have to put in a claim to have the landing place in Sydney; we have almost equal claims with Queensland, but surrender the point to get it settled, and now you ask us to carry you further; we do not think it is fair.

The Hon. Dr. COCKBURN: No; we do not ask that.

The Hon. Mr. REEVES: We ask that my Government be allowed further time to consider; I cannot see why the Conference cannot allow this to go, and leave it for the Governments to negotiate; it is purely a domestic matter.

The Hon. Mr. COOK [*With map.*]: There is New Zealand standing alone; we are taking a special line down to her at a cost of £114,800 on purpose to get New Zealand in, and she wants us to give her further guarantees.

The Hon. Mr. REEVES: Our guarantee would be a pretty heavy one anyhow for our population, and if you left New Zealand out it would not be an Australasian cable.

The Hon. Mr. COOK: No, it would be an Australian one.

The Hon. Mr. REEVES: I did not expect this to be the main business of the Conference. It seems to me it should be a matter of negotiation between the Governments. But it is not necessary to make a dead stop now just because New Zealand will not agree to come in on an equal basis.

The Hon. Mr. DUFFY: It is a curious combination—the Colony least interested and the Colony most interested will not come in.

The Hon. Dr. COCKBURN: You have discussed it before.

The Hon. Mr. COOK: This thing has been thrashed out with Mr. Ward, I understand.

The Hon. Mr. REEVES: I am not aware of that.

The Hon. Mr. COOK: Mr. Ward made a very astute bargain with us before, and he wants to make further good terms.

The Hon. Mr. REEVES: I have read Mr. Ward's speeches very carefully, and I do not see the faintest indication of the equal basis anywhere.

The Hon. Dr. COCKBURN: It has never been expressed or understood in any way whatever.

The Hon. Mr. COOK: Queensland recognises that they are getting some advantage in getting the landing place. I think we had better have a specific resolution on this matter of the contribution part from South Australia—take a vote on it—those who are not prepared to vote, let that be attached to the resolution.

The Hon. Mr. DUFFY moved,—"That the Colonies joining contribute equally to the undertaking."

The Hon. Mr. THYNNE seconded.

The Hon. Mr. COOK: If New Zealand and South Australia do not agree, how shall we put it?

The Hon. Dr. COCKBURN: I do not say we agree or disagree, but as this is a new question, and never been considered by my Government, and a departure from all their recognised modes of undertaking federal affairs, and as it might be a bar to the facility with which they should be undertaken in future, I should like time to further consider it.

The Hon. Mr. COOK: Mr. Reeves has to go to-morrow—if he could stay over till Monday I would prefer postponing it.

The Hon. Mr. REEVES: My steamer leaves Brisbane on Tuesday.

The Hon. Mr. THYNNE: I think you could catch her at some of the ports by staying for the "Wodonga."

The Hon. Mr. REEVES: I do not care to risk it. I shall simply not record my vote against it, so as to leave my Government a free hand, and will communicate the temper of the Conference and the gist of the opinions expressed by the Conference to my Government in writing.

The Hon. Mr. DUFFY: And the record will be that this was moved, and seconded, and carried—the representatives of South Australia and New Zealand refraining from voting pending further instructions.

The Hon. Dr. Cockburn and the Hon. Mr. Reeves appeared to assent to this, without saying anything.

The resolution was carried. Hon. Dr. Cockburn and Hon. Mr. Reeves refraining from voting.

The Hon. Mr. COOK: Now to deal with this resolution:—

> "In consideration of South Australia joining equally with the others in the Pacific Cable project, they will be prepared, with other countries interested, namely, Great Britain and Canada, to guarantee that Colony against actual loss in connection with their transcontinental line."

The Hon. Dr. COCKBURN: With regard to this question of contribution, say "the terms on which South Australia would be prepared to join"—strike out the word "equal," and use the word "join." The resolution is already recorded, then we get common ground; the voting explains the position.

An alteration was made in the wording of the resolution, which was moved by the Hon. Mr. THYNNE and seconded by the Hon. Mr. DUFFY, and put by the Chairman. The

The Hon. Mr. REEVES: I vote for that. Of course I may receive some instructions about it during the morning from my Government, but I take the responsibility meantime of voting for it.

The resolution was carried.

The Hon. Dr. COCKBURN: May I ask—it is not much difference—instead of "on behalf of his Government," put (in yesterday's resolution) that "Dr. Cockburn be invited to make a proposition embodying the terms on which South Australia would be prepared to join the other Colonies." It expresses as much as I can do. I do not want to appear to be doing more. This was agreed to.

The Hon. Mr. COOK: Now, there is the question of delegates—two have been asked for.

The Hon. Dr. COCKBURN: Well, I have instructions from my Government to ask for the appointment of a delegate to represent the position of the Western Colonies, not with a view of influencing the voting, but simply to secure the position of these Colonies being brought before the Commissioners, and I am requested, as you all know, by Sir John Forrest, to press this matter on behalf of Western Australia, which I am prepared to do to the utmost. I also make the same request from Tasmania. The interests of Canada and Great Britain in this matter are homogeneous. They are one Government each. Here we have a number of Governments; and it seems to me that there will be a difficulty in selecting two Commissioners who will be expected to speak from the various points of view of all the parties concerned. I therefore respectfully ask the Conference to take this request into consideration—which I am deputed by South Australia as well as the other two Governments to make—and grant it.

The Hon. Mr. DUFFY: I am afraid it would look awkward if Australia is about to federate and cannot agree upon the appointment of delegates.

The Hon. Mr. COOK: The reason given for the special representation of South Australia is, their special interests—the same would apply to all the others—therefore, I don't think he should press that matter any further under the circumstances. There is no reason for getting a special representative.

The Hon. Dr. COCKBURN: I am very sensible of the manner in which the Colonies have viewed the interests and claims of South Australia, and I am very anxious to see the Conference unanimous. Has any proposal as to representation been made?

The Hon. Mr. COOK: I am glad to say we did talk this matter over, and Mr. Duffy and I are strongly of opinion that since the matter is a federal one, representatives of the two large Colonies should sit on the Commission, stipulating that on all important matters they should consult with all the Agents-General.

The Hon. Dr. COCKBURN: That is, that the Commissioners representing Australia should, as far as possible, be the mouthpiece of the combined Agents-General. That, of course, to a great extent provides for unanimous action.

The Hon. Mr. COOK: I take it we are settling up all our differences here beforehand.

The Hon. Mr. REEVES: Do you mean that this Conference should suggest to the Commissioners—should send a kind of suggestive mandate—that they should consult the combined Agents-General in London?

The Hons. Messrs. COOK and DUFFY: Yes.

The Hon. Mr. THYNNE: I may say when Messrs. Duffy and Cook met me here before I suggested the names of two gentlemen, not Agents-General,—Lord Jersey, who is well acquainted with Australia, and Sir Edwyn Dawes, the latter a well-known financier, and a gentleman of great experience in large undertakings, such as the Suez Canal, of which he is Chairman.

The Hon. Dr. COCKBURN: Four names have been mentioned. Let it be distinctly understood before the personnel is agreed upon that they are to act in conjunction with the Agents-General, and to consult with them in reference to matters brought before the Commission.

The Hon. Mr. REEVES: I am indifferent on that point.

The Hon. Mr. THYNNE: Apparently my proposition is not received.

The Hon. Mr. REEVES: I would say at once it would suit our Colony perfectly—Lord Jersey and Sir Edwyn Dawes. I am prepared to support that.

The Hon. Mr. THYNNE: Men are wanted with special training in the management of large undertakings such as they have had. Those are the views of my Government.

The Hon. Mr. DUFFY: My Government is very strong on the point of the two Agents-General. They are capable men, in full touch with the Colonies, and if they are directed to consult with the Agents-General of Australasia, these would have control over them, which could not be in the case of Lord Jersey or Sir Edwyn Dawes. As regards Lord Jersey, he is an admirable man, but probably the Home Government will appoint him as one of their own Commissioners. Sir Saul Samuel and Mr. Duncan Gillies are familiar with the affairs of the Colonies, and the Parliaments of the Colonies have after all to be consulted over these things. It would facilitate matters if, when things are discussed, our interests are looked after by men in touch with ourselves. My Government is very strong about that.

The Hon. Mr. REEVES: Do we wish to interfere with the Commissioners after they are appointed, other than by general directions? They go in to probe matters to the bottom and give their own opinion.

The Hon. Mr. COOK: There will still be the acceptance or rejection after a scheme has been prepared. Supposing you have your own Agents-General to consult, you could say to them what you could not say to an outsider—"If this is carried in a certain way, we cannot join the undertaking." If you had independent Commissioners who would be disposed to take an Imperial as against a Colonial view of a matter, it would be very much more difficult. That is the feeling. Imperial considerations may conflict with Colonial, and as the policies in that respect of England and the Colonies differ very materially on some points, it would be an advantage to have people directly under our own control to whom we can talk freely. Here is another reason—I put it to you in all candour: Sir Saul Samuel is now old; he has been there thirteen or fourteen years; he has done our business so splendidly that he has acquired a sort of proprietary right in his office;—it might be that younger men would have more energy, but it would not be a gracious action in his old age to snub him in any way, or to make an invidious distinction. We feel that if the matter were referred to the Agents-General themselves, Mr. Gillies and Sir Saul Samuel would be selected as being the senior.

The Hon. Mr. REEVES: The question is, are we called upon to decide on the ground of seniority? I would much sooner be in a position to talk on this matter without my remarks being taken down.

[*Shorthand writer requested to stop note-taking.*]

After a time,—

The Hon. Mr. THYNNE: To bring the matter to a point, I formally move, "That Lord Jersey and Sir Edwyn Dawes be nominated as the representatives." The

The Hon. Mr. REEVES seconded.

The Hon. Mr. COOK: Put it "That Lord Jersey and Sir Edwyn Dawes be the two Commissioners in London."

(On a vote—2 for, 3 against.)

The Hon. Mr. DUFFY: And that they be requested in any important questions arising to consult with the Agents-General.

The Hon. Dr. COCKBURN read a telegram he had received from Tasmania *re* giving his vote on the appointment of the Commissioners. I recognise that the terms of the resolution moved by Mr. Duffy (providing that those who are appointed should take the opportunity of consulting with the other Agents-General) remove very much the difficulty I would otherwise feel in voting for it, and I am bound to be swayed by the mode in which the resolution has been brought forward, and the kindly feeling shown, and further, will admit the cogent reason that I see no prospect of the ideas of the Colonies I represent in this matter being met. I therefore support the resolution.

The Hon. Mr. COOK moved, and Mr. DUFFY seconded: "That Sir Saul Samuel and Mr. Gillies be appointed as representatives of the Australasian Colonies as delegates on the Commission in connection with the Pacific cable, and that they be requested to consult in all important points with the Agents-General of the other Australian Colonies."

The resolution was put.

The Hon. Mr. REEVES: I could not vote for that. I do not know what view our Government may take of our action here. Some may dissent. As a matter of courtesy, I think what we do here should be communicated to our Governments. Ought we to take upon ourselves the responsibility of sending these resolutions on to the Commissioners?

The Hon. Mr. DUFFY: Oh, no, no; that is not proposed. There will be another resolution that our Governments be requested to do that. Pass this first, then we can have another motion.

The Hon. Dr. COCKBURN: Will you allow me to record a motion to show those Governments with which I am not connected that I have at least not lost sight of their special mandate. Each has given instructions, and I would like to have a motion tabled that an additional Commissioner be appointed to represent the views of the Western Colonies; although I suppose it is no use asking for a seconder.

The main resolution (The Hon. Mr. Cook's) was then carried, and it was understood that the other delegates consented to record The Hon. Dr. Cockburn's motion *re* third Commissioner.

The Hon. Dr. COCKBURN submitted a resolution: "That the Commission be asked, in any recommendations they may make, to take into consideration the outlay incurred by South and Western Australia in providing telegraphic communication with the outside world." Sir John Forrest authorised me to represent Western Australia only on one point, but I do not think he meant—I do not want to take him absolutely at his word, especially as my own Government ask for consideration. Western Australia has certainly done something, though not as much as South Australia.

[*The shorthand writer was asked not to take down remarks at this stage.*]

Subsequently, The Hon. Dr. Cockburn's resolution was read.

The Hon. Mr. COOK: Is that necessary?

The Hon. Dr. COCKBURN: Well, I would like to move it; but if it does not meet with general consent I will not press it.

The Hon. Mr. THYNNE: What about communicating the results of this Conference to delegates?

The Hon. Mr. DUFFY: That should be done by the Governments when they are appointed. We will recommend that our suggestions be conveyed to our Governments.

The Hon. Mr. COOK: I think what is wanted is a short explanation or report—a sort of explanatory report, with the votes and proceedings.

The Hon. Dr. COCKBURN: And on the appointment of the Commission by the respective Governments, a copy of the proceedings of this Conference be furnished to them.

The Hon. Mr. COOK: We have to report to someone; that someone is our respective Governments, and we had better have an explanatory report.

The Hon. Mr. THYNNE: If you have a report of that kind, of course it would have to be brought up and considered.

The Hon. Mr. REEVES: I move, "That it be a recommendation to the Governments represented at this Conference to forward the foregoing resolutions to the Australian Commissioners."—Carried.

The Hon. Mr. DUFFY: What about the Press?

The Hon. Mr. REEVES: I suppose they ought to get the resolutions with some general statements.

The Hon. Mr. COOK: Ought they to get the resolutions? There should be a general statement. I would suggest that Mr. Duffy and Mr. Reeves—as two old pressmen—make out a statement.

The Hon. Mr. REEVES: The only thing is, I am very much pressed for time. I have to pack up for to-morrow.

Nothing definite was decided upon, and the Conference adjourned at about 12·30 p.m.

MONDAY, 20 *JANUARY*, 1896.

Hon. Mr. COOK took the Chair at 11 a.m.

It was decided that as the London Postal Authorities requested that all proceedings connected with the preparation of the invitation for tenders for the Federal Mail Contract should be considered as confidential, it was not expedient to admit the Press.

On the Secretary reading the minutes of Saturday's proceedings, conversation took place on several points, and some alterations were made. The minutes were then confirmed, *nem con.*

The Hon. Mr. COOK: Nothing remains but the consideration of these mail conditions. At the last Conference we made a number of stipulations with regard to the next contract; they were duly forwarded to London and considered there. In reply there came out on the 29th March last year a reply to the representations of the Hobart Conference. I see by a later letter from London that the only two points that now present any difficulty are the questions of cold storage and coloured labour. I think we are pretty well

well agreed not to insist upon the mail boats providing cold storage for Australian products. We recognise that England must have a large say in this matter as well as ourselves, she being the largest contributor and has a very strong feeling in the matter. Some of her arguments, no doubt, are very cogent—for instance, that in which she says she could not be expected to contribute towards the cost of carrying Australian produce. I think we might very well let that go by the board. With regard to the other matter, that of manning the boats with white labour only; that is one that does not present difficulties of the kind which the other does. The London Office goes into the question at some length, and makes, I may say, some rather sarcastic remarks. There is some fine irony in the sentence in which they "see a difficulty in defining the shade of colour which would render sailors eligible, &c." I have only to say in reply to that that we are forced from our point of view to raise this question, and we are forced by reason that the shipowners themselves make a choice between the two kinds of labour. If they simply left the matter open and employed indiscriminately black or white labour as it came along, it would be different; but they themselves religiously exclude from their boats any white labour whatever so far as the lower class of labour is concerned. (Dr. COCKBURN: You don't say the "Orient"?) I am speaking of course of the P. and O. Company only. So that while it may be a point of difficulty with the British Government, it is also a point of difficulty with regard to the Colonies. We are compelled to make a choice because the company, with the concurrence evidently of the British Government, makes a choice which involves the exclusion of white labor; and in self defence, and in justice to our own people living amongst us and subject to the same conditions of life as we are, I think we should simply say—"Since we have to pay these ships handsomely for carrying our mails, they should carry our own labour in preference to that which does not assimilate to our mode of life." That is my view of the matter, and I hold it very strongly.

The Hon. Mr. DUFFY: Of course, the difficulty in this matter is that we are not the predominant partner. Not only is the Imperial Government the largest proprietor, but we are not even a united Australia ourselves, as Sir John Forrest takes the trouble to remind us by telegram. Mr. Fysh is indifferent in the matter, and I understand that Queensland is practically indifferent also. Only three Colonies, therefore—South Australia, Victoria, and New South Wales—take any real interest in the matter. No doubt in Victoria there is a very strong feeling held that owners of mail boats should not employ coloured labour, and strong prejudice is felt in favour of the Orient as against the P. and O. Company; and we are corroborated in the practicability of this course by the action Queensland has taken already. I understand they have a mail contract with the British-India Company, under which the Company is prohibited from bringing coloured labour into Queensland, and they arrange accordingly. They employ it in other contracts, but when sending ships to Queensland they don't have a coloured crew on board. I don't know if it would be practicable for the successful tenderer for the Federal Service to adopt such a plan. Of course, if we were conducting our own mail service, I presume there would be no difficulty about it; but we only take fifteen thirty-fourths, and England nineteen thirty-fourths, and even of that smaller part, fifteen thirty-fourths, only some contributors have an interest in this question. It is very difficult, and I am not prepared to say how far we should go. At present I think we ought to wait until we get the letter from England on which that telegram we have received is based. It says "letter following," and it is this letter with full explanations which may place us in a better position to judge; but unless the arguments are absolutely overwhelming we ought to send a reply to the Imperial Government that certain Colonies must insist that coloured labour must not be employed, or if it is we fear there will be a difficulty with our Parliaments in getting the necessary votes passed. I understand Queensland is prepared to back up the other three Colonies as regards that proceeding at all events.

The Hon. Mr. COOK: I would like to say what I omitted a moment ago, that I have just concluded an agreement with the Canadian Pacific Company, owned by Mr. Huddart, and in that agreement it is stipulated clearly that no coloured labour shall be employed, and I may say that Mr. Huddart cheerfully assented to that.

The Hon. Mr. THYNNE: It seems to me that there should be no difficulty whatever in any contract in which the Colonies have a controlling power in making such a stipulation, and it is in accordance with Australian sentiment that it should be observed. As stated by Mr. Duffy, in our contracts we have had that stipulation for many years, and in our negotiations for a renewal of the agreement as a refrigerating cargo service the same stipulation is inserted. Our Government would like to see the stipulation applicable to the Suez mail contract if it could possibly be done. Where we are lukewarm is not in the desire to have white labour employed, but in the belief that we are at all likely to succeed in getting the Imperial Government to consent to such a stipulation being inserted. We have already pressed the matter strongly on the Imperial Government, and they—although we have not yet received their full explanation as to the reasons why they refuse—we can quite see that the Imperial Government are in a difficult position, having its duties to a large number of subjects who are not white, and to whom they owe care and attention just the same as to the people of our own race. They no doubt are embarrassed with this question, and it is a matter for us to consider how far we should press upon the Imperial Government the insertion of a clause which would greatly embarrass them. That is the view which I expressed on behalf of the Queensland Government, and which I think I conveyed to the meeting of Postmasters-General which I attended at Adelaide last year. (Mr. Thynne here read a copy of the letter which he had written to Dr. Cockburn in June last, relative to the manning of mail boats by white labour, and hoping that the British Government would waive its objections in the matter.) I think that, Mr. Chairman, expresses the views which my Government holds in this matter, and which have been, I believe, communicated to the Agent-General in London in some correspondence. I should be very glad if you think there is any possibility of succeeding, to support you in this question.

The Hon. Dr. COCKBURN: It is with regret that I see no prospect of carrying out the wishes of South Australia, and of several other Colonies, in reference to cold storage, but I recognise difficulties in the way of this. There is no unanimity on the part of the Colonies; there are difficulties from the Imperial point of view, and, more than that, the requirements of the Colonies in this respect are from time to time being met by other than the mail boats, which of course alters the aspect of the case which it assumed at previous Conferences. I am reluctantly bound to admit that we cannot further press the question. About the coloured labour question, I think the best interests of the Imperial Government, the Colonies, and all English-speaking races, are identical in this matter, and I certainly think we should relax no effort to obtain the retention of this clause. (Mr. DUFFY: Hear, hear.) That is the opinion strongly held by South Australia; in fact, I raised the point at the New Zealand Conference, and supported the Chairman when

he

he went into it still more fully at the Hobart Conference. Of course, as the Conference is aware, I have also to place before it that Western Australia does not share these views, and in recording my vote according to the commissions placed in my hands by Sir John Forrest, I shall record the vote for Western Australia in favour of the view expressed by the British Post Office, but at the same time for South Australia in the other direction.

(Some conversation ensued as regards the telegram from the London Office requesting a reply by telegraph.)

The Hon. Dr. COCKBURN: I should like to remove some misapprehension which may possibly have arisen in regard to the wording of that telegram. It reads, "Please telegraph acquiescence." Those are the words of the British Post Office, not my own. I never heard till yesterday that there was any ambiguity. I forwarded it on in the first instance with no comment, merely for circulation to all concerned. I was surprised when I heard that Queensland read those words as coming from myself.

A resolution was then drafted by The Hon. Mr. Cook, who remarked that Mr. Reeves had authorised him to record the New Zealand vote. When the resolution was finally revised by the delegates, it was read by the Chairman.

The Hon. Dr. COCKBURN: Wait a minute; I don't quite know what to do in regard to Tasmania.

The Hon. Mr. COOK: I have a similar telegram from Mr. Fysh regretting he could not accept our invitation, and instructing you to represent that Colony.

The Hon. Dr. COCKBURN: I am not very sure how strong their attitude was.

The Hon. Mr. DUFFY read a telegram from Mr. Fysh, remarking that they did not seem inclined to fight.

The Hon. Mr. COOK: You are quite safe in holding up your hand against it.

The Hon. Mr. DUFFY: Western Australia is distinctly adverse.

The Hon. Dr. COCKBURN: If I place on record that Tasmania is in favour of acquiescence in the views of the London Post Office, and that Western Australia desires her vote to be recorded against the resolution—

The Hon. Mr. DUFFY: This is quite confidential—you have only to report that it was carried, and Western Australia dissented.

The Hon. Mr. COOK: Just say "carried."

The motion was then put:—

"This Conference having considered the reply of the London Office to the stipulation of the Hobart Conference, with regard to the manning of the Mail Boats by white instead of coloured labour, recognises fully the force of the reason given by the Imperial Government against insisting on the exclusion of coloured labour, viz., the necessity of discriminating between various classes of British subjects; but in reply would respectfully point out that by some Steamship Companies the labour of the contributing Colonies is excluded from employment, and an invidious preference given to the labour of countries which do not contribute to the maintenance of the service. No injustice would thus be done by the stipulation that the labour of the countries subsidising the service only should be employed. And, therefore, this Conference is of opinion that the mails to and from Australia and Great Britain should be carried by ships manned with white crews only."

It was added: "That this Conference concurs with the London Office on the other points in connection with the new mail tenders."

A cablegram embodying the decision of the Conference was framed to send to London Post Office, and the Conference adjourned at 1 p.m. to 10 a.m. Tuesday, to sign report, &c.

The Hon. Mr. THYNNE said, that before separating he desired to move a cordial vote of thanks to the Chairman, the Honorable Mr. Cook, for his valuable services and courtesy in presiding over the Conference. He felt sure that the satisfactory conclusion of their work had been materially assisted by Mr. Cook's special tact and ability in the matters which had been before them for discussion, and it was a pleasure to move that a hearty vote of thanks be accorded to him.

The Hon. Dr. COCKBURN seconded the vote, saying he was glad they had been able to meet in a friendly way, and discuss matters of general interest to the Colonies in regard to telegraph affairs, &c. In thus mutually meeting one another, and acting as far as possible co-operatively, they were carrying out the spirit which had characterised the transactions of Australasian Conferences in the past. He expressed to Mr. Cook his indebtedness for the hospitality and courtesy with which that gentleman had, on behalf of his Government, administered to the comfort of the delegates and their friends during their visit to Sydney.

The Hon. Mr. COOK: Gentlemen, I am only going to say that I am obliged to you for the vote of thanks you have so kindly accorded to me. I think we have every reason to congratulate ourselves on the amicable arrangements that have been made. I think they must be satisfactory on further reflection to all who are represented here. I express what I believe to be the feeling of the larger colonies when I say we are very glad that South Australia has shown a spirit of reciprocity in joining in the contract in regard to the Pacific Cable; and I am sure that the other colonies will maintain the friendly attitude which they have taken up. I hope the way is now clear, and that ere long United Australia will see the accomplishment of the Pacific Cable. The views we have expressed here will stand as an indication of the way in which the various conflicting interests of the colonies may be dealt with. He thanked the delegates for their kindly expressions towards himself.

The vote of thanks was passed.

The Hon. Mr. DUFFY moved a vote of thanks to Mr. James Dalgarno, for the efficient manner in which he had carried out the duties of Secretary to the Conference, and The Hon. Mr. THYNNE seconded.

The Hon. Mr. COOK said he had much pleasure in putting the resolution to the meeting.

The vote was carried.

Mr. DALGARNO acknowledged the compliment.

Re Proposed Pacific Cable Commission.

Extract from a Memorandum of His Excellency the Governor of New South Wales to The Honorable the Premier of New South Wales, dated 15th February, 1896.

"In accordance with your desire I have this day cabled the Secretary of State that the Colonies have agreed to the nomination of Sir Saul Samuel, K.C.M.G., &c., and the Honorable Duncan Gillies as Australasian Representatives on the proposed Pacific Cable Commission. Proposals to be reserved for the approval of the Colonial Governments."

Cablegram from The Honorable the Premier of New South Wales to The Agent-General for New South Wales, dated 14th February, 1896.

Pacific Cable Commission. You and Gillies have been nominated representatives Australasia, on understanding you consult other Agents-General on important points, and that any scheme proposed shall be subject to approval. Letter by post giving resolutions passed at Intercolonial Conference, which are published in *Herald* of the 20th January last.

Further Telegraphic Communications re Question of Employment of Coloured Labour in connection with the Federal Mail Service.

Telegram from The Postmaster-General, London, to The Postmaster-General of New South Wales, acting as President of the Intercolonial Postal and Telegraphic Conference, Sydney.

25 January, 1896.

Duke of Norfolk, thanking Conference for considerate telegram, regrets necessity for saying Government must decline exclusion coloured labour. Such restrictions opposed to settled policy of Parliament during nearly fifty years, and specially indefensible for service touching Asiatic possession and connecting Australasia with Asiatic dominions. Of course, contract would not exclude Colonial labour. Time pressing, and, in view of position of Government, do Colonies consent invitation tenders as drafted?

Telegram from The President of Postal Conference, Sydney, to The Postmaster-General, London.

19 February, 1896.

Federal Mail. Will be difficult, if not impossible, some Colonies obtain Parliamentary sanction without stipulation. Urge your reconsideration matter.

Telegram from The Postmaster-General, London, to The President of Postal Conference, Sydney.

20 February, 1896.

Difficulty much regretted; exclusion coloured labour from Federal Service impossible after fullest consideration.

Telegram from The President of Postal Conference, Sydney, to The Postmaster-General, London.

24 March, 1896.

Regret your decision *re* coloured labour. Suggest you ask tenderers to state class of labour proposed to employ.

Telegram from The Postmaster-General, London, to The President of Postal Conference, Sydney.

27 March, 1896.

No tender excluding coloured labour could be accepted. Specification of class therefore useless. If Colonies cannot join in Federal Service on terms agreed, please telegraph whether they will arrange branch service to and from Colombo and Aden alternately, or complete homeward service, as advertisements cannot be delayed longer.

Telegram from The President of Postal Conference, Sydney, to The Postmaster-General, London.

1 April, 1896.

Much regret you decline to do anything *re* coloured labour. We are not in position to call for tenders on our own account, and are therefore compelled accede to your proposal.

Telegram from The Postmaster-General, London, to The President of Postal Conference, Sydney.

1 April, 1896

Colonies' consent received with satisfaction. Tenders will be immediately invited, returnable 7th July.

Sydney: Charles Potter, Government Printer.—1896

1896.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

PENNY POSTAGE—POSTAGE ON NEWSPAPERS.

(PETITIONS FROM RESIDENTS OF NEW SOUTH WALES, IN FAVOUR OF A MEASURE EQUALISING THE POSTAGE IN TOWN AND COUNTRY.)

Received by the Legislative Assembly, 19 *August*, 1896.

To the Honorable the Speaker and Honorable Members of the Legislative Assembly of New South Wales.

The Petition of the undersigned Residents of New South Wales,—

SHOWETH:—

1. That the present postage rate within the large metropolitan area of Sydney is one penny for a letter not exceeding half-ounce in weight.

2. That throughout the country districts of New South Wales the postage, even for short distances, is twopence for letters of the same weight.

3. That country residents, the producers of the Colony, are thus compelled to pay twice as much for the postage of their letters as residents in Sydney.

4. That whereas country residents, who post very little printed matter, pay twopence for every letter weighing half-ounce or under, while printed matter, coming mostly from Sydney, is carried at one-fourth that rate for four times the weight, or sixteen times cheaper than country letters.

5. That this is inequitable, and presses unfairly upon country residents and all who correspond with them.

Therefore your Petitioners pray that your Honorable House will pass a measure equalising the postage in town and country, by making a general rate of one penny upon all letters not exceeding half-ounce in weight posted and delivered within the Colony, and that if it be necessary to raise further revenue to enable a penny inland post to be established, that your Honorable House will impose a half-penny postage rate upon all newspapers posted for delivery within the Colony, save and except newspapers sent free as exchanges and newspapers delivered free within the Electorate in which the paper posted has been printed and published.

And your Petitioners, as in duty bound, will always pray.

[*Here follow* 728 *signatures.*]

1896.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

MILITARY FORCES OF THE COLONY.

(REPORT FOR THE YEAR 1895.)

Printed under No. 2 Report from Printing Committee, 28 May, 1896.

REPORT for the Year 1895, by Major-General E. T. H. HUTTON, C.B., Aide-de-Camp to Her Majesty the Queen, Commanding the Military Forces of New South Wales.

1ST SECTION.

SUMMARY AND REMARKS.

(1.) As a result of the reconstruction and reorganization of the Military Forces of New South Wales which has been effected since June, 1893, the Colony now possesses a small but complete military force, organized throughout every branch and every department upon the latest modern lines. The requisite proportions of Cavalry (including Mounted Rifles), Artillery, and Infantry have been laid down, together with the requisite number of Engineers, Medical Staff, Army Service Corps, and Ordnance Store Corps.

A Veterinary Department, a Remount Depôt, and a Corps of Staff Clerks have recently been added.

(2.) The peace establishment of each military unit was approved in 1894, and the increase of this establishment to the war requirements has now been similarly accepted. A complete framework has thus been approved by Government upon which the details of mobilization in time of war have now been built, and the whole available Military Force of the Colony can, at short notice, be mobilized for war upon the principles and at the places laid down in the Defence Scheme.

The principle has been observed of making the Military Force of the Colony upon peace footing a complete Cadre Force, which, upon the declaration of a national emergency, can be at once expanded to the adequate dimensions for the effective fufilment of the "Defence Scheme of the Colony." The Colony thus possess a complete cadre form of each administrative department in proportion to the peace or war establishment of its fighting strength, so that the whole Military Force can be mobilized, and then utilised at the shortest notice in any manner which Parliament may think best in the public interest without the improvised creation of those departments upon a sudden emergency, which are vital to the efficiency of any military force, and without which an army is a mere assemblage of armed men without cohesion, without power of locomotion, and without the proper means of maintenance. In this respect the Military Force of the Colony of New South Wales stands alone among other similarly constituted military forces.

(3.) Following upon the decentralisation of command, and upon the effective measures for improving the professional knowledge of the officers, which have been carried into effect, a satisfactory condition of discipline and subordination exists throughout the Force. The improved knowledge of the officers, and the system of Annual Field Training, initiated in 1894, have caused a most marked increase of military

military knowledge and efficiency throughout the entire Force. This has been conspicuously so in the Permanent Artillery, where the technical training up to June, 1893, was small and utterly inadequate to modern requirements.

The officers throughout the whole Force have combined to make the reorganisation of the Force successful, and to ensure the far higher standard of efficiency which has been reached.

(4.) Reduction in Military Expenditure.

A rigid economy has been exacted throughout every branch of the Force, and the following comparative Schedule will show the reduction in expenditure which has been effected since 1890 :—

Year.	Voted by Parliament.	Spent.	Saved.	Remarks.
	£	£	£	
1890 ...	246,000	246,000	.. ..	Including nine days' training in a central Camp of Instruction.
1892 ...	225,366	224,746	620	No training in camp.
1894 ...	174,372	170,874	3,498	Short local Camps of Instruction.

It will be seen from the above that a reduction in the military expenditure for 1894 has been effected of £75,126 since 1890, or a 30½ per cent. reduction from the total Military Vote for that year; and a reduction of £53,872, or 23 per cent., has been effected since 1892, when no camps of training were held, although a slight increase in numbers has taken place. The expenditure for 1895 will be approximately the same as for 1894.

I desire to invite attention to the fact that this important reduction in military expenditure, demanded by the recent financial depression, could only have been carried into effect without serious detriment to the effective condition of the military Force by the heartiest determination upon the part of all ranks to co-operate for the advantage of the State by much self-sacrifice.

I am of opinion that the reduction of the Military Vote below £200,000 per annum cannot be reckoned upon, having in regard the constant advances of military science, and the necessity for maintaining the war material and equipment in a proper and complete condition of modern efficiency.

(5.) Head-Quarter Staff, &c., Services of.

Upon the relinquishing of my command it is my pleasing duty to bring the services of the members of the Head-Quarter Staff most prominently to the notice of the Government. It is to them that is due the credit for carrying into effect the orders that have been given so as to ensure a modern system of organization, increased efficiency, and decreased expenditure.

It has been, moreover, due to the labours of the members of the Head-quarter Staff that the details of the "Australian Federal Scheme of Defence" have been elaborated for use upon a national emergency. The New South Wales Government have thus been in a position to submit for the general acceptance of the Australian Colonies and Tasmania a scheme of Australian federal defence complete in every detail, which has received in principle the official concurrence of the Colonial Defence Committee, composed of the highest naval and military authorities in London.

The promotions and distinctions which have been conferred by His Excellency the Governor and Commander-in-Chief, with the advice of the Executive Council, upon several officers for their services in various capacities are deeply appreciated by the whole Force as a recognition, not only of the merits of the officers concerned, but of the efforts of the whole Force to merit these tokens of His Excellency's approval.

The selection by Her Majesty the Queen of the Colonel Commanding the 3rd Infantry Regiment, who is not only the senior officer of the Volunteer Force, but who has also commanded his regiment for sixteen years, for appointment to the Most Distinguished Order of St. Michael and St. George, has been received with a feeling of the greatest satisfaction, as not only an honor to the recipient, but as a gracious recognition on the part of Her Majesty of the loyalty and zeal of the whole Military Force of the Colony.

2ND SECTION.

GENERAL REPORT.

(6.) ADMINISTRATION.

The Executive and Administrative Departments of the Head-Quarter Staff have worked in every respect satisfactorily.

The duties of the Military Secretary in connection with "C" (or Ordnance) Branch of his Department have been confirmed by his recent appointment as Director of Artillery and Stores.

The Quartermaster-General's Department has been conspicuous in enforcing a rigid economy. The Ordnance Department has made great and most important strides towards a high degree of efficiency, and has, in consequence, been the means of ensuring a proper care and supervision over all stores, and an economical control over Government property.

(7.) REDUCTION.

A reduction of one-third of the personnel of the Artillery Workshops has been effected, representing a saving of approximately £800 per annum.

(8.) ORGANIZATION.

The following Departments, &c., have been added to the Military Establishments :—

Ordnance Store Corps.

This Corps has thus been formed without extra cost by enrolling as soldiers the employés in this Department, who were formerly serving as civilians in a military department. The Corps is divided as follows :—

1st Section—Gun Wharf.
2nd Section—Magazine.
3rd Section—Armourers.

Veterinary Department.

A nucleus of this important Department has been created, which can be rapidly expanded on mobilization. A Principal Veterinary Surgeon has been appointed, and regulations framed for the maintenance and guidance of this Department. The necessary stores, &c., have been procured. A system of instruction and supervision of Farriers and Shoeing Smiths in the Mounted Corps will now be initiated. The cost has been nominal.

Corps of Staff Clerks.

The civilian clerical Staff have been enrolled as soldiers, and are now formed into a corps without extra cost. The members are classified in accordance with their duties, and their responsibilities.

(9.) TRAINING OF TROOPS.

The Annual Field Training, instituted in 1894 for the whole of the squadrons, batteries, and companies, has had the most beneficial results.

Due to the requisite military knowledge having been gained in the Schools of Instruction for officers created in 1893, the Annual Training of the squadrons, batteries, and companies is now entirely carried out by their own officers. This has had the effect of increasing the confidence of the men in the knowledge and professional acquirements of their officers, which in its turn has most materially improved the discipline as well as the efficiency of the whole force. The great principle has thus been maintained "that the man who leads must be he who instructs."

However sanguine I had been of the success that would attend the institution of a system of Annual Field Training, I was not prepared for the very marked and important results that have followed.

The

The infinite trouble taken by the officers to make the instruction given during the course of a practical character and the lectures attractive is only equalled by the interest shown by the non-commissioned officers and men themselves in the new system of training. In many instances a very considerable standard of military knowledge has been reached.

(10.) Artillery Practice.

The firing carried out during the year 1895 is published herewith in Appendix "C."

(11.) Advanced Training in Camp.

A series of local Camps of short duration have been held so far as money and means allowed. (*Vide* Appendix L.)

The short course of continuous training for the Metropolitan Troops, even though it consisted only of two days, exclusive of a Sunday, was productive of much good.

I have already pointed out that these local Camps for such short periods as two or three days are inadequate for the purpose of continuous training. I cannot too strongly urge the necessity of a system of continuous training for at least six working days for Field Artillery, Cavalry, Mounted Rifles, and Infantry.

Not only is this instruction necessary if the troops of the Colony are to have any pretension to real efficiency for war, or, in other words, for the purpose for which they exist, but without the concentration of larger bodies of troops the staff and senior officers cannot possibly learn their duties. The result of the senior officers having no opportunities of practice and instruction must be that no officers in the Colony will exist who have the requisite knowledge and experience to lead and command the men whom the Colony spend large sums of money yearly in training and equipping. The command, the organization, and the administration of troops in the field cannot be learnt except by practice, and it should be the aim of New South Wales to so give her officers opportunities of acquiring these powers as to make the Colony independent of Imperial officers, or of officers trained elsewhere.

Rather than sacrifice their continuous training in camp, I would recommend that if additional money cannot be placed at the disposal of the General Officer Commanding, a readjustment of the half-day parades should be made, and pay for six whole days should be set aside for a six days camp of continuous training per annum. I would point out that some measure of efficiency on the part of the individual squadrons or companies would be sacrificed from this curtailment of their individual training; but I attach a higher importance to the concentration of larger bodies for the reasons stated above, than to any other matters in connection with the training of the New South Wales troops.

(12.) Training of Officers.

A Schedule is given in Appendix "B," which shows the various Schools of Instruction for officers which are in existence.

It is proposed during the current year to organize a similar system of Schools of Instruction for the non-commissioned officers of each branch of the Military Force.

A School of Instruction for Field Artillery, for machinery in connection with Artillery, and in Field Engineering, has been instituted since 1894.

The greatest benefit has been derived from the institution of the whole of these schools, the cost of which is nominal.

The following officers returned from India on the 29th March, 1895, after having been attached for instruction to the Staff and to the various arms of the Service with Imperial Troops in India, viz.:—

Lieut.-Colonel H. D. Mackenzie, Assistant Adjutant-General.
Captain H. W. Dangar, Field Artillery.
Captain J. G. Legge, General Staff.
Captain J. W. MacArthur Onslow, Mounted Rifles.

The last-named officer returned on the 7th January, 1896, having been permitted, at his own expense, to be attached to the Chitral Expeditionary Force in N. W. India.

Very

Very satisfactory reports have been forwarded regarding the above officers from the Commander-in-Chief in India and the various officers under whom they served. Captain Onslow served upon active service with the 1st Battalion, King's Royal Rifles, throughout the Chitral Campaign, and was present at the assault of the Malakand Pass, and subsequent operations.

It is impossible to over-estimate the importance to the Colony of the practical knowledge and training obtained by the above officers, and I strongly advocate that at least two officers be sent during the cold season of 1896–7 to India in a similar manner.

Captain Kyngdon, Permanent Artillery, is at present in England undergoing a complete course of Gunnery, Field Artillery, and Small-arm course. This officer concludes his course of training on 31st July, 1896.

(13.) Permanent Artillery.

I have found it my duty to consistently advocate, since my arrival, as of paramount importance to the efficiency of the defence of the Colony, the retirement of the two senior officers of the Artillery.

It is much to be regretted that the small sum of money requested by the Officer Commanding the Artillery Forces as a gratuity on retirement has not been provided. The opinion which I have previously expressed as regards the retention of this officer are no less strong now than when I submitted my Annual Reports for 1893 and 1894. I have already reported that I am not prepared to recommend that this officer should be retired without any pecuniary consideration after the twenty-four years' service which he has rendered to the Colony. Such a course would be unfair to the officer in question, and unwise, inasmuch as it would deprive the officers now serving of any hope of receiving some remuneration for their services, when age or the exigencies of military service make their retirement advisable in the interests of the State. This officer, as I have already had occasion to report, has done his utmost to carry out the orders and instructions given him for the reconstruction and reorganization of the Artillery Force generally, and, therefore, he the more merits fair consideration for his past service.

The Officer Commanding the 1st Garrison Division Artillery has now been reported on two separate occasions by a Medical Board as being unfit for further military service, and this Board has further reported that there is no possibility of recovery. This officer is now on sick leave pending his retirement.

A very great improvement has taken place in the Artillery training, and in the technical knowledge of all ranks.

The forts are practically complete in equipment and material; magazines are full, and there is an adequate supply of ammunition in the Artillery Reserve.

The 6-pounder Q.-F. guns for additional mine-field defence have been ordered, and are likely to reach the Colony very shortly. The sites for the emplacements have been selected.

The system of interior economy in the Permanent Artillery, both Field Battery and 1st Garrison Division, is not altogether satisfactory. I recommend that a selected officer should be sent during 1896–97 to Hong Kong and Bombay for six months in order to study the system of artillery regimental organization and administration by being attached to Garrison Artillery at those places.

I have every reason to believe that the change of command in the 1st Garrison Division recently carried out will result in an improved system of regimental interior economy, as well as in the increased efficiency of that Division generally.

A new Battery of 12-pounder B.L. guns is on its way from England, and will be allotted to "A" Battery, Brigade Division, Field Artillery. "B" Battery will then be equipped with the 9-pounder R.M.L. in place of the 16-pounder guns.

An excellent spirit exists in "A" Battery. It has made very great progress in acquiring a knowledge of its duties since 1893, and has recently carried out the annual instructional march to Newcastle and back in a manner very creditable alike to all ranks. This Cadre Permanent Field Battery has proved of the greatest possible service for instructional purposes in the Brigade Division Field Artillery and in the Mounted Services generally.

The number of Artillerymen required for manning the guns in connection with the defence are, as I have already stated in previous reports, insufficient. In order temporarily to meet this serious deficiency a portion of the Naval Forces of the Colony, no longer required for sea-going purposes, have been allotted to a share of the artillery defence. I recommend that the Naval Artillery Volunteers should be converted into Artillery, and should now become Nos. 7 and 8 (Naval) Companies, 2nd Garrison Division, and that for the present they should retain their uniform. It is of paramount importance that no divided authority should exist in the artillery defence, more especially of so important a city as Sydney, that the whole Artillery Force should be trained upon one uniform plan, and that the training should be of a high order. Above all, it is imperative that the officers should be put through a regular course of gunnery, under the Commandant, School of Gunnery, upon a system similar to that of their comrades of the Garrison Artillery.

I venture to think that the time has arrived when the anomaly of a force of Naval Artillery Volunteers, whose duties have now become by the change in the condition of the defence of the Colony those of purely Garrison Artillery, should cease.

(14.) Engineers.

I am, on the whole, satisfied with the condition of the Corps of Engineers, and the manner in which the Engineer Services have been carried out.

The Field Companies are in a satisfactory condition of efficiency.

No. 3 (or Submarine Mining) Company carried out their Annual Field Training very successfully. I consider that the submarine mine defence is in every respect satisfactory, and that all the technical details connected with the mine-fields are complete, and in a high degree of efficiency.

The services of Major Reynolds, R.E., Commanding Engineer, Victorian Military Forces, were placed at my disposal as "Consulting Military Engineer," from the 6th to 13th August, 1895. This officer, at my request, carefully inspected the whole of the Submarine Mine Defence, Defence Works, and Engineer Services generally. His report was in all respects satisfactory. This officer further assisted me with advice in the selection of sites for guns, the completion of the defences of Port Jackson, and in other matters. His advice and assistance were of the utmost value.

I have already stated that without the occasional assistance of an officer of Royal Engineers I should not be prepared to accept the sole responsibility of the Engineer Services. I venture to hope that the appointment of a Consulting or Inspecting Engineer Officer for the whole of Australia and Tasmania may be carried out by mutual agreement between the Colonies, as proposed by the Military Conference of October, 1894.

The electric light instalment of Port Jackson is now practically completed. Permanent telephone communication is also complete. A central magazine at Bradley's Head is about to be erected. The original designs included a site for a Naval Torpedo Depôt, but the Officer Commanding N. S. Wales Naval Forces now proposes an amendment to this arrangement.

Married quarters, at comparatively small cost, are being erected at South and Middle Heads, which will entail a large yearly saving in lodging allowance.

The military maps of the neighbourhood of Sydney approach completion. The plans for the erection of field works covering Sydney on the land side are being prepared, of which a portion will be erected in profile for instructional purposes by the Field Companies during the current year.

A schedule of rates for carrying out minor works and periodical services has been framed, by means of which a strict economy can be insured. A complete inventory of all fixtures in connection with all Government buildings and defence works has been completed. This system will ensure an increased care in the maintenance and charge of Government property.

No. 4 (or Electric) Company is in a satisfactory condition of efficiency; its reconstruction has been most beneficial.

The Officer Commanding No. 4 (Electric) Company has been appointed to the Head-quarter Staff as Director of Military Telegraphs. This officer, who is also head of the Government Electric Telegraph Department, will then be in a position to inspect and advise the General Officer Commanding upon all matters of electric

electric communication, electric light, and telegraph works generally, and will further be responsible for the completion and maintenance of a system of intercommunication during a national emergency.

(15.) Honorable Distinctions.

The "Volunteer Officers' Decoration" having been conferred by Her Majesty the Queen upon certain officers, in accordance with the terms of the Royal Warrant, His Excellency the Governor and Commander-in-Chief presented the same at a State Ceremony of an appropriate kind in the Town Hall, on Monday, December 16th.

It is to be regretted that the "Long Service Medals" and the "Volunteer Long Service Medals" for N.C.Os. and men have not yet been received. The lists of the recipients are prepared.

(16.) Federal Military Conference.

The very important proceedings of the Federal Military Conference held on 24th October, 1894, have been further supplemented by a "Draft Federal Defence Agreement," including the "Powers of an Australian Council of Defence in time of War."

The labours of the above Conference have been still further supplemented by the Intercolonial Military Committee proposed by the Government of New South Wales, which sat on the 29th January, 1896, and following days.

The Report of the Federal Military Conference of October, 1894, together with the Draft Federal Defence Agreement, &c., have been circulated to all the Colonies concerned. The Colonial Defence Committee, London, have been pleased to comment very favourably upon the recommendations of the Military Conference and Federal Scheme generally.

(17.) Intercolonial Committee for framing a Manual of Mounted Drill.

The labours of the Intercolonial Committee held on 30th October, 1894, have resulted in a Manual, which has been printed and which will be published shortly and issued for general use.

(18.) Creation of a Reserve.

In pursuance of the recommendation contained in the Annual Report for 1894, the creation of a Volunteer Reserve from the authorized Civilian Rifles has been effected, and has proved a complete success. In return for certain concessions as regards ammunition, a large proportion of members of the Rifle Clubs, who are passed as physically fit and of a suitable age, have been enrolled as Volunteer Reservists. The enrolled members of the various Rifle Clubs have been affiliated as reservists to the nearest Military Unit, by whom they are now being armed and partially equipped. Sufficient numbers of reservists have been already enrolled to complete the peace establishments of the Cavalry, Mounted Rifles, and Infantry to war strength.

An excellent spirit pervades the Rifle Clubs, who throughout have shown a very praiseworthy and patriotic anxiety to meet the defence requirements.

A reserve for the Medical Staff Corps from the members of the St. John's Ambulance Association is being similarly organised.

It is hoped that hereafter the financial condition of the Colony will admit of a small capitation grant being allowed in order to provide the reservists with uniform. A short course of drill will hereafter be exacted from the reservists.

I now recommend that an Artillery Reserve be formed during the present year, which shall be composed of men who have passed through the ranks of the Permanent or Partially-paid Field or Garrison Artillery. A capitation grant should be given for such a reserve, in order to provide uniform, and a small yearly retaining sum of money should be paid to each man in consideration of attendance at a short course of drill and gunnery. It is impossible to create a reserve of artillerymen from the ranks of the Rifle Clubs in the manner effected for the Cavalry and Infantry. It is essential that the Artillery Reserve should have at least a fair technical knowledge of the duties which they may be called upon to exercise at the shortest possible notice.

(19.) Magazine Small-bore Rifle.

It is of the utmost importance that the recommendation under this head in the Annual Report for 1894, paragraph 24, should be carried out as soon as possible.

I beg to reiterate my recommendation of last year as regards the gradual re-equipment of the Force of the Colony, and as regards the present training of the Forces with the existing rifle.

(20) Head-quarter Staff.

In addition to the routine of Staff duties, the following work has been carried out :—

Assistant Adjutant-General's Department.

Tactical schemes for instruction of troops, Nos. XX to XXIII, and criticisms.

Syllabus for examination of Non-Commissioned Officers and for instruction of recruits of all branches of the Service.

Rules for Military Engineering and for Field Artillery Schools of Instruction.

Rules and Regulations in connection with the formation of a Volunteer Reserve from existing Military Units, and issue of regulations controlling same.

Assistant Quartermaster-General's Department.

A Strategical Scheme for mobilization of the Movable Column, or Offensive-Defensive Force, and subsequent movements, as a test for the whole of the Force, especially of the Administrative Departments, in the detail of their duties on mobilization.

Chapters III and V of the "Defence Scheme of New South Wales."

Veterinary Regulations.

Transport Regulations.

Standing Orders for the Army Service Corps.

Equipment Regulations.

(21.) Defence Scheme of the Colony and Mobilization for War.

The "Defence Scheme of New South Wales," prepared in 1893, and accepted by the New South Wales Government, has received the concurrence of the Colonial Defence Committee, London, who have been pleased to express their complete satisfaction with its principles.

The whole of the detailed arrangements for mobilization for war in accordance with the principles laid down in the Defence Scheme are now complete. A sequence for mobilizing by successive stages of the whole available Military Force in time of war has been prepared.

The troops allotted to the various districts and to fortress defence have been exercised at their posts in accordance with the provisions of the Defence Scheme, and have shown much interest and intelligence in mastering their allotted duties.

3rd SECTION.

RECOMMENDATIONS.

(22.) Appointment of Inspecting Officers of Artillery and Engineers.

I recommend that the proposals made by the Colonial Defence Committee, London, in their remarks of the 21st November, 1895, upon the "Report of the Federal Military Conference of October, 1894" should be adopted, and that an Inspecting Officer of the Royal Artillery and an Inspecting Officer of the Royal Engineers should be jointly appointed by the colonies of Australia and Tasmania. These Officers would have the supervision of the Artillery services and of the Engineer services (including Submarine Mines) of New South Wales no less than the whole of Australia.

This system would save expense to this Colony by obviating the necessity of having an Officer Commanding Artillery Forces. It would further insure the whole of the Artillery of Australia being organized and maintained upon one general plan.

The

The Officer Commanding the Artillery Forces in this Colony, now receiving £1,076 per annum, would then be no longer required. The share of an Inspecting Officer of Artillery might be estimated, approximately, at £500, thus leaving a net gain to the Colony of nearly £600 per annum.

I have already urged in my report of 1893 the necessity of having a thoroughly competent officer of Engineers as Inspecting or Consulting Military Engineer. In consequence of the Government of Victoria having lent the services of Major Reynolds, R.E., for this purpose in 1895, no action has hitherto been necessary on this head, but as that officer's appointment shortly expires it will be advisable that the recommendations of the Colonial-Defence Committee should be adopted, and that the services of an officer of Royal Engineers should be secured to succeed him under joint agreement of the Colonies of Australia and Tasmania. This officer should exercise a general supervision over the Military Works and Engineer Services, insuring by these means a continuity in the system of military defence works throughout Australia.

(23.) Federal Regiment of Artillery.

Upon the appointment of a Federal Military Head or Inspecting Officer, a Federal Regiment should be formed, to which I attach the greatest importance. The efficiency of the Permanent Artillery of the Colony would be, as I have already stated in my Annual Report for 1893, immensely benefited if amalgamated with the Permanent Artillery units of the other Australian Colonies.

An occasional change of quarters for all, and a more constant flow of promotion among the officers, would afford encouragement, and would promote emulation among all ranks. A long sojourn in any place, and a stagnation of promotion invariably destroys all that enthusiasm and zeal without which a military career becomes lifeless to the individual, and useless to the State. The higher training of the officers, and their education for holding the higher military commands and Staff appointments in Australia, could be more easily ensured.

Such a system would promote a higher standard of military knowledge and capacity among the Australian Artillery officers, which would fit them for employment in any military position. It is in the highest degree inexpedient and unwise for Australia to reckon upon being able to obtain the services of Imperial Officers to fill the higher and more responsible military positions. It is equally unreasonable to expect that Australian officers will be found who are equal to the responsibilities of the Staff and of high command unless trained to the latest modern requirements of military science.

The proposed amalgamation of the Artillery units of each Colony might be adopted without any increased expense. The initial difficulty of pay and allowances to officers would at once be simplified if the scale laid down in Royal Warrant for Imperial Officers serving in South Africa were adopted by all Colonies, as has been done by New South Wales. The rates or pay for the men, and the terms of service, would alone require to be fixed.

(24.) Second in Command, Mounted Brigade.

I have already in my Annual Reports for 1893 and 1894 recommended the appointment of an officer from the Imperial Service to be Second in Command of the Mounted Brigade for a term of three years. Having regard to the age of the present veteran Commandant, the services of such an officer to insure sound practical efficiency to the regiments comprising this fine Brigade is absolutely essential. At the present time there is no officer in the Colony suited for such a responsible command, or who has the seniority, experience, or knowledge necessary. At the termination of the three years, it may be confidently assumed that the Imperial Officer could be replaced by an officer selected locally.

(25.) Saddlery.

I again beg to recommend the purchase of 400 saddles for use of the Mounted Troops, which shall be stored for issue when required.

The principles governing the pattern of saddle necessary for Australian Mounted Troops have been fixed, and I urge most strongly that a certain proportion of suitable saddles should be procured yearly until the maximum stated above has been reached.

It is useless to suppose that the Mounted Troops of this Colony are in an efficient condition for service in the field without a saddle of a description suitable for military service. (26.)

(26.) Military Act.

I desire especially to urge the adoption of a Military Act, framed upon the lines of the "Draft Federal Agreement," which has been prepared and provisionally approved.

It is impossible with any regard to any sound military organization to postpone the adoption of such a Bill until a National emergency arises.

The existing Volunteer Act of 1867 and 1878, under which the troops of New South Wales are enrolled, is well known to be obsolete, and is, moreover, inapplicable to a system of Federal Military Defence. It is sufficient to state that by the provisions of the existing Volunteer Act under which the troops of New South Wales serve, it is not possible to move a single soldier beyond the confines of the Colony.

(27.) Public School Cadet Force.

I again recommend that the Cadet Force of the Colony should form a branch of the Military Force of the Colony, and that the General Officer Commanding should undertake the supervision of the drill and the military instruction generally of the Cadet Force, subject to the general requirements of the Educational Department.

The Cadet Corps would, in my opinion, gain in efficiency and in value to the State by this change, since their training and discipline would be placed on a higher plane, by becoming members of an auxiliary branch of the Military Defence Force of the Colony. It would re-act to the distinct advantage of the State if the Cadet Force were considered in the light of a nursery for training officers and men for the existing Military Corps, and ceased to be treated as a quasi-scholastic and separate organization.

(28.) Retirement Scheme.

Instructions have been given for the preparation of a Retirement Scheme for Officers.

I trust that a scheme embodying the principles, and for the reasons stated in my Annual Report for 1894, may be adopted. The remarks on this head are quoted from the Annual Report for 1894, as follows:—

"A recognised scale of retirement exists in other Government Departments of this Colony, and is provided for in all European armies. It is universally recognized that it is not to the true interest of any State to abandon its public servants, be they soldiers or civilians, to want and a poverty-stricken old age, after having extracted from them years of faithful service.

"The pay of the Officers of the Staff and the Permanent Artillery of New South Wales has been fixed at Imperial rates, which it is well known are considered low even in England, where the average value of labour is far lower than in Australia. Officers of the Imperial Service have, moreover, a fixed scale of pension or gratuity on retirement to look forward to, so that their position and prospects are in this respect better pecuniarily than those of their comrades in this Colony.

"The Warrant Officers and Non-commissioned Officers and men in this Colony are not similarly in so unequal a position as the officers, as their pay is relatively higher than that of corresponding ranks in the Imperial Service. It may be assumed, therefore, that in their case the higher rate of pay enables them to save so as to make provision in the event of their discharge or retirement.

"The absence of a system of retirement makes itself seriously felt by all the New South Wales Officers. In several notorious instances it has resulted in serious detriment to the effective service of the State, since it has been found necessary to retain officers upon charitable grounds long after they had ceased to be of any use for military duty, as there were no means of providing for them."

"I recommend, therefore, in the best interests of the State, and with due regard to the future efficiency of the Officers of the Colony, that this most important question should be dealt with as soon as possible."

(29.)

(29.) Capitation Grant and Clothing of Troops.

The existing system of providing the clothing for the Military Force is highly unsatisfactory, and is, moreover, the reverse of economical.

Each Commanding Officer of a Regiment or Corps arranges his own contract as best he may, with the result that Commanding Officers compete one against the other, thereby raising the price of tenders. The clothing supply is of unsatisfactory material, quality, and shape. I recommend that the existing system be abolished, and that the clothing be contracted for and issued by a Central Military Clothing Department, which, under the General Officer Commanding, shall be organized as a portion of the Head-quarter Staff. A large yearly saving would result, and the clothing would be delivered punctually and of a better quality.

The Capitation Grant is in this Colony a Clothing Allowance, and is not, therefore, upon the same footing in this respect as the Capitation Grant of the Volunteer Force in Great Britain, which is intended to cover all expenses with the Volunteer Force.

(30.) Drill-halls, Provision of.

I beg strongly to recommend the erection of a suitable Drill-hall at the Head-quarters of each Military Unit in place of the existing system of hiring a building, often unsuitable, for the office work, for military stores, and for drill purposes with each Half Squadron of Cavalry, Half Company of Mounted Rifles, or Company of Infantry.

By the existing system a yearly sum is allowed to each Half Squadron of Cavalry, Half Company of Mounted Rifles, and Company of Infantry for hire of Orderly-room. This amounts in all to £900 per annum, which, if capitalised at rather more than the Government rate of interest, viz., 3½ per cent., represents the capital sum of £27,000. This sum, divided among the several Orderly-rooms existing in the Country Districts, would represent a capital sum of £570 to each. I recommend that the lump sum of £280, or half that amount, be allowed to each Military Unit for the purpose of building a suitable Drill-hall and Orderly-room combined upon a design, under a contract approved by, and under the supervision of the General Officer Commanding. There would then remain the interest represented by the sum of £450 per annum for the maintenance of these Drill-halls, while the buildings themselves would be the properties of Government.

In each case the land required should be a free grant by the Department of Lands.

I know of no improvement which is likely to add more to the popularity and efficiency of the local or country district troops than the institution of such Drill-halls.

The sum of money required, viz., £14,000 might be allotted from the Loan Vote of £20,000 now available for the erection of Head-quarter Staff offices, which sum is not proposed to be utilized for that purpose. The Loan Vote might be re-submitted to Parliament for re-allotment accordingly.

(31.) Naval Forces.—Recommendations by President Local Defence Committee.

In my position as President of the Local Defence Committee, and as Genera Officer Commanding the Military and Naval Forces of New South Wales, in time of war, I have to submit the following recommendations, viz.:—

(*a*) In clause 13, of this Report, it is recommended that the Naval Artillery Volunteers should now form Nos. 7 and 8 (Naval) Companies of the 2nd Garrison Division. I am of opinion that this Corps should now be trained solely as Artillery men, thus fulfilling the purpose for which they were originally raised. Their maintenance as Naval Artillery under a local Naval Commanding Officer, when their duties are those purely of Artillery under the Artillery officers concerned, presents an anomaly which should now cease.

(*b*) The duties of the Naval Brigade have been clearly defined in the "Defence Scheme of New South Wales." They are held responsible for the Rules of the Examination Anchorages and Traffic Regulations being carried out in time of war at the various fortified harbours, and for the manning of the local Torpedo Boats as a portion of the defence of Port Jackson. Their duties will be of a very arduous and responsible character. The functions of the New South Wales Naval Brigade have

have been restricted solely to the defence of the harbours and entrances of the coast in the manner laid down for them in the Defence Scheme, as the Royal Navy assumes the responsibility of maintaining supremacy at sea.

(*c*) The principle has been laid down in the Defence Scheme, and approved by the Government, that in time of war or National Emergency the whole of the Defence Force of the Colony, both military and naval, shall be placed under one head. I recommend most strongly, as essential to a complete and undivided command in time of war, that this principle should be now adopted in time of peace; and that the Naval Brigade, though forming as at present a distinct branch of the Defence Force, should be placed under the command of the General Officer Commanding.

4TH SECTION.

(32.) Concluding Remarks.

I desire in conclusion to place on record my high appreciation of the consideration and courtesy shown me by the present Government of New South Wales. The task which was imposed upon me by the late Government in the complete re-organization and re-construction of the Military Force has been both delicate and difficult. The condition of the Force upon my arrival was well known to the public from the report of the Royal Commission, dated September, 1892.

The difficulty of making military efficiency, its consequent discipline, its organization, and its machinery generally conform to the political exigencies of a constitutional Government, is well known. I can only say that it has been my aim in all respects, and at all times, to so adapt the military measures for an increased efficiency as to satisfy the policy and political requirements of each of the Governments of New South Wales under which I have served.

Any measure of success that may have attended my efforts is due less to myself than to the zealous hard work, and ready co-operation of my Staff, who, in all their several degrees, have accorded me such loyal assistance as could not have been surpassed.

I cannot speak too highly of the loyal and patriotic spirit which permeates the whole Military Force of the Colony. Every officer, non-commissioned officer, and soldier have combined to carry out the reforms necessary, and have together contributed to bring about the increased efficiency which I have now the satisfaction of bringing to the notice of the Government.

EDWD. T. H. HUTTON,
Major-General and A.D.C.,
Commanding New South Wales Military Forces.

Sydney, 24 January, 1896.

APPENDIX A.

Return showing the Establishment and Actual Strength of the Partially-paid and Volunteer Forces at the end of each year from 1888 to 1895.

Year.	Establishment—all ranks.	Actual strength—all ranks.	Wanting to complete—all ranks.	Percentage short—all ranks.	General remarks.
1888	3,114	2,657	457	14·67	Camp held at Paddington Rifle Range.
1889	4,337	3,973	364	8·39	,, ,, National Park.
1890	4,229	4,062	237	5·81	,, ,, ,,
1891	4,660	4,397	263	5·64	,, ,, Campbelltown.
1892	4,667	4,268	399	8·54	No camp held.
1893	4,418	4,070	348	7·87	,, ,,
1894	4,418	4,169	249	5·63	Short camps held locally.
1895	4,637	4,372	265*	5·71	Short camps held locally.

* A considerable number of men have been discharged in 1895 who were found to be below the required standard of efficiency at the annual field training, which accounts for this slightly increased shortage since 1894.

EDWD. T. H. HUTTON,
Major-General and A.D.C., Commanding N.S.W. Military Forces.

1896.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

NAVAL FORCES OF THE COLONY.

(REPORT FOR 1895.)

Printed under No. 1 *Report from Printing Committee*, 21 *May*, 1896.

The Captain Commanding the Naval Forces to The Principal Under Secretary.

Sir, Naval Brigade Office, 15 March, 1896.

I have the honor respectfully to report as follows on the Local Naval Defence Force of the Colony of New South Wales for the year 1895.

As there are no ships, with the exception of the small torpedo-boats "Avernus" and "Acheron," available for utilising the service of this valuable body of men afloat, they have been stationed at different places about the harbour and along the coast, in accordance with the mobilisation scheme lately issued by the Committee for the General Defence of the Colony.

The possibility of a territorial attack being so remote, in consequence of our isolation and to the enormous difficulties which would have to be encountered in the attempt to bring a large body of soldiers here, it follows that the most an enterprising enemy could do would be to prey on our commerce with war-hawks, after the style of the "Alabama" and "Florida," which did so much injury to American commerce during the late civil war.

To meet a contingency of this sort modern war-ships become a pressing necessity. If vessels of this class were procured, the experience lately gained in H.M.C.S. "Wolverene" would be a guarantee that they could be efficiently and economically manned and relied on to prevent our coastal and other coal-laden ships becoming the prey of an enemy, thereby putting him in possession of the very commodity he is certain to be in need of to enable him to continue his predatory warfare outside our range of fortifications.

It is almost unnecessary to add that no disposition of fixed guns or mobile soldiers or Federal schemes of defence would aid us under such conditions. The enemy must come from the sea. He should therefore be met on the sea; if he is not he simply holds the game in his own hands, and in the absence of the vessels of the Royal Navy could do as he thought fit on our extensive seaboard.

It is perhaps not out of place to remark here that the mother country was the victim of all sorts of raids and humiliations, with their accompanying horrors, from maritime attacks in the early days of her history, and that she never became great until she adopted the policy of meeting her enemies on the sea, and in point of fact carried her defence to their frontier.

The Local Naval Forces were inspected by His Excellency the Naval Commander-in-Chief on the Queen's Birthday. The following is the report he made to His Excellency the Acting Governor on the subject.

Sir, "Orlando," at Sydney, 27 May, 1895.

In compliance with your Excellency's request, I have the honor to inform you that I inspected on shore, on the 24th instant, the combined Naval Brigade and Naval Artillery Volunteers, under Captain Francis Hixson.

2. There were four field-guns on naval carriages, two machine-guns, and eight companies of small-arm men with rifles.

3. The general appearance of the men was admirable. Their physique is exceptionally high, and they were clean and neatly dressed.

4. They went through several formal parade movements under Commander Lindeman with a precision which showed that they must have been carefully drilled, and that they had paid great attention to their Instructors' directions.

5. The men were then put through less formal exercises, which they carried out with much intelligence and spirit. The field and machine guns' crews, under Lieut.-Commander Gardner, exhibited most commendable smartness. A party was exercised at cutlass drill by Acting Lieutenant H. L. Hixson, and the performance was in all respect satisfactory.

6. On the whole, I was most favourably impressed by what I saw, and consider that the result of the inspection was highly creditable to both officers and men.

7. I shall send a copy of this letter to the Lords Commissioners of the Admiralty.

I have, &c.,
CYPRIAN A. G. BRIDGE,
Rear-Admiral.

The torpedo-boats "Acheron" and "Avernus" have lately had their boilers lifted and repaired; their hulls have also been overhauled and put to rights. They are now in good order.

Accompanied by Commander Lindeman, I inspected the Newcastle Company of the Naval Brigade, under Lieut.-Commander Gardner, on the 7th November. There was an excellent muster, and the men were clean and sailorlike in appearance. They acquitted themselves well as a Company in the field and also in the casemate battery, where they were stationed in accordance with the before-mentioned scheme lately adopted for the General Defence of the Colony.

The aggregate cost of the Naval Forces for the year amounted to £7,987. This includes money for repairs to the torpedo boats and covers the expense of 574 men.

I have, &c.,
FRANCIS HIXSON,
Captain Commanding N. S. W. Naval Forces.

1896.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

OFFICERS OF THE DEFENCE FORCE.

(RETURN RESPECTING.)

Printed under No 14 *Report from Printing Committee*, 20 *August*, 1896.

RETURN to an *Order* made by the Honorable the Legislative Assembly of New South Wales, dated 4th August, 1896, That there be laid upon the Table of this House a Return showing,—

"1. The names of all Officers of the Defence Force who have attended "Military Schools or been attached to British Regiments in England or "India while in receipt of salaries from the Government of New South "Wales.

"2. The total amount of salary received by each such Officer during the "period he was absent from the Colony learning his profession.

"3. The total sum paid by the Government to or on behalf of each such "Officer during his absence from New South Wales, including travelling "expenses, fees, maintenance, and all other moneys (exclusive of salary) "paid in connection with the military education of such officers."

(Mr. Griffith.)

EXTRACTS FROM THE VOTES AND PROCEEDINGS OF THE LEGISLATIVE ASSEMBLY.

VOTES No. 22. TUESDAY, 30 JUNE, 1896.

12. CASE OF STAFF-SERGEANT W. JIFFKINS:—Mr. Waddell moved, pursuant to Notice,—
(1.) That a Select Committee be appointed to inquire into and report upon the case of Staff-Sergeant W. Jiffkins.
(2.) That such Committee consist of Mr. Brunker, Mr. Millen, Mr. Moore, Mr. Watson, Mr. Bavister, Mr. Chanter, Mr. O'Sullivan, Mr. Chapman, and the Mover.
Debate ensued.
Mr. Cotton moved, That this Debate be now adjourned.
Debate ensued.
Question for the adjournment of the Debate put and negatived.
Original Question then put and passed.

VOTES No. 26. WEDNESDAY, 8 JULY, 1896.

4. CASE OF STAFF-SERGEANT W. JIFFKINS:—Mr. Waddell (*by consent*) moved, without Notice, That the Return to an Order, "Suspension of Staff Colour-Sergeant William Jiffkins, Volunteer "Permanent Staff," of Session 1892-3, and the Report, together with Minutes of Proceedings and Evidence of the Select Committee on "Case of Staff-Sergeant W. Jiffkins," of Session 1894, be referred to the Select Committee now sitting on the subject.
Question put and passed.

VOTES No. 27. THURSDAY, 9 JULY, 1896.

3. CASE OF STAFF-SERGEANT W. JIFFKINS:—Mr. Waddell presented a Petition from William Jiffkins of Sydney, stating that a Select Committee had been appointed by the House to inquire into and report upon his dismissal; and praying to be represented by counsel or attorney, or in person, before the said Committee, with the right to call witnesses and to examine and cross-examine all witnesses that may give evidence.
Petition received.
Ordered to be referred to the Committee.

VOTES No. 47. WEDNESDAY, 26 AUGUST, 1896.

4. CASE OF STAFF-SERGEANT W. JIFFKINS:—Mr. Waddell, as Chairman, brought up the Report from, and laid upon the Table the Minutes of Proceedings of, and Evidence taken before, the Select Committee for whose consideration and report this subject was referred on 30th June, 1896.
Referred by Sessional Order to the Printing Committee.

CONTENTS.

1896.

CASE OF STAFF-SERGEANT W. JIFFKINS.

REPORT.

THE SELECT COMMITTEE of the Legislative Assembly, appointed on 30th June, 1896, "*to inquire into and report upon the case of Staff-Sergeant W. Jiffkins*," and to whom was referred, on 8th July, 1896, the Return to Order, "Suspension of Staff Color-Sergeant William Jiffkins, Volunteer Permanent Staff," of Session 1892–3, and the "Report, together with Minutes of Proceedings, and Evidence of the Select Committee," of Session 1894, on the same case, have agreed to the following Report:—

1. Your Committee having examined the witnesses named in the List* (whose evidence will be found appended hereto), and considered the evidence and papers referred, find,— *See List, p. 5.

(1.) That the facts, as disclosed in the evidence and papers referred to, show that Staff-Sergeant Jiffkins was dismissed from the Service on the uncorroborated statement of Warrant-Officer Barnwell that he saw Jiffkins copying from an official register.

(2.) That the official register referred to had been out of use for a number of years, and that at the time it was lying open in the lavatory, and consequently accessible to all persons in the Department.

(3.) That the evidence shows some doubt exists as to whether the offence had been committed; but, even if it had been, the transgression was a trivial one.

(4.) That for a considerable time prior to the date of dismissal, disagreements between Warrant-Officer Barnwell and Staff-Sergeant Jiffkins had been of frequent occurrence, and that a recommendation by minute had been made by Major-General Richardson for their separation, which minute was not given effect to.

2. In view of all the circumstances, and taking into consideration his long services, your Committee are of opinion that Staff-Sergeant Jiffkins has been harshly treated; and that had the recommendation to separate the two officers been carried out, he would probably not have been dismissed; and they therefore recommend his case to the favourable consideration of the Government.

T. WADDELL,
Chairman.

No. 1 *Committee Room,*
Legislative Assembly,
26th August, 1896.

PROCEEDINGS OF THE COMMITTEE.

WEDNESDAY, 8 *JULY*, 1896.

MEMBERS PRESENT:—

Mr. Chapman, | Mr. O'Sullivan,

Mr. Waddell.

Mr. Waddell called to the Chair.

Entry from Votes and Proceedings, appointing the Committee, *read* by the Clerk.

Ordered,—That Colonel Roberts and Mr. W. Jiffkins be summoned to give evidence next meeting.

[Adjourned till to-morrow at *Twelve* o'clock noon.]

THURSDAY, 9 *JULY*, 1896.

MEMBERS PRESENT:—

Mr. Waddell in the Chair.

Mr. Chapman, | Mr. Moore.

Entry from Votes and Proceedings referring the Return to Order of Session 1892-3, and the Report from the Select Committee of Session 1894 on this subject, to the Committee, *read* by the Clerk.

Printed copies of the papers referred, before the Committee.

William Jiffkins, sworn and examined.

Witness withdrew.

Colonel Henry Douglas Mackenzie, A.A.G., called in, sworn, and examined.

Witness withdrew.

[Adjourned till Tuesday next at *Twelve* o'clock noon.]

TUESDAY, 14 *JULY*, 1896.

MEMBER PRESENT:—

Mr. Moore.

In the absence of a quorum, the meeting called for this day lapsed.

WEDNESDAY, 15 *JULY*, 1896.

MEMBERS PRESENT:—

Mr. Waddell in the Chair.

Mr. Moore, | Mr. O'Sullivan.

Entry from Votes and Proceedings, in reference to Petition of William Jiffkins, praying for leave to appear by Counsel or Attorney or in person before the Committee, *read* by the Clerk.

Present:—Mr. William Jiffkins.

William Jiffkins further examined.

[Adjourned till Wednesday next at *Two* o'clock.]

WEDNESDAY, 22 *JULY*, 1896.

MEMBERS PRESENT:—

Mr. Waddell in the Chair.

Mr. Chanter, | Mr. Moore,

Mr. O'Sullivan.

Present:—Mr. William Jiffkins.

Colonel Charles Fyshe Roberts called in, sworn, and examined.

Witness withdrew.

Colonel Henry Douglas Mackenzie re-called and further examined.

Witness withdrew.

Colonel Charles Fyshe Roberts re-called and further examined.

Witness withdrew.

[Adjourned till Wednesday next at *Two* o'clock.]

WEDNESDAY, 29 *JULY*, 1896.

MEMBERS PRESENT:—

Mr. Chapman, | Mr. Chanter.

In the absence of a quorum, the meeting called for this day lapsed.

THURSDAY, 30 *JULY*, 1896.

MEMBER PRESENT:—

Mr. Waddell.

In the absence of a Quorum the meeting called for this day lapsed.

WEDNESDAY,

WEDNESDAY, 5 *AUGUST*, 1896.

MEMBERS PRESENT:—

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

MINUTES OF EVIDENCE

TAKEN BEFORE

THE SELECT COMMITTEE

ON THE

CASE OF STAFF-SERGEANT W. JIFFKINS.

THURSDAY, 9 *JULY*, 1896.

Present:—

MR. WADDELL, | MR. MOORE,
MR. CHAPMAN.

T. WADDELL, ESQ., IN THE CHAIR.

William Jiffkins called in, sworn, and examined:—

1. *Chairman.*] What is your name? William Jiffkins.
2. Is there anything fresh that you can add to the evidence which you gave before? No. I wish the report of the former Committee to be taken into consideration. There are things in the letter of dismissal from Colonel Roberts which I wish to explain. Colonel Roberts said that much annoyance had been caused by me from time to time. Mr. W. Jiffkins. 9 July, 1896.
3. You wish to give evidence on that? Yes. I want Colonel Roberts to be called and asked if he had evidence that I was the cause of annoyance.
4. Is there any evidence that you want to give besides? No.
5. *Mr. Moore.*] Have you read the evidence which you gave before the Select Committee in 1894? Yes.
6. Is it correct? There is one sentence which I should like to have taken out. In answer to Question No. 27 I am made to say that I was searched in the lavatory. That is wrong; I never said that. I was not searched in the lavatory.
7. Did you say that you had been searched in the lavatory? I do not think I did say so. It is an error.
8. As a fact, you were not searched? No.
9. All the rest of your evidence is correct? Yes.
10. You have read it over carefully? Yes.

Colonel Henry Douglas Mackenzie, A.A.G., called in, sworn, and examined:—

11. *Chairman.*] Have you any papers in connection with this case? I have no papers whatever, except the printed copies of minutes of evidence taken before the Select Committee in 1894, and the correspondence laid on the Table of the Legislative Assembly, in order to be printed, on the 30th of May, 1893. I have been making inquiries this morning, and I cannot find any other papers in connection with Mr. Jiffkins's case except what are contained in the printed correspondence. Colonel H. D. Mackenzie. 9 July, 1896.
12. You have nothing fresh? I know of nothing fresh, and the originals of these papers are in the Colonial Secretary's Office. I am firmly under the impression that all the correspondence that can possibly be got together is contained in the printed papers.
13. Have you any knowledge as to Jiffkins's conduct whilst he was in the service—as to whether he was rather inclined to be quarrelsome? My knowledge is obtained from reports which I received—reports borne out by the defaulter's book—and they show that Mr. Jiffkins had nothing whatever against his moral character, but that he was decidedly of a litigious and quarrelsome nature; that he was so constituted that he was unable to agree with the other warrant and non-commissioned officers with whom he was brought in contact, and that not in one branch of the service but in several.
14. Have you any knowledge beyond what is conveyed in the papers in reference to the inquiry at the time Jiffkins was dismissed;—could you say whether he was allowed on that occasion to offer evidence to rebut the statements which were made against him? At that inquiry, owing to General Richardson's illness,

Colonel

Colonel H. D. MacKenzie. 9 July, 1896.

Colonel Roberts was the Acting Colonel, and he investigated the case in the usual way—that was in the presence of the accused, the accuser, and the witnesses, and after hearing them he asked Jiffkins what he had got to say in reply.

15. Was it well known amongst the officers in the service that Barnwell and Jiffkins were on very bad terms for a long time prior to this complaint, which was the cause of his dismissal? To such an extent that it led to a Court of Inquiry into it.

16. They first quarrelled at Maitland, did they not? I am now speaking from memory, but I believe so.

17. And the papers I think disclose the fact that a recommendation was made by General Richardson that they should be separated? General Richardson ordered that they should all be removed. So far as I can recollect, they were all more or less in fault, and some were removed at their own expense. General Richardson thought, and we all thought, that it would be a very good plan if we could separate them, but unfortunately there was not a single commanding officer willing to receive Jiffkins under his command. I explained this to the General, and he said, "Well, I will not force a non-commissioned officer upon any person; if they cannot agree amongst themselves they must bear the brunt of it. If we cannot separate them, it is to their own interest to agree; if they do not agree somebody will have to go."

18. Has Barnwell got on tolerably well with other officers in the service? I have never heard a complaint against him except in this one case.

19. Jiffkins wishes me to ask what other non-commissioned officers he has not agreed with? I cannot recollect whom everybody was associated with, but I see by the records that he could not get on with the Cavalry; he could not get on with Sergeant Moyens; he could not get on with Warrant Officer Barnwell; anything else that I know is only from the reports made from time to time.

20. Jiffkins wishes me to refer you to the animus shown in the documents on pages 12 and 13;—is it usual to put such things in the report in the absence of the General? This, so far as I can recollect, was worded on the report which was sent in by Sergeant Barnwell. It was written in such a strain that the General was not disposed to receive it as written, and pointed out that on the face of it it appeared to show animus. The whole of that was submitted to the Court of Inquiry; then the Court came to a conclusion, which will be found recorded on page 15, which finding was approved by the General.

21. When a warrant officer is deemed to misconceive his position, and is supposed to be accused, is it usual, under any circumstances, for a man to be kept serving under him afterwards? Certainly; because the whole thing depended on what the Court of Inquiry found. We could not condemn a man unheard.

22. Jiffkins wishes to refer you to page 10 in reference to the Court's decision? So far as I can see, the Board appears to have made two separate reports—one is in reference to Sergeants Moyens and Jiffkins, and the other is on a question between Jiffkins and Barnwell.

23. Is it not an established system throughout the British Army that where two non-commissioned officers cannot agree they shall be separated? Certainly it is, and it would have been done in this case if Mr. Jiffkins had been a *persona grata* to any other commanding officer. As a matter of fact Moyens and Barnwell, after the punishment which they received, led a different life, but I am sorry to say in the case of Jiffkins it did not quite obtain.

24. How came Colonel Roberts to hold back Major-General Richardson's minute for twenty-five days? The letter was before Colonel Roberts when he investigated the case; that I do know for a fact. If there was a delay of twenty-five days it must have been owing to the illness of the General at Mittagong. The General's minute on the letter was before Colonel Roberts when he investigated the case and decided to report to the Minister.

25. *Mr. Moore.*] Were you present at the inquiry held by Colonel Roberts? I was.

26. Jiffkins was asked, "Were you prevented from making a statement"? He says, "I was; I was prevented from doing so, and I was ordered away." I should like your version of it? It is utterly incorrect. Colonel Roberts investigated the case, and in doing so exhibited a great deal of patience. At last Jiffkins allowed his tongue to run away with him, and Colonel Roberts said, "You are wasting time if you have nothing further to say." I was present, also Captain Bouverie, Sergeant Molloy, and, I am almost positive, Mr. Tideswell.

27. At all events, Jiffkins was afforded every opportunity to state his case? Yes.

28. *Chairman.*] Jiffkins says that it states in the same paragraph that evidence being adduced, Colonel Roberts amended the charge in Jiffkins's presence? Yes. Colonel Roberts said, "We will not make it quite so serious as this," and he altered the charge to tampering with records. It was worded rather more seriously than was necessary, and Colonel Roberts toned it down. It was not an alteration in principle, only in degree.

29. Is the Commanding Officer supposed to inquire into a charge and to alter it—is it usual? It is usual; it is done every day. If the charge is too serious or too light, he can alter it at his discretion.

30. *Mr. Chapman.*] The alteration was made not to make it a different charge, but simply because the Commandant thought he would make it a lighter one? To modify it in some way.

WEDNESDAY, 15 *JULY*, 1896.

Present:—

MR. MOORE, | MR. O'SULLIVAN.

T. WADDELL, ESQ., IN THE CHAIR.

Mr. W. Jiffkins appeared in person on his own behalf.

William Jiffkins recalled and further examined:—

Mr. W. Jiffkins. 15 July, 1896.

31. *Chairman.*] Have you any statement to make in addition to the evidence which you have already given? Yes. I wish to refer the Committee to the evidence taken before the previous Select Committee. In Question No. 23 I stated that Warrant Officer Barnwell charged me with making a false statement. In answer to Question 57, I said, "It was Colonel Roberts that made the charge of taking notes from the register." In answer to Question 62 it will be seen that I stated Colonel Roberts said, "You are

remanded

Mr. W. Jiffkins. 15 July, 1896.

remanded until the return of the General, to a higher authority." I now want to refer to Colonel Roberts's statement at page 26 of the papers. In his memo. to the General Officer Commanding, Colonel Roberts wrote, "He appeared again before me, to the best of my recollection, for a grave case of tampering with official records (as the papers are at the Military Secretary's Office, I am stating to the best of my recollection). His case was forwarded to you." As he states in that letter, the matter was forwarded to the General to deal with. What I want to point out is that in the first instance I was charged with making a false statement, and on that charge I was remanded until the return of General Richardson, or higher authority. The false statement was that Barnwell said he saw me taking notes from an old register. I denied this.

32. Was your denial the false statement? Yes. When I was brought before Colonel Roberts he amended the charge to making a false statement and taking notes from an official record. Since that remand I have never been heard.

33. The case was then heard behind your back? Yes; behind my back it was submitted to the Colonial Secretary, and I was dismissed.

34. Did you get any notice to attend after being remanded? Not until I was told I was dismissed by the General.

35. You gave no evidence except on the first charge? I did give evidence on the first charge that I made a false statement.

36. Then you say the charge was amended? Yes; unknown to me it was amended.

37. And it was then referred to General Richardson? It should have been; but instead of that it was referred to the Colonial Secretary.

38. Did he deal with it, and not General Richardson? Yes.

39. You had no opportunity of offering evidence on the second part of the charge of taking notes from a register? I had no opportunity.

40. Has any statement been made by any of the witnesses that you had an opportunity of being heard on that second charge? Yes. Colonel Roberts says that I was given a full opportunity; but that is contradicted by Barnwell. At page 23, in a memo. by Captain Bouverie, there is the following sentence:—"I have read the General Officer Commanding's remark, and he said he has learnt that there has been an addition made to the crime against him since he was before Colonel Roberts."

41. Did you want to have an opportunity of seeing the General? Yes; and I was prevented from seeing him. What I have just quoted shows that I was not aware of an addition having been made to my crime until a month afterwards.

42. *Mr. Moore.*] That addition being the alleged tampering with official records? Yes.

43. At page 26 there is a minute by the General, "He again committed himself on the 28th January, 1892, in making a false statement, and whilst in the presence of the Acting Commandant evidence was produced of his having tampered with official records, which was then and there inserted on the crime report." It appears that that addition was made in your presence whilst being dealt with for making a false statement;—do you now swear positively that you did not know anything of this addition being made to the charge until after the proceedings had closed? Until after the proceedings closed I knew nothing about it.

44. He says this additional charge was then and there inserted, presumably in your presence? I have not denied that it was inserted, but I deny having been examined on it.

45. Were you aware of it? I am aware of it now. I was not at the time aware that that was inserted. I learnt after I was remanded that there was an addition to it.

46. *Mr. O'Sullivan.*] Were you given an opportunity to deny that additional charge? No. I denied telling the lie; that was that I did not take the notes from the official record.

47. *Chairman.*] Colonel Mackenzie states that, after amending the charge in your presence, it was then and there investigated;—is that correct? The latter part of the charge was not investigated. The only part of the charge investigated was in reference to my telling a lie. Barnwell said he saw me taking notes, and I said he did not.

48. Barnwell said he saw you taking notes, and you said you did not. That was investigating the charge of taking notes from the register;—how do you now say that it was not investigated? I was taken before Colonel Roberts for making a false statement. In describing the false statement it was asserted that I was taking notes from this official record.

49. *Mr. Moore.*] I wish to follow out your positive statement that this additional charge was made before Colonel Roberts, that you were not informed of it, and that you did not know anything of it until afterwards, and that, therefore, you had no opportunity of replying to it? Yes; I had no opportunity of replying to it.

50. When Colonel Roberts was examined before the Select Committee, on 3rd May, 1894, Mr. McCourt asked the following Question:—"In one of his letters, on p. 27 of the printed papers, Sergeant Jiffkins says, 'On 2nd April, 1892, Sergeant Jiffkins was informed unofficially that the charge upon which he had last been dealt with had been added to by charges of taking notes from a register, and furnishing information outside to someone. Sergeant Jiffkins has never been officially informed that any such charges were against him, and if they exist he has never been given an opportunity of replying thereto.' Is that true, or is it not true?" Colonel Roberts replied, "It is not true. The charge itself disproves the statement. The charge is entered in these words, 'making a false statement, and taking notes from an official register.' Then it is not true that he had not an opportunity of defending himself? I do not know whether he had before the General afterwards. But before you? He had every opportunity of clearing himself from the charge of taking notes from the official register. I added that charge after I had heard the evidence of Captain Bouverie that, in addition to making a false statement, he had done this." Further on, Question 358, there is the following question and answer:—"One of the main points in Sergeant Jiffkins's case was that he had not a chance to clear himself. That he was dismissed on a charge of which he had no knowledge until after he received notice of dismissal. Are you clear upon the point that he had ample opportunity of clearing himself if he wished? When I altered the charge I read it to him; the whole thing was gone into. He said all he could say for himself with regard to taking notes, and the other witnesses proved as much as they could against him. It was clear to my mind that he had been at the book which he really had no right to." Is that statement of Colonel Roberts true or false? It is false.

51. You declare on your oath that that statement is false? Yes; and there is no evidence to corroborate it.

Mr. W. Jiffkins. 15 July, 1896.

52. *Chairman.*] You say Barnwell only gave evidence as to your taking notes from this register? Yes.
53. Have you read the following letter by Molloy?—

Sir, Metropolitan, Western, and Southern Reserves Office, Sydney, 25 February, 1892.

About 11·40 a.m. on the 22nd instant I was called by Captain Bouverie into the lavatory, where a register was lying open. Captain Bouverie asked me how I left the register. I told him I was looking at the last number in the book, with reference to some correspondence. The book was then open at the centre. Warrant-Officer Barnwell then said, "I saw Sergeant Jiffkins taking notes." Captain Bouverie asked Jiffkins what he was doing at the registers, and he said, "Nothing." Warrant-Officer Barnwell again reiterated his former charge, and said, "I saw him put the paper in his pocket. Captain Bouverie asked him if he would show him the papers he had in his pocket. After a little hesitation he produced the paper, with the following note upon it :—'22/4/89. Mr. Barnwell said, *re*—&c.'" That is the paper.

L. MOLLOY,
Quartermaster-Sergeant.

That appears to be a statement by Molloy on the subject? That was on the 25th February, the day I was remanded.
54. *Mr. O'Sullivan.*] Did you write those notes on the paper? I might have written them a week or a month before, but not at that time.
55. Did you go to the book at all? Only as I have stated. I found this old book on the bath-stand. Having to go into the lavatory with another book, and seeing this old book out of its place, I closed it up and put it in a pigeon-hole. Then Barnwell popped in and accused me of taking notes. When we were in the wash-house Barnwell said that the notes were in my pocket. I pulled out everything out of my pocket—a knife, tram-tickets, matches, a little bit of pencil, and a little bit of paper, on which was written, "22/4/89. Mr. Barnwell said, *re*, &c." I handed that to Captain Bouverie. He handed the paper back again, and I put it into my pocket. Captain Bouverie then said, "Take out all the papers you have in your possession," and I did so.
56. What made you write those figures on the paper at any time? I could not say what the figures referred to. The Committee looked at the book to see if they were in it, but they were not.
57. Do you contend that although you wrote those figures they had no connection with the book? No, they had not.
58. *Mr. Moore.*] Who was present at the inquiry before Colonel Roberts? Colonel Roberts, Colonel Mackenzie, Captain Bouverie, Warrant-Officer Tideswell, Warrant-Officer Barnwell, Molloy, and myself.
59. *Mr. O'Sullivan.*] You have stated several times that you believed that the fact of an anonymous letter having been sent to the Principal Under Secretary has been an impediment in the way of your claiming justice? Yes.
60. Have you stated that you have been led to believe they supposed you were the writer of that letter? Yes; that I wrote the address on the envelope which contained the letter.
61. Did you write that letter? No.
62. Did you address the envelope which covered the letter? No.
63. Did you inspire it in any shape or form, directly or indirectly? Neither directly nor indirectly.
64. Did you know that that letter was being sent by anybody? Not until I was accused of it.
65. *Chairman.*] Was the substance of that letter made known to you afterwards? I have got it from several persons. I have never seen it, only the envelope.
66. *Mr. O'Sullivan.*] Did you ever make a declaration that you were not the author of the letter, or the writer of the address on the envelope? I made two affidavits to that effect, and I sent them to the Principal Under Secretary.
67. Do they believe now that you were the author? I understand they do not believe I am the author of it.

WEDNESDAY, 22 JULY, 1896.

Present:—

MR. CHANTER, | MR. MOORE,
MR. O'SULLIVAN.

T. WADDELL, ESQ., IN THE CHAIR.

Mr. W. Jiffkins appeared in person on his own behalf.

Colonel Charles Fysshe Roberts called in, sworn, and examined:—

Colonel C. F. Roberts. 22 July, 1896.

68. *Chairman.*] Do you remember the circumstances under which Mr. Jiffkins was dismissed? Yes; I have the papers before me.
69. Was the book which he was charged with copying entries from an old book containing matter that could be of no interest to anyone, or did it contain any matter that it was necessary to keep private? I did not see the book myself. According to the report it was one of the ledgers then kept, I think, by the Reserves.
70. Have you any knowledge of any circumstance that would lead you to think that Mr. Jiffkins had an improper motive in trying to get any information out of that book? No; all I know is that he was doing a thing contrary to regulations. No non-commissioned officer is supposed to take an extract from a register unless he is directed to do so.
71. Where that rule was transgressed, as was alleged against Jiffkins, is it usual to follow it with such a severe course as dismissal;—are not cases of that kind treated in a more lenient way? It depends entirely upon what was the man's previous conduct.
72. *Mr. Jiffkins.*] Who made the charge of making a false statement and taking notes from this particular record? Captain Bouverie, as the Adjutant in charge of that department.
73. Did Warrant-Officer Barnwell make that charge? Warrant-Officer Barnwell and another sergeant were brought up as witnesses against you as having seen you use the register.
74. In Question 148 in the evidence before the Select Committee it is stated that Barnwell made both charges;—is that true? Captain Bouverie, as the Adjutant, brought forward these charges. This charge was brought by the Adjutant for a crime or an act committed in Phillip-street. Jiffkins was brought before me at Dawes' Battery, and his case was reported to me by Captain Bouverie, who brought the charges.
75. *Mr. Chanter.*] Is it part of the regulations that charges of this character should be made through some commissioned officer? Yes.
76. A charge could not be made direct by a non-commissioned officer? No; Barnwell could not come to me and make any charge. He would be sent back to make it through the proper channel. 77.

Colonel C. F. Roberts. 22 July, 1896.

77. This charge was made by Captain Bouverie, and what caused you to amend the charge by adding to it? The first charge was for making a false statement that he had not touched these books. When it went further on it appeared from the evidence that Jiffkins was taking notes from a register, which only aggravated the crime—that was why it was altered. You can alter a crime as much as you like according to the evidence which comes before you. The evidence disclosed this fact.
78. *Chairman.*] You amended the charge? Yes, I added "And taking notes from an official register."
79. Is that the usual way, when apparently a fresh charge comes up, to amend the charge? Yes, certainly.
80. Was your information received from Captain Bouverie? Yes, and from the evidence brought before me.
81. Did the evidence brought before you emanate from Warrant-Officer Barnwell only? And Molloy. No man had more rope in trying to clear himself than Jiffkins had.
82. *Mr. Chanter.*] Did you act as judge? Yes, the case was brought before me, and I had to settle it one way or the other.
83. *Mr. Jiffkins.*] Was the charge proven only on the evidence of Barnwell? Molloy gave evidence also. The evidence brought before me by these non-commissioned officers satisfied me that Jiffkins had been taking notes.
84. *Chairman.*] Did Molloy state that he saw Jiffkins taking the notes, or did he only give secondary evidence? As well as I remember, he gave me to understand that he was aware of the fact that Jiffkins had taken the notes.
85. He did not state that he had seen it, but that he was aware from some other facts that Jiffkins had taken notes? Yes; because he had left the book in a certain position, and he found it altered, and when they searched this man they found a piece of paper with notes on it.
86. Was there any other evidence by Molloy except that? Not that I remember; it is four years ago, and it is hard to remember.
87. Were you annoyed by any action that Jiffkins had taken? Not at all. If a man chooses to do anything that is wrong it does not annoy me. It is more likely to be an annoyance to him.
88. *Mr. O'Sullivan.*] Apart from this charge of tampering with records, what character did Sergeant Jiffkins bear in the force? Decidedly an indifferent one, if not to say bad. He was perpetually being complained of. He would not agree with anybody.
89. Was it more a matter of discontent on his part? More insubordination than anything else—an insubordinate tendency. If necessary I can produce to this Committee a copy of a letter which was sent to me two years after I adjudicated on this very matter, to show exactly the class of man he is.
90. *Chairman.*] Do you produce that letter now? Yes; I am only producing it to show that my judgment was not far wrong two years previously. The letter is as follows:—

[Confidential.]

Dear Roberts, Department of Prisons, Comptroller-General's Office, Sydney, 22 May, 1894.

Wm. Jiffkins served as a warder from the 8th June, 1876, until the 14th March, 1882, when he narrowly escaped dismissal for writing an anonymous letter to the Comptroller-General (my predecessor). He was given the option of resigning. His resignation was accepted on 14th March, 1882. His previously clean defaulter-sheet saved him from dismissal.

Believe me, &c.,

Colonel Roberts, C.M.G. GEORGE MILLER.

91. *Mr. Jiffkins.*] I wish to refer to my evidence in Question 62 before the Select Committee;—I asked Colonel Roberts if he was annoyed at my writing to the General? I said I was not annoyed.
92. Is it in accordance with military custom for a prisoner to be cautioned by saying, "This is your last chance," in front of the prosecutor, who is known to be a deadly enemy of that man? The officer trying the case could say anything he liked before anybody. It is natural to caution a man as you were cautioned, that it would be his last chance, in order to put him on his guard.
93. *Chairman.*] Did you make that statement? It is military custom. If you refer to the defaulters' sheet in these papers you will find that General Richardson did the same thing.
94. Is it military custom? Yes; if you do not want to punish a man too severely, and you want to warn him that he is getting to the end of his tether, you caution him.
95. *Mr. Jiffkins.*] Were you aware that Barnwell was my bitter enemy at that time? I was not. It would have made very little difference. I would have to deal with you according to the nature of the crime.
96. *Chairman.*] If you had been aware that Barnwell was Jiffkins' bitter enemy, would you, on his testimony, mainly recommend Sergeant Jiffkins' dismissal? Possibly I might not. I will not say that I would not. It all depends on the offence.
97. *Mr. Chanter.*] Is Barnwell still in the force? I do not know. I have been Military Secretary for four years, and I do not know who have been employed as sergeants.
98. *Chairman.*] Were you aware that Barnwell had been guilty of any improper conduct himself prior to this trial that would warrant you in not placing confidence in his testimony? I was not aware. I was only acting for a month or six weeks while General Richardson was away. All the previous acts were unknown to me.
99. Had Mr. Jiffkins a fair opportunity at the trial of bringing out the character of his accuser if he wished? Yes; a fair opportunity to bring any distinct charge or anything that would shake his evidence sufficiently to make me suspect it.
100. Is that always allowed to a person charged? Yes, and inquiry can be made at once. He went on accusing everybody—the Adjutant-General and all sorts of people.
101. *Mr. Chanter.*] At your military inquiries is it usual to take evidence on oath? Not in a case like this. If a man is to be tried the evidence has to be taken on oath under the regulations. The officer commanding the forces has the power on his own responsibility to dismiss a man, especially when he is on the permanent staff.
102. You arrive at a decision in cases of this kind on statements made by various officers? Yes; if any man gives false evidence he can be immediately made a prisoner and punished.
103. *Mr. Jiffkins.*] Do you know of any case in your military experience where a non-commissioned officer tendered an apology for an offence and he was not dismissed, but only reprimanded? I have known of a man expressing regret that he had committed a crime. That is very often taken into consideration, and he is leniently dealt with.
104. *Chairman.*] Did you know of any favouritism being shown to Barnwell? No. Jiffkins has tried to bring me in as having previous knowledge, which is not the case. General Richardson was Commandant

before

Colonel C.F. Roberts. 22 July, 1896.

before this case of Jiffkins. Those cases of Barnwell's and Molloy's took place under General Richardson's *régime*, and I cannot speak about them.

105. *Mr. Jiffkins.*] If you knew that it had been recommended that I should be removed from Barnwell, would you have taken this serious step? It would not have weighed the least bit on my mind if you committed a crime whether you were to be removed or not—that would have no effect on me. My business was to deal with what you had done, and not what was done previously.

106. *Chairman.*] If two men are in the habit of quarrelling is it the practice to separate them? It would be advisable to do so, but it would depend upon the exigencies of the Service.

107. Did the Principal Under Secretary say anything to you with reference to an anonymous letter in connection with Jiffkins? I do not remember anything of that kind.

108. *Mr. Jiffkins.*] Did anyone say they took a piece of paper out of my pocket? I think it was Molloy who said a piece of paper was produced out of your pocket.

109. Is it a fact that anyone said they took a piece of paper out of my pocket? All I know is that it was proved to me a piece of paper was obtained from you on which a mark was made.

110. *Chairman.*] Is there any rule or regulation preventing a man in Jiffkins' position from having any or ordinary letters or papers in his possession when on duty? No; the piece of paper referred to was a piece of cartridge paper, which, as far as I remember, was similar to what was in the room.

111. *Mr. Chanter.*] Are there any records of the original inquiry into this case? No. As I just now said, unless a man is going to be tried by court-martial, the evidence would not be taken on oath. If a man is going to be punished severely, the man has to write down all he is going to say in the case, and it appears in the returns.

112. Is everything in the inquiry disclosed in these papers? Yes; there might be some cross-questioning that does not appear.

113. The details of the evidence are not kept or disclosed as records? No.

114. Is this particular piece of paper in existence? I cannot say.

115. Does your memory serve you as to what it was like? As far as I recollect it was a little three-cornered bit of paper.

116. In a letter by Quartermaster-Sergeant Molloy, dated 25th February, 1892, he says the only note upon it was "22/4/89";—is it to be presumed that that was all that was on the paper? I suppose that was all.

117. If that was all that was upon the paper would that be of any value to anybody? You cannot say what that refers to. It might be some date they were referring to. He might have been obtaining any date from the book.

118. *Mr. Jiffkins.*] Was not the book referred to produced at the inquiry, and no entry found in the book of that date? I do not remember.

Colonel Henry Douglas Mackenzie recalled and further examined:—

Colonel H. D. Mackenzie. 22 July, 1896.

119. *Chairman.*] Do you remember whether the book that Jiffkins was charged with taking an entry out of was produced when the case was being inquired into, and found not to contain any entry similar to the entry he had on the piece of paper? I do not remember.

120. If such had been the case, would you be likely to be made aware of it? Yes; I was present, and all I remember was some piece of paper being produced. Whether or not the book was produced I do not know.

121. Do you remember the book being produced on any occasion when you were present, and no such entry being found? I cannot remember whether the book was produced on any occasion.

122. Can you say anything of your own knowledge with regard to Sergeant Jiffkins' character prior to this charge? Sergeant Jiffkins' character throughout has been perfectly consistent. We have never had anything against him morally, but he has been unable to agree with those he has been brought into contact with—especially the other members of the staff. I was asked at the last meeting of the Committee to look up certain correspondence which I admit I had forgotten all about. By your direction I traced the records, and I am able now to produce some correspondence which before was missing. The following is the correspondence I refer to:—

Memorandum from the A.A.-General to Lieut.-Col. Eden, Commanding M.W. & S.D.R.

28 December, 1887.

SERGEANT JIFFKINS has been ordered this day to report himself to you for thorough instruction in drill and office work. A report of the N.C.O.'s qualifications to be made at a reasonably early date, with a view of its being determined whether his services should be retained or not.

By order,
H.D.M., A.A.-G.

The W.O. with whom this N.C.O. acts to report in accordance with A.A.-G. memo. above.—T.M.E., Lieut.-Col., 13/3/88. Mr. Tuite,—To state as to clerkly efficiency of S.-S. Jiffkins.—T.M.E., Lieut.-Col., 19/3/88.

[Confidential or otherwise as needed.]

Memorandum to the Asst. Adjt.-General.

WITH reference to the item overleaf, and the attached documents, I may point out that since the reduction of the Reserve Corps, coupled with the contemplated further disbandment of other corps of this branch of the Defence Force, I cannot see any definite need for the services of this N.C. officer. He is an indifferent instructor, though, as set forth by his friends, a dependable person. Were I required to secure instructors on a fresh departure I should hesitate to select S.-S. Jiffkins. The reduction from Reserve Corps to R. Rifle Companies suggests an economy that should eliminate all but those specially adapted to the new organisation proposed. This N.C.O. I do not regard as one suitable to the scheme. I understand I may be looked upon as responsible for as regards its success. He may have military proclivities, but they have not, to my knowledge, demonstrated any sign of adaptability to R. Rifle Companies.

T.M.E., Lieut.-Col., 18/5/88.

In the event of any after consequence of this I may be entitled to a copy.

To Colonel Eden, S. District Reserves, Sydney, 19 March, 1888.

In accordance with your instructions, I accompanied Staff-Sergeant Jiffkins to Campbelltown, and saw him drill that corps on Friday evening, and beg to report that I consider him an average instructor. He seems fairly well acquainted with his drill; he is inclined somewhat to proziness in detail, and is apt at times to confound old drill with the new. His commands are well pitched, and he seems pretty sharp in detecting errors.

I am, &c.,
F. P. LIGGINS, W.O.
Memo.

Memo. from Warrant-Officer Tuite to Lieut.-Col. Eden.

Colonel H. D. Mackenzie. 22 July, 1896.

Sir, Sydney, 21 March, 1888.

With reference to Staff-Sergeant Jiffkins' clerkly efficiency, I am of opinion that he is quite well able to do the work which usually falls in the way of a staff-sergeant, if he will only attend to it. He is, however, very careless and inattentive, and takes anything said to him on the matter in a very bad spirit. As an instance, I gave him a para. of orders to copy, and two railway passes to fill in of three or four names. In the order he left out one; he entered the wrong year on one of the passes, and the wrong month on another. When I spoke to him on the matter he said, "Well, its only a mistake"; "Anyone can make a mistake"; "I wonder how many mistakes have been made this year"; "I was only eleven months out." This latter remark had reference to the wrong month on the pass. The above is only one instance out of many of a similar kind.

As Sergeant Jiffkins' fitness for his position is being inquired into, I think it right to mention that he was engaged as scorer at the last meeting of the Rifle Association, and was under my orders. I had to find fault with him several times for breaches of orders in allowing men to fire when the danger flag was "up" at the firing-point; not putting up the flag when firing had ceased for the time being; allowing non-competitors to crowd around the firing-point, and other such acts. I spoke to him, but got only surly and disrespectful replies. I eventually reported him to Mr. Tideswell and Major Strong, and recommended him to be relieved from the duty of scoring.

I have found him an obstinate and cross-grained man whom, unless allowed to have his own way, most people will find it difficult to work with.

I have, &c.,
M. TUITE, W.O.

[Private.]

Dear Sir, West Maitland, 17 May, 1888.

Staff-Sergeant Jiffkins called upon me this week, and from what I could gather from him, is under the impression that he is rather under a cloud with the authorities, and wished me to drop you a line private, asking your favourable consideration.

Jiffkins, whilst stationed in this district, was very steady, sober, and industrious, but rather self-opinionated. When he first came here he was rusty and old-fashioned in his drill, and required brushing up a bit. He was respectful to his officers, and well spoken of by the Quirindi officers and Tenterfield. No doubt he will have opportunities of improving in his drill at headquarters.

Yours, &c.,
ALEX. WILKINSON, Lt.-Col.

Colonel Eden, Sydney.

Memo. from A.A.-G. to O.C.M.W. and S.D.R.

22 May, 1888.

SERGEANT JIFFKINS to be informed that his services will not be required after the 30th June. To enable this N.C.O. to look about for suitable employment from that date, Lt.-Col. Eden is empowered to grant him leave from time to time as may be required.

H.D.M.

123. *Mr. Jiffkins.*] The Colonel was asked to furnish a telegram from Colonel Wilkinson? I have hunted everywhere, and these are absolutely all the papers.

124. There was also a letter that was sent by Colonel Wilkinson to the witness? I cannot trace that. The only letter we can trace from Colonel Wilkinson is the one I have read, but it is addressed to Colonel Eden, not to me.

125. *Mr. Chanter.*] What is the meaning of the term in these papers, "Cavilling at orders issued by Adjutant-Captain Bouverie";—does it amount to disobedience of orders? No; that is exactly what it stops short of. It is not absolute disobedience; it is setting himself up in judgment against the officer authorised to give the instruction.

126. I suppose you would almost look upon that as an actual case of insubordination? It is trenching so close upon it, especially in the case of a man occupying the responsible position of staff-sergeant, that it would have to be taken notice of.

127. The term is so wide that the Committee would like to know what degree of crime it was? Evidently it was not a very serious degree, because the General contented himself with administering a caution. It was sufficiently grave for the General to administer a caution, showing that the order was not as readily and cheerfully obeyed as it should be.

Colonel Charles Fysshe Roberts recalled and further examined:—

Colonel C. F. Roberts. 22 July, 1896.

128. *Mr. Moore.*] When Sergeant Jiffkins was being examined the other day with reference to the addition you made to the charge of tampering with official records, I said to him that it appeared that the addition was made in his presence whilst he was being dealt with for making a false statement; he said that he did not know of the addition until afterwards, and that he was never examined on that charge; I reminded him of your evidence on that point, and he swore that your statement was false;—I would like to ask you to reply to that? I altered the charge and read it out to him. Then this evidence was again gone into. This evidence absolutely proves that he was taking notes from the register.

129. He having been informed of it, and being perfectly aware of it at the time the investigation was going on, had he every opportunity of replying to that additional charge of tampering with official records? Yes, certainly. I think Colonel Mackenzie was present the whole time, and he will bear me out that I gave every possible latitude.

130. Then his statement that he had no opportunity of giving evidence, and that he was not aware of this addition having been made to the charge, is not true? He must be labouring under a misapprehension altogether.

131. *Chairman.*] In giving evidence before this Committee, Colonel Mackenzie said, "It is utterly incorrect." That is with reference to Jiffkins' statement that he had no opportunity to answer the additional charge. He goes on to say:—

> Colonel Roberts investigated the case, and in doing so exhibited a great deal of patience. At last Jiffkins allowed his tongue to run away with him, and Colonel Roberts said, "You are wasting time if you have nothing further to say." I was present, also Captain Bouverie, Sergeant Molloy, and, I am almost positive, Mr. Tideswell.

When an addition is made to a charge it is read over to the accused person. If the evidence shows that a man has been guilty of a second crime, that is added to the charge, and read out to him, and it is said, "the charge now is so and so." To the very best of my recollection that was done when the case was before me. I remember that there was a great deal of time taken up. The reason why Colonel Mackenzie made that statement was that Jiffkins had then begun to make charges against Colonel Mackenzie and others of stopping papers.

132. *Mr. Chanter.*] Do you remember this charge that was made against Mr. Jiffkins at Inverell? No; I was only taking General Richardson's place during leave.

133. Is there any official record in your department to show whether or not Jiffkins was present at that inquiry? I do not know.

WEDNESDAY,

WEDNESDAY, 5 AUGUST, 1896.

Present:—

MR. CHANTER, | MR. O'SULLIVAN,
MR. MOORE.

T. WADDELL, ESQ., IN THE CHAIR.

Mr. W. Jiffkins appeared in person on his own behalf.

Colonel Henry Douglas Mackenzie, A.A.-G., recalled and further examined :—

Colonel Mackenzie, A.A.-G. 5 Aug., 1896.

134. *Chairman.*] Do you want to correct some of the evidence which you gave on a previous occasion? Yes. After reading it over, going through the papers, and having my memory refreshed, I found that I had confused this case with another case. I said that the former crime was altered, and that it was lessened. That was wrong. I should have said that it was increased.

135. *Mr. Jiffkins.*] I will mention the names of a number of non-commissioned officers with whom I came in contact, and I would like if you could mention any of them with whom I have fallen out, as stated in evidence : Tideswell, Thompson, M'Ewan, Beauman, Murphy, Toovey, Leckey, Tuite, Liggins, Barnwell, Furnish, Mooney, Masters, Woods? Tideswell, Thompson, and M'Ewan have gone; Beauman can be called; I do not know where Murphy is; Toovey is dead; Lickie can be called; there is a report from Tuite already in the papers, and it is not very favourable; Liggins and Barnwell can be called; Furnish is dead; Mooney has gone; I do not know whether Masters has been in conjunction with Jiffkins; I think Woods has gone.

136. I will now read the following list of non-commissioned officers—Brady, Marston, Williams, Whitmore, Burns, Conway, Gover, Collier, Moyens, Wilson, Holmes, Berry, Blakeley, O'Dea, Riley, Molloy, Lee, Chidgey, Crotty, M'Donald, Rose, Ormsby, Carmichael, White, Woollams, Smith, Adams, Parker, Coleman, Macready, Melville, Gibson, Cooper, M'Cann, Garty, Brears, Sullivan, Sadler, Dransfield, Egan, Hamilton;—can you point out any of those with whom I fell out? I cannot speak from memory, I must look into the defaulter's sheet again. With regard to the cavalry, I should think Colonel M'Donald could give evidence on that subject. Mr. Jiffkins has now quoted all the non-commissioned officers during his time. A great many of them have gone away, several are dead, two or three were discharged for misconduct, and so on. It is impossible for me to speak from my own personal knowledge as to how one man gets on with another, when I have only to do with the records. We can only go upon the reports, which show that he was not a *persona grata* with any one of them. I was asked to produce the registers, from one of which Jiffkins was charged with making extracts, not mutilating them. I produce these registers now from which Staff-Sergeant Jiffkins was accused of making extracts. I do not know which one.

Mr. James Henry Watson called in, sworn, and examined :—

Mr. J. H. Watson. 5 Aug., 1896.

137. *Mr. Jiffkins.*] Were you the officer commanding the Hunter's Hill Reserve Company? Yes.

138. How long was I under your command? Six months.

139. Was I ever late or absent, or under the influence of liquor during the six months I visited Hunter's Hill? No.

140. Was my manner or demeanour in any way offensive or disrespectful on parade or afterwards? Not the slightest.

141. *Mr. Moore.*] What year was that? In the beginning of 1888.

142. *Mr. Jiffkins.*] Did I possess the confidence of both officers and men, and did I pay respect to you and the others? Yes, certainly.

143. How did I stand with regard to my qualifications as drill instructor, as compared with other sergeants who attended at Hunter's Hill? I think you were a very good drill instructor, and painstaking in attending to details. You were one of the best instructors I have ever had.

144. Did I ever laugh at the men if they made a mistake, or did I make use of any improper language? Certainly not.

145. Would you explain to the Committee what meaning you attach to Regulation 55 in connection with the Volunteer Permanent Staff? I take it that all appointments, promotions, and dismissals of non-commissioned officers on the permanent staff emanate from, and must have the authority of the officer commanding the forces. That is the meaning of the word "rests" in the regulation.

146. *Chairman.*] You think that whatever takes place should be done at the instigation of Major-General Richardson under that regulation? Yes; it should emanate from him.

147. *Mr. Jiffkins.*] When I was a prisoner before my officer, and he said, "you are remanded to higher authority," what does that mean? It means that the case is to be dealt with further by the higher authority. It is not a determination of the case.

148. Would the higher authority be Major-General Richardson? The Officer Commanding the Forces.

149. On the latter part of page 1 of the printed papers, the Colonel Commanding the troops, writing to the Principal Under Secretary, says, "He, as the evidence attached proves, was discovered taking notes from a record-book, with which he had no business. Much annoyance has been caused from time to time by information being furnished to persons outside the Military Branch on military matters." Do you think that refers to me? I can give the opinion that I think it means that Staff-Sergeant Jiffkins has been dismissed for conveying information on military matters to persons outside.

150. During the time that you commanded the Hunter's Hill forces was it commonly talked about that a certain individual in connection with the staff was the correspondent of the *Sunday Times?* I do not see that I can answer that question. I have heard a name mentioned.

151. *Chairman.*] Did that rumour refer to any other person? It was generally believed that a great many things that appeared in the papers must have come from a person altogether different to Staff-Sergeant Jiffkins.

152. Were they attributed to him? No.

153. *Mr. Jiffkins.*] Can you give the Committee any information with reference to that matter, or with reference to anything that I have failed to ask you outside of that? No; I have never heard your name mentioned in the slightest degree in connection with any newspapers. I have heard military men talking

Mr. J. H. Watson, 5 Aug., 1896.

talking over things that I have read in newspapers, and they arrived at the conclusion that they came from an altogether different source, but there was no evidence whatever to implicate any person.
154. *Mr. Chanter.*] During the six months that you were in charge of this force, did you have any opportunities of judging Jiffkins' conduct? Yes; I was for some years in the force, and I had many opportunities of judging of Jiffkins' conduct. I have always found him most respectful; very careful in detail drill. He was very painstaking, and he treated the men in a much better manner than many drill-sergeants. I considered him a very painstaking drill-instructor.
155. *Mr. Jiffkins.*] Did you also have experience of my conduct in camps? Yes.
156. *Mr. Chanter.*] Do you know anything personally of this charge of making an extract from a register? No.
157. If an extract was made by any warrant officer from the register, would that be considered by you to be a serious offence against the military regulations? The register contains letters that come under the notice of every person in the office. I do not see anything of a particularly private nature in them. They are only on regimental matters that anybody in the office can look at.
158. If the contents of the register was considered to be anything of a private nature, would it not be locked up in some more private place than a lavatory, and would it not be in the care of some official? I presume it would be in the Adjutant-General's office, and not in the staff-sergeant's office, or orderly-room. The lavatory was public to everyone. Anyone could look at the register, and no blame would be attached to him.
159. Would the lavatory be open to visitors to the barracks? No; it would be confined solely to the military officers.
160. *Mr. O'Sullivan.*] Have you formed any opinion of this case as to the reason why Mr. Jiffkins was treated in this way by the military authorities? I have read through the papers in the former case, and I have formed the opinion that Staff-sergeant Jiffkins was treated harshly. My impression is that the origin of the case was at Maitland, where another non-commissioned officer was implicated. The great mistake was in allowing the two men to remain together; they ought to have been separated. My impression is that the other staff-sergeant whose name is mixed up with this case was more to blame than Jiffkins.
161. I presume you refer to Sergeant Barnwell? Yes. I do not know him, but I have come to this conclusion from reading the papers.
162. Was his conduct whilst in connection with your corps very satisfactory? Yes.
163. Did you notice anything irritating or peculiar about his manner that would be offensive to other people? No; he was most respectful to me and the other officers and the non-commissioned officers.
164. As a man of military knowledge—putting the very worst aspect on the case, and supposing that Jiffkins did copy something out of these books—do you think that would be an offence of a very serious character? It would depend entirely upon the nature of the book. If it was any of the ordinary books found in a regimental office, I do not see that there would be anything in it at all.
165. Look at the registers and see if they are of sufficient importance to justify such a serious step as the dismissal of a staff-sergeant for copying from them? I find that they are registers of correspondence passing between officers commanding companies and the regiment. Staff-sergeant Jiffkins at this time was attached to the reserves. They are scattered all over the country; all inquiries must go through the head office, and they go into the orderly-room. Every letter is registered in this book, but they only deal with regimental matters.
166. *Chairman.*] You said something about correspondence passing between officers;—would correspondence with reference to officers holding inferior positions be shown in these books. Supposing one officer over Sergeant Jiffkins had been then making a complaint about him to a superior officer, would anything of that kind be shown in the book? No; it would not go into this book. That would go from the regiment to the head office.
167. Do you think that nothing of a private character would be shown in the book? No; I never knew anything in the books kept in the regimental officers quarters to be of such a nature that they should not be public. There is nothing in them of a private nature.
168. *Mr. O'Sullivan.*] Would the fact that these registers found in a lavatory near the orderly-room indicate that they were of no great importance? I should say they were not important, and that the books were only placed there for future reference. I do not see that it would be wrong for one to make an extract from them. If I have omitted to take a note of something, I have gone to the orderly-room, and with the permission of the staff-sergeant, I have copied what I wanted.
169. You say with permission? Yes; the sergeant has opened the books for me.
170. Would Staff-sergeant Jiffkins have had any right to open the books? They are open to all staff-sergeants. They are all written in by staff-sergeants in the office.
171. *Mr. Moore.*] Was Jiffkins in such a position at the time he was under your command? During the time he was attached to my company he drilled the company at night, and he was at the Phillip-street offices during the day.
172. At the time it is alleged that Jiffkins tampered with this book, was he then in such a position as you speak of;—was he one of the sergeants who had to keep these books? I cannot say.

Major Charles George Norris called in, sworn, and examined:—

Major C. G. Norris. 5 Aug., 1896.

173. *Chairman.*] What is your occupation? Retired from the Military Staff.
174. *Mr. Jiffkins.*] Were you in the Imperial service? Yes.
175. For how many years were you Adjutant of the Second Regiment? Ten years.
176. Did you know me all the time I was on the Staff? I cannot say all the time.
177. What year did you leave under Colonel Eden? 1891.
178. Can you mention any non-commissioned officer with whom I could not agree during that time? Not to my knowledge.
179. Did you ever hear that I was rude or disrespectful to anyone? No.
180. Did you look upon me as truthful, honest, and diligent? Yes; I had no reason to find any fault with you.
181. Were you President of the Board which passed me in my examination as instructor? Yes.

Major C. G. Norris. 5 Aug., 1896.

182. I wish to refer you to page 22 of the printed papers, where I am accused of want of knowledge in detail or explanation;—in your opinion is that a correct report? No; because I should not have passed you, and the Board would not have passed you if that had been the case.
183. After passing my examination would I have improved instead of going back in the drill;—after a man has passed his examination does he not improve himself? Certainly that ought to be the case.
184. Do you not think that if the Volunteer Permanent Staff require twenty sergeants as instructors I should be one according to my military experience and qualifications? I think your passing the Board, of which I was president, is sufficient answer to that question*.
185. In the event of any staff officers being required as instructors, would not my qualifications entitle me to be considered one of the first rank? Yes.
186. Have you some knowledge of the old registers that were kept in the lavatory? Yes, if they belong to the reserves.
187. Do they contain anything of a confidential character? No.
188. *Chairman.*] Would the fact of Jiffkins being found taking notes from them be considered an offence to the service? Certainly not—they are open to everybody in the office.
189. As they were in the lavatory, would that fact in itself indicate that they were put there as books of no importance? They simply wanted to get rid of them out of the office, and they were put in the lavatory to make room.
190. Would the fact of Staff-sergeant Jiffkins taking a note from them be an offence? Certainly not, to my mind.
191. *Mr. Jiffkins.*] When employed in the office, and having to make out a return of Government property in charge of the Reserve Rifle Company, Fairfield, would it not be necessary for me to go to the books in order to make out that return? Certainly; that is the only way to get it.
192. Was it possible for the outside public to go into the lavatory and use these books? I fancy not. There was always a messenger in the place.
193. Were they under lock and key in the lavatory? No.
194. I wish you to look at page 13 of the printed papers, where there is a minute signed by Barnwell, dated 22/1/89. In your experience as an officer, would an apology be sufficient to meet such a case? It is a breach of discipline, and I would put him under arrest.
195. *Chairman.*] Was Barnwell under your authority? Yes; for the same six months.
196. *Mr. Jiffkins.*] I wish to refer you to page 16 of the evidence given before the previous Select Committee;—having read question 382, what would be the result if such an offence was proved of making out a railway pass? It would have to be inquired into.
197. If you had been dealing with the case, would you have let him off without taking more notice of such an offence? Certainly not.
198. I now wish to refer you to page 23 of the printed papers. It is stated there:—

A.A.G.,—I have read the G.O.C.'s remarks to S.C.S. Jiffkins, and he says that he has learnt that there has been an addition made to the crime against him since he was before Colonel Roberts. 2. S.C.S. Jiffkins states that if certain efficiency money has been paid to certain men of rifle reserve companies it is wrongly paid, and is known by Mr. Barnwell, W.O.; and in other cases if it has been paid, it is doubtful. Whilst I was taking this down, Mr. Barnwell called S. C.S. Jiffkins a mischief-making cur. He also called him a thing. S.S. Jiffkins states that on a previous occasion Mr. Barnwell stated in my presence that he hated him.—C. Bouverie, Captain Cg. M.W., S.R. 5/4/92.

If that had occurred in front of you when a report of this sort was being made, what would you have done with the offender? I would have put him under arrest.
199. Is it not the rule and custom that, when a warrant officer has a complaint against his sergeant, to bring that sergeant before his officer? Yes.
200. If the complaint or offence was serious, would not that officer cause the arrest, and not the warrant officer; for instance, you had Sergeant-major Murphy under you;—if he had any complaint to make against the sergeant, would he not bring that sergeant before you, and would it not be for you to say whether he should be placed under arrest? Certainly.
201. What do you understand to be meant by the word "remand"? Sent back.
202. To appear before somebody else? Yes.
203. I wish you to refer to the evidence taken by the Select Committee, question 360, where Colonel Roberts says, "to a higher authority";—what would that mean? I cannot tell what was in Colonel Roberts' mind.
204. Who is the higher authority in the matter, according to the rules? Major-General Richardson. That is what is in my mind.
205. *Mr. Moore.*] Would not the Minister at the head of the Department be considered the higher authority? Yes; the highest.
206. Would not the Minister or the Governor be the higher authority? Certainly.
207. *Mr. Chanter.*] Does it not mean some authority higher than Colonel Roberts? Yes; the General, the Minister, or the Governor.
208. *Mr. Jiffkins.*] At question 333 there is the following:—"Then it is not true that he had not an opportunity of defending himself? I do not know whether he had before the General afterwards." Does not that imply that I was remanded to the General? It certainly appears so from that.
209. I direct your attention to the following extract from the papers:—

G.O.C.,—Sergeant Jiffkins was brought up before me as Acting Comdt. in your absence, and cautioned the first time that from previous cases brought against him he would not get another chance. He appeared again before me, to the best of my recollection, for a grave case of tampering with official records (as the papers are at the M.S. office, I am stating to the best of my recollection). His case was forwarded to you, and I was informed I was to deal with it.—Chas. F. Roberts, Colonel, O.C.A.F., 30/4/92.

To whom does the word "you" refer to there? That is the General.
210. If a warrant or non-commissioned officer brings another man up three times within three months in succession, does not that show that there is some spite in connection with the matter? He might have deserved it. It is impossible for me to answer a question like that.
211. *Mr. Chanter.*] In the event of visitors going to the office—civilians not connected with the force—could they not, by permission, use this lavatory? Yes, certainly. It was in general use for the whole of us on that floor.

212.

*Note (*on revision*):—I can only speak for the time I passed Jiffkins—it is impossible to do so for the present time.—C. G. Norris.

212. If a civilian attempted to open those registers lying there would he be interfered with by the messenger? Certainly. Anybody who saw him would stop him at once. Major C. G. Norris. 5 Aug., 1896.
213. Would anyone connected with the forces, having the use of the lavatory, be interfered with by the messenger if he opened the book? No.

Mr. Arthur Herbert Collis, Deputy-Comptroller of Prisons, called in, sworn, and examined:—

214. *Chairman.*] It appears that when Mr. Miller was Comptroller-General of Prisons, he wrote a confidential letter to Colonel Roberts with reference to an anonymous letter sent to Mr. Miller by Staff-sergeant Jiffkins; have you that letter? It did not occur while Mr. Miller was Comptroller-General, but previously. It appears that some prisoners were quarrelling, and Warder Jiffkins reported the matter to the Governor of the Gaol. The prisoners were punished, but Jiffkins did not seem to be satisfied with the punishment, and he wrote an anonymous letter to the Comptroller-General, simply stating the facts as to the treatment of the prisoners. This letter was subsequently acknowledged to be written by ex-Warder Jiffkins. The letter is as follows:— Mr. A. H. Collis. 5 Aug., 1896.

Sir, H.M. Gaol, East Maitland, 26 February, 1882.

Two prisoners, J. Jurley and William Fox, charged by a warder with attempt to murder, and prisoner Edhall with attempt to murder and threatening to murder a prisoner named Frederick Paton. Paton admitted into hospital. Occurred at 11·30 a.m., and told off by the gaoler at 1 o'clock p.m. this day. Punishment:—The two former prisoners with seven days' cells and three months' indulgences stopped; the latter, seven days' cells. Two other prisoners assaulted; chisels and planes freely used, and occurred in carpenter's shop.

Justice to prisoner and warder.

The Comptroller-General of Prisons, Sydney.

215. Do you put in that letter as the anonymous letter written by Jiffkins, and subsequently acknowledged by him? Yes; this matter has been before two Ministers of Justice. Jiffkins expressed his regret, and acknowledged having written it. The decision in the case was as follows:—

The default, or rather offence, of Warder Jiffkins is one calling without question for dismissal. On no consideration would I retain in the Service an officer who would write an anonymous letter. As Jiffkins has a clean sheet I will give him the option of resigning, which will leave him in a better position for his future elsewhere than dismissal.

216. *Mr. Chanter.*] The offence was for writing an anonymous letter, more than the subject matter? In the Service it would not do for officials to write behind the backs of their superior officers. If there is a complaint to make, there is a proper way of doing it. It would never be tolerated in a disciplinary Service like ours.
217. *Mr. Moore.*] You had nothing else against him? It says there that he had a clean sheet. I know of nothing else against him.
218. *Mr. Chanter.*] What followed? He resigned, and his resignation was accepted.

Mr. George Lynch Hill called in, sworn, and examined:—

219. *Chairman.*] What is your occupation? Locker in the Customs. Mr. G. L. Hill. 5 Aug., 1896.
220. *Mr. Jiffkins.*] Were you the officer commanding the Tenterfield Company when I was drill-sergeant there? Yes.
221. How long was I under your command? About six months.
222. Was that prior to my going to Inverell? Yes.
223. During the time I was under you, was I ever late or under the influence of drink at any time? No.
224. Was my manner or demeanour in any way offensive, disrespectful, or rude, or was it outside the conduct of the general run of drill-sergeants? No.
225. Was I as respectful after parade as my position allowed? Yes; always.
226. Did I possess the confidence of the men as well as yourself at Tenterfield? Yes.
227. How did I stand with regard to my qualifications as compared with any other sergeant? I think you were perfectly competent as a drill instructor.
228. While I was at Tenterfield did I not use every endeavour to advance the company in the interests of the Service? Yes; you were a very painstaking, earnest, drill instructor.
229. Did I ever laugh at the men if they made a mistake, or did I make use of any improper language? No.
230. In the case of any offence, who would have the final decision under the regulations? The senior and superior officer of the Volunteer Forces.
231. At the time would that be Major-General Richardson? Yes.
232. Do you remember the opening of the railway at Tenterfield? Yes.
233. That occurred during the time I was there? Yes.
234. Did you receive a letter from the Commander-in-Chief with reference to the Governor's escort? Yes.
235. Who was the man who was the means of bringing the parade to perfection in the way mentioned by the Commander-in-Chief? I should say that any efficiency shown was due to the drill instructor.
236. Can you give the Committee any other information with reference to my ability or character at Tenterfield? I consider you an efficient and painstaking drill instructor, and certainly not quarrelsome. I never heard of any disagreement between yourself and the men, and I had none whatever.
237. Have you observed my conduct in camps also? Yes.

THURSDAY, 13 *AUGUST*, 1896.

Present:—

MR. CHANTER, | MR. O'SULLIVAN.

T. WADDELL, ESQ., IN THE CHAIR.

Mr. W. Jiffkins appeared in person on his own behalf.

Mr. William Jiffkins called in and examined:—

Mr. W. Jiffkins. 13 Aug., 1896.

238. *Chairman.*] Do you want to add anything to your evidence? I wish to direct the attention of the Committee to certain questions and answers given in the evidence before the previous Select Committee: Question No. 100, No. 28, No. 67, No. 172, No. 175, No. 213, No. 215, Nos. 307, 309, Nos. 308, 352, in connection with evidence given by myself, Barnwell, and Colonel Roberts; No. 27, No. 183, No. 263, No. 302, Nos. 309, Nos. 346, 348, No. 85, Nos. 109 and 115, in connection with piece of paper with certain figures on it, the evidence given before the present Select Committee.

WEDNESDAY, 19 *AUGUST*, 1896.

Present:—

MR. A. CHAPMAN, | MR. O'SULLIVAN.

T. WADDELL, ESQ., IN THE CHAIR.

Mr. W. Jiffkins appeared in person on his own behalf.

Mr. William Jiffkins recalled and examined:—

Mr. W. Jiffkins. 19 Aug., 1896.

239. *Chairman.*] Do you want to make a statement? Yes; I wish to refer the Committee to the question of the remand. It will be found in the old Select Committee Report, in my evidence, questions 62, 63, 64, that I was remanded to Major-General Richardson, the higher authority. Then I wish to refer to questions 265, 266, Mr. Barnwell's evidence. The point is, that I stand remanded at this present time, according to Colonel Roberts' decision, and the evidence I am able to produce with regard to what took place on the 25th February, 1892.

240. You were brought up on the 6th April? Yes; and dismissed by order of the Government—the Major-General being the mouth-piece of the Government.

241. Were you not remanded and on the 6th April the case came on again? No; my case was not heard on that date. I was not allowed a hearing on that occasion. Then I wish to refer to Barnwell's evidence, questions 265 and 266. That evidence shows that I was remanded until the return of Major-General Richardson. I refer to Colonel Roberts' evidence, question 330. He says there distinctly that he will report the matter to a higher authority—that is, Major-General Richardson. Then I wish to refer to questions 360, 333, 359. It is stated there that I had ample opportunity of proving otherwise; but when I was brought before General Richardson in April, 1892, I had no opportunity of saying anything in my defence. Now I wish to refer to a letter, 30/4/92, from Colonel Roberts to the Commandant, on page 26 of the printed papers. Although Colonel Roberts remanded me, he at the same time wrote out a recommendation for my dismissal to Sir George Dibbs, although I was remanded to General Richardson. I now wish to refer to question 82, before the new Select Committee, and question 101. There is no doubt Colonel Roberts could not have dismissed me at the time he submitted my case to the Colonial Secretary. I wish to refer to Mr. Watson's evidence, questions 145, 146, 147, and 148, also Major Norris's evidence on that matter, questions 201 to 208 inclusive, and 290, also Captain Hill's evidence, questions 230 and 231. I wish to draw attention to Colonel Roberts' evidence, question 330. There he says, "As well as I remember, on the very day Jiffkins was before me I wrote a letter to the Chief Secretary"; that was after he remanded me. I wish to comment strongly on that. He told me when I was before him that I was remanded until Major-General Richardson's return; but he at once recommended me for dismissal to Sir George Dibbs, which was acting contrary to Major-General Richardson's instructions.

242. Where did Major-General Richardson disapprove of that? At page 4, paragraph 2, of the printed papers, he says: "Seeing the long continued friction between W. O. Barnwell and this N.C.O., it would perhaps be well to transfer him, and thus give him a final chance of re-establishing himself.—J.S.R., M.-G., 28/1/92."

243. Was not that in connection with another trial? No; it was in connection with this very trial. Major-General Richardson was put in possession of these facts (*see* page 3 of the printed papers, letter dated 8 Jan., 1892), and he wrote in that way to the Acting Commandant; and Colonel Mackenzie, in the second Select Committee, question 24, says that Colonel Roberts had that very letter in front of him when he made that recommendation.

244. So you contend that General Richardson, as head of the Force, was not in favour of your dismissal at all? Most decidedly. What I have quoted shows that he was not in favour of it. That memo. was kept for twenty-five days by Colonel Roberts, and no notice was taken of it. Had that memo. of General Richardson's been acted upon, the last case would not have occurred. The General there recommended that Barnwell and myself should be separated. Mr. Watson, in his evidence, questions 160 and 161, said that it was a mistake to keep us together. Colonel Wilkinson wired to the A.A.G., and also wrote a letter which he gave to my wife, at Maitland, to be delivered to the A.A.G., at Dawes' Battery, for me to remain in Maitland under Colonel Wilkinson's orders. The A.A.G. says that he cannot find these two communications. It is not likely that he can, because they are very strongly in favour of my being kept separate from Barnwell. On April 10th, at the camp, Colonel Eden took me before the A.A.G.—that was after I had been transferred to Sydney from Maitland—and recommended that I should be sent back to Maitland. On the 23rd June, 1890, it was recommended by Colonel Eden, by letter, that I should be sent back to Maitland. This is the A.A.G.'s reply: "I do not see, in the face of antecedents, how this can be recommended." I consider that the antecedents are altogether opposed to that view, and that I should have been sent back to Maitland. I was serving under Barnwell at this time. I was brought up by Barnwell

at

Mr. W. Jiffkins. 19 Aug., 1896.

at every possible chance, and Colonel Eden saw that Barnwell was determined to get me the sack, and he recommends that I should be separated from him. I wish to point out that Colonel Spalding, on the 17th April, 1891, twelve months before I was dismissed, said to the A.A.G.: "Transfer this man from Barnwell, for I can see he is determined to get him dismissed." That is exactly twelve months before Barnwell effected his object. Colonel Spalding, Colonel Eden, and Colonel Wilkinson all said the same thing. I blame this entirely on Colonel Mackenzie, in favouring Barnwell against the interests of the Service, because in spite of all these representations he was responsible for keeping us together. Colonel Roberts and Barnwell say that Colonel Mackenzie was responsible for keeping us together after this bother. I wish to refer to questions 317 and 318 of the old Select Committee, when I was before Colonel Roberts, and he told me that that was my last chance. I told Colonel Roberts that it was impossible for me to serve under Barnwell. I pointed out to him that, after he told me this was my last chance, as soon as I got outside the door Barnwell was in a position to bring me back before Colonel Roberts on a charge that I was disrespectful, or on any other charge, and then my means of living would be gone. I was kept under Barnwell in order to get me out of the Service. Colonel Roberts has made reference to my having a lot of records, and that I gave a lot of trouble. I wish to refer to Colonel Roberts' evidence before the new Select Committee, question 88. He was asked what character I bore in the Service. He said: "Decidedly an indifferent one, if not to say bad; he was perpetually being complained of." In question 89, he says, that I was of an insubordinate tendency. I wish to point out that Colonel Roberts had a very limited knowledge of the facts. In question 98 he said he was only acting for a month or six weeks while General Richardson was away, and that all the previous acts were unknown to him; then, in question 326, before the Select Committee, he said that the first time he saw me was on the occasion of the inquiry on the 12th January. Now, I wish to refer to Colonel Mackenzie. In question 122 before the new Select Committee, he says: "Sergeant Jiffkins' character throughout was perfectly consistent. We have had nothing against his moral character, but he has been unable to agree with those he has been brought in contact with, especially the other members of the Staff." It will be remembered that I read out the names of all the members of the staff with whom I had been brought in contact, and I asked him if he was able to state definitely if there was one of them with whom I could not agree. In reference to the same matter I wish to refer to the evidence of Major Norris, who knew me better than Colonel Mackenzie did.

245. *Mr. O'Sullivan.*] Is it a fact that you were generally disagreeable to your colleagues? I was disagreeable to those who I found did not do right according to my military experience. Colonel Roberts in his evidence said that there were a great many charges against me. With regard to the charge of laxity and want of zeal, Colonel Roberts stated, in answer to Mr. Chanter, that that charge was illegally made. Then the next charge of insolence is also an illegal record.

246. *Chairman.*] What do you mean by an illegal record? Mr. Chanter asked Colonel Roberts: "Was it in the power of Barnwell to place me under arrest without bringing me before another officer?" Colonel Roberts said, "No;" and that if Barnwell brought me down to him without bringing me before another officer, he would send me back again. The charge was illegal because it had not gone through the proper channel. The charge of neglect of duty is in the same position. Barnwell placed me under arrest himself without consulting anyone.

247. How many charges did Barnwell prefer against you? He was the accuser in every instance; but three of them are entered which have no right to be entered, according to the evidence of Colonel Roberts and Major Norris.

248. Of the six charges preferred against you, did Barnwell make them all? No; he made five of them; and the charge of general laxity and want of zeal was made by Major Macdonald. Barnwell made five charges—four in ten months; and he made three charges in three successive months. Colonel Roberts was asked, was there any favouritism shown to Barnwell? I wish to point out distinctly that there was a lot of favouritism shown to Barnwell in this matter. I refer you to questions 20, 21, 22, containing the evidence given by Colonel Mackenzie before the new Select Committee. His evidence is so worded as to deceive the Committee, and it is done of course to shield Barnwell. I now wish to refer to the letter of the 25th February (page 1 of the printed papers) written by Colonel Roberts to the Principal Under Secretary, on which I was dismissed. He writes: "I have the honour to bring to the notice of the Colonial Secretary a case of gross breach of duty on the part of Sergeant William Jiffkins, of the Permanent Staff, who also, when before the officer (Captain Bouverie), who is in charge of the records of the Reserve Corps, made a false statement." I maintain I made no false statement, and there is no evidence to show that I did make a false statement. He then goes on to write: "I regret to trouble the Minister at the head of the Department in a case of this nature, but the sergeant has given so much trouble." This trouble is in reference to the charges I have brought to your notice which were illegally made by Barnwell. It is entirely wrong to say that there were so many records against me. I know that there are records, but they have no business to be there—good, bad, or indifferent. The letter goes on to say: "He, as the evidence attached proves, was discovered taking notes from a record book with which he had no business." Now, I say that I took no notes from the record book, and the Committee has had before it gentlemen who know more about those records than Colonel Roberts or Colonel Mackenzie do. I refer to Major Norris and Captain Watson, who know more about these books than all the other Staff officers put together.

249. *Mr. O'Sullivan.*] Why do they know more about them? Because Major Norris was employed in the office.

250. Why does Captain Watson know more about them? As captain of the company at Hunter's Hill, he had to come down to the reserve office very often to seek for information. As he said the other day, there was nothing confidential in any of those books. Evidence has been given that I had a perfect right to go to any one of these books at any time, and that I had a perfect right to take notes from any of the books that I thought fit.

251. *Mr. Watson.*] What is your explanation with regard to the writing on a piece of paper that was found in your pocket? I do not know when that was written on the paper; I do not know whether it had been in my pocket for a week or a month. I was ordered to take the papers out of my pocket, and I took out some tram-tickets, a knife, a match-box, and this little bit of paper with the date written on it, "22/4/89."

252. *Mr. O'Sullivan.*] Did you write those words on that bit of paper? I wrote them, but not on that occasion.

Mr. W. Jiffkins. 19 Aug., 1896.

253. Was there anything in the book which had any bearing upon it? Not the slightest that I know of. In the latter part of Colonel Roberts' letter he says: "Much annoyance has been caused from time to time by information being furnished to persons outside the Military Branch on military matters, and I bring the case to the notice of the Colonial Secretary in order that, in addition to the dismissal of this non-commissioned officer, some expression of grave displeasure may also be recorded, as this would serve as a strong warning to other non-commissioned officers in responsible positions." I have brought before the Committee two witnesses to show that they never knew of my being accused of such a thing in the slightest degree, and they gave evidence to the effect that the man who was in the habit of doing that is still in the employ of the Military Staff.

254. *Chairman.*] Do you know anyone named Bruce? Yes; I never had any trouble with him. The wording of the letter which I have quoted would lead anyone to the conclusion that I was caught taking notes with the view of giving information outside. I asked Colonel Roberts to produce any evidence to bring that home to me; but he simply laughed and said the letter did not refer to me at all. Mr. Watson, Mr. Hill, and Mr. Norris said that the whole of the letter referred to me, and that is what makes my case look so bad. I say there is no evidence to prove that, and that there is evidence to show that the man who did this is still employed in the Staff office; therefore, I contend that the whole of that letter should be scratched out, and that the General Order referred to there should be countermanded.

Sydney: Charles Potter, Government Printer.—1896.

1896.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

CASE OF STAFF-SERGEANT W. JIFFKINS.

(PETITION FROM WILLIAM JIFFKINS, OF SYDNEY, PRAYING TO BE REPRESENTED BY COUNSEL, ATTORNEY, OR IN PERSON, BEFORE SELECT COMMITTEE ON.)

Received by the Legislative Assembly, 9 *July*, 1896.

To the Honorable the Speaker and Members of the Legislative Assembly of New South Wales, in Parliament assembled.

The Petition of William Jiffkins, of Sydney, in the Colony of New South Wales,—

HUMBLY SHOWETH:—

That on the 30th June, in the year of our Lord one thousand eight hundred and ninety-six, your Honorable House appointed a Select Committee to inquire into and report upon the dismissal of Staff-Sergeant William Jiffkins, Volunteer Permanent Staff.

2. That your Petitioner humbly prays that he may be represented by counsel or attorney, or in person, before the Select Committee appointed to inquire into and report upon the said matter, with the right to call witnesses and adduce evidence, and to examine and cross-examine such witnesses as may give evidence before the said Committee.

And your Petitioner, as in duty bound, will ever pray.

WILLIAM JIFFKINS.

Sydney, 9th July, 1896.
