ROYAL COMMISSION ON FISHERIES.

MINUTES OF PROCEEDINGS.

SUPPLEMENTARY REPORT.

WEDNESDAY, 26 *JUNE*, 1895.

The Commission met at the Offices, Bligh-street, at 11 a.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.
The Hon. Robert Hoddle Driberg White, M.L.C. | Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

In view of the important nature of the work still devolving upon the Commission, it was resolved that a letter bearing the President's signature should be forwarded to the Principal Under Secretary, asking him to invite the Chief Secretary to extend the period of the Commission's operations for a further term of three months.

[The Commission, at 1 p.m., adjourned until 11 a.m. on Monday, 1st July.]

MONDAY, 1 *JULY*, 1895.

The Commission met at the Offices, Bligh-street, at 11 a.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission considered and approved of a letter which it was proposed should be forwarded to fishermen at various fishing centres, asking them to furnish replies to questions respecting the habits, spawning times, &c., of different kinds of fish.

The Secretary was instructed to forward copies of the letter in question to those fishermen whose evidence had been taken by the Commission, and to others in various parts of the Colony.

[The Commission, at 1 p.m., adjourned until 11 a.m. on Thursday, 4th July.]

THURSDAY, 4 *JULY*, 1895.

The Commission met at the Offices, Bligh-street, at 11 a.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Secretary, in reply to the President, reported that no communication had been received from the Chief Secretary with reference to the extension of three months asked for by the Commission to enable them to continue their investigations into the condition of the fishing industry in New South Wales.

The Commission adjourned, pending the receipt of a letter from the Chief Secretary, announcing the decision arrived at by the Cabinet regarding the application for the extension of time necessary for the prosecution of the labours of the Commission.

FRIDAY, 23 *AUGUST*, 1895.

The Commission met at the Offices, Bligh-street, at 10·30 a.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Secretary read a letter from the Principal Under Secretary, transmitting an instrument under the hand of His Excellency the Lieutenant Governor, with the advice of the Executive Council, extending the time "within which the Report of the Royal Commission to enquire into the Fishing Industry is to be made for a further period of three months beyond the time appointed for the purpose, to take effect from the 4th ultimo."

The Commission, after deliberation, decided to prepare an abbreviated popular description of the principal food fishes of the Colony.

[The Commission, at 2·30 p.m., adjourned until Tuesday, 27th August.]

TUESDAY,

6

TUESDAY, 27 *AUGUST*, 1895.

The Commission met at the Offices, Bligh-street, at 10·30 a.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission proceeded to consider the abbreviated popular description of the principal food fishes of the Colony, which it had been decided to prepare in connection with their Supplementary Report.

The Commission also directed that the abbreviated popular description should be illustrated by photo-lithographs of the fishes described.

[The Commission, at 3 p.m., adjourned until Wednesday, 28th August.]

WEDNESDAY, 28 *AUGUST*, 1895.

The Commission met at the Offices, Bligh-street, at 10·30 a.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission further considered their abbreviated popular description of the principal food fishes of the Colony.

The Commission decided to visit the fisheries at Lake George, with a view of inquiring into their capabilities as an adjunct to the fish supply of the Colony.

[The Commission, at 3 p.m., adjourned until Thursday, 29th August.]

THURSDAY, 29 *AUGUST*, 1895.

The Commission met at the Offices, Bligh-street, at 10·30 a.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.
The Hon. Robert Hoddle Driberg White, M.L.C. | Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission further considered their abbreviated popular description of the principal food fishes of the Colony.

A letter was received from J. M. Chanter, Esq., M.P., pointing out the extent to which the Murray River fisheries were being depleted for the benefit of Victoria.

The Secretary was instructed to write Mr. Chanter, informing him that the matter was one which was engaging the attention of the Commission, as would be seen from a perusal of that portion of the Commission's Report (pp. 40, 41) relating to the inland fisheries; and further that the Commission purposed, at a later date, visiting the Murray River in order to become personally acquainted with the requirements of that fishery.

[The Commission, at 3 p.m., adjourned until Friday, 30th August.]

FRIDAY, 30 *AUGUST*, 1895.

The Commission met at the Offices, Bligh-street, at 10·30 a.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission further considered their abbreviated popular description of the principal food fishes of the Colony.

[The Commission, at 3 p.m., adjourned until 9 p.m., when they proceeded by the Southern Mail to Bungendore, *en route* to Lake George.

SATURDAY, 31 *AUGUST*, 1895.

The Commission met at the Lake George Hotel, Bungendore, at 8·30 a.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission proceeded in conveyances to Lake George, where they embarked on a steam launch and inspected the southern and eastern shores of the lake, and the creeks running into it.

[The Commission adjourned at 7 p.m.]

SUNDAY,

7

SUNDAY, 1 *SEPTEMBER*, 1895.

The Commission met at Lake View House, Lake George, at 9 a.m.

PRESENT:—

Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission continued their inspection of the Lake George fishery, and examined the western and northern shores of the lake.

[The Commission, at 7 p.m., adjourned until Monday, 2nd September.]

MONDAY, 2 *SEPTEMBER*, 1895.

The Commission met at Lake View House, Lake George, at 9·30 a.m.

PRESENT:—

Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission took evidence respecting the Lake George fishery.

The following witnesses were sworn and examined:—John Gale, Esq., J.P., Queanbeyan; Mr. William Harry Glover, meteorological observer, Lake George; and Mr. Frederick Nelson, sergeant of police, stationed at Queanbeyan.

[The Commission adjourned at 4 p.m.]

MONDAY, 2 *SEPTEMBER*, 1895.

The Commission met at the Lake George Hotel, Bungendore, at 8 p.m.

PRESENT:—

Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission received a deputation from residents of the Bungendore and Queanbeyan districts, with reference to the desirableness of stocking Lake George with suitable fish, &c.

The members of the deputation (consisting of Messrs. John Gale, J.P., John McAllister, Joseph F. Dignam, John McJennett, and William H. Crow), spoke at length with reference to the question of introducing other fish into the lake; the closure of the creeks and portions of the lake against net-fishing; the appointment of an Inspector of Fisheries to supervise Lake George; the offering of a reward for the destruction of cormorants, pelicans, black shags, cranes, and other fish-eating birds; and the necessity for providing a better and readier means of access to the shores of the lake.

The President, in reply, said it afforded the Commission pleasure to receive the deputation from the inhabitants, and he was especially glad to see that there were gentlemen in the district who took an interest in the fisheries at Lake George. Speaking on behalf of the Commission, he felt at liberty to say that the Commission was fully in accord with all that had been stated. Taking the requests *seriatem*, he might say, with reference to number one, that in regard to the introduction of other species of fish into the waters of Lake George, they would have great pleasure in making a recommendation that this was desirable. It would be a matter for after consideration as to the kinds of fish to be introduced into the lake. They had had it in evidence that there was a probability that the brown trout could be successfully introduced into the lake, and he believed, judging from the conditions of the fishery, that this fish could be successfully introduced. With reference to the protection of the fishery, he thought it was highly essential that a qualified man should be appointed as inspector. The duty of the Commission would be to recommend the appointment of a gentleman who should exercise some supervision and control over the fishery; he did not believe in the appointment of an honorary inspector; it was better to pay a man for services rendered, and then there could be no excuse for neglect of duty. This matter would receive the attention of the Commission, and they would make a recommendation accordingly. He thought a reward should be offered for the destruction of fish-eating birds, and he might say that a provision had been introduced into the Bill recently prepared by the Royal Commission, which would allow of their destruction. With regard to the important question of obtaining a better means of access to the shores of Lake George, he hoped the day was not far off when, in the public interest, a good road would be made right round the foreshores of the lake. Such a work was national in its character and importance, and he considered the people should have access to the shores of this magnificent sheet of water.

Mr. Lindsay G. Thompson said he heartily endorsed all that Mr. Farnell had said, and it would afford him pleasure to co-operate with him on the lines indicated.

Mr. John Gale, on behalf of the deputation, thanked the Commission for the courteous manner in which they had been received.

[The Commission, at 10 p.m., adjourned until Wednesday, 4th September.]

WEDNESDAY,

8

WEDNESDAY, 4 *SEPTEMBER*, 1895.

The Commission met at the Offices, Bligh-street, at 11 a.m.

PRESENT:—
Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission further considered their abbreviated popular description of the principal food fishes of the Colony.

[The Commission, at 2 p.m., adjourned until Thursday, 5th September.]

THURSDAY, 5 *SEPTEMBER*, 1895.

The Commission met at the Offices, Bligh-street, at 11 a.m.

PRESENT:—
Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission further considered their abbreviated popular description of the principal food fishes of the Colony.

[The Commission, at 2 p.m., adjourned until Friday, 6th September.]

FRIDAY, 6 *SEPTEMBER*, 1895.

The Commission met at the Offices, Bligh-street, at 11 a.m.

PRESENT:—
Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Secretary read a letter from Mr. F. J. Gibbins, the lessee of certain oyster beds in the Hunter River, calling attention to the wonderful growth of oysters in the Hunter, and inviting the Commission to inspect the same.

The Secretary was instructed to inform Mr. Gibbins that the Commission would have pleasure in visiting the oyster beds in the Hunter River at an early date.

[The Commission, at 3 p.m., adjourned until Monday, 9th September.]

MONDAY, 9 *SEPTEMBER*, 1895.

The Commission met at the Offices, Bligh-street, at 11 a.m.

PRESENT:—
Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission further considered their abbreviated popular description of the principal food fishes of the Colony.

The Commission decided to visit the oyster beds in the Hunter River on Friday, 13th September, and the Secretary was instructed to make arrangements accordingly.

[The Commission, at 3 p.m., adjourned until Tuesday, 10th September.]

TUESDAY, 10 *SEPTEMBER*, 1895.

The Commission met at the Offices, Bligh-street, at 10·30 a.m.

PRESENT:
Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission further considered their abbreviated popular description of the principal food fishes of the Colony.

[The Commission, at 2 p.m., adjourned until Thursday, 12th September.]

THURSDAY,

THURSDAY, 12 *SEPTEMBER*, 1895.

The Commission met at the Offices, Bligh-street, at 10·30 a.m.

PRESENT:—

Frank Farnell, Esq., M.P., President.
The Hon. Robert Hoddle Driberg White, M.L.C. | Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission took further evidence respecting deep-sea fishing, Mr. John Pollard, fisherman, being sworn, and examined.

[The Commission, at 1 p.m., adjourned until Friday, 13th September.]

FRIDAY, 13 *SEPTEMBER*, 1895.

The Commission met at the "Great Northern Hotel," Newcastle, at 1·45 p.m.

PRESENT:—

The Hon. Robert Hoddle Driberg White, M.L.C., Acting-President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Secretary read a telegram from the President (Frank Farnell, Esq., M.P.), stating that owing to the late sitting of the Legislative Assembly he was unable to be present with the Commission.

The Commission proceeded to the Back Channel in the Hunter River, where they inspected some of the oyster-beds leased by Mr. F. J. Gibbins, and witnessed several dredgings in different parts of the Channel. The Commission ascertained that the worm disease, which had proved terribly destructive to oysters in this water, was on the decline. The lessee had combatted it for a number of years, and although it was still present in certain places, he was getting it under by constantly working the beds and removing all shell taken from the infected spots. The growth of spat in the Back Channel was shown to be very free and quick, a considerable amount of spawn which had set during the winter having made rapid growth.

[The Commission, at 6 p.m., adjourned until 8 a.m., on Saturday, 14th September.]

SATURDAY, 14 *SEPTEMBER*, 1895.

The Commission met at the " Great Northern Hotel," Newcastle, at 8 a.m.

PRESENT:—

The Hon. Robert Hoddle Driberg White, M.L.C., Acting-President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission continued their inspection of the oyster-beds in the Hunter and proceeded to Fullerton Cove, where several dredgings were made. In Fullerton Cove, as in the Back Channel, the growth of the oyster was very noticeable. The Commission were informed that such a rapidity of growth had not been apparent for years. In consequence of the prevalence of the worm disease the place had been literally cleared of shell, and for over ten years oysters had not been taken from the beds in the Cove. The investigations made by the Commission established the fact that spawn was setting well in Fullerton Cove, which, provided the worm disease did not make its re-appearance, was likely to prove quite as fertile as in past years, when it supplied not only the Sydney but the Melbourne market. The Commission were shown marketable oysters of from nine to twelve months' growth which had been dredged from the Cove, and at one place—the point off Smith's Island—the ground was found to be so prolific that oysters become marketable within nine months of spatting. Mr. Gibbins was said to have leases amounting to 2,200 yards. He had been paying a rental of £22 per annum for these for over ten years, during a large portion of which period he had received no return. In addition to this it was stated by Mr. Hans Andersen, superintendent of Mr. Gibbins' oyster leases, that it was absolutely necessary to keep a special constable on the watch night and day in order to save the beds from the depredations of thieves, who made a practice of stealing the oysters and then offering them for sale in bottles. The Commission expressed themselves as highly gratified at the perseverance and persistence shown by the lessee, Mr. Gibbins, in combatting this worm disease, which had proved so absolutely fatal to oysters in other waters.

[The Commission adjourned at 3 p.m.]

WEDNESDAY, 18 *SEPTEMBER*, 1895.

The Commission met at the Offices, Bligh-street, at 10·30 a.m.

PRESENT:—

Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission further considered their abbreviated popular description of the principal food fishes of the Colony.

[The Commission, at 1 p.m., adjourned until Thursday, 19th September.]

10

THURSDAY, 19 *SEPTEMBER*, 1895.

The Commission met at the Offices, Bligh-street, at 10·45 a.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.
The Hon. Robert Hoddle Driberg White, M.L.C. | Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission further considered their abbreviated popular description of the principal food fishes of the Colony.

[The Commission, at 1 p.m., adjourned until Friday, 20th September.]

FRIDAY, 20 *SEPTEMBER*, 1895.

The Commission met at the Offices, Bligh-street, at 10·30 a.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission further considered their abbreviated popular description of the principal food fishes of the Colony.

[The Commission, at 12 noon, adjourned until Tuesday, 24th September.]

TUESDAY, 24 *SEPTEMBER*, 1895.

The Commission met at the Offices, Bligh-street, at 11 a.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The following witnesses were examined with respect to the condition of the Woolloomooloo Fish Market :—Senior-constable Thomas Whelan, and Senior-constable Josias Dawe.

[The Commission, at 1 p.m., adjourned until Wednesday, 25th September.]

WEDNESDAY, 25 *SEPTEMBER*, 1895.

The Commission met at the Offices, Bligh-street, at 10·30 a.m.

PRESENT :—

Frank Farnell. Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission took further evidence with reference to the condition of the Woolloomooloo Fish Market.

John McElhone, Esq., M.P., and Mr. John Thomas Taylor, fisherman, were sworn and examined.

[The Commission, at 1 p.m., adjourned until Friday, 27th September.]

FRIDAY, 27 *SEPTEMBER*, 1895.

The Commission met at the Offices, Bligh-street, at 11 a.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission, at noon, interviewed the Chief Secretary (Mr. Brunker) with respect to the Fisheries and Oyster Fisheries Regulation Bill, prepared by the Commission (embodied in their Advance Report submitted to Parliament), a deputation from the New South Wales Fishermen's Benefit and Protective Society being present in reference to certain points in the proposed legislation to which they objected.

During the interview certain members of the deputation having expressed a desire to be heard before the Commission, the President decided to summon the following witnesses to give evidence on Wednesday, 2nd October, respecting the matters referred to by them :—Robert Vine, fisherman, Double Bay; P. Richardson, fisherman, Glebe Point; and H. Pearce, fisherman, Double Bay.

[The Commission, at 1·45 p.m., adjourned until Wednesday, 2nd October.]

11

WEDNESDAY, 2 *OCTOBER*, 1895.

The Commission met at the Offices, Bligh-street, at 11 a.m.

PRESENT:—

Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission continued the taking of evidence, the following witnesses being sworn and examined:—Mr. Henry Pearce, fisherman, Double Bay; Mr. Peter Richardson, fisherman, Glebe Point; and Mr. Robert Vine, fisherman, Double Bay.

[The Commission, at 1 p.m., adjourned until Friday, 4th October.]

FRIDAY, 4 *OCTOBER*, 1895.

The Commission met at the Offices, Bligh-street, at 11 a.m.

PRESENT:—

Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Secretary read a letter from the Principal Under Secretary, transmitting an instrument under the hand of His Excellency the Lieutenant-Governor, with the advice of the Executive Council, extending the time "within which the Report of the Royal Commission to inquire into the fishing industry of New South Wales is to be made for a further period of six weeks beyond the time appointed for the purpose, to take effect from the 4th inst."

The Commission further considered their abbreviated popular description of the principal food fishes of the Colony.

[The Commission, at 1 p.m., adjourned until Wednesday, 9th October.]

WEDNESDAY, 9 *OCTOBER*, 1895.

The Commission met at the Offices, Bligh-street, at 10·45 a.m.

PRESENT:—

Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The following witness was sworn and examined:—Mr. Alfred Brown, fisherman, Brougham-street, Woolloomooloo.

[The Commission, at 1 p.m., adjourned until Tuesday, 15th October.]

TUESDAY, 15 *OCTOBER*, 1895.

The Commission met at the Offices, Bligh-street, at 11 a.m.

PRESENT:—

Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission decided to pay a visit of inspection to the Snowy River, for the purpose of ascertaining the suitability of those waters for fish propagation and acclimatisation, and the Secretary was instructed to make the necessary arrangements.

The Commission further considered their abbreviated popular description of the principal food fishes of the Colony.

[The Commission, at 1 p.m., adjourned until 11 a.m., on Wednesday, 16th October.]

WEDNESDAY, 16 *OCTOBER*, 1895.

The Commission met at the Offices, Bligh-street, at 11 a.m.

PRESENT:—

Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission took further evidence respecting the inland fisheries.

John Moore Chanter, Esq., M.P., was sworn and examined.

[The Commission, at 1 p.m., adjourned until Thursday, 17th October.]

THURSDAY,

12

THURSDAY, 17 *OCTOBER*, 1895.

The Commission met at the Offices, Bligh-street, at 11 a m.

PRESENT:—

Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq , J.P.

The minutes of the previous meeting were read and confirmed.

The Commission took further evidence respecting the inland fisheries.

Travers Jones, Esq., M.P., was sworn and examined.

The Commission further considered their abbreviated popular description of the principal food fishes of the Colony.

[The Commission, at 9 p.m., left Sydney by mail train *en route* to the Snowy River.]

FRIDAY, 18 *OCTOBER*, 1895.

The Commission met at Dodds' Hotel, Cooma, at 11 a.m.

PRESENT:—

Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq , J.P.

The minutes of the previous meeting were read and confirmed.

The Commission, at 11·45 a.m., proceeded to Buckley's Crossing for the purpose of inspecting the Snowy River, with the object of ascertaining the suitability of its waters for fish propagation and acclimatisation.

[The Commission, having inspected the Snowy River, in the vicinity of Buckley's Crossing, adjourned at 7 p.m., until Saturday, 19th October.]

SATURDAY, 19 *OCTOBER*, 1895.

The Commission met at Boloco Station, Monaro, at 8 a.m.

PRESENT:—

Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq , J.P.

The minutes of the previous meeting were read and confirmed.

The Commission continued their inspection of other portions of the Snowy River, after which the following witnesses were sworn and examined:—Reuben Uther Bartlett Rose, Esq., Boloco Station, Monaro; Henry Dawson, Esq., solicitor, Sydney; and Henry Charles Merrett, Esq., J.P., Buckley's Crossing.

[The Commission, at 6 p.m., adjourned until Sunday, 20th October.]

SUNDAY, 20 *OCTOBER*, 1895.

The Commission met at Boloco Station, Monaro, at 9 a.m.

PRESENT:—

Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission, accompanied by G. T. C. Miller, Esq., M.P., and several gentlemen interested in trout acclimatisation, continued their inspection of the Snowy River, visiting Carroll's Corner and other points on the river.

[The Commission, at 6 p.m., adjourned until Monday, 21st October.]

MONDAY, 21 *OCTOBER*, 1895.

The Commission met at Boloco Station, Monaro, at 6 a.m.

PRESENT:—

Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

[The Commission, at 6·30 a.m., left Boloco Station for Cooma, *en route* to Sydney.]

THURSDAY.

13

THURSDAY, 31 *OCTOBER*, 1895.

The Commission met at the Offices, Bligh-street, at 11 a.m.

PRESENT:—

Frank Farnell, Esq., M.P., President.

The Hon. Robert Hoddle Driberg White, M.L.C. | Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission further considered their abbreviated popular description of the principal food fishes of the Colony.

The Commission took further evidence respecting the Snowy River Fisheries.

Gustave Thomas Carlisle Miller, Esq , M.P., was sworn and examined.

[The Commission, at 3 p.m., adjourned until Tuesday, 5th November.]

TUESDAY, 5 *NOVEMBER*, 1895.

The Commission met at the Offices, Bligh-street, at 10·30 a.m.

PRESENT:—

Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission proceeded to consider their Supplementary Report for presentation to His Excellency the Governor.

The following witnesses were sworn and examined:—

Mr. J. Chinnery, fishmonger, Hunter-street, Sydney; and Henry Daniels, Esq., Town Clerk, Sydney.

[The Commission, at 1 p.m., adjourned until Wednesday, 6th November.]

WEDNESDAY, 6 *NOVEMBER*, 1895.

The Commission met at the Offices, Bligh-street, at 10·30 a.m.

PRESENT:—

Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission further considered their Supplementary Report for presentation to His Excellency the Governor.

Mr. Richard Seymour, Inspector of Nuisances, Sydney, was sworn and examined.

[The Commission, at 1 p.m., adjourned until Thursday, 7th November.]

THURSDAY, 7 *NOVEMBER*, 1895.

The Commission met at the Offices, Bligh-street, at 10·30 a.m.

PRESENT:—

Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission further considered their Supplementary Report for presentation to His Excellency the Governor.

Mr. Frederick William Smithers, Acting Secretary, Department of Fisheries, was sworn and further examined.

[The Commission, at 1 p.m., adjourned until Friday, 8th November.]

FRIDAY, 8 *NOVEMBER*, 1895.

The Commission met at the Offices, Bligh-street, at 10·30 a.m.

PRESENT:—

Frank Farnell, Esq, M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission further considered their Supplementary Report for presentation to His Excellency the Governor.

[The Commission, at 1 p.m., adjourned until Tuesday, 12th November.]

TUESDAY,

14

TUESDAY, 12 *NOVEMBER*, 1895.

The Commission met at the Offices, Bligh-street, at 10·30 a.m.

PRESENT:—

Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission further considered their Supplementary Report for presentation to His Excellency the Governor.

[The Commission, at 1 p.m., adjourned until Wednesday, 13th November.]

WEDNESDAY, 13 *NOVEMBER*, 1895.

The Commission met at the Offices, Bligh-street, at 10·30 a.m.

PRESENT:—

Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

Mr. Thomas Mulhall, late Inspector, Department of Fisheries, was sworn and examined.

The Commission further considered their Supplementary Report for presentation to His Excellency the Governor.

[The Commission, at 1 p.m., adjourned until Thursday, 14th November.]

THURSDAY, 14 *NOVEMBER*, 1895.

The Commission met at the Offices, Bligh-street, at 10·30 a.m.

PRESENT:—

Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission further considered their Supplementary Report for presentation to His Excellency the Governor.

[The Commission, at 1 p.m., adjourned until Tuesday, 19th November.]

TUESDAY, 19 *NOVEMBER*, 1895.

The Commission met at the Offices, Bligh-street, at 11 a.m.

PRESENT:—

Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

Mr. Herbert Lewis Bridger, Trafalgar-street, Annandale, was sworn and examined.

The Commission further considered their Supplementary Report for presentation to His Excellency the Governor.

[The Commission, at 1 p.m., adjourned until Tuesday, 26th November.]

TUESDAY, 26 *NOVEMBER*, 1895.

The Commission met at the Offices, Bligh-street, at 11 a.m.

PRESENT:—

Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

Paget Bayley, Esq., late honorary inspector, Department of Fisheries, was sworn and examined.

The Commission further considered their Supplementary Report for presentation to His Excellency the Governor.

[The Commission, at 3 p.m., adjourned until Wednesday, 27th November.

WEDNESDAY, 27 *NOVEMBER*, 1895.

The Commission met at the Offices, Bligh-street, at 11 a.m.

PRESENT:—

Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission further considered their Supplementary Report for presentation to His Excellency the Governor.

[The Commission, at 2 p.m., adjourned until Thursday, 28th November.]

THURSDAY,

15

THURSDAY, 28 *NOVEMBER*, 1895.

The Commission met at the Offices, Bligh-street, at 11 a.m.

PRESENT:—

Frank Farnell, Esq., M.P., President,
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission further considered their Supplementary Report for presentation to His Excellency the Governor.

[The Commission, at 3 p.m., adjourned until Friday, 29th November.]

FRIDAY, 29 *NOVEMBER*, 1895.

The Commission met at the Offices, Bligh-street, at 11 a.m.

PRESENT:—

Frank Farnell, Esq., M.P., President,
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission further considered their Supplementary Report for presentation to His Excellency the Governor.

[The Commission, at 3·30 p.m., adjourned until Monday, 2nd December.]

MONDAY, 2 *DECEMBER*, 1895.

The Commission met at the Offices, Bligh-street, at 11 a.m.

PRESENT:—

Frank Farnell, Esq., M.P., President,
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission further considered their Supplementary Report for presentation to His Excellency the Governor.

[The Commission, at 2 p.m., adjourned until Tuesday, 3rd December.]

TUESDAY, 3 *DECEMBER*, 1895.

The Commission met at the Offices, Bligh-street, at 11 a.m.

PRESENT:—

Frank Farnell, Esq., M.P., President,
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission further considered their Supplementary Report for presentation to His Excellency the Governor.

[The Commission, at 1 p.m., adjourned until Wednesday, 4th December.]

WEDNESDAY, 4 *DECEMBER*, 1895.

The Commission met at the Offices, Bligh-street, at 11 a.m.

PRESENT:—

Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission further considered their Supplementary Report for presentation to His Excellency the Governor.

[The Commission, at 1·15 p.m., adjourned until Thursday, 5th December.]

THURSDAY, 5 *DECEMBER*, 1895.

The Commission met at the Offices, Bligh-street, at 11 a.m.

PRESENT:—

Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission further considered their Supplementary Report for presentation to His Excellency the Governor.

[The Commission, at 2·30 p.m., adjourned until Friday, 6th December.]

FRIDAY,

16

FRIDAY, 6 *DECEMBER*, 1895.

The Commission met at the Offices, Bligh-street, at 11 a.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Secretary read a letter from the Principal Under Secretary, transmitting an instrument under the hand of His Excellency the Governor, with the advice of the Executive Council, extending the time "within which the Report of the Royal Commission to inquire into the Fishing Industry of New South Wales is to be made for a further period of one month beyond the time in and by the aforesaid instrument appointed for the purpose—to take effect from the 15th ultimo."

The Commission further considered their Supplementary Report for presentation to His Excellency the Governor.

[The Commission, at 1 p.m., adjourned until Friday, 13th December.]

FRIDAY, 13 *DECEMBER*, 1895.

The Commission met at the Offices, Bligh-street, at 2 p.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.
The Hon. Robert Hoddle Driberg White, M.L.C. | Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission finally considered and adopted their Supplementary Report for presentation to His Excellency the Governor.

The Supplementary Report was signed, and it was decided to forward the same to the Chief Secretary for transmission to His Excellency the Governor as soon as the evidence was complete.

The Commission directed that there be recorded on the minutes an acknowledgment of the satisfactory manner in which Mr. Walter D. White had carried out his duties as Secretary and Shorthand Writer to the Commission.

[The Commission adjourned *sine die*.]

17

ROYAL COMMISSION ON FISHERIES.

SUPPLEMENTARY REPORT.

To His Excellency The Right Honourable HENRY ROBERT, VISCOUNT HAMPDEN, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies.

MAY IT PLEASE YOUR EXCELLENCY,—

We, the members of the Royal Commission appointed on the 20th day of November, 1894, "to make a diligent and full inquiry as to the best means of developing the Marine and other Fisheries of the Colony, and as to the proper regulation of that industry by law," have the honor to submit the following Supplementary Report :—

Meetings held and witnesses examined.

Subsequent to the date of forwarding our Advance Report to your Excellency we have held fifty-five meetings and examined twenty-seven witnesses.

At a meeting of the Commission held on the 1st July, a letter which it was proposed should be forwarded to fishermen at various fishing centres, asking them to furnish replies to certain questions respecting the habits, spawning times, &c., of different kinds of fish was considered, adopted, and sent accordingly. Some of the information gathered through this channel has been embodied in the Abbreviated Popular Description of the Principal Food Fishes of the Colony, which accompanies this Report. The work in question has been carefully prepared and the illustrations accompanying it have been drawn from photographs of fish specimens specially obtained for the purpose.

Popular Description of Principal Food Fishes.

Deep-sea Fisheries.

We have taken some further evidence with reference to deep-sea fishing, the use of well-boats, and trawling on our coast.

Inland Fisheries.

The Inland Fisheries of the Colony have received considerable attention. We have personally visited and inspected Lake George and the Snowy River, and ascertained the suitability of those waters for fish propagation and acclimatisation. Valuable evidence has been taken with reference to the question of stocking some of the colder streams with trout. This portion of the work of the Commission is referred to under a separate heading.

Monaro waters.

We append a map showing the extent of the Monaro waters system.

Oyster beds in Hunter.

We have also paid a further visit to the Hunter River, and inspected the oyster beds in the Back Channel and in Fullerton Cove, in which places the lessee, Mr. Gibbins, has shown considerable persistence and perseverance in combatting the worm disease.

Woolloomooloo Fish Market.

Additional evidence has been taken with reference to the condition of the Woolloomooloo Fish Market. Mr. John McElhone, M.P., and several other witnesses having expressed a desire to place statements on oath before the Commission respecting the condition of affairs at the market, it was deemed advisable to give them an opportunity of making their views public.

Fisheries and Oyster Fisheries Regulation Bill.

As a result of a deputation from the New South Wales Fishermen's Benefit and Protective Society which waited upon the Chief Secretary on 27th September last, and at which members of this Commission were present, certain provisions in our Fisheries and Oyster Fisheries Regulation Bill and to which they desired to take exception were brought forward. After consultation it was arranged that three members of the deputation should be afforded an opportunity of giving evidence before this Commission. Accordingly the fishermen referred to presented themselves and were examined generally and on the points at issue. After an explanation of

the

18

the special bearing of the several provisions alleged to be objectionable, the witnesses expressed their general satisfaction with the measure. The evidence of these and other witnesses examined by us, respecting the various matters already referred to, is submitted with this Report.

Attached to this Report will be found an Abbreviated Description of the habits, &c., of our Principal Food Fishes, collected from the several sources at our command. In the course of extended inquiries, which we have been able to make during the period of our commission, we have found that so little is known by the majority of persons respecting the fishes which abound in our inlets and on our coast, that we hope our efforts in the direction of supplying that knowledge will prove useful and interesting.

The descriptions are accompanied by photographs and a scale, by which the actual length and other dimensions of each fish represented can be estimated.

As the several questions dealt with are to some extent separate from each other, we have thought it expedient to refer to them under certain specific headings as follows :—

The Deep-Sea Fisheries.

Inquiry not so comprehensive as desired.

We have taken such evidence as was available respecting the deep-sea fisheries, but at the outset we are forced to admit that our inquiry into this most important phase of the fisheries question has not been of the comprehensive nature we wished it to be. We regret the Government have not seen their way clear to place at our disposal the appliances we had suggested as necessary for the institution of an effective investigation of this important branch of the subject. Had such appliances been afforded to us, we feel confident we should have been in a position to make an important recommendation respecting this matter.

Letter to Chief Secretary.

For instance, in a letter having reference to deep-sea fishing, submitted by us to the Chief Secretary in January last, we very strongly emphasised the fact that little or nothing had been done in the direction of encouraging and extending our offing or deep-sea fisheries. "To prosecute our inquiry into the important subject of the deep-sea fisheries, and to carry our investigations to a successful issue," we said, "it is absolutely necessary that a thorough and systematic exploration by means of a completely equipped trawling vessel should be made of the several fishing grounds contiguous to the shore line of the Colony. In this way the Commission expect to ascertain important, highly valuable, and necessary information concerning the quality and habits of the fish tribes frequenting the deep sea, and also hope to be in a position to form an approximately accurate opinion as to the success or otherwise that would attend the employment of steam trawlers in these southern waters."

Cost of steam trawler and well-boat.

The cost of a steam trawler was approximately estimated at about £5,000, and the outlay necessary for the acquisition of a fully-equipped well-boat, which we urged should be acquired for the purpose of demonstrating the suitability of this class of craft for our fisheries, was set down at about £400. Had the vessels in question been placed at our disposal, we are confident we should have been able to throw considerable light upon the possibilities of the offing fisheries ; and our observations would in all probability have been the means of directing attention to the piscine treasures in our own waters, which, as is the case in other countries, could most undoubtedly be made a source of national wealth and individual benefit. The evidence we have taken, coupled with inquiries made in other directions, goes to show that up to date the vast stores of piscine life in our waters have been almost totally ignored ; and further, that when fully developed our marine fishing-grounds, which extend along the entire length of the sea-board—some seven hundred miles—will, beyond all doubt, prove of immense value to the Colony. We greatly deplore the fact that our representations have not had the attention their importance seemed to us to demand.

Value of deep-sea fisheries.

Trawling.

With reference to the advisableness of instituting trawling operations over certain portions along our coast, also to the much vexed question of the existence, or otherwise, of bottoms suitable for trawling, we have obtained trustworthy evidence which warrants us in asserting that such bottoms do exist, and in considerable areas.

For

19

For instance, we have it in evidence that between Newcastle and Port Stephens, off the Shoalhaven River, off the Tuggerah Lakes, and at other places such bottoms exist, and fish are known to abound on each of them. Captain Coulon, who at one time owned a fishing-schooner, the "Dauntless," stated during his examination that there are banks suitable for trawling on which soles, flounders, whiting and flat-head could be caught. From his experience of the New South Wales coast, extending over a period of about thirty-five years, he is of opinion that trawling could be carried out successfully, and there can be no question that the use of the trawl could be largely availed of for the capture of many kinds of good edible fish.

Suitable bottoms or banks.

As we have previously stated, some few attempts have been made to use the trawl in our waters, but it has to be admitted that, as a rule, these experiments were carried out under unfavourable conditions, yet, even so, the result of one experiment with the trawl was looked upon as decidedly promising, as the existence of a true skate was made known, and several John Dorey, a fish of unrivalled quality and flavour, were captured by this means. The result of such attempts as have been made goes to show how little we really know regarding the piscine life of our ocean floor. It is known, however, that various species of ground fish do exist in considerable numbers, and this in itself should be sufficient to warrant the anticipation of successful results from a well-equipped trawling expedition, carried out under suitable weather conditions.

Attempts at trawling.

With respect to this question of trawling in our waters, we desire to record our emphatic opinion that the Government should lose no further time in providing means for the institution of a trawl survey of the coast to test the suitability of some of the known places on which it is believed trawling could be successfully undertaken. Were this done, valuable information would undoubtedly be gained regarding the bottoms, the several families of fish possibly inhabiting or frequenting them, and their economic value.

Government should institute a trawl survey of New South Wales coast.

It is more than probable also that extensive deposits of oysters exist in the deep-sea, and a proper trawl survey might be the means of locating a number of these valuable deposits. Deep-sea deposits of oysters occur in other waters, and in view of the fact that the rocks at the mouth of almost every inlet along our extensive coast-line are freely covered with spat and young oysters, we cannot avoid arriving at the conclusion that extensive deep beds of this valuable mollusc will be found at certain places on the ocean floor. As we have not had the opportunity of making practical investigations into the deep-sea fisheries and deep-sea oyster fisheries, we strongly urge the attention of the Government to this matter. In the absence of sufficient reliable data we can but assume the existence of such fisheries, which, if properly worked and developed, would in all probability lead to the establishment of an immense and ever-expanding industry, which would prove a substantial source of revenue to the State, and afford remunerative employment to a large section of our population.

Deep-sea deposits of oysters.

Existence of fisheries assumed.

We desire to direct attention to the use of the well-boat as a means of conveying live fish from outlying centres to the Metropolitan and other markets. For too long have the bulk of the New South Wales fishermen confined their attention merely to the inlets, rivers, and harbours in more or less close proximity to Sydney. Speaking generally it is to be inferred that their neglect of the magnificent fishing grounds which undoubtedly exist, almost on the margin of our ocean shores, is largely owing to the fact that they have been, and still are, unprovided with the means of keeping their fish in a live state when captured. As a consequence of the non-employment of well-boats in our several fisheries, the loss of fish—the most perishable of our articles of food—has been enormous. Tons and tons of this valuable food have been annually lost to the community, especially during the summer season, owing to the lack of proper means of conveying them in a sound condition to the Metropolitan and inland markets. A more general employment of fishing craft suitably fitted with wells would obviate much of this loss, and prove a distinct gain both to the fishermen and to the consumer. Were well-boats more extensively employed by our fishermen, advantage could be taken of the magnificent though little known grounds which exist at various places off our coast line. Right up to the Solitaries, and far to the north of those Islands, even to the boundary of the Colony, there are splendid fishing grounds; many

Use of the well-boat.

Enormous loss of fish.

Fishing grounds north of Sydney.

20

many of which have never been properly tested. In some localities, such as the grounds off the Fish Rock at Smoky Cape, huge black rock cod are found in quantities, some weighing from 100 lb. to 150 lb. Again, on the Sandon Shoals big rock cod are known to be very plentiful. The bottom is reported to be a coral formation, and the large cod frequent the place in great numbers. Enormous blue-nose whiting and very large crabs are to be found in the Sandon River, and between Woody Head and the entrance to the Clarence River there is a splendid sandy bottom over which the trawl could be drawn freely, and flat-head, soles, flounders, and whiting, taken in numbers. At Evans' Head Reef is a good schnapper ground, and from thence to Lennox Head, north of the Richmond, is another excellent trawling ground on which many varieties of fish could be caught. Other bottoms suitable for trawling exist between Lennox Head and Byron Head.

Southern fishing grounds.

South of Sydney, from the Sir John Young Banks to Cape Howe, are other splendid fishing grounds; but generally speaking, these are little known to the average fisherman, who has been content to follow in the footsteps of his predecessors instead of striking out for himself into new channels.

The development of the sea fisheries of the older countries of the world, in addition to furnishing a much-needed and nutritious article of food for their peoples, has produced a class of men inured to hardship and exposure; persevering, brave, and patient in their calling; resolute, prompt to face danger; and accustomed to co-operate with others for the attainment of a given end. The sea fisheries of the United Kingdom have proved invaluable as nurseries for the navy and the mercantile marine. From the fishing ports of the old country have come the hardy and seasoned seamen who have proved invincible on the ocean, and have carried the flag of England to the remotest corners of the earth. What the fisheries have done, in this respect, for the mother country, they are probably

Importance to New South Wales of sea fisheries.

capable of doing for this newer land. Certain it is, that as a result of the development of our deep-sea fisheries, we may expect to produce a race of fishermen second to none in the world; indeed the fisheries of New South Wales should form the training-grounds for the men who in future years may be required to man the trading fleets of Australia.

We strongly urge that this important question of the systematic development of the deep-sea fisheries should be one of the first matters to engage the close attention of the newly-constituted authority proposed in the Bill which we have submitted.

Whaling in Australian Waters.

Whaling once an important factor in trade of Colony.

We have devoted considerable time and attention to the important question of the revival of the whaling industry in these waters. Although the evidence taken with regard to whaling is not voluminous, and the number of witnesses who have made statements upon oath respecting this industry is not great, still we have lost no opportunity of prosecuting our inquiries with respect to a possible revival of this trade, which once formed so important a factor in the commercial life of New South Wales.

Existence of whales in South Pacific.

During our visits to the various fishing centres, information has been gained sufficient in itself to establish the fact that the whales most sought after for commercial purposes do exist, and in very considerable numbers in the South Pacific. In this connection it might be of interest to state that the first notice of whaling at Sydney dates in August, 1790, when a spermaceti whale made its appearance in Port Jackson. The commander of the "Britannia," a transport ship which arrived in Port Jackson in 1791, whose owners were the Messrs. Enderby, of London, reported that on the voyage, after doubling the south-west of Van Diemen's Land, a large sperm whale was sighted off Maria Island; the vessel fell in with more sperm whales when within 15 leagues of the latitude of Port Jackson; and within 3 leagues of the coast of New South Wales sperm whales were seen in numbers, and from the mast-head of the ship shoals of these creatures were visible all around the horizon. Later on the "Britannia," and the "William and Anne," another vessel, sailed out of Sydney harbour on a whaling cruise. The two vessels killed the day after their departure seven sperm whales, but owing to bad weather succeeded only in securing two. Other ships also went out and engaged

in

21

in the whale fishery with greater or less success, according to the peculiar circumstances in which they carried on operations. All the masters engaged in the trade agreed that the coast of New South Wales abounded with whales.

Whaling in early colonial days.

Whaling was carried on with various degrees of success for a number of years down to 1830, which appears to have been an especially prosperous season. By the ship "Elizabeth," which arrived in Sydney on the 18th May in that year from the whale fishery at the Bay of Islands, New Zealand, news came that there were at the Bay ten vessels with full cargoes, besides two others spoken at sea; these were carrying a total quantity of 14,500 barrels, worth, at a rough estimate, about £120,000.

Sydney a prosperous whaling centre.

Sydney in 1830 was a prosperous whaling centre, no less than twenty-two vessels engaged in the industry sailing out of Port Jackson in that year. In a paper published at the time it is recorded that while three years previously New South Wales had but three vessels engaged in the whale fishery, aggregating about 450 tons, at that present time she had 4,000 tons of shipping so employed. Early in 1831, the "Elizabeth," belonging to Robert Campbell & Co., sailed into Sydney harbour, having 361 tuns of sperm oil aboard. This was the take for an eighteen months' cruise, and was the most valuable cargo that had yet been brought into the port, its estimated money value being £21,600. In this year also the whaling trade began to further expand, black whale oil considerably swelling the export.

The following tables will serve to show the commercial value to the Colony of the whale fisheries in the years indicated:—

Quantity of Whale Oil, Whalebone, and Sealskins exported from New South Wales from the Year 1828 to 1840 inclusive, so far as can be ascertained from the incomplete returns obtainable:—

Whaling a profitable enterprise.

Twofold Bay a whaling station.

Enough has been said to show that, in the early colonial days, whaling was followed with considerable profit. Sydney was the head-quarters and depôt of the whaling trade in New South Wales, the result being that this industry proved of great value to the capital and to the Colony. Twofold Bay also was an important whaling station. Consequent upon the discovery of gold in Australia, interest in the whaling industry rapidly declined, officers and men preferring the excitement and chances of life at the various gold-fields to following their ordinary calling at sea.

Efforts to revive interest in whale fisheries.

We are pleased to notice that whaling has of late received a little more attention at the hands of men engaged in commercial pursuits. Efforts were, and we believe are still being made to direct attention to the undoubted value of the whale fisheries in southern waters, and there can be little doubt that if a vigorous and determined attempt is made to revive this once flourishing industry, substantial benefit will accrue therefrom to all concerned.

Existence of right and sperm whales. Capt. J. B. Carpenter.

The evidence taken upon the subject is both interesting and important. It establishes the fact that the right whale and the sperm whale exist in numbers at no great distance from the Australian coast. Captain J. B. Carpenter, late master of the whaling vessel "Costa Rica Packet," states that within a radius of 1,200 miles from Sydney lie about the best whaling grounds in the world. These grounds are frequented by the right whale, the sperm whale, and the humpback, and the seasons following

23

following on as they do, one after the other, makes it possible for a ship sailing from Sydney—which he regards as being one of the best ports in the world and the nearest to the whaling grounds in the Southern Ocean—to utilise the whole of the year in whaling. Another thing in favour of Sydney is that it has such a fine climate—so much sunlight and fine weather—that the oil from the whales could easily be separated and clarified, and placed on the market ready for use at a minimum cost. A few days sunlight will take the colour out of the very darkest whale oil and make it clear.

Sydney nearest port to whaling grounds in Southern Ocean.

According to Captain Carpenter the range of the right whale is from the west coast of Patagonia east to 170 degrees west latitude. They go north as far as the Brazil Banks in the Atlantic Ocean, and 34 degrees south latitude in the Pacific. Their range extends from that to about the 50th parallel of south latitude. Outside of those limits it is scarcely worth while to look for them. They come north in about October. "We generally reckon," he says, "that about the 13th of October they will be upon the ground, and they shift about from one ground to the other up to about the middle of February. Then they go south and generally frequent the bays and the coast and the different islands for breeding. The right whaling grounds can always be recognised by the colour of the water. The colour of the water is no doubt caused by under-currents coming from the south, and in these particular places this current comes to the surface and brings the food of the whale to the surface. A ship sailing over one of those places very early in the season will see the water slightly discoloured, having a reddish appearance. That is owing to the brit as it is called—small animalculæ which the whales eat—being low down in the water. It is no use looking for whales there when the feed is low down. A week or so after that the feed will come within a foot or thereabouts of the surface, and any whaler would stop where he was until the whales came to the ground, which would be within a day or two. When the brit is about a foot from the surface the water is blood-red, patches of it several acres in extent. When the season is over that food, so much of it as is left, comes to the surface and dies; it turns a sort of straw colour. Then it is no use to look for whales any longer on that ground."

Range of right whales.

Right whaling grounds.

Brit—food of whales.

Right whales are frequently seen on the New South Wales coast, and several have latterly been taken at Twofold Bay.

Right whales on New South Wales coast.

Regarding the sperm whale, their range in the Southern Ocean is right from the Equator to 60 degrees south, and almost right round the world, with the exception that the sperm whale has never been known to go round the Cape of Good Hope; they always make their passage round Cape Horn. They are distributed pretty well through the tropics in the Pacific Ocean, right from the coast of Peru over to the coast of New South Wales. There are certain grounds called the offshore and inshore grounds, where the whales congregate at certain times, and about the different islands. The sperm whaling grounds are generally close to the islands. At full, the change, and the quarters of the moon, a day or two before or after those times, the whales are always close inshore; but between those times whalers have to look for them off the shore, say about 20 miles off, and always in deep water. The sperm whale never goes on soundings under 100 fathoms, and it is very seldom they come on to that. The sperm whales on or near the land are a smaller species than those further south. They are gregarious, and travel in very large herds, and breed throughout the year. Down in the tropics, or just above the Tropic of Capricorn, the whales run large; the bull whales sometimes average from 70 to 140 barrels of oil, the cow whales very seldom exceed 40 barrels. The sperm whale season lasts throughout the year; they are to be found in any season but in different localities.

Range of sperm whale.

Sperm whaling grounds.

whaling season.

The other whale of commercial value is the humpback. They come from the south in the early part of May and travel up close inshore along the coast of New South Wales and New Zealand. They go up as far north as about 15 degrees of south latitude, and collect all around the reefs and shores. They go up there to calve, and remain there until about October. When the calves are old enough to travel with their mothers they start south again, generally taking the same track as they followed coming up, and no doubt they go down among the ice in the Southern Ocean.

The humpback whale.

Captain Carpenter is of opinion that the whaling industry might be very largely developed, and he asserts that such development would be of great commercial value to New South Wales. When he first went whaling he sailed in company with over

Whaling might be developed.

24

over 500 ships in the Southern Ocean, right whaling in the season and catching sperm whales afterwards. In those days bone was worth from 17 to 20 cents. per pound, and they always chased the whale that was worth the most—the sperm whale. About four years ago, he brought bone into Sydney from the Southern Ocean, and it fetched 24s. 6d. per pound. The right whale of the Southern Ocean generally yields from about 800 lb. to 1,200 lb. of whalebone—that is, baleen.

Value of whalebone.

Antarctic exploring expedition.

We have also had the advantage of obtaining the evidence of two gentlemen who occupied the positions of manager and scientist, respectively, of the Antarctic Exploring Expedition, despatched in 1894 to the Southern Ocean by the late Commander Sven Foyn, an old Norwegian whaling master.

Mr. H. J. Bull.

Mr. H. J. Bull, the manager of the expedition, states that on making the 64th degree of south latitude many large whales were sighted, and from 64 to 74 degrees large whales were seen nearly every day. The whales referred to by him are termed the finback, or sulphur-bottom whale.

Mr. C. E. Borchgrevink.

Mr. C. E. Borchgrevink, scientist on the "Antarctic," asserts that great numbers of blue whales or finbacks were daily seen by the expedition. The blue whale is about 80 feet long and weighs about 90 tons. It sinks directly it is shot; the right whale and the sperm whale float on the surface after being shot. All the parts of the blue whale are of commercial value, but special appliances, similar to those now in use in the blue whale fisheries in Norway, are needed for their capture.

Blue whales.

Sperm whales.

During the voyage of the "Antarctic" to South Victoria Land, sperm whales were seen in great numbers, some of them being sighted off the southern part of the island of Tasmania.

Whales numerous on coast of New South Wales.

This last winter whales were unusually numerous off the coast of New South Wales, the masters of vessels and lighthouse-keepers and fishermen at different points continually reporting their presence in numbers, sometimes close in. One witness stated that two years ago he saw the sea off the coast of New South Wales thick with right whales; whales could be seen as far as the eye could reach. That was off Cape St. George. Sperm whales have also been seen in the Shoalhaven Bight and at other places.

Although we have not taken the evidence of many practical whale-men, owing to the fact that such evidence was difficult to obtain—whaling as a colonial industry having almost completely dwindled away—the information before us is sufficient to warrant the assertion that all that seems necessary to successfully conduct the whaling industry in our waters is enterprise, the proper equipment of a certain number of suitable vessels, and the employment of men skilled in whaling operations. Were this done, we feel confident that a revival of the industry would soon be effected, and Sydney, once the home of the trade in these latitudes, would take her rightful place as the great whaling depôt in Australasian waters. As a result of a revival of the whaling industry, other industries would naturally be started, considerable sums of money would be disbursed, and employment found for a large number of our population.

Steps necessary to revive whaling industry.

Government and the whaling industry.

In view of the importance of whaling to the Colony, we venture to express the hope that the Government will take some steps to assist in the revival of a trade which would undoubtedly prove of immense value to New South Wales.

The Herring Fishery.

Herring in our waters.

In our Advance Report we made a brief reference to the presence of the herring in New South Wales' waters, and reiterated the fact that no less an eminent authority than the late Sir William Macleay, F.L.S., affirmed that there is no sea on the globe favoured with a more rich or varied supply of fishes of the herring tribe than that which washes our shores. He claimed that the two principal species, the maray, *clupea sagax*, and the southern herring, *clupea sundiaca*, were, for excellence and delicacy of flavour, unsurpassable, and asserted that if preserved in oil, after the manner of sardines, would be finer eating even than those much esteemed delicacies. Sir William, whose experience of the fisheries, both from theoretical, practical,

25

practical, and economic standpoints, was very considerable, laid it down as a fact that these fish visit our coast in the winter months, passing from south to north in enormous shoals. Enormous shoals.

Of the presence of the maray in numbers close to these shores we have indisputable evidence. At many of the coastal fisheries visited by us we were enabled to establish the fact, on the authority of intelligent and reliable witnesses, that the herring does frequent our waters at certain seasons of the year. During September and October pilchards made their appearance in countless numbers, both along the coast and in many of the estuaries, and, from inquiries instituted at the time, we are enabled to say that, had the Colony been in possession of establishments for treating and preserving these fish, millions of them could have been netted and converted into a marketable commodity. Mr. D. W. Benson, Inspector of Fisheries, stationed at Lake Illawarra, has informed us that vast shoals of pilchards were for several weeks seen off the entrance to that lake and off Shellharbour. At Manly these fish swarmed in countless numbers, and at Middle Harbour and other parts of Port Jackson, nearly as far up as Chowder Bay, the water was alive with the immense shoals. Large schools of the herring tribe were also observed at other fishing centres. The amazing abundance of these fish makes it indeed regrettable that from the mere lack of the necessary appliances for canning, salting, and otherwise treating them, tons upon tons were permitted to leave our shores. Shoals of pilchards on the coast.

The concluding paragraph in our advance report respecting the establishment of the herring fishery reads as follows:—"We urge attention to the claims of our herring fisheries with all possible earnestness." We again desire to press the claims of the herring fishery with all the force and earnestness of which we are capable. Immense possibilities lie before the development of the industry. The annual value of these fisheries to Great Britain and to other countries represents an immense sum. As a consequence of the establishment and development of the industry remunerative employment is afforded to a vast number of people, ranging from those who engage in building fishing-smacks to those employed in the final distribution of the several catches. We again repeat that, owing to the costly nature of the undertaking, it is one which the Government must initiate, for it could not be undertaken with much hope of immediate success. It is to be hoped that some practical steps will be taken in the way of initiating and carrying on what we believe would eventually prove to be a very valuable industry. The doubt that existed in some quarters respecting the permanence of the trade, if established, has been dispelled, it being proved beyond all doubt that the *clupea* is an annual visitant to these waters. There is every reason to believe that a large and ever expanding industry could be instituted in the capture and treatment of the shoals of herrings that make their appearance at stated intervals, and it is imperative that something should be done to turn to account this valuable source of food supply which now, owing to the lack of suitable appliances and the requisite knowledge of skilled methods of treatment, is allowed to go to waste. Immense possibilities if industry developed. Government must initiate. *Clupea* an annual visitant to our waters.

We desire also to reiterate our assertion, "that apart from the value of the herring as a food fish, it would be difficult to estimate its worth as oil-producing material." Some countries extract large quantities of oil from herrings, and the annual value of the oil so obtained is estimated at many thousands of pounds. For years herrings have been largely converted into oil in Russia—about 100,000,000 of these fish are said to be sacrificed annually for oil-making. During the time that the influx of fish continues, 100,000 to 250,000 pouds (of 36 lb.) of herring oil are made on the Volga, according as the fish are abundant, and the fish more or less fat. The herrings are placed in open casks, containing about 1,000, and boiling water poured over the mass. After the lapse of several days the fish enter into putrid fermentation, when, under the action of the air, the heat, and the hot water, the oil separates. The whole is transformed into a half-liquid reddish paste, of a disagreeable odour. When once this putrid fermentation has commenced, a day suffices: the oil is then collected from the surface, and the mass thrown away. In Japan, also, oil is extracted from the herrings, which are caught in immense numbers. The fisheries in Japan afford employment to thousands of the inhabitants, and are a source of great profit, the prices varying from 48s. to 56s. the picul (130 lb.). Value of the herring as oil-producing material.

The

26

The Inland Fisheries of New South Wales.

The Snowy River and Acclimatisation of the Salmonidæ.

The Snowy River.

Referring to the remarks in our Advance Report respecting the Snowy River system, we have since visited the Monaro district and made ourselves personally acquainted with the capabilities of some parts of it for fish-culture, and have no hesitation in stating that our inspection has amply confirmed our previously-conceived favourable opinion concerning it.

Snowy River suited for fish propagation.

The Snowy River is undoubtedly a stream perfectly suited for fish propagation —indeed so suitable does it seem to us that we cannot press too strongly the desirableness of utilising its capabilities in the best direction and to the utmost extent.

At the present time, strange to say, the river is practically devoid of fish-life, so that any attempt at its utilisation for fish-culture would be commenced under unusually favourable conditions. With its perennially snow-fed streams, its frequently recurring eddies, rapids, falls, and currents, to say nothing of its value from the anglers' and the tourists' points of view, it seems so peculiarly suited to the nature and habits of the *Salmonidæ* that, in our opinion, it should be exclusively set apart for the propagation of species of that family, and be stocked with them in quite prodigious numbers.

River suited to *Salmonidæ*.

Special measures.

Now, it will be obvious that in a territory so remote from the metropolis as Monaro, and yet so specially important and valuable from a piscicultural standpoint, special measures will be necessary to ensure the complete success of any piscicultural experiments that may be attempted.

Vastness of Monaro water system.

As will be seen from the accompanying sketch-map, its rivers, creeks, lakes, and tributaries present a water system more vast and far reaching than has perhaps been conceived by many persons, and the very vastness of that system seems in itself quite a sufficient warrant for our contention, and for establishing fisheries there on quite a wide and comprehensive basis.

Any attempt to stock a river flowing for some 240 miles through rugged precipitous and mountainous country must, to be successful, be undertaken on a scale commensurate with the object to be attained.

The present necessary journey of trout fry from the metropolis by train, occupying some thirteen hours, seems but a sorry preparation for the further transit by coach of such a delicate commodity over the 30, 40, or 50 miles of rough country which has to be negotiated, and at not the most favourable season of the year, before even any principal points of settlement along the river can be reached, to say nothing of parts still more remote, and tributaries yet further back, which under such circumstances could never be reached at all.

It needs but little reflection to apprehend that a territory so distant from the metropolis as Monaro, and yet so specially important and valuable for fishery purposes, needs to have within itself all the accessories necessary for fish propagation and development, and to be not at all dependent for stocking upon outside sources.

Hatchery should be established at Dalgety.

We have therefore no hesitation in recommending that a perfectly-equipped hatchery, with ponds attached, should be at once established in the district; and we consider that the Government township at Dalgety (Buckley's Crossing-place), where there is unalienated land which could be availed of for the purpose, should be the spot at which the hatchery should be located.

Dalgety is a settlement on the Snowy River, and is the most readily-accessible point in one direction from Cooma. Its stream there is wide and of considerable volume; adjacent to it and at several intervals both up and down the stream, within the limits of our inspection, occur rapids, falls, and eddies, where the *Salmonidæ* would find locations suitable to their habits, and where, unimpeded by adverse conditions, they would of necessity grow and flourish. The erection of a hatchery need not be expensive; all that would be required would be an enclosure of, say, 5 acres of land, the erection of a caretaker's residence, and the construction of a hatchery and ponds. The cost of these ought not to exceed £500.

Cost of hatchery.

Migratory *Salmonidæ*.

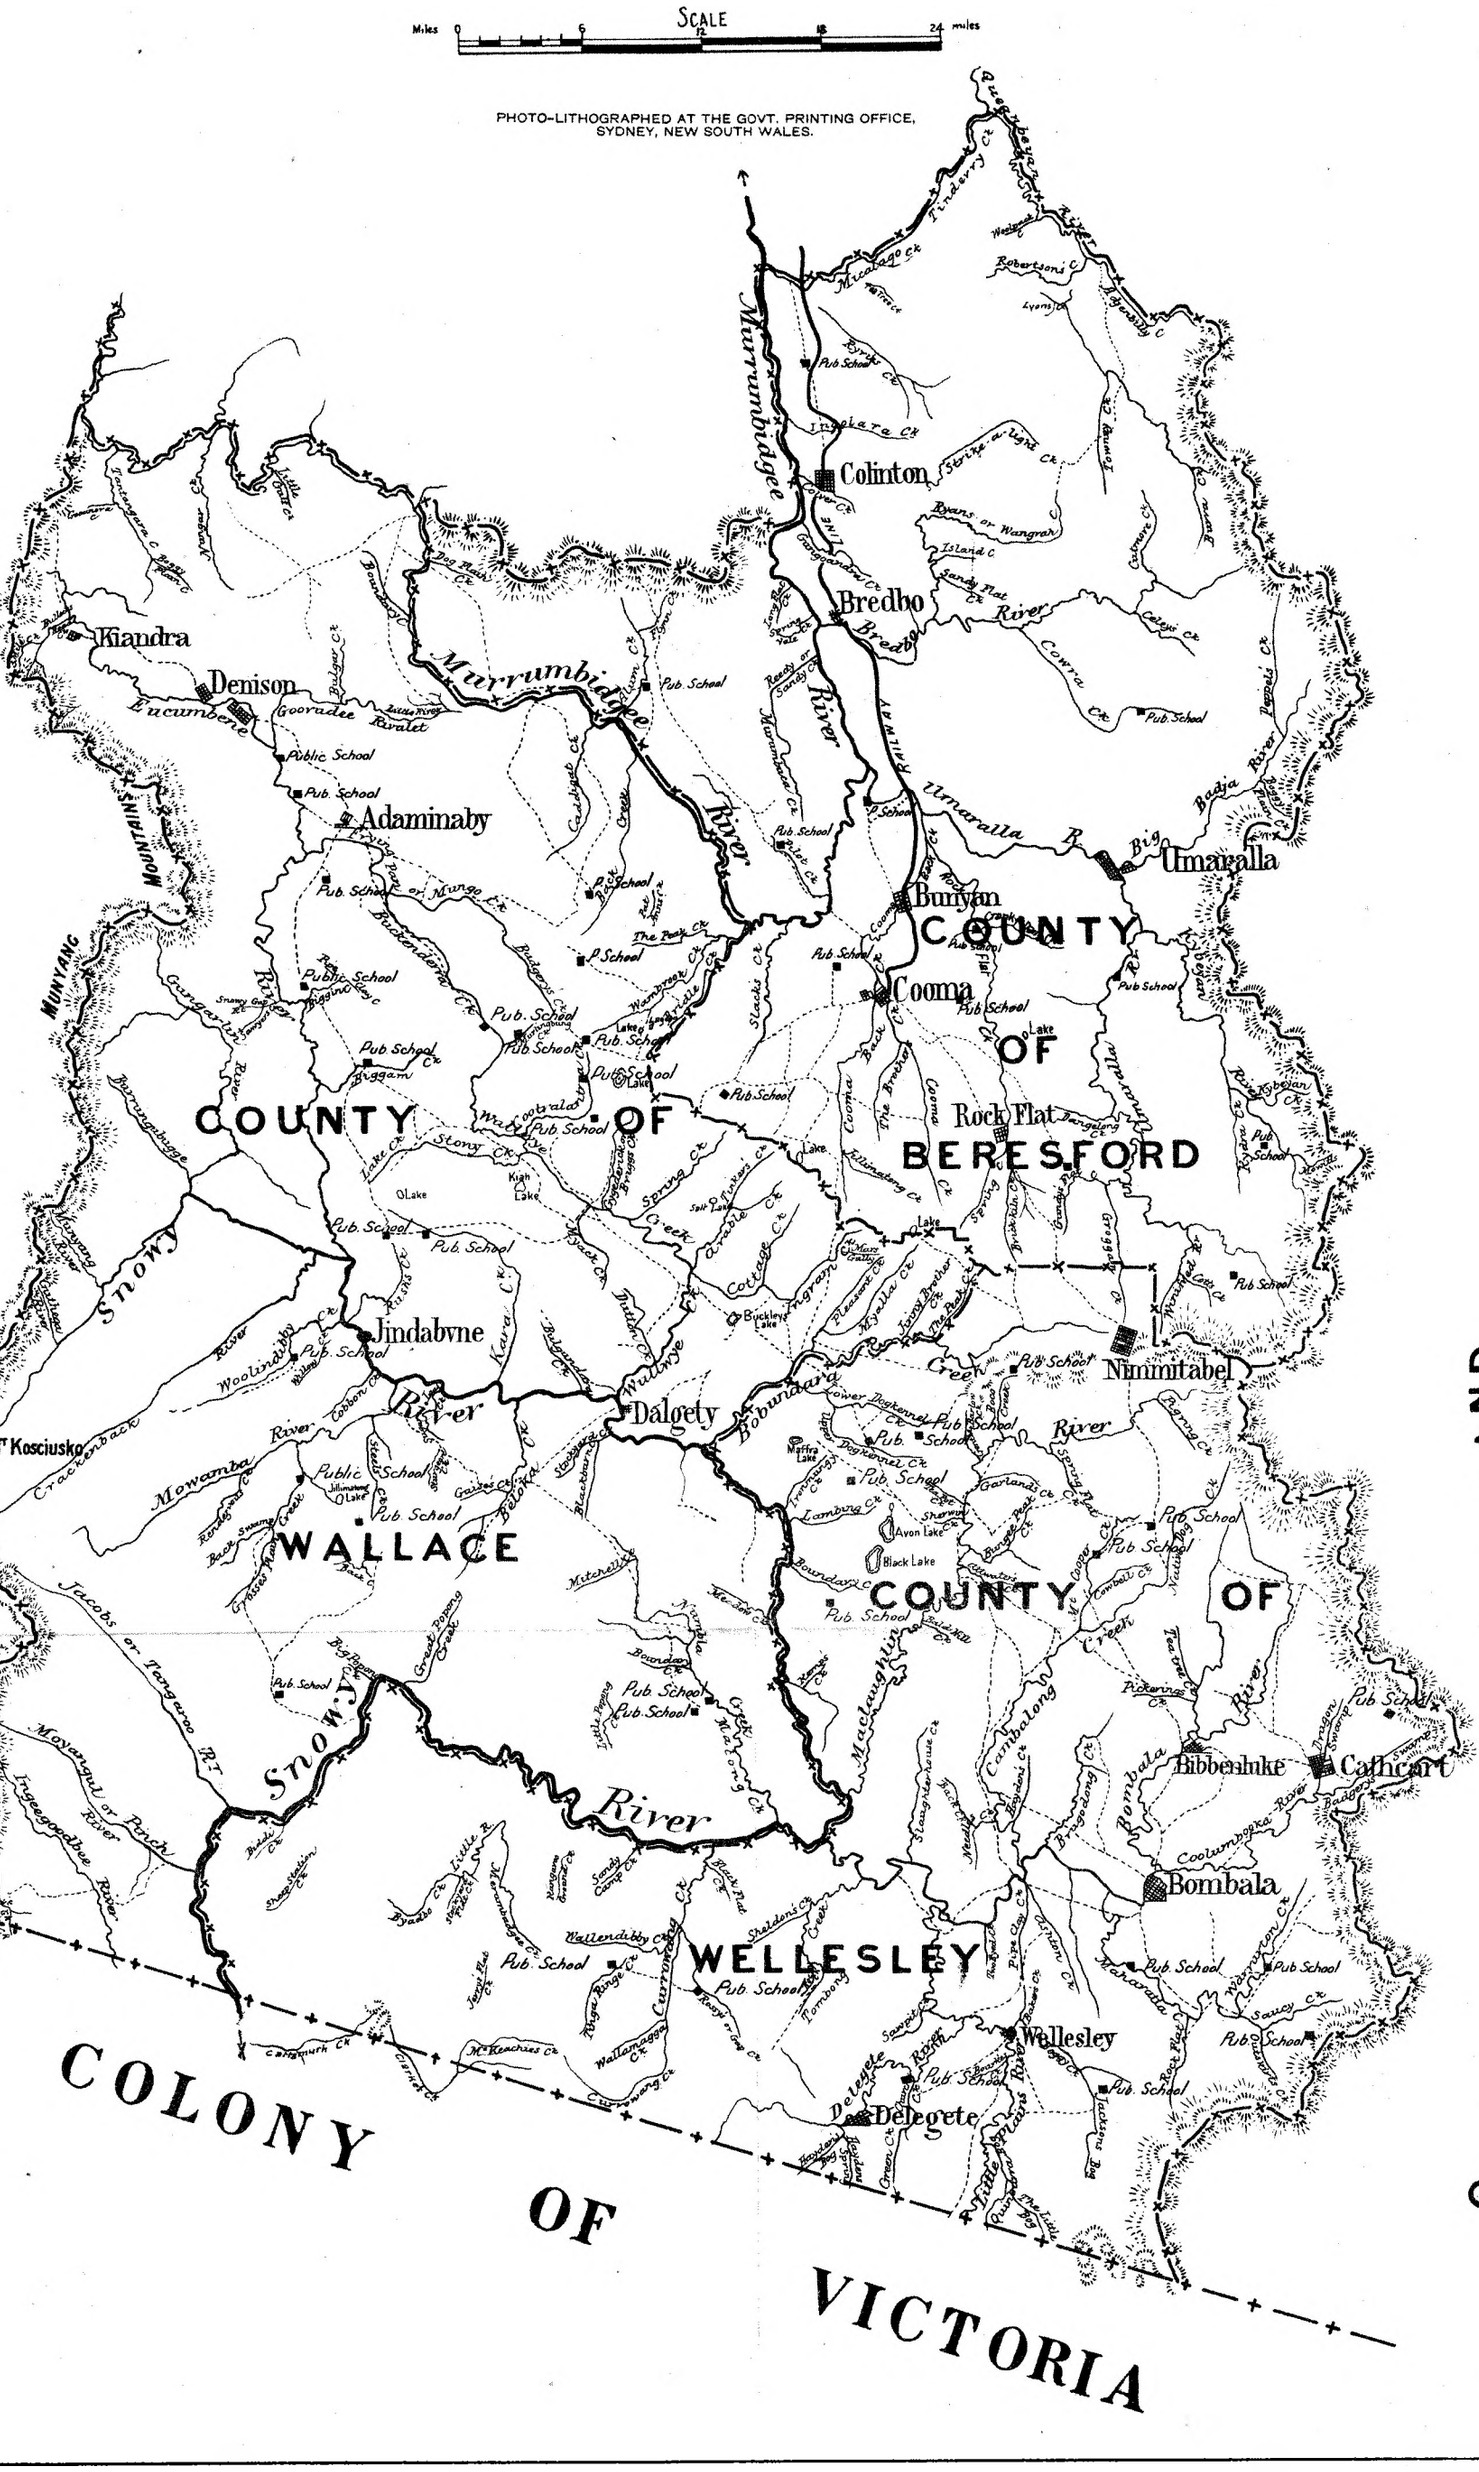
Moreover, the Snowy River is about the only water in the Colony in which it would be possible to fairly test the success of an experiment to introduce the migratory *Salmonidæ*. A possible impediment to the experiment might

be

MAP

showing the River system of the Monaro District embracing the

COUNTIES OF BERESFORD, WALLACE & WELLESLEY



(Sig 326-)

27

be the warmth our waters attain while passing through the long stretch of low lands intervening between the mountain coast-ranges and the coast itself. But except for an obstruction in the shape of some impassable falls at Popong, any migratory species of salmon reared in the Snowy could, if these falls were cut away—and we are informed that the work could be done at quite an inconsiderable expenditure—find their way through snow-fed waters to the sea, at a point in the lowest available latitude. It might be that the ocean-water even in that latitude would prove too warm for the salmon; but in the interests of pisciculture we think the experiment worth a trial, because if it succeeded it would mean the introduction of this king of fresh-water fish to the inhabitants of New South Wales.

The quinnat.

At any rate the quinnat—the American salmon—is a species which takes somewhat kindly to a comparatively warm ocean-water, and is the particular fish so largely imported here in the tinned state as Californian salmon.

The successful acclimatisation of this species alone in Australian waters would open out such enormous possibilities and advantages to the fisheries of the Colony that it would seem almost calamitous to refrain from making the attempt.

The landlocked salmon.

Then, again, there is the sebago or landlocked salmon, a variation of the true salmo-salar, its peculiarity being that it has lost its migratory instinct, and propagates and thrives in waters remote and separated from the sea. Its growth is said to be more rapid than the salar itself, and the flesh is described as rich and of a more delicate flavour. This fish is much sought after in the United States, taking, perhaps, in public favour the lead of all fresh-water fish species. According to the waters in which it is placed it reaches a weight from 5 to 12 pounds, ranging in exceptional cases as high as 18 pounds and 20 pounds. It has a preference for deep streams, and is very highly prized for food.

The rainbow trout.

Again, there is the rainbow trout—*irideus*—a hardy game fish, which is said to thrive in streams having a temperature higher than is suitable for the common trout. It hatches out in larger percentage, lives well in captivity, and grows rapidly.

This latter, of course, would be a fish suitable to the larger number of the rivers of the Colony, and in connection with the Snowy River is mentioned only incidentally; but supposing the attempt to introduce the quinnat should fail, we have still the landlocked salmon to fall back upon, which, from its habit, should prove a complete success. We believe that this species was sometime since introduced into the Scottish Lakes and Midland Waters, where its advent was hailed with immense satisfaction by Scottish lairds and other water proprietors who hitherto had been accustomed to suffer an immense percentage of loss from poaching during the necessary migration of the salmon proper to and from the sea.

We think that the utilisation of the Snowy River in the directions we have indicated should engage the immediate attention of the Government, so that the approaching season for hatching may not be lost.

The Murray and Murrumbidgee Rivers.

We have not yet found opportunity to visit the Murray River Fisheries, so that, beyond the remarks embodied in our Advance Report, we can report upon them only so far as the evidence we have been able to collect will warrant us.

Loss of effective supervision of Murray fisheries deplored.

We deplore the policy which for the past two or three years has involved the loss of effective supervision of these fisheries, and we urge very strongly the reinstatement of Messrs. Manton and Wilshire as Inspectors, at a salary. It would appear that these gentlemen have for some two years been doing duty in an honorary capacity; but it is scarcely within reason to expect that, at great personal inconvenience, they should continue the prosecution of unusually arduous official work, sometimes involving stripping and going into creeks to secure illegal nets, and taking them long distances to Police Courts for confiscation, without any remuneration whatever. One result of this policy must be that the interest they possess will eventually flag, and their supervision grow lax, thus really offering inducement to fishermen to infringe the law when they find opportunity. Indeed, that such has already been the case may be inferred by the fact that some of these fishermen seem now practically able to employ two steam-boats to convey fish to the several

Victorian

28

Victorian rail termini, which could scarcely be the case if legitimate fishing only were practised. If a check be not at once placed on this mode of business, it is only a matter of time, and a short time too, when the river will become entirely depleted of its produce.

Possible depletion of Murray.

Murray fish supplies the Victorian market.

The unfortunate side of the matter is that the fish of this river is availed of almost entirely for the benefit of Victoria—none of these fish reach the metropolis of New South Wales. Indeed, even the fish brought into consumption in Riverina are from the Murrumbidgee—not the Murray. This may in part be attributed to the limited railway communication on the New South Wales side, which is complete to the metropolis only from one point. In view of the use this river may be to New South Wales when the further contemplated railway connections have been made, it seems only judicious in the meantime to protect it from the spoilation to which it is now subject.

Destructive nets used.

We append emphatic evidence respecting the destructive character of many of the fishing-nets used in the Murray. These nets are very minutely described by Mr. Chanter, M.P., and from the description he gives of them it is really surprising that their almost unrestricted use in the past has not already depleted the river of fish. It is asserted that even cormorants, with their proverbially insatiable appetites, do not destroy anything like the number of fish which is accomplished by the ingeniously-constructed nets now in use.

Legal net.

We recommend that the net legal for use in the Murray should be the gill net proper—that is to say, a plain wall net without any bag or attachments or other auxiliary nets; it should be at least four inches in the mesh, so as to allow of the passage through it of any fish under marketable size.

Closures against net-fishing.

We consider also that the system at present adopted for the protection of young fish in inland waters is not a good one; the lakes and creeks being the breeding-grounds proper, should be closed against net-fishing, rather than stretches of river in close proximity to water-side towns, where the gravid fish and the smaller fry are seldom located.

Murray fisheries to be regulated by Governments of Victoria and New South Wales.

. From the evidence before us we are of opinion that it will be impossible to regulate the Murray fisheries with any hope of success, unless the Victorian Government will join in the attempt.

Special regulations.

In our Bill to regulate the fisheries we provide power to make special regulations to govern those in the Murray, and we urge that this should be undertaken as soon as ever the Bill becomes law, on a basis to be agreed upon at a conference between the fisheries authorities of the two Colonies.

Importance of Murrumbidgee River fishery.

The Murrumbidgee River on the other hand, one of the most important of our inland streams, differs from the Murray inasmuch as it is wholly within New South Wales territory, and could be largely utilised for purposes of supplying the metropolis and the south-western towns of the Colony with fish. Taking its rise in mountains not far from the Snowy River sources, it is fed along its course by numerous affluents, all of which add to it their quota of fish life. The evidence we have obtained discloses the information that these affluents, as well as lagoons and billabongs, which occur at intervals, are the natural breeding places of the fish commonly known as the Murray cod. This fish possesses an exceptional value peculiarly its own, and is in immense request by all fish connoisseurs; this indeed is evident from the avidity with which the Murray River alone is being netted for the Victorian market, in which this fish is always to be found in far greater abundance than in our own metropolis.

Murrumbidgee should be under effective control.

Now the Murrumbidgee, if placed under effective control, and its affluents and lagoons sufficiently protected by a judicious system of closures for the conservation of the young fish, which, it would appear from the evidence, has not so far been the case, we might with confidence expect this river to be a large factor in the production of a fresh water fish, which for excellence and general economic usefulness may be regarded as of co-ordinate value with the schnapper of marine waters.

Other principal rivers of N.S.W.

The other principal rivers of the Colony we have not found opportunity to inspect. We are, however, of opinion that they all need efficient oversight, provisions for protecting the fry of the fish they contain, and to be brought under some general regulations which shall ensure fishing operations being carried on in them under conditions which shall obviate to the greatest possible extent the wholesale destruction of fish life which at present obtains.

29

Lake George.

Lake George, distant about 5 miles from Bungendore Railway Station, may be described as an inland sea. It is the largest sheet of fresh water in New South Wales. Situated in the midst of a mountainous country, it has a well-defined catchment area but no visible outlet, although by some it is thought that a certain quantity of its waters disappears yearly through subterranean channels which are said to exist eastwards to the Shoalhaven Gullies. The lake was discovered early in the present century, during Governor Macquarie's term of office. At the present time it is about 18 miles in extent from north to south, its greatest breadth being something like 6¼ miles. The greatest depth is about 13 feet, the average depth being 7 feet—the difference is explained by the fact that its margins for many miles are extremely shallow. The lake has four tributary streams discharging their waters into its basin. Turalla, and Deep Creeks flow from the southern watershed; from the eastern watershed comes Taylor's Creek; while Collector Creek enters from the northern watershed. It was owing to the action of Mr. (afterwards Sir) Terence Aubrey Murray, that fish were first introduced into the lake. This gentleman at one time owned the estate of Windradene, through which property ran Collector Creek. The channel terminated, like those of other creeks, in an extensive bed of silt on the margin of the lake. Into Collector Creek Mr. Murray had introduced a consignment of cod, bream, or perch, which he caught in the Queanbeyan River and forwarded to their destination in hogsheads on a bullock dray. The perch, or bream, were never afterwards seen, but the cod thrived and increased so rapidly that in the space of a few years they became abundant in Collector Creek. In the year 1864, a very wet season, the waters began once more to be retained in the basin of Lake George which had previously drained dry. They gradually spread until in 1874, or thereabouts, another very wet period, the area of the lake extended upwards of 20 miles in length, by 12 or 14 miles in width. The silt beds at the mouth of the various contributary creeks being permanently covered, the fish in those affluents had free ingress and egress from them to the brackish waters of the lake. For a long time, however, the existence of the Murray cod in the waters of Lake George remained unknown. The first captures of these fish appear to have been made by settlers in the neighbourhood of Deep Creek, who found that stream teeming with large cod ranging up to 40 lb. in weight. Later on the people of Bungendore discovered shoals of cod in the Turalla Creek, which flows through that town. It would appear that those fish, or the stock from which they were bred, had been carried into the lake in the rainy season of 1864, their natural liking for fresh water leading them to forsake the brackish waters of the lake for the sweeter waters of the creeks. Sometime afterwards the brackishness of the lake water diminished, and it was then found that fish were present in larger quantities in the lake itself. This is the condition of the fisheries at the present time.

An inland sea.

Extent of lake.

Introduction of fish.

Murray cod in lake.

Our inspection of Lake George has led us to form a very high opinion of its capabilities as a fishery. It contains large quantities of Murray cod, also other fish of less material and economic value. As a fishery this immense sheet of water is practically unworked, although in former years great quantities of cod—totalling probably many hundreds of tons—were taken out of it, and distributed in the important centres of Goulburn, Queanbeyan, and Bungendore.

Capabilities as a fishery.

It seems improbable that much good will accrue to the community as a whole from the fishery at Lake George until it is placed under efficient supervision and is governed by proper regulations. If this were done its development would follow and a most important source of food supply for the inhabitants of the adjacent towns and the metropolis would be created, there being no doubt that by the employment of suitable trawling apparatus a constant and regular supply could be forwarded to the Sydney market.

Efficient supervision necessary.

Under favourable conditions practical fishermen, provided with proper boats and appliances, would undoubtedly reap a large reward for their labours. Indeed the use of a trawl would seem indispensable, as the fish, being naturally well fed, are shy of the bait even in the summer, while in the winter months they lie dormant in the soft mud at the bottom of the lake. In addition to the undoubted value of the Murray cod as an article of food, the oil obtained from this fish is said to be equally as good as imported cod liver oil. It would also be of value for lubricating machinery. Some years ago, owing to certain deleterious matter draining into the lake, many fish died. This created a little trade in fish oil, several barrels being sent away, the consignments realising 2s. 6d. per gallon.

Trawling at Lake George.

Complaints

Closure of creeks, &c.

Complaints have been made that much destruction of cod fry has been caused through the use of small nets in the creeks and shallow places along the shore. This is a matter calling for attention, and we urge the closure of the creeks and certain portions of the lake against fishing operations at certain times of the year. Also,

Fish-eating birds.

fish-eating birds, principally cormorants, shag, and pelicans, destroy such an immense quantity of fry, that some inducement for their destruction seems to be demanded.

No ready means of access to shores of lake.

Grievous complaints have been made to us by the inhabitants of Bungendore and other places, that the public have not access to the shores of the lake. Apart from its value as a fishery we regard Lake George as a future great national pleasure resort, and would strongly urge upon the Government the advisableness of resuming an area sufficient to form a road of access to the water frontage of the lake, and a good drive right round the foreshores. It seems imperative that some such thing as this should be done in order to conserve the public interest, as at the present time the people cannot, except on sufferance, approach most parts of Lake George. As the lake will in all probability be largely resorted to in the not distant future, it is of the utmost importance that this matter should have attention.

Oysters.

Hunter River deposits.

We have made a visit of inspection to some of the oyster-beds and foreshore deposits in the Hunter River. An examination of numerous specimens taken in the dredge from deep-water beds leads us to hope that the worm disease which for so many years has proved so fatal to the bivalve, is being gradually overcome, and that the time is not far distant when it will have been completely eradicated.

The lessee, Mr. F. J. Gibbins, has been most persistent in his efforts to combat this pest—his plan of action has been to keep the beds constantly worked and to remove all the shell from affected areas. This work has been a long and expensive one, but the wonderfully prolific nature of the Hunter River in oyster development, and the exceptional excellence of the oyster itself seemed to justify the efforts so untiringly made, and the result is now becoming apparent.

Growth of spat in Back Channel and in Fullerton Cove.

In the Back Channel the growth of spat appeared to be very free and quick, as was evidenced by the unusual development of the spawn which had set during the last winter.

In Fullerton Cove the development seemed more pronounced still; indeed, we were informed by the manager that such a rapidity of growth had not occurred for years.

Natural foreshore deposit at Smith's Island.

As the mode of occurrence of the oyster may be new and, perhaps, interesting to some persons, we append an illustration showing a section of a natural foreshore deposit at the south-eastern end of Smith's Island, in Fullerton Cove, obtained under some difficulties, at a point of time as near as was possible to the lowest neap-tides. The foreshore, as will be observed, is well covered with oysters of all sizes of growth, partially buried in the mud, but spread as evenly as if they had been sown broadcast. In the distance are to be seen boats engaged in the operation of dredging, and men employed in raking up oysters and shovelling them into baskets and other receptacles for deposit on some of the adjacent beds under deep water. This flat at lowest neap-tide is uncovered quite up to the houses on the higher land, and for a considerable distance and width on the south-western side as well. The total area of the deposit

Quantity of oysters on island.

may be estimated at about 5 acres; the quantity of oysters, large and small, upon it at the present time would fill about 1,000 3-bushel bags. If these oysters were to be left to grow to maturity they would in about nine months time fill (say) quite 3,000 of these bags. But the lessee has been, and indeed is still engaged in removing them to some deep water beds in the vicinity where he expects them to mature more quickly, and to acquire a flavour even better than they now possess.

Quality of oysters.

It may not be known to every one that the quality of oysters grown in beds under deep water is immeasurably superior to that of oysters grown on shores where they are wholly or partially uncovered at every tide.

There are eight men employed in gathering and removing these oysters. They can work only at certain states of the tide, and it will take from twenty-four to thirty tides to effect complete removal.

This is only one of numerous foreshores existing in most, if not all, of our rivers, where oysters would, under protection, grow and thrive naturally, and there

Oyster farms at Port Macquarie and Clyde River.

are frequently recurring spots where they can be made to grow artificially as well, but this branch of the business has not, except in very few instances, been taken up with

Section of a Foreshore Oyster Deposit at Smith's Island, Hunter River.

31

with enthusiasm. We are informed that, amongst others, there are artificially cultivated oyster farms at Port Macquarie, and at Clyde River, but opportunity has not occurred to visit these distant waters, which we are given to understand are well worth inspection.

Market Accomodation.

As evidencing the value of the recommendations and suggestions made in our Advance Report, we cannot feel other than gratified in knowing that many of our suggestions respecting market accommodation have been adopted by the civic authorities. For instance several important improvements at the Woolloomooloo Fish Market which we advocated are to be immediately carried out. Briefly stated the reforms referred to include the erection of raised tables, a reduction in market dues, and the granting of authority for fishermen to vend their own fish.

Adoption by civic authorities of suggestions made by Royal Commission.

The adoption of the raised tables alone will prove a vast improvement upon the system of displaying the fish which now obtains, unnecessary handling of this perishable product will be avoided, and it will at once assume a much cleaner condition than has hitherto been the case.

Vast improvement.

Nevertheless we feel it incumbent upon us to reiterate our opinion, already expressed, that the Fish Market to be of use generally to the community should occupy a more central site. We think there are sites better suited than the one at Woolloomooloo. The Darling Harbour railway terminus, to which access is available by water, rail, and road, would form a far more convenient site for the central fish market; and were auxiliary markets established in each of the most important suburbs, and the whole system properly supervised and placed under the control of the Government, something more approaching perfection in our mode of fish distribution would result. Were such a system as we have indicated brought into operation the fishermen and the consumer would be equally benefited, and besides, our inland towns would share in the advantages to be gained by the institution of a more ready means for despatching consignments of fish to the interior.

Fish Market should occupy a more central site, say Darling Harbour.

Fish supply to inland towns.

Fisheries Legislation.

We think it a matter for extreme regret that it has not been found practicable to introduce to Parliament during the session now terminating the Bill to regulate the Fisheries and Oyster Fisheries of the Colony, which we had the honour to submit so far back as the 14th June last.

Fisheries and Oyster Fisheries Regulation Bill.

We feel confident that the fisheries, if properly controlled and developed—as we venture to think they would be under a measure like the one to which we refer—will prove an important and valuable addition to the staple industries of New South Wales.

We have the gratification of knowing that our Bill has been most favourably received and commented upon in various quarters, and in concluding the task entrusted to us under our Commission, we desire to record our earnest hope that in the public interest and in the interests of the particular classes the Bill has been designed to relieve and benefit, it may receive the attention of the Legislature and be passed into law at the very earliest possible opportunity during the next session of Parliament.

We have the honor to be,

Your Excellency's obedient Servants,

FRANK FARNELL,
PRESIDENT.

R. H. D. WHITE,
Commissioner.

LINDSAY G. THOMPSON,
Commissioner.

Sydney, 13th December, 1895.

ROYAL COMMISSION ON FISHERIES.

MINUTES OF EVIDENCE.

SUPPLEMENTARY REPORT.

DEEP-SEA FISHERIES.

WHALING.

TUESDAY, 26 *MARCH*, 1895.

[*The Commission met at the Offices, Bligh-street, at* 10·30 *a.m.*]

Present:—

FRANK FARNELL, Esq., M.P., President.

L. G. THOMPSON, Esq., J.P.

Captain John B. Carpenter, late master of the whaling vessel "Costa Rica Packet," sworn and examined:—

1. *President.*] You were captain of the "Costa Rica Packet"? Yes. Capt. J. B. Carpenter.
2. Have you had considerable experience in connection with the deep-sea fisheries in southern and other waters? I have had considerable experience of whaling, but not so much with the fisheries generally. 26 Mar., 1895.
3. What is your opinion regarding the future prospects of the whaling industry in New South Wales? Well, I have been these last four years trying to start a company to go in for whaling, because I have such confidence in what whaling might be made—I mean, of what value it might be to New South Wales, Sydney being one of the best ports in the world, and the nearest to the whaling grounds in the southern ocean. Within a radius of about 1,200 miles from here lie about the best whaling grounds in the world. There are any amount of whales there—the right whale, the humpback, and the sperm whale; there are any amount of them, and the seasons following on as they do, one after the other, makes it so that a ship sailing from Sydney could utilise the whole of the year in whaling.
4. Is that because the whales seek a temperature that is congenial to them, or is it on account of their having certain feeding grounds to which they make periodical visits? I think it is that they have certain feeding grounds which they visit regularly. We see them there at times, and they go away again and we do not know where they go; but there are times when you can count upon their arrival at that place almost as certainly as you could depend upon the arrival of a mail steamer at a given port. I know something about whaling, being a practical whaler; my experience and study of whaling extend over a period of about thirty-five years.
5. Will you tell the Commission something about the different species of whales? The range of the right whale is from the west coast of Patagonia east to 170 degrees west latitude. They go north as far as the Brazil Banks in the Atlantic Ocean, and 34 degrees south latitude in the Pacific. Their range extends from that to about the 50th parallel of south latitude. Outside of those limits it is scarcely worth while to look for them. They come north in about October. We generally reckon that about the 13th of October they will be upon the ground, and they shift about from one ground to the other up to about the middle of February. Then they go south and generally frequent the bays, and the coast, and the different islands for breeding. The right whaling grounds can always be recognised by the colour of the water. The colour of the water is no doubt caused by under-currents coming from the south, and in these particular places this current comes to the surface and brings the food of the whale to the surface. A ship sailing over one of those places, very early in the season, will see the water slightly discoloured, having a reddish appearance. That is owing to the brit as it is called—small animalculæ which the whales eat—being low down in the water. It is no use looking for whales there when the feed is low down. A week or so after that the feed will come within a foot or so of the surface, and any whaler would stop where he was until the whales came to the ground, which would be within a day or two. When the brit is about a foot from the surface the water is blood-red, patches of it several acres in extent. When the season is over that food, so much of it as is left, comes to the surface and dies; it turns a sort of straw colour. Then it is no use to look for whales any longer on that ground.
6. In regard to the animalculæ which discolour the water, what are they? An animal production. I have often looked at them through the microscope. They are little things with a red head and a long tail like a hair.
7. Where do the animalculæ come from? From close down amongst the ice-fields.
8. They must be conveyed some hundreds of miles, then? Very likely. The Antarctic current comes pretty close to this coast at Cape Howe. There it splits and goes to the eastward, and about 70 miles east of Cape Howe there is a whaling ground. There is a whaling ground in about 40 degrees south, and there the feed is always to be seen. The right whales go into the unfrequented bays around the coast of New Zealand, Campbell Island, and the Auckland Islands, for the purpose of calving. They have been chased off the New South Wales coast. They are being chased from Twofold Bay owing to the steamer traffic on the coast, but they still come up to the Great Australian Bight to calve.
9. What about the sperm whale? Their range in the southern ocean is right from the Equator to 60 degrees south, and almost right round the world, with the exception that the sperm whale has never been known to go round the Cape of Good Hope; they always make their passage round Cape Horn. They

 are

Capt. J. B. Carpenter. 26 Mar., 1885.

are distributed pretty well right through the tropics in the Pacific Ocean, right from the coast of Peru over to the coast of New South Wales. There are certain grounds, called the offshore and inshore grounds, where the whales congregate at certain times, and about the different islands. The sperm whaling grounds are generally close to the islands. At full, the change, and the quarters of the moon, a day or two before or after those times, the whales are always close inshore; but between those times we have to look for them off the shore, say about 20 miles off, and always in deep water. The sperm whale never goes on soundings under 100 fathoms, and it is very seldom they come on to that. The sperm whales on or near the land are a smaller species than those further south. They are gregarious and travel in very large herds, and they breed throughout the year.

10. Have they no fixed season for breeding? No; they breed right throughout the year. I have seen them every month in the year with small calves beside them, and I suppose they breed in about eight or nine months, because I have seen them with two calves, one a few days old and the other under a year old. After you get well down in the tropics, or just past the tropic of Capricorn, you generally find the whales large, the bull whales sometimes running from 70 up to 140 barrels. The cow whales very seldom exceed 40 barrels—it is a large cow whale that would make 40 barrels. The sperm season is right throughout the year. You will find them any season, but in different localities.

11. What about the humpback? The other whale of commercial value is the humpback. They always come from the south in the early part of May and travel up close inshore along the coast of New South Wales and New Zealand. They go up as far north as about 15 degrees of south latitude and collect all around the reefs and shores. They go up there to calve and remain there until about October. When the calves are old enough to travel with their mothers they start south again, generally taking the same track as they followed coming up, and no doubt they go down among the ice in the southern ocean.

12. What special advantages does the port of Sydney possess, so far as the whaling industry is concerned? It would be very advantageous to engage in whaling from this port. The whaling grounds are, comparatively speaking, close to Sydney, and whales are undoubtedly plentiful. Another thing in favour of Sydney is that it has such a fine climate—so much sunlight and fine weather—that the oil from the whales could be separated and clarified—which is mostly done by the sun—and placed on the market ready for use at a minimum cost. A few days sunlight will take the colour out of the very darkest whale oil and make it clear.

13. Are there any other whales worth looking after? There are no other whales worth going for. There are finbacks and sulphur-bottoms in the southern ocean. Those whales are of great size, but if you kill them they sink.

14. What is the origin of the term "right whale"? I think it was given to the Greenland whale by the early whalers. They found several species of whale in Arctic waters—finbacks, the rorq whale, or sulphur bottom, and the humpback. The name "right whale" was given to the Greenland whale on account of its being the one of most commercial value. They mostly sought after it, and in order to distinguish it from the others they call it the right whale.

15. Are the different whales you have mentioned numerous within the radius you have given;—do you think the whaling industry might be developed, and that such development would be of great commercial value to New South Wales? Yes, I do. At one time whaling was carried on with great success in Australia; but when the gold-fever broke out, all the whalers struck for the gold-mines, and there was nobody left to catch whales. That was how whaling broke up here. When I first went whaling, I sailed in company with over 500 ships in the southern ocean, right whaling in the season and catching sperm whales afterwards. In those days bone was worth only from 17 to 20 cents. per pound, and they always chased the whale that was worth the most—the sperm whale. About four years ago I brought bone into Sydney from the southern ocean, and it fetched 24s. 6d. per pound. The right whale of the southern ocean generally yields from about 800 lb. to 1,200 lb. of whalebone—that is baleen. We do not trouble about the other bones, although the bones of the whale would be worth £3 per ton for making animal charcoal; besides, in humpbacking there is not only the whales to make profit out of, but there are countless sharks, and they could be killed and their fins and tails turned into a marketable commodity.

16. What is the value of shark's fins and tails? They are worth in China from £120 to £130 per ton, and they give you £80 a ton here for them. When I had the "Costa Rica Packet," while they were cutting-in, I have caught from sixty to eighty sharks. I have caught sharks until I got tired of it, and cut their fins and tails off and let them go again. I dried the fins and tails. The Chinamen grade their fins. In the market you will see white sharks' fins—the fin black on one side and white on the other—that is the side fin of the shark; but the fin they cut off the back and the tail goes with the other. The white shark fins bring the biggest prices.

17. Is any use made of the liver of the shark? Yes; sometimes on a whaler the crew cut the liver and leave it in the sun. That draws the oil out. Shark oil is pretty valuable. We got half a tub full of oil from a great tiger-shark. There is nothing inside a shark but his liver. If the liver is boiled it will boil like a bullock's liver, and you will get nothing out of it, but if allowed to remain in the sun it runs away to nearly all pure oil. The oil is of a light amber colour, and very pure.

18. Have you any knowledge of the experiments made by the captain of the "Jenny Lind" in trying to capture whales on this coast last winter? The captain of the "Jenny Lind" has been to sea with me. He is a whaleman. He will catch a whale if he sees it—that is, he will try to catch it; but I do not think the men with him had enough experience.

19. Would the experiments have proved more successful if the captain had had practical men associated with him in the capture of whales? Yes, it would. If a whaling vessel were out here, I am confident, if I could take her out, I should bring her back so full that hundreds of people would want to put their money into whaling. If the Dutchmen will give me my money, I will fit out a ship and prove that what I have written and spoken about for so many years is a fact; but really there is no proof wanted. If you look at the statistics of New South Wales from 1826 to 1850, and see the quantity of whale oil and bone procured, it would astonish you; and remember, every bit of that was got within 1,600 miles of this coast. The American whalers come to these seas, get whales, and take the oil home, and it is sent out here and sold at a tremendous increase in price. Why should we not fit out our own whaling vessels in Sydney, send them to the grounds, capture the whales, and so supply ourselves with the oil and other things we want.

20. Are you aware of any other expedition that has been fitted out of late in order to search for whales in the southern ocean. Yes; I have read an account of the trip of the "Antarctic," the facts in connection with

with which, as elicited from the crew, I have undertaken to answer. The statement, and my answer thereto, are contained in the following paper, which I will with the permission of the Commission, now read: — Capt. J. B. Carpenter. 26 Mar., 1895.

THE Norwegian whaling barque "Antarctic" has returned, after an absence of six months cruise for right whales in the southern ocean, reporting that they had not seen a single right whale, and with the exception of one small sperm whale captured off the coast of Tasmania, totally unsuccessful. Mr. H. J. Bull, who was in charge of the expedition, has come to the conclusion that there are no right whales in the southern ocean, and that Captain Ross in his report of having seen large numbers of them must have been mistaken in the species of the whales he saw, and mistook the humpback for the right whale. A person who has once seen a right whale could never make a mistake, and certainly not Captain Ross and some members of his crew, for they had made several voyages to Baffin's Bay in whalers; therefore they knew one whale from the other.

A right whale has a smooth back, the humpback has a sort of hump or fin on his back, and their manner of spouting is totally different. It is impossible to confound the two species. The natural haunt of the right whale is in the temperate zone, not in the frigid.

Before whaling was carried to its greatest extent, the right whales in the northern hemisphere were to be found as far south as the coast of France on the European side, and Massachusetts on the American, in the Atlantic, and the coast of Japan, and California, and the Ockotsh Sea. The fact of their now being found in the northern ice is that they have been driven there by the whalers. That the right whale is in the southern ocean is an undisputed fact. Three-fourths of the oil and bone placed on the market for over 150 years has been procured in the southern ocean.

Fifty years ago, when Captain Ross reported right whales in high southern latitudes, he was no doubt perfectly right, for at that time there were over 500 ships from American ports, and about thirty-five from Sydney, chasing the whales in these waters, and had been doing so for the last sixty years or more, and had chased the whales from their natural haunts to the ice.

About 1847, the right whale and bon-head was discovered on the North Pacific Ocean about Japan and California, and there was a rush of whalers for that locality, and the southern whales were left apparently unmolested except by a small number of ships, and after the American war in 1865, only a few ships resorted to the southern ocean; consequently, the whales being unmolested, they have increased enormously, and have returned to their former feeding-grounds in the lower latitudes.

The range of the right whale in the southern ocean is from the west coast of Patagonia east to 170 degrees of west longitude. They come as far north as the Brazil Banks, and their range is from 34 degrees to 50 degrees south latitude. Outside of these limits it is useless to look for them. They have certain feeding-grounds where they congregate in the proper season, and to find them these places must be known; without that knowledge a ship might sail until the day of judgment without coming in contact with them. The southern ocean is a large place to search, and their feeding-grounds occupy only small areas. On a former cruise the "Antarctic" came across right whales, and saw several, but was unable to capture them, and the result of this voyage would have been just the same, even if they had seen a number of them, because their ship is not properly equipped for a southern whaling voyage, and there were no experienced whalemen in her crew, which can be plainly seen by the mode adopted in the capture of the small sperm whale mentioned above. The best argument that can be used in the present case is the fact that while the "Antarctic" has been cruising aimlessly about and seeing nothing, three ships have filled up with sperm oil in one place, and two American whalers have made a good catch of right whale oil and bone within 1,000 miles from Sydney in three months less time, and have been into port and shipped their catch to America. This plainly proves that an experienced man can find and capture whales, and an inexperienced one can roam over the sea for six months and never catch a glimpse of a whale. It also proves that whales exist in the southern ocean; and if further proof were needed, reference to statistics of New South Wales shows at the time Captain Ross reported whales in the ice fifty years ago, there was shipped from Sydney to London in five years, 4,851 tons of right whale oil and 520 tons of whalebone. I have caught right whales there also and brought the oil and bone to Sydney, and last season several right whales were seen from the shores off Twofold Bay, and one was captured.

The right whales are on their feeding-grounds in low latitudes in the summer months only, and go to the bays in higher latitudes in the winter to breed. The sperm can be found every month of the year. Humpbacks only in the winter months and in low latitudes, in the bays and among the reefs. In the summer months they go south, probably in amongst the ice. All the oil and bone shipped from Sydney and Bay of Islands was procured in the Southern Ocean.

Sydney, 25 March, 1895. J. B. CARPENTER.

I think this is the third time he has gone out from Melbourne. He got on the whaling grounds by a fluke, and if he had remained where he was he would have seen plenty of whales; but the equipment of the vessel is such that it is an impossibility for him to catch whales in the south.

21. Can you say, speaking in the light of your long experience in whaling, whether the port of Sydney might be made the depôt of a great whaling industry in the future? Yes, it can; and if ever I get the chance I will make it a whaling depôt. No one has tried harder to induce people to go into the whaling business than I have. If only one ship were sent out, and she proved a success, there would be plenty of capital forthcoming for this business; but they are all afraid to make a start. If people will only look back in the history of New South Wales they will see that before the gold fever broke out the whole of this place, and Twofold Bay also, got nearly all its money from whaling. It will be just the same again if you once get the whaling industry started here in Sydney. No money would go out of the country, as the crew would spend their wages here. As a result of the establishment of the whaling industry, other industries would naturally be started. In America, near the place I came from, they had nearly 47,000 men alone to chase the whales, and double that number engaged directly and indirectly on shore.

22. What is the name of the town you refer to? New Bedford; it is a great whaling centre in America.

23. Have you had a practical acquaintance with deep-sea fishing? No; but I have often observed the natives in the China Sea, around the coast of Japan, and up in the Malay Archipelago; they all have their own way of fishing, and I think some of their methods could be adopted here. Take the Javanese—there are very few surface fish up in those waters, and they have to catch their fish from the bottom, they go out so far. Sailing along the coast of Java and Madura, sometimes 40 miles away from the shore, you will come across a lot of bamboos sticking up in about 40 fathoms of water; these bamboos are pointed at the ends, and the fish go into the trap, but cannot get out again. When you see those bamboos above the water, you know that it is a fish-trap placed there by the natives.

24. Can you describe the trap in question? It is made of bamboos. It is a basket about 6 feet long and 3 feet wide, and about 18 inches high. I have been thinking of trying it myself out on Long Reef. You make the mesh of the basket so that the very small fish can go in and come out; but the big ones cannot leave the trap. By using something like that on our coast you would get schnapper and other fish, plenty of them. The natives up there in the East go out into the deep water, miles away from land, and put those baskets down and catch plenty of fish. The natives sink their baskets, leaving a few bamboos above the surface to mark the place, and in that way they get them full of fish. That system could be employed on this coast, on the rocky bottoms and places where we could not trawl. In Siam I have loaded fish in my ship. The fish are salted in the ship. The fish are like herrings, about 8 inches long. The natives call them plahenge. Those fish are caught at the bottom of the river. I suppose they are the fish bred in the river, and those that are not captured travel out to sea when they get to a certain size. The natives keep this

Capt. J. B. Carpenter. 26 Mar., 1895.

this fish alive by forming a kind of pen into which the fish are driven, and the natives go in at low-water, and dip up immense quantities of them. The natives sink the fish-trap or pen to the bottom of the river, and in one single tide those traps will catch large lighter loads of plahenge. They bring them up the river and put them into the ships, head downwards, in regular rows. They put a layer of fish right through, from one end of the vessel to the other; the layer is at the bottom of the ship and the fish are standing on their heads, with their tails uppermost. Then they put a layer of salt on top, and follow that with a layer of fish, another layer of salt, and so on until the ship is full. I have loaded 7,900,000 of those fish in one shipload, and I took them to Java, and my ship was only one of about 120 others engaged in the same work. That happens in that country every year, from October to the end of January. The fish caught in the river at Siam are readily disposed of at the ports in Java; there is an immense demand for fish in all those countries. It would be just the same if these shoals of fish that pass our coast were caught and salted—there would be a market for them right throughout the Malay Archipelago. All the natives live on fish, when they can get it. Notwithstanding the fact that thousands of fishermen follow their calling in China, there are thousands of tons of fish imported into that country from Saigon, Siam, and wherever they can get it.

25. Are you of opinion that if the shoals of fish which pass our coast at certain seasons of the year were captured and salted a market could be found for them in China and the East? Yes, salted fish; there would be a good market for salted fish.

26. What about tinned fish? I do not think it would sell so readily up there.

27. And what about smoked fish? It would sell readily. You do not want to split open the small fish; just drysalt them and send them away. The large fish should be split open, gutted, and salted.

28. Would it be advisable to remove the backbone? In some cases it is removed, not in all. I may say I have carried fish that have come 1,500 miles from the rivers in China, and when they have been placed in the market in Hongkong they have been alive and kicking.

29. How did you carry them? Well, on our steamer we had four fish-tubs on either side of the deck. They were about 8 feet in diameter and 3 feet high—just big tubs. We filled those tubs with water from the river and dropped the fish into them alive. On the passage down to Hongkong we kept a Chinaman constantly baling the water out of one tub into a bucket overhead, from whence it returned to the original tub. This process was kept up during the whole of the voyage, and it kept the water sufficiently aerated. The fish were in very good condition when they arrived at Hongkong. The people bought the fish alive in the market at Hongkong. You could bring your fish alive from the Murray River to Sydney by adopting a similar mode of conveying them to market. The Chinese fishing-boats go out from 10 miles up to 500 miles from the land. Two boats always go together, good-sized junks, and they catch large quantities of fish. They pick out the best edible fish and put them in their wells. They keep their fish alive in the wells for a fortnight and more. When they make a big catch of albicore and skipjacks they split them down the backs and salt them. Weights are then put on the fish, and when they get to land they are spread out and dried in the sun.

30. Is there good market accommodation in Hongkong? One market does for everything there. It is like most native markets. I think the native, take him all round, can give points to the European in fishing.

31. Have you seen their system of hand-line fishing? There is a place in the Equatorial Islands where they have to use all sorts of stratagems to get the fish to bite. You will see a native sitting in his boat and it may be that his hook is 200 yards away in the water. The fish will not bite while the boat is handy to them; but the natives are very ingenious and they know how to catch the fish.

32. Then you are of opinion that New South Wales might even send fish to the East? I would like to say there is an immense market for all kinds of fish in the East. There are millions of people in Java who would buy them, and the natives in the other islands would also purchase our fish. They are great fish-eaters up that way, and we could send immense quantities of the fishes that frequent this coast in shoals to those eastern countries if they were properly treated.

33. Are the fish sold ready cleaned in the market at Hongkong? No; just as they are caught.

34. Have you had any experience in trawling? No.

35. *Mr. Thompson.*] You think it would be quite possible to establish a lucrative trade between New South Wales and Java? In Java and India and over the Dutch East Indies. Then again, I have not the slightest doubt but what you could establish a trade in fish with the South Sea Islands if once it was started. If salt fish were introduced there it would sell. If the natives have not got money they have something which is better than money, because you could make a profit both ways out of what they would give you for the fish.

36. Then, in your opinion, there are great possibilities for a big export trade in fish? Yes; that is so, especially if they bring in fish alive here. They would do much better by bringing the prices down if they found people would buy more fish, and it would be better for everybody. Let the fishermen sell their own fish; let them bring them in alive in well-boats. I would guarantee to keep fish alive a month in a tub of water. So long as you keep the water in proper circulation you can keep your fish alive.

MONDAY, 29 *APRIL*, 1895.

[*The Commission met at the Offices, Bligh-street, at* 1·45 *p.m.*]

Present:—

FRANK FARNELL, Esq., M.P., President.

L. G. THOMPSON, Esq., J.P.

Carsten Egeberg Borchgrevink, Esq., Scientist, attached to the exploring vessel "Antarctic," sworn and examined:—

C. E. Borchgrevink, Esq. 29 April, 1895.

37. *President.*] You were a scientific member of the expedition sent out to the Antarctic Seas, to ascertain whether the right whale existed in any numbers, and whether the whaling industry could be successfully prosecuted in the Southern Ocean? Yes; I was scientist on the "Antarctic," and the expedition was sent out by Svend Foyn, a wealthy Norwegian whaling-master, for the purpose of seeing whether the right whale existed in any great numbers in the Southern Ocean.

C. E. Borchgrevink, Esq. 29 April, 1895.

38. Would you be good enough to acquaint the Commission with the results of your observations in those latitudes—did you encounter the right whale in the far south? We did not meet the right whale; we did not see one right whale within the Antarctic Circle while I was on board the "Antarctic." On a previous voyage made by the "Antarctic" to the far south, they saw right whales in those waters; but, speaking for myself, I saw no right whales. We met with the blue whale in any numbers; there were great numbers of blue whales, which are known as finbacks down in those waters. We had not the appliances with us on the "Antarctic" to capture those blue whales, so we got no great profit out of them. If we had had suitable appliances for their capture, we would have been able to fill the "Antarctic" up with blubber and bone. Both the blubber and the bone are very valuable. We shot fast into four blue whales, but our lines broke; this was owing to our not being properly equipped for the capture of these whales. The blue whale sinks directly it is shot. This whale is about 80 feet long, and weighs about 90 tons. The right whale and the sperm whale float on the surface after being shot. Svend Foyn recently perfected a special apparatus for the capture of these blue whales. Before that time the blue whale could not be taken with success; but it can now be captured by using the appliances I have spoken of.
39. Do you consider the blue whale of considerable commercial value? Yes, I do. All the parts of the blue whale can be made of commercial value. The blubber and bone found in this whale are of considerable value, and the other parts of the whale could be turned into exceedingly good manure.
40. Did you see any other species of whale in those waters? We saw a small whale—a fin whale—and we caught three or four of them. They make excellent beef. The beef is excellent eating; the people on board the "Antarctic" ate some of this beef, and it is good meat. This whale is from 20 to 30 feet long. It might be made of commercial value; but the bone in it is small. Strange to say, in the northern seas this particular whale is not considered to be of any great value; but the same species in the Southern Ocean might be made of value.
41. Is there any other species of whale in those latitudes that would be worth looking after, from a commercial point of view? We had a white and black whale down there; this whale had a very big fin sticking high out of the water. The fin must have been 3 or 4 feet long. It was a large-sized whale, and it had white stripes. The natives of Stewart Island—we had one of them on board—called this particular whale the killer.
42. Is that because it is regarded as an enemy to the other whales? Yes, I believe so; the killers are great enemies of the whale species.
43. Do they grow to any size? The one we saw in the Southern Ocean was about 50 feet long.
44. I suppose you had no opportunity of judging whether it could be turned to account, and made of commercial value? No, I had not; but I do not think it is considered of much value.
45. Did you see any other species of whale on your trip? We caught the sperm whale a little to the south of Tasmania. We saw sperm whales in very great numbers. When the "Antarctic" was just within sight of the southern part of Tasmania, we saw a great number of sperm whales.
46. What time of the year was that? It was in March of this year.
47. Do you think sufficient evidence has been gained as a result of this expedition to warrant further expeditions being sent out? As to whales?
48. Yes? I do, certainly. If I had the money to invest in whaling out here I would go in for it at once.
49. Would the port of Sydney form a suitable depôt for vessels engaged in whaling in the Southern Ocean? Yes, undoubtedly it would; it is the port of all the Australian ports. There could be no choice. Sydney must have it. Sydney must be the depôt for the whaling fleet in the Southern Ocean if you can establish whaling on a large scale.
50. Are you surprised that nothing has been done in developing the whaling industry in these waters? Yes; very much so. Whaling has been taken up and laid down again. Seeing that it once paid very well out here, it seems to me very strange that they do not try and go in for it again. They should try and find the proper hunting-grounds and go in for the capture of whales. It astonishes me greatly that the people of Australia have not done this, seeing that it paid so well in former years.
51. I suppose the people of Norway look upon whaling as a national industry? It is a great industry; it gives employment to a great number of people directly and indirectly. Svend Foyn, who was a great whaling master, made several hundreds of thousands of pounds by whaling in the northern seas.
52. Can you give us an estimate of the cost of a fully-equipped whaling vessel? I would rather the Commission took Mr. Bull's opinion on that matter. He was the commercial man of the expedition. I desire to record my experience from a scientific point of view only. I think whaling would be a very great success down in the far south. We landed on one part of what is supposed to be a great south continent, and we found a harbour there—a sheltered harbour in which vessels could take refuge. We saw plenty of blue whales, and there is not the slightest doubt that the capture of these whales could be made a very valuable industry.
53. How many days' steam would it be from Sydney to that unexplored continent you refer to? If you went straight down in a steamer of 12 knots, down Ross's Track, you could reach the Great Southern Land in a fortnight. Sydney would form a splendid place for whalers to sail from, and when they filled up they could return to this part, unload, and refit for further voyages.
54. Are there deposits of guano on any of the islands in the Southern Ocean or on the mainland? Yes; there are deposits of guano at several places.
55. Could those deposits be worked;—could that guano be made an article of commercial value? Yes, and of very great value. I brought some specimens back from Possession Island and from the mainland, and I believe it could be made an article of great commercial value.
56. *Mr. Thompson.*] Did you see any whales while you were on the Australian coast? Yes; lots of small whales. We saw them blowing away all round. I saw a number of whales during my passage up in the steamer from Melbourne.
57. Do you think whaling could be successfully pursued on the New South Wales coast? I can hardly give an opinion on that matter; I have not studied the question sufficiently. I am told whales are often seen on this coast, and even off Sydney Heads; but I have not gone into the matter. I may say that on the first voyage of the "Antarctic"—I sailed in her on the second voyage—they both saw and killed a right whale at Campbell Island.

C. E. Borchgrevink, Esq. 29 April, 1895.

58. You said there were special appliances for the capture of the blue whale; can you describe them? It is a little steamer of 75 tons, carrying a very heavy gun in the bow and discharging a harpoon containing an explosive point. When the harpoon enters the whale it is closed and laying back. On entering the whale, when the strain is on the rope, it opens and the explosive charge is fired, and this kills the whale.

59. But you said the blue whale sinks;—does the apparatus prevent the loss of the whale? Yes; the apparatus invented by Svend Foyn prevents the loss of the whale.

THURSDAY, 2 MAY, 1895.

[*The Commission met at the Offices, Bligh-street, at 1·50 p.m.*]

Present:—

FRANK FARNELL, Esq., M.P., President.

L. G. THOMPSON, Esq., J.P.

Henry John Bull, Esq., late manager of the Antarctic Exploring Expedition, sworn and examined:—

H. J. Bull, Esq. 2 May, 1895.

60. *President.*] What is your name? Henry John Bull.

61. I understand you were manager of the expedition sent out from Norway to the Antarctic Ocean in order to ascertain whether the right whale was to be found in those latitudes? Yes; that is so.

62. Would you mind acquainting the Commission with the results of your observations in those waters? I will do so with pleasure. We sailed from Norway in the steamer "Antarctic," in September, 1893, with the object of going to South Victoria Land, to ascertain if right whales were to be found in those waters. We did not get far enough south on that voyage, so we decided to run in to Kerguelen Island in order to replenish our water-tanks, intending to pursue our voyage to South Victoria Land when we had filled our tanks. On reaching Kerguelen Island we found plenty of sea elephants there, and we captured a great number. After we had done this, as the whaling season, or the summer season for going south, was pretty fairly advanced, we filled up with sea elephants and proceeded to Melbourne, at which port we disposed of the oil from the sea elephants, and the skins were sent to London.

63. When did you reach Melbourne—what month was it? We reached Melbourne in February, 1894. After that we went away again. We made for Campbell Island, to the southward of New Zealand, looking for whales.

64. Were you on the "Antarctic" during the voyage to Campbell Island? No; I was not on the "Antarctic" on that voyage, but the captain and crew saw the right whales there. They caught one right whale, and made fast to others, which, however, were lost again.

65. Did the "Antarctic" return to Melbourne from Campbell Island, or did she go straight down to the Antarctic? The "Antarctic" returned to Melbourne from Campbell Island in August, and we sailed out of Hobson's Bay in September, 1894, with the intention of going to South Victoria Land. On making the 64th degree of latitude we sighted many large whales, and from 64 to 74 degrees we saw large whales nearly every day.

66. What species of whale are you alluding to? I am referring to the species which we in Norway call the blue whale. That particular whale is known out here as the finback or sulphur-bottomed whale. We saw those whales in great numbers. They were spouting about in the open water, and also amongst the pack ice. We shot fast to some of them, but the whales, after being shot, broke the line and escaped, we not having the proper appliances to capture them with.

67. Then the "Antarctic" was not properly equipped for the capture of that species of whale? The fact is, with a heavy vessel like the "Antarctic" they cannot be taken; because when we shot fast to them, the whale, being of immense size and prodigious strength, proved altogether too strong for the rope, which eventually carried away. Those blue whales could be captured by employing vessels similar to those now in use in Norway, small, but powerful well-equipped steam vessels, we call whale-boats. Norway is the only place in the world I know of where the blue whales are captured with success, and those small steam vessels I have spoken of are used in their capture.

68. Did you see any other species of whale besides the blue whale? We caught a couple of small whales which we made beef of, and consumed on the "Antarctic," but they were not of great value.

69. Any other species of whale? We saw a few more species that I cannot name. We also saw a whale similar in appearance to that described by Sir James Ross; it has a very large fin, and is known as a killer.

70. Did you see any right whales on the expedition to South Victoria Land? No; not one.

71. But it is a fact, is it not, that right whales were seen in the vicinity of Campbell Island, to the southward of New Zealand? Yes, that is so, the people on the "Antarctic" saw right whales there, they caught one and made fast to others; Campbell Island is about 53 degrees south latitude, to the south of New Zealand. I was not on the "Antarctic" when she made the voyage to Campbell Island.

72. Do you think sufficient evidence has been gained by the expedition to warrant the sending of further exploring expeditions into the Antarctic Ocean, I mean speaking from the scientific and commercial standpoint? Yes, I do; I am fully convinced that another expedition would prove successful; the blue whale fishery alone should prove, if properly developed, of immense value to New South Wales, and we know besides that right whales and sperm whales are all over the Southern Ocean.

73. Would Sydney form a suitable port or depôt for the vessels engaged in the whaling trade in the southern seas? Yes, a very suitable port indeed; I think Sydney is the port on the Australian Continent; Hobart is also a good port.

74. Do you think whaling in the Antarctic Ocean could be developed to such an extent that the industry might be made of national importance to Australia? Yes, I am sure of it; there is an immense future before the whaling industry if it is taken up in a proper manner.

75. Can you furnish the Commission with an estimate of the cost of a fully equipped whaling expedition, I mean an expedition that might be despatched to the southward for the purpose of engaging in the whale fisheries? Yes, I have made out an estimate, and in the estimate of the cost of such an expedition, which

H. J. Bull, Esq. 2 May, 1895.

which I will submit to the Commission, I have been careful to keep well within the mark. My statement is based on the purchase of two whaling steamers similar to the "Antarctic," and one small steamer of about 60 tons for killing the whales. The two larger whaling steamers would really be used as store ships. 76. I suppose the smaller steamer would be employed in the capture of blue and other whales, and you would have your tanks on board the two larger vessels, and these would be filled up with oil and so forth as the whales were taken? That is so, I will give you the figures:—

Estimate of cost of two Whaling Steamers (auxiliary), and one small Steamer of about 60 tons, for Whaling South.

Purchase money in Norway, 2 whalers		£10,000	
,, ,, 1 small steamer (for killing)		3,500	
		£13,500	
Thorough overhaul, &c., before leaving		1,500	
			£15,000
Outfit, &c., from Norway to the Antarctic and back to Australia, calculated to occupy 8 months, viz.:—			
Wages per month for one whaler—			
Captain	£10		
Chief officer	7		
Second ,,	6		
Chief engineer	7		
Second ,,	6		
First carpenter	4		
Second ,,	3		
Blacksmith	4		
Boatswain	4		
Sailmaker	4		
Steward	4		
Cook	4		
Six A.B. sailors, £2 10s.	15		
Ten mixed sailors, £2	20		
Wages total		£98	
Provisions—			
28 men—30 days at 1s. 6d. each per day		63	
Total wages and provisions per month one ship		161	
Or for each of the two whalers for 8 months		1,288	
Total for both ships		£2,576	
Crew of the small steamer, per month—			
Captain	£8		
Mate	6		
Engineer	7		
Second engineer	5		
First gunner	12		
Second gunner	8		
	£46 0 0		
Provisions, 6 men, 30 days at 1s. 6d. each	13 10 0		
	£59 10 0		
Total for eight months		476	
600 tons of coal from England, at 10s.		300	
Oil and requisites to engines, about		100	
Salt for preserving skins (seals), 40 tons at 15s.		30	
			3,482
			£18,482
To meet unforeseen expenses, &c., add			1,518
Total			£20,000

Estimate of value of whale oil and whalebone by two whaling vessels and one small steamer from the Antarctic.

40 fin whales (blue whales) will yield 400 tons of oil, at £16 per ton		£6,400	
In Norway, we calculate 3 whales to give 2 tons of bone, or 40 whales 28 tons—but say, 25 tons whalebone, at £350		8,750	
			£15,150
Less expenses—			
2,400 empty casks (for oil), at 4s.		480	
Port charges, &c., for both ships and steamer		300	
Commission, London and Australia, 2½ per cent. on £15,000		375	
Management		500	
Crew's share at home is usually one-sixth of gross amount, and would, in this case, be about		2,000	
			3,655
Balance			£11,495
From this amount to be deducted—Outfit and other expenses concerning voyage			3,482
Actual net			£8,013
To meet the capital invested in the vessels, viz.:—			
Purchase money		£15,000	
Unforeseen expenses		1,518	
		£16,518	

NOTE.—The outfit will be greatly reduced when the vessels can leave Australia the following year, a trip south from this quarter not necessarily occupying more than four months.

Melbourne, 27th March, 1895.

77.

H. J. Bull, Esq. 2 May, 1895.

77. What, in your opinion, would be the result of such an expedition as you have suggested—supposing two store ships and a killer were sent to the "Antarctic," what would be the result of such an expedition? I think they would capture a sufficient number of whales to net probably £8,000 on the one whaling trip. In the statement I have furnished to the Commission, it is quite possible that the expenses may be reduced in some respects.

78. *Mr. Thompson.*] Are sea elephants plentiful on Kerguelen Island? Fairly plentiful on Kerguelen. It took us six weeks to capture 1,600 sea elephants, but I should add that we were very much delayed in our work at the island by bad weather.

79. Do you consider Kerguelen Island the home of those sea elephants? I cannot say; they make for Kerguelen during the breeding season, which is from November to February, and then they leave again and go no one exactly knows where.

80. Between what latitudes did you find the blue whale? We found them all through, from 64 degrees south to 74 degrees south.

81. In this Antarctic work the vessels would only be employed during some few months of the year? That is so.

82. Could not then the same vessels be used on the Australian coast during what might be termed the off months? Yes, certainly; that would bring further profit to a company.

83. *President.*] The Norwegians have greatly developed the blue whale fishery, have they not. I understand that the blue whale fishery gives employment to a very large number of men? Yes, that is so. Since 1865, when Captain Foyn, the owner of the whaler "Antarctic," started the blue whale fishery off the Norwegian coast, the industry has been developed by degrees until in 1894 there were employed in that particular whale fishery no less than forty-four steamers, having 912 men on board and at the establishments ashore. That whaling fleet in 1894 killed about 1,528 blue or finback whales. Those whales yield a large quantity of oil, and the fishery proved very valuable indeed; the exact figures I am unable to give you. In addition to the whaling stations in connection with this fishery on the Norwegian coast, other stations have been established by Norwegians in Iceland, where blue whale fishing is carried on with considerable success. In addition to this, seventeen steamers of the "Antarctic" type are engaged at present from Norway in sealing in the Arctic Seas. Those steamers gave employment to 839 men during the last season. There is also a particular whaling business carried on in the open seas between Iceland and Norway which we call the bottle-nosed whale fishery. During 1894 sixty-three steamers and sailing vessels, all hailing from Norway, were engaged in that trade. They killed 2,767 bottle-nosed whales; that fishery alone gave employment to 936 men. When the blue whale is brought ashore the blubber is cut up and taken off, and the carcases are turned into manure.

84. I suppose these whale fisheries give employment to a considerable proportion of the population, both directly and indirectly? Yes; directly upwards of 3,000 men are employed in capturing the whale and in cutting up the blubber and trying it out. Indirectly employment is found for a host of other persons in connection with the whale fisheries. Every particle of the whale is utilised, the carcasses are turned into manure.

THE OFFING FISHERIES—WELL-BOAT FISHING, TRAWLING, &c.

WEDNESDAY, 27 MARCH, 1895.

[*The Commission met at the Offices, Bligh-street, at 10·30 a.m.*]

Present:—

FRANK FARNELL, Esq., M.P., President.

The Hon. R. H. D. WHITE, M.L.C. | L. G. THOMPSON, Esq., J.P.

Captain Joseph Coulon, late master of the schooner "Dauntless," sworn and examined:—

Capt. J. Coulon. 27 Mar., 1895.

85. *President.*] Your name is Joseph Coulon, and you were captain of a fishing vessel; are you a certificated master? No; a licensed fisherman.

86. You were proprietor of the "Dauntless?" Yes.

87. What was she—a schooner? Yes, a schooner; she registered 22 tons.

88. Is that the boat that was lost through a collision with the "Jones Brothers" off Barrenjoey? Yes.

89. How long ago? On the 26th November, 1894.

90. Had you been on a fishing expedition? Yes. I was then bound for Bird Island, Bungaree Norah, and Catherine Hill Bay. Those are three of my principal fishing grounds. I have always caught fish there.

91. Had you a well in your schooner? Yes.

92. What was the length of your schooner? She was 47 ft. 6 in. over all.

93. What was the breadth? 12 ft. 10 in.

94. What was the size of the well in the "Dauntless?" It was 12 feet by 12 by 4 feet. There was always 4 feet in the well from the top of the keelson.

95. Had you had any experience in well-boat fishing before taking charge of the "Dauntless?" Yes; my brother and I were two years well-boat fishing before I got the "Dauntless."

96. What did the "Dauntless" cost you for building and for her equipment? She cost me £525.

97. Had you made any trips with the schooner and brought fish into the market? Oh, yes; I had been fishing for seven months in her. I brought fish into Sydney alive and put them on the floor at the market. On my first trip I fetched fish from Jervis Bay. Wreck Bay was my greatest fishing place, and off the Banks and off the lighthouse. I brought ten baskets of fish into Sydney on my first trip.

98. What kinds of fish? Schnapper, teraglin, and cod; some morwong, different classes of deep-sea fish.

99. How long were you in making that catch? I was three weeks on that trip.

100. Did you keep the fish alive during that period? Yes, I did. I caught those fish in the first three days I was down there. I got jammed in Jervis Bay at the Hole in the Wall. I was jammed there a fortnight, with a heavy sea and bad weather.

101. Did you feed your fish while they were in the well? Yes; I was three weeks and three days from the time I put the first fish in until I reached the market.

102.

Capt. J. Coulon. 27 Mar., 1895.

102. Did the fish take kindly to their food? Yes, after three days, but you must have the food for them when you first put them in the well; that is the art of fishing. You prick them. Nearly every fish has to be pricked, and you require to keep them alive by suction before they will go to the hard bait, and then the hard bait has to be chopped up for them. I have seen garfish come into the well at night, but they do not stop there very long, the schnapper would eat them up. I have great confidence in well-boat fishing; it can be made a great success, but I have not the gear.
103. What do you mean by suction? I mean that we have to feed the fish during the first three days while their mouths are sore. We feed them with oatmeal sprinkled on the water. They would eat this readily and after three days they would eat the hard bait, shark, and other bait, but the fish in my well would not take stale bait. They used to get fat on the oatmeal and after a fortnight they would come and take the bait—shark—out of my hands, they got that tame. While I was feeding the fish with oatmeal I shut the valves, so as not to allow the suction, as I call it, to flow out; I would open the valves when I wanted the sediment and slime to flow out. When the well is in motion, I mean through the motion of the vessel, it takes the sediment off the water, and off the fish, and the fish are kept clean.
104. Where do you prick the fish, behind the pectoral fin? No; it used to be done, but it had the effect of piercing the liver, and the fish would die. I prick the fish about three-quarters of an inch forward from the ventral fin. In June, July, and August they are full of wind; they wind more readily then than at other times in the year. After pricking the fish I close the scale over the prick in order to prevent the ingress of water, and then I drop the fish tail first into the well and he will live alright.
105. Was your well constructed on a different principle to those generally used? Far different to any other well-boat I have seen. In other well-boats I have seen the fish have been too much confined altogether. I had only a centreboard in my boat, the object being to allow of the water being kept level. Where the others make the mistake is in putting in too many cross-pieces and partitions, and keeping the water still.
106. Have you fished in other grounds besides Jervis Bay, and the grounds to the south of that water? I have fished from off the Clyde River to Catherine Hill Bay.
107. How long have you been engaged in fishing altogether off the coast of New South Wales? I have been fishing four years with the well-boats.
108. From your experience are you of opinion that the system could be carried out successfully in New South Wales? Yes; it can be, if it is carried out in a proper way, but there should be no stinting in the material and gear. I had not the means to get the gear to fish with. I have only had the long lines, the hand line, and the drift line. If I had the lines, the gear, the net, and proper equipment, I could do splendidly. I could go south and run into Jervis Bay and catch any amount of fish.
109. When you brought your fish to market did you come up the harbour and anchor in Woolloomooloo Bay? The first trip I came right up to the baths in Woolloomooloo Bay. I lay there five days, and the fish never died. I came up again two trips afterwards and lay in the same place, and the fish died within ten hours.
110. Was that owing to the water being polluted? Yes; there had been very heavy rain. If I had known that I would have stayed at the Bottle and Glass. The reason I lost my fish was that I did not know there had been heavy rain in the city, and they were filled with fresh water—it was that killed them.
111. Do you think the system of placing fish in fish tanks moored in pure salt water would answer here? Yes; you could put them in tanks down at the Bottle and Glass, near Watson's Bay.
112. What did you get for the catch on your first trip? I can give you what I realised on one trip. I brought seven baskets of fish alive to the market, and I received £10 clear for that quantity.
113. How long had it taken you to obtain that quantity? Three weeks.
114. Was there anyone else with you? Two hands besides myself, but if I had had favourable weather I should have saved a fortnight's delay at least. Actually out of that three weeks I had not fished three times on the grounds. All along the coast, from the Toll Gates off the Clyde River to Point Perpendicular, thence along the Black Rocks to within 2 miles of Ulladulla, you can get enormous quantities of fish.
115. Have you fished off the Tweed Heads at all? No, I have not. Captain Arthur, who I understand is to be examined, has fished off that place. Captain Arthur has an excellent knowledge of the different fishing grounds along the New South Wales coast.
116. You say the Bottle and Glass in Watson's Bay is a good place to keep fish in, in well boats? Yes, it would be; you must not come into the fresh water. You could run into Watson's Bay and stock your fish tanks, and then clear outside again for your supply of fish.
117. Have you had any experience in trawling? No, only with the long lines and side lines. I have a side line of wire fastened from the bow of the boat. The hooks are 5 feet apart, with swivels fastened on to the wire, and the lanyards fastened on to the swivel.
118. Why do you call them side lines? Because the line always hangs from the side of the vessel, fastened at one end by the bowsprit head, and the other by the stern.
119. Have you ever done any whaling? No.
120. Have you ever seen any whales on the coast? Any quantity of them.
121. Of what species were they? I have seen the sea off the coast of New South Wales thick with right whales, that was two years ago, you could see the whales as far as the eye could reach. I was off Cape St. George when I saw those whales; it was in July two years ago. I have also seen sperm whales off the same place. On one trip I saw upwards of twenty whales between the Clyde River and Port Hacking. That was the time the "Jenny Lind" was out. I have been sailing close alongside the whales on the coast—they were all about, blowing and spouting, but the "Jenny Lind" was further out to sea and she missed them. All the whales were close in; that was last winter.
122. Are you of opinion that the whaling industry could be revived? I think it ought to be revived; if I had had the gear I could have fastened on to the whales I saw right enough. I used to run right on top of them in my schooner. They were blowing about all day long. I saw a big whale 40 or 50 feet long off Port Hacking Reef, but the "Jenny Lind" missed her.
123. Have you a pretty good knowledge of the bottoms along our coast? Yes, I have. Where I have been I have found it reefy, and then the reefs were followed by banks of sand.
124. How far out from the coast would that be? About 5 to 7 miles.
125. Do you think if the bottoms are found to be suitable trawling operations could be carried out successfully in New South Wales waters? There are places you can trawl on this coast; there is no doubt they exist. There are places where you will go for 2 miles over banks where you can catch whiting, soles, flathead, and flounders.

Capt. J. Coulon. 27 Mar., 1895.

126. Do you think the Government should institute a trawl survey of the coast? Yes, I do. There are big grounds off Port Stephens, and off the Nine Mile Beach, off Lake Illawarra. There are good trawling grounds there. It is a good sandy bottom.
127. Your experience of the New South Wales coast has extended over what period? About thirty-five years. I have been on the coast all that time. I did not get a certificate because I never ran passengers in my vessels.
128. The fish that died in the wells, did you cure them? Yes.
129. How did you cure them? By putting them in brine and drying them, and then they were ready for sale.
130. Have you ever come across any indications of deposits of oysters in the deep sea? Only the one in Jervis Bay. The oysters there are big ones, about the size of your hand.
131. *Mr. Thompson.*] You say you know a number of the outside fishing grounds? Yes, all of them between here and the Toll Gates, off the Clyde River, and from Sydney to Lake Macquarie northward.
132. If the Commission supplied you with a chart, would you aid them by marking out those grounds on it? Yes, I would be very glad to do so.
133. *President.*] Do you intend, now that you have the case arising out of the sinking of your schooner practically settled, to re-engage in well-boat fishing? Yes, if I can manage it, I shall do so.
134. Is this Commission to understand that it was only on account of the accident, by which you lost your schooner, that you have been prevented from continuing your fishing operations? That is so.

Captain Robert Arthur, fisherman, Botany, sworn and examined:—

Capt. R. Arthur. 27 Mar., 1895.

135. *President.*] You reside at North Botany, and your name is Robert Arthur? Yes.
136. You have a sobriquet? Yes; I am known to the fishermen and others as "Yankee Sam."
137. How long have you resided in the Colony? About twenty-six years.
138. During that time have you had a considerable experience in connection with deep sea fishing? Yes; I have put more fish into the market than one half the men who have been at it all their lives.
139. How long have you been fishing off the coast? Sixteen years off and on.
140. Did you use a well-boat? I have never used a well-boat.
141. How did you send your fish to market? By train and steamer.
142. Did you have good catches? Very good catches.
143. What kinds of fish did you catch? Schnapper and net fish.
144. Where have you fished chiefly? Between Sydney and the Clyde River.
145. Where did you find fish life most prolific? On the Sir John Young Banks, very wide.
146. How far off the coast? About 10 miles E.N.E. from Beecroft Head. I have taken great quantities of fish in Wreck Bay. There is another place, Browlee; a place off Ulladulla is another great place, and so is Brush Island, 7 miles south of Ulladulla.
147. Have you fished any grounds to the north of Sydney? Yes; right away from Port Stephens to Cape Moreton.
148. Where did you find the best grounds within those limits? Off the Edith Breakers.
149. Where are the Edith Breakers? A little to the northward of Seal Rocks. There are good grounds 5 miles E.N.E., off Cape Hawke, and 3 miles east of the old Manning Bar, Kirby Shoals about a mile and a quarter east of Crowdy Head, and the Mermaid Reef between Crowdy Head and Camden Haven. There are also other good grounds 3 miles east of Tacking Point, and at about 2 miles off Corregorra, near Smoky Cape. Then again there is another fine ground off the Fish Rock at Smoky Cape; that is where the large black rock-cod are found in quantities; those cod weigh from 100 lb. to 150 lb. The next ground I know of is about 3 miles E.N.E. off Smoky, abreast of Yallahapnie, and you can take right along there from that ground right north to the Bellinger River and you will get good fish all the way. The next ground I know of is a place called Green Point, 12 miles north of the Bellinger. Then you can go north from the Solitaries to the Red Rocky River; you will find fish all along, good fish, both inside and outside the Solitary Islands. It is a great piece of ground and it has never been explored, although I have caught fish all along that ground. From the Sandon River right up to the Clarence Heads is an excellent fishing ground for schnapper, and here again on the Sandon Shoals you will find the big rock-cod very plentiful. This gound is not rock; it is a coral formation and the large cod frequent the place in great numbers. In the Sandon River you will also catch enormous blue-nose whiting, and very large crabs. Between Woody Head, 7 miles north of the Clarence, and the entrance to the Clarence River, there is a splendid sandy bottom, over which you could use the trawl freely and catch all kinds of fish,—flathead, soles, flounders, and whiting. The next place I know of is Evans' Head Reef; there you will catch any amount of schnapper. From there to Lennox Head, north of the Richmond River, is an excellent trawling ground of sandy bottom, and many varieties of fish could be taken. To the east of Lennox Head is a good schnapper ground. There are a few sandy bottoms between Lennox Head and Byron Head which would be suitable for trawling. Anywhere from half a mile to 5 miles to the eastward of the Byron you will get good schnapper, and from there down to the Brunswick Heads in Byron Bay is all a trawling ground. From the Byron to Point Danger you will get schnapper in great quantities, off all the headlands, and you could trawl on all the bottoms which are sandy.
150. Do you think that with a well-boat, properly equipped, the fish frequenting the grounds you have enumerated could be brought into the Sydney market in a fresh condition? I do; I have every faith in it.
151. Have you known fish to be kept alive in well-boats for any length of time? I have. I have known us to keep fish in a sort of a well for seven days; that was in a 24-foot boat.
152. Did you feed them during that time? Yes.
153. How did you prick their bladder? Some prick them under the pectoral fin, and others prick them near the ventral fin. I believe in pricking them near the ventral fin. When the "Rachael Thompson" was here I took the trouble to examine some fish that had died after being pricked, and I found that there was a black mark on the liver. To my mind that was clear evidence that the lance had burst the liver. Had they been pricked at the ventral fin that would not have occurred.
154. What kind of pricker would you recommend for use? I would recommend the trocha and cannula made of silver, and of a proper size.
155. Have you known fish after being kept in the wells some days to take their food freely? I have.

Capt. R. Arthur. 27 Mar., 1895.

156. And have they improved in condition? The only fish I have seen improve in condition were those kept in the well of the "Dauntless," belonging to Captain Coulon.
157. What in your opinion should be about the size of the well in the boat? I would have a boat about 50 feet long, with a well about 15 feet by 12 and 4 feet depth of water.
158. Do you think the centreboard is sufficient to prevent the fish being killed by the roll of the sea? I would have the centreboard fixed in a casing which would make a permanent partition.
159. Have you had any experience in trawling? I have.
160. Do you think from your observations along our coast, extending over a period of 15 or 16 years, it would be possible for trawling operations to be successfully carried on in these waters? Trawling has never been tried here yet. Our charts are very inferior. You can take up a chart and where you see it marked sand you will find it is rock. The experiment of trawling has never been carried out here yet; no proper survey has been made. The survey that has been made is very unreliable, as witness in Jervis Bay, where one place marked on the chart as sand is to my knowledge rock.
161. Do you think any harm would result if the Government were to authorise a trawling expedition? I do not, providing there be good practical men in charge of it. I was one of a party who made a trial of a trawl for the Government in the "Dove" about twelve years ago. The experiment proved a failure owing to incompetent men having charge of the trawl.
162. Where did that experiment take place? We were in Jervis Bay and off Cape St. George. We broke the beam to the northward of Cape St. George.
163. If experienced and practical men were placed in charge of a proper trawling expedition do you consider that good results would follow? I do.
164. Do you know of the existence of good trawling grounds all along our coast? I know they do exist at different places on the coast, but no proper survey has been made.
165. Have you had practical experience in trawling in the old country? Yes; I was trawling on the Dogger Bank.
166. What depth of water would there be on the Dogger Bank? From 35 to 70 fathoms. I have trawled outside the Outer Dowson to the further lightship from the Humber.
167. How did you trawl—against, with, or across the current? Whichever way the wind led us. I have seen two or three letters in the newspaper about that recently, and I have laughed to myself about it. The men who wrote those letters could not have had any practical experience or knowledge of the subject.
168. Would you advise that a steam-trawler be used in making experiments on the coast of New South Wales? Yes; a steam-trawler. My brother is the largest steam-trawler on the Tyne.
169. Have you ever noticed any evidence of the deposit of oysters in the deep sea? Yes, in Jervis Bay, and down to the Redhead in Wreck Bight. They are very thick there and of a great size.
170. Have you ever seen any shoals of fish making their way from the south to the northward? I have.
171. What kinds of fish? Tailer, trevally, garfish, and mullet.
172. Have you ever seen any of the herring species? No. The other fish always break, the herring never break. I have seen immense shoals of fish which I believe to be tailer, garfish, mullet, mackarel, and trevally off the Five Islands, off Port Hacking Bight, and off Port Stephens.
173. Did you notice anything bearing a resemblance to oil on the surface of the water after the passage of those fish? No.
174. If the surface of the water had borne an oily appearance after the passage of those shoals of fish, would you consider that to have been an evidence of the existence of the herring species? I would.
175. In regard to the inlet fisheries, do you think there should be a close season? Yes, I do.
176. Would you apply that close season to all the inlet fisheries? I would.
177. For how long? From November to March.
178. Would you proscribe the use of nets altogether in any inlets from November to March? Yes; they should be used only on the outside beaches.
179. Have you ever seen any whales on the coast? Yes; last year they were very thick. I was out two or three times in the "Jenny Lind."
180. What species were they? Most of them were finbacks, sulphur bottoms; some were right whales. I saw one sperm whale in the Shoalhaven Bight.
181. Do you think the whaling industry might be successfully revived? I do, most certainly.
182. I suppose you think it only needs enterprise and the proper equipment of a good vessel or vessels? Yes; that is all that is required to make whaling a great success.
183. From your experience of the fisheries in Great Britain, and with your knowledge of the number of people employed directly and indirectly in connection with them in fish-curing, and so forth, do you think there is room for any development of that character in connection with the fisheries of New South Wales? I do, especially in fish-curing, because if you get a mullet properly tinned it is equal to any American salmon.
184. Would the same remark apply to many other kinds of our fish? Yes; to black bream. A salted or smoked tailer is superior to any English or Scotch haddock that is imported, and yet the tailer is a fish that is much despised out here; it could be made of considerable commercial value. Then there is the teraglin—that is a fish despised out here, but you get one and salt it, and you will find it beats all the ling that ever you came across.
185. *Mr. Thompson.*] You have mentioned several outside fishing grounds—the coastal fishing grounds—would you have any objection to mark those grounds on a chart for the information of the Commission? No; I will do so for the Commission.
186. How long were you trawling on the Dogger Bank? From the time I was 7 years of age for many years.
187. Do you hold any trawling certificates? No; I was only a young fellow at the time.
188. Can you give any information respecting the use of the long line? I would have my line ready, and when I dropped on the fish I could catch them. I had a line with about 500 hooks on it. I have caught three baskets on the long line. You want to be very quick about it; you must not leave the line too long to give the sharks a chance.
189. Have you done any shark-fishing? Yes; I have been out with Mr. Dent fishing off Point Perpendicular, Jervis Bay. We have caught forty and fifty sharks a day; we captured them for their oil and fins.

Capt. R. Arthur. 27 Mar., 1895.

190. Did you find it profitable? Yes, more profitable than the schnapper. I used to get half a crown a gallon for the shark oil and 10d. per lb. for the fins.
191. Where did you get your market for the oil and fins? The tanneries took the oil and the Chinamen took the fins.
192. Did you find a ready sale for those products? Yes, a very ready sale.
193. Is that industry—I allude to the capture of sharks and the preparation of shark oil and the fins—capable of extension? Yes, it is capable of great extension. Then again there are the teeth of the shark. The teeth of the shark called the greynurse have fetched a shilling per dozen; you can sell them to any jewellers. I have been offered by a jeweller 1s. 6d. each for the teeth of a blue pointer shark. These teeth are serrated, and are used for ornamental appendages to watch chains and for other purposes.

THURSDAY, 12 *SEPTEMBER*, 1895.

[*The Commission met at the Offices, Bligh-street, at* 11 *a.m.*]

Present:—

FRANK FARNELL, Esq., M.P., President.

The Hon. R. H. D. WHITE, M.L.C. | L. G. THOMPSON, Esq., J.P.

Mr. John Pollard, fisherman, Sydney, sworn and examined:—

Mr. J. Pollard. 12 Sept., 1895.

194. *President.*] Your name is John Pollard, and you have followed the occupation of a fisherman for some years? Yes.
195. Where do you reside? Thirty-nine, Cumberland-street, Sydney; I was a licensed fisherman for some considerable time, and after that I was engaged as an engineer on the tug-boats.
196. Have you had any experience of well-boats? Yes.
197. What boats are they? I first started with the "Endeavour," a little steamer built by Rock Davis, at Blackwall.
198. What size was that vessel? About 15 tons.
199. What part of the coast did you fish? North and south.
200. Had you any success in her? Oh, yes; we did very well.
201. What fish did you put in the well-boat? Schnapper, nannegai, teraglin, Sergeant Baker, flathead, and rock-cod.
202. Did any of those fish suffer while kept in the well? The only time they would suffer would be by the overflow of current running through the well, when the vessel was going too fast, the effect of which is that the fish are unable to stem the current and are all huddled together at the after end of the well and damage each other.
203. Did you find that the well-boat is suitable for schnapper? Yes; the well-boat is suitable for schnapper, but it depends very much on the depth of water in which the schnapper are caught.
204. When fishing for schnapper to place in your well, did you take any precautions when hauling the fish up from great depths? Yes; first of all if you are fishing in any great depth of water you do not want to haul them up at any great pace, they must be brought up very steadily.
205. Any other precautions? Yes, when you get the fish out of the water if he has swallowed the hook he is no good for the well; if you bring him up alright to the top of the water in eleven cases out of twelve the fish is blown and the wind-bag is drawn up to his mouth; if you prick that bag the wind escapes and the fish is alright.
206. Then you do not make a practice of pricking all fish under the fin? No; the fish that do not bring the bag up we prick near the fin—about an inch from the fin—that is, about an inch from the pectoral fin.
207. Do you find that the schnapper are wild or furious in the well? No; they are very docile fish in the well. The teraglin is a very wild fish.
208. Do you take any precaution with him—he has a large air-bladder? I do not value the teraglin much; I do not care for them.
209. Do they come to the surface at all; do you prick them? Yes; every fish we catch, except flathead, Sergeant Baker, and rock cod—they do not want pricking; you have to prick the others.
210. A fishing-boat, called the "Iron Duke," having a well in her, was lying at the Circular Quay some time ago; was the well in the "Endeavour" constructed on the same principle as the well in the "Iron Duke";—which would be the better well? The one in the "Iron Duke" is the best, but it can be improved upon.
211. In what way? By giving the escape a greater chance of getting away at the after end, and less in the forward end. I would do away with valves altogether, and have only ordinary holes.
212. Would not valves be best—would you not be able to close them as you wished? No; I prefer ordinary holes, so that the water can flow into the well and pass out again, so taking the slime away.
213. By reducing the number of holes in the forward end of the well, would you not prevent the flow of the water? No.
214. If the fish in the well generate slime, how, if you prevent the influx of water, can you do away with it? There should be a greater outflow than intake.
215. Have you used ice on your well-boats for preserving dead fish? Yes.
216. Would it be a good plan to form an ice-chest on each side of the well, so that the fish which die could be cleaned and kept in fit condition for market? An ice-chest is a good thing; but I would have it on the forward and after ends of the well. I would also have planks on the top of the well, and then I would kill some of my fish and bring them into the market in cold weather—they would keep for two days in cold weather—but that plan would not answer in the summer.
217. What size well-boat do you favour? A boat over 30 feet on the keel is no good for men to work; if you get into calm weather, it is very hard work to move her along.
218. How long have you been on the "Iron Duke"? Only a week. I left her because the owner, Morgan, and I did not agree about going south fishing.
219. At what distance apart are the holes in your well; if you were going to construct a new well, at what distance apart would you place the holes? You can put them in rotation from the keel upwards at intervals

Mr. J. Pollard. 12 Sept., 1895.

intervals of 18 inches; say four rows of holes at the after end, and at the forward end in rows of 3 inches, the object being to make the outflow of more capacity than the intake. The well should be built with sloping sides, in order to prevent the fish striking against the sides when the boat is rolling.

220. You favour the construction of an ice-chest fore and aft of the well, instead of on the sides? Yes; by that means more room is given to the men for fishing, for stowage of ballast, and for other general purposes.

221. Do you find that fish which die in the well become rigid like ordinary fish? Yes; they remain very hard, and are really in a better state for keeping than fish caught and killed in the ordinary way. The reason is that fish when caught and thrown down on the deck, knock themselves about so much before dying. Of course it is necessary to watch the well and take out the fish as soon as they begin to show signs of turning up.

222. Do you consider the well-boat system of fishing suitable to New South Wales waters? I do; and if I had the means I would order a boat at once with a good well in her. If any gentleman will start me it will be my heart's delight to get a boat right away, and go in for well-boat fishing.

223. The "Iron Duke" was moored at Prince's Stairs, Circular Quay; did you find the foul water there have any prejudicial effect on the fish? No; that is, if you do not keep them in the foul water for any considerable time. I had a fish in the well at the Circular Quay for one week, and I took that fish away again and brought it back the week after, when it was in perfect condition.

224. Did you find the fish suffered from being kept in still water? They improved; I fancy they got bigger. I am of opinion fish thrive in the well.

225. How do you get rid of the slime the fish generate when the well is in still water? It mostly flows out itself; sometimes I go round and take a dipper, and take the top of the water off, and throw it overboard.

226. Do you advocate the adoption of the well-boat for fishing purposes in New South Wales? I do, most strongly.

227. Have you heard of tanks, or fish-boxes, being used in connection with well-boats? Yes, I believe in that; but according to the fish you have, so the tank or box should be sunk to a certain depth.

228. What number of fish did you have in the well in the "Iron Duke" when you came into Sydney? Over 100.

229. How long were you catching them? Three days looking for them; the fish could be caught in an hour.

230. What size is the well in the "Iron Duke"? About 10 feet long, and 6 feet beam.

231. And those 100 fish did well? Splendidly.

232. How many more would a well of that capacity carry? That well would carry about 300 fish for three or four days; time enough for us to get to market.

233. *Mr. Thompson.*] You know various fishing grounds along the coast? Yes.

234. The Commission are anxious to publish, for public information, a map showing the fishing-grounds; can you help us by marking on a map which will be supplied to you, the position of these grounds, giving us the cross-marks? Yes; I daresay I could.

235. Have you had any experience in trawling on this coast? Yes; about four months and a half. I was out with Dr. Marano and Porchelli, trawling from the steamer "Midget." We trawled the coast south from Broken Bay to Coalcliff.

236. Had you any success with the trawl? Yes; The greatest number of fish was flying gurnet—we caught them in thousands; we also got flathead and sword-fish, but no schnapper. I have never caught schnapper with a line, or in the trawl, on sandy bottoms.

237. I suppose you do not think trawling would be beneficial for the capture of schnapper? No.

238. Would trawling be a good means for capturing other kinds of fish in our waters? Yes; for many other kinds of fish.

239. Will you mark out for us, on the map, the positions of the various fishing-grounds with which you are acquainted? I will be very happy to accompany you in a boat, and obtain and give you the compass bearings of the grounds I know; if you were with me I could show you the marks I use. I could not otherwise explain them to you on shore, or on the map.

THE INLAND FISHERIES.

LAKE GEORGE.

MONDAY, 2 SEPTEMBER, 1895.

[*The Commission met at Lake View House, Lake George, at* 9·30 *a.m.*]

Present:—

FRANK FARNELL, Esq., M.P., President.

L. G. THOMPSON, Esq., J.P.

John Gale, Esq., J.P., Queanbeyan, sworn and examined:—

J. Gale, Esq. 2 Sept., 1895.

240. *President.*] Your name is John Gale, and you reside at Queanbeyan, what are you by profession? A journalist.

241. I understand you have an extensive knowledge of the fisheries of Lake George and the Queanbeyan district? Yes; my acquaintance with these fisheries has extended over a very long period.

242. You have been intimately connected with the fisheries of Lake George? Yes.

243. Would you mind prefacing what questions the Commission may put to you, by affording us some particulars with respect to the Lake? I have a short statement with me which I would like to read. It is as follows:—I first saw Lake George in 1854. It was then an extensive and richly grassed pasturage. The entire bed of the present extensive sheet of water from the Turalla Estate, Bungendore, to the lagoon at Winderradeen, 4 miles south of the village of Collector (Kaligda), was clothed in rich verdure, and fed herds of many hundreds of cattle and flocks of sheep, owned by Mr. (afterwards Sir) T. A. Murray, of Winderradeen; Mr. Cooper, of Willeroo; Mr. De Lauret, of Currendooley; Mr. Powell, of Turalla, and others. The high road from Goulburn to Bungendore, Queanbeyan, and Monaro, traversed the bed of the lake. No water was visible, none to be had even in the gullies of the slopes of the ranges forming the western boundary of the lake for the purpose of slaking the traveller's thirst. There

was

J. Gale, Esq. 2 Sept., 1895.

was a small reedy swamp, however, on the eastern side, under the range in the vicinity of Kenny's Point. Yet, we have testimony that within the early decades of the present century this vast plateau of upwards of 20 miles north and south (from Turalla to Winderradeen), and 12 miles or 14 miles east and west, from Geary's Gap to Kenny's Point; indeed, northwards to the site of the present village of Collector, and southwards evidently to Brook's Hill, some 4 miles south of Bungendore (Bungadow), was fathoms under water. I frequently travelled this part of the country from 1854 to 1860, in which year I took up my residence permanently in the town of Queanbeyan, and whilst so travelling was the guest of the late Rev. Robert Cartwright, one of the early colonial chaplains. Mr. Cartwright had settled in Collector where he owned an extensive property, built a church and parsonage, and was then the parish clergyman. It was from this venerable gentleman, then about 80 years of age, I obtained an interesting account of the first discovery of Lake George. Early in the present century, during Governor Macquarie's time, Mr. Cartwright was attached to the Governor's suite, and accompanied the vice-regal party on a visit to Wollogorang, Breadalbane Plains, the most southerly point at that time taken up by the early settlers. The owner of this fine pastoral property was the ancestor of the present owner of Wollogorang, and the Governor and his suite were Mr. Chisholm's guests. It was proposed during his stay there that Governor Macquarie and his party should make an excursion still further southwards with the object of exploring the country. The first day's stage of this excursion was to a point since known as Rose's Lagoon, 4 miles north of Collector. Having camped there for the night, and whilst breakfast was being got ready, and preparations made for the second day's progress, two blackfellows accompanying the party were sent on to explore, with instructions to return and report. This they did, and with some degree of perplexity, reported that they had come to the sea. Surprised at this discovery, the party followed their aboriginal guides, and ascending the rising ground on the north side of the hill (since known as the Windmill Hill, from the fact of a windmill having afterwards been erected thereon) overlooking the site of the present village of Collector, to their surprise saw a boundless sheet of water extending southwards, whose waves were washing the base of the hill on which the party stood with a force equalling that of billows rolling in on an ocean beach. "Where we sit now," said Mr. Cartwright to me, as he was narrating the fact in his own dining-room, "there were fathoms of water, and the bell-turret of my church, had it then stood, would have been submerged far beneath the waves." In a few years, however, after this adventure and discovery, and while this part of the country remained still unsettled, the waters of Lake George (as it was named by Governor Macquarie) suddenly subsided, and in a remarkably short space of time was transformed into a rich pasturage which presently tempted to settlement, and was taken up immediately by the gentlemen I have already named. There have been various theories advanced to account for this phenomenal subsidence of so vast a body of water. The true theory doubtless is, that as Lake George is beyond all question the crater of an extinct volcano, and has all along been subject to earthquake waves at irregular and infrequent periods, one of those convulsions opened a fissure in the bed of the lake through which the vast body of water rapidly disappeared through subterranean channels which are known to exist eastwards to the Shoalhaven Gullies. The lake has four contributory streams which discharge their waters into its basin. From the southern watersheds, Turalla and Deep Creeks; from the easterly watersheds, Taylor's Creek; and from the northern watersheds, Collector Creek. During all the years that intervened between the first disappearancee of this inland sea, and up to 1862, the contributions of these, and of minor and less permanent creeks, failed to furnish the bed of the lake with anything approaching a sheet of water. There was a morass on the eastern shores, in the neighbourhood of Kenny's Point and Willeroo, in which rank rushes grew, where cattle frequented, and through which stockmen rode with the water never reaching beyond the saddle girths. It was after the heavy rains and destructive floods of 1852, so fatal to the original township of Gundagai, that, many years before my acquaintance with Lake George, Mr. Murray owned the estate of Yarralumla on the Queanbeyan River, some 10 miles below Queanbeyan, as well as the fine estate of Winderradeen. Through the latter ran the Collector Creek, the channel terminating, like those of Taylor's Creek, Deep Creek, and Turalla Creek, in an extensive bed of silt on the margin of the lake. Into the Collector Creek Mr. Murray had introduced a consignment of cod and bream or perch which he caught in the Queanbeyan River and forwarded to their destination in hogsheads on a bullock dray. The perch or bream were never afterwards seen, but the cod-fish thrived and increased rapidly, so much so, that, in a few years, the Collector Creek was found to abound with this fine fish, and large numbers were regularly caught by the population who had now settled in the district. In the year 1864, a rainy season, the waters began once more to be retained in the basin of the lake. Previously to this the volumes discharged into the lake as fast disappeared after trending towards the southerly areas under Kenny's Point and Willeroo. This pasturage, as I have already remarked, was a favourite resort of the cattle, whose constant treading, assisted by the decaying vegetable deposit, must have effectually puddled and stopped the crevices through which previously the gathering waters had escaped. The waters gradually spread until, in 1874 or thereabouts (another rainy period) the water area of the lake extended upwards of 20 miles in length by 12 or 14 miles in width at the point of its greatest breadth. In this year the waters had permanently covered the silt beds at the mouth of the various contributory creeks, affording free ingress and egress to fish between the freshwater creeks and the brackish waters of the lake. But no one suspected that all through those years these brackish waters were teeming with Murray cod. It was, nevertheless, a fact, though an unknown one; and the discovery of this fact was made first by settlers in the neighbourhood of Deep Creek, who found that stream teeming with large cod varying from 6 lb. up to 40 lb. in weight. They were so numerous as to be captured with ease by means of the rudest appliances as well as by ordinary fishing gear. Some year or two afterwards the residents of the town of Bungendore discovered large shoals of fish, varying in weight from 6 lb. or 7 lb. to 30 lb. or 40 lb., making their way up the Turalla Creek which flows through the town. Many dray-loads were captured and found a ready sale in the neighbouring towns of Goulburn, Queanbeyan, and Braidwood. Those fish, or the stock from which they were bred, had evidently been carried into the lake in the rainy season ten years before. But their natural liking for pure fresh water led them when opportunity presented to forsake the brackish waters of the lake for the sweeter waters of the creeks for, though, from thenceforward, they were caught in large numbers in all the surrounding creeks, neither by use of net or line, for some years, could a solitary fish be found in the lake itself. A few years later, however, the brackishness of the lake waters diminished, and it was found that fish were present in larger quantities in the lake itself than in the neighbouring creeks, as at the present time.

J. Gale, Esq. 2 Sept., 1895.

244. Now, confining our attention to Lake George, will you name the kinds of fish at present in the lake? There is an indigenous fish in Lake George—a kind of loach I call it. The true loach has barbels, this one has not, and, of course, the crayfish, which is found everywhere in all waters. The species that have been introduced and which are at present in the lake are the Murray cod, and the black bream or perch. I am not sure whether the silver bream was introduced, but no fish, save the cod, seems to have survived here, excepting Asiatic carp or gold-fish, which grows to a considerable size and attains a weight of 3 or 4 lb., but is unsuitable for food.
245. I suppose you have been naturally observant of the habits of the fish in the lake? Yes; I have.
246. When do the cod spawn? They are found heavy in spawn early in the spring-time and up till November and December.
247. Have you noticed the localities in which they spawn? In the creeks and the shoal margins of the lake.
248. Is the spawn separate or attached? Attached.
249. Have you noticed whether the cod school? I do not think they do in the lake, but I know the young cod school in the rivers about the months of February and March; then you will find them in great shoals.
250. What is their natural feed in Lake George? The crayfish and perhaps those indigenous loach. I have found both these as well as fresh water mussels in their maws.
251. What bait is used in their capture? Various kinds of bait—the flesh of bears, of birds, fat mutton, pieces of fish, and crayfish.
252. What methods are employed for the capture of cod in the lake? The ordinary hand-line and a long hand-line, known as a cross-line, some hundreds of yards in length, with snoods attached about 6 feet apart. These lines are laid out in the known resorts of the fish and left there overnight. They are visited occasionally and the fish taken off the various hooks. The locality of the lines is marked by large pieces of wood and corked bottles.
253. Would the lines be made fast at one end? No; excepting that a stone is attached to it. Sometimes it is attached to a stake.
254. Are any other methods used for the capture of the cod in the lake? Netting.
255. Is the netting practised very much? It has been indulged in too much by one or two persons living on the margin of the lake. When I say too much, I mean in season and out of season. This led to the destruction, to some extent, of the fish.
256. Are we to gather from what you say that it is necessary to have a competent man to supervise this fishery? Yes; it is most necessary—it is highly necessary.
257. Are there any other modes by which the fish are caught? Not that I know of.
258. Do those engaged in fishing adopt any means, by establishing paddocks, in order to keep the fish alive? They have large drapery cases sunk in the water and the fish are put inside these cases when caught and kept there until they have a sufficient quantity to take to a distant market.
259. Do the fish endure confinement well? They seem perfectly contented. I believe they would live there some time. These cases are pierced with augur-holes and this lets the water in and out.
260. Have you ever known these fish to be fed while in captivity? No.
261. What was the size of the largest cod taken out of the lake? I caught a cod of 46 lb. weight here. The largest I have heard of, and I have it on reliable authority, was something over 60 lb. in weight.
262. You referred to the waters running into Lake George—do you think any of those creeks serve as spawning and breeding grounds for the fish? I am certain of it, with the exception of Taylor's Creek; I am satisfied that pre-eminently, if not exclusively, Deep Creek, and Turalla Creek are the spawning grounds of the cod.
263. Taking that for granted, would you favour a proposal to permanently close those creeks during the spawning season? Yes; and that should not be too short a time either. It is, perhaps, worth while to remark that all who fish lawfully—that is with the line and for sport—rarely ever catch a fish under 5 lb. in weight.
264. The small fish, then, do not appear to be attracted by the bait? No; I think they have so much natural food that the bait has no attraction for them.
265. It is only the bigger and more voracious fish that bite readily? Yes; that is so.
266. Has a great quantity of cod been taken out of Lake George? Yes; the gross amount must total many hundreds of tons.
267. Where would that fish be distributed? In the neighbouring towns. Lately much of it has been sent to Sydney; before that fish was sent to Goulburn, Queanbeyan, Collector, and Bungendore.
268. Is there a large demand for this fish for the Sydney market? I know that for the last seven years there has been a fair market in Sydney for cod caught in the lake.
269. What price does the cod realise per pound in the Sydney market? I cannot say what it is; but the local price has been rarely below 6d. per pound.
270. I understand Lake George is situate about 5 miles from Bungendore railway station? Yes.
271. So that during the winter months, without any difficulty, if the fish was caught, it could be sent to Sydney? Yes, they could be sent there if the fish could be caught; but I doubt very much if they can be caught in the winter months.
272. Why do you think they could not be caught in the winter? I have made the habits of the cod and other indigenous fish in the rivers in this district a study for many years. I once constructed a pond in my own grounds, as an observatory, and the results of my observations were that during the intense cold of our southern winters the cod embedded itself in the sediment at the bottom of the pond, and in a sense hibernated there. I have frequently disturbed them when the water, being very clear, and the sun shining on it, I found their whereabouts, to see that they only sleepily moved about, and when left alone immediately returned to their beds or winter quarters. I have fished with the rod and line in the Murrumbidgee and Queanbeyan rivers, in all months of the year. In the winter months I would occasionally, during the middle of the day, and when the sun was fairly warm, catch a fish at that season—always a large one. I have for years been accustomed to set hand-lines in the month of August, always with the result that towards the end of that month I caught fish, and those always very large ones. This is my theory, which is the result of my observations: that the cod only moves out from its winter quarters upon the approach of spring, when the temperature of the water rises a little higher, and that the big fish, being the hungrier, are the first to leave their winter quarters.

J. Gale, Esq. 2 Sept., 1895.

273. Referring to the supply during the spring and summer months, are you of opinion that a regular supply could be kept up for the Sydney market? I think, under careful legal provisions, an unlimited yield of marketable fish could be obtained from Lake George and elsewhere.
274. You think that by slight improvements in the method of transit of fish by railway, consignments of cod could be delivered perfectly fresh in Sydney and other towns? Yes; fish could be taken to Sydney as easily as they take dead meat to Sydney at all seasons of the year.
275. Do you think it would be an improvement to gut the fish before it leaves Lake George? A very great improvement indeed. My own method of keeping fish, when I have been fishing in the Murrumbidgee, is to kill it, and put a little salt on the backbone, and the gills, and it keeps well for a day or two; in fact, you can take your fish home sweet after two or three days,
276. How do they send the fish caught in the Lake to Sydney? In boxes, I think.
277. Can you tell us whether the cod spawns once or twice a year? I have heard that they spawn twice in Lake George; and I have also heard, but it is only hearsay, that they only spawn once a year in the Murrumbidgee and Queanbeyan Rivers.
278. You were speaking of the natural food of the cod being crayfish;—are they here in any quantity? Yes; there are too many crayfish to make it a good fishing-ground. The abundance of food the fish find here naturally diminishes the chance of catching them with the hook. They have not to go searching about for food; there is plenty for them here. It is only the voracious fish which takes the bait on the hook.
279. You stated that at one period in the history of this lake the water became so brackish that the fish sought purer water by going up the creeks? The fish could and did live in Lake George, but they naturally preferred sweeter water, and so went up the creeks. It was fully seven years before we could catch fish in the Deep Creek and Turalla Creek.
280. The water at present is suitable in every respect for all kinds of fresh-water fish? Yes.
281. That being so, would there be any difficulty in introducing the brown trout or Loch Leven trout? No; I think no more suitable water exists in all Australia for fish of that kind. I have for many years used all my influence in the direction of inducing the authorities to introduce the big brown trout into this lake; other varieties also might be introduced with success. I have for many years regarded Lake George as being a source of untold national wealth, if only it were properly developed.
282. You think the capabilities of the lake, as a fishery, are great; and further. that they could be increased, and a profitable industry could be established here? Yes; I do.
283. As to the private ownership of land surrounding the lake, is it a fact that in consequence of private ownership the public are not able to get access to the water except by trespassing? It is so, unfortunately; but something should be done to remedy such a state of things.
284. Would you advocate the dedication of a reserved road right round the foreshores of the lake, and would you also apply the same principle to the rivers of the Colony, so as to give people access to the water? I should like to see an absolute resumption of all water frontages. I think some legislation should be effected which would give persons the right of access to all water frontages, within a fixed limit, under certain well-defined conditions.
285. Do you know of any other destructive agencies, besides those people who use nets out of season? Yes; there are formidable natural agencies; there are two or three varieties of the cormorant, commonly known as the shag. Then there are the pelican, and certain waders, such as the red-bill and coot, all of which seem to feed upon fish or the ova of fishes, and they frequent the spawning-beds seemingly for that purpose. Of course there is a solitary fish-hawk to be seen here and there, hovering over the surface of the lake.
286. Do you think it inadvisable to protect the birds you have named? I would rather see a premium offered for their heads, and it would be in the interest of the fisheries to destroy these fish-eating birds.
287. Have you any acquaintance with the waters of Lake Bathurst? Only a little.
288. Has any attempt ever been made to introduce fish there? Yes; both from Lake George and Collector Creek.
289. Have they increased there? No; I do not think they have been a success. I think I should say here, as one who has made experiments in that direction, I have come to the conclusion that the eastern waters of the southern districts are not suitable to the cod. I gather that from the results of experiments that have been made in the introduction of this fish into these waters. For example, two or three attempts have been made to stock the Wollondilly and the Mulwarree Ponds, at Goulburn, and shortly afterwards an individual cod of large dimensions was caught here and there, seemingly the grown originals, but no young fish or any fish at all have ever been seen since. I have had a hand in similar experiments in transporting fish—cod and perch—to the Shoalhaven River and the Little River, in the Braidwood district, where the people once offered a premium of £50 to anyone who should successfully introduce the cod into that stream. Two or three consignments were successfully placed there, but nothing was afterwards heard of them. I have for many years taken an active interest in the introduction of all kinds of fishes.
290. Do you know whether the eel will survive and breed in the waters of the western watershed? They are known to be exceedingly common on the eastern watersheds. I regard Lake George as being neither on the eastern or western watershed; but there are no eels here. I do not know that they have ever been introduced. I did, however, make an experiment some years ago in introducing eels into the tributaries of the Murrumbidgee at Queanbeyan, the Molonglo, and the Queanbeyan. I placed them in a nursery and watched for their increase; but I never saw it, though I frequently saw the original eels. Gradually they disappeared, and for years past I have seen nothing of them.
291. Do you consider the waters of Lake Bathurst on the eastern watershed? Yes; it is probable there are eels there. It is contiguous to the Mulwarree.
292. Do you think, if it were not thought advisable to introduce indigenous fish into those waters, brown trout might be successfully placed in Lake Bathurst? Yes; I am satisfied the lake trout would thrive in Lake Bathurst as well as in Lake George.
293. As to the introduction of fish not indigenous to the waters of the Colony, have you conducted any experiments in depositing fish at different places? Yes; in 1887 I accompanied a neighbour, Mr. Fred Campbell, to Ballarat. We took with us all the appliances necessary for bringing back a stock of the several kinds of trout and other varieties of fish which are reared by the Acclimatisation Society at Ballarat. We brought safely to Queanbeyan nearly 300 yearling trout, about fifty English perch, and a like number of Russian carp. The trout were successfully deposited in seven rivers, all tributaries of the

J. Gale, Esq.
2 Sept., 1895.

the Murrumbidgee, and in the main river itself. They were placed in what we regard as the finest possible trout stream in Australia, the Cotter River, a western tributary of the Murrumbidgee. We placed upwards of sixty of those trout in that stream. We deposited thirty-six in the Queanbeyan River, thirty-six in the Molonglo, and similar numbers in the following rivers:—The Bibbenluke, a tributary of the Snowy River; the Little River, in the Braidwood district; the Molonglo; the Yass River, at or near its sources, which are close to Queanbeyan, and the Naas River.

294. What have been the results of your experiments in that direction? In some respects disappointing, so far as regards the minor streams; fairly successful as regards the Queanbeyan River, speaking of three or four years ago; pre-eminently successful as regards the Bibbenluke, which is a tributary of the Snowy, a river flowing eastwards, and the Cotter, first named. I have seen a few trout of various ages that have been taken from the Queanbeyan and Molonglo Rivers since.

295. What age would they be? It is hard to say. I am not satisfied about their growth. They seem to grow in proportion as they have an abundance of feed. I may state that a Treasury official found one stranded on the bank of the Molonglo which weighed 5½ lb. and measured 25½ inches in length. The fish was in very poor condition as it was immediately after spawning-time. That fish must have attained its growth from 2 or 3 inches to its then dimensions in so short a time as eighteen months or two years. In fact, as proof positive that the fish have bred, several small trout, only a few inches in length, were brought into Queanbeyan, having been caught by anglers, and one more recently still 3 lb. in weight which must have been the progeny of the original fish. I have angled for them with the best of tackle, being an old trout fisherman, but I never succeeded in hooking one. I once unquestionably saw a trout make a leap from the water where I was fishing. That was within a mile of the town of Queanbeyan. With regard to the Cotter, a river which furnishes another instance of the permanent success of their introduction, I have had statements from reliable authorities of the presence there of shoals of trout fry. For instance, during one of my visits in connection with my coronial duties, I had occasion to put up at a squatter's residence in the neighbourhood of the Cotter. During my stay, the lady of the house informed me that her son had told her he had seen in one of the streams flowing into the Cotter, a number of little fish, which were, to use his own words "a new variety, and prettily spotted." The lady of the house informed me that she knew the fish in question to be trout, although her son did not possess that knowledge, he being a native of the Colony and she coming from Scotland. This incident occurred about five or six years ago. That would be about two years after we placed the yearling trout in the Cotter. I have also been informed that a party consisting of Mr. King, Police Magistrate and Mining Warden, Mr. Johnson, railway contractor, and Mr. McAllister of Bungendore, visited a copper lode known to exist at the junction of the Cotter with the Murrumbidgee. The two gentlemen first named were first over the ford, and had disturbed the water, which is as cold as ice, and clear as crystal, and they had evidently frightened some fish, which Mr. McAllister, following them, saw passing up the stream. He describes them—I use his own words—as "being about five in number, 15 or 18 inches in length, olive-green on the back, and they seemed to have golden-yellow flanks, and were spotted on the sides. He had never seen any fish like them. They were neither cod or perch, and he thought they must be trout." These instances, to my mind, are the strongest possible evidence of the existence of trout in numbers in the Cotter, and prove their successful introduction. I may also state that I have received satisfactory and reliable evidence that a trout 3 lb. in weight was taken at Wantabadgery, on the Murrumbidgee, 160 miles below the Cotter River.

296. What are the fish indigenous to the rivers? The indigenous fish in the Murrumbidgee and its tributaries are different in the various regions through which the river flows. Low down the Murrumbidgee, in the level country, from Wagga Wagga to Hay, there is a very fine fish known as the silver bream. That fish is rarely seen in the Upper Murrumbidgee. There is a fish in the Murrumbidgee, which I caught at Wantabadgery, entirely new to me. It is a loose scaled fish; the scales come off the moment you touch it. It is deeper in its chest structure but otherwise resembles the English dace. In the Upper Murrumbidgee I once caught a strange fish. Its flesh was pink like that of a trout or salmon; it was in shape like that of a grayling, except that it had not the adipose fin. It was pure silver in colour everywhere, and the scales, as in the case of the fish I mentioned as having caught at Wantabadgery, came off the moment I touched it. This fish was about 1½ lb. in weight, and took the bait—a worm—greedily. The fish in the Upper Murrumbidgee and its tributaries are the Murray cod, black-bream, and a light coloured bream or perch, which is erroneously called the silver bream, but is not that fish.

297. What about the minnows you catch? The indigenous fish in the Cotter, and Goodradigbee River are what is known as the mountain trout, which goes in shoals. It is a sweet edible fish, weighing about 4 or 5 ounces, the biggest of them being about 7 inches in length. There is also a small fish in all the mountain streams in the county of Cowley, and also here in the tributaries of the Upper Queanbeyan River, in the county of Murray, a small fish, a true minnow, very much like the English minnow. It never attains ½ ounce in weight, and not more than 1½ or 2 inches in length. Of course there are crustacea in all the waters.

298. When introducing the trout from Ballarat you took them as yearlings? Yes.

299. They were liberated at a stage in their growth when they could feed and protect themselves? Yes; by their activity and natural vigour.

300. Would you advocate the placing of fish in any waters at a stage of growth earlier than that? No; it has been a failure wherever tried, to my own personal knowledge.

301. Do you know what fry has been introduced into the different water? Yes; as an aid to the Fisheries Commissioners, I assisted in placing fry in the different streams.

302. Were those experiments attended with success? No; so far as I have observed, and I have observed carefully, patiently, and earnestly, it seems to have been an utter failure.

303. So that really the trout at present abounding in the rivers you have named, are fish reproduced from those introduced years ago by Mr. Campbell and yourself? They are undoubtedly the progeny of the fish we brought over.

304. Taking all the conditions and characteristics of the county of Murray into consideration, do you think it would be judicious to establish a fish hatchery and nursery here? Yes, I do, and have long been of that opinion, and had I capital I would employ it in such an enterprise.

305. Can you say whether the climate of this county is anything like the Tasmanian climate? Yes, it is; and I say there is no climate in Australia, excepting that of Ballarat, in which a fish hatchery and nursery could be more successfully established for introducing and raising the several varieties of fish than in that of the Queanbeyan and Monaro districts.

J. Gale, Esq. 2 Sept., 1895.

306. Do you think, if a hatchery and nursery were established here, the several waters in the district could be stocked with food fishes? Yes; and I also know from my own observations that there are natural formations and places here that could be cheaply and easily converted into nurseries. A nursery should be safeguarded against floods; there are many places where pure, cold, sweet water could be obtained, water which would constantly run and never be disturbed by floods.

307. Speaking of indigenous fish, have you ever seen the catfish here? No; never in the regions of the Upper Murrumbidgee. I have heard of catfish being found, and I know them to be in the Yeo Yeo Creek, a tributary to Lake Cowal.

308. Do you think, if the tributaries of the Murrumbidgee were well stocked, and the fish put in at a proper age, that eventually they would be found to extend into the main river? Yes; our object in putting fish into the tributaries of the Upper Murrumbidgee was that we were sure they would find their way into the main river.

309. From your knowledge, gained in connection with experiments in fish propagation, do you think it would be more successful to have a hatchery established in a climate, and under such natural conditions as you have here, or would it be better to have it established in the county of Cumberland? The only objection to the establishment of a hatchery and nursery up here is the distance from Sydney; but as a set off to that you have the advantage of climate, and now that our railway is through, it is only a night's travel for anyone to come here and inspect. The county of Cumberland, I have no hesitation in saying, does not possess the climate suitable to the successful hatching and rearing of the salmonidæ. I have heard the Commissioners are establishing a hatchery and ponds at Prospect Reservoir; this is a mistake, from my point of view. From my own experience, as a trout and salmon fisherman—and I have been fishing since my early boyhood—I am satisfied that the climatic conditions at Prospect are against the successful rearing of healthy fish. It seems to me that the fish reared in the warm waters at Prospect, would deteriorate in their flavour, and would be weakened to a considerable extent when transferred to mountain torrents. They would not have the vigorous constitution necessary for them to stand the change.

310. Have you ever noticed any indications of disease in any of the fish in these regions? I have, recently.

311. Would that be *saprolegnia ferax*? It is undoubtedly the *saprolegnia ferax*. Since this discovery I have read up the authorities on the matter, in addition to the information I got from the Fisheries Commission, which was to the effect that the disease was *saprolegnia ferax*—that was all I got from them. I have found out, from my own observations, that it attacks the fish, and is known by white spots upon the surface of the skin which eat into the tissues of the fish, and which, in its more advanced stages, present the appearance of a thick mucous adhering to the fins, gills, and mouth.

312. After having communicated with the Fisheries Department, did you seek further information from them? Not from them; several letters passed between us. I reported fresh developments I had discovered; but they gave me no further information respecting the disease. I asked particularly for information regarding the origin and cause of the disease, but they never furnished me with the information I sought. By research, however, I discovered—I think it was from Blackie's Encyclopedia—that *saprolegnia ferax*, during late years, has been very prevalent in the British trout and salmon rivers, and has proved very destructive to the fish. I also ascertained that aquatic plants, as well as fishes, were subject to it. Sergeant Nelson, of Queanbeyan, has reported to me that he has discovered in the waters of the Queanbeyan River, which is a mountain stream, and has no stagnant water in it, some decaying vegetable matter rising from the bottoms of the pools, carried forward by the stream, and possibly this resulted from the *saprolegnia ferax* having attacked the aquatic plants in the river. I intend to closely examine the aquatic plants in the Queanbeyan, with the object of discovering any further evidence of *saprolegnia ferax*.

313. Do you know whether it has attacked any aquatic birds? Within the past few days I have discovered upon the webbed feet of the black swan of Lake George, white spots and excrescences, having all the appearance of *saprolegnia ferax*.

314. Do you know of any cure for this disease; would immersion in salt water effect a cure? I am informed that fishes affected by this disease are speedily restored to health when brought into contact with salt water.

315. *Mr. Thompson.*] Referring to the spawn of the Murray cod, is it extruded attached? Yes.

316. In the shape of a ribbon? It looks more like a cord or thread than a ribbon.

317. Do you find it attached to anything? Yes; I have found it attached to logs, weeds, grass, and other things.

318. Do you favour the theory that the cod makes furrows or redds like the salmon? No; I am certain it does not.

319. How long would the fry of the cod remain in the creeks? I cannot speak with regard to these creeks; but in the Murrumbidgee and its tributaries the fry and the young fish grow very rapidly, and go in shoals. They are gregarious until they attain about ½ a pound in weight. They then become more solitary in their habits; in the fall of the year, from February to April, anyone who is interested in fish life would be grieved at the numbers of fish that are caught by the use of very small hooks.

320. You tell us that the fish begin to spawn very early in the spring, and continue until November and December? Yes, in November and December the fish are sick as the result of spawning. When you do catch an odd one it is in poor condition.

321. How long does the spawn take to hatch? I cannot say; it cannot take long, because at Christmas time the fish get strong appetites again, and you begin to get great numbers of very small fish, perch and cod, and so on, until the winter sets in.

322. Would you favour the permanent closing of the creeks emptying into Lake George? Yes, I would; but as regards the other rivers sufficient protection could be obtained by regulating the size of the hook.

323. Is the absence of the bream and the blackfish from the lake to be accounted for by the voracity of the cod? No; I think there must be some natural cause, the conditions are against it, otherwise how is it the hatched cod in the Murrumbidgee did not destroy the perch there. I have seen the cod and perch fraternising with each other in that river.

324. Supposing steps were taken to stock the inland rivers of the Colony with suitable fish to such an extent that angling might be carried on at proper seasons, are you of opinion that amateurs would object

J. Gale, Esq. 2 Sept., 1895.

object to pay a licence for the privilege afforded them, the fees collected for the license being devoted to the expenses of the Department having charge of the fisheries? I think it should be made compulsory on the part of all anglers to take out an annual license.
325. Do you know anything of the system of netting pursued in the Murrumbidgee? There is no netting practically in the Upper Murrumbidgee—rocks render it impracticable.
326. But do they not use nets in the Murrumbidgee? You can rarely use a net without getting it snagged.
327. Do you know the Murrumbidgee at Tumut; can nets be used in the Tumut River? Yes, nets can be employed there.
328. Have you ever known them to be employed at the junction of the Tumut, the Jugiong, and the Tarcutta Creeks, with the Murrumbidgee? I have heard it is a common practice.
329. Do you think it a desirable practice? It is most objectionable.
330. Would you recommend the closure of those creeks against net-fishing from the junctions upwards? Yes; I would.
331. Do you consider that the employment of drum-nets is destructive? Yes, very destructive; I approve only of a net with a large mesh to catch a large fish.
332. What is the minimum mesh which you think should be used in the rivers? A 5 or 6 in. mesh, that would capture a ten-pound cod, and certainly not smaller than an eight-pound cod.
333. What should be the minimum size for a cod which anglers should be allowed to take? Half-a-pound.

Mr. William Harry Glover, Meteorological Observer, Lake George, sworn and examined:—

Mr. W. H. Glover. 2 Sept., 1895.

334. *President.*] How long have you resided at Lake George? Ever since October, 1884.
335. During the time you have been here, have you had a good opportunity of judging of the capabilities of the fishery? Yes; I have.
336. Was there plenty of fish in the lake in 1884? Yes.
337. The fishery was a very prolific one at that time? Yes; it was.
338. Has it maintained its standard? To the best of my belief it has.
339. What kinds of fish are there in the lake at the present time? Murray cod, carp, and a small fish called the gudgeon.
340. You have crustacea as well? Yes.
341. What, in your opinion, forms the natural food of the cod in the lake? Before the introduction of the carp to the lake they lived upon little winged insects and also upon the horse-stinger and the crayfish.
342. Are there any fresh water mussels here? Yes, there are.
343. How long is it since the carp were introduced? About seven years ago.
344. Have they multiplied at all? Wonderfully.
345. Were they introduced for the purpose of providing food for the cod? No.
346. Do you look upon the carp as a fish of commercial value as compared with the cod? Yes, I do.
347. Is it as nutritious a fish? It is a fish of splendid flavour.
348. What weight does it attain in the lake? The largest I have seen in Lake George would weigh about 4 lb. It was 15 inches long and about 2 inches across the shoulder.
349. Are they caught with a hook and line? They can be.
350. What bait is used for their capture? Dough. I have only known of two being caught—I caught them myself with a hook and line.
351. Have any been taken in the nets? No; the nets used are of too large a mesh.
352. When do the carp spawn? It is difficult to say exactly; but I take it to be nearly all the summer months.
353. Once or twice a year? That is more than I can say.
354. Have you observed the spawn at times? Yes.
355. Was it attached or separate? Separate.
356. Referring to the habits of the cod in the lake, when do they spawn? Nearly all the summer months.
357. Do they spawn once or twice a year? I cannot say.
358. Have you ever observed the spawn; is it separate or attached? It is separate.
359. Where is it usually deposited? I have seen places on the eastern side of the lake, in about 3 feet of water, where there have been ridges or grooves made apparently by the fish, and I believe spawn has been deposited there.
360. Do the cod seek the upper reaches of the creeks whose waters empty into the lakes? They used to about four years ago, but not so much lately.
361. How is that? Chiefly on account of the lake having risen, thus giving them more shoal water for spawning grounds.
362. I suppose a certain proportion of the fish, at any rate, breed in the creeks flowing into the lake? I really do not think they do, it is too muddy; they pick the sand.
363. In your opinion would any good result be achieved by closing the creeks permanently? Yes; it would be a good thing in one way; the fish go up the creeks a good deal, but not to spawn; they travel up and down a good deal.
364. Do you think the fry which may be hatched in the shallow portions of the lake seek the more secluded spots in the creeks? I think until they attain a fair size they keep in the deep water to avoid their natural enemies, the cormorants.
365. You have plenty of cormorants in the lake? They are here in great numbers.
366. I suppose they destroy large quantities of fry? A wonderful amount; chiefly the fry of the carp.
367. Would you advocate the offering of a reward for destroying the cormorants? Yes; I would strongly advise that a reward be offered for the destruction of cormorants, shags, and pelicans.
368. What would be a fair price, per head, to offer for the destruction of those birds? For cormorants, sixpence per head, and the same for pelicans; nobody would shoot them for a less amount, for the reason that they would not be shot for bait, as they are not very good bait. If sixpence were offered they would be shot for the reward alone.
369. Have there been any other destructive agencies at work besides the natural enemies of the fish? Not since I have been here.

Mr. W. H. Glover. 2 Sept., 1895.

370. Have you ever known dynamite torpedoes to be exploded, for the purpose of catching the fish? No, not in the lake.
371. Has the process of meshing been carried out here to capture fish? Yes, by inexperienced persons.
372. Do you mean by that, that the methods used for taking the fish were of a primitive character? That is what I mean.
373. What did they use? A mesh-net, made in a very heavy style, and unsuitable for meshing, the top and bottom lines being of very thick cord.
374. What was the mesh? Four inches square.
375. Do you approve of that mesh for catching fish in the lake, or would you rather see a larger mesh used? I do not believe in the mesh-net at all for this place.
376. What methods are best for the capture of the cod? A trawl that would go down into the mud, and catch the fish in the winter time, and an ordinary trawl in the summer time.
377. You would use a different trawl in the winter to that employed in the summer? Yes.
378. Why? I have tried the summer trawl in the winter months and could not get any fish. What I mean by the summer trawl is the ordinary beam trawl.
379. And the winter trawl you refer to? I have an idea of a trawl that would go down into the soft mud that is held in solution, and which would be the means of disturbing the fish lying dormant in this mud, and so capture them.
380. Is it one of the habits of the Murray cod in the lake that it covers itself during the winter? Yes; I have held that opinion for years.
381. That consequently would be the reason they do not bite at all in the winter? Yes.
382. Do you think the temperature of the water has anything to do with their not biting? Certainly.
383. Can you give us an idea of what the temperature of the water has been for a few years? It is about 40° Fah. in the winter time. The average summer temperature is about 65°; 72° is the temperature at which the cod bite best—that is the maximum summer temperature. At 50° the fish usually start to bite.
384. When do you think the temperature of the water in the lake will rise to 50°? It is very irregular. Sometimes we get 50° in the middle of September—sometimes earlier or later, just according to the prevailing winds.
385. Have there been any indications of a lowering of the water in the lake? During the eleven years I have been resident here I have noticed a rise in the lake of 8 inches. It is now 8 inches higher than it was eleven years ago.
386. What is the greatest depth of water in the lake? About 13 feet at the present time.
387. And the average depth? About 7 feet. This is explained by the fact that the edges of the lake for miles are very shallow.
388. Have you ever noticed any indication of a tide in the lake? I have. On the 15th March, 1885, ⅛ an inch of tide could be traced.
389. Was that under favourable weather conditions? Yes; very favourable.
390. Can you account for that tide at all? The observations have not been carried on sufficiently long to enable me to do so.
391. Have you any idea as to the origin of the lake? I believe it was a deep chasm at one time which has gradually silted up. I have one proof of the amount of silt that goes into it. I was caught in a heavy storm in my yacht one day and had to throw overboard half a ton of timber—ironbark. I just had time to secure the logs together before the storm came on. Three days afterwards I went and lifted the logs and there was one inch of silt on top of them.
392. Do you favour the idea that this chasm was caused by volcanic disturbances? I do.
393. What are the dimensions of the lake at present? It is about 18 miles in extent from north to south. Its greatest breadth is 6¼ miles.
394. Have you seen a greater body of water in Lake George than at present? Yes; I have seen the level of the lake 18 inches higher than it now is.
395. I notice the water in the lake is discoloured—can you account for that? Yes; it is owing to the heavy winds raging last week.
396. If the water is discoloured during the fishing season, do the fish bite as well as when it is clear? Better if it is rather discoloured.
397. Have you ever had the water of the Lake analysed? Yes; Mr. Dixon of the Technical College Laboratory, Sydney, made an analysis of the water. It is as follows:—

My dear Mr. Russell, Technical College Laboratory, Sydney, 2 May, 1885.

The water from Lake George contains 187·5 grains per gallon of solid matter dried at 212° F. The residue has a strongly alkaline reaction, effervesces with acid, blackens much on ignition, but does not show the presence of nitrates in doing so. The metals present are aluminium, calcium, and magnesium; the acids, chlorine, carbonic acid, sulphuric acid, and phosphoric acid,—the last two in small quantity. The salts are probably arranged as chloride of sodium, sulphate of sodium, phosphate of sodium, carbonate of sodium, and carbonates of calcium and magnesium. The purgative properties of the water are probably due to the salts as a whole, and especially the carbonate of magnesium. It should be borne in mind, however, that waters containing much organic matter frequently have a purgative effect.

P.S.—Zinc and copper are entirely absent. W. A. DIXON.

398. Was not another analysis of the water made at an earlier date? It was water from the Currawang Copper-mines.
399. What was the object in obtaining an analysis of the water? It was because several fish had been found dead, and it was asserted that it was owing to the deleterious matter draining into Lake George from the copper-mine, where active operations were being carried on. Mr. Russell, in an address given in 1885, said:—

Lake George is called a fresh-water lake, and some have even gone so far as to propose to use it as a reservoir for the supply of towns. When there I ascertained that no one could use the water on account of its purgative properties, one glassful being quite enough to satisfy those who made use of it; and it is there said that the water running into the lake from the Currawang copper mine had poisoned all the fish. This is not literally true for there are still fish in the lake; but very many were killed some years since, presumably by the cause mentioned. I obtained some of the water, and am indebted to Mr. Dixon for the following interesting information as to what the water contains. It is quite evident that with 187·5 grains of mineral matter per gallon, the water cannot be used for domestic purposes, and from the fact that this matter is constantly being added to it cannot improve, unless it were possible to withdraw large quantities of the water, and supply its place with rain-water; but during by far the greater number of years during which the lake has been known, viz., sixty-four years, the supply of rain-water going into it annually has not been equal to the evaporation, and there is no other outlet. After the great flood of 1870 the lake, during the last fourteen years, has gradually decreased by nearly a foot per annum, and similar conditions existed before; and it is therfore obvious that it would not be possible to wash out the salts with rain-water and artificial drainage except in wet years—perhaps once in twenty years. Extract

Mr. W. H. Glover. 2 Sept., 1895.

Extract, Mining Department's Report, 1880 :—"Three samples of water from the Currawang Copper-mines were sent for analysis, with special reference to their poisonous action on the fish in Lake George, and were therefore only examined with regard to the metals in solution. The metals were present as sulphates, and are stated below :—Water from the creek contains : Sulphate of copper, 1·12 grains per gallon ; sulphate of zinc, 16·78 grains per gallon ; sulphate of iron, 0·43 grains per gallon. Water from the working shaft : Sulphate of copper, 17·67 grains per gallon ; sulphate of zinc, 53·54 grains per gallon ; sulphate of iron, 1·42 grains per gallon. Water from the old shaft : Sulphate of copper, 6·42 grains per gallon sulphate of zinc, 7·20 grains per gallon ; sulphate of iron, 0·98 grains per gallon." This water would necessarily be poisonou to fish, and, flowing into a lake without outlet, would ultimately render the whole water poisonous.

400. How long did they carry on operations at the mine? I cannot say.
401. They are not working now? Not for the last twelve years.
402. Had they carried on operations the whole of the fish in the lake might easily have been poisoned? Yes, certainly.
403. Have you had any large catches of fish in the lake? I once saw a very large haul.
404. How were the fish captured—by the net? Three nets at the head of Deep Creek. It is chiefly on account of this haul that I strongly recommend the closing of the creeks.
405. Was that during the open season? September ; the fishing season had just started.
406. What was done with the fish? Three nets were set, and about sixty cod were taken. They were distributed in various places in the district. The average weight of the fish would be about 12 lb.
407. Do many professional fishermen come here in the season? No professional fishermen. One professional fisherman used to make his living here.
408. Are there any public reserves round the lake, so that the public may gain access to its shores? We are very badly off indeed in that respect.
409. Would it be a national benefit to have a proper road made right round the lake? Certainly it would ; it would be one of the greatest benefits the Government could confer upon the public.
410. Do you think a few professional fishermen, with suitable appliances, now that the railway is so close at hand, could keep up a supply of fish for the Sydney market? Yes ; but I reckon their plant would prove expensive.
411. What are the methods mostly employed for the capture of fish here? Amateurs only are fishing now, and they use cross-lines and a roughly-constructed net.
412. What do they bait the cross-lines with? The fishermen have usually baited the lines with the inside of a swan, frogs, crayfish, wood grubs, and beef marrow. I have used fish bait itself. Others have not tried this much. I have found the codfish bait very successful, and it takes less trouble than the other in attending to the lines, and will remain good for a couple of days and nights.
413. Will the cod take the stale bait? They will at night, if it is of a white colour.
414. You spoke of the plant being extensive ; what plant would be required? A steam launch and a set of trawls.
415. Do you mean the English beam-trawl? No ; a trawl 10 feet on the beam, with a bag rising up about 4 feet, floated by corks.
416. You would have the beam on the bottom? Yes, right on the bottom. This trawl could only be worked in some parts of the lake. That is on account of some portions of it being a hard bottom, and other portions having this mud in solution where it could not be worked.
417. Would that be what might be termed the summer trawl which you are now referring to? Yes.
418. Will you describe the winter trawl? It is an idea I have to construct one of an iron rod of about 3 ft. 6 in. long with a light wire, hoop-shaped, suspended from the top of it, the net part of it to be formed of light copper-wire. The reason for this is, that the mud would be able to go through the wire—it would cut its way through well. This trawl will be worked in the soft mud, and so catch the fish at the bottom. The mesh to be as large a size as possible to take about a 12 lb. fish.
419. What size mesh would catch an 8 lb. fish? Four inches on the square ; about 5 inches on the diagonal. The cod is rather a hard fish to mesh.
420. Why? On account of its shape. In a mesh-net, with one size of mesh right through it, you are very liable to catch only one size of cod.
421. You can only mesh for the particular size of fish you want to catch? That is so.
422. Do you know what a trammel-net is? Yes.
423. Would that be suitable for use in Lake George? I do not think so.
424. Have you ever tested the waters of Lake Bathurst to see whether they were suitable for fish propagation? No. I have a reason for the fish dying that were put there.
425. What is it? It was owing to the long weeds in the lake ; the fish got meshed in them.
426. You think it was not due to the presence of poisonous constituents in the water? I think not.
427. Do you think it possible that fish might be successfully introduced into that lake? Certainly.
428. Do you think the brown trout would do in Lake George? I believe they would do well here ; there are so many different kinds of bottoms in the lake—sand and rock, and shoal patches.
429. Do you think it is necessary that there should be proper supervision established over this fishery in order to protect the lake from depredators who might be inclined to use all sorts of methods for the capture of fish? Yes, I do. That would stop these large hauls that have taken place.
430. Do you think, if proper regulations were framed for the development of this fishery, that a constant and regular supply of fish could be forwarded to the Sydney market? Certainly ; with practical fishermen and suitable boats and appliances, I believe there is a fortune in it.
431. Can you preserve the cod alive in paddocks? Yes, for months.
432. Would it be necessary to feed them during the time? No.
433. What area of water would form a convenient size for a paddock? A paddock from 50 to 80 yards square would answer to keep them in for two months. Sapling piles should be used to permit of the free ingress and egress of water. Wire would not suit at all ; the fish would wear themselves right away against it.
434. Do you think the cod when caught could be travelled from all parts of the lake in well-boats to the paddock or paddocks? Yes.
435. Would it be a good idea to have the fish cleaned and gutted before sending them to market? Yes ; especially in the summer time.
436. Have you ever known fish caught in the lake to be cured? Yes, they cure beautifully ; with a very little smoking they turn a beautiful golden colour.

Mr. W. H. Glover. 2 Sept., 1895.

437. Would not the oil in the cod be prejudicial to smoking? No, not if the solid fat is removed. A 30-lb. cod has 8 lb. of solid fat.
438. Could that fat be rendered down so as to put it to any other use? I have it from a doctor who examined it that it is equally as good as cod liver oil. He said the cod oil would be far more wholesome than much of the cod liver oil put on the market. It would also be of value for lubricating machinery. At the time the fish died in the lake some years ago, a little trade was done in fish oil. Several barrels were sent away; it realised 2s. 6d. per gallon.
439. Do you think, even if professional fishermen were not allowed to ply their vocation here, it would be a good thing to have the lake set apart as a national fishing or health resort? I think professionals should be allowed to come here, and the lake should form a national pleasure and fishing resort.
440. Do you think if proper supervision were established, and this fishery became prolific, that amateurs would offer any objection to pay a license fee, say, 2s. 6d. or 5s. to fish? That would be a good idea.
441. Is there anything else you would like to add to supplement your evidence? On the north, south, and eastern shores of the lake there are three reserves, two of which can be reached by boat, viz., one at Taylor's Creek, midway on the eastern shore, with a frontage of about half a mile; very few know of this reserve. No. 2 is at Kenney's Point, which is pegged out as a village reserve; this one is well known to the public. No. 3 is up Deep Creek, but the lake is not quite high enough for it to be reached by boat at the present time. Taylor's Creek and Kenney's Point reserves are the only places on the three sides mentioned at which the public can land without trespassing.
442. Is there no access by road between the reserves you have mentioned without trespassing? Only by a very roundabout way.

Mr. Frederick Nelson, Sergeant of Police, Queanbeyan, sworn and examined:—

Mr. F. Nelson. 2 Sept., 1895.

443. *President.*] Your name is Frederick Nelson, and you are a sergeant of police, stationed at Queanbeyan? Yes.
444. How long have you resided at Queanbeyan? Three and a half years.
445. Before going to Queanbeyan you were in charge of the Bungendore district? Yes; for eleven years and a half.
446. While you were located at Bungendore you had good opportunity of judging of the capabilities of the Lake George Fishery, and I understand you also occupied the position of Inspector of Fisheries there? Yes, that is so.
447. Did the Department of Fisheries give you any salary for your services? £20 per annum.
448. Who was appointed as your successor? No one.
449. So that practically, during the past three and a half years, the fisheries have been left unsupervised? Yes.
450. What kinds of fish are there in the lake? Cod, or Murray cod, and carp.
451. Can you tell us what time of the year the cod spawn? I have found fish containing spawn all the year round; but I believe they spawn from about the 1st September up to March, sometimes later, according to the season. During that period I have found the spawn almost protruding; after the month of September up to March.
452. Where do they spawn? I have seen spawn on the sandy shores of the lake, and also on the sandy shores of the creeks; but whether deposited by the fish, or washed there by the water, I am not able to say.
453. Do you think the creeks are places in which the fish are likely to deposit their ova? I do; I have frequently found the fish very numerous in the creeks during the spawning season.
454. Do you think they come there for the purpose of depositing spawn? I do.
455. Would you advise that those creeks which appear to be breeding-grounds be closed against fishing operations? Yes; at certain times in the year.
456. Have you noticed the ova of the cod, is it separate or attached? Separate.
457. Where do the fry go to after they are hatched? Into the creeks, and the heads of the streams.
458. So that in the interests of the fry you think it advisable to make a closure of these creeks? I think so; the creeks should be protected.
459. What is the largest fish you have known taken out of Lake George? From 48 to 54 lbs. weight.
460. What is the general run of the fish; I mean, what is their usual weight? The general run of the fish is about 8 lbs. to 18 lbs.
461. Have you seen quantities of fish taken from the lake? I have; I have known as much as 800 lbs. of fish taken in one month by cross-lines.
462. Where was that fish taken to for sale? To Bungendore, Queanbeyan, Braidwood, and Goulburn.
463. Has anyone attempted to supply the Sydney market from here? Yes.
464. Did that attempt succeed? It did, so far as the fish they caught was concerned. That is, what fish they did catch they had a market for in Sydney.
465. What is the price generally paid for fish in the country—say in this district? Sixpence per pound in the country.
466. Do you think the most modern methods of fish capture are employed here? No; the methods employed for fishing on the lake are primitive.
467. Is this fishery capable of expansion and development? Yes.
468. Have you any reason to believe that the supply of fish in the lake is growing less? I believe that there are as many fish in the lake as ever there was.
469. Have you ever known any cases of dynamiting in the lake? Not in the lake.
470. Mesh nets have been employed here? Yes; they have employed meshing nets—a 5-inch mesh—for the capture of fish, and it has been successful. The other means of capture has been cross-lines with hooks snooded 6 feet apart. I have caught a large number of fish by cross-lines myself in Lake George.
471. What bait did you use? Frogs, grubs, worms, the flesh of birds, the entrails of swans, the spinal marrow of sheep and bullocks, and fresh fish. In some rivers they use the fresh-water prawn and-crayfish.
472. What is the best bait? I have found grubs and fish about the best.
473. Do you think the cod spawns more than once a year? I do not think so.
474. As to the carp in the lake, have you ever caught any by line? Not by line. I have seen them caught by rushing them into shoals. They were caught by spear or with a net. This is done when there is a fresh in the Turalla Creek.
475. Are they in any quantity in the lake? Yes; a large quantity.

Mr. F. Nelson. 2 Sept., 1895.

476. Do they form food for the cod? I am unable to say, but am of opinion they do.
477. Do you think that by proper regulation this fishery could be developed and a regular supply of fish maintained for the Sydney market? I think so. There should be a large industry of that kind established here.
478. You think that if some means could be contrived by which the fish could be sent to Sydney in proper condition a big industry could be established here? I am certain of it from my own experience. I know people who have attempted to carry on the industry who have not attended to it in a proper manner and yet gained a good livelihood.
479. Supposing they did not engage wholly in sending fresh fish to the Sydney market could they supplement their income by smoking and curing the cod? I am certain of it; the cod are excellent fish smoked.
480. Do you think the brown trout, or lake trout would do well here? Any lake fish ought to do well here.
481. Can you say whether the public have a proper means of access to the shores of Lake George? The public have not a ready means of acccess to the eastern shores of the lake although there is a lot of Government land there.
482. Would it be advisable as well as judicious on the part of the Government to resume an area which would form a road of access to the water frontage to the lake, and likewise make a good drive right round the foreshores? It would be a great advantage to the public, and it is very necessary that such a thing should be done in the public interest, as at present the public have not access to all parts of Lake George.
483. I understand at present there are only two reserves on the lake shore at which the public can land? Yes, that is so, only two at which they can land, there is a third reserve of some hundreds of acres in extent on the Butmaroo Creek, to which there is no access at present either by road or water, as the original road to it from Bungendore is closed up by Mr. P. H. Osborne.
484. Do you think if this fishery were developed, and a means of access given to the general public for recreation, and other purposes, the expenditure in forming such means of access would be justified, seeing that Lake George will in all probability be largely resorted to in the not distant future? Yes, especially if the fishery was supervised, and other kinds of fish introduced into the lake.
485. You have a good knowledge of the fisheries in the Queanbeyan district? Fairly so.
486. Have you ever seen any evidence of trout propagating there? I have not seen any trout in the Queanbeyan waters.
487. Have you seen other kinds of fish there? Yes, Murray cod, perch, and carp.
488. Who placed the carp there? I cannot say.
489. Have they been long there? Some years.
490. Are the rivers pretty well supplied with fish in your district? Yes, there is a fair quantity of fish there; a good deal of fish is caught each year both in the Murrumbidgee, the Queanbeyan, and the Molonglo Rivers.
491. The rivers you speak of are permanent streams, they are snow-fed? Yes, they are permanent streams; the Murrumbidgee is snow-fed.
492. Is Lake George a pleasure resort during the year? Yes, a great number of people visit Lake George in the summer.
493. Can you say how many people have been there at one time? We had a regatta here during my stay and nearly 1,000 people attended it; I have known other sports arranged which have been attended by 400 and 500 people. I would like to mention that I have heard a new Bill has been prepared by the Royal Commission, dealing with the Fisheries of the Colony, and I should like to say that where there have been licenses issued to fishermen, that license has apparently only been extended to the boat they use, consequently they could have two, three, or six men at work fishing at the same time with that boat. That would only mean £1 per annum to the revenue. I would suggest that a clause should be added to to the Bill that each and every person fishing, whether amateur or professional, should be required to pay a license. I know during my time as an inspector here there were only about three licenses issued during the year, those were for three boats, yet there were about twelve men engaged; that meant a distinct loss to the revenue.
494. *Mr. Thompson.*] Have you observed anything of this disease amongst the fish? Yes; at Queanbeyan, in the river there.
495. What shape does it take? White patches on the sides of the fish immediately behind the gills. Both the top and bottom lips were apparently affected by some fungus growth.
496. Do you know the disease termed *saprolegnia ferax*? I did not know of it until I was in communication with the Fisheries Department.
497. Did the Department of Fisheries explain its origin? They said it was brought about by stagnant water, and sent me a description of the malady.
498. Is the Queanbeyan River a stagnant stream? No, it is not.
499. Then it would appear that that could not be the cause so far as the Queanbeyan is concerned? No; not to my mind. The Queanbeyan is a running stream all the year round.
500. Does the cod when spawning form a ridd? I cannot say.
501. Do you know how long it takes between the extrusion of the spawn and the hatching of the fry? No.
502. Would it be a hardship if the creeks running into the lake were permanently closed, so as to afford protection to the spawn and fry? I think it necessary to close the creeks to protect the fry, and I also think the lake should be properly supervised for the same purpose.
503. Would you advise the offering of a reward for the destruction of fish-eating birds? Yes.
504. What would be a fair price per head to pay for their destruction? Fourpence per head.
505. What size mesh would catch an 8-lb. cod? A 5-inch mesh.
506. What would you make the minimum weight of a fish to be caught? One pound.
507. Have you received any instructions from the Fisheries Department telling you how to deal with the *saprolegnia ferax*? I have not.
508. Does any deleterious matter discharge into the Queanbeyan River? Not at present. Soap and soda has been discharged from the woolwash.
509. When did that discharge cease? About a month ago.
510. Did it have any effect upon the fish? I rather think it did, although no fish were found dead in the immediate vicinity of the place.
511. Where were the dead fish found? Above the wool-wash and boiling-down works. There were none found nearer than 1 mile above the wool-wash.

THE

THE SNOWY RIVER.

SATURDAY, 19 *OCTOBER*, 1895.

[*The Commission met at Boloco Station, Monaro, at 4 p.m.*]

Present:—

FRANK FARNELL, Esq., M.P., President.

L. G. THOMPSON, Esq., J.P.

Reuben Uther Bartlett Rose, Esq., Boloco Station, Monaro, sworn and examined:—

R. U. B. Rose, Esq. 19 Oct., 1895.

512. *President.*] How long have you been residing in this district? Twenty-two years.
513. Are you acquainted with the river system of Monaro? Yes; very well acquainted with it.
514. Is the Snowy the main river—the chief river of Monaro? The Snowy is the main river here.
515. How many tributaries has the Snowy? A large number. I cannot exactly say; but I know of ten or twelve good tributaries.
516. Is the Snowy a permanent stream? Yes; undeniably permanent.
517. Are the tributaries all permanent streams? All the good tributaries are permanent.
518. Where do the tributaries principally take their rise? Several of them take their rise in the mountains adjoining Kosciusko.
519. So that most of them are snow-fed? Yes; that is so.
520. Have you ever known, during the driest season in the Monaro district, any of the tributaries, or the Snowy itself, to run dry? Never.
521. Have you made any experiments with a view of ascertaining the temperature of the water in the main river and its tributaries? No; I have not.
522. Are you of opinion that the Snowy maintains a good even temperature throughout the hot season? Yes; there is no doubt about it.
523. I understand you have taken considerable interest in the development of the inland fisheries? Yes; I have.
524. Is there much fish life in the rivers you know of at the present time—have you caught any fish? Trout in the main river.
525. Have you any indigenous fish in the rivers of Monaro? Excepting eels, there were no other fish until we carried them from Currawang Crossing and put them in the Snowy River; we put mountain trout—*Gadopsis marmorata*—in the Snowy River above the Falls; perch are to be caught below the Falls.
526. Has any attempt been made to introduce the trout or any other species in the river system of Monaro? Yes; fish have been put in the river. I have a short statement referring to the subject which I would like to read; it is as follows:—

In anticipation of the visit of the Members of the Royal Commission on Fisheries to Monaro for the purpose of inspecting the streams, rivers, and lakes, with a view to their suitability for a hatching-station, I should like to offer a few remarks concerning the fish liberated in our streams, and the success attending that enterprise. In 1883, Mr. W. Beaty, of Bullembalong, conveyed some fish, Crucian carp, from a stream near Goulburn, and liberated them in a lake on his estate. As it was known that the fish had increased, and there was a probability of the lake drying up, in 1885 it was that gentleman's wish that the fish should be removed to the river and lakes of a greater depth, with a view to their preservation. Mr. W. Hepburn, J.P., of Coolamatong, was the first to take steps in the matter. Procuring a net, he made it known that all interested in pisciculture were welcome to its use. I, in conjunction with Mr. A. Crisp, Mr. A. Rose, of Campbelltown, and Mr. H. Merrett, started for the above lake, where we met Mr. Hepburn, who gave us every assistance in securing a supply, some of which were liberated in the Snowy River, at Jindabyne, on 14th May of that year. Others were liberated in the Mowembah, a tributary of the Snowy, and in Jillamatong Lake; and a number were given their freedom, by Mr. Merrett, in the Snowy River, bordering that gentleman's estate. A few taken by Mr. Crisp and placed in a pond fed by a spring have acted ever since as a kind of hatchery, from which many hundreds have since been forwarded to the different lakes and streams of the district. Messrs. Betts and Gale successfully conveyed from Ballarat, Victoria, English trout, perch, and 40 Russian carp, which were distributed in tributaries of the Murrumbidgee and other rivers; Mr. Edwards, of Burnima, receiving a number of trout and perch, which he placed in a tributary of the Snowy. But it remained for Mr. Henry Dawson, then Member for Monaro, and an enthusiast in pisciculture, to obtain English trout, *Salmo Fario*, for the upper and more suitable waters of this matchless stream. A small consignment of this valued fish was forwarded to me from the Fisheries Department, Sydney, through this gentleman's influence, and liberated by me in the parent stream, some 10 miles above Buckley's Crossing. Never relaxing in his efforts to obtain fish for our streams, in the following year a consignment of brown, Loch Leven, and Californian brook trout fry reached me from Sydney. There were not many deaths. Some of the Californian fish I conveyed to and liberated in the Mowembah, a stream suitable for cold climate fish; the others were placed in the Snowy, the trout being liberated at suitable places in the same river. On 11th October, 1891, Mr. Amos Crisp liberated 11 English trout fry in a small lake at Jimenbuen, part of a consignment forwarded to me; and on the 16th December, 1894, one of these fish taken in a net, measured 25 inches in length, 15 in circumference, and weighed 7 lb. The fish in question was kindly brought to me by Mr. Crisp on the evening of its capture, and forwarded by me to Mr. Frank Farnell, President of the Royal Commission, on the following day, and by that gentleman sent to the Sydney Museum, to be mounted, where it is now to be seen, a splendid specimen of *Salmo Fario*. This, then, proves the suitability of our lakes for trout-rearing; and Mr. Crisp is to be congratulated on the success which attended his efforts.

Early in January, 1895, an English trout weighing 3 lb., was caught by hook and line, Master G. Collman being the captor, in the Snowy River, near Buckley's Crossing. This fish was brought to me a short time after its capture, and contained a large quantity of roe. The young man informed me he was greatly excited when bringing it to bank, on account of its struggles, and beautiful colour, and little wonder, when the description in the "Practical Angler" is before you: "his symmetry and colour are unexceptional, and when contemplated by its captor, immediately on being banked, is a richer feast for the eyes than the prettiest *Salmo Salar*, ever produced in English waters." This young gentleman deserves the thanks of all interested in angling as being the first to prove that English trout were prospering in the Snowy. In 1892, Mr. Dawson informed me that 1,200 trout fry would be forwarded to me from the Fisheries Department, and I, in company with Mr. Crisp, met the consignment at the railway station, Cooma. That was on the 13th of September, and in a few hours after their arrival, about 300 were liberated in the river, at Buckley's Crossing. About one-third of the number were dead; the rest were placed in jars, filled with water from the Snowy; and on the following day Mr. Crisp liberated 21 in the large lake at Jimenbuen, (where he had previously placed some on October 11th, 1891), and 97 at a favoured spot in the Snowy. Thirty were liberated by me on the same date at Ironmungy, in a lovely reach of the Snowy; and the fact of no deaths occurring after being placed in water taken from the river proves the suitableness of this stream for trout. Mr. Crisp also assisted me in procuring a number of mountain, or marbled trout—*Gadopsis marmorata*—from the Snowy River, below the junction of the Quedong. These were caught with hook and line, and we succeeded in carrying them in buckets over the rough country intervening to his residence, and thence to a portion of the river 80 miles above the Falls. It is impossible for fish to pass this barrier, hence our undertaking some six years since, and these fish now afford good sport to the angler. These particular fish were originally brought from the Slip-pannell River, Victoria, by Mr. Herriott and liberated in the Delegate, from which they found their way to the larger stream; and our success was mainly due to Mr. Crisp's

Crisp's untiring energy, and perseverance. I have not known this fish to scale over 1 lb., but a writer in the *Town and Country Journal* stated he had known them to weigh 3 lb. They bite well, and are a delicate table fish. The fish from Bullembalong Lake, are the Crucian carp, and as an instance of their increase, I may state that, when dragging the net for trout in the small lake at Jimenbuen, over 500 of these fish were taken at one haul, the largest weighing 3 lb. So far as I know they afford no sport to the angler, as I have never known one to be caught with hook and line. In the autumn of 1894, I forwarded, with Mr. A. Rose, of Campbelltown's assistance, a number of English perch to Mr. Hepburn, of Coolamatong; but as many died in transit, only six survived to be liberated in the Coolamatong Lake. Those fish were obtained at Mount Gilead reservoir, near Campbelltown. Messrs. Dawson and Miller obtained a number of English perch and tench from the same water, which they placed in the Umaralla River, a tributary of the Murrumbidgee, and I was informed by Mr. Vale, of Cooma, an ardent fisherman, that he had caught two of the former in the latter stream. The tench I have not heard of. A number of trout fry have been liberated in the Murrumbidgee and its tributaries. It is said that American rainbow trout have been placed in the Eucumbene River, but of this I have no authentic information. Fish have been caught in the Snowy River, near Buckley's Crossing, within the last twelve months; but as I had no opportunity of determining the species, I am quite powerless to report. I have not known any of the Californian brook trout to have been either seen or captured, but was an eye witness of a fine fish sporting in the main stream, which I feel sure was an English trout. Perch are to be caught in the river below the Falls—a splendid fish—and although the river has been fished for many years, no small fish of this species are ever caught. Last year we obtained, for the first time, a fish new to us, which I have since learned is the *Aphrites cassi*, allied to the whiting, and it is the opinion, advanced by a competent judge, that the spawn of this fish was conveyed to the Snowy River by shags, which infested the stream in numbers a few years since.

R. U. B. Rose, Esq. 19 Oct., 1895.

We possess then this magnificent river, taking its rise at Mount Kosciusko, 7,308 feet above the level of the sea, fed for many months of the year by the pure snow waters, its ana branches bountifully supplied by cold and limpid mountain streams, ever rushing onward in its irrepressible and illimitable gladness over its gravelly and boulder-strewn bed. It stands out pre-eminently the pearl of all rivers in the south, is pronounced by anglers from other climes as the trout stream *par excellence*, being in every way fitted by nature for the future home of the trout.

527. In your statement you mentioned something about the lakes having been stocked with a small supply of trout? Yes.

528. Are there many lakes on Monaro? Yes; beautiful lakes.

529. Would they act as natural breeding grounds for whatever fish were introduced into them? I should think so. In the smallest lake—we have one at Jimenbuen—we caught a trout weighing 7 lb. He was netted.

530. At what stage of growth were the trout you speak of liberated? At what age?

531. Yes? They would be about six weeks old, and about ¾ of an inch long.

532. Do you find much loss occur in transit? Out of the last 1,200 trout fry sent here, more than one-third was lost.

533. Do you approve of liberating trout at such an early stage of growth? No, certainly not. It is better to keep them until they are 12 or 18 months old at least. At that age they would be better able to protect themselves from their enemies.

534. Have the experiments, although conducted on a small scale, been successful? Partially successful.

535. Do you think the waters of the Snowy and its tributaries are suitable for, and adapted to, the purposes of trout acclimatisation? Yes, in every way.

536. Would there be any difficulty in obtaining a suitable place for the construction of a hatchery for the artificial propagation of trout and other kinds of fish? No; a good site could be found at many places along the river, either above the bridge at Buckley's Crossing or below it.

537. If trout were propagated in the waters of the Snowy, would they in your opinion be hardier than those hatched in a higher temperature? Undoubtedly they would, and a far greater number of fish would be saved. They would be sounder, more vigorous, and healthier fish in every way.

538. Do the residents of this district take any interest in the question of fish acclimatisation? Yes, a very great interest.

539. Do you think they take sufficient interest to afford assistance in order to help in the development of the fisheries of this district? Yes; I feel confident every possible assistance would be willingly given.

540. Is the climate such as will allow of the successful artificial production of the varieties you wish to introduce here? Yes, undoubtedly so. From facts that have come within my own knowledge, I have not the slightest doubt about it. The fish could be hatched here and they would thrive wonderfully well in the Snowy and other rivers.

541. Has any attempt ever been made to introduce the Murray cod into the Monaro waters? No.

542. Then it remains to be proved whether the cod will do here? Yes. It was in contemplation by a number of us to bring the Murray cod over but it was thought advisable, the Snowy River being such a beautiful stream, to leave it wholly to the trout.

543. What is the average depth of water in the lakes on Monaro? From 12 to 15 feet in summer in the larger lakes. I know of a lake at Bungarby, which has a depth of over 26 feet. It is a very large lake and it has never been known to go dry.

544. Is there plenty of Government land available for settlement in the district, and could Government land be obtained alongside of the river for the erection of a hatchery? There is plenty of Government land in the district.

545. Is Buckley's Crossing, or Dalgetty as it is called, a Government township? Yes.

546. So that there is land available there for a hatchery? Yes.

547. Where would be the most suitable site for the establishment of a hatchery? At a place called Carroll's Corner; that, in my opinion, would be the most suitable site for a hatchery.

548. How far is that from Buckley's Crossing? About 8 miles.

549. Is that Government land? Some parts of it.

550. I mean on the river banks? There is Government land on the river banks. There is Government land at Buckley's Crossing from the bridge across the river down into the village, the village reserve fronts the river.

551. I suppose, if the streams of Monaro were stocked with suitable fish, and they were allowed to grow to maturity, there would be a great inducement for anglers to come here from different parts of Australia and indulge in the sport of fishing? Yes; I believe anglers would come from all parts of Australia. They go to Tasmania, Victoria, and New Zealand; and why should they not come here?

552. Do you think if trout-fishing could be obtained it would lead to settlement in the district;—are you of opinion that gentlemen would erect fishing-boxes on the banks of the river? Yes; directly the fish were sufficiently large to be taken.

R. U. B. Rose, Esq. 19 Oct., 1895.

553. *Mr. Thompson.*] Are there any falls at Buckley's Crossing township by which water could be conveyed by a race to a hatchery, supposing one were established—a hatchery must be erected above flood-level;—would it be possible to convey the water on a line above flood-level to Buckley's Crossing? I think so.
554. Are there falls more than sufficient to allow of the working of a ram? I can hardly say; but there is sufficient fall in the river by natural gravitation to gain the required stream of water by providing a tail-race for about three-quarters of a mile. In my opinion the scheme would be more successful if water were raised by artificial means.

Henry Dawson, Esq., solicitor, Sydney, sworn and examined:—

H. Dawson, Esq. 19 Oct., 1895.

555. *President.*] You represented the Electoral District of Monaro in the Legislative Assembly for a number of years? Yes.
556. I understand you have taken a very deep interest in fish acclimatisation, and in the development of the fisheries of this district? That is true.
557. Are you conversant with the river system of Monaro? Yes; with every mile of it.
558. Have you seen any evidences of fish-life—I mean indigenous fish—in those rivers? None at all in the eastern waters of Monaro. There are fish, I believe, below the Popong Falls, about 90 miles below Buckley's Crossing, but I never saw them.
559. So that whatever fish-life is to be found in the tributaries, and in the Snowy River itself, is the result of introduction and acclimatisation? With the exception of eels. Eels are indigenous. The western waters of Monaro contain perch and cod, but no eels.
560. Have you ever known the main river or its tributaries to run dry? I think in the driest season I ever recollect on Monaro the Snowy River was higher than I have yet seen it; that would be accounted for by the snow on the Australian Alps melting during the hot summer months, which is the time streams in other parts of the Colony run nearly dry. There is an immense snowfall on the Muniong Range during the winter months.
561. Do you consider the Snowy and its tributaries to be suitable places for the liberation of trout fry or other kinds of fish suitable for acclimatisation? I suppose very few men know the Victorian and New South Wales waters better than I do. I have been all over them, and I can say I know of no waters anything like as suitable for the acclimatisation of trout or any cold-water fish.
562. You believe the temperature of the water is such as to put it beyond doubt that there are great possibilities of success if trout and other cold-water fish were introduced here? I am positive that is so.
563. I understand you have been the means of introducing the trout into this river? Yes. With reference to the acclimatisation of trout, I would like to state that, hearing in 1877 that trout fry had been obtained from Ballarat by Mr. Gale, of Queanbeyan, and placed by him in the Murrumbidgee and some of its tributaries, as well as in the Bibbenluke, a tributary of the Snowy, I determined the following year to obtain some for the Snowy River. Accordingly, in 1878, I obtained about 150 from Ballarat, and 500, I think, from Mr. Lindsay Thompson, the then Secretary to the Fisheries Commission. Some of these were forwarded to Mr. Rose, of Boloco Station, and placed in the Snowy River; the remainder were forwarded to Mr. Edwards, of Bibbenluke. In each succeeding year till 1894, through the kindness of Mr. Thompson, I obtained trout of various kinds, which have been placed in the Monaro rivers by Messrs. R. Rose, J. Harnett, Edwards, and Orr, of Michelago, the latter having about 200 for the Murrumbidgee. Mr. Rose placed the fish in the Snowy, and a few in a lake. From this lake a large fish of 7 lb. was taken this year. Mr. Harnett placed his fish, which were Loch Leven trout, in the Eucumbene River, and a few in the Eucumbene Lake. From all accounts these fish have thriven, as the fry have been seen this year in the Toll-bar and Hughes' Creeks, mountain streams, and a fish of about 1½ lb. has been seen by Mr. Barrett in the Frying-pan Creek. I also heard on good authority that rises were seen last summer in the Eucumbene Lake. I have also been informed on the most reliable authority that the fry have been seen in the Bibbenluke within the last two years, whether the offspring of the trout sent by Mr. Gale or myself it would be hard to say, but probably from both. It must be borne in mind that the Snowy is a large river, and on account of its width, even in the shallows, it would be very hard indeed to notice the fry in the main river; in fact, the river might contain fry in the thousands before they would be noticeable; but the fact of the young fry being seen in the various feeders proves beyond all doubt that the fish will thrive in this river. The climate of the country through which the river flows is certainly more like that of the home of the trout than any other part of Australia. I may add that it is my opinion that to properly establish the trout in our streams it would be necessary to erect a hatchery on the Snowy River, and from my local knowledge of the river I would recommend Jindabyne as the place. I am under the impression that if this was done, and the ova hatched, there would be very little loss, as everything is so favourable with regard to the temperature of the water and climate, and it would do away with the long carriage from Sydney. The Fisheries Commission, I believe, have succeeded in hatching trout ova at Prospect, but even if fish are hatched there in numbers, there must always be a great percentage of loss in deportation, and it must not be forgotton that fish reared in a cool climate on a gravelly bottom are in every way superior to those reared in a warm or even temperate clime, being much firmer and pink in colour.
564. Why do you mention Jindabyne as the site for a possible hatchery? My reason for recommending Jindabyne is, that I thought the river not being of great volume at that place, it might be better; but I must admit I know nothing of engineering, and therefore will say that if a hatchery could be established at Buckley's Crossing, and the water pumped up or raised by other artificial means, I would recommend its establishment there, in preference to Jindabyne. There is a Government reserve at Buckley's Crossing, and a great many unsold allotments of land. It is also a township, and within convenient distance of Cooma; whereas at Jindabyne the hotel there is part of a station property, and land would, I think, have to be resumed for the purposes of a fish-hatchery. Another thing is, that at Buckley's Crossing the residents have been very enthusiastic with reference to fish culture and acclimatisation. They have taken long journeys to Cooma, and although the Government have forwarded fish to Cooma railway station, the expense has always been borne by the people of the district, and mainly I think, by Mr. Rose, of Boloco Station. So far as Jindabyne is concerned, I do not know of any individual who has taken any interest in fish acclimatisation, and no one has made any application to me for a single fish.

565.

H. Dawson, Esq. 19 Oct., 1895.

565. How many tributaries of the Snowy do you think could be considered suitable for trout, if the fish were introduced? I think at least twenty-five, and all of them would make splendid trout streams, the water being clear and cold, with gravelly bottoms, and each of them is larger than the streams in Victoria in which I have caught trout.
566. In reference to the lake system of Monaro, are those lakes connected with the Snowy River—are they fit for the reproduction of trout? I would not like to say that. I will give my reason: At Lake Wendouree, Ballarat, from whence the water is taken for the acclimatisation ponds, the summer before this the trout were dying on account of the heat. We might have these lakes stocked with fry, and then it might come a dry season, and we might lose all of them; it would be very much safer to put the trout in the river, as we need fear no loss if that is done, there being an abundance of water. The hotter the weather the colder the water, on account of the snow melting. I think trout would do in Jillamatong Lake, and Cootralantra, and Eucumbene.
567. What was the size and age of the fish originally put into this river by yourself and others? About three-quarters of an inch long, and six weeks old.
568. Do you consider that a desirable age to liberate fish in these streams? Certainly not. I should like to see yearlings put in. At that time the Fisheries Department had no means of keeping them in Sydney, and were glad to get rid of them.
569. Do the Monaro waters maintain an even temperature throughout the summer? Yes, I think they do; towards evening the water gets a little cooler.
570. If the streams of Monaro were thoroughly stocked with suitable fish, do you think it would be an inducement to anglers to come to the rivers and indulge in fishing? Yes, most decidedly, considering now that I know that fifteen or twenty gentlemen are going to Victoria to fish, and lots are going to Tasmania; if we had good fishing here we would have a great number of visitors to the district.
571. *Mr. Thompson.*] Can you point out to us the position of the Government township at Buckley's Crossing? Yes; it is bounded on the south by the Snowy River, and on the other three sides by the Longfield Estate; there are over 200 acres of Government land in the township.
572. Sites could be readily obtained there above flood-level? Yes.
573. Do you know of any suitable spot for a hatchery on the Boloco run? Yes; there is a very good place at Carroll's Corner, and there are half a dozen good places between Carroll's and Buckley's Crossing.
574. I suppose Buckley's Crossing would be the most desirable place, inasmuch as it is the nearest point to the railway? Yes; it is 8 or 9 miles nearer to the railway than Jindabyne, and a much better road.
575. There are no indigenous fish in the Snowy? No—except eels; of course I mean the Snowy as it runs through the Monaro district.
576. *President.*] The Popong Falls—was not an offer made some years ago to cut them away in order to provide unbroken communication with the sea? I made representations to the then Government, as I had an offer of 7,000 salmon ova, and was anxious to put them in the Snowy River. I consulted with Mr. Lindsay Thompson with reference to hatching them, and he told me he thought if this could be done he could hatch the ova, because he intended, if possible, to hatch salmon trout in the following year; I think that was 1886. Mr. Thompson very kindly gave me the names of the salmon to get. He mentioned the quinnat as being the salmon most likely to thrive in our warm ocean waters. The Government did nothing in the way of clearing the river, so I did not get the salmon ova.
577. What was your estimate of the cost of blowing the obstruction away? I had information to the effect that the sum of £400 would have cleared a passage sufficient for salmon to get up the river after going to the sea.
578. Have you ever heard of the landlocked salmon? Yes, I have; I made inquiries about almost every sort, especially the American fish, both salmon, char and lake fish, and I believe that the ova could be procured. I think the landlocked salmon might thrive in the Snowy River, as there is great depth of water and an immense area of water.
579. Does this salmon possess all the edible properties of the migratory species? I am told there is no difference; I believe it does not weigh so heavy; if you get one 30 or 35 pounds it is a big fish.
580. Have you heard of any other description of fish that has been successfully introduced into the waters of Monaro? Yes. Mr. Miller, M.P., and myself placed 100 odd tench and thirteen English perch in the Umaralla River, and the tench have thriven, and some of them have been caught since.
581. Would you advocate the introduction of any other species of fish into the Snowy if trout are to be placed there? No, certainly not; the perch is a kind of fresh-water shark, and the tench is no good when you get him. The perch is very voracious, and would destroy the young trout fry. There are lots of lakes on Monaro that would suit the pike admirably.

Henry Charles Merrett, Esq., J.P., Buckley's Crossing, Monaro, sworn and examined:—

H. C. Merrett, Esq., J.P. 19 Oct., 1895.

582. *President.*] How long have you resided in the district? Thirty years.
583. Have you a good knowledge of the river system of Monaro? Yes; I have been to the head of the Snowy River, and know that stream well.
584. Do you consider the Snowy River and its tributaries permanent streams? Most certainly I do.
585. Would they be suitable streams for the introduction of trout? Most decidedly.
586. You have heard the evidence given by Mr. Rose and Mr. Dawson—do you agree with their statements? Yes; they are perfectly correct. The river and its tributaries would make splendid trout streams, being fed by snow-water. They have beautiful gravelly beds right up to Kosciusko.
587. Have you anything to say with regard to the suggestion to establish a fish hatchery on Monaro? Only this, that I think it will be most desirable, and most strongly urge the Commission to recommend, and the Government to undertake, the work of erecting a hatchery on the banks of the Snowy, as it would be of national benefit and a great success.
588. Do you approve of the suggested site at Buckley's Crossing? Yes. I think there is a suitable site on the village reserve at Buckley's Crossing, and there are other sites that might be more suitable. There is a site upon my own land, about 6 miles from Buckley's Crossing, and if the Government desire it I shall be happy to give them a lease of whatever land may be required, free of any charge whatever; and, in addition to that, I shall be glad to afford any assistance in my power.

H. C. Merrett, Esq., J.P. 19 Oct., 1895.

589. *Mr. Thompson.*] Is Buckley's Crossing the first point of contact with the Snowy River coming from Cooma? It is the most readily accessible point on the river. It is about 28 miles from Cooma railway station, on a good road, and can be reached in fair weather in four hours' driving.
590. So that if the Snowy and its tributaries were well stocked with trout there would be a great inducement to people to come here for the sport of angling? Yes; and there are many miles of Government land available on the river on which could be erected fishing-boxes and other places.

THURSDAY, 31 *OCTOBER*, 1895.

[*The Commission met at the Offices, Bligh-street, at* 11 *a.m.*]

Present:—

FRANK FARNELL, Esq., M.P., President.

The Hon. R. H. D. WHITE, M.L.C. | L. G. THOMPSON, Esq., J.P.

Gustave Thomas Carlisle Miller, Esq., M.P., sworn and examined:—

G. T. C. Miller, Esq., M.P. 31 Oct., 1895.

591. *President.*] You are the present member for Monaro? I am.
592. You represented the old electorate for a number of years? Yes; in conjunction with Mr. Henry Dawson.
593. Are you well acquainted with the Monaro District? Yes.
594. Do you possess a good knowledge of the river system of Monaro? Yes.
595. What is the main river? Well, there are two main rivers, the Snowy and the Murrumbidgee; I suppose the Snowy is the main river of Monaro.
596. Is the Snowy River a permanent stream? Undoubtedly; the snow melting makes it a permanent stream. It also has many tributaries which guarantee the permanency of the river itself.
597. Where do the Snowy and its tributaries take their rise? In the mountains, the Australian Alps.
598. Does the Snowy maintain an even temperature during the summer months? Yes, in the summer and in the winter; I have bathed in the Snowy River at different parts, and at all seasons, and I am confident it maintains an even temperature.
599. Do you think the Snowy, with its tributaries, is suitable for trout culture? I am positive of it from what knowledge I have of the subject, and from what I have heard and read of the habits of the trout in the old country.
600. Have any experiments been made in the way of distributing trout in the Snowy or its tributaries? Yes; thousands of trout fry have been liberated in the Snowy River and its tributaries.
601. Is there any evidence to show that those fish have succeeded? Yes, there is, especially in the Bibbenluke River. I had a conversation with Mr. Henry Copeland, M.P., the other day, and he told me that when he was passing through Bibbenluke he was asked by the station manager, Mr. Edwards, to go and see for himself the result of the trout distribution in the Bibbenluke River. Mr. Copeland told me he saw trout fully 2 feet 6 inches in length, and further, that he noticed numberless smaller trout. I also know that one fish, a trout, has been caught in the Snowy River by a friend of Mr. Rose, of Boloco Station. That trout was sent to Sydney; it was a fairly large fish.
602. Is there a lake system connected with the Snowy River? There are many lakes on Monaro; but I cannot say they are connected with the Snowy. There are several lakes on Monaro—permanent lakes—which would be suitable for fish, if not trout for other kinds. I think trout have been placed in one or two lakes, and they have grown to a considerable size.
603. Would there be any difficulty in obtaining a suitable place for a hatchery on the banks of the Snowy River? Not the slightest.
604. Can you suggest a good site? Yes, there is a suitable one at Jindabyne, and another equally good site at Buckley's Crossing (Dalgetty), just above the bridge, and it is 5 miles nearer to the Cooma Railway Station.
605. Do you think if a hatchery were established on the banks of the Snowy, and trout propagated and placed in the river, it would be the means of growing a hardier and better fish? Most decidedly. The fish reared in a climate like that of Monaro must necessarily be better than those grown in a warm climate. The trout is essentially a cold-water fish.
606. Is there any Government land available at Buckley's Crossing that could be used for the purposes of a hatchery? Yes; at a place called Dalgetty, in the vicinity of Buckley's Crossing, there are a number of allotments, and land could be secured there. Some of the sites could be utilised for a hatchery.
607. Do you approve of the practice of placing young fry in the rivers at a stage of growth when they are unable to protect themselves against their enemies? No; and I would like to say that if trout-fishing is to be encouraged in this country, it would be far more advisable to have a hatchery on the rivers, than to hatch the ova in a warm climate like Prospect, and then send them to the colder regions of the Colony. The experience we had, a fortnight ago, in conveying trout hatched at Prospect to the Snowy River was very disastrous, only five per cent. of the fish so conveyed being alive on reaching the Snowy. I am aware that since then a number of trout have been sent to other parts of Monaro; but it was a costly process, and it entailed enormous expense to the Government. They had to send a man with the fish, and ice had to be used, and it was altogether pretty expensive. It would be far wiser to establish a hatchery on the banks of the river where the trout are intended to be liberated. Were a hatchery established on the Snowy River, the many streams forming tributaries to that river could readily be stocked with fish, entailing little or no expense to the Department; and in addition other streams on the tablelands of the Colony could be stocked with advantage.
608. Do you take a general interest in the development of the inland fisheries, as well as the marine fisheries? Naturally I do.
609. Are you acquainted with the Bill dealing with the fisheries and oyster fisheries of the Colony, which has been prepared by this Royal Commission? Yes; partially acquainted with it.
610. Do you approve of the measure? So far as I have gone through it, I think it is a very desirable Bill, and one which will meet with general approbation from members of the House of Parliament.
611. I suppose you are of opinion that it is time some attention should be devoted to the question of developing and conserving the inland fisheries of New South Wales? Certainly. Such a step would be most beneficial; and I am quite satisfied if the acclimatisation of trout is carried out on a proper scale in

in the Monaro waters it will cause that district to become another summer resort for anglers, sportsmen, and tourists generally. G. T. C. Miller, Esq., M.P. 31 Oct., 1895.

612. *Mr. Thompson.*] I suppose you consider that apart from the advantages of angling, as such, the trout from a river like the Snowy would command a high price in the Sydney and other markets, and being a valuable article of food would create an industry? There is no doubt about it.

613. Considering the mountainous nature of the Monaro country, do you consider a hatchery at Dalgetty would be sufficient for the whole of the district? I think so; I think it could supply the whole of the Snowy River; that is a proper hatchery would.

614. Would you be inclined to recommend the permanent reservation of the Snowy River for the *Salmonidæ* generally? I think it desirable to maintain the Snowy, as far as possible, wholly as a stream for the acclimatisation and propagation of the *Salmonidæ*.

615. Are you acquainted with the Popong Falls? I have heard of them.

616. Do you know whether they could be successfully cut away? I have heard so; I believe they could be cut away, and the advantage would be that the American or other species of salmon might be introduced in the Snowy and the fish would be able to go to the sea according to their habit.

617. The name of the township at Buckley's Crossing is Dalgetty? Yes.

618. Is there fish in quantity of any other kinds in the Snowy? I think not.

619. Then I suppose you are of opinion that the most valuable kinds of fish, such as the *Salmonidæ*, should be introduced into those waters? Certainly.

620. Would there be any difficulty in conveying fish along the river by means of canoes in order to overcome the rugged character of the country at certain places? I think that would be practicable.

621. Do the inhabitants generally of Monaro favour the establishment of a hatchery on the banks of the Snowy? Most decidedly, they do. I may say it is due to the energy of the inhabitants in this direction, they being very anxious to see a hatchery established on the river banks, that Mr. Dawson and myself have taken such an interest in this matter of the acclimatisation and propagation of trout. The people of the district were really the first to start the idea of turning this splendid river into a trout stream.

THE MURRAY RIVER.

WEDNESDAY, 16 *OCTOBER*, 1895.

[*The Commission met at the Offices, Bligh-street, at* 11 *a.m.*]

Present:—

FRANK FARNELL, Esq., M.P., President.

L. G. THOMPSON, Esq., J.P.

John Moore Chanter, Esq., M.P.; sworn and examined:—

622. *President.*] Your name is John Moore Chanter, and you are the present member for Deniliquin? Yes. J. M. Chanter, Esq., M.P. 16 Oct., 1895.

623. Before representing Deniliquin you represented the Murray district for a number of years? Yes, for about ten years.

624. During that time have you had a good opportunity of judging of the capabilities of the Murray River and its tributaries, as far as its fish-producing qualities are concerned? Yes, numerous opportunities; my business took me all through the Riverina.

625. Have you taken an interest in the fishing industry? I have, with a strong desire to see the Murray and the Riverina waters properly conserved.

626. Are the rivers which run through your electorate navigable? The Murray is navigable nearly all the year round for about 1,400 miles; the Murrumbidgee and the Wakool are navigable part of the year only.

627. Have you ever made any representations to the permanent body of Fisheries Commissioners in respect to the matter of providing protection for the fisheries of the Murray? Yes, on several occasions I have pointed out to that body the terrible depletion of fish in this river consequent upon the unrestricted netting that is carried on, and I have recommended that they should enter into negotiations with the authorities in Victoria for the purpose of arming the inspectors with a joint control over the whole of the river. At present the inspectors acting for this Colony can only operate upon the River Murray itself, that is the waters up to the New South Wales banks: but as most of the netting is done from the Victorian side, the netters, immediately they see the officers, or hear of them coming, put their nets on the Victorian bank, and our officers are powerless to seize the nets or to interfere with them.

628. You would recommend that joint action be taken by the New South Wales and Victorian Governments with the view of supervising and controlling the fisheries of the Murray? Yes, very strongly; on several occasions I have been on the river with one of the inspectors, Mr. John Manton, and on one occasion I saw him openly defied by the fishermen on the Murray lifting their nets before they could be reached, placing them on the Victorian banks, and defying him to interfere with them. On another occasion I saw him defied at the Moira Lakes, which are the real breeding-grounds for the Murray River, and are very large, covering thousands of acres, the water averaging from 2 to 8 or 9 feet in depth, being mostly covered with reeds, in which the fish breed. On the Victorian side of the lakes it is just one mass of nets that are termed gill nets, and it is absolutely impossible for the fish to get out of the lakes into the river, no matter how small or large the fish may be. It is only the fish which are higher up that can get down the river. On the same occasion I assisted Mr. Manton in taking from some of the small creeks running from these lakes no less than three bag nets which were full of fish. I suppose I should be correct in saying that in the three nets there was not less than a ton of fish, and as this was a holiday time, and the netters were probably away at some sports, the fish had been in the nets for more than a week; a large number of them were dead. On the same occasion we saw where a net had been lifted on the river, and several hundredweight of good fish, not quite suitable for the Melbourne market, had been thrown on the bank to rot. On the whole river, from the Moira Lakes down to a place called Bama, about 7 miles distant, you would not lose sight of one net before you would see another. As they get nearer the town of Echuca they are more careful, as the inspectors are more about there; but lower down the river again,

towards

J. M. Chanter, Esq., M.P. 16 Oct., 1895.

towards a town called Koondrook, and from there to Campbell's Island, and up to Swan Hill, almost the same conditions apply as regard to nets as at Moira Lakes. That portion of the Colony is very low, and is intersected by a large number of creeks running from the overflow of the Murray into the Wakool, and into the Edwards River, and into what are called the Barbers' Creeks; these are breeding-grounds for fish, and on the last occasion that I was there—some few months ago—I saw nets within sight of the crossing-place, and there is no doubt that, seeing the nets were placed within view of anyone passing, there were large numbers that I did not observe. While on this point I may, perhaps, call your attention to a letter I forwarded to you as President of the Royal Commission on Fisheries, enclosing a paragraph taken from the Melbourne *Argus* of the 17th August last, which letter and paragraph, with your permission, I will read to you. The letter, bearing date 27th August, 1895, was as follows:—

Dear Mr. Farnell,—The enclosed extract is from the Melbourne *Argus* of the 17th inst., and I trust the Commission will take note how the Murray is being denuded of fish for the benefit of Victoria.

Yours truly,
J. M. CHANTER.

The paragraph referred to, dated from Swan Hill on the Friday preceding the date given in the *Argus* of the 17th August, reads as follows:—

The Fishing Industry.

Swan Hill, Friday.

The growing importance of the local fishing industry was demonstrated yesterday by the arrival of the steamers Invincible and Ellen here from down river with 330 baskets and thirty-two bags fish, the total weight of which was nearly 18 tons. The former quantity was consigned to Melbourne, and the latter to Bendigo, the freight received by the Railway Department being a few shillings within £40. This industry, fostered by the steamers, has been gradually but surely growing, and is now finding employment for a very considerable number of men many months in the year.

This is only one case, and possibly there are many others, and it certainly tends to show the necessity there is for the protection of fish and the fishing industry for the benefit of our own people, and it also shows very clearly the extensive nature of the transactions that are taking place. I may say that the fishermen are becoming emboldened by the want of action on our part to supervise this river, and by the laxity displayed by our own inspectors, for which I do not at all blame them, for the reason that two of these men whose duties took them through these parts were paid a small sum of £75 per annum each for the purpose of properly supervising the fisheries and seizing the nets, and I must say that they were very active in the performance of their duties, and a large number of nets were seized on the river, and largely owing to the attention paid by them the Victorian fishermen, who had been taking the fish, were a little more careful, and were not able to deplete the river as much as they are doing now. For some reason—I believe, for the purpose of retrenchment,—these men are still continued as inspectors, but without pay. I think this has been going on for about two years, and it naturally cannot be expected that they are going to put themselves to a great deal of personal inconvenience, which sometimes involves them stripping themselves and going into the creeks to get the nets, and taking them long distances to Police Courts for the purpose of having them confiscated, and that they should get no reward for their trouble, and they have grown careless in matters of supervision, and as a result of that having become known to the Victorian fishermen they have done what they have not done before,—they have practically employed these two steamers which are mentioned in the paragraph I have read to you, the Invincible and Ellen, for no other purpose than to steam down the river, and to take from these nets these large quantities of fish. I think it is fair to assume that when steamers are engaged in this business, this may be taken as only one of a series of a large number of other consignments which have been sent to Melbourne, and I would say that, as far as the Murray River and its tributaries are concerned, if this state of affairs is allowed to continue without some check being placed upon it, in a short space of time, instead of their being famed for fishing purposes, they will become entirely depleted of fish. There are several kinds of fish of the most valuable character,—the cod principally, the perch and the bream, they are very marketable,—and it is a most peculiar, and to my mind a very deplorable thing, that in our Colony we are under the greatest difficulty in getting this class of fish for our own people, but in Melbourne they are as plentiful as butcher's meat. I am strongly of opinion that this Commission should again urge the necessity of retaining the services of these two officers,—Messrs. Manton and Wilshire. I would recommend this Commission to urge upon the authorities the necessity of reinstating these gentlemen at their former rate of salary; and further, that the authorities here should open up communication with the Victorians, with a view of conserving the fish in this river for the future;—they should empower these two gentlemen whose names I have given to seize all illegal nets in the river, whether attached to the Victorian bank or otherwise. If this is not done, I am afraid that the depletion will go on in the same manner in which it is going on now. When I first went to the district, now some twenty-three years since, anglers could go to any part of the river, and within a short time would be able to catch a number of fish, if they stayed any length of time; but now the fisheries are so depleted you have to drive the fish before you have a chance. In addition to the nets, there are what they call cross lines, and these are put across the river, and across the creeks at all points; and baits are placed upon them, and they are sunk down with bottles filled with sand, and a large number of fish are caught that way. There are also other lines—night lines—used. As to the net called a bag-net, as you are perfectly aware it is a matter of impossibility for any class of fish to get through if they once get into this net; they are captured, and cannot get out. I would suggest if netting is legalised that the bag-net may be illegal, and only certain parts of the river be opened for the mesh that would catch the largest size fish only. When the cod gets to a large size there is no object in conserving it any longer; but the nets I am speaking of, more particularly the bag-nets, will catch sprats,—even the mussels that float into them. The gill-net has a very small mesh, and will catch fish a quarter of a pound in weight; they get caught by the gills and cannot get away. In conclusion, I may say that I am continually receiving complaints from the residents of the towns in my electorate with respect to the terrible destruction of fish in this river, and I have been repeatedly asked to bring the matter under the notice of the authorities; and I am pleased to place it before this Royal Commission, hoping that some good will arise from it, that the present defective conditions of supervision and other matters may be remedied, and that the people of the Colony will be able to enjoy the fish existing in their own waters, which I believe to be second to none.

629. Is the Sydney market availed of to any extent by the fishermen on the Murray River? Not to any extent.

630. Victoria reaps the whole benefit of the fisheries on the Murray? Yes; the whole of it. The only Riverina fish we get, that I know of, is from the Murrumbidgee, not from the Murray. 631.

631. Do you think it possible to develop the Murray River fisheries—I include the tributaries—so that a constant supply could be brought to Sydney? Yes; the only difficulty is the want of direct railway communication to that part where the greatest captures could be made. When the railway is completed the fishermen will have as good a market, and could place their fish here in twice the space of time they are now able to do in the Melbourne market. J. M. Chanter, Esq., M.P. 16 Oct., 1895.

632. You advocate that certain closures should take place in connection with the tributaries and lakes at certain times of the year? Yes, strongly; the danger is really more in the creeks than the river;—the fish go into these lakes, and as the water recedes they go back into the river and are anticipated by these nets.

633. You think it is necessary that the Victorian Government should pass a Bill that would authorise our inspectors to have proper control over the fisheries, so that the fishermen should not be allowed to fish indiscriminately as at present? Yes, with this reservation in regard to legalising certain classes of nets with a large mesh, a net adapted for catching the large fish.

634. Do you know whether any of the members of the permanent Fisheries Commission have visited the inland waters of the Murray or the Murrumbidgee? Not that I am aware of; I think not.

635. What do you think would be the value of the fish sent to Melbourne and other towns in Victoria in the course of the year? Well, I have had no opportunity of arriving at anything like a definite opinion in regard to that; it must be very large, because I have myself observed that on every occasion I travel by train from any part of the Murray I always see large numbers of baskets of fish being sent down—it is continuous.

636. Can you give us any idea of the number of men who are engaged fishing on the Murray and its tributaries? No; I cannot.

637. Do you think there are more than fifty? I should say there were three times fifty.

638. Do you know if they pay any license fee? Not to us; I do not know whether they do to the Victorian authorities,—that is the Victorian fishermen.

639. Do you know the quantity of fish that is sent over the Victorian border each year? I think it is considerably over 100 tons; the Victorian railways tap the Murray River at seven places, and fish is sent down from all those parts.

640. Did you say that the late inspectors, Mr. Wilshire and Mr. Manton, were employed at a salary? They were employed at a salary of £75 a year each.

641. And have their services been dispensed with? No; some two or three years ago—I think about two years since—they were notified that their services would be dispensed with, and therefore no further salary would be paid them. I thought this a very unwise proceeding, and at my suggestion, with a desire to conserve the fish, and hoping the authorities would see the necessity of reimbursing these officers, I induced them to undertake the work in an honorary capacity; but they have now been in that position for about two years, although I have on one or two occasions advised that they should be paid. These men have naturally grown sick of the matter, and under the circumstances they do not feel justified in carrying on the work.

642. Their services were absolutely dispensed with, and they volunteered to undertake the duties in an honorary position? Yes; they made a condition that they would continue to do the work without pay until financial matters were in a better condition. That condition was struck out, and they were informed they would have to do the work without any condition at all.

643. You made representations at one time to the effect that the Victorian authorities would be glad to co-operate to protect the fisheries? Yes; at one time they were willing to do so.

644. Did the Commissioners of Fisheries give you any encouragement in your suggestion? No; I cannot say I received any particular encouragement. I brought the matter under the notice of the Colonial Secretary and it was referred by him to the Commissioners, but nothing practical resulted from it. I was requested by Mr. Salmon, who was President of the Victorian Select Committee, to give some evidence before the Committee, and I then recommended what I now recommend,—that the Victorian authorities should arm our inspectors with full authority to seize the nets,—and this brought it under the notice of the Member for Rodney. Mr. Webb and another Member, Mr. White, asked him to take steps to induce the Victorian authorities to carry out what I understand was contained in a paragraph in the Report of the Victorian Select Committee, but during the last one or two years I have heard nothing further.

645. *Mr. Thompson.*] You have spoken of several kinds of nets, the gill-net and the bag-net, would you favour us with a description of these nets? The bag-net is a net which is stretched entirely across a creek, from bank to bank, from a few feet on either side of the bank; the net is fastened to a stake and is straight; then there is an inner net somewhat circular in shape inside that, within that again there is another inner net forming a second series with a smaller opening than that of the first, and then a third which is called the bag, with a small opening not more than a foot at the opening, then this bag is about 5 or 6 feet from this opening. The fish get through this opening and are surrounded by this balloon-shaped bag and cannot get back again; they cannot get out, the opening is so small; they swim round and round, and have no idea of getting out; if they do get out they are in the second series and first series. Now as to the gill-net—the gill-net is cast out into the lakes—one of these nets that I saw I am quite sure would be 200 feet long;—the net is fastened to stakes in a vertical position, sometimes in a semicircle, but more often straight across; a long net, then another net will be put some few chains above that, a little overlapping the end of the first net, and so on till they get a series right through. The fish in going through the reeds move the reeds about with their heads to get through. In the lakes they are easily caught; they look on the nets as a series of reeds, and, putting their noses in to get through, they force the gill and are caught in the gills. It is a series of nets in shallow waters, where there is no current.

646. What is the net they use which is extended by a series of hoops? That is the bag-net—it is hooped.

647. That is the sort of net in which you found the fish all dead, impacted together by the current? Yes; I am quite satisfied there was fully a ton of fish on that occasion. We have also lifted gill-nets and found dead fish in them.

648. What kind of net would you recommend as proper and legal for use in the Murray River? I should recommend a net on the gill-net system,—that is without any bag or attachment or other nets,—a plain wall-net with a mesh that would allow a cod under 6 lb. in weight to go through; anything under 6 lb. I do not think should be caught.

649. What size mesh would allow of that? I should think about a 5-inch mesh.

650.

J. M. Chanter, Esq., M.P. 16 Oct., 1895.

650. You would make that a minimum size mesh and fish that should be caught? Yes, for a number of years; I should strongly recommend it until the rivers were stocked again.
651. Would you recommend the seizure and destruction of all nets below that size? I would.
652. The seizure of nets we have altogether excluded from our Bill, as far as marine fishing is concerned; as regards inland waters that may be a matter requiring further consideration by this Commission. The Murray River and, perhaps, the inland waters generally may have to come under a different category, which the Commission will have to consider. In regard to the seizure and loss of one of these bag-nets to the fishermen, the loss is very considerable? I am told that they cost about £40, and in the past I believe all the nets that have been seized on the River Murray and its tributaries have been destroyed. Messrs. Manton and Wilshire would bring the matter before the Police Court and ask for authority to destroy the nets. In Victoria I think the class of net is illegal. I understand they are there sent to the Custom authorities.
653. What principle, in your opinion, should regulate the closing of waters on the Murray against net-fishing? I recommend that instead of closures being made in close proximity to the towns, the lakes and creeks should be closed, as they are the breeding-grounds. I should be pleased if this Commission could spare the time to go and see these lakes for themselves, and judge of their capabilities.
654. When do the cod spawn in the Murray? Well, I really could not answer that question.
655. You do not know how long they carry their spawn, or whether they carry it separate or attached? No, I do not.
656. What bait do they use? Meat, as a rule, and often large frogs.
657. At what depth are the lines set? Near to the bottom; the lines are sunk with bottles filled full of sand, and they are 2 or 3 feet off the bottom, right across.
658. Are the fry of the Murray cod easily obtainable? There is a Mission Station at a place called Cumeroogunga, about 16 miles from Moama, and about 12 miles from the lakes. I have seen the natives catch the fry in millions in little nets, and they fry them in their pans—little fry of about three-quarters of an inch in length.
659. At what time of the year? In the summer months—from the present month, October, up till about March.
660. I suppose, for purposes of propagation and distribution, it would be quite easy to get a supply of this fish? Oh, yes; quite easy.
661. Would the services of Messrs. Manton and Wilshire be sufficient to supervise the Murray River; would they require further assistance? Mr. Manton is the inspecting forester, and he has a steamer; he goes up the river as high as Albury, down to the junction of the Darling with the Murray; and that embraces all the breeding-grounds of the fish on the Murray. Below that point the nature of the country alters very considerably—the banks of the river becoming very much higher, and a different country altogether is seen; but the flat country—the swamps and the lakes where the fish breed—are in his district.
662. And you think their services would be sufficient to conserve those fisheries without further aid? I would not like to say that altogether. I think from the nature of Mr. Manton's occupation that it would be difficult to get any two or three men that could do as much good as he can, as he is always on the move on the river.
663. Do you recommend the payment of a fee for the destruction of fish-eating birds—seeing that the fisheries are protected only for the benefit of the Victorian fishermen? The lakes are fairly infested with these birds, and no doubt they destroy a large quantity of small fish; but while the present arrangements in connection with the nets are allowed to continue, I would not recommend the destruction of cormorants, as they do not destroy anything like the number the nets do; one should go with the other. It would be useless on our part to offer a fee without the Victorian authorities join in. I have known of one or two occasions, and heard of several others, that these birds have not been captured in New South Wales at all, but have been captured in other places and brought over here to get the reward. In conclusion, I shall be glad indeed if the Commission, as a whole, or some of its members, could arrange with the Department of Forestry to place Mr. Manton and his steamer at their disposal, and visit the Murray any time between now and New Year. The river would be navigable over the whole of its length, and the Commission would be enabled to see for themselves not only the nets but also the location of the country, and the necessity for conserving the lakes and breeding-grounds. After New Year the water shallows in parts, bars running across the river, and you might not be able to get down, except by driving; but now you would be able to get down the whole length of the river, and would be able to do so up to Christmas time.

THE MURRUMBIDGEE RIVER.

THURSDAY, 17 *OCTOBER*, 1895.

[*The Commission met at the Offices, Bligh-street, at* 11 *a.m.*]

Present:—

FRANK FARNELL, Esq., M.P., President.

L. G. THOMPSON, Esq., J.P.

Travers Jones, Esq., M.P., sworn and examined:—

T. Jones, Esq, M.P. 17 Oct., 1895.

664. *President.*] Your name is Travers Jones? Yes.
665. You are at present Member for the Electoral District of Tumut? Yes.
666. You have represented that district for many years? For seven or eight years.
667. What rivers are they that run through your electorate? The Tumut River; the junction with the Murrumbidgee is outside of my electorate, it is just about the boundary of the electorate of Gundagai; the Little River that goes into the Tumut River extends up to Talbingo Mountain, the head waters of the Snowy River, and several creeks that carry fish running into the Little River, and the end of the Tumut River.
668. Have you a good knowledge of the waters of these rivers and creeks? Yes. 669.

T. Jones, Esq., M.P.
17 Oct., 1895.

669. Can any of them be considered permanent streams? Yes; most of them—permanent waters all the year round, I do not think there is a creek in the electorate of any importance that goes dry, some minor ones may. The Nacka Nacka, Yaven Yaven, and Adjungbilly all contain fish and are permanent waters.
670. Do all those streams contain fish life? Yes; all of them.
671. Can you tell us the kinds of fish you have noticed in them? We have in the Tumut River and the Little River the cod fish, the bream, perch, and jewfish, or catfish. They are also found in the main creeks.
672. Are they all good, all edible fishes? Yes; all of them.
673. Are they caught with nets? I had to apply to the Fisheries Commission some time ago to stop netting at the junction of the Tumut with the Murrumbidgee, as the netting stopped the fish coming up; they got so scarce it was almost impossible to get any with the rod or line. The Commissioners closed 5 miles of the river both above and below the town, but that was of very little use, as the portion closed has not been netted at all; the closure was absolutely valueless for the purpose we wanted to serve.
674. Do you think the closure should have been made at the junction so as to allow the free ingress and egress of the fish? Yes; to allow them to go up to spawn; the constant netting prevented them going up. There are numbers of lagoons that contain quantities of fish which are also netted.
675. Do you think these lagoons are the natural breeding and feeding grounds of the fish? Yes, I am certain of it; I had a knowledge of trout and salmon fishing in Ireland in my early days; in the spawning season nature provides them with a horn on their nose, that is the lake trout; this horn is on the tip of the nose, for rooting up the sand for the female fish to spawn in; they make a hole in the sand for this purpose. In Loughs Mask and Corrib I have seen them with the horn on the nose. [*The witness was here shown a diagram of a trout caught in the Molonglo River, and he said the trout he spoke of had not the extended lower jaw but had the horn on the tip of the nose.*] I have caught them in Loughs Mask and Corrib; there was a subterranean passage between these loughs, and the eels were known to go through. Lough Corrib was a splendid lake for salmon-fishing, and had an outlet into the sea at Galway. Just before I left home, in the time of the potato famine, which, as you remember, was caused by the disease, the English Government cut a canal from Lough Corrib to Lough Mask to allow the salmon to go up, and to give employment; the salmon, as you are aware, leaps and sometimes jumps as far as 20 feet. In Lough Mask there is a superior kind of eel, the silver eel—the people would not eat the common black eel or conger eel—and these eels were caught at the mouth of this subterranean passage; there were openings down to this passage in several places, and they caught the silver eel going backward and forward to the sea; then there were the small salmon trout in the rivers, they were confined to the streams, seldom weighing more than 3 or 4 pounds in weight, sometimes 5 pounds. There are several kinds of trout, besides the large trout which took the fly. I may also state that trout have been introduced into small creeks on Ellerslie station; Mr. Webb is the manager; this station is in my electorate.
676. Do they reproduce? Yes, they got on very well; when I was up at Humula, which is 22 miles from Tarcutta, I was told there was a splendid lot of fish in Kyamba and Tarcutta Creeks. Mr. Yeomans owns the station, and Phillips, the trainer, told me that you could get any quantity there. It was cold weather when I was there and they would not bite; there is a creek there crossing the mountains said to be literally alive with young trout fry. I have heard that the fish introduced by Mr. Webb have succeeded and some nice trout have been seen.
677. Is it far away from the Tumut River? Oh, yes; it is 50 miles drive to go round from Humula.
678. Of what river is it a tributary? Of the upper end of the Tarcutta, which goes into the Murrumbidgee above Wagga Wagga, and Nacka Nacka Creek; they said there were swarms of fish there supposed to be trout. I will probably go up during the recess and see if they are trout.
679. Do the local residents get any supply of fish from the river? They get them from those who are netting who bring them up in loads; they get from 4d. to 6d. a pound for the Murray cod and perch.
680. Speaking of the necessity for conserving the natural supply of fish in the inland rivers throughout the Colony, this Commission has made certain remarks and it is stated, in addition to other matters bearing on the question, that a closure was made at Tumut and is still maintained, notwithstanding protest by local residents against it; one purpose of such closure should be to afford a sufficient supply to the townspeople, but the Tumut residents contend that the closure there, to have been of use, should have been made from the junction of the river with the Murrumbidgee, do you believe that? Yes.
681. Where did the trout that were introduced into the rivers come from originally? From Sir Samuel Wilson's place, near Ballarat—he had hatching-beds there; I knew Lake Wendouree, at Ballarat, when it was nothing but a waste of rushes, it has improved wonderfully. When the water supply was brought into Ballarat it was allowed to flow into Lake Wendouree; it was nothing but a wild swamp for years, and now by prison labour being brought to bear upon it it has been made into a beautiful lake with plenty of islands, and is full of English perch and carp.
682. Do you think that with proper supervision and control the fisheries in your district could be so developed as to be of use not alone to the local residents, but to people living along the line? Yes, I am sure of it; in the winter season there are visitors to Tumut and Gundagai who bring the cod and perch down by the mail-train and land them quite fresh.
683. Have you read the Bill prepared by this Commission and embodied in the Report submitted to the Government? Yes.
684. Do you think if the provisions of the Bill were passed into law they would give power to the authorities to deal with questions more satisfactorily? I am quite satisfied they would; the powers provided in that Bill are quite necessary to stock our rivers with fish and to protect the fish that are naturally in them.
685. Can you give us any idea of the quantity of fish caught there during the year? I have seen when I was constantly working in Graham's Town, for five or six years, a man who used to bring a waggonette up from the river full of them, a tremendous lot, as much as he could put into it.
686. How often did that happen? There were something like 150 miners working on the two mines at Shepherd's Town and Graham's Town, Adelong Creek, and they were mostly Irish people and Roman Catholics, and they like to get fish on a Friday; this man used to come specially to provide these people with fish on that day, he used to obtain from 4d. to 6d. a pound for the fish.
687. What sort of nets do they use in the capture of the fish? I do not know the kinds of nets used.
688. Have they a purse to their nets? The draw-nets in the old country have a purse, and the mesh is much smaller in the purse.
689. You do not know whether they use that sort of net? I could not say; I have not taken any particular notice.

T. Jones, Esq., M.P. 17 Oct., 1895.

690. Do they use the long lines there? The principal fishing is with the set lines at night, and the rod. The time the fish in the river bite is usually early in the morning, or at sunset. I have fished a good deal in the Macquarie River, and have gone to look at my night-lines, and in less than half an hour I caught the fish as fast as I could take them off. I remember on one occasion my mate came down, and there was an immense large fish took one of the lines; I was hauling him in, and it was just as much as I could do; he made one splash and broke the line. I remember a sad event happening on the river. There was a shepherd's little son fishing and he fell asleep; he had tied the line on to his foot, and while he was asleep a small fish took his bait and got hooked on the line, the boy remaining asleep, and then a large fish, about 60 lb. weight, came and took the small fish, and dragged the unfortunate little fellow into the water and he was drowned. It was about 4 miles from where I was mining: we went down and searched for the boy, and found him stuck in a tree under the water, and a big fish about 60 lb. weight on the line dead. That was in the year 1861, or 1862. I might state that some few years ago there were some trout fry—some ova—sent up to Tumut which they emptied into the river, and there was never anything more seen of it again; it must have been put in to feed the other fish. They just tumbled it in out of a bucket into the river, it was the ova before it was hatched. I sent up a letter received from you gentlemen, and asked what preparation they had made to receive the trout fry; I have not received a reply to that yet, when I do get it I will send it on to you.

691. *Mr. Thompson.*] When do the Murray cod spawn? I do not know; I have seen them very small.

MARKET ACCOMMODATION AND GENERAL EVIDENCE.

TUESDAY, 24 SEPTEMBER, 1895.

[*The Commission met at the Offices, Bligh-street, at* 11 *a.m.*]

Present:—

FRANK FARNELL, Esq., M.P., President.

L. G. THOMPSON, Esq., J.P.

Mr. Thomas Whelan, Senior Constable, New South Wales Police, No. 3 Station, Darlinghurst, sworn, and examined:—

Mr. T. Whelan. 24 Sept., 1895.

692. *President.*] Your name is Thomas Whelan, and you are a constable in the New South Wales Police Force? Yes.

693. Does the district over which you have supervision embrace all parts of Woolloomooloo? Yes; down to the water and round by Potts Point.

694. You are a plain clothes officer? Yes; since the 18th of May last.

695. How long have you been in the service? I joined in 1884.

696. Since then have you been carrying on your duties in the Darlinghurst district? No; I have been there a little over two years.

697. The latter portion of your term of office? Yes.

698. Have your duties necessitated your attendance at the Fish Market at any time? Yes; every morning, when in charge of the relief, it was my duty to see that the constable deputed to do duty in the Fish Market was properly attending to the same.

699. Have you had a good opportunity of noticing the manner in which matters are conducted at the market? Yes; I have had a very good opportunity of seeing how matters were conducted there.

700. Do you think that matters have been conducted satisfactorily? I do not think so, as far as I could see.

701. Do you think there is urgent need for reform? Yes; in many ways.

702. Have you ever watched the consignments come in to the Fish Market? No, not particularly; I have noticed several coming in, and seen them bringing fish in and putting them on to the floor on several occasions.

703. What sort of system do they usually adopt in regard to the display of the fish? They are simply brought in in baskets and thrown on to the floor.

704. Has the floor been clean on all occasions? There were parts where the fish were on which men walked about barefooted; there were many persons walking about where the fish were thrown.

705. Have you seen smoking or tobacco-chewing going on in the market? Yes; smoking, and men spitting all over the floor.

706. Have you noticed fish exposed for sale when unfit for human consumption? Yes, I have, and have made a note of it at the time—at a time when my attention was drawn to the bad fish.

707. Have you a note of the date? Yes; I have the date noted in a book I was using at the time. The first day I made a note was on Tuesday, 5th of March, 1895, when at about 8 o'clock in the morning a fish hawker named Samuel Squires, residing at Milk-street, Surry Hills, came into the Fish Market, carrying a basket of fish containing a number of fish of various sorts, and informed Mr. Baker, the auctioneer, from whom he had bought the fish he had in the basket early in the morning, that it was bad. Mr. Baker denied selling Squires the fish, and called on Mr. Augustus, the agent for the fish, to corroborate his statement, but Mr. Augustus declined to do so, and said he remembered Squires buying the fish. Squires asked that the money he had paid should be returned to him, which amounted to 4s. After a short conversation Augustus paid him 3s. The fish was green and putrid and was laid on the floor, and Squires walked away. On the same date I saw various lots of fish; the first lot of fish condemned was about a basket full. Mr. McElhone drew Mr. Seymour's attention to it, and it was condemned—it was putrid. The second lot was also condemned in the presence of Mr. McElhone, and that was putrid. The third lot was divided into sixteen small lots, it was put up for sale at 6d. per lot, and there was no buyer nor any offer. The fish was condemned by Mr. Seymour; there was about three baskets, and Charles Augustus was the agent for the fish, and was present when it was condemned. On the same date, when the sale was over, about four baskets, containing about 158 fish, were brought into the market, and

Mr. T. Whelan. 24 Sept., 1895.

and thrown on the floor. The fish was putrid and had a very offensive smell arising therefrom; Mr. Baker condemned the fish. Charles Augustus was the agent, and Mr. McElhone was also present. The fifth lot was also condemned—there was about one and a half baskets; the fish was putrid and it was condemned by Mr. Seymour; they were on the floor and exposed for sale. On Friday, the 8th March, the same year, a fish hawker named Edward Doyle, residing at No. 37 Hartley-street, Balmain, bought a small lot of fish from Mr. Lynch, the auctioneer employed by the Council, and returned them to the agent, Mr. Fitzgerald, who returned him the money for them. Mr. McElhone drew Mr. Seymour's attention to them and said the fish were unfit for human food. He inspected them and ordered them to be sold; the same time the fish were putrid. On Friday, 8th March, the same year, a man named John Watts, a fish hawker, residing at No. 23 Harvey-street, bought several lots of fish from Mr. Seymour, for the sum of 1s. 9d., and after being a short time away from the market he returned and complained about being unable to sell the fish; he threw them on the floor. Mr. McElhone was present, and I drew Mr. Seymour's attention to the fish myself. He examined them and said they were good. Several of the fish were picked out of the lot and handed to the agent for the purpose of being cooked and sent to the City Council to allow the aldermen to see them. These are the only notes I made. All these fish I have mentioned were exposed on the floor for sale. I fancy of the lot spoken about Mr. John Watts, a bystander asked Mr. Seymour if he would eat the fish, and Mr. Seymour acknowledged that he would not, and the man he handed the fish over to was the agent for the fish—Antonio, I think—who has a fish shop in Market-street. I was called on at the District Court to give evidence, but on account of their making a certain date I was unable to give evidence.

708. Who is Mr. Baker? An auctioneer employed by the City Council—as far as I could see it was his duty to sell the fish.

709. How many auctioneers have you seen at the market in the morning? Mr. Seymour, Mr. Baker, and Mr. Lynch.

710. Have you seen many agents there? Mr. Fitzgerald, Augustus, Antonio, and several agents whom I do not know.

711. Do you see any necessity for these agents? I do not know; I am not in a position to say.

712. You have seen fish sold in the market on many occasions—good fish? Yes; I have seen good fish sold on many occasions, and I have seen sound fish condemned. After the sale was over, on the morning the fish was condemned, Mr. McElhone took hold of a fish and said, "Is not that a shame, there is a good fish condemned;" but the other fish were very bad, some of the worst I have ever seen in the market. You could almost smell them when you came into the market. That was lot four. That morning, after the sale was over, there were four baskets brought in, and before Mr. Baker came to them you could smell them, and he said that fish would have to be condemned. We picked several of the fish up, Mr. McElhone and myself, and they were really sound fish. It appears to me that the good and bad were mixed together.

713. That would be caused by bringing fish out of the cool chamber—fish stored there the day before—and mixing them with fish that had arrived that morning? I was of that opinion at the time, as the fish picked up there were really first-class fish, fit for any person to eat.

714. In regard to the storage of surplus fish not sold, do you think they would be likely to go bad when they get restored to their normal condition again—that the deterioration would be arrested when they went into the cooling-chamber; but afterwards the deterioration would continue? I think so.

715. And you think that accounts for a lot of the fish that is bad and sold to the public? There is no doubt that is the cause of it—being placed in the chamber for a couple of days, and then brought out—when they get into the open air they begin to decompose at the point they left off.

716. Do you think, in comparison with the price the public have to pay for fresh fish, the fishermen get fair remuneration for their catches? I do not think they do; as far as I can see I think the thing is badly conducted all through. I think if the fishermen were allowed to sell their own fish they would get more for their catches.

717. Have any cases come under your notice where fishermen have complained of their fish having been stolen in transit, and at the Woolloomooloo Market? I never heard them complaining; I have heard of men losing fish after it has been placed on the floor, but not losing fish in transit. It has never been brought under my notice. It may have happened.

718. As to the unsatisfactory manner in which the fish are displayed, do you think an improvement would be made by having raised tables, would that be an improvement in the right direction? There is no doubt about it, it would prevent people from walking on the fish, and from spitting on them. I have seen men with a great chew of tobacco spit about the floor and walk on the fish repeatedly. In fact when they are gathering round they start in the middle of a lot of fish and kick them about, and that is how the fish get stolen. The tables would also give a man a chance of seeing what he was buying.

719. In regard to the sale of fish generally, have you ever noticed that under-sized fish has been sold? I do remember seeing under-sized fish there; I have seen Mr. Seymour condemn two or three little lots of very small fish. I saw him go round on one occasion picking out the small fish and condemning them.

720. As to the operations of the agents and the hawkers at the market, in regard to the cleaning and gutting of the fish, are they conducted in a satisfactory manner? I have not taken much notice of how they clean the fish.

721. Where do they get the supply of water from? I am not in a position to say where they get their water; of course I have heard them saying that it came out of Woolloomooloo Bay, but I am not in a position to prove that.

722. Are you aware of a case, heard in the District Court, where an agent named Augustus sued Mr. McElhone for damages for slander? Yes, I was supœnaed by Mr. McElhone to give evidence, but as I was not present I gave no evidence.

723. Are you aware what the result of that case was? Yes, a verdict was given for the defendant.

724. Mr. McElhone stated practically what you have stated to the Commissioners to-day? Yes, that is so.

725. Do you know if the City Council have taken any action with a view of instituting reform at the market? I have seen several posters about the Fish Market at Woolloomooloo, calling the attention of the fishermen to the fact that there was an inquiry being held at the Town-hall, but I have not been called upon to give evidence.

Mr. T. Whelan. 24 Sept., 1895.

726. Is the market properly situated for a fish market? If it were more central it would be better for everybody.
727. You think the market should be where access could be gained by rail, road, and water? Yes; at the railway the fish is thrown into the carts, and then when they come to the market they catch hold of them and throw them out, and they get bruised and knocked about.
728. Is Mr. Seymour at present in charge at Woolloomooloo Market? I have not been there since I have been doing plain clothes duty; I never come out until half-past nine and cannot say if he is employed there at present.
729. Do you think it would be a good thing to establish auxiliary markets in the different suburbs for the local supply of fish? Yes, it would.
730. In regard to the matter of sales which take place at Woolloomooloo, do you think it would be a good idea to have more than the one sale a day there? I think it would be a good thing to have a person there to sell the fish whenever the fishermen bring it in, or to have two sales a day.
731. Under the present system, if a consignment arrives too late for the morning sale it has to be put into the ice-house, or held over until the next morning sale? Yes.
732. *Mr. Thompson.*] Considering our summer temperature, would it not be preferable to have the market open the whole day? Yes; the whole of the day, so that any person who had fish could dispose of it immediately after it was caught.
733. Are you aware that Mr. Seymour is an inspector under the Fisheries Department? I have been told so. I heard Mr. McElhone say so at the Court.
734. One of his duties would be to see that the small-sized fish are not sold? Yes.
735. Do you not think he attends to that duty diligently? I do not think he does.
736. Have you ever seen any other fisheries inspectors looking after small fish? I do not know any of the fisheries inspectors at all; I do not ever remember seeing them. I would like to draw your attention to one particular occasion—I think it was the Monday after last Good Friday. There was a quantity of fish—somewhere about sixty-six baskets I should say—it was a consignment from the Manning River, and the whole of the consignment was received into the market; it was in a very bad state. The agent, if I remember correctly, was Augustus. This fish was thrown on the floor, as it seemed to me, simply for the purpose of the Corporation people to carry it away. It was something horrible—so bad they did not inspect it at all. A great heap, about three cart-loads, was thrown into the market, and made the whole place unbearable.
737. Do you think Augustus did this on purpose to get rid of a bad article? I think so; I understood no putrid fish was to be placed on the floor at all,
738. Is there no one there to examine the fish? I think Mr. Seymour's duty is to see to that.
739. What becomes of the condemned fish? I think there are men employed by the Council who cart it away to the tip out at Moore Park. I know on this particular morning there were a good many people obliged to leave the market through the stench arising from these fish.
740. Are the fish subjected to any process for the purpose of disinfecting them—are they sprinkled with carbolic acid? Yes; there is some fluid thrown over the fish condemned in the market. I was looking over the books some time ago; I think I saw it laid down that no person was to place putrid fish on the floor.
741. In your opinion then, the officers of the Corporation do not take steps to enforce this law? No, I think not. If you had a copy of the Act I think you would see that there is a clause in it to that effect. I have often thought, with respect to the complaints about the fish being allowed to be put on the floor for sale, that if the instructions were followed out putrid fish would not be placed in the market at all.
742. Is there any preference given to purchasers of fish? I have heard a great deal of talk about it, and to the effect that Chinnery always gets the preference.
743. Are you aware whether there is any foundation for the statement? No; Chinnery is a man who does a large business; he keeps very good fish. As for there being anything between him and Seymour, I am not in a position to say. When certain matters were brought under my notice I made a note of them, so that I might be prepared to give evidence if required.
744. *President.*] Are you aware whether it is a fact that when fish come in the agents pick out the finest fish and send them away to the country on their own account, and sell the smaller fish at the market and charge their constituents at the rate they get for the smaller fish? I have been told that they have sent the best of the fish away to the country.
745. They send the larger fish away and sell the smaller fish by auction, and send in returns to their constituents based on the price they get for the smaller fish? I cannot say. The best fish are sent away. That is all I know.

Mr. Josias Dawe, Senior-Constable, New South Wales Police, No. 3 Station, Darlinghurst, sworn and examined:—

Mr. J. Dawe. 24 Sept., 1895.

746. *President.*] Your name is Josias Dawe, and you are a constable in the New South Wales Police Force? Yes.
747. How long have you been in the Darlinghurst district? I think it is nine years last July—within a month, at any rate.
748. How long have you been in the service? A little over nine years.
749. Are you still stationed at No. 3 Station? Yes.
750. Does your district embrace Woolloomooloo and the foreshores? Yes.
751. During the time you have been stationed there have you had a good opportunity of observing the manner in which business is conducted at the Woolloomooloo Fish Market? Yes.
752. Do you think, from your observations, there is room for reform? Yes, very largely. In many ways matters are conducted very badly I think.
753. Do you think, in the first instance, that the market is suitably and conveniently situated? Well, I think there should be benches.
754. I mean the market itself, is it centrally situated? Yes, very conveniently.
755. Do you think it would be better to have a market that could be reached by rail, road, and water Yes; that would be beneficial.

Mr. J. Dawe. 24 Sept., 1895.

756. Have you noticed how the greater quantity of fish comes to the market, whether by water or rail? That all depends. Sometimes a boat comes in bringing a good quantity of fish; at other times boats do not come in, and the fish come by cart from the Redfern railway station, or from Botany and Darling Harbour wharfs.
757. You are not prepared to say which way the greater quantity comes? No; I cannot say.
758. Have you attended any of the fish sales in the market? Hundreds, I suppose.
759. Have these sales been conducted with satisfaction to the fishermen and the agents? No; I do not think they have.
760. Do you think the fisherman obtains a fair price for the product of his labour, compared with the price the general public has to pay for fish? No; I do not think they do.
761. Do you think the arrangements for the sale of fish at the market could be much improved upon? Yes.
762. Do you think there is any absolute necessity for the retention of the agents in the matter? I think if the fishermen had someone representing them it would be better for them. The agents do not seem to take sufficient interest in the matter. If they had a man to represent themselves I think it would be better for them.
763. Would you allow the fishermen to come into closer contact with the general public? Yes.
764. Have you ever heard any complaints on the part of the fishermen of their fish having been stolen either in transit or at the market? I cannot say that I have. I cannot say exactly where they have complained of them being stolen.
765. Have any cases come under your notice where people have been caught stealing fish? When I was in charge of the watch-house there was a man locked up for stealing fish, I believe.
766. Would you mind describing the manner in which the fish are sold, from the time they reach the agent's hands to the time they leave the market? The fish are brought in in baskets, and they are placed on the ground in little heaps in a space marked out in chalk, and the names of the owners of the fish written down, and they are sold by the auctioneer; but if a private individual wants to bid for a heap of fish he would have a bad chance of getting them, as if the large buyers bid they would be knocked down to them.
767. You think undue preference is given to the large buyers? I am certain of it; I have frequently seen private buyers trying to get a heap of fish, and it is almost impossible unless the fish are bad.
768. You say the fish are thrown on the floor in heaps;—does that render them liable to be trodden upon, and spat upon? Yes; it is impossible to walk through the market on a busy morning without walking on the fish. I have seen people spit on the fish when chewing tobacco.
769. You think some improvement should be made in regard to the display of the fish? Yes.
770. Would you suggest raised tables be established? Yes, if they only raised them 3 or 4 inches from the ground and made little paths so that the people could walk up and down, it would be a great advantage. You could not make a path between every heap of fish, but if they had tables from one end to the ot h, and left a space so that they could see the fish, and see what they were buying, and be kept clean, it would be a great advantage.
771. Have you ever seen putrid fish sold in the market? Yes.
772. Do you think some of that fish has been consumed by the general public? I have not seen them sold by the hawkers to the public. I remember on last Good Friday morning there was a gentleman I know very well who bought a heap of fish. I was standing outside, and he asked me if I would have a couple for breakfast. I said "No, and don't you eat them either." He told me he had bought them from Seymour. I said, "Take them back to Mr. Seymour." He said he would ask some of the fishermen's opinion about them. They told him that they were very aged. He took them back to Seymour and he told his man to give the purchaser back his money. Afterwards I bought a lot of fish for him which were very good—a lot of bream. There is no doubt that in the summer time every morning there is fish sold I would not like to eat.
773. Do you think they are fish that come direct from the fishing grounds, or are they fish that have been placed in the cooling chamber? Some that I have seen coming out of the cool chamber are not very good, and I have seen others brought in from the Cape Hawke boat very bad.
774. I suppose you have noticed consignments that have come from distant fishing grounds? I have seen the fish, but have not noticed particularly where they have come from.
775. Do you think, if the general public could be assured of the freshness of the fish sold, there would be a greater consumption? Yes; I am sure there would.
776. Are you of opinion that if the prejudice against the use of fish, created by the fact of people treading and spitting on the fish, were removed, that commodity would be more extensively indulged in? Yes; I think it would.
777. Do you think there is sufficient supervision exercised in the market in respect to the sale of sound and fresh fish, and also respecting undersized fish? No; I think the system they have is altogether bad. In my opinion the men holding positions there do not seem to be fit for their posts at all. They do not seem to have the minds of men—there is too much of the crawler about them. There should be a man to see the fish as they come in, who would not cringe to the big buyers, fishermen, or any other person, who would do what he thought was right conscientiously, and we might then have good fish; but as they go on now it is impossible to get good fish. There is an old talent that has been there some time, and they seem to work into one anothers' hands—a sort of ring.
778. Have you ever noticed or heard that the agents when they have received consignments of fish, have selected the best of those fish and sent them away to the country, and after having sold the balance have sent returns back to the fishermen based on the prices realised for the smaller fish? No; we would not be likely to hear anything about that if it were done. There is no doubt the fishermen are served very badly under the present system.
779. Are the cooling chambers extensively used? Yes, a great deal; a quantity of fish goes in there.
780. Is the storing of the fish in the cool chambers owing to the fact that they cannot be sold, or that they arrive too late for sale in the morning? They have different objects in putting them into the cool chamber; for instance, if there were a large quantity of fish in this morning and they were bringing a low figure, they would put them into the chamber until to-morrow, and sell them to-morrow, and get a better price for them. A few days previously to each Friday—that being a great fish day—they put them in the cool house, bringing them out for sale on the Friday.

781.

Mr. J. Dawe. 24 Sept., 1895.

781. The people who use the cool chamber are not the fishermen, are they? I could not say; the agents might put them into the cooling chamber if they thought they would bring a low price.
782. It is quite possible fish that are decomposing are placed in these cooling chambers, is it not? I have repeatedly seen them coming out in such a condition that I would not like to eat them. I have not seen much of them when they were going in.
783. Do you remember a case in the District Court in which Mr. Augustus, an agent, figured as plaintiff and Mr. McElhone as defendant? Yes.
784. Mr. McElhone, I believe, made some charges against the agent of selling putrid fish? Yes.
785. Do you remember the result of that case? Yes.
786. What was it? The case was dismissed.
787. Do you know whether the City Council have been making any inquiries in regard to the conduct of the market? I have heard so.
788. Have they not called upon you to give evidence? No. I gave evidence at the District Court, in the case Augustus v. McElhone.
789. Do you think it would be a good idea to have auxiliary markets established in the suburbs for the distribution of fish? I think a central market would be better; if they had a good market carried on properly—a central market—it would be as good a thing as they could have.
790. Do you approve of the means of distribution that we have at the present time, by the agency of hawkers. Do you think they are a proper class of men, as a rule, to do this business? Well, the hawkers as a class are about the lowest kind of people we have in Sydney, most of them being of the larrikin stamp, and other undesirable characters; and the reason most of them take to hawking is to keep out of the hands of the police.
791. When they have the fish in their carts and baskets ready for distribution, do they place wet sacks or bags over them to keep them fresh? Yes; I have seen them place wet bags over them.
792. In regard to the sales which take place at the market, do you think it would be an improvement to have more than the one sale a day? Well, no; I do not think it would.
793. Supposing consignments of fish arrive too late for the morning sale, would it not be a good idea to give an opportunity for the sale of that fish immediately they arrive? People as a rule do not eat fish in the evening, but at breakfast. I do not know whether it would take early in the afternoon; ladies, as a rule, like to change their dresses in the afternoon—they do not care about cleaning fish at that time of the day.
794. Looking at it from the fisherman's standpoint, do you think it would be a good thing to offer him that facility, if the fish could be disposed of, giving him the opportunity of disposing of his fish at any time during the day when they arrive to prevent the fish going bad? Yes, a good idea to give him a chance of disposing of them at any time if he was going to sell them himself, but not to keep a staff and the auctioneers there.
795. If you had one man to perform the duties, there would not be any further charge for his carrying out the duty of selling at any time? I think the mistake is in having a man to act as auctioneer and inspector. In my opinion, there should be a man appointed by the Government who would examine the fish as it comes in, and he should have nothing to do with the sale, but he should condemn the fish if it was not fit for human food.
796. *Mr. Thompson.*] Do you think a system of gutting fish before they come to the market would be an improvement? Yes, certainly it would, they would keep so much better.
797. Do you think the public would take to that system? Yes, I do. The heads should not be taken off the fish, only gut them. In Cornwall, great numbers of fish are sent to the London market; we used to gut them there; I was brought up in the business, and connected with it for a number of years.
798. Is it not the general practice to gut fish in the old country when sent from distant fishing grounds? We used to do so.
799. And you found that practice generally obtains in England? Yes, as far as I know, the fish keep very much better.
800. And considering that the climate here is so very detrimental to the preservation of fish food, you think it would be very much more desirable to adopt that practice here? It would be better every way.
801. Do you think the middleman or agent is a necessity in the market? If you could get a man who would do justice to the fishermen it would be all right, but nine out of every ten of the agents I have seen in the Woolloomoolloo market are men that I would not like to trust with sixpence.
802. What becomes of the fish that are condemned? They are carted away.
803. Are they subjected to any process? A man goes round the market with a can containing disinfectant, and afterwards they are taken away in a cart.
804. Are the heaps of fish sufficiently far apart when this disinfecting process is being carried out to ensure that none of the carbolic acid, or whatever disinfectant is employed, goes on to the sound fish? It might accidentally get on to the sound fish.
805. Is it not very difficult to cleanse the floor thoroughly from the effect of the disinfectant? Yes, you can always smell it.
806. You think the fish should be examined before they enter the market? I think every basket should be examined before the fish are put on the floor.
807. There are certain portions of the market to which fish are brought for examination, and that should be done by an inspector and not by the auctioneer, whose duties should be entirely separate? Yes.
808. You are aware that Mr. Seymour is an Inspector of Fisheries under the Fisheries Department and it would be his duty to seize all small fish below the market weight? Yes.
809. Does he attend to that duty? I never saw him take out any small fish.
810. Have you ever seen any of the other inspectors of the Fisheries Department attending to their duties? I do not know them. I have seen Mr. Mulhall condemn a lot of small fish; I do not know the other inspectors. They have been there looking after the small fish and their other duties and I have not seen them. It is said that some of the fish is given to friends by agents.
811. In that case the fishermen are deprived of a portion of what should be the proceeds of the sale of their fish? Fishermen are victimised in every possible way.
812. Is this practice largely indulged in? I believe it is.

WEDNESDAY.

WEDNESDAY, 25 SEPTEMBER, 1895.

[*The Commission met at the Offices, Bligh-street, at* 11 *a.m.*]

Present:—

FRANK FARNELL, Esq., M.P., President.

L. G. THOMPSON, Esq., J.P.

John McElhone, Esq., M.P., sworn and examined:—

J. McElhone, Esq., M.P. 25 Sept., 1895.

813. *President.*] Your name is John McElhone, and you are a Member of the Legislative Assembly? Yes.
814. Where do you reside? In Macleay-street, Sydney.
815. This Commission is anxious to promote the development of the fisheries, and they can see as well as anyone else who has devoted any study to the question, that in order to make their proposals a success, it will be necessary to have important alterations made in regard to the arrangements at present in vogue at the Woolloomooloo Market. Have you had an opportunity of judging how matters are carried on there? A few months ago I had a very good opportunity of judging how matters were conducted there. I went specially down to the market, on account of a friend of mine having been threatened with the watch-house for claiming some fish that were knocked down to Mr. Chinnery, and I attended the market in both the months of February and March, until eventually an action was brought against me in the Metropolitan District Court for slander at the instance of an agent named Augustus.
816. You attended some of the morning sales? I attended the sales morning after morning; I was there and inspected the fish, as to their condition, morning after morning.
817. Can you tell us whether you discovered fish in an unfit state for human consumption? In the latter end of the month of February, on two occasions, and in the month of March, on several days, there were lots of fish that were bad, rotten, and in a filthy condition, and utterly unfit for human food; in fact they were unfit to give to a pig, and those fish were sold to fish dealers and others, and some of the fish sold was absolutely as rotten as it could be. In many cases I called the attention of the Inspectors to them, and, as a rule, the people that had bought fish got their money back again.
818. Were the fish thrown on the floor in heaps? Yes, in little heaps, in rows east and west, with a small space of some 5 or 6 inches between them.
819. Do you approve of the existing system of displaying the fish? It could not be worse. You can imagine a market full of fish, and men spitting about, and chewing tobacco and spitting the tobacco juice all over the floor, treading on the fish—men walking about barefooted, and other objectionable occurrences. The people crowd round the man who is selling the fish, and the Inspectors, instead of looking after their business, stand about yarning; then they ring a bell and commence selling. On account of the fish being on the floor and the crowd round the auctioneer, it is an utter impossibility to see what they are selling. I saw fish offered for sale, principally by Augustus, as rotten as they could be. I called Seymour's attention to fish, privately by himself, that was utterly unfit for human food. They were fairly rotten, and were bought by people and brought back again. Stanley saw those fish, and Brown; they were both standing by. The fish were put in the trough and brought out again and sold. The good fish are knocked down to Chinnery, lot after lot; they blow a whistle to call Chinnery's attention to them, to call him or his men up, and they buy the fish. If you call upon a Mr. Taylor to give evidence before your Commission, and question him on the subject, you will find that the men are afraid to bid against Chinnery. It is a common custom of Lynch's and others to call the police to give men in charge that bid against Chinnery. I had witnesses to prove that garfish were not allowed to be sold privately; but when Seymour came he sold them himself; he knocked them down at 1s. 3d. You cannot get behind Chinnery and others.
820. Do you think it would be an improvement to have raised tables? I am sure it would; you could then stop them being spat upon and trodden upon, and you would also see what you were buying. I recommend that the fish be placed on raised stands or tables as in the Melbourne market. These stands are made of slate, and the market is paved with asphalt, and the walls lined with tiles. Then again, as to the water they use in the Woolloomooloo Markets, and which the fish are cleaned in, this water is drawn from the bay just near the baths. The whole harbour of Sydney is one mass of sewage matter, and this is the water that is used for the purpose of cleaning the fish. You can see the filth which accumulates round the baths in the bay.
821. Comparing the prices the general public have to pay for fish with those received by the fisherman, do you think the fisherman gets a fair price? No, they cannot possibly do so, the fish are knocked down to Chinnery and others, and they cannot dispute it; they do not get one-fifth of the price we have to pay for them. The large buyers get the best of the fish, and what they won't buy is knocked down to the poorer people. I have handled fish there quite soft, and as different as possible from the fresh fish, which one cannot make any mistake about, colour and all appearance of freshness gone, and the smell would knock you down. I saw a lot of fish sold in February; I think Brown was with me, and I spoke pretty loud about the fish, and there was a man there who called Lynch on one side; there was a large quantity of fish as rotten as they could well be, and when Lynch came to sell I said, "You had better not sell them; they are rotten;" he said, "Who says so?" and called Seymour, and he asked what was the matter; I said the fish were rotten; he replied they were not; I said, "They are absolutely rotten and totally unfit for human food." They called some men up and picked the best out and sold them. A man named Cabban bought the pick of these fish, thinking that if they were picked they would be all right; I saw him shortly afterwards putting his fish in the freezing chamber. Alderman Penny was there and he looked at the fish; I said to him the fish were rotten, and you could hardly bear the smell; Alderman Penny vomited all over the floor. Cabban was told to say he did not buy his fish from Augustus; he returned his fish and received his money back. Seymour admitted that he had sold rotten fish, and gave his reason for doing so. I said to him, "Dick, I thought you were there to prevent the sale of rotten fish," and he said, "So I am." He admitted to the Judge the reason was that the fish sold were a mixed lot, the good fish being at the top and the bad at the bottom. They swore all the fish were inspected and were good. There was no inspection at all; they were all yarning about the market; Lynch, Baker, and Seymour. A bell is rung and they commence selling; the mob stand round, and there

J. McElhone, Esq., M.P. 25 Sept., 1895.

is no inspection at all. They swore the fish were fresh when they came into the market at 5 o'clock in the morning, and they were rotten at 6 o'clock. They said it was the floor that made them rotten after being in the market for an hour; it was the concrete floor that turned them rotten. I won't allow a fish in my house ever since I saw the fish washed in the filthy sewage matter. Brown sometimes buys fish for me; harbour fish, and cleans them, and they are all right then. In the winter time I saw a lot of schnapper, and after a time they were sold, and the man took them to the trough and cleaned and gutted them, and they were condemned and he got his money back; this was in the winter, and if fish is bad in the winter what can be expected in the summer time. Fish are caught at Cape Hawke and put in boxes and stuck on the boats for forty-eight hours or three days. You can imagine fish coming from the Clarence packed in boxes. What sort of condition must they be in? The Board of Health say they have no power to deal with these matters. I have written to various people, Mr. Reid and Mr. Brunker, and they say they have no power to deal with it. There is the most infernal rascality going on among the market officials. I have had any number of complaints from men and women of the manner in which they are treated, many of them being poor people, and they cannot afford to make bad speculations, and the loss to them involved in the purchase of fish which they cannot retail is a serious matter. I was told Seymour had a whip, and he used to flog the people, and then after that was stopped he took to using a big stick to poke the people round. The most filthy language is used to the poor fishermen, but they dare not say anything about it. This system of terrorism drove some of them to the Redfern Market. Taylor will tell you all about these abuses if you ask him.

822. Have you ever heard any of the fishermen complaining of their consignments being reduced? Yes; very much. They are picked over and the best taken out. A man cannot conceive the reign of terror that was carried on by Seymour over the unfortunate fishermen. I was informed he has condemned live fish. The officials of the market and friends of the auctioneers get their fish for nothing. You may see, especially on Friday mornings, you may see them go away with little baskets of fish, taking them round to aldermen and others.

823. Were you called upon to give evidence before the City Council? I was; and I said that I was prepared to defend an action for every word I said.

824. Do you know if they have taken any steps to bring about the necessary reform? None at all that I am aware of; the people got tired of going up to give evidence. There is no redress at all for the unfortunate men against Seymour. His word is like the laws of the Medes and Persians, and the fishermen can do nothing against him. There is a system of blackmailing going on. I have moved for a Select Committee to get at the bottom of the ring business that exists; they favour the large buyers. Some of the fishermen have tried to break down this ring business, but as soon as they begin to complain they are threatened with being turned out of the market. There is an old talent that has held sway at the market for a long time. They want sweeping out; they work into one another's hands.

825. In regard to the sale of fish, would you advocate the opening of the market all day so that fish might be sold? What I advocated was this—let the inspectors be on a similar footing to the Inspectors of Nuisances, and let the fish be inspected outside the market, and allow nothing but good fish to come into the market, and take care that a good supply of fresh water is used, and let the fishermen sell their own fish in the market. Let the inspectors condemn anything that is bad outside the market and the fishermen sell their fish inside. There are numbers of men who dare not go into the market at all. This man Seymour has such a hold over them that they will not go into the market. Taylor will give you particulars if you ask him. The fish are put into the ice-house, and they are rotten before they go in; the freezing makes them hard, and as soon as they are taken out and they thaw they almost tumble to pieces. On one of the mornings I was there I saw a lot of fish with a filthy look about them, and I asked Mr. Smyth to buy these fish for me. He said, "They are rotten," and I said, "That is why I want to buy them—I want to show them to the Mayor." He said, "I don't want to get into any row." The heaps were pretty nearly all the same; my friend Brown stood by, and Constable Byers, of Parramatta, was also standing by. We were all waiting by the fish. Lynch stood near at hand and knocked them down to Chinnery, and I saw Chinnery taking those fish away. I said, "Lynch, you have sold rotten fish," and I said to the constable, "Seize those fish; they are rotten." Chinnery said, "I dare you to touch them; I have bought them," and he swore those fish were perfectly good. Byers and I and Brown swore they were rotten; they were bought as a plant so that I should not get hold of them, yet this was one of the lots for which the man brought an action against me for saying they were rotten. Instead of selling one lot, they sold a whole square of them; Constable Byers will prove this, and it is a common occurrence morning after morning. Augustus had fully one-fourth of the market to himself, and for four or five mornings running there was hardly a single fish fit for human consumption. It was a difficult matter for me to keep myself from being sick.

826. It is quite likely this has been going on for years before you took notice of it? Yes; for years nothing could be worse nor more filthy than the doings at the market. The Board of Health say they are powerless in the matter, although I have pointed out that they take steps in respect to cattle, and I have told them they are allowing rotten fish to be sold every day. I interviewed Mr. Brunker, and wrote to the Premier. Mr. Reid advised a prosecution under the Adulteration of Foods Act. For several mornings in the latter end of February and in March, when the weather was muggy, there was scarcely one really good fish with its proper colour and sweet in the market. And the worst part of it is the cruel way the fishermen are treated by Seymour and the other fellows. People are afraid to bid against the favoured ones, and on account of the way the matters are conducted there people want to be well off to buy fish at the market. You cannot get fish,—it would take 3s. or 4s. to pay for a decent meal. Seymour has asked Byers to take me in charge several times because I have been looking at and handling these rotten fish. I have been told by Seymour to lay fish down, and he has called a policeman to give me in charge. One morning a poor woman bought a fish as rotten as it well could be, and she brought it to me, and I said, "I will get you your money back." I went to Baker and said, "Look at this fish; give this woman her money back." You really do not know what you are buying. In some cases the people do get their money back, but the whole system is something infamous and filthy in every way that it can possibly be. There is no room between the fish; the heaps are nearly touching each other, with no passage between,—the whole market is alike. The fish is trampled upon and spat upon; if the inspectors did their duty it would not be allowed. The inspectors of fish and nuisances exercise a regular reign of terror over the people.

827.

827. As to the site of the present market? The site is right enough.
828. Do you think, considering the great supply of fish that comes by rail, it would be better to have a centrally-established market accessible by rail, road, and water? Yes; of course it would be.
829. Instead of having a market conducted by municipal authorities, would it be better to have it under Government control? I am certain it would; kick the Corporation out altogether. The less you handle the fish the better. If you can get a site convenient for rail, road, and water communication so much the better.
830. Have you ever heard that fish are pilfered from the carts at the market? I do not know that—very likely they would be. Some of the fishermen have their carts watched; complaints are bitter about fish being stolen about the markets. Taylor put a lot of schnapper into the ice-house, and he got a receipt for them, and when he went to get his fish there were so many short, and he afterwards picked up a receipt showing that an engineman named Beers was supplying men with fish, this account or receipt showing where Beers had been supplying people with fish up the country. They appear to do simply as they like, and the poor men dare not say a word or else Seymour would not allow them in the market at all. It is a well-known fact that fish were stolen wholesale in the market. As things are carried on nothing could be worse, nothing more filthy and vile;—I have seen men spitting and blowing their noses on the floor, and I have heard people say that they have seen dogs urinating on the floor. I generally get up at 5 o'clock in the morning to see the early sale, and they swore they were inspected before they were offered for sale; I swore they were never inspected at all. What I saw at the market has completely turned me against eating fish, and many other gentlemen I know have the same feelings about the matter. Respecting the water the fish are cleaned with—the ebb-tide brings all the filth down into the harbour from Parramatta and other places, and the smell is sufficient to knock you down; you can see the filth coming down with the ebb-tide into the baths. People ought to go and see the state of the markets for themselves, especially now the weather is getting a little warmer.
831. Are matters any better since your action? Not a bit, they are just as bad as ever; you can imagine if rotten fish is sold in the depth of the winter what it will be in the summer time. They were told about what I said about the fish being rotten, and they were put on one side and dealt with later on. It is useless for others to bid against Chinnery; suppose Chinnery bids 5s. and I bid 6s. they would be knocked down to Chinnery, and the next lot to Playfair, and so on until they get all they want. I have seen Lynch, Seymour, and Baker, when a lot of fish has been knocked down to Chinnery, blow a whistle to call his attention that fish was knocked down to him.
832. *Mr. Thompson.*] Have you gone into the question of transit at all, or the suitableness of the baskets fish is conveyed in? No; I believe they are brought down in the old country in boxes and that special trains are run on Sundays for the conveyance of fish. It is a question if the boxes are large whether the weight does not injure the fish, the fish at the top pressing too heavily on those at the bottom.
833. Would you favour the gutting of fish in the waters where they are caught? I think it would be an improvement for the same reason that if you kill a bullock and let him lie with his offal he will go bad very much quicker than if the gut is taken out of him. It stands to reason that if the fish were gutted they would keep much better. I think it would be very beneficial. Certainly not gut and clean them in the filthy water they are in the habit of using now.
834. Have you read our Report? No, I have not; I gave my copy of the Report to Mr. Brown so that he might read it up.

J. McElhone, Esq., M.P. 25 Sept., 1895.

Mr. John Thomas Taylor, fisherman, Woolloomooloo, sworn and examined:—

835. *President.*] What is your name? John Thomas Taylor.
835½. What are you by profession? A fisherman.
836. How long have you followed the profession of a fisherman? It will be seven years in December next.
837. Are you directly connected with the industry? Yes, I am, and have been making my living at it for the last seven years, both deep-sea and net fishing.
838. Where have you carried on your operations? From Cape Hawke down to Botany.
839. Do you superintend the sale of your own fish? I have been doing so; sometimes I have employed a man there. Lately I have been in the market myself, for the last two or three years.
840. Have you entrusted your consignments to agents at any time to sell for you? I have.
841. Did you find your transactions satisfactory? So far as the agents were concerned, but not so far as the fish being delivered from the railway station to the markets.
842. Something occurred that was an injury to you? Yes, the loss of fish.
843. You think they were stolen? I am sure of it; I have had them stolen off the train I have been on myself, between the Hawkesbury and Sydney.
844. In sending your fish to market, do you always see that they are fresh? Yes; I always endeavour to send them as fresh as possible.
845. Have you ever had fish condemned in the market? I have; that has been the two days' fish, when we could not make the port at night, and could not catch a train to send them on by.
846. Have you ever had any fish that could be said to be fresh condemned? I have.
847. Have you had an opportunity of witnessing the operations at the market? Every opportunity.
848. Have you ever seen unsound fish sold there? No later than this morning fish was sold there that was not fit to be given to a pig—fish that had been in the ice-house two or three times.
849. Do you think the inspectors or auctioneers are aware of this? Certainly they are; there are favourites in the market—some men can do as they please.
850. Do you think there is a ring in existence there? I am certain that there is.
851. Do you think the fisherman gets a fair amount for the product of his labour, compared with what the public have to pay? There are certain members of that market that never need to look, they simply have to raise their hats and they can get what they want.
852. There appears to be a reign of terrorism existing? There has been for the last two years, and when I started to break it they began to seize my fish. Seymour threatened to have me put out of the market because I wanted to break this ring. There was no chance of competing against Chinnery; I can fetch fifty buyers to prove what I say is true. I have seen Seymour pass through the market and pass fish on the floor that Baker has refused to sell on account of their being undersized. The fish belonged to Duncan,

Mr. J. T. Taylor. 25 Sept., 1895.

Mr. J. T. Taylor. 25 Sept., 1895.

thirty or forty lots of trumpeter whiting. They were passed by Seymour as being full-sized and up to weight, and sold by Seymour, and after they were sold they were seized by Baker as being undersized, and they were shovelled up and taken away, and at the same time the same sort of fish were being sold at the opposite side of the market.

853. Have you ever heard of officials and others getting their fish for nothing? They have got them for nothing.

854. Do you think there is truth in the statement that the fishermen are robbed right and left? They are; there is no doubt about it. I have had to pay a man to sit on my cart to see that the fish were all right.

855. Do you think there is need for reform in connection with the market? I think the whole staff in the market should be put out, and that Seymour has no right to be an inspector, as he does not give fair play. If he sees one small fish in a lot, he whistles for the man to take them away. He has weighed fish when Mulhall has said they were up to weight.

856. Do you approve of the way in which the fish are exhibited for sale? No, I do not; they are stolen, trodden on, and you see men spitting chews of tobacco on the floor, and when it is emptied they spit over it again when it is being washed down.

857. Do you think the system of raised tables would be better? Yes; the accommodation at the Redfern market is much superior to that at Woolloomooloo.

858. Would you advocate that the fisherman should be allowed to sell his own fish? Yes.

859. Would you approve of a central market being established where it would be accessible by rail, road, and water? Certainly; somewhere round by Darling Harbour would be better.

860. And would you have that institution carried on under Governmental control, and do away with the municipal authority in connection with the market altogether? Yes; there is too much favour shown under the present system. A friend of the auctioneers will go down, and there may be a choice lot of fish not big enough for a heap, and they say, "Here you are, sir; a shilling," which lot would bring 3s. or 4s. if sold by auction.

861. So that you maintain there is great favouritism shown at the Woolloomoolo Market? I do indeed.

862. Have you ever met Mr. McElhone at the market? I have, and I gave evidence in the case tried at the Metropolitan District Court. I was in the market on the morning when he raised the question as to the fish being fit to eat; I was present on that occasion.

863. Actually, although it is said Lynch knew the fish were rotten, he was trying to sell them? Yes; at 6d. per lot.

864. And if sold they would have gone into human consumption? Some were sold and brought back; when they took them out to wash them they found they were rotten.

865. Have you noticed Mr. McElhone there on any other occasions? Yes, on several occasions. The market worked fairly well for a little while after Mr. McElhone's action in the matter, but has gone back to its old form again, there being no one to take an interest in it.

866. As to the gutting and cleaning of the fish in the market, do you think matters are satisfactory in this respect? With the exception of the water. I do not know how far that comes from the Bay. It looks clear when it comes into the market.

867. Would you approve of the establishment of what might be termed auxiliary markets? Yes; that is what is wanted—some places where they would have a cool store, and where a person could get a little fresh fish at any time during the day.

868. Do you approve of the market being kept open all day for the sale of fish? Yes, I do.

869. As to the market dues, do you think they should be modified? Yes; they are excessive—1s. in the pound.

870. Are you aware that a committee of the City Council have been sitting and investigating matters in connection with the markets? Yes; I gave evidence before them. I was there three days.

871. Do you know if anything has been done? I never heard anything about it.

872. Have you ever heard of certain aldermen and other people in authority getting fish sent to them by officials of the market without payment? Yes; I know one gentleman who had some fish brought him, and he asked what the price was, and he was told, "Oh, nothing to you;" and he said, "Do not bring any more." It is a common thing to see officials away from the market on a Friday morning. They go away with little baskets of fish, and if you look the books up I do not think you will find that they bought any fish.

873. Have you used the ice-house? Yes.

874. Did you ever suffer any loss by your fish being stolen? Yes, I had schnapper stolen out of the old ice-house. I put eighty-nine schnapper in and got a receipt, and when I came for them on the Monday morning I found nine gone; this was before the new cage was put up. A man named Beer was in charge at the time. I was cautioned by Mr. Kelly to go and see if my fish were all right. I asked him why, and he told me there were some missing: I said I had a receipt. There was only the one man who had charge of the key at the time, and he was the engine-man named Beer. I afterwards wrote to the Town Council about it, and they replied that they could not do anything in the matter. I afterwards received a letter; where it came from I do not know. It contained £2, and I let the matter drop. I do not know where that letter came from, but have formed my own conclusions on the subject, and have let the matter drop. There was a little ring there who used to send fish to the country. Two of the men having a good deal to do with this ring business were Beer, already mentioned, and a man called Dutchy, or Curly Scotty. I think they are broken up now. The one was an engine driver, and the other a "bummaree."

875. Is there any truth in the statement that fishermen are robbed by the best of the fish being picked out and sent away to the country, and the balance being sold, and on the basis of what the balance brings a return is sent back to the fishermen? I cannot say that is done by the agents. There were men in the market who used to do this. I sent up thirty or forty baskets of fish from Cape Hawke, and put them in the ice-house, and Mrs. Smith saw Dutchy coming out with three or four baskets of blue-nosed whiting, and asked him who the fish belonged to. He made reply that "they belonged to some bugger named Taylor at Cape Hawke." She told me about it afterwards and said she would swear to the truth of the statement.

876. Do you use ice? Yes, when sending from Cape Hawke.

877. Does that keep them well? I have packed fish that have been eight days in the ice and they have been sold fresh. As you shoot along the lake it is best to let the fish lie on the grass and stiffen and

then

Mr. J. T. Taylor. 25 Sept., 1895.

then pack them in ice. It is the dirt and filth that spoils them. If you throw a great quantity into the boat and let them lie they naturally go bad. I have had cases expressly made for my fish for which I paid £2 10s. There is an inside box that will hold about four baskets, with sawdust between the two boxes, and they are screwed down by an iron bar along the top, keeping them air-tight, and I find that they keep well for a long time.

878. Do you think it would ensure a more ready sale if the fish were gutted? I do not see how you can manage it.

879. But if the fisherman received an advance in the price? I do not think it would do. If you had to send them by rail you would not have time to gut them, as it takes some time to gut twenty or thirty baskets of fish, and apart from this I do not think the necessary care is taken as a rule, as I have seen fishermen gutting for salting, and they cut and split the fish about anyhow. I cannot see anything better than good ice boxes or a cool chamber in the steamer if they come from a distance.

880. Is it not desirable to get rid of the conveyance of all this offal and entrails? I do not know how you would manage it. If you had well-boats they would have to go up the rivers into deep water, some places where you haul you could not get a steamer. At Cape Hawke you could not get it within 3 miles of where you land your fish.

881. Have you heard anything of the new patent discovered for preserving fish in a sound condition? No.

882. Do you think if something were discovered that would keep fish in good condition it would be a good thing for fishermen? It would; it would open up waters you cannot go near now. There is any amount of good fish south.

883. *Mr. Thompson.*] If the fishermen sold their own fish that would break up the ring, would it not? The reason that they do not sell their own fish is that they would have to credit some people till the following morning, and they could not wait.

884. We do not mean an agent but a partner desirous of getting as good a price as yourselves? That would break up the ring. The only thing is about getting the cash. If you sell them to an agent he is not allowed to sell them.

885. We know that? I am not allowed to sell a fish on my floor. I am threatened that I will be summoned if a heap is missing; but on the opposite side they are allowed to do it.

886. You would recommend it? Yes; let every man sell his own fish.

887. You mentioned several malpractices on the part of the officials? Yes; that is why they hunted me out of the market, through trying to break this ring up. I have reported it to Seymour and Baker.

888. Have you reported it to the Town Hall officials? Yes; I brought one of them, an auctioneer, before the Mayor.

889. What was the result? They asked if I wished him dismissed and I said I wanted him kept in his place.

890. Are you a licensed fisherman? Yes.

891. Are the fish brought straight away from the carts into the market, or are they inspected first? They are brought direct to the market, and supposed to be inspected there.

892. Are the market officials supposed to inspect the fish before submitting them for sale? Yes.

893. Then they neglect that duty? You will sometimes see Mr. Seymour walk round the market. He generally inspects his fish when selling them, and if you have a word with him he generally condemns your fish. The fishermen are afraid of him.

894. Do you approve of the present baskets that are used? No, they are too large. Latterly I have got half baskets about 10 inches deep.

895. Would you recommend a rectangular shallow box? A box would do, if you could get the draught through it.

896. Suppose it was made on a galvanised iron frame? That would do, if not more than 6 inches, on account of the weight.

897. So as to avoid the superincumbent weight? I am sure that would do; I have tested it, and they are no extra expense for carriage.

898. Have you found your fish stolen on the way to the market? I have; I have had my fish numbered, and when I have come to count them I have found several deficient.

899. Would that be overcome by having locked boxes? Yes.

900. You will be pleased to know that this Commission have recommended the use of locked boxes? I am pleased to hear that.

WEDNESDAY, 9 OCTOBER, 1895.

[*The Commission met at the Offices, Bligh-street, at 11 a.m.*]

Present:—

FRANK FARNELL, Esq., M.P., President.

L. G. THOMPSON, Esq., J.P.

Mr. Alfred Brown, 26 Brougham-street, Sydney, sworn and examined:—

Mr. A. Brown. 9 Oct., 1895.

901. *President.*] What is your trade or calling, Mr. Brown? I am a plumber by trade.

902. Where do you reside? No. 26, Brougham-street, Sydney.

903. Is your residence situated conveniently to the Woolloomooloo Market? Yes; it is no distance from the markets.

904. How long have you lived there? About twelve years.

905. Have you taken an interest in the fishing industry at all? Yes, I have.

906. Would you term yourself an experienced amateur fisherman? Yes, I would.

907. Have you a knowledge of our coastal fisheries? Yes.

908. During the time you have been residing at Brougham-street, have you had an opportunity of witnessing the manner in which the sales have been conducted at the Woolloomooloo Market? Yes, I have.

909. In the first place, do you think the Woolloomooloo Market is centrally situated? Well, it is; I think it is about as good a place as they could have, unless they could get it nearer the water—that is the only thing.

910.

Mr. A. Brown. 9 Oct., 1895.

910. Do you think that establishing a market on a site that would be accessible by road, rail, and water would be better? Yes; that would indeed be much better.
911. Do you know the officials connected with the Woolloomooloo Market? I do.
912. Have they held their appointments long? Lynch and Baker have held their appointments some time, and Seymour has been there ever since I can remember.
913. Have you attended any of the early morning sales? Yes.
914. Have you ever met Mr. McElhone there? I took him there first; I went for him.
915. What was the object of your taking him there? He wished to have a look at the fish in the markets on a sale morning, and the best morning for that purpose being on a Friday I called for him at 5 o'clock, and took him down.
916. Did both of you witness the sales that morning? Yes.
917. Can you tell us the date on which you visited the market? I cannot remember the date just now.
918. Was Mr. McElhone satisfied with what he saw on that occasion? Very well satisfied.
919. In what respect? That the fish market is not carried on properly, and the best part of the fish is not fit to be sold.
920. Did you arrive at the same conclusion as Mr. McElhone? Yes.
921. Have you noticed the treatment of the consignments of fish when they are about to be sold? Yes; the fish is thrown on the floor; they are fetched in in the baskets and emptied out in heaps.
922. Do you approve of the system of throwing the fish on the floor? No; I do not.
923. Do you think, by exposing them for sale in that way, they are liable to be trodden and spat upon? Certainly they are.
924. Have you seen that done? Yes.
925. Do you think any fish are stolen from the heaps? Yes; I have seen it done. I remember a man getting fourteen days for stealing fish. I was standing close by him when it happened; he kicked the fish along with his foot into the gutter, and went and picked it up; and one of the men saw him and gave him in charge.
926. Do you think it would do away with a number of complaints and grievances of the fishermen and the general public, if a system of raised tables was established? Yes; it would. The floor is clean when the first lot goes on it; after the first lot of fish is sold, the crowd of people walk about all over the floor,—some spitting on the floor; others chewing tobacco, and spitting the tobacco juice on the floor; some walking barefooted; and I have actually seen them, myself, blow their noses on the floor,—and this dirt and stuff is allowed to accumulate on the floor, and the next lot of fish is emptied out from the baskets on the top of it. Mr. Fernandez, who is a fish-dealer, would corroborate what I say fully; the system is scandalous and beastly.
927. Have you attended many of the sales in the morning? Yes.
928. Have you noticed, on more than one occasion, that fish unfit for human consumption has been sold? Yes, and the money returned; and then they have been condemned.
929. You think it possible that a quantity of fish unfit for human food has gone into consumption? Yes; I do.
930. Do you think the officials connected with the market carry out their duties satisfactorily? Well no; I do not.
931. Do you think there is any foundation for the statement that the officials work in with the agents? Well, I would not like to say there is a foundation; but it looks very suspicious,—there are two or three men who can buy fish when no other man's bid is taken.
932. Have you noticed that people have been desirous of obtaining certain lots of fish and were prepared to bid higher, and that these lots were knocked down to certain favoured individuals? Yes.
933. Have you ever heard the fishermen complain that they have not received justice at the hands of the auctioneers? Yes, scores of times.
934. Have you ever heard them say they had better hold their tongues or else Mr. Seymour or some other official will have a down on them and condemn their fish? Yes, that is quite right; it has been told me hundreds of times when standing outside the Fish Market.
935. Have you ever heard it stated that Mr. Seymour got his fish supplies for himself and his friends for nothing? We have heard it said that he does. He has knocked fish down to an unknown person named Cashess, whom nobody appears to know, and when they are knocked down in this name, one of the officials would come along and these fish were picked up and taken away.
936. Do you think it possible for the auctioneers to work in with the agents, so that these fish might be knocked down to friends? Yes; certainly.
937. Have you ever heard of consignments of fish coming into the market, and the best being picked out and sent into the country, and the balance being sold? Yes, many a time.
938. Have you ever heard that returns sent to the fishermen would be on the basis of what the inferior fish brought? Yes, and seen the fish picked out and put into another basket for the purpose of being sent away. I have also seen them shake the greater portion of the fish out of the baskets, leaving some at the bottom, and then putting an empty basket in the part-filled one as if it had been completely emptied.
939. By that system the fisherman is robbed? Yes, right and left; if not in that way, they are robbed by people who are waiting an apportunity at the carts—perhaps a basket or two may roll off the cart and there are always men waiting to pick them up.
940. Do you think there are many baskets of fish sent to Sydney which may be in a sound condition, that are in the returns to the fishermen stated to have been condemned? Yes, they adopt all sorts of means.
941. Do you think it would be a desirable thing to have a fish market open all day, instead of having the one sale in the morning? Yes; that was my suggestion at the Town Hall. Fish are sent in from all parts of the lakes and rivers that get here at a certain time, and are carted from the boat to the ice-house, and are left there till the next morning, when a few are put out to try how the sales are, and perhaps twenty or thirty baskets left till the next morning which are going worse and worse all the time. If fish are not in the best of condition coming in they will not go out of the ice-house good; when the fish arrive at the market the sale should be on to get rid of them at the time.
942. Would you favour the proposal that the fishermen should be allowed to come into more direct communication by being allowed to sell their own fish? Yes; I do not see why it should not be done.

I do not think the Corporation should have auctioneers there at all; they can knock the fish down to whom they like, and if the men interfere they are given in charge or put out of the market.
943. Are you aware that most of the fish come by rail? Yes.
944. Do you think it would be a good idea to establish a market—say at Darling Harbour—and have it conducted under Governmental control? That is just what is wanted.
945. Do you believe that in connection with the distribution of fish, it would be a good thing to have auxiliary markets established in the populous suburbs? I do, it would not be a bad idea at all. When the fish are bought at Woolloomooloo they have to cart them out to the suburbs, and the fish won't keep in the warm weather any length of time, especially if they have to be carried any distance.
946. Have you ever noticed the manner in which people treat their fish by placing a wet bag over them? Yes. That turns them worse than anything else; you want to keep fish dry as much as you possibly can; I have told them that before they got to their journey's end their cart would smell; you want to keep a draught through the fish and always keep them dry.
947. Have you noticed the way fish are sent to the market? Yes.
948. Do you approve of the basket system? No, I do not.
949. What would you suggest in place of the basket? Boxes with partitions, with holes of a certain size bored between the partitions, so as to allow a current of air right through—say a box of the same size as a basket—and put bream, whiting or schnapper on shelves to suit, so as to prevent the weight of the top fish from squeezing the fish below, shelves with holes in so as to get the air through the fish, and they would keep, I believe, a day longer. I have tried it at Jervis Bay and it was a success, a brother of mine made the boxes.
950. Have you watched the process of gutting fish in the Woolloomooloo market? Yes.
951. Do you think that satisfactory? No, it is not, for the reason that the water that the gut is washed and cleaned in is pumped back again into the tanks; it is polluted water. And then there is the sewer that runs into Woolloomoolloo Bay; four different sewers run into the Bay, and therefore the water is bad.
952. Is the place of intake near the sewers? No; but the water is affected, you can see it going right round the Bay on a rainy day.
953. Do you think, considering the prices the general public have to pay for fish, and the prices realised by the fishermen for the product of their labour, that the fisherman gets fair remuneration for his labour? No, he does not.
954. Do you think the system of having the market open all day long, and the fisherman to sell his own fish, and if they could bring them gutted to the market, would be better in the interests of the fishermen? It would be a lot better.
955. In connection with the storage of fish which may arrive late for a sale, have you found this practice in vogue, that some of the ice-house fish have been placed amongst the fresh fish in the heap? Yes, and sold.
956. Have you had any experience in well-boat fishing? No, I have not.
957. Do you think if it has proved a success in other parts of the world it is likely to prove a success here? Yes, I do.
958. Do you think some precaution should be taken to prevent the wholesale destruction that has been taking place in the River Murray? Yes.
959. Do you think we could acclimatise several species of the fish in the waters of this Colony? Yes; I think we ought to be able to do so.
960. Have you a knowledge of the deep-sea fisheries? Yes.
961. Where did you fish? All over this coast, right from Twofold Bay to Port Stephens, as far as Cape Hawke.
962. Have you a knowledge of the system of well-boat fishing? Yes; I have a knowledge of it.
963. Do you think if the experiment were tried it would prove a success in regard to the catches which are taken in the deep-sea? Yes, I do.
964. Do you think there is any possibility of trawling being carried out on our coast? Well, on certain places there is, but I do not think it would be a success here, I do not think you would get enough fish along the coast, I do not think you would get any schnapper by trawling, at any rate it would be only rarely that you would get them.
965. Have you, when fishing outside, ever noticed shoals of fish travelling from the north to the south? Yes.
966. Have you ever noticed what they were? No; I generally used to call them pilchards, others call them maray, and some call them sardines, they do not seem to have a proper name. I call them maray myself, I got a lot of them down at Jervis Bay this time, there are tons of them down there. [*The witness was here shown a specimen of the pilchard in possession of the Commission; he stated they were the same sort of fish, but not nearly so large as the specimens.*]
967. Do you think they could be put to some commercial value if we had people with skill and enterprise? I do, indeed.
968. Have you ever seen any whitebait along the coast, and caught any? Yes; once or twice, but very seldom.
969. What sort of fish do you think they are? I cannot tell you.
970. Have you ever caught what is known as the southern herring? I do not think I have. [*The witness was here shown a specimen of the fish in the possession of the Commission, when he said he had caught them in Broken Bay.*]
971. In any quantity? No, not many.
972. You have had an opportunity of coming in contact with the fishermen from time to time? Yes.
973. Have you ever heard them complain of the provisions of the Fisheries Act being harsh? Yes; they have said so.
974. Do you think they require more liberal legislation? Yes; they say it is rather too hard on them.
975. Have you watched the administration of the fisheries at all by the present Fisheries Commission? No; I have not taken much interest in it.
976. You would not be in a position to state whether it is essential to retain that body or make some change in its constitution? There might be a little change, but I cannot see how you can make much change in it.

Mr. A. Brown, 9 Oct., 1895.

977. Do you think it should be part of the person's duty who is administering a law in connection with the fisheries to make himself acquainted with the local circumstances and conditions of the fisheries? Oh yes, but in my opinion, no matter how you made the laws there would still be fishermen who would complain, there are some who are never satisfied; there are always some who would object no matter what was done, some would be for and some against. They are a peculiar lot. I have been a long time with them and could never make head or tail of them. I have had one of the Reports and I read some of the evidence.
978. *Mr. Thompson.*] Have you had any experience in the inland fisheries? No, I have not worked them; but I have seen them catching cod on the Murray. I never had anything to do with them.
979. You are not in a position to form an opinion as to the character of the nets they use? There is a fisherman I know who has made a net for Murray cod.
980. Do you think the nets they use are suitable for the purpose? I think so; but I have not had a great opportunity of judging.
981. Did you notice that the City Council had taken some interest in regard to the way matters were conducted at the Woolloomooloo Market? I gave evidence, I was there four or five hours; but they do not seem to take any steps, I have never heard of any result.
982. You have not heard whether they are going to make any of the suggested alterations? I saw in the paper that they are going to put the tables in the market. They showed me the plans of the tables and asked me if I approved of them, either of slate or marble. I told them it would be the finest thing that ever happened, as it would give everybody a chance of seeing what they were buying, and would do away with the dirty, filthy state the fish now get into by being laid on the floor.

TUESDAY, 5 NOVEMBER, 1895.

[*The Commission met at the Offices, Bligh-street, at* 11 *a.m.*]

Present:—

FRANK FARNELL, Esq., M.P., President.

L. G. THOMPSON, Esq., J.P.

Henry Joseph Daniels, Esq., Town Clerk, Sydney, sworn and examined:—

H. J. Daniels, Esq. 5 Nov., 1895.

983. *President.*] Your name is Henry Joseph Daniels, and you are the Town Clerk of Sydney? Yes.
984. You have held that position for a considerable time? For about ten years.
985. Can you inform the Commission what action the Municipal Council has taken in respect to a further improvement of the accommodation at the Woolloomooloo Fish Market? Yes, so far as passing a resolution and accepting designs of marble tables for the display of the fish.
986. Raised tables? Yes. A specimen wooden table has been submitted to the dealers, it is slightly different to what the adopted design was; the adopted design was a flat slab with a small platform running along it. In consequence of the salesmen representing that they preferred sloping tables, with divisions about every 2 feet or so apart, the Mayor has authorised that in calling for tenders there should be alternative tenders of our adopted plan and the one the fish-dealers require, so that will have to be settled on the acceptance of the tenders, which close on Thursday week, and the matter will then most probably be decided.
987. Is the Municipal Council of Sydney going to do anything in regard to an alteration of the system of selling the fish in the market? Yes; the Council have passed a resolution to the effect that it is expedient to do away with the custom of the city officers acting as auctioneers, and that the method of charging the percentage by our auctioneers be done away with, and that dues be charged for all fish brought into the market for sale, the said fish to be disposed of by auctioneers to be approved of by the Council. These regulations are to come into force as soon as possible after, but not before, the first day of next year, that is pending the sanction and adoption of the by-laws by the Executive; but I am afraid we shall not be in a position to start on the first of the next year.
988. This new system would practically allow the fishermen to sell their own fish in the market? So long as it is sold by authorised auctioneers.
989. Has the Council recommended more than the one sale a day? No; they are against more than the one sale.
990. It is proposed to continue the present system? Just the wholesale auction sales in the morning. We did open the market once, and it was found to be a failure selling fish at any time it came in; it was quite a failure.
991. There was a committee appointed consisting of Aldermen of the City Council, and I understand they took evidence and made certain recommendations—are those the recommendations which you have stated that they have made? Yes.
992. Have you, as Town Clerk, ever had any complaints brought under your notice of the unsatisfactory manner in which matters are conducted at the market? Only by Mr. McElhone, and an occasional grievance from an agent, but not from the fishermen; I mean to say that an agent might grumble about the space allotted to him, or something of that kind.
993. Where does the water supply come from that is used in cleaning and gutting the fish? Nearly three-quarters of a mile from the market, right from the other side of Foley's Baths, between the baths and the rowing-shed. I asked the City Surveyor what distance it was, and he said it was quite half a mile from the market.
994. Is it proposed to reduce the charges at all in the markets? That is a thing to be arranged, it is not a matter of reducing the charges; the question is to see what is the lowest we can charge. We used to charge 5 per cent. commission, and the agents another 5 per cent. commission; now I want to embody in the by-laws an equitable charge for dues somewhat similar to the system that obtains at Melbourne.
995. How many auctioneers have you at the present time? Three.
996. Is Mr. Seymour one of them? Yes; he is the chief auctioneer.
997. *Mr. Thompson.*] You are aware of the system adopted in Tasmania as to market dues? They sell on the wharf, do they not?
998. No; they have a market, and the fishermen sell, and they pay 6d. or 1s., according to the size of their

their boat? I wish you gentlemen to understand that as I am speaking about matters that are under consideration, I am not in a position to speak fully on the subject until the resolutions and recommendations are adopted by the Council and made public. H. J. Daniels, Esq. 5 Nov., 1895.

Mr. John Edward Chinnery, fishmonger, Hunter-street, Sydney, sworn and examined.

999. *President.*] What is your name? John Edward Chinnery.
1000. What are you? A fishmonger.
1001. How long have you been engaged in that occupation? For twenty-three years.
1002. Have you had a good opportunity of gaining a thorough insight into the fisheries laws as well as into the operations at the fish markets? Yes. Mr. J. E. Chinnery. 5 Nov., 1895.
1003. How long have you been purchasing fish at the Woolloomooloo Markets? For about twelve years.
1004. Were you actively engaged in the fishing industry before that? Yes.
1005. Have you ever purchased any fish from the Redfern Market? Yes.
1006. Have you been satisfied with the manner in which the business of the Woolloomooloo Market has been conducted? Yes, perfectly satisfied.
1007. Do you think some improvement in the way of displaying the fish, in the way of having raised tables, might be effected at the Woolloomooloo Market? Yes, I think it could; but I do not think they would answer, that is, the tables.
1008. Why? Because there would not be room and there would be a lot of time wasted, and they would not get through with the work.
1009. Provided there was room? Yes, provided there was. My own idea was to have the middle of the floor raised in squares, raised up off where the people walk, and to have a passage through.
1010. Would not that be a kind of table? The tables they have got in the market now I believe will never do; they have a sample table there. If they had the little squares I have referred to the people could walk round and would not be allowed to go on them. The table they have got there is about 3 feet square, divided like a fruit stall, it slopes, and along the middle of it the auctioneer has to walk.
1011. Would it be a good idea to allow the fishermen to sell their own fish? Yes, I think so; but how could those who cannot get to Sydney sell their fish?
1012. I mean one of their own body, so as to do away with the compulsion that at present exists of their having to pass it through an agent and a municipal auctioneer, the fishermen to appoint their own auctioneer, do you think that would be better? I do not think so.
1013. Do you think the municipal authorities conduct the sales so satisfactorily that they should be continued? Yes.
1014. Have you ever heard the fishermen complain that the agents get the bulk of the results of the sales of their fish? Yes, ever since I have been there; they are always complaining, they are never satisfied, and they get a better price now for their fish than they ever got.
1015. Do you purchase largely? Yes.
1016. In public competition with other people? Yes.
1017. Have you known of cases where a consignment of fish has been put up for sale and knocked down to a fishmonger, when there were people standing by prepared to give a higher price for it? No, not at all; they grumble after it is gone, and they could not get in.
1018. Have you ever heard it stated that there was a ring, and that this ring could use the municipal auctioneers as they like? No, I never heard it.
1019. Do you know that such a thing exists? No, I do not; I think the buyers are cutting one another's throat; it is all the other way.
1020. Have you heard of the municipal officers—the auctioneers—selling fish on their own account? Never.
1021. Have you ever heard of the agents selecting the best fish out of a consignment belonging to a fisherman and sending them to the country, and giving no credit to the fishermen for them? Never.
1022. Do you think the fishermen get a fair price for the fish compared with the labour they have to undergo? I think they get an exorbitant price at times, and a fair price for fish in any way fresh or good.
1023. With reference to the consignments of fish, are they not placed in heaps upon the floor to be displayed before being sold? Yes.
1024. Have you ever seen people treading on them, or spitting on them? Not spitting on them; they cannot help treading on them at times, there being no space for them to walk between the heaps.
1025. You have mentioned that when fish is received fresh the fishermen obtain a good price; have you ever known unsound fish to come into the market? Yes.
1026. Have you ever known it to be sold? No; I have bought schnapper which I have thought fresh, but when opened have found them to be rotten in the guts, and all the other parts good; bream, too, and mullet, in the same condition; blackfish as well.
1027. And do you not know of cases where auctioneers have sold stinking fish, and have had the fish returned, and refunded the money? They have sold me bad fish, and I have returned it, and got the money back again. I have bought it thinking it good, and when opened it stank awfully; you cannot tell until you have opened it.
1028. I understand there is only one sale a day at the market; do you approve of that;—or do you advise having two sales, or having the market open all day? I think one sale is enough. They used to have it open all day long, and it did not answer; they used to have sales and sell fish all day long.
1029. Do you think it would be a good thing to allow of another sale—say at 10 o'clock in the morning—so as to dispose of the consignments of fish that may arrive too late for the first sale? Yes; I think it would be a good idea.
1030. Do you think the Woolloomooloo Market is centrally situated? Yes, I think so.
1031. How does most of the fish come to the market? By rail.
1032. Do you not think it would be an advantage to have as little handling as possible in connection with the fish? Yes, the less they are handled the better.
1033. Would it not be a good thing to have a market established to which access could be gained by rail, road, and water? Yes, it would not be a bad thing; it would be better, I think.
1034. As to the market dues which are at present charged, do you think them excessive? I think they pay 2s. in the £. I do not think they charge too much. 1035.

Mr. J. E. Chinnery. 5 Nov., 1895.

1035. Do not a number of hawkers frequent the market? Yes.
1036. Do you think it is possible for the agents to work in with the hawkers and so deprive the fishermen of much that should belong to them? I do not think so. I could not say what the agent does; I could not say anything about him.
1037. How many other fishmongers are there besides yourself that attend at the market? Some mornings there are a couple of hundred there.
1038. And all have the same right to purchase as yourself? Yes, every one of them, everybody has as much right to purchase fish as I have.
1039. Do you know of any occasion when the auctioneers have been guilty of favouritism in regard to the purchase of fish by public auction? No, I do not. On one occasion a fisherman grumbled about my taking his teraglin; they were put up for sale by Mr. Baker, and somebody bid 1s. 3d. for a large one. Baker said "I am selling the whole lot and I am offered a shilling for each of them"; there was a bid of 1s. 3d. given for one; he said "1s. each for the lot, will anyone give more than 19s. for the lot"; nobody bid except myself and he knocked them down to me. The man grumbled about the way his fish were sold and I told Baker to sell them again, and he said all right. The ring stood round again; he sold the big one for 1s. 3d., and the others were not bid for; I said, "Can't you get a bid," he answered "No"—there were about fifty standing round—I said, "I will give you 6d. each now"; there was no advance. Baker asked if there was any advance, and he knocked them down to me and I got all the other lot for 6d. when I was previously giving 1s. each for them.
1040. *Mr. Thompson.*] Could you multiply instances of this kind? Yes, the auctioneer knows he could get more off me for the whole of those fish than he could by selling the man an individual fish, the man only wanted one fish. I got all the others for 6d. each after they were knocked down to me for 1s. each; I think he lost 9s. over that transaction. Brown came one morning and wanted a big schnapper, and they were knocked down to me because I took the lot. If the auctioneers are not working in the fisherman's interest in disposing of the fish in this manner, I do not know what is in their interest. The fishermen never got such a price as they get now.
1041. You say the fishermen get satisfactory prices for their fish? It is knocked down at a good price; I do not know whether they get the money.
1042. Are you aware the returns sent in to them frequently bring them in debt to the auctioners? Their fish are bad then and not saleable. If they go into the ice-house they are not worth much. On Saturday morning there was a nice lot of jewfish and the man was offered 1s. a piece for them and they were put into the ice-house and I got them for 9d. on Monday morning.
1043. Then, in your opinion, poor returns are wholly due to the fish being in bad condition? Yes, if the fish is right they get a good price for it.
1044. Do you not think the market dues are a little too much? No, I do not think they pay too much—1s. in the £. I think the agent ought to do it for a little less.
1045. What do you think would be a fair charge for the agent to make? I think if they got 2½ per cent. it would be a fair thing; but I do not know how the agents do it, there must be something wrong with them. When they have good fish they get a fair price for it.
1046. This 5 per cent. commission is on the value of the amount the fish brings? Yes, I think it is 2s. in the £; 1s. to the market, and 1s. to the agent.
1047. You think the sales are fairly conducted and that no favouritism is shown? No; the apparent favouritism is only a bit of jealousy.
1048. About the tables, this is an end view of the tables (*exhibiting a rough sketch*)? Yes, something like an enlarged school desk, the auctioneer walks along the centre of the sloped table, they are divided and are about 3 feet square; the auctioneer stands on the platform above them and offers each lot, and so on right to the end.
1049. Do you not think it is a very much easier matter when the fish are sold in that way for the fishermen just to sweep them off into the basket than to pick them up one by one? It would be a much easier arrangement.
1050. You mentioned that they could not get through the business with this system if it was adopted, why is that; if the tables were properly disposed where would be the difficulty? You cannot all stand round one small table.
1051. You have different auctioneers selling at different parts of the market? Yes.
1052. If there were a sufficient number of auctioneers the difficulty would be disposed of? Yes.
1053. Then, in that view of the case the tables would be an improvement? I think the little low slabs would be a better one.
1054. My idea of these tables is that they should be 60 or 80 feet long? They are placed in between the pillars of the market.
1055. Then they cannot be anything like 80 feet long? No, they are about 12 feet long, and a dozen people round them would smother them up; in my opinion if they had these little squares with a passage running between would answer better.
1056. Would it not be better to have tables, say, 50 to 80 feet long, running right along the market? The tables they have got now—12 feet long—will never answer; it is absurd.
1057. Are private purchasers allowed to obtain fish in the market? Yes, as much as I am; they can go and buy a heap of fish as well I can.
1058. If the fish are put out in large quantities would not that prevent the private purchaser from buying fish, he would not want such a large quantity? The way they put the fish out is in little heaps of half a dozen flat-head or bream, one schnapper, and one jewfish. I have bought them about 3 lb. in a heap, fetching 2d. at a time.
1059. You would not allow the fishermen to dispose of the fish in quantities? Well, that is as he likes; I think it would be more to his advantage to have them in big heaps.
1060. Would not that be in favour of the large purchaser? I do not think so, if a private buyer comes down he ought to be able to buy 10 lb. of fish and whack them between two or three; I have bought 3 lb. of fish for 2d. a heap. I think they ought to make their heaps a little better than they do. The fishermen say they will not put their fish on the tables; if you get twelve people round them there is no room, and sometimes you get 200 people standing round. There is only one table, a sample, made of wood.

WEDNESDAY,

WEDNESDAY, 6 NOVEMBER, 1895.

[*The Commission met at the Offices, Bligh-street, at* 11 *a.m.*]

Present:—

FRANK FARNELL, Esq., M.P., President.

L. G. THOMPSON, Esq., J.P.

Mr. Richard Seymour, Inspector of Nuisances for the City of Sydney, sworn and examined:—

Mr. R. Seymour. 6 Nov., 1895.

1061. *President.*] Your name is Richard Seymour—what position do you occupy? Inspector of Nuisances for the City of Sydney, and salesman for the Eastern Fish Market, Woolloomooloo.
1062. How long have you held the respective positions? I have been Inspector of Nuisances since 1862, and salesman at the Woolloomooloo Market for twenty-three years; previous to that I was for seven years inspecting fish on the wharfs, which makes thirty years in all.
1063. Does the Municipal Council of Sydney pay you a salary? Yes; they do.
1064. Are you not also an Inspector of Fisheries under the Fisheries Act of 1881? A sub-inspector.
1065. Do you receive a salary for that? Yes; £50 a year.
1066. How long have you held that position? Since shortly after the appointment of the Commission.
1067. You have acted as salesman on behalf of the Municipal Council of Sydney for a number of years? Yes; twenty-three years.
1068. In that case you have been a very long time attending at the Woolloomooloo Fish Market? I never missed a morning until during the time of my sickness, and when for three weeks I went to Melbourne for the Railway Department, and the three weeks I was away inspecting on behalf of the City Council for the City of Melbourne, inspecting sanitary arrangements in New South Wales, Victoria, and Tasmania. When I returned I handed in a report of my inspection to the Municipal Council and the Railway Department.
1069. Are there any other gentlemen besides yourself acting as auctioneers on behalf of the Municipal Council? There are two others—Mr. Baker and Mr. Lynch.
1070. What is the mode of procedure from the time the fish enter the market to the time they get into the hands of the public? When they come to the market—the first lot generally comes from the steamers, the second from the railway—they are brought in in baskets—80 or 90 lb. baskets, and 35 to 40 lb. baskets, adopted recently—they are brought into the market and emptied out on the floor, and each auctioneer goes round and inspects the fish he has to sell. Before the sale I go round with the clerk of the market, and inspect all the fish I can possibly see on the floor. Of course you will understand I cannot see the fish that is in the baskets; the auctioneer has to judge of that as he goes along.
1071. What originated the adoption of the smaller baskets? I have been advocating the adoption of the smaller baskets for years—ever since I went to Melbourne, in 1880. I saw they were sold in small baskets there, and I thought it much better than using the large ones; the fish are too much confined in the large baskets.
1072. And after the fish have arrived at the market, are they displayed for sale by being placed in heaps on the floor? Yes; they are.
1073. What is generally the size of the heaps? Generally, five or six heaps to a large basket; small baskets, three to four heaps, sometimes five heaps.
1074. Is it any part of your duty to see that the floor is perfectly clean before the fish are emptied out on it? It is; and the market is washed down by hose. There are two men kept for nothing else, and it is washed as clean as the table here every day of the week, except Sunday, on which day it is not used.
1075. Do you approve of the system by which fish are displayed at the market? I do not.
1076. Would you approve of raised tables being substituted? That is going to be adopted now—tables with marble slabs, and the fish is to be sold in baskets; no fish is to be exposed for sale on the floor at all, or sold off the floor.
1077. Have you had occasion during your term of office to condemn much fish? Some thousands of bushels.
1078. Would that be from the fact of the fish having been caught at a distance away from Sydney, that would not allow of them arriving fresh at the market? Yes; fish that is caught in the summer months at Cape Hawke, Port Stephens, and the distant fishing-grounds. In the summer they come in, and sometimes it is almost as much as you can do to sell them, and at other times they come in in a very bad condition; and that is how it is fish is condemned continually. My opinion is—if you will permit me to say so—that if the home fisheries were shut in the winter, and opened in the summer months, the public would have a better chance of getting a good fish supply, because in the winter they could go further from home to get fish; in the winter, the fish from Cape Hawke comes in in splendid condition.
1079. You do not mean all the waters in the home division to be thrown open; you would have due regard to the nurseries? I should not allow the nurseries to be opened under any consideration.
1080. You would give the fishermen more extensive waters in the home division than they have now? Yes; in the summer months.
1081. I think you mentioned that it was difficult for you to ascertain whether fish were in a fresh condition or not when in the baskets? It is.
1082. Is it if the fish is exposed for sale on the floor? Whether it is exposed for sale on the floor, or emptied on the tables, the fishermen, as a rule, will put the best of the fish on the top of the basket, while the fish at the bottom I have found in many instances very bad.
1083. Would not the use of the large baskets be a means of causing the fish at the bottom to become bad in condition? Certainly it would.
1084. Do you think it would be better to adopt the system of conveying fish in cases, so as to prevent it? I do not approve of the manner in which cases come to the market at the present time—there is no ventilation; if there were it would be well.
1085. Would you approve of the use of boxes made of galvanized wire on an iron frame? Yes; there would then be a chance for the air to get round the fish.
1086. Is the ice-house availed of to any extent by the fishermen? Yes, it is; it is a cooling chamber.

Mr. R. Seymour. 6 Nov., 1895.

1087. Do you know whether it is possible that fish in a bad condition has been placed in the ice-house, and that it has been sold a day or two afterwards, and when it has regained its normal condition the fish has been found to be bad? It has been so, and the fish was condemned.
1088. Has it been the practice of some of the agents to mix the ice-house fish with the fresh fish and sell them in heaps? I have never seen it.
1089. Could it be done without your knowledge? It could; the fish that goes into the ice-house comes into the market between 11 o'clock and 11.30; we do not see that; the clerk of the market has instructions to inspect that fish.
1090. Would he be under the same disadvantages as yourself in regard to the fish at the bottom of the baskets which might be bad? Yes.
1091. Would this state of things—the ice-house fish being sold with the fresh fish—account for any of the complaints that have been made of unsound fish being sold in the market? Of course it would.
1092. Have you, on any occasion, knowingly sold fish that were unsound? No, not knowingly; I have, on several occasions, found fish topped over with good fish, and when picked up the bottom ones were bad, and they were seized and condemned.
1093. If consignments of fish have been sold and have been found to be unsound afterwards, and application has been made to you for a refund of the amount which has been paid for the unsound fish, has it been refunded? In such cases where anyone has spoken to me, I have gone to the agent and seen the money refunded.
1094. Has it happened on any occasion that anyone has complained to you of putrid fish having been sold, or of its being in the market, and you have refused to take any notice of the complaint? I never refused to take any notice of a complaint. I know one agent there in March who wished a lot of mullet condemned and it was sound; the agent was Mr. Fitzgerald, and the men—the large buyers—standing round said the fish were sound and they bought them; and in another instance where a man said he bought fish in the market, in the morning, early, and none of us remembered seeing him in the market that morning. He came in about 8 o'clock, I was not there; he said he bought the fish from Mr. Augustus. Augustus said, "you bought no fish from me"; the man said he did, and paid him 4s. for it. The matter was referred to Mr. Baker, who stated he never saw the man there that morning; he is a remarkable man, we call him "drunken Sam"; he afterwards said Augustus said the fish were sold and he gave him 3s. instead of 4s. Fish is sometimes bought at other places and brought to our market, and they say we sold it.
1095. Would that person, Augustus, whom you have mentioned, be the man who took action against Mr. McElhone? Yes; the same.
1096. Have you ever seen Mr. McElhone at the Woolloomooloo Markets? Not since the election for the House; he was there repeatedly previous to that; but since he got his seat in Parliament I have not seen him.
1097. Did he, on any occasion, bring under your notice the fact of putrid fish being sold in the market? Yes; on one occasion a morwong, and also some fish sold by Mr. Lynch and which when pointed out Mr. Lynch condemned them. I was called down by McElhone to see the fish, and I said they were not fit for sale and Mr. Lynch said, "I have condemned the fish Mr. Seymour," so I replied, "I have nothing more to do with them if you have condemned them." We had an officer going round the market at the time watching all the fish that were put out.
1098. By the mode of displaying the fish are they liable to be trodden and spat upon? They are liable to be trodden upon, but we do not allow any smoking in the market during the sales; if we catch them spitting we summon them.
1099. Do you not think it is likely that the contention of some of the fishermen could be borne out, that owing to the manner in which the fish are placed on the floor in heaps, that several fish are stolen from them? There is no doubt of it, we have prosecuted people for stealing fish, especially on the Friday mornings; they come down in a gang and a man will stand in the front and kick the fish out. They have stolen fish from Chinnery and several others.
1100. Have you heard of the fishermen complaining that they have lost fish either in transit or at the market? I have; I have inspected baskets and boxes repeatedly, and they are supposed to contain a basket or box full, and I have found them not half full in many instances.
1101. How does most of the fish come from the fishing grounds? Mostly by the railway, excepting that from Cape Hawke and Ulladulla and those places; from the Clarence River they come by water.
1102. Would you consider the Woolloomooloo Market centrally situated for all purposes? I consider it in a good position for a wholesale market but not for a retail market. I may mention that there is going to be a retail market established in the new market in George-street, there is provision made for it.
1103. Do you not think that as most of the fish comes by rail it would be advisable to have a market which would be accessible not only by rail, but by road and water, if possible? Yes; I think myself the present one may do for a wholesale but not for a retail market.
1104. Would it be a good idea to have what they call auxiliary markets established in the different suburbs for the distribution of fish? We have two now in Redfern.
1105. In regard to the sales at the Woolloomooloo Market, what time do you start? At half-past 5 sharp.
1106. Winter and summer? In the summer at a quarter to 6, as sometimes we have not got three buyers in the market and it is no good going on. In the winter, we begin at half-past 5 sharp.
1107. I take it the suggestion to commence earlier would be to give more time to have the fish distributed during the cool part of the day? During the morning.
1108. I think you said the ice-house was availed of for the purpose of storing the fish that arrived too late for the morning sale? Yes.
1109. Do you think it would be a good thing to provide against that by having an extra sale a day—say at 11 o'clock? Yes, if we could get the buyers; the class of buyers we have want to get their fish early and get away home; the buyers that purchase by basket, or barrel, would not come to the market after breakfast, as after that they go out with either fruit or vegetables. We tried it for some time and it was a dead failure.
1110. You think it would be better to have the different markets for distribution rather than have the second sale? Yes.
1111. Is it absolutely necessary for the fishermen to appoint agents to do their business in the market? Under the new regulations the fishermen can sell their own fish from the first of January next, as well as the

Mr. R. Seymour. 6 Nov., 1895.

the agents. The city auctioneers have nothing more to do with it; they will only have to attend to their legitimate duties and inspect the fish.

1112. Have you ever heard the fishermen complain of having returns sent to them bringing them in debt to the agent? We have been called on for returns in cases where men get no returns at all, and we have our books to check everything that takes place in the market. For all condemned fish we give a certificate, which is sent to the agent, and the fisherman can examine the books of the market at any time from 10 o'clock in the morning until 6 o'clock in the evening; he can also go to the Town Hall and see what was done with the fish. The bad fish is sent out to Moore Park.

1113. Knowing the fishermen so well, do you think it would be likely that the majority of them would think of looking at the Corporation books and going to the trouble to find out for themselves, in respect to the agent's transactions in the market? They have done so.

1114. In a case like this: say fifty baskets were sent in from a certain fishing-ground to the market for sale—is it not open to the agent to give returns for forty baskets, certifying that there were ten baskets condemned, while the whole consignment may have been sold and thus the fisherman would be deceived? But the fisherman cannot be deceived about them being condemned as we keep a book expressly for condemned fish.

1115. Yes; but in the case of a fisherman having confidence in the agent he employs, the agent is not compelled to send the certificate to the fisherman, so that if he chose to be dishonest he could send a return, saying forty were sold and ten were condemned? He could.

1116. Have you ever heard of the practice said to be in vogue of the agents culling out the best fish that come from some of the fishing-grounds, selling the inferior fish, and sending a return back on the basis of what the inferior fish brought? I have not heard it, but some of the agents pick out their fish, they are allowed to put a price on it. We start them at a certain price and if we get a bid and cannot get another we knock it down. The agents will sell the best fish that comes from the waters, and keep the inferior fish for the auctioneers to sell; where they send a return to their catchers that all the fish only brought a certain sum that is the catchers' fault if they accept it, as they can find it out.

1117. Would it not be possible for the agents to work in with the hawkers in respect to the consignments of fish which come from the fishermen? I do not think so except they sold privately; in that way they could do it, they could not do it by public auction, but by private sale.

1118. If it has been alleged there has been undue favouritism shown to certain fishmongers, can you tell us whether there is any ground for that? It was alleged that a certain man got his choice of fish, when I can solemnly say that man always bids the highest price for fish; and this statement was made by a man who was once an agent, who was serving seven or eight establishments, and whose purchase for the year amounted to £160 9s.; and the weekly accounts of the man whom they complained about are often more than that. I remember a case of a basket of whiting belonging to a man named Smith. I spoke to the agent about it, and he said, "You have nothing to do with them, they belong to my boss;" I have said, "You must put them out," and they have insisted upon keeping them; and I have sold them, and they have brought over £1, of which amount the man would have been robbed had I not seen them and sold them.

1119. Robbed by the agent? Yes.

1120. Do you think it is possible that in emptying the fish from the baskets on to the floor, when putting them into heaps, some of the fish can be left in the baskets, and after they have removed what apparently are empties, the fish in these baskets could be collected? Yes; I will tell you why; the owners of the fish, if they are in the market, such as the Botany or harbour men, will say, "You put out this fish for me, and you can have half a dozen fish for yourself;" and these are left in the baskets, and these men take these fish; they do not steal them, they are told to take them.

1121. As to the prices realised for the fish sold in the Woolloomooloo Market, do you think the fisherman obtains a fair price for the result of his labour, compared with what the general public has to pay for fish? Certainly not, for the public has to pay four times more than the fisherman gets for his fish.

1122. You think then that the closer the communication between the fisherman and the general public the better? Yes.

1123. Can you give us an idea of what is the average number of baskets that go through the market? Recently, they averaged from 400, 500, and 600 a week; before that they would be as much more—fish being very scarce lately. One agent has over 100 baskets in a morning, especially on a Friday; sometimes 120 and 130.

1124. What do you charge for selling the fish—what percentage? Five per cent.

1125. And do the agents charge a percentage? Yes; 5 per cent.

1126. And they charge cartage; and that comes off the fisherman's profit? It does.

1127. Are many fish brought to the market by means of the well-boat? A few schnapper, not many; we may have eight or ten dozen now and then come from the southwards.

1128. It being compulsory for those fish to be sold through the market, have you taken the opportunity of noticing whether the fish have deteriorated by being confined in the well-boat? I have noticed in some of the schnapper that the scales are off; they are an uneasy fish, and knock about and fight with one another. I have noticed some of the well-boat fish when cleaned; when you cut them open the whole fish opened away from the backbone, which I attribute to the manner they have been knocked about in the well-boat.

1129. Were they cleaned immediately after death? Yes, immediately afterwards. The well-boat, in my opinion, for schnapper, ought to be a great deal larger than it is.

1130. Have you any reason to believe that the practice of well-boat fishing would be a success? I believe it would be a success in bringing good and wholesome fish to the markets.

1131. Do you find any damage occurring to the flathead brought to the market? There are none brought in in the well-boats, it is all schnapper.

1132. Do you think it would be a good idea to have the fish gutted at the fishing-grounds before being sent to market? I do; all large fish ought to be gutted and cleaned in their own waters, because there are times when the bait they use is bad, and no sooner does the fish die than it begins to decompose.

1133. You have all the necessary arrangements for gutting and cleaning fish at the market? We have.

1134. Where does the water supply come from for that purpose? Down near Lady Macquarie's Chair. You may see the engine down below the Corporation private baths, some distance away from there, and that water also goes to the baths in Castlereagh-street.

1135.

Mr. R. Seymour. 6 Nov., 1895.

1135. Are there not several sewers emptying themselves in the vicinity? Not just there; about the centre of the Woolloomooloo wharfs, where the American boats used to be, Cowper Wharf.
1136. Do you ever, besides having the fresh fish submitted for auction in the market, have any preserved or dried fish? We have preserved fish.
1137. What sort of prices do they realise? Very little. William Twibble buys a great quantity of fish; he cleans them in the market, and takes them home and salts them, and they are very delicious fish.
1138. You mentioned something about the supply of fish having become diminished of late; speaking more particularly of the supply of schnapper, has that supply become diminished? It has, very much.
1139. Do you see any reason why it should? I cannot see any reason, only that our schnapper fishermen will not go out to fish for them.
1140. You think, then, that if they had an enterprising spirit, and proper boats, and so on, with the system of well-boat fishing, a good supply of schnapper could be kept up? I am sure of it.
1141. During the number of years you have been in the market, have you ever noticed consignments of the herring family—of pilchards—come into the market? Yes; recently there was a great quantity.
1142. But for many years previously have you noticed them? I have not; years ago large quantities came in; I have seen them sold on Circular Quay.
1143. Was a great quantity of pilchards sold or brought into the market lately? There was.
1144. What did they realise? They were sold very cheap, realising from 6d. to 1s. a heap.
1145. How much in a heap? Between 20 and 30 lb. in the large heaps.
1146. They would be fresh, of course? They were splendid.
1147. Have you any reason to doubt that they are a palatable and good edible fish when freshly caught? They are a very beautiful fish, for I have had them myself.
1148. Where were those pilchards caught? Down in Middle Harbour, by the Newtons and two or three others; they told me they had over 100 baskets one morning down about the Spit.
1149. Have you ever heard it is the usual thing for these fish to make their appearance at certain times of the year along our coast? I have heard so.
1150. Do you think if these fish occur in great numbers along our coast, and can be caught easily, we could make them of some commercial value? I am sure you could—why should we get sardines and other kinds from home when we could do it here if we had men of enterprise to go in for it?
1151. Do you know whether much fish is sent into the country? On the Newcastle side I believe there is; all they send us down from there is blackfish; the bream, schnapper and that is sent up north.
1152. Where are those fish from—the blackfish? Newcastle, Port Stephens, and the different inlets, and Lake Macquarie.
1153. Then, all the take of the finer fish is sent north? Yes; the superior fish is sent north.
1154. Sydney gets no supply of the finer fish? Except the large mullet and the blackfish; we get some very fine black bream at times.
1155. But you do not know as to the quantity, or if any are sent into the country from Sydney? Oh, yes; Mr. Jennings sends fish into the country, and Mr. Comino, of Oxford-street, used to send a good deal.
1156. Do you think if the Railway Department established a means by which fish could be conveyed without fear of their becoming unsound in condition during transit, it would be patronised by the agents? I am sure it would be patronised by the general public all along the line.
1157. Do you see any reason why a good fish supply should not be brought into vogue throughout the towns near the railways? I do not.
1158. You think, then, if a cooling car, either adopting the principle of the cool air process or by means of ice, were placed at the disposal of the fishermen, it would be availed of by the agents? I am sure it would.
1159. Have you, as sub-inspector of fisheries, ever noticed any under-sized fish exposed for sale in the fish shops about the city? I have not; but have noticed them in the market, no later than this morning. There is a great difficulty about the matter; these fish are sometimes caught where you have no inspector, by northern or southern fishermen, and they are sent to the market, and the question is who are you to summon? If you summon the catcher you will have to go away up the country to summon him. I have had advice on the subject, and cannot see my way clear. In the case that occurred this morning, it is one that happened in our harbour, and the man will be summoned next week.
1160. Do you not think it would prevent this sort of practice continuing if we published to the fishermen and those engaged directly and indirectly in the sale of fish a plain straightforward interpretation of the law? I will tell you what I got done myself; I had 200 books printed with the Act on the top, small books, showing the sizes and weights of the various kinds of fish and I gave a copy to every fisherman that came to the market, and sent them up the country, and still the small fish comes in.
1161. Is it not quite possible by the use of the legal phraseology contained in these Acts of Parliament, that the fishermen become confused? Yes, just so.
1162. Would it not be better to have it put in plain language what he is liable for and what he is not liable for? Yes, and the same sort of thing should be done in respect to the size of the nets, and other matters, and the agents and everyone concerned could read for themselves and see the position they were in.
1163. You are under the control of the Fisheries Commission to a certain extent? Yes.
1164. Have they ever made an official visit to the market as a body? I have seen them once or twice.
1165. As a body? I do not think so. I have seen Mr. Thompson.
1166. He is not one of the body. Mr. Thompson is Chief Inspector. I mean the Board of Commissioners, there are five of them. Have you ever heard of any official visit made by the members of the Fisheries Board to the market? I have not; the only one I have seen there to my knowledge is Dr. Cox.
1167. Have you ever had any official intimation given you from the Fisheries Board suggesting any improvements in regard to the accommodation and the general mode of procedure that should be adopted in the market? No.
1168. *Mr. Thompson.*] Are the fish put into the ice-house cleaned? No, just as they come in.
1169. Would it be an advantage if all fish put into the ice-house were gutted and cleaned? Yes, and well dried; fish ought not to be put in until it is perfectly cool and dry.
1170. Do you approve of the mode which is adopted by the hawkers of dipping a bag in water and putting it wet over the fish? I do not indeed.

1171.

1171. You think it is an erroneous idea that it keeps the fish fresh? I am sure it does the fish harm. Mr. R. Seymour. 6 Nov., 1895.
1172. What becomes of the bad fish? It is taken out to Moore Park and destroyed by fire.
1173. Is not that rather a wasteful disposition, could it not be utilised for manure and oil? Of course it could. We had a man coming from Botany who used to get the whole of the condemned fish and made oil from it, but he gave it up, and as no one came for it now we have to send it to the tip. There were 6 tons sent there one morning, mullet, flathead, and other kinds.
1174. Can you tell us what price the man you spoke of got for his oil? I do not know.
1175. You have heard of no attempt to convert the residue into manure? No.
1175½. Do you wish to add anything further to the evidence you have given? I should like to mention in respect to the great complaints about the water that is brought from this pump up to us by engine power, one morning when I got a complaint I took a cup and washed it out clean and went to one of the taps and filled the cup with water and said, "Now to show you that this water is clean, I am going to drink it," and I drank it and I also took a bottle and filled that up and took it to the Town Hall and I said, "To show you that the water is quite fit to wash the fish in I am going to drink some"; I then filled a tumbler and drank that, and I am not dead yet. When I go to a bath I always make it a practice to have a good drink of salt water.

WEDNESDAY, 2 OCTOBER, 1895.

[*The Commission met at the Offices, Bligh-street, at 11 a.m.*]

Present:—

FRANK FARNELL, Esq., M.P., President.

L. G. THOMPSON, Esq., J.P.

Mr. Henry Pearce, fisherman, William-street, Double Bay, sworn and examined:—

1176. *President.*] Your name is Henry Pearce—what are you? A licensed fisherman. Mr. H. Pearce. 2 Oct., 1895.
1177. Where do you reside? William-street, Double Bay.
1178. How long have you been engaged in the fishing industry? For twenty-eight years.
1179. Where have you carried on your operations? From Wollongong as far north as the Tuggerah Lakes.
1180. Where have you principally carried on your work of fishing? In Sydney Harbour, and the waters of Broken Bay.
1181. Does that include the waters of Woy Woy and Gosford? Yes, the whole of it, when you say the waters of Broken Bay.
1182. Are you connected with any Association? Yes, I am a member of the Fishermen's Benefit Society.
1183. How many members does that Society contain? About 140.
1184. Are they all financial members, that is paid up? I believe so.
1185. How long has that Association been in existence? Going on for five years.
1186. Is it not designated the Australian Fishermen's Protective Association? Yes.
1187. Does the word Protective mean that the Association looks after the fishermen in connection with the operation of the Fisheries laws? It is also to benefit the fishermen and the public.
1188. Do I understand that it comes within the functions of the Association to see no injustice is done to fishermen through the operation of the law? Yes.
1189. How often do you hold your meetings? Upon the first Saturday in every month.
1190. Have you a good attendance of members when meetings are called? Yes, very fair.
1191. Do you discuss matters in connection with the fishing industry? Yes.
1192. Has your Association at any time had under consideration a Draft Bill for the better regulation of the fisheries of the Colony? I believe not.
1193. Have they on any occasion petitioned the Government or the Commissioners of Fisheries asking that certain grievances might be remedied? Not that I am aware of.
1194. Has your Association ever formulated a list of grievances which might not have gone as far as the Government? I think so.
1195. During the discussions which have taken place at your meetings, have you ever heard the fishermen complaining of the hardships which they undergo owing to the defective provisions of the Fisheries Act? Yes.
1196. Could you enumerate any of the grievances they have? Yes.
1197. Will you please state those grievances? There is one thing we have brought forward in our Society, that when a place is closed against net-fishing, it should also be closed against amateur fishing; there is as great destruction among amateur fishermen as there may be amongst experienced men; but on our side the remedy can be effected by doing away with the sunken nets; they are a great destruction in our parts. The way places are closed at the present time does not afford us an opportunity of making a living, the places that are near being closed in the summer months, where, if we were allowed to fish, we could get fish to the market within a few hours of their being caught; but at present we have to go a long distance and use ice, and when the fish are unpacked they thaw, and shortly afterwards are rotten. Some places that are closed in the winter time are open in the summer The small mesh-nets should be done away with. I do not think it is fair that we should have our living taken out of our hands by the seizing of our nets; it is quite enough to inflict a fine without seizing our nets. I think the matter ought to lie in the hands of the inspectors, that is as to seizing the nets; if they know a man there is no necessity to take his net. If he is not known they might take his net as security, as in some cases of the Italians or the Chinamen who are not known, and who are all alike. The whole of the waters should be left open, provided a certain sized meshing-net was allowed to be used, and it should be left then for a fisherman and an inspector to decide whether it should be closed or open.
1198. Are you directly engaged in netting? Yes.
1199. How many are associated with you? Three, all told.
1200. What is your average catch per week? One week I may catch 50 or 60 bushels, and another week only 2 or 3—it varies.
1201. Where do you generally consign your fish? To Lawler.
1202. How do you send your fish? By train.

Mr. H. Pearce. 2 Oct., 1895.

1203. What kinds of fish do you catch? A mixture—all sorts of fish—bream, whiting, &c.
1204. How long have you been engaged in business in connection with the Woolloomooloo Market? Ever since it has been a market.
1205. Have you always consigned to an agent? Yes; always to the one agent since it started.
1206. Have you been satisfied with your returns? Yes.
1207. Have you any complaint to make as to loss of fish in transit? None whatever.
1208. Are you satisfied with the price realised for your fish? Yes; by the agent I send them to.
1209. Have you ever heard other fishermen complain in this respect? Yes.
1210. Have you ever heard them complain of losing fish in transit? Yes.
1211. Where do you think this pilfering takes place? It is hard for me to say.
1212. Do you consider, comparing the prices which the public have to pay for fish, and the price received by the fishermen in their returns for the sale of their fish, that the fishermen get a fair amount as the product of their labour? I have got a fair price; I cannot speak for others.
1213. Although the public pays at a very high rate for fish, you are satisfied that you get sufficient to compensate you for the labour which you are put to for catching your fish? Yes. On the other hand, I think the public pay too much for their fish at the present time—for if we had places open that are closed, we could catch a larger quantity of fish, and could sell at a lot less than we are getting at the present time.
1214. Do you think the fishermen would be satisfied generally if they received one-half of what the public pays for fish? If they got one-half, and got sufficient places to work, they would be.
1215. How do you send your fish to market? In baskets.
1216. Do you consider that is the best way? We have two ways: sometimes we have not sufficient baskets, and then we buy boxes.
1217. Which do you think the better? In the summer, the boxes are the best, as the fish do not get crushed.
1218. Are you satisfied with the charges made by the Railway Commissioners for the carriage of fish? Yes; they are very fair.
1219. Have you ever lost any of your baskets? Yes, we often lose a few baskets; but it is not the fault of anyone connected with the railways; it is the fishermen's own fault.
1220. Did you have any connection with the Co-operative Company started in Sydney? I was a member for a short time.
1221. Was it a success? I cannot tell you.
1222. Is it in existence now? I think not.
1223. You say you have had dealings with the Woolloomooloo Market ever since it has been a market? Yes.
1224. You are familiar with the way in which business is conducted at the market? I am perfectly satisfied with the agent I consign to, and I have given him my fish since it has been a market, and have seen nothing wrong.
1225. Do you think there is any room for reform in regard to the manner in which the fish are displayed? I do not see there can be any improvement made more than by elevating them off the floor a little; that is the only improvement I can see could be made.
1226. Is there not a well-founded objection to having the fish thrown on the floor in heaps and exposed for sale, as they are now? I think it could be carried on a bit better than that.
1227. Do you think the present system creates a prejudice in the minds of the public, and deters people from purchasing and consuming fish? If every agent was his own auctioneer it would be a lot better than it is at the present time.
1228. Have you ever noticed at the morning sales in the market people treading on the fish and spitting about? Well there may be a little treading on the fish sometimes, but I know Mr. Seymour is very particular if he sees anyone spitting about, and he has summoned people.
1229. Are you not of opinion that is one of the first things that should be attended to in having the fish displayed, so that it should not be contaminated by being trodden or spat upon in the market? Yes, it should.
1230. Have you known bad or rotten fish to be sold in the Woolloomooloo Market? I have known bad and rotten fish to be sold there; there has been during the last five years more bad fish sold in the market than in twelve years previously; owing to so many places being closed, it is impossible to get them into the market fresh.
1231. The fish being brought a long distance? Yes, packed in ice. They may be fresh when put into the market, but after being there for one or two hours, and then hawked through the town before they are sold, they go rotten.
1232. Would you advocate the opening of the market all day for the sale of fish? I do not think it would be any improvement.
1233. Do you think it would be better to have more than one sale a day? You might have an evening sale.
1234. Would it be better to give fishermen the opportunity of selling their fish at any time they arrive instead of keeping them ten or twelve hours? It would be much better if they could sell them straight away, the fish are not so good after being packed in ice.
1235. Would you advocate fishermen being allowed to sell their own fish in the market? Certainly.
1236. Do you believe in the establishment of a central market? Well I do not know; I think Woolloomooloo is sufficiently convenient for Sydney.
1237. If a market were established at Darling Harbour which would be accessible by road, rail, and water, would that be better? It would be very convenient for fish coming by rail, but for those using boats Woolloomooloo Bay is the best.
1238. Supposing the Woolloomooloo Market were allowed to remain—that would suit a number of people who bring their fish by water—would there be any objection to establishing a central market in addition at the Darling Harbour? It would be very convenient round Darling Harbour.
1239. Is it not a fact that most of the fish come by rail? Yes.
1240. And is it not a fact that the less handling the fish undergo the better it is for the condition of the fish? Yes.

Mr. H. Pearce. 2 Oct., 1895.

1241. Then taking into consideration all these circumstances, would it not be better to have a market centrally situated where all this extra handling could be avoided? It would be better for the fish certainly.
1242. Do you believe in establishing auxiliary markets for the better distribution of fish? Yes; you would dispose of a great deal more fish in that way.
1243. Have you any objection to the amount of the license fee which they charge you? No.
1244. Any objection to the boat license? No.
1245. Have you ever heard of the existence of a ring at the Woolloomooloo Market? Well, I have heard of the existence of a ring, of course; I do not bother my head about such things.
1246. Do you think there is a likelihood, on occasions, of the agents working in with the hawkers? Some of them may do it; but my agent does not do that.
1247. Have you ever heard fishermen complain of their having sent fish to the Woolloomooloo Market, and the best of those fish have been taken out and sent away to the country, without having passed through the market at all? There is no doubt it is done; but I cannot prove this.
1248. Have you also heard it complained of that whilst the best of the fish have been sent to the country and sold at a good price, the fishermen have received a return based on the price which they have received for the inferior fish? Yes; there is no doubt it is done.
1249. Does that not convince you that there is necessity for reform? I think by allowing the agents to become their own auctioneers you would remedy all these things.
1250. Have you ever sent fish to the Redfern Market? Never yet; only to the Woolloomooloo Market.
1251. Supposing that a system were recommended of gutting fish before sending them to market, do you think that would answer? Yes; the fish would keep a lot longer by doing so.
1252. If the fisherman received a fair advance on the price he now receives he would take the trouble to gut them? I think so.
1253. Have you ever sent any fish into the interior? Never.
1254. Do you think there are possibilities for sending fish in large consignments into the country? Yes; I think so.
1255. Do you think if the Railway Commissioners placed a van having a cool chamber in it on the line, the fishermen would avail themselves of that means of sending fish into the country? I think they would take the opportunity of doing so.
1256. Looking at the population of the Colony, do you think there is as much fish consumed as should be? No; I am sure there is not. When I first went fishing there was three times the amount sold in the city to what is sold at the present time; owing to so much rotten fish being sold these last few years it has poisoned the public mind against buying fish.
1257. You think if the fish could be relied upon being fresh——? There would be three times the quantity sold, and the fishermen ought also to get a better return.
1258. Where did you say you principally carried on your operations? Between Sydney Harbour and Broken Bay; but I have also worked from Wollongong to the Lakes.
1259. Have you fished at Woy Woy? Yes; a good deal
1260. What is your opinion of those grounds? That they are teeming with fish at the present time.
1261. Are they closed at the present time? There is about a mile open for every 10 miles closed; it is not sufficient ground to work.
1262. Do you think, then, more waters should be allowed to the fishermen? I think so.
1263. Do you think all the closures that are made are justifiable? I think not.
1264. Do you think in connection with those closures that they could be said to be the recommendations of practical men? I think a practical man should be allowed to give his opinion as much as the inspector or the Commissioners, that he should be present as well.
1265. In connection with the closures that have been made, have they all been made on the recommendation of practical men? No; Brisbane Water has been closed because it was said it was becoming exhausted, and we can prove that the last two months it was open, more fish came out of it during those two months than for the last fifty years, which is well known by a practical man named Richardson. There could still be any quantity of fish got out of it if we were allowed to work it. If we were allowed to work with nets that were not destructive there would be no harm to the place, and that is not the only place, there are plenty of others too.
1266. You were only allowed to work between the expiration of the last proclamation and the gazetting of the present one? Yes.
1267. How long was it closed on the last occasion? One part was closed for twelve months, and the other for six months; it has not been opened for longer than two months at any time during the last eight or nine years.
1268. Does it not strike you as proof of the value of a closure that after it has been closed for twelve months you are enabled to get in two months a supply of fish that has never been equalled before? No; it is a place where there is always plenty of fish, it is never short of fish.
1269. Did not the Commissioners leave some portion open for the fishermen? Broadwater is now left open, but that is not sufficient.
1270. In connection with the last proclamation, did that not leave some portion of the entrance open? Yes, they did.
1271. Would you, as a practical man, advise that a closure should be made as that was made, leaving the breeding grounds protected, but leaving an opportunity for fishermen to prevent the ingress of fish to breed? The fish in going in cannot be caught, fish always work one way; they go in left handed, and leave left handed; they can catch them going out, but not coming in. In Sydney harbour you can catch them both ways.
1272. Supposing a channel led into a lake system, and supposing all the lake system is closed, and the channel open for fishermen to scour and scrape out, do you think it a justifiable opening? On the channel it is all tide work; the fish can come up when the tide is running up, and out when the tide is running out, and cannot be caught until slack water, anywhere about the entrance up as far as the Heads, you cannot haul the channel for more than a quarter of an hour every six hours. There are bays where you were allowed to haul just near the entrance; you will have to go out of the narrows before you can get a haul, you can get about one haul at low water; when you get out of the channel you

Mr. H. Pearce. 2 Oct., 1895.

have a better opportunity of making two or three hauls. The heads and bays are the places that should be closed, not the channel, in the channel you will only find very small fish.

1273. Have you worked the Parramatta River at all? A great deal at one time, as far as you can go with a boat, as far as Parramatta.

1274. The river has been closed for net-fishing above the railway bridge for some considerable time, has it not? Yes.

1275. What do you think of the fish supply of Port Jackson compared to what it was some years ago? They are scarcer now than ever they were, owing to the traffic that is carried on, the increase of sewage matter, building wharves, the explosion of torpedoes let off down at the fortifications, and the blasting that is carried on which causes the destruction of any amount of small fish. The weed the fish used to breed in and feed on is all killed with sewage matter; in the Parramatta River at one time you used to be up to your knees in weeds. Lane Cove used to be nothing but a mass of weeds where bream, garfish and all other kinds of fish used to breed. If you destroy the natural feed you cannot expect to have fish. The fish that are caught in the harbour are fish that are watched by fishermen and go in one side and out the other—mullet, bream, garfish, whiting and all kinds of fish like that come in and go out again, they are migratory fish. Middle Harbour is the only place that has weeds and breeding grounds, there is no sewage matter that kills the weeds, where you find the weeds thickest there you find the fish thickest.

1276. What nets do you use in the capture of your fish? All sorts of nets, at the present time a garfish-net, one of the most destructive there is.

1277. What length? Ninety fathoms.

1278. No longer? Well, a fathom or two sometimes; the Act says 150 fathoms; you can have 150 fathoms not more than 30 fathoms of 1¼ inches, not less than 30 fathoms of 2 inches, it would not do for me to have less.

1279. Any other nets? A meshing-net and all sorts of nets.

1280. What is the mesh of your meshing-net? Four inches.

1281. What length? Sixty fathoms.

1282. Do you use the 2¼-in. hauling-net at all? No; we do not consider that a fair size for catching fish.

1283. Which net do you consider the more destructive, the hauling-net or the garfish-net? Sunken nets are the most destructive, and a garfish-net can be made into a sunken net.

1284. The smaller net does more damage to the young fish? Yes.

1285. Have you ever noticed when using the hauling-net that a quantity of small fish get meshed? Yes.

1286. What sorts? Little red bream or black bream, a saleable whiting would go through a 2¼-in. net.

1287. Then supposing you had made the same haul with a garfish-net that you made with a hauling-net, would there be the same likelihood of destruction of the black bream and red bream, or would they be saved? You might save them; but if you got them on a hot flat in the summer time, when the water is hot, you would be sure to kill them.

1288. Do you strand your fish? Yes.

1289. Do you not use a back-net? Yes; but you cannot land your net, where there is a drawback, in a foot of water; there may be a break of 3 or 4 feet on the beach; one minute you may be dry-footed, and the next 10 or 20 feet up.

1290. Would you be one to leave it to the discretion of local authorities to decide where these nets should be used—to local authorities, such as a Board, to recommend what descriptions of nets should be used in the different waters;—I am speaking of a Board on which the fishermen would be represented? Yes; I would be satisfied.

1291. In connection with the hauling-net, do you think the fishermen have any *bona fide* grievance in respect to that? I think a 2-inch mesh for a bunt, with 2½ wings, up to 90 fathoms, would give the fishermen a fair opportunity of catching saleable fish.

1292. Ninety fathoms in the wings? Thirty fathoms of 2-inch, and thirty of 2½-inches.

1293. That is a hauling-net? You can make it up by filling it up with 3-inch, 30 fathoms in the bunt of 2-inch, 50 on either side, middle wings 2¼-inches; and if you want more, make them have 3 inches on the outside wings, up to 150 fathoms, in the Hawkesbury. In lakes you might give them 300 fathoms.

1294. You would leave it to the local authorities to decide, what length and mesh should be used in the different places? Yes.

1295. Have you ever used a sunken net? Yes.

1296. Do you consider it advisable that they should be allowed? As long as they continue with the small mesh they should be done away with.

1297. Do you know whether any of the European fishermen use them. Very few.

1298. Are they used mostly by Greeks? Yes; Greeks and Italians. I think they should be done away with in hauling, everywhere; there should be certain waters left open for prawning. Speaking for this harbour, Johnson's Bay is not of much value for other kinds of fish, and it is about the best that could be picked for prawning, and they would not be destroying so many little fish if it was left open for that purpose. You see by them hauling all over the harbour they are destroying small fish; if they get one flathead or a sole in a haul they are satisfied. They say they are going for prawns, but they go for all they can get.

1299. You think they kill a number of the fry, and destroy the breeding and feeding grounds? Yes.

1300. You think the European fishermen are opposed to that heavily-weighted sunken net? Yes.

1301. As to the meshing-net, are you satisfied with that? I believe in doing away with meshing-nets altogether; they don't get half-a-bushel on an average, and they frighten the fish out of the water by using meshing-nets. They are the most destructive nets for frightening fish; you don't catch them, you frighten them.

1302. Do you think the dimensions of the prawn net are satisfactory, have they got sufficient length? I think so, I think they can get plenty to supply the public of Sydney out of the place I have mentioned.

1303. Do you think that whilst we are allowing prawns to be caught we are diminishing the feeding grounds? I do not think so with reference to the place I have mentioned.

1304. Have you noticed swarms of black bream coming into the harbour? Yes.

1305. Have you ever noticed whether prawns preceded them or not? I have seen the prawns come in at times but cannot say whether it is before or after; I have seen the small prawn very thick at times in patches.

Mr. H. Pearce. 2 Oct., 1895.

1306. In connection with closures, you have made a complaint that the closures that have been made have been unjustifiable ones, insufficient waters being allowed for fishermen to carry on their calling? Yes.
1307. Would you be inclined to leave the matter of determining what closures should be made to a local board on which fishermen should have representation? Yes, if the fishermen were represented.
1308. You think then that a knowledge of local circumstances would be a very great advantage in deciding what closures should be made? Yes, we do not want to work against our own interest, we want fish to breed so that we can remain fishing, not like the Italians who make all they can and clear out. We want to stay, we have children to look after who may come after us—we do not want to destroy but to protect the fish.
1309. Do you think the Inspectors in connection with the Fisheries Department are practical and suitable men? I know of one or two only.
1310. Would you secure the services of men who understood the subject and have a practical acquaintance with it? One or two that I know I have not known them to be fishing for the last fifteen or sixteen years and another man for the last twenty years.
1311. Is it not a fact that the conditions and circumstances connected with different fisheries vary? Yes.
1312. So that you would approve of the establishment of a local board on which the fishermen should have representation for the purpose of advising the central authority as to matters of closure, as to matters of length and dimensions of nets to be used, and in connection with other matters pertaining to the fishing industry. Do you think that would be a good thing? Yes, I think that would be a good thing.
1313. Would that do away with the complaints that the fishermen have at the present time against Inspectors recommending closures unjustifiably? Yes.
1314. Do you approve of the leasing of waters for general fisheries? No, I do not believe in it in anyway, not in anyone holding a monopoly.
1315. You think it would tend towards monopoly? It would not be fair, it would always cause a jealousy.
1316. Do you believe in licensing amateur fishermen? No, we do not believe in making them pay a license, by giving them a license it would give them a chance of having the same voice in matters as a practical man; I would not license any amateur.
1317. Supposing a provision were incorporated in a Bill preventing the interference of amateurs with the professional fishermen, would you have any objection then? I think it would be unjust; you might make the people that let boats to amateurs pay a license for their boats, but not license the amateurs.
1318. Do not a lot of people fish from boats who sell their fish? There is no doubt there are; but they do not let the professional fishermen see them.
1319. If the Crown takes upon itself the responsibility and expense of closing certain waters, and affording certain protection to those waters, those who derive the benefit should pay something towards the cost of protecting, should they not? I do not think they should have the benefit when the professional fisherman is not allowed in it.
1320. Would you approve of the professional fisherman being allowed to go and enter closed waters under certain conditions? No; if a place is closed no one should have any right there with any sort of net or lines.
1321. For instance, would you approve of the use of a meshing-net in closed waters? No; certainly not.
1322. You believe in rigidly adhering to the principle of making a closure, and keeping it closed? Yes; from everyone, from line as well as any other, from amateur as well as professional.
1323. Do you think the amateur fisherman does an injury to the fisheries? The amateur fisherman, as you may learn from Mr. Piggott, catches seventeen dozen of whiting, which do not fill a bucket, and when that number can be caught with lines, how many will fifty or 100 boats destroy? I cannot think it should be left open for line-fishing, they destroy more than we do with nets.
1324. If people were punished for having undersized fish in their boats? If that were done you would want about 100 inspectors for every place to look after them; you cannot do it. There are hundreds of people sometimes in the summer fishing, and how can one or two inspectors look after them; it would be a trap for the public.
1325. Supposing we imposed upon the boat proprietor the responsibility of seeing that no small fish were brought in by those boats? Well, it is this way—if an amateur fisherman comes in with his boat, he is not going to let the boat proprietor see what he has in his bag, and he may have a lot of small ones.
1326. Supposing we give him power to search the bag, or anything else he has, to see whether he has undersized fish? I do not think it would do; the best thing, if a place is closed, is to close it against the amateur and everyone else.
1327. Supposing a certain clause regulated the amateur fishing by prescribing a certain sized hook to be used? That would not do; I have caught small fish with a No. 5 hook, even a black bream hook will catch a fair-sized fish. You cannot regulate it with the hooks.
1328. Would they not be as likely to catch the small fish outside a closure as inside? Yes; just as likely.
1329. Can you see how that can be avoided? No, I cannot; if a fish gets on their hook they must haul it up.
1330. But it would live if cast into the water? But the chances are he would die, as the fish is not the same as he was after the prick of a hook; it must leave him sick when you take it out of his mouth. If they are thrown in out of a net where they are not pricked, they have a better chance of recovering than if they had been hooked.
1331. Have you ever heard of fishermen complaining of having their nets seized? I have heard of them.
1332. Have you ever heard of them being deprived of their tools of trade, which might have cost them £30 or £40, owing to the action of the inspectors? Yes.
1333. Do you believe in giving the inspctors half the fine? I do not.
1334. Do you think it acts as an inducement for the inspector to act harshly? Money will always encourage a man to do what he would not do otherwise.
1335. You think their salary ought to be sufficient for the duties they perform? I think so.
1336. Do you think the inspectors ought to have the right of issuing licenses to the fishermen? I think it is right enough as it is; they know who have licenses and who have not.

Mr. H. Pearce. 2 Oct., 1895.

1337. You are satisfied because you are within the metropolitan area, but do you think people living 50 or 100 miles from the Clerk of Petty Sessions should be allowed to pay their license fee to the inspector? Yes, in that case.
1338. And it would be a good thing for the purpose of identification, the inspector would know to whom he had issued licenses? Yes; he would know who were licensed men and who were not.
1339. Have you done any outside fishing? Yes.
1340. Where? Along the coast, I have been schnappering all along the coast.
1341. Have you found schnapper pretty prolific? Yes; off the Heads.
1342. Do you think there is a general scarcity just off the immediate coast line? Yes; just off the Heads.
1343. How is that? I think it is on account of so much rubbish being taken out of the harbour—it has filled all the crevices in the rocks where the fish resorted to, it has killed their feed and driven the fish away.
1344. Have you brought whatever fish you have caught to market? Not all of them; I sell a few round my neighbourhood.
1345. Have you ever tried the well-boat system? No, never. I have been amused with accounts I have seen from time to time respecting herrings; the catching of herrings outside the harbour I do not consider possible on account of the numbers of sharks. I have used a trammel net which cost me a considerable sum of money, the net was set edgeways with the tide as for net-fishing outside the Heads, but it would not answer.
1346. But it is carried on successfully in other parts of the world? There are no sharks.
1347. There are sharks all along our coast? Yes, at any time you like.
1348. The season for sharks is in the summer? In the summer they are most plentiful of course; but in the winter there are almost as many.
1349. Have you ever seen herring travelling along the coast? I have seen the pilchard, but not herrings.
1350. Have you not seen the southern herring, that has its habitat in the Crookhaven and Shoalhaven Rivers? I have seen what they call the herring, but they are not like the English herring—they call them pilchards or maray, we used to call them pilchards; they used to be plentiful in the Hawkesbury at one time.
1351. Do you think it would be possible to carry on trawling outside the Heads? I do not think so, there are too many rocks.
1352. Would it not be well to have a proper survey? If you look at a chart you will see that you cannot go far without coming foul of the rocks; and again, the fish you would catch would be stingaree and cat-fish; very few flathead and flounder. Our principal fish lie among the rocks—schnapper, jew-fish, rock-cod, all these fish lie among the rocks. I have seen trawling tried, but have seen no good result from it; trawling was tried about forty years ago by a man named Malcolm.
1353. As to the oyster fisheries, do you know anything about them? We know where there used to be a good place for oysters at one time, but not now.
1354. Have you ever held any leases? No, never.
1355. So you would not be competent to give an opinion as to what system should be adopted as to the giving of leases? No.
1356. Have you ever had any transactions with the Commissioners of Fisheries? We waited on the Commissioners at one time to get a larger portion of the Parramatta River opened.
1357. Did they accede to your request? Yes.
1358. How long after? A week or fourteen days afterwards,
1359. Do you think it was owing to their disposition to grant your request, or owing to the fact that the whole of the closures had been illegal for years? The fish had become thick, and it was only open then as far as Hunter's Hill; and we got them to open it up as far as Ryde Bridge, and a fair quantity of fish was got out of it.
1360. Have you ever attended any other deputations to ask for assistance? No.
1361. Have you ever heard the fishermen complain of the Commissioners, or express the opinion they should be retained or abolished? We have heard lots of things; that they should remain; and, on the other hand, they should be done away with. I do not think they should be done away with; someone should be allowed to look after the fishermen and the public interest.
1362. Granting it is necessary for someone to look after the public interest, do you think it essential to retain that body; do you think the fishing industry has been properly developed under the present regime? The only thing I can say in connection with the present Commissioners is, that if they had had a fisherman—one or two as they chose—to give a little information, things would have been carried on more satisfactorily.
1363. You think the members of the Commission have not been competent to take an intelligent view in respect to the fishing industry, on account of their not having practical experience? I think if practical men had been on the Board things would have been carried on in a proper manner.
1364. You think, then, that if local Boards were established, on which fishermen would have representation, and say one gentleman was placed in charge to administer whatever Act is passed, that that would be satisfactory, taking it for granted that the person to be appointed as Commissioner would be a man having a thorough acquaintance with the fish and fisheries of the Colony? A practical experienced man should be appointed on the Board as a Commissioner.
1365. And you think, instead of these gentlemen giving their services free, as do the present Commission, you should have one paid man at the head of the whole thing? Well, I do not know; my reason for saying we should have a practical man on the Commission, is that when a place is being inspected for the purpose of seeing whether there is a scarcity of fish, he should be in attendance.
1366. Would that not be a matter that should come within the functions of the local Board to advise, and then if there was a dispute the Commissioner could go down and inspect the waters for himself? What, the practical man?
1367. Yes? I am sure in some places that have been already closed on the recommendation of someone, that it is owing to false reports. Brisbane Water has been closed, it is alleged, through becoming exhausted, and there is more fish coming out of it within the last two months than was ever known before and it would save those false reports by having this fisherman.
1368. By having the local Board, you mean? Yes.
1369. You say that your Society has monthly meetings? Yes.

1370. Was the existence of this Royal Commission known to your Society at all? Not that I am aware of. Mr. H. Pearce.
1371. And not to any individual fisherman comprising it? No; not that I am aware of, I knew nothing about it. 2 Oct., 1895.
1372. You are entirely under a misapprehension in supposing this body and the Fisheries Commission are the same? I thought if we were required to give evidence we should get notice from the Commissioners of Fisheries.
1373. *Mr. Thompson.*] Have you read the Bill prepared by this Royal Commission? Yes; some of it.
1374. Have you arrived at the conclusion that very many of what you term the abuses under which you labour are cured by this Bill? I have already pointed out there is one class prohibited from killing small fish, and the other is allowed to kill them.
1375. Where is that? The amateurs.
1376. I think you are wrong, this Bill specially provides that if any person whatsoever, be he fisherman or amateur, shall have in his possession, or in his boat, any fish of less than the prescribed size, he shall be liable to punishment. That disposes of your objection that the fisherman is treated in one way, and the amateur in another. And then again this Bill provides that any waters may be closed against the use of fishing-nets or lines or both or either, so that amateurs will be precluded from fishing in closed waters to quite the same extent as the professional fishermen. Therefore, when we close a water against the use of fishing nets it can be closed against the use of fishing lines also. Then before we close a water at all we close it on the recommendation of the local fisheries Board, that is provided for. This local fisheries Board must make the recommendation before it can be closed. Have you any further objections? I think that any place that has to be closed should have at least six months notice of it.
1377. That is a matter for regulation afterwards? It is very hard upon the fisherman who has rigged up a net to suit a place, and has gone to the expense and trouble to suit that special place and then by the place being closed to lose his money.
1378. You have said you would disallow the use of meshing-nets in closed waters under any conditions. You are assuming the ordinary use of the net, and as you correctly say you disturb more fish than you catch. That is not the way proposed by the Royal Commission. You know that in closed waters there are a number of fish fit for consumption left there doing no good, and they might just as well be caught in the closed waters as left to wait for a flood to drive them down into open waters where they can be caught; you know that a flood will drive them down. Now, we have conceived an idea for the capture of these fish while in the closed waters; we propose to take a net and cast it from a boat into the water and, allowing these fish to mesh in this net, to haul it back into the boat without touching the shore at all—no noise is made, nor are the young fish disturbed in the feeding grounds? Ninety-nine times out of a hundred that net would not be shot in the manner laid down in the Act; I would be one of the first to set it in the way it would splash and make a noise.
1379. But under the mode of supervision that would obtain it would make it very difficult for you to do this, nets would not be allowed to be used in this way except under official oversight and special conditions? You could be within 20 yards of me and I could deceive you; I could make the same noise by putting a ring or chain on the end of the pole, and if you came to me I could say I was merely poking my boat along.
1380. I do not think so, but our object is to deal out all the benefits we can to honest *bona-fide* fishermen; we cannot suppose you would lend yourself to such fraudulent action as you have suggested? But surely there are no fishermen who recommend the use of a meshing-net in closed waters?
1381. All have approved of it? Then they must be men who would not go away from the smoke of their own house.
1382. There is another point about the length of the nets; the Commission does not propose that the length of nets should be set down by hard and fast legislation. Their Bill provides that the lengths of nets and dimensions of meshes may be fixed to suit any specified water, and that would be a matter for determination by a local board to which the fishermen would elect a representative. The Commission recognise the fairness of relieving the fisherman from all the difficulties he labours under, and that is one of the lines on which the Bill has been prepared. You know the inconvenience you suffer from the seizure of nets. This Bill does not allow the seizure of a net, it relies on fines and no net can be seized. Have you ever heard of any legislation as liberal as that. And if you read the Bill impartially from beginning to end, we think you cannot be otherwise than satisfied and be willing to signify your approval to its provisions generally? So then meshing-nets may be used where we cannot use any other sort of nets as Mr. Farnell mentions, at the Hawkesbury for instance, but in most places meshing-nets are, I think, most destructive.
1383. *President.*] Where a local board would recommend, you would have your voice in the matter as a fisherman, but on the Hawkesbury, if circumstances warrant it, you would say "Oh yes allow it"? Just so.
1384. *Mr. Thompson.*] Respecting the use of meshing-nets, this Bill provides that they may be used under conditions to be from time to time specified by the Commissioner, but they must be cast from and hauled into a boat. It is not contemplated that they shall be used at all in the ordinary way in which meshing-nets are worked? Just so.

Mr. Peter Richardson, fisherman, Ferry-road, Glebe Point, sworn and examined:—

1385. *President.*] Where do you reside? Glebe Point. Mr. P. Richardson.
1386. Are you a licensed fisherman? Yes.
1387. Do you also hold a boat license? Yes. 2 Oct., 1895.
1388. How long have you been licensed? Ever since they were in vogue.
1389. How long have you been engaged in the fishing industry? About thirty-three years.
1390. Where have you principally fished? About equally right through, part of the time here, and at the Hawkesbury River, and then at Gosford.
1391. Can you tell us whether the provisions of the present Fisheries Act operate harshly or not on the fishermen? Yes, it does.
1392. Do you think there is room and necessity for reform in that direction? Yes.
1393. You have heard the evidence given by Mr. Pearce here to-day? Yes.
1394. Do you agree with the evidence he has given? Yes.

Mr. P. Richardson. 2 Oct., 1895.

1395. Do you think he has spoken and given his evidence in a manner which can be considered to be of a representative character? Yes.
1396. Is there anything you would wish to add to his evidence? No, I cannot see there is anything I could add to what he has said.
1397. Are you satisfied, having heard the proposed legislation explained to you, that the Bill proposed by this Royal Commission is a little more liberal than you expected? Well we have not read the Bill right through, they are a little more liberal than we thought they were.
1398. Are you a member of the Fisherman's Benefit and Protection Association? Yes.
1399. Were you aware of the existence of the Royal Commission to inquire into the fishing industry? I heard something about taking evidence, but did not know what it was and was expecting to get notice from the Fisheries Board if I was to go.*

Mr. Robert Vine, fisherman, Double Bay, sworn and examined:—

Mr. R. Vine. 2 Oct., 1895.

1400. *President.*] Your name is Robert Vine, what are you? A licensed fisherman.
1401. And a boatman? No, not a boatman.
1402. Where do you reside? At Double Bay.
1403. How long have you been engaged in the fishing industry? Twenty years.
1404. Where? Sydney Harbour and Broken Bay.
1405. Have you a good knowledge of those fisheries? Yes.
1406. Have you heard any complaints made by your fellow fishermen as to the provisions of the present Fisheries Act bearing harshly upon them? Only in the closing line, and the seizing of nets in closed waters.
1407. Generally have they complained of the provisions of the Bill being defective? Well, yes it is defective.
1408. Do you think there is room for reform? There is room for improvement.
1409. Have you read the proposed Bill of the Royal Commission? No, I have not.
1410. After having heard some of the provisions explained this morning do you consider it is a Bill of a character that should be passed? Yes, I think so.
1411. You have listened to the evidence of Mr. Pearce, are you satisfied that he has given *bonâ-fide* straightforward evidence, and do you agree with the evidence he has given? Yes, I do.

TUESDAY, 19 *NOVEMBER*, 1895.

[*The Commission met at the Offices, Bligh-street, at* 11 *a.m.*]

Present:—

FRANK FARNELL, Esq., M.P., President.

L. G. THOMPSON, Esq., J.P.

Mr. Herbert Lewis Bridger, Trafalgar-street, Annandale, sworn and examined:—

Mr. H. L. Bridger. 19 Nov., 1895.

1412. *President.*] What is your name? Herbert Lewis Bridger.
1413. Where do you reside? Trafalgar-street, Annandale.
1414. How long have you been in the Colony? Ten or twelve years.
1415. Prior to that had you any experience in connection with trout raising? Yes; some twenty-five years' experience.
1416. Where? Principally on the Marquis of Abergavenny's Estate at Erridge, in Sussex; I was also with Mr. Ramsbottom, Croboro' Warren; and with other gentlemen, my services being availed of by different persons living in the vicinity of the place where I was employed.
1417. What classes of trout did you rear? Brown trout and rainbow trout.
1418. Did you find the brown trout the hardiest of the lot, the best to cultivate? I believe they are the best to cultivate; we used to cultivate them splendidly; our hatching principally used to be done in water-races. There is not a better thing going than water-races if properly managed.
1419. About what quantity of trout did you use to rear? We never counted them, we reared large quantities.
1420. Did you distribute them to other parts of England? No; sometimes we would take yearlings and place them elsewhere in distant positions.
1421. What river ran through the estate you refer to? Several small streams, feeders to the Tunbridge River.
1422. Do you mind explaining the process you adopt in hatching trout? Yes. In dealing with the rivers of our Colony for the purpose of trout culture, knowing the terrible nature of the flood-waters, the shifty sandy bottoms and swift undercurrents to be contended with, I have no hesitation in saying that only an experienced man, who knows his business, and will do it, can succeed; and on this alone hinges the success of trout culture. Without constructing expensive weirs or dams of a permanent character, a simple method—"battening" or "break-water"—might be adopted, by which the under-current may be dealt with successfully. I have seen twenty-six trout taken out of a river within an hour after a 2-feet plank had been secured in proper position; the water at this time being not more than 3 feet above the fish, and I unhesitatingly affirm that on this principle alone can success attend any efforts. The absence of this principle has been nearly the sole cause of failure, there being no protection from flood-waters for the young fry, which are consequently drowned; and, in all cases, this principle must be acted upon, in the absence of work of a more permanent nature. At Bathurst and on the Monaro, there are said to be trout. Had a man been placed at those places who understood "fry-nursing," and dealt with the rivers in a practical manner, the Macquarie and Monaro waters would be teeming with trout. If this suggestion be carried out, and a good season ensue, 50,000 trout would, in all probability, be added to their numbers.

Supposing

* Note (*on revision*):—I and the other fishermen who gave evidence before the Commission strongly favour the immediate passing into law of the new Fisheries Bill prepared by the Royal Commission.—P. Richardson, 6th November, 1895.

Mr. H. L. Bridger.

19 Nov., 1895.

Supposing that the man in charge will have time to get his own ova and hatch on the American principle,—select a spring, hang the trays in the water, and bring the current of water up from beneath; then the under-current floats off the addled eggs, which are caught and thrown away without trouble. When the trout are on the point of hatching, place the trays in the waters that have been prepared to receive them. Now, without any guiding hand to assist the almost helpless creatures, there are many enemies that exist; such as eels, shags, ducks, wild-fowl, swans, &c., to root up the spawn;—for one swan will eat 30,000 ova in a day, if not disturbed. But the greatest enemy of all in this river at present, is the shifty sandy bottom—gravel or shale bottoms excepted. This, in most cases, covers the whole of the spawn, and the entire season is lost without any possibility of recovery. Under the circumstances, and as I understand, it is from want of funds, or the above conditions could be carried out, I should advise a cessation of operations in that direction, and to turn your attention to Berrima (as recommended by Royal Commission, page 41.) One season of operations there would in all probability establish success. Roughly, about £50 would be ample for a two-roomed weatherboard house and utensils for hatching on the American principle, as described. Get a spring, if possible in close proximity to the river for the hatchery; erect the shed with sapling and thatch, and the hatchery is complete. This is the best method for river purposes, apart from the main hatchery—the safest and most convenient that I know of—and removes the otherwise difficult solution as to temperature. I do not mean to abandon the Prospect hatchery by the above process; but I think if large numbers of trout were hatched there, the necessity of removing the fry as quickly as possible is apparent to all. The difference in temperature, if left to a later date, would affect the young trout materially, and great numbers would die from this cause.

1423. *Mr. Thompson.*] Have you seen anything of the method of trout culture as practised in New South Wales? No; but I know what it is.

1424. Do you approve of the system? Certainly not; it is not possible for success to attend it.

1425. Why? To make it possible you must put a man on the river,—the shifty nature of the rivers—the rushing torrents—makes it impossible. Supposing you turn 10,000 trout out into the rivers, about 9,500 would be drowned by the flood waters.

1426. Is that owing to the tender age at which they are put out? Yes; they are put out when they are not fitted to protect themselves;—it is like putting a child in a nursery, and leaving it; they must be assisted. Then the temperature of the water where they are now hatched is different to that of the rivers in which they are placed.

1427. Do you approve of the liberation of trout in the fry stage? Undoubtedly not, under certain conditions.

1428. What are the conditions? Such as those I have referred to; there must be preparation made for receiving them.

1429. What kind of preparation? You must control the water.

1430. How would you control the water of a river? Well, the rushing torrent going into a river off a hill-side will drown half your trout; they need proper protection. Barriers could be erected at certain places to check the great flow of water.

1431. Are you not aware that our rivers contain boulders, rocks, and so forth, and that these boulders form a natural protection for fish? No, they do not so much.

1432. What rivers have you been on? The Nepean and the Hacking River.

1433. Then that is all your experience. Have you seen the Nepean River at Picton? Yes.

1434. Would that be a good place for trout? Yes; it would.

1435. But there the conditions you propose to create artificially exist naturally? Yes; that is so.

1436. You have been accustomed to rear trout in races? Yes.

1437. What attention did you give them;—for instance, when they were hatched how did you get rid of the egg shells? When they are reared you have to watch them as carefully as you can.

1438. Why is it, in your opinion, that races are preferable to hatching boxes? I did not say so only under certain conditions.

1439. Have you seen the hatchery at Prospect? No; I tried for a pass, but they would not give me one.

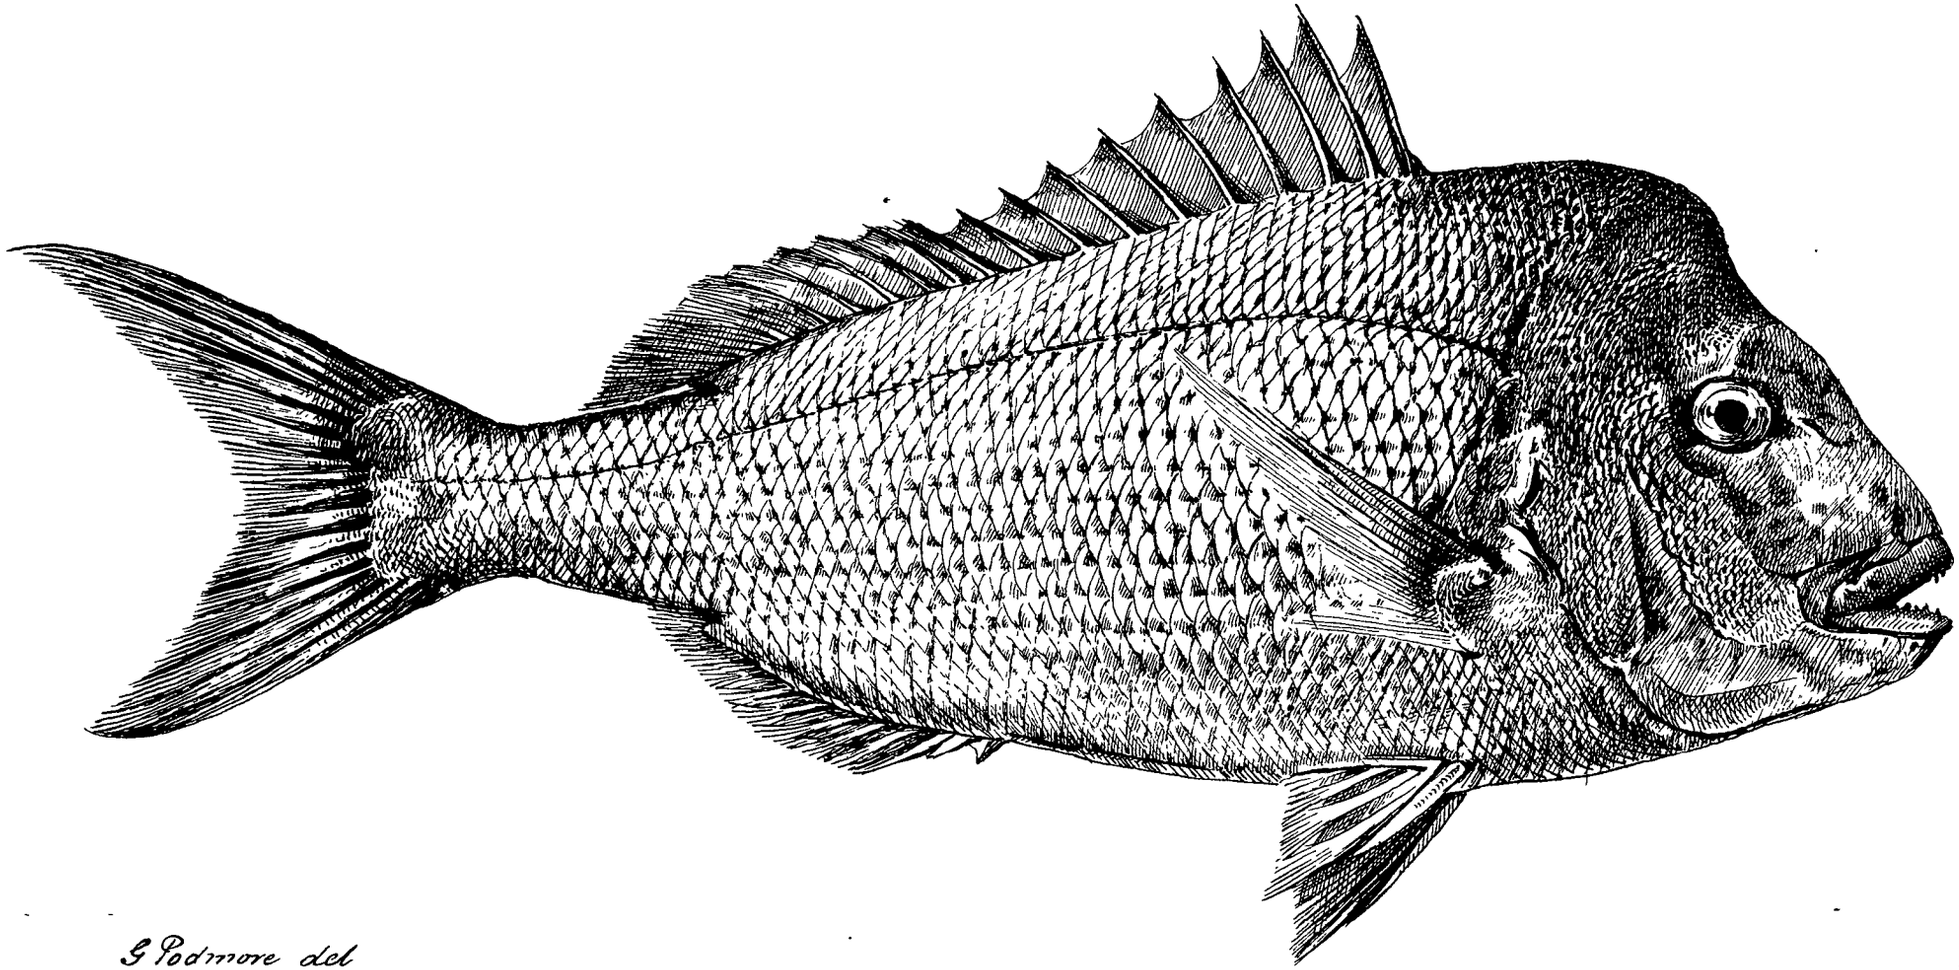
1440. Whom did you ask? I asked an officer at the Department; I was told Mr. Smithers would give me one, but he has not done so. I am acquainted with the hatchery at Prospect through reading an account of it in the newspapers. It is on wrong principles; it is iron-topped where it should be thatched in order to make it as cool as possible. The trout there will die. I saw an account in the paper which said there were 3 or 4 feet of water in the ponds; young trout abominate deep water. I think Prospect is not a proper place for a trout hatchery; it is too hot.

ABBREVIATED DESCRIPTION

OF THE

Principal Food Fishes of New South Wales.

ILLUSTRATED BY PHOTO-LITHOGRAPHS.



G Podmore del

(326-)

SCHNAPPER.

(*Pagrus unicolor.*)

PHOTO-LITHOGRAPHED AT THE GOVT. PRINTING OFFICE,
SYDNEY, NEW SOUTH WALES.

THE SCHNAPPER; Aboriginal Name, WOLLOMAI.

Family, **Sparidæ**; *genus*, **Pagrus.**

Colours.—Varying with age from silvery red in the young to bright red in the adult, the upper parts of which, especially the head, are tinted with brown; the abdominal region is pinkish or silvery; the body is ornamented with pale blue spots, which are numerous in the yonng and entirely disappear in very old examples.

It may be fairly presumed that this fish is known to almost every one in the Colony, and often recognised in the adult state, and when just caught, as the ideal of a fish, representing beauty to the eyes, sport to the fisherman, and a firm, palatable, wholesome, and nutritious food to the multitudes. No party of amateurs who go out for a day's general fishing think their basket complete without schnapper being among their number,—that name floats uppermost in calling over the day's sport, and covers many defects in other fishes which may happen to be in the list of the day's catch, and indicates, as a rule, that the sport was fair and good.

Although by comparison some would imagine there were more than one of the same species along our coast, it is not the case; the mere difference of shade in colour, or lanky or chubby appearance are in all probability caused by the abundance or scarcity of the feeding grounds. The schnapper is migratory, and omnivorous. It frequents all reefs, bomboras, and foul grounds along the whole extent of the coast.

The usual grounds fished in the vicinity of the Heads of Port Jackson are numerous, for example may be named South Reef, North Head, Blue-fish, Colours, Pine-tree, Tumble-down, and Mud Island, and the wide or Maori grounds in deep water, all of which places are known to fishermen by bearings of land-marks, but they are not nearly as prolific as they were years ago.

The usual method of apportioning quantities for sale by the fisherman is, by the schnapper or count-fish, school-fish, squire (among which, so named from its metallic appearance, is the copper-head or copper-colour), and red bream. The fact, however, is that all these are one genus, merely in different stages of growth.

By the term schnapper, or count-fish, is implied that all of a certain size and of about 6 lb in weight are to count as twelve to the dozen; the shoal or school-fish, eighteen or twenty-four to the dozen; and the squire, thirty or thirty-six to the dozen—the latter just according to their size, the red bream at per bushel. With some exceptions, these are usually caught in the vicinity of reefs or rocks, by anchoring the boat according to the turn of tide, so that the line will trend on to or along the rocks; when migratory, and in winter, they are caught further off in deep water; but when in large shoals, or wide off and on the top of the water, which is termed schooling, they will rarely take the bait.

The adult fish is sometimes caught off points within our harbours after nightfall, and at certain times of tide—young flood at some, ebb at others. An adult or native, as he is termed, is, as E. S. Hill describes it, a fine old fish, monarch of his ground, with, as shown in the lithograph, a figure-head as bold and defined in its outline as that on the North Head of this port; cunning and fastidious to a degree—a regular epicure—he must be tempted with choice morsels before the well-chosen bit which conceals the hook will engage his attention. If he be once fairly hooked with strong tackle, the work and anxiety of landing him will for the time it lasts be somewhat intense. The tugging, jerking motion of the schnapper is unmistakeable, and when he gets his shoulder to the line he goes off with a rapidity that makes the cord whistle again, either through the fingers or over the boat's gunwale; a steady and continuous strain, no stray line, together with some skill, enables him to be safely landed, when it will be realised that patience, toil, and anxiety are rewarded with a fish, from twenty to twenty-five pounds weight, fit to embellish a noble banquet.

The bait for these fishes are prawns, stale shark, star-fish, squid, mackerel yellow-tail, mullet, tailors, and a variety of other fishes; the whole of these at particular times will be readily taken, but when the schnapper appears dainty, mackerel and squid may tempt him when all others fail. In its young stage, such as red bream, lean beef is about the usual bait for amateurs, and answers in the absence of fish tolerably well. Thousands of what would be the future schnapper are destroyed in Port Jackson alone, either by the line or net, even from the very smallest of the genus, for in their earliest stage they appear willing to take the bait.

It is believed that the schnapper spawns in December, January, and February, having carried its roe for some months—the spawning is supposed to occur in the vicinity of coastal reefs, the young fry finding its way into the quiet waters of harbours and inlets, where it remains until it reaches maturity, when in its turn it too migrates seawards for the purpose of reproducing its species. It is a matter for regret that no systematic attempts have been made to determine the habits of fishes generally. In 1880 the Royal Commission appointed to inquire into the fisheries had occasion to deplore this want of knowledge, and the pity of it is we are not much better informed now.

BLACK BREAM.

(Pagrus australis chrysophrys.)

PHOTO-LITHOGRAPHED AT THE GOVT. PRINTING OFFICE,
SYDNEY, NEW SOUTH WALES.

THE BLACK BREAM.

Family, Sparidæ; *genus*, Chrysophrys.

Colours.—Upper surface of head dark bluish-gray, lighter between the eyes; cheeks and opercles gray and gold, with a tinge of pink; mandibular region silvery white; a dark gray arcuate band from the occiput to the origin of the lateral line; back, olive green; sides, silvery; each scale margined with dull yellow; lower surfaces white, tinged with yellow below the base of the pectorals; dorsal opaque, with a narrow black margin; anal yellow, basally tinged with pink, and with a broad dark gray median band; ventrals yellow; a black axillary spot; caudal, yellowish-brown, with a moderately broad black marginal band; irides brown and gold.

This fish, the "darkie" as it is popularly called, is a great favourite and much sought after by amateur line fishermen. Its capture affords splendid sport and requires considerable skill. The darkie is present in our harbours and inlets in more or less abundance throughout the year. Its usual spawning time is said to be January and February, but many are of opinion that it, as well as some other species, spawn twice in the year, and this opinion is, as regards this particular species at least, fortified by the fact that in Lake Illawarra a general spawning takes place in September and October. Ogilby, a standard authority on Australian Ichthyology, reports having found that "of two specimens examined in the month of August, both having been taken in the same haul of a seine, one contained ova in a very early stage of development, while in the other the ova were fully developed, but exceptionally few in number;" again, on the authority of Mr. Hood Pegus, black bream in the Clarence River spawn in July. There are not, however, sufficient data on which to base actual facts, at least in this regard. The systematic investigation of fish life is a subject which should engage the attention of the authorities to whom the development of our fisheries is entrusted, and until facts are established by actual research we shall to a great extent have to be satisfied by mere conjecture. Fishermen are of opinion that black bream spawns in the lower parts of rivers and lakes near the sea, and that the young fry when hatched betakes itself to the sweeter waters of the upper reaches. Edward Smith Hill gives some good information respecting the characteristics of the black bream as a sport fish; he suggests for its capture a very light tackle, the finer the better; and for bait, fresh or a day-old mackerel, or much better still, prawns which may be procured at low tide by stamping down the weeds to muddy the water; these prawns are called nippers from the improportionate size of one claw. Pastes composed of herring or oysters, mixed with flour or pollard, form a favourite bait.

The black bream likes these large soft bait as a rule, but on occasions he seems to prefer the crustacean named; he picks it up and rushes off at full tilt, and pulling hard and shearing about with a full determination if possible to get away.

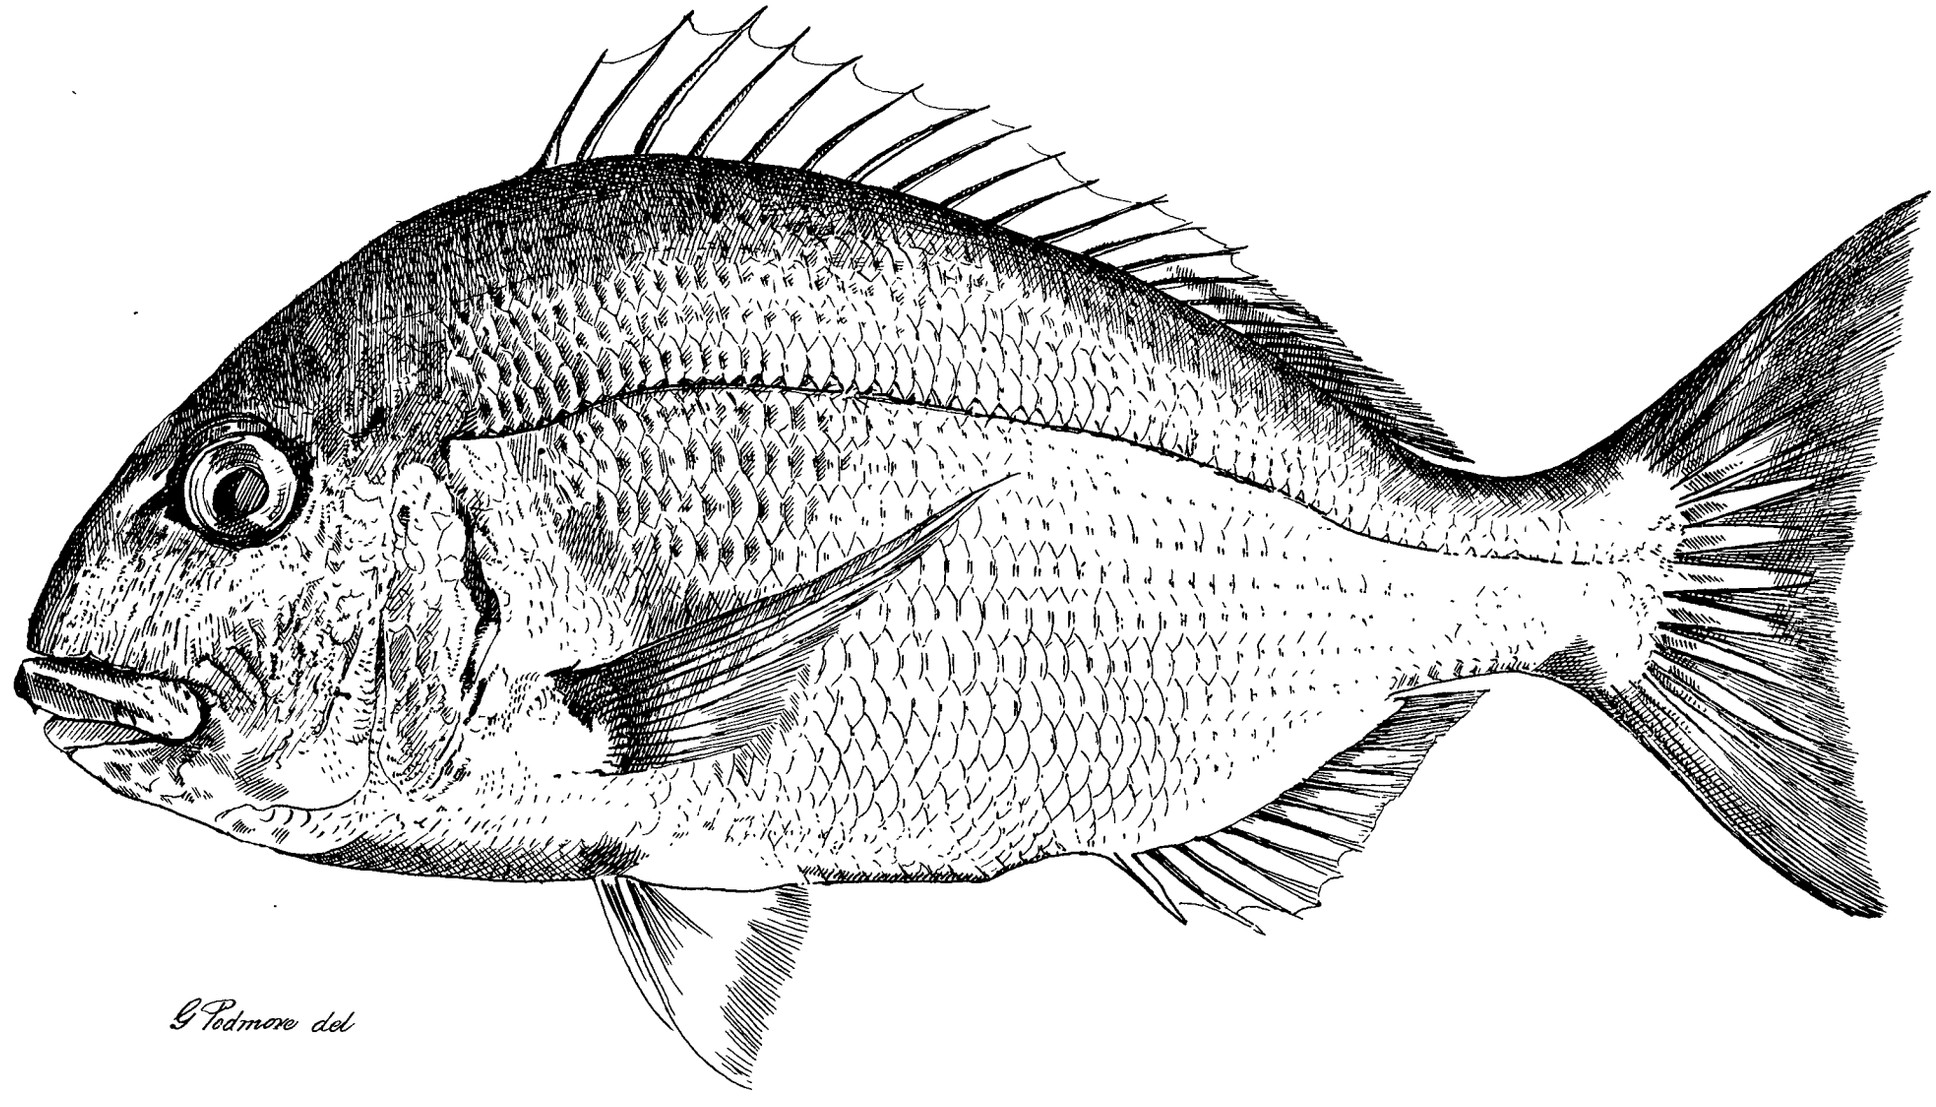
Some difficulty is experienced by the novice in attempting to unhook this fish, and often a lacerated hand is the penalty of his want of skill. The bream is armed with spines, but his are sharper and more robust than any of his order, indeed so effective are they that the aboriginals used the first rays of the pectoral and ventral fins to tip their fish spears.

To unhook a black bream it should be firmly grasped about the middle—certainly about the pectoral fins—sufficient to paralyse him. Otherwise, if the fish is handled gingerly, the first wriggle he gives will release him, and the second motion will, perhaps, cause the hand of the captor to be cut deeply by the operculum or bony gill covering, which is as sharp as a good knife, or stabbed with a spine or two in the struggle.

The black bream, which remain and are plentiful in the harbour at most times, become terribly gross and filthy feeders. Nothing seems to come amiss to them, and they are plentiful about the mouths of sewers, hulks, and ships which remain stationary for any period, under wharfs, and near bathing-houses. They are often sought at these places by the amateur. These fish exhibit a great deal of cunning, and require an artificial bait to tempt them—dough, amalgamated with herring, anchovy, or ling. With this the hook, already snoozed with gut, is concealed and carefully lowered down into the water. The bait, like a plump oyster, rarely sliaf to attract; but very often the darkie seizes the bait and comes off best.

Dark nights and flood tide afford the best black-bream-fishing. At such times it is usual to have a lamp in the bottom of the boat to aid in disentangling the line or examining the bait, &c. This, however, is not indispensable; but in its absence it certainly is advisable to have a set of lines ready for use, so that when one is disabled it may be bunched-up and another used. Black-bream fishing, when freely biting, is first-rate sport, and is much enhanced by having one party in the boat for the express purpose of making ready the bait and attending to the lines.

Notwithstanding the cunning and shyness of these fish during the day they can be often caught at night by baited baskets or traps lowered to the bottom with a junk of beef boiled almost to tatters secured inside to the bottom of the trap. The small fishes are first attracted. They enter and tug away at the bait, which is easily shredded. The bream soon follow and are captured. Meshing nets, placed along the rocks, also secure many at night, but the ordinary hauling net or seine very frequently captures great numbers.



TARWHINE.

(*Pagrus sarba.*)

THE TARWHINE.

Family, **Sparidæ**; *genus*, **Chrysophrys.**

Colours.—Upper surface of head lead color; preorbital and preopercle silvery; cheeks and opercles with a golden tinge; body silvery, each scale with a broad, median, dull gold bar, forming together longitudinal bands, which become gradually fainter on the lower part of the sides; generally a bright golden band above the base of the ventral; dorsal fin dusky, with a basal hyaline spot between the rays; caudal dull yellow, with a broad dusky terminal band; ventrals golden; anal with the basal half silvery, the marginal half golden.

The tarwhine (Chrysophrys sarba) is, as its genus implies, a near relation of the black bream. It may be regarded as a semi-tropical fish, being much more plentiful in our northern than our southern waters; from the former it is sent in numbers to market and commands a ready sale. In shape and size it is similar to the black bream, but its colour is brighter and more silvery—its scales smaller and its head more circular in form, being somewhat similar to that of a young schnapper. There is very little difference in the habits of the two species, except that the tarwhine is more frequently found on sandy bottoms not far from the sea, and is seldom seen in the upper rivers; as may be supposed it is more scarce in winter than in summer. It is supposed to spawn generally in the hot months, but specimens have been found as early as July with the roe more than half developed; this would lead to the inference that the tarwhine is amongst those classes of fishes which are believed to spawn bi-annually. It is inferior to the black bream, but when perfectly fresh and in good condition is a fairly well flavoured fish.

THE BLACKFISH.

Family, **Sparidæ**; *genus*, **Girella.**

Colours.—Blackish or dark brown above, lighter below; or silvery gray with a variable number of dark brown transverse bands.

The blackfish is largely distributed along our coast-line and is common both to the sea and the inlets; it is a fairly good food fish, but not by any means equal to the black or red breams. It is a purely herbivorous feeder, and after capture rapidly declines in quality, but its declension in this regard can to a great extent be averted by the immediate removal of the entrails. Its habitat is chiefly amongst weedy bottoms. The principal mode of capture is by net, though it often contrives to escape capture by laying on its side and allowing the ground net to pass over it, but it may sometimes be taken by line with a bait composed of a green mossy grass which forms its principal food; common cabbage also is an effective bait. It spawns amongst weeds in deep muddy-bottomed holes and on outer beaches, this latter being evidenced by the fact that its young are frequently to be found in the pools on the rocks during the autumn and winter months, the actual spawning taking place during February and March. The fish attains a weight of 3 to 4 lb., its average length being about 12 inches, though much larger sizes are sometimes captured. The fish appears in shoals throughout the year.

PILCHARD.

(*Clupea sagax.*)

THE PILCHARD.

Family, **Clupeidæ**; *genus*, **Clupea (sagax)—maray.**

Colours.—Dark blue above, changing rather abruptly into the silvery of the sides; a series of round blackish spots along the middle of the sides.

Though this fish is not yet generally regarded as amongst our principal food-fishes, yet from its undoubted abundance on our coast during the winter season, and from the first rank it occupies in the fisheries in other parts of the world, it seems destined in the near future, when means shall have been taken to place our fisheries in a position to ensure their due development, to play an important part in New South Wales. We, therefore, think it fitting to give this fish a passing notice here.

We have reason to think that the maray, as we are accustomed to call it, is known only to a few of our colonists, and though elsewhere the capture of the pilchard would engage the attention of thousands of persons and provide them with remunerative employment, it has year by year been allowed to pass our coast unheeded, and thus an important item of national wealth, both in the shape of food for local consumption and in its boundless possibilities as an article for export, has been permitted to escape without any attempt being made to utilise it.

The late Sir William Macleay, a scientist, and an enthusiast in all matters relating to fish and fisheries, at one time endeavoured to incite an interest in this fish, but without effect. It may be assumed that while fish generally were so easily captured by simple seining in inlets and other still waters, there was no incentive to fishermen to encounter the dangers and inconveniences of the open sea in pursuit of this fish, while, moreover, they were totally unprovided with proper appliances for its capture.

Sir William describes the shoals which visit us as enormous, covering miles of sea, and accompanied by flights of birds and numbers of large fish.

On the Victorian coast, McCoy notices the occurrence of this fish at various dates between August and January, and in the International Exhibition Essays, 1866–67, gives an account of an extraordinary visitation which took place in Hobson's Bay during August of the former year; he writes:—"They arrived in such countless thousands that carts were filled with them by simply dipping them out of the sea with large baskets. Hundreds of tons of them were sent up the country to the inland markets, and through the city for several weeks they were sold for a few pence the bucketful, while the captains of the ships entering the bay reported having passed through closely packed shoals of them for miles."

Speaking of its abundance in New Zealand waters, Hector remarks:—"This is a true representative of the herring kind in these seas, and it visits the east coast of Otago every year in February and March, and when the schools migrate they extend as far as the eye can reach, followed by a multitude of gulls, mutton-birds, barracouta, and porpoises. So densely packed are they in some years that by dipping a pitcher in the sea it would contain half fish; so that if large boats and suitable nets were employed thousands of tons could be caught."

In view of this fact it seems to us almost criminal that opportunity has so far not been availed of to build up an industry which would be so far-reaching and so expansive in its results.

THE DRUMMER.

Family, **Sparidæ**; *genus*, **Pimelepterus Sydneyanus.**

Colours.—Dark gray, washed with silver on the lower part of the sides; upper surface of head darkest; all the fins dark coloured; irides golden and silvery about equally mixed.

The "drummer" of the Sydney fishermen is not uncommon in Port Jackson and Broken Bay, and though occasionally a dozen or more may be seen at one time in the market, this is certainly the exception, not because of the rarity of the fish, but owing to its habit of frequenting closely the neighbourhood of rocky shores and inlets where the nets in vogue here cannot be used. It is a true rockfish, dwelling in the crevices and indentations of our rocky shores, where it finds abundant food and shelter; it is not given to roaming, and is only taken by the trammel, one end of which is attached to the shore, against which the mesh must actually lie or else the fish would assuredly pass inside, whence it happens that this fish is almost always caught within a few feet of the shore. So far as can be ascertained, it is never known to take a bait.

The breeding season is about midsummer, and the ova is probably deposited in sheltered spots among weed covered rocks.

As food the drummer does not readily command a sale in the market, nevertheless halfgrown examples are quite equal in flavour to the other herbivorous sparids.

The drummer grows to the length of thirty inches.

NANNEGAI.

(*Beryx affinis.*)

PHOTO-LITHOGRAPHED AT THE GOVT. PRINTING OFFICE,
SYDNEY, NEW SOUTH WALES.

THE NANNYGAI.

Family, **Berycidæ**; *genus*, **Beryx.**

Colours.—Red, with violet reflections, each longitudinal series of scales with a large median spot, which is golden on the back and grows gradually paler on the sides, becoming silvery below, and forming well defined bands; abdominal region dirty white; fins red.

The name given to this fish is derived from the aboriginal "Mura ngin a gai." By the early colonists it was called "Mother nan a di," evidently a corruption of the original, and from the corruption is derived the now accepted name of the fish.

The species, which visit some of the headlands on our coast, is shaped like a squire or small schnapper, but does not attain a great size; seldom more than 15 inches. Its bright red colouring matter appears to be in the skin and epidermis, as it retains a portion even after having been cooked. Nothing is known of the habits, or time of spawning of this fish, or of its reasons for periodical migration to our coast.

The nannygai has a very large eye, is found in the vicinity of reefs, and is fished for in deep water with hook and line, and the ordinary schnapper bait. Great caution is necessary at times in approaching the ground so that the boat may not be pulled over the rocks where these fish congregate, as they have been known to take alarm in such instances, and in consequence not to take a bait during the day; otherwise they bite freely, and many are taken. The North Heads of Port Jackson and Botany Bay afford a rendezvous for this fish, as also Middle Head and points at intervals along the coast.

The beauty of this fish is to be seen best when first caught, and the flesh is much better when fried very fresh. In fact, most of the Australian fishes are tenfold better as food when just caught, although some keep tolerably well; but the nannygai will not keep many hours after removal from its element.

THE WHITE TREVALLY.

Family, **Carangidæ**; *genus*, **Caranx.**

Colours.—Steel blue above, silvery on the sides and below; a black spot on the opercle, behind which, along the median line of the body, a broad golden band is present or absent; tip of spinous-dorsal blackish.

This fish is abundant along the entire coast of this Colony. It possesses a fine and delicate flavour and is said to attain a weight of 10 to 12 lb. It does not confine itself to the sea, but enters freely into harbours and rivers where it is readily captured in the net. When about 12 inches long it is most fitted for the table, having at that stage of growth attained its greatest delicacy of flavour. It smokes splendidly, but is said to be not suitable for canning. This trevally sheds its spawn in October and November. It frequents shallow water, feeds amongst rocks and takes fish-bait ravenously.

THE BLACK TREVALLY.

Family, **Teuthididæ**; *genus*, **Teuthis.**

Is shaped something like the white one, but is brown in colour and irregularly marked. It is also slimy and more rigid, having all its prickles pointed and very small scales. The dorsal ray, as well as every fin, is not only kept stiff, but each point of any one of them can inflict a very painful wound. The black trevally is said to be a very good eating fish, but it must be used as soon as possible after capture in order to bring out its best qualities.

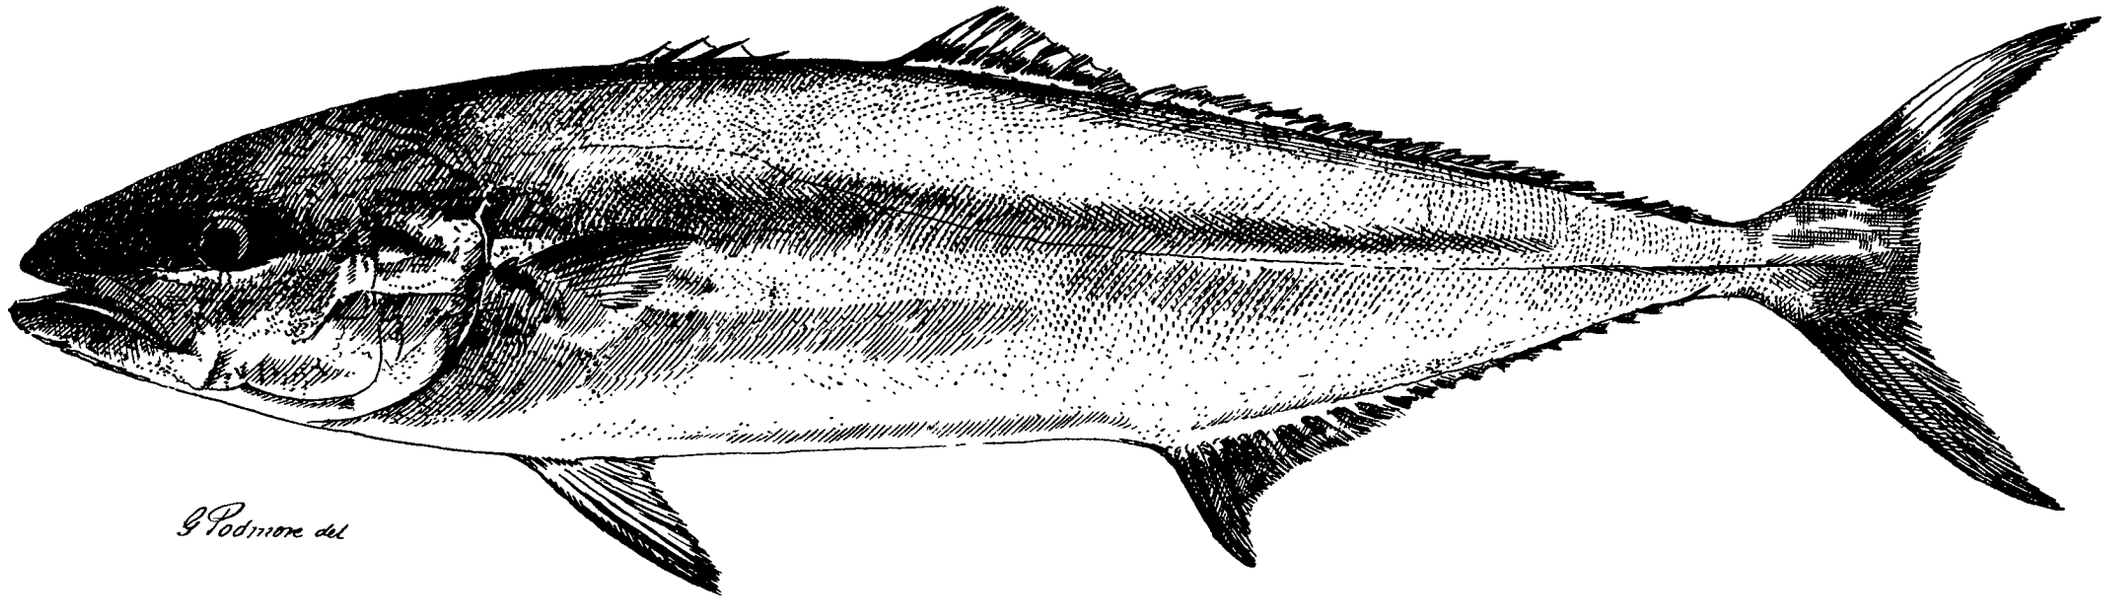
PHOTO-LITHOGRAPHED AT THE GOVT. PRINTING OFFICE,
SYDNEY, NEW SOUTH WALES.



(326-)

KING FISH.

(Seriola lalandii.)

PHOTO-LITHOGRAPHED AT THE GOVT. PRINTING OFFICE,
SYDNEY, NEW SOUTH WALES.

THE KINGFISH.

Family, Carangidæ; *genus*, Seriola.

Colours.—Brilliant purplish blue above, the head darker and with a distinctly greenish tinge; sides silvery; abdominal region pearly white; a broad golden band commencing behind the eye, and traversing the median line of the body may or may not be present; soft dorsal and anal olive green, the elongate anterior rays tipped with yellow, the latter fin with a narrow white margin, and with a pearly spot between the bases of each pair of rays; caudal olive green with the lobes yellow; ventrals white outside, yellowish-green inside; pectorals and spinous dorsal gray; irides silvery, clouded in parts with golden brown.

The kingfish visits our shores in large shoals at irregular intervals throughout the year, the large fishes not, however, consorting with those of smaller size. The most marked visit consists of a run of large breeding fish, commencing during August, and lasting till about the middle of November; from this time, and during the summer and autumn months, large shoals of immature and half-grown fishes make their appearance, these in their turn retiring, with the approach of cold weather, to more open, deeper, and consequently warmer waters. Even, however, in the depth of winter, some few examples, chiefly of large size, may be met with in the market. The principal spawning takes place in October. That the ova is shed as a rule out to sea, possibly at some considerable distance from the land, is probable, while it may be taken for granted that it floats; the fry are, however, never found in our harbours, nor even on our outer shores; where, therefore, they remain, during the interval between their hatchment and their appearance in shoals along the coast during the latter end of summer, when they measure from 12 to 18 inches, is merely matter for conjecture. In the Twofold Bay District they are reported to spawn in deep water outside about the month of September, after which "they make for a large sandbank which exists about 12 miles out from the Heads, where they are found in great numbers." At all ages their voracity is very great, and they do much damage to such fishes as the mullet, both by harassing the parents when on the breeding grounds, and subsequently by the enormous consumption of fry. Their food consists almost exclusively of small fishes, hardyheads, yellowtails, whitings, and mullet having been taken from the intestines of a single large individual. As a table fish it varies much with the season, and its size, examples measuring 2 feet and under being firm and palatable, except in the spring months when they are soft and unpalatable having quite a cheesey taste, while the larger fishes become according to growth increasingly coarse, tough, and flavourless. When the kingfishes are in good condition and perfectly fresh, the belly part, properly cured and smoked, is said to be far superior to any imported fish cured in that way. The kingfish also ranks high in estimation as a game fish for sporting purposes.

THE TAILOR.

Family, **Carangidæ**; *genus*, **Temnodon.**

Colours.—Pale green above, silvery below : soft dorsal, anal, and posterior half of caudal tinged with yellow.

This fish, known as the Skipjack in Melbourne and as the Bluefish in the United States of America, is one of the most rapacious of fishes, destroying an immense number of other shore fishes and killing many more than it can devour. It is very strong and swift in its movements, and is remarkable for its piercing teeth. It is a fairly edible fish, but must be used as soon as possible after capture, as its quality very quickly deteriorates. In a smoked state, however, it is essentially a delicacy of rare excellence.

During the spring months the tailor arrives off our coasts in countless numbers for the purpose of shedding its spawn; this function takes place in the open sea, but well within the influence of the tides, and the impregnated ova float on the surface in large masses, where they become the prey of numerous predaceous fishes and birds; owing to the combined warmth of the sun and water, and influenced doubtless by the action of the tides, the ova mature quickly, and the young fish on their emergence soon find their way into sheltered harbours and inlets, though, should stormy weather intervene during their passage, thousands of fry under two inches in length are frequently washed ashore on the outer beaches, those, however, which survive the perils of the journey, and reach the comparatively safe shelter of our harbours and salt water lakes rapidly increase in size, and are taken by the seine at all seasons of the year, measuring from 4 to 10 inches in length, and are sent to market along with yellowtail, to be sold as bait, for which purpose they are excellent.

Consequent on its rapacity, it takes a bait of almost any kind freely, and affords good sport to the angler. The great majority of the fish brought to market is, however, taken by the seine net, but, though commanding a remunerative price, the enclosure of a shoal of large tailors is frequently no great cause for congratulation on the part of the captors, as their strong subulate teeth, aided by their strength and determination, enable them in an incredibly short time to cut through the meshes, and not only escape themselves, but by rendering the net useless cause the loss of that night's fishing, not to speak of the trouble and expense incurred in mending the nets. Instances have been known where the entire bunt of a net has been torn to shreds by a few dozen tailors.

Tailors may also be captured with a bait of red rag by trolling a line of some length from a steam boat going at the rate of four or five knots per hour.

(326-)

AUSTRALIAN CARP.

(*Chilodactylus fuscus.*)

PHOTO-LITHOGRAPHED AT THE GOVT. PRINTING OFFICE,
SYDNEY, NEW SOUTH WALES.

THE AUSTRALIAN OR SEA CARP.

Family, **Cirrhitidæ**; *genus*, **Chilodactylus** (*Aboriginal*, **Bingátti**).

Colours.—General colour of the body bluish-silvery, each scale with a reddish-brown margin which is much broader above than below; two or three oblique silvery bands on the posterior portion of the tail, which are very conspicuous in immature examples but almost obsolete in adults; head reddish-brown; an orange band, broadest in front, round the eye, except on the supraorbital region; chin and branchiostegals silvery, with a chestnut patch between them; anterior margin of pectoral region orange; dorsal reddish-brown, the rays narrowly edged with orange; anal and ventrals black, with or without a bluish submarginal band; pectorals pale brown, with a small axillary spot and the elongate portions of the simple rays red; caudal reddish-brown basally, deepening almost to black behind, and with a broad orange posterior margin.

The Australian carp differs much from others of its genus, though it has by certain writers been confounded with at least two of its congeners—the jackass fish and the red morwong. Notwithstanding that the carp is found in moderate numbers along our coast at all seasons of the year, and freely enters our harbours and estuaries, where it doubtless breeds, since the young are taken there by seine, and hook, nothing definite can be learned as to its manner of breeding. It is more of a rockfish than the two species named, but is frequently taken in the harbour in nets; the adults are fairly common on the outside reefs and rocky shores throughout the year, though apparently in greater numbers during the warmer months. In such places they are chiefly caught by hook and line; they are among the most common as well as the most handsome fishes to be found in our aquaria. As food this is one of the best fishes of the Colony, and is obtainable at a moderate price, but, as is unfortunately the case with so many of our fishes, there is no special fishery for them, and, except in the case of the immature examples which frequent the shoal waters of our inlets, they, therefore, escape capture. Their food seems to consist of small worms, finely triturated masses of foraminifera, and small shells. This is another one of those species whose range is either very limited, or the centre of whose distribution has not yet been discovered, the coastline lying between Lake Macquarie and Shoalhaven being so far the only locality from which it has been recorded.

THE MULLET.

Family, **Mugilidæ**; *genera*, **Mugil and Myxus.**

COLOURS.

The Sea Mullet.

Steel blue, with a tinge of green or olive above; sides and lower surfaces silvery; a small black axillary spot, and a golden spot on the upper angle of the opercle; dorsal and pectoral fins dark bluish-gray, caudal and anal yellowish-green.

The Flat-tailed Mullet.

Steel blue above, silvery on the sides, white below; scales of the back with a narrow median longitudinal streak forming bands, and often with golden reflections; a small black axillary spot preceded by a golden blotch; soft dorsal, anal, and caudal fins tinged with gold on the outer margin.

The Sand or Tallegalann Mullet.

Light reddish-brown or dark green above; sides pink; lower surfaces silvery; a small black axillary spot.

This family is very widely distributed and is immensely plentiful along the whole coast of New South Wales. The difference in the *genera* named is that one, the *mugil*, does not possess teeth, the other, the *myxus*, possesses feeble teeth. The principal species are the sea mullet, *mugil grandis;* the flat-tail mullet, *mugil peroni;* and the sand or talleygalann mullet, *myxus elongatus.* Talleygalann is the aboriginal name for this mullet.

The sea mullet is the one of all our fishes that offers the greatest inducement for a special fishery for purposes of export. It makes its appearance on our coast in prodigious shoals in the months of April and May, travelling in a northerly direction and showing a disposition to enter every inlet and harbour along its course. It is at that time full of roe and in prime condition, prosecuting its migrations in search of suitable spawning grounds. The quantity locally consumed in a fresh state during this season, which lasts only six or eight weeks, is but infinitesimal in proportion to that which could be captured if means were available for securing the great shoals of the fish while at sea. But this in passing only. The late Sir William Macleay expressed the opinion that the ova shed in the autumn remains in the mud during the winter and does not germinate until the spring. It was in this way that he accounted for the presence, on one occasion, about the middle of October, in Elizabeth Bay, Port Jackson, of large shoals of the fry of this fish, but Ogilby contends that it spawns biennially, that is to say in the spring as well as the autumn, and that the fry which Macleay saw were the result of the spring spawning.

The ovaries in both the adult and immature fish are very large, while each individual ovum is exceedingly small; the quantity shed by an adult female has been estimated to number between two and three millions.

The young mullet on their emergence from the ova remain quiescent until the absorption of the yolk-sac, after which they wander in small schools along the shore in shallow water, mostly working up stream, frequently into purely fresh water; in such places they pass the first two years of their existence, during which they increase rapidly in size; they then drop quietly down the rivers and for the first time seek the open sea about the early autumn months, returning, however, much improved in flavor and condition during the months of January and February, at which time they are sent in large numbers to the Sydney market, where they are sold as "hard-gut mullet." It is scarcely necessary to say that this title is ridiculous, there being no difference in the hardness of the œsophagus of the immature and the adult fish; if, therefore, a distinctive appellation is necessary for the former, river, or, better still, estuary, mullet would be far more appropriate.

The mugils, owing to the absence of teeth, are in the ordinary sense of the term incapable of eating either vegetable or animal substances. In this connection it may be instructive to quote from the late Professor Gunther the mode in which these fish obtain their food. He says:—"They frequent brackish waters in which they find an abundance of food, which consists chiefly of the organic substances mixed with mud or sand; in order to prevent larger bodies from passing into the stomach, or substances passing through the gill openings, these fishes have the organs of the pharynx modified into a filtering apparatus. They take in a quantity of sand or mud, and after having worked it for some time between the pharyngeal bones they eject the roughest and most indigestible portion of it." The whole apparatus which Gunther describes very minutely constitutes a kind of sieve admirably adapted to permit a transit for the water through the gills, retaining at the same time every other substance in the cavity of the pharynx.

FLAT-TAILED MULLET.

(*Mugil peroni.*)

PHOTO-LITHOGRAPHED AT THE GOVT. PRINTING OFFICE,
SYDNEY, NEW SOUTH WALES.

The flat-tailed mullet, though it does not attain to the commercial importance of the sea mullet, nor possess the exceptional richness of flesh peculiar to that species, is of considerable value as a food, and is abundant and in good condition throughout almost the whole year. The spawning season appears to be spread over a number of months, specimens examined during December having been ripe for spawning, while others of the same catch had the ova in all different developments between that and the barely possible discernment of its formation in the ovaries; the main body, however, appear to shed their spawn about the latter end of spring or during the early winter months, but at any time between December and June, inclusive, spawning fishes may be observed. This prolongation of the breeding season doubtless accounts for the fact that they are rarely noticed to arrive in the enormous shoals, for which we are accustomed to look in the case of *Mugil dobula*.

The average marketable size of this fish is 12 inches, but it sometimes reaches 16 inches.

In habits, feeding, &c., it differs in no wise from the other species of *Mugil*. Not being so oily as the sea mullet it is more delicate in flavor, and more adapted for these reasons to the use of invalids.

This fish is found along our coast from south to north, but in the former direction quickly decreases in numbers.

The sand or tallegalann mullet does not materially differ from its congeners in habits, but is readily distinguishable by its expanded tail and the absence of an adipose membrane over the eye and its more pronounced dentition. It is a long-bodied fish, and is found chiefly on flats at flood tide, or near shoal waters abutting on a deep stream or channel. It is more delicate and palatable in the young than in the adult stage. It is found at the mouths of small fresh-water streams on clean white sand, and when half-grown will take a bait, dough kneaded with bread crumbs, and afford fair sport to anglers.

THE WHITING.

Family, **Trachinidæ**; *genus*, **Sillago.**

COLOURS.

Trumpeter Whiting.

Sandy brown above, silvery below; the sides with a conspicuous, median, longitudinal silvery band, and with seven or eight irregular dusky blotches directed obliquely forwards, which are sometimes very faint or even absent; cheeks golden, a dark green blotch on the opercles; spinous dorsal blotched, rayed dorsal spotted, with olive green; anal and ventrals golden; pectorals and caudal cloudy gray, the former with a deep black spot in front of the base.

Sand Whiting.

Sandy brown above with purple and green reflections; upper surface of head and the snout olive green; a broad but rather indistinct yellowish band along the middle of the sides; spinous dorsal with faint dusky blotches, the rayed with rows of blackish spots; anal and ventral golden; pectorals pale brown with a darker base; caudal yellowish with blackish margins.

There are two species of whiting on the New South Wales coast—the trumpeter whiting and the sand whiting. The habits of the two species do not materially differ, but the latter is larger and more handsome and is a greater market favourite. It is a delicious fish, and is regarded as a most suitable food for convalescing invalids—the flesh is of snowy whiteness, while in flavour it is perfect; like the gar-fish or the mullet, it has a distinctive taste entirely its own. Neither of the colonial species bears any similarity to the British whiting, which belongs to an entirely different family, the Gadus or cod tribe.

The trumpeter whiting sheds its spawn during the months of March and April—the ova is deposited on sandy beaches in sheltered bays and estuaries in shallow water, but the young fish are not observed until the early summer, the inference being that the coldness of the water during the intervening winter months impedes the development of the spawn. Ogilby says that each young fish is in possession of a hole in the sand, and at the mouth of it, which is only large enough to admit of the passage of its body, the little creature lies, and on approach of danger, or even the passage of a dark cloud across the sun, immediately disappears, the anterior half of the head however as quickly reappearing, thus showing that beneath the surface a chamber must exist sufficiently large to permit of the fish turning round with ease; should any movement occur to cause further alarm when in this position it is able to back down again into its hiding place with great celerity, but if perfect quiet is maintained it soon emerges and takes up its original position near the opening. To anyone curious in the matter it would be quite interesting to make observation of this habit, and it could easily be done (say) from such a position as the bridge over Narrabeen Lagoon or other similar points of vantage.

The breeding season of the sand whiting extends from October to December. The general mode of capture is by net, but the medium-sized fish is very generally caught by line on sandy flats and bays in smooth water. The best bait consists of small worms, but it can be attracted by any fish bait. The whiting is essentially a ground fish and, like its fry, has the habit, on approach of danger, of burying itself in the sand; in this way it frequently escapes capture by the net, which when too lightly leaded passes over the fish buried beneath. The whiting is present in our waters during the whole year, but the principal supply for market comes from Sydney Harbour, Botany, Broken Bay, Tuggerah Lakes, Lake Macquarie, and Wollongong.

SEA GARFISH.

(*Hemiramphus intermedius.*)

THE GARFISH.

Family, **Scombresocidæ**; *genus*, **Hemiramphus.**

COLOURS.

The Sea Garfish.

Back bright green, with three narrow dark brown streaks from the occiput to the origin of the dorsal, immediately in front of which the three meet; a silvery lateral band, broadest posteriorly, and margined above by a narrower lead-colored band; lower surfaces pale greenish-silvery; posterior part of the ventrals and the pectorals dusky.

The River Garfish.

Back pale green, the upper surface of the head darker with golden reflections; three narrow black vertebral streaks not extending backwards to the dorsal; two similar but irregular and broader streaks between these and the broad lateral silvery band, which is boarded above by a narrow orange streak; a faint black spot at the base of the pectoral.

The Short-beaked Garfish.

Bright green above, the head darkest, pale green below; sides with a broad well defined silvery band.

There are three species of this fish—the sea, the river, and the short-beaked varieties. These fish possess a distinctive and most delicious flavour, a flesh white, flaky, and delicate, and are highly esteemed as a choice article of food. They are present in the market during nearly the whole year, the principal takes occurring during July, August, and September. Opinion is divided whether these fish spawn once or twice in the year, but at any rate they are found with ripening ova from September to November. The sea variety, known to professional fishermen as Ballahoo, which beyond doubt is the most excellent of the three, frequents only the lower parts of estuaries and rivers, and its capture is effected by seines of special construction. It may be readily distinguished from the river species by the shape of its triangular upper jaw, which is longer than broad, while in the river variety it is, on the contrary, broader than long. The sea garfish may also be distinguished by the deciduous character of its scales; indeed, so deciduous are they that the fish often appear to be without any scales at all.

The river variety, except that it is a permanent resident in streams, differs but little from its congener, but its range of occurrence seems more limited, extending only to the tropical and sub-tropical parts of the coast.

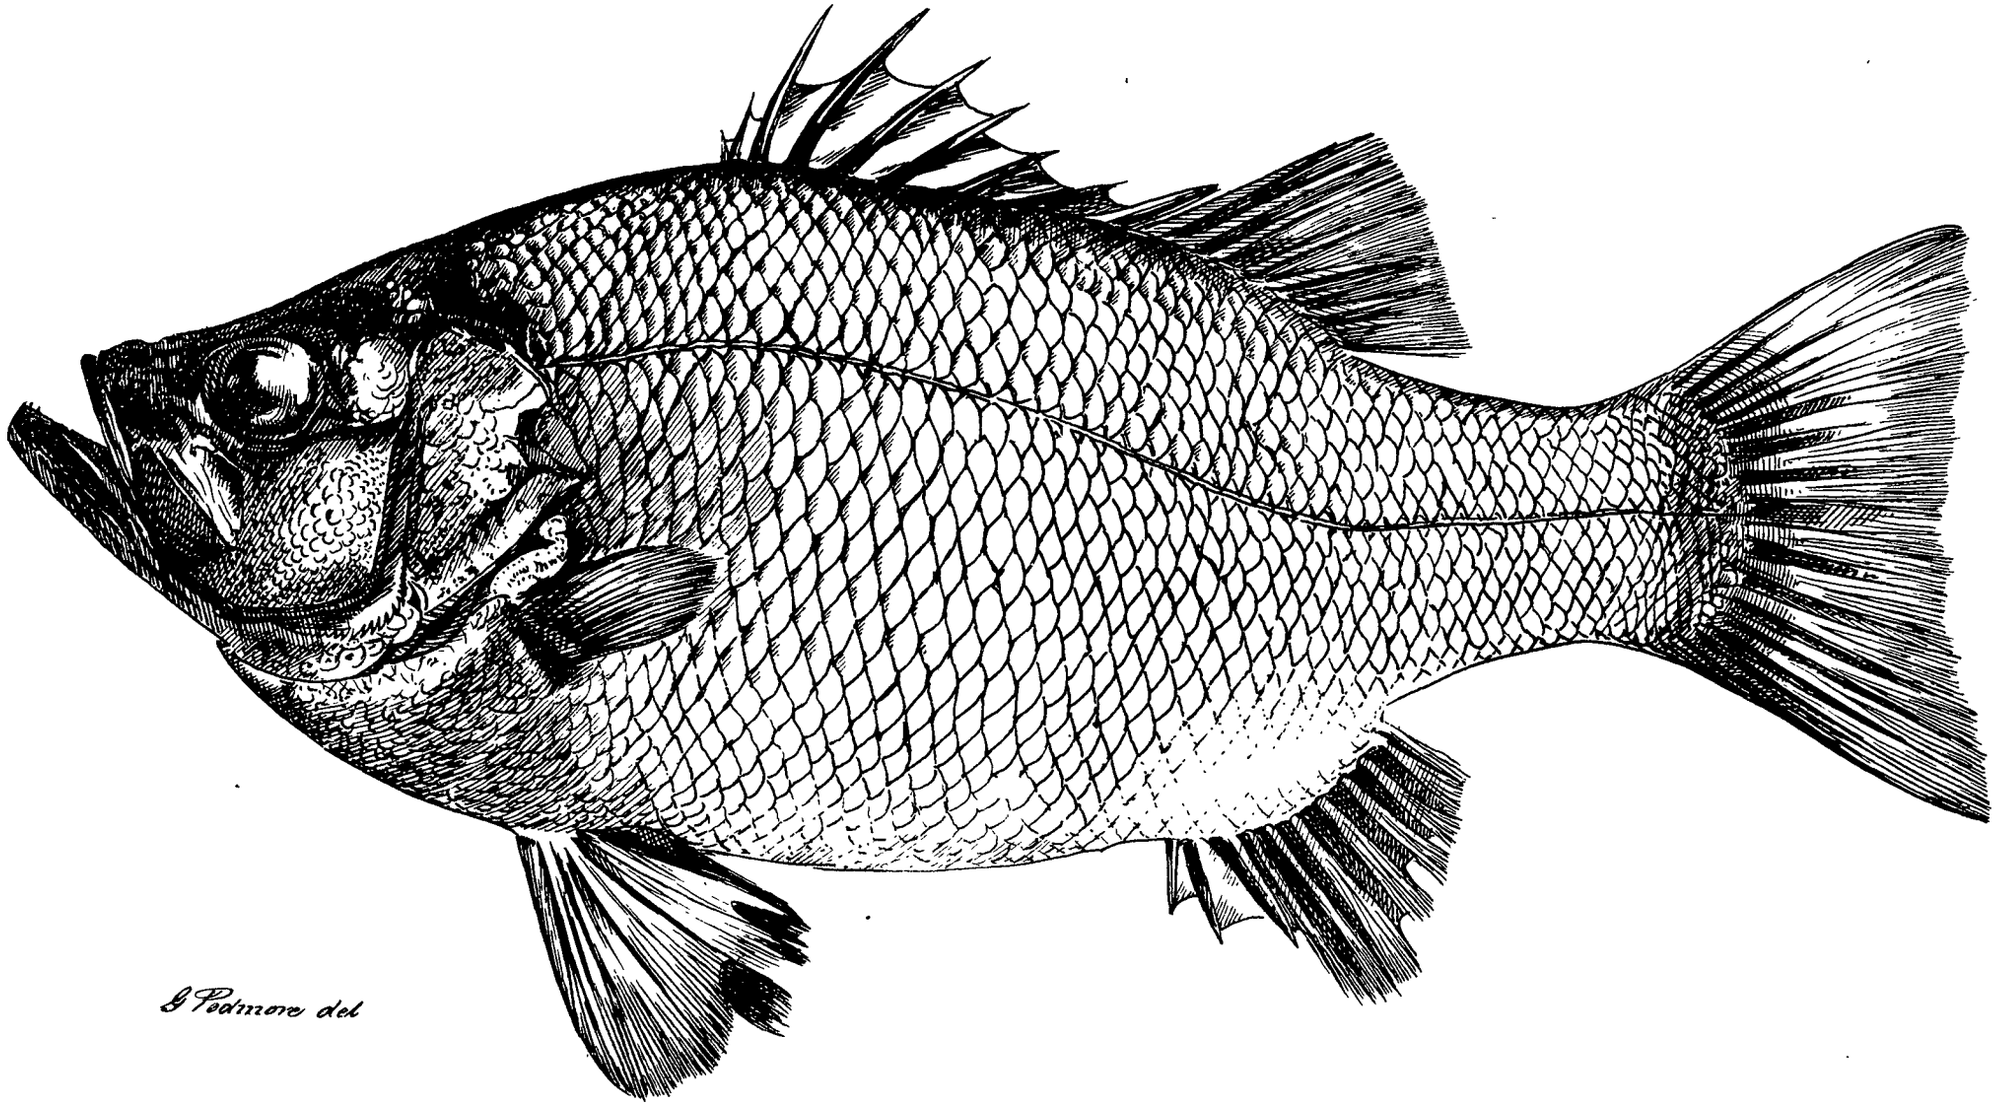
Of the short-beaked garfish there is not much to be said, except that it is most common in our northern rivers, from whence supplies are sent to Sydney during the summer months. Its time of spawning is supposed to be during those months.

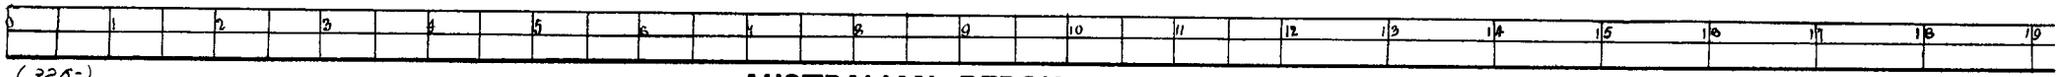
THE PERCH.

Family, **Percidæ**; *genus*, **Percalates.**

Colours.—Upper surfaces olive green, the head very dark; sides and lower surfaces gray washed with yellow; all the fins dark green.

There are several species of this family. The one referred to here is the perch of the Colony (percalates colonorum). It is really a fresh-water fish, that is to say, it has its origin in upper waters where the ova are deposited and hatched during the summer months, though in the more adult stage the fish frequents estuaries and mouths of rivers, and is extensively caught and sent to market. Its entrance into salt water very much improves its table value. When in that element its food consists principally of small fish and prawns, and these it will take readily as baits, but when located in its more proper habitat, the upper waters, it will take also worms, frogs, grubs, moths, grasshoppers, and such like. The perch is said to spawn in the winter months, but some fishermen contend that it spawns between November and January. It deposits its spawn amongst logs and debris in lagoons and upper waters. The perch frequenting the sea attain a weight of 7 or 8 lbs., while those captured in the river seldom exceed 3 or 4 lbs. The perch affords good sport to anglers. It loves quiet shady and deep holes in rivers, but when the tide is flowing it may be caught in the stream. In winter the particular bait is a small mullet or herring, or, better still, one of the small grubs that bore into trees. In the early spring months it will take a moth readily, either sunk or on the surface. The artificial salmon fly is also a splendid bait for trolling at this time. When moths are scarce a frog is a good bait at night; it must be fastened so that it can swim, or, if dead, must be played in the water to imitate a frog swimming. In summer, grasshoppers, especially the species known popularly as the "percher," are a good bait, but the best is a black house-cricket or an earth-worm. A prawn will be found effective when crickets cannot be obtained. The bait should be at least 4 feet from the float. In landing the fish great care should be used as the mouth is weak, and is easily torn away. As a rule, perch prefer tributary streams to main waters.





(326-)

OLD WIFE.

(*Enoplosus armatus.*)

THE OLD WIFE.

Family, **Percidæ**; *genus*, **Enoplosus.**

Colours.– Silvery white, with eight blackish vertical bands, the first from immediately behind the occiput passing obliquely forwards and downwards through the eye, and sending two narrow branches along the interorbital space to the snout; the second from in front of the first dorsal to the base of the ventral; the third very broad, beneath the first dorsal, and extending on to that fin; the fourth narrow, beneath the dorsal interspace; the fifth broad, between the soft dorsal and the anal, and continued to the extremities of their elongated rays; the sixth narrow, from behind the dorsal to the last anal rays; the seventh across the caudal pedicle, and the eighth across the base of the caudal fin.

Nothing is known of the breeding habits of the "Old Wife." It is but seldom captured by the hook, although it is abundant in sheltered parts of bays and estuaries, also frequenting wharves and probably attaching its ova to the tangle. Being an excellent fish for the table, it is to be regretted that it does not appear more frequently in the market, but this is probably owing to its habitat being on foul ground which the net cannot reach. It attains a length of 12 inches, the average length being 6 inches. It is known in Melbourne as the Bastard Dory, owing to its shape and the prolongation of the rays of the dorsal fin. It is also called the Zebra fish from its striped appearance.

THE BLACK ROCK COD.

Family, **Percidæ**; *genus*, **Serranus.**

Colours.—Body and fins deep blue black, uniform in the adult; young examples with or without scattered lighter spots on the sides of the head and body, and a black spot crossing the caudal pedicle above; spinous dorsal with a darker, soft dorsal and anal with a lighter submarginal band.

This fish, commonly known as the sea-perch, was in former days very abundant in waters adjacent to Port Jackson, but at the present time it is rarely captured there, though on the more northern parts of the coast it is abundant and grows to a large size, approaching in weight to something like 100 lb. A specially favourite ground for this fish is the coast-line between the Macleay and Clarence Rivers. It has been found as far south as Jervis Bay. For the table it is most excellent, possessing a flesh of exceeding whiteness, very firm and flaky, and of perfect flavour; by some it is regarded as the best edible fish on the coast. At Lord Howe Island, where it abounds, it is highly valued. But little, if anything, is known of the habits of this fish. Its time of spawning is supposed to be midsummer, though its mode of deposition and places of retreat for its fry are unknown. The habitat of this fish being in deep water, in the vicinity of rocks and reefs, it is captured only by line, and being very voracious takes a bait greedily. When once hooked it exhibits very little spirit, and suffers itself to be hauled up with very little show of resistance.

MURRAY COD.

(*Oligorus macquariensis.*)

PHOTO-LITHOGRAPHED AT THE GOVT. PRINTING OFFICE,
SYDNEY, NEW SOUTH WALES.

THE MURRAY COD.

Family, **Percidæ**; *genus*, **Oligorus.**

Colours.—Olive green above, with numerous small darker spots; below white or pale yellow; soft dorsal, anal, and caudal fins with or without pale margins.

This fish might more properly be termed the cod perch. We are said to have two principal species, the *Macquariensis* and the *Mitchelli*; the latter differing from the former in having a much broader head, a larger eye, the upper jaw longer than the lower, and a greater height of body. By the aboriginals of the Lower Murray the fish is known as "Pundy," and by those of the Murrumbidgee "Kookoobul." It is very voracious, devouring everything that its enormous jaws can compass. It has been known to reach a weight of 120 lb. The Murray cod is the principal fresh-water fish indigenous to the Colony which we possess, and it is much esteemed for the table; the flesh is snow-white, rich, flaky, and has a flavour distinctly and peculiarly its own. The young fish are to be found in the billabongs and at the heads of streams, the adult fish lower down. They seem to have their period of migration, ascending streams, in summer and descending them in winter; but as they thrive well in Lake George, where they cannot make their ascent and descent, their propagation and development are evidently not dependent upon facilities for migration. Not much has been attempted in distributing this fish in our various rivers. That it is capable of distribution is evidenced by the fact that it has been introduced successfully into Lake George, and that it has been found also in the Clarence River. Very little art is needed in the capture of this fish, a strong line, a large hook, and a bait consisting of beef or large grubs being all the appliances necessary. Indeed, being voracious and predatory to a degree, he can be lured by almost anything; but, when fairly hooked, he succumbs very quickly and remains quiescent until lifted into the boat, which, on account of his often great weight, is usually accomplished by means of a small scoop-net. The fish can also be captured by set lines baited in the like way. The set lines should be laid at night and overhauled early the following morning or even earlier if found convenient; but the method of capture of this fish in quantity is by net. Although contrary to law, these nets are frequently set right across a stream and are provided each with a huge bag; by this means every fish, small and large, passing along a stream is captured. It is in this way that much of the large supply which is sent from the Murray to Melbourne is secured, No exact season for spawning can be stated. It is probable that it spawns in different rivers at different times. Those in the Murrumbidgee River are said to spawn between November and January. A peculiarity in connection with the Murray cod may be stated. It is that it carries within itself a perfect drawing of a tree. Some contend that it is an impression of the tree under which it had spawned. Be that as it may, it is within the means of any angler to obtain a view of the tree, or even to remove the tissue on which it is impressed, and preserve it for exhibition to his friends. The *modus operandi* is as follows:—Lay the fish on his port or left side—that is, with his back fin towards the right hand; then cut from the tail close along the backbone as far as the first rib; cut the first rib through, but be careful not to disturb a very thin transparent skin, something like tissue paper; if necessary spring a few more of the ribs and pull the fish asunder, the picture of the tree will then be exposed in the skin, on which, if carefully removed and spread on a sheet of paper, it will be more plainly seen.

THE BLUE GROPER.

Family, **Labridæ**; *genus*, **Platychærops.**

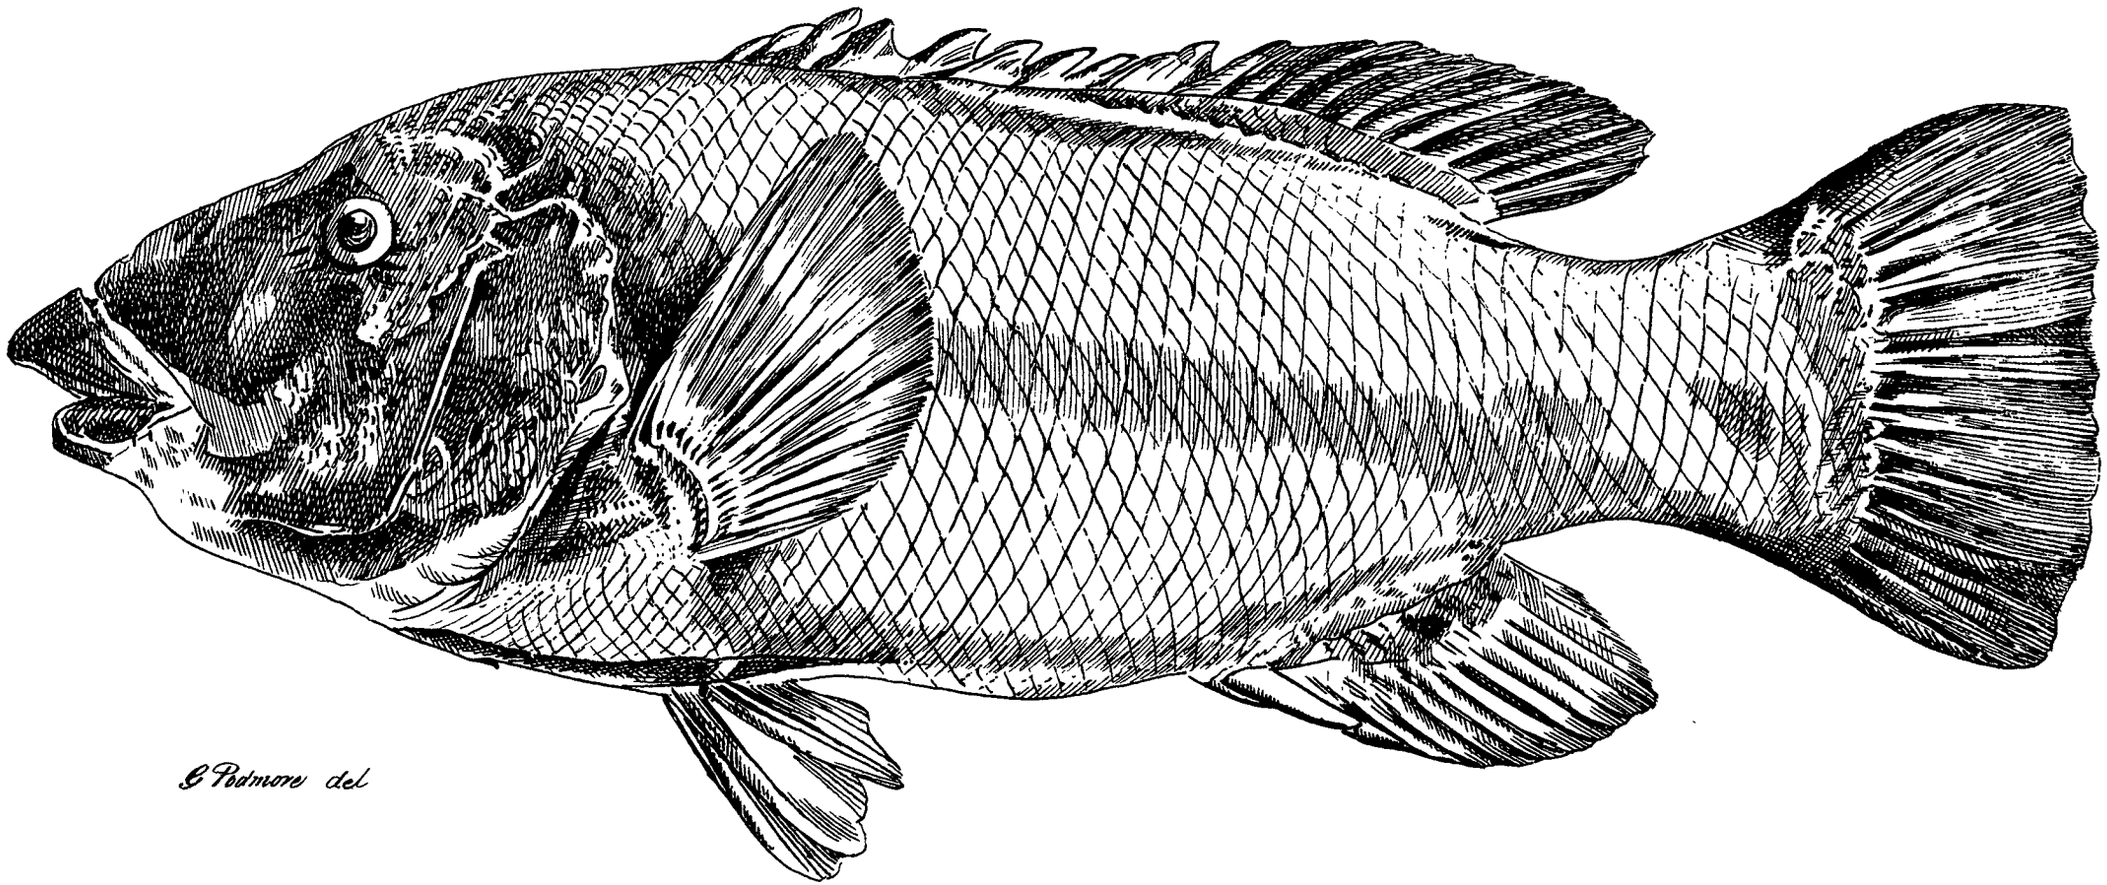
Colours.—Above purplish-brown, sides and lower surface yellowish-brown, each scale with an orange spot or vertical bar; a narrow orange band encircles the eye; sides of snout with three similar bands, one of which crosses the cheek, separated by blue bands; fins purple, the membranes of the anterior rays of the dorsal and anal with orange spots; all these markings are most conspicuous in the young, but almost totally disappear in adult examples.

The blue groper, which has probably obtained its name from its habits, is essentially a rock-loving fish, its favourite haunts being rocky points, rising from a moderate depth, and with the bottom shelving somewhat rapidly into deep water; in such spots it may be found, coming in with the flood tide to search every wave-worn crevice and channel for the molluscs, crustaceans, echinoderms, and starfishes, which form the bulk of its food, and retiring with the ebb to the deeper waters in the vicinity; it is an unsociable fish, not more than two being found about the same spot, and then possibly only during the spawning season, and each one appears to confine itself to its own particular stretch of shore.

It is a clumsy-looking fish with large scales very difficult of removal, except immediately after capture, while even then it is a somewhat difficult task. The fish attains to a maximum weight of 40 lb., and a length of $3\frac{1}{2}$ feet. Nothing positive is known of its breeding habits, but it is supposed that the ova is deposited in crannies amongst weed-covered rocks.

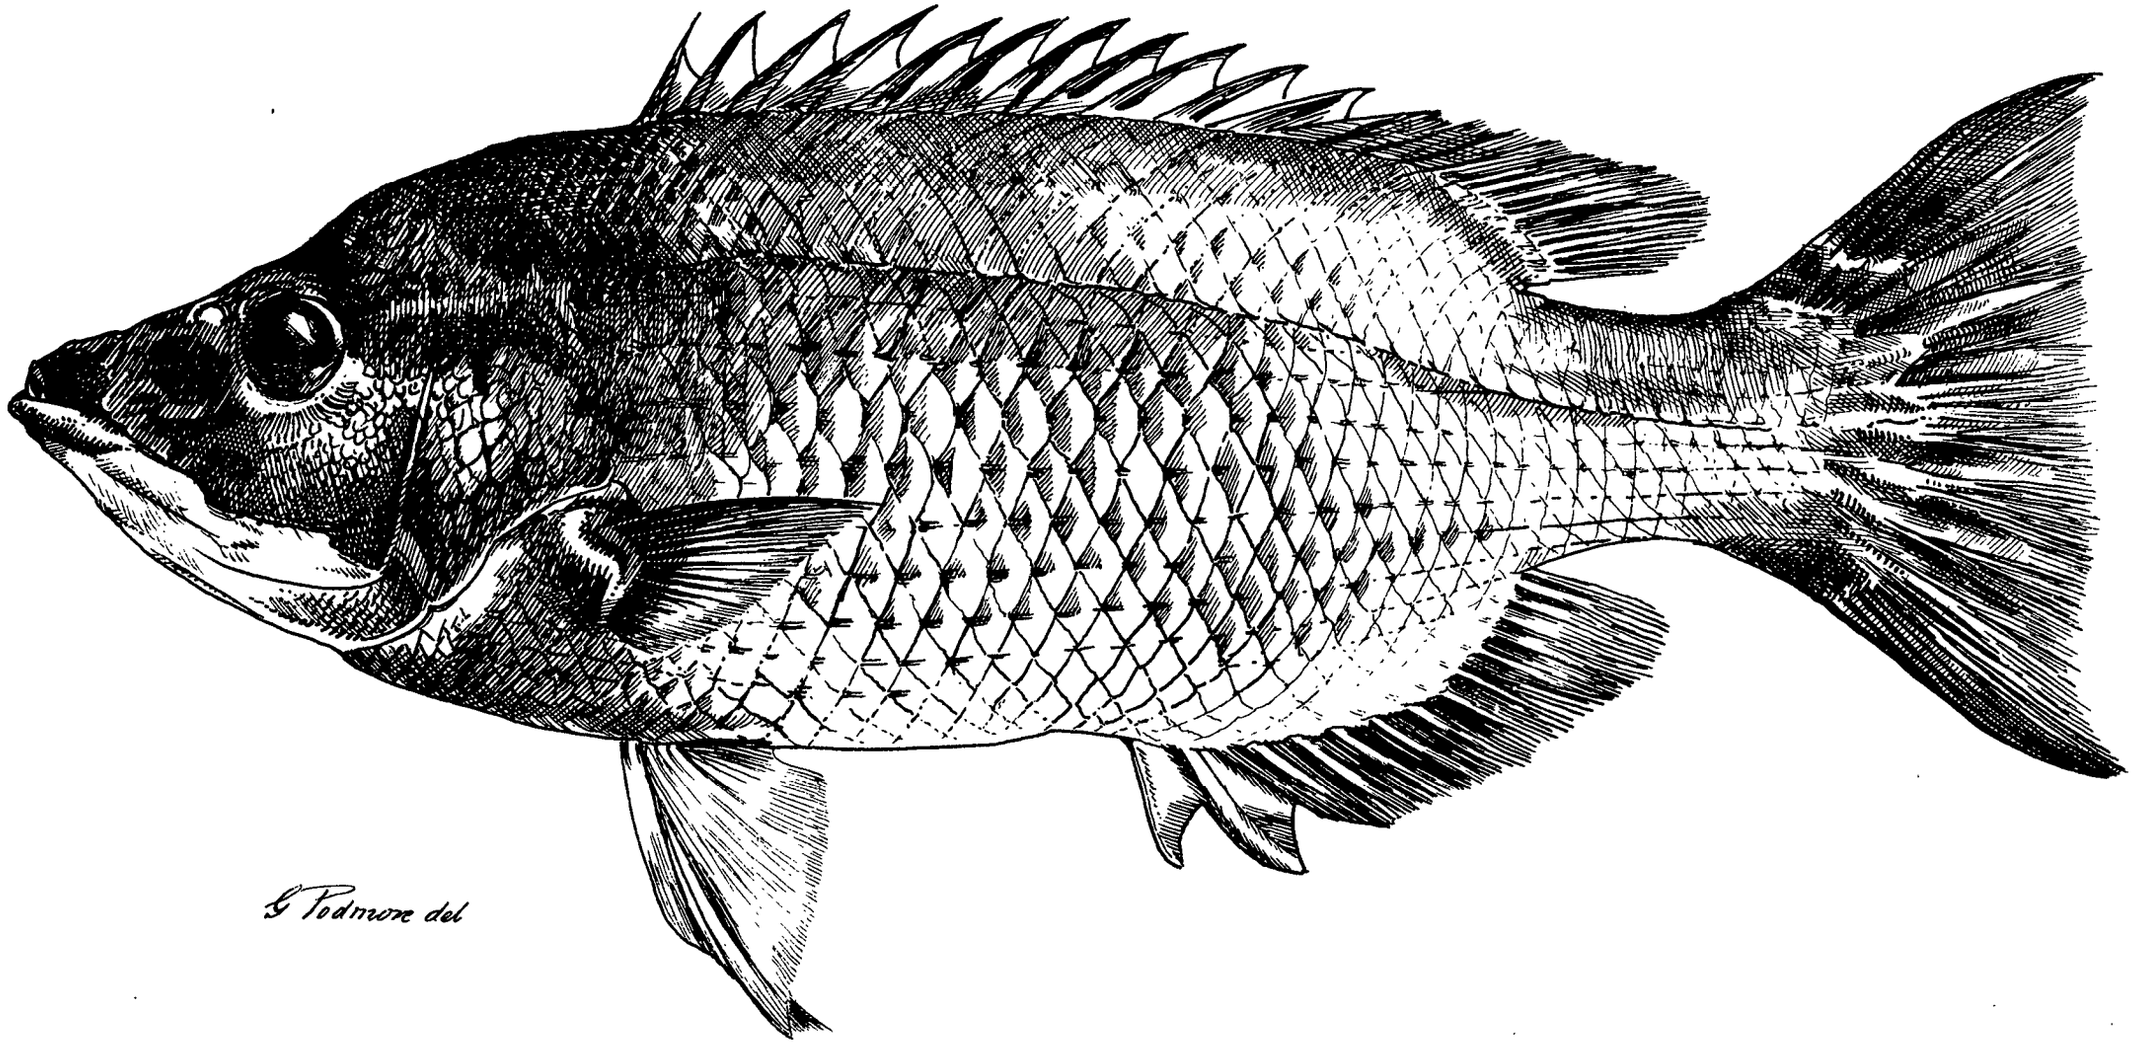
Blue gropers are sometimes taken in the meshing-net, but the greater number sent to the market are caught by hook and line, crab, squid, and cuttle being the best baits. Mr. E. S. Hill says that the bait should be crabs; it is usual to wrench off the legs and shell, and having broken them up throw them out as berley mixed with oysters and comminuted oyster-shells, by which means they are often decoyed from their hiding-places; "the body of the crab is then secured to the hook with a piece of thread or flax and thrown out; if a groper should be at home that is the surest way to entice it."

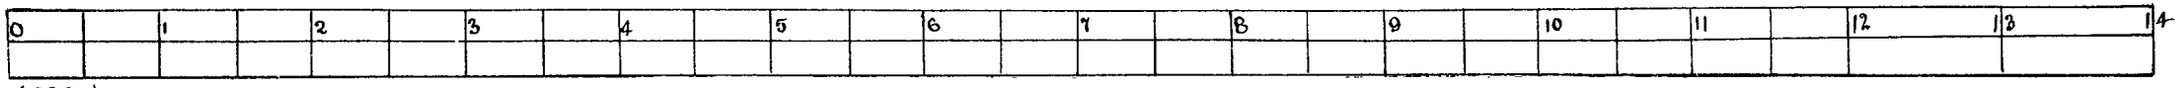
It is somewhat surprising that the blue groper, though an excellent table fish and of common occurrence on our coast, is rarely to be seen in the market, even though it can always command a high price.



BLUE GROPER.

(*Platychærops gouldi.*)





(326-)

PIG FISH.

(*Cossyphus unimaculatus.*)

PHOTO-LITHOGRAPHED AT THE GOVT. PRINTING OFFICE,
SYDNEY, NEW SOUTH WALES.

THE PIG FISH.

Family, **Labridæ**; *genus*, **Cossyphus.**

COLOURS.

Spotted Pig Fish.

Deep scarlet above, gradually changing into pink or saffron yellow below; each scale on the sides has a narrow median reddish streak, thus giving the fish a longitudinally banded appearance; a large pinkish patch below the origin of the rayed dorsal, and some small spots of a similar colour in front of it on or near the lateral line; dorsal and caudal fins scarlet, with a more or less broad lighter margin; the former with a large dark blue spot between the sixth and eighth or seventh and ninth spines, surrounded, except at its base, by a pearly white band, similar, but small, spots generally present on the adjoining spines; anal scarlet anteriorly, yellowish posteriorly; ventrals hyaline, with the outer ray golden; pectorals reddish, with a small dark blue axillary spot; irides orange.

Banded Pig Fish.

Red above, the upper surface of the head brightest, gradually passing into pale saffron below; each series of scales with a narrow, dull, reddish-brown longitudinal streak; three rows of oblong crimson spots on the back and sides, the upper one just below the base of the dorsal fin; the median and lower rows commencing close together at the posterior margin of the eye, the former following the curvature of the lateral line, the latter straight; spinous, dorsal, pectorals, and ventrals pink; rayed dorsal, anal, and caudal yellow; irides silvery, with three orange spots round the pupil.

There is but little if any difference in the habits and mode of life of these two species, except that the spawning time of the latter may be a trifle the earlier, fully developed ova having been found towards the end of July, while the former has been found with ova ripe for extrusion in September or October, but nothing is recorded or known as to places of deposition or subsequent habitat. As may be judged from the colours above described this fish presents a very handsome appearance. It is also an excellent table fish, possessing all esteemed qualifications. It has acquired its name on account of its elongate conical snout and its thick fleshy lips, this peculiarity being common to the Labridæ family. It is a littoral fish, feeding chiefly on molluscs and crustaceans, its system of dentition being admirably adapted for crushing hard substances. It is not a common fish in the market though scientists contend that it should be abundant in all suitable localities in the vicinity of Port Jackson at least, though its occurrence on other parts of the coast is not recorded.

THE SERGEANT BAKER.

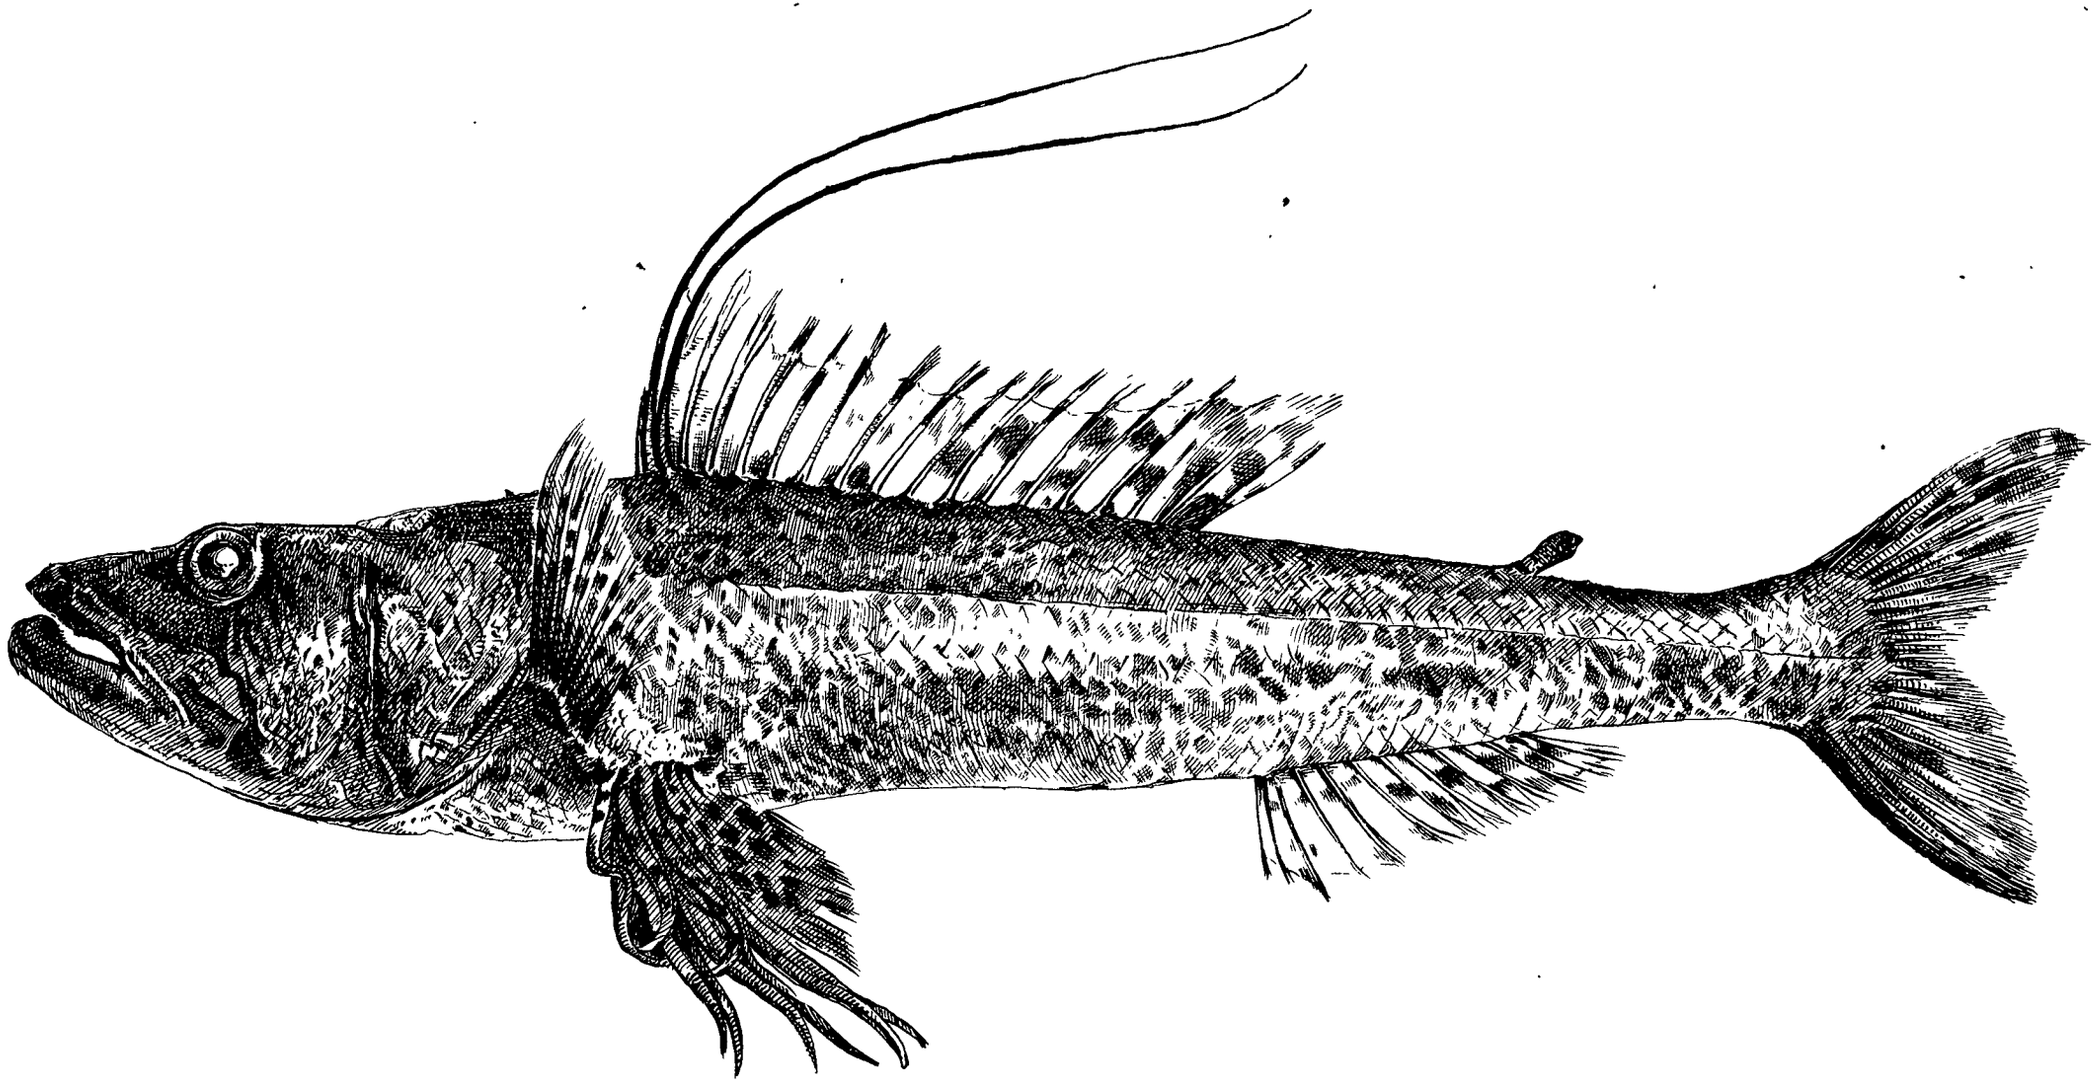
Family, **Scopelidæ**; *genus*, **Aulopus.**

Colours.—Upper surfaces purple with a more or less prevailing tinge of red and with the edges of the scales crimson, and the top of the head sometimes spotted with the same colour; back and sides with large irregular crimson spots or transverse bands covering two or three scales in width, not reaching across the abdomen; the sides are of a paler purplish-red than the back, and gradually merge into the pearly white of the abdominal region; dorsal and caudal fins pale yellowish-red obliquely banded with rows of crimson spots, which are frequently confluent on the caudal lobes; adipose fin basally purple, terminally crimson; and white or pale straw-colour with orange longitudinal bands; ventrals and pectorals yellow with crimson transverse bands.

The Sergeant Baker—so named probably from having been first obtained after the founding of the settlement by a sergeant of that name—frequents moderately deep water on the outside reefs, but is rarely taken inside Port Jackson. It is not an uncommon fish, but as those which find their way to the Sydney market are with rare exceptions taken by the schnapper fishers the supply is never equal to the demand. In examining a series of fresh specimens taken at all seasons of the year two points are likely to strike the observer, namely, that the stomach will almost invariably be found empty, it being exceedingly rare to find ova in any stage of development in the ovaries; in a few cases ova have been detected in a very early stage, and these occurred during the spring months. It is a good fish for the table, the flesh being white, firm, flaky, and well flavored.

Its range is very imperfectly known.

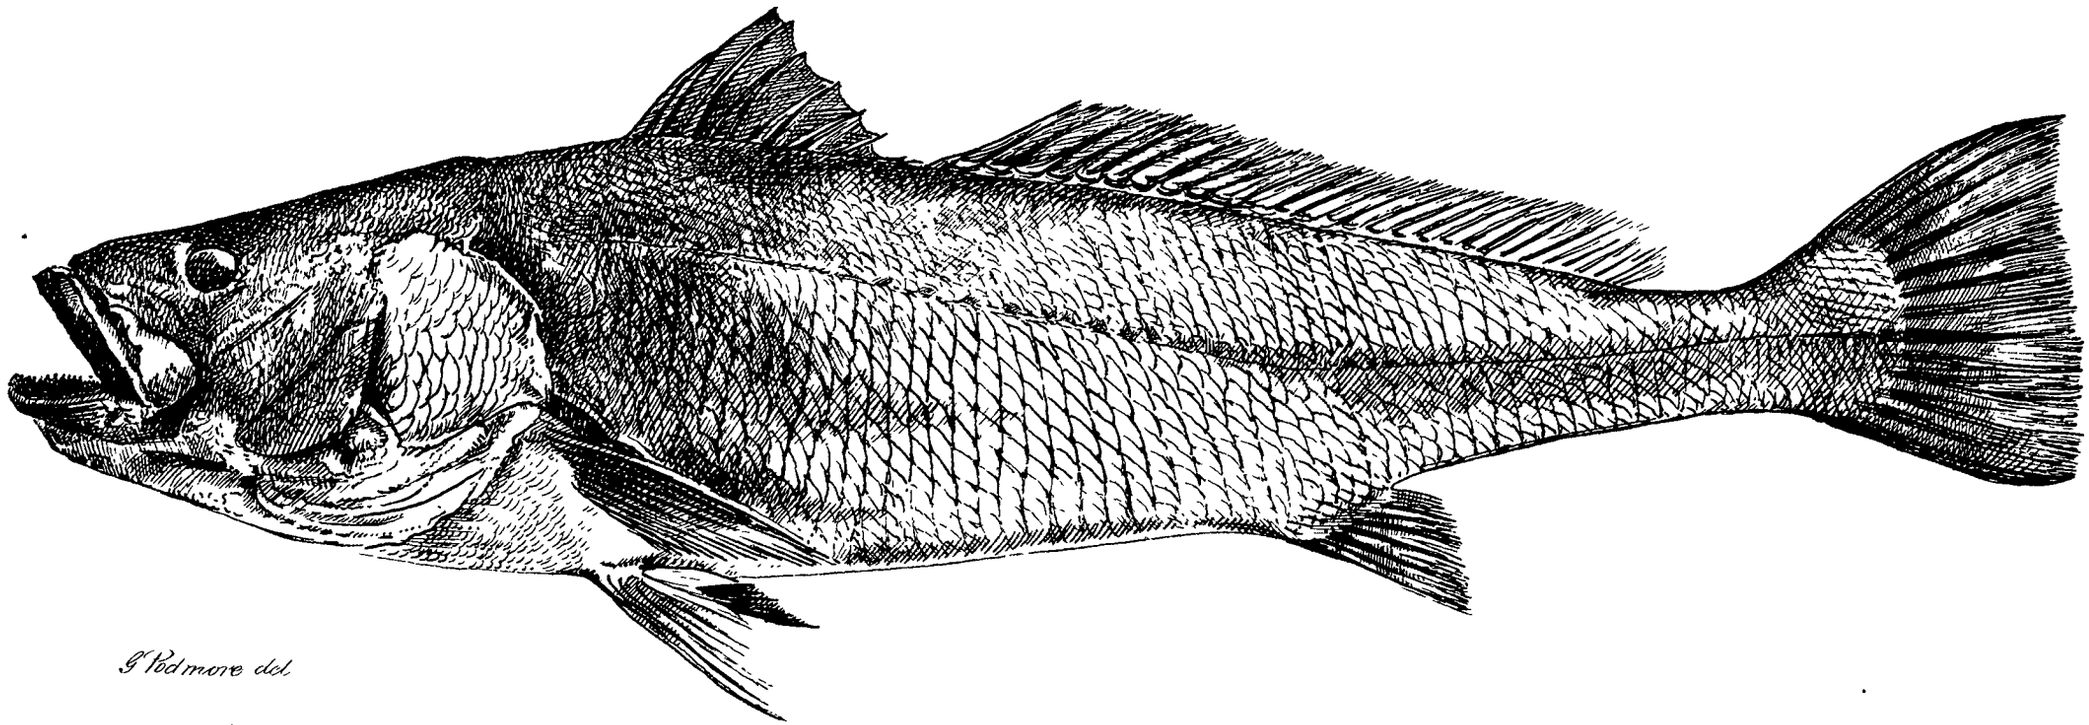
The Sergeant Baker attains to a length of 24 inches, and may be captured by line and very occasionally by net.



G Podmore del

SERGEANT BAKER.

(*Aulopus purpurrisatus.*)



JEWFISH.

(*Sciæna aquila.*)

THE JEWFISH.

Family, Sciænidæ; *genus*, Sciæna.

Colours.—Deep steel blue above, gradually changing through the silvery of the sides into the white of the lower surfaces; head not so brilliantly tinted above as the back, its sides suffused with gold; a black axillary blotch; all the fins, except the ventrals which are white, pale brown; irides golden and brown; inside of jaws and lower margin of the opercular region orange.

The jewfish attains an immense size, and is abundant along the whole stretch of our coastal line—it is exceedingly voracious, and nothing in the shape of fish comes amiss to it. The adult is extremely cunning; when in search of its prey it will ascend rivers even beyond the limits of tidal influence, making sad havoc amongst spawn and fry. But little is known of its time of breeding, though one observer, Mr. Hood Pegus, of Yamba, at the mouth of the Clarence River, asserts that it spawns in May. The air bladder of this fish is unusually large. It was in evidence before the Fisheries Inquiry Commission of 1880 that the bladder of fish of this genus formed, on the Malacca and Indian Coasts, a valuable article of export, the merely dried bladder being worth three shillings of our money per pound. It is a matter for regret that in New South Wales no heed is paid to this as a commercial product, the bladders of many thousands of fish caught annually being thrown away in common with the scales and entrails.

The jewfish seizes fish or squid bait voraciously, and affords splendid sport to the amateur, as when hooked it fights dearly for life. It frequents points where the water is deep and the tide strong. Here it lies in wait for its prey, but after rain, when the water is muddy and discoloured, it sallies out thence in every direction. Early morning or nightfall is a favourite time for fishing for jewfish. The jew is a much prized fish in restaurants, the flesh being white and of fair flavour. When schnapper is scarce, the jew is frequently served up as schnapper, from which in the cooked state it cannot readily be distinguished, except, of course, by connoisseurs. The fish cures very readily, and when properly smoked is an excellent article of diet. An adult fish will weigh from 50 to 60 lb.; at this weight the flesh is coarse and unpalatable; when under 2 feet in length it is called the silver jew, and in that stage is most suitable for food.

THE TERAGLIN.

Family, **Sciænidæ**; *genus*, **Otelithus.**

Colors.—Upper surface and sides silvery, below white; dorsals yellowish-gray with darker spots at the base; caudal yellowish-gray with the outer margins dark; pectorals with a black spot at the base inside; ventrals pink; anal silvery with the elongate rays dusky; inside of mouth and inner margin of opercle orange.

The name teraglin is stated to be aboriginal, but its signification is not known, neither are the habits or manner of life of the fish. Our first acquaintance with it is when it makes its appearance from seaward during the late winter and the spring months. Like the jewfish it is very rapacious, but as to a great extent it confines itself to the vicinity of the mouths and rivers of estuaries, that is to say, it seldom ascends upper waters, it is not so generally destructive to young fish-life as its congener. Ogilby states that, so far as is known, it is found only on the New South Wales coast. It has a fine handsome appearance, and is amongst the best of our food fishes, being superior to the silver jew. It would seem from official returns that its principal resorts are the harbour of Port Jackson, Botany Bay, and Long Reef, though doubtless it is present in more or less quantity all along the seaboard. Like the jewfish its air-bladder is of large size, and could be profitably used in the manufacture of isinglass. It is said that the bladders, without any preparation beyond simple drying in the sun, would be worth from threepence to sixpence each.

(326-)

AUSTRALIAN SALMON.

(*Arripis salar.*)

THE AUSTRALIAN SALMON.

Family, **Grystidæ**; *genus*, **Arripis.**

Colours.—Upper surfaces green, the head the darkest; young examples with darker spots; lower surfaces white; fins hyaline.

The species—*salar*—in its adult state, is known to Australian fishermen as salmon, and its young as salmon-trout, but it must not be confounded with the Salmonidæ family, to which it bears no relation whatever. It obtains its name merely from a similarity to that fish in its shape and bright appearance, and from its lively habits.

During the summer months the Australian salmon presents itself in immense shoals, and at these times so numerous and general is the catch that often the fish becomes so perfect a drug in the market as to be almost unsaleable, and when other fish are abundant the fishermen find it not worth while to send it to market at all. Bushels upon bushels of salmon have, upon occasion, been left upon beaches to rot. On one of these occasions at Lake Macquarie these dead fish induced such a pestilential condition of the air that special means had to be taken to remove them.

The salmon-trout is a very fair table-fish, and Cohen contends that the adult salmon also would, if properly and systematically utilised, yield ample profit to all concerned in the industry. He asserts that if treated after the manner of cod or ling it would form as palatable an article of food, and that, considering our large imports of those fish, it is more than surprising that it should be allowed, year after year, to pass our doors, as it were, untouched and unheeded.

The Australian salmon is supposed to commence spawning in September, but very little is known as to place of deposition, though, as small fry are sometimes found washed ashore on ocean beaches after heavy weather, there is a possibility of the spawn having been deposited in the sand in suitable places. The salmon especially those which have been previously wounded take a bait freely. Their food consists of fishes and crabs.

THE MACKEREL.

Family, Scombridæ; *genus*, Scomber.

Colours.—Upper surfaces bright-green, frequently becoming dark-blue after death, with numerous irregular, wavy, transverse bars; sides paler green, with darker spots and short streaks; lower surfaces pearly white, washed with orange and pink, and ornamented with many more or less indistinct dark-gray blotches and spots; interorbital space pale; cheeks with a golden tinge.

Large shoals of mackerel appear upon our coast at irregular intervals during the year, and their visits may number as many as three or even four in the twelve months or may be entirely wanting during a similar period. Those shoals which periodically appear in the bays and inlets of our deeply indented coast, consists entirely of immature fishes, never or very rarely exceeding 12 inches in length, and showing no trace of their having spawned in the past, nor any likelihood of their so doing in the near future. We are, therefore, indebted for these visits solely to the abundance or scarcity of suitable food, which consists chiefly of the fry of other fishes, and, according to Mr. Edward Hill, of shrimps and young prawns. Taking into consideration the thousands of individuals which go to comprise a single shoal, and their extreme voracity, necessitated by an exceptionally active mode of life, it is not surprising that these sources of food supply are quickly exhausted, and this having been effected the shoals disappear as suddenly as they had previously made their appearance. There seems, however, to be a general consensus of opinion that enormous shoals of mackerel annually pass along our coast about midsummer, heading in a northerly direction, but whether these shoals consist of adult and breeding fishes, or what their ultimate destination is, can only be conjectured. It is, however, more than probable that these shoals are engaged in the very act of shedding their spawn. The mackerel, though normally a fish of very rapid growth, such growth may be retarded by the absence of suitable food, or by a long continuance of cold and stormy weather.

Mackerel give excellent sport to the line fisher, either from a boat under easy sail or anchored in a strong tideway, so as to permit of the lines, of which it is always best to use several in each boat, streaming away behind, the sinkers used being of course graduated to the swiftness with which the boat is moving or the strength of the tide; nor must it be lost sight of that the Australascius species is much more liable to be taken near the bottom than from the surface. Mackerel are not by any means choice in their selection of a bait, almost any glittering substance being sufficient to attract them, but the most effective is a strip cut off the side of the tail of another mackerel, which, when in motion through the water, has a wonderful resemblance to the sinuous movements of a small fish, and being exceedingly tough a single bait may with care be used for the capture of a number of individuals.

Mackerel are excellent when freshly caught but they will not stand exposure to the light of sun or moon, They become flaccid and dangerous as food, and even as bait they are soft. Care should be taken to use them for the table only when fully assured of their immediately previous removal from the water. In that stage, and having been well bled, the mackerel is an excellent food.

HORSE MACKEREL.

(*Pelamys chilensis.*)

PHOTO-LITHOGRAPHED AT THE GOVT. PRINTING OFFICE,
SYDNEY, NEW SOUTH WALES.

HORSE MACKEREL.

Family, **Scombridæ**; *genus*, **Pelamys.**

Colours.—Back green with violet reflections, below silvery; a broad dusky band covering the upper surface of the head and extending along the dorsal profile to the base of the rayed dorsal, growing gradually narrower posteriorly; five to eleven dark longitudinal wavy bands on the sides, the lower ones faint or wanting; dorsal fins dusky, the upper third of the anterior spines darkest, of the rays yellowish, as also are the tips of the finlets; anal and ventral fins whitish; pectorals and caudal blackish; irides silvery.

The horse mackerel, as this fish is invariably called here both by fishermen and dealers, appears on our shores in considerable shoals at irregular intervals, and even ascends shallow bays and estuaries to some distance in pursuit of fry. Specimens obtained from Port Jackson and Botany during the month of March contained ova in an early stage of development.

Like all its allies, these fishes are exceedingly active and voracious, nothing which it can swallow coming amiss to its appetite, while as food it is only very moderate when quite fresh.

The horse mackerel is the scad of Europe; it is dry in its character, and requires much garnishing to make it palatable. Like all deep-sea fishes, such as the bonito and albicore, it prefers a live bait, and is readily caught by an artificial one over the ship's counter. The pace these fishes swim at is astonishing. E. S. Hill says that on one occasion coming coastwise in a steamer, and when off Port Macquarie, we caught several by towing a line over the stern, the hook covered with a piece of white rag in the shape of a small squid; then we were going about ten knots, and the mackerel appeared to be playing near the stern in the wake—every now and then they would start off as if the ship was at anchor. We were going too fast for the generality of fishes, that is to catch them in the way described. There are many of the deep-sea fishes caught in this way. The usual method is, when the vessel is going through the water at three to five knots, to put out a line with an artificial bait, and to have a small bridle of twine fast as well as the line on board; the bridle being the first to have a strain is easily snapped when any additional weight is put on; consequently, that being an indicator, soon tells when anything is fast. By this means a line can be set, and which requires little attention except when a fish is on, and does not bore the parties by looking after it.

THE FLATHEAD.

Family, **Cottidæ**; *genus*, **Platycephalus.**

Colours.—Rich brown above and on the upper half of the sides, the head lighter with numerous reddish-brown spots sides of head and subopercular flap spotted with pale olive green; lower half of sides pale greenish-yellow with indistinct blotches of olive green; white below; first dorsal with a series of small chestnut spots in front of each spine; second with the spots crossing the rays, forming interrupted bands; upper third of caudal similar to the dorsals, but with much larger spots; the remainder dark bluish-gray, unspotted, and narrowly edged below with white; pectorals grayish, thickly freckled with reddish-brown; ventrals similar, but with much larger spots, and with the spine and a narrow margin white; anal white.

This fish is common to the whole length of our coast. Fishermen recognise two principal species—the drab or sand flathead of the sea, and the brown or black mud flathead of the rivers; but they are said to be so similar in their habits and construction that their few distinctive characteristics need not necessarily be regarded here. The flathead may be found in bays and estuaries as well as at long distances up rivers; it also frequents sandy bottoms at sea in deep water; numbers are captured by the seine, and though really a sluggish fish on the hook, is much sought after by amateurs. It can be caught with prawns or fish bait quite readily on the sandy bottoms of inlets and estuaries during the summer months, but in colder weather it makes its way to deep water, where also it may be captured at considerable depths. The flesh is white, firm, and flaky, and of excellent quality.

A favourite mode employed by amateurs of capturing this fish is by drifting in calm weather over stretches of sandy bottoms where they abound; by this means it is possible on occasions to secure large numbers in a short space of time. The flathead is a ground fish, and has the habit of burying itself all but its eyes in the sand. Great sport can be had on a sunny day by watching for the fish from a drifting boat, and transfixing the animal with a light spear.

The flathead is armed on each gill cover with a double thorn, with which it can inflict a most painful wound, so that great care has to be observed in unhooking the fish. A wise precaution is to stun it by a sharp blow on the nose before attempting to extricate it from the hook. The flathead is in roe in January and February, and sheds it in February or March. Its food consists of squid, small fishes, worms, and crustaceans.

RED GURNARD.

(*Trigla kumu.*)

PHOTO-LITHOGRAPHED AT THE GOVT. PRINTING OFFICE,
SYDNEY, NEW SOUTH WALES.

THE RED GURNARD.

Family, **Cottidæ**; *Genus*, **Trigla.**

Colours.—Upper surfaces and sides of the head red, with or without an admixture of brown; lower surfaces white washed with pink; dorsal and caudal fins reddish with a strong tinge of yellow, the latter colour frequently predominating on the posterior half of the caudal; anal and ventral fins white or pinkish; pectorals externally pale red, the membrane frequently tinged with violet, and with a broad pale blue marginal band posteriorly; the inner or posterior side olive green or purple, with more or less numerous light blue spots on its outer half, and with a large black blotch on the lower third of the fin, the spots on which are milk white.

The red or, as it is sometimes called, the flying gurnard may be recognised by its peculiar squarish head and long broad pectoral fin-like wings. A peculiarity of this fish is the possession of three finger-like pectoral appendages which serve as organs of locomotion and touch. As will be apparent from the colours described above, it presents a most beautifully ornamented appearance. From the size of its pectoral fins it might be supposed that this fish is capable of supporting its body in the air like the flying fish; it is not known, however, to exert this power, or even to possess it. The peculiar structure of its head enables it to move without injury amongst stones and rocks, and drag from thence the crustaceans, molluscs, and small fish which constitute its food.

The spawning season of this fish on our coast is not accurately known, but from observations made by Ogilby the period is supposed to be November and December. The fry are never seen in the harbour, nor have they been discovered amongst *débris* drawn up by the seine. Though as a table fish it is excellent, it is seldom seen in the market, for, being an inhabitant of deep water, fishermen do not possess appliances for its wholesale capture, so that the only specimens to be obtained are stray individuals taken by persons engaged in schnapper fishing. When taken from the water this fish emits a grunting noise which has earned for it the soubriquet of "Growler." This noise is said to be caused by the escape of gas from the air bladder through the pneumatic tube. The species delineated grows to a length of 20 inches.

THE SOLE.

Family, **Pleuronectidæ**; *genus*, **Solea.**

COLOURS.

Narrow-banded Sole.

Right side rich purplish-brown, with numerous narrow lighter bands, which frequently branch and connect with the neighbouring bands, and are extended on to the margins of the fins; left side white.

Black Sole.

Right side rich dark olive brown with some large round darker blotches, and occasionally with small round yellowish or cream white spots; left side white, not unfrequently clouded with yellowish-brown or slate-blue in irregular patches; vertical fins narrowly margined with white or pale-straw colour; posterior half of the dextral pectoral black.

There are two principal species of this genus, the narrow-banded sole and the black sole—the colours of each are given above.

There is a considerable similarity in the general appearance of the sole and the flounder, so much so that the latter is frequently palmed off to the purchaser as the former. The sole may be distinguished by the extreme shortness of its tail, and the continuity of the rays around the fish, while in the flounder there is a pronounced tail, and a space between the dorsal and anal rays and the caudal fin. The sole will not take a bait—he feeds on molluscs, crustaceans, and worms when lying perfectly flat upon the ground, dark side up, and almost completely covered with sand and debris, leaving his mouth, which is formed very like the letter S, and without perceptible teeth, free to take that food. Having, like the flounder, its habitat so close to the ground it is difficult to secure this fish with the net, so that the best known method of capturing it is by the spear during calm mornings while the water is clear and free from ripple. The spear should have but one fine steel prong to probe the sand on the feeding patches. When the fish is speared it makes but little resistance, and is easily brought to the surface. The spear is used from a light boat either set to drift over the feeding patches or to be gently propelled by the spear. The fish when only partially covered is easily seen and captured. In the summer months they usually feed along the edge of a channel, in the winter they frequent deeper water generally just inside ledges or banks of sand formed by the tide, they are then more difficult to find.

FLOUNDER.

(*Pseudorhombus arsius.*)

PHOTO-LITHOGRAPHED AT THE GOVT. PRINTING OFFICE,
SYDNEY NEW SOUTH WALES

THE FLOUNDER.

Family, **Pleuronectidæ**; *genus*, **Pseudorhombus.**

COLOURS.

Large-toothed Flounder.

Yellowish-brown with or without darker blotches, which are most constant, and frequently edged with white, on the lateral line.

Small-toothed Flounder.

Rich brown above, the edges of the scales with a rusty tinge, with numerous small, round, milk-white spots, which are sometimes confluent, and with five dark spots on the lateral line, the second and fourth of which are the most conspicuous, each spot being closely dotted with yellow; the anterior portion of the dorsal faintly marbled, posterior with dark blotches, which are more pronounced on the outer two-thirds of the fin; anal similar, but more richly coloured; caudal clouded with light brown; lower surfaces white.

Ogilby describes two species of this fish, to which he gives respectively the popular names of the larged-toothed and the small-toothed flounder. The former may in a general way be distinguished from the latter by its colour, which, as above-described, is of a yellowish-brown with an edging of white on the lateral line, while the latter is of a rich brown, bearing numerous milk-white spots, with dark spots two of which are dotted with yellow, on the lateral line.

The flounder is taken by line and net, but the closeness with which it adheres to the ground renders its capture by the seine somewhat uncertain. The bait used in line capture is either fish, prawns, or crabs. The flounder is usually found on sandy bottoms, both inside and outside the bays and inlets of the coast, but they are occasionally taken by nets in the muddy bottoms of rivers. Not very much information is available as to its mode and times of spawning. It is, however, supposed to breed in the summer months and in the open sea, the young fry betaking itself to the quieter waters of the inlets. Of its habits at sea scarcely anything is known. Doubtless, when systematic trawling experiments are entered upon, important discoveries will be made respecting it, and will result in securing an abundant supply for consumption of a fish at present somewhat rare, and held in high repute for its delicacy of flavour and excellence. The flounder of either of the above species grows to a length of 15 or 16 inches.

Some particulars of the flat fish family collected by Gunther will doubtless be read with interest. He says: The fishes of this family, called "Flat-fishes" from their strongly compressed, high, and flat body, in consequence of the absence of an air-bladder, and of the structure of their paired fins, are unable to maintain their body in a vertical position, resting and moving on one side of the body only. The side turned towards the bottom, sometimes the left, sometimes the right, is colourless, and termed the "blind" side; that turned upwards and towards the light is variously, and in some tropical species even vividly coloured. Both eyes are on the coloured side, on which side also the muscles are more strongly developed. The dorsal and anal fins are exceedingly long, without division. All the flat fishes undergo remarkable changes with age, which, however, are very imperfectly known and not yet fully understood, from the difficulty of referring larval forms to their respective parents. The larvæ are, singularly enough, much more frequently met in the open ocean than near the coast. They are transparent, perfectly symmetrical, with an eye on each side of the head, and swim in a vertical position like other fishes. The manner in which one eye is transferred from the blind to the coloured side is subject to discussion. While some naturalists believe that the eye turning round its axis pushes its way through the yielding bones from the blind to the upper side, others hold that as soon as the body of the fish commences to rest on one side only, the eye of that side, in its tendency to turn towards the light, carries the surrounding parts of the head with it; in fact, the whole of the fore part of the head is twisted towards the coloured side, which is a process of but little difficulty as long as the framework of the head is still cartilaginous.

Flat-fishes when adult live always on the bottom, and swim with an undulating motion of their body. Sometimes they rise to the surface. They prefer sandy bottoms, and do not descend to any considerable depth. They occur in all seas, except in the highest latitudes and on rocky, precipitous coasts, becoming most numerous towards the equator. Those of the largest size occur in the temperate zone. Some enter fresh water freely, and others have become entirely acclimatised in ponds and rivers. All are carnivorous.

THE EEL.

Family, **Murænidæ**; *genus*, **Anguilla.**

Colours.—Above dark olive, more or less spotted and streaked with black; below white; fins rather darker; irides orange; teeth purple.

The breeding habits of eels is a subject as yet but imperfectly understood, but it is known that they are obliged to descend from the fresh water to brackish or pure sea water in order to develop their spawn; that the young migrate to the upper waters of rivers and creeks in countless thousands, overcoming in their course obstacles seemingly insurmountable; that they increase in such places in size, but not in numbers; that the adults, after spawning, either become permanently resident in the tidal waters to which they have descended, or return to their freshwater haunts irregularly and individually; and that they are unisexual and not, as was long supposed, hermaphrodite.

This, the common eel of the Sydney markets, occurs in greater or less numbers at all seasons of the year, and should be present much more abundantly, but there is no regular fishery for it, such as are offered for sale being the produce of the seine and prawn net, taken accidentally when seeking other prey.

The eel may also be easily taken with hook and line, for, being exceedingly voracious, it will greedily snatch at almost any bait, provided always it be fresh, or, better still, living; tainted meat it will avoid, unless pressed by hunger. It takes the bait best during the night-time, and a live frog, worm, or singing locust, a piece of fresh fish, meat, or the entrails of fowls or fishes, will all be found excellent baits. Eels may also be taken in wicker or wire fish-creels, the former for preference, baited with fish or any fresh offal, and by spearing.

As a food fish the freshwater eel has few rivals, being rich, wholesome, nutritious, and of excellent flavour.

The eel is very tenacious of life, and, given favourable circumstances, can remain for a long time out of its natural element without inconvenience; while the fact is well attested that should it for any reason take a dislike to its surroundings, it will leave any such localities as isolated ponds, and migrate overland to the nearest pure water. When on migration it is not easily turned from its path, crossing even ploughed fields in its efforts to reach more suitable quarters.

The eel is very susceptible of cold, and in localities subject to a low winter temperature is accustomed to bury itself deeply in the mud during the continuance of the cold season; nevertheless it can bear great cold without life becoming extinct.

The long-finned eel is common in all the rivers and estuaries which drain the eastern watershed of New South Wales, but whether this or any other species of eel inhabits the rivers and lagunes of the vast territory lying to the westward of the mountains is still an open question.

THE GREEN EEL.

Colours.—Ground colour, yellowish-brown, almost hidden by purplish-brown spots. When first taken from the water bright green.

The green eel is very common along the New South Wales coast, frequenting the crannies and crevices among the rocks, and the larger rock pools on the shore reefs, but it is not often brought to market, its habits and the peculiar localities which it frequents not leading the professional fisherman to seek for it. It is an excellent food fish, its flesh being white, delicate, and of good flavour. It can be easily taken in the rock pools with a prawn or fish bait, by the use of a stout rod, and short line, but the moment it is hooked it must be jerked out of the water, for if once allowed to retreat into its crevice great difficulty is experienced in inducing it to come out again. It is very savage when irritated, returning repeatedly to the attack, swimming slowly about, winding among the seaweeds, and raising its snout to the surface. The green eel grows to a length of 33 inches.

At Lord Howe Island this is the most common eel on the shore, and is easily obtained under stones between tidemarks, up to a length of 2 feet.

CRABS.

Scylla serrata *and* Neptunus pelagicus.

But little observation seems to have been made, or at least recorded, respecting the habits and breeding times of these crustacea, of which several species are to be found on our coast. The two genera named above have a very wide range, and are often to be seen in the market. They are generally taken in the seine net, and being of excellent quality command a ready sale. *Neptunus pelagicus*, the swimming or sea-crab, is present on occasions throughout the year; its average weight is one and one-half pounds, but it is said to attain a weight of three pounds. These crabs are much in request for bait as well as food.

NEW SOUTH WALES.

NEW SOUTH WALES GOVERNMENT RAILWAYS AND TRAMWAYS.

(ANNUAL REPORT OF RAILWAY COMMISSIONERS, YEAR ENDING 30TH JUNE, 1896.)

Presented to Parliament, pursuant to Act 51 Vic. No. 35.

Printed under No. 13 *Report from Printing Committee,* 18 *August,* 1896.

Offices of the Railway Commissioners of New South Wales,
Sydney, 6th August, 1896.

TO THE HONORABLE THE MINISTER OF RAILWAYS,—

SIR,

In accordance with the provisions of the 45th clause of the Railways Act of 1888, 51 Vic. No. 35, we have the honor to present, for the information of Parliament, our Annual Report upon the working of the Railways and Tramways for the year ending June 30th, 1896.

GENERAL REMARKS.

The financial result for the year is as under:—

Total traffic, **Railways** and **Tramways** ...	... £3,109,598
Total expenditure, **Railways** and **Tramways**	... 1,788,171
Balance after paying working expenses	... £1,321,427

making an accumulated increase of £3,332,413 paid into the Treasury during the past eight years to meet the interest on capital.

From this sum must be deducted £375,000, five instalments of £75,000 each, towards paying off the £1,000,000 vote under Act 53 Vic. No. 24, for reconstruction and improvement of rolling-stock and permanent-way, which fell due up to the 31st December last; after deducting this amount the Treasury will still have received £2,957,413 increased net earnings during the past eight years.

The

[625 copies—Approximate cost of Printing (labour and material), £103 13s.]

The year closed by this Report has been one of considerable difficulty—

(1) The general depression throughout the Eastern Colonies not having completely passed away ;

(2) The serious drought which afflicted New South Wales, by which about 13,000,000 of sheep and lambs were lost, causing a heavy decrease in wool and other traffic.

(3) The strike of the coal-miners at Newcastle, which commenced on the 27th April and lasted until the beginning of July, causing serious loss of traffic at that port ;

(4) Floods in the Bourke District, in February, which led to a considerable expenditure for repairs.

RAILWAYS.

During the year closed by this report no new lines have been handed over to us; but during this month the line from Jerilderie to Berrigan is expected to be opened, and the line from Narrabri to Moree is now being used for traffic under the control of the contractors. These two lines bring the total mileage to 2,616 miles. The 85 miles of new line is of the "Pioneer" class, and the cost of construction, including bridges, station accommodation, and charges of all kinds, will be under £2,300 per mile.

The construction of a line from Parkes to Condobolin, a distance of 62½ miles, is proceeding, and it is expected that it will be opened for traffic for a length of 23½ miles in November next.

The construction of lines of railway from Nevertire to Warren, Tamworth to Manilla, Berrigan to Finley, and Condobolin to Broken Hill *via* Menindie, are under consideration.

The cost of the lines open for traffic on the 30th June amounted to £36,852,194. Of this amount, £903,565 has been provided out of the Consolidated Revenue, and debentures of the value of £1,288,646 have been paid off, leaving £34,659,983 as the amount upon which interest has to be paid.

The revenue for the year was £2,820,417, and the working expenses amounted to £1,551,888, or 55·02 per cent. of the gross revenue, leaving a net revenue of £1,268,529, or a return of £3 8s. 10d. per cent. upon the total capital expenditure on the railways open for traffic.

We are unable to give the actual amount of interest payable upon the railway capital, as the Treasury provided the moneys for railway construction, in nearly all cases, out of the loans raised for general purposes; the only way, therefore, to arrive at an estimate of the annual interest cost is to charge the railway capital with interest at the average rate the loans of the Colony bear, and this rate at the present time is 3·738 per cent.

The total capital cost being £36,852,194, interest at 3·738 per cent. calls for a sum of £1,377,535 to meet this liability. The moneys provided out of the Consolidated Revenue, and the amount of debentures paid off, make a total sum of £2,192,211; and as no interest has to be paid on this sum, the total amount upon which interest has to be paid is £34,659,983. This sum, at 3·738 per cent., amounts to £1,295,590, and the net result of the year's transactions, after paying all working expenses, is a sum of £1,268,529, thus leaving the deficiency to be made up by the General Funds of the Colony at £27,061; but if the whole of the cost of the lines open for traffic is considered there is a deficiency of £109,006.

In our recent inspection of the whole of the lines, we were pleased to find a very large amount of additional land being placed under cultivation, and there is every reason for looking forward to a very heavy grain-crop in the coming season.

The

The indications for the coming wool season are that the fleece, generally, will be heavier than last year; but, in consequence of the great loss in sheep and lambs, the aggregate quantity of wool will not much exceed that carried during the year closed by this Report.

During the time of drought, stock was carried from the dry districts to the districts where feed was to be obtained at one-half the ordinary rates.

With regard to the general details of the year's transactions, it may be stated that the revenue shows a decrease of £57,787. The working expenses have been reduced by £15,701.

The coaching traffic shows an increase of £20,069; 1st class traffic having increased by £7,543, 2nd class by £9,212, and miscellaneous traffic by £3,314.

For the increased money earned there were 1,279,630 additional passenger journeys made.

The total revenue derived from the Goods Department shows a decrease of £79,403, the drought and its after effects having very seriously affected the revenue.

The decrease in the wool traffic amounted to 102,622 bales, and £76,641 in money.

The grain and flour traffic fell short by 66,961 tons, and the revenue by £31,742.

Hides, skins, and tallow to Darling Harbour alone fell off to the extent of 15,149 tons, and the revenue by £22,686.

These three items alone, directly attributable to the drought, show an aggregate decrease of £131,069; and as the total decrease in the Railway revenue is only £57,787, it would indicate that the business of the country in other directions is fairly satisfactory.

The live stock traffic was exceedingly heavy during a part of the year, and the revenue from this source increased from £340,173 to £362,791, a net increase of £22,618.

The train miles run were 7,719,618, being an increase of 125,337 miles.

The earnings per train mile are 7s. 3¾d., and the net earning, 3s. 3½d., as compared with 3s. 5½d. last year.

The percentage the working expenses bear to the gross revenue is 55·02.

SAFETY APPLIANCES.

The following return will show the progress made in extending the absolute block system of working, and the interlocking of points and signals:—

RETURN showing number of Miles of Line open for Traffic, number of Miles worked under **Absolute Block System,** also Number and Percentage of Places which have or have not **Points and Signals Interlocked.**

Date to end of—	Number of Miles of Line open for Traffic.				Number of Miles of Line on which the Traffic is worked under the Absolute Block System.			Number and Percentage of Places which have or have not Points and Signals Interlocked.				
								Number of Places.			Percentage.	
	Quadruple.	Double.	Single.	Total.	Quadruple and Double.	Single.	Total.	Interlocked.	Not Interlocked.	Total.	Interlocked.	Not Interlocked.

July, 1896	8½	154½	2,368¼	2,531¼	159½	991	1,150½	376	215	591	63·62	36·38

Authority has been given for the interlocking of a number of additional stations and sidings.

The fitting of the goods stock with the Westinghouse quick-acting freight brake has been continued, the number of vehicles fitted with brakes or pipes during the year being 1,623, making a total of 6,223 goods vehicles now provided with this great security.

We are pleased to state that the year has been entirely free from any passenger train accident, the amount included in the expenses of the year, under the head of compensation, being the final costs of the Redfern Station accident in 1894.

In consequence of the many exorbitant claims made in connection with the Redfern accident, we deemed it our duty to ask the Government to introduce a Bill into Parliament limiting the liability in connection with accidents to a maximum sum of £2,000, and we trust that Parliament will, in its wisdom, see its way to pass the measure.

RATES.

Following up the policy of not attempting to make high interest returns upon the capital invested upon the railways, but to assist in developing the trade of the Colony by giving as low rates as possible consistent with paying the interest cost on the capital invested, various reductions in rates have been made during the year; and on the 13th April a general re-classification of goods took place by which a large number of articles were reduced to lower classes.

In

In order to assist the agricultural industry, further modifications have been made in the rates for produce for long distances. The rates that are now in operation are as under:—

Grain, Flour, Meal, Bran, Pollard, Millet Seed, Beet-root, Chicory-root, Potatoes, &c., on the Up Journey.		Hay, Straw, Chaff, Green Fodder, and Ensilage.		
Per ton in 6-ton Truck Loads.		**Per truck** (not to exceed **6 tons**).		
	s. d.	£ s. d.		Per ton.
100 miles...	8 0	1 8 1	or	4/8
150 „	9 8	1 18 10	„	6/5
200 „	11 4	2 11 0	„	8/6
250 „	11 8	2 13 6	„	8/11
300 „	12 0	2 18 6	„	9/9
350 „	12 4	3 3 0	„	10/6
400 „	12 8	3 7 0	„	11/2
450 „	13 0	3 11 0	„	11/10
500 „	13 4	3 15 0	„	12/6

The rates for agricultural implements, when packed in cases and forwarded in 5-ton truck loads, have been reduced by 50 per cent. A reduction of 20 per cent. has also been made on small consignments.

To assist the mining industry, the rates for explosives have been materially reduced, and the rates for mining machinery, such as gold-crushing plant, diamond drills, &c., have been reduced by more than 50 per cent.

The system of truck loads for general merchandise has been very largely availed of during the past year; by this means the rates have been considerably reduced to storekeepers and others sending their traffic in considerable quantities.

It will be seen from the following return that 81·40 per cent. of the whole of the tonnage carried during the year ending December last paid a rate per ton per mile varying from ·42 to ·84 of one penny. Looking at the small amount of traffic on so many of our lines, and the exceedingly heavy grades on all the trunk lines, this result is, we consider, a fairly satisfactory one.

Return of Ton Mileage for Year ending 31st December, 1895.

Description of Traffic.	Total Tons carried.	Total Miles carried.	Average Miles per Ton.	Earnings, exclusive of Terminal Charges.	Earnings per ton per Mile.	Percentage of each class to Total Tonnage.	
	tons	miles	miles	£	D.	per cent.

* First section, Lismore to Mullumbimby, opened 15th May, 1894; second section, Mullumbimby to Murwillumbah, opened 24th December, 1894. † Opened 1st February, 1895.

The foregoing returns show that with one or two exceptions there has been little expansion of traffic upon the unprofitable lines, the principal exception is in the case of the line from Junee to Hay, which has been so long a burden upon the general revenue; this section during 1895 earned sufficient to pay all its working expenses and interest upon capital. The Riverina district served by this line enjoyed a much better rainfall than the other parts of the Colony, and the live stock traffic was exceedingly heavy therefrom, the number of sheep consigned from the stations between

between Narrandera and Hay for the year amounting to 908,000 as against 180,500 in the previous year, whilst from the Jerilderie branch 351,750 were consigned as against 48,550 in the previous year.

The earnings on the Cobar and Molong to Parkes and Forbes lines continue to improve. The line to Cobar has led to the reopening of the copper works there, and to the development of the gold-mining industry in the district, and it is expected that the branch will soon be quite self-supporting. The extension of the Parkes line to Condobolin will also lead to improved traffic, and, we hope, for an early withdrawal of the Molong-Parkes and Forbes line from the list of unprofitable lines. The gold-mining in the Parkes and Forbes district has received a great stimulus by the opening of the railway.

Accommodation for the Traffic and Condition of Lines and Rolling-stock.

In our recent inspections of the lines we have authorised various works to meet the altered requirements of the traffic, particularly in view of the expected largely increased grain traffic of the coming season. Additional carriage rolling-stock will also be provided to meet the requirements of new lines and the extra pressure now experienced at holiday times.

The permanent-way expenses show a good decrease; this has been brought about by the excellent condition of the lines generally, owing to the liberal expenditure incurred during the past few years, and also to the lower price of permanent-way materials.

56½ miles of line were completely re-laid or re-railed and re-sleepered during the year.

During recent years 195 miles of 70 lb. to the yard iron rails have been removed from the main lines and steel rails substituted, nearly all of the latter being of a heavier section (80 lb. to the yard); the whole of the cost of the improved road has been charged to working expenses.

Flood repairs cost £11,215 during the year.

The flattening of the 8 and 10 chain curves in the Blue Mountains has been continued, and before the close of 1896 this work will be completed.

The work of cutting out some of the 1 in 33 and other heavy grades on the main lines has been carried on with vigour during the year, and great advantage to the working has been experienced.

On the Western Line the improvement of grades between Wellington and Dubbo has been almost completed.

The Locksley deviation will be completed on the 9th instant, and the alterations between Bell and Clarence are well in hand.

On the Southern Line several alterations have been completed, and other works of an important nature will be taken in hand immediately.

Diagrams showing the work dealt with since the last report was issued are given in the Appendices, pages 29 to 35.

The men in the locomotive, carriage, and waggon shops were working full time throughout the year; and the expenditure incurred for the repair and renewal of engines, carriages, and waggons has been increased, for wages and materials, by a sum of £42,832.

The

The rolling-stock is in excellent condition.

The reports of the Chief Mechanical Engineer and Engineer-in-Chief for Existing Lines will be found on pages 14 and 15.

Appendices are attached giving full information regarding the traffic expenses, &c., &c.

TRAMWAYS.

No new lines have been opened for traffic during the past year.

The cable line from King-street, Sydney, to Ocean-street, Woollahra, opened in September, 1894, has during the past year earned a return upon the capital of £4 15s. per cent.

The traffic on the City lines generally has at last shown some signs of improvement, and we hope that authority will soon be given by Parliament for the conversion of the steam system to the electric system, by which means we will be enabled to give a much more frequent and expeditious transit to and from the various suburbs.

The electric line in George-street recently recommended by the Public Works Committee will, when constructed, afford the much-needed relief to Elizabeth-street and the Bridge-street yard.

The general result of the working of the whole of the Tramways for the year is an increase of revenue of £6,865; the working expenses also increased by £5,290.

The cost of the lines open for traffic is £1,434,896, of which £36,837 has been paid out of the Consolidated Revenue, leaving £1,398,059, upon which interest has to be paid.

The return upon the capital invested is £3 13s. 9d. per cent.

The table on the following page will give further details regarding the year's operations.

Condition of Existing Lines.

A considerable amount of money has been spent upon the lines during the year, and they are generally in excellent order. Additional relaying has been authorised for the coming year.

Accommodation for the Traffic.

The duplication of the Glebe Point line has been authorised, so as to enable an improved service to be given.

A connection between the Crown-street line and the Cleveland-street line is being made, so as to enable a service to be given between the city and Dowling-street. This will be a considerable public convenience.

RESULTS OF THE WORKING.

TRAMWAYS—ALL LINES.

Year ending 30 June, 1896, compared with 1895 and 1888.

RAILWAYS.

TRAMWAYS.

APPENDIX I.

REPORT on Condition of Lines and Works for the Year ending 30th June, 1896.

New South Wales Government Railways,
Sir, Office of Engineer-in-Chief for Existing Lines, 17 July, 1896.

I have the honor to report, for the information of the Commissioners, that the whole of the Permanent Way, Buildings, and Works have been thoroughly maintained during the past year.

Heavy floods occurred in February between Nyngan and Bourke, and also between Nyngan and Cobar. On the former section 100 miles were damaged (about 7½ being completely destroyed). On the Cobar line the damage extended over 50 miles, 1 mile being completely destroyed. Though the extent of the damage was so great (the repairs costing £8,000), traffic was only interrupted for eight days, and within a month the lines damaged were in order to admit of fast traffic.

During the year 56 miles 55 chains have been completely relaid, rerailed, and resleepered; 131 miles 54 chains have been lifted and ballasted; and 32 miles 51 chains of fencing have been renewed; the whole expenditure being charged to working expenses.

In connection with the relaying, &c., I might point out that in addition to the total mileage of road completely renewed, viz., 56 miles 55 chains, 41,955 new sleepers and 43,072 good sleepers recovered in relaying were used for partial resleepering and repairs, thus adding largely to the mileage of road made perfect during the year.

Various additional works fairly chargeable to capital have also been provided and paid for out of working expenses.

Improvement of Grades and Curves.

Steady progress has been made in the work of cutting out the sharp curves (8 and 10 chains radius) on the Western Mountains, improvements of this character having been made in the vicinity of Karabar, Faulconbridge, Valley Heights, and Linden. Similar works are in progress near Woodford, Lawson, and Katoomba.

Grade improvements have been completed at Toowong, on the Northern line; near Wingello, Moss Vale, and Carrick, and between Goulburn and Cullerin on the Southern line; and between Wellington and Maryvale and Geurie and Dubbo on the Western line; while rapid progress has been made with the deviations to cut out the steep grades between Locksley and Brewongle, and between Maryvale and Geurie on the Western line. Other grade improvements have been put in hand near Moss Vale and Exeter on the Southern, and between Bell and Clarence on the Western, Line.

I have, &c.,
THOMAS R. FIRTH,
Engineer-in-Chief for Existing Lines.

The Secretary to the Railway Commissioners.

The following work was performed during the year:—

Sidings laid in and extended	4 miles 30¾ chains.
Sleepers used in new sidings	9,691.
Sleepers used in main lines	231,146.
Ballast used on maintenance of main lines	120,679 cubic yards.
Length of fences renewed	32 miles 51¼ chains.
Length of fences wired	58 chains.
Culverts and flood openings constructed...	232 feet extra waterway.

APPENDIX II.

The Chief Mechanical Engineer's Report for the Year ending 30th June, 1896.

Eveleigh, 27 July, 1896.

Sir,

I have the honor to report for the information of the Railway Commissioners, that the rolling stock, machinery, pumping and hydraulic plant belonging to this branch have been maintained in good working order.

Locomotives.

One tender engine was rebuilt and converted into a tank engine, nine others have been rebuilt, and 370 have been repaired during the year; 191 of them at Eveleigh, 52 at Newcastle, and the remaining 127 at smaller depôts. Two hundred and twenty-six of these engines received heavy repairs and 144 of them had general repairs of a lighter character.

Three new boilers were made in the Eveleigh Works, and 6 new boilers built by Messrs. Mort & Co. have been fitted to engines, and paid for out of Working Expenses. Three hundred and twenty-nine boilers were overhauled during the year; 189 of them at Eveleigh, 47 at Newcastle, and the remaining 93 at smaller depôts. One hundred and forty-nine of these boilers were internally examined, heavily repaired, refilled with tubes, and returned to locomotives. Sixty-six stationary boilers were overhauled; 15 of them received heavy repairs.

Carriages and Waggons.

Ninety-four vehicles were built in the Eveleigh and Newcastle shops during the year and charged to Working Expenses. One thousand three hundred and seventy-seven passenger vehicles were repaired in the workshops; 1,051 of them at Eveleigh and the remaining 326 at Newcastle. Five hundred and nineteen of these vehicles received heavy repairs, and 6,871 waggons and vans passed through the Eveleigh and Newcastle shops during the year, 2,265 of them being heavily repaired.

One hundred and fifteen defective axles have been withdrawn from traffic and replaced by stronger ones. One thousand seven hundred and thirty-three axle-boxes of defective design have been replaced by standard types, and charged against Working Expenses.

New Stock.

One Consolidation goods engine has been built in the Eveleigh Works, added to stock, and charged to Capital. Five heavy goods engines built by contractors have been put into traffic, two of which have been charged to this year's Working Expenses. The two new engines have a mean traction power of 57,600 and replace five old small engines of a traction power of 45,780.

Two trains of suburban bogie carriages (six first and six second class) have been built by contractors as renewals, and charged to Working Expenses. These replace twenty-four old four-wheel second-class carriages, the new vehicles having a floor area of 4,296 square feet, as compared with 3,456 square feet in the twenty-four old ones.

Twenty-five bogie sheep-vans and six tubular bolster waggons have been built by contractors as additional stock, and charged to Capital.

Sixty-four new vehicles (goods) have been built in the Eveleigh Works as renewals, and charged to Working Expenses; fifteen of these vehicles are bogie sheep vans, and have replaced thirty old vans of smaller capacity. Fourteen new goods vehicles have been built in the shops as additions to rolling stock, and charged to Capital.

Practically,

Practically, throughout the whole of the year, the mechanical staff has worked full time in contrast with the short time of last year, and the repairs effected have been of a more extensive and costly character.

The following statement shows the relative mileage executed and the working costs of the Locomotive Branch (including oiling and greasing) during the years 1895 and 1896 :—

	1896.	1895.	Increase.	Decrease.
Train miles	7,719,618	7,594,281	125,337	.....
Engine miles	10,895,776	10,444,441	451,335	.....
Revenue	£2,820,417	£2,878,204	.....	£57,787
Expenditure	£682,200	£625,433	56,767	.....
Do in per cent. to revenue	24·19	21·73	2·46	.....
Cost in pence per train mile	21·209	19·765	1·444	.....
Do engine mile	15·027	14·372	0·655	.....

I have, &c.,

W. THOW,

Chief Mechanical Engineer.

The Secretary to the Railway Commissioners.

APPENDIX III.

RAILWAYS.—RETURN OF WORKING ROLLING STOCK, 30TH JUNE, 1896.

	LOCOMOTIVES.		COACHING.							MERCHANDISE.						DEPARTMENTAL STOCK.	TOTAL.

TOTAL, RAILWAYS AND TRAMWAYS	1,375	10,018	11,393	1,271	9,821	11,092

A Includes 48 officers in charge of locomotive running sheds and time keepers.

B Includes 71 officers for additional stations and crossing places, 21 night-officers transferred from wages to salary list; also clerical positions formerly filled by men on wages list. Of the remaining 666, 364 are officers and night-officers in charge of stations and sidings, and 163 are clerks employed at stations.

C Includes 36 telegraph operators.

The Wages Staff does not include gatekeepers with free house only, as the information was not kept in 1888.

APPENDIX X.

RETURN of the Mileage of Suburban Passengers on All Lines of Railway during the years ending 30th June, 1896, 1895, and 1888.

DESCRIPTION.	1896.	1895.	1888.
NUMBER OF ORDINARY PASSENGERS ..... No.	10,635,753	10,192,545	7,413,868

AVERAGE RECEIPT PER MILE PER PASSENGER ..... D	0·58	0·60	0·64

Note.—Suburban Lines include only distances within 20 miles of Sydney and Newcastle, Liverpool and Morpeth included.

APPENDIX XI.

STATEMENT showing cost of Additions to Stations, Buildings, Siding Accommodation, &c., Machinery and Rolling Stock, the cost of which was charged to Capital Account, during the year ending 30th June, 1896.

	Amount. £
Additions to Stations, Buildings, &c.	18,674
Rolling Stock and additional appliances, including continuous brakes	41,266
	£59,940

APPENDIX XII.

Report of the Tramway Locomotive Superintendent.

Randwick, 27 July, 1896.

To the Secretary to the Railway Commissioners,—

Sir,

I have the honor to submit, for the information of the Railway Commissioners, the following report on the working of the Locomotive Department of the Tramways for the year ending 30th June, 1896:—

SYDNEY CITY AND SUBURBAN LINES.

The whole of the rolling stock, machinery, and plant has been maintained in good order, and the requirements of the traffic fully met. On the King-street to Ocean-street cable line the work of fitting the cars with an air-brake, referred to in my last, was completed in October, and the running is, in consequence, conducted in a much more satisfactory manner. The working expenses have also been considerably reduced, principally by the extensive improvements effected in the bottom gripper with which the line was originally equipped. Four grip-cars have been added to the stock and charged to working expenses. On the steam lines six cars have been renewed out of working expenses, while the remainder of the rolling stock was overhauled and renovated in the workshops in the following order:—

Motors: 62 received general overhaul; 64 heavy repairs; 480 minor repairs, occupying from one to eight days each; and 186 had casual repairs effected.

Cars: 176 (138 steam, and 38 cable) thoroughly overhauled and repainted; 190 repaired and partially repainted; and 1,017 received minor repairs occupying about one day each. In addition, one hearse was constructed for the Newcastle Tramways, and 21 road-watering tanks, 23 service trucks, and 29 cars for other lines received repairs.

Although called upon to render a greater service by 106,082 train miles on the steam system than in the previous year, it is gratifying to find that the aggregate expenditure was less, while the cost per mile fell from 14·59d. to 13·62d. In this connection the following table is of interest as showing the continued effort made in this Department to curtail the cost of working:—

SUMMARY of Train Mileage and cost of working Locomotive Department C. and S. Tramways from 1888 to 1896.

Year.	Train Mileage.	Working Expenses.	Loco. Cost per Train Mile.	Percentage Decrease on Cost in 1888.
		£	d.	d.
1888	1,246,543	128,688	24·775	.....
1889	1,338,386	126,301	21·833	11·673
1890	1,474,646	125,980	20·504	17·239
1891	1,553,048	130,978	20·241	18·300
1892	1,630,938	121,161	17·829	28·036
1893	1,708,042	122,468	17·208	30·543
1894	1,764,607	109,862	14·942	39·689
1895	1,767,043	107,443	14·593	41·098
1896	1,873,125	106,325	13·623	45·013

NORTH SHORE CABLE LINE.

On June 17th the main frames of the duplicate engines at the Ridge-street power-house were fractured during a trial run, and two new frames are now being fitted in lieu thereof; otherwise the engines and plant are in excellent condition. The Whitecross cable, brought into use on 1st June, 1895, is still running, but it is showing signs of wear, and will have to be replaced in the course of a few weeks. Ten grip and trail cars have been thoroughly overhauled and repainted, while the remainder have received necessary attention.

MILITARY ROAD OVERHEAD ELECTRIC LINE.

The reserve power at the Ridge-street Station has been augmented by the transfer there of the storage batteries recently used under the electric accumulator car which had been running as an experiment on the Sydney City and Suburban lines.

The motors and cars have been maintained in good condition, and although the train mileage was greater by 3,396 miles, the total expenditure of the power branch in 1896 was 10 per cent. less than in the previous year.

NEWCASTLE

NEWCASTLE CITY AND SUBURBAN LINES.

The maintenance of the rolling stock here has demanded a greater expenditure than in the previous year, owing to the necessity for overhauling and repainting a much larger number of cars. Six motors and cars of the combined type which had become worn out have been condemned and replaced by independent motors and cars from the Sydney lines. On the whole, the condition of the rolling stock and plant is much improved.

KOGARAH TO SANS SOUCI, AND MORPETH TO EAST MAITLAND LINES.

The rolling stock has been maintained in good order, and the traffic requirements fully met. At Morpeth an additional car has been supplied.

I have, &c.,
GEO. DOWNE,
Locomotive Superintendent.

APPENDIX XIII.

Report of Engineer for Tramways.

Tramway Department, Office of Engineer for Tramways, July, 1896.

To the Secretary to the Railway Commissioners,—

Sir,

I have the honor to submit, for the information of the Railway Commissioners, my Annual Report on the condition of the City and Suburban Tramways for the year ending 30th June, 1896.

No additional mileage, either for new lines or duplications, has been added during the year.

The roads are generally well paved and macadamised, and in good running order. During the year 10,608 tons of metal have been used for repairs.

On the Crown-street line, for a distance of 30½ chains, the track has been repaved and relaid with 60-lb. T rails. The following relaying has also been completed :—Portions of Forest Lodge line, 50 chains ; Botany line, 40 chains ; Newtown Junction to Forest Lodge Junction, 15 chains ; Leichhardt line, from Forest Lodge Junction to Ross-street, 73 chains. Total length, 2 miles 48½ chains of single track.

The wood-paving from kerb to kerb between Newtown and Glebe Point Junctions has been commenced. The whole of the work is being carried out by this branch, a portion of the cost being borne by the Works Department. Provision is being made to relay and renew the paving from Bridge-street to Redfern during the ensuing year.

With the exception of the crossings at King-street (which are seriously affected by the heavy steam-motors, and which will require renewing at an early date), the Ocean-street Cable line is in very good order.

The North Shore Cable, Military Road Electric, and Ashfield to Enfield lines have been well maintained during the year.

The buildings and waiting-sheds generally are in good order.

I have, &c.,
G. R. COWDERY,
Engineer for Tramways.

STATEMENT OF ACCOUNT OF THE EXPENDITURE AND REVENUE FOR YEAR 1896, WITH COMPARISONS FOR 1895.

Sydney . Charles Potter, Government Printer.—1896

1896.

NEW SOUTH WALES.

RAILWAYS AND TRAMWAYS.

(REPORT OF RAILWAY COMMISSIONERS, QUARTER ENDING DECEMBER, 1895.)

Presented to Parliament, pursuant to Act 51 Vic. No. 35, sec. 44.

Printed under No. 1 *Report from Printing Committee*, 21 *May*, 1896.

Offices of the Railway Commissioners of New South Wales,
30 January, 1896.

To The Honorable the Minister of Railways,—

Sir,

In accordance with the provisions of the 44th clause of the Railway Act of 1888, 51 Vic. No. 35, we have the honor to submit, for the information of Parliament, our Report, for the quarter ending 31st December, 1895, upon the subjects specified.

I.—State of the Traffic.

RAILWAYS.	Quarter ending 31st Dec., 1894.	Quarter ending 31st Dec., 1895.
Miles open	2,526	2,531¼
Revenue — 1894. 1895. Passenger £272,480 £280,472 Merchandise £670,621 £590,366	£943,101	£870,838
Expenditure	£436,543	£413,867
Train miles run	2,095,007	2,095,314
Earnings per train mile	9/0	8/3¾
Expenditure per train mile	4/2	3/11½
Percentage—Expenditure to earnings	46·29	47·52
Number of passengers	5,056,243	5,357,918
Tonnage of goods traffic	1,001,542	1,019,069
Tonnage of live stock traffic	41,827	50,495

TRAMWAYS.	Quarter ending 31st Dec., 1894.	Quarter ending 31st Dec., 1895.
Miles open	61	61
Revenue from all sources	£75,065	£73,728
Expenditure	£61,184	£62,879
Tram miles run	655,048	672,973
Earnings per tram mile	2/3½	2/2¼
Expenditure per tram mile	1/10½	1/10½
Percentage—Expenditure to earnings	81·51	85·29
Number of fares collected	17,779,806	17,407,309

[875 copies—Approximate Cost of Printing (labour and material), £12 4s. 6d.]

RAILWAYS.

II.—Condition of the Lines.

A report as to the condition of the lines will be found as an Appendix, page 4.

III.—Special Rates.

A statement of the special rates, and the reasons for making the same, will be found as an Appendix, page 4.

IV.—Staff.

These returns are given as an Appendix, pages 5 to 7.

General Remarks.

The earnings for the quarter show a decrease of £72,263, arising entirely from the effects of the drought, which has so seriously affected the pastoral industry of the country during the year 1895.

The decrease in the revenue from the wool traffic for the quarter amounted to £92,279; this, however, does not correctly represent the actual decrease in the wool for the season, as, in consequence of the shearing being an early one, some of the wool that last year came into the December quarter was carried in the September quarter; the net decrease from wool revenue as from the 1st July to 31st December represents a sum of £72,410.

General merchandise and coal and coke also gave a decreased revenue. The live-stock traffic, however, was largely in excess of any previous period, the revenue derived from this source for the quarter being £113,898, an increase of £23,777.

The coaching traffic shows an increase of £7,992.

The gross tonnage carried for the quarter showed an increase of 17,527 tons. The number of passengers carried exceeded the corresponding period of last year by 301,675.

The train mileage run during the quarter was practically the same as last year. No saving could be effected, as the large increase in the live-stock traffic necessitated a greatly increased train mileage, as compared with what would have been required for the wool traffic, which is the best paying traffic carried on the railways.

The working expenses for the quarter show a reduction of £22,676, and the percentage of working expenses to gross traffic stands at the low figure of 47·52.

While a decrease of revenue for the quarter of £72,263 has to be reported, we would call attention to the fact that the revenue for the September quarter showed an increase, and the net reduction in revenue for the half-year closed by this report is £35,130.

Condition of the Lines and Accommodation for the Traffic.

The lines are all in excellent order, and every necessary provision exists for the accommodation of the traffic.

TRAMWAYS.

TRAMWAYS.

The earnings show a decrease of £1,337, the City and Suburban Trams having suffered to the extent of £2,788. The expenditure shows an increase of £1,695, considerable additional expenditure having been incurred in relaying.

We have the honor to be,
Sir,
Your most obedient servants,

E. M. G. EDDY,
Chief Commissioner.

CHARLES OLIVER,
Commissioner.

W. M. FEHON,
Commissioner.

APPENDIX I.

NEW SOUTH WALES GOVERNMENT RAILWAYS.

Sir, Office of Engineer-in-Chief for Existing Lines, 3 January, 1896.

I have to report that the lines and works have been maintained in a thoroughly satisfactory state during the past quarter.

Relaying and resleepering operations have made steady progress.

The grade improvements at Moss Vale and Cullerin have been opened for traffic, and also No. 1 contract between Wellington and Dubbo; and other portions are approaching completion.

The sharp curves in the vicinity of Linden and Faulconbridge are being flattened, and further improvements will shortly be taken in hand.

I have, &c.,

THOMAS R. FIRTH,

Engineer-in-Chief for Existing Lines.

The Secretary to the Railway Commissioners.

APPENDIX II.

NEW SOUTH WALES GOVERNMENT RAILWAYS.

STATEMENT, in accordance with clause No. 44 of the Railway Act, showing the Special Rates which have been made, and the reasons for making such rates, quarter ending 31st December, 1895.

Article.	Rate.	Reason for rate.
Bamboo for basket making	To be charged first-class rates and conditions	New rates.
Cocoa-nut oil—cake	In lots of not less than 6 tons to be charged miscellaneous class rates; smaller quantities "A" rates and conditions.	New traffic.
Damp-course	To be charged "A" rates and conditions	New rate.
Lime and cement	Carried in mixed truck loads of not less than 4 tons, to be charged in up transit "A" rates.	To equalise rates.
Rhubarb	To be carried under the same conditions as fruit	To encourage traffic.
Single package rate by-law 113.	Where articles are sent under the single package scale of charges, the through mileage rates to be imposed.	To equalise rates.
Do do	Single 10-gallon can of cream, weighing up to 112 lb., to be charged at the single package rate for 90 lb.	do
Single package rates	The rates and conditions in by-law 113 to apply to consignments of seeds of all kinds.	To encourage traffic.
Specimens	Specimens of animal, vegetable, and mineral products consigned to Technological Museums at Sydney, Bathurst, Albury, Goulburn, Newcastle, West Maitland, and Broken Hill, also fruit consigned to the Agricultural Department, for naming purposes, are carried free of charge.	Special concession.
Biscuits for dogs, &c., and Granulated meal.	To be carried at "A" rates and conditions	To equalise rates.

APPENDIX III.

NEW SOUTH WALES GOVERNMENT RAILWAYS AND TRAMWAYS.

RETURN, in accordance with Clause No. 44 of the Railway Act, showing the Appointments of Employees from the 1st October to the 31st December, 1895.

[6*d*]

1896.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAYS AND TRAMWAYS.

(REPORT OF RAILWAY COMMISSIONERS, QUARTER ENDING 31st MARCH, 1896.)

Presented to Parliament, pursuant to Act 51 Vic. No. 35, sec. 44.

Printed under No. 1 *Report from Printing Committee,* 21 *May,* 1896.

Offices of the Railway Commissioners of New South Wales,
Sydney, 20th April, 1896.

TO THE HONORABLE THE MINISTER OF RAILWAYS,—

Sir,

In accordance with the provisions of the 44th clause of the Railway Act of 1888, 51 Vic. No. 35, we have the honor to submit, for the information of Parliament, our Report, for the quarter ending 31st March, 1896, upon the subjects specified, viz :—

I.—STATE OF THE TRAFFIC.

RAILWAYS.	Quarter ending 31st March, 1895.	Quarter ending 31st March, 1896.
Miles open	2,531	2,531
Revenue — 1895. 1896. Passenger £264,740 £277,489 Merchandise £583,135 £371,493	£647,875	£648,982
Expenditure	£368,959	£372,832
Train miles run	1,867,262	1,890,021
Earnings per train mile	6/11¼	6/10½
Expenditure per train mile	3/11½	3/11½
Percentage—Expenditure to earnings	56·95	57·45
Number of passengers	4,846,193	5,236,431
Tonnage of goods traffic	917,152	1,015,538
Tonnage of live stock traffic	40,285	40,790

TRAMWAYS.	Quarter ending 31st March, 1895.	Quarter ending 31st March, 1896.
Miles open	61	61
Revenue	£73,366	75,143
Expenditure	£54,221	53,781
Train miles run	638,930	681,619
Earnings per train mile	2/3½	2/2½
Expenditure per train mile	1/8¼	1/7
Percentage—Expenditure to earnings	73·90	71·57
Number of fares collected	17,343,232	17,735,940

[615 copies—Approximate cost of Printing (labour and material), £12 2s.]

II.—Condition of the Lines.

A report as to the condition of the lines will be found as an Appendix, page 4.

III.—Special Rates.

A statement of the special rates, and the reasons for making the same, will be found attached, page 4.

IV.—Staff.

These returns are given as an Appendix, pages 5 to 7.

RAILWAYS.

General Remarks.

The revenue for the quarter shows a slight increase of £1,107 over the corresponding period of last year.

The total revenue derived from the goods traffic decreased by £11,642. General merchandise, minerals (other than coal and coke), hay, straw, and chaff, and wool showing an aggregate decrease of £20,659; live stock, coal and coke, and miscellaneous items show an increase of £9,017, leaving a net decrease of £11,642.

The coaching traffic increased by £12,749, contributed to by an increase of £5,188 from first class traffic, £5,360 from second class traffic, £2,201 from parcels, &c., traffic.

390,238 additional passengers were carried to earn the increased revenue.

Although the goods revenue shows a decrease, 98,386 tons of additional traffic were carried; this is entirely made up by an increase in the coal and coke traffic to the extent of 149,183 tons.

General merchandise shows a decrease of 7,795 tons; grain, flour, &c., 35,712 tons decrease on the Up journey; wool, 475 tons decrease; minerals (other than coal and coke), 6,815 tons decrease.

The expenditure for the quarter shows an increase of £3,873; a decrease would have been shown had not special debits arisen under the following heads:—

(1.) Workshop staff working full time.

(2.) One day's extra wages included in consequence of leap year.

(3.) Heavy exceptional expenditure for repairing damage caused by floods on the Bourke and Cobar Lines in February last.

Condition of the Lines and Accommodation for the Traffic.

The lines are in excellent order; relaying and resleepering is being carried on where necessary, and the improvement of grades and curves is also progressing.

All needful accommodation for traffic exists on the lines, but some additional carriage stock will have to be provided ere long, as the special facilities now given for passengers to move about at holiday times calls for additional rolling-stock.

TRAMWAYS.

General Remarks.

The tramway traffic shows an increase of £1,777, and the expenditure a decrease of £440.

The lines and rolling-stock have been maintained in good order during the quarter.

We have the honor to be,
Sir,
Your most obedient servants,

E. M. G. EDDY,
Chief Commissioner.

CHARLES OLIVER,
Commissioner.

W. M. FEHON,
Commissioner.

APPENDIX I.

NEW SOUTH WALES GOVERNMENT RAILWAYS.

Sir, Office of Engineer-in-Chief for Existing Lines, 11 April, 1896.

I have to report for the information of the Railway Commissioners that the Permanent-way and Works have been maintained in a satisfactory state during the past quarter.

Steady progress has been made with the relaying and resleepering operations.

The grade improvements authorised between Wellington and Dubbo, are, with the exception of one short length, completed and opened for traffic.

A deviation to cut out the steep grades on both the Up and Down journeys between Locksley and Brewongle is being rapidly pushed on, and a contract has been let to carry out a similar work between Bell and Clarence.

The improvement of the 8-chain curves in the vicinity of Linden and Faulconbridge is completed, and others near The Valley and Woodford are well in hand.

During the quarter serious floods occurred on the Western Lines—the portion between Nyngan and Bourke and between Nyngan and Cobar being most affected. On the former length the damage extended over 100 miles of line (about 7½ miles being completely destroyed) and traffic was interrupted for eight days. On the Cobar branch the floods extended over nearly 50 miles of line, 1 mile of the railway being seriously damaged. Repairs have been completed, and the line is again in good order.

I have, &c.,

THOMAS R. FIRTH,

Engineer-in-Chief for Existing Lines.

The Secretary to the Railway Commissioners.

APPENDIX II.

NEW SOUTH WALES GOVERNMENT RAILWAYS.

STATEMENT, in accordance with clause No. 44 of the Railway Act, showing the Special Rates which have been made, and the reasons for making such rates, quarter ending 31st March, 1896.

Article.	Rate.	Reason for such rate.

[6d.] Sydney: Charles Potter, Government Printer—1896.

1896.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAYS AND TRAMWAYS.

(REPORT OF RAILWAY COMMISSIONERS, QUARTER ENDING 30TH JUNE, 1896.)

Printed under No. 13 *Report from Printing Committee*, 18 *August*, 1896.

Offices of the Railway Commissioners of New South Wales,
Sydney, 31st July, 1896.

TO THE HONORABLE THE MINISTER OF RAILWAYS,—

Sir,

In accordance with the provisions of the 44th clause of the Railway Act of 1888, 51 Vic. No. 35, we have the honor to submit, for the information of Parliament, our Report, for the quarter ending 30th June, 1896, upon the subjects specified, viz. :—

I.—STATE OF THE TRAFFIC.

RAILWAYS.	Quarter ending 30th June, 1895.	Quarter ending 30th June, 1896.
Miles open	2,531¼	2,531¼

Percentage—Expenditure to earnings	87·24	85·09
Number of fares collected	16,287,171	17,448,019

[587 copies—Approximate Cost of Printing (labour and material), £20 8s. 6d.]

RAILWAYS.

II.—Condition of the Lines.

A report as to the condition of the lines will be found as an Appendix, page 4.

III.—Special Rates.

A statement of the special rates, and the reasons for making the same, will be found attached, page 4.

IV.—Staff.

These returns are given as an Appendix, pages 5 to 10.

General Remarks.

The traffic during the quarter has been considerably affected by the after-effects of the drought, the business in tallow, skins, hides, &c., &c., showing a considerable falling off.

The strike of coal-miners in the Newcastle district, which commenced at the end of April and continued throughout May and June, also injuriously affected the quarter's revenue.

The revenue from the goods and live-stock traffic generally shows a falling off of £30,681; the coaching traffic, however, shows an increase of £6,917, leaving a total decrease of £23,764.

The working expenses were reduced by £18,737.

Condition of the Lines and Accommodation for the Traffic.

The lines are in excellent condition, and a large increase in traffic can be dealt with without materially increasing the expenses.

TRAMWAYS.

The traffic shows sign of improvement, the services in various directions have been improved, and so soon as the necessary money is voted by Parliament for converting the existing lines to the electric system, a large development of traffic may be looked for.

We have the honor to be,
Sir,
Your most obedient servants,

E. M. G. EDDY,
Chief Commissioner.

CHARLES OLIVER,
Commissioner.

W. M. FEHON,
Commissioner.

APPENDIX I.

NEW SOUTH WALES GOVERNMENT RAILWAYS.

Sir, Office of Engineer-in-Chief for Existing Lines, 2nd July, 1896.

I have to report for the information of the Commissioners that the Permanent-way and Works have been satisfactorily maintained during the past quarter.

Relaying, resleepering, and reballasting operations have been steadily carried on and the lines generally have been much improved.

The curve improvements near Linden and Faulconbridge have been completed, and others in the vicinity of Valley Heights, Woodford, and Hazelbrook are well advanced, and a commencement has also been made near Lawson and Katoomba.

The alterations to cut down the steep grades between Wellington and Maryvale, and also between Geurie and Dubbo, have been completed, and good progress is being made with similar work between Maryvale and Geurie, and between Locksley and Brewongle. On the Southern Line the cutting out of the steep grades near Moss Vale and Exeter has been commenced.

I have, &c.,

THOMAS R. FIRTH,

Engineer-in-Chief for Existing Lines.

The Secretary to the Railway Commissioners.

APPENDIX II.

NEW SOUTH WALES GOVERNMENT RAILWAYS.

STATEMENT, in accordance with clause No. 44 of the Railway Act, showing the Special Rates which have been made, and the reasons for making such rates, quarter ending 30th June, 1896.

Articles.	Rate.	Reason for rate.
Coal	Carson's Siding to Darling Harbour, Liverpool, Milson's Point, and intermediate stations, 7s. 8d. per ton, except where the ordinary rate is cheaper.	To equalise rates.
Flour	The maximum charge for flour in 8-ton lots per each 4-wheeled truck between the undermentioned stations to be as follows:— Bathurst to Byrock or Bourke... 20s. per ton. Blayney „ „ ... 19s. „ Millthorpe „ „ ... 18s. 8d. „ Orange „ „ ... 18s. 2d. „ Wellington „ „ ... 16s. „ Dubbo „ „ ... 16s. „	
Horses	Where two or three horses belonging to one owner are forwarded to Agricultural Shows in one truck, they must be reloaded on the return journey in the same way as carried to the show; otherwise the ordinary charges will be imposed for each additional truck used.	To ensure reasonable payment for service.
Waxworks	Second-class rates when carried in connection with travelling company.....	To secure traffic.
Sheep	Carried from Trangie and Narromine to Bourke at £3 per truck	To re-stock stations and secure traffic.
Wheat	Special consignments to Goulburn, per "Ross-shire" and "Cavalliere Ciampa," sent in truck loads at convenience of Department, A rates.	To meet exceptional circumstances.
Bricks	Shunting charge from wharf to the Goods Yard, Newcastle, 4s. per four-wheeled truck.	do
Rails	From Darling Harbou to Dapto for Lake Illawarra Railway, B rates.....	To secure traffic.
Contractor's Plant	From Darling Harbour to Dapto for Lake Illawarra Railway, B + 50 % ...	do

1896.

LEGISLATIVE ASSEMBLY,
NEW SOUTH WALES.

RAILWAYS AND TRAMWAYS.

(REPORT OF RAILWAY COMMISSIONERS, QUARTER ENDING SEPTEMBER, 1896.)

Presented to Parliament, pursuant to Act 51 Vic. No. 35, sec. 44.

Printed under No. 25 Report from Printing Committee, 5 November, 1896.

Offices of the Railway Commissioners of New South Wales,
29th October, 1896.

TO THE HONORABLE THE MINISTER OF RAILWAYS,—

Sir,

In accordance with the provisions of the 44th clause of the Railway Act of 1888, 51 Vic. No. 35, we have the honor to submit, for the information of Parliament, our Report, for the quarter ending 30th September, 1896, upon the subjects specified, viz. :—

I.—STATE OF THE TRAFFIC.

RAILWAYS.	Quarter ending 30th Sept., 1895.	Quarter ending 30th Sept., 1896.
Miles open	2,531¼	2,531¼
Revenue — 1895. 1896. Passenger £224,374 £243,044 Merchandise £480,651 £494,141	£705,025	£737,185
Expenditure	£393,679	£405,756
Train miles run	1,938,908	1,969,585
Earnings per train mile	7/3¼	7/5¾
Expenditure per train mile	4/0¾	4/1½
Percentage—Expenditure to earnings	55·84	55·04
Number of passengers	5,027,326	5,392,491
Tonnage of goods traffic	962,513	1,113,950
Tonnage of live stock traffic	45,427	42,830

TRAMWAYS.	Quarter ending 30th Sept., 1895.	Quarter ending 30th Sept., 1896.
Miles open	61	61
Revenue	66,220	70,606
Expenditure	56,578	58,833
Tram miles run	659,835	745,170
Earnings per tram mile	2/0	1/10¾
Expenditure per tram mile	1/8½	1/7
Percentage—Expenditure to earnings	85·44	83·32
Number of fares collected	15,517,996	16,653,775

*441—A

[565 copies—Approximate Cost of Printing (labour and materials), £21 8s. 9d.]

RAILWAYS.

II.—Condition of the Lines.

A report as to the condition of the lines will be found as an Appendix, page 4.

III.—Special Rates.

A statement of the special rates, and the reasons for making the same, will be found attached. [Appendix page 4.]

IV.—Staff.

These returns are given as an Appendix, pages 5 to 10.

General Remarks.

The revenue for the quarter shows an increase of £32,160. It is very satisfactory to be able to report that this increase was brought about by an improvement in nearly all classes of traffic.

The First-class Passenger traffic increased to the extent of £7,764; the Second-class, £8,633; and the Miscellaneous traffic in the Coaching Department, £2,273.

In the Goods Department a net gain of £13,490 was obtained, General Merchandise showing an increase of £17,865; Coal and Coke, £6,233; Miscellaneous traffic, £1,309; aggregating £25,407; a decrease of £11,917, however, occurred in connection with the Wool, Live Stock, and Mineral traffic, other than Coal and Coke.

For the increased revenue earned in the Passenger Department 365,165 additional passenger journeys were made.

In regard to the Goods Department traffic, 104,549 additional tons of coal were carried, and 48,886 additional tons of general merchandise.

The expenditure shows an increase of £12,077, and the Working Expenses for the quarter represent 55·04 per cent. of the gross earnings as against 55·84 per cent. in the corresponding quarter of last year.

Liberal provision was made during the quarter for renewals and replacements both of Rolling Stock and Permanent-way.

CONDITION OF THE LINES AND ACCOMMODATION FOR THE TRAFFIC.

The lines are in excellent order. Relaying and resleepering is going on where required. The improvement of grades and curves is proceeding, and much advantage is being obtained in connection with the working of the present heavy traffic from the alterations already completed.

TRAMWAYS.

The revenue shows an increase of £4,386, and the working expenses an increase of £2,254. The percentage the working expenses bear to the total traffic is 83·32 as against 85·44 per cent. for the corresponding quarter of 1895.

We have the honor to be,

Sir,

Your most obedient servants,

E. M. G. EDDY,
Chief Commissioner.

CHARLES OLIVER,
Commissioner.

W. M. FEHON,
Commissioner.

APPENDIX I.

Report on the Condition of Ways and Works for the quarter ending 30th September, 1896.

Sir, Office of Engineer-in-Chief for Existing Lines, 2 October, 1896.

I have to report for the information of the Commissioners that the permanent-way and works have been satisfactorily maintained during the past quarter.

Relaying, resleepering, and reballasting operations have been steadily carried on.

The curve improvements near Faulconbridge, Woodford, Hazelbrook, and Lawson have been completed, thereby cutting out all sharp curves east of Katoomba, and considerable progress made with those in the vicinity of Katoomba and Blackheath.

The deviation to cut out the steep grade between Locksley and Brewongle has been completed, and the similar work between Geurie and Dubbo is nearly finished. A contract to improve the grade near Dargan's Creek has been let, and is making satisfactory progress.

On the Southern Line the work of cutting out the steep grade between Moss Vale and Exeter is being carried out departmentally.

I have, &c.,
THOMAS R. FIRTH.

The Secretary to the Railway Commissioners.

APPENDIX II.

NEW SOUTH WALES GOVERNMENT RAILWAYS.

STATEMENT, in accordance with clause No. 44 of the Railway Act, showing the Special Rates which have been made, and the reasons for making such rates, quarter ending 30th September, 1896.

Article	Rate.	Reason for rate.
Luggage	Luggage allowance to passengers holding 1st or 2nd class special cheap excursion tickets not to exceed 28 lb.	Special circumstances.
Parcels	Fruit, fish, and excess luggage between Sydney, Melbourne, Adelaide, and Broken Hill to be charged for at the bulk weight instead of for each parcel separately.	Additional facilities.
Fares	Fares from Murrumburrah to Harden: Single—1st, 4d.; 2nd, 3d. Return—1st, 6d.; 2nd, 4d.	Encourage traffic.
Cream and milk	Koorawatha to Young, to be charged single package rates, up transit	To secure traffic.
Junction charges	Goods carried between Wodonga and Albury, intended for the Albury Exhibition, free.	Special concession.
Wool (greasy)	Beabula to Hay (to be scoured), 2s. 8d. per ton	Special rate.
Wool	Wagga to Albury, special clips not less than 1,000 bales, 27s. 6d. per ton	To secure traffic.
Salt	Sydney to Culcairn, in 50 ton lots, for pastoral purposes, 38s. 6d. per ton	To secure traffic.

APPENDIX III.

APPENDIX.

(To Evidence taken before the Committee.)

(To Evidence taken before the Sectional Committee.)

PLAN.

Showing line recommended by the Committee and line originally submitted by the Department.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

RAILWAY FROM TAMWORTH TO MANILLA.

REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the first Session of the present Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, and the Public Works (Committees' Remuneration) Act of 1889, 53 Vic. No. 11, to whom was referred the duty of considering and reporting upon "the expediency of constructing a line of railway from Tamworth to Manilla," have, after due inquiry, resolved that it is expedient the proposed railway should be constructed, but instead of starting from Tamworth it should leave the Great Northern line at West Tamworth, pass on the southern side of the Peel River to a crossing below Attunga Creek, and thence follow approximately parallel the main road to Manilla, at a cost not exceeding £2,500 per mile, the total cost of land resumption not to be greater than that within the municipal boundary of Tamworth, as proposed by the Railway Commissioners; and, in accordance with the provision of subsection IV, of clause 13, of the Public Works Act, report their resolution to the Legislative Assembly:—

History of the proposal to construct the railway.

1. The line submitted by the Department originally formed part of a proposed branch railway from Tamworth to Barraba, the survey for which was made many years since. The plans were, however, burnt in the Garden Palace fire. In 1882 a deputation waited upon the Minister for Works and advocated the construction of a tramway or light railway. Nothing further of a definite character transpired until 1889, when the Minister promised to have the country examined as far as Bingera. Accordingly, an exploration was made by Mr. C. O. Burge, who furnished a report in February, 1890. In the same year Messrs. Scarr and Price, acting as Examiners of Public Works Proposals, reported on the proposed line as a possible route by which Inverell might be connected with the railway system. During 1892 Mr. S. Alexander, Examiner of Public Works Proposals, reported upon the proposed line; his report was laid before Parliament on 29th November in that year. On 15th February, 1893, Mr. Dowel moved in the Legislative Assembly that the proposal to construct a railway from Tamworth to Barraba, *via* Manilla, be submitted for the consideration of the Parliamentary Standing Committee, but on the question being put it was rejected. On the 15th March, 1893, a deputation representing Tamworth and district, waited upon the Minister and asked for his assistance in the matter of constructing the line by private enterprise. The next action taken was in December following, when a survey was made from Tamworth to Manilla. Subsequently, Mr. Young approved of its being extended to Barraba. The survey and plans were completed in October, 1895. On 27th September, 1895, a deputation representing the districts of Manilla, Barraba, and Bingera, urged the submission of a line from Tamworth to Barraba to the Public Works Committee. On 11th October, 1895, the Railway Commissioners were requested to report on the proposal from Tamworth to Barraba, and, after fully considering the whole question, they recommended that a line should be constructed as far as Manilla only, the extension to be

be dealt with at a future date. On 11th December, 1895, the Minister for Works moved in the Legislative Assembly, "That it be referred to the Parliamentary Standing Committee on Public Works to consider and report on the expediency of constructing a line of railway from Tamworth to Manilla." The motion was passed on division by forty-seven votes to nineteen.

Departmental description of the proposed railway.

2. The line as submitted by the Department is known as a light railway, and is 27¾ miles in length. According to the official statement it would leave the Great Northern railway at the south end of the Tamworth railway station, at about 182 miles 65 chains from Newcastle, and terminate on the left bank of the Namoi River, at about 210 miles 45 chains. The line is located to the west of the main road throughout its course to Manilla, following the valley of the Peel River for about 12 miles. The formation of the line is fairly level between Tamworth and Attunga Creek. Between this point and Manilla the line rises to a height of 428 feet, and then falls again 114 feet. The steepest grades shown on the section are, near Tamworth, 1 in 50, which are to be improved to 1 in 66, and on the rest of the line the steepest grades are 1 in 66, which it is proposed to improve to 1 in 80. The sharpest curves are 12 chains radius. The waterways are unimportant, there being only four small timber bridges proposed in addition to the culverts.

Estimated cost.

3. The estimated total cost of the railway proposed by the Department is £72,150, or about £2,600 per mile, exclusive of the cost of land and compensation.

Railway Commissioners' Report.

4. The railway is recommended by the Railway Commissioners who, in their report to the Minister, state "the land throughout the whole route is of good agricultural character, and for a considerable distance beyond the proposed terminus of the line the same class of country exists. The road through from Bingera and Barraba is a metalled one, and a considerable stream of traffic finds its way through Manilla from the district even beyond Bingera. The whole of this traffic would be intercepted by the proposed branch line, and would add a *bonâ fide* additional income to the revenue of the railways." Their estimate of the annual cost of the railway and of the traffic returns shows a loss at the commencement, but it is anticipated that when the district is further developed this loss will disappear. The Commissioners estimate the working expenses, including the interest on capital expenditure, at £5,245 per annum, and the probable receipts from traffic at £4,044, showing an annual loss of £1,201. While in the district the Commissioners "intimated to the people that if the line were constructed, local rates would be charged on all traffic passing over it." With reference to land required for railway purposes they report:—"We also informed the deputations that waited upon us for the purpose of giving information that we should advise the Government that it should be made a *sine qua non* that all the alienated land required for the line should be conveyed to the Government free of any payment for the same or for compensation, the Government doing all the legal work in connection therewith"; the land within the population area of Tamworth to be excepted from this arrangement.

The Committee's Inquiry.

5. The Committee have made full inquiry into the proposed work. The case generally as regards the railway was fully explained by the Engineer-in-Chief of the Railway Construction Branch; following him there were examined: the Secretary to the Railway Commissioners; the Railway Goods Superintendent; the Acting Chief Draftsman, Department of Lands; the Resident Engineer for Roads at Tamworth (who has charge of the road from Tamworth to Manilla); and the Hon. P. G. King, M.L.C. The Departmental evidence having been taken, a Sectional Committee visited the district, took evidence, and inspected the route of the proposed railway.

Sectional Committee's Report.

6. The Sectional Committee report that the area of country specially benefited lies within the county of Darling, extending about 35 miles east and west, and about 45 miles north and south. To this may be added a further extent of country lying to the north-east on the Horton River, and directly north towards Bingera; on the south the limit may be extended beyond Attunga, but since there is already in existence a good road to Tamworth it is not reasonable to expect much traffic between that place and Attunga. The Stock Inspector estimates the stock depastured on the area which would be benefited by the construction of the railway to be:—Sheep, 1,000,000; cattle, 50,000; horses, 30,000.

The

The area of cultivable land, which by reason of the heavy cost of road carriage offers little inducement to the agriculturist, may be approximately stated at 100,000 acres. The Sectional Committee were satisfied that if moderate railway charges were substituted for the present cost of transit it would induce not only the holders of small areas to cultivate their land, but also permit the pastoralists to make arrangements with farmers over much of the larger estates. The estimates of returns prepared by the Railway Commissioners are likely to be realised, and there is every probability that in a few years the loss now anticipated will disappear. The increase of production during the past few years, even with heavy carriage charges, justifies the belief that the traffic returns will be at once considerably augmented.

The evidence.

7. The evidence generally is favourable to the construction of a railway to Manilla. The most important points in the inquiry were :—

(1) Object in view in constructing the railway.
(2) Expected traffic.
(3) Question of cost of construction.
(4) Location of route.

Object in view in constructing the Railway.

Object in view in constructing the railway.

8. The chief object in view in constructing the line is to afford a cheaper and more expeditious means of transit to the residents in this large settled district. It is anticipated that railway communication between Tamworth and Manilla will result in a considerable increase in agricultural settlement, and aid further development in mining.

Expected Traffic.

Expected traffic.

9. The traffic expected on the line will consist mainly of wool, wheat, general merchandise, and passengers. This will be drawn principally from the district already described, and will not be materially affected by any railway extension north of Bingera, that place being the utmost limit of the influence of the proposed railway.

Question of Cost of Construction.

Question of cost of construction.

10. The estimated cost of the railway, as submitted by the Department, was £2,600 per mile. The route approved by the Committee is about one mile longer, and is estimated at £2,534 per mile. Although termed a light line of railway, the estimate per mile is in excess of the cost of the railway from Narrabri to Moree, given as about £2,409 per mile, and the railway from Jerilderie to Berrigan, which is stated at £2,000 per mile. The Engineer-in-Chief for Railway Construction explains that the earthworks on the proposed line are heavier than in the latter case.

Location of Route.

Location of route.

11. The surveyed line, as submitted to the Committee, interferes with properties within the municipal boundaries of the town of Tamworth, the value of which is estimated by the Municipal Valuer at £3,010, no allowance being made in this estimate for forced sale or for those incidental expenses which always increase the cost of Government resumptions. From the municipal boundary to the village of Attunga the value of the land is estimated at £6 per acre; to this must be added severance and the value of improvements affected. Through the Attunga holding no difficulty is apprehended in obtaining the necessary land free of cost. From the boundary of that holding to Manilla the cost of resumption would be heavy; the interference with improvements and damage by severance being considerable. It is not possible to estimate accurately what the total amount would be; but were the line, as submitted to the Committee, forced through, the expenditure for land resumption and severance would form a serious item of cost. Although Manilla is the centre of a sufficiently important district to justify the construction of a railway to it, still the Committee are not prepared to recommend Parliament to expend a large sum upon land resumption. It would be beyond the power of those specially interested in the railway to obtain the land by private agreement. The location and character of the road prevent it being utilised for railway purposes.

Route approved by the Committee.

Route approved by the Committee.

12. The Committee are of opinion that it is possible to obtain a route starting from West Tamworth, on the southern side of the Peel River, passing through the A.A. Company's Estate, crossing the Peel River below the junction of the Attunga Creek, and joining the Departmental line on the reserve beyond Attunga Creek; thence following approximately the route laid down in the original Departmental survey to the northern boundary of Attunga run; thence to Manilla, keeping back from the road a sufficient distance to the west, or placing the railway to the east of the road, and adjacent thereto, thus preventing any interference with the more costly improvements. By this means it is anticipated that it will be possible largely to reduce the cost of compensation. The only serious deviation from the originally-surveyed line is adjacent to the town of Tamworth, but since there is a good road from Attunga it is probable that residents on much of this length would prefer to cart their produce to Tamworth, even were a railway constructed adjacent to the road.

The line recommended would serve every interest as fully as that submitted by the Department of Public Works. The cost of construction would be about £64 per mile less than that of the line originally surveyed, but this route will be one mile longer. The distance from Sydney to Manilla will be unaltered. The grades on this line will be equal to those possible in the Departmental survey.

Resolution of the Committee.

13. The following extract from the Committee's Minutes of Proceedings of 4th September will show the resolution arrived at by the Committee:—

"Mr. Lee (with consent) moved—

'That in the opinion of the Committee it is expedient the proposed railway from Tamworth to Manilla, referred to the Committee by the Legislative Assembly, be carried out; but instead of starting from Tamworth it should leave the Great Northern line at West Tamworth, pass on the southern side of the Peel River to a crossing below Attunga Creek, and thence follow approximately parallel the main road to Manilla, at a cost not exceeding £2,500 per mile, the total cost of land resumption not to be greater than that within the municipal boundary of Tamworth, as proposed by the Railway Commissioners.'

"Mr. C. J. Roberts seconded the motion.

"Mr. Humphery moved—

'That the motion be amended by the omission of all the words after the words "per mile," with a view to the insertion of the following words: "and that, in terms of the Railway Commissioners' Report, it be made a *sine qua non* that all the alienated land required for the line should be conveyed to the Government free of any payment for the same, or for compensation, the Government doing all the legal work in connection therewith."'

"The amendment was seconded by Mr. Hassall, and negatived on the following division, upon the question, 'That the words proposed to be omitted stand part of the motion':—

Ayes, 6.	Noes, 5.
Mr. Ewing,	Mr. Humphery,
Mr. Roberts,	Mr. Trickett,
Mr. O'Connor,	Mr. Clarke,
Mr. Lee,	Mr. Hassall,
Mr. Fegan,	Mr. Wright.
Mr. Black.	

"The motion was then passed on the following division:—

Ayes, 6.	Noes, 5.
Mr. Ewing,	Mr. Humphery,
Mr. Roberts,	Mr. Trickett,
Mr. O'Connor,	Mr. Clarke,
Mr. Lee,	Mr. Hassall,
Mr. Fegan,	Mr. Wright."
Mr. Black.	

F. T. HUMPHERY,
Vice-Chairman.

Office of the Parliamentary Standing Committee on Public Works,
Sydney, 1 October, 1896.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

RAILWAY FROM TAMWORTH TO MANILLA.

THURSDAY, 20 *FEBRUARY*, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (Chairman).

The Hon. Frederick Thomas Humphery.	Charles Alfred Lee, Esq.
The Hon. John Davies, C.M.G.	Thomas Henry Hassall, Esq.
The Hon. James Hoskins.	George Black, Esq.
Henry Clarke, Esq.	Francis Augustus Wright, Esq.

The Committee proceeded to consider the proposed Railway from Tamworth to Manilla.

Henry Deane, Esq., Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and examined:—

1. *Chairman.*] What are you? Engineer-in-Chief, Railway Construction Branch, Department of Public Works. H. Deane, Esq.

2. You desire to give the Committee the Ministerial view of the railway proposal before them, and also to deal with the engineering aspect of the case? Yes. I will read to the Committee the following statement:— 20 Feb., 1896.

Proposed Railway from Tamworth to Manilla.

The history of the proposed railway shows that the line originally formed part of a proposed branch line from Tamworth to Barraba, the original survey for which was made many years ago, but the plans were burnt in the Garden Palace fire.

The proposal was brought forward again in 1882 by a deputation to Mr. Secretary Lackey advocating construction of a tramway or light railway. The reply of the Minister was that consideration would be given to the matter if the Camden tramway, which had just then been constructed, and which was in the nature of an experiment, proved to be a success. Nothing further of a definite character appears to have been done until 1889 when Mr. Dowel, M.P., brought the matter before Mr. Secretary Bruce Smith who promised to have the country examined as far as Bingera. An exploration was accordingly made by Mr. C. O. Burge who reported in February 1890.

In the same year, Messrs. Scarr and Price, who were acting as Public Works Examiners, reported on the line as a possible route by which Inverell might be connected with the railway system.

In April, 1892, a deputation waited upon Mr. Secretary Lyne to request that a further report might be obtained as to the desirableness of constructing a line from Tamworth to Barraba with branches to Moree and Inverell. As a result, Mr. Alexander, then Examiner of Public Works Proposals, was instructed to report. His report, which is attached hereto, was laid before Parliament on 29th November, 1892.

On the 15th February, 1893, Mr. Dowel moved in the Legislative Assembly that the proposal to construct a railway from Tamworth to Barraba *via* Manilla be submitted for the consideration of the Parliamentary Standing Committee, but on the question being put it was rejected. Shortly afterwards, namely, on the 15th March, 1893, a deputation representing Tamworth and district, introduced by Messrs. Dowel and Hassall, Ms.P., waited upon Mr. Secretary Lyne and asked for his assistance in the matter of constructing the line by private enterprise.

Mr. Lyne, in reply to the deputation, stated that he had not the least objection to the construction of the line by private enterprise, but such a course would be a deviation from the established rule and system, as the railway construction of the Colony was at present being carried out by the Government.

H. Deane, Esq. 20 Feb., 1896.

He promised, however, to consult his colleagues on the matter. The next action taken was in December following, when Mr. Lyne approved of a survey being made from Tamworth to Manilla. Subsequently, Mr. Secretary Young approved of its being extended to Barraba. The survey and plans were completed in October, 1895.

On 27th September, 1895, Mr. Moore, M.P., introduced a deputation representing the districts of Manilla, Barraba, and Bingera, and urged the submission of a line from Tamworth to Barraba to the Public Works Committee.

On the 11th October, 1895, the Railway Commissioners, by direction of the Minister, were asked to report on the proposal from Tamworth to Barraba, and after a full consideration of the whole question, they recommended that a line should be constructed as far as Manilla only, the extension to be dealt with at a future date. The Commissioners' letter, dated the 1st November, 1895, in which they set forth their reasons for their recommendation, is as follows :—

Office of the Railway Commissioners of New South Wales, Sydney, 1 November, 1895.

The Honorable the Minister for Public Works,—

We have the honor to intimate that, in accordance with the request contained in Minute of 11th October, we have investigated the proposal to construct a railway from Tamworth to Barraba, and after full consideration of the whole surroundings we would beg to recommend that a line should be constructed from Tamworth to Manilla only, leaving the extension to be dealt with at a future date.

One of our main reasons for recommending this course is that a costly bridge would be necessary to carry the railway over the Manilla and Namoi Rivers at Manilla—the cost of the bridge would probably amount to £20,000—and that the country from Upper Manilla northwards is of a rougher character and would be more costly to construct a railway through ; moreover, it is not such good agricultural country as further south.

A larger question is opened out if the line is constructed as far as Barraba, and that is whether it would not be a desirable thing to extend the line to Inverell. This subject requires most careful consideration in conjunction with other schemes that have been proposed at various times for connecting Inverell with the general railway system.

We would be glad to know whether the Minister still wishes to have our report under seal in regard to the line throughout from Tamworth to Barraba, or whether he agrees in the view expressed in regard to the line terminating at Manilla. If so, we will submit our report under seal in regard to that section.

We may state that we intimated to the people of the district that if the line were constructed, local rates would be charged on all traffic passing over it. They expressed their willingness to pay the rates which were indicated.

We also informed the deputations that waited upon us for the purpose of giving information that we should advise the Government that it should be made a *sine qua non* that all the alienated land required for the line should be conveyed to the Government free of any payment for the same or for compensation, the Government doing all the legal work in connection therewith. We think it would be only reasonable, however, for the land necessary within the population area of Tamworth as now defined on the maps of the Department of Lands to be excluded from this arrangement, as the residents in the suburbs of Tamworth will not, of course, be interested in any way in giving land.

E. M. G. EDDY,
Chief Commissioner.
CHARLES OLIVER,
Commissioner.
W. M. FEHON,
Commissioner.

The Minister having concurred in this recommendation the Commissioners were asked to report on the proposal from Tamworth to Manilla *only*, and on the 11th November, 1895, they forwarded their report in accordance with the provision of the Public Works Act. It is as follows :—

Office of the Railway Commissioners of New South Wales, Sydney, 11 November, 1895.

Proposed line of Railway, Tamworth to Manilla, 27¾ miles.

In accordance with the provisions of section 13 of the "Public Works Act, 1888," we beg to report as under :—

Cost of construction—		
The Engineer-in-Chief for Construction estimates the cost of construction of a single line of light railway (exclusive of land and compensation) at		£72,150
Annual cost—		
Interest on capital expenditure, at 3¼ per cent.	£2,345	
Cost of maintaining permanent-way, traffic, and locomotive expenses	2,900	
Total working cost		£5,245
Traffic estimate—		
Goods and live stock traffic	£2,908	
Passenger traffic	800	
Mails	336	
Total estimated traffic		£4,044

The land throughout the whole route is of a good agricultural character, and for a considerable distance beyond the proposed terminus of the line the same class of country exists.

The road through from Bingera and Barraba is a metalled one, and a considerable stream of traffic finds its way through Manilla from the district even beyond Bingera. The whole of this traffic would be intercepted by the proposed branch line, and would add a *bona fide* additional income to the revenue of the railways.

We may state that we intimated to the people of the district that if the line were constructed local rates would be charged on all traffic passing over it. They expressed their willingness to pay the rates which were indicated.

We also informed the deputations, which waited upon us for the purpose of giving information, that we should advise the Government that it should be made a *sine qua non* that all the alienated land required for the line should be conveyed to the Government free of any payment for the same or for compensation, the Government doing all the legal work in connection therewith. We think it would be only reasonable, however, for the land necessary within the population area of Tamworth, as now defined on the maps of the Department of Lands, to be excluded from this arrangement, as the residents in the suburbs of Tamworth will not, of course, be interested in any way in giving land.

The Seal of the Railway Commissioners of New South Wales was hereunto affixed, this eleventh day of November, One thousand eight hundred and ninety-five, in the presence of—

H. M'LACHLAN.

E. M. G. EDDY, (L.S.)
Chief Commissioner.
CHARLES OLIVER, (L.S.)
Commissioner.
W. M. FEHON, (L.S.)
Commissioner.

On

H. Deane, Esq.

20 Feb., 1896.

On the 11th December, 1895, Mr. Secretary Young moved in the Legislative Assembly, "That it be referred to the Parliamentary Standing Committee on Public Works to consider and report on the expediency of constructing a line of Railway from Tamworth to Manilla." The motion was passed on division by 47 votes to 19. The official description of the line is as follows:—

LINE FROM TAMWORTH TO MANILLA.

Single line; length 27¾ miles; estimated cost, £72,150, for a light line of railway, exclusive of land and compensation.

THE proposed branch line would leave the Great Northern Railway at the south end of the Tamworth railway station, at about 182 miles 65 chains from Newcastle, and terminate on the left bank of the Namoi River, at about 210 miles 45 chains.

The line traverses ground on the west of the main road throughout its course to Manilla, being on the right bank of the Peel River for about 12 miles, passing through Attunga. The formation of the line is fairly level, with slight undulations between Tamworth and Attunga Creek. Between this point and Manilla the line rises to a height of 428 feet and then falls again 114 feet down to Manilla. The steepest grades shown on the section are, near Tamworth, 1 in 50, which are to be improved to 1 in 66, and on the rest of the line the steepest grades are 1 in 66, which it is proposed to improve to 1 in 80. The sharpest curves are 12 chains radius. The waterways are all very small, there being only four small timber bridges proposed in addition to the culverts.

The proposed line of railway traverses the southern end of a route by which the produce from extensive areas as far as the Queensland border have regularly been carted to the Great Northern Railway at Tamworth, and along which, from Tamworth, all sorts of supplies have been returned. A considerable portion of this traffic will now be directed from this route to Moree, which place will soon be the terminus of an extension of the North-Western Railway that is now being built from Narrabri, and another portion of the same traffic would undoubtedly be taken to Inverell were a railway connection constructed between that town and the Great Northern Railway, or *via* Moree if a railway be constructed between Moree and Inverell; but there still would remain an extensive area in the county of Murchison and along the Gwydir River which will ever be served by the Tamworth station on the Great Northern Railway. The route *via* Bingera, Barraba, and Manilla to Tamworth has ever been a favourite with drovers and teamsters, because of the favourable conditions for travelling always experienced along it—in climate, good roads, and good camping grounds.

These arguments have equal force in favour of constructing the whole line as far as Barraba at once, but it is felt that some hesitation is advisable before taking this step in view of the uncertainty that surrounds the question of the service of that tract of country lying to the west of the Great Northern Railway as far north as the Queensland border. The direct connection of Inverell with the existing railway system must, if decided on, alter very considerably the conditions to be served in the districts now being catered for.

The proposal now made to construct a line from Tamworth to Manilla only may be supported on its own merits as not being in conflict with or infringing other interests in the way of diverting traffic from existing lines, and as being a decided feeder to the existing railway system, because it will bring to pass considerable development in all branches of farming and settlement of lands, and, possibly, in mining.

The situation of Manilla is a favourable one for a railway station, as it is surrounded by extensive areas of the best land, and is a point to which several routes of traffic converge.

Statistics of the district to be directly served by the proposed railway, including all the area within 10 miles of Tamworth, have been furnished by Mr. Alexander to the Minister for Public Works, and they show that in 1892 the population was 3,000; the cultivable area, 145,730 acres; and the area under cultivation, 10,389 acres; that the land alienated amounted to 545,383 acres, or 852 square miles, and unalienated to 499,805 acres, or 781 square miles.

From this area it is estimated that 5,000 bales of wool were collected in the season of 1891-92, and that in addition 6,000 bales were passed through the district from the north. There were ninety-six regular carriers on the road, representing 113 teams, but during the busy season their numbers were considerably augmented.

The whole of these areas are confined by natural features in a way that no outlet from them is possible except *via* Tamworth. The Nandewar Range is the boundary of the district on the west and north, and the Moonbi Range on the east.

The estimated cost of constructing the line from Tamworth to Manilla is £72,150. The Railway Commissioners estimate the working expenses, including the interest on capital expenditure, at £5,245 per annum, and the probable receipts from traffic at £4,044. This estimate shows an annual loss of £1,201 per annum, but the Railway Commissioners recommend that the line be constructed, stipulating that special local rates shall be charged on all traffic passed over it, and that all the land required for the line shall be conveyed to the Government, free of charge or claim for compensation, excepting for the legal expenses incurred in conveyancing, and excepting from this arrangement the land within the population area of Tamworth.

I hand in a map showing the country situated within 20 miles of the proposed railway; a compilation of parish maps showing the course of the line and the properties through which it will pass; a plan, on a scale of 4 chains to the inch, showing in greater detail the course of the proposed railway; also section of the line, and Book of Reference. It is proposed by the Railway Commissioners that all the land shall be given free, and I think that as a rule the residents should only be too glad to do so, as a return for getting the railway constructed.

3. *Mr. Hoskins.*] Have any of the them notified their willingness to give the land? I cannot say whether they have actually done so. With regard to severance, when I was in Manilla, I asked Mr. John Barling, who has the station of Upper Manilla, his opinion as to severance, and he told me that if the line were made without fencing, so that people could get their produce and stock across at any point, there should be no claim whatever for severance.

4. *Mr. Hassall.*] You say the cost of this line would be £72,150, or about £2,600 per mile? Yes, that is the estimated cost of construction only.

5.

H. Deane, Esq. 20 Feb., 1896.

5. There is no difficult country along the proposed line? No; it is not a difficult country through which to make a railway.
6. Will there be any heavy cuttings or embankments? Yes; there will be some few at the start near Tamworth. It will not be a surface line, like some lines that have been recommended lately—not quite so cheap. There will be more earth-works.
7. But the country itself is of a fairly level character, is it not? Yes, undulating; there are some good hills, but still they are easily negotiable.
8. Practically, I suppose the line follows the course of the road? It never diverges very far from the road.
9. On the eastern or western side of the road? On the western.
10. That is lying between the road and the Peel River? Yes.
11. Have you any idea why the Railway Commissioners recommend the construction of the line only as far as Manilla? I think that is pretty well explained in their report.
12. Is it in consequence of the difficulty of construction further north? The portion from Tamworth to Manilla is the cheapest, and the land is the best.
13. But do you think there will be any advantage in constructing a line from Tamworth to Manilla without taking it any further? I should think so. There will be an advantage in constructing this portion of the Barraba line, even if the other be not constructed.
14. In what way? You go through some very fine country, and when you get to Manilla you serve a good deal of the country beyond. By constructing this portion of the line, you would save nearly 30 miles of cartage.
15. But there is a very good road for that 30 miles? Yes.
16. And a good road right away through to Warialda? There is a good road as far as Barraba; I have not been any further.
17. As there is a good road and plenty of carriers, what advantage would be derived from putting down this short length of line to Manilla if it is not intended to carry it any further? It would be an advantage to all the producers; they would get cheaper freights.
18. The Railway Commissioners propose that local rates should be charged, and expressly stipulate that if the line is constructed they will have to charge heavier rates than those charged on existing lines? Yes.
19. We have had an illustration of the effect of local rates on different lines in the fact that carriers have competed with the railway; and if this short length of line were constructed it might happen that carriers would be able to compete with the railway if local rates were charged, considering that the road is a good one? On that point I would be glad if you would ask the Commissioners, who would be able to give you better information than I can.
20. You have been up as far as Barraba? Yes.
21. What is your opinion of the country between Manilla and Barraba? A great deal of it is very good. It is considerably more hilly between Manilla and Barraba, than between Tamworth and Manilla.
22. Is not the country at Barraba as good as that about Manilla for agriculture? I should say it was, only, perhaps, there is not so much of it. It is not so extensive or so unbroken.
23. But the quality is equally as good as that at Manilla? I should say the quality was about the same.
24. There is a good scope of country between Manilla and Barraba equally as good as the country about Manilla? Yes; it is closed in. As you go along the road you notice that after a time the hills close you in, and there is rough country which is only good for pasturage. But where the country opens out again as you get to Barraba, the land is very good indeed.
25. Are the engineering difficulties much greater between Manilla and Barraba, than between Tamworth and Manilla? They are greater.
26. Has a survey been made of that portion? Yes; it has all been surveyed right into Barraba. My estimate of the cost of the whole line from Tamworth to Barraba is £200,800. The distance between Manilla and Barraba is 30 miles. Therefore, the cost of the portion between Manilla and Barraba would be £128,150 according to my estimate, or between 60 and 70 per cent. more than the cost of the line from Tamworth to Manilla.
27. And according to their report the Railway Commissioners do not feel justified, at any rate at the present time, in recommending the construction of the line through to Barraba, involving such a large expenditure? That is how the matter stands. I may say that about £20,000 of the estimate just mentioned is due to a bridge over the river.
28. Does your survey show that any large quantity of land would have to be resumed for the construction of this line? I have not calculated the matter out, but I can obtain the information for the Committee.
29. Have you any idea of the value of the land through which the railway will pass? That is a point upon which I would rather not give an opinion.
30. Judging from what you saw of it, is it fairly good agricultural country? Yes.
31. You do not think the Government could resume it for £1 an acre? No; I should think it would be three or four times that amount.
32. Would it be necessary to resume much land in the vicinity of Tamworth? I have had the line laid out so as to avoid as much as possible cutting into property, even at the cost of rather increasing the earth-works. I have endeavoured to keep parallel to the road, so as not to cut across allotments cornerways.
33. But it would appear from the plans that the line would go through a considerable quantity of purchased land close to Tamworth? Yes; it would.
34. I think you said the steepest grade on the line would be 1 in 66? The grades shown on this section are 1 in 50 facing Manilla, and 1 in 66 facing Tamworth. They will be improved to 1 in 66 facing Manilla, and 1 in 75 facing Tamworth, so that the ruling grade, with the heavy traffic going towards Tamworth, will only be 1 in 75. The grade of 1 in 66 is the best that could be obtained without serious expense. The estimate of cost applies to the improved grades.
35. I think you said that the residents would be pleased to give their land in order to get the railway? Yes.
36. Do you not think they might say, "We have a railway already at Tamworth; we have no particular desire to see this railway constructed out towards Manilla, and we object to give our land free";—would not

H. Deane, Esq.

20 Feb., 1890.

not this be the case, especially with regard to land of a valuable character? There might be some who would say that.

37. Do you think there would be a little difficulty in that respect? I think it possible that some of the people might not care for the railway—might not think it worth while.

38. And if three or four, or five or six of them objected to give their land free, do you not think the rest would follow suit? No; I think it probable that the others would combine and buy them out. It could scarcely be expected that the people who had land for the first few miles of the line would give their land free, because they would not benefit, as they would just as easily run into Tamworth, and probably prefer to do so than take the local station. That, however, would only apply for the first few miles.

39. Might not the Manilla people say the same thing—that they have a good road to Tamworth, and could drive there in half a day, or take their produce in in two days? I do not think they would say that; I think they are anxious for the railway.

40. As a first instalment, perhaps, of something further out? I think they would prefer that it should stop at Manilla.

41. I think I heard you say that if the line were constructed to Barraba, there might be a question as to carrying it on to Inverell;—do you think there is any probability of that being done? I think it will take a good many years. I have had the country between Barraba and Inverell examined, and between Barraba and Bingera it is very heavy.

42. Do you think there is little or no prospect of the line being constructed from Barraba towards Bingera? Not immediately; I could not say what might be done in the future. It might be a desirable thing to carry out, but there is no immediate necessity for it, and I should say the necessity is not likely to occur for some time. I think it is very likely that if the northern line had not been taken up the Moonbi, a line along Manilla and Barraba would have been a better line by which to get up into New England. The comparatively short distance of heavy works between Barraba and Bingera would be trifling as compared with the large extent of heavy works on the existing line.

43. I suppose you are of the same opinion as the general body of the public in that respect—that the line took the wrong route from Tamworth to the New England country? Yes; I think it ought to have gone the way I have mentioned.

44. Have you any knowledge of the deputations that waited upon the Minister with reference to the construction of the railway further out? No.

45. Did you travel over the route as far as Bingera? No; I only went as far as Barraba.

46. It is only, therefore, from reports that you have a knowledge of the country beyond Barraba? I have the reports of the examiners (Messrs. Wilkinson, Price, and Scarr), and the report of my officers—Mr. Burge and Mr. Stewart.

47. And what is the general tenor of their reports with regard to the construction further out? That it is extremely heavy.

48. Of too expensive a character? Yes. From Bingera you have to rise about 500 feet to get over the range, and then there is a drop of about 1,000 feet into Hall's Creek. The steepest grade between Barraba and Bingera is at the Devil's Elbow.

49. I gather from what you say that the prospect of any further extension of the railway from Manilla would be very problematical, at any rate, for many years to come? Yes.

50. I suppose you have a knowledge of the survey which is being made between Moree and Inverell? Yes.

51. Do you think there is a probability of that portion of the country being served either from Moree or from Glen Innes? Yes; the survey of the Moree to Inverell line is complete, and I am now going into the estimate.

52. If the extension were made from Moree to Inverell, do you think there would be very little necessity to carry this line any further than Manilla? No; the map shows that Bingara will not be very far from that proposed line.

53. If the proposed extension were made from Moree to Inverell, serving all that country and taking in the Warialda and Bingera country, and all the country out to the northern border, do you not think that line would intercept all the border traffic which would come in to Moree and round by Narrabri? Yes; the line from Moree to Inverell would certainly intercept all the border traffic.

54. Then the proposed line to Manilla would be left practically with only the traffic from a little way beyond Barraba, say as far a Cobbedah, or a little beyond? Yes; comparatively speaking, it would be local traffic. Still it is a pretty good sized district, taking it as far as Cobbedah.

55. In the event of the construction of the line from Moree to Inverell, do you not think this portion of the country would almost be as well served by the road which the people have at present, as by the proposed railway, for a distance of 27¾ miles? I do not think so. I think there would be an advantage in making the line, even if it only went for 30 miles.

56. And to act as a feeder to the main line? Yes; the district is a very important one for wheat cultivation. I do not think that if this railway is taken to Manilla the lines will clash, assuming that the Moree to Inverell line is constructed. You have to consider whether the line from Tamworth to Manilla is desirable, not to assist the traffic from the border, but to carry the produce from the neighbouring district extending as far as Barraba or Cobbedah, and both east and west of the line.

57. You are of opinion that the construction of this proposed railway would further develop the country and assist in creating traffic? Yes.

58. That more land will be put under cultivation, and greater traffic result from the facilities offered to carry produce to market? Yes; even as it is, I believe every year there is more land put under cultivation. So that in that way every year there is an increasing chance of the revenue from the railway being sufficient to pay.

59. There is a large area of land very suitable for agriculture not at present under cultivation? Yes.

60. And a good deal of Crown land still available? It will be seen from the map that I handed in that the land is nearly all alienated. The part coloured purple represents actual freehold, and that coloured blue land conditionally purchased.

61. *Mr. Hoskins.*] Is this proposed railway from Tamworth to Manilla what you term a light line of railway? It is a cheap line. It is really one of the same class; but the earthworks are heavier than in the case of the Berrigan line and the Parkes to Condobolin line.

H. Deane, Esq. 20 Feb., 1896.

62. The estimated average cost of the line from Narrabri to Moree was £2,409 per mile. How is it that while that estimate includes an expensive bridge, and a liberal provision in the shape of culverts required owing to the flooded state of the country, the estimate for this proposed railway, which does not show the same difficult features, should be £2,600 per mile? The Narrabri to Moree estimate is divided into two parts. The estimated average cost for the whole line is £2,409 per mile. The estimated average cost for the second part—the part north of Narrabri itself—was £2,667 per mile. That is the part that does not include the bridge, and that would be the part with which we might make a fair comparison. That country is much more level than the country between Tamworth and Manilla. The earthworks on the Manilla line are heavier. I have estimated their cost to be £109 per mile more than the cost of those on the Narrabri line. On the other hand the box-drains and culverts come to less. I find that on the whole the items fairly balance one another, except those relating to station works and junction. In the case of the Tamworth to Manilla line the cost, distributed over the line, of junction arrangements and station accommodation, amounts to £281 per mile; whereas on the second section of the Narrabri line the cost only amounts to £143 per mile. In that second section there is no junction. That would account for the difference in the main body of the estimate. The rest of the difference is in the contingencies that are allowed. I have thought it desirable to allow more in the case of the Tamworth to Manilla line.

63. Do you usually allow more for contingencies on a length of railway where you have to cross a river by a bridge, and have to construct expensive box-drains and culverts, than you do on a length of railway where the work is plain, and there are few cuttings? On the second section of the Narrabri line I have mentioned there is no bridge.

64. Is it not customary to allow more for contingencies on a length of railway where you have to contend with rivers and large creeks, and a great rush of water, such as occurs in flooded country, than where the line is comparatively free from flood? The difference really lies in this: these quantities have been taken out for the steeper grades as shown on the section. I went carefully into the matter of the flattened grades which the Railway Commissioners wanted me to provide, and I put that additional cost in the contingencies, so that the contingencies really cover any extra cost there would be through flattening the grades.

65. You still contend that this is to be one of the class of light railways about which you gave us interesting information when you came back from America, except that there are rather heavier cuttings than on the other light lines? Yes.

66. Do you propose to use ballast on this line? Some ballast, but I will save it where I can. I have reckoned for one-third of the line to be ballasted.

67. And with regard to the remaining two-thirds the sleepers are to be laid on the ground? They will be laid on the bank, but there will be a greater number of sleepers than on the existing lines. The number of sleepers will be the same as are being put on the new lines—that it 2,400 to the mile—a little over 2 feet apart, or about 2 feet 2 inches from centre to centre.

68. I suppose you intend in this proposed railway, if constructed, to adhere to the views you expressed when you returned from America, and make it what may be termed a pioneer line—to lay the sleepers and rails for the greater portion of the line on the enbankment, with ditches at the sides to drain it? The sleepers will be laid on low enbankments made from the ditches at the sides.

69. And they will be closer together than is the case on the ballasted lines? Yes.

70. What weight of rails do you propose to use? 60-lb. steel rails.

71. Do you propose to fence in the railway? No.

72. As this proposed line, according to your evidence, will probably be a very short one, and only carry local traffic, have you any reason to believe you will be able to reduce your estimate of cost below £2,600 per mile? No, I should not like to reduce the estimate; but I will save in construction if I can.

73. Who is the officer responsible for laying out this line; had he any experience of the Narrabri to Moree, the Jerilderie to Berrigan, or the Parkes to Condobolin line? Mr. Jamieson was the officer who laid out this line.

74. Did he have any previous experience of these new cheap lines you are constructing? He acted under instructions. He laid out the Berrigan line.

75. When were the surveys of this line completed? Before those of the Berrigan line, I think.

76. I gather from the statement you read, that surveys for a railway from Tamworth to Barraba had been made for some time;—have those surveys been modified by you in conformity with the views previously expressed, as to what the public required in the shape of light lines of railway, where the traffic is expected to be limited? Yes, they have.

77. The original surveys? Yes. I paid great attention to the branch lines for the last two or three years, with the object of reducing the cost.

78. *Mr. Davies.*] You are aware that the proposed line will go through private land—right through, except at the Manilla end? Yes.

79. Have you any idea of the probable cost of resumption? No.

80. Would it be £100 per mile? I would rather that the Committee obtained that information from some other officer. I have already mentioned that I think the land would be worth £3 or £4 an acre; but I am not in a position to give an accurate estimate.

81. The recommendation of the Railway Commissioners is, that it should be a condition that the land should be given? Yes.

82. Even if the land is given, the line will show an annual loss of £1,200? I think that was the amount mentioned.

83. Do you propose to use second-hand rails, or new rails? New steel rails.

84. In the construction of the Moree line a large proportion of the rails were second-hand or re-rolled rails, were they not? No; we are using new rails.

85. How do you account then for the increased cost per mile of this cheap kind of railway between Tamworth and Manilla? It is chiefly on account of the earthworks, which are heavier.

86. Are they very much heavier than on the Moree line? Yes; sufficient to account for the difference.

87. What do you estimate is the cost per mile of the earthworks? With the grading as shown on the section submitted, I estimated the cost of the earthworks at £409 per mile; but this will be slightly increased if the grades are altered to 1 in 66, and 1 in 75.

88. Could you furnish the Committee with a detailed estimate of the cost of the proposed line? Yes; it is as follows:— H. Deane, Esq. 20 Feb., 1896.

TAMWORTH TO MANILLA.

Estimated cost of a single line of railway 27 miles 60 chains in length with 60-lb rails against 1 in 66. Sharpest curve, 12 chains radius Ruling grade with load, 1 in 80,

Description	Estimated Cost.	Average per mile
	£ s d.	£
Earthworks	11,342 5 0	409
Box-drains, culverts and timber bridges	4,717 10 0	170
Overbridge	500 0 0	18
Level crossings, cattle-stops and fencing	2,700 0 0	97
Permanent-way materials	19,315 6 6	696
Platelaying at 1s, £2,442		
Ballasting one third at 3s, £2,376	13,784 2 0	497
Sleepers at 2s 9d, £8,966 2s		
Station-works, including sidings, junctions, &c.	3,986 0 0	144
Stations, passenger building "C", £350; shelter-sheds, £375, platform, £100; loading-banks, £300; station master's house, £350, goods-shed, £300, stock yards, £600; weighbridge (20 ton) £275; crane (5 ton) £200; engine shed, £500, coal stage, £100, carriage-shed, £350	3,800 0 0	137
Water supply	1,500 0 0	54
Signals	500 0 0	18
Miscellaneous, Telegraph, &c.	600 0 0	22
	62,745 3 6	2,261
Engineering and contingencies, 15 per cent.	9,411 15 6	339
Total cost	£72,156 19 0	2,600
Average cost per mile	£2,600 0 0	
Say £72,150, or £2,600 per mile.		

89. You have put down the sleepers at 2s. 9d, did not the sleepers on the Moree line cost much less? Yes; but this is not a good district for sleepers.

90. Do you propose to have dressed sleepers? No, I think they would probably be the same as those on the Moree line.

91. Where do you intend to get them from? I should think they would have to come from about Branxton or Singleton, the nearest place for ironbark

92 You do not regard 2s 9d as a high price? No, it would only be a cheap class of sleeper that you could get at that price delivered at Tamworth

93. Do you propose to erect the station buildings of timber or brick? All timber.

94 Where will you get the water supply from? I presume there will only be one water supply necessary—that will be at Manilla

95. Will the station buildings be built of timber impervious to the white ant? Yes, the local pine is very suitable

96 *Mr. Lee.*] You will remember that in considering the railway from Jerilderie to Berrigan this Committee made a very important feature in their investigation of the question of the resumption of private lands? Yes.

97 And that eventually the line was taken almost solely along the public roads? Yes.

98. I notice in examining the parish maps in connection with this line, that from start to finish the line is almost wholly alongside the main road It runs approximately parallel with the main road; but in some cases it is half a mile away, or perhaps more.

99. In some places, and for several miles at a stretch, it is absolutely alongside the boundary of the road? Yes

100. Taking the survey sketch of the road and the railway together does it not appear that the road is the shorter track of the two? It is the shorter track of the two.

101. What is the width of the road? Perhaps I might save a little time if I state that the road is not suitable by reason of the grades You could not carry a railway along the road all the way.

102 Is that the only objection? It is a very serious objection

103 Are there other objections to carrying the line along the road? It might be carried along the road if the grades were suitable in the same way as it could be carried anywhere. If there is no objection to carrying it along the road in one district, it might be carried along the road here

104. But the grades would only be found unsuitable in certain places? Up to ten or fifteen miles from Tamworth you get rises in the road and the plan shows where the spurs run up. Further on, near Attunga Creek, the line is practically alongside the road, and I do not think there would be anything to prevent the railway going along the road there. But it would be utterly impossible to follow the road after leaving that point, except as regards about 2 miles before getting into Manilla · Altogether, I do not think the line could follow the road for a greater length than 4 or 5 miles There is a rise of 300 feet in 4 miles, and some of the heaviest grades would be on that portion

105. With regard to the Tamworth end of the line, could the private lands be avoided between Attunga and Tamworth? No

106. Could you not utilise the main road there? No, it is too hilly

107. Would it not be possible to skirt the road for the whole distance, that is to say to bring the line up to the boundary of the road and get your grades there? No; it would be quite impossible. Of course, you could make a line there, but you would have grades in some cases of 1 in 20.

108. There would be two advantages by doing so. In the first place, you would have the traffic of the existing road alongside the railway, and consequently no cross roads would be necessary to get to the railway station, and by having the line alongside the road, you would possibly be able to avoid the grade of the road

H. Deane, Esq. 20 Feb., 1896.

road of which you complain? If the country were all rolled out flat, but unfortunately that is not the case.

109. *Mr. Hoskins.*] Would it not be possible to make a tramway like the Campbelltown to Camden tramway, where a few short lengths are constructed to avoid steep grades, and the rest of the line goes along the road? I think the grades on that line are 1 in 20 or 1 in 25, and you would find that the Railway Commissioners would say they could not work such a line.

110. *Mr. Lee.*] Are you responsible for the figures of the Railway Commissioners? No.

111. You are acting in a Ministerial capacity to-day, and in regard to those opinions do you not care to offer any opinion? No.

112. Taking the figures as a whole, they show that with an estimated cost of construction of £2,600 per mile, the line will result in a loss of £1,200 a year? Yes.

113. If the compensation to be paid for the resumption and severance of land came to about the same amount, it is clear that the loss would be just double? I think it would be more than double, as there would be an additional amount for interest.

114. You have already stated to the Committee that this is only regarded as a local line, and not for the purpose of being extended to Barraba, Bingera, or other places further north? Yes, I think it is clear from the statement I made that in some respects it remains a local line; that is to say, it does not tap the traffic from the extreme north of the colony on the assumption that the line from Moree to Inverell is made.

115. Viewing it in that light, would there be any insuperable objection to having a little heavier grade on a short local line? The answer to that question is so bound up with traffic considerations, that I think it would be better to consult the Railway Commissioners on the point.

FRIDAY, 21 *FEBRUARY*, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (Chairman).

The Hon. Frederick Thomas Humphery.	Charles Alfred Lee, Esq.
The Hon. John Davies, C.M.G.	John Lionel Fegan, Esq.
The Hon. James Hoskins.	Thomas Henry Hassall, Esq.
The Hon. William Joseph Trickett.	George Black, Esq.
Henry Clarke, Esq.	Francis Augustus Wright, Esq.

The Committee further considered the proposed Railway from Tamworth to Manilla.

Hugh McLachlan, Esq., Secretary to the Railway Commissioners, sworn, and examined.

H. McLachlan, Esq. 21 Feb., 1896.

116. *Chairman.*] What are you? Secretary to the Railway Commissioners.

117. You come here under instructions from the Railway Commissioners to express their opinion with regard to this proposed line? Yes.

118. *Mr. Hoskins.*] Did the Commissioners of their own motion select the proposed line from Tamworth to Manilla as a line of railway which, in their opinion, ought to be made? They do not select any line of their own motion. The proposal was referred to them for their report by the Government through the Minister for Works.

119. Have the Commissioners been over the route of the proposed railway? Yes.

120. The detailed statement shows an estimate loss of £1,200 per annum? Yes, including interest.

121. With the estimate of traffic based on their statement, as well as the estimate of cost, do the Commissioners think that this is a line which it would be advisable to construct? Yes.

122. Will you kindly tell me why? Because they think it is a line which will pay more than its working expenses. Though there may be a little loss as far as interest is concerned, they think it will develop the country, and will assist the main trunk line. I have already, on one or two occasions, expressed the views of the Commissioners in regard to the construction of new railways. In their opinion it is desirable to construct a railway which will pay something more than working expenses, leaving the natural development of traffic to pay interest as well, especially where, in the meantime, the line will assist the main trunk railway.

123. Is the Committee to understand that the Commissioners are in favour of constructing a railway providing it will pay working expenses? I do not say that in all cases; but I have expressed their general opinion on the subject of new railways. I have not a copy of their views with me, but I have already quoted them once or twice before the Committee.

124. Will you give their substance? Where the country is capable of development and the line immediately upon its construction will return working expenses and a little over, they would generally recommend the construction of such a line.

125. That is not to be taken as an arbitrary dictum, but is to be modified according to the circumstances of the case? Yes; they report in each individual case.

126. Do you know whether the Commissioners took this point into consideration, that this line being only 27 miles long, the probability is that it will only be patronised by local producers, because carriers bringing goods from the northern portions of the colony, who have hitherto made Tamworth their terminus, might not be disposed to unload their goods at Manilla and send them on by railway to Tamworth, a distance of 27 miles; but would prefer to take the loading on to Tamworth, where there are larger stores and greater facilities for business? That would apply if Tamworth were the final terminus for the goods; but most of the goods having to go right through to the seaboard by rail, they would take the first trucking point. That has been the experience in the case of most of our railway extensions, some of which have been very little longer than this proposed line.

127. Have you any knowledge which would lead you to believe that the local traffic on this proposed line would yield a return more than equal to the working expenses? On matters relating to the probable traffic, it would be better that the Committee should obtain information from Mr. Harper, the Goods Superintendent, who has collected data in the district, and on whose figures the estimate of traffic is based.

128.

H. McLachlan, Esq.

21 Feb., 1896.

128. We are to take it then that the Commissioners are favourably disposed towards this line? Yes.
129. *Mr. Lee.*] The interest on capital expenditure is calculated at 3¼ per cent. In the case of previous lines interest has been calculated at 4 per cent.; why has this difference been made? Three and a quarter per cent. is about the rate at which money is being raised by the Government.
130. But has it not been the custom of the Railway Department to take an all-round calculation at 4 per cent.? No; in their estimate relating to some of the more recent lines they have calculated the rate of interest at 3¼ and 3½ per cent.
131. That is not the rate estimated in the case of the Narrabri to Moree line? That estimate was made some time ago; in more recent reports you will find 3¼ and 3½ per cent.
132. But what change has happened in the money market that you now allow only 3¼ per cent.? It is some time ago since 4 per cent. was allowed in the case of the Moree line. At the present time 3½ per cent. loans are a good deal above par. If the Government were borrowing money now they would get it at about 3¼ per cent.
133. Is not 3¼ per cent. a trifle below the actual amount, even at the present cheap rate for money? I do not think so. Three and a half per cent. is comparatively high, and is equal to a good deal over £100.
134. I want to know in view of all recent recommendations at 4 per cent. why there should be a smaller amount in this case? Recent recommendations have not been at 4 per cent.
135. There has been nothing under 3½ per cent.? I think the last was 3¼. But if you were to add another ¼ per cent. there would only be a total difference of £180 per annum. It would not affect the merits of the proposal.
136. Your reply is that the Commissioners are of opinion that 3¼ per cent. will cover the actual interest? That is about the ruling rate of interest which the colony is now paying.
137. Was the interest in the case of the Jerilderie and Berrigan line calculated at 3½ per cent.? Yes. In the case of one line it was calculated at 3¼ per cent.
138. And was not the amount 3½ per cent. in the case of the Parkes to Condobolin line? I think there was one case where the interest was 3¼ per cent. Still, as I have pointed out, it would only make a total difference of £180.
139. But can you offer any additional reason why the reduction should be made at the present time from 3½ to 3¼ per cent.? In the opinion of the Commissioners 3¼ per cent. is about equal to the average rate which the colony is paying for its loans at the present time.
140. In all your previous estimates of annual cost you have included this item, "Permanent-way, traffic and locomotives." In this estimate I find you have provided for "Cost of maintaining permanent-way, traffic, and locomotive expenses, £2,900." Does this include the whole of the general estimate? Yes.
141. And is based upon the same calculations as those made with regard to previous lines? Yes.
142. Do you know whether the Commissioners recommend this line as a local line or as a section of a probable extension to Barraba and other places? Simply a local line.
143. Without regard to any future extension? No. The Commissioners reported on the merits of the line as a local line in the first instance.
144. You are very clear on that point? Yes.
145. They report upon it, and recommend it as a local line? Yes. Of course it may get through traffic; but they do not report upon it with any idea of an immediate extension. In their report made early in November, they state they would not be prepared to recommend the line from Tamworth to Barraba.
146. *Mr. Clarke.*] You have just stated that it is not intended to extend the line further than Manilla? Not at present. The Commissioners regarded the line as a local one.
147. I suppose you are aware that the road from Tamworth to Manilla is a very good one? It is a good road.
148. Do you think it advisable to construct a railway from Tamworth to Manilla, where the road is so good, when it is not intended to extend the line further to serve the traffic of Moree, Warialda, and Inverell? The question of a further extension of the line is, of course, a matter for future consideration. But the line, as far as Manilla, will serve a large district, and its construction cannot involve any considerable loss to the State. It must help to develop the country, because there is a great deal of good agricultural land in the district, the produce from which would certainly be conveyed by railway at very much lower rates than by teams.
149. But do you think that teams from Barraba with wool and other produce would unload at Manilla, instead of carrying the goods right on to Tamworth at lower rates than those charged by the railway? I do not think so. I think you would get the greater proportion of the goods at Manilla.
150. You are aware that in some parts of the country, teams are competing with the railway, and in some instances, successfully? I am sure they do not carry a very large proportion of the colony's traffic by teams alongside the railway.
151. Still they carry some? A very small quantity, in comparison with the bulk of the traffic that the railways carry.
152. You think that if the railway were extended to Manilla the teamsters would be driven off the road? They would go further back. They would bring the goods to the railway at Manilla, instead of going to Tamworth.
153. I notice from the report that a good deal of the traffic is expected to come down from the Queensland border;—will not the Moree line, which will soon be in working order, take away a portion of the traffic coming down towards Barraba and Manilla from the northern country? No doubt that line would interfere with the distant traffic, but I think the Goods Superintendent in giving his estimate allowed for that. He went right through the district, and I think is pretty sanguine that his estimate will be realised.
154. But if the railway were extended from Moree to Warialda, and from there to Inverell, would not a great deal of the traffic which now comes down to Manilla and Tamworth, go by that route? The traffic estimated to be carried by the proposed railway from Tamworth to Manilla is traffic that will come down to that line even if the railway from Moree were extended as suggested.
155. *Mr. Hassall.*] Was it not originally proposed to construct a line from Tamworth to Barraba? Yes.
156. And the various deputations that waited upon the Commissioners had that object in view? The Commissioners did not receive any deputations in Sydney. They went through the district and met the people at different points. The Manilla people naturally wanted the railway to Manilla, and they did not mind

H. McLachlan, Esq.

21 Feb., 1896.

mind it going through. The Barraba and Bingera people wanted it to go to Barraba with a view to a further extension. The Commissioners at the present time say that they are not prepared to recommend the construction of the railway beyond Manilla.

157. That would lead one to suppose that it is to serve the people out at Barraba and beyond that they would like that line constructed? This line must help the people of that part of the country a little, as it will save them 30 miles travelling by road. The Commissioners in the minute which they forwarded to the Minister on the 30th November, pointed out that the line beyond Manilla would be a most expensive one, that £20,000 would probably be required to construct a bridge, that the country generally was rougher in character, and that the prospect of local traffic was not so good.

158. Are you aware that it is one of the best roads in the colony between Tamworth and Bingera? I believe the road is a good one.

159. Do you know that the railway line would practically be hemmed in between two ranges of mountains—the Nandewar Ranges on the west and the Moonbi Ranges on the east? Yes.

160. Therefore you could not expect any traffic to come from either east or west to feed the railway? To a large extent the traffic would be local, but there would be some traffic taken by the railway, which now passes through Manilla.

161. The Commissioners in their report say they propose to charge local rates. Those local rates, I presume, would be heavier than the ordinary rates charged upon existing lines? They would be the same as the rates charged on existing lines, but they would be heavier proportionately than through rates. If you take 27 miles as against 400 miles, they are the same rates as we apply out of Sydney. For instance, if you went from Sydney to Rooty Hill—nearly the same distance—you would pay the same rate as from Tamworth to Manilla for certain classes.

162. Then what is the meaning of the term "local rates"? A rate always decreases in proportion to the distance. In going from Manilla to Sydney you would pay the ordinary rate for the first 27 miles. Then you would commence again at Tamworth. You would not get the same proportionate reduction as if you were running right through.

163. Does it not seem likely that if local rates are charged on the railway, teams will be used for the carriage of goods instead of the railway, seeing that there is a first-class road available which will be practically shorter in length than the line? That has not been the experience in the case of other extensions. If that were found to happen in regard to certain high-class goods, I have no doubt the Commissioners would be prepared to take steps to counteract it. But it would not be likely to occur in the case of the low-class traffic—the bulk traffic, such as agriculture—the rate for which would be from 3s. to 4s. for that distance. No teamsters could compete with the railway at such a rate as that. If it were found that they were competing in the case of high-class goods, for which the rates would be higher, I daresay the Commissioners might deem it necessary to make some arrangement in order to obviate such a state of things.

164. They would have to do something to attract the traffic? In the case of the line from Temora to Cootamundra, for instance, where the country is level—more level—I think, than this, we have not found that there has been any local competition.

165. There is not a very good road there? It is level country.

166. But not a good road? It may not be quite as hard as the Manilla road.

167. Are you aware that this is one of the best metalled roads in the colony? Still there is a good pull for a team for some little distance out of Tamworth.

168. The Commissioners in their report say, "We should advise the Government that it should be made a *sine qua non* that all the alienated land required for the line should be conveyed to the Government free of any payment for the same or for compensation";—does it seem reasonable to suppose that the owners of valuable land, such as it is said this proposed railway would pass through, would be willing to give their land free without any compensation? Where a man has an estate of some hundreds of acres, and we take, say, a couple of acres for a railway, which is going to improve his property, it is only a fair thing that he should give the land free to the Crown. In their report the Commissioners say that in regard to small allotments of land near Tamworth, they would make an exception. Where an owner would derive no benefit from the railway, I take it that the Government would not, as a matter of equity, insist upon the land being given free. The Commissioners do not arrange for the resumption of land. They simply recommend that the giving of the land should be a general condition.

169. Might not the owners of land 10 or 12 miles from Tamworth say that the railway would not be of any benefit to them, compared with the loss they would sustain by the severance of their land, or by their land being taken away? If you look at the matter in detail, there may appear to be some cases in which it would not be an advantage to the small holder to give his land free. But the details would have to be settled by the Government. The Railway Commissioners could not give an opinion as to what the Government would do with regard to the land. But they think that practically the line should cost nothing with regard to the resumption of land. A similar recommendation was made in the case of the line from Jerilderie to Berrigan, and I understand the land was obtained without any cost to the Crown. I believe that many people who were benefited by the railway helped to obtain land from others who would not be benefited, and the same thing has taken place at Crookwell. The people there are collecting money, in order that the land required for the railway may be given to the State free. They have, I believe, a sum of money in hand for the purpose.

170. *Mr. Black.*] You stated in answer to Mr. Hassall, that the route of the proposed railway is situated between the Moonbi and the Nandewar Ranges;—do you know the distance between those two ranges? No.

171. Manilla, I believe, is situated on a flat? It is situated at the junction of the Namoi.

172. Is the flat as wide as that on which Tamworth is situated? I could not say of my own knowledge.

173. I see by the report that the cultivatable area to be served by the proposed railway is 145,730 acres, and the total area about 781 square miles;—I suppose such an area under favourable conditions—the soil being good as a rule—is sufficient to support a very large population? If the whole of that area were under cultivation it would certainly pay a railway.

174. *Mr. Wright.*] You stated just now, referring to the rate of interest on the capital cost of the railway, that the colony could borrow money at the present time at 3¼ per cent.;—are you aware that the colony has never borrowed money at less than 3½ per cent., and that no loan has ever been obtained at par?

par? That may be so; but is it not fair to look at the present price of New South Wales 3½ per cent. bonds in the English market: to-day they are £106, or something like that.
175. Does the estimate of the cost of the proposed line, namely £72,150, exclusive of land, include station-buildings, loops, sidings, furniture for the stations, weighing accommodation, and all things necessary, except rolling-stock, to make the line a perfect-going railway? I think so.
176. In fact, everything is included in the estimate except the cost of land? So I understand from the Engineer-in-Chief.
177. Though the Commissioners recommend that the bulk of the land be given, they say that they cannot expect that in regard to the land within a few miles of Tamworth the owners will be prepared to hand it over free? Yes.
178. Consequently that land must be paid for? Yes.
179. And whatever is paid for that land must be added to the capital cost of the line? Certainly.
180. And the interest on the cost of the land will have to be added to the estimate? Yes
181. The cost of the permanent-way, traffic and locomotive expenses, is estimated at £2,900, which is practically £100 per mile. Is there any existing line, or any section or portion of a line at present run for that sum? Yes; you will find several lines worked at a less cost, and with a very much larger traffic than is estimated in this case.
182. You say you are not prepared to state what the local charges will be? The local charges will be generally the 1 to 28 miles charges.
183. The local charges between Cobar and Nyngan are not based on that calculation? They have been varied in several ways; but there was a truck rate there.
184. My experience of local charges is that they are simply an arbitrary sum based on nothing? They are based to some extent on the rate-book, and are varied to meet the local conditions. If the Commissioners found that teams were competing with the railway they would, perhaps, make some special charge in regard to a truck load.
185. And your idea is that the local rate mentioned would be the full rate from Tamworth, and beyond that the maximum rate for 27¾ miles? Yes, practically.
186. What traffic do you expect to get over the main line by this extension that you have not got at present? A line going into a grain-growing district must encourage the production of grain. This is an agricultural country, and to have to cart their produce 27 or 30 miles is a big handicap to the producers. If you can induce people to go in for increased cultivation, it must result in increased traffic to the main line.
187. I suppose you are aware that at the present time a great deal of this land is in the hands of a few gentlemen, and is used for pastoral purposes? But these owners may find, as Mr. Greene and others have done, that it is better for them to allow their land to be cultivated.
188. I find, on looking at the merchandise rates in the railway traffic-book, that without local charges the rate for third-class goods, is 16s. 3d. per ton over the length of the proposed railway; for second-class goods, 12s. 10d. per ton; and for first-class goods, 10s. 9d. These charges embrace all goods carried over the railway, except agricultural produce and minerals. Are you aware that at the present time all over New South Wales, the whole of these goods can be carried by team for 10s. per ton? I know there is not at the present time a great deal of competition by teams alongside the railways.
189. Is the estimate which has been placed before the Committee based upon existing rates, or upon a proposed increased rate? An increased rate—not an extension of the Sydney to Tamworth rate.
190. Yet you say that if the Commissioners found there was keen competition by teams, they would have to reduce the rate in order to secure the traffic? I take it they would do that as commercial men.
191. To a certain extent that would destroy your estimate as to the traffic returns? No; the Commissioners propose to charge local rates based on the book. If they found competition was taking place, they would probably make a bulk truck rate. I think Mr. Harper has made some allowance for that in his figures.
192. But if he has not, and the Commissioners have to make that reduction it would affect this estimate would it not? Yes.
193. Is there a possibility of any additional traffic being brought over the main trunk line by the construction of this proposed railway other than what may be produced out of the ground between Tamworth and Manilla? So far as I am concerned I do not know of anything outside of that.
194. This extension would not increase the traffic over the main line, unless it increased the cultivation of grain in the Manilla district? Facilities for carriage will always create increased traffic.
195. All the calculations with regard to traffic, I take it, were prepared by the Goods Superintendent after an inspection of the district? Yes.
196. *Mr. Davies.*] Are the Committee to understand that the recommendation or report of the Commissioners is a conditional one? They say it should be made a condition that the land required should be conveyed free. They think that ought to be done.
197. And that special or local rates should be charged? Yes; that would rest with the Commissioners to a large extent.
198. Can you tell the Committee of any other railway that has been built on similar terms? The Cobar line, the Parkes to Forbes line, the Temora line, and the Berrigan line.
199. Was the Cobar line built on those terms? Yes, with regard to local rates.
200. And with regard to the land being conveyed free? In that case I do not think the land was an important item. It was nearly all Crown land. But the same conditions were made in the case of the Berrigan line.
201. I suppose you are aware that the land through which the proposed line would pass is principally private land? Yes.
202-3. In the event of the property-owners refusing to convey the land free as proposed by the Commissioners, would the Commissioners still adhere to their recommendations that the line should be constructed? The wisdom or policy of constructing the proposed line would, of course, rest with the Government; but the Commissioners think the land should be given free, except in a few cases where the line would not benefit the persons whose land would be required.
204. I would like you, as the mouthpiece of the Commissioners, to tell the Committee whether, in the event of the property-owners refusing to convey the land free the Commissioners would still recommend

that

H. McLachlan, Esq. 21 Feb., 1896.

that the line should be constructed, notwithstanding that with a most liberal estimate as to earnings, and a low rate of interest on the capital cost, there would be an absolute annual loss of £1,200? The condition made by the Commissioners is not an absolute one. They say they would advise the Government that it should be a condition.

205. Have you any knowledge of the character of the country? I have only been over it once.

206. Is not most of it rich and fertile land? So far as I can say, it is good land.

207. And would be expensive to resume? I cannot say. I do not know anything of the value of the land. The Railway Commissioners do not deal with the resumption of land.

208. But I want to get at the actual cost? The Commissioners have no valuation of the cost of the land. The matter of land valuation is dealt with by the Department of Public Works. They know what land is to be taken, and they may have put a value upon it, but that is a question which has not come before the Railway Commissioners.

209. It may cost £200 per mile for all you know? It may cost that.

210. It may cost more? I have no idea what it would cost.

211. So that, instead of the cost of the line being £2,600 per mile, it may be £2,800 per mile? The opinion of the Commissioners is that it should not cost anything for the resumption of land, except as regards some few allotments.

212. Will the Commissioners still persist in recommending the construction of the line, in the event of the landowners refusing to convey their land to the Government free? I think a good deal would depend upon the amount that was involved. If the Government could not get the land free they would, perhaps, ask the Commissioners to consider the matter further. It would depend upon what sum would actually be required. But so far as the Commissioners are concerned they say they would advise the Government that it should be made a condition that the land should be given free.

213. There is not only the taking of the land from the property-owners, but there is the question of severance, which is a still more important matter? I would point out that the line is not to be fenced.

214. But there is nothing to prevent it being fenced hereafter? The Act of Parliament would provide that the line should be unfenced.

215. One serious accident on the line caused by cattle getting in the way might cost as much as the money required to fence the line on both sides? We have other lines unfenced. The Cobar line is unfenced.

216. What is the traffic on that line? Very heavy—heavier than the traffic you would get on this line probably.

217. And you have had no accidents on the Cobar line? No; I do not recollect any accident being reported resulting in considerable damage.

218. But the Cobar line was not built within the estimate of the constructing branch? I am not sure of that. I know some extra expense was caused by heavy floods, either while the line was in progress or shortly afterwards, and the grade was reduced.

219. *Mr. Lee.*] The Commissioners state in their report that they informed certain deputations that waited upon them that they would recommend to the Government that the land through which the proposed line would pass should, with certain exceptions, be given free of cost? Yes.

220. Do you know whether any definite proposal was made to the Commissioners to give the land? I believe one or two of the persons stated there would be no difficulty in getting the land free as regards a considerable portion of the line.

221. But there was nothing beyond a statement? No. As I have said, the Commissioners do not resume the land.

222. I am asking you whether any definite information has been given to the Commissioners as to giving this land? I think not.

223. Do you remember that a similar statement was made to the Commissioners in respect to the Jerilderie to Berrigan line? Yes.

224. And you also remember that when the Committee came to inquire into the matter the land-owners absolutely refused to give the land? I understand that afterwards most of the land required for the railway was given free—I do not know of my own knowledge.

225. You know now that that line has been taken chiefly along the main road? Yes; I know the route was altered.

226. And consequently the necessity for resuming large quantities of land was done away with? Yes.

227. The landowners in that case, although they made representations to the Commissioners that the land would be given, absolutely refused to give it when the time came? Still I believe that the land which has been taken for the line which now exists has been largely given free, though some of the owners may have backed out from the original proposal.

228. Are the Committee to understand that the Commissioners recommend the construction of this line if the owners of land will give the land free? That is their advice.

229. You are aware that it runs through purchased land from beginning to end? Yes.

230. Supposing it were known to the Commissioners that these people would not give the land, do you think that they would recommend its construction? I think they would like to reconsider the question, if they found that the expense of taking the land was going to be a very heavy item. It would depend, I think, upon the particular circumstances of the case.

231. If the line runs through purchased land from beginning to end, the question of land resumption is likely to be an important one? Yes.

232. I want to know, definitely, whether it is in the mind of the Commissioners that this line should only be constructed if the land is given free? That is their opinion—that the land should not cost much.

233. *Mr. Humphery.*] Is it not definitely stated in the minute of the Commissioners, dated 11th November, 1895,—"that it should be a *sine qua non* that all the alienated lands required for the line should be conveyed to the Government free of any payment for the same, or for compensation"? Yes. That is also stated in their former report.

234. Are they still of that opinion? Yes.

235. That unless the land can be obtained free of cost, the railway should not be built? I would not say that, absolutely. They advise the Government that the land should be given free, subject to certain exceptions.

236. This Committee wants the opinion of the Commissioners on that point—do they still adhere to their recommendation? I could not say anything more than is covered by their own statement.

H. McLachlan, Esq. 21 Feb., 1896.

237. You are unable to say definitely whether the Commissioners would recommend the construction of the line in the event of the owners of the land being unwilling to give the land free of cost? I am not.
238. Will you ascertain that? Yes.
239. *Mr. Wright.*] What officer of the Department prepared the estimates of working expenses? They are prepared by the Commissioners. The Commissioners had the officers before them, but the estimate is really that of the Commissioners themselves.
240. They had the officers of the Locomotive Department and of the Traffic Department before them? They would speak to the different officers, and it is the Commissioners' estimate.

John Harper, Esq., Goods Superintendent, Department of Railways, sworn and examined:—

J. Harper, Esq. 21 Feb., 1896.

241. *Chairman.*] What are you? Goods Superintendent, Department of Railways.
242. Have you furnished a report in connection with the proposed line of railway from Tamworth to Manilla? Yes; it is as follows:—

As directed by the Commissioners, I have made careful inquiries as to the probable traffic, &c., on this line of railways. The route traversed by the proposed line may be briefly described as an intermediate one, between the main Northern and North-western lines. It passes through a large area of excellent agricultural and pastoral land, and is comparatively thickly populated by, as a rule, small holders carrying on a system of mixed farming. It also runs parallel with a main road which is at the present time used as the chief route for wool and other traffic from as far north as the Queensland border. The construction of the Moree line will, of course, divert a certain quantity of wool which has hitherto found its way by this route to Tamworth. To as far north as Warialda, however, it is probable that this route will continue to attract the traffic of the district. Whilst wheat has been extensively grown in the past, there is no doubt that the capacity of the areas adjoining the line have scarcely been touched. The rainfall is an excellent one—from 27 to 30 inches per annum. The rates for road carriage to Tamworth range from 4d. to 6d. per bushel, and these have to a large extent tended, in view of low values, to retard any very extensive addition to the areas placed under crop. Last year the area under cultivation was as follows:—

Between Tamworth and Attunga, 2,894 acres, yielding	42,266 bushels.
Attunga and Manilla, 9,217 acres, yielding	156,400 ,,

The population of the district through which the line will pass is as follows:—

Attunga and district	500
Manilla and district	1,300

whilst the district around Barraba and Bingera has a population (a portion of which would use this line) of 3,500.

Live Stock.

The district at present is not generally a fattening one, and consequently the drafts of fat sheep, which would be available for rail carriage, would not be large. There is no doubt, however, that a fair proportion of stock from the fattening districts to the north and north-west of the line would find its way to Barraba. At present this stock is trucked at Breeza, 170 miles from Newcastle, Gunnedah 196 miles, and Tamworth 183 miles. In a good season cattle would, I think, continue to be trucked at these stations as the travelling stock routes to them are more favourable. The following is my estimate of the probable traffic on this line:—

	£	
Goods Traffic.		
Merchandise inwards to Attunga, 10 miles, 80 tons, at 3s. per ton	12	
Do do Manilla and beyond, 2,000 tons, at 8s. per ton	800	
Outwards from Attunga—		
Wool, 140 tons, at 3s. per ton	21	
Wheat, hay, &c., 2,000 tons, at 1s. 3d. per ton	125	
Stock	50	
Outwards from Manilla—		
Wool, 1,300 tons, at 7s. 6d. per ton	488	
General, 600 tons, at 5s. per ton	150	
Wheat, hay, &c., 6,000 tons, at 3s. per ton	900	
Stock, 500 trucks, at 8s. 6d. per truck	212	
		2,758
Passenger Traffic.		
Passengers, 4,000, at 4s.	800	
Horses, parcels, &c.	150	
Mails	336	
		1,286
Grand total		£4,044

243. *Mr. Humphery.*] How did you obtain the material for this report? In the district and from the Government Statistician.
244. Have you the details? Yes; but they are somewhat voluminous. I have the record of every bale of wool that arrived at Tamworth Station.
245. You have gone into the matter exhaustively, and your figures are trustworthy? Yes.
246. In your opinion, will your estimate of traffic be fully realised? Yes.
247. How many bales of wool have you estimated will be carried along the line? Eleven thousand.
248. How many bales do you estimate will come from the country beyond Manilla? The bulk of the wool will come from that country.
249. How far north of Manilla? At the present time the wool is brought to Tamworth from country as far north as the Queensland border. But the construction of the Moree line will alter the present state of things, and several large clips will then go to Moree. In view of this, I have discarded about 6,000 bales of wool which now come to Tamworth, but which I anticipate will go to Moree when the railway is extended there.
250. So that in your estimate you have made full allowance for the traffic that will be diverted to Moree? Yes.
251. You know a line is projected from Moree to Inverell, *via* Warialda;—if that extension is carried out, will it affect your returns? I do not know. I have not gone through the district to see to what extent that may occur.
252. Assuming the line to be constructed between Inverell and Glen Innes, would the construction of that line affect the returns you have just given us? I do not think it would very materially.
253. You think that no portion of the wool would be sent to Inverell? A small portion might be, but not sufficient to materially affect my estimate of traffic.

J. Harper, Esq. 21 Feb., 1896.

254. You think that the earnings of the proposed railway would not be appreciably affected by the construction of a line between Glen Innes and Inverell, or a line between Moree and Inverell? No; I think the rates of carriage on the route from that northern country *via* Manilla would be more favourable than the rates could possibly be either *via* Moree or Inverell, owing to the greater distance of railway carriage by the two latter routes.
255. Have you examined the country north of Manilla as far as Inverell and Warialda? No; not beyond Barraba.
256. Then you have not been as far as Bingera? No, not by that route.
257. Then do you only estimate for traffic that may reach the Manilla line from about Barraba north? No, I go as far north as Warialda, but not inclusive of Warialda.
258. In what way have you made up your estimate? By taking out the individual clips of wool coming in to Tamworth from the north.
259. Then you have assumed that that wool would be carried from Manilla to Tamworth? Yes; at present it is brought into Tamworth. I estimate that 6,000 bales of wool which now come to Tamworth from the country north of Warialda and about there will go to Moree, when the line to that place is completed. But from a point about Bingera, just south of Warialda, the wool will come over the Manilla line.
260. Have you estimated for wool now reaching Tamworth north of Manilla? Yes.
261. That is the only wool you have included in your estimate? That is all.
262. So that whatever may happen with regard to the construction of a line between Moree and Inverell, and if a line should be constructed there, your estimate will not be lessened? I may explain that north of Manilla is a very comprehensive term. It extends at the present time to the Queensland border.
263. But I understand you to say that at the present time the wool is not brought down to Tamworth? Yes, from the Queensland border.
264. What quantity of wool have you ascertained is brought to Tamworth from the country north of Bingera? I could scarcely tell definitely.
265. It is not necessary that you should ascertain what quantity of wool will now reach Manilla that formerly came to Tamworth? I only had in view this projected line. I do not know of the existence of either of the Inverell lines. I simply have to deal with the proposed extension to Manilla, and the extension from Narrabri to Moree.
266. Then in making your estimate you did not take into consideration the possibility of a line being constructed between Moree and Inverell? No.
267. Assuming that there will be a line of railway in that direction, would your estimate be appreciably affected? I do not think it would be affected very much as regards the traffic coming to Manilla. But that is only an opinion, not based on actual investigation.
268. Have you been over the whole of the country shown on the map which gives the holdings within a radius of 20 miles of Manilla? I have been over a great portion of it.
269. Can you say whether the whole of the land is suitable for agriculture? I do not think the whole of it is; but a very large proportion of it is.
270. What is the rainfall? Between 27 and 30 inches.
271. Can you say whether it would cost much to resume the land required for the construction of this railway in the event of the owners not being willing to give it free? Some of the owners there entertain a fictitious notion of the value of their land. Some of them talk about £10 and £15 per acre. I did not see any land I thought worth that much. Other owners would be content with £2 or £3.
272. Are you speaking of the land beyond Tamworth? Land between Tamworth and Manilla—outside the population area of Tamworth.
273. You mean within 20 miles of Tamworth? Over the whole distance of the proposed railway.
274. Have you over-estimated the passenger traffic between Manilla and Tamworth? I do not think so. In addition to the 1,800 people in and about Attunga and Manilla, there is a population beyond of 3,500.
275. How many coaches are running at the present time? Two coaches daily.
276. Have you been careful to obtain statistics before forming your estimate as to the passenger traffic? We base the estimate of passenger traffic upon ascertained returns in the case of existing lines where there is the same population. We take a district where the population is about the same, and which is similar in character, and we ascertain the number of passengers booked to and from that station.
277. Do you look forward to the extension of this line beyond Manilla? I do not at present.
278. Then Manilla would be the terminus in your opinion? Yes.
279. That being so, do you see any prospect of the earnings of the railway covering interest upon the cost of construction, besides working expenses? I think they would. I think larger areas would be placed under wheat than is the case at the present time, and I think also that the district would then carry a great many more sheep. For instance, Mr. John Barling, who owns the Upper Manilla station, since he has gone in extensively for wheat cultivation, has been able to increase his carrying capacity for sheep very materially, and to improve the quality of his stock. In that country where they could not fatten before, they are fattening now on the wheaten straw. My experience, not only in that district, but also in others, is that where you get an agricultural population settled, you immediately begin to find the number of sheep increasing.
280. Do you think it probable that the annual estimated loss of £1,200 on the working of this proposed line would be overtaken within a certain period from the completion of the railway? I have a strong impression that it will be overtaken very shortly.
281. Within what period, making every allowance? I should think within five years at the most.
282. Then it is your opinion that within five years the working expenses and interest on the cost of construction would be covered by the earnings? Yes.
283. And you express that opinion from the experience you have had of similar districts elsewhere? Yes.
284. You think this line should be constructed, having regard to the character of the district, and the probability of its development? Yes, I think so.
285. Do you think it will be necessary to fence the line? I should not think so.
286. Have you travelled over the proposed route? Practically, the route runs alongside the road. At any rate it is within sight of the road the whole way.
287. What is the width of the road? In some places it is 5 chains, in others 2 chains, and in others 3 chains. It varies a good deal in width. The most important portion of the road, where the line runs, is unfortunately only about 2 chains wide. If they could only get another chain in width there they could keep on the road, and avoid a lot of severance. Approaching Manilla, the line goes through a great deal of household property.

J. Harper, Esq.
21 Feb., 1896.

288. *Mr. Lee.*] Town allotments? No; they are outside the township of Manilla. They are situated about 3 or 4 miles from Manilla, where there appears to have been a lot of settlement by small farmers. At that point the road is very narrow.
289. Starting from Tamworth, what is the width of the road, or the reserve for the road? Two or 3 chains.
290. Does it widen? Yes, in some places; it is very irregular.
291. Describe, generally, the varying width? When you get about a mile or three-quarters of a mile outside of Tamworth, the road widens out to about 5 or 6 chains; but there is a reserve there. Then you get into a lane which is only 2 chains wide, and extends for about 2 miles. Then the width of the road increases, and afterwards closes in again. It alters so much in its character that you could not give a general description as to the width.
292. The narrowest portion is about 2 chains? Yes.
293. And for how many miles is the road 2 chains in width? I should think about 7 or 8 miles altogether, probably more. That is simply a guess.
294. Are there any reserves between Manilla and Tamworth? Yes.
295. Has the railway been surveyed over any portion of the road? Yes, it goes through several of the reserves.
296. Is it possible to avoid private lands, and to keep to the road? Mr. Deane, the Engineer-in-Chief, who was with the Commissioners said not. He had the surveyor with him. It seemed to me a pity—and I drew attention to the fact—that the line should pass through these small properties and create severance, and I suggested that it would be desirable if that could be avoided.
297. *Mr. Trickett.*] Would the local rates spoken of be an increase on the ordinary rates? The charge for wheat over that length of 27 miles, assuming it were going through to Sydney, would be about 3d. per ton, that is to say, if the extended rate were charged it would be 3d. a ton over the whole distance.
298. Would there only be the two railway stations? There would be about three unimportant sidings in addition close to the farms.
299. Would this increased rate be of any importance in making up the total gain? No, the total is practically included in the Attunga and Manilla estimates.
300. But would not the increased or local rate have the effect of making the people convey their produce direct into Tamworth? The rate for 28 miles from Manilla to Tamworth would be 3s. a ton, and the people could not possibly carry their goods at that rate or anything like it. From Attunga to Tamworth, a distance of about 11 miles, the rate would be about 1s. 3d. a ton.
301. I have been on several sectional committees inquiring into branch railways, and the evidence has been largely in the direction that when once a dray is loaded up with wheat, it makes very little difference whether it goes 10, 15, or 20 miles;—what do you say to that proposition? As a matter of fact there is absolutely nothing in it. Our experience is that when a line is constructed traffic is not conveyed by road parallel with it.
302. You think that is only an argument used by people to get the line in their own direction? Yes
303. I read in a paper yesterday of some proposal not to fence this line, so that the people could bring their goods direct to it all along the line; what was the idea of that? I do not think that is the object. The reason is, of course, to save the cost of fencing, as was done in the case of the Berrigan and Cobar lines. The people would have to bring their goods into the sidings as in the case of any other section.
304. What kind of country is it? Red-soil country.
305. Is it bad for travelling in wet weather? Yes; it is like all red soil when it gets thoroughly saturated. The main road is a good road, but in the by-roads the ground is soft.
306. Does the good agricultural country start right away from Tamworth? Yes; and goes practically right through.
307. I suppose, for a distance of 7 or 8 miles, the traffic would still continue to go into Tamworth by road? Yes; until you reach Attunga most of the people would continue to use the road, although it is hard to say—probably one or two sidings might have to be provided between Attunga and Tamworth. We generally find, after a line is opened, that the people are anxious to join the railway as quickly as they can.
308. What is the experience of the Department as to these local rates, with regard to their being maintained? They have been generally maintained. The only line on which they have been abandoned so far is the Corowa line, and their abandonment there was brought about by competition from Victoria.
309. *Mr. Wright.*] And on the Cobar line? No; they have not disappeared there yet.
310. *Mr. Trickett.*] What are the lines on which the local rates are maintained? On the Cobar line, the Parkes to Forbes line, and the Temora line. There is a partial local rate on the Cooma line, but that is scarcely worth mentioning, being only on one or two classes of goods.
311. Have not the local rates been discontinued on the Forbes line? No; they are still in operation.
312. You mentioned the Cobar line;—that is working out all right now, is it not? Yes.
313. Paying full interest and expenses? I do not know that it is doing that yet, but it is improving very rapidly.
314. From the figures which you have read, there does not appear to have been much increase in the productiveness of this district since, at any rate, 1892? No; they have been handicapped to a large extent. The low values which obtained during the years succeeding that date, together with the high rates they had to pay, handicapped them very much.
315. It appears from Mr. Alexander's report that in 1891-2 there were 11,000 bales of wool collected in that district? But Mr. Alexander included what I have rejected—all the wool I have given to the Moree line. As a matter of fact, under normal conditions, 19,000 bales of wool come in there. But I estimate that 6,000 bales of this wool will be diverted directly the Moree line is opened.
316. Has the population increased since 1891–2? It has increased in the district beyond Manilla. I do not think it has increased very much about Manilla. The development of Crow Mountain, and one or two other gold-fields, has led to an increase of population.
317. I suppose this may be regarded as a very good agricultural district? Yes.
318. Are they mostly small holders in this locality? Yes; there are a great many selectors. There are several large estates; but one owner at least is adopting the plan that has been followed in Riverina, of letting farms on shares. Mr. Barling, of the Upper Manilla, has been doing this.

J. Harper, Esq. 21 Feb., 1896.

319. Has be been doing it long enough to say whether or not it is a success? No; he has only been doing it for a couple of years, I think.
320. In your examination of the district did you see many abandoned or neglected holdings? No, beyond what you would expect to see where the selections had become the property of the station.
321. I am speaking of ordinary farmers? No.
322. They seem to be all holding on and doing fairly well? Yes; they seem to be progressing.
323. This short line of railway, as far as you can see, is one that stands by itself, is it not? Yes.
324. The country is not served by any other railway at the present time, and not likely to be? No.
325. What is the average yield of wheat per acre in the district? From 16 to 18 bushels.
326. Is that a good average? It is a good general average.
327. The locality to be served by this proposed railway is hemmed in by hills, is it not? Yes; there are two ranges—the Moonbi and the Nandewar—one on the east, the other on the west.
328. The district appears to be a kind of basin, surrounded on the one side by the Nandewar Range, and on the other side by the Moonbi Range, so that whatever traffic may take place is not likely to be a largely-increasing traffic? Except from the fact of the areas being put more extensively into cultivation, and being rendered more productive than at the present time.
329. Although it would not serve a larger area, it would in time serve a larger population by reason of the increased agricultural operations? Yes.
330. But the land is all held by private owners, is it not? All the best of it is.
331. Did you ascertain whether the farms were freehold or leasehold? There are a good many selectors—freeholders.
332. What is the area of the property which the owner is trying to work on the co-operative principle? I think the purchased land is about 12,000 or 14,000 acres in extent. There is a very large area available,
333. Is that agricultural land? A great deal of it is.
334. At the present time it is being used for sheep grazing? Yes.
335. Did you ascertain from this owner whether it would be more remunerative for him to let the land out on the farming principle, than to merely feed sheep on it? Yes, he was satisfied; and when I was there he had 1,700 acres let out for agriculture. He started about two years ago. His conditions were, I think, that the farmers were to clear and fence the land, and he was to get nothing for the first two or three years, and then the rental was to be assessed according to the production of the preceding year.
336. Mr. Deane stated yesterday, positively, that the residents would be pleased to give their land free, in order to have the railway constructed;—have you gone into that question? No.
337. Have you any reason to endorse Mr. Deane's statement? There was no general expression of opinion to that effect when I was with Mr. Deane and the Examiners of Public Works proposals. The people were told that they must consider that aspect of the question.
338. It is apparently quite an open question? It was quite an open question at the time of the Commissioners' visit.
339. What is your opinion of the value per acre of the land required for the railway? I should not think any of it would be worth more than £5 an acre.
340. That would be a liberal price? I think so for agricultural land. Where the line goes through people's backyards, and where severance is created in that way, of course the question of value would be different.
341. Is it mostly cultivated land that the line goes through, or merely grazing land? There is much cultivated land; it is chiefly grazing land.
342. Then there would be few improvements? Yes. The worst place in regard to severance and where most damage would be done, would be approaching Manilla, about 2 or 3 miles.
343. Is this a line of railway that you would recommend? Yes.
344. Although at first it would not be a paying line? Yes.
345. You think from the general character of the country that it would lead to an increase of population and productiveness to such an extent that it would pay within a short space of time? Yes; I think it is splendid agricultural country, comparatively close to big centres of population, and it seems a pity to see it a sheep walk as it is at present. It might produce both more wool and more agricultural produce.
346. Did you ever get any evidence from the residents as to whether they would patronise the railway line if it were constructed? Yes; I saw a great many people in the district in reference to that.
347. Are they keen for a railway themselves? Very keen. I did not meet with a single dissentient in the district.
348. Have not the selectors and farmers mostly got their own teams? No; they themselves do not carry to any extent. The road is one upon which there are a great many carriers. It is a very busy carrying road, and the carriers from out back are generally available after the wool is down. Most of the produce is carried by contract with these carriers.
349. *Mr. Davies.*] You estimate the earnings from goods and live stock at £2,908? Yes.
350. Do you base your calculation upon the whole of the 27¾ miles or do you break the journey? You will see in the details I read about, that there is about £200 credit to Attunga, about 10 miles from Manilla. The rest is from Manilla.
351. Would you get much wool or live stock within 10 miles from Tamworth? I only estimate 700 bales of wool. A station adjoining where the railway station will be gets about 600 bales. The wool-shed would be within a stone's throw from the station.
352. Would not the wool when on the drays or teams go straight into Tamworth? No; the railway station would not be more than 300 yards from the wool-shed.
353. Would not a large proportion of the traffic you have estimated over this 27¾ miles of railway be likely to go by teams? No, I am quite sure that teams could not carry the wool for 7s. 6d. a ton, especially as when they go to Tamworth they have to feed their horses.
354. Is it a fact that on the western and southern lines teams have been competing with the railways? Yes.
355. What is to hinder teams from carrying wool and other merchandise on this route? They would not be able to compete with us at the rates we should charge.
356. But they are successfully competing with the railway on the western, southern, and northern lines? It is not competition at all—it is compulsion with them.
357. Why? In order to get out of the debt of the storekeepers, and to live. They have no alternative. They must do it, even if they only get enough to feed their horses.

358.

J. Harper, Esq. 21 Feb., 1896.

358. Is it not a fact that teamsters can manage to carry freight successfully during the bad times we are passing through, with horse feed and everything at the very highest prices, and compete successfully against railway carriage? As a matter of fact they have not done so. The traffic of the teamsters has fallen off 50 per cent. this year. It is really dying out, with the exception of that between Glen Innes and Grafton.
359. But they have done it? They have done it; but you cannot say successfully. You cannot consider that the carriage of about 4,000 bales of wool by team as against the carriage of 700,000 by railway is successful competition.
360. But the wool which comes to Tamworth at the present time, whether this railway is constructed or not, will still find its way to Tamworth? I am quite sure that no teamster would carry wool 28 miles to Tamworth for 7s. 6d. a ton.
361. Is it not one of the best roads in the Colony? No; not by a long way.
362. Not the road that runs parallel with this surveyed line? There are portions of that road as bad as any road in the Colony I have driven over.
363. Is it not macadamised? No, not the whole way; there are patches which are as good as can be.
364. What has been the amount spent per mile upon the road? I could not say; but I should think that in places very large sums have been spent.
365. Then you do not regard it as one of the best roads in the Colony? No; I consider that the road from Glen Innes to Grafton is infinitely better, and also the road from Tenterfield to Casino—of course, leaving the mountains out of the question.
366. What is the longest distance that teams come in the wool season, from the borders of Queensland to Tamworth? About 200 miles.

WEDNESDAY, 26 FEBRUARY, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (Chairman).

The Hon. Frederick Thomas Humphery.	Charles Alfred Lee, Esq.
The Hon. John Davies, C.M.G.	John Lionel Fegan, Esq.
The Hon. James Hoskins.	Thomas Henry Hassall, Esq.
The Hon. William Joseph Trickett.	George Black, Esq.
Henry Clarke, Esq.	Francis Augustus Wright, Esq.

The Committee further considered the proposed Railway from Tamworth to Manilla.

Arthur James Stopps, Esq., Acting Chief Draftsman, Department of Lands, sworn, and examined:—

A. J. Stopps, Esq. 26 Feb., 1896

367. *Chairman.*] What office do you hold under the Government? I am Acting Chief Draftsman in the Department of Lands, and I have particular supervision of the Roads Branch.
368. Have you brought with you a map of the road from Tamworth towards Manilla? Yes.
369. Have you a map of that portion of the road marked as portion 34, 612 acres in area, passing from Tamworth? Yes.
370. You will see going away from Tamworth that a road was originally reserved through portions 37, 36, 35, 34, 64, 63, 66, 70, 72, 73, 74, 75 and 34, making a severance in each of those portions? Yes.
371. From the map does it appear that most of that road has been alienated? Yes.
372. At what date was it alienated? In portion 35 the land was alienated in 1872; in portions 64, 65, and 66 the road was sold in August, 1873. With regard to portions 72, 73, 74, 75 and 34, I have no precise data, because the papers relating to those portions were destroyed in the Garden Palace fire, but the road was probably sold in 1872 or 1873.
373. Was the road, which was surveyed directly from Tamworth to Barraba, opened in lieu of the road in those portions? Literally, it was in lieu of that road, but not practically—that is to say, the land did not revert to the owners. That is what we term giving a road in lieu of another one. The new road rendered unnecessary the old reserved road which was sold.
374. In your Department, do you ever take into consideration the possibility of the construction of a railway? I do not think that has been taken into consideration.*
375. Is it not clear that if, in the portions I have enumerated, there had already been a severance, it would be very easy now to make a railway through them? Yes.
376. But having sold the road which caused a severance, it may now become a difficult matter? It may be so.
377. Your Department does not take that into consideration? No; the main consideration in this case was the improvement of the line of road. The new road was a more direct one, and on better ground.
378. You see a road running through portion 35;—has that road been closed? No.
379. Has the road through portion 36 been closed? No.
380. Are the boundary roads to the east of portion 29 open? I have not the information, but probably they are.
381. Is the road through portions 31, 32, 33 and 46 closed? I believe not, but I will inquire into the whole matter, and when I have examined the papers I will furnish the Committee with a sketch, which will enable them to see exactly the state of the roads.

*Note (*on revision*):—It would be more correct to add "except in a partial or fragmentary way, but some Deeds of Grant contain a reservation of such lands as might be required for a railway, &c."

THURSDAY, 27 FEBRUARY, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	CHARLES ALFRED LEE, Esq.
The Hon. JOHN DAVIES, C.M.G.	JOHN LIONEL FEGAN, Esq.
The Hon. JAMES HOSKINS.	THOMAS HENRY HASSALL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	GEORGE BLACK, Esq.
HENRY CLARKE, Esq.	FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Tamworth to Manilla.

Charles William Jenkins, Esq., A.M. Inst. C.E. Resident Engineer, Department of Public Works, Tamworth, sworn, and examined:—

C. W. Jenkins, Esq., A.M.I.C.E. 27 Feb., 1896.

382. *Chairman.*] Are you the Resident Engineer, Public Works Department, in charge of the Tamworth district? Yes.

383. Are you in charge of the road from Tamworth to Manilla? Yes; I know the line which has been surveyed for the proposed line.

384. *Mr. Trickett.*] Have you before you a sketch plan of the proposed railway line? Yes.

385. Is the railway properly described as a line traversing ground on the west of the main road throughout its course to Manilla, being on the right bank of the Peel River for about 12 miles, passing through Attunga. The formation of the line is fairly level, with slight undulations between Tamworth and Attunga Creek. Between this point and Manilla the line rises to a height of 428 feet, and then falls again 114 feet down to Manilla? Yes; that is a fair general description.

386. Then the proposed railway line is close to the present roadway? Yes; it joins it in many places. Its greatest distance from the road is a little more than half a mile.

387. Is the country suitable for the formation of a railway? Yes, generally. It is a country where a railway can be easily constructed.

388. Near Tamworth is it not somewhat steep? I should call it generally undulating country.

389. Are there any difficult waterways? No; nothing serious. The principal stream is the Attunga Creek.

390. Are they sufficiently small to be covered by wooden railway bridges? Yes; no expensive bridges will be required.

391. How long have you had charge of the line of road from Tamworth to Manilla? About eighteen months. It is described as a first-class road the whole way. Its width varies very considerably; from Tamworth to Attunga it is a chain and a half wide. The road proper is a chain and a half wide all the way to Manilla; but on the upper side of the road there is a travelling stock route, 10 chains wide, adjoining the road; that is from Attunga to mileage 207; that is within 4 miles of Manilla. That travelling stock route adjoins the main road, and is available for road purposes.

392. In what state is the road with regard to being metalled or gravelled? About two-thirds in length of the road between Tamworth and Manilla is metalled. On an average the road is 18 feet wide. It is constructed of blue-metal and gravel—chiefly metal, covered with gravel in some cases. Seventeen miles of the road is in that condition. The remaining third of the road is formed with light earthworks, drains, at the side, and water crossings.

393. Is that portion in good state for traffic? Only in dry weather. It is always passable, but it is heavy in wet weather.

394. Is it like the country out towards Moree? No, it is not to be compared with the black soil country at all.

395. How much money has been spent on this road? There has been a total expenditure of about £29,400 from Tamworth to Manilla.

396. Is the greater part of that for the two-thirds of the road which has been made? Yes, about half of the expenditure is for maintenance, labour, and material. £15,000 has been spent in wages, maintenance, and material for maintenance purposes. £14,400 has been spent in construction. That has been spent since 1864 up to date.

397. In Coghlan's work I find an item giving the value of our roads. What would you estimate to be the present value of this road? It would cost to construct a road of equal service £10,200 for road work, and £3,000 for bridges.

398. Could you make it as good as it is now for £13,200? Yes, that is for 17 miles.

399. What would the remaining 10 miles cost? A road similar to the one already constructed would cost about £900 a mile. That is £9,000 additional.

400. What is the nature of the traffic along the road at present? The heaviest traffic is the wool, and next to that wheat and corn. They are both very heavy items. There is a large amount of light traffic and a daily coach runs each way. About 12,500 vehicles pass over the road annually, exclusive of Sundays, that is coming and going. It is equal to about forty vehicles a day.

401. Does that include two coaches a day? Yes; I obtained that information from two or three monthly records kept by a man engaged on the road.

402. What is the outward destination of the traffic beyond Manilla? The greater part of the wool traffic comes from the country lying beyond Barraba; it goes right up to the Queensland border through Warialda, Goondiwindi, and Boggabilla, then to Myall Creek, towards Inverell from Bingera, and sometimes from Yetman. The wheat traffic is confined chiefly to the country between Barraba and Tamworth.

403. Have you had any conversation with the carriers in the direction of Warialda as to where they would go to when the railway is constructed to Moree? Yes, many of them will go to Moree without question.

404. Is there a good road from Warialda to Moree railway station? No, it is a bad road, a good deal worse than from Warialda to Barraba.

405. Why will they go there? It is a good dry-weather road, and most of the wool traffic occurs during the summer months.

406. Will they go there because it is the nearest point to the railway? Yes; the only time when they might not do so would be in a very dry season.

407.

C.W.Jenkins, Esq., A.M.I.C.E. 27 Feb., 1896.

407. Supposing the line from Moree to Inverell were constructed, would not that pick up the greater part of the traffic coming to Sydney? Yes.
408. Would they not prefer that line, instead of coming down to Manilla? If a line were constructed from Inverell to Moree, it would pick up nearly all the traffic north of Bingera.
409. You say that wheat does not come much beyond Barraba;—is that because wheat is not grown much beyond Barraba? No; there are two mills at Bingera, and they treat the grain.
410. There is a range of hills shown on the plan a little north of Barraba; what is the height of that range? I do not know; but it is a very steep ascent, and it is a barrier to traffic.
411. Does not this line from Tamworth to Manilla seem to be very much confined to the Nandewar Range on the one side, and the Moonbi Range on the other? Yes; I think the line will be purely a local one.
412. Is it a line capable of very great extension beyond Barraba? No; I think the proposal to take a railway from Inverell to Moree will limit the value of the line now under consideration very much.
413. What do you think of the desirableness of a line from Manilla to Bingera, or Inverell? I do not think there would be sufficient traffic to justify the construction of a line from Manilla to Bingera.
414. What is the nature of the country beyond Manilla? It is very much rougher after you pass Manilla, and it would be much more expensive to construct a railway.
415. Would there not be a very expensive bridge? Yes; over the Namoi.
416. What is the character of the country from Manilla to Bingera? A great deal of it is poor country—hilly and mineral.
417. Do you think a line could be constructed from Tamworth to Attunga on the public road, and from Attunga to Manilla, either on the road, or on the travelling stock-route? No.
418. For what reason? I think the expense of earth-works would be too great. The line would be very much heavier.
419. Would not the roadway, being 1½ chain, be wide enough for the railway? I hardly think so.
420. Then you think that from Tamworth to Attunga the road would not be wide enough for a railway? I think not.
421. Knowing the line surveyed by the railway officials, do you think that that is the easiest line to adopt? Yes; looking at it generally I think it is in the best possible position.
422. Would this line have to be fenced? I do not think that would be necessary.
423. What is the nature of the occupancy of the land between Tamworth and Manilla, on either side of the projected line? From Tamworth to Attunga it consists of small farmers, growing wheat; from Attunga to within about 10 miles of Manilla, you pass through the Attunga Station, or Burdekin Estate; from that point to Manilla you come into small farms again. I should like to qualify my statement as to the general nature of the country from Manilla to Bingera. From Manilla to the Upper Manilla, a distance of about 8 miles, the country is good.
424. Would there be a good deal of land which would have to be taken in constructing this line, and the owners compensated? Yes.
425. Have you had any conversation with the owners of property through which the line is proposed to be taken, with regard to compensation? I have had conversations with them; but I never touched on the question of compensation. The only matter touched upon was the statement that they will not give the land. They will not give the land between Attunga and Tamworth.
426. Have you heard any expression of opinion with regard to the land between Attunga and Manilla? No.
427. How much of the railway line do you think would be used for the purpose of bringing traffic on to the main line? I think the first 12 miles of the proposed line would not be used by the adjoining farmers. They would bring their produce right into the town.
428. Do you think that beyond that point they would bring their produce by the railway? Yes. In conversation with one of the property holders beyond Manilla, he told me a movement was on foot there to subscribe sufficient funds to purchase the land from those who objected to give it for the railway, and he thought the property-owners to the north of Manilla would easily subscribe sufficient funds for that purpose.
429. Opponents of a proposed railway often advance the argument that once a team is loaded it does not matter whether they travel 12, 15, or 20 miles; do you think that would apply in this case? I think the limit might be fixed at 12 miles. For anything over that I think the people would prefer to use the railway.
430. What is now the rate of carriage from Manilla to Tamworth for wool and wheat? I think it is £1 a ton.
431. Would not the railway rates be very much less for that distance? Yes.
432. Do you consider that this is a desirable line to construct? I think it would be desirable and payable as a local line, and might be constructed.
433. The railway without land resumption will cost £2,600 a mile, so that it can be hardly classed as a light railway, and the Commissioners estimate that at the outset the line will be run at a loss of £1,200 a year;—with these facts before you, do you still think it would be a desirable railway? We would save about £350 a year in the maintenance of the road when the railway is constructed. That would reduce the loss to £900.
434. But if you save that in the maintenance of the main road, would you not very likely have to spend the same amount on branch roads to feed the railway? Yes; but eventually we will have to do that to feed the road.
435. And from a road you would get no revenue at all? Yes; and besides that a railway would induce considerable additional cultivation at Manilla where there is land available.
436. Is not that land mostly held by private owners? Yes.
437. Have you heard whether it is probable the owners would let that land in small farms? I have not heard them say so, but very likely they would do so. In my opinion, it would be a much better investment for them. I think the portions of the land lying between the road and the railway might be resumed and sold in small farms without any considerable loss. The country is such that it could be easily cut up into small cultivation paddocks. I refer to the land between the present line of road and the proposed railway. I think that would be preferable to moving the road so as to join the railway, or moving the railway on to the road.
438. Is that all good land for cultivation? Nine-tenths of it is.

C.W.Jenkins, Esq., A.M.I.C.E. 27 Feb., 1896.

439. Would not that be a new idea in railway construction? I do not know; but I think it would be much more economical than paying directly for severance.
440. Instead of resuming the land that is actually necessary for the purposes of the railway, you would recommend the resumption of the whole of the land between the road and the railway, with a view to selling it again? Yes.
441. *Mr. Lee.*] Are you of opinion that the railway could not be taken along the road, because the embankments would be too heavy? Yes.
442. What are the ordinary grades on the road? The ruling grade is 1 in 15.
443. Would that mean that there are steeper grades occasionally? Yes, for a very short length.
444. How many of these steep grades are on the road between Tamworth and Manilla? Not more than a quarter of a mile; 1 in 15 is adopted as the limit in any new works we construct.
445. I suppose a great deal of the road would be only 1 in 50? Yes; a great deal is practically level.
446. Are there any particularly steep pinches on the road? Yes; some that would entail heavy earthworks for the railway. There are only three such points, and one of these might be overcome.
447. Would it not be possible to work the line around those three places by a small resumption of land, supposing the railway were taken over the road or alongside of it? I have considered that aspect of the case very closely, and I think it would involve a great deal more expense to bring the road and railway together than to pay for the land that is severed. The nature of the country immediately adjoining the road would necessitate very much heavier works for a railway to obtain the grades that are now proposed.
448. Do you think that the easiest route, from a railway construction point of view, has been selected? Yes.
449. Are there not some portions of that road which could be utilised for railway purposes without difficulty? Yes; unquestionably.
450. Which are they? Starting from Tamworth, the first mile from the railway station brings the line on to the road. From that point to mileage 191 the railway and the road do not join. I do not think they could possibly be brought together between those two points. The objections are that at mileage 185, 187, and 191 there are high points in the country which the railway would have to get through if brought up to join the road at considerable expense. To obtain a proper gradient it is necessary to go round those points with a railway. The reason why the road cannot be brought down to the railway there is that we would have to abandon work of the value of about £600 a mile, and reconstruct the road to suit the local traffic, at a cost of about £500 per mile. From 191 to 192⅕, it appears to me the railway and the road might be made to adjoin, with the exception of 20 chains; that portion of the line passes through the village of Attunga, and not through private property. I think the greater part of it is Crown land—a few allotments may have been sold;—but in any case the value of the land would be very inconsiderable. From 192⅕ to 195 the railway and the road are parallel, apparently about half a chain separating them. There is no reason why they should not absolutely adjoin there. From 195 to 200 the railway and the road again separate. The road rises over high ground; but the railway contours around it. The objection to shifting the railway is that this high ground would necessitate heavy works.
451. If the road were brought to the railway at that point, what would be the cost? About £500 per mile, and we would have to abandon works worth about £600 per mile. From 200 miles to 201¼ the railway seems to be separated from the road by a width of 2 chains. I think they might join there—practically they do join. From 201¼ to 207 the road and railway again separate. The reason for that is the high ground, and the same reasons apply there. The cost of reconstruction would be about the same, and the cost of the work to be abandoned would not reach more than £300 per mile for that length. From 207 to 209¼ the railway and the road join. That is 1⅕ mile from Manilla.
452. Then you are now practically into Manilla, and it would not matter whether you ran along the road or not? Yes.
453. Which would be the more practicable—to remove the road to the railway, or the railway to the road? To move the road to the railway.
454. In those cases where circumstances would permit? Yes, when they are separated by any considerable distance. Where they join it would be necessary for us to increase the width of the road.
455. If that were adopted, and half a chain of your road were used for railway purposes, would not that leave sufficient for ordinary dray traffic? If only half a chain were taken for railway purposes, the remaining chain would be sufficient for traffic.
456. Supposing a line were not constructed between Moree and Inverell, and keeping in view the present extension to Moree, what would be the state of affairs with regard to the traffic? I think that all the traffic from Warialda, and from all points from the north-west and west of Warialda, would go to Moree. That would embrace Goondiwindi and Mungundi and all the intervening country, but would hardly include Coollatti.
457. Where were you stationed before? At Inverell.
458. And you are very familiar with the country and stations about there, and the routes taken by station produce for many years? Yes.
459. If what you have stated is correct, and if this railway is constructed to Manilla, where would the traffic come from? I think Bingera would be the most northerly point from which traffic would be derived by the Manilla railway. Any traffic to the north of Bingera would assuredly go to Moree.
460. That would to a certain extent make this railway a local line? Yes; the traffic area will be very much restricted. It would come from the country up the Namoi to a point 15 miles above Manilla, thence northerly till you strike the Gwydir, down the Gwydir to Bingera, from Bingera across to the Horton River, westward along the Horton River to its source in the Nandewar Range, and from the Nandewar Range to Mount Lindsay, and from Mount Lindsay along the Nandewar Range.
461. At present the traffic by way of Manilla to Tamworth is very great? Yes.
462. Is not the bulk of that traffic from the outside country north of Warialda? No; I should say that half of the wool traffic comes from the north of Bingera.
463. And the return loading about the same? Yes.
464. When the extension to Moree is opened, all that traffic will go to Moree? Yes; I will be very much surprised if that is not the case.
465. Therefore the present traffic passing through Manilla to Tamworth will be somewhat delusive from a railway point of view? It will be considerably less than the present road traffic.

C. W. Jenkins, Esq., A.M.I.C.E. 27 Feb., 1896.

466. If the present road traffic is depended upon, will it not be altogether misleading? Yes, if it is used as a basis.
467. *Mr. Hassall.*] If there be no extension of the railway from Moree to Inverell, will not the great bulk of the wool traffic between the Gwydir and the Queensland border gravitate to Moree? Yes; most of them will send their wool that way.
468. Therefore, the wool traffic to Tamworth by this railway will be confined to a limited area? Yes.
469. Do you not think that the whole of the traffic which will be commanded by the proposed railway will be confined to Myall Creek, Reedy Creek, Bangate, Terry-hi-hi, Rocky Creek, Cobbadah, Piedmont, Bingera, Mount Lindsay, and around Barraba? Yes; but the Terry-hi-hi traffic would go to the Moree line. That is on the down grade; whereas coming into Manilla we would have some very heavy country to travel. At present the Terry-hi-hi wool goes to Narrabri, so does the Rocky Creek. From the north-east of Warialda we would get the wool by way of Manilla.
470. In all probability the great bulk of the wool traffic from the great pastoral country between the Gwydir and the MacIntyre would go to Moree? Yes.
471. Then you are confined practically to an area from Cobbadah, 12 miles beyond Barraba? Yes; I think the extreme northern limit of traffic would be Bingera.
472. From the nature of the country you would be restricted to an area of about 20 miles east of Bingera? Yes.
473. The wheat grown in that district is dealt with in Bingera itself, is it not? Yes.
474. It is converted into flour at Bingera, and the bulk distributed out west? Yes.
475. There are no great pastoral properties in the vicinity of Bingera except Myall Creek and Bangate? Yes.
476. Coming south you are confined on the eastern side by a continuation of the Moonbi Ranges, and on the other side by the Nandewar Range? Yes.
477. When you are coming from Bingera towards Tamworth you see a range on each side? Yes; it is very marked.
478. Until you get to Cobbadah you get no great amount of traffic? Yes.
479. On the eastern side there is nothing? Yes.
480. On the western side you have the road coming in from Horton? Yes.
481. The existing road is a first-class one? Yes; it is a good natural road where it has not been formed.
482. Do you not think that the farmers who do their own carrying would continue, even if the railway were made, to bring their produce into Tamworth in order to get their back loading? I would not be prepared to say that.
483. Are you not aware that Cohen and Levy have a very large establishment in Tamworth, and do an enormous business throughout the north-western district? Yes.
484. Does it not stand to reason that when the farmers bring their produce to Tamworth to deliver it to Cohen and Levy, they would take the goods they require at Tamworth as back loading? Yes.
485. Are they likely to discharge their produce at Manilla, and wait for the back loading to be sent there from Tamworth? I think the construction of the railway would prevent a great many of these farmers from continuing to be their own carriers. I think they would apply their horse-power to other purposes, and send their loading by regular carriers.
486. Are you not aware that the majority of the settlers combine carrying with farming in order to make a living? Yes.
487. When these people carry the produce from the back country would it not be as easy for them to carry it on to Tamworth as to stop at Manilla? I am not prepared to say that.
488. Are there any difficulties on the road between Manilla and Tamworth? It is a very good traffic road.
489. Along that road are there not very good reserves for camping? Yes.
490. Do you not think that with these advantages the people themselves would care very little whether you constructed a railway from Tamworth to Manilla or not? I think the men engaged in carrying would not be affected very much by the railway. They would not care very much whether it was constructed or not.
491. I suppose the property-owners would like to have the railway, because it will enhance the value of the property? Yes; the large land-owners beyond Manilla would be glad to have a railway.
492. Do you think it would be desirable to spend £70,000 in constructing a railway from Tamworth to Manilla only, when there is already a good road there? I am inclined to think the railway would be a profitable investment, and a convenience to a large number of settlers.
493. Are you not aware that there will be an estimated loss of £1,200 per annum on this railway? Yes; but I think that loss will be made up in the course of a few years. It would be at once reduced by £350 a year in the maintenance of the road.
494. Will not the road have to be kept in a good state of repair? Yes; but at very much less cost when the heavy traffic is removed.
495. But if the wool teams compete you will have the heavy traffic, and you will require to keep the road in first-class repair? Yes; if the railway cannot successfully compete with the road, I should say decidedly do not construct it.
496. What is the value of the land through which the railway will pass? I am hardly qualified to give an opinion; but I should say generally it is worth about £5 an acre for farming purposes.
497. Do you think that the owners will give it away for nothing? I understand that they will not give it away for nothing between Tamworth and Attunga, and beyond that I think it is doubtful.
498. *Mr. Black.*] Does not Manilla lie in a flat between the Moonbi and Nandewar Ranges? Yes, comparatively flat.
499. What is the width of that flat? Twenty-five miles, and most of it would be suitable for farming purposes.
500. Is the flat as wide as the one in which Tamworth lies? Yes, probably.
501. Is the soil as good as it is in the vicinity of Tamworth? Yes.
502. I find that the land alienated amounts to 545,383 acres; of this land, 10,889 acres are under cultivation;—do you think that the area of cultivation on the alienated land would be greatly increased if a railway were made to Manilla? Yes.

503.

C. W. Jenkins, Esq., A.M.I.C.E. 27 Feb., 1896.

503. I find that the unalienated land amounts to 449,805 acres;—is there any great portion of that fit for cultivation? Not a large proportion. I think the bulk of it is unsuitable for agriculture. It is all suitable for grazing. It consists of stony ridges and poor soil.
504. You have stated that the bulk of the wheat grown around Bingera is treated locally in the flour-mills;—is that due to the fact that the quantity produced is only equal to the consumption in the district around Bingera? Yes.
505. If by means of a railway the wheat grown around Bingera could be more readily conveyed to market, do you not think that there would be increased production there? Yes, decidedly.
506. Do you think it would be advisable to extend the survey as far as Barraba? No; the contour of the country would make it too expensive, and it would be necessary to build a costly bridge. There would not be sufficient traffic to justify the heavy expense.
507. Do you not think that the construction of the line would bring traffic by opening up the country? Not in that particular case.
508. Are you inclined to recommend the construction of this proposed railway as a feeder to the main line? Yes, as far as Manilla.
509. Not with a view to further extension? No.
510. Do you think that within a reasonable period it would be made self-supporting? Yes.

Arthur James Stopps, Esq., Acting Chief Draftsman, Department of Lands, sworn, and further examined:—

A. J. Stopps, Esq. 27 Feb., 1896.

511. *Chairman.*] Have you some further information to give the Committee? I find there has been only one road alienated beyond those I mentioned yesterday, and I have now shown that road on the map. It is the road through portion 70, in the parish of Tamworth.
512. Do all the other roads shown as boundary roads and otherwise on the map still stand good? Yes, they are still open. In portions 121, 111, and 110, in the parish of Burdekin, there are areas set apart for railway purposes: also in portions 24 and 40, in the parish of Cuerindi. I hand in the following return:—

Roads Branch, 22 February, 1896.

RETURN of Unnecessary Roads sold in the Parishes of Tamworth and Woolomol, County of Inglis.

Date of sale.	Parish.	Area of Road. a.	r.	p.	Portion through which Road passes.	To whom sold.	Remarks.

Road Tamworth to Manilla, confirmed 1 March, 1867.

TUESDAY, 17 *MARCH*, 1896.

Present:—

THOMAS THOMSON EWING, ESQ. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.
The Hon. JOHN DAVIES, C.M.G.
The Hon. JAMES HOSKINS.
The Hon. CHARLES JAMES ROBERTS, C.M.G.
The Hon. WILLIAM JOSEPH TRICKETT.
HENRY CLARKE, Esq.
CHARLES ALFRED LEE, Esq.
JOHN LIONEL FEGAN, Esq.
THOMAS HENRY HASSALL, Esq.
GEORGE BLACK, Esq.
FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Tamworth to Manilla.

John Harper, Esq., Goods Superintendent, Department of Railways, sworn, and further examined:—

J. Harper, Esq. 17 Mar., 1896.

513. *Chairman.*] Since you were last before the Committee, have you been in Moree, Inverell, and Warialda? Yes.
514. Do you believe that the estimate you have placed before the Committee will be fully realised? Yes.
515. Is it your opinion that any traffic west or north of the Nandewar Range would either make Narrabri or Moree, or a line from Moree to Inverell? I would not like to say that.
516. Where would the traffic split between Moree and Warialda? The traffic I have estimated is at a point not inclusive of Warialda, but south of Warialda from Bingera, and probably a few miles to the north of Bingera. I have estimated north of Bingera, inclusive of Bingera, and south of Warialda. I have not included a single bale of wool or a single ton of goods north of that line.
517. If the line from Moree to Inverell were built the traffic from Bingera could not make Manilla, supposing there were a railway to Manilla also? I should be rather disposed to think it would.
518. Even if there were a railway a few miles to the north? It is 43 miles.
519. What is the distance from Bingera to Warialda? Twenty-six miles.
520. Your evidence is simply this,—that the Manilla-Tamworth extension can rest upon its own foundation without taking into consideration any traffic north of Bingera, west of the Nandewar Range, or east of the Moonbi Range? Yes; no matter whether an extension is made to Inverell, from Glen Innes, or from Moree, the Bingera traffic would still drift to Manilla.
521. You believe the people would rather pay road carriage from Bingera to Manilla, and from there to Sydney or Newcastle by rail, than pay road carriage from Bingera to Warialda, and round by Moree to Sydney? That is in regard to the bulk of the traffic which would earn anything like money. I daresay that low grade traffic, such as wheat and other produce, would probably go by the shortest route.

522.

J. Harper, Esq. 17 Mar., 1896

522. The Nandewar Range lies between Bingera and Barraba? Yes.
523. Do you know the height of that range? I think it rises 1,100 feet from Bingera, and falls about 500 feet to Barraba—that is as far as the railway survey is concerned.
524. What height is Manilla above the sea? I could not say; at all events the line rises from Bingera 1,100 feet and falls 500 feet. Between Barraba and Manilla the country is very much broken.
525. Could you say whether a line from Tamworth to Manilla *via* Barraba or Inverell is likely to be a portion of the policy of this country in the immediate future? I could not say so, unless the authorities are guilty of the unwisdom which has been done in the past of building this Northern line. But I think that that is the way the main northern line should have gone in the first instance. I think it would be a most unwise thing to build a parallel line through there.
526. Therefore you believe the railway from Tamworth to Manilla should be considered without any reference to any railway construction north of Bingera? Yes; I think that should be dismissed from consideration altogether.
527. You believe it is not complicated by the question of a Moree-Inverell or a Glen Innes extension? I think not. I think a railway line could be provided which would suit the intermediate district, but I say that if that line were to be built to-morrow, that is the way it should be built; but the main northern line having been built it is folly to consider it.
528. Do you think it is improbable that there will be an extension to Inverell or to Warialda? I think it would be an unwise policy to follow.
529. *Mr. Hassall.*] You do not think it would be a profitable speculation? I do not think it would.
530. *Mr. Lee.*] If the line were made to Moree the question is whether the traffic west of that would come by any line which might be extended to Manilla? I do not think you could get any practicable country. I take it that the country now feels it has spent too much already in heavy railways.
531. *Chairman.*] Do you put it in this way, "My reasons for believing it improbable that there will be an extension beyond Manilla, Inverell, or Warialda, are first of all that it will be a very expensive line; secondly, that it will not be likely to pick up any of the traffic from the Moree district, certainly not west of Moree, and a good deal of the traffic from the north must always make to Moree"? Yes, either to Moree or down to Tamworth. As I pointed out the other day, the Moree extension will divert a lot of the northern traffic, but still it will continue to come down that road, which is essentially a favourable one for carriers to travel on.
532. Is there any other reason except that the Moree extension limits the area, and the character of the country precludes cheaper construction? Of course the Moree line is under construction now, and I take it that it will tap the country both to the north-west and the south-east. It will take a lot of the traffic which has hitherto come by road. The traffic estimated as coming into Manilla practically is traffic as between Warialda and Manilla. They have a comparatively good road.
533. Supposing there is eventually a connection from Glen Innes, Inverell, and Warialda to Moree? It would not affect my estimate one bit.
534. *Mr. Wright.*] Have you any knowledge of the local traffic between Tamworth and the Manilla district? Not of the purely local traffic. We have taken Manilla and the district beyond it.
535. As far as Barraba, for instance? Yes, that is included in the return; Bingera is included as well.
536. But you have no return of the actual traffic between Tamworth and Manilla and its environs? Yes, we have—that is if you embrace Bingera.
537. Do you know what wheat is produced in the Manilla and Upper Manilla and Bingera district? Including Attunga, 198,000 bushels.
538. The Secretary of Railways in his evidence speaks of a large additional traffic the proposed line will bring to the main line; as a matter of fact, has any of the wheat from the Manilla district ever come to Sydney? No; it has principally found its consumption in Tamworth.
539. So that the wheat will bring no accession to the main line? No; but, of course, the wheat estimate does not represent very much altogether.
540. It has been stated that the construction of this line would largely augment the traffic of the main line? It is possible that if they had railway communication the producers might find buyers other than the Tamworth millers.
541. Do you think they would send the wheat away if it could be locally consumed? It would be a matter of price. They might get a better price of millers elsewhere—say at Glen Innes, for instance.
542. Is it likely when they do not grow more than is sufficient for their own requirements anything will come down the main line to Sydney? I do not think so. If they can consume it all at Tamworth it is likely they will do so.
543. So that this assumption as to the augmentation of traffic to the main line does not exist so far as wheat is concerned? Not so far as the present production is concerned; but with the increased production, which we hope will take place owing to railway communication, there might be a surplus.
544. If I am credibly informed that all the traffic of Manilla and Upper Manilla is at present done by one waggon and two drays, would you believe that information correct? No; I would unhesitatingly say it is incorrect.
545. And the wheat traffic is done with less than twenty teams? Twenty teams would carry a lot of wheat spread over a year.
546. I am informed on good authority that a waggon carrying 5 tons goes through to Manilla from Tamworth in ten hours? I dare say it would in good weather.
547. And the same authority tells me that the whole of the traffic is confined to a single waggon and two drays? That is on one side. I may state that between Manilla and Tamworth I passed fifteen teams, and, as you know, it is the dead of the year just now. Of these fifteen teams, five were loaded from well-known Tamworth dealers' stores. Each of them carried about 4 tons. They were going to Manilla, or beyond it.
548. I want to find out what is the justification for building a railway if the purely local traffic is so small, because you will get the traffic beyond whether the railway is built or not? It would not increase at all events. We look to a district like that to produce far more than it is doing now.
549. Do you think, for instance, the production of wheat around Bingera would increase very much if the railway were built? No; I think the area for wheat in the vicinity of Bingera is very limited.
550. Then I suppose for the first 12 or 15 miles you would not expect to get traffic? I think we should pick it up at Attunga.

J. Harper, Esq. 17 Mar., 1896.

551. Do you think a farmer growing wheat within 12 miles of the town in which he sells it would be likely to carry it 2 or 3 miles to a railway, and then pay for its carriage to the town? I think so, for the simple reason that a large amount of his wheat would be bought on the farm. Of course the whole of the traffic, as far as wheat is concerned, would be very little. I only give the value of the wheat traffic at Attunga at £125; I think we would realise that by chaff and hay. I may mention, incidentally, that we had for three months an average of sixty or seventy truck loads of chaff per week from Jerilderie. It had come in from Berrigan.
552. In answer to the Chairman, you stated that if there were railway communication across the country between Moree and Glen Innes, or between Moree and Inverell, the traffic about Warialda would still come to Manilla? I think the Warialda traffic would come by Moree, but I fancy the Bingera traffic would always come, that is if the survey north of the Gwydir were carried through Warialda. I do not think an extension from Glen Innes to Inverell or from Moree to Inverell would affect Bingera.
553. I suppose you include Talune and stations like that in your estimate of the wool coming through Manilla? No.
554. Myall Creek, for instance? I discarded that altogether. I also discarded Bective. I have not accepted stations even adjoining Warialda.
555. But still you say there would only be a decrease of 6,000 bales? I left my figures doubtful in view of a possible extension. I have not gone any way north of Warialda.
556. If the returns from the Tamworth station-master show that, instead of losing 6,000 bales you will lose 16,000 bales, what then? I do not place much reliance generally on the returns given by our station-masters; I generally verify these matters myself.
557. Do you think there will only be a decrease of 6,000 bales through the extension of the Moree line? That is what I estimate it at.
558. And yet you think if the Moree line is still further extended through Warialda to Glen Innes it will not affect the proposed line much more? I do not think so.
559. Looking at the proposed line as a purely local line, and not contemplating its extension beyond Manilla, do you think the Committee would be justified in recommending its construction? Yes.
560. You think the present local traffic, with the through traffic which is likely to gravitate towards it, and the possible addition to traffic from the construction of the line, will bring in a revenue sufficient to justify the country in going to the expense of constructing the line? Yes.
561. Whilst you were in the district, did any of the local land proprietors notify that they were likely to throw their land open and go in for the cultivation of wheat? About the only large landowner affected by the line is Mr. Barling. Of course there is Mr. Rogers, of Attunga.
562. And there are two other large landowners on the river? There is Mr. Baldwin; but I think these people do not speak of matters over which they have no control. I think, however, they would all like settlement.
563. *Mr. Black.*] If a Sectional Committee were to visit the route of the proposed line, do you think they could form any opinion as to its advisableness or otherwise, unless they went beyond Manilla, say right through to Barraba, Bingera, and, possibly, to Moree? I should think it would be a desirable thing to go to Barraba and Bingera, and it would also be necessary to have a look at the Horton River.
564. You do not think any railway proposed, or likely to be made, would interfere with the success of the Tamworth to Manilla line? I should not think so.
565. There is no possibility of any line likely to be made diverting any of the traffic which you think likely to be carried by the proposed line? Not any of the traffic I have estimated.
566. *Mr. Hoskins.*] Did you hear any of the people say that they were so anxious to have a line constructed from Tamworth to Manilla that they would cheerfully give the land required for the railway to the Government? Whatever they may have felt, they did not say it to me. On the other hand, I did not hear anything against it. I pointed out to the people I met at Manilla that, in order to expedite matters and to save time, they should make up their minds as to what they were going to do, either to give it or not to give it; but some of the principal landowners have no voice in the matter.
567. Then you have not heard any expressed opinion from the people of the locality to the effect that they would be prepared to give the land for the railway? Most of the settlers there are anxious to get the railway, and they are most anxious that the land should be given, but a great many of them do not own any land.
568. Therefore it would be necessary to get the consent of the mortgagee? Yes, that is the position.
569. *Mr. Lee.*] Do you say that those who are willing to give land have their land in the hands of mortgagees? It was no part of my business to ask them what they were going to do, but I advised them to make up their minds what they were going to do before the Sectional Committee visited them.
570. But you did not hear any responsible landowner say they were so anxious to get the railway that they would be prepared to give the land? I do not know that you could find any responsible landowners there. You cannot find them on the land, at all events.
571. Are there any selectors there? Yes; but the line does not go through many selectors' properties.
572. The proposed line goes through a good deal of the Attunga run? Yes.
573. Are there many farmers on the Attunga run? The resumed area there has been a good deal cut up, but most of the selections have been acquired by the run.
574. I suppose the people who have farms on the Attunga run are mainly tenants of the lessees of the run? I think the number on Attunga is very limited. But the Sectional Committee will not meet a fairer man, nor one who will give them better information, than Mr. Rogers, the owner of the run.
575. If there are not many people engaged in farming on the Attunga run at the present time there are not many people there waiting to take advantage of the construction of the line? I think if the Attunga run were thrown open for the purpose of agricultural settlement, a great deal of it would be jumped at and taken up.
576. Thrown open by whom—by the Government? No; by the owners of it.
577. The last time you were here you told the Committee that a good deal of traffic came down the road through Bingera, Barraba, and Manilla from the northern part of the Colony;—do you believe if a railway is constructed from Moree to Inverell that that line will take all that northern traffic away? I have discarded that in my estimate. I have not gone beyond Warialda for a single bale of wool.

578. You believe all the Warialda wool will still come down to Manilla? Yes. I have discarded everything doubtful. I have discarded Myall Creek, with 78,000 sheep upon it; Bangheet, with 17,000 sheep; Pallal and Bective. J. Harper, Esq. 17 Mar., 1896.

579. Although you have discarded 6,000 bales of wool, do not the large stations north and west of Moree in the aggregate turn out more than that amount? They did not last year. From Talune we had 1,700 bales, and from Yallaroy 1,300.

580. But there are stations still further north, near the Queensland border? Yes; but I selected all those which came into Tamworth.

581. At all events, if the Moree-Inverell railway is constructed, it naturally will divert a large quantity of trade which now comes down the northern road by Manilla to Tamworth? The same with regard to the merchandise traffic. I have only included that traffic which will legitimately belong to that line. My estimate is based on the local traffic which I think will always find its way to Manilla.

582. Is it not very rough country from Manilla, by Barraba, to Bingera gold-fields and Bingera township? Yes; but there is not much production. The settlement is principally along the Peel and Minilla Rivers. When you get further north you get into good country again.

583. Are there many people settled and engaged in producing anything from the soil, excepting gold, about Barraba and Bingera? Yes, there is a good deal of farming. Moree is almost exclusively supplied with flour from the Bingera district.

584. Have you reported on other lines that have been before the Committee? Yes.

585. Can you name any line which has been constructed since you reported upon it, and which is now working? I reported on the Cootamundra to Temora line, the Nyngan to Cobar line, and the Kiama to Nowra line.

586. Are you in a position to show that any figures you have placed before the Committee on previous occasions with reference to proposed lines have been borne out since those lines have been open for traffic? I do not know that I have ever submitted any set of figures to the Committee before, unless in connection with the Nyngan to Cobar line. I reported against that line; but I am happy to say it has been a success nevertheless. I may say that most of my estimates have been of a negative character. Many lines have not been built, because I did not think they would pay. My evidence was of a negative character in connection with the Cobar line; but owing to the development of the copper-mines it has paid better than any one expected it would.

587. Your evidence in regard to the line under consideration is of a favourable character? Yes.

588. And you arrive at your conclusions after personal inspection and investigation? Yes.

589. You are aware that the Commissioners estimate the line will show a loss of some £1,200 a year? Yes.

590. I would like to know why you suppose that this line will pay in the future if it is going to show a loss at starting, and is to be a local line? There is one little item which occurs to me, which shows how many different items have been left out of calculation altogether. There is a copper-mine at Barraba, in regard to which a syndicate has been formed; if it opens, that mine alone will pay half the interest on the capital cost. Of course I look to the future development which always follows the construction of a railway.

591. But, apart from the copper-mine, do you think there is sufficient land to carry an agricultural population? I think so. The land carries, on an average, one sheep to two and a half acres, and there is no reason why it should not carry one sheep to every acre. I fancy they will be able to carry cross-bred sheep there very well. I may say that farming there is in the most primitive condition.

592. Do you think it is fair to assume that the construction of that line will bring additional traffic to the main line? Yes.

593. To a degree which it does not feel at present? Yes.

594. When you were before us on a previous occasion I asked you one or two questions with reference to the dray road—as to whether it would be possible to take the road to the line or bring the line to the road; have you looked into that matter? Yes. I do not think you will get over the difficulty. It is an engineering question. You will find the sidlings coming down there on the stock route. Where you could possibly get the line on the road it is 2 chains wide; but in other places, where the line is away from the road, it slopes down so that you would have to go into rather expensive cuttings to get anything like a grade.

595. Have you any idea whether the district suffers very much in dry weather? No; it suffers more from the effect of cold. Most of the sheep lost in that district this year were lost after shearing, from the cold storms. They did not lose many sheep in that district from drought.

596. *Mr. Fegan.*] How long have the copper-mines at Barraba been working? Ten or twelve years intermittently.

597. Were not 20 tons of copper obtained from there last month? It may be so, but I discarded that item altogether. Whilst I was in the district I could not see much prospect of carting copper that distance, but I think it is possible that it will be done.

598. I suppose you know they are trying to float the concern into a company? Yes.

599. And they have had very good results from the copper? If it is half as good as it is reported to be, I think we shall have a very big traffic.

600. And then what may seem to be a deficit will be wiped out entirely? Yes.

601. And the line will be made to pay at once? Yes, if the mine can be made to produce copper in sufficient quantities.

602. And the opening of the mine will bring a greater population there, and the passenger traffic will be greater than you have estimated? Yes.

603. Do you know how many men are employed copper-mining there now? When I was there there were ten or twelve.

604. Would you be surprised to hear that there are now nearer forty? Yes; I did not make any further inquiries the last time I was there.

605. Then the development of the copper-mine will add a new item of revenue to the line? Yes.

TUESDAY, 31 *MARCH*, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (Chairman).

The Hon. Frederick Thomas Humphery.	Charles Alfred Lee, Esq.
The Hon. John Davies, C.M.G.	John Lionel Fegan, Esq.
The Hon. Charles James Roberts, C.M.G.	Thomas Henry Hassall, Esq.
The Hon. William Joseph Trickett.	George Black, Esq.
Henry Clarke, Esq.	Francis Augustus Wright, Esq.

The Committee further considered the proposed Railway from Tamworth to Manilla.

James Burt, Esq., Draftsman in charge of the Information Bureau, Department of Lands, sworn and examined:—

J. Burt, Esq. 31 Mar., 1896.

606. *Chairman.*] What maps do you produce? I have brought a map showing the position of the pastoral holdings situated between Tamworth and Manilla, and also a map of the town of Tamworth.

607. Have you a map of West Tamworth? No; that is a private township.

TUESDAY, 12 *MAY*, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (Chairman).

The Hon. Frederick Thomas Humphery	Charles Alfred Lee, Esq.
The Hon Charles James Roberts, C.M.G.	John Lionel Fegan, Esq.
Henry Clarke, Esq.	George Black, Esq.

The Committee further considered the proposed Railway from Tamworth to Manilla.

Henry Deane, Esq., Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

H. Deane, Esq. 12 May, 1896.

608. *Chairman.*] Have you any definite information with regard to the cost of a line turning off at West Tamworth and passing on the southern side of the Peel to Attunga? Yes.

609. Have you any statement to make as to the cost and grades of such a line? Yes; the grades would be about equal to the grades on the other line. The route is a very good one. Although there is the river to cross, the cost per mile works out at less than the cost per mile of the original route. At the same time it must be remembered that the new route is a mile longer than the original route. Consequently the total cost of the line taken by the new route would be about £1,000 more than the cost of the proposed line taken along the original route.

610. *Mr. Black.*] You are referring merely to the cost of construction? Yes; my remarks have nothing to do with the cost of resumption.

611. *Chairman.*] What grades can you get on the new route? Pretty well anything you like.

612. Can you get a grade of 1 in 100? Yes.

613. What was your grade on the original route from Tamworth to Attunga? On that route you could get anything you liked. The line as marked out had grades of 1 in 50 and 1 in 66; but there is no reason why, without any increase of earthworks, by altering the location, an easier grade should not be got. The difficult portion is between Attunga and Manilla.

614. If you made the grade on the original route 1 in 100, the cost would be considerable, would it not? You could get any grade you liked without increasing the cost. As shown on the section, the new route has not a ruling grade of 1 in 100. It starts with a grade of 1 in 85, and then there are several grades of 1 in 80 before you get to the Peel River, but a grade of 1 in 100 is easily obtainable.

615. Is 1 in 80 the worst grade on the route? Yes. After you cross the Peel River, if you make a direct connection with the original route, you have a grade of 1 in 50; but that can be altered, Mr. Wilkins has assured me. Whatever grades are wanted at this point can be obtained, though he says that it will lengthen the line to put in easier ones, but I have not taken any of that lengthening into account in making the estimate.

616. What would the grades be on the other route? You could reckon on getting the same grades there without any material increase of distance. If you keep at the foot of the spurs you can get any grade you like.

617. *Mr. Black.*] The conditions are somewhat different at the point of junction? Yes; but flattening the grades does not necessitate any lengthening of the line there.

618. Would not your estimate be reduced by reason of the fact that at the proposed junction at West Tamworth no earthworks would be required? Earthworks will be required, but everything has already been taken into consideration in the estimate which I have made. The earthworks on the commencement of the original route from Tamworth are heavy, but the estimate makes provision for the better grades which I referred to in my previous evidence. As against these heavy earthworks we have on the new route the necessity of crossing the Peel River, and one thing balances the other. The cost of the line from Tamworth to Attunga on the original route is estimated at £31,209, or £2,379 per mile, the length of the line being 13 miles 9 chains. The cost of the new route is estimated at £32,229, or £2,262 per mile, the length being 14 miles 20 chains. That shows a difference of £100 a mile in favour of the new route.

619. *Chairman.*] The cost of the earthworks on the original route is pretty well equalised by the extra length on the new route, and the necesssity for a bridge? Yes.

620.

H. Deane, Esq.
12 May, 1896.

620. How much higher is East Tamworth than West Tamworth? About 14 feet.
621. What distance is it from West Tamworth to the crossing of the Peel, on the surveyed route? A little over 13 miles.
622. The country from West Tamworth to the crossing of the Peel is possibly as suitable for cheap railway construction as any in the colony? You could not find anything much better.
623. But on the other side of the river, or at any rate for the first 2 miles, the country is by no means so good? For the first mile and a half, it is not so good; but when you get beyond the crossing of the main road it becomes very easy, and about as good as that on the other side of the river. The route from West Tamworth to Attunga would be a very easy one if you could leave out the Peel River bridge, and the other route would be very easy if you could take out the first portion passed through before leaving the town. Taking everything into consideration the two routes are very similar. If there is anything in favour of either it is perhaps in favour of the West Tamworth line.
624. The new route is shown on the map in blue? Yes.
625. Would it be possible to take the line further south with a grade of 1 in 60? I do not think it could be done with advantage.
626. Would you express an opinion with regard to it? I can only express the opinion that Mr. Wilkins has given to me. I have not been over the new line, so I can only tell you what he states. I examined him very carefully with regard to the matter. The further away you get from the river the more undulating the country becomes.
627. Could you get through that undulating country? If you go far back I do not think you could get through with a grade of 1 in 60, or even 1 in 50. You will find some very steep pinches on the road.
628. You give it as your opinion that you could not bring the line very much further south than it is shown on the map? Yes.
629. If the new route is adopted, must it be located where the blue line is shown on the map? That would seem to be the best place for it.
630. The hills slope very easily on the southern side? I daresay you could take the line a little further back, and still get a 1 in 60 grade, but I could not say how far back without having levels taken. If you go further back you would get a worse line. There would be slight cuttings and banks to increase the cost, as the watercourses would be more defined. The cheapest position for the line is that adopted by Mr. Wilkins. If the Peel River Company want the line put a little further back I daresay it could be managed; but at the present moment it is impossible to state to what extent, because this has only been a flying survey.
631. How do the waterways on the new route compare with those on the original route? The cost of providing for waterways on the new route is less.
632. Proceeding from Attunga, and following approximately the line which you surveyed until you pass through the gap near Chlori, you say that the railway could be kept on the west side of Green Hatch Creek without any greater cost than would be incurred by adopting the route as you have it? Yes. I looked into that matter when I went over the route with Mr. Jamieson in November last.
633. I suppose you are aware that for the last 10 miles, as you approach Manilla, the line goes adjacent to and pretty well through every house in its vicinity? Yes; but I do not think anything of that, because this is only a trial survey, and it can easily be shifted.
634. When did you abandon the idea of taking the line out on the west side of Green Hatch Creek? I have not abandoned the idea. The survey had been made when I went through the country, and I looked upon it as a most promising deviation. However, we had this line already laid out and the Book of Reference prepared, and if I had altered the line the Book of Reference would have been wrong.
635. Your opinion with regard to the line from West Tamworth is that it would be an easy one to construct, although about a mile longer than the proposed line? Yes.
636. What has been the cost of the Berrigan line? I do not know at the present time.
637. Do you know what the tender was? The tender shows only the minimum cost. There are places where the line must be raised. I fixed the quantities for the contractors to tender upon as low as possible, but they will be increased during the execution of the line.
638. Will that line cost £2,400 a mile? It will not cost much more than the estimate, though that estimate was made on the assumption that the Railway Commissioners would supply us, as promised, with a large quantity of second-hand material, which they have not been able to do. If there should be an increase of cost on this account it is clear that I am not responsible.
639. What did your estimate you would save by getting these second-hand rails? I really do not remember.
640. Would it be £200 a mile? I do not think it would be that.
641. Supposing it were £200 a mile, a reasonable estimate for the Berrigan line would be £2,300 a mile? Yes.
642. What has been the cost of the Condobolin line? The estimate is £2,100 a mile, I think.
643. Of the Moree line? I think that was about £2,400 a mile, including bridges.
644. How does the country between West Tamworth and Manilla compare with the country in these other places? It is more undulating.
645. Not the first 13 miles of it? No, but beyond that. The heaviest part is between Attunga and Manilla, going over the hill.
646. You estimate that this line will cost £200 a mile more than any of the other lines that have been named? Yes.
647. It is perfectly clear that the extra cost is not incurred in connection with the first half of the line, so that we may reason that the latter half will cost £400 a mile more than any of the lines that have been named? You must not forget that there are no stations to be provided for on the first half of the line.
648. I am leaving the cost of stations out of count? In ascertaining the cost per mile, you must take into account the cost of stations.
649. What, then, is the total cost of railway stations and buildings? £137 per mile for buildings, &c., and £144 per mile for earthworks sidings, and so on, making a total cost of £281 per mile.
650. Taking £2,300 as the minimum cost per mile of a line of this character, the latter half of the proposed line will cost close on £600 per mile more than the average? On the first section the station arrangements will only cost about £121 per mile, as against £281 per mile on the whole line. If you double

H. Deane, Esq.

12 May, 1896.

double the difference between these amounts, you get £320, which accounts for a good part of the £600 which you mention, and leaves only about £280 a mile to be accounted for by extra earthworks, waterways, &c.

651. If the Berrigan, Condobolin, and Moree lines cost only £2,300 or £2,400 a mile, £2,600 seems a pretty heavy estimate for this line? There is no very heavy work on the Condobolin line.

652. The country there is as bad as this? I do not think so, and I have been all over it. I do not think any part of it is anything like so lumpy as the hill on the other side of Attunga.

653. What do you estimate the cost of the new line to be? £2,534 a mile. If you deduct from that £281 per mile for station arrangements, and £54 per mile for water supply, you get the cost of the line itself as £2,199 per mile.

654. That is the cost of the running road? It is a little more than the cost of the running road. It includes signals, telegraphs, engineering, and contingencies.

655. *Mr. Humphery.*] Should you not deduct £50 for the 15 per cent. on the £335? Yes; that would make the cost £2,149 per mile for the roadway, discarding the cost of station works, &c. The cost of the line from the junction to Attunga is £2,262 per mile. Stations, &c., cost about £138 per mile. Increasing that by about £20 for the percentage you get £158 per mile, which, deducted from the total cost, leaves £2,104 per mile.

656. *Chairman.*] Have you taken into consideration whether the item £97 per mile for level-crossings, cattle stops, and fencing could not be materially reduced? I have, and for the deviation I provide only £49 per mile for that work. I think everything has been taken into consideration. My estimate for the line from West Tamworth through the Peel River Company's land to the junction with the trial survey at 195 miles 74·82 chains—length, 14 miles 20 chains—is as follows:—

TAMWORTH TO MANILLA.

WEST TAMWORTH, through Peel River Company's land, to junction with trial survey at 195 miles 74·82 chains; length, 14 miles 20 chains.

Description.	Estimated cost.	Average per mile.
	£ s. d.	£
Earthworks	3,089 0 0	217
Timber Bridges, &c.	1,213 0 0	85
Timber Bridge over Peel River	4,000 0 0	281
Level-crossings, &c.	696 0 0	49
Permanent-way materials	9,917 13 6	696
Platelaying, &c.	7,082 15 6	497
Stations	1,720 0 0	121
Signals	237 0 0	17
Miscellaneous	278 0 0	19
	28,233 9 0	....
Engineering and contingencies	3,995 11 0	280
Total cost.....£	32,229 0 0	2,262
From Junction to Manilla—14 miles 50 chains	40,941 0 0	3,121
Total cost, West Tamworth to Manilla—28 miles 70 chains.....£	73,170 0 0	2,534

You will see that all the items here have been reduced as compared with my original estimate.

657. *Mr. Humphery.*] How do you expect such a large saving in regard to station arrangements? Because there are no terminal works. The figures I have just read are for the 14 miles 20 chains.

658. *Chairman.*] You estimate the cost of the rest of the line to Manilla as pretty much the same as the cost of your surveyed line? Yes.

659. Supposing it were thought desirable to keep the cost of the proposed line within £2,400, how could you do it? I do not think it could be done. It would be most inadvisable to attempt it.

660. You could not save it in earthworks? I do not think you could save very much, even by adopting steeper grades over the hills. You could not make this line as cheap as the other lines you have mentioned, without making it much worse. The conditions are different, and a larger expenditure is required.

661. You have provided for an overbridge where the railway crosses O'Connell-street, Tamworth? Yes.

662. How far beneath the level of the road would the railroad be? About 13 feet, as shown on the section.

663. Then it would be necessary to raise the level of the road about 4 feet at this place? Yes.

664. Would not that interfere with the street? We could so arrange it that there would be no interference at all. The rails could be dropped a little.

665. Did you take the matter into consideration when estimating the cost of the earthworks? Yes.

666. *Mr. Roberts.*] I understand that the cost of the new line and the further portion of the old line to Manilla will be £2,534 per mile;—could you not save £134 per mile with a view to bringing down the cost to £2,400 per mile, the cost of the Condobolin line? The cost of that line was £2,300, I think. I do not see how it could be done.

667. Is it usual to allow 15 per cent. for engineering and contingencies? It would be in a case like this.

668. Why is this made an exceptional case? I do not think it is exceptional. I have cut down some estimates to 5 per cent. for contingencies, and 5 per cent. for engineering, but those figures are very low. Even a rise of 10s. per ton in the price of rails would run you close into 5 per cent. on the cost of the line.

669. You could not see your way to make this item 10 per cent.? I should not like to do it.

670. *Mr. Fegan.*] Although a bridge over the Peel River would be necessary, do you not think that the proposed bridge will be better than the original route, because the grades will not be quite so heavy? I do not think there will be any difference.

671. How many chains in the old survey will give a grade of 1 in 100? I think we can reduce the grades to a minimum. The only bad part of that line is the piece running out of Tamworth. That is rather ugly, but after you cross the main road the country is easy.

672.

H. Deane, Esq.

12 May, 1896.

672. What would be the difference, taking the cost of resumption in the one case and of the bridge in the other, between the cost of the two lines? I do not know. I do not know what the cost of the resumptions would be.
673. On the original survey you have a very heavy cutting between Tamworth East and the municipal boundary? Yes; the earthworks are heavy.
674. Further on you have an embankment? Yes.
675. Do you not think that more will be spent upon the cutting and the embankment than upon the bridge? No; it has all been very carefully reckoned out. You can get earthworks done very cheaply now.
676. We have had no guarantee that a number of people on the old route would give their land for railway purposes? I know nothing about that.
677. The new route will be cheaper, because of the land being given to it? If the Peel River Company give the land to the Government, and the people on the other route will not give their land, that will make a difference? Yes; it will make a great difference.
678. Do you think that £10,000 for resumptions and earthworks will get you out of Tamworth on the old route? I have not gone into the question of the cost of resumptions; but at present values the land cannot be worth very much. I should not think it would cost as much as you say.
679. When there are buildings on land it makes a very great deal of difference? I think we have been very careful to avoid buildings on that portion of the line running out of Tamworth.
680. The new route will offer more inducements to traffic than the old route, because it gives the Sommerton people a better opportunity to use the railway? I should not think it would help them very much. I think they will go into Tamworth.
681. Although the line will go $1\frac{3}{4}$ miles nearer to them? They have a good road into Tamworth, and they might prefer that.
682. You think that the adoption of the new route would not induce those people to use the railway? Not unless a good road was made towards the line.
683. Will the roads be kept in as good order after the railway is made as they are in now? My experience is that the roads are kept in better order after a railway is made.
684. Do you think that that is a good way of doing business? I would rather not make any criticisms; but I think there is a good deal to be said for the practice generally. It brings traffic to the railway.
685. *Mr. Lee.*] Having had an opportunity of seeing the flying survey of this proposed deviation, do you favour the deviation? I think it is a very good line.
686. From a professional point of view you raise no objection to it? I do not raise the slightest objection to it. I think that it is a very good line.
687. It will answer every purpose that the original line was intended to answer? Well, the instructions in the first place were to survey a line from East Tamworth. One advantage that the deviation has over the proposed route is that the land traversed by it will be obtained free of cost from the Peel River Company; but I do not know that that is an advantage which could have been anticipated.
688. If you had received instructions to survey a line from West Tamworth, do you think it probable that you would have selected a route somewhere near the suggested deviation? I think it is almost certain that I should.
689. You therefore offer no objection to the deviation? No.
690. In the aggregate it would not increase the cost of construction? It will add £1,000 to the total cost, though the cost per mile will be less.
691. *Mr. Humphery.*] How will the earnings of the railway be affected if we start from West Tamworth instead of from East Tamworth? I do not think the estimated earnings will be affected at all. The Railway Commissioners propose that there shall only be three stations on the line—at Attunga, at Green Hatch, and at Manilla, which would be the same in either case.
692. Then, putting the question of compensation aside, the question of traffic would not weigh with you? No.
693. When you say that the deviation would cost £1,000 more than the original line, you assume that the owners on the East Tamworth side would give their land without compensation? I make that statement on the assumption either that you get the land on both routes without cost, or that the cost of resumption in both cases is the same.
694. If the West Tamworth line may be constructed without compensating land-owners, while on the East Tamworth route compensation must be paid, which do you think is the more desirable? If it were simply a matter of cost, I should say the new line. The new line would undoubtedly be the cheaper, taking compensation into consideration.
695. Therefore, unless the owners of land along the original route are prepared to give up their land free of cost, you think the West Tamworth route would be the cheaper? Yes.
696. And, as far as you can see, should be preferred? I think it would answer all purposes.
697. May we assume that if you were free to select a route, and you found that on one line compensation would have to be paid, while on the other there would be practically no compensation, would you select the West Tamworth route? Yes; if it were a question of joining on to the main line wherever it cost the least, I would choose the West Tamworth route.
698. The question of compensation did not enter into your consideration when you had the line from East Tamworth to Manilla surveyed? No; we had to take the line from East Tamworth along the best route, independently of the cost of land.
699. Would the West Tamworth line be as convenient for traffic as the original route? I think so, if the Railway Commissioners make the fares the same. The distance from East Tamworth to Manilla will be increased 2 miles by the proposed line.
700. But what about the distance between Manilla and Sydney? It would be the same by either route.
701. *Chairman.*] I find that $12\frac{1}{2}$ per cent. was allowed for contingencies on the Bega-Eden line, and 5 per cent. on the Berrigan line; here you allow 15 per cent.? That includes engineering.
702. What have you allowed for contingencies alone? From 8 to 10 per cent. The cost of engineering and supervision runs from 5 to 6 per cent.
703. Roughly, then, we can say—contingencies, 10 per cent.? Yes.

H. Deane, Esq. 12 May, 1896.

704. Have you anything further to add? I hand in a detailed estimate of the portion of the original route from Tamworth to Attunga for comparison:—

TAMWORTH TO MANILLA.

ESTIMATE of Trial Line from Tamworth at 182 miles 65·51 chains to 195 miles 74·82 chains, being the point where line from West Tamworth joins; length, 13 miles 9·31 chains.

Description.	Estimated cost.	Average per mile.
	£ s. d.	£
Earthworks	4,571 0 0	349
Box drains, culverts, and timber bridges	2,261 10 0	172
Overbridge	500 0 0	38
Level crossings, &c.	1,745 0 0	133
Permanent-way materials	9,136 0 0	696

	26,964 10 0	.....
Engineering and contingencies, 15 per cent. nearly	4,244 10 0	323
Total cost £	31,209 0 0	2,379
From Junction to Manilla, 14 miles 50 chains	40,941 0 0	3,121
Total cost, Tamworth to Manilla—27 miles 60 chains £	72,150 0 0	2,600

THURSDAY, 18 *JUNE*, 1896.

Present:—

THOMAS THOMSON EWING, ESQ. (CHAIRMAN.)

The Hon. FREDERICK THOMAS HUMPHERY.
The Hon. CHARLES JAMES ROBERTS, C.M.G.
The Hon. WILLIAM JOSEPH TRICKETT.
HENRY CLARKE, Esq.
CHARLES ALFRED LEE, Esq.
JOHN LIONEL FEGAN, Esq.
THOMAS HENRY HASSALL, Esq.
GEORGE BLACK, Esq.
FRANCIS AUGUSTUS WRIGHT, Esq.
FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Tamworth to Manilla.

George Lawrence Wilkins, Esq., Surveyor, Railway Construction Branch, Department of Public Works, sworn, and examined:—

G.L. Wilkins, Esq. 18 June, 1896.

705. *Chairman.*] Have you had an opportunity of seeing the evidence of the Engineer-in-Chief for Railway Construction with regard to the alternative route of the proposed line from Tamworth to Manilla? Yes, I have read it.
706. And you recently made further inquiries into the matter? Yes.
707. Do they substantiate the opinions previously formed? Yes; there are no essential alterations.
708. It is possible, turning off from West Tamworth, to go through the Peel River Company's estate, and then approximately parallel to the road from Tamworth to Manilla through Attunga, passing down the western side of Green Hatch Creek, and over the junction of that creek with the river joining the original Departmental survey near the travelling stock reserve? Yes, with grades of 1 in 66.
709. That route would be as good as the Departmental survey? Yes.
710. The part of the line which passes through the Peel River Company's estate will be extremely easy? Yes.
711. You can get pretty much what you want there? Anything you require.
712. Will it be possible to take the line at the back of the stock-yards? Yes.
713. And not to approach within half a mile of the creek except near the village of Attunga? On an average the line will be fully half a mile from the creek; but in one or two places it may be less than that distance.
714. No great alteration has been made in the estimate of the cost of the bridge over the Peel below the junction of Attunga Creek? No.
715. Is it necessary to alter the evidence which has already been given on this matter? No; I do not think that there is anything requiring alteration.
716. *Mr. Fegan.*] Is there anything new in connection with your last survey? No. The estimates in connection with the last survey have not yet been prepared; but there will be no material difference.
717. *Mr. Lee.*] Is there any increase in the price of the bridge? There will be no alteration.
718. Will any deviation of the main roads be rendered necessary? No; the line does not interfere with the main roads, or with the travelling stock routes.
719. *Chairman.*] Is there any interference with improvements, that is, of a serious nature? The line goes through a few cultivated paddocks, but that is almost unavoidable in the case of every line.
720. Will the alternative route meet all public purposes as well as the line originally surveyed by the Department? I do not think that so good a station will be obtained on the new route at the Somerton Road.
721. The people will have to go off the road to get to the railway? Yes; the line will be nearly a mile from the road.
722. Does this new survey vary from the route which met with the approval of the Sectional Committee? No.
723. For the first few miles out of Tamworth the railway is not likely to be used by the people in the vicinity, because they will be able to drive into Tamworth? That is so.

724. The first important station will be in the reserve beyond Attunga Creek? Yes. G. L. Wilkins, Esq.
725. There the new survey and the original line are almost adjoining? They are not very far apart.
726. From that point the new survey is not far from the Government line until you get to Klori? It coincides with the Government line for the next 8 miles after leaving Attunga Creek. 18 June, 1896.
727. With regard to the accessibility of the station near Klori, people to the east will have from half a mile to a mile further to travel if the new route is adopted? Yes.
728. And people to the west will be benefited by having a shorter distance to travel? Yes.
729. But inasmuch as there are more people to the east than to the west the new route is not so convenient at this point as the original route? No.
730. Do you regard the extra distance as a serious matter to the people on the east of the line? No; because all the traffic of the line from that direction will have to come a considerable distance, and half a mile will make very little difference to it.
731. The distance from Manilla to Sydney will be the same whichever route is adopted? No; the deviation will increase the distance to Sydney by a mile.
732. *Mr. Wright.*] And how much will the distance between Tamworth and Manilla be increased? The distance from Manilla to Tamworth East will be increased by $2\frac{3}{4}$ miles.
733. *Mr. Humphery.*] What is the length of the Departmental route? About 27 miles 60 chains.
734. And of the new survey? Twenty-nine miles 55 chains.
735. *Chairman.*] Have you had an opportunity of ascertaining the nature of the improvements along the Departmental line? Yes.
736. Within the Municipality of Tamworth the resumption of these improvements would be rather costly? I think it would be very costly.
737. Can you give us an opinion as to what the cost of resumption will be? I have heard evidence as to the actual cost of resumption.
738. Outside the Municipality of Tamworth, and to the south of Attunga run, would the resumptions be considerable? They would be very considerable.
739. And from Attunga to Manilla? There is a number of small holdings there.
740. Can you express an opinion as to what it would cost to resume them? Well, I have not gone into the matter myself. I might add that although Mr. Deane estimated the length of the new survey at 28 miles 70 chains, it is now necessary to add 65 chains to that.
741. *Mr. Humphery.*] Where will that addition to the length be rendered necessary? In the last 8 miles.
742. *Chairman.*] You do not go right into Manilla? Not into the settlement, but the line goes into the township.
743. Does not that cut off 30 chains from the length of the line? The line stops at the same place as it did when Mr. Deane estimated its length at 28 miles 70 chains.
744. In point of fact, you have three-quarters of a mile more to come down after you get into Klori? Yes, that is the case.
745. *Mr. Fegan.*] With a much better grade? No; the grade remains the same.
746. *Mr. Lee.*] Does this increased mileage occur from the point where you break off at West Tamworth, or does it include the distance between Tamworth and West Tamworth? It does not include the distance between Tamworth and West Tamworth.
747. *Chairman.*] It means 1 mile further for traffic going to Sydney that has been trucked at Manilla? Yes.
748. Estimating the cost of resumptions at £15,000, and the saving on the line at £1,900, and deducting the cost of 2 extra miles—£5,000—there is a net balance in favour of the new survey of nearly £12,000? Yes; but I know nothing of the cost of resumptions.

WEDNESDAY, 2 SEPTEMBER, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (Chairman).

The Hon. Frederick Thomas Humphery.	Charles Alfred Lee, Esq.
The Hon. Charles James Roberts, C.M.G.	John Lionel Fegan, Esq.
The Hon. William Joseph Trickett.	Thomas Henry Hassall, Esq.
The Hon. Daniel O'Connor.	George Black, Esq.
Henry Clarke, Esq.	Francis Augustus Wright, Esq.

The Committee further considered the proposed Railway from Tamworth to Manilla.

The Hon. Philip Gidley King, M.L.C., sworn, and examined:—

749. *Chairman.*] You represent the Peel River Land and Mineral Company? Yes. The Hon. P. G. King, M.L.C.
750. You have had various communications from the Committee with regard to a deviation of the line from Tamworth to Manilla through the property of your company on the south side or left bank of the Peel River? Yes; through yourself as Chairman. 2 Sept., 1896.
751. The route of the line was marked on a plan submitted to you? Yes.
752. What the Committee would like to know, first of all, is, will your company give the land required for the railway? The company are not prepared to give the land.
753. You understand that the line will not be fenced? I understand that that is the proposition.
754. What is the attitude of your company with regard to this proposal? The attitude is this: The company wish to meet the Government in a friendly spirit, and have no intention of offering any serious opposition to the line, although they see no advantage whatever in its construction.
755. They do not think that it would be of any benefit to them? No; rather the contrary.
756. From West Tamworth railway station, until the proposed line passes out of the company's property, near Attunga Creek, is about 13 miles? A little over.
757. To have a railway going through your property for about 13 miles will give you no benefit? We cannot see that it will.

The Hon. P. G. King, M.L.C.

2 Sept., 1896.

758. Would you say that a man living 13 miles from a railway was not benefited by having a line brought to his own door? The land 13 miles from Tamworth is hardly worth taking up. That within 6 miles is valuable land.

759. On general principles, would you grant that a man situated 13 miles from a railway was benefited by having the line brought to his own door? Yes, to a certain extent he would be.

760. Will you explain to the Committee how it is that the company's property would not be benefited by the construction of the proposed line? My experience is that persons living within a certain distance of a railway station do not use the railway to get to that station.

761. What distance would that be? People living within 6 or 7 miles of a town would always prefer to go there in their own vehicles, and to send their own carts in than to go to the expense of the train journey.

762. Are you prepared to allow that, 6 miles from Tamworth, the railway will be of some small benefit to your property? I quite admit that beyond that distance the line might be of slight advantage to persons living on the land.

763. What do you consider the value of your land? For the first 6 miles I consider that it is worth £6 an acre. That is to say, if an allotment ran back from the railway-line to the river, I would reckon the whole of it equal in value to £6 an acre.

764. Therefore, about £576 would have to be paid for land resumptions if 2 chains were required for the railway for the first 6 miles? Yes.

765. What would be the value of the land in the next 7 miles? I put that at 30s. an acre.

766. *Mr. Wright.*] Is it inferior land? It is hard dry soil, very full of grass-seed. You can hardly keep a beast there in dry weather

767. Is it unfit for agriculture? Quite, except in little garden-patches.

768. *Chairman.*] Again, allowing 2 chains as the width of the railway resumption, we should have to pay £168 for the land along that length, or £744 for the whole of the land resumed? That estimate appears to be correct.

769. You understand that the line is not to be fenced? I hope to convince the Committee that it ought to be fenced. The line will be in the immediate neighbourhood of a populous town, and people should not be allowed to trespass upon it wherever they like.

770. Is it the risk of the people in the district that we have to consider? The danger to the local community, the danger to passing trains from large animals straying on the line, and the danger to stock.

771. What is the danger to the local community? Well, it would be rather a serious matter for any person to get close in front of a train.

772. Are you aware that the Berrigan line, the Forbes line, and the Narrabri to Moree line are not fenced. If the community are prepared to accept the risk in other places, do you consider that there is any special reason why the line at West Tamworth should be fenced? I look upon it that a line upon which trains run both by day and by night ought to be protected, so that the general public should not trespass upon it.

773. There is a considerable amount of steam traffic in Elizabeth-street, Sydney, is there not? Yes.

774. More people would cross that street in a day than would cross the proposed line in a decade? But the people of Sydney have been broken in to the trams.

775. *Mr. Fegan.*] And there are gas-lamps along Elizabeth-street at night? Yes; that is an important point.

776. *Chairman.*] At Newcastle they have steam trams running through the streets, and in parts of Adelaide the train runs through the streets? My chief objection to having the line left unfenced is, that this country will be used largely for cattle, and if these cattle stray upon the line there may be a serious accident.

777. You say that the line should be fenced for at least the first 6 miles? Yes.

778. What would be the cost of fencing it on both sides for 6 miles? I do not think that you would get wire-fencing under £70 a mile; that would make it £840.

779. Then there is the question of severance? I presume that it is not intended to fence the remaining 7 miles, in which case there will be no severance. On the other hand, however, the public may demand that the whole of the line shall be fenced.

780. Although, legally, a severance will take place by the construction of the line, there will be no difficulty, so far as you are concerned, until it is fenced? To my mind, if the public demand that the whole line shall be fenced. a claim for severance will accrue. The line runs directly along the river-frontage.

781. Do you hold there is no severance unless there is a fence? There is no practical severance.

782. But legally there is a severance? There may be a legal severance, but we should not make a claim for that.

783. A claim for compensation on account of severance will lie in abeyance until such time as the last 6 miles are fenced? Yes.

784. What will be the immediate claim for severance? I put the claim for the first 6 miles at £1,500. We shall have to spend about £3,000 in providing water, if we are cut off from the river by the railway, and we are prepared to spend half of that amount. The compensation money would be spent in the same way.

785. Your claim, as you put it, is this—land, £744; fencing, £840; severance, £1,500; total, £3084—a further claim for severance to lie dormant until the rest of the line is fenced? Yes.

786. Can you tell us what the claim for compensation would be if the rest of the line were fenced? We should not ask for more than £1,000. The necessity for having water there is not so great as it is higher up.

787. Excluding the fencing, the total amount you would demand from the Government would be £2,244? Yes.

788. If the railway were taken on the other side of the river it would have to be fenced? If you went on the north side of the river you would have to fence right up to Attunga.

789. We should have to fence to the town properties and farms as far as Attunga, a distance of under 9 miles? Yes; further, if the Attunga people are to benefit by the construction of the railway on our side of the line, you will have to make a bridge over the river, and a pretty good bridge, too.

790.

The Hon. P. G. King, M.L.C. 2 Sept., 1896.

790. Do you desire to say anything more with regard to this proposal? No. The railway will not benefit our property. The people living within 6 or 7 miles of Tamworth will not use it, and those living beyond that distance are and may be too few to be taken into account. There will be only a few market-gardeners, or something of that sort.
791. *Mr. Wright.*] If the company at some future time alienated their land, would not the railway be of advantage to the purchaser? If the railway ran into the middle of our property, so that the land there could be cut up and sold, it would be of advantage to us; but a railway running along the river-bank, as this does, is of no advantage to us.
792. *Chairman.*] Is there anything you would like to add? No. I take it for granted that if the line is fenced two or three gates will be put in to allow us to get across.
793. *Mr. Hassall.*] The settlement in the district is practically along the Peel River Valley? Yes.
794. The farmers there have a very good road for the conveyance of their produce to Tamworth? Yes, a metalled road.
795. Do you think that the people between Tamworth and Attunga would use the line to get to Tamworth? I think that in nine cases out of ten people would prefer to go in with their own vehicles.
796. They do nearly the whole of their business with the town of Tamworth? Yes.
797. And when they take their produce in they bring out whatever household goods they require? Yes.
798. If the railway were built they would probably continue to go to Tamworth with their own vehicles? Yes. On the other side of Tamworth there has been no station for the convenience of the Nemingar settlers for years, though I believe that a station is now being put up where the Nundle Road comes in for the convenience of the traffic from Nundle.
799. The country near which the line runs from Tamworth towards the Moonbi Ranges is equal to anything about Tamworth? Yes.
800. And it is highly cultivated? Yes.
801. But the Railway Commissioners have not thought it necessary to make any provision for the traffic within 7 miles of Tamworth? That is so.
802. It will not be necessary to give station accommodation anywhere upon the company's land? Not so far as I can see.
803. If any station accommodation was given, it should be 6 or 10 miles out of Tamworth? It should be at least 6 miles away from Tamworth.

Henry Deane, Esq., Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

H. Deane, Esq. 2 Sept., 1896.

804. *Mr. Lee.*] Since you were last examined in regard to this railway proposal, have you had occasion to consider whether a more suitable route could be obtained in going out from Tamworth than has already been proposed? I have not gone into the question since I was last examined; but I know that at the time two or three alternative routes were considered.
805. *Chairman.*] Do you think that there could be any material alteration in the location of the line? It could be altered.
806. Could it be altered so as to affect the question of compensation or the question of severance much? A proposal was made to carry the line along one of the roads, but I did not like it; because it appeared to me that it would cut off the frontage of the land on one side of the street, and consequently be productive of serious expense in the matter of compensation. I do not remember whether the rails were to be on the street-level, or whether they were raised much above it. From my recollection, that line would probably have been cheap as regards earthworks; but I thought that it would be better to go at the back of the properties concerned, rather than at the front, and thus save compensation. I considered at the time that it would be better to pass over or under the street at such levels as would obviate the necessity for level crossings.
807. The remarks you have made apply to the line immediately adjacent or within half a mile of the Tamworth railway station? Yes.
808. Could you get from Tamworth to Attunga any more cheaply than at present proposed? Only in the way I mentioned. But before giving any definite answer on the subject I should like to have an opportunity to look the matter up.
809. Have you any idea what the cost of resumption will be between Tamworth and Attunga? I will get the best information available in the office for you.
810. Where land is resumed for railway purposes, can the owner force the State to fence? Yes, unless there is a clause in the Act which sanctions the construction of the line by the Government without fencing.
811. Therefore the State can protect itself from a demand for fencing? Yes; but the compensation would have to be regulated accordingly.
812. If we have a statement by the municipal valuer at Tamworth that the value of the land through which the line will pass before it reaches the town boundary is about £3,010, would you doubt its accuracy? I should have no reason to do so.
813. The amount does not seem an unreasonable one? I should not think it was too high.
814. You are aware that the line as located by the Department will necessitate fairly heavy resumptions between Tamworth and Attunga? Yes.

FRIDAY, 4 SEPTEMBER, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (Chairman).

The Hon. Frederick Thomas Humphery.	Charles Alfred Lee, Esq.
The Hon. Charles James Roberts, C.M.G.	John Lionel Fegan, Esq.
The Hon. William Joseph Trickett.	Thomas Henry Hassall, Esq.
The Hon. Daniel O'Connor.	George Black, Esq.
Henry Clarke, Esq.	Francis Augustus Wright, Esq.

The Committee further considered the proposed Railway from Tamworth to Manilla.

Henry Deane, Esq., Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

H. Deane, Esq. 4 Sept., 1896.

815. *Chairman.*] You have seen the valuation of the local valuator at Tamworth? Yes.
816. Are you aware of the amount of it? I think you said, the other day, that it was about £3,000.
817. *Mr. Lee.*] That is within the municipal district of Tamworth, on the original route? Yes.
818. The estimate is for resumption without including severance? Yes. At the verbal request of the Chairman I looked into the matter, and got Mr. Thompson, the Government Land Valuer, to confer with me, and the conclusion arrived at was that—with some slight modifications, so that the line may clear buildings, and with a sweep round so as to clear the saw-mill property as much as possible—the valuation was a fair one. The allotments are not in the most important part of the town. Some of them were valued at about £1 per foot and others at about £2 per acre.
819. *Mr. Roberts.*] I think we came to the conclusion when we were in the locality that you would have to take the whole of the saw-mill? As the line was laid out it did not, in my opinion when I was there, hurt the saw-mill; but I can modify the line so as to cut only into the extreme corner of the saw-mill property, and that will do no damage to the saw-mill. The cost of those few perches of land—the most inconvenient portion of the property—would be a very small matter. Taking that into consideration, and modifying the line here and there, as it would be modified in staking it permanently, so as to do as little damage as possible to the property, I think the valuation a fair one; in fact, the calculation Mr. Thompson and I made in the matter, came to less than £3,000.
820. *Chairman.*] Having made all these arrangements, that will be the cheapest way of getting into Tamworth? Yes. With regard to the 2-chain road—the next street to the main road—it seemed it would be quite as expensive as regards construction as the other one and might lead to complications with regard to the land; and it was very doubtful whether it would be any cheaper as regards land resumption to come that way.
821. You say, then, that you cannot recommend any route into Tamworth which will cost less than £3,000 in resumptions? I cannot recommend any other route entering Tamworth than the one which has already been submitted, with the slight modifications I have mentioned.
822. Therefore, we are justified in believing that any route into Tamworth railway station, which will meet your approval from an engineering point of view, must cost pretty nearly what the valuator stated—£3,000? I think it will cost somewhere near that.
823. *Mr. Lee.*] Not including severance? I do not think that there will be any severance within the municipality at all. I do not think that need be taken into consideration at all, because where we cut through the centre blocks, the owner, if he possesses the land between the two streets, has the value of the frontage on both streets, and he can scarcely claim for severance when he has the frontage to both streets. In other cases we simply have to take the frontage as it stands.
824. But I think you will find that where a line goes through small town allotments, it renders the whole of it valueless, and the Government, as a rule, have to take the lot? Where that takes place it has been allowed for.
825. *Chairman.*] After you get outside the municipal boundaries you have rather extensive severance and resumption through the properties, pretty well all the way to Attunga? Severance—yes.
826. With regard to the difference between the Departmental route and the route suggested on the southern side of the river, are we justified in saying that in places they are from 2½ to 3 miles apart? About 2 miles.
827. *Mr. Humphery.*] Would the proposed deviation be accessible to the owners of the holdings through which the submitted line passed? It would be practically the same from Attunga.
828. But between Tamworth and Attunga? No; it would be quite different. The river divides the two lines.
829. Could the owners of land, who would be served by the line submitted, between Tamworth and Attunga, make use of the line if constructed as now proposed through the Peel River Company's estate? No; the same people could not make use of it.
830. *Chairman*: At Attunga there would be a railway station which would give access to the people on the further end of the 12 miles from Tamworth? Yes.
831. But as it approached nearer to Tamworth they could not use the new line at all? No.
832. *Mr. Lee.*] The resolution passed by the Committee some time ago bound the route down very hard and fast in these words:—

> Thence following approximately parallel the main road to the crest of the ridge; and thence by the western side of the road, but not adjacent to it, to the site selected as the terminus at Manilla.

Would it not be better to leave the matter to the discretion of the engineer as to whether he should be tied down in following the main road to the crest of the ridge, and thence by the western side of the road, or would it be more advantageous to divert the line at that particular point? I think as much latitude as possible should be left; because there may be an engineering difficulty. We cannot follow the road between Attunga and the top of the hill.
833. You might find it better to go on the eastern side of the road? Yes; in fact the line is shown here running into Manilla on the eastern side of the road. I thought that was the line the Committee really favoured. The line was staked on the western side provisionally, and it went through some properties there which of course it ought to avoid. It has been placed since on the other side. I think that is the proper side for it. It ought to go on the eastern side for the last 3 or 4 miles to Manilla. I can assure the Committee that whatever the location is it will have the most careful consideration.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

Railway from Tamworth to Manilla.

APPENDIX.

A.

[To Evidence of H. McLachlan, Esq.]

LAND REQUIRED FOR THE PROPOSED RAILWAY.

Government Railways of New South Wales,
Secretary's Office, Sydney, 21 February, 1896.

Sir,

With reference to the inquiry made by your Committee as to the views of the Railway Commissioners in regard to the cost of land required for the construction of the railway from Tamworth to Manilla, I beg to inform you that the opinions of the Commissioners are set forth in their report on the proposal as under :—

"We also informed the deputations which waited upon us for the purpose of giving information that we should advise the Government that it should be made a *sine qua non* that all the alienated land required for the line should be conveyed to the Government free of any payment for the same or for compensation, the Government doing all the legal work in connection therewith. We think it would be only reasonable, however, for the land necessary within the populated area of Tamworth, as now defined on the maps of the Department of Lands, to be excluded from this arrangement, as the residents in the suburbs of Tamworth will not, of course, be interested in any way in giving land."

With regard to the further question as to the views of the Commissioners in the event of the landowners declining to arrange for or to give the land free, I am directed to say that if the land is not given free—other than allotments specially excepted and referred to in report—the Commissioners would not be prepared to recommend the construction of the line.

I have, &c.,
H. McLACHLAN,
Secretary.

The Secretary, Parliamentary Standing Committee on Public Works.

B.

[To Evidence of H. Deane, Esq.]

APPROXIMATE AREAS OF CROWN AND ALIENATED LANDS REQUIRED FOR RAILWAY PURPOSES.

Department of Public Works, Railway Construction Branch, Engineer-in-Chief's Office,
Sydney, 27 February, 1896.

Tamworth to Manilla Railway.

IN connection with the inquiry into the above proposed railway, I beg to forward herewith the approximate areas of Crown and alienated lands that would be required for railway purposes :—

Crown land	116 acres.
Alienated land	243 ,,
Total.....	359 ,,

The largest resumption, consisting of 87 acres, would be from the Attunga Estate, owned by Mr. Alexander Rodgers,

H. DEANE,
Engineer-in-Chief.

The Secretary, Parliamentary Standing Committee on Public Works.

C.

LETTER FROM THE CHAIRMAN OF THE COMMITTEE TO THE ENGINEER-IN-CHIEF FOR RAILWAY CONSTRUCTION RESPECTING A SUGGESTED ALTERNATIVE ROUTE.

Parliamentary Standing Committee on Public Works, Sydney, 30 March, 1896.

Sir,

The line as laid out from Tamworth to Manilla will necessitate a large sum of money being paid for resumption and severance. The Sectional Committee desire that you will have various matters inquired into in order to enable them to form a definite opinion with regard to the possibility of a deviation, or alteration of route.

With regard to the line as surveyed by the Department :—

1. Immediately joining Tamworth would it not be possible to turn off the main line at the bank which forms the approach to the bridge over the Peel River, thence by an embankment towards a 2-chain street, and along that street until it reaches the main road? This route will not attain so great an elevation as that surveyed by the Department, and can be carried through without severance. From the main road to the reserve beyond the municipal boundary is it not possible here, by an alteration of the line, either taking it lower down on the flat, or contiguous to the road, to lessen the amount of improvements embraced in the surveyed line, and make the severance less objectionable? From thence to Attunga Creek is it not possible, for almost the whole length, to bring the railway right along the southern side ; and in any case when it passes houses, where these are close to the road, for a small extra width to be taken on the other side of the road, in order to leave ample width for the railway to pass? What will be the difference in cost between following the travelling stock reserve and the line laid out by the Department from mile 201 to mile 205? Will it be possible by taking an intermediate course to return to the travelling stock reserve about 203 miles, and thence follow down to 205 miles, crossing between this place and 207 miles on to the eastern side of the ridge ; thence following that side of the road into Manilla, and passing round the toe of the ridge instead of cutting through? This route would very much lessen the cost of resumption, and would enable the land for the railway to be obtained free of cost. We should be glad to be advised on the various points in connection therewith.

2. *Different route.*—Would it not be possible to turn off at West Tamworth and, maybe, follow for a distance the road to Bective, and proceeding thence in a northerly direction, cross the Peel River somewhere below Long Island, portion 38, Mary Ann Burdekin ; thence continuing almost parallel to the line as at present located, and keeping all the distance upon lower country, eventually reaching the present line on the reserve to the southern side of mile 210?

From casual inspection it appears possible that a very cheap line, at a lower elevation than that laid out, and meeting all the public requirements as fully as the surveyed line, might be obtained, provided it is possible to obtain a cheap crossing over the Peel River. Inasmuch as there will be a long stretch of river from which to choose a bridge site, it appears possible that one costing no more than your Namoi Bridge on the Narrabri-Moree line may be obtained. The Namoi carries more water than the Peel, and it does not seem improbable that a cheap bridge may be constructed somewhere in the position mentioned. I shall be glad if you will instruct one of your officers to inquire into the matter.

I have, &c.,
THOS. EWING,
Chairman.

Henry Deane, Esq., Engineer-in-Chief, Railway Construction Branch, Department of Public Works.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

SECTIONAL COMMITTEE.

RAILWAY FROM TAMWORTH TO MANILLA.

REPORT.

THE Sectional Committee appointed on the 17th March, 1896, to inspect, take evidence, and report with reference to the proposed Railway from Tamworth to Manilla, have the honor to report to the Parliamentary Standing Committee on Public Works :—

That the Committee, consisting of Mr. T. T. Ewing, M.L.A. (Chairman), the Hon. C. J. Roberts, C.M.G., M.L.C., Mr. G. Black, M.L.A., and Mr. J. L. Fegan, M.L.A., left Sydney by the 6·15 train on Friday, 20th March, 1896, arriving at Tamworth at 4 a.m. the following day. At 11 a.m. the Committee, accompanied by Mr. G. L. Wilkins, Railway Surveyor, and Mr. C. W. Jenkins, District Engineer, Roads and Bridges Department, left Tamworth for Manilla by special coach, following the surveyed line to the proposed site of the Manilla Railway Station.

The Committee opened the inquiry at the Manilla Court-house on Monday, 23rd March, and subsequently proceeded for a distance of 10 miles towards Keepit, and inspected the country between there and Baldwin's Mountain.

On Tuesday, 24th March, the Committee again took evidence at the Manilla Court-house, and afterwards inspected the proposed site of the Manilla Railway Station and the surveyed line for some distance from that point.

At 10·30 a.m. on Wednesday, 25th March, the Committee left Manilla for Barraba, and leaving the main route made an inspection of the country in the vicinity of Manilla Station, and on the eastern side of Manilla Creek. The Committee arrived at Barraba at 5·30 p.m., and from 8 to 10 o'clock the same evening took evidence at the Court-house.

On Thursday morning, 26th March, the Committee again took evidence at the Court-house, Barraba, and returned to Manilla in the evening.

The Committee left Manilla for Tamworth at 11·15 a.m. on Friday, 27th March, and again inspected the proposed site of the Manilla Railway Station, and considered in detail various deviations which appeared necessary in consequence of obstructions along the route of the surveyed line. The Committee arrived at Tamworth at 5 p.m., and inspected that portion of the proposed line passing through the allotments within the municipal boundary.

On Saturday, 28th March, the Committee took evidence at the "Imperial Hotel," Tamworth, from 10·30 a.m. to 12 p.m., examining the District Engineer, Stock Inspector, and the Property Valuator to the Tamworth Municipal Council. At 1 p.m. the Committee left Tamworth for Newcastle, which was reached at 7·30 p.m., and subsequently considered their report.

On Monday, 30th March, the Committee met at the "Great Northern Hotel," Newcastle, at 8·30 a.m., and after hearing evidence proceeded to Sydney, which was reached at 1 p.m.

The

The area of country which the proposed railway is primarily intended to serve may be regarded as being embraced within the boundaries of the county of Darling, in an area extending approximately 35 miles east and west, and about 45 miles north and south. To this may be added an area of country lying to the north-east, on the Horton River, and directly north towards Bingera, to which further reference will be subsequently made, and on the south an area of country lying between Manilla and the village of Attunga. The railway may incidentally be of advantage on the Tamworth side of Attunga, but as there is a good metal road between Tamworth and that place, it appears reasonable to suppose that from within a few miles of Tamworth produce will be carted to the Tamworth Station, despite the fact that the proposed line is adjacent to the road.

The county of Darling may roughly be described as embracing the upper waters of the Namoi and its tributaries, chief of which is the Manilla River. Surrounding all the main waterways are broad flats, at times extending for several miles into the back lands, and forming a great area of cultivable land suitable for growing wheat and other crops which are adapted to the climate. Wheat, the main product of these agricultural lands, is variously estimated as giving a return of 15 to 20 bushels per acre. The area of accessible cultivable land could not be estimated at less than 50,000 acres, to which must be added large areas of lesser dimensions in various parts of the county, which, notwithstanding the existence of a railway depôt at Manilla, might, from the contour of the country, or by reason of distance, still remain unavailable for agricultural settlement. This area of cultivable land is further increased by the belt lying south of the county boundary, and extending as far as Attunga. Taking a reasonable area upon either side of the proposed railway line and outside the boundaries of the immediate influence of the railway station at Tamworth, it will be a low estimate to state that an aggregate of 100,000 acres of cultivable land will be benefited by the construction of the line. The rest of the land may be regarded as fair sheep country, with a carrying capacity of one sheep to 2 acres, and gradually deteriorating towards the table-land. In the vicinity of Ironbark, the country becomes very inferior and not useful for much more than summer feed.

That agriculture settlement at present is limited is primarily due to the distance which farming produce has to be carried, and the fact that considerable areas are held in large estates, whose owners have had little inducement to turn them to more profitable use. It appears probable that the estimated return furnished to the main Committee by the Railway Commissioners will be fully realised, and that there will be a speedy increase in agricultural settlement. Consequently the estimate in the course of a few years will be found to be very materially augmented.

In the county of Darling are depastured about 1,000,000 sheep. The Stock Inspector estimates the annual wool clip from these to be about 1,600 tons. This would, in every instance, find its way to the Manilla Railway Station. The steadily-proceeding improvement of the country by burning off and clearing renders it fairly certain that this return will be maintained, subject to reductions, should the flats be placed under cultivation, and it appears that the Departmental estimate is by no means over-stated.

The Stock Inspector estimates that there are a little under 1,000,000 sheep, 50,000 cattle, and 30,000 horses depastured within the boundaries affected by the railway construction. It is probable that, in many instances, the stock would not use the railway, the great bulk of it being likely to travel by road, but there will be many lots from small holders which will justify the Departmental estimate of 500 trucks per annum. With regard to passengers and mails, the estimate does not appear excessive. The estimate of inward merchandise towards Attunga and Manilla is a reasonable one.

A mineral belt, running through the county of Darling in a north-westerly direction, extending east from Manilla towards Barraba, gives promise of development. The residents are at present very hopeful in consequence of some revival in connection with copper-mining and recent valuable finds of gold. Although the Committee believe there is a reasonable hope of development in connection with this industry, and that considerable traffic incidental to it will ensue, still the figures and information supplied are so vague that it is impossible to make any definite statement.

Nevertheless

Nevertheless it cannot be doubted that the mining industry, though not taken into consideration by the Railway Commissioners, will have a definite effect upon the traffic.

It has been already explained that the traffic lying within a few miles of Tamworth, and connected therewith by a good metal road, may continue to use road transit to the railway station at Tamworth. At Attunga some traffic should be gathered on the road from Attunga to Hall's Creek on the east, and from towards Somerton on the west. To the north-east the traffic of a tract of country lying approximately 20 miles west from Barraba will make towards Manilla, irrespective of railway communication to the north or west. It is difficult to state exactly where the traffic would split to the north were a railway constructed from Inverell, *via* Warialda, to Moree. The Committee have definite evidence that it would be some considerable distance north of the Nandewar Range. The matter, after all, is one of freightage, and traffic selects the cheapest route to market. At Werris Creek the main trunk line becomes common to traffic *via* Manilla, or *via* Narrabri. From Werris Creek to Warialda is a distance of 216 miles. From Werris Creek to Manilla is a distance of 54 miles. The Warialda-Narrabri traffic would therefore have an extra distance of 164 miles of railway carriage. From Warialda to Manilla is approximately 92 miles. If the distance from Manilla to Werris Creek were the same as that from Warialda to Werris Creek the traffic would split about 18 miles north from Barraba. It is, therefore, simply a question as to how many miles of road carriage are equal to 164 miles of railway carriage. Under the circumstances, it appears to the Committee not unreasonable to estimate that most of the traffic south of Bingera would still make Manilla, even were a railway constructed from Moree to Inverell.

The facilities for grazing at Manilla, and the difficulty of obtaining grass-feed at Tamworth, at which place carriers would require to feed their horses, render it unlikely that teams would pass a railway depôt at Manilla and extend their journey to Tamworth. In addition, goods would have the further disadvantage of slower transit. The prices quoted for road carriage between Manilla and Tamworth are, under the most favourable conditions, so much greater than the quoted railway rates that there is no doubt most road traffic will be transferred to the railway. It is, therefore, highly improbable, unless in very special cases, that the railway depôt at Manilla will be passed by teams making for the Tamworth Railway Station.

The road from Tamworth to Manilla is between 27 and 28 miles in length. It varies in width from 1½ to 10 chains, widening out in places into the travelling stock reserve, is well formed, of a slightly undulating character, and well suited for heavy team traffic. For the first 7 miles it has been formed and metalled at a cost of £600 per mile. Thence for a distance of 2 miles to a point beyond Attunga Creek the road has been cleared and drained at a cost of £40 per mile; from Attunga Creek to Burdekin's Springs, a distance of 4½ miles, it has been formed and metalled at a cost of £600 per mile, exclusive of two bridges; for a further mile and a quarter it has been metalled at the same cost; for the next 3 miles it has been formed and metalled in places at an expenditure of about £300 a mile; from that point, near Norris', to a distance of 2 miles or a little over, it has been cleared at a cost of £30 a mile, and from thence to Manilla it has been metalled at a cost of £600 per mile. This large expenditure upon the road precludes the possibility of the Committee suggesting, except in minor details, any divergence, for a lesser sum would be required for severance and resumption than the amount necessary to furnish a new road in lieu of the portion abandoned.

The line, as surveyed by the Department, leaves the main Northern Line at Darling-street immediately on the Newcastle side of the approach to the Tamworth Railway Station; it runs through section 33 to Macquarie-street, passes in close proximity to a saw-mill and cottages, and causes a rather extensive severance; thence it passes on a rising grade to O'Connell-street; thence on a falling grade for a distance of about 1 mile in a westerly direction, causing considerable severance in town allotments, which will necessitate a further extensive resumption; thence in a north-westerly direction almost parallel to the existing route to Manilla, through suburban allotments, where further extensive resumptions will be necessary. Thence it passes through country portions almost parallel with and

varying in distance from the main road from 2 to 30 chains to the village of Attunga. The Committee are informed that there is no certainty of any of the land to this point being given for railway purposes; in fact, it is probable that such will not be the case. Thence the railway almost adjoins the main road as far as Attunga Creek. On this length it appears probable that most of the land required can be obtained without cost. At Attunga Creek the line bears away from the main road until a distance of some 40 chains intervenes, becoming again contiguous to the road at the north-east corner of portion 109. Thence the line proceeds, within 2 chains of the road, to the north-east corner of portion 111. Leaving the road at this point, until distant therefrom about 40 chains, it again approaches it at the north-east corner of portion 22. On the whole of this length, with the exception of portions 20, 22, and 23, it appears probable that the necessary land will be obtained. Thence the surveyed route follows contiguous to the road and travelling stock reserve to Manilla. From portions 72 to 68 it is doubtful whether the land can be obtained. With regard to portions 57 and 73, it appears probable that arrangements can be made to obtain the land. In portions 23 and 22, and from portion 72 to portions 12 and 13, the surveyed route passes either through or in close proximity to houses and other valuable improvements. It is suggested that the land required for railway purposes should be conveyed to the Government free of cost, and there appears to be a probability that a fund to purchase the necessary areas will be formed by landholders adjacent to and north of Manilla; but it is highly improbable that a sufficient sum of money can be obtained to secure the requisite land should the present Departmental survey be adhered to, which, as located, makes it impossible that any effort made by the residents to obtain the land can be successful.

The Sectional Committee are strongly of opinion that the time has arrived when a railway should be constructed to Manilla, provided it can be done at a reasonable cost. They are not prepared, however, to make an unqualified recommendation until certain information which they require has been obtained from the Engineer-in-Chief for Railway Construction, when they will make a final report.

THOS. EWING,
Chairman.

31 March, 1896.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

SECTIONAL COMMITTEE.

RAILWAY FROM TAMWORTH TO MANILLA.

SUPPLEMENTARY REPORT.

THE Sectional Committee, in placing their report of the 31st March, 1896, before the Parliamentary Standing Committee on Public Works, although expressing the opinion that the railway should be constructed from Tamworth to Manilla, were not prepared to recommend the construction of such railway if it entailed a heavy outlay for land resumption. It was not possible to express a definite opinion until the Engineer-in-Chief had stated definitely his views with regard to the cost of a line suggested to him which would leave West Tamworth at the railway station, and thence passing through the Peel River Company's Estate, would pick up the Departmental survey beyond Attunga, thence following that survey approximately through Attunga Run, thence taking a more westerly route through Klori and following down on the western side of Greenhalgh Creek, crossing near its junction with the river, and reaching the Departmental line in the travelling stock reserve.

From the information received in detail from the Department, it is apparent that it will be well to modify this proposal, and accept, approximately, the location of the Departmental line for the last few miles into Manilla. By removing the railway from the road frontage, and placing it sufficiently far to the west to prevent any serious interference with the important improvements upon the various holdings, it will be possible to obtain a line which will require but a small amount to be expended for resumption purposes. The Sectional Committee would have recommended a line passing down the west side of Greenhalgh Creek, thus avoiding almost all claims for severance, but the extra length caused by its westerly trend would have necessitated the expenditure of a greater amount in extra railway construction than will be required for the resumption of the land if the line be located adjacent to the Departmental route, provided that care be taken to place it west from the present marked line.

The Sectional Committee, therefore, recommend that a line turning off from West Tamworth and passing over the Peel River, near its junction with Attunga Creek, and passing on then approximately parallel with the road from Tamworth to Manilla, thence picking up the Government survey on the top of the ridge, and thence on the western side of that road, keeping well back from it, but passing through the same holdings as are intersected by the Departmental line, be constructed.

The railway will be built more cheaply per mile over this route than over the route shown in the Departmental survey, but will be about a mile longer. It will meet all public requirements that are met by the line located by the Department. It will avoid any payment for severance from Tamworth till within a few miles of Manilla.

In respect to the land in these few miles, an understanding appears to have been come to with some of the holders.

It does not appear likely, should the line be located as suggested by the Sectional Committee, that any resumption money will require to be paid in more than four or five holdings, and the obligations incurred in this way do not appear to be more heavy than the residents interested in the construction of the railway might be expected to discharge.

The heavy resumption particularized previously on the line as originally surveyed would render any negotiations on behalf of the residents to obtain the land abortive.

The Sectional Committee recommend the construction of the line as suggested by them at a cost not exceeding £2,500 per mile, including cost of land resumption.

THOS. EWING,
Chairman.

Office of the Parliamentary Standing Committee on Public Works,
Sydney, 19 June, 1896.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

RAILWAY FROM TAMWORTH TO MANILLA.

[TAKEN BEFORE THE SECTIONAL COMMITTEE.]

MONDAY, 23 *MARCH*, 1896.

[*The Sectional Committee met at the Court-house, Manilla, at* 10 *a.m.*]

Present:—

THOMAS THOMSON EWING, Esq. (Chairman).

The Hon. Charles James Roberts, C.M.G. | John Lionel Fegan, Esq.

George Black, Esq.

The Sectional Committee proceeded to consider the proposed Railway from Tamworth to Manilla.

Mr. Charles Baldwin, grazier, Durham Court, Manilla, sworn, and examined:—

Mr. C. Baldwin. 23 Mar., 1896.

1. *Chairman.*] What distance is Durham Court from Manilla? About 2 miles.
2. What area of land have you? 26,000 acres of freehold and conditionally-purchased land.
3. Is that land on both sides of the Namoi? Yes.
4. What area have you which you regard as first-class land? About 20,000 acres.
5. That is land which might practically be regarded as Namoi flats? It is all land which would be fit for agricultural purposes, and the back lands are quite equal to the river-flat lands for similar purposes.
6. To what use do you put it? Grazing cattle, sheep, and horses.
7. To what use would you put it if there were a railway terminus in Manilla? I would lease it to people who would use it for agricultural purposes.
8. You believe the land would then be used for agriculture rather than for grazing? Most decidedly.
9. Do you think you would be able to get tenants or people to purchase the land? I believe, with good means of communication to Tamworth, I would be able to make arrangements which would induce people to farm the land.
10. What would be grown on the first-class country which you have? Wheat chiefly.
11. To what other purpose would it be put? To growing corn.
12. How many bushels of wheat to the acre do you think you would be able to obtain? About 20.
13. Is the Manilla wheat fairly good? It is very good.
14. Would the railway have any effect upon what you may term your second best land? Certainly; the stock and the wool which would be produced would be carried by the railway then.
15. You do not consider that the second-class area will go under cultivation? I believe that of the 26,000 acres I have there are 20,000 acres fit for agricultural purposes, and the balance is fit for grazing purposes.
16. Would the cattle and sheep travel more cheaply by railway than by road? Certainly.
17. Are you certain of that? If there were a railway here we should send stock away in smaller numbers than we do at present, and it would be much cheaper to send by rail than by road. Then, of course, there is the wool.
18. Any stock going from your place would be put on the railway at Manilla? Yes.
19. What route do the stock leaving the district take to go to Sydney—are they driven right down? There is very little of that done. In a good season like this they would be sent by road.
20. Would the cattle in this district, except in a good season, be trucked to Tamworth? If the season were very good people would chance going by road with their stock, but the bulk of the stock during five years has been trucked from Tamworth to Homebush.
21. The cattle which at present pass through Manilla would be trucked here? Most decidedly.
22. Do you get any merchandise direct from Tamworth? Yes.
23. Do you bring it in your own drays? No; by the carriers.
24. What is the cost of carriage from Tamworth to Manilla? One shilling and sixpence a cwt, or 30s. a ton.
25. If the railway carried merchandise at 8s. a ton, you would use it? Certainly.
26. Would your neighbours also use it? Yes.
27. What do you pay for the carriage of wool from Manilla to Tamworth? £1 per ton.
28. If the railway carried it for 7s. 6d. a ton, would you use it? Yes.
29. What does it cost you to drove sheep in small lots from Manilla to Tamworth? Something more than 1d. per sheep, but not much more.
30. Is there any advantage in having them taken in rapidly by train? Certainly; that is where the gain comes in. They would go by train in a few hours, and three days by droving.
31. If it costs the same to get your sheep to Tamworth by rail as it would by road, which mode of transit would you choose? The rail, on account of time.
32. Have you any knowledge of the timber of the district? Yes.
33. Do you know the box timber? Yes.
34. Do you regard it as a good lasting timber? Yes.

Mr. C. Baldwin. 23 Mar., 1896.

35. What is your experience with regard to box timber? I have seen good sound box timber taken out of the ground after having been there for nearly thirty years. In some of my out-buildings I have box slabs which have been split for forty years, and they are still sound.
36. Then it would be safe to estimate the life of good white box at twenty-five years? Yes.
37. Do you care to express an opinion in regard to the quantity of timber available? No.
38. Is there anything else you would like to state which would influence the Committee in regard to the railway? I may state that the places adjoining my property are equal in quality so far as the land is concerned.
39. How long have you been in the district? Forty-seven years.
40. How many acres of the inferior land in the country are required for a sheep? In its present condition about 2 acres. The good land will carry one sheep to the acre.
41. Can you give us a description of the county of Darling? It is first-class county, with broad areas on both sides of the Namoi River, running back into second-class grazing country on the higher lands. There is the same class of country—good flat country—up the Manilla River, and then the Namoi flats run into second-class country. Towards the east the flats are more pinched, but still good in places. As you approach the Moonbi Range you pass into granite country, which, although not very highly regarded, is first-class summer-feed country.
42. And you believe that all that area would use Manilla as its trading depôt if there were a railway to it? Yes. I may say the reason cultivation is retarded is because of the difficulties connected with 27 miles of carriage by road from Manilla to Tamworth.
43. Do you believe any traffic east of the Moonbi would come to the railway? No.
44. Do you believe any traffic west of the Nandewar Range would come to the railway? No.
45. Do you believe any traffic would come to Manilla from north of the Nandewar Range towards Warialda? Yes. At present, on account of the good condition of the road to Manilla, the carriers choose that route; but if a railway be built in the future across from Moree to Inverell I believe it will intercept nearly all the traffic coming north of the line and some traffic from the south of it.
46. *Mr. Roberts.*] I presume you are thoroughly familiar with the whole of the district from Tamworth to Manilla and further north? Yes; as far out as the MacIntyre River.
47. Is the whole of the land between Tamworth and Manilla good agricultural country? Yes, every bit of land which the plough could be put into would grow wheat.
48. Is the whole of the land between Tamworth and Manilla taken up? I think so. I do not know of any Crown lands between the two places except the travelling stock route.
49. Is a good deal of the land held by large holders? There are a few large holders, but a considerable area of the land is taken up by small holders. In all probability the bulk of the best land itself is held by large holders.
50. Do you think the holders of these large areas would be induced to cut up their land into farms, and lease them if the railway were constructed? I feel certain they would. It would be to their interests to do so. They would make ten times more money in that way than by grazing stock.
51. Have you had any offers from persons willing or anxious to lease the land? I have had a few, but they have not been in sufficient numbers to entertain them, because there are no facilities for getting produce to market. If, however, a railway came here, I think there would be sufficient inducement.
52. The population between here and Tamworth would, under those circumstances, largely increase? Yes.
53. Do you think, with an increase of population, the railway would become a paying concern in a short time? Yes.
54. How many acres of your 20,000 acres of first-class land have you under cultivation? About 150 altogether, in patches. I only grow for my own use.
55. And you have no hesitation in saying that those 20,000 acres of first-class land would average 20 bushels to the acre? Yes.
56. Is that the land which, if sufficient inducement offered, you would be inclined to lease? Certainly.
57. Does the proposed line go through any of your property? No, not from Tamworth to Manilla.
58. Are you in a position to say whether the owners of land would give to the Government the land required for railway purposes? I do not know.
59. *Mr. Black.*] I suppose you are fairly well acquainted with the character of all the land within the neighbourhood of the ranges? Yes.
60. Are you aware that about one-half of the land in the district is as yet unalienated? I am not aware of that.
61. According to the official return a large proportion of the land is as yet unalienated? Then I presume that that land is not very good, otherwise it would have gone, because I know of some very inferior land in this neighbourhood which has been alienated.
62. It is not even suitable for grazing purposes? I think all of it is suitable for grazing purposes; but then, of course, there is not water everywhere.
63. The bulk of the land taken up around here is, I suppose, not only suitable for grazing purposes, but for the purposes of cultivation? Yes.
64. Supposing increased facilities for reaching market caused the cultivable land to be used for agricultural purposes, do you think the graziers of the district would give up cattle, horse, and sheep breeding, or that they would take up the land which is now unalienated for grazing purposes? I think they would do so gradually. I do not think it would be done very suddenly.
65. Would they relinquish grazing altogether on the good land and use it for agriculture, and would they go further back on the rougher and as yet unalienated land, for grazing purposes? I think they would lease the land for agricultural purposes. It is the most profitable, and I presume they would do it in their own interests.
66. You say the bulk of this unalienated land is fit for grazing purposes? Yes.
67. Possibly, therefore, the reason it has not been taken up is because better land is available? That is so.
68. It is a matter of positive fact in all countries that the first-class land is taken up first, and then the second-class land comes into use;—do you think that course will be followed here, as in other places? Decidedly.
69. Do you not think it is probable that if with increased market facilities the bulk of the good land is used for agriculture that the graziers will fall back on the now unused land for grazing purposes? Certainly.

Mr. C. Baldwin. 23 Mar., 1896.

70. I suppose that what holds good of the land in the neighbourhood of Manilla holds good in the neighbourhood of Barraba? Yes.
71. Do you think the traffic from Barraba, or immediately around Barraba, would come this way under present circumstances if a railway were constructed to Manilla only? Yes, and for some distance beyond it.
72. Would you get the traffic as far as Warialda? Yes.
73. If a railway were constructed from Moree to Inverell, where would the Warialda traffic go to? It would go on the Inverell-Moree line.
74. How much further in a southerly direction would it go to that line? I should say for 30 miles.
75. In advocating a line to Manilla, are you most moved by the saving of time in transit, and the obtaining of a good condition of stock, or by some idea that with a railway you lessen the cost of carriage;—which reason has the greatest weight with you? Lessening the cost of getting stock, &c., to market.
76. Then, if the railway did not greatly lessen the cost of carriage, you would not be in favour of it? No.
77. *Mr. Fegan.*] Do you know the average rainfall of the district? No.
78. Has not the rainfall a great deal to do with the question of settlement on land? No doubt.
79. Is the river Namoi near your property? Yes.
80. I suppose if your property were cut up into small farms an artificial method could be found for supplying them with water? Yes.
81. I presume if you split your 20,000 acres into small holdings, your property would give you a larger return than it does at present? Certainly.
82. And a larger number of men would be employed? Yes.
83. How many men do you employ now? Twelve continuously. There is other labour, of course, at shearing time.
84. How much wool do you produce? I have about 16,000 sheep, and I produce about 250 bales of wool.
85. What is the freight to Tamworth? It costs £1 a ton.
86. Then railway carriage would be much cheaper than team carriage? Yes; it would be much cheaper than team carriage, and more expeditious.
87. How long is it since this line was first advocated? It was advocated when the line ran from Tamworth to New England.
88. Has the population of the district increased since then? Yes; I should think by 1,000 per cent.
89. How many droughts have you passed through during the time you have been in the district? Four.
90. The other seasons, I suppose, have been average good seasons? Yes; of course we take no notice of partial droughts. We call it a drought when it kills off a large number of stock.
91. I suppose people have been asked to rent part of their land for farming purposes? Yes; and you will receive evidence to-day to the effect that there are places in the district where considerable areas have been let for farming purposes.

Mr. Edwin Oliver Watt, mine-owner, Crow Mountain, sworn, and examined:—

Mr. E. O. Watt. 23 Mar., 1896.

92. *Chairman.*] How far is Crow Mountain from here? Twenty-four miles north.
93. Would you make Manilla your depôt if a railway were constructed? Yes; Manilla is the natural outlet for the field.
94. Have you any statement to make with regard to mining interests in connection with the railway? The residents of the adjacent fields are desirous that in the consideration of the construction of a line the mineral wealth of the district should not be overlooked. I have been requested to state that the land to the north and east of Manilla is very rich in valuable minerals.
95. Define the areas north and east? The metalliferous belt extends from Nundle on the south-east of Tamworth through Bingera, and on towards the Queensland border. It is about 5 miles wide at the outside, and it runs 10 miles east of Manilla, and thence in a north-westerly direction until it becomes north of Manilla. It abounds in gold, copper, antimony, manganese, chromium, and other ores, but is as yet practically undeveloped. The industry of gold-mining has received attention during the last twelve months in the vicinity of Crow Mountain, and I should think in that neighbourhood about 250 men are at present employed in mining. Some thousands of pounds worth of gold have been won in the past year. I do not think I am far wrong when I state that £5,000 worth of gold and more has been obtained in the vicinity of Crow Mountain within the last twelve months. I have considerable practical and theoretical knowledge of the minerals of the district, and I venture the opinion that the field will shortly prove to be one of the most important in New South Wales. The present mineral finds justify considerable outlay on heavy and expensive machinery. We have already one battery on the field. Another is coming almost immediately, and probably others will follow. Of course, the machinery will have to come through Manilla.
96. What effect would the construction of the railway have upon the mining industry? It would give better facilities for getting machinery into the district and for the transit of various ores. There is no doubt that large quantities of ore would be sent away for shipment or for smelting.
97. What about the timber of the district? From 20 to 25 miles distant there are unlimited supplies of the very finest box and ironbark timber—ironbark particularly.
98. What sort of road is it? It would require some construction for heavy traffic, but it is for the most part down hill from Crow Mountain to this place. The country is practically open.
99. Have you any other information to offer? With regard to the area of land in the county of Darling which is unalienated, I may state that a considerable portion is at present being held by the miners as mining reserves, and all the unalienated land is actually used for grazing purposes under annual leases.
100. *Mr. Roberts.*] Have any shafts been sunk in the neighbourhood of Crow Mountain? Over 100 claims are working.
101. What is the average yield of gold to the ton? At my battery I have crushed stone going from 7 dwt. to 33 oz. to the ton.
102. Do you use the most modern machinery? We have for our own use a very small modern plant. The cost of carriage was too great to permit of us getting a larger plant. The other mining plants are more or less obsolete.
103. Is Crow Mountain nearer to Manilla than to Barraba? It is a few miles nearer to Barraba, but Manilla is our natural outlet.
104. Do you think the development of the field is retarded by the present high rates of carriage? Yes.

Mr. E. O. Watt. 23 Mar., 1896.

105. Are the copper-mines adjacent to the gold-mines? No; they are north-east from Barraba; we are south-east.
106. Is there only one copper-mining company or more? I believe there are two.
107. Do these copper companies send ore to Sydney? I am informed that they are sending mat—that is, the product of the first smelting—to Newcastle or somewhere down the line.
108. Have you heard them complain of the want of better communication with the metropolis? Yes.
109. Have you had a large experience in mining? Yes; here, in Victoria, and South Australia.
110. Can you mention any district similar to this which has developed by means of railway communication? I was on Fairfield, east of Tenterfield, before the railway was constructed through there, and the improvements in the field after railway communication was given were very marked.
111. I suppose it not only decreased the cost of carriage, but also induces people to visit the field and invest their capital? Yes, it is very difficult to get men to come to Crow Mountain at present because of the difficulty of access to it.
112. From your observation, do you think the district between Manilla and Tamworth is one which should have railway communication? I think so. I have seen similar districts in Victoria, which have been largely benefited by railway communication.
113. *Mr. Black.*] Is there any alluvial at Crow Mountain? Not much at present.
114. Is there any likelihood of it? There are extensive deep leads there, but I scarcely think they will pay. It is virtually all reefing. They are sinking to 120 feet at the present time.
115. Are the ores easily treated? Very.
116. Do you think it will be necessary to send any of the ore to Sydney for treatment by chlorination? Scarcely at present, but I think it is highly probable it will be necessary later on.
117. How do you get your supplies from Manilla? By vehicle.
118. On which side is Crow Mountain situated? On the eastern side, although it is practically north of Manilla.
119. Is it likely to develop nearer Tamworth or further from Tamworth? I think it is likely to develop towards Tamworth. Some recent discoveries have led me to believe it will develop on towards the Namoi River.
120. Should it develop in that direction, would the traffic still come to Manilla? Unquestionably.
121. Would a development in that direction make the field more readily accessible? Yes.
122. *Mr. Fegan.*] Is there plenty of water at Crow Mountain? Yes.
123. I suppose you know of fields which have spun out on account of the want of water? Yes; we have had some hardships there in regard to water, but they have not been very pronounced as yet. Unlimited supplies can be obtained by sinking.
124. Is the field likely to be permanent? Yes; later developments seem to indicate that it will be.
125. Are provisions dear there? They are fairly reasonable.
126. Do you think a railway would make things cheaper for the miner? Yes, somewhat cheaper.
127. And somewhat better, I suppose, at times? Yes. Of course we live pretty roughly at present, on account of the time it takes to reach Manilla and Tamworth.
128. And railway communication to Manilla would obviate these difficulties? Yes, to some extent.

Mr. Edward Bowman, farmer, Upper Manilla, sworn, and examined:—

Mr. E. Bowman. 23 Mar., 1896.

129. *Chairman.*] How long have you lived at Upper Manilla? Twenty-five years.
130. What area of land do you hold? One thousand two hundred and eighty acres.
131. *Mr. Fegan.*] How far are you from the proposed railway terminus? About 10 miles.
132. Do you use teams for carting to and from Tamworth? Yes.
133. In the event of the line being constructed to Manilla, would you still continue to use your teams as far as Tamworth? No; I should bring them to the terminus and unload.
134. Would it not pay you better to carry right on to Tamworth? No.
135. Would the majority of the people at Upper Manilla be satisfied to bring their produce to Manilla, and unload? Yes.
136. What do you produce? Wheat and corn.
137. How many acres have you for grazing? Two thousand acres.
138. What do you graze? Sheep, principally.
139. Do you find the distance from railway communication hampers you in connection with the production of wool? Yes; it takes me a week to deliver it in and out, and with the railway I could do it in a day.
140. How do you send sheep to market? By road.
141. Do you know that it is estimated that there will be an annual loss of £1,200 on the railway? Yes.
142. Do you think that that loss would be soon wiped out? I think so, in a few years.
143. Have you had any applications to lease some of your property? No.
144. Would you lease any of it? No; I can work all my own.
145. I suppose there are large tracts of country in this district which would settle a larger population than is at present living upon it? Yes.
146. Would you go to Tamworth more frequently than you do now if the line were constructed? Yes.
147. I suppose other people would do the same? Undoubtedly.
148. Does the Manilla River flow near your holding? Yes.
149. Have you ever known it to be dry? I have known it to stop running, but it has never been dry.
150. *Mr. Roberts.*] Do you send all your wheat to Tamworth? Yes.
151. What is the rate of carriage? About 1s. 9d. per bag of 4 bushels; nine bags go to the ton.
152. That is about 15s. or 16s. a ton? Yes.
153. Have you any idea what the Railway Department would carry the wheat for? No.
154. If wheat were carried at 3s. a ton, I presume it would give a large impetus to farming in the district, and thereby tend to an increase of population? Yes.
155. *Chairman.*] Did you ever send any wool to Tamworth railway station? Yes; I carted it myself.
156. What is your average yield of wheat per acre? About 16 bushels.
157. Can you depend upon that? Yes; taking one with another.
158. How many acres have you under cultivation now? 250 acres.

Mr. Thomas Bowen, builder and contractor, Manilla, sworn, and examined:—

Mr. T. Bowen. 23 Mar., 1896.

159. *Chairman.*] How long have you resided in the district? Ten or eleven years.
160. What timber do you use for decking the bridges about here? Box and ironbark.
161. How does the box last? Very well. I have some specimens taken from Durham Court Estate, which have been in the ground for twenty-eight years. I have also some which the water has been running over for eighteen years.
162. Could timber suitable for sleepers be got out of box? Yes.
163. Fairly contiguous to the proposed line? Yes.
164. Have you considered the question as to what it would cost to get sleepers? They could be got here as cheaply as in any other place.
165. Where is the nearest ironbark? About 20 miles away.
166. Do you know the rate of carriage from there to here? No.
167. What length of time should good sound white box last? Thirty or forty years.
168. Do you know anything in regard to the rates of carriage from here to Tamworth? 1s. 6d. per cwt. is the general price for produce.
169. *Mr. Roberts.*] Do you think the sleepers for the proposed line could be delivered at a lower rate than they could be brought by rail, say, from Singleton? I think so. You could get a great number within 5 miles of the line between here and Tamworth, provided, of course, the Government would take box.
170. Do you think ironbark could be procured here for sleepers as cheaply as they could be brought by the railway? I believe so.
171. Is the ironbark timber of good quality? First-class.
172. Is it a further distance away than the box? Yes; the nearest ironbark I know of is 20 miles away.
173. Do you think box would be as suitable as ironbark for sleepers? Yes; my experience teaches me that box is a first-class wood in or out of the ground.
174. Where do you say is the box country? On both sides of the proposed line.
175. *Mr. Fegan.*] Where is the ironbark to be found? At Crow Mountain.
176. What would it cost to supply ironbark sleepers? Three shillings each, I think.
177. Is that a liberal allowance? I think it could be done at that price.
178. I suppose you are aware that the Commissioners object, as a rule, to other than ironbark timber? Yes.
179. Is there any other timber in the district? There is gum.
180. Do you think the construction of a line would open up a small timber trade? Yes.
181. What have you to pay for the cartage of timber from Tamworth? In small lots, 1s. 6d. per cwt.; in large lots, the rate is 20 or 25 per cent. less.
182. Has any fault been found with box-wood that you know of? No.
183. And you think it is as admirable as ironbark? Quite so. You will find it hollow sometimes, but you find that in ironbark. I may state we have a very fine gravel pit here. It is about 400 yards long. The average width is 30 yards, and it is about 3 feet deep. It would give you at a rough estimate 12,000 cubic yards of gravel on this side of the river, and it is easily accessible.
184. What is the height of the bank? Fifteen or 16 feet, but the contractor could run his line upon it very cheaply. I suggest that instead of using metal they should use gravel at the station-yard and approaches.
185. *Mr. Roberts.*] Is there much pine in the district? Not within 20 miles. We have a mill 16 miles from here cutting pine, but we have not got it in any great quantities.
186. Would it be suitable for station buildings? Yes.
187. Could piles for culverts be obtained? I am at present getting box piles from here for the purpose of building a Government culvert at Lahey's Gully. I can deliver the piles at Tamworth at about 10s. each. I estimate 5s. to cut them and 5s. to draw them.
188. What is the size of the piles? Twelve feet up to 13 feet, and as long as 34 feet.

Mr. John Barling, grazier, Upper Manilla, sworn, and examined:—

Mr. J. Barling. 23 Mar., 1896.

189. *Chairman.*] What area have you? 11,500 acres of secured land.
190. *Mr. Black.*] Have you increased your area since you gave evidence before Mr. Alexander in 1892? No. Crown land has been selected—about 3,000 or 4,000 acres by others, out of the area we were leasing at the time referred to.
191. Do you run as much stock as you did then? No, for this reason—we are trying the experiment of farming.
192. Have you more dairy cattle? No, not at all; but we have more horses for ploughing.
193. Is a large proportion of your land suitable for agricultural purposes? About 3,000 acres.
194. Under present conditions, would you be disposed to place the whole of that area under crop? Yes; more than half of it is under crop now, and it will not be long I hope before the whole of it is under crop.
195. I suppose you chiefly grow wheat? Yes; fodder as well.
196. Is the district more suitable for the growth of wheat than maize? Yes; maize is very uncertain.
197. What is the average per acre here? Last season was dry and reduced it, but up to this year it was supposed to be from 18 to 20 bushels, but this year there has only been half a crop. I should think 15 bushels is a fair average.
198. What is the average rainfall? For the last 11 years it has been something over 30 inches.
199. Is such an average as that sufficient for agricultural purposes? It is more than sufficient. Statistics show that the best of wheat is grown with an average of 20 inches. Averages, however, are most misleading. Sometimes we get no rain when it is most wanted, and afterwards we get a superabundance.
200. Do you not think that with better farming the average yield of wheat per acre of this district could be increased? I think so. It could be brought to 20 bushels per acre easily.
201. Has there been a tendency of late to increase the area under crop? Yes.
202. Do you think, if a railway were brought here, agricultural pursuits would make a further advance? Yes. I have 1,500 acres under cultivation now, but I hope before the railway arrives here to have fully 3,000 acres under crop.

Mr. J. Barling. 23 Mar., 1896.

203. Is that because you expect the railway? I cannot say it is because of that, but the railway will expedite it.
204. What do you imagine to be the greatest advantage to be gained by the railway? We could send away not only wheat and wool, but anything that could be produced. A farmer could occasionally send a single truck of sheep or cattle to Tamworth; but at the present it does not pay him to do so. It costs as much to send a few as it does 1,000.
205. I suppose the bulk of the land, which is not yet alienated, is not of first-class quality? No; it is the very roughest.
206. Nevertheless, it is accompanied with fairly good soil? Yes; it could all be utilised.
207. Is it stony? Yes; but it could be used by sheep.
208. Good second-class country? Yes; and capable of improvement.
209. Do you think that if the railway were extended in that direction there would be any demand for land of that character? Yes, I am sure of it, if one could increase one's holdings; but under the present Act one could not do so. If it were still open to be taken as "conditionals" where no residence was required, the whole of it would be taken up.
210. For instance, if Mr. Baldwin were permitted to remain at his present residence, to use the land surrounding his homestead, he could take up land further back? Yes; but that cannot be done under the present Act.
211. Does the area which would be served by the railway extend far north of Barraba? Considerably beyond.
212. Do you think the construction of a railway from Moree to Inverell would very much reduce the amount of traffic coming this way? No.
213. Do you think that even with the opposition of that railway the whole of the traffic south of Warialda would come to Manilla? I have been informed that it would, but I cannot speak personally.
214. Is that the impression of the district? Yes.
215. Has there been any large increase of population in the district? I have only been in the district eight years, and during that time it has increased very much, both naturally and by people coming here.
216. You are of opinion that the soil and climate are eminently suited for agricultural purposes? Yes.
217. And that the true capabilities of the district have not yet been developed? They have not yet been half developed.
218. And a railway is required for their best development? Yes.
219. *Mr. Fegan.*] Are you aware of the proposals of the Commissioners in reference to the carriage of grain and wool? Yes.
220. Do you know whether any of the owners of land have signified their willingness to give the land required for the construction of the line? Some have done so. Mr. Dow, near Tamworth, has said that he would give his freely. The report is also that Mr. Rodgers, of Attunga Station, would do the same.
221. Has there been any movement in Manilla and other parts of the district to provide the land? Yes; a deputation called on the different owners last week.
222. Did they meet with any success? The newspapers say they met with great success.
223. Do you think if that were the only difficulty in the way it would soon be got over by the residents of the district? Yes.
224. I suppose a railway would benefit the growers of wool and wheat? Certainly.
225. And it would induce settlement? Yes.
226. So that any immediate annual loss on the line would soon be wiped out? Yes.
227. Do you know whether the Railway Commissioners have taken into consideration the development of the copper and gold mines in the district to the north? I do not think they have.
228. What is the land along the route of the line worth? I would not like to estimate it. I have heard people say it is most unnecessary for the line to go close to their houses. Those who are not engineers think it can be moved so that it will interfere with no one.
229. Is there any opposition to the line? I believe there will be by people whose houses will be interfered with. People alongside the road naturally say, "Why not put it on the road instead of going through our land?"
230. But is there any opposition to the railway scheme? None whatever. The only complaint is of it going through small properties. Those with large areas have no objection whatever.
231. *Mr. Roberts.*] Do you own any land along the proposed railway? No; mine all lies to the north. If it is required when the extension is made I shall be glad to give it.
232. I suppose the district is thoroughly well watered by the Namoi and the Manilla? Yes.
233. And the land is admirably adapted for wheat-growing? Yes.
234. Is it easily farmed? Yes.
235. Does the quality of the wool compare favourably with that of other districts? Yes; it is always classed by the auctioneers as good. It does not go to the first-class, on account of grass-seed, which takes away very much from the value of it.
236. Do you produce much wool? About 100 bales a year. They are heavier bales than usual, and most people would call it 150 bales.
237. Where do you send it to? Tamworth.
238. How many fat cattle and sheep do you send annually? There is no regularity about it.
239. What is the rate of wool per ton to Tamworth? Thirty shillings from my own wool-shed, but it would be somewhat less of course from Manilla itself.
240. If the wool were carried from Manilla by rail at 7s. 6d. per ton, it would of course be a great advantage? Yes.
241. Do you think it would be likely that those who send a wool a considerable distance now—say from Warialda, or even from the Queensland border—would unload at the Manilla station, or go straight on to Tamworth? I have no doubt they would unload here.
242. After all, it would be a matter of £ s. d.? Yes.
243. Is your homestead adjacent to the road? Yes.
244. Is there very large traffic on the road? Yes; wool is the chief item. The wheat, however, will soon greatly outweigh the wool traffic.

245. I suppose the construction of a line to Moree would somewhat interfere with the quantity of wool sent to this district? I am told by those who draw it that it will make no difference whatever. They prefer this route to any other route. It is a favourable route for carriers, inasmuch as the road is good. Mr. J. Barling. 23 Mar., 1896.
246. Do you think the district would soon increase in population by farmers leasing the land if the railway came here? I do.

Mr. Michael Francis M'Keown, farmer, Mountain View, Manilla, sworn, and examined:—

247. *Mr. Fegan.*] How much land have you? 740 acres conditional purchase and conditional lease. Mr. M. F. M'Keown. 23 Mar., 1896.
248. How long have you been in the district? Twenty years.
249. Have you seen the population increase considerably? It has almost trebled.
250. Is your land under cultivation or used for grazing purposes? Both.
251. Do you grow any wheat? About 60 acres. I have 100 acres fit for the plough now.
252. What price did you obtain for it last year? Two shillings and three pence was the ruling price in Tamworth; this year it is about 4s. 3d.
253. Do you know the route of the proposed line? Yes.
254. Does it run through good country? Excellent.
255. Is it good for settlement? The greater part of it is.
256. Will it support a large population? Yes.
257. What sort of a country is that upon which you live? It is equally as good as that through which the line will travel.
258. You live on the Durham Court Estate? Yes; 7 miles from here. The nearest point of my land is about 5 miles from here.
259. And all the land from there to here is good agricultural country? 20,000 acres of Durham Court are excellent agricultural land.
260. How many men do you employ? Generally, two.
261. If railway facilities were given I suppose you would employ more? Yes; three times as many. I should require to clear further land, which means, of course, expenditure of money.
262. What reasons have you for saying a railway should be constructed? The importance of the district and further prospect of settlement.
263. What do you mean by the importance of the district? There is a large number of settlers on the land, some of whom are crippled for want of facilities to bring their produce to market.
264. You do not think grazing is the best use to which to put the land? No; it is not paying at all, because the price of stock and horses is very low now.
265. And you think a country like this should be put to such use that it will feed the people instead of the cattle? Yes.
266. Do you think it will pay both owner and every one else concerned to devote the land to agriculture instead of to grazing? That is my impression.
267. How often do you go to Tamworth? Six or seven times a year.
268. If you had a railway would you go more frequently? Yes.
269. I suppose you cannot grow much wool? The grazing capacity of the land in its improved state is about two sheep to the acre.
270. Have you heard that the Commissioners intend to carry wheat at 3s. per ton? Yes; it will be a great boon to farmers and the public in general.
271. And you, for one, would be only too willing to use the railway at those rates? Yes.
272. It has been said that some people might not unload their drays until they got to Tamworth? I think they would.
273. *Mr. Roberts.*] What is your average yield of wheat to the acre? From 15 to 20 bushels.*

Mr. Leonard Bailey, farmer, carrier, and produce dealer, Manilla, sworn, and examined:—

274. *Mr. Roberts.*] Where do your teams ply? From Tamworth to Manilla and back. I am not, of course, confined to the town alone. Mr. L. Bailey. 23 Mar., 1896
275. Do you go further north than Manilla? I used to do so, but I have not done so of late.
276. What is the present rate of carriage for wool from Tamworth to Manilla? About 25s. per ton for anything close to the town.
277. How long has it been 25s.? The last year or two it used to be 30s.
278. Is there any chance of the price being raised or lowered? I do not think it will get any lower. At all events it will not pay the carriers if it is lower.
279. If the railway were to carry wool at 7s. 6d. per ton, do you think the carriers would still continue on the road? I do not think so.
280. Do you think the teams carrying wool from Warialda or the Queensland border to Tamworth will unload here? I think they would.
281. *Chairman.*] Have you any doubt about it at all? None whatever. I have seen a load or two go from here to Morpeth, but it is an exceptional thing, and may have been only an experiment.
282. Is this a favourite route for carriers from the far north? It is.
283. Is there a very large traffic on the road at the present time? Yes; principally wool.
284. Is there a large quantity of merchandise coming from Tamworth? Yes.
285. Are you, yourself, favourable to the construction of the line? Yes; I am not opposed to it.
286. Have you any property in the district? Only a house in town.
287. I suppose that, personally, it matters very little to you whether the line is constructed or not? That is so. I have a business, and it may help me, and it may not.
288. What is the cost of carriage of wheat from Manilla to Tamworth? About 9s. a ton.
289. Have you carried wheat at that price? Yes.

* NOTE (*on revision*):—I wish to add in contradistinction to others who gave evidence, that there is splendid agricultural land unalienated within the parishes of Baldwin, Dinawirindi, Dowe, Willan, Rangiri, and Borah, which, if thrown open to settlement, and in suitable areas, would be taken up and a further number of yeomanry would settle on the soil. Instead of having it locked up in a number of reserves, and in the interest of monopoly, I for one am in favour of having it made available for settlement.

Mr. L. Bailey. 23 Mar., 1896.

290. Is it a paying price? No; I only take wheat at that price when I am going in for a load of merchandise. Nine shillings per ton is the lowest price I have ever heard of, and it is only within the last year or two that it has come down to that.
291. Do you contract for carriage by the ton? We draw by the bag.
292. How much a bag? It varies according to the distance from town, from 1s. to 1s. 9d. and 2s.
293. What is a fair price to pay for wheat carriage from Manilla to Tamworth? From £1 to 25s. a ton.
294. I suppose it is a rare occurrence for a man to get his wheat carted at 9s. a ton? Yes.
295. If a farmer could get his wheat carted by rail for 3s. a ton, it is not likely there would be any carriers on the road? I should think not.
296. And there would not be much probability of general merchandise being carried by road if the railway carried it for 5s. a ton? I should think not.
297. I suppose it would not pay a carrier to go down 3s. a ton in the carriage of wheat, and only get 5s. a ton for the carriage of merchandise on the return journey? Certainly not.
298. Can you give us any idea of the number of bales of wool which pass through Manilla to Tamworth annually? From 15,000 to 20,000 bales. That estimate was obtained from the Tamworth West railway station, with a deduction of about 2,000 bales which are loaded around Tamworth.
299. How much of that wool comes from north of the Nandewar Range? I should say the bigger half comes from the other side of it.
300. Does some of it come from the Queensland border? Yes.
301. Would the construction of a line to Moree make much difference in the number of bales brought to Tamworth? It might make a little difference, but not much.
302. How many bales go to the ton? There is a difference in their weight, but I suppose about six.
303. *Mr. Roberts.*] If it has been estimated that about 6,000 bales of wool might possibly go to Moree when the railway is constructed to that place, do you think the estimate is fair? I do not think they would get that much to Moree.
304. Do you think a great number of carriers would still keep to this road on account of its excellent character? I think they would, instead of going to Moree.
305. Does much hay go from here to Tamworth? No, it would not pay to send it.
306. I suppose it would, if a railway were opened? I think so.
307. Have you heard of anyone being anxious to lease his land if it is available? Yes; I know there are people who are trying to get land for cultivation on the rent or half system.
308. Is there any land about here being worked on the half system? I am working some on that system myself.
309. Where? On the other side of the Namoi River.
310. How many acres are you working on that system? 150 acres.
311. What is the average yield per acre? Last year it was low, but in the two previous years it was over 20 bushels. Last year it went down to 9 or 10 bushels.
312. At what do you estimate the average for the district? Sixteen bushels.
313. *Mr. Fegan.*] You say you carry wheat to Tamworth at 9s. a ton only when you have merchandise to bring back? Yes.
314. You would not carry at that price if you had nothing to bring back? No.
315. What would you charge if you had no merchandise at the other end? Twenty-five shillings a ton.

Mr. Alexander Rogers, grazier, Attunga, sworn, and examined:—

Mr. A. Rogers. 23 Mar., 1896.

316. *Chairman.*] How many acres of land have you? About 20,000 freehold and conditional purchase adjacent to the proposed line.
317. How much is fit for growing wheat? 12,000 acres.
318. Do you think it would be more profitable to use it for growing wheat than for running cattle or sheep upon it? Very much more.
319. Do you think you would be able to so use it were a railway built from Tamworth? There would be no difficulty except in regard to obtaining purchasers, or tenants to rent it. I would be only too glad to cut it up to rent or sell.
320. Do you believe you would be able to part with your land by sale on long terms, or lease it at such a price as would enable farmers to live? To the latter part of the question I would say yes; but to the first part I am not prepared to give an answer. It would depend on the surroundings, and on whom the purchaser was.
321. Would there be a demand for such land as you have? Not amongst the residents around me. There is too much good land to get at the low price they can obtain it from the Government. Whilst there are cheap Crown lands they would not take my land at the price I would want.
322. Where are the Crown lands to which you refer? In the parish of Halloran which adjoins me.
323. How far away is the nearest Government land, equal in quality to yours? I do not know that the land I speak of on the Namoi is equal in quality to mine, but I think it is equal in quality for wheat growing.
324. And is there much Government land available? I am not prepared to say; but there has been a considerable amount taken up in the last two years up the river.
325. Is your land immediately along the proposed railway line? Yes.
326. How far from the proposed line is there any fair area of Government land? I do not think there is any within 14 miles.
327. Do you think that that land would come into competition with land immediately alongside the railway? The circumstances being equal it would not.
328. Do you know the Tamworth district fairly well? Yes, on the side on which I live. Land offered to lease is readily taken up within 2 or 3 miles of Tamworth; but land 12 miles away is not so readily leased.
329. The railway carriage from Attunga to Tamworth for wheat, would be from ¼d. to ½d. per bushel. Therefore if your land gives 20 bushels to the acre, your land ought to be worth within 6d. an acre of that against Tamworth? That is so. I look upon my land as a little under the value of the Tamworth land as it stands. Of course there are other important considerations which farmers look at in renting land.

land. Take my place as the centre of the district of 10 miles radius. The people can only market their grain. They make nothing of the refuse of a farm, such as chaff and straw; but the people who live near Tamworth can find a market for every straw that grows. It would not pay farmers living near me to carry it in that distance. My house is about 12 miles from Tamworth. Mr. A. Rogers. 23 Mar., 1896.

330. Do you know where the proposed line is located? Yes.

331. Will you allow the land on the south side of the creek to be taken for the purposes of the line? I will not object.

332. After passing Attunga Creek there is a deviation to the west, cutting off 300 or 400 acres? Yes.

333. The road is 100 feet above that, and it is not possible to bring the railway along the road there; therefore it will be necessary to make a deviation; do you know that deviation? Yes.

334. Will you have any objection to the land being taken there? No; I must make a virtue of necessity. It seems to be the proper track for a railway. I have someone else to consult in the matter, but as far as my interest is concerned I will offer no objection.

335. Then you personally are prepared to give the land on the large deviation, coming up from Attunga Creek, or say, the first 2 or 3 miles or more? The deviation continues for nearly 4 miles.

336. Is there anything more you would like to say? Only that the areas of agricultural land go on increasing. From Attunga, looking west towards Somerton, on the north side of the Peel River, it is all an agricultural district.

337. Would the Somerton people come to Attunga, or go straight to Tamworth? When I was amongst them, those on the north side of the river stated they would come to Attunga. I think they would come all the way from Keepit.

338. Is there any population from Attunga to the east? Yes, there is a river population, and the farming population I speak of, in the parish of Halloran, is behind the Attunga Creek. A considerable amount of wheat is cultivated there. At present at least twenty farmers bring their produce to the main road.

339. But the great increase of production immediately surrounding Attunga would be dependent upon your action in allowing the farmers to get your land? That is too great a compliment to saddle me with. I should be glad to facilitate the advance of the people in every way possible.

Mr. Alfred Horatio Sampson, farmer, Upper Manilla, sworn, and examined:—

340. *Chairman.*] How far do you reside from Manilla? Nine miles. Mr. A. H. Sampson.

341. Have you been long in the district? Since 1879. 23 Mar., 1896.

342. *Mr. Fegan.*] Have you any statement to make to the Sectional Committee? I have nothing to add to the evidence I gave before Mr. Alexander, excepting that the cost of carriage was a little more then than it is now. Now there is more cultivation being carried on. Much of the land too, since that time, has been let to tenant-farmers. In contradistinction to what Mr. Rogers has said with reference to the facility of leasing land 12 miles from Tamworth, I may state that the land here leases very readily indeed to tenant-farmers. I know dozens of instances in which persons have written here asking for land. At present, owing to the difficulties of carriage, we are confined almost to wheat-growing, whereas if we had a railway by which we could get straw and other things away, the line would make work for itself.

343. Has there been any new settlement in the district since 1892? Not to my knowledge, except in a few cases.

344. Has there been much increase in population during the last few years? No.

345. Carriage by road is cheaper than it was? Yes.

346. But it is not so cheap as the railway carriage would be? No; the carriage as I calculated it in 1892, on the basis of the carriage from Tamworth to Sydney, would be 10½d. on 20 bushels. I may state that although there has not been much increase in what you may term outside population, a number of young men have grown up in the district, and they are the persons who have entered largely into cultivation. They have rented farms, in addition to taking up selections themselves. I may state that if the landholders give the land for the purpose of the construction of the railway they are not prepared to make it freehold. They think the State should make their own titles secure.

TUESDAY, 24 MARCH, 1896.

[*The Sectional Committee met at the Court-house, Manilla, at 10 a.m.*]

Present:—

THOMAS THOMSON EWING, Esq. (Chairman).

The Hon. Charles James Roberts, C.M.G. | John Lionel Fegan, Esq.
George Black, Esq.

The Sectional Committee further considered the proposed Railway from Tamworth to Manilla.

Mr. W. J. L. Kyle, post and telegraph master, Manilla, sworn, and examined:—

347. *Chairman.*] How long have you been here? Eight years. Mr. W.J.L. Kyle.

348. Have you any information to give the Sectional Committee? Yes, I have prepared a few statistics, which I have put in narrative form. The population of the town is 402, and for the electoral division of Manilla 1,650, but as Somerton and Keepit are in the Tamworth electorate, although belonging naturally to Manilla, we are, in a sense, deprived of 200 people that rightly belong to us. Hence it may be said a local population of 2,000 would be served if the proposed line were constructed.—Wheat; The total yield of wheat for the Police District of Manilla, in 1894, was 156,390 bushels; but owing to the severe drought which prevailed here, in common with other parts of the Colony, the yield for 1895 was only 71,273, but had the season of 1895 been anything like as good as previous seasons right back to 1887, it is only fair to estimate that the yield would have been close upon, if not actually, 200,000 bushels. The average yield for county Darling is set down in the Statistical Register at 16; but as Barraba is included in county Darling, and the yield per acre at Barraba is not so high as at Manilla, it is believed by many competent to judge that the average yield for Manilla is nearer 18 bushels to the acre than 16, as published. 24 Mar., 1896.

Mr. W. J. L. Kyle. 24 Mar., 1896.

349. In your opinion would all that wheat come through Manilla? I believe it would. That estimate, of course, is from the Manilla portion of county Darling alone. The figures I give are correct approximations, and are taken from a district about 20 miles around Manilla as a centre. For 1895, the police return the number of holdings at 231, and those holdings comprise an area of 182,883 acres of freehold and 104,980 acres of Crown lands, such as conditional leases, &c., or a total of 284,863 acres. Wool: In 1893, 14,000 bales of wool passed over the Manilla bridge; but this return would not include what might be termed locally-grown wool, as most of that would not pass over the bridge. Estimating the quantity grown on this side of the river at 2,000 bales, and allowing for a quantity that might have escaped the notice of the maintenance man (who counted this number of bales whilst at work on the road), it can be said that 17,000 bales of wool were carried through Manilla in 1893; but as the number of holdings has since increased, it is believed that nearly 20,000 bales would be handled at the Manilla Railway Station if the line were constructed.
350. How many bales go to the ton? About six.
351. Therefore, you estimate that 3,000 tons of wool would be handled at Manilla Station? Of course I only take my estimate from the evidence given before Mr. Alexander, in 1892, and that was for wool which passed over the Manilla bridge. Then there is the Ukolan, Durham Court, Borah, Keepit, and other large stations on this side of the river, besides a number of small graziers. Maize—County Darling: I find from a return supplied by the Government Statistician's Department that a total area of 1,512 acres was cultivated in 1895, divided as follows:—Manilla, 750 acres; Barraba, 615 acres; and Somerton, 129 acres; and the average yield per acre is set down at 22 bushels. Live stock (also from the Government Statistician's Department) for the county Darling—this return is for the year ending March, 1896: There were 5,387 horses, 1,008 milch cows, 18,060 ordinary cattle, and 405,329 sheep, notwithstanding the great mortality which prevailed amongst stock in this district through the severe drought.
352. *Mr. Roberts.*] Do you know how much land is cultivated around Manilla? 9,218 acres were cultivated, including Upper Manilla, in 1895. This year (1896) the amount is 8,316 acres. I should say, however, that the whole of the land which will be put under cultivation this year has not yet been touched. These figures include Manilla and Upper Manilla, from the fall of the water from here to Tamworth, and from here to Tarpolly Creek. The estimate does not include Attunga and Barraba. These figures show land actually under crop. In addition to the area given to the police whilst collecting the returns, I am informed that there are quite 2,000 acres more actually under wheat. There has been an increase in holdings since Mr. Alexander was here in 1892, and also a very large increase in land under cultivation.
353. Do you occupy any other position in Manilla than that of post and telegraph master? I am a member of the Railway League.
354. Can you give us any information as to the increase in the value of property? When I came here eight years ago, an allotment of land 150 yards from this building was offered to me for £50. The same allotment was sold two or three weeks ago to Mr. Odell for £100, so that it has increased 100 per cent. in eight years.
355. Do you look upon this district as a prosperous one? I look upon it as one of the most prosperous districts in the Colony.
356. Do you think, if a railway were constructed, there would be a large increase in the population—more especially of persons desirous of farming land, which they would probably be able to lease from the large holders? I think a great quantity of land would be thrown open to those desirous of going upon it.
357. *Mr. Fegan.*] What increase of business has there been in your Department during the last eight years? It has increased sixfold.
358. *Chairman.*] What is the rainfall of the district? The mean average when I came here was 27 inches, but it has increased a good deal since then, and it is now over 30 inches. In 1892 it was 31·16 points. I can safely say that the mean average is now 30 inches. During the eight years I have been here we have only had one drought, and notwithstanding that we got 26 inches, but it was not evenly distributed. From the 31st December, 1894, to the 26th January, 1895, we had 12 inches; then we had only 2 inches until August; and then heavy rain from August to December.
359. *Mr. Black.*] I suppose the mails are carried by contract with the coach-driver? Yes; the contract is from Tamworth to Warialda.
360. What does the Department pay yearly for the carriage of mails? £1,500.
361. If the railway were brought here the Postal Department would, I suppose, pay the Railway Commissioners for the carriage of mails? Yes.
362. Do you know whether the rates of mail carriage by rail are lower than they are by road? I could not say.
363. Have you any idea as to whether there would be a saving to the Department? I believe there would.
364. How far is it from Tamworth to Warialda? 130 miles.
365. What is the time occupied in transmitting the mails? Twenty-six hours.
366. And how much from Tamworth to Manilla? Five hours.
367. *Chairman.*] Then they travel as fast from Manilla to Warialda as they do from Tamworth to Manilla? At the same rate.
368. Then the inference is that the road is pretty good all through? I think until recently the road has been better at that end than this.
369. *Mr. Black.*] The passengers by coach from Tamworth to Manilla are five hours on the road? Yes.
370. Would they be satisfied with a train service which took them the same distance in one and three-quarter hours or two hours? I think so.
371. Do you think the people here would be satisfied with one of the light lines which are so common in some parts of America? I think so.
372. They would prefer a light line to none at all? Certainly; they would be satisfied with anything in the shape of steam.
373. I suppose one of the smaller engines, drawing one composite carriage and four or five trucks daily, would be ample for the traffic? Yes.
374. If the railway ran to Manilla, I presume that those who came down from Bingera and Barraba in their own traps would leave their traps here and go on? Yes.
375. Seeing that there is no likelihood of an extension beyond Manilla, and the traffic is not likely to be as heavy as on the main lines of the colony, do you not think a light line of railway would amply meet all the requirements of the district? I think it would.

376.

Mr. W.J.L. Kyle. 24 Mar., 1896.

376. *Chairman.*] What is the fare from Manilla to Tamworth by coach? Five shillings for a single fare, but prior to this year it was 10s. It has been reduced by competition.
377. Does it pay to carry at 5s.? I do not think it does. I may say, however, that there is one coach-driver here who is quite satisfied with that charge. Still it depends a good deal upon parcels. The rate appears to be rather low.

Mr. Alfred Stafford, store manager, Manilla, sworn, and examined:—

Mr. A. Stafford. 24 Mar., 1896.

378. *Chairman.*] Have you taken an interest in the construction of a railway to Manilla? Yes.
379. Have you occupied any official position in connection with it? I am only one of the members of the League.
380. In accordance with the desire expressed by the Railway Commissioners, you lately interviewed the people along the road from Manilla to Tamworth? I did.
381. Will you inform the Committee of the obstructions in the shape of houses that you found on the route of the proposed railway? Going from here the proposed line, for the first 9 miles, goes through four houses and through the centre of all the cultivation land.
382. What are the names of the owners of the houses? The first is Bignell. It runs right through his cultivation land and through his house. The next is Donnelly. It goes right through his house, but does not interfere with his cultivations, with the exception of a piece which he has just put under cultivation. The next is Short. It goes through the house, but not through any cultivation. The next is Sneddon. It runs through a dam close to the house, on which he depends for water, but not through the house. Passing Sneddon's, it goes on to a reserve for about 1½ or 2 miles; then it touches Norriss'. It goes almost through one house and about ½ chain at the back of another house belonging to him, and right through his land. Then it goes to Ahearn's, through his land and close to the house, but not through it. The next place is Muggleton's. It does not touch the house there. The next place is Hill's. It goes through his cultivation.
383. Have you now enumerated all the improvements in the shape of buildings which will be interfered with? Yes; there are a few pieces of cultivated land at the Tamworth end which it would pass through—that is outside the municipal boundary.
384. Tell us what fortune you had in interviewing these men? Bignell would not give the land.
385. *Mr. Black.*] What is the reason for not giving the land,—because of the destruction of his house and the interference with his cultivation? I think so; I believe that was his only objection. The next piece is Donnelly's; it runs through his house, and that is an objection, but he is prepared, as far as we know, to give the land if the line were moved a little further away. He would rather have it run through the centre of his land than that his house should be taken.
386. *Chairman.*] If the line went on the other side of the road he would not object? Not necessarily on the other side of the road, for he is inclined to give the land if it goes further down on the same side of the road as his house. Short has promised to give the land. The line does not interfere with his house. Sneddon's place is just about changing hands, and we did not see very much of him about it; but the man who has bought the house has bought it, I think, because he thinks the railway is coming.
387. Do you believe the land would be obtainable? I believe the man who has bought it would give it, but I do not know. Sneddon himself would not give it. Norriss would not give, but he does not want a railway. He is keeping an hotel. Ahearn has promised to give the land, although the railway goes close to his house. The next piece belongs to Muggleton, and we do not know whether it would be given. It is only a piece from 15 to 20 chains wide. Hill said he would give his land, but he would not make a promise. The next place belongs to a widow named Carey. One of her sons told us he was almost certain she would give the land, but she was not at home. The next piece belongs to Mrs. Byrne, but we could not see her. The next piece is portion 48 and 49, adjoining the village of Attunga. The owner is away on the Hunter. Then there is a large reserve of ½ mile which the line passes through. The next place is Quick's. He would not make a definite promise, but we understood from him that he would give it. Hall said he would not give his property, and so did Sneddon. The line will not interfere with his house, cultivation, or anything else, but he does not want his land cut up. Muggleton's property is in the hands of a trustee, and we could not ascertain anything about it. The line runs through the middle of Brown's cultivation paddock; he is not inclined to give the land, but he said that if it could be run through some other cultivation across the road he would give it. The next is Dow's, which is in the hands of four trustees. We saw one of them, and he said he could not state what the others would do, but he was not prepared to give it. That is as far as we went—to the municipal boundary of Tamworth; but inside the municipal boundary there is one piece belonging to Mr. George Dow, and he has promised to give it.
388. Supposing the railway as far as Attunga were made contiguous to the road, would that remove the objections these people have? In some cases it might, but with most of them the houses are close to the road.
389. How many houses are there within a chain or two of the road between Tamworth and Attunga? Three.
390. Are they outside the town boundary? Yes; there are two almost on the road, and one very close to it.
391. Would it be possible to so construct a railway that individual objection would cease? Not on the same side of the road as it is measured now. Some of the people look at it in this way: there is vacant land on one side of the road, and still the line is surveyed between Attunga and Tamworth through their houses and cultivation paddocks on the other side.
392. Do you think it possible to so locate the railway between Tamworth and Attunga that all objection to severance and the giving of land would cease? I could not say.
393. *Mr. Black.*] How many stores are there here? Three.
394. I suppose they bring their goods by team from Tamworth? Yes.
395. And to the people further on, of course? Yes.
396. If the railway were constructed, would the storekeepers bring their goods by train? Yes.
397. Would the people further on, at Barraba and elsewhere, also bring their goods as far as the Manilla terminus? I can say yes to that, because I have seen all the storekeepers.
398. I suppose if the goods came by train to Tamworth they would not be transhipped there, but would be brought on in the same truck? I should think so.

399.

Mr. A. Stafford. 24 Mar., 1896.

399. Have you any idea how many tons of goods come yearly by road to Manilla? About 150.
400. And what quantity passes through the town to the townships further on? I could not say.
401. I suppose a large number of the landowners buy direct from Sydney? Yes; as far as the quantity of stuff coming to the town is concerned, I may state that there are no heavy goods, such as wire, iron, and rock-salt, kept here. The station-owners take their wool to Tamworth, and bring things of that kind back with them.
402. So that it is impossible to say what is the quantity of road traffic from Tamworth to Manilla? No; for the simple reason that from two roads they can get upon the Tamworth road without passing through here. There are roads cutting into the main road about 4 miles from here.
403. Do you think the traffic from Tamworth would be equal to the traffic to Tamworth? It would not.
404. Would it be two-thirds? It might be.
405. Do you think there would be any objection to bring the railway upon the road? I do not think there can be any objection to that, so far as the people are concerned.
406. Do you think the road all the way is sufficiently wide to carry a railway, without interfering with the ordinary traffic? I think it is, nearly all the way.
407. There are not many engineering difficulties to prevent it being brought along the road? In some places there are, but they do not extend over a large part of the road.
408. Would it be possible, at such places, to leave the road for an easier track, and then return to the road further on? Yes. There are two places that would be difficult; but the one which is most difficult has a reserve on either side of the road.
409. Therefore it would not be necessary to resume land? No; and in the other place it would run through Mr. Rogers' property on the Attunga Run.
410. Do you know the road for about 2 miles immediately out of Tamworth? Yes.
411. There is a considerable declivity? Yes.
412. That, possibly, would be the most expensive part of the line if it were brought along the road? I suppose it would.
413. Do you know of a route which could be taken out of the town in order to get on the level, without climbing that part, where the land could be obtained free? On the right-hand side coming out of the town, just where the line comes on to the road. It was suggested at one time to keep it a little to the north-east; that would bring it higher up the hill than is now proposed.
414. You think, then, that if the line were brought directly out of the town on the road it would necessitate heavy cutting? It would; in fact you could not bring it right along the road. Of course you could do it where the projected line strikes the road.
415. Do you think the proposed site of the station at Manilla is a fairly central one? Yes.
416. Is it situated in that part of the town towards which development would extend? Yes.
417. I suppose the town is growing in a southerly direction? Yes; in a south-easterly direction.
418. Possibly, with the construction of a railway, it would have a greater tendency to grow that way? It must extend that way; there is no other way to go.
419. You think, then, that settlement on the other side of the river—that is in the building of houses—is not likely to go on? No; the principal part there is very low land.
420. Virtually, the construction of a station on the proposed site will not be prejudicial to the other side of the river? Not in any way.
421. *Chairman.*] Is it possible to construct any other railway which will develop what you regard as the resources comprised in the county of Darling? No; no other railway could affect this, and this would not affect any other railway.

Mr. William Hill, farmer and grazier, Upper Manilla, sworn, and examined:—

Mr. W. Hill. 24 Mar., 1896.

422. *Mr. Fegan.*] Have you anything to add to the evidence you gave before Mr. Alexander in 1892? Very little, except that since then much more land has been cleared for cultivation.
423. How many acres have you? About 5,000. I have 240 acres under cultivation.
424. How many men have you working for you? Nine at present. The average number during the year is three; then there are myself and family, including one son.
425. Would the majority of the people at Upper Manilla be glad to unload their stuff at Manilla? I know that everything I have will be carried by train.
426. What was the average yield of your wheat crop last season? Sixteen bushels. The largest I have ever had was 32 bushels. For six years I cultivated 40 acres, and the average was 25 bushels.
427. Then you could not get much better country than this? I do not think there is any better in the colony for wheat growing.
428. And with improved facilities for carriage there would be a larger acreage under cultivation? There is not the slightest doubt about it, because the pastoralists find that by letting the land they make more out of it. Up the Namoi River there are some few thousand acres fit for cultivation, but up to the present time little has been cultivated.
429. What is the average wage paid for labour? It has come down to 12s. and 15s. a week.
430. Is that looked upon as a good wage? Fifteen shillings is looked upon as a good wage at present. I am paying two men £1 a week; the other is engaged in contract work.
431. To what was the reduction of wages due? To bad seasons; everything has been low for some time.
432. Should the railway be constructed it will be of immense gain to the producers of the district? No doubt.
433. If the farmers are placed in a better position by the construction of a railway, are they likely to pay better wages to their workmen? I could not say.
434. If better times come from the construction of a railway, should not some one else share it with you? There will be more labour engaged, and if prices go up I have no doubt wages will also go up.
435. *Mr. Roberts.*] In the statement you made to Mr. Alexander three years ago you said you had 40 acres of land under cultivation, but that you had altogether 500 acres of cultivable land, and would be likely to extend the area;—have you thought it wise to do so? I have cultivated since then 170 acres, and I am now clearing 120 acres with a view to further cultivation.
436. What do you produce, as a rule? Wheat.

437.

Mr. W. Hill. 24 Mar., 1896.

437. What do you pay for carriage to Tamworth? One shilling and sixpence a bag. My farm is 13 miles beyond Manilla by the dray road.
438. Do you produce any wool? Yes.
439. How many bales do you send annually to Tamworth? Seventy or seventy-five.
440. What carriage do you pay? One shilling and sixpence per cwt.
441. I notice that in your statement to Mr. Alexander you say that forty-six selections, chiefly of red soil, were taken up, and that you believe a large number of them would be cultivated, as they had large areas of cultivable land? Yes; several of these farms have now large areas of cultivation on them.
442. I understand that the country is more suitable for the cultivation of wheat than of any other cereal? Yes.
443. Is all the good land in the district taken up? It is. There is very little good land that I know of that is not taken up.
444. If some of the large holdings were cut up into small farms with a view to being leased, do you think they would be readily taken up? Yes.
445. Has there been a demand for land in the district? Yes; there are young people who, if they can get the land, will take it instead of going away to look for work.
446. Would it pay the pastoralists better to lease it out? I think so.
447. What would be a fair rent per acre for wheat-growing land within a reasonable distance of the proposed railway? I could not tell you; but Mr. Barling has let some, cleared, I think, at 6s. an acre.
448. Is there much land being cultivated in the district on what is known as the half-system? I have 140 acres adjoining the town on halves. I do not know of anyone else who has let it on halves.
449. What return per acre do you get? About £1 an acre. That is only in regard to the cultivated land.
450. Is that on the half-system? Yes; you make about £2 an acre net off the crop.
451. Do you regard that as a satisfactory return? Yes. Of course you would not make that after paying expenses.
452. What is the carrying capacity of your 5,000 acres? About one sheep to the acre. I have 5,000 sheep upon it. I may say I have improved my land very much.
453. Is the land in the district well suited for dairying purposes? Only fairly so.
454. If the railway were constructed would you send all your produce to Manilla for conveyance by it? Yes.
455. Do you get your supplies from Tamworth? Yes.
456. Have you any reason to anticipate that the carriers would be able to carry your merchandise or produce at a lower rate than the railway? No; they would not carry it at the price Mr. Eddy stated when he was here.
457. Were any figures supplied as to the probable cost of railway carriage? Wheat, I think, was put down at 3s. a ton, and cattle at 10s. a truck.
458. Would 7s. 6d. per ton for wool and 5s. per ton for general merchandise be a reasonable rate? Yes.
459. Do you look upon 3s. per ton for wheat and hay, and 8s. 6d. per truck for stock, as satisfactory prices? Yes.
460. In what direction is your property? About 9 miles from here in a northerly direction.
461. Is there a large traffic on the road from Barraba to Tamworth? Very.
462. Do you know that as a matter of fact? Yes; I have been thirty years here, and should know something about it.
463. Can you tell us anything as to the increase of traffic or otherwise from the Queensland border to Tamworth? No; I could not. I have been twenty years where I am now, and, of course, I have very little communication with the road; but last Sunday when I was going up, there were ten heavily-loaded teams between here and Upper Manilla.
464. There is an immense traffic on the road from Manilla, Barraba, Bingera, and much further north? It goes out to Gundawindi.
465. Is this a favourite road for carriers? Yes; especially in wet weather.
466. Is that on account of the excellent road and the good supply of water? Yes.

Mr. John Fitzgerald Finn, licensed surveyor, Land District of Tamworth, sworn, and examined:—

Mr. J. F. Finn. 24 Mar., 1896.

467. *Chairman.*] Do you know the county of Darling? Yes.
468. There is a considerable area of land in the county yet unalienated;—can you make any statement as to the effect of the construction of a railway to Manilla on the area in question? There are more than 200,000 acres of land unalienated in the whole county. It is principally broken grazing country, and I think if it were cut up by the Crown into areas of 2,560 acres, it would be readily taken up by selectors under settlement-areas, and the stock they would keep there would come upon this road.
469. How do you come to the conclusion that the construction of a railway to Manilla would have a definite effect upon those lands? For the reason that there is no other way for the people to come.
470. Taking Manilla as a centre, how far ought it to command the trade to the east, to the north-east, north, west, and north-west? It would be bounded pretty well by Bendemeer, and, generally speaking, 60 or 65 miles round Manilla—I consider it will command a trade to a distance of 35 miles north of Barraba. Towards the west and south-west it will go below Keepit, and right down the Namoi River.

Mr. Andrew George Gardiner, farmer and grazier, Manilla, sworn, and examined:—

Mr. A. G. Gardiner. 24 Mar., 1896.

471. *Mr. Roberts.*] What is the size of your holding? 2,400 acres.
472. How many acres have you under cultivation? 200 acres.
473. How long have you been in the district? Four and a half years.
474. What is your average wheat crop? I have grown up to 22½ bushels, but last year cut it down to about 12, owing to the dry weather.
475. Do you grow anything else? Yes, oats and barley.
476. How far is your property from Manilla? It is adjoining the town.
477. Do you send your produce to Tamworth? Yes, the whole of it.
478. What price do you pay for carriage? About 9s. a ton for wheat.

Mr. A. G. Gardiner. 24 Mar., 1896.

479. Can you always get carriage at that price? Not always.
480. What is the highest and lowest you have ever paid for carriage? Nine shillings is the lowest I have ever paid. About 10s. 6d. is the highest.
481. Are you anxious for the construction of the railway? I should like to see it constructed.
482. What is your reason for that? I have about 1,100 acres of land fit to cultivate and it does not pay me at the present rate of carriage. I have had a few applications to let land out on lease, provided the railway is constructed. Therefore, it will be a benefit to me and the community at large.
483. Do you think there will be a large quantity of land leased, if the railway is constructed? Yes.
484. Is it a fact that the large holders of land would throw open their lands to lease? I think they would throw a great deal open.
485. And there would be a large increase of population in the district? Yes.
486. Have you any knowledge of the traffic along the line of route from Tamworth, through Manilla, Barraba, and Bingera on the way to the Queensland border? There is a lot of traffic between Tamworth and Manilla.
487. What is the principal carriage? Wool and grain, and sometimes a few loads of copper ore.
488. Do you think the cultivation of wheat would be largely increased, if railway communication were afforded? Yes, on account of the lowness of transit.
489. Is there much general merchandise brought from Tamworth to Manilla and further northwards? A great deal.
490. How many acres have you under barley? About 20.
491. How many acres under oats? About the same.
492. How many bushels do they yield per acre? Twenty-six or 27.
493. Is the land about here suited for growing wheat and barley? More so for wheat, but I think it will grow oats. I have been satisfied with what oats I have grown.
494. Is your land better than the greater part of the land about here? No.
495. Have you taken an active part in connection with the Railway League here? I have been appointed a member of the Committee.
496. Is your land freehold or conditional purchase? Conditional purchase, excepting a few acres.
497. How many bad years have you had in the 4½ years you have been in the district? One.
498. And the three years prior to that were good years? Very fair.
499. So that considering all things, there seems to be a great necessity for a railway here? I think so.
500. How many men have you working? Two all the year round.
501. If we have the railway will you employ more? Yes, about five.
502. Do you intend to cut up some of your land and lease it? Yes, if I am not able to attend to it all myself.
503. When your wheat was carried for 9s. and 10s. 6d. a ton, has there generally been a load waiting at the other end? Mostly.
504. If you wanted to get your wheat to market, and the carrier had no load at the other end, do you think he would carry it for 9s. 6d. a ton? No.
505. What would he expect? 15s. or 16s.
506. Then the average contract for carrying wheat is about 15s. ton? Yes, but as a matter of fact, they do not take it by the ton, but by the bag. Last year we paid about 1s. per bag, and there would be about ten bags to the ton.
507. Was not the last year the cheapest year you have had? No; the year before it took about nine bags to weigh a ton, and that made 9s. This year it takes about ten bags to weigh a ton, and still we pay 1s. per bag.
508. As a rule then, a carrier would not carry for 10s. a ton or 1s. a bag unless he had a load at the other end? I do not think so.
509. Do you send much stock to market? No, for the simple reason that it does not pay.
510. If a railway were constructed would you send them to market? Yes.
511. Do you find an easy sale at Tamworth? Not always. I generally sell privately. It pays us better now to leave the sheep on the run and cut the wool off. It does not pay to send them to market.
512. How much do you get for your sheep? Five shillings locally. I may state that a good many sheep are trucked at Tamworth which pass through here.

WEDNESDAY, 25 *MARCH*, 1896.

[*The Sectional Committee met at the Court-house, Barraba, at* 8 *p.m.*]

Present:—

THOMAS THOMSON EWING, Esq. (Chairman).
The Hon. Charles James Roberts, C.M.G. | John Lionel Fegan, Esq.
George Black, Esq.

The Sectional Committee further considered the proposed Railway from Tamworth to Manilla.

Mr. William Henry Reynolds, Mining Manager, Cornish Copper-Mining Company, Gulf Creek, near Barraba, sworn, and examined:—

Mr. W. H. Reynolds. 25 Mar., 1896.

513. *Chairman.*] Where is Gulf Creek? About 20 miles from here.
514. What business do you follow? I am mining manager of the Cornish Copper-Mining Company.
515. *Mr. Fegan.*] How many men have you employed? From thirty to thirty-five.
516. How long have mining operations been carried on? Two years; but I have only been there about six months.
517. Do you send your copper to Newcastle? Yes, regularly.
518. Is Mr. Langers the chairman of the company? Yes.
519. How many tons of ore did you send to Newcastle last month? Twenty-four or 25 tons of copper regulus.
520. What did you pay for carriage to Tamworth? Thirty shillings a ton from the mine.

Mr. W. H. Reynolds. 25 Mar., 1896.

521. What weight can you put on a dray? They have occasionally taken 7 tons, but 5½ to 6 tons is the average.
522. If a line were constructed from Tamworth to Manilla, would it be a means of developing the mine? It would not be of so great an advantage as it would be if it were brought to Barraba.
523. If there were a railway from Manilla here, what price do you think you would get your ore drayed for? About 10s. a ton.
524. Would not that allow the company to develop the mine to a greater extent? Certainly.
525. Have you very good ore at the mine? Yes; and it is likely to increase. We are about to put up a water-jacket furnace, and we shall then probably return 20 to 25 tons of metal per week, instead of, as now, half that quantity in a fortnight.
526. Do you send it to the Waratah Smelting Works? Yes.
527. How much do you pay for carriage from Tamworth to Newcastle? About 12s. a ton.
528. Do you think you have a permanent mine? Yes.
529. How many acres have you? About 250—that is with what has been applied for.
530. How many tons to the acre will it give you? I am not aware what the total quantity of ore on the property is; but we have 2,000 or 3,000 tons already discovered.
531. Will it be an advantage to the company to have a line constructed from Tamworth to Manilla? Yes, with a view to its being extended to Barraba.
532. When your new machinery is at work how many men will you employ? Fifty or sixty at least.
533. *Mr. Black.*] Are there any other copper-mines at work in the locality besides yours? Yes.
534. How many? One.
535. Have you any idea as to its output? No; it is more a prospecting claim at present than anything else.
536. Do you know how many men are employed there? Five, I think.
537. How long has it been at work? Six or eight months. They have good prospects, but they have not yet opened upon any rich deposit.
538. If the railway were opened to Manilla, would you send your copper to Manilla instead of to Tamworth? Yes.
539. Would the saving in time, as well as the saving in cost of carriage, be an advantage? Perhaps the saving in time would not be a great consideration.
540. Do you purchase gunpowder, dynamite, and so on, at Tamworth, Sydney, or Newcastle? Yes.
541. Have you any idea as to your tonnage of that kind of goods? No.
542. You are not particularly enthusiastic about the railway, are you? I think a railway to Barraba would be of great advantage to us, but even a railway to Manilla would be an advantage.
543. Is there any great area of metalliferous area in this country? Yes, a large extent of mineral lodes all through the district.
544. Is there any other precious metal besides copper? Yes, there is some gold also, but the reefs require development.
545. Are there many men in the locality prospecting for gold? About half a dozen.
546. *Mr. Roberts.*] Is your mine nearer to Bingera or Barraba? To Barraba—about 20 miles north.
547. Is it far from the main road? Yes; I think the main road goes through Cobbadah, which is 12 or 13 miles from here.
548. Have the copper-mines ever suspended work on account of the low price of copper? I do not know that they have done so on that account, but they have been suspended once or twice.
549. Was the mine in full work when you took charge? Yes.
550. Did you hear the reason for work being suspended? No.
551. Did you hear the reason for the mine being reopened? I do not think it has ever been, properly speaking, suspended; they have always had two or three men working, but they have not always been raising large quantities of ore.
552. You carry on smelting at the mine? Yes.
553. What is the price of copper now? About £45 or £46 per ton.
554. Has the price gone up since you took charge of the mine? No.
555. What price do you expect to get for copper in order to make your mine a paying concern? We make it pay at present prices.
556. Have you paid dividends? No; but we have accumulated money, which is going towards the erection of the water-jacket, and so on.
557. Is it a joint stock company? Yes; a limited liability company.
558. Have you any objection to state the amount of money annually expended on the property, including all salaries? We are spending more than £200 a month.
559. What percentage of copper do you get? It varies from 15 to 30.
560. Do you consider that a satisfactory return? Yes.
561. Have you a well-developed lode? Yes; a large strong lode. The deepest point is 18 fathoms.
562. Have you had large experience in the working of copper-mines? Very few have had more.
563. Where has that experience being obtained? In Cornwall, these colonies, and Queensland.
564. What mine have you superintended in Queensland? The Mount Perry Copper Works.
565. Is it still working? No; I was there from 1872 to 1876.
566. Did it cease working on account of the low price of copper? Yes, partly.
567. What was the percentage of ore raised at Mount Perry? About 21 or 22; it was very good.
568. Then, if your returns are from 15 to 30, they may be considered satisfactory? Yes.
569. Can you give any idea as to the quantity of ore in sight? At our deepest point we have a very good lode, and it is the same class of ore as we have at the level above, but there has been very little done at that level yet; but as far as it has been developed it is very good.
570. Can you give any estimate as to the time it would take to work the ore at present in sight? That would depend on the furnaces which are erected, and the speed with which they extract the ores. As far as we can see from the deepest point reached, it will last for a considerable depth. At the deepest points which have been reached and for a large extent—400 feet in length—the lode is all good. At the rate at which we are extracting it now the ore already in sight will last for two years or more.

Mr. W. H. Reynolds. 25 Mar., 1896.

571. Does the company contemplate sinking further and erecting more powerful machinery? Yes; the water jacket is already on the ground ready to be erected, and we shall call for tenders shortly for the construction of dams.
572. What is the value of the machinery on the ground? About £1,000.
573. Are you so satisfied with the prospects of the mine that you have recommended a further expenditure on machinery? The directors have done so; in fact the arrangements were made for the purchase of the water jacket before I undertook the management.
574. I am not speaking of what is already on the ground;—has any further machinery been ordered? No; we do not require anything more at present. We can go considerably deeper than we are now, and develop the mine a great deal further with the machinery we already have.
575. How many tons will your machinery turn out when the water jacket is erected? Thirty tons a day.
576. Then, at present you would not feel justified in asking the company for any further expenditure on machinery? No; we have already sufficient machinery to put us at least 10 or 15 fathoms deeper than we are now. When we are that much deeper we shall require more powerful driving and drawing machinery, but not at present.
577. If the railway is constructed to Manilla, how many tons of regulus will you send there per week? As soon as the water jacket is completed we shall send from 20 to 25 tons weekly.
578. In what way do you think the railway will be of benefit to your company? We shall save a little in carriage, and considerably when the water jacket gets to work, both to and from the mine.
579. Where did the machinery come from? Tenterfield.
580. Do you consider the mining industry in this part of New South Wales is being retarded owing to the high rate of carriage? There is no doubt of it. When it is made easy of access there will be more capitalists.
581. Is there any coal in the district? Not that I am aware of.
582. Can you give the Committee any other information as to the mining resources of this part of the country? Mining seems to be quite in its infancy here, and I cannot say much about it. There are strong mineral lodes with indications of copper, and some of gold, cropping out in various places; but money is required for their development.
583. *Mr. Fegan.*] Can the copper works at Waratah take more than you can send them? I should think so.
584. You have never had any trouble in sending your copper to them? No; they will take as much as we like to send them.
585. Is your copper carried to Tamworth in all seasons of the year at 30s. a ton? Yes.
586. Have you never paid more? Not since I have been there.

Mr. Maurice Hamilton Dawson, Manager, Commercial Bank, Barraba, sworn, and examined:—

Mr. M. H. Dawson. 25 Mar., 1896

587. *Chairman.*] How long have you been here? About two years.
588. You have some idea with regard to the stability of the place so far as mining, pastoral, and agricultural pursuits are concerned? Yes.
589. Do you understand fairly well the position of all classes of people engaged in those industries? Yes.
590. *Mr. Black.*] Do you buy gold? No, we take the gold from those who bring it in, give them an advance upon it, and give them the actual returns, charging them the ordinary banking commission.
591. What quantity do you receive per month on an average? About 200 oz.
592. Has there been an increase during the last year or two? It has increased 200 per cent. from 1894 to 1895.
593. Do you think any further development is likely? Most decidedly.
594. Do you know any reasons which retard the development of the industry? The want of a battery on the field more than anything else at present.
595. I suppose that in the case of a battery the element of carriage would enter largely? Very largely.
596. Do you think that would be lessened by the construction of a railway to Manilla? Very, because from Manilla to Crow Mountain would be no great distance.
597. Do you think any development of the copper-mining industry in the district is probable? I cannot say I have any great knowledge of it.
598. Would you consider it likely if a railway were constructed to Manilla that traffic north of Barraba, say as far as Bingera, would be diverted to Manilla? It would decidedly go to Manilla.
599. Would it continue to go to Manilla if a railway were constructed from Moree to Inverell? I should think not from Bingera way. It would go the other way if railway rates were equal.
600. You think the Bingera traffic would follow the Inverell line? I should think it would, but I could not speak very positively on the point.
601. Supposing a line were constructed from Tamworth to Manilla, and the line from Moree were carried on to Inverell, have you any idea as to where the dividing line—the watershed of the traffic, so to speak—would be formed;—where would the traffic begin to go on the one side to the Inverell-Moree line, and on the other side to the Tamworth-Manilla line? About Bingera.
602. Why do you think the traffic north of Bingera would go the Moree-Inverell way? It would be closer to Inverell from Bingera, than it would be from Bingera to Manilla.
603. Have you any idea as to the capability of the country here for the growth of fruit? There has been very little fruit cultivation gone into, but what has been gone into has been very productive; there, is however, no market.
604. *Chairman.*] Have you any knowledge of the position of the farmers of the district? Yes.
605. Is it a fairly stable position? It is the soundest district I have been in.
606. How do you regard the position of the pastoralists? As sound.
607. If the carriage from here to Tamworth were lessened 5s. or 10s. a ton by the construction of a railway to Manilla, what effect would it have on the farming industry? The farming area would be greatly increased.
608. What effect would it have on the pastoral industry? There would be more fat cattle sent down than there are now.
609. Is the district capable of carrying more stock than it has at present? Yes.

Mr. M. H. Dawson. 25 Mar., 1896.

610. What effect would the railway have on the mining industry? If they could get machinery cheaper on the fields, it would have a good effect on it. The expensive carriage of heavy goods, such as batteries, seems to be the great drawback.
611. *Mr. Fegan.*] Was the Bank doing business at Manilla when you came here? Yes.
612. Why was it closed? It was thought the business could be done between here and Tamworth, instead of keeping an extra branch.

Mr. Daniel Capel, grazier, Piedmont, sworn, and examined:—

Mr. D. Capel. 25 Mar., 1896.

613. *Chairman.*] Where is Piedmont? Twelve miles north of Barraba on the road to Bingera, a few miles above Cobbadah.
614. *Mr. Roberts.*] How long have you resided in the district? I was born in it.
615. How long have you held your present property? Fifty years.
616. What area do you hold? 50,000 acres, including leased land from the Crown.
617. What stock have you? 24,000 sheep, and 1,500 cattle.
618. Do you send your wool to Tamworth? Yes.
619. In the event of a railway being constructed, would you send it to Manilla? Certainly.
620. What quantity of wool do you generally send per annum? 400 to 500 bales. I have another place 12 miles west—Campo Santo, area about 15,000 acres—from which I send about 100 or 200 bales.
621. What rate of carriage do you pay to Tamworth? 2s. 9d. per cwt., or £2 15s. a ton.
622. *Chairman.*] You are drawing your wool a lesser distance than the mine is drawing its ore, and still you are paying £1 a ton more? Yes, but they have a contract. We could get it lower if we liked, but we do not cut the price down.
623. *Mr. Roberts.*] In the event of a line being constructed from Moree to Inverell, would you still send your wool to Tamworth or to Manilla? To Manilla.
624. *Chairman.*] How far is Warialda from Piedmont? Fifty-six miles.
625. And how far are you from Manilla? Forty miles.
626. *Mr. Roberts.*] I understand Piedmont is a very good sheep country? Middling.
627. Is there much agricultural land on it? I do not think there is any—not of any extent.
628. Do you consider it desirable that the railway should be constructed from here to Manilla? Yes.
629. On what grounds? Because the farmers would be able to get to market cheaper.
630. Do you think there would be much land leased for farming purposes if the railway came to Manilla? Certainly there would.
631. Is there a large traffic of wool from the far north along this road? Yes.
632. Is it a favourite road for carriers? Yes; there are a great many teams on it.
633. Is there much good agricultural land between Barraba and Manilla? Yes; there is a good lot of wheat-growing land.
634. Will it compare favourably with the land between Manilla and Tamworth? I think the land between Manilla and Tamworth is better.
635. *Mr. Fegan.*] How many men on an average do you employ on your 50,000 acres? Fifteen
636. You say you have not many acres of cultivable land? No.
637. If the railway is constructed the Commissioners propose to charge 3s. per ton for wheat, 7s. 6d. per ton for wool, and 5s. per ton for general merchandise;—would those charges make a great deal of difference to you? Yes; we get up about 60 tons of salt every year.
638. Would not the cost of the carriage of your wool be considerably lessened? Yes; nearly one half.
639. Could the railway authorities rely upon the people of Barraba to unload at Manilla? I could not answer that question, but I should do so.
640. What will your land carry? One sheep to 3 acres.
641. Then it is not first-class land? No.
642. How much wool do you send down, as a rule? We shear between 20,000 and 35,000 on the two places. We get 600 to 700 bales.
643. *Mr. Black.*] Is the wool in the district of good value? Pretty fair. It usually realises a fair price.
644. Do you breed cattle? Yes; a few.
645. Where do you send them? I generally sell them about Tamworth, sometimes I send to Sydney.
646. What number of fat stock do you send away per annum? We do not fatten many. We sell them as stores.
647. How many store cattle do you send away? Between 300 and 400 head annually.
648. If the railway were extended to Manilla, would you truck fat cattle there? Yes.
649. If you were sending store cattle to Tamworth, would you truck them at Manilla? No.
650. Do you send any fat sheep to market? Sometimes.
651. Would you truck them at Manilla? It depends on the season. If it were a good season we would sooner drove them.
652. Is there any great area of land about here suitable for agricultural purposes? It is nearly all suitable for agriculture in the neighbourhood of the town.
653. Are there any large cultivable areas between here and Manilla? Yes.
654. Where do they lie? On both sides of the road.
655. But the land in the immediate vicinity of the road is not so good? No.
656. Do you know anything of the capabilities of the soil for fruit-growing? It will grow very good fruit.
657. Would it be difficult to get a market for it? Yes.
658. Have the droughts a great effect upon you in this locality? Not so much as in other places. It is higher here, and as a rule we have a better rainfall.
659. Has any attempt been made at any time to lease from you any of your land for farming purposes? No.
660. Do you know of any attempts in the neighbourhood in that direction? No.
661. Have you ever heard that wool raised about Bingera has been sent to Glen Innes, with a view of being trucked from there to Brisbane? No; but I think Myall Creek, 14 miles on the other side of Bingera, sent it one year.
662. It has not been made a practice? No; all the wool comes this way.

Mr. Bernard Finkernagel, storekeeper, Barraba, sworn, and examined:—

Mr. B. Finkernagel. 25 Mar., 1896.

663. *Chairman.*] How long have you resided here? Nearly eight years.
664. Have you any statement to make? There is a difference in the carriage paid by the Copper Company and other persons in the district. The person who carries for the copper mines has a special agreement to carry ore at the rate of 30s. a ton, which is exceedingly low. I myself am paying £2 a ton, and a short time ago I paid £2 10s. and £2 12s. 6d. a ton.
665. What do you think is a fair freight from Barraba to Tamworth for general merchandise? £2 a ton.
666. What is the freight on wool from Barraba to Tamworth? £2 a ton.
667. Do you know of any stuff being carted from Barraba to Warialda? No.
668. Do you know what it would be worth to take stuff from Barraba to Warialda? The distance is 66 miles, and I should think it would be worth from £2 to £2 10s. a ton.
669. Supposing a railway were built from Moree to Inverell, and also from Tamworth to Manilla, where would the loading from Barraba and district go? Decidedly to Manilla. We should have to pay ever so much more for carriage if we sent it to the other line, because it is so much further.
670. At what point north towards Bingera would the traffic commence to go to a line constructed from Moree to Inverell? I think it would be better for Bingera to send their merchandise to Manilla for this reason: The country between here and Inverell is nearly all black soil, and it is impossible to travel through it in wet weather. For this reason I believe the carriers could take loading from Bingera to Manilla cheaper than from Bingera to Inverell. It is 38 miles from here to Bingera, and 26 miles from Bingera to Warialda—in all, 64 miles. To Inverell from Barraba it is 83 miles.
671. Your opinion is that all produce from 38 miles north from Barraba would make to Manilla, even supposing a line were constructed from Moree to Inverell; what is your opinion of the mining industry in Barraba? It is very promising, and if we had a railway it would bring it very much to the front. For instance, 40 miles from here there is an antimony mine which is practically useless now, but it would become a valuable property if we had a railway to Manilla. The carriage from that particular mine to Tamworth is too high to make the ore pay. Antimony is a very cheap ore, and a few shillings in the cost of carriage would make a great difference.
672. Do you think 5s. would do it? Yes. The manager recently told me that if the carriage were a certain price the mine would pay handsomely. He also told me he could get 60 tons per week out of the mine if it were in the hands of a company.
673. What is the future of gold in the district? I do not think it has ever been so promising.
674. What about the copper? The copper-mine was never in such full swing as it is at present.
675. Then you think the mining industry will furnish fair returns to the railway at Manilla? Yes.
676. Do you think it is possible there would be any great increase in the farming industry in the Barraba district? I do not think it could be otherwise. I know farmers in this district are often at a loss to get rid of their produce, because they cannot find a market for it.
677. Have you any statistics as to the size of the town of Barraba? In the Police Patrol District of Barraba the population is 1,700. We have altogether 102,000 acres of freehold land in the district, and 8,286 acres of rented land. The area of the Crown lands is 248,262 acres. The total area under cultivation for last year was exceptionally small, namely, 1,812 acres. Our area of wheat was also very small, viz., 692 acres. These figures apply to the police district of Barraba. The total yield of wheat was 10,454 bushels. These were exceptionally small returns owing to the drought. There were 615 acres of maize in Barraba, and the average yield was 22 bushels. The acreage I have given for freehold land does not include conditional leases.
678. *Mr. Black.*] Have you any reason to suppose the tonnage of goods arriving in Barraba from Tamworth has been lessened since you gave evidence in 1892 before Mr. Alexander? No, I have every reason to believe it has increased.
679. You gave the tonnage then at 700 tons a year? I believe it is considerably more now. I myself get over 200 tons a year.
680. How many storekeepers are there in the town? At present two; there will be three before long.
681. Do you know anything of the mining interests in the neighbourhood? Yes; I am interested in the mining centres of the district.
682. Do you know anything of the diamond-mining at Bingera? A little.
683. Is there any likelihood of its proving successful? I believe so.
684. Is it a fact that kaolin is found in large quantities near Cobbadah? Yes.
685. Has anything been done with regard to it? Not to my knowledge. There are no miners working there. There is also kerosene shale in this district.
686. Is it being worked? No.
687. Is it of sufficient quality to be worth working? That is more than I can say. There is also chrome in the district.
688. Is the Bingera Gold-Mining Company still in existence? I think they are suspended.
689. Is there any other gold-mining company still in existence in that district? Yes, there are small syndicates, but no large company to my knowledge.
690. Is it a fact that the ore in that locality requires treatment which cannot be locally provided, and therefore has to be sent to Sydney? I have heard so.
691. Then the construction of a railway, lessening the cost of carriage, would be an inducement to miners in that direction? Yes. I may state there are three gold-mining companies in Bingera working now.
692. Is it true that there is also cinnabar being worked at Bingera? Yes.
693. Is it now being worked? No.
694. Do you know why the working has ceased? No.
695. Is any large quantities of hides, skins, and tallow, and kindred products sent to market from this locality? Yes, a large amount.
696. Is there any marketable timber in the district? We have some very good timber about 15 miles out east.
697. What timber is it? Stringybark and box.
698. Is the timber likely to be used for building purposes? For bridges and that kind of thing.
699. Is any of it sent to Tamworth? Not at present, on account of the carriage.
700. Are you of opinion that if the facilities for taking goods to market were increased the farming industry would flourish? I am.

701. What is the ordinary time in which goods are delivered here from Sydney? About a fortnight; but I have had them on the road for as long as two months in wet weather. The average time of a team from Tamworth to Barraba is from five to six days. Mr. B. Finkernagel. 25 Mar., 1896.
702. Have you ever known any great delays in delivery from Tamworth to Barraba? Yes; on one occasion I have known of a carrier being unable to travel more than 2 or 3 miles a day.
703. Do you know the value of the town allotments? Yes; in the main street, in a good position, land is worth £2 to £2 10s. a foot, perhaps in the best position £3.
704. *Mr. Roberts.*] In the event of a railway being constructed to Manilla, would the people of Bingera make use of it in getting their goods up? I have every reason to know the feeling of the Bingera people, and I can say that they would.
705. If a railway were constructed from Moree to Warialda, and on to Inverell, would it be to their advantage still to patronise the Manilla railway? If the railway touched Warialda, I believe a portion of the traffic might go there. I believe that the extra charge of the railway on account of the greater mileage to Sydney from Warialda would more than outweigh the extra carriage; teams would carry from Bingera to Manilla; I believe they would send to Manilla.
706. Are you familiar with the country between Moree and Warialda? I have travelled over it several times, and it is very barren. The country begins to be soft 3 or 4 miles north of Bingera on the road to Inverell.
707. Is that the reason why you think it would be better for the goods to come down to Manilla? I believe it would be one factor towards it.
708. Do you think people would get their goods quicker from Manilla than from Inverell? Yes; in wet weather no one could travel there with a load—it is all black soil.
709. Do you know anything of a coal discovery in this district? No.
710. Have you ever visited the gold-fields of Crow Mountain? Yes, I have a store there.
711. Do you know what is the population and the future of the place? There are some 250 miners there, and there are twelve or fourteen payable reefs, some of which are extraordinarily rich.
712. Do you think the progress of that district is being retarded for want of railway communication? Yes; the want of a battery is greatly felt there. If we had a railway the carriage of it would be considerably less.
713. Have you any knowledge of the yield per ton of the mines? It varies very much. The "Dodger" has yielded 57 oz. to the ton. Three tons were crushed. Since then they have had 10 tons crushed, which yielded 20 oz. to the ton. The others had only small parcels crushed. One mine yielded 6 oz. to the ton. There are several mines there which I should say range from 2 oz. to 6 oz. to the ton.
714. Is there much machinery upon the ground? There is one small prospecting battery there, but it is totally incapable of doing the work required on the field.
715. Do you think the high rate of carriage prevents the introduction of machinery? I think its introduction would be facilitated if we could get it here more cheaply.
716. How long have you been in business at Crow Mountain? I started there last April. I know there are plenty of miners there who are having splendid shows. They stack the ore and cannot get it crushed. Hence they are in want of money, and the field is kept back to a certain extent. The field is languishing for the introduction of capital.
717. Do you think if the railway were constructed there would be a great chance of capital being introduced, of valuable machinery being erected, and of the field becoming a large and profitable one? Yes; I think so.
718. *Chairman.*] How far is it from Warialda to Moree? Fifty-seven miles.

THURSDAY, 26 *MARCH*, 1896.

[*The Sectional Committee met at the Court-house, Barraba, at 9 a.m.*]

Present:—

THOMAS THOMSON EWING, Esq. (Chairman).

The Hon. Charles James Roberts, C.M.G. | John Lionel Fegan, Esq.
George Black, Esq.

The Sectional Committee further considered the proposed Railway from Tamworth to Manilla

Mr. Sylvester Joseph Lillis, grazier, Barraba Creek, sworn, and examined:—

719. *Chairman.*] How far is Barraba Creek Station from Barraba? Two miles south.
720. What area of land have you? 4,000 acres of purchased land and 1,200 acres conditional purchase.
721. *Mr. Fegan.*] Do you wish to add to or alter the statement you made before Mr. Alexander? One item which has altered since that statement was made is in regard to carriage. The carriage then was £2 12s. 6d. That was the Union rate. The carriage this year has been down to £2. I will put in a statement I made, with one or two alterations, before Mr. Alexander:—"There were 5,000 acres of freehold and 1,500 acres of conditional purchase, and no leasehold land; this will carry one sheep to the acre, being about the pick of the district; considers that the district, taking improved and unimproved land all round, is capable of carrying a sheep to the acre; he himself runs cattle principally, but has also sheep and horses; the whole of this is a very sound country for sheep; those bred here in the Barraba district are always marketable, not being subject to any disease; the price fetched by the wool compares very well with that of any other district; from Campo Santo, about ten years ago, the wool brought the highest price in the English market; this country, is in parts a fattening district, is not used very much for fattening, but mostly for breeding; a large number of stores are sent away from here; he sends fat cattle away, mostly to Tamworth, but also to Narrabri, Bingera, and other places, but he himself never trucks his stock; quantities are trucked by other owners; a large number of cattle are run in these districts generally; sheep-grazing has increased considerably since the railway opened to Tamworth, but formerly, the carriage of wool was so high, cattle were in greater favour; he does not truck, because he generally Mr. S. J. Lillis. 26 Mar., 1896

Mr. S. J. Lillis. 26 Mar., 1896.

generally sells to buyers locally, but a railway to Barraba would induce him to truck largely; he estimated that about 10,000 head of cattle pass through Barraba annually; of these, he believes that about 6,000 would be fat; during one week about 1,500 head of fat cattle have gone through; these were all from the north; he estimates that if there were a railway-station at Barraba about 800 head of fat cattle would be trucked there annually; of sheep, he believes that 20,000 fat sheep would be trucked there for market; within one fortnight about 12,000 fat sheep have passed through; there is a common attached to Barraba of 1,100 acres of fairly good land, and there is a considerable amount of land within the population area still in Crown hands; there is a considerable amount of leasehold land still in the district—fairly good grazing land, and some of it very good for cultivation; this is now being proclaimed as special areas. When the leases lapsed six years ago the greater part available was immediately taken up; some selectors came from outside the district, but the major part of the land was taken up by residents of the district; some of the special areas are rated as high as £3 per acre; the sizes run from 40 to 320 acres; some have been taken; the country, from a few miles north of Upper Manilla to Barraba, on the east of the main road, as far as the river, is not fit for agricultural purposes in very large blocks, but it is good grazing land; east of the Manilla River the country becomes mountainous, and is fairly good grazing land, but not agricultural, and it is badly watered; westward of the main road between Barraba and Manilla there is considerable agricultural land; and along the Manilla River right up to its head there are large areas of good agricultural land; some of it is under cultivation and produces good crops; there are some large areas of Crown land left on Buirindi, Tarella, and Campo Santo; a good part of most of this is agricultural land; it would grow wheat well, and is cultivable; in county Murchison there had been little settlement up to 1891, and this simply took place on the Horton River; knows of much good flat land on Ulumbaralla pastoral holding; Rocky Creek is more or less mountainous; Cobbedah is good grazing land, but stony and not good for agriculture; a good sound country for sheep; Piedmont is good sheep-country, with very little agricultural land on it; all north of the Devil's Elbow, on the road in that fall of the water, is all good country; believes that when the land in this Central Division is thrown open it will all be taken up by selectors; knows of several who are waiting to take up land there; there is a considerable population of young men in these districts who require land on which to settle who are looking forward to being able to acquire it in the Central Division, and this county of Murchison is very favourably situated, having a fairly good rainfall and situation with regard to the existing railways and markets; this route *via* Barraba is much used by stock from Queensland, because it is best served by natural water, and there is not so much black soil to be passed over; this, in and after wet weather, becomes almost impassable; from Moree to Narrabri is a very dry route, but the Gwydir River always has water, and so have the Horton River and Cobbedah Creek; would note that wheat is ready for market at about the same time as the wool is going down, so the former cannot find carriage except at the full Union rates, and has to be kept back until the wool season is over, when it is taken at 7d. per bushel; believes that if a railway was built to Barraba greater quantities of hay would be grown, viz., wheaten, lucerne, and oaten, and by being pressed he considers that a market would be found for it in many places; also believes that large dairies would be started in the district; there would be great inducement to send fat lambs, calves, and pigs to Sydney; these always realise good prices; without a railway such a trade is impossible; he also finds that onions do well in this district; in 1891, 8,000 bales of wool passed through Barraba; in that year passed 140 teams, counting both ways; he is informed that the wheat grown in this district compares well with the best grown in any part of the colony."

722. How many men have you employed? I have five sons, and I generally employ two regular hands.
723. Have you any agricultural land? Yes; 40 acres.
724. What do you cultivate? Wheat, but principally lucerne, for home purposes.
725. How long have you been in the district? Sixteen years.
726. How many bad seasons have you had during that period? Four.
727. What do you call a bad season? A season of drought.
728. Where, in your opinion, would the traffic commence to split? I think all the traffic would go to Manilla from Bingera, and 7 or 8 miles north of it. Of course it would depend a great deal on the carriage. If there were a line of railway going from Warialda it would be like going round the country. This is the most direct route to Sydney.

Mr. James Waddell, Bingera, sworn, and examined:—

Mr. J. Waddell. 26 Mar., 1896.

729. *Chairman.*] What is your opinion as to the proportion of the traffic of the district which would go north, and of the portion which would go south? I have been a hawker all through the district for some years, and I have an intimate knowledge of it. I think there is no question whatever that the traffic of Bingera, and for a few miles on the other side, even if a railway is made from Warialda to Moree, would come this way. A railway to Warialda *via* Moree would be 100 miles longer than by this route. If there were a railway from Tamworth to Manilla it would be 100 miles shorter than the one *via* Narrabri-Moree. There would be £1 more railway freight to pay that way.
730. *Mr. Black.*] Is there much black soil between Bingera and Warialda? Not much.
731. Then the item of difficulty of road carriage does not enter into your calculation? No.
732. There is not enough of the black soil to make it advisable for the carriers to come this way, all other things being equal? There is not much difference; it is not a bad road. Of course into the surrounding district it would make a great difference. The Horton River people are the people out there who would have the difficulty to contend with in regard to the road. Another thing which operates in favour of this route is the fact that sometimes for one and two months you cannot cross the big river.
733. In that case the traffic would be compelled to come this way? Yes.
734. *Mr. Fegan.*] How long have you been in the district? Nine years.
735. Were you not one of Proudfoot & Co.'s overseer's? Yes.
736. Therefore you know a little about railway construction? Yes.
737. Do you think the country between Tamworth and Manilla a good one for a railway? Yes.
738. If the line were constructed, do you think the carriage of this portion of the country would stop at Manilla? There is no doubt of it.

739. Are you in business in Barraba? Yes.
740. Would you go any further than Manilla if the railway were brought there? Certainly not.
741. Have you ever had to find fault with the teams on account of the delay in the delivery of merchandise? Yes.
742. Do you consider that a railway would be the means of inducing more cultivation as well as settlement on the land? I have no doubt it would double the settlement in a year or two.
743. *Mr. Roberts.*] Can you give any information as to the mineral resources of the district? There is no doubt the mineral resources of the country are very great; there is a great scope of auriferous country. The whole country from Manilla to Warialda is auriferous. Prospecting is going on even to within a few miles of Warialda.
744. Do you think that if a railway were constructed to Manilla there would be any influx of population? I believe there would; the want of railway communication is the means of keeping capitalists out of the district.
745. Have you ever visited the copper-mine in the district? Yes; it is looking exceedingly well. Unless it were very good it would not pay in view of the way in which it is being worked. If the owners would spend more money upon it it would pay a great deal better, and there would be more people upon it.

Mr. J. Waddell. 26 Mar., 1896.

Mr. John Edward Ethridge, selector, Horton River, sworn, and examined:—

746. *Chairman.*] Where do you reside? On the Horton River, about 20 miles from here, west of the range.
747. How far are you from Moree? About 80 miles.
748. Are there many selectors in your vicinity? Yes, about sixteen. About 30,000 acres have been selected.
749. Would all the wool from there come this way? Yes.
750. No matter what developments took place with regard to railway construction from Moree westward? It would all come this way. At the present time the railroad at Narrabri has nothing to do with the selectors in this part.
751. How far are you from Narrabri? Sixty miles.
752. What will the land carry? One sheep to 2 acres.
753. Is there any farming land? A lot; there are many instances in which selectors would go in for wheat-growing if the railway came to Manilla.
754. Do you think you represent public opinion? Yes; I was specially delegated to come down and give evidence.
755. *Mr. Roberts.*] Is there plenty of land available for farming? Yes; at my own place I have 600 or 800 acres which I feel sure I should cultivate.
756. Would you lease it? I think I should lease a little.
757. Is there any land being cultivated there on the half system? I do not think so. At present the great drawback is the want of a market.

Mr. J. E. Ethridge. 26 Mar., 1896

Mr. Edwin Blaxland, Horton River, sworn, and examined:—

758. *Chairman.*] How far is your place from Narrabri? Seventy miles from Narrabri; the same distance from Moree, and 46 miles from Manilla.
759. What area have you? 2,400 acres.
760. *Mr. Fegan.*] How many acres have you under cultivation? I only grow a little for my own use. I have plenty of land which I could cultivate if there were a market.
761. What cultivation would you go in for if a railway line were constructed? Corn and wheat.
762. How many men do you employ? Two.
763. Would you employ more if you went in for cultivation? Decidedly.
764. Is the land good for fruit-growing? I have only been there three and a half years; but I have seen good fruit grown, and the trees I have planted are coming on well.
765. Is your land freehold or conditional purchase? Conditional purchase and lease, and it is only a young district; but it will be a large one before long.
766. Is there plenty of water? Yes; and there is a good rainfall.
767. Will you send your produce to Manilla if the line is constructed to that place? Decidedly.
768. In preference to Moree or Warialda? Most decidedly, the road is so much better. Warialda is out of the question.
769. *Chairman.*] Do you think it would be possible for you to reach any portion of the Narrabri-Moree line more easily than you could reach Manilla? No; it would be impossible, simply because there is a large range running down north, and we should have to go 50 miles north to get round it, and then travel west again. We should have to go right down the Horton River, and then west to get to the line, whereas we can come direct to Manilla, and by doing so get close to market.
770. A new road has recently been measured from that country here? Yes.
771. Would that suit you? Yes, when we get it made.
772. But it is in the right direction? Yes.
773. What would your distance then be from the centre of the country of which you are speaking? Eighty miles from here.
774. That makes it 46 miles from Manilla? Yes.

Mr. E. Blaxland. 26 Mar., 1896.

SATURDAY,

SATURDAY, 28 *MARCH*, 1896.

[*The Sectional Committee met at the Court-house, Tamworth, at* 10·30 *a.m.*]

Present:—

THOMAS THOMSON EWING, Esq. (Chairman).

The Hon. Charles James Roberts, C.M.G. | John Lionel Fegan, Esq.

George Black, Esq.

The Sectional Committee further considered the proposed Railway from Tamworth to Manilla.

Mr. Charles William Jenkins, A.M. Inst. C.E., Resident Engineer, Roads and Bridges Branch, Department of Public Works, Tamworth Division, sworn, and examined:—

Mr. C. W. Jenkins, A.M.I.C.E.

28 Mar., 1896.

775-6. *Chairman.*] You desire to hand in a list of the roads which will act as feeders to the proposed railway from Tamworth to Manilla? Yes; the list is as follows:—

Road.	Length in Miles.	Feeding Railway at
Attunga to Hall's Creek	15	Attunga Creek.
Attunga towards Somerton	12	do
Manilla towards Somerton	8	Manilla.
Manilla towards Carroll	16	do
Manilla towards Borah	20	do
Manilla towards Bingera	36	do
Manilla towards Bundarra	25	do
Manilla up Namoi River	25	do
Barraba towards Bundarra	25	do
Barraba to Head of Horton River	20	do
Barraba to Buirindi	12	do

777. How much agricultural or pastoral land, or inferior land, does the road from Attunga to Hall's Creek pass through? I should say one-fourth is suitable for agriculture, and the remaining three-fourths is good agricultural land.

778. What about Attunga to Somerton? That is good agricultural land. It is also good agricultural land from Manilla towards Somerton, 8 miles, and from Manilla towards Carroll 16 miles.

779. What about the road from Manilla towards Borah 20 miles? Three parts of that pass through good agricultural land. The remaining fourth is fair pastoral country.

780. What about Manilla towards Bingera? I should say that one-fourth of that country is suitable for agriculture. The first quarter from Manilla, until you pass Upper Manilla, is good flats on the Manilla River and its branches. The hills are tolerable grazing country. As you approach Barraba the flats become more pinched, and the ridges poorer. Still in the vicinity of Barraba there are fair areas of agricultural country on the creeks and rivers. Passing beyond Barraba the country becomes second-class pastoral country. The first 7 miles of the country from Manilla towards Bundarra is good agricultural land. From there the country gets pinched and broken until you reach Crow Mountain goldfield. From there northerly it is poor granite country of little value to anyone.

781. What about the country from Manilla up the Namoi 25 miles? The first 10 miles consists of good agricultural land. After that the country gets poor, and can only be regarded as pastoral country. The flats facing the river here, become limited.

782. What about Barraba towards Bundarra 25 miles? The whole length is poor pastoral country, but carries a good deal of mineral.

783. What about Barraba to the head of Horton River—20 miles? The first 10 miles of that passes through second-class agricultural country. From there you ascend the Nandewar Range, and pass on to the Horton River. The Horton River country itself embraces a rather limited area of second-rate flats. The ranges are very poor country.

784. What about Barraba to Buirindi, 12 miles? It is second-class country on the ridges, with ordinary flats on the banks of the creeks, which, although not first-class agricultural country, might possibly be used in limited areas for it.

785. You consider that from the limits you have mentioned the trade will set towards Manilla as a depôt, or some portion of the line from Tamworth to Manilla? Most decidedly. I have been careful to limit the lengths of the roads in order to embrace only such country as will be affected by the railway.

786. And which will not be affected by any future extension to the north, nor by any existing railways to east or west? No other railway system could touch that country in the least.

787. Will you describe the present road from Tamworth towards Manilla? For the first 7 miles to 1 mile past Attunga Village the road has been pretty well formed and metalled all through.

788. What would it cost to put a road in similar order? £600 a mile. From the point stated as 1 mile past Attunga Village to Attunga Creek the road has only been cleared at a cost of £40 a mile. That distance is 2 miles. From Attunga Creek to Burdekin's Springs, a distance of 4½ miles, the road has been formed and metalled.

789. What would it cost to put that road in the order in which it is in now? About £600 a mile, exclusive of two bridges. From that point for another mile and a quarter, the road has also been metalled at the same cost. For the next 3 miles it has been formed and metalled in places at an expenditure, roughly speaking, of about £300 a mile. From that point, near Norriss', to portion 72, a little over 2 miles, it has only been cleared at a cost of £30 a mile. From portion 72 to Manilla it has been metalled right through at a cost of £600 a mile.

790. *Mr. Fegan.*] If the line were constructed would it materially save expenditure on the road? Yes, to the extent of £350 a year.

791. I suppose it would ultimately save a great deal more than that? I think there would always be some expenditure necessary on the road.

792. Could you keep the road in order, if the railway were constructed, for £1,000? Yes; I have £2,000 voted now for the road from here to Barraba, or £1,000 to Manilla; and if the line is constructed it will make the expenditure on the road less by £350.

793.

Mr. C. W. Jenkins, A.M.I.C.E. 28 Mar., 1896.

793. *Mr. Roberts.*] What is the width of the constructed road from Tamworth to Manilla? From Tamworth to Attunga Creek it is 1½ chain. From there to the mail station, 2 miles from Attunga Creek, it is 1½ chain. It then increases to 10 chains, and widens out into the Travelling Stock Route. Four miles from Manilla it returns to 1½ chain.
794. What would be the least width upon which, in your opinion, the railway and road could run alongside each other. In flat country, 2 chains would be sufficient. In heavier country, where there would be deeper cuttings, a greater area would be required. On most of the length from Tamworth to Manilla 2 chains would be sufficient.
795. *Mr. Fegan.*] The people have asked for a railway to be constructed for their convenience and there being so much traffic on the road, do you not think that the Government should introduce some regulation whereby the tires of wheels should be widened? I am strongly of that opinion. I think legislation in that direction is urgently needed.

Mr. William Darley Dowe, Inspector of Stock, Tamworth District, sworn, and examined:—

Mr. W. D. Dow. 28 Mar., 1896.

796. *Chairman.*] How long have you been here? I have been Inspector of Stock for twenty years.
797. How many cattle are there in the county of Darling? About 50,000 cattle, 30,000 horses, and a little under 1,000,000 sheep at present.
798. Do you believe the traffic connected with this pastoral area would regard Manilla as its depôt? No, very few stock come to Tamworth now to truck at all. Most of the stock above Manilla turn off at Tarpolly Creek and go towards Breeza.
799. Do you believe the wool would make Manilla its depôt? Yes.
800. Would Manilla be the trade centre for those engaged in the pastoral industry all over the county of Darling? Although I believe there will be a great tendency for the stock to travel to market and not use the train, still all the business incidental to the enterprise would regard Manilla as its centre.
801. Have you any idea what the wool clip of the county of Darling is? The county should carry quite 1,000,000 sheep, and the clip should average about 5 lb. a sheep.
802. How many pounds of wool go to the bale? Three hundred and a half generally. Take it as 80 sheep to the bale and there would be, roughly speaking, about 12,000 bales. There are roughly speaking 6 bales to the ton. There would be, therefore, about 2,000 tons of wool produced.
803. How do you view the county of Darling for pastoral enterprise? Most of it is very good until you get between Barraba and Bundarra.
804. Do you know the flats on the Namoi River, creeks and the tributaries? Yes; it is nearly all first-class land—good for agriculture and grazing.
805. Almost as good as Liverpool Plains? Yes, from Ironbark Creek station to the table-land, I regard as very inferior country.
806. What about the country lying west of the Moonbie? That is the granite country. With regard to the granite belt which runs under the range towards the west the country may be regarded as fairly good agricultural country on the flats, and fairly good pastoral country on the hills. Even about Barraba there is a considerable area of country which is well fitted for wheat-growing. I think also fruit may be grown there successfully.
807. *Mr. Fegan.*] Do you not think that if people could get their sheep to market a day or two sooner by rail they would take advantage of it? Since I have been here, very few sheep have been trucked since the railway has been constructed.
808. Is not that on account of the want of railway facilities? It may have something to do with it.
809. Do you not think if there was railway communication with Manilla a large number would be sent to Tamworth? They might truck to Tamworth in small lots; but I do not think they would be trucked to Flemington. Sheep and other stock in small lots will use the railway.
810. Do you think the estimate of the Department of 500 trucks of stock will be realised? Yes; I do not think that is over-estimated.
811. *Chairman.*] Do you think, over the whole area of the county of Darling, any wool coming from the north would pass Manilla and come to Tamworth were there a railway station at Manilla? It would not pass Manilla; I believe it would unload there. I may state that the estimates of this year are not a fair index with regard to the county of Darling. A severe drought has lessened the number of stock considerably; but the statements I have given may be regarded as approximately correct.

Mr. Alexander Christopher McLeod, auctioneer, Tamworth, sworn, and examined:—

Mr. A. C. McLeod. 28 Mar., 1896.

812. *Chairman.*] You did the valuation for the Municipal Council of Tamworth lately? Yes.
813. Do you know where the proposed railway turns off from Tamworth? Yes; in Darling-street.
814. Passing from Darling-street to Macquarie-street, what does land sell at? On lots 2, 3, 4, 5, marked on your plan, there are about £150 worth of improvements in buildings, and about £190 worth of land? Yes.
815. Do you think it might be obtained for that? Yes.
816. Is that the selling value or the ratable value? It is the value we have put on for rating purposes. It is not nine-tenths of the value, but the full absolute value.
817. What is the value of the mill? In valuing a mill there are many things to be considered. There is a siding there, and it will be difficult to get another as suitable in Tamworth. About £1,000 would be fair compensation.
818. Supposing the railway resumption went within a few feet of the mill chimney, could the work of the mill be carried on? I do not think it would affect them very much; but if you took the siding you would have to allow compensation.
819. What do you value the mill, the machinery, and the position at? £1,800.
820. What is the total value of land and improvements in the area lying between Darling-street and Macquarie-street? About £1,350.
821. Could it be obtained for any less than that? I do not think so.
822. Supposing the machinery were used and sold again, what would it bring? About £800, including the building material.

Mr. A. C. McLeod. 28 Mar., 1896.

823. Passing from there to the other side of Macquarie-street, there is an area of land bounded by Macquarie-street, Carthage-street, and O'Connell-street? That is Government land, all reserved. Then we pass on to O'Connell-street without any interference with private interests at all, and thence to Bligh-street to the back of No. 10. Between O'Connell and Bligh Streets you would not be able to resume the land, with the small cottages thereon, under £250. Then you pass section 19, of which the railway would cut off about £50 worth. Then you cross North-street to section 21, of which the railway would cut off £60 worth. It then goes through allotments 22 and 23, which would cut off £50 worth of land and buildings; through 25 and 26, £10 worth of land only. In regard to lot 27 it would cut off about £30 worth; lot 28, about £20 worth; lot 29, £20 worth. It then goes across Piper-street into allotment 31, and cuts off £40 worth of land. It then goes across Dean-street to allotments 33 and 34, and cuts off £50 worth of land; through allotment 35, and cuts off £30 worth; 36, of which there are two divisions, upon one of which is a house, and the railway would take it, doing damage to the extent of £130 for house and land; 37, £30 land. In connection with allotment 38, it takes away a stable, which, with the land, I value at £40. On allotment 39 there is another set of stables, which, with the land, will come to £70. Then there is another piece of allotment 39 which is taken, and the railway cuts off £30 worth of land. Coming back from 35 to Hunt-street, there is a lane, and the railway takes it; it destroys the back entrance to the property. I have not considered that, but it would somewhat increase these amounts. With regard to allotment 41, you would take away a brick building, which, with the land, I value at £160. Allotment 42, £25. Crossing to 44, you take the front garden of a house, and destroy about £50 worth of land. Allotment 45, £35 worth of land. Here we pass the main road to Manilla, and get into the open paddocks. From allotments 47 to 51 you take away £60 worth of land, not including severance. Allotments 52 and 53, £40; allotments 55 and 56, £40; allotments 58 to 63, £60; allotment 65, £20. At the main road the railway cuts off the areas from water-frontage. With regard to allotments 47 to 51, which is up to the street, I estimate the severance at £25. With regard to allotments 52 to 53, I estimate the severance at £100. The severance in allotments 55 and 56 I estimate at £50. The severance in allotments 58, from the municipal boundary, I estimate at £100. This totals up to about £3,010.

824. You have not added anything on for forced sale? No.

825. Do you know where the line is located from Tamworth to Attunga Creek? Yes. I value the land from the municipal boundary for a distance of 2 miles out at about £8 an acre. To this you must add any improvements, or orchards and severance. It is difficult to say what the severance would be without taking into consideration every portion. If the railway adjoined the road and did not interfere with the houses, that is the price which might reasonably be expected to be paid for the land.

826. Taking the bare value of the cultivable area from here to Attunga, at what do you estimate its worth? From 2 miles from the municipal boundary to reserve 1,508, I consider it to be worth £6 an acre. From there to Attunga Creek, which is about 4 miles, it is of the same value. I believe the bare value of the land through the Attunga freehold is £4 an acre. Beyond this point I think it is worth £3 an acre. I may add that to all these values severance value must be added. It is impossible to state absolutely what the severance cost will be unless I know whether the line will ultimately be fenced or not.

MONDAY, 30 *MARCH*, 1896.

[*The Sectional Committee met at the Great Northern Hotel, Newcastle, at* 8·30 *a.m.*]

Present:—

THOMAS THOMSON EWING, Esq. (Chairman).

The Hon. Charles James Roberts, C.M.G. | John Lionel Fegan, Esq.
George Black, Esq.

The Sectional Committee further considered the proposed Railway from Tamworth to Manilla.

Mr. Rudolph Langer, Chairman, Cornish Copper-Mining Company (Limited), Newcastle, sworn, and examined:—

Mr. R. Langer. 30 Mar., 1896

827. *Chairman.*] Have you any statement to make? Yes. I hand in a written statement, as follows:—The nominal capital of the Cornish Copper-Mining Company is £8,000, in 32,000 shares at 5s. each; Subscribed and fully paid up capital, £3,000. The company's mine and smelting works are situated at Gulf Creek, near Barraba. A small furnace is erected which reduces the ores as mined into regulus of average quality of 57% to 60%. Average percentage of ore, calculated as the actual quantity of metal extracted (during last half-year), 12½%. Width of lode, 1 foot 6 inches to 16 feet; produced last half-year, 80 tons of regulus; 60 tons of ore forwarded for treatment to Newcastle; average quality over 16%. Estimated freight for year ending 31st May, 1896, 330 tons. Estimated value of receipts from sale of regulus, &c., from mine for year ending 31st May, 1896, £5,000; number of hands employed in and about mine, smelting works, &c., thirty-five men; depth of working, 122 feet; area of land under lease and applied, 250 acres; railway freight for year ending 31st May, 1896, estimated value, £260; road carriage for year ending 31st May, 1896, estimated value, £600; profit on capital earned during previous half-year at the rate of 28 per cent. per annum. The above company is now in existence for about three years, and was originally started by a number of working-men with insufficient capital to develop the mine and to erect necessary machinery, &c. About eighteen months ago the then paid-up capital of the company was exhausted, and liabilities to the extent of over £500 incurred. By the aid of a number of shareholders fresh capital to the amount of about £900 was subsequently raised, the liabilities wiped off, and matters put more shipshape. The labour on the mine was largely increased and smelting operations resumed; developments were taken in hand and working considerably extended. It is now expected to have the daily output of the mine reach about 40 tons per day within two months, and the erection of a water-jacket blast-furnace, which is now on the road to the mine, will be immediately proceeded with. The output will, of course, be enormously increased, necessitating, on the calculation of 180 tons of ore smelted and reduced to fine copper, provision for carriage of 50 tons per week. It will be seen at a glance that within reasonable time even this comparatively large increase must, by the further extent of developments, enormously increase, and in itself largely add to

the

Mr. R. Langer. 30 Mar., 1896.

the number of hands employed, who again will use the proposed railway for the conveyance of passengers and goods traffic to supply the settlement. From the statistics given in the beginning, it will be seen that the mine is established at a thorough paying basis. So far the whole of the profits have been reinvested in the mine for its further development. The success of the mine, in the opinion of the manager and the board of directors, is assured, and within a few months the company's mine will take its place as one of the largest copper-producing properties in New South Wales. The extension of the railway from Tamworth to Manilla would be a great help to the company, still, as chairman of this company, and having an acquaintance with the country as far as Barraba and Gulf Creek, it seems to me that the magnificent agricultural lands and the late great development of mining near Barraba should be sufficient inducement to extend the proposed railway as far as Barraba, and ultimately to Bingera.

828. *Mr. Roberts.*] Have you declared any dividend? No; the whole of the profits have been devoted to the development of the mine.

829. When do you expect you will be in a position to pay dividends? Within the next few months.

830. *Chairman.*] How far is it from Tamworth to the mine? Seventy-five or seventy-eight miles.

831. What do you pay per ton for carriage? About 32s.

832. Is it a cheap rate? Yes; it has been reduced from £2 15s.

833. Have you a contract for carriage at 30s. a ton? No; but trams have been carrying for fifteen months at that price.

834. Do they get any back loading? Yes, mining stores and so on.

835. *Mr. Fegan.*] With the back loading, I presume they will earn about £2 a ton for the return journey? Yes.

836. *Mr. Roberts.*] If a railway were constructed to Manilla, would you unload at that station? Undoubtedly, it would save us 9s. per ton.

837. Instead of doing business with Tamworth, you would do it with Manilla? Yes.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

Railway from Tamworth to Manilla.

APPENDIX.

A.

[*To Evidence of C. Baldwin, Esq.*]

LAND REQUIRED FOR THE PROPOSED RAILWAY.

Sir, Durham Court, Manilla, 19 April, 1896.

In reply to the message from you, through Mr. Loughnan, I have to say that I am quite willing to give my land on the west bank or west side of Greenhatches Creek, and convey same to the Crown on conditions that a line of railway will be constructed on it.

At the same time I presume that access to the water in the creek by me will not be wholly interrupted.

Yours, &c.,
CHAS. BALDWIN.

The Chairman, Public Works Committee.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

RAILWAY FROM NEVERTIRE TO WARREN.

REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the first Session of the present Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, and the Public Works (Committees' Remuneration) Act of 1889, 53 Vic. No. 11, to whom was referred the duty of considering and reporting upon "the expediency of constructing a line of railway from Nevertire to Warren," have, after due inquiry, resolved that it is expedient the proposed railway should be constructed; and, in accordance with the provision of subsection IV, of clause 13, of the Public Works Act, report their resolution to the Legislative Assembly :—

History of the proposal.

1. The initial steps in connection with this line appear to have been taken in May, 1882, by residents of Warren. The Resident Engineer at Bathurst reported, in March, 1883, that a line could be constructed for about £2,200 per mile, or a total of £30,000. In September of the same year some 400 residents of Warren and the surrounding districts petitioned the Minister in favour of a light railway or a tramway. In November, 1885, a trial survey between Nevertire and Warren was completed. A petition was received in June, 1887, for the repair of the road between Nevertire and Warren, and on the papers having reference to the question being referred to the local Roads Officer, he reported that the road was a bad one, on black soil, and there being no metal convenient it would be much cheaper in the end to construct a light line of railway. A description of the proposed line was, on 4th May, 1888, forwarded by the Engineer-in-Chief for Railways to the Minister, the length being stated at about $12\frac{1}{4}$ miles, and the earthworks very light, consisting chiefly of forming. No proper estimate was then prepared, but it was stated that the cost of a cheap line, if constructed below the flood-level of the Macquarie, would be, approximately, about £3,500 per mile. During 1892 the Minister approved of a re-survey of the line for the purpose of framing an estimate for a light railway between Nevertire and Warren. On 21st January, 1893, the Engineer-in-Chief estimated the total cost of the proposed railway at about £3,114 per mile. The proposed work, at an estimated cost of £2,692 per mile, was, in December last, referred by Parliament to the Public Works Committee, it being made clear during the discussion which took place on the motion to refer the railway to the Committee that the line was not submitted as part of a railway to Coonamble and Walgett.

Official description.

2. The proposed railway leaves the Great Western Railway at the western end of Nevertire Station, 341 miles 20 chains from Sydney, proceeding in a north-easterly direction until the main road to Warren is reached. From that point it follows approximately along the road, on its eastern side, to near Warren, and, after diverging slightly towards the north, it ends near the north-west corner of the township. The works will be generally light. The ruling grade is 1 in 100, and the sharpest curve 15 chains radius.

Estimated cost.

3. The length of the line is 12 miles 13 chains. The estimated cost per mile is £2,692, or a total of £32,730, exclusive of land resumption.

Railway Commissioners' Report.

4. The Railway Commissioners report that the line will be a payable one from its opening. "It has," they say, "the further advantage that the whole revenue earned upon it will be new revenue to the Railway Department, and will not be traffic diverted from existing stations." Their estimate of the total annual cost of the proposed railway is £2,695, made up of the following items:—Interest on capital expenditure of £32,730 at 3½ per cent., £1,145; cost of maintenance of permanent way, £500; locomotive and traffic expenses, £1,050. The carriage of passengers is expected to bring in a sum of £400 yearly; merchandise and live stock traffic, £2,250; mails, £144; the total revenue amounting to £2,794, or £99 in excess of the estimated annual cost of the line. The proposed railway will pass through Crown land for nearly the whole distance. The report states:—"Very little private land is concerned, but we recommend that it should be made a condition that the people of the district should arrange for the conveyance to the Government of any private lands that may be required, free of expense. The representatives of Warren whom we met expressed their readiness to make this agreement."

The Committee's inquiry.

5. The Engineer-in-Chief for Railway Construction furnished the Committee with a statement with regard to the proposal and also supplied estimates of cost in detail. The views of the Railway Commissioners with regard to the railway, and the basis of their estimate of the traffic results from it were supplied by the Secretary to the Railway Commissioners and the Railway Goods Superintendent. A Sectional Committee subsequently visited the district and obtained all necessary local information.

Sectional Committee's Report.

6. The Sectional Committee report favourably upon the construction of the proposed railway. They confirm the statement made by witnesses regarding the unsuitableness of the road from Nevertire to Warren for traffic purposes. Owing to the absence of suitable material, the cost of constructing a good road capable of carrying the traffic would be very great. Warren is the centre of a large and fertile district, the surrounding country being suitable for pastoral and agricultural purposes. As a site for trucking stock, Warren could hardly be excelled, there being an abundant water supply and a large area of commonage around the town, where several travelling stock routes converge. In recommending the construction of the railway, the Sectional Committee express the opinion that the cost should be kept well within the sum estimated by the Department, and that in all probability the Departmental estimate of revenue will be realised.

Expected traffic on the proposed railway.

7. A very large proportion of the traffic dealt with at Nevertire passes through Warren, and it is anticipated the proposed railway will secure the whole of it. The Railway Goods Superintendent, who was examined with respect to the probable traffic, is of opinion that this will be new revenue, and that no existing railway centres will suffer through the construction of the line.

Land resumption.

8. The question of compensation for land necessary for the railway is not of pressing importance. The route as surveyed passes through only a small portion of private land, which should not entail any large expenditure. The people are, however, powerless to take the initiative in this matter, but, the Government having resumed the land, will be able readily to obtain from those most interested a sufficient sum to pay all legitimate demands. The Mayor of Warren has given an assurance that the amount required will be forthcoming.

Necessity for the railway.

9. The main reasons given in support of the proposal to connect Warren with the railway system of the Colony are:—

(1.) The bad condition of the road between Nevertire and Warren both for travelling stock and vehicular traffic.
(2.) The large outlay necessary to construct a suitable road.
(3.) The unsuitableness of Nevertire for a railway depôt.
(4.) The advantages possessed by Warren as a trucking centre.

Referring to the first of these, it is stated that 200,000 sheep travel the road between Warren and Nevertire annually, and that fat stock depreciate in value owing to the state of the road and the prevalence of the Bathurst burr. The Department has spent a large sum of money in endeavouring to form a portion of the road, with unsatisfactory results.

Nevertire is unsuitable as a railway depôt for stock, not only by reason of the bad approach but also from the fact that although there is no other available supply the animals refuse to drink the water at the Government tank.

At Warren there is a permanent supply of good water and ample commonage, which render it eminently suitable for a trucking centre.

The railway will assist in the development of the country beyond the Macquarie, and save the construction of a costly road between Nevertire and Warren. The construction of this line practically means the transference of the depôt for the produce of a great area of country from an unsuitable and, at times, almost inaccessible depôt at Nevertire to a suitable one at Warren.

Method of construction.

10. The country through which it is proposed to carry the railway is level, presenting few engineering difficulties. About 4 of the 12 miles of line will pass through land subject to inundation, and in time of exceptionally high floods some of this portion will be submerged, even if considerable flood openings, to provide for the ordinary overflow of the Macquarie River and its tributaries, be constructed. The line will be unfenced—half-round sleepers and 60-lb. rails will be used. As it is a light surface railway, the Committee are of opinion that it should be constructed at a cost well within the Departmental estimate.

Decision of the Committee.

11. The Committee have unanimously affirmed the expediency of carrying out the proposed railway.

Resolution of the Committee.

12. The resolution passed by the Committee is shown in the following extract from their Minutes of Proceedings of 20th May :—

Mr. Lee moved—

"That the Committee proceed to consider the evidence on the proposed Railway from Nevertire to Warren, with a view to reporting on the subject to the Legislative Assembly."

The motion was seconded by Mr. Trickett, and passed.

Mr. Lee moved—

"That, in the opinion of the Committee, it is expedient the proposed Railway from Nevertire to Warren, as referred to the Committee by the Legislative Assembly, be carried out."

The motion was seconded by Mr. Trickett, and passed.

THOS. EWING,
Chairman.

Office of the Parliamentary Standing Committee on Public Works,
Sydney, 20 May, 1896.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

RAILWAY FROM NEVERTIRE TO WARREN.

TUESDAY, 21 *APRIL*, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (Chairman).

The Hon. Frederick Thomas Humphery.	Henry Clarke, Esq.
The Hon. John Davies, C.M.G.	Charles Alfred Lee, Esq.
The Hon. Charles James Roberts, C.M.G.	John Lionel Fegan, Esq.
The Hon. William Joseph Trickett.	Thomas Henry Hassall, Esq.

George Black, Esq.

The Committee proceeded to consider the proposed Railway from Nevertire to Warren.

Henry Deane, Esq., Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and examined:—

H. Deane, Esq.

21 April, 1896.

1. *Chairman.*] You produce a Departmental statement signed by the Under Secretary for Public Works? Yes.

2. Will you read it, please? This proposed line was first brought before the Department in May, 1882, when a public meeting was held at Warren, and resolutions in favour of the construction of a tramway from that place to Nevertire were passed, and copies of same forwarded to the then Minister for Works, Mr. Lackey. The Minister promised to give the matter consideration. In February, 1883, Mr. Copeland, who had succeeded Mr. Lackey as Minister, directed that a report should be obtained in regard to the proposed line. Mr. Avern, the Resident Engineer at Bathurst, accordingly made an exhaustive report on the proposal (7/3/83), and estimated that a line could be constructed for about £2,200 per mile, or £30,000 in all, including bridging of two creeks and necessary terminal arrangements. The residents of Warren and surrounding districts continued their agitation for a line, and in September, 1883, forwarded to Mr. Secretary Wright a petition signed by nearly 400 people in favour of a light railway or tramway. A deputation from Warren, accompanied by Sir Patrick Jennings and Mr. Cass, M.P., also waited on the Minister and urged that the line be built, which they thought could be done for a sum of £20,000. Mr. Wright, in reply, promised to have a further report made, and on the papers being referred to the then Commissioner for Railways, that officer considered that the line, including rails, would cost about £51,000. In September, 1885, a further deputation, introduced by Sir Patrick Jennings and Mr. Cass, M.P., waited upon Mr. Wright and asked that a trial survey be made between Nevertire and Warren. The Minister approved of this being done, and the survey was completed by Mr. Surveyor Carter in November, 1885. In June, 1887, a petition for the repair of the road between Nevertire and Warren was received, and on the paper being referred to the Local Roads Officer (Mr. R. A. Fraser) that officer reported that certain repairs were then being carried out, but the road throughout was a bad one, on black soil, and there being no metal convenient he considered it would be much cheaper in the end to construct a light line of railway. The Engineer-in-Chief for Railways, on the 4th May, 1888, forwarded to the Minister a description of the proposed line, which showed that the length would be about 12¼ miles, and the earthworks very light, consisting chiefly of forming. No proper estimate was prepared at that time, but it was stated that the cost of a cheap line, if constructed below the flood level of the Macquarie River, would be approximately about £3,500 per mile—£45,000. In 1891, Mr. R. E. Jones, who was acting as Examiner of Public Works Proposals, was instructed to report, amongst other lines, on the proposal to extend the railway from Nevertire to Walgett, of which the line now under consideration forms a very small part. His conclusion was, however, that the extension should be made from Mudgee, and he did not deal particularly with this particular portion of the line. On the 20th August, 1892, Mr. Lyne approved of a re-survey of the line being made between Nevertire and Warren, so that an estimate could be prepared for a light line. In December, 1892, a deputation, representing the residents of Warren and district, introduced by Messrs. Morgan and A'Beckett, Ms.P., waited upon Mr. Secretary Lyne and urged the construction of the line. They represented that the people of the district were anxious to establish meat freezing works, and would do so if the railway were built. Mr. Morgan stated that the district carried 193,000 sheep and that the passenger traffic would be considerable. The Minister informed the deputation that the survey was being proceeded with, and he believed that the line could be built for something under £2,000 a mile. The survey having been completed, Mr. Deane (Engineer-in-Chief for Railway Construction), on the 21st January, 1893, forwarded

for

H. Deane, Esq.

21 April, 1896.

for the Minister's information an estimate which showed that the total expense of the running road would be £31,000, or about £2,418 per mile, but to complete the line, certain other expenditure for station buildings, junction works, &c., would be required, amounting to a further sum of £8,930, or £3,114 per mile. On the 16th January, 1894, another deputation in favour of the construction of the railway, waited upon Mr. Lyne. The advisability of constructing a railway instead of making and maintaining an expensive road was strongly brought under attention, and the Minister promised to submit the matter to Cabinet with a view to having it referred to the Public Works Committee. On the 27th March, 1895, Mr H Macdonald, M P, wrote enclosing copies of resolutions passed at a public meeting held in Warren, urging establishment of railway communication between Nevertire and Warren, and early in June of the same year petitions in favour of the proposal were forwarded to the Premier and Mr Secretary Young In June last year the Government came to the decision to refer the question to this Committee for consideration, and the Railway Commissioners were accordingly asked to submit their report as required by the Public Works Act.

The official description of the line is as follows —

NEVERTIRE TO WARREN RAILWAY.

Length 12 miles 13 chains—Estimated cost £32,730, or £2,692 per mile, exclusive of land and compensation

This proposed light railway begins by a junction with the Great Western Railway at the western end of Nevertire Station at 341 miles 20 chains from Sydney, and proceeds in a north-easterly direction until the main road to Warren is reached, thence it follows approximately along the road on its eastern side to near Warren, where, after diverging slightly towards the north, it ends near the north-west corner of the township. The works will be generally light, the ruling grade being 1 in 100, and the sharpest curve 15 chains radius. Materials suitable for construction are scarce.

The Railway Commissioners' Report, which is dated 8th October, 1895, is as follows:—

Proposed Branch Line of Railway, Nevertire to Warren—12 miles 13 chains

In accordance with the provisions of the "Public Works Act of 1888," section 13, we beg to report as under —

Cost of construction—	
The Engineer-in Chief estimates the cost of construction of a single line of light railway (exclusive of land and compensation) at	£32,730
Annual cost—	
Interest on capital expenditure at 3½ per cent	1,145
Cost of maintenance of permanent way	500
Locomotive and traffic expenses	1,050
Total annual cost	£2,695
Traffic estimate—	
Passenger traffic	400
Merchandise and live stock traffic	2,250
Mails	144
Total annual revenue	£2,794

The proposed line passes through Crown property nearly the whole way Very little private land is concerned, but we recommend that it should be made a condition that the people of the district should arrange for the conveyance to the Government of any private lands that may be required, free of expense. The representatives of Warren whom we met expressed their readiness to make this agreement

An exceedingly large proportion of the traffic dealt with at Nevertire Station comes in from the district lying to the north west, and the roads from all directions converge upon Warren The road between Warren and Nevertire Station is not a good one for either stock or vehicular traffic; it is almost certain, therefore, that the whole traffic now passing through Warren will be placed upon the railway at that point, if the line is constructed

In our opinion the line will be a paying one from its opening, and it has the further advantage that the whole revenue earned upon it will be new revenue to the Railway Department, and will not be traffic diverted from existing stations.

(Signed) E M. G EDDY,
Chief Commissioner.
CHARLES OLIVER,
Commissioner.
W. M FEHON,
Commissioner.

On the 11th December, 1895, the proposal was referred to this Committee by Parliament in the following terms:—"That it be referred to the Parliamentary Standing Committee on Public Works to consider and report on the expediency of constructing a line of railway from Nevertire to Warren" In the discussion which took place on this motion it was made clear that the line was submitted as a distinct extension in itself, and not as part of an extension to Coonamble and Walgett, although it is, of course, possible that in the future extension in that direction will take place.

3. You desire to hand in certain plans? Yes; I hand in a parish map showing the proposed Nevertire to Warren Railway, the general map; the detail plan of the survey, 10 chains to an inch; the section of the line, drawn to a scale of 10 chains horizontal and 100 feet vertical; and also the Book of Reference.

THURSDAY,

THURSDAY, 30 *APRIL*, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	CHARLES ALFRED LEE, Esq.
The Hon. JOHN DAVIES, C.M.G.	JOHN LIONEL FEGAN, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	THOMAS HENRY HASSALL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	GEORGE BLACK, Esq.
HENRY CLARKE, Esq.	FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Nevertire to Warren.

John Harper, Esq., Goods Superintendent, Department of Railways, sworn, and examined:—

J. Harper, Esq. 30 April, 1896.

4. *Mr. Lee.*] Have you prepared a statement with regard to the estimated traffic on the proposed railway? I have a report here which I will read:—

New South Wales Government Railways, Goods Superintendent's Office, Sydney, 4 October, 1895.

Nevertire to Warren Railway.

The distance between Nevertire and Warren by the projected line is 12 miles.

The road is of such a character that it becomes at times absolutely impassable. This occurs chiefly during the winter months, and continues, as a rule, until about October in the wool season.

Practically, the whole of the traffic loaded at Nevertire station comes *via* Warren; many roads converging at this point on the Macquarie, causing produce from as far north as Walgett, north-east as Coonamble, and north-west as Mount Harris, to find its way by this route.

I have carefully analysed the returns of the Nevertire station for the purpose of ascertaining the wool, goods, and live-stock which will be served by the proposed line, and find that a very large passenger traffic from Coonamble and the districts surrounding Warren also finds its way to that point. The distance from Warren to Coonamble is 60 miles, or about 73 to Nevertire, and although the district from Nevertire to Sydney is 341 miles, as against 278 from Dubbo, the bulk of the passenger traffic coming from Coonamble finds its way to Warren and Nevertire. The local rates of carriage between Nevertire and Warren are very high owing to the character of the road, and the fact of a large portion of the route consisting of a narrow lane causes the live-stock, which is trucked at Nevertire, to suffer very considerably. In addition to this, the water at Nevertire is very defective, and stock will not, as a rule, drink it; the camping ground at the latter point is also absolutely destitute of feed and very limited in extent. On the other hand, at Warren a very extensive common, intersected by the Macquarie River and several contributing creeks, is available, and the disposition, therefore, would undoubtedly be to load stock and wool at the latter point, provided the railway were constructed.

At the present time the storekeepers are paying 15s. per ton for the carriage of their goods between the two points, and the coach fares are from 5s. to 10s. for passengers according to the condition of the road.

When the Commissioners were at Warren on the 2nd instant, the representatives of the town and district expressed themselves prepared to pay special rates should the railway be constructed. I append my estimate of the probable traffic based, as I already stated, on the ascertained traffic at Nevertire station and the rates which the people of Warren expressed themselves willing to pay:—

Goods (inwards and outwards), 3,500 tons at 5s. per ton	£875
Wool, 40,000 bales, equal to 7,000 tons, at 3s. per ton	£1,050
Live-stock, 2,500 trucks at 2s. 6d. each	£312
Passenger traffic, 4,000 passengers at 2s.	£400
Mails	£144
Total	£2,781

Under ordinary circumstances I should have some doubt as to whether these rates would be paid over this mileage, but as I have already pointed out, the existing means of communication between Warren and Nevertire are of such a character and the conditions in favour of teams camping at Warren, as against Nevertire, so great that I have no doubt these promises will be carried out, and I am disposed to think that the line would pay interest on capital cost and working expenses from its opening.

New South Wales Government Railways, Goods Superintendent's Office, Sydney, 30 September, 1895.

Nevertire to Warren Railway.

The distance between Nevertire and Warren is 12 miles.

The road is of such a character that it becomes at times impassable. This occurs during the winter months especially, and continues, as a rule, until about October in the wool season.

Practically, the whole of the traffic which is received at Nevertire comes *via* Warren, and assuming that it were trucked at the latter point, the earnings of the line would estimate as follows:—

Goods, 3,500 tons at 4s. per ton	£700
Wool (40,000 bales), 7,000 tons at 2s. 6d.	£875
Live-stock, 2,500 trucks at 2s. per truck	£250
Passenger and parcel traffic	£400
Mails	£144
Total	£,2369

5. It shows an advance in the case of goods 35 per cent.? Yes.

6. You are depending largely on the traffic coming in from Coonamble and Walgett? Yes.

7. The traffic having got as far as Warren do you not think there is a possibility of its proceeding to Nevertire instead of unloading at Warren? No; my impression is that they would truck at Warren for the reason which I have pointed out. The road during the greater part of the year is almost impassable. Sheep travelling over that road would be depreciated nearly as much per head as we should charge per truck from Warren. There is good camping on the river at Warren, but the road to Nevertire is one of the worst pieces of road that can be conceived.

8. Is there any market for stock at Nevertire? No.

9. Any meat works? No.

10. You infer then that the stock trucked at Warren would be intended to go over the parent line? Yes and this would contribute to the earnings of that line.

11. How is the country held about Warren? There is a considerable area to the north still in the hands of the Crown. When I was there some months ago the Government were cutting up a lot of land into small settlements to the north, the north-east, and north-west to Warren, on the creeks and rivers.

12. Are there many selectors there? Yes; a good many.

13. In your estimate you do not include the prospective traffic? No; it represents the traffic for a year at the Nevertire station.

J. Harper, Esq.
30 April, 1896.

14. I notice that the difference between your two estimates is somewhat large; the local rates in the case of goods advance 25 per cent., and in the case of wool they are 6d. per ton more, and live stock 6d. per truck more? Yes.
15. Would that prevent any of the stock from travelling by the railway? No; I have already mentioned the advantage of the good camping reserve at Warren.
16. You attach great importance to the fact of there being fine camping ground about Warren? Yes.
17. When the seasons are good, do you not think that much of the stock would go by road? No; in good seasons the road is soft, and during a drought there is no water available.
18. What is the distance? Thirteen miles.
19. They are not likely to drive stock 13 miles to save 2s. 6d. a truck? No.
20. It would cost more to drive them? It would in cost of droving and loss of condition.
21. What other sources of revenue do you anticipate in the future? Agriculture is at present only carried on to a limited extent there, but they get very good crops of hay, and have a fairly good rain-fall —about 25 inches a year.
22. Is not that country subject to floods? Action is being taken now by putting in weirs to neutralise the floods; the water being diverted into channels.
23. Have you calculated for a daily service? Yes, the same as on the main line; one train out and one back. During the time when stock are being trucked heavily it will necessitate more than one train.
24. To which railway station does most of that traffic go at present? All of it goes to Nevertire. I have not included anything that goes anywhere else. There is a possibility that some of the traffic further east which goes to Narromine or down to Dubbo, might go to Warren, but I do not calculate on that.
25. You estimate that the whole of it will be new revenue? Yes.
26. And that no other railway station will be robbed by the construction of this line? No.
27. Necessarily the estimate is an approximate one? Yes.
28. And the season you based upon was rather a good one? Yes.
29. It is possible that your figures might in some years be reduced to one-half? I do not think that.
30. Of course that line of railway would have to submit to the same chances as any other? Yes.
31. What is the population of Warren? Eight hundred and sixty.
32. And what would be the prospect of a future extension beyond Warren? There is a possibility of its extension to Coonamble or to Walgett if deemed desirable. It is a line almost at right angles to the existing main line.
33. Without reference to any future extension, you feel certain that the traffic will be there? Yes.
34. Is there any mining in the vicinity of Warren? No.
35. The line would depend upon the produce of the land? Yes.
36. *Mr. Wright.*] You were asked by Mr. Lee whether there is any danger of teams bringing the wool through Warren and taking it on to Nevertire instead of trucking it at Warren? I do not think that would be done to any extent. The road has usually been bad during the time that the bulk of the traffic has been carried. I went fully into the matter and the general experience was, that about five years out of six until the latter end of the wool season the roads were bad.
37. You are aware that at Haddon Rigg Station the rate they pay is 25s. a ton? Yes? I should say that the great bulk of that traffic would be carried on the railway between Warren and Nevertire.
38. One item struck me as being very large—£144 for mails. Is not that an excessive rate for 13 miles? I think the Government are paying more than that.
39. The Government are getting mails carried for £2 a mile? In some places. There is some understanding between the Postal Department and the Commissioners.
40. Then the Commissioners are to receive £12 a mile whether they carry a ton or a pound of mail matter? Yes.
41. The revenue from the passenger traffic is put down at £400 per annum, but I suppose that Warren will not supply anything like that passenger traffic? There are three coaches running daily now between Warren and Nevertire, and every time I have been to Nevertire I have seen a good number of passengers.
42. You anticipate all the Coonamble trade coming in there? Yes.
43. You estimate to receive 40,000 bales of wool? Yes.
44. Did you ever receive anything like that quantity? We received 44,000 bales in the year that the estimate is based upon.
45. How much in the year before that? 39,000 bales.
46. You give what you think is a fair and honest estimate? Yes.
47. Have not the people of Warren been promised a railway for many years? There has been a good deal of correspondence on the subject but I do not think it has come under the notice of the Commissioners before.
48. You anticipate that it will be a paying line? Yes.
49. Because it will get all the traffic that comes to Nevertire? Yes.
50. *Mr. Trickett.*] Seeing that the railway goes through only a very small portion of private land, are you in a position to say what the owners will do in regard to it? The approach to the site proposed for a station is on land belonging to Mr. Rutledge, and the residents almost undertook to secure that and make a free gift of it.

TUESDAY, 5 MAY, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (Chairman).

The Hon. Frederick Thomas Humphery.	Henry Clarke, Esq.
The Hon. John Davies, C.M.G.	Charles Alfred Lee, Esq.
The Hon. Charles James Roberts, C.M.G.	John Lionel Fegan, Esq.
The Hon. William Joseph Trickett.	Thomas Henry Hassall, Esq.

The Committee further considered the proposed railway from Nevertire to Warren.

Henry Deane, Esq., Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

H. Deane, Esq.

5 May, 1896.

51. *Chairman.*] You have already handed in a Departmental statement of the estimated cost of construction? Yes. I have a further note on the subject, which is as follows:—

Nevertire to Warren.

The country being flat, and the main road being from 3 to 5 chains wide, it has been possible to keep the line on the side of the road for nearly 4 miles, and it has been arranged with the Lands Department that the latter is to be altered so as to adjoin the railway from 349¼ miles to 352 miles. The line, except for about 1½ mile, is through Crown property, and it will be generally unfenced.

About 4 miles will be through country subject to flood, and in time of exceptionally high floods, some of this portion will be submerged.

The grades and curves are very easy.

The mileage cost seems at first sight high for a surface line, but considerable flood openings for the overflow of the Macquarie River and its tributaries are necessary, and the cost of junction and terminal station work, as well as superintendence, is distributed over a very short total length.

52. *Mr. Hassall.*] I presume you have made a thorough examination of the proposed route? Yes; I have not been over the ground, but I have made a careful examination of the reports and plans. I did intend to go over the ground, and on to Coonamble and Walgett, so as to examine the whole district lying between the Western line and the Namoi, but I have not yet had an opportunity of doing so.

53. Do you desire to make yourself acquainted with the country with a view to any further extension that may be contemplated towards Walgett? Yes; and I intend to combine the two objects. As mentioned in the statement the other day, this line is submitted as a separate proposal altogether. It is not submitted as part of a larger proposal. At the same time, travelling through the whole district I could examine the country through which this railway will run, and in that way I would economise time.

54. Are you aware that there has been an agitation for a number of years to obtain railway communication between Walgett and the metropolis? Yes.

55. Do you think that the point of departure from the Western line at Nevertire would meet the requirements? Yes.

56. Would it be as good a point at which to make the connection as it would be to come straight from Walgett to Narrabri? I have not considered the matter very thoroughly. It is apparent, I think, that in making a line branching off the Western railway or the Mudgee railway, a great deal more country will be opened up than by running a line from Narrabri to Walgett along the south side of the Namoi.

57. Do you know the nature of the country on the south side of the Namoi? I have only been a few miles out from Narrabri, as far as Molly station.

58. That is practically the good country? Yes.

59. Are you aware, from the reports of your officers, that the country on the south side of the Namoi is very inferior? Yes.

60. From the reports you have received, do you think that the country between Nevertire and Warren, and on to Coonamble and Walgett, would be good country to open up? Yes; I believe it would.

61. Do you expect any great increase in traffic by making the extension to Warren? I have not examined into the traffic question.

62. It has been stated that this proposal will result in increased traffic for the railway, and will practically bring traffic to the railways which they have never had before. Is it not a fact that that traffic must come to the railway at some point? Yes; I suppose this line will bring it nearer and sooner to the railway. There will be more railway carriage in consequence.

63. Is this proposal made in consequence of the difficulty of transit by team between Warren and Nevertire? Yes; the ground is very soft, and the water lies about very much.

64. With the exception of about a mile and a half, will the line run through Crown lands? Yes.

65. How is that land held for a distance of a mile and a half? Some of it is private property. Some of it is held under conditional lease. It will be seen by reference to the map that the line makes a bend through Chapman's land. The object of that is to get a good crossing over the creek. The site has been carefully located in conjunction with the road officers.

66. Has any inquiry been made as to the probable cost of the land that will have to be resumed? I have made no inquiry, but it could not amount to very much.

67. With regard to the estimated cost, are the engineering difficulties between Nevertire and Warren greater than on the line between Narrabri and Moree? Yes; there are more waterways to be provided on this line. Otherwise the character of the country is very much the same in both those districts. On this line there will be a larger extent of flooded country to traverse.

68. What description of line do you propose to make over the 4 miles of flooded country? I do not propose to deal with the exceptionally high floods. I propose to follow the surface, and to allow the high floods to come over the line. Over the creeks I propose to carry the line on timber.

69. Does the necessity for providing an outlet for flood-waters increase the cost of this line as compared with the cost of a line on country of a similar character? Yes; and I have already pointed out that the cost of the junction station arrangements will be higher in proportion on this short line than it would be on a long line.

70. Will the material for construction have to be conveyed a long distance? Yes; it will be brought along the line from Dubbo. The sleepers will be brought from Dubbo. I propose to use very little ballast. I will use the ballast which is obtainable on the Western line. I believe there is a little gravel at Warren, but not much.

H. Deane, Esq.

5 May, 1896.

71. Do you think that Warren will be practically the depôt for the traffic from Marra, Martaguy, and portion of the Castlereagh country? Yes.

72. From the calculations which have been made, do you think that the construction of this line is justified, and that there is a prospect of its paying working expenses and interest on the cost of construction? Yes.

73. As an engineer, do you think it would be advisable to make the line? Yes; it is a line that will evidently pay. It will bring in a lot of traffic, and as it will pay more than working expenses and interest, it is better to make the railway than to make a good road.

74. *Mr. Roberts.*] In the Departmental statement which you handed in, it is stated that the Minister informed a deputation that the survey was being proceeded with, and he believed that the line could be built for something under £2,000 per mile;—is it not a fact that that anticipation does not appear to have been realised? I think the Minister forgot the station arrangements and some other items, because, as a matter of fact, the cost of the running road, exclusive of the cost of supervision, only amounts to £1,891 per mile. That amount includes the item of £471 per mile for the bridges and drainage, so that you see it is really a cheap line.

75. Does not £2,692 per mile appear to be rather a high estimate for what is called a light line of railway? Not if the above is taken into consideration. The detailed estimate is as follows:—

NEVERTIRE TO WARREN.

Estimated cost of a single line of railway 12 miles 13 chains in length, 60-lb. rails.

Description.	Estimated cost.	Average per mile.
	£ s. d.	£
Earthworks	2,550 5 0	210
Box drains and timber bridges	4,222 10 0	347
Bridge over Cunningbar Creek	1,500 0 0	124
Level Crossings, cattle stops, and fencing	496 0 0	41
Permanent-way materials	8,167 10 0	872
Laying, at 1s., £1,089; ballasting, one-fourth at 4s., £1,088; sleepers, at £2s. 6d., £3,866 17s. 6d.	6,044 17 6	497
Stations—Junction, £300; passenger building "C," £275; station-masters house "B," £325; goods-shed, £350; trucking yards, £550; wool platform, £150; engine-shed, £450; carriage-shed, £100; sidings, £300; signals, £150; telegraph, £100; water supply, £200; metalling, £300; turn-table, £600; weigh-bridge, £275; 5-ton crane, £180	5,105 0 0	420
	£28,096 2 6	
Engineering and supervision, 7½ per cent.	2,107 4 3	172
	£30,203 6 9	
Contingencies, about 8½ per cent.	2,526 13 3	203
Total cost	£32,730 0 0	

21st April, 1896. Average cost per mile, £2,692.

76. The item of £2,526 for contingencies seems to be very large;—is an allowance of 8½ per cent. for that purpose the usual one? No; we usually allow 10 per cent. The contingencies can very easily run into £2,526 on a short line of this character. Being a short line, an additional expenditure at any particular point will make a large proportionate difference.

77. Is there any item here on which you think a saving could be made? No; I should not like to say that any saving could be made.

78. Do the Railway Commissioners think that it is necessary to have a station-master at Warren, a distance of only 12 miles from Nevertire, where there is a station-master already? Yes. All such items have been gone into with the Railway Commissioners, and decided after a consultation with them. They have been cut down to the very lowest, and I think they are much more likely to be increased than diminished.

79. Do you propose to build the station-master's residence of wood? Yes.

80. Is 2s. 6d. considered a reasonable price to fix for sleepers? Yes; it is a very low rate.

81. Is the road between the two places very bad at present, and is it almost impassable in wet weather? Yes.

82. Is it that fact which will cause the large expenditure of £4,222 for box-drains and timber-bridges? Yes; that item includes the crossing of a creek.

83. Where will the money be expended for a water supply? At Warren.

84. *Mr. Trickett.*] Looking at the parish map and also the general map, it appears that when you get to 348 miles from Sydney to Warren the line takes an angular dip;—will you explain why that is? The line is curved round there in order to get a good crossing over the creek. It is high ground just there—all the rest is flat country.

85. Why is there a similar dip a little further on between 349 and 352 miles? The large plan will show why that is done. It is curved round there to avoid a swamp. The line crosses below the swamp; the drainage of the swamp will cross the road and the line, and will run into the Gunningbar Creek to the east of the line.

86. Do you propose to embank that in any way? We do not propose to provide for the very highest floods. I have already stated that it has been arranged with the Lands Department that the road is to be altered so as to join the railway from 349¼ miles to 352 miles, which will not involve any compensation for land.

87. Will this line of railway, in point of construction, compare with the Parkes and Condobolin line? Very nearly, except for the water-ways.

88. Do you look upon this as a light surface line? Yes; except that on this line there are more water-ways than on the line you have mentioned, and that accounts for the extra expenditure.

89. *Mr. Davies.*] Are you aware that the Railway Commissioners make it a condition in the construction of this railway that the owners of the land are to convey what land is required for the line free of charge? Yes.

H. Deane, Esq.

5 May, 1896.

90. What do you consider is a reasonable distance between settlement and a railway? As a rule, I should not think it necessary to make a line 10 miles long, but this is a special case.
91. Is not 10 or 12 miles a very short distance to be away from a railway in the country? Yes; but still this is a special case, where the traffic comes in conveniently to Warren, and the cost of making a good road from Nevertire to Warren would be high.
92. Can you furnish any information as to the cost of the road? No; but it must be borne in mind that a road would have to be maintained, and there would be no revenue from it.
93. Even if this railway is made would it not be necessary to maintain a road for the farmers and producers? I should not think that anything particular would be done to the road—it would be left very much as it is.
94. Do you think it would pay a producer to discharge his loading simply for the purpose of conveying his produce over a short distance of 10 miles by rail? The traffic from a distance now comes in to Nevertire, instead of Warren. This line will not be made for the benefit of Warren, but for the benefit of the district. The line might not be justifiable merely to save the Warren people the trouble of conveying their goods to Nevertire, but the line will take all the goods which now come into Nevertire for a greater distance.
95. Do you know of any similar case in connection with the railway system where a short line of 10 or 12 miles has been made? I do not know that there is any other case.
96. Has it not always been regarded that 20 or 25 miles at the outside is a fair distance for a railway to run? Not exactly, I think. In pastoral country I daresay that would be the case.
97. Has it not been the case in most parts of the country? Not in agricultural districts.
98. Can you name any case where you have a short line of 12 miles to join the main line? There is the line from Goulburn to Crookwell, which is only 20 or 25 miles.
99. Has that been authorised by Parliament? No; but it has been recommended by this Committee.
100. If the Railway Commissioners and the Railway Construction Department are going to provide railway communication for all pastoral and agricultural communities within 10 miles of existing railways, will they not be making very good provision? That is not intended. I have explained that this is quite a special case. With regard to traffic considerations you are no doubt aware that I have really nothing to do with them. I have instructions to lay out a line and make the estimate of cost.
101. Did I not understand you to say that there had been a conference with the Railway Commissioners? Yes, as to station arrangements.
102. What kind of sleepers are you going to use? Round-topped sleepers.
103. Does not the cost of this railway seem to be very large for a light, cheap line? No, when all things are considered. The cost is really very low, because the cost of the running road is only £1,891 per mile, but there are heavy terminal charges.
104. Will the Railway Commissioners carry the railway and rolling stock at a cheap rate? Yes.
105. Is it proposed to fence the line? No.
106. Does the line go principally through Crown land? Yes, or along the road.
107. Do you propose, before the work is started, to visit the locality? Yes, undoubtedly.
108. *Mr. Lee.*] What portion of the line do you contemplate will be covered by flood waters? At the Warren end of the line. It will occur at the two creeks and between them.
109. Will it be the overflow of the creeks or the Macquarie River? At the further end it will be the overflow from the river backing up the water.
110. Is the site for the station, the goods sheds, and the trucking yards at Warren above flood level? Yes, I have a good site for the station.
111. Do you propose to make the line stronger at the point where the floods will occur? No; there will only be the ordinary embankments.
112. Will you use plenty of ballast where the embankment is likely to be flooded? No; I will not put any more ballast there than elsewhere. It will only be in very exceptional cases that the line will be flooded. The lower the line is the less there will be to make up. If the embankment gets washed away the rails can be packed up, and traffic carried on without interruption.
113. Is it rushing or slow water? It is chiefly slack water. It is a very slow current. The bridge over Gunningbar Creek will be the most expensive;—it will cost £1,500. All the bridges will be of timber.
114. At what rate of speed will the trains run on this line? Not more than 20 miles an hour.
115. Of what material will the station buildings and station-master's house be built? Of wood.
116. Could you not use galvanised iron with advantage? Such buildings would be very hot, and I do not know that the saving would amount to much. The cost is very small.
117. Do you propose to have an engine-shed at Warren or at the junction? Probably at Warren.
118. Will the water supply be also at that end? The water supply is only a small amount required for an addition at the junction.
119. Is this line proposed as a line from Nevertire to Warren only or as the first section of a line that may be ultimately extended? This is intended as a separate line.
120. But if the reasons offered by you are substantially sound to carry the traffic by rail for this short distance, would they not apply with greater force in favour of an extension of this line, that is to say, the roads and the camping places are bad, and if it is an advantage to teamsters to discharge their loads on the railway at Warren—would it not be a greater advantage to them to be able to discharge them further inland? Yes.
121. If at any time it is thought desirable to extend this line, is there a future for such extension? I believe there is.
122. Do you say that as a matter of railway policy the construction of this line does not bind the country to extend it to Walgett by way of Coonamble? Yes.
123. *Mr. Clarke.*] Why is the usual course to be departed from by constructing a short line of this character? The line is intended to carry a large amount of traffic which now converges into Nevertire, and thus save the construction of a costly road.
124. Is not £2,692 per mile rather high for a light railway? No; the cost of running the railway is very low considering the number of bridges and waterways we have to provide.
125. Is it probable that this line will be extended at some future time? I think it is very likely that it will be considered.

H. Deane, Esq. 5 May, 1896.

126. What kind of country is this for the construction of an ordinary road? It is very flat, and the water lies about very much.
127. Is there a road there at present? Yes, but it is a very bad one.
128. Do you think that because it is difficult to make a good road there it is necessary to make this railway? It is better to have a railway, which will pay, than to make a road, which would bring in no revenue.
129. Do you agree with Mr. Harper that this line will pay from the start? Yes, as far as I am able to judge, but I have not gone very much into the traffic question.

Hugh M'Lachlan, Esq., Secretary to the Railway Commissioners, sworn, and examined:—

H. McLachlan, Esq. 5 May, 1896.

130. *Mr. Fegan.*] Have you any statement to submit to the Committee? No; I understand the Railway Commissioners' statement was submitted to the Committee giving an estimate of the traffic.
131. Have you seen Mr. Harper's evidence? No; but he told me that he had given full particulars with regard to the traffic. What influenced the Commissioners in recommending the line is that there is a very large amount of traffic coming into Nevertire from Warren, and it is thought that the line would be a paying one from the start. The position of Warren is exceptional. The short length of road between Warren and Nevertire is a very difficult one. At Nevertire there are very few facilities for stock and teamsters, whereas at Warren there are excellent facilities.
132. Do you know whether it is the intention of the Commissioners to work this as a branch line, or in connection with the traffic of the Dubbo section? I do not know that that has been finally determined. I daresay it will be conducted as a branch line, working a train in and out. We generally find employment for men on the main line, if they are not fully engaged.
133. Do you not work branch lines sometimes with different rolling stock, and on a different gauge? No; we perhaps work a branch line with a different engine, but the trucks always go through.
134. Do you not work the Morpeth line on a different gauge, and with different trucks? It is worked with a different motor, but the same trucks run over the line.
135. I see the annual cost for this line is put down at £2,695, and the total annual revenue at £2,794, so that from the commencement you look forward to the line paying? Yes; and the present intention is that a modified local rate will be charged on this line.
136. Have you had deputations or petitions from the people of Warren in favour of this line? The Railway Commissioners have not, but I know the Public Works Department have. Petitions for a new line go to the Public Works Department, and they have been presented for years past in favour of this railway.
137. Do you entirely agree with the statement which has been submitted from the Railway Commissioners' office? Yes.
138. Have you no doubt as to the line paying? That is the opinion of the Commissioners.
139. *Mr. Hassall.*] Do you think that the difficulty in trucking and dealing with stock at Nevertire necessitates some better provision? This railway will be a convenience to the people, who will have trucking yards and loading yards at Warren. At Nevertire there is not a good water supply, and there is no good camping accommodation. At Warren there is a common, with a river running through, and there are also one or two creeks.
140. What water supply is there at Nevertire? I think there is only a tank, and in dry weather we have to bring the supply along the line.
141. By making this line to Warren you open out good country and supply good camping ground and pure water for stock? Yes; that is one of the reasons the people put forward in asking for the railway.
142. Another reason is that there is a bad road between the two places? Yes; we have been told that people there pay as much as 15s. per ton for the carriage of goods between the two towns in bad seasons.
143. Do a great many roads converge at Warren? Yes; there is a large pastoral district around it which will be tapped by the proposed railway.
144. Do the same difficulties exist on the other side of Warren as exist between Warren and Nevertire? I do not know; but I think it is the opinion of the Commissioners, that if you extend the railway to Coonamble, it would be desirable to extend it from Warren. They have already expressed that opinion.
145. What is the distance between Warren and Coonamble? About 60 or 65 miles.
146. If they extended the railway to Coonamble in the future, would they then think of extending it to Walgett? That is a matter that has not been settled; they have been considering it.
147. Would it be expedient to make an extension from Warren to Coonamble? Yes; it opens up good country.
148. Practically, Warren and not Nevertire is the converging point for the traffic from that direction? Yes; that is shown by the fact that Warren has always been a town of some importance, whereas Nevertire never has been.
149. The Railway Commissioners think that the construction of this line will be a payable undertaking? Yes.
150. Have they based their estimate of receipts on the recent estimate made by Mr. Harper? On Mr. Harper's last estimate.
151. But, according to Mr. Harper's figures, will there not be a loss? The Commissioners' figures are based on higher rates. Mr. Harper's figures were based upon the ordinary scale of charges, whereas the Commissioners' estimate is based on a modified local rate.
152. Have you had any communication with the people there with regard to the lands that would be required? No; I think the Commissioners state in their report that they understand that the land will be given free.
153. Have you trucking yards at Nevertire? Yes.
154. Does any traffic come to Nevertire from the southern side of the line? Not a great deal, to my knowledge. Three hundred and twenty-four thousand sheep were trucked at Nevertire in 1895. They came from the northern side principally.
155. This line is proposed so as to enable the people on the northern side of the railway to convey their stock and goods more expeditiously? Yes.
156. Under these circumstances the Railway Commissioners think that this proposal is justified? Yes.
157. *Mr. Roberts.*] Have the Railway Commissioners been over the proposed line of railway? Yes.
158. Are they favourable to its construction? Yes.

159.

H. McLachlan, Esq.
5 May, 1896.

159. Have they gone into the estimated cost of £2,692 per mile exclusive of land and compensation, and do they consider that a fair estimate? That is the estimate of Mr. Deane, but Mr. Deane always sees them and has some conversation with them. Mr. Deane is the responsible officer for the construction of the line.
160. Can you tell us whether it struck the Commissioners as being a rather high estimate for such a line? I think that in some places there are water-ways and other matters which make the cost heavy.
161. I notice in the Commissioners' report that they fixed the rate of interest on the capital expended at $3\frac{1}{2}$ per cent., whereas in the case of other works the rate is fixed at $3\frac{1}{4}$ per cent.;—can you explain the difference? The report of the Commissioners on this railway was made in October last. Since that report was written the rate of interest has been calculated at $3\frac{1}{4}$ per cent.
162. If the Commissioners were submitting their report to-day would the interest be reckoned at the lower rate? Yes; I think they would reckon it at $3\frac{1}{4}$ per cent.
163. What difference would it make on the return from this railway? It would only make a difference of £80 per annum.
164. After paying interest and all maintenance, locomotive and traffic expenses, there would be a clear profit of £180 a year on this line? Yes; that is the estimate.
165. Will this expected revenue be all new revenue to the Commissioners? It is all new revenue. It will be traffic which we get already, but it will be credited to the branch. The construction of the line may induce people to go in more for agriculture. It must increase the facilities given to the surrounding district.
166. *Mr. Humphery.*] Your estimate of the cost of locomotive and traffic expenses is £1,050;—is that treating the line between Nevertire and Warren as a branch line? Yes.
167. Do you consider that that is a full estimate? Yes; the Commissioners think it can be worked for that. The Commissioners have cut down the working expenses of branch lines very considerably. I have mentioned the Cobar, and other branch lines, as showing the very low cost at which they are worked.
168. Is not the Cobar line a very much longer line than this one? Yes.
169. Would it not cost considerably more, proportionately, to work a short line of 12 miles than a line of 60 or 70 miles? It would depend upon circumstances. There would be good traffic over this line. The Commissioners went into the matter carefully.
170. Do I understand that this is the view that the Commissioners take of the proposed work—that Nevertire is an unsuitable railway depôt for the traffic sent to that station? Yes.
171. That at Warren you will have a suitable railway depôt for the whole of the traffic now coming into Nevertire by way of Warren, and that, at local rates, that traffic will provide ample revenue for the cost of the traffic and for interest on the cost of construction? Yes; that is the view which the Commissioners take.
172. As a matter of fact, the unsuitableness of Nevertire is the principal reason for extending the line to Warren? Yes; and the inconvenience at present entailed upon a very large traffic by having to convey it from Warren to Nevertire by an unsuitable road.
173. There will be no loss on the line, and therefore the Commissioners favour its immediate construction? Yes.
174. *Mr. Trickett.*] Is this short extension of 12 miles unique, or is it likely to be the forerunner of other short lines? It is likely to be the forerunner of a much longer line, namely, an extension to Coonamble.
175. Do you think it may go on to Coonamble? I think it is likely to be the first section of the Coonamble line.
176. Even if it does not go on further than Warren, do you think that the construction of this line will be amply justified? Yes, on account of the convenience which it will give to the public, while it entails no loss to the State.
177. I see that in running this branch it is proposed to charge rather high special rates;—will you tell us what has been the experience of the Railway Commissioners with regard to special rates on several lines;—have those rates been maintained, or has the enthusiasm of the promoters of the lines died out after a time, and has that resulted in a reduction of rates? Those rates have been maintained in many cases where the Commissioners wanted to maintain them. Of course, from all quarters, both on the main lines and on the branch lines, persistent applications are made for reduced rates, but on many of the branch lines we have local rates, and they are apparently paid without any hardship. The Warren people have already expressed themselves in favour of the rates suggested.
178. Were not special rates charged between Nyngan and Cobar? Yes.
179. Are those rates still maintained? Yes, to a large extent. In some cases through rates have been given where it was necessary to develop traffic, such as a through rate for coke, in order to develop the mining industry.
180. It is proposed here to charge 5s. a ton for 12 miles;—is not that a very high rate? That is lower than the ordinary local rate—that is to say if it was a line terminating at Warren and running to Nevertire. If it started from Nevertire as a terminal we would charge more than 5s.
181. As compared with the heavy rates the people now pay for carriage by teams, do you think it is likely that these rates will be maintained? Yes.
182. I see that this line is mentioned as one to be constructed for a certain sum, irrespective of land-value compensation;—have you estimated whether that compensation will be nominal? The Commissioners say they think the land ought to be given free. When they were at Warren the people there told them there would be no difficulty about getting the land free. I understand there is not much land required between Warren and Nevertire, and it is not valuable if it has to be taken. It will practically not affect the cost of the line.
183. *Mr. Lee.*] With regard to the question of local rates, I presume that, as a rule, the public have little idea whether they are paying a local rate or a general rate? They generally know what rates they pay.
184. Is it your practice to issue a programme of rates? Yes; we must do so.
185. Do you regulate the rate from place to place? Yes.
186. Is there a man in the community who would know whether he was paying a general or a local rate? Yes; each consignment is accompanied by a note which shows the rate.

H. M'Lachlan, Esq.

5 May, 1896.

187. Is it not the practice of the Department to make special rates for large quantities? Yes, for truck loads.

188. And also for larger quantities? As a rule, it is for truck loads. There are a few special cases, when a special rate might be made.

189. Whatever rates you may commence with on this proposed line, will not the future rates depend entirely on the traffic? Yes, and on the conditions and circumstances. The Commissioners would not bind themselves to any fixed scale.

190. If the public largely patronise the railways, and send them goods, will not that be a reason in favour of their obtaining a reduction in rates; is not that the rule in your Department? The rule is this. If there is so much traffic upon the lines as to enable a big profit to be made the Commissioners reduce the rates generally, so that the more traffic we get the more ready the Commissioners would be to reduce the rates. The Commissioners have to consider they must pay a certain amount for interest and working expenses. If they can recover that they are quite prepared to give the public the advantage of low rates.

191. Where people have agitated for the reduction of the rates, and when a reduction has been made, no increased quantity of goods have been sent over the railway, has there not been a loss to the Department? Yes.

192. Will not the future rates at Warren depend very largely upon how the people patronise the line? Yes, upon the amount of traffic.

193. If the traffic doubles or trebles in future they will have a fair claim to the reduction of the rates? Yes.

194. At present you think the traffic is of sufficient importance to justify the construction of this proposed line at a certain cost, and if the rates proposed are charged the line will pay working expenses and interest on cost, and in addition will be a valuable cockspur to the main line? Yes; and it will be a great assistance to the people in the district.

195. Whatever charges may be deemed expedient in the first instance the charges ultimately made on the line will depend very largely upon how it is used? Yes.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

SECTIONAL COMMITTEE.

RAILWAY FROM NEVERTIRE TO WARREN.

REPORT.

THE Sectional Committee appointed on Wednesday, 6th May, 1896, to inspect, take evidence, and report with reference to the proposed Railway from Nevertire to Warren, have the honor to report to the Parliamentary Standing Committee on Public Works as follows :—

The Committee, consisting of the Hon. W. J. Trickett, M.L.C., T. H. Hassall, Esq., M.L.A., and F. A. Wright, Esq., M.L.A., left the Redfern Railway Station by the 8 p.m. train on Friday, 8th May, 1896, for Nevertire, which place they reached at 11·30 a.m. on Saturday, 9th May. After interviewing residents of that place, and arranging to be there on 12th May to take evidence, the Committee proceeded in special vehicles along the route of the proposed Railway from Nevertire to Warren. Although the weather was very dry, and the main road was then in good order, evidences were frequent to indicate what its soft and boggy character must be in wet weather, and the Committee were shown a length of road on which the Government had spent a considerable sum of money in embanking the natural road soil and adding river sand, with the result that more harm than good had evidently been done, and this portion of the road rendered absolutely impassable and useless for wheel traffic. The points of divergence of the proposed line from the main road were inspected by the Committee, who found that the deviations were necessary to facilitate the crossing of creeks, and to avoid land subject to flood.

Arrived at Warren, the Committee commenced their inquiry at the Court-house, on the afternoon of the 9th May, by taking the evidence of the Mayor, Mr. James Struthers.

On Monday, 11th May, the Committee resumed their inquiry, and examined the following witnesses :—Mr. H. W. D. Nardin, solicitor, and secretary of the Railway League; Mr. W. R. Rowles, storekeeper and selector; Mr. M. H. J. Seale, stock and station agent; Mr. D. McAlary, grazier; Mr. W. Wallace, selector; Mr. John Colleyan, an old resident; Mr. E. Utley, timber merchant; Mr. C. Hunter, station manager; Mr. C. B. Halliday, solicitor; Mr. H. A. D. O'Connor, licensed surveyor; Mr. H. W. Stanford, Crown Lands Agent and Clerk of Petty Sessions; Mr. G. Self, Post and Telegraph Master; Mr. James Kenny, Sergeant of Police; and Mr. A. B. Chadwick, timber merchant.

On Tuesday morning, at 8 o'clock the Committee left Warren for Nevertire, where they arrived at 10·15 a.m., and forthwith continued their inquiry by examining the following witnesses :—Mr. E. K. Rutledge, grazier; Mr. Geo. Reynolds, hotel-keeper; Mr. W. Butler, manager for Wright, Heaton, and Co.; Mr. R. McRae, manager for Permewan, Wright, and Co.; Mr. P. Lyons, blacksmith; and Mr. J. M. Oriel, carrier. Leaving Nevertire by train, at 3 p.m. on 12th May, the Committee arrived in Sydney at 6 a.m. on 13th May.

The

The scope of the Committee's inquiry was necessarily limited, by reason of the fact that in the discussion in the Legislative Assembly, when the matter was referred to the Parliamentary Standing Committee on Public Works, it was made clear that the proposed line from Nevertire to Warren was "submitted as a distinct extension in itself, and not as part of an extension to Coonamble and Walgett," although it was stated that, in the future, an extension in that direction may take place. This being so, the Committee confined the evidence mainly to two points, viz.:—(1) the necessity for the railway; and (2) the probability of its paying working expenses and interest on capital cost. As to the first point, the evidence was unanimous that the present road from Nevertire to Warren was very bad for traffic of all kinds, in fine weather being dry and dusty, with no suitable water for stock on the route or at the Nevertire end, and, in wet weather, being soft and almost impassable. Numerous witnesses testified that, while stock and teams could always travel to Warren from the country beyond, to get from Warren to Nevertire, along the road where the traffic converged, was at times most difficult. The tonnage rates and fares are high in proportion, from 15s. to £1 per ton being charged for the carriage of goods and 5s. per head for passengers over this short distance of 12 miles. The Committee, in their journey to and from Warren, were satisfied that the evidence given as to the bad character of the road was substantially correct, and it was apparent that owing to the absence of suitable material for road-making, the cost of forming a road capable of carrying the traffic properly would be enormous. The road is also unsuitable for travelling sheep by reason of its confined space and the existence of the Bathurst burr which grows unchecked along the whole distance. Looking, therefore, at the evidence on these points the Committee have come to the conclusion that the necessity for the railway has been established. The town of Warren is a thriving business centre, situated on the south bank of the Macquarie River, in the midst of a very fertile district. It was proved conclusively by the evidence given that for very long distances in every direction the country was of the best description, both for pastoral and agricultural purposes. The pastoral returns are equal to those from any other district in the Colony, and evidence was placed before the Committee showing the productiveness of the soil for cereals, fruit, and vegetables. The district possesses many advantages for a railway depôt, as roads from the north, north-east, and north-west converge at or near the town. As a site for trucking stock, Warren could hardly be excelled. There is an abundant water supply from the Macquarie River, and also the Burlong Creek, into which a permanent supply will be conveyed from the Macquarie as soon as the works in connection with the weir on that river are completed; and in addition, there is a very large area of commonage around the town, into which travelling stock routes lead from all directions. The value of the adjacent country is demonstrated by the fact that when land has been offered for settlement it was at once selected. The Committee were assured that if the whole of the leasehold areas were thrown open, the land would be taken up almost immediately, and there seems no doubt that, as the surrounding country gradually becomes available for closer settlement, it will be eagerly competed for. With regard to Nevertire as a stock depôt, complaints were made by stock-owners of the disadvantages of trucking stock at that place, not only by reason of the bad approach, but also from the fact that when the stock arrived there they refused to drink the water in the Government tank, and there is no other supply available, the Government having recently abandoned the attempt to obtain an artesian supply near the town, where the boring operations had extended to a depth of 2,500 feet.

Regarding the traffic likely to be carried on the railway, evidence was forthcoming that, at the outset, the Departmental estimate of revenue would, in all probability, be realised, and all the witnesses testified that they would be willing to pay the special rates indicated by the railway authorities. One of the principal witnesses at Warren, Mr. Nardin, stated from apparently reliable data, although on a slightly different basis to that submitted by the Department, that the annual revenue would amount to about £3,000. The increased settlement that would inevitably follow the construction of the line would, of course, add to the railway revenue, which would be materially augmented as cultivation was more largely carried on.

With

With two exceptions, all the witnesses examined by the Committee testified in favour of the proposal, and the dissentients gave reasons for their opposition which were not of a character to which the Committee could attach much weight.

The question of compensation for land is only in a very slight degree involved in this inquiry, as but a small portion of private land will be traversed by the line; one owner has already been arranged with, and the Mayor of Warren gave a distinct promise to procure the necessary compensation for the remaining private land, in which connection the Committee recommend that the Government should first resume the land at the Warren end of the line, and then obtain the arbitration value from the residents.

Although the construction by the Government of so short a railway as 12 miles 13 chains is almost unique in the history of our railway system, still the case seems to be an exceptional one, and the Committee, therefore, recommend the construction of the line as proposed.

The country being level and presenting few engineering difficulties is particularly suitable for the construction of a light surface railway, such as that contemplated, the cost of which, the Committee think, should be kept well within the sum estimated by the Department of Public Works.

W. J. TRICKETT,
Chairman.

14th May, 1896.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

RAILWAY FROM NEVERTIRE TO WARREN.

[TAKEN BEFORE THE SECTIONAL COMMITTEE.]

SATURDAY, 9 *MAY*, 1896.

[*The Sectional Committee met at the Court-house, Warren, at* 3·30 *p.m.*]

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

THOMAS HENRY HASSALL, Esq. | FRANCIS AUGUSTUS WRIGHT, Esq.

The Sectional Committee proceeded to consider the proposed Railway from Nevertire to Warren.

Mr. James Struthers, Mayor of Warren, sworn, and examined:—

Mr. J. Struthers. 9 May, 1896.

To the Chairman: I am the Mayor of Warren, and have occupied that position for about twelve months. The town has been incorporated a little over twelve months. Its present population is a little over 1,000, and the number of ratepayers last year was about 230, the municipal revenue being about £350. The population of the police district is about 3,000. It extends from Nevertire on the one side to Grahway on the Lower Macquarie, to Bullagreen on the north, and to Enaweena on the west, and to the boundary between Ellengerah and Mullah on the east. The district extends 12 miles in the direction of Nevertire, 50 miles on the lower side down the river, 30 miles towards Bullagreen, and about 20 miles up the river. I have resided in this district for six years, and have been in business as a storekeeper during all that time. In regard to the necessity for the proposed railway from Nevertire to Warren, in the first place, the very bad state of the road in wet weather causes a serious depreciation in the value of the stock travelling on the road to be trucked at Nevertire. The number of fat stock travelling along the road is very large, amounting to something like 200,000 sheep in one year, and varying according to the nature of the season. By travelling this road fat stock depreciate in value to the extent of 1s. a head, owing to the bad state of the road, both as regards mud and the Bathurst burr. Some drovers have taken a whole day to travel a mile along the road in wet weather, and in dry times there is no feed or water. If sheep could be trucked at Warren they would reach Sydney two days earlier than at present, even in favourable weather, and this would make a considerable difference in the value of the sheep. There is a permanent water supply at Warren, and a large common where the sheep could obtain grass, so that they would be put into the trucks in good condition, which is not the case at present. A great number of cattle and horses travel along the road to Nevertire, and in dry seasons suffer considerably from the want of water at Nevertire. The Roads Department has spent nearly £1,000 in endeavouring to form a portion of the road by putting sand upon it, but the attempt to improve the road in this way has been a failure. At one time I counted no fewer than thirteen teams bogged on the portion of the road upon which the Government had spent nearly £1,000. It requires 2 or 3 inches of rain to make the road really bad. If 2 inches of rain were to fall now, 2 inches next week, and another 2 inches the following week, the road would be simply impassable. The part of the road to which I referred just now is not at the present time used at all by vehicles; they prefer to take the side of the road. Another reason why a railway is necessary is that should we have a wet season at the end of the year, between August and February, such as we had in 1891 or 1892, the settlers here would suffer great loss, owing to delay in the transit of their wool from the stations to the market. If a team takes three weeks to accomplish a journey which it ought to accomplish in three days, it follows that it would take the team the same time to get back to load again; and I venture to say that if we had a really wet season here, and a good wool clip, the clip of one season would not be sent to Sydney before the beginning of the following shearing, which, of course, would mean considerable loss to the woolgrowers of the district. I have had goods lying at Nevertire for between two and three months, not being able to obtain teams to bring them to Warren, and I am only one amongst many others. At one time there was only one bag of flour in the town, and we had considerable difficulty in getting to the other side of Sandy Creek. That was in the year 1890. During the last three years the seasons have been pretty dry, and we have not suffered as much inconvenience from the bad state of the roads as previously. The greater part of the stock trucked at the railway station at Nevertire travel through Warren. I should say over 90 per cent. With regard to water for the use of travelling stock, at Nevertire there is only a Government tank, the water in which the stock will not drink except in the greatest extremities, while at Warren we have a permanent water supply from the Macquarie River. A railway is also desirable in view of the general development of the district. We shall be brought very much nearer to a market. If we grow wheat now it costs about 4½d. a bushel to deliver it on the railway at Nevertire, to come into competition with other parts of the colony. We have grown wheat here, and with very great success, but the cost of carriage has been so heavy that we have not been able to compete with other parts of the colony. Last year wheat was at a very low price.

Mr. J. Struthers. 9 May, 1896.

I bought fine wheat here for 1s. 10d. a bushel after it had been carted into Warren. At Bullagreen crops of wheat have been grown which have yielded 30 bushels to the acre. If a railway is constructed to Warren the settlers would be better able to get their produce to market, while they will obtain their stores from Sydney at a cheaper price. The cost of carriage from Nevertire to Warren by rail would be less than the cost by team. At present I pay 15s. per ton for carriage between Warren and Nevertire, and I used to pay £1 per ton. In bad weather I have paid as much as £2 per ton, and could not even get the goods carried for that on some occasions. The usual rate for goods and merchandise is 15s., and I believe some people pay £1 per ton. The charge of 2s. 6d. a ton for wool from Warren to Nevertire, which the Railway Commissioners say they are prepared to impose, would be very much less than a carrier would charge for the same distance. The road from Warren to Nevertire is worse than the other roads which the teams traverse in taking goods to Nevertire. The traffic comes to Warren from different directions, and then it is taken along the one road to Nevertire. The road to Nevertire has to bear the whole of the traffic supplied by all the different roads converging at Warren. On the latter roads teamsters can avoid bad places, as they have ample room, but that is not the case along the road to Nevertire, where the traffic is congested. It has been said that when once a team is loaded it does not matter much whether it carries the goods an extra 10 or 15 miles; but I do not agree with that argument in the present case, because if a railway were constructed to Warren a teamster would save the two days that would otherwise be occupied on the journey to Nevertire. The rates proposed to be charged by the Railway authorities, namely, 4s. per ton for ordinary goods, 2s. 6d. a ton for wool, and 2s. a truck for live stock, are fair and reasonable, particularly when compared with the present charges. At these rates I think the railway would be used exclusively. The tonnage conveyed along the road from Nevertire to Warren on my account is about 1,000 tons a year. These goods represent a total amount paid for carriage of £750. There are five general storekeepers in Warren, as well as many retail shops, and there are seven hotels. In addition to the goods imported into the place by all these business people, a number of the station-owners carry goods to their own places. Large quantities of goods come through Nevertire from Sydney, and are taken as far down the country as the Barwon, and even to Coonamble. Having been here for six years in a large way of business, I consider that this is a progressive district. Its population has doubled in the last six years. There are large areas of land not yet thrown open, and if better means of communication were given I am convinced that the district would progress even at a greater rate than it has done in the past. Agriculture has increased since I have been in the district. There was no agriculture at all when I came here. The people tried agriculture and found that it would succeed, but they had to abandon farming because they could not get a market. Wheat-growing has been successful in the district. I could not state exactly the average yield to the acre, but I know that one man grew a crop of 30 bushels to the acre, and another a crop of 25 bushels to the acre. The district has a favourable rainfall, the average being about 18 or 19 inches. This part of the country does not suffer from floods. When heavy rains occur, the land being so level, there is no great rush of water. The water gradually subsides, and does more good than harm. If three-fourths of the proposed railway were constructed as a surface line, with little or no ballast, the ground being slightly banked up, I do not think the spread of water which occurs in heavy rainfall would be at all likely to injure an embankment of the kind, if it were protected by box-drains and culverts at frequent intervals. There has not been a severe drought in the district during the six years that I have been here. We have had two seasons that might be called fairly dry, but there has only been one season in the six years during which the farmers would not be able to grow wheat, and that was the last season. Taking it all round, I should say that the district is fairly favourable for pastoral pursuits. With regard to the capacity of the land for pastoral purposes, the large station-holdings generally carry one sheep to the acre, or perhaps four sheep to 5 acres. The smaller holders may carry two sheep to an acre. The larger pastoralists generally keep in view the possibility of a dry time, and keep grass in reserve, while the smaller men are anxious to make all they can out of the stock they have, because the stock market is always uncertain, and a man with only about 2,000 sheep has some difficulty to make any more than a living. Many of the large holders grow wheaten hay and lucerne to provide for dry seasons. Along the banks of the river, on the big stations, any quantity of lucerne is grown, and also wheaten hay, but they make provision principally by under-stocking. If a railway were constructed to Warren I should say that the number of small holders would increase. If a number of them have been able to make a living with the present disadvantages as regards means of communication, it seems reasonable to suppose that settlement would increase if better access were given to a central market. Having a pretty good business knowledge of Warren, I consider that the business people generally are financially sound, and able to pay their way. I do not find many people giving up business and clearing out of the place. I consider that the railway is necessary, and that if constructed it would be a paying concern.

To Mr. Wright: I have not specially considered the question of extending the railway beyond Warren. For the present I should be perfectly satisfied to get a railway to this place. The large settlement that has taken place in the district, and to which I have referred, has been in the nature of selections. Nearly all the available land has been taken up in selections. There is a large quantity of land not selected, but it is not yet open for selection. The special areas that have been offered have nearly all been taken up at enormous prices. There is a number of leasehold areas which have not yet been thrown open, and a number of reserves still existing. A lot of special-area land has been taken up at about £4 an acre, but I cannot see how people can possibly live upon it after paying that price. Dairying is carried on in the district only to a small extent, and at the present time we do not supply our own wants in this respect, and have to import butter. I said, in answer to Mr. Trickett, that in consequence of the difficulty of traffic I had been able to buy wheat here at 1s. 10d. a bushel. It is quite true that wheat was sold at the same rate at Narromine and lower down the line; but I would point out that if the wheat had been sent from Warren to Nevertire the cost of taking it there would have been 4½d. a bushel, which would bring the price down to 1s. 5½d. at Nevertire. When I paid £2 a ton for the carriage of goods from Nevertire it was during a wet season. The fare for passengers on the coach between Nevertire and Warren is 5s. Six coaches are running on the line. The whole of the traffic from the Lower Castlereagh and Mara Creek goes through Warren. There are two coaches running three days a week from Coonamble, and they always have a fair load—at any rate the owners are able to make a living. At a charge of 2s. per head on the railway I think the number of passengers would be sufficient to represent a revenue of £400 per annum, estimated by the Railway Commissioners from this source. In fact, I believe the revenue would

Mr. J. Struthers. 9 May, 1896.

would be greater than that. The estimate of 2,500 tons of goods that would be carried on the railway per annum would, I think, be realised, and the estimate of 40,000 bales of wool I consider low, as 57,000 bales of wool have been sent from the Nevertire railway station in one year. The estimate of the Railway Commissioners, that 2,500 trucks of live stock per annum would be carried on the railway I should say would be more than borne out. If the railway were constructed to Warren there would be a larger amount of settlement in the district, and a greater area of land under wheat. At present the charge for carrying wheat to Sydney from Nevertire by rail is about 12s. 6d. per ton. A railway to Warren would not only be a benefit to the business people in the town, but would also largely tend to increase production in the district. I could not state exactly the extent of land, apart from special areas, available for selection within 20 miles of Warren, but I think there is sufficient to enable 1,000 more people to be settled on the soil. Land close to Warren has been offered in special areas at £4 per acre, but I think it would be possible to buy every selection in the district, including improvements, at a less price than that. In my opinion, as a business man, the high prices which the Crown are asking for land are detrimental to settlement. If they were prepared to sell the land at reasonable prices it would be readily taken up.

To Mr. Hassall: The road to Nevertire is in wet seasons practically impassable, and in dry weather, though there is some water at Sandy Creek, there is none available at Nevertire, for stock will not drink the water in the Government tank. In a dry season you cannot depend upon getting water at Sandy Creek. The difficulty of transit between Nevertire and Warren is much increased by the fact that the road for nearly the whole distance is fenced on both sides; only one portion is unfenced, but that is liable to be fenced at any time by the lessee, who has threatened several times to do so. If it were so fenced it would be confined for the whole distance to a width of 4 chains. The land in this district is suitable for closer settlement than at present exists. Along the river the land is considered to be second to none in quality. Agriculture has been successfully carried on at Narromine, as the members of the Committee might have seen as they came along the railway line. The land in the district of Warren is of similar quality, and the rainfall quite as good. The people here dread the road between Warren and Nevertire, because in wet weather they practically get bogged, and in dry weather the sheep are injured by having to pass through the crop of burrs along the road. I consider that all the stock that now travel from here to Nevertire for shipment by rail would be trucked at Warren if facilities were provided. We have better facilities here both in regard to the commonage available and the water supply. There is better provision by which they could obtain both good feed and pure water before starting on a long railway journey. All the fat stock from the district travelling by the roads converging at Warren are trucked at Nevertire. An odd lot of sheep may, perhaps, be sent to Trangie in order to avoid the road between Warren and Nevertire. It is the general opinion of stock owners that it would save their stock from being knocked about if they could be trucked at Warren, instead of travelling on the road to Nevertire. With regard to the country to be served by the proposed railway, if it were constructed to Warren, and for some considerable time did not go any further, it would certainly in wet seasons command all the traffic from Mara Creek. At present the traffic to Nevertire comes from country as far as 50 or 60 miles down the river. If the railway were constructed to Warren it would command all the traffic from the Marthaguy and from the Meri Meri. With regard to the Castlereagh, the bulk of the Coonamble traffic comes through here now, and if the railway were extended to Warren we should get the whole of it. We get the traffic from Walgett, and down the Barwon. All the wool from that country as far as Brewin and the return goods pass through Warren. The traffic to the east and north of Warren would not gravitate to the railway higher up, but would go through Warren, which is practically the converging point for the whole of these river districts, the traffic from which naturally comes here to get to the nearest point on the railway. The country in the districts just mentioned is good grazing country, and a great portion is good agricultural country. At present it is principally under pastoral occupation, the stock carried being principally sheep, though there are some cattle. There are a number of large holdings, but there are also a great many small holdings—selections which have come into existence within the last eight or nine years. When the pastoral leases fall in, I anticipate that the settlement in these localities will be nearly doubled. The settlers in the district I believe are doing very well indeed. There is very little private land along the proposed railway, and though I cannot say that this will be given free of cost, I am in a position to state that if the Government should take the land over at a fair valuation, the people in the district will willingly subscribe towards its payment. When droughts occur in this district forage has to be imported at a pretty heavy cost. The railway people meet us very fairly with regard to the rates charged, but the cost of carriage from Nevertire is very expensive. Any quantity of timber for railway purposes could be obtained along the banks of the Macquarie. All the sleepers for the Cobar line were procured about 4 miles up the river. It consisted of red gum, of which there is still a large quantity on the other side of the river. A bridge was commenced so that the timber might be taken across the river to the saw mills, but a flood occurred, which stopped the operations, and the timber had to be obtained elsewhere. The red gum which it was intended to remove is still there. There is plenty of pine, suitable for station buildings, at a distance from Warren of from 8 to 12 miles. In regard to timber suitable for piles and waterways, it would be necessary, perhaps, to go 30 miles for ironbark, but plenty of suitable timber, such as gum, could be obtained in the vicinity of Warren. Piles could be obtained in lengths of from 18 to 20 feet. In regard to ballast, gravel has recently been found close to the town, near the site of the proposed railway station, where a gravel-pit has been dug. The gravel is about 8 or 10 feet from the surface. I am not aware of any reasonable opposition to the proposed line. We have had many public meetings in favour of the railway, but none against it, nor has there been any counter-petition. I think there would be sufficient traffic between Nevertire and Warren to justify the running of a daily train, which would be a mixed train. In the wool season the traffic would be exceptionally heavy, but at other times of the year there would not be so much. In the event of the proposed railway not being constructed, the residents of Warren would be justified in asking for the construction of a road, which would cost nearly as much as a railway, and give no revenue in return. Failing a railway, Warren would be entitled to a macadamised road, and a stock route of 4 chains, kept clear of burrs. There is no metal available for the formation of a macadamised road. I do not think that the reason why small holders, as a rule, run more stock than large holders, is because they utilise their land to better advantage by subdividing it into paddocks, thus giving the land a spell now and again. The reason why small holders carry so many sheep is that if a man has only 2,560 acres of pastoral land, he runs upon it more than one sheep to the acre, and if a drought

Mr. J. Struthers. 9 May, 1896.

drought comes he has a risk of losing the whole of his stock, so that to a certain extent he "chances" it. If a railway were constructed to Warren, I believe several large industries would be established, including a flour-mill, freezing works, soap works and other industries. I believe this would occur before the line had been open twelve months. The want of direct railway communication prevents the people of this district from establishing industries which, while profitable to themselves, would employ a large number of men.

To the Chairman: In regard to the resumption of private land, I have made inquiries, and I find that there is only one owner who will not consent to give his land free—I refer to Mr. Ryrie, who owns land adjacent to the town, through which the railway would pass for a short distance. It is possible that he may yet consent to give the land free. But should the construction of the railway be recommended, the people of the district will willingly subscribe towards the purchase, at a fair rate, of any private land that may be required. The proposed site for the railway station is on land belonging to the Government, and not to Mr. Rutledge, as stated by Mr. Harper of the Railway Department. As mayor of the town, I am in a position to state that where a private owner will not give the land required for the railway free of cost, the residents of Warren will be prepared to put their hands in their pockets, and pay for it, whatever may be the arbitrated value.

MONDAY, 11 *MAY*, 1896.

[*The Sectional Committee met at the Court-house, Warren, at* 10 *a.m.*]

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

THOMAS HENRY HASSALL, Esq. | FRANCIS AUGUSTUS WRIGHT, Esq.

The Sectional Committee further considered the proposed Railway from Nevertire to Warren.

Mr. Herbert William Dundas Nardin, Solicitor, Warren, sworn, and examined:—

Mr. H. W. D. Nardin. 11 May, 1896.

To the Chairman: I am a solicitor practising at Warren, where I have resided for the last two years, and I occupy the position of secretary to the Warren Railway Extension League. Before coming to reside at Warren, I was acquainted with the district for about six years.

To Mr. Wright: In regard to the traffic passing through the district of Warren, the report of the Railway Commissioners for the year ending 30th June, 1894, shows that 40,890 bales of wool were received at Nevertire, while in the year 1893 the number of bales received was 29,583, showing a large increase. Together with Mr. Harper, of the Railway Department, I went through the list of stations and holdings from which the wool was received at Nevertire, and found that fully 85 per cent. came through Warren. For the same period the goods sent by the railway from Nevertire outwards amounted to 8,478 tons, including wool, and the goods received amounted to 2,803 tons, making a total inwards and outwards of 12,281 tons. In regard to the goods other than wool, I should say that the proportion sent from and received at Warren was about 85 per cent. I believe that fully four-fifths of the total tonnage inwards and outwards at Nevertire passed through the town of Warren. The following is a list of stations and holdings from which wool is sent to the railway at Nevertire, and which receive return stores, &c., and I believe it to be correct:—

Warren Downs	Merimbah	Bundilla	Gradgery
Warrana	Back Creek	Woodlands	Major
Bimble	Quilbone	Woodside	Drungalear
Bullarora	Pier Pier	Billaroy	Marebone
Wingadee	Warrie	Carwell	Umangla
Polly Brewan	Bourbah	Stanley	Jedburgh
Terrobile	Myall Park	Regensbah	Hatton
Terembone	Avoca	Benah	Bullagreen
Urawilkie	Myall (Bullagreen)	Mount Harris	Gillendoon
Tooloon	Collie	Kiameron	Overflow
Nebea	Dragon Cowell	Grahway	Geanmoney
Neinby	Merrigal	Buttabone	Belagula
Haddon Rig (133,000 sheep, 1894)	Eurobla	Raby	Baangal
Weemabung	Meryon	Mumblebone	Coonimbia
Emby	Oak Vale	Reddanville	Quabathoo
Ellerslie	Wonbobbie	Wanbandry	Mungragambone
Eversleigh	Emu Park	Millawa Park	Wallangambone
Noonbah	Macville	Combogolong (25 miles from Walgett)	Gum Holes
Quambone	Pigeonbah	Merri Merri	Wangawalli (30 miles from Walgett)
Mayfield	Tenandra		

The stations named certainly send their wool through Warren, and there are no doubt others that I have omitted from the list. I cannot give the aggregate clip of these stations and holdings, but it can be approximately ascertained by the return of the total amount of wool received at Nevertire. I believe the residents of Warren would be quite prepared to pay 5s. a ton for goods conveyed by rail to Nevertire. When the Railway Commissioners were in the district, they expressed themselves as quite willing to do so. They would rather pay 5s. a ton by rail than 15s. a ton by road. In regard to the passenger traffic, according to the railway returns for the year 1893-4, 4,305 passengers were booked at Nevertire, and of these I consider that three-fourths went through Warren. I have put down the number of passengers on the railway from Warren at 3,000. On the main Coonamble Road there are two separate lines of coaches running three times a week, in addition to the Quambone coaches. I have known three or four coaches, including special ones, to run on the one day from here to Coonamble. People returning to their homes at or near Coonamble in small parties frequently engage a special coach. They prefer to hire vehicles rather than go to the expense of keeping their own horses waiting here for them, especially in the dry times. Special coaches are also used by commercial travellers journeying between Warren and Coonamble, who require special accommodation for their samples. With regard to the stock traffic by railway, the official returns for the year 1894-5 show that there were sent from Nevertire by rail 160 horses, 6,588 cattle, and 324,215 sheep. As 85 per cent. of the wool came through Warren, it is only fair to put down the stock passing through this town at the same proportion. The figures with regard to the stock traffic were not prepared

in

Mr. H. W. D. Nardin. 11 May, 1896.

in conjunction with Mr. Harper, who puts down the number of trucks at 2,500. The number of trucks estimated by me is 2,925, which at 3s. makes a total revenue of £438 15s. The following is my estimate of the probable revenue from the railway:—

	£	s.	d.	£	s.	d.
3,000 passengers each way at 4s. (*i.e.*, return fares) ...	600	0	0			
2,700 sheep trucks at 3s.	405	0	0			
225 cattle trucks at 3s.	33	15	0			
5,000 tons of wool at 3s. 9d. per ton	937	10	0			
3,800 tons of goods at 5s.	950	0	0			
				2,926	5	0
Mails				144	0	0
				£3,070	5	0

The cost of the mail service at present is £59 a year. The figures I have given are prepared from the best information obtainable, and I believe them to be correct. The district of Warren is very well watered. The Macquarie River runs through the town, and in the Burlong Creek there is a permanent supply of water, which will be supplemented when a channel is cut into the creek in the Macquarie River at the point where a weir has been constructed. There is also a supply of water in the Ewenmar Creek about 2½ miles on the north-east side of the Macquarie River. The district is well supplied with travelling-stock routes, and there is seldom any complaint in this respect, There are several water and camping reserves. A second weir has been constructed 30 miles up the Macquarie River, where it is intended to send an extra supply of water down the Ewenmar creek. I have prepared a map showing the extent of country to be served by the proposed railway extension. Wool would come in from stations about 100 miles to the north and north-west. I consider that the construction of a railway would induce settlement in the district, and lead to cultivation. Even in my own time there has been an increase of cultivation. Although the railway would not in my opinion be of very much value to those cultivating land as affording a market in the direction of Sydney, yet the settlers would have supplies brought from Sydney to satisfy their wants, although they might send their wheat out back. I do not see any reason why the people of this district should not grow wheat, and supply flour to the back country. If the railway were constructed it is probable that a flour mill would be erected in the town, and several other industries started, such as freezing works. We could start freezing works here just as they have done at Nyngan and Dubbo. A lot of the stock treated at Dubbo comes from the Warren district. I am aware that there is already a freezing depôt at Dubbo and another at Nyngan, and that it is very expensive to construct these works, but at the same time it is in the interests of the pastoralists to have freezing works established at the nearest points. I think a boiling-down establishment could be started in conjunction with the freezing works. Closer settlement, and a larger cultivation of cereals, would result from the construction of the railway. As regards the character of the land, the district is considered one of the best in the colony. The rates at present charged for carriage between Warren and Nevertire, namely 15s. a ton for goods, and 5s. for passengers, is exceptionally high. From Gulgong to Mudgee, a distance of 20 miles, the charge for passengers is 3s. return, as against 7s. 6d. return between Warren and Nevertire, a distance of 12½ miles. Between Mudgee and Cassilis, a distance of 60 miles, the return fare for passengers is 8s. The reason of this difference must be that the roads in the other districts referred to are in better condition. The roads are not composed of the black soil which is found here, and horse feed is not so dear. In a dry season, when the roads are in good order, feed in this district is very scarce, and it costs the carriers a good deal to keep their horses, while in the wet season they have to use a great many horses, and the difficulty of the work knocks them about a good deal. I have known people to give £1 to be conveyed from Warren to Nevertire in a really wet time. The late Police Magistrate at Dubbo told me that it took him twelve hours to go from Warren to Nevertire on one occasion. Chaff is produced in this district. We cannot supply our own wants in a bad year, but can do so in a good season when, owing to the plentiful supply of grass, much chaff would not be required. Considering the large number of teams employed to and from Nevertire, the consumption of chaff must be very great, except of course in a really good season. The district could grow enough chaff and corn to supply the wants of the carriers and coach proprietors, but I cannot say that it does so now, though I know that a great deal of chaff is grown. Mr. Seale, over the river, grew a good deal of chaff last year. The butter consumed in the district comes from the south coast to a great extent. Sufficient milk is produced locally. In summer the climate would be too hot for dairying.

To the Chairman: I should like to give information as to the value of land about the town of Warren. An allotment at the lower end of Dubbo-street was sold by F. C. Thompson & Co. at the end of last year, and realised £87 5s., the purchaser being Dr. J. H. Wilson. Three years ago this block was purchased at the Government sale for £40. The area is about half an acre. Nearly all the special-area land open for selection in the vicinity of Warren has been taken up. The upset price varied from £2 10s. to £4 an acre. In the Act of 1895 there was a section allowing the holders to apply for reappraisement within three months from the 1st June. Although it was considered that the prices paid for these lands were high, very few of the purchasers applied for reappraisement. At a Government land sale on the 29th January, 1896, an allotment, offered at an upset price of £40, realised £80. In regard to the return of stock trucked at Nevertire, of which 85 per cent. passed through Warren, the figures for the year 1894–5 exceed those I have quoted for the year 1893–4. Last year the number of bales of wool was 45,000, in the previous year 40,000, and the year before 29,000.

Mr. William Robert Rowles, Storekeeper, Warren, sworn, and examined:—

Mr. W. R. Rowles. 11 May, 1896.

To the Chairman: I am a storekeeper residing in the town of Warren, and also a selector, holding a special area. I have been in business in Warren for about seven years, though I only came to live at Warren three years ago. I have held the special area for a little over three years. Its area is 111 acres, and I paid £3 5s. an acre for it. It is 2½ miles from the town, and within the municipality. I purchased it at a sheriff's sale, and it was then in a virgin state. Forty acres have since been cleared. It must have cost from £3 to £4 an acre to clear the land ready for the plough. At present I have 15 acres of orchard, in which are growing about 600 summer fruit trees, about 150 citrus trees, and about 500 vines. I have also 500 or 600 rooted cuttings, all ready to be put out this coming year, and for which the land

is

Mr. W. R. Rowles. 11 May, 1896.

is already cleared. Within the area of the orchard I am also growing experimental crops, consisting of Kaffir corn, better known as Darrah, two or three varieties of sorghum, and some broom corn. I have had also a little wheat, oats, barley, potatoes, and pumpkins. In another paddock, which I have cleared ready for the plough, I have more sorghum, maize, and Darrah, and I have also experimented with Johnstone grass, or evergreen millet, which I think is a very suitable fodder for this district. I have had two cuttings of this since last September, and have placed 3 acres more under cultivation. I have also 20 acres ready for the plough. We started ploughing with the intention of putting in cereal crops, but the ground being dry for the want of rain, we had to give the work up for this season, and that ground is at present uncultivated. I submitted three samples of the soil to the Department of Agriculture, of which they analysed two. They state that it is "well adapted for fruit of all kinds, and grapes and oranges especially." And they say further that "in all respects it is an excellent soil, and should grow anything suitable to the climate of the district." I produce for the inspection of the Committee specimens of oranges and lemons grown in my orchard, the product of the first trees planted. I had a good show of summer fruits, particularly Japanese plums, which are suitable for a dry climate. I may mention that I planted some Kaffir corn in September, and I cut it down for stock in January. We had good rains in February, and the sample produced shows the second growth, which it will be seen is of exceptional size, especially as we have had comparatively little rain since February. It is an admirable variety of fodder plant in an unusually dry district. It has made about 5 feet of growth since it was cut down in January, and it was then 6 feet high. I produce a specimen of sorghum which was also planted in September, and which represents a fair average growth; its height is from 6 to 7 feet. Also a sample of broom corn planted in November. It will show that the soil is of a good quality, and very productive, even under ordinary conditions. In regard to vegetables, we need not depend upon our celestial friends for pumpkins, as the members of the Committee will see from the two varieties I now produce. I do not irrigate my land, but adopt a system of thorough cultivation—continually working the soil—which, I think, is of more importance than irrigation. In regard to the growth of cereals, I had little less than an acre growing oats, wheat, and barley, which I cut for feed. Agriculture is of comparatively recent date in this district, but I know of two or three farmers who have been fairly successful with their crops. Two farmers here were able to supply chaff for all the horses that were employed during the construction of the weir, and there were over 150. A farmer named Boucher, living 8 miles down the river, has about 30 acres under wheat, and his crop realised from 25 to 30 bushels to the acre, which would be only a fair average crop. Most of the chaff consumed by the local teamsters is not grown and cut in the district, but is obtained from Nevertire, to which place it comes by rail. The teamsters, when they go to Nevertire, generally buy from the commission agents there, for whom they carry. I am a storekeeper at Warren, but not in a large way. Financially, I consider the district exceptionally sound. I have lived in Tamworth, Singleton, Hay, and Dubbo, and I think Warren, in a financial sense, compares favourably with any of those towns. I believe that if a railway came to Warren it would give a great impetus to agriculture. So far most of the agriculture has been carried on by the special-area holders on land comparatively close to the town. But if these men simply depended on their crops I do not see how they would be able to make a living out of the very small areas they hold, and pay three or four shillings per acre rental. At present the profit from my land is prospective. You cannot, of course, get any return from fruit-trees for the first year or so. I fully anticipate that the speculation will be a good one. Nothing had been done with the land before I purchased it. The holders of special areas in the vicinity of Warren are not, as a rule, making a living out of their special areas only. Most of them depend on something else as well. There are not many abandoned selections in the district, and people are not leaving their selections. The percentage of those who have got into difficulties and have been sold out is very small. I pay 15s. a ton for the carriage of goods from Nevertire. This is not a high rate considering the state of the road, but it is high in comparison with the rates in districts where the roads are good. On the road between Nevertire and Warren I have seen twenty-eight bullocks yoked to a waggon, which they have been unable to move. On one occasion it took me seven hours to go from Warren to Nevertire in the coach. We had three changes of horses. It would be a great boon to the people here if they could get passengers and goods carried at reduced rates. And if a railway were constructed, little or no traffic would be taken by coaches or teams between Nevertire and Warren.

Mr. Michael Henry Seale, Stock and Station Agent, Warren, sworn, and examined:—

Mr. M. H. Seale. 11 May, 1896.

To Mr. Hassall: I have lived in the district about five years. Before coming here I resided on the Lachlan below Forbes, and for nearly ten years I lived out on the Darling, about half-way between Wilcannia and Bourke. I have been in business at Warren for about five years, and am a member of the firm of Joseph Leeds & Co., of Sydney. We do a large amount of business in selling store and fat stock at Warren, and also attending to and sending fat stock from Nevertire to Sydney by train. In the year 1894 nearly 30,000 fat sheep must have passed through Warren to be trucked at Nevertire, and between 2,000 and 3,000 fat cattle. That is in connection with my own firm. We do not use the train for store sheep. In the course of twelve months our sales of store sheep would amount to from 40,000 to 50,000, and about 5,000 head of cattle. The number of sheep passing through Warren to go by train in the course of twelve months, is between 250,000 and 300,000, and the number of cattle, of which I have no record, is about from 15,000 to 20,000. The whole of the stock coming from this direction to be trucked at Nevertire has to pass through the lane that has been referred to. There is no other way to get to Nevertire except across the Burlong Bridge near Warren. The country round this centre is pastoral country. I should call it first-class pastoral country. The country beyond Warren north and north-west would compare with the country you saw yesterday when you visited Gunningbar. It is, perhaps, not quite so open as that country, but very nearly the same. There are portions just as open. This good country extends right through to Walgett on the north, right through to the Barwon on the north-west, and to Coonamble and further on to the north-east. Towards the east it is very good for 40 miles. It practically embraces the whole of the country between the Castlereagh and the Macquarie, and extends lower down on the west side of the Macquarie and down the Mara Creek. The whole of this country I should describe as first-class pastoral country. It carries sheep principally. There are not many cattle stations now, but the Mole country is stocked with cattle. Every yard of the country I have described is occupied.

Mr. M. H. Seale. 11 May, 1896.

occupied. No portions of the pastoral leases have been thrown up. It contains no worthless country at all. Some of it is scrub, but that is good country if ringbarked. There are a great number of small holdings, and also some large ones. There are a large number of selectors scattered right through that country to the Barwon. Practically they occupy the whole of the resumed areas of the various runs. I do not think there is any of the resumed area left. I think these men are all in fairly sound positions. They are all well able to do business at any time. In buying stock numbers of them are always prepared to pay cash. They do not want to give bills for twelve months to renew for another twelve months; but in this district there are a lot who can do with a six months' bill. Practically the whole of the traffic on the territory I have described converges at Warren, in order to get to the railway at Nevertire. The state of the ordinary bush roads from Warren outwards depends upon the character of the seasons. If it is dry, the roads are good, but if it is wet, they are very bad in places. The teamsters have plenty of sea-room to get backwards and forwards. About eight different roads converge at Warren, and the traffic is there concentrated on one track. If stock-owners could get stock conveyed at 2s. 6d. per truck between Warren and Nevertire, I think they would be willing to pay that amount. Taking all seasons, I think also they could afford to pay 2s. 6d. a ton for the carriage of wool between Warren and Nevertire. In regard to the objections to Nevertire as a trucking station for stock, I may say that in the dry time there is scarcely any common there on which stock can feed. In addition to that, it is not a good place for water. There are plenty of water in the Government tank, but stock that are not used to drinking out of troughs will not go there to drink. Besides, the water is discoloured, and sheep do not care for it. I have seen sheep drink there, but cattle will not look at the troughs at all. The stock passing through Warren have had scarcely any experience of drinking out of troughs, and when they get to Nevertire, they see these troughs for the first time, and will not go up to them. The probability is that a lot of cattle, or the majority of them, will go into the trucks at Nevertire without a drink. This would affect their value to a certain extent, especially with a long train journey before them, and the probability of their having gone dry the day before. These objections would be overcome if Warren were used as a central trucking-station, and facilities provided for the loading and unloading of stock. In the first place, we should have a permanent supply of good water here. We have the Macquarie River, and also the Burlong Creek, which always contains water. Ever since I have been here I have seen plenty of water. The town common embraces the two water-courses I have mentioned. Stock coming to a railway station here would cross both; they would travel up the one, and cross the other. They would, therefore, be able to get a good drink before going into the trucks. There is a more extensive common at Warren than at Nevertire, but the country is not better. In grazing capability it would practically be about equal. Another objection to trucking at Nevertire is the fact that the stock have to traverse the road between there and Warren. That road is very bad in the winter time, and also in the summer, because it is now almost practically one lane. I think it will not be very long before the portion called Snakes Plain will be fenced in, so that there will be only about 4 miles out of the 12 along which the road will not be fenced in on both sides, giving a width of only 4 chains. The effect of taking a flock of sheep through a long lane like that, in which there are plenty of Bathurst burrs, is that they will be covered with burr at the other end. The burrs alone would reduce the value of the sheep by at least 6d. a head. In addition to that, if the weather were wet, another 6d. a head would be taken off the value of the sheep, so that, practically, the sheep would be worth 1s. a head less in the market through having to travel along this road under the circumstances mentioned. The roads from Warren outwards are very clear of burr. Nearly all the stations keep them very clean. So that practically, stock arriving in Warren are in a good, clean, sound condition. But when they get to Warren there are a few burrs growing on the common. These may be removed later on either by the Town Council or some other authority. If Warren were made the principal trucking station I think steps would be taken to clear the common of Bathurst burr, in order to assist stock-owners to send their sheep down in first-class order. The year before last the burrs were very long on the Nevertire common, and a firm at Nevertire, as well as our own firm, paid men to cut the burrs on the common, so that we could get the sheep to the trucks without their being covered with this pest. On odd occasions our stock are delayed at Nevertire for want of trucks, but I do not think that is altogether the fault of the Government. It arises perhaps through the trucks not having been ordered in sufficient time. Stock may arrive earlier than was intended, or the drover may not have given sufficient notice that he would be here on a certain date, and the trucks have not been able to be here by that date. In the event of stock having to remain at Nevertire for a day or two, they, of course, do not get much feed. Warren would be a superior place as a depôt under circumstances of that character. A few miles from Warren you could manage to get paddocks for the stock if they arrived before their time. As a man who has had five years' experience of Warren in connection with stock, I am of opinion that it would benefit this great pastoral district if the railway were extended here, and increased facilities thus given for the conveyance of stock to market. In the event of the railway being extended to Warren, I think there would be a movement towards the establishment of chilling or freezing works. The idea has been mooted for some two years. My own opinion is that Warren would be a very suitable place for the purpose, commanding as it does such a large extent of first-class pastoral country. There is a number of convenient places which could be obtained close to the town on which to erect boiling-down and chilling works. Warren and the district around compare favourably with any other district that I have been in. In fact, I do not know any better district in New South Wales. I have been to Moree, and this district is of a very much similar description. I think the prospects of the district would warrant the Government in constructing a railway from Nevertire to Warren, and from my knowledge of the extent of business carried on in stock and goods, I believe it would be a payable speculation. In reference to stock and goods, as well as passengers, going to Nevertire from the Warren side of the Macquarie, I would point out that they must come to Warren. There is no other crossing-place between here and Coorinda, a distance of nearly 100 miles. All the roads converge at Warren, and there is no other crossing-place on the river.

Mr. Daniel M'Alary, Selector, near Warren, sworn, and examined:—

Mr. D. M'Alary. 11 May, 1896.

To Mr. Wright: The country there is similar to that in the neighbourhood of Warren, consisting of myall plains and occasional pine scrubs. It is all good pastoral country, and good agricultural country as well. Land has been cultivated in that neighbourhood. I have seen wheat growing on Haddon Rig. I live

Mr. D. M'Alary. 11 May, 1896.

live on the adjoining run. The wheat I saw grown on Haddon Rig was a very fine crop, and, as far as I remember, the season was an average one. I could not state the rainfall in the part where I live. Although wheat-growing would not be a success every year, taking one year with another, I believe that a larger yield per acre could be grown here than in any other part of Australia I know of. I do not think it would pay to grow wheat at 2s. 6d. a bushel, either here or anywhere else, and I made my living for a number of years by growing wheat. If it paid to grow it anywhere else in the colony, it would pay to grow it here. I know the Goulburn River in Victoria very well, and I know that it does not pay to grow wheat there at 2s. 6d. a bushel. The soil here is better than any on the Goulburn in Victoria, and, taking one year with another, we could produce more wheat per acre than can be produced on the Goulburn River in Victoria. Though we have not as good a rainfall, we have a far better soil. All the land within a radius of 20 or 30 miles from here available for settlement in small holdings has already been taken up. All the resumed area is gone. In the event of the leasehold areas being thrown open, every acre of it would go within one month. It would be taken up by *bona fide* selectors looking for homes. It would not be in the shape of additional conditional purchases. A great many new-comers would take up this land, and many of those already here would take up additional holdings. No doubt the sons of many of the people already here would take up land apart from their parents, and I suppose some of the station hands would also take up land. While matters remain as they are at present, without a railway, the settlers here must produce wool. If a railway were constructed, the land within 20 miles of Warren would probably come into other forms of occupation. I believe that dairying would be one of the principal occupations, and I think also wheat production. It has been said that dairying operations could not be successfully carried on here in summer time unless ice could be obtained, but, in my opinion, if a railway were constructed, we should soon have a refrigerating establishment second to none in New South Wales, where meat would be frozen and tinned. I have no doubt that such would be the case, and I would take 1,000 shares to-morrow myself. I see no reason why dairying should not be carried on successfully. At present a great deal of the butter used in the district comes from the South Coast. There is some good pine out where I live, and some box, though I am not aware that the latter is useful for any purpose. I am quite confident that if the leasehold areas were thrown open not an acre of it would be left within one month. Before coming here I lived on the Ovens River in Victoria, and I also lived for four years on the Tuppal Station on the Murrumbidgee. From my knowledge of this district I should recommend my friends in Victoria to come here and take up land for selection. Some of them have already done so. My opinion of the district is so favourable that I think it would be a good thing for any man to come and settle here. I have brought members of my own family here, brothers and others, and have tried to induce other men to come. I should like to see the railway go even beyond Warren—to Coonamble, or anywhere through the producing district. If the railway went to Coonamble it would go near my place, the surveyed line being within half-a-mile of one portion of my holding. A railway to Nevertire would do the people around my neighbourhood a great deal of good. I had fat sheep one year, and I sent one draught of them to Nevertire. The roads were very bad at the time, and I resolved to wait until they were better before sending the others. The road between Warren and Nevertire continued so bad that I had to keep these sheep, over 1,000 in number, and shear them, and I consider that I lost at least 6d. a head by keeping them. Had there been a railway at Warren they could have been trucked here, because you can always get to Warren. When I speak of the road being bad I refer particularly to the road between Warren and Nevertire. Had there been a railway at Warren the loss I suffered would not have occurred. My case is a typical one, and others have been in the same position. My place adjoins a travelling stock route, along which a great many stock travel from the Coonamble direction. I think stock-owners would prefer to send their stock from Coonamble to Dubbo, rather than along the road past my place, which it is not always possible to travel. I am convinced that at least 50 per cent. more sheep than are now trucked at Nevertire would be trucked at Warren if we had a railway station here. Sheep that are now trucked at different stations between here and Dubbo would come to Warren. The owners now send them to these other stations, because they dread the 12 miles of road between Warren and Nevertire. In winter time that road is almost impassable, and in summer time there is no water for the stock. There is a tank at Nevertire, but my experience is that sheep will not drink out of it. I would not even think of trying my sheep at it, because they are not used to drinking out of troughs. If I attempted to get them to drink, the result would simply be to knock them about, and I do not suppose that 1 per cent. of them would taste the water. I have never tried to give my sheep a drink there. I think the railway, at any rate, should come to Warren, and I am quite satisfied it would pay the Government well. If it were necessary I should be quite prepared, as a producer, to pay special rates on the line between here and Nevertire, but I feel quite satisfied that special rates would not be necessary. In common with other producers, I would not object to pay 2s. 6d. or 3s. a truck for sheep and cattle from Warren to Nevertire. That would be less than the present cost, besides being of benefit to the stock. I do not think it likely that the people would afterwards turn round and repudiate the special rates, because it would be a decided advantage to them to pay the rates proposed by the Railway Commissioners.

To Mr. Hassall: The area of the land I hold is a little over 12,000 acres, and it carries at the present time between 9,000 and 10,000 sheep. I send the whole of my wool through Warren to Nevertire, and receive my goods back from Nevertire through Warren. There are a great number of selectors in my locality in a similar position to myself, some holding almost as large an area, and others not so much. They all do business with Warren, and they would be benefited by the proposed railway, because at present they have to go to Nevertire. In my neighbourhood *bona fide* settlers, with their families, have on an average more than two sections each, and a family holding would range from 5,120 acres to 10,240. These settlers would benefit equally with myself by the construction of a railway to Nevertire, and I feel convinced they would be content to pay the rates indicated by the Railway Commissioners, as it would be an advantage for them to do so. I should like to mention that at present a portion of the wool grown at Coonamble is sent to the railway at Nevertire. The bulk of the Coonamble passenger traffic also goes to Nevertire, and a portion of the goods required by the Coonamble people is brought from Nevertire. I believe if the line were constructed to Warren, and the 12 miles of the worst part of the road got over, the whole of the wool from Coonamble would come into Warren, as well as the whole of the passenger traffic, and all the goods required for Coonamble would be taken from Warren. Therefore, I believe that even in the first year of its working, the returns from the railway at Warren would be more than equal to the present Nevertire returns. The increase in the way I speak of would more than compensate for the loss of the traffic that belongs to Nevertire alone.

Mr.

Mr. William Wallace, Selector, near Warren, sworn, and examined:—

Mr. W. Wallace. 11 May, 1896.

To the Chairman: I am a selector, living 9 or 10 miles from Warren, in a north-west direction; I hold altogether about 4,000 or 4,500 acres, consisting of conditionally purchased and conditionally leased land, and also some annual leases. I have been there between twelve and thirteen years. My holding carries about 4,000 sheep, and about fifty head of cattle. I have a cultivation of 5 acres consisting principally of wheat. I consider the land very good for wheat-growing, and I get a good crop in most seasons. Taking one year with another, I consider it a good district for wheat-growing. I grow the wheat principally for my own consumption, and I make hay of it, of which I get from 1 to 2 tons an acre. I have grown lucerne as well as hay. I think the district is a very good one for growing wheat for grinding purposes. I should say the average yield of wheat per acre is about 20 bushels. In my neighbourhood there are many selectors in a similar position to myself, and so far as I know, they are all doing fairly well. I send my produce to market through Warren to Nevertire, which is a direct line. The quantity of stock per annum which I send to the railway varies. In some years I might, perhaps, send 1,000 fat stock, and in other years I might send 1,500. Last year I sent cattle but no sheep. My holding has a frontage to the Macquarie River. I think the proposed railway is very much wanted. I generally drive my own stock to the railway, and I have had considerable trouble in taking them through the lane between Warren and Nevertire. I can always get to Warren with stock or goods without difficulty; the trouble is between Warren and Nevertire. We can get along the road in a dry season, but there is no water at Nevertire that the stock will drink. I have often paid for the sheep to drink, and perhaps only thirty of them would drink, and the others would go without water. Then in wet weather you cannot get through the lane at all. I have had to ask for permission to go through one of the paddocks, or otherwise I should never have got to Nevertire. By going through the paddock on the occasion referred to, I did the journey from Warren to Nevertire in a couple of days, and sometimes it takes longer. I could not have got there at all if I had not obtained permission to go through the paddock. The road is nearly all fenced in at the present time, and if it were fenced in altogether it would be impossible to get the sheep through in a wet season. Through having to travel that short road the sheep deteriorate in value, owing to want of water in dry weather, and to the bad state of the road in wet weather. If a railway were constructed to Warren I should be prepared to put more land under cultivation, probably about 100 acres, but it would depend upon whether or not it was a paying speculation. Personally, I should be prepared to pay the special rates which have been mentioned if the railway were constructed to Warren, and I have spoken to other selectors, who say they are prepared to do the same. With regard to the carrying capacity of the land in my neighbourhood, in good seasons it would carry a sheep to the acre, but I think, taking all the year round, the average would be about 2 acres to a sheep. That would be on the river flats.

Mr. John Colley, Warren, sworn, and examined:—

Mr. J. Colley. 11 May, 1896.

To Mr. Hassall: I reside at Ravenswood, in the township of Warren. I have been in the district for about forty-four years. I retired from business about five or six years ago. When I first came to the district, the whole of the country, except one sheep station, was under pastoral occupation, and there was just a hut here and there on the river, where the stockmen used to live. There was no sign of the fine buildings that are now seen in the town. There was no mail at the time, and any stockman going to Dubbo, brought back the letters to all the stations as far as he went. I was the first Government postmaster on this river. It is about twenty-seven years since land was first sold in Warren, but there were very few selections taken up for a considerable time. Just over the river a selection was taken up in 1868 or 1869. Very little settlement took place until 1884, when men began to come across from Riverina. The Land Act of 1884 induced people from Victoria and elsewhere who had capital to come here, where they remained and developed the country. They had no idea we had such splendid country, and when they came they sent for their friends, and people came in large numbers and took the country up. Nearly every selector here came from Riverina, and they were all good men. The growth of the district has been very rapid. It was such a good district that it never retrograded, and since it started the town of Warren has steadily improved. It has progressed without any check whatever. I do not suppose you could find a better town than Warren, as regards business and everything else, in the whole of the western districts. Commercially, it is very sound. I have heard commercial travellers say that it is the best township of their experience as far as money matters are concerned. There are no unemployed here, with the exception of a few who may camp about before shearing time. From what I have seen of the district and of its progress during the many years I have lived here, I am of opinion that it has claims sufficiently strong to justify the Government in constructing a railway to Warren. The effect would be to still further increase the prosperity of the district. Many new industries would crop up, including a flour-mill. I consider that the rates proposed to be levied on the railways are reasonable, and believe the people would be perfectly willing to pay them. Considering the prices I have had to pay for carriage when in business, I consider it would be a great boon to get the railway here, and to have goods and stock carried at the prices mentioned, and with those prices I think the people ought to be perfectly satisfied. They are a great deal lower than the prices now being paid for carriage. The people have wanted a railway for a long time, and if the Government refused to construct it, they would be perfectly willing to build it themselves, and were prepared to subscribe the necessary funds. We have been agitating for a railway ever since the late Mr. Sutherland was in charge of the Public Works Department. I think the agitation started in 1882. I have been present at deputations that have waited upon different Ministers on the subject. A direct promise of a railway was received from Mr. Sutherland, and also from Mr. Lyne, and Sir Patrick Jennings. The present Premier, when he was here, spoke in favour of the railway. Everyone who has been in the district and seen the quality of the land, the traffic along the many roads converging at Warren, and the amount of business done, has recognised that we ought to have a railway. At one time I had selections down the river, and I have frequently taken stock along the road from Warren to Nevertire. After very wet weather, when the teams had cut up the road, I have had sheep drowned in the ruts, and I could not get them out. People have had to pay commonage until they could get their stock to Nevertire, the delay lasting, possibly, for a week or ten days. The great drawback to the town of Warren and the extensive district surrounding it is the existence of this length of road between Warren and Nevertire. The construction of a metalled road would not remove the objection. It would never pay to construct a road, because you would have to be constantly repairing it.

Mr. J. Colley. 11 May, 1896.

it. I have seen a bit of road made there, and I have seen teams get bogged in it and capsize. I refer to the part that has been formed by the deposit of sand and earth. In regard to the fertility of the soil, I may mention that some of the land over the river has produced very fine crops. Three crops have been produced in one year off the same piece of land. I have grown pumpkins, potatoes, and wheat successively on the same piece of land in the same year. I have grown as fine potatoes as ever were seen.

Mr. Edwin Utley, Timber Merchant, Warren, sworn, and examined :—

Mr. E. Utley. 11 May, 1896.

To Mr. Wright : I am a timber merchant, and have lived in Warren for about eight years. I started the first saw-mill in Warren. We get our timber between here and Bullagreen, and gradually we have to go further and further away. For the last six months I have been cutting red gum from my own land about a quarter of a mile from where we are now sitting. There is plenty of suitable timber for railway sleepers, but in regard to timber required for bridge work it would be difficult to get it in sufficient lengths. I daresay we might be able to get sufficient timber to supply sleepers for the railway at Warren, but we would have to go some distance away. We took a lot of timber out for the Cobar line. I could supply sleepers, 8 x 4½, for about 7s. a pair. I think I might manage to find sufficient for the line. We have some good pine here, but it is gradually getting further away. We are drawing logs now for a distance of about 24 miles. There is pine growing on Crown land 9 miles nearer Warren than the place from which I am now getting pine. I am getting 10s. per 100 feet for ordinary sawn pine delivered to any building about the town, and 13s. per 100 for dressed timber. There is any quantity of pine to be got at these prices, but it has to be drawn a long distance. If it were determined to construct a railway to Warren I could supply at reasonable prices all the sleepers and all the pine required for the station buildings. With regard to the long stuff required for girders and piles for the bridges, we should have to go into the ironbark country for that class of timber. In fact, I think it would be almost better to get it from the coast. I refer to extra long stuff—anything over 25 feet. There is no suitable ironbark nearer to Warren than about 56 miles. If the railway were constructed I should be able to supply people along the line with timber, and in that respect a traffic would be created. On one occasion it cost me £1 a ton to bring timber from the Nevertire railway station to Warren. If the railway were constructed it would enable myself and others in the same line of business to import foreign and coast timber. In my opinion a railway to Warren would be a great boon to the whole district, and it would do good to the country as a whole. It would pay well, because it would open a lot of country now lying dormant, and some of which will not carry a sheep to 50 acres. I could drive the members of the Committee in an hour and a half to one of the Wonbobbie leaseholds, where there is land that would grow 30 bushels of wheat to the acre, but which, in its present condition, will not carry a sheep to 50 acres. The land, being exceptionally rich, has grown so much scrub that the grass has all been killed, and sheep cannot get a bite off it. It only wants to be opened up for settlement. In regard to the richness of the soil in this district, I may say that when I came down here about eight or nine years ago I rented a small holding of Mr. Cook, and I put the plough in the second day after I rented it. It had not been ploughed for thirteen years, and I got 28 tons of hay off it. In the following year I got as much more. I sowed nearly 2 bushels of seed to the acre. It grew about 7 feet high, and the hay was of beautiful quality. I cleared over £200 off 14 acres of land in two crops. I cut the hay up into chaff, and sold it for £8 a ton.

Mr. Charles Hunter, Manager of Haddon Rig Station, near Warren, sworn, and examined :—

Mr. C. Hunter. 11 May, 1896.

To the Chairman : I am manager of Haddon Rig Station about 20 miles to the north-west of Warren. I have been in the district for about five years, but I have been acquainted with it since 1874. The resumed area of the station is all gone. There are about 47,000 acres of freehold land, out of which there are about 8,000 acres of conditional purchases and conditional leases. There are about 70,000 sheep on the station at the present time, besides a milking herd, and sufficient horses to work the station. There ought to be more sheep on the run, but last spring and winter were very bad, and I had to sell off a lot of sheep to make room. We generally carry about 100,000 sheep or over. Taking one season with another, good and bad, the country will carry about a sheep to 1½ acre. That is a fair sample of the country around. We have double frontage to the Marthaguy, which, however, is not a permanent creek, and we have four dams upon it, which we placed there by permission of the Land Board. The water seldom fails, but it has done so. The dams are very good, and hold the water well. The water at Nevertire, which cattle and sheep will not drink, is tank-water from the surface, and it gets the drainage of the town, and I think that is the reason stock will not touch it. The dams on Haddon Rig, to which I have referred, are all filled by water coming down the creek. With the exception of two or three small portions, the land on the station which has been resumed by the Government, has all been selected. After it was thrown open it was taken up gradually—about the year 1888 and afterwards. It is true, as stated by several witnesses, that directly land about Warren has become available for selection it has been quickly taken up, and it would seem that land is wanted. But I think there are a great many making a noise about wanting land who are not eligible to take it up. I do not think the agitation is genuine—that is to say, not within the meaning of the present Land Act. The policy of the Land Act is that every man in this division should have 2,560 acres and no more, and the agitation for land is got up mostly by people already holding that area, and also by land-agitating agents for their own purposes—to create business. I think there is a fair demand for land around this district, but not such a demand as these agitating agents would lead people to believe. I do not think people have got their eyes on this part of the country as the one place to which to come and settle. We have got remarkably good sheep at Haddon Rig. I do not know that there are any better in the district. I always try to keep plenty of grass for the sheep. I have generally got more grass on Haddon Rig than the neighbouring stations have, and consequently Haddon Rig has a good name for grass, and is said to be better country, which is not the case. It is because the other stations are overstocked that Haddon Rig looks so much better. The land is equally good in quality. It does not do to keep this country too fully stocked without spelling it. Squatting here is gambling with the weather. It will not do to overstock, and allow all the grass to be eaten. I have known 60,000 sheep die on Haddon Rig in three years. Of late years there have been no heavy droughts but what has occurred once may occur again. If a similar thing took place now it would be very disastrous, because the country is much more heavily stocked, even allowing for its improved condition, than

Mr. C. Hunter. 11 May, 1896.

than it was during the bad drought to which I have referred. Now that the railway is at Nevertire, and the Railway Commissioners are allowing store stock to be carried at half price, there is some chance of getting the stock away in dry seasons. During last winter and spring there was a drought which affected most of this country, and had it become a little more severe I do not know where the sheep could have been taken to. I could not have taken advantage of the railway, and the sheep would have had to remain at home and do their best. I think the country about here is suitable for holdings about 2,560 acres in extent, and that with that acreage men can make a fair living, more especially where they have a family and can take up a few selections and manage it themselves. I know some who are doing very well—steady, hard-working, decent fellows. As a rule the men with holdings, such as I have just mentioned, are industrious settlers, doing fairly well. With regard to agriculture, I reckon that if I get one crop out of three I do very well. That has been my experience. I grow a wheat crop because it is the hardiest. I always like to keep a big stock of hay. I generally put wheat in every year, reckoning upon one crop out of three. I cultivate about 50 acres—just sufficient to grow a reserve of hay. With regard to the rainfall, I have statistics since 1878, and the average is about 18½ inches. It is a very fair average for country of this character, but I have known the rainfall to be as low as about 9 inches, which, of course, means disaster. We had a very bad drought in 1888, but it lasted only one year. When droughts occur, as they used to do in the olden times, two and three years running, then they become very serious in their effect. I do not deal in fat stock, but sell sheep as stores in bulk, and, with regard to my station supplies, they come from Nevertire through Warren, and my wool all goes through Warren. I can tell what I have sent away during the last three years, and the figures will show fluctuations in the seasons. In 1893, I sent away 2,203 bales; in 1894, 2,831 bales; and in 1895, 1,704 bales. The reduced number in 1895 meant a bad season and fewer sheep. This did not exactly mean a loss of sheep, because I sold them to make provision for a bad time. In 1895 the clip was a light one. Another explanation of the reduced clip in 1895 was that in 1894 we went through the shearing troubles, and I was nearly three months shearing. In 1895 I had a full board, and I cut through very quickly, which meant that the growth of the wool on the sheep was a month or six weeks less than the year before. With regard to the cost of carriage from my station to Nevertire, I cannot tell the price per ton, as I make a contract in bulk with Wright, Heaton, & Co., who deliver the wool in Sydney. With regard to other people in the neighbourhood, I think they pay about 25s. a ton for carriage to Nevertire, but I cannot say for certain. As to the proposed railway from Nevertire to Warren, considering the very bad condition of the road, which is often impassable, I have had my wool stopped—there is no doubt the railway would be a great advantage. I consider that from 15s. to £1 per ton is a heavy charge for carriage over a road of 12½ miles, but the high rates charged are owing to the state of the road. It would cost far more to make a road than to make a railway, and there would be no return. It is my experience that until the carriers get to Warren they can always get along, as there is, so to speak, plenty of "sea room" for them, and they can make their own road. The trouble begins when the traffic is concentrated upon the one road from Warren to Nevertire, which is the worst bit of road about here that I know of. The road from here to Nevertire is a constant joke, particularly the part at Snakes Plains, as it is called. I have travelled through there in a buggy with a strong pair of horses, and had to walk slowly the whole way. There is no material available for making a road; it would be a most expensive work. The road would first have to be logged in order to get a foundation, and ballast of some sort would have to be deposited on top of that. A light railway could be made at less cost. In regard to trucking stock, there is plenty of good water at Warren, but none at Nevertire, and in this hot country that is very important. In this respect Warren is a more suitable place for trucking sheep than Nevertire. The Government started boring for water at Nevertire, but I believe have given up the attempt. Looking at the fact that I only get one crop of wheat in three years, I do not think this is likely to develop into an agricultural district. Farmers might possibly get two or three consecutive crops, but on the other hand they might have two or three consecutive failures. It all depends upon the seasons. I think it is chiefly a pastoral country. The most distant place from which wool is sent through Warren to Nevertire is Brewin, down near the Barwon, distant about 80 miles. All the wool from intermediate stations comes this way. I have not made a calculation as to what proportion of the wool and other traffic put upon the railway at Nevertire passes through Warren, but I have a pretty good idea of the proportion, inasmuch as a great bulk of the wool and produce sent to the railway at Nevertire goes through Haddon Rig, and necessarily passes through Warren. Except at Gil Gil, about 27 miles from here, there is no means of crossing the river besides the bridge at Warren. There is no doubt that all these things point to Warren as a centre for traffic finding its way to the main line of railway. If a railway is not constructed, it will be necessary to erect another bridge at Warren, as the present one is too narrow for the traffic. There have already been several accidents owing to wool teams jambing in the bridge. I think if a railway were constructed the people here would be willing to pay the special rates proposed to be fixed by the Railway Commissioners, namely, 4s. a ton for goods, 2s. a head for passengers, 2s. 6d. a ton for wool, and 2s. 6d. a truck for live stock. It strikes me, however, that the charge for goods is rather high, and also the charge for the trucking of live stock, because if the road was good the stock would be taken on and trucked at Nevertire. I for one would be prepared to pay the charges mentioned.

To Mr. Wright: I was formerly managing the Gingie Station, on the Barwon. While there I knew of wool coming from the neighbourhood of Walgett in this direction. It came from Brewin, which is about 50 miles down the river this side of Walgett. That is the furthest point from which I have known wool to come in this direction.

To Mr. Hassall: With regard to the cost of conveying stock from Warren to Nevertire, there is no doubt that in summer time the advantages in the shape of a large common and good water supply which exist at Warren would more than compensate for the railway charge from Warren to Nevertire. Sheep take two days to go from here to Nevertire, and when there they do not get a decent drink of water, and consequently are trucked on the railway at a great disadvantage. The stock get feverish, and when they arrive in Sydney they are not in a fit condition for killing. I have noticed this by observing sheep in the butchers' shops in Sydney, the fat of the sheep exhibiting a pink tinge. As a practical man, I am aware that where stock are taken through a lane where they are confined, and where the burrs are pretty thick, a serious injury is done to the wool. It is not the case that the roads leading into Warren are fairly free from burr. Some of them are, but the bulk of them are not. A few of us cut the burr, but the great majority will not do so. For my part, I cut the burr on the Government roads, and everywhere, but the great majority of the people in the neighbourhood will not cut them, and thus they keep up a supply for

me

Mr. C. Hunter. 11 May, 1896.

me to cut again. It is a great pity that the old Act which made the cutting of the burr compulsory was ever repealed, and I should like to see that law introduced again, as nothing is more urgently required. The Bathurst burr ought to be treated as a noxious weed. You could not well get a worse road through which to take sheep than that between here and Nevertire. For this reason I do not think that many stock would pass through Warren to be trucked at Nevertire if there were trucking facilities here, and the charge between Warren and Nevertire were 2s. 6d. a truck, except, perhaps, at a very good time, when there was plenty of grass and water about, which is very seldom the case now.

Mr. Charles Bathurst Halliday, Solicitor, Warren, sworn, and examined:—

Mr. C. B. Halliday. 11 May, 1896.

To the Chairman: I am a solicitor practising in Warren, and I have been here about three years and three months. I produce a plan which was used when the town was incorporated, and which shows that the municipal boundaries are the same as the boundaries of the Warren temporary common. The area is given in the *Government Gazette* of the 24th April, 1895, as 22·8 square miles. The area of the Warren temporary common is between 14,000 and 15,000 acres. A few special areas have been taken from the common, but these amount to a very small portion. Compared with other towns, Warren is exceptionally favoured as regards the extent of its common. The quantity of land taken from the common in the shape of special areas does not exceed 1,000 acres. The common is very well watered, as besides the Macquarie River, the Gunningbar, or Burlong Creek, and also the Beemullnel Creek run through it. I can testify to the activity of the town of Warren as compared with Kiama, Carcoar, and other towns. You see more activity in the main street of Warren in a day sometimes than you would see in these other places in a month, even including some of the towns on the northern rivers, and I have been on the Tweed River. As far as my experience goes, this is a very progressive district. The Tweed River is a progressive district, but there is considerably more life here than in the towns on the northern rivers.

Mr. Henry Arthur Davies O'Connor, Licensed Surveyor, Warren, sworn, and examined:—

Mr. H. A. D. O'Connor. 11 May, 1896.

To the Chairman: I am a licensed surveyor residing at Warren. I was employed in the Warren district from about 1883 to 1889. After that I was away for about five years, and then I came here, where I have been residing for the last two years.

To Mr. Wright: During the first period that I was here I was engaged in surveying all through the district—down the Marthaguy and Merri Merri Creeks. I can give you a pretty good idea how the land is taken up to the north, north-west, and north-east of Warren. Practically the whole of the land available for conditional purchase and conditional lease has been applied for. With the exception of about half a dozen, the whole of the runs in this part of the central division have obtained an extension of lease. In most instances the lessees have five years to run. A few have two years, and two or three have one year, so that, generally speaking, for four years longer this land is all locked up. I consider that it is suitable for settlement. To the north, north-west, and north-east of Warren the country is suitable for comparatively close settlement in blocks of from 2,000 to 7000 or 8,000 acres, occupied by families. If this land were opened now for ordinary conditional purchase and lease the whole of it would be taken up at once. It is in every way suitable for small pastoral holdings. I believe if the land were thrown open now under the settlement lease provision of the Act in suitable areas the whole of it would be taken up. Under existing conditions it would be retained for pasturing sheep; and even with smaller holdings up to 5,000 acres, it would still be used principally for sheep. It may be true to some extent that our rural population do not care for cultivating land when they can get a living by grazing sheep, and agriculture is a hard and laborious work, with uncertain results, while, in the case of sheep-farming, the wool is always growing. Nevertheless, the land in this district, I believe, would be cultivated if the people had railway communication. I believe that if a man had 5,000 acres upon which he could live comfortably growing wool, he would still cultivate 400 or 500 acres, because by doing so he would add considerably to his income. I consider that rapid settlement would take place in this district even without a railway, because the land is so good; but if there was access to a railway agriculture would be combined with grazing. I have been led to believe by men who are now holding the land that if the proposed railway is constructed they will give agriculture a good trial. A very large proportion of the land here is suitable for agriculture, and the rainfall is a fairly good one—somewhere about 20 inches. I do not believe that in the Land District of Warren there are 2,560 acres of land available in one block. I do not think there are many reserves on what we know as the resumed areas. The only reserves I know of are stock reserves and camping reserves. There are no unnecessary reserves. I think if the railway were constructed it would pay from its inception, and that the country as a whole would benefit. It would also be beneficial to the district generally, and to the town of Warren in particular, provided it does not go beyond. The people of the surrounding districts would be able to get their produce to the metropolitan market at lower rates than at present. I believe the railway would pay, because Warren is the focus for such an immense traffic. With regard to the rates indicated by the Railway Commissioners, the general impression is that they are reasonable, and I think the people would be willing to pay them. I have been engaged in appraising land for a good many years in connection with conditional lease rents, and so on. With regard to the value of land in the town of Warren, I daresay that a frontage to the main street would be worth from £7 10s. to £10 a foot. The land in the back streets would be valued at so much per lot. Personally, I do not think that from £3 to £5 per acre for the suburban lands which have been recently thrown open for conditional purchase is too high, considering the terms. There is land within a mile of the Court-house in which we are sitting worth from £10 to £12 an acre—or at any rate within three-quarters of a mile. Beyond that distance the value of the land would rapidly go down to about £4 or £5. There are some sections in the outlying parts of the town that are not yet sold. Probably these are some lands that are subject to inundation. At every land sale which takes place at Warren the land is nearly always sold, and there is an advance on the upset price. If twenty lots were put up to-morrow, comprising half-acre allotments, at the site of the proposed railway station along the flat, I think they would readily fetch £10 each. An allotment was sold there the other day for £80. That might have been partly owing to the projected railway. If this Committee negatived the railway proposal, the land would only be valuable to a man who wanted to use it. It would not have a speculative value. I should say that the intrinsic value of the land on the proposed site of the railway station between the gravel pit and the cricket ground would be about £15 an acre—the intrinsic, and not the speculative value.

Mr. Harold Wingfield Stanford, Crown Lands Agent and Clerk of Petty Sessions, Warren, sworn, and examined:—

Mr. H. W. Stanford. 11 May, 1896.

To the Chairman: I am Crown Lands Agent and Clerk of Petty Sessions at Warren. I have occupied the position of Crown Lands Agent for two years, and that of Clerk of Petty Sessions for four years. I have a return of my work as land agent, which shows the amount of revenue received for the year in the shape of sales, rents, instalments on conditional purchases, rents of conditional leases, rents of annual leases, and proceeds of auction sales. The total revenue from these sources for the year 1895 was £14,253 12s 3d. This amount does not cover the whole of the rents of the land in the district, about half of which would be paid direct to the Treasury. So that really this only represents about half the land revenue of the district. The proportion of revenue derivable from the Warren district would be about two-thirds. The total area of the land district is 2,900,000 acres. The instalments and payments in connection with the land are paid up very regularly. There are very few defaulters. Only about one conditional purchase has been forfeited in the district since I have been here, and very few have changed hands. As far as my observation goes, the settlement which has taken place is of a permanent character. Several areas have lately been thrown open for settlement lease, and the competition for them has been very keen. There have been as many as seventy-five and sixty applicants for one block, and there are always from forty to fifty applicants. I am referring to any area up to 2,000 acres in extent. Where freehold land has been offered the upset price has been generally exceeded. I have the sheep return for the Warren district for the year 1895. The total number of sheep was 617,317. The revenue derived from assessments would be £234 7s. per annum. This number of sheep includes a portion that would go to Nevertire. A very large number of sheep goes through the town of Warren to Nevertire. There are constant complaints about the bridge here—that it is a bad place for crossing, and people come here to see if anything can be done about the matter. A large quantity of wool also passes through Warren in the wool season.

Mr. George Self, Post and Telegraph Master, Warren, sworn, and examined:—

Mr. G. Self. 11 May, 1896.

To the Chairman: I am Post and Telegraph Master at Warren, which position I have occupied for sixteen years. The town of Warren has increased very much within the last three or four years. I have made out a return of the post and telegraph revenue received at Warren, and showing the business done there for the last quarter in each of the years 1893, 1894, and 1895. It is as follows:—Quarter ending December, 1893—Issued, money orders, £1,657 6s. 5d.; commission, £17 4s.; savings bank deposits, £1,590 15s. 10d.; postal notes, £112 11s. 6d.; stamps, £408 5s. 6d. Quarter ending December, 1894—Money orders, £1,324 1s. 6d.; commission, £13 18s. 6d.; savings bank deposits, £1,497 14s. 5d.; postal notes, £206 14s. 5d.; stamps, £365 5s. Quarter ending December, 1895—Money orders, £1,480 0s. 5d.; commission, £18 16s. 6d.; savings bank deposits, £1,030 13s. 5d.; postal notes, £220 17s. 4d.; stamps, £396 9s. 6d. The business transacted is pretty uniform throughout the year. It will be observed that in regard to the issue of money orders and savings bank deposits, the figures for the year 1893 are greater than those for the subsequent two years. The reason of this is, because, owing to the suspension of the banks, which took place about May or June in 1893, the money orders and savings bank deposits were greater at the end of that half-year. There is a mail twice a day from Warren to Nevertire. There is a large amount of money in deposit at the Government Savings Bank here, and the accounts show a very regular average. There is a great number of permanent deposits, the average being about £5,000 a year. Besides the mail coach, there are six others running between Warren and Nevertire, and the owners have been making a living for the last three or four years. There is a very heavy mail from Nevertire to Warren and the district beyond. The revenue for the year 1895 was as follows:—Money orders issued, £4,879 12s. 5d.; commission, £57 6s. 6d.; savings bank deposits, £3,204 19s. 1d; postal notes issued, £686 13s. 6d.; postage stamps, £614 4s. 6d. We do a pretty fair business at the telegraph office, the average revenue being £9 per week.

To Mr. Wright: The number of mails we send to Nevertire per week is twenty-eight. We make up mails for Coonamble three times a week, for Quambone twice a week, for Mount Harris twice a week, and altogether we make up about forty-five mails a week, besides which we have twenty-four private boxes, some being very large. After all the expenses are paid at the post and telegraph office at Warren, there is a clear revenue of about £1,200 or £1,300 a year.

Mr. James Kenny, Police Sergeant, Warren, sworn, and examined:—

Mr. J. Kenny. 11 May, 1896.

To Mr. Wright: I am a sergeant in charge of the police force of this district. If the runs were thrown open I have no doubt the population would increase very largely in a short time. At present there is a great quantity of land that is not available. If the railway were constructed to Warren, I think it is likely that the farmers round here would go in for wheat-growing in good seasons. I think it would pay in good seasons. Some seasons they would not be able to grow wheat. If the conditions were very favourable I believe they would cultivate, and I believe it would pay, though of course the seasons are not regular. As a public officer, having no interest outside of my official position, I believe that the construction of the railway between Nevertire and Warren would be of benefit to the district, and I have no doubt it would pay. I believe the people without exception would patronise it, because in wet weather the road between Warren and Nevertire, and especially through the lane, is impassable. I have counted forty-eight bullocks attached to a load of wool from the Wonbobbie Station, and they were unable to shift it. It was imbedded in the mud. At the same time I saw seventeen horse and bullock teams bogged in the lane between the creek and the plain. The road is bad also in dry weather for sheep on account of the scarcity of water, and the injury caused to the wool by the Bathurst burr. During the wet season to which I have referred people were paying £1 for a return ticket by coach from Warren to Nevertire. I have known men to walk from Nevertire to Warren because they could not get a coach. At the present time this district is almost exclusively confined to sheep. The cattle from about the Mole come up here to be trucked, and some go to Trangie. The approaches to Trangie are good, and there is water there. If there were a railway station at Warren these cattle would not go to Trangie. At present they go there for water. The people of Warren are an industrious and hard-working community, and I believe they would take advantage of the facilities offered to them by the construction of a railway.

Mr.

Mr. Arthur Bathurst Chadwick, Timber Merchant, Warren, sworn, and examined :—

Mr. A. B. Chadwick. 11 May, 1896.

To Mr. Hassall : I am a timber merchant, and have resided in this district for nine years. I have carried on the business of a timber merchant here during the last two and half years, and I do a fairly large business in the surrounding district. I despatch timber to the surrounding stations. I obtain my principal supply of pine from the country between Warren and Bullagreen, a distance of 28 miles. The pine is of good quality. Within 8 miles I can obtain very large quantities of hardwood, principally gum. I am certain that this timber could be obtained in sufficient quantities to provide sleepers for the railway between Warren and Nevertire. I do not think they could be delivered at the cost of 2s. 6d. each as estimated by the Department. I do not think they could be cut for less than 6s. or 6s. 6d. a pair. I am not aware of any material in the neighbourhood suitable for ballast, except what might be obtained from the gravel pit on the town common. The gravel obtained there is of good binding quality, and fairly coarse. The extent of the gravel supply has not been ascertained, but there is 7 feet of stripping, and 7 feet of gravel. With regard to gum or ironbark suitable for piles and other bridge work, it would depend upon the length required. I supplied timber for the weir on the Macquarie up to 26 feet in length. Of course the long lengths are difficult to get in gum. I could get lengths up to 26 feet. Ironbark of the best quality is obtainable within 36 miles of Warren. The road over which it would be drawn is not a very good one. There is a fair supply of timber in the vicinity, which could be utilised for the construction of a railway, if timber could not be obtained cheaper anywhere else. As a business man I should be perfectly content to pay the charges suggested by the Railway Commissioners for the conveyance of goods on the railway. They would be cheaper than the rates at present paid for carriage by road, and the railway would be a great convenience in every way. For these and other reasons I think it very desirable that the railway should be constructed. I am sure that within 10 miles of Warren the 31,000 sleepers required for the railway could be obtained, if necessary.

TUESDAY, 12 *MAY*, 1896.

[*The Sectional Committee met at the Court-house, Nevertire, at* 10·30 *a.m.*]

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

THOMAS HENRY HASSALL, Esq. | FRANCIS AUGUSTUS WRIGHT, Esq.

The Sectional Committee further considered the proposed Railway from Nevertire to Warren.

Mr. Edward Knox Rutledge, Grazier, Ingar Station, near Nevertire, sworn, and examined :—

Mr. E. K. Rutledge. 12 May, 1896.

To the Chairman : I reside on the Ingar Station ¾ of a mile from the town of Nevertire. I have lived there for the last five years, and I have been acquainted with the district for twenty years. I first came to Nevertire about eleven years ago. The only building then about the place was on the spot where I am living, which was used as an out-station. At the present time I think there are about 200 residents at Nevertire. When I came here five years ago the township of Nevertire was in about the same condition as it is now, and it has made very little progress since. There is one store in the town, four hotels, two blacksmiths and wheelwrights, three forwarding agents and forage dealers, and a butcher and baker. It is not a progressive town. The run on which I live extends to the population boundary of Warren. There is an immense amount of traffic at Nevertire in the shape of stock and wool sent away by rail, and goods coming from Sydney. I understand that the quantity of wool and stock sent from Nevertire is larger than that sent from any other railway station in the Colony excepting Bourke and Narrabri. The bulk of the stock and wool brought to Nevertire comes from the Coonamble side by way of Warren. I should say the percentage was at least 80. Nevertire is not a good centre for stock, because there is no place where they can be watered when they come in. There are some good reserves, but no one takes charge of them, and they are not properly looked after, the consequence being that there is never any grass. I should think we are quite as well off as Warren with regard to commonage, though I do not know the exact amount of common at either place. But as regards water, Warren is in a far better position than Nevertire. In wet times it is a very troublesome thing to get stock from Warren to Nevertire, as the road becomes soft and much cut up. Within the last five years I have seen the road almost impassable for any traffic. Carriers bringing wool in have to wait until the road dries, and they come in repeatedly with half a load. There is nothing to prevent stock travelling from Warren to Nevertire in dry weather except that when they arrive here they cannot get water. The water in the Government tank is of a red colour. There appears to be something in the soil at that particular spot which affects the water, and stock do not like it. The water is given to them in troughs, and not having been trained to this method of drinking they do not like it. The Government carried on boring operations at Nevertire for some time. The boring continued for two years and three months. For the first 860 feet it went through drift rock, and after that through solid rock to a total depth of 2,500 feet. The solid rock or granite was so hard that they could only bore a foot in 24 hours. No artesian water was obtained and the bore was abandoned. There is no river or creek in the vicinity of Nevertire where stock can be watered. It is immaterial to me whether or not the railway is extended to Warren ; I shall still continue to ship my stock and wool at Nevertire. As an unprejudiced witness, I think it would be in the interests of all the property owners in the direction of Warren that a railway should go there. I think Warren unquestionably the better centre for shipping goods, wool, and stock, on the railway. It is a better site for a town, possessing superior natural advantages. There is more land on the river suitable for small farms and gardens than is the case at Nevertire. I have had experience as a grazier all my life. With regard to stock and wool coming in from a number of diverging roads and being concentrated in a long lane or road on their way to a railway station, my experience is that the last 2 miles are very bad to travel where the road is soft In the outlying country where the roads are soft, carriers can pick their way. The trouble begins where the traffic is concentrated along one road. That is the state of affairs between Nevertire and Warren. Whenever the road gets at all wet, it is cut up and it is almost impassable for sheep or other stock. Sheep coming through mud deteriorate in value very seriously. I have heard

heard many complaints about this road, from stock-owners, drovers, teamsters, and every one who has to travel along it. Its bad condition is notorious. In regard to the country beyond Warren, if better means of communication were provided, I think there would be a certain amount of farming close to the railway; but away from the railway, I do not think there would ever be much agriculture. The land about the Macquarie is of a splendid character, and grows lucerne, and crops of that description. I do not think there is much land suitable for wheat close about Warren. The red ground is more suitable for wheat. Between Nevertire and Warren there are patches of ground that would be very suitable for the growth of wheat. I am inclined to think that the southern side of the line will be a great producing district, between here and Nyngan. The country in the direction of Coonamble is similar to that between here and Warren. Patches of the timbered country there would be suitable for wheat. I should describe that country as first-class pastoral country. Speaking generally it is all pastoral country, pretty well, between here and Coonamble. It is similar country out towards the Bogan, except that it is rather more heavily timbered. It is equally good grazing country. I refer to the land on this side of the Bogan. On the other side of the Bogan it is altogether different. Speaking of the country between Warren and Coonamble, I think that men with moderate holdings—say, 2,560 acres—would be able to make a very good living. For sheep farming, it would be better to have a larger area, say, not less than 5,000 acres. Still, I think a holding of 2,500 acres would support a family. In all that country they can fatten, which is an advantage.

Mr. E. K. Rutledge. 12 May, 1896.

To Mr. Wright: If the leasehold areas were thrown open I am certain they would be taken up at once, although perhaps it may be against my interests to say so.

To the Chairman: My experience so far has been that whenever land has been thrown open it has been eagerly seized. None of the resumed area remains on my holding. Every acre has been taken up all round Nevertire.

Mr. George Reynolds, Hotelkeeper, Nevertire, sworn, and examined:—

To Mr. Hassall: I am an hotelkeeper at Nevertire, where I have resided for the last twelve years. I have been practically all my life in the interior of the colony, and can form a good idea of the character of land suitable for settlement. I have travelled a good deal over the country between here and the Barwon. I have been backwards and forwards between here and Moree. My opinion with regard to the country beyond Warren, embracing the districts of Mara Creek, Macquarie River, the Marthaguy, the Merri Merri, and the Castlereagh, is that it is really good country—first-class fattening country. A man with some 5,000 or 10,000 acres of land in that country would be able to live comfortably, and rear a family. The bulk of the traffic to Nevertire comes from the Marthaguy, the Merri Merri, and Brewin, and away back from the Barwon. All this traffic has to cross the Macquarie River at Warren. It naturally converges there, and then has to traverse the road to Nevertire. As a practical drover, my opinion of the road between here and Warren is that it is very bad in wet weather. If I were droving stock, and there were a trucking station at Warren, I should prefer to truck my stock there rather than bring them on to Nevertire. The advantage of being able to give the stock a drink of pure water before they started on a long train journey would far more than counterbalance the cost of driving them over the 12½ miles between Warren and Nevertire. The advantage of trucking them at Warren would be equal to a saving of 2s. per head, because, besides being fed and watered, they would be placed in the trucks clean, while if they travelled along the road through the mud in wet weather, by the time they got to Sydney, carrying the mud, as they would do, into the trucks, their condition would be very much deteriorated. The value of the fleeces would be affected as well as that of the stock. I think that the people in the great scope of country beyond Warren have some right to be considered in this matter, and that if reasonable grounds can be shown, the railway might be extended from Nevertire to Warren. As a business man at Nevertire, I cannot state any objections to the proposal.

Mr. G. Reynolds. 12 May, 1896.

To Mr. Wright: I question whether the railway would really pay at the present time. I do not think the people would object to pay the rates mentioned by the Railway Commissioners, namely, 4s. per ton for goods, 2s. a head for passengers, 2s. 6d. a ton for coal, and 2s. 6d. a truck for stock. I do not think the carriers would compete with the railway at those prices.

Mr. Walter Butler, Manager, Wright, Heaton, & Co., Nevertire, sworn, and examined:—

To Mr. Wright: I am manager at Nevertire for Wright, Heaton, & Co., and I have been here for nearly eleven years. I know the country pretty well. I am thoroughly impartial as regards the proposed railway, as it will not effect me either personally or as a business man. I hardly think the railway would pay if constructed, on account of the short length of the line. No doubt the traffic would increase every year, and probably trade would come to the terminus at Warren, which does not come here at present. Of the large quantity of goods, stock, and wool put on the railway line at Nevertire, I think that about 85 per cent. comes through Warren, the remainder being divided between Nevertire and the district on the Bogan side. I think that the rates which the Railway Commissioners propose to charge, if the railway is constructed, and which they estimate will pay working expenses and interest, and still leave a margin of profit, would be advantageous to the people in the Warren district, who, at present, pay 15s. and £1 a ton for road carriage. It would also be an advantage to the people beyond Warren towards Coonamble. Of late years a great deal of the traffic that used to go to Dubbo is being diverted, and it would be a great advantage to these people in the Coonamble district, notably Bullagreen, to have a railway at Warren. The lowest rate charged for carriage upon the road between Nevertire and Warren is about 15s., and the maximum rate is £1. When the road has been very bad we have paid as high as £3 a ton. I have known the teams when the road was exceedingly bad to take seven or eight days on the trip. This was to a great extent caused by a flood at Sandy Creek. There was no bridge there at the time, and the teams were stopped by the water. As to whether the trade from the north, north-east, and north-west would increase if the railway were constructed I do not think there would be much more traffic. The only difference would be that the little traffic now being taken into Trangie might come to Warren. I think the maximum traffic which could be obtained with the present population is already reached. The country around Warren and beyond is all good country. If it were all thrown open, I am sure it would be taken up. If the railway were constructed and the country opened there would be a larger population and consequently a greater amount of produce to be carried. I think Warren would be a very suitable depôt for freezing and boiling-down works. There is in the district a number of squatters comparatively wealthy, and

Mr. W. Butler. 12 May, 1896.

Mr. W. Butler. 12 May, 1896.

and I think it would be to their interest to contribute towards the erection of such works, as has been done in other parts of the colony. We do a little stock trucking; in dry times we have complaints from the drovers about the road. In wet times they do not complain so much about the road being bad as about the want of feed and water, particularly the latter. The water at Nevertire is bad, but it is not so bad now as it used to be. Having to drive the sheep into the Government tank and the difficulty to get them to drink at the troughs are occasionally subjects of complaint. When the burrs have been bad on the stock route, I have noticed that the sheep coming here have been very burry. On the road between Nevertire and Warren, the burrs are pretty bad at the present time, and they were last year; but there are years in which they disappear altogether. When sheep come in very burry the wool is injured. If a railway were constructed, I think all the stock would be trucked at Warren. The railway there would catch pretty well all the trade; but at times when there might be a congestion of wool traffic at Warren, there would be a possibility of the the teams running through to Nevertire when the roads were good, getting their wool quickly off, and returning again to Nevertire where the feed would be better. There are no good roads from here leading out to the Bogan, and there is no possibility of making good roads. The reason why a good deal of the Bogan traffic is diverted from Nevertire is because there has been no bridge here. One has now been built in the neighbourhood, and probably more trade will come in from that side than previously. It is because of the bridge over the Macquarie that so much traffic concentrates at Warren.

Mr. Robert MacRae, Manager, Permewan, Wright, & Co., Nevertire, sworn, and examined:—

Mr. R. MacRae. 12 May, 1896.

To Mr. Hassall: I am manager at Nevertire for Permewan, Wright, & Co., forwarding agents. I know a good deal about the Coonamble district and the stations there. I should call that country first-class pastoral country. It is very much like the Moree district, and is suitable for closer settlement. Whatever land may be available there for selection, in my opinion, will be rapidly taken up. At present it is taken up as fast as it is thrown open. There is practically a rush for land. Additional settlement would undoubtedly increase the traffic. There are a lot of good sound selectors in the district beyond Warren on the Coonamble side. The settlement that takes place undoubtedly increases the productiveness of the land, and although settlers may take up station land when it is made available, the number of stock in the district increases. The effect of selectors going upon pastoral country is to increase the quantity of stock, and the productiveness of the soil. Knowing the country pretty well, I look upon it as a very sound district and the people are in a fairly good position. I find no difficulty with regard to payment for carriage and charges, and regard them all as pretty sound men, considering the times. I think if the railway goes to Warren it will have an effect on the Dubbo traffic. It is very likely that some of the goods which go to Dubbo will then come through here *via* Warren. For instance, wool that goes to Dubbo will come to Warren from the Coonamble district. There is no doubt that Warren, with its natural advantages in the shape of a supply of pure water and a large commonage, is a more suitable place for a large trucking station than Nevertire could ever hope to be. The furthest station beyond Warren from which wool is brought is about 130 miles from here. Wool comes from one station very near Walgett. The station is nearer to the railway at Narrabri, but the wool is sent this way because there is a better road. I think it would be beneficial to the district to have a railway constructed, and to pay the following charges:—goods, 4s. per ton; wool, 2s. 6d. per ton; live stock, 2s. 6d. per truck; and passengers, 2s. per head. These represent a very big reduction when compared with the prices now paid by coach and team. I think the people would be willing to pay these rates, and that it would be to their advantage to do so. The rate of carriage by team from Nevertire to Walgett is about 15s. a ton, and about twelve months ago it was £1 a ton. As to whether, being a manager of a firm of forwarding agents, I shall have any objection to the proposed railway from Nevertire to Warren, I am of course only a servant of the firm, but I do not think it would make much difference to them; they would move on if the line went to Warren. As a practical man, having to deal with the forwarding and loading of goods, trucking and so on, I think that Warren is a more suitable place than Nevertire at which to carry on these operations, by reason of the natural advantages it possesses, and the avoidance of the bad road between the two places.

Mr. Patrick Lyons, Blacksmith, Nevertire, sworn, and examined:—

Mr. P. Lyons. 12 May, 1896.

To the Chairman: I am a blacksmith carrying on business at Nevertire. I do not think a railway between Nevertire and Warren is desirable as far as the people of Nevertire are concerned, and I do not think it would pay. I believe that for about eight months of the year two vans would do all the work between here and Warren. The wool season would be the only time a railway would pay. Three or four teams have been waiting here for a week now, and would be only too glad if they could get loading. They are going back empty. There is not enough loading going to Warren to keep the teams going. Any resident of Nevertire knows that two vans would carry all the Warren loading. I have not gone into the question of the actual tonnage; I merely speak of what I see, and in a general sense. I do not believe that an income of £2,500 a year, as estimated, would be realised from the carriage of goods, stock, and passengers on the proposed railway. I cannot tell what the wool traffic would realise, but apart from the wool the railway might pay, perhaps, for three months in the year, but not more. I believe it is the case that of the wool and stock put on the railway at Nevertire between 80 and 90 per cent. comes through Warren. I recollect the time referred to when a price as high as £3 a ton was paid for the carriage of goods by road between Nevertire and Warren; but I do not know that even the railway could have taken the goods on that occasion as the creek must have been 2 miles wide. That was very exceptional. Most of the carriers are very glad to take loading at 9s.—from 9s. to 15s.

To Mr. Wright: I am aware that it is only proposed to charge 4s. a ton for goods carried on the railway. Several carriers resident in the town say that if the railway were in existence they would bring their wool through to Nevertire and not unload at Warren. A good many of the carriers have their homes here, and they would come through with their wool. I admit that if the railway were extended to Warren it would injure my business a great deal and property at Nevertire would be worth very little. But apart from that the railway could not pay. I have been a resident of Nevertire for more than 8 years, and I can form a pretty good idea on the subject. I have heard many expressions of opinion as to the railway. The coach proprietors tell me they cannot make a living with the few passengers they take, and if this is so how could a railway possibly pay. Three coaches are about the average, and they often go 4 or 5 days backwards and forwards without a passenger. It is true that they keep on, but they only make a bare living, and many of them cannot pay their debts. On an average from four to five coaches run daily.

Mr. James Martin Oriel, Carrier, near Warren, sworn, and examined:—

Mr. J. M. Oriel. 12 May, 1896.

To Mr. Wright: With regard to the proposal to construct a railway to Warren, I think it is a very bad thing for this part. It will knock a lot of carriers and others out of employment, and I cannot see how the railway can pay. It will do Warren a lot of harm, as I do not think it will stay there. The storekeepers at Warren can now get their goods carried by teams at 10s. a ton. I am not aware that goods are being carried at that rate, but carriers have offered to do it. In winter time carriers could make a living at 10s. a ton. I can always do better in the winter time, when it is wet, than in the dry seasons. In winter time I do not get more than 15s. a ton, and I can do well at it. As a carrier, I am naturally opposed to anything that takes the bread out of my mouth. I think that the railway would be of no benefit to the people of Warren, or the people beyond. I hardly think it can be correct that, at the rates for carriage mentioned, the railway would be able to pay working expenses and interest, and have a profit besides. I do not think the estimate of 3,500 tons of goods in and out, apart from wool, between Warren and the outlying districts, would be realised. I know the country beyond Warren. It is all good pastoral country, and I consider it suitable for agriculture. If it is opened up, and a railway constructed to Warren, I do not think that the people are likely to go in for the cultivation of wheat. The land is good enough for the purpose, but my opinion is that if the railway goes through, it will drive all the people out of the country. The rate of carriage to Warren has never been, to my knowledge, less than 15s. Supposing there were no railway, and a storekeeper at Warren said, "I will give you so many loads of wheat, as much as you can do, if you bring my goods here for twelve months at 15s. a ton"—I would take a contract of that kind. Owing to the fact that the traffic is not constant, but that some weeks there is loading and some weeks none, we cannot do the work at as low rates as we should otherwise be able to do.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

PROPOSED RAILWAY FROM BERRIGAN TO FINLEY.

REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the first Session of the present Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, and the Public Works (Committees' Remuneration) Act of 1889, 53 Vic. No. 11, to whom was referred the duty of considering and reporting upon "the expediency of constructing a line of railway from Berrigan to Finley," have, after due inquiry, resolved that it is expedient the proposed railway should be constructed, at a cost not exceeding £2,000 per mile; and, in accordance with the provision of sub-section (IV), of clause 13, of the Public Works Act, report their resolution to the Legislative Assembly:—

Departmental statement.

1. The proposed extension of the railway from Berrigan to Finley appears to have been first brought into prominence in October, 1894, when a communication from the Murray Hut Progress Committee, urging the necessity for railway extension to that place, was forwarded to the Department of Public Works, and the Railway Commissioners being engaged in considering the question of railway extension in the vicinity, the matter was referred to them for consideration. In December following the Railway Commissioners forwarded to the Minister for Public Works a memorandum with reference to the subject; subsequently instructions were given by the Minister for the preparation of a revised estimate of the cost of the railway. In this estimate, submitted by the Engineer-in-Chief for Railway Construction, the cost was stated at an average of £2,316 per mile. A proposal to extend the railway from Jerilderie to Berrigan being then under consideration, no further action was taken with regard to the suggested extension from Berrigan to Finley. Afterwards the construction of a line of railway connecting Jerilderie with Berrigan was commenced, and is now approaching completion. In April last the Minister instructed the Railway Commissioners to report upon the proposed extension to Finley. On the 8th May, a deputation, representing the residents of Finley and district, interviewed the Minister, urged that the extension be carried out, and submitted statistics in favour of the line, together with a statement showing, amongst other things, that in the space of about five years the area under cultivation in that district had increased from 3,930 acres to 34,156 acres. On the 28th of May the proposal was referred for the consideration of this Committee, the motion being as follows:—"That it be referred to the Parliamentary Standing Committee on Public Works to consider and report on the expediency of constructing a line of railway from Berrigan to Finley."

Official description.

2. The length of the proposed extension is 13 miles 50 chains. It will be a light railway, beginning at Berrigan, close to the termination of the Jerilderie to Berrigan line, now under construction, at 438 miles 78 chains from Sydney, and following generally along the main road, thus avoiding severance, to the proposed Government township of Finley, where it will end in reserve No. 16,389, in the parish of Finley. The line is on a dead flat throughout; grades, curves, and works generally are easy. There is no drainage to cross but what can be provided for by surface openings. The station work is considerable in proportion to length, and the country being closely settled numerous accommodation works are necessary. These, it is explained, keep up the mileage cost.

3.

Estimated cost.

3. The estimated cost of the railway is stated at £27,250, or an average of about £2,000 per mile, exclusive of land resumption and compensation.

Railway Commissioners' Report.

4. The Railway Commissioners report that the total annual cost of the proposed line—inclusive of interest at 3¼ per cent., maintenance, traffic, and locomotive expenses—will be £1,536; the estimate of traffic receipts amounts to £701. This shows an annual loss of £835. They acknowledge the fertility of the district which would be served by the extension, and state that local rates would be charged for the conveyance of traffic over the line. With reference to the question of land requisite for railway purposes, the Commissioners "advise that the railway be not made unless the whole of the necessary land is granted to the State free of cost." If this be done they recommend the construction of the line.

The Committee's inquiry.

5. In the course of their inquiry the Committee have examined the Engineer-in-Chief for Railway Construction, who fully explained the details of the proposed scheme; the Secretary to the Railway Commissioners; and the Railway Goods Superintendent. A Sectional Committee subsequently visited the district, and obtained all necessary local information.

Sectional Committee's Report.

6. The Sectional Committee report favourably upon the construction of the proposed railway. They state that Finley is the natural centre of a large tract of arable country, which may eventually become one of the most prosperous districts in New South Wales. The cost of road construction and maintenance would be very considerable, principally owing to the absence of suitable material, and, in their opinion, its necessities and prospects entitle it to railway communication with Sydney. The Report of the Sectional Committee further states that the Departmental estimate of the traffic has not been over-estimated; the returns from the carriage of wheat, with good seasons, are likely to be double the amount given by the Department. As large a quantity as 34 bushels to the acre has been reaped under favourable circumstances, while the average is stated to be about 17 bushels; and all the crops raised on an extensive area, of which Finley is the centre, with the exception of the amount consumed locally, would find their way over the railway from that township to Jerilderie. The stock from this district would also be carried on the railway. Although, under existing circumstances, the bulky supplies purchased in Sydney may be forwarded to the district by way of Melbourne, it is expected that when greater facilities are afforded to the inhabitants for trading direct with the metropolis, their goods will be sent overland from Sydney.

Route recommended by the Sectional Committee.

7. The surveyed route of the proposed line is generally well located. The Sectional Committee, however, believe that some expense in the matter of severance might be avoided, and the settlers better served, were a slight deviation made by not leaving the main road at the corner of Robertson's section—No. 68—but by following a straight line until reaching the border of Phipps' holding, and thence making the deviation through Phipps' second paddock to the fenced road.

District to be served.

8. The district to be served extends west from Finley towards Deniliquin, a distance of, approximately, 20 miles; east, towards Berrigan, a distance of about 5 miles; north, about 8 miles—and to the south it is reasonable to expect the grain traffic almost to Tocumwal on the Murray may be secured, if the produce be intended for consumption within the Colony. The soil within these limits may be generally described as a red loam, eminently suitable for the growth of cereals and fruit, and may be regarded as comparing favourably with any other wheat-producing locality in the Colony. The rainfall is generally sufficient for farming operations. The area under wheat is being rapidly extended, and the cheaper freight, which will be possible if the railway be extended to Finley, will have the effect of still further stimulating agricultural occupation.

Traffic on proposed line.

Traffic on proposed line.

9. If it were possible to obtain all the produce from so fertile a district the volume of traffic would be extremely satisfactory. The proposed railway would, however, have as competitors :—

1. Road Carriage to Berrigan.
2. Road Carriage to Jerilderie.
3. The Victorian Railway System at Yarroweyah.
4. The Deniliquin-Moama Line.

1. Road Carriage to Berrigan.

The rate of road carriage to Berrigan from Finley is estimated by residents to be about 6s. per ton.

The railway rate is to be 1s. 6d. per ton, a saving between the termini of 4s. 6d. per ton. The trade would split at that point where the cost of road carriage to Finley was within 1s. 6d. per ton of that to Berrigan, a distance which the Sectional Committee estimate at about 5 miles east of Finley, if a through rate were charged and no intermediate stations used. Produce would, however, be placed on the railway at intermediate stations to within such a distance of Berrigan as represented road carriage to the amount of 1s. 6d.

2. Road Carriage to Jerilderie.

The cost of road carriage to Jerilderie in fine weather is about 9s. per ton, but during wet seasons traffic is almost suspended. The through freight from Finley to Jerilderie by the proposed railway will be 4s. per ton, a saving of about 5s. between these terminal points.

Traffic will split at that point where it ceases to be 4s. per ton cheaper to cart to Finley than to Jerilderie. That point the Sectional Committee estimate would be about 8 miles north from the former place.

3. The Victorian Railway System at Yarroweyah.

The rebate line laid down by the Victorian authorities passes approximately from Jingellic west in the direction of Savernake, cutting the Jerilderie-Berrigan line about midway. To the north of this line there is a rebate granted on the Victorian railway system of 46 per cent. which applies to all freights except agricultural produce. The line under consideration is mainly to provide for the carriage of farming produce, and since the country to be served is mostly south of the rebate line, it will be sufficient to compare the ordinary charges upon the New South Wales and Victorian systems.

The freight from Yarroweyah to Melbourne per ton of wheat is 15s., from Finley to Sydney 16s. 10d., being an advantage to the Victorian system of 1s. 10d. per ton. The road carriage to Yarroweyah from Finley is stated to be about 12s. 6d. per ton, thus (without taking into consideration the cost of conveyance by sea from Melbourne to Sydney, if the produce be consigned to that market,) it is reasonable to presume that an extension to Finley would, under present conditions, command all the grain traffic of the district. These remarks apply to produce seeking Melbourne for export.

The freight from Wagga Wagga to Sydney—a distance of 309 miles—for wool is £2 18s. 6d. per ton, that amount being greater than the rate from Yarroweyah to Melbourne. The distance from Wagga Wagga to Finley would be about 140 miles—thus wool freight could only be obtained by means of a special agreement at a rate considerably less than the prevailing charge for a like distance in other parts of this Colony.

The rate for general goods is greater to Jerilderie from Sydney than from Melbourne to Yarroweyah, but, if station supplies under the truck-load system be also considered, the cost of the goods most likely to make up return freight more nearly approximates.

4. The Deniliquin-Moama Line.

The competition from the Deniliquin-Moama line will be felt about 20 miles west from Finley. Beyond this point it appears probable that all produce for export will pass in bond through Victoria. Wool and all return supplies for the district outside the limit indicated are likely to use the Victorian railways in preference to those of New South Wales.

Estimated traffic on line Jerilderie to Berrigan is likely to be realised.

10. The evidence given before the Sectional Committee on the proposed railway from Jerilderie to Berrigan was to the effect that the Departmental estimate of the wheat traffic was correct, and that increased areas would be brought under cultivation if that line were sanctioned. The evidence given before the Sectional Committee on the proposed extension from Berrigan to Finley, fully bears out that expectation, and there is reason to suppose that the increased earnings on the Jerilderie-Berrigan line will largely compensate for the estimated deficiency on that to Finley.

Ultimate development of district.

11. This line was submitted to the Committee simply as a local line to furnish the district, of which Finley is the centre, with cheap transport, but all works of the kind must be regarded as forming portion of a complete scheme. A direct line from Jerilderie to Deniliquin would be located for the greater part of its distance in plain country, much inferior for agricultural occupation to the timbered belt known as the Murray Fringe. The line from Jerilderie to Berrigan conducts the railway system by the shortest route out of the plain country into the timbered loamy lands where farming operations are certain to succeed; thence turning westerly towards Deniliquin *via* Finley good land will be traversed till within a few miles of that place; this line, therefore, forms part of a line which, after the completion of such arrangements as this Colony deems necessary, will join the two systems at Moama; towards the east the Committee believe suitable land for settlement extends in large belts to The Rock. Thus the line from Berrigan to Finley will eventually form part of a complete system passing through one of the best grain-producing districts in the Colony, of which for the present the Berrigan-Jerilderie line forms the easiest outlet; but it appears probable that eventually the Berrigan-Jerilderie line will be but a connection between The Rock-Moama line and the railway from Jerilderie to Narrandera. It must be understood that the Committee do not recommend these extensions at present, but state what appears to be the probable location of a line for the proper development of this part of the Colony, in order that it may be clear that the construction of the line under consideration is not antagonistic thereto.

Land resumption.

12. The amount of land required for the railway will not in any case be very large. The recommendation of the Railway Commissioners that the land requisite for railway purposes should be given to the Government free of charge, has received attention from both the Committee as a whole and the Sectional Committee. Certain owners of property at the Berrigan end of the projected line will require to be compensated, not only for the land which may be resumed but also for damage caused by severance. As a result of personal examination by the Sectional Committee it has been ascertained that the majority of the property-holders on both sides of the proposed railway are prepared to give their land either free of cost to the State, or in return for areas of corresponding value, to be taken from Crown lands abutting on their holdings. The probable total amount required as compensation is not likely to be large, and the Committee are of opinion that the line should not be constructed unless all the land required for railway purposes be conveyed free of cost to the Government.

Resolution of the Committee.

13. The resolution passed by the Committee is shown in the following extract from their Minutes of Proceedings:—

"The Committee further considered the proposed Railway from Berrigan to Finley.

"Mr. Black moved,—

'That it is expedient the proposed Railway from Berrigan to Finley, as referred to the Committee by the Legislative Assembly, be carried out.'

"Mr. O'Connor seconded the motion.

"Mr. Humphery moved,—

'That the motion be amended by the omission of all the words after the word 'expedient,' with a view to the insertion of the following words: 'that the decision as to the proposed Railway from Berrigan to Finley, as referred to the Committee by the Legislative Assembly, be deferred for twelve months.'

"Mr. Wright seconded the amendment.

Upon

Upon the question "That the words proposed to be omitted stand part of the motion," the Committee divided, as follows:—

Ayes, 8.	Noes, 3.
Mr. Ewing.	Mr. Humphery.
Mr. Roberts.	Mr. Trickett.
Mr. O'Connor.	Mr. Wright.
Mr. Clarke.	
Mr. Lee.	
Mr. Fegan.	
Mr. Hassall.	
Mr. Black.	

"The amendment was therefore negatived.

"The original question having (with concurrence) been amended by the addition of the words: 'at a cost not exceeding £2,000 per mile'—was then passed on the following division:—

Ayes, 8.	Noes, 3.
Mr. Ewing.	Mr. Humphery.
Mr. Roberts.	Mr. Trickett.
Mr. O'Connor.	Mr. Wright.
Mr. Clarke.	
Mr. Lee.	
Mr. Fegan.	
Mr. Hassall.	
Mr. Black.	

THOS. EWING,
Chairman.

Office of the Parliamentary Standing Committee on Public Works,
Sydney, 19 August, 1896.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

RAILWAY FROM BERRIGAN TO FINLEY.

FRIDAY, 5 *JUNE*, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (Chairman).

The Hon. Frederick Thomas Humphery.	John Lionel Fegan, Esq.
The Hon. Charles James Roberts, C.M.G.	Thomas Henry Hassall, Esq.
The Hon. William Joseph Trickett.	George Black, Esq.
Henry Clarke, Esq.	Francis Augustus Wright, Esq.

The Committee proceeded to consider the proposed Railway from Berrigan to Finley.

Henry Deane, Esq., Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and examined:—

1. *Chairman.*] You produce a statement? Yes; I have a short statement. I now hand in, compilation parish maps, showing the line; a plan drawn to a 10-chains scale; a section of the line; and the Book of Reference. H. Deane, Esq. 5 June, 1896.

2. Will you read your statement? Yes; it is as follows:—

Railway Extension from Berrigan to Finley (Murray Hut).

This line appears to have been first brought under notice in the year 1894. On the 2nd October of that year, Mr. Hayes, M.P., addressed a letter to the Department on the subject, and enclosed a communication from the Murray Hut Progress Committee, in which the necessity for railway extension to that place was strongly urged. As the Railway Commissioners were dealing with the question of railway extension in that neighbourhood at the time, the matter was referred for their consideration.

On the 3rd December, 1894, the Commissioners forwarded to the Minister a memorandum on the subject, in which they stated they had inspected the country between the two places, and as there was so much cultivation in the district, and the construction of the suggested line would also influence traffic which now finds its way to Victoria, they advised that a careful estimate should be prepared of the cost of an extension from Berrigan to Finley. They added, that some of the landowners had already expressed their willingness to give the land, and that they had informed a deputation which waited upon them that they would advise the Government to make it a *sine qua non* that all the land necessary should be conveyed free of cost to the Government if the extension were entertained.

Instructions were then given by the Minister for a revised estimate to be prepared. This was shortly afterwards submitted by the Engineer-in-Chief, the cost being then put down at an average of £2,316 4s. per mile, which has since been reduced to £2,000 per mile.

No further action appears to have been taken in the matter at this time, the proposal to extend the railway from Jerilderie to Berrigan being under consideration. The construction of this line was afterwards undertaken, and is now near completion.

The Minister had the extension to Finley again before him in April last, and gave instructions that the Railway Commissioners should be asked to submit their report upon the proposal in accordance with the Public Works Act. The report was submitted on the 12th May, and is as follows:—

Office of the Railway Commissioners of New South Wales, Sydney, 12 May, 1896.

Proposed Railway Line, Berrigan to Finley—13 miles 50 chains.

In accordance with the provisions of the "Public Works Act of 1888," section 13, we beg to report as under:—

Cost of Construction—		
The Engineer-in-Chief for Construction estimates the cost of construction of a single line of light railway (exclusive of land and compensation) at about		£27,250
Annual Cost—		
Capital expenditure at 3¼ per cent	£886	
Estimated cost of maintaining permanent way, and for traffic and locomotive expenses	650	
Total annual cost		1,536
Traffic Estimate—		
Passengers, parcels, and mails	196	
Goods, live stock, and agricultural produce	505	
Total annual revenue		701

The

H. Deane, Esq.

5 June, 1896.

The district is very fertile, and similar in character to that served by the line from Jerilderie to Berrigan, at the present time under construction, and there is no doubt that with better facilities in connection with the transit of produce considerable development in the amount of land under cultivation will take place.

We would propose to charge local rates for the conveyance of traffic over this section of the line; but even with these local rates a very considerable reduction in the present rates of cartage would be effected.

When in the district some time ago, we were told that but little difficulty would be experienced in obtaining the necessary land free of cost for the construction of the line, and we advise that the railway be not made unless the whole of the necessary land is granted to the State free of cost. If this is done we recommend the construction of the line.

A copy of a memorandum we made in December, 1894, on the subject of this line, is attached hereto.

The Common Seal of the Railway Commissioners of New South Wales was hereunto affixed this twelfth day of May, one thousand eight hundred and ninety-six, in the presence of,—
H. McLACHLAN.

E. M. G. EDDY, Chief Commissioner.
CHARLES OLIVER, Commissioner.
W. M. FEHON, Commissioner.

Office of the Railway Commissioners of New South Wales, Sydney, 3 December, 1894.

Application for Railway Communication to Finley (late Murray Hut).

When at Berrigan recently we took the opportunity of inspecting the country between Berrigan and Finley, and as there is so much cultivation in the district, and as the construction of the suggested line would influence traffic that now finds its way through Victoria, we would advise that a careful estimate should be prepared, showing the cost of an extension of the proposed Berrigan line to Finley.

The Commissioners are of opinion that the Acting Engineer-in-Chief for Railway Construction would be able to submit a much lower estimate than £30,000 upon careful examination of the country, as this line might be made in the cheapest possible way and be of less cost than £2,000 per mile.

Some of the landowners have already expressed their willingness to give the necessary land, and we intimated to the deputation that waited upon us that we should advise the Government to make it a *sine qua non* that all the land necessary should be conveyed free to the Government, if such an extension were entertained.

These views can be forwarded for the information of the Hon. the Minister for Public Works.

E. M. G. E.
W. M. F.
C. O.

On the 8th May, Mr. Hayes, M.P., introduced a deputation to the Minister, representing the residents of Finley and district, to urge that the extension be carried out. They submitted statistics in favour of the line, and a statement showing, amongst other things, that while about five years ago there were but 3,930 acres under cultivation in the district there were now no less than 34,156 acres under cultivation.

The Minister informed them that he had already taken steps to obtain all the information possible about the line, and expressed himself in favour of its construction if it could be done at a reasonable cost. On the 28th of May the proposal was referred for the consideration of the Public Works Committee, the motion being as follows:—"That it be referred to the Parliamentary Standing Committee on Public Works to consider and report on the expediency of constructing a line of railway from Berrigan to Finley."

The official description of the line is as follows:—

Berrigan to Finley Railway.

Length, 13 miles 50 chains. Estimated cost, £27,250, or £2,000 per mile, exclusive of land and compensation.

This proposed light railway begins at Berrigan, close to the termination of the Jerilderie to Berrigan line, now under construction, at 438 miles 78 chains from Sydney, and follows generally along the main road, thus avoiding severance, to the proposed Government township of Finley, where it ends in reserve No. 16,389, in the parish of Finley.

The line is on a dead flat throughout, so that grades, curves, and works generally are easy. There is no drainage to cross but what can be provided for by surface openings, but the station work is considerable in proportion to length, and the country being closely settled numerous accommodation works are necessary. These keep up the mileage cost.

Berrigan to Finley Railway.

REVISED estimated cost of a single line of railway, 13 miles 50 chains in length, with 60-lb. rails.

Description.	Estimated cost.	Average per mile.
	£ s. d.	£
Earthworks	1,635 0 0	120
Small timber openings	540 0 0	40
Level crossings, fencing, and road diversions	1,240 0 0	91
Permanent-way materials	8,597 7 6	631
Freight	2,640 10 6	194
Platelaying, at 1s., £88 Ballasting, ⅛ at 3s., 44 Sleepers, at 3s., 360 } £492 per mile	6,703 10 0	492
Station works, including sidings	762 0 0	56
Station buildings, passenger building, "C" £250; waiting-shed, £125; goods-shed and platform, £400; loading banks, £200; grain-shed, £250; station-master's house, £300, 20-ton weighbridge, £275	1,800 0 0	132
Telegraph	100 0 0	7
Water supply	500 0 0	37
	£24,518 8 0	
Engineering and contingencies, about 11 per cent.	2,731 12 0	200
Total cost	£27,250 0 0	
Average cost per mile		£2,000 0 0

19 May, 1896.

ROBERT HICKSON,
Under Secretary for Public Works and Commissioner for Roads.

3.

H. Deane, Esq. 5 June, 1896.

3. *Mr. Trickett.*] What is the exact length of this line? Thirteen miles and 50 chains.
4. How does the country between Berrigan and Finley compare with the country between Berrigan and Jerilderie? It is better in a way; the country is drier. There are are no flats or hollows filled with water to encounter, and the waterways will consequently be somewhat less. Otherwise, it would have been impossible to have brought the line down to the present estimate.
5. Are there any creeks to cross? Nothing of importance.
6. The culverts, drains, and waterways will be considerably fewer, and less expensive than those on the Jerilderie-Berrigan line? Yes.
7. That accounts for the lower estimated cost? Yes; also, the earthworks are less.
8. In what way are they less? They are less, because there is less in the way of small embankments over the swamps.
9. What height would the earthworks be? From 8 inches to a foot.
10. Have you been in that country yourself? I have only been to Berrigan. I have not been to Finley, so I am relying on the reports of the officers, but I think they are quite satisfactory.
11. You say the earthworks will be from 8 inches to a foot;—will that be only earth or gravel mixed with it? That will be the embankment alone. I am only providing for a small portion of ballast on the line.
12. Will that be generally used, or only in portions? Only in portions, and chiefly at the stations.
13. Will that be procurable in the locality? Yes. I think the material that is obtainable at Berrigan itself—some decayed granite, which is used for roads there—will answer very well for the purpose—a good deal of it; if not, material could be brought down from the Narrandera to Jerilderie line, as it is proposed to bring the other ballast.
14. And the character of the sleepers will be the same as those on the line from Jerilderie to Berrigan? Yes; they will probably be red gum.
15. Can they be got as cheaply now as they could be when you got the tender for the Jerilderie to Berrigan line? I think about the same.
16. Have you any portion of the line from Jerilderie to Berrigan completed? No; there is none actually completed, but the earthworks are pretty well ahead.
17. Are you in a position to say whether that work will be carried out for a less amount than that which was estimated when we passed that line? I think that the works that were estimated for will be carried out for less; at any rate, they will be well within the mark. But, in connection with another inquiry a few days ago, I pointed out that the cost of the rails would be higher than was estimated on account of the inability of the Railway Commissioners to provide second-hand rails. Then, also, there will be the shifting of the fence, which was not provided for in the original estimate. But I have provided in this estimate for everything that I consider will be required, keeping everything as low as possible.
18. The average cost, £2,000 a mile, is the lowest that you have yet fixed, is it not? Yes, it is the lowest. I think this is without exception the best bit of country we have had. In connection with a remark made in the statement, I should like to point out that the cost of station works and buildings is high in proportion to the total estimate. It will be seen that, without adding engineering and contingencies, the station works and buildings amount to about £2,562. I have gone into the matter with the Railway Commissioners, and at the terminus they require very similar accommodation to that provided at Berrigan, the conditions being almost exactly the same.
19. You mean, by that, that Finley will be quite as much a trucking centre as Berrigan? Yes.
20. There is an amount here for freight—£2,640 10s. 6d.—is that not rather a large amount? Not at all. It is only taken at 1d. per ton per mile the whole distance from Granville. It amounts to a good deal, because the distance is so great.
21. Do they charge the ordinary rates for the material required? No; it is really a reduced rate.
22. You mean less than they charge to the ordinary public? Yes.
23. Do you know how much less is charged by the Railway Department than to the public? I believe that in the schedule of rates the charge is 2d. per ton per mile for rails and material of that kind, but the Commissioners will charge us 1d.
24. When we were considering the Jerilderie to Berrigan railway we found that the expenditure and interest were pretty well balanced by the probable revenue to be derived from the line, whereas in this case, according to the figures, the total annual cost is put down at £1,536, and the total estimated revenue at £701, showing a loss of £835 a year;—in the face of that, do you suggest that that revenue is likely to increase? I think the tendency of the Railway Commissioners' report is to show that they consider it will be increased, but perhaps I might suggest that the Secretary to the Railway Commissioners should be questioned on that point.
25. Looking at the Book of Reference, I see that this line of railway will pass very largely through the properties of private owners? Yes.
26. The statement that you read indicates that the land should be given free;—do you know that any steps have been taken in the direction of getting that land free? I do not think that any further steps have been taken beyond what the Railway Commissioners took at the time. I think there would be some difficulty about the owners of land in the immediate neighbourhood of Berrigan, because they would not be benefited by the construction of this portion of line, but it may be possible to make some arrangement to give them some reserved roads in exchange.
27. With regard to the termination of this line at Finley, does it go up to the town or fall short of it? It goes right into the town of Finley and terminates at the firm red line on the map where the figures "66" are. It will be seen from the tracing that it terminates on the northern side of Osborne-street.
28. Is that Crown land? Reserves.
29. The line, as shown on the plan, appears to run right through the town—is that necessary? It is brought half-way into the town—up to Osborne-street—so as to terminate on reserves there, in the township.
30. In this inquiry it appears to me to be rather important for us to know whether it is contemplated to take the line further on than Finley in an easterly direction;—if this line be constructed do you know if there is any intention of that kind? I believe not. A survey has been made down to Tocumwal—that is all I can say.
31. That is in a southerly direction? Yes.
32. Nothing has been thought out with regard to taking it in a westerly direction;—can you tell us whether anything has been thought out as to taking it an easterly direction, from Berrigan towards The Rock?

H. Deane, Esq. 5 June, 1896.

Rock? A survey has been made right through from The Rock to Finley. This line makes use of a portion of the survey from The Rock to Murray Hut or Finley.

33. Then if there is any probability of a line from The Rock right through to Finley being constructed, would it not seem rather as if a mistake is made in making the line from Narrandera to Jerilderie, Berrigan, and Finley? A portion of that line may possibly be contemplated; not the whole. I have been going into the question of survey and estimate for a portion of it.

34. If we are going at any time to construct a line from The Rock right through to Finley that line and the line from Narrandera to Jerilderie, Berrigan, and Finley will be competing lines? An extension from Berrigan to Finley will not, of course, affect either question.

35. That will always come in? Yes.

36. When the line from Jerilderie to Berrigan was submitted to this Committee, would it not have been possible to have adopted a kind of intermediate course that would have suited both Berrigan and Finley without making the line in the very peculiar formation as it appears on the plan? My instructions of course were to prepare the survey to Berrigan. The Finley line was, I think, really an afterthought. A line could have been carried to Finley direct. There is a travelling stock route running down all the way.

37. Looking at the map, do you not think that it shows that rather an injudicious route has been taken? I do not know. If you want to serve both Berrigan and Finley it may make very little difference. Straight lines connecting Jerilderie, Berrigan, and Finley form an isosceles triangle. Going to Finley first and then to Berrigan would be the same as going to Berrigan first and then to Finley.

38. When we were considering the line from Jerilderie to Berrigan the evidence was that that line would serve the people right up to Finley, or within a mile or two of Finley; at page 9 the report says,—"The area around Berrigan from which traffic will be drawn, the Railway Goods Superintendent describes as between Savernake in the south-east, the border of Barooga in the south, and a point within three or four miles of Murray Hut or Finley in the west. The information collected by the Goods Superintendent appears to have been carefully obtained with a desire to under-estimate rather than to over-estimate the capability of the district." Seeing that the Berrigan line is estimated to serve the people living within three or four miles of Finley, it would seem to me that an intermediate line between the two places would have been a far more desirable one than this irregularly-shaped line which is about to be constructed. So far as you are concerned you say it is a line of railway that could be easily constructed and at the lowest possible rate that has yet been estimated? Yes.

39. I suppose in this estimate of yours you do not have any intermediate stations at all between the two places? I have provided for one intermediate station.

40. That will be about half way? Yes.

41. Can you tell us what the cost of that station will be? £125—it is a waiting-shed.

42. And a platform? No; there are passenger landings—only just a wooden kerb round. It is very inexpensive device.

43. Can you tell us where that would be? The Railway Commissioners will have to locate the position. It will be about half way, I expect.

44. In addition to the waiting-shed will there be a goods-shed and platform? Not there; they will be at Finley.

45. I notice that in the official description of the line this statement is made "The line is on a dead flat throughout, so that grades, curves, and works generally are easy. There is no drainage to cross but what can be provided for by surface openings, but the station work is considerable in proportion to length, and the country being closely settled numerous accommodation works are necessary. These keep up the mileage cost"? That means crossings and gates.

46. Is the line to be fenced? It will follow the road, so we shall have to fence it on one side. The road is not wide enough to take the line as well. A good deal of the road is only a chain wide, so we shall require to have another chain alongside of that, and shall have to put up a fence, or shift the road fence.

47. I see you estimate the cost of the sleepers at 3s.? Yes.

48. Will those be only rough sleepers—what they call half-round sleepers? They will be red-gum sawn sleepers. On the line at present under construction from Jerilderie to Berrigan, Smith and Finlayson are bringing ironbark sleepers a long distance. They found it very difficult to get all the red-gum sleepers in time.

49. What distance apart would you put the sleepers? They will be 14 to the 10-yards length—that is about 2 ft. 2 in. from centre to centre.

50. How does that compare with the distance on a metalled railway line? The older practice is to use 11 and 12 for the same length of rail. I am putting down 14 on all these new lines, and I believe it will be economical in maintenance, even if the line is afterwards ballasted.

51. Have you had any experience so far in any of the light lines which you have laid as to whether these sleepers laid on the made-up ground are sufficient for the purposes of the railway traffic—for instance, on the Moree line? The experience is not very complete. I may say that very recently there has been a good deal of rain there, and the line has not been in a very good condition over the black soil on the Moree railway. The contractors have been very careful, but I think that all those portions will have to be ballasted. The ballast was included in the estimate of the line.

52. But that hardly compares with this character of country? No. I think that each class of country will have to be dealt with on its own merits. There may be some classes of country where we may be able to avoid the use of ballast altogether. I hope so. I think that in the black soil country we shall always have to put in ballast; but in the red soil country we may be able to do without it. It depends on what condition the soil is in when it is wet—whether it is suitable for packing under the sleepers or not. If it is of a gritty character, even when wet, you may be able to use it for packing, but black soil gets so greasy and impalpable that it is of no use whatever for the purpose.

53. That lot of sleepers provided for the Moree railway cost 2s. 6d. each? Yes.

54. Could you not get these at the same price? The price for these includes adzing and putting them in the road.

55. They have to be prepared for the rail afterwards? Yes.

56. Would that make the cost up to about 3s.? That costs about 2d. or 3d. apiece. These red-gum sleepers are certainly more expensive than those round-top ironbark sleepers, because the sawing and the waste in the case of the red-gum are more productive of expense than the corresponding operation in the case of the ironbark.

H. Deane, Esq.
5 June, 1896.

57. There is a charge here for water supply, £500; how do you propose to supply this line with water—would it be by catchment, or what means? I think we shall very likely have to make a dam and put up a small pump. There are wells in the district, but it has not yet been proved that they are very suitable for engine supply.
58. But that sum will be adequate for supplying water? Yes; that will be adequate for the purpose.
59. Is 11 per cent. a moderate sum to allow for engineering and contingencies? Yes; that is a moderate sum. If you allow engineering 6 per cent., it only leaves 5 per cent. for contingencies.
60. *Mr. Clarke.*] I notice that this is described as a level country; do you not think that £2,000 a mile is rather excessive? No; it is very cheap.
61. In a level country, for a light railway? Yes; very cheap.
62. Are you aware whether there is much settlement about this place—Finley or Murray Hut? There is a good deal of settlement.
63. Between Berrigan and Finley, I suppose? Yes.
64. And I presume that the railway is proposed to be made in consequence of that settlement? Yes.
65. The soil is very good? Yes, it is very good soil, very similar to that which you see in passing through to Berrigan.
66. Is it adapted for growing wheat or oats? Yes.
67. I see it is stated here by the Commissioners that one of the objects of constructing this line would be to prevent the traffic from going to Victoria? Yes; that is in their 1894 report.
68. But extending the line from Berrigan to Finley brings it nearer to the Victorian border;—would that not be an inducement for settlers or farmers to send their produce to Victoria if it suited them to do so, and be therefore injurious to the interests of New South Wales? I suppose that would be in a great measure a question of rates.
69. I understand that the greater portion of the traffic on the Culcairn-Corowa line, in fact nearly all of it, goes to Wahgunyah, so that we have actually made a line which benefits another colony? I am not prepared to give any evidence on that point. I am not consulted on those questions, and therefore I do not study them.
70. On the whole you think that it would be desirable to have this proposed line made? Yes, I think so.
71. You think it would be to the general interests of this country? Yes.
72. *Mr. Fegan.*] You say you think it is right to construct this line, but do you not think that we are starting with a balance on the wrong side in constructing a line, the total revenue of which will be £701 per annum, whilst the expenditure will be £1,536? If the land put under cultivation increases, of course the revenue will very largely increase; but definite information could be obtained from Mr. Harper, who has examined the district.
73. *Mr. Hassall.*] With regard to the estimated annual cost and the estimated revenue, showing an annual loss of £835, do you think that that estimated loss could be reduced to any considerable extent? That is the same question.
74. You do not care to commit yourself? It is not a point I have considered. I have not been instructed to go into that question. It is dealt with by the Commissioners and their officers.
75. Well, with regard to construction, it is estimated in one place that the cost will be £2,316 4s. per mile—that is an estimate submitted by the Engineer-in-Chief; but I find that afterwards it is stated that the cost will be £2,000 per mile; do you think that the £316 4s. difference can be eliminated? Yes. I think it is very likely that at that time I might have submitted an estimate of that kind, but it so happens that that estimate was made in December, 1894, by Mr. Firth, who was acting for me during my absence. While I was away from the colony, I looked into the matter of railway construction elsewhere, especially in America, and I came to the conclusion that we could cut down our cost of construction a good deal by lowering the formation and leaving out ballast; and the reduction in this case is effected chiefly in that way.
76. You think the estimate could be reduced to the extent stated? Yes.
77. By reduction of wages, I presume, and perhaps less cost of material? Yes.
78. In their report the Commissioners say, "The Commissioners are of opinion that the Acting Engineer-in-Chief for Railway Construction would be able to submit a much lower estimate than £30,000, upon careful examination of the country, as this line might be made in the cheapest possible way, and be of less cost than £2,000 per mile"? The Acting Engineer-in-Chief for Railway Construction in 1894 was Mr. Firth, but I have since convinced Mr. Eddy that it is not possible to reduce the cost below £2,000 per mile.
79. You do not think it is possible to construct the line properly for less? No; not to make it satisfactory at all.
80. Do you think there is any prospect of the area under cultivation being increased if this line be constructed? I think there is every possibility of that. The area under cultivation has largely increased in that district during the last two years.
81. You say this estimate is exclusive of the cost of land and compensation;—have you any idea what that would come to? No, I have not made any estimate.
82. The Commissioners only recommend that this line should be constructed on the condition that the land required for it shall be given free? I think a great deal of it will be given free, and I think it will be possible to arrange for exchange in other cases.
83. With regard to the traffic, the railway line now being constructed from Jerilderie to Berrigan, and, of course bringing the railway within 13½ miles of Finley, do you think that the construction of this line is warranted—that the traffic would drift anywhere else if this line were not constructed? It seems to me the Commissioners believe it will take traffic that would otherwise go into Victoria.
84. If that is the idea, would it not be better to run the line from Berrigan, say, to Tocumwal or Barooga, in order to get the border traffic? That would be carrying the traffic down there.
85. *Mr. Roberts.*] Are you in a position to tell us the exact cost per mile of the line from Jerilderie to Berrigan? No, not yet.
86. Can you give us an approximate idea of what it will cost? I do not think I can tell you approximately. Except for the rails I have already mentioned, I do not think it will greatly exceed the estimated cost.
87. You contemplate using some second-hand rails for about 10 miles of that line, which enabled you to bring in a lower estimate than otherwise would have been given? Yes.
88. But you found out afterwards that you had to use new rails? Yes.
89. What was the amount of the successful tender for that line? It was about 4 per cent. under my estimate.
90. Your estimate was £2,000 per mile, was it not? The 4 per cent. applies only to certain portions of the earthworks and bridges. It would not affect the rails and a lot of the other works.

H. Deane, Esq. 5 June, 1896.

91. Do you think that this line from Berrigan to Finley could be constructed at a lower price per mile than the line from Jerilderie to Berrigan? My estimate is much lower.
92. I think your estimate for the line from Jerilderie to Berrigan was £2,000 per mile? No, £2,100, including the old rails. The earthworks on the Jerilderie-Berrigan line were put down at £225 per mile. For this line they are put down at £120. The box drains and tender bridges were put down at £111 per mile. In this case they are put down at only £40.
93. There are no waterways on this line? No; and that makes a saving of £71 per mile.
94. If this line be constructed it will really be the cheapest line yet constructed in this colony? Yes.
95. *Mr. Wright.*] In answer to Mr. Trickett you said that the official description of the line says, "The country being closely settled, numerous accommodation works are necessary"; and looking through the detailed estimate submitted here, I see the item "level crossings, fencing, and road diversions, £1,240," which is only a fraction over 4½ per cent. on the cost of construction;—that is not unusually high, is it, for work of this kind? No; it is not at all high.
96. How then do you account for the statement, "numerous accommodation works are necessary," when, in fact, they are not necessary? When you consider that the line is intended to be an exceptionally cheap line, it may have been thought that that portion of the estimate could be cut down.
97. Below that I see you make provision to the following effect: "Station buildings, passenger building 'C,' £250; waiting-shed, £125; goods-shed and platform, £400; loading banks, £200; grain-shed, £250; station-master's house, £300; 20-ton weighbridge, 275";—I do not know if you have ever been in the great wheat-producing districts of South Australia? I have been there.
98. Well, the South Australian Government do not provide any sheds for covering wheat, in fact, they would be of no use for that purpose, for they would have to cover 2 acres of ground; I think that item grain-shed, £250," is altogether unnecessary, and it strikes me that a goods-shed, except a very small one, is altogether unnecessary? It is a point the Railway Commissioners have the decision of.
99. Then there is no necessity for a 20-ton weighbridge—a 10-ton weighbridge is all you want? They use large drays down there.
100. They do not carry more than 10 tons on them? Yes.
101. In reference to level crossings, there is a system of level-crossing with our gates known as the Pitt system;—do you approve of that? Yes; I put them down in some places.
102. Do you not think they are a very great improvement, and though not cheaper in the original cost of construction they save a lot of wear and tear in after years? Yes.
103. You propose to adopt them on this line, do you? I have put them where they were suitable. On this line the crossings that will occur will be chiefly of this character. The line being alongside the road, there will be no road crossings in the same sense as if we were going through the country.
104. Are there no intersecting roads? Yes; there will be one or two, but most of the crossings will be crossings out of paddocks across the line, on to the road, where, of course, a gate will be necessary.
105. You have to put a gate in a private owner's fence? Yes; where he has a gate at present on to the road he will require to have a gate on to the line and a crossing over the line.
106. Do you propose to run this line all along a public road? It is proposed to run it in the same way as the Jerilderie to Berrigan line is run, that is, alongside the public road, and to divert the road where the road is not in a suitable place so as to go alongside the line.
107. Then do I understand that in carrying it alongside the road you resume a slip of land? Yes, to form the railway.
108. To carry it just clear of the road? Yes.
109. You say that £2,000 per mile will make the cheapest line constructed in this colony? Yes.
110. Are you aware that much cheaper lines have been constructed in the adjoining colonies? I have heard of a line recently constructed in Victoria.
111. Are you not aware that lines have been constructed in Queensland at a very much lesser rate—of course, with a narrower gauge? I was looking through the cost of the Queensland lines, and I could not find any.
112. I wish you would look at the cost of construction of the line from Homebush to Hughenden, on the main western line to Townsville? I knew the cost of those lines some time ago, and I do not think they cost less than ours.
113. £1,850 per mile, I think, one of them cost? That is for a narrow-gauge line, with 40-lb. rails.
114. On the question of ballasting, you estimate for one-sixth;—do you mean one-sixth ballasting or one-sixth part of the line? One-sixth part of the line.
115. How far would you have to bring ballast? From about 2 miles out of Narrandera, or a lesser distance. As I have explained, you can get the decayed granite, which makes very good roads, at Berrigan.
116. Do you know what the Deniliquin-Moama line is ballasted with? Yes.
117. Burnt clay? There is a lot of gravel. There are gravel-pits on that line.
118. Has the Department made any satisfactory exploration of the district for water? No.
119. Then your estimate of £500 for water supply, which I suppose includes pumps and everything else, is, to a certain extent, one that cannot be relied upon? It is only a subsidiary expense to what has been provided on the Berrigan line. We do not require a separate water supply for this line.
120. You can do without a water supply for this line? Yes, we can run trucks.
121. So if you found the expense of obtaining water was very great, you could omit that item altogether? Yes. But between Jerilderie and Finley, I estimate £1,250—that is, £750 for one, and £500 for the other line.
122. You think that in all probability that will be ample? Yes.
123. And you say that your estimate for the construction of the Jerilderie-Berrigan line will not be exceeded as regards the carrying out of the works? Except in the matter of rails and road-fencing; I think everything else will come out alright.
124. You estimated to get old rails for the Berrigan line? Yes, for half the length.
125. At half cost? At much less than half cost.
126. And when the works were undertaken you found that the old rails were not available, and you had to use new rails? Yes.
127. And that has added very materially to your original estimate? Yes.

H. Deane, Esq. 5 June, 1896.

128. How much per mile do you think it has added? About £250.
129. This estimate, I take it, includes new rails? Yes.
130. And you have no doubt that this estimate will cover the actual cost? Yes, I believe it will.
131. *Chairman.*] Looking immediately west of the terminal railway station—Jerilderie to Berrigan line—you will notice that when you leave that station you go through various small areas, and then eventually reach the main road at 435 miles, in portion 64? Yes.
132. You will have a fairly considerable severance there? Yes.
133. If you had followed that line on the north side until you got within 4 or 5 chains of the north-east corner of portion 33, and then turned in a north-westerly direction, you would have picked up the survey from The Rock, and then apparently you would have a clean get-away on The Rock route, whereas if you take the line as you suggest it now, right up into the railway station, and if population settles round the station on the western side, it will be difficult to get out on to the line; it would not be a through line, but a line from Finley to Berrigan, and then out of Berrigan again to The Rock? I believe that we shall find that to the south of the railway station, as shown at present, the land has been subdivided into allotments, and there might be more difficulty in obtaining that land than in obtaining land directly to the west. Besides that, The Rock line, after going through Berrigan, cuts through some subdivided land. The line, as located by me, appeared to do the least damage. But there would be no engineering difficulty in shifting it one way or the other, because the country is all level.
134. Would it not appear, without a knowledge of the immediate surroundings, that, in order to make a good through line of it, the line should be taken in a curve from A to B, as shown on the plan? The interference with allotments on the road to the west of A would be found considerable. Furthermore, the road is the main trunk road, and it is only a chain wide.
135. I notice that your line curves in a southerly direction after going to the allotments to the north of Finley;—is there any intention to take it to Tocumwal? I do not know that that is part of the policy of the Government.
136. If the line be eventually extended to the west, to reach the country towards Deniliquin, might it not be well to stop at 447 miles, provided a suitable station site could be obtained on Government land, instead of putting in a bend that may eventually prove to have been taken in a wrong direction? I believe that at 447 miles a suitable site would not be found; but if the line is bent, as shown on the plan, it can be continued through the township of Finley, and carried either to Tocumwal or westward.
137. If the line should eventually go on to the west, and not south, would it not be better for the present not to put a southerly bend in it—always supposing that a suitable railway station site can be obtained somewhere in the position marked—near 447 miles? I consider that, taking either contingency into consideration, the site proposed is the best.
138. Can you give any reason for that? In choosing the north side of Osborne-street I was influenced purely by the circumstance that there appeared to be sufficient Government land there to meet all station requirements, and an extension either west or south would proceed better from there than from anywhere else.
139. You intend, according to one of the plans furnished to the Committee, to divert the road anywhere that is possible? Yes.
140. And with the exception of the first mile from Berrigan the line will be continuous to the present road or to the road as diverted? Yes.
141. In your estimate you have no statement with regard to the cost of road diversion? No.
142. You think your earthworks and other things will cover it? Yes; and the crossing and fencing.
143. And the 11 per cent. for engineering and contingencies also will be sufficient to cover it? I do not want to have to draw upon that for that purpose.
144. Do you intend to fence the line right through? It will have to be fenced on one side of the road, or the present fence will have to be removed.

FRIDAY, 12 *JUNE*, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (Chairman).

The Hon. Frederick Thomas Humphery.	Charles Alfred Lee, Esq.
The Hon. Charles James Roberts, C.M.G.	John Lionel Fegan, Esq.
The Hon. William Joseph Trickett.	Thomas Henry Hassall, Esq.
Henry Clarke, Esq.	George Black, Esq.

Francis Augustus Wright, Esq.

The Committee further considered the proposed Railway from Berrigan to Finley.

Hugh McLachlan, Esq., Secretary to the Railway Commissioners, sworn, and examined:—

H. McLachlan, Esq. 12 June, 1896.

145. *Chairman.*] You are Secretary to the Railway Commissioners? Yes.
146. You have already given a statement from the Railway Commissioners regarding the proposed railway? Yes.
147. Have you any further statement to make? No; the Commissioners thought that the statement they submitted clearly expressed their views with regard to the proposed extension.
148. There is an estimated annual loss of £835? Yes.
149. Will you explain why the Commissioners, notwithstanding this loss, think it advisable that the railway should be constructed? In dealing with new lines the Commissioners have, on many occasions, recommended their construction, even though there would be a loss on interest and working expenses, provided the railway would pay its working expenses, believing that the development of the country and the opening up of the district would warrrant the construction of the line.
150. *Mr. Fegan.*] What is the advantage to be gained, seeing that there are so many non-paying railways at present, that we should add to their number by constructing this line? This line would be an advantage to the district, though, according to the Commissioners' figures, it would not make the other lines more

H. McLachlan, Esq. 12 June, 1896.

more payable. It is just a question whether you should not give to the district the advantage of railway communication. As far as the financial result is concerned it would not help the railway system.
151. You have refused to recommend railways in other districts on the ground that they would not be payable? The Commissioners have looked upon each case according to its merits. I have on more than one occasion stated that the Commissioners generally lay down this rule—that if a line paid its working expenses, and showed a reasonable prospect of paying anything more, in view of the advantages derived to the railway from the development of the country, they would be prepared to recommend such a line; but they would make no general rule. They would deal with each case on its merits. In this case, subject to the land being given free, they are prepared to recommend the construction of the railway.
152. Have you any reason to think that a line from Berrigan to Finley would be the means of inducing people to settle in that district, and open up the country for cultivation? Yes; I think it would lead to the development of agricultural production in the district. Within recent years there has been a great development of agriculture in that locality. Within three years the production of grain in the county of Denison, which includes this district, has almost doubled.
153. Is the land along the route Crown land or private land? Most of it is private land.
154. You think the country should be saddled with a line of railway to improve private property without itself getting some return? The Commissioners make it a condition that the land should be given free, but it is difficult to provide for anything beyond that.
155. If, according to your statement, the line will open up the country, by whom will the benefit be derived? Primarily by the people of the district.
156. Or the landowners of the district? It will be of benefit to them.
157. At a cost of £835 a year to the State? At the present time that is the estimate.
158. You think it is reasonable to ask the country to construct this line where there is no probability of a return to cover the cost? The estimate given applies to the first opening of the line; it might, owing to future development, become more self-supporting.
159. Do you expect much of a passenger traffic? No, not a great deal.
160. What freights do you propose to charge? Mr. Harper prepared a schedule of local rates which the Commissioners thought of introducing, and he will be able to give evidence on that point. I think it was proposed to charge 2s. a ton for grain, and 3s. a ton for general goods.
161. How far is Finley from Deniliquin? A long way—about 30 miles.
162. Is it the intention of the Commissioners to proceed further with the line? No; they have no idea at present of going further with it.
163. Do you think that by extending the railway from Berrigan to Finley the effect will be to take the traffic from New South Wales and send it on to Victoria? No; I do not think the line would have that effect.
164. You think that with the greater facilities given to our own people in the shape of railway communication, they will send their goods to our own market? I think that within a reasonable distance from the proposed railway the whole of the grain produced will come to Sydney.
165. I suppose at present a great deal of this traffic goes to Victoria, owing to the absence of railway communication? It is only recently that grain production has been so largely developed in this district, and the cost of cartage to Jerilderie has been a handicap against the grain coming to Sydney.
166. Do you know whether the people have asked to have this line constructed? Yes.
167. What reasons have you for saying so? The Commissioners were themselves in the district, and the people asked that the line should be constructed. Usually such requests do not come to the Commissioners, but to the Department of Public Works, and if there is a public demand for the railway the Commissioners are asked to report. Requests I know were made to the Department of Public Works, and also to the Commissioners themselves when they visited the district.
168. When the Commissioners are on tour the people generally approach them and ask for railway extension? No. The Commissioners went into this district specially to look at the proposed line, and they met a number of the people about Finley. The question of this extension was raised at the time when the Public Works Committee considered the line from Jerilderie to Berrigan, and I think the Sectional Committee to some extent advised the construction of the line to Finley.
169. But it is not an unusual thing for deputations to approach the Commissioners asking for railway communication when the Commissioners are visiting the district? Such a thing would be unusual. The Commissioners, as a rule, would suggest to such persons that they should go to the Government, the construction of a new line being a matter of policy. When visiting a district and inquiring as to its probable development the Commissioners would, of course, see the people and get information from them.
170. The length of the proposed line is 13 miles and 50 chains, and the country is almost flat? Yes; the line would be a very cheap one to make.
171. The estimated cost is £2,000 a mile, exclusive of land and compensation? Yes.
172. Will there be much land along the line to be bought? There is not a great deal, but the land required may be given free.
173. Does the route run exclusively through private property? I think it does. It terminates on a reserve, but otherwise I think it goes through private lands.
174. *Mr. Hassall.*] The calculation in regard to the receipts and expenditure shows an estimated annual loss of £835? Yes.
175. Have you any idea whether the traffic will be sufficient to reduce that loss, or to leave a profit? I do not think anybody could say that; it is extremely problematical. The Commissioners recommend the construction of the line, in the face of this estimated loss, but they do not say that in a year or two the loss will be covered. I do not think they would like to hazard the opinion that it would be turned into a profit within any particular time.
176. The land being held by private owners, do you think there is any possibility of the traffic so increasing that this loss would be materially reduced? I would not care to say. There ought to be a certain development to reduce the loss, but I should not like to say to what extent. I think the Committee should look at the proposal in the light of the figures given—that the probability at present is that the traffic on the line will result in a loss of £835 a year.
177. Have you any knowledge with regard to any proposal to obtain the land? Except that the Commissioners have made it a condition of their recommendation that the land shall be given free. When they

H. McLachlan, Esq.
12 June, 1896.

they were at Finley they understood from the people there that there would be no difficulty in getting the land.
178. They say they think there would be "but little difficulty"—there may be some difficulty? There was nothing definite done—nothing formal. It was only a matter of conversation.
179. There was no guarantee from the owners that they would give their land free of cost? No.
180. That is a matter that would have to be further inquired into? Yes.
181. If that were done the Commissioners, you say, would recommend the construction of the line? Yes.
182. But without that, I presume they would not? Without that the Commissioners would not. Their feeling is that the people should give the land free.
183. Have you any idea of the extent of cultivation that is carried on in the district? I have not the exact acreage. Mr. Harper went through the district. One of the statements submitted to the Commissioners showed that there had been a very great increase in the area under production; in fact, I think it had increased within a few years from about 4,000 acres to 32,000 or 33,000 acres. And I know from the returns with respect to the county of Denison, that while in 1893 the quantity of wheat produced was 479,000 bushels in 1895—that is, up to the end of April, 1895—the production had increased to 879,000 bushels. So that already there has been a very big increase in the production of the district. No doubt that has been influenced, to some extent, by the probability of a railway being constructed to Berrigan. We are informed that a great deal more land is being put under crop, and the same thing may be expected to some extent if the railway is extended to Finley.
184. Do you not think that the imposition of a duty on cereals may have had a great deal to do with so much more land being put under cultivation, and that this fact may not be altogether attributable to the prospect of a railway being constructed? I could not say.
185. Have you any idea what the Commissioners call a reasonable cost;—do they take the estimate for the construction of the line as submitted here as a reasonable cost? Yes.
186. They think that if the line can be constructed at that rate it will be a reasonable figure? They had that figure before them when they made their report.
187. You have no idea, I suppose, how many stations will be required along the line? It will be possible to put in intermediate sidings at no great expense, the same as has been done on the Lismore to Tweed line. In that district, at many farms, an additional siding has been put in for the accommodation of a number of people close together. Sugar-cane is a very heavy crop, and you get a fairly good load from a small area. At a number of places intermediate sidings have been put in. They cost nothing, except for putting in; no station hands are required. Between Berrigan and Finley it is not likely that a station staff would be located at any place, although there might be some sidings. On the Richmond to Tweed line we run the American car with steps, and consequently there is no necessity for an expensive platform.
188. You do not think, then, that the works on this proposed line would be of a very expensive character? No. The details are shown in Mr. Deane's estimate. It will be seen that he does not provide for expensive work.
189. The proposed line runs away at right angles from Berrigan to Murray Hut;—having brought the railway down to Berrigan, do you think there is any necessity to carry it on to Finley in order to obtain that traffic? If you bring it on to Finley you are more likely to develop production. Grain and agricultural products are articles of low value, and cannot afford to pay a high rate of carriage. What I mean is this: Take an area close to Sydney—say the Crookwell district—it is 34 miles from Goulburn and 160 miles from Sydney. On account of that 34 miles of road carriage the cultivation and the progress of the district are very much retarded. If you constructed a line over those 34 miles the result would be a large increase in the production. Every 10 miles would make a big difference in the area under agriculture, because, as I have said before, grain and other articles of farm produce are of comparatively low value, and cannot afford to pay a high rate of carriage, and cartage by road is always much heavier than by rail.
190. But there is a difference between 34 miles and 13 miles? Still, every mile must make a difference otherwise you might just as well stop at Jerilderie, and not go to Berrigan.
191. Admitted that it is advisable to construct a railway to Finley, in view of the increased production that may take place, do you contemplate that the residents of Tocumwal would begin to agitate for an extension to that place, the same arguments being used as those now put forward in favour of the extension to Finley? I think you will find that the people of every agricultural district in the country agitate for railway communication. It is just a question whether the Commissioners will recommend it, and whether the line asked for is likely to pay. There is no doubt you will find people agitating for a railway, because they all recognise its advantages.
192. In the event of this line being constructed, and an agitation being got up for its further extension as far as Barooga, a distance of 20 miles, that would bring you right into juxtaposition with the Victorian railway at Cobram;—if that extension were carried out, is it not extremely probable that the traffic from this portion of the country would go across the border into Victoria, along the shortest railway route to the market? It is not likely that any grain from this district would be sent across into Victoria. If there were no other obstacle, the Victorian duty on the border would prevent such a thing. On the other hand, Sydney is a better local market than Melbourne, because Melbourne has so many producers close at hand.
193. There is another phase of the question. In the event of federation taking place, and the border duties being swept away, the result of this railway extension will be to provide increased facilities for the residents of this portion of the colony to send their produce to the Victorian market;—is not that a matter that must be considered? It is a matter which would come into consideration. But it will be a long time before Melbourne is a better market for that district than Sydney, and with the Victorian duty there is no doubt as to which way the grain will come.
194. In view of the difference in the distance, and that the stuff will have to be carried on the railway line, in the event of the duties on the border being removed, must not the traffic naturally drift to the nearest point? Not naturally. It would drift to the best market.
195. But Melbourne may be the best market? I do not think so, because there is such an immense amount of production immediately adjacent to Melbourne. Go further north and take the Brisbane market. You might say that Brisbane ought to be supplied with sufficient grain from an area within 100 miles of that market, but we know that sufficient grain is not produced there, and that the people have to import it.

H. McLachlan, Esq.

12 June, 1896.

196. But there are very large quantities of grain grown in the Darling Downs? Not sufficient for the requirements of Queensland. It is not so much the proximity of a market as the adaptability of the market to the requirements.

197. You have to take into consideration the soil and climate, and as you go further north the land is not so suitable for the growth of cereals? That is one reason why the production from this district is likely to come to Sydney. At the present time, with the Victorian border duty, there is no doubt as to which way it will come.

198. Under the circumstances, you think the Commissioners are justified in recommending the proposed extension? Yes; the Commissioners recommend it with a full knowledge of the whole of the circumstances.

199. *Mr. Roberts.*] Have the Commissioners been over the proposed line? Yes.

200. Were they struck with the fertility of the district, so as to cause them to come to a determination to recommend this line, notwithstanding that the figures show a probable loss of £800 per annum? Yes; they mention in their report that the district is very fertile, and previously they said, with regard to the district, that the land was the most suitable for grain-growing that they had seen in the colony.

201. It is a wheat-growing district, is it not? Yes, principally.

202. Is not Berrigan what may be termed the centre of that wheat-growing district? I suppose Berrigan would be a fair centre for the district.

203. And at the present time the wheat cultivation is nearer to Berrigan than to Finley? I think it is at present.

204. Is it a fact that if this railway were constructed a large area of land would be thrown open for lease? That is the feeling—that if there were railway facilities a great deal more land would come under cultivation, and squatters would find it to their advantage to cut up their holdings, as has already been done to some extent.

205. Does the wool from Tuppal Station now come to Sydney? No; it goes to Melbourne. We had the clip one year, but, as a rule, the Tuppal wool has gone to Melbourne.

206. Is it probable that you would get this wool if the line were constructed? The Commissioners would not like to advance that, and say they would be certain to get it. They would not like to give an estimate which might not be realised. They have not considered the Tuppal clip in their estimate.

207. But they think the construction of the railway would induce a number of people to settle about Finley, with the view to the cultivation of wheat? Yes.

208. The Commissioners are very emphatic on the point that the land required for the railway must be given free of cost? Yes.

209. You propose to charge 3¼ per cent. interest on the cost of construction? Yes.

210. Is that the lowest rate yet charged? That is the lowest rate the Commissioners have allowed.

211. Are you in a position to verify the statement that, while the cultivated area of the district was about 4,000 acres some five years ago, it has now reached 44,000 acres? I am not in a position to verify those figures. The information came from local sources. I think it was given by a deputation that waited upon the Minister for Works. I have no personal knowledge to support the statement.

212. You have no reason to doubt it? No.

213. Will the line be easy of construction? Very easy. The country is level, and there are no engineering difficulties.

214. *Mr. Wright.*] Do you know if there are any Crown lands at all in this neighbourhood? Not to my knowledge.

215. As far as you know the whole of the land is alienated? Yes, the greater extent, so far as I am aware.

216. Are you aware that a map was recently laid on the Table of Parliament showing that there was no land there at all, except private land? No; I am not aware.

217. Do you think it advisable that the people of New South Wales should construct a railway on which an annual loss is shown of £800 for the benefit, almost exclusively, of a few large pastoral holders? The benefit would be to the people who would settle and cultivate the land.

218. But at present the land is held by a few big men? There is no doubt that in the first instance it would be to the advantage of the owners of large estates.

219. Do you think we should be justified, at a loss of £800 a year, in constructing a line for the benefit of these owners and possible settlers who may be induced to go there? It is the opinion of the Commissioners that the line is a desirable one to make.

220. Do you know what proportion of the land is cultivated? No; I have never been in the district.

221. By reason of the duty placed on wheat in Victoria, and the distance from the Victorian border, you hope to secure the whole of the grain grown in these districts if the railway is constructed? Yes; within a reasonable distance of the line.

222. Do you get now, or do you expect to get, any other traffic but wheat traffic from that district? Very little general traffic is included in the estimate.

223. At the present time do we get over our railways one-third of the goods that are consumed in Jerilderie? I should not like to say of my own knowledge.

224. When the line to Berrigan is completed, do you think Sydney will supply any large proportion of the goods for that district? I do not think it will supply a big proportion; it will supply a proportion of the goods.

225. That being so, this railway would be constructed practically for the purpose of wheat carrying only? To a large extent, that would be so.

226. Do you think there is any feeling in the minds of the Commissioners in recommending this line in the way of competition or opposition to the Victorian railway system? No; I do not think that to any large extent they were influenced by that feeling.

227. You are aware that for some time past very active competition has taken place between the Railway Commissioners of New South Wales and the Railway Commissioners of Victoria for the wool traffic of this particular district? Yes.

228. You are aware that on one occasion we drew the Moulamein and Tuppal wool at a rate £1 a ton less than the rate charged to other people? We drew it at a special rate.

229. And notwithstanding that special rate we failed to get it last year and the year before? Simply because the Commissioners last year would not quote the special rate that they quoted the year before.

H. McLachlan, Esq.
12 June, 1896.

230. Are you aware that Mr. Faulkner, the owner of Tuppal and two other stations, tried to set up one body of Commissioners against the other, and offered absurd rates of carriage first to one and then the other? The Commissioners looked at it in this light. They quoted a rate which they thought would return a profit. If the Victorian Commissioners quoted a rate lower than that, and it did not pay, then the Commissioners let them carry the wool.
231. You are aware that there has been considerable competition between the two sets of Commissioners for the wool of this district? Yes.
232. And that this colony has not been able to obtain that wool at a fairly remunerative rate of carriage? The wool that we have obtained has been obtained at a rate that pays.
233. But, as regards the wool of this district, we have not been able to get it at a fair rate of carriage? The Tuppal wool is taken at a very low rate.
234. And we have not been able to keep it at that rate? I think we could have got it at the same rate, but my impression is that the Commissioners did not care about quoting it again.
235. So that if this railway were constructed to Finley the chances are that there would be a large cultivation of wheat, and in your opinion a certainty that that wheat would come to Sydney? Yes; at the present time.
236. While the duty remains on the Victorian border? Yes.
237. And in the event of the wheat being desired for export, do you still think it would come to Sydney? Under the present circumstances it would. The rate from Cobram to Melbourne is about 12s. 6d. a ton, and the wheat would not be carried from Finley to Cobram under 7s. 6d. a ton at the lowest. That would amount to a total cost for carriage from Finley to Melbourne of £1.
238. That is something above the cost of carriage to Sydney? Yes, a couple of shillings above our rate; which would be 17s. 6d. right through from Finley.
239. But you have no hope of capturing the traffic of the district other than cereals? I do not think we would get the traffic in general goods.
240. Do you think it fair to the taxpayers of this country to construct a line of railway for the benefit of a few landowners, and possibly some cultivators in Riverina, where a large annual loss is shown in the estimate? The benefit will be spread over a large number of people. Employment will be given in opening up the country, and in that way the construction of the line will be an advantage to the whole community.
241. You cannot open up much country by 12 miles of railway? I think you can.
242. Do you not think it would be more beneficial if we spent the money nearer home, where we could cultivate land—for instance, on the line you mentioned from Goulburn to Crookwell? The Commissioners recommended that line as well.
243. *Mr. Trickett.*] When you were examined in reference to the line from Jerilderie to Berrigan you stated that the loss on the branch line from Narrandera to Jerilderie in 1893 was £18,000? About £17,000 or £18,000.
244. Can you tell us what the loss was for 1894? About £14,000.
245. Can you tell us what it was for 1895? The figures are not yet published, but I should say about £10,000.
246. So that the line is gradually improving? Yes. I might explain that last year was a particularly good one for the Riverina district. The earnings particularly on the Hay line improved wonderfully. As you are aware there was a big drought in the west and north-west, while in Riverina the season was fairly good, and we had a very heavy stock traffic from Riverina which helped considerably towards making the Riverina line pay this year.
247. Do you think it is likely that the figures will go back again to a greater loss this year? I do not know if the Hay line itself will be as good. This last year has been an exceptionally good one, and I should not like to say that the current year will be as good.
248. *Mr. Black.*] In reply to Mr. Fegan, you said that the grain production had doubled in the county of Denison? Yes, within three years—from 1893 to 1895.
249. Is it likely from the quantity of ground now being ploughed and put under crop, that there will be an increase for the coming season? I think there will be. Mr. Harper visited the district specially to obtain information of this kind, and he will be able to give you reliable evidence on the point.
250. *Mr. Lee.*] You were asked whether there were any Crown lands along the proposed route, and your reply was that you thought there were not? Not to my knowledge.
251. I suppose you have no personal knowledge of the district? No; I have not been beyond Jerilderie.
252. Are you aware that when the line was proposed from Jerilderie to Berrigan, there was absolutely no Crown land along the route? I believe that was so.
253. With the exception of a small travelling stock reserve, there were absolutely no Crown lands on that route? Yes.
254. Therefore the whole of that country, which is 21 miles 10 chains long, was freehold property? Yes.
255. You are aware that the rate of carriage between Jerilderie and Berrigan was 9s. a ton? Yes; 9s. or 10s. per ton, according to the information we obtained.
256. And that the Commissioners struck a rate for carriage on the railway at 2s. 6d. per ton? Yes; for grain.
257. Is it not a fact that since the construction of that line has been commenced, farmers have been and are at this moment stacking their wheat, and holding it until the completion of the line? Yes; a letter reached the office to-day from some persons interested, urging that the line should be opened without delay, as they had a large quantity of wheat stacked waiting for the line to be opened.
258. If there were no Crown lands between those two points, or in the locality of Berrigan, and yet the Commissioners could see that the line would afford great facilities to the settlers, and pay the country as well, do you think the same results are likely to accrue from this extension to Finley? That is the impression of the Commissioners—that somewhat similar results will follow.
259. Are you aware that there are 160,000 acres of freehold land on the Tuppal station? I do not know the exact area.
260. Are you aware that the owner of Tuppal has on a previous occasion sworn that he is prepared to throw it open for settlement? I am not aware.
261. But you are aware that the owners of the adjoining stations and stations above Berrigan have thrown open their lands on the same conditions—that is, partly lease and partly sale? Yes; I know that that has been the case in regard to many of the large holdings.

H. McLachlan, Esq.

12 June, 1896.

262. With the result that a large population has been introduced who are carrying on farming on a large scale? Yes.
263. As a matter of fact is not that part of the country at the present moment the largest wheat-producing portion of New South Wales? Denison I think, has produced the greatest quantity of wheat of any of the counties.
264. Is there not a probability of a very large extension of wheat growing there? I think so.
265. You said that you believed that Berrigan is the centre of the agricultural district? At the present time I think it is.
266. You had in view, of course, the large area on the eastern side towards Savernake, and in that direction? Yes.
267. And you are also aware that a line from Jerilderie to Finley, or from Jerilderie to Berrigan could not possibly serve the whole of the people about Savernake, Berrigan, Finley, and west of Finley? I am not acquainted with the local circumstances.
268. The fact of there being no Crown lands in the locality in no way influenced the Commissioners in their estimate of the probable ultimate success of the line? No, they were aware of the circumstances.
269. They look at the matter from two points of view—one is, I presume, the relief that would be given to settlers in the country, and the other, the extreme probability of the state being recouped for the cost of the line? I do not know what view they had with regard to the ultimate payableness of the line, but they looked upon it as being a desirable thing to undertake in the interests of the country—that the line would open up an extensive area, and give a great deal of traffic, although at first it would result in a loss.
270. Inasmuch as the Commissioners show that the line from Jerilderie to Berrigan will not only pay working expences and interest upon capital, but leave a small profit upon the first year's workings, although it all goes through Crown lands, is it not a fair presumption that the extension of the line through similar country to Finley and to touch similar country west of Finley, will produce the same result? The Commissioners do not actually show that. In one case they show that a profit will be made, and in the other they do not show that at the present the whole expenditure will be covered.
271. In estimating the probable profits of the Berrigan line, did they not take a certain radius from Berrigan? Mr. Harper went through the district, and he obtained a very good idea of the traffic that would come to the line.
272. Drawing a line which he thought would govern the traffic—showing the traffic it would draw from towards the Finley side? In the same way he went through the Finley district, and showed what would be the result there. You must recollect that as you go further into the country the traffic will taper off, as a rule, towards the terminal point.
273. In their estimate for the Berrigan line they necessarily had to go a certain distance west of Berrigan? Yes.
274. In their estimate for the Finley line, I presume they have not included that a second time? No; although, of course, the double traffic would be covered by the Berrigan line. That is to say traffic must taper off towards the terminal point, because you have the aggregation of traffic as you go along.
275. It would appear from the Commissioners' report that they have been largely influenced in suggesting the construction of this line, by the fact that there is a large amount of traffic in that portion of the colony which finds its way to Victoria? Yes.
276. And it would be in the interests of the country to divert that traffic to its proper channel—that is what it means? That is really the meaning of their first memo.
277. Is wheat in that portion of the colony a commodity that will stand diverting to the metropolitan market and intermediate markets;—is it a commodity of such value that it would stand the cost of transit? It is a commodity that would not stand much cost in transit.
278. But will it stand the additional 15 or 16 miles? Yes, I think so. The charge will be about 2s. a ton, or roughly ½d. a bushel.
279. As that part of the country is essentially a grain-producing country, and as that grain, under present conditions, cannot possibly go into Victoria for consumption, it could only be sent through Victoria by way of export to Great Britain, or for re-entry into New South Wales? Yes.
280. As a matter of fact, do you happen to know from your railway returns whether much of it is sent for those purposes? I do not think that a great deal of it, at any rate from about Berrigan at the present time, is finding its way into Victoria, because the cost of carriage from Berrigan to Cobram would not, I think, be under 10s. a ton, and from Cobram to Melbourne the railway carriage would be 12s. 6d. a ton. On the other hand the grain could be carried from Berrigan to Sydney under our special rates for 15s. 4d.
281. Regarding the condition of that particular kind of agriculture in that portion of the colony, is it not a fact that there are very large intermediate markets in this colony? Intermediate markets are supplied locally, as a rule. Hay furnishes a market—that is the only one I know of. A great deal of grain has been sent from Jerilderie to Murrumburrah, and to Goulburn, not so much for local consumption, as for the purpose of being ground and being subsequently sent to Sydney. In both those cases, so far as local requirements are concerned, I daresay the markets could be supplied locally.
282. But you know from your railway returns that a large proportion of wheat grown out there does not come into Sydney as wheat? No, it is ground into flour.
283. It is intercepted? Yes; that has been the case.
284. At all events, that business has been going on for some years. Your railway is used for the transport of flour and wheat, and it would appear that that has been a profitable business? Yes, it has been.
285. Have you found since the Department of Railways reduced the rates for the conveyance of wheat that it has led to any large additional traffic—that it has induced larger quantities of wheat to be sent along the line? The Commissioners consider that that has been one of the means by which the increased area under grain has been created or fostered.
286. The cheaper cost of transport then has induced larger areas of cultivation? That must be the case. In fact, the reduction for long distance has been nearly 50 per cent.
287. If this line were made to Finley under what circumstances could we fear the loss of trade to the colony generally? Under present circumstances I do not see any fear. I think whatever grain is produced there must come to Sydney.
288. Can there be any inducement held out by the other colonies to attract it that way? I do not think so. As a matter of fact, three or four years ago they did hold out an inducement by giving a special rebate, but there was such an outcry that they had to drop it. Looking at the rates, I cannot see how the wheat traffic could be diverted to the other colony, from that district at any rate. 289.

H. McLachlan, Esq.
12 June, 1896.

289. Can you inform the Committee whether you are at present deriving any traffic from within a radius of 30 miles of the town of Deniliquin? I do not think we are.
290. Does not the whole of that traffic at the present time go to Victoria by way of the Moama Railway? Yes.
291. Is not the trade of that district at the present time entirely absorbed by the private railway from Deniliquin to Moama, and the Victorian railways? Yes.
292. If it were desirable on the part of the Railway Commissioners to obtain that traffic, any extension west of Berrigan must necessarily bring them more in touch with it than is the case at the present time? It might help us a little; but I would not be too sanguine about getting the general goods traffic from that district.
293. There is a large settlement for 25 miles west of Finley—agricultural and grazing; without any inducement on the part of this colony to touch that traffic, must it not be driven on to the semi-private railway to Moama and into Victoria? Yes; at the present time they get the whole of that traffic.
294. Then any extension west from Berrigan must have the effect of collecting at all events a portion of that traffic? It must help us to gain the traffic.
295. If you know of no reason why an inducement could be held out by Victoria to take the grain traffic from there, the inference would be that you would obtain the grain traffic, and would collect a portion of that traffic which is at present driven into Victoria by way of Moama? Yes; it would help us to get a little. I would not be too sanguine and say very much.
296. I suppose the war of rates is still going on between the Victorian Commissioners and our own Commissioners? The differential rates still exist.
297. But for years past the colony of Victoria has had railway possession of that portion of our colony? Yes; the extreme south.
298. And will continue to do so unless we offer facilities to our own people? Yes.
299. So that, after all, so far as the trade of the country upon which you base your calculations is concerned, it matters very little whether the lands are held by the Crown or by private individuals? That is to say, in both cases they will come under cultivation.
300. Is it not within your knowledge that, owing to the inducements and the assistance given by private owners, the land is coming under cultivation much quicker than could be the case if it were taken up as selections by ordinary individuals? Yes; the effect must be to encourage cultivation, and bring additional areas under crop.
301. Are not the station-owners assisting the cultivators under certain conditions? Yes.
302. Is not that having the effect of largely increasing the production of grain? Yes. In the county of Denison the production has doubled within a few years.
303. And it appears to be increasing? Yes. In 1895 that county alone produced 879,000 bushels, which represents a very large area.
304. *Mr. Clarke.*] It would appear that a great deal of the traffic from that part of the country now goes to Victoria? Yes.
305. If the extension from Berrigan to Finley is carried out, will not that carry the traffic still closer to the Victorian border? The railway will certainly be closer to the border.
306. Then it will not be a benefit to this colony if the line is taken nearer to Victoria than is the case at present? The gap that exists at present between the two railway systems in that part of the country is too great to permit of our agricultural produce being sent to Victoria.
307. I think you said that, owing to the tariff on the Victorian border, there was not much probability of wheat being sent into that colony? I do not think there is.
308. Is it not probable that, when the price of wheat in Victoria was low, wheat would come across the border into New South Wales if our market was higher than theirs? Yes; I should think that would happen. I do not say that it would come from this particular point, because there would be about 20 miles of road carriage, which in the case of grain is a big handicap. At present we get grain from Victoria by sea-board, the grain being produced on farms lying close to the sea. If the line were extended to Finley, I do not know that there would be any tendency to attract grain from Victoria.
309. If our market were higher than the Victorian market the grain would naturally come to New South Wales? Yes; but grain can be carried from the Victorian border to Melbourne for about 12s., and from there it could he brought to Sydney by sea at a fairly low rate. This would more than counter-balance the cartage from between the Victorian border and Finley. Locally grown wheat put on to the railway at Finley would certainly find its way to Sydney.
310. How do the Commissioners propose that the loss of £835, as shown in their report, shall be recouped? They propose special rates in order to bring about that result. It is likely, however, that there will be increased development which will make the line pay better. The Commissioners would not like to say, however, that the line would be a profitable one in two or three years.
311. But do not these reports of the Commissioners generally describe how the loss is to be made up? No. They have laid down the rule that where there has been a loss on a branch line, the increased traffic brought to the parent line by that branch would justify them in recommending its construction.
312. Ultimately you think that the line, if made to Finley, would go to Tocumwal? I would not like to say that. It is a matter that has not been considered. The question asked was whether an agitation would not arise, and no doubt it would.
313. The distance from Berrigan to Finley is 13 miles; if another line were made to Tocumwal that would be another 12 or 13 miles? Yes.
314. Would it not answer the public interest if a railway were made direct from Berrigan to Tocumwal a distance of about 15 miles? There is no proposal that I am aware of to extend the line beyond Finley.
315. *Mr. Humphery.*] Is it the view of the Commissioners that Finley should be the terminus of the line? That is their view at present; they have not considered any extension beyond Finley.
316. And the Committee in dealing with this proposal will have to consider it only as an extension from Berrigan to Finley, the latter being the terminal point? Yes.
317. Are you aware of the extent of settlement around Finley? No. I have not been in the district.
318. Do you know that in connection with the Jerilderie line certain information was obtained showing two areas—one 13,000 acres and another 10,000 acres, making a total area under cultivation of 23,000 acres of which Finley was the centre? No; I am not aware of the local circumstances.

H. McLachlan, Esq. 12 June, 1896.

319. And that there were thirty-six and fifteen farmers respectively, making a total of fifty-one farmers cultivating that area? The only figures I saw were those submitted by a deputation, showing the large growth of the district.
320. *Chairman.*] Have the Commissioners taken into consideration an extension towards the east in the direction of the Rock? No, I think not.
321. You have no statement with regard to that? No. I should think the extreme length of the extension would militate against it. The Commissioners have been asked to look at a line from the Rock to Urana.
322. How far is it from the Rock to Sydney? 326 miles.
323. And how far from the Rock to Melbourne? 250 miles.
324. As far as distance is concerned then the traffic would pretty well centre at Wagga? Junee is about half way. Wagga is nearer the Melbourne side.
325. Therefore, any junction with the southern line ought to be as close to that half-way point as possible, if you are going to take Sydney interests into consideration? Yes; it would be more likely to divert the trade this way.
326. Any distance beyond Junee the balance would be thrown in favour of what you regard at present as a rival system? Yes.
327. Do you regard the cost of land carriage between Finley and Yarrowean on the Victorian side as constituting an interval between the two systems sufficient to prevent undue competition? In the case of grain, yes.
328. With regard to wool, you are not quite so sure? No; because wool is an article that can stand a heavier cost of carriage, and the rates are much heavier.

TUESDAY, 23 *JUNE*, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (Chairman).

The Hon. Charles James Roberts, C.M.G. | John Lionel Fegan, Esq.
Henry Clarke, Esq. | Frank Farnell, Esq.

The Committee further considered the proposed Railway from Berrigan to Finley.

John Harper, Esq., Goods Superintendent, Department of Railways, sworn, and examined:—

J. Harper, Esq. 23 June, 1896

329. *Chairman.*] Do you desire to make a statement? Yes. As is the usual practice, I will read a copy of the report which I made to the Railway Commissioners. It is as follows:—

11 May, 1896.

Estimate of traffic on proposed extension from Berrigan to Finley.

The length of this line is about 13 miles; estimated cost, £26,000.

By direction of the Commissioners I have again looked into the probable traffic on this proposed extension. It is well, perhaps, to draw attention to a report made by me on 26th November, 1894, to the following effect:—

"The distance between these two points on an air line is 12 miles, and therefore it is reasonable to suppose that the line could be built in 13 miles. From a point 8 miles west of Berrigan almost the whole of the land is leasehold, from Tuppal and Barooga Stations. Assuming, however, the cultivation continues on these two holdings as at present, the following is an estimate of the probable traffic which would be derived from an increased length of 13 miles of line:—

Goods Traffic.	£	s.	d.
At Finley—3,200 tons of wheat at 2s. 6d. per ton (not included in Berrigan estimate).....	400	0	0
General goods for whole distance from Jerilderie, 100 tons—			
36 miles at 3d. per ton per mile	45	0	0
50 tons, 8 miles, at 2s. 6d. per ton.....	6	5	0
400 passengers at 1s. 6d.	30	0	0
Parcels, &c.	10	0	0
Mails	156	0	0
	£647	5	0

Should the construction of this extension have the effect of securing the Tuppal and other clips in the vicinity, then 600 tons of wool, yielding a through rate to Jerilderie of £225, would require to be added to this and the Berrigan estimate, the proportion to be credited to the Finley extension being £52 10s., making the total estimate for the Berrigan to Finley extension £699 15s.

The inquiries made by me at this time were not as complete as I have since been able to make them; and I therefore submit the following amended estimate, premising that a *pro rata* extension of the arbitrary rate of 2s. 6d. per ton fixed by the Commissioners for the distance from Berrigan to Jerilderie would be applied to the distance between Berrigan and Finley. I may also mention that the wheat production of this district has increased, and that there is no doubt a portion of the wheat credited to the Berrigan extension would be delivered at points on the projected line. My estimate is—

	£	s.	d.
Wheat, 6,000 tons at 1s. 6d. per ton	450	0	0
General goods, 100 tons at 3s. per ton	15	0	0
Live stock, 200 trucks	40	0	0
Passengers, 400	30	0	0
Parcels	10	0	0
Mails	156	0	0
	£701	0	0

To this might be added, assuming the competitive quotation were given, 600 tons of Tuppal and other wool clips at 7s. 6d. per ton, £225. There is no doubt that this line will, to a certain extent, feed the Jerilderie line in the matter of agricultural produce, whilst the conditions of rates, &c., which prevail in Victoria continue to exist.

I may draw attention to the fact that the settlement of Finley is within 16 miles of the Victorian border, and that the carriage of either wheat or wool from any point to the south will largely be controlled by the conditions referred to.

330. *Mr. Roberts.*] You have a full knowledge of the locality where this proposed railway is to run? Yes.
331. When were you last over the route of the proposed line? In August last.
332. What area of country would be affected by this railway? It would have the effect, in my opinion, of making certain the whole of the traffic from a point 8 miles west of Berrigan, and for a distance of about 10 miles south-west. It would also control, I think, about 14 miles to the west—practically as far as Tuppal. I fancy that that would about represent the area that would be served. As a matter of fact, I have

J. Harper, Esq.
23 June, 1896.

have left Tocumwal out of my estimate altogether, because the road carriage between Tocumwal and Yarroweyah is so small that, for export wheat, I think the traffic would certainly go into Yarroweyah. From Tocumwal they would have about 16 miles carriage to Finley, as against only 8 to Yarroweyah.
333. How far south from Finley would this line get the wheat? I think about 8 miles. There is extensive cultivation between Berrigan and 8 miles due south of Finley. There is also extensive cultivation from the north to the same point, and extensive cultivation from Tuppal to the west.
334. I want to know what traffic the New South Wales railway system would get, which it does not get now, by this line being constructed from Berrigan to Finley? I do not know that we could get any Tocumwal traffic which we have not at the present time, but it is possible that we might get some traffic at Tuppal which we do not now get, and from the neighbourhood of Finley we should get traffic equal to the amount of my estimate—that is, instead of wheat being brought along the travelling stock route from Finley to Jerilderie, as at present, it would be delivered at Finley, which is, of course, an intermediate point.
335. Do you not get the Tuppal wool now? We had it one season.
336. Was that at a payable rate? Yes; it paid us the season we got it, but the owner of it wanted us to quote a lower rate for the next year, but it would not pay us to do it.
337. Is there not a heavy loss on the line from Jerilderie to Narrandera? Yes, unfortunately; but it is being made up to a large extent by the increased traffic which we are getting from the carriage of breadstuffs; the loss is decreasing in quantity.
338. Do you think that, through this line being constructed, the annual loss on the line to which I have just referred would be lessened? That is my impression. I think it would tend to bring more traffic on to the branch line.
339. Has the area under wheat cultivation increased during the last two years in that district? Yes.
340. Has it been accelerated by the construction of the line from Jerilderie to Berrigan? Yes; I think that has given it a distinct impetus.
341. I suppose that Berrigan is looked upon as being the centre of that wheat-growing district? Yes. In my opinion, from a knowledge of the district, it is, for the reason that there is a great deal of wheat land in the neighbourhood of Savernake to the south-east of Berrigan, and also due south, down towards Mulwala, there is a large wheat district, and practically the whole district between Berrigan and Finley consists of wheat-growing land under cultivation.
342. From what area do the farmers send their wheat to Berrigan? From Savernake.
343. What distance is that from Berrigan? I think it is about 14 or 16 miles. The Clear Hill farmers send their wheat by another road into Jerilderie. The farmers on the northern boundary of Barooga would also send their wheat to Berrigan.
344. Are there more farmers nearer to Berrigan on the proposed line of railway than at Finley? I cannot speak confidently, for I do not know the exact areas, but I should think there are.
345. If this line were constructed, do you think that the land about Finley would be taken up for wheat-farming? I think so. In the neighbourhood of Finley it is all very good wheat land.
346. Can you, from your own knowledge, say that the owner of Tuppal Station would be likely to lease out his land? Yes; I think he would, because he would make more out of that than out of sheep.
347. If your estimate were borne out, the line would show a loss of £835 per annum? Yes.
348. Can you give the Committee any idea what time would elapse before this line would become a payable line? No. It would be such a difficult thing to do. So much would depend on the inducements held out to the people to go in for cultivation for the purpose of giving increased traffic to it. I dare say that if wheat realised the same values as it did this year there would be a very strong inducement to considerably increase that estimate; but if, on the other hand, wheat went down to 2s. a bushel, I imagine that the inducement would not be very strong for people who do not own the land.
349. A good deal would depend on the wheat market? Yes. The people in the district under consideration are very different from the bulk of the settlers about Berrigan who own their own land. Of course, the system of half or any other shares, or the rental system, could never induce such a permanent cultivation as the other system.
350. Is the half-share system generally adopted in that neighbourhood? In the neighbourhood of Finley the land is principally owned privately, and is worked under that system, and on Momolong, between Berrigan and Clear Hill, they work under that system.
351. The proposed line would be a fairly level one, would it not? Yes; it should be an easier line than the Berrigan line. The ground is sounder, at any rate, along the road.
352. The land is very fertile? Yes; pretty well the whole of it is under crop from Berrigan to Finley, or it was when I was there.
353. Is most of that land held under lease? For about 8 miles due west from Berrigan they are chiefly selectors, but after that you get on to the leasehold areas of Tuppal and Barooga, where they have been working on the half-share principle.
354. Is there much cultivation to the north of Finley? Not immediately to the north.
355. It is principally between Finley and Berrigan? Yes.
356. Where do the Finley farmers send their wheat to at the present time? To Jerilderie they have been in the habit of sending it.
357. What distance is that from Finley? About 21 miles.
358. Are you in a position to say that they would send it to Berrigan, considering that there would not be a very great difference in distance? The difference is 9 miles. It is 12 miles by road from Finley to Berrigan, and 21 miles from Finley to Jerilderie.
359. Then you think that the whole of the wheat that now goes from Finley to Jerilderie by road would go by rail from Finley to Berrigan? I am inclined to think it would. The farmers in that district appear to have the idea that if it represents only a day's trip to a station there and back—that is practically 34 miles—it is not such a serious detriment as it is when they have to send their teams away for two days.
360. Would the farmers act differently if the wheat were to be ground in Jerilderie than they would if it were going on to some other place by rail from Jerilderie? I believe there might be some difference.
361. They might convey it by road if it were going to be ground at Jerilderie, but there is no doubt that they would put it on the railway at the nearest point if it were going further than Jerilderie? Yes.
362. Is there a flour-mill at Jerilderie? Yes.

J. Harper, Esq. 23 June, 1896.

363. And large quantities of wheat find their way into Jerilderie? Yes. I may say that I have a return up to May for this year. The year is not quite concluded. We have shipped from Jerilderie 99,000 bags this year, and I think there are between 40,000 and 50,000 bags at present being held in that district pending the completion of this proposed line.
364. Would that be at Berrigan, or right along the line? A great deal of it has been stacked at Berrigan. Permission has been given to the owners of wheat to stack it on the site of Berrigan Station, and they are waiting until the line is finished to forward it. That is exclusive of the flour dealt with at the Jerilderie mill. I may mention that it shows a very considerable increase on the quantity despatched during the previous year. Practically, the whole of the wheat was exhausted in May, 1894, and 1895, when 96,000 bags had been sent, whereas this year 99,000 bags have been sent already, and I am credibly informed that between 40,000 and 50,000 bags are waiting in the district.
365. Do you think that the increase in the quantity of wheat grown is to a large extent owing to the construction of the railway from Jerilderie to Berrigan? Yes; and also, to a certain extent, it is owing to the favourable conditions that have prevailed for the crops there. When I gave evidence here in 1894, I referred to the large quantity of wheat land then going into cultivation. My estimate was 150,000 bags of wheat, and apparently it will be more than realised.
366. Coming back to the question of loss, do you think that five years is a fair time in which to expect this line to become a paying line? It is very difficult to say. As I have stated, the entire thing would be contingent on the values obtained for produce. But that is an exceptionally favoured district in regard to soil, and getting the rainfall at the proper time.
367. What is the rainfall? Twenty to 21 inches.
368. A fall of 21 inches would be very favourable for wheat production? Yes; getting it at the periods in the year they generally do in that district.
369. What is the rate of carriage at the present time from Finley to Jerilderie by road? Nine shillings a ton.
370. What do you propose? Our proposed through route is 4s.—2s. 6d. from Jerilderie to Berrigan, and 1s. 6d. from Berrigan to Finley.
371. Would that charge of 9s. per ton be in dry weather? Yes; the roads are impassable in wet weather. The teams simply cannot go along them.
372. Is all traffic put a stop to in winter? I will read you what the output has been during each of the months of the year, and this does not necessarily mean that the whole of the wheat has been carried by road, because a great deal of it is stored at Jerilderie in summer and despatched as demand arises. In June, 1,488 bags; July, 3,033; August, 1,063; September, 1,617; October, 1,504; November, 792; December, 29,849; January, 33,531; February, 18,928; March, 3,291; April, 1,563; May, 3,072. But the greater part of that wheat despatched in winter is taken from stocks at Jerilderie.
373. Have the Commissioners been over this line? Yes.
374. In your company? I was with them.
375. The question had not been discussed then as to whether this line would probably be a paying line? Oh, no. As a matter of fact, the Commissioners were going over the line between Jerilderie and Berrigan, and they went round by Finley, and along the travelling stock route for the purpose of having a look at that side of the country, and they were met at Finley without any prior arrangement by a number of the residents there, who brought under their notice the matter of the line to Finley.
376. Can you tell the Committee on what ground the Commissioners recommend the construction of this proposed line in view of the loss of £835 per annum? Well, I take it that seeing the desire of the country is to build pioneer lines in good agricultural districts, this line is regarded as complying with those conditions.
377. And probably the extreme fertility of the soil? Yes.
378. And the probability of increased settlement taking place there? That is their motive, I think.
379. The Commissioners are very emphatic that the land through which the proposed line is to pass shall be given by the owners? Yes.
380. Do you think there would be any difficulty in that respect, or have you heard that the people are willing to give the land required? I think that, as a matter of fact, Mr. Faulkner made a definite offer of a chain of land, or whatever was necessary, as far as he was concerned. I do not know of any other.
381. Is Mr. Faulkner the proprietor of Tuppal Station? Yes.
382. Would the line go through a great portion of his property? Yes.
383. You think that a large increase in the farming population would take place there if this line were constructed? I think so. I think that the difference in the cost of getting their wheat to market would act as an extra inducement to people to settle there and cultivate the land.
384. Have you any doubt about it? I have none at all, so long as the prices remain favourable.
385. Did you form your estimate on the basis of the present population of the district? Yes; the population which was in existence there at the time I was there in August.
386. You have not allowed for any possibility or probability of increased population? No.
387. Have you put forward these figures as the result of personal observation, or are they taken from "Coghlan"? They are the result of personal observation, I knowing the area that was under crop at the time I was in the district within that radius of the line.
388. You have had large experience in submitting estimates for railway lines? Yes; I have had considerable experience.
389. And, as a rule, you make your estimate well within the mark? Yes; I always take particular care to endeavour to do that.
390. You think it is a fair thing to assume that within a few years settlement will increase around Finley, and that this line will become a paying one? If, as already stated, the conditions are favourable —that is to say, if too extravagant terms are not demanded by the owners of the land from their tenants, and the prices of wheat and farm produce remain pretty sound.
391. Would you care to give your own individual opinion as a man who has had a large experience? No; I would not care about saying any more than I have already said in my report, where I draw attention to the difference in the character of the settlement generally speaking in the neighbourhood of Berrigan and Finley. I hold that in cases where the land is in the hands of small owners, there is a stronger inducement to continue cultivation, even under adverse circumstances, than there would be where land is rented.

392.

392. And you feel sure that in the near future the line from Berrigan to Finley would be a paying one? I would not like to say that. With rented land like that the thing is so dependent on circumstances.
393. *Mr. Farnell.*] In your report you mention the fact of this proposed line having to pass through two holdings;—in what direction are those holdings? Both due west from Finley; about 8 miles from Finley the line would pass through those holdings.
394. Is that leasehold or freehold? I think most of it is secured. I think that evidence on that point was obtained before in connection with the Berrigan line. There is not much Crown land left in that district, but I cannot say how much.
395. You mean it is in the possession of only two people? Principally, but not entirely.
396. Do you think it is likely that the people who own those areas would be agreeable to allow settlement to take place on reasonable terms if this line were constructed? They are really doing it now. Those areas are occupied now by settlers. The question as to the terms being reasonable is, of course, another matter. I did not at the time consider that 5s. an acre was quite a reasonable rental, but I think it has been modified since.
397. You have said already that a great deal of settlement would be served by this line, and you are of opinion that its construction would conduce to a further increase of settlement in the district? Yes.
398. Have you had an opportunity of conversing with people in the district through whose lands this proposed line would run? No.
399. So that you cannot quote us any authoritative statement in regard to their disposition towards the Government so far as giving the land is concerned? No; the only case I know of is a voluntary offer on behalf of Mr. Faulkner, the owner of Tuppal, to give the necessary land.
400. For about what distance would this line run through Tuppal Station? About 5 or 6 miles, probably.
401. Supposing the people were not agreeable to give the land required, that would necessarily be a considerable item to be considered? Yes.
402. You think that if the land were given, the construction of this line would, commercially speaking, be a good undertaking on the part of the Government? I think so—that is, for the policy of building cheap lines for the purpose of inducing agricultural settlement I think it would be.
403. In connection with your estimate for this line, have you made any allowance for the erection of platforms at different points? The estimate of the Engineer-in-Chief includes all that is necessary.
404. How many platforms do you propose to have between Berrigan and Finley? There would be about two sidings I should think. They would not necessarily be platforms, but simply sidings.
405. And probably those would be worked by the guards? Yes; there would be no staff on the line at all, except during the wheat seasons.
406. Do you know what is about the acreage at present under cultivation in the district which would be served by this railway? This particular railway would serve from 18,000 to 20,000 acres of wheat land.
407. Would this line be the natural channel for the conveyance of the produce to Sydney, or to the nearest market? In view of the existence of the line from Narrandera to Jerilderie, and from Jerilderie to Berrigan, it certainly would be.
408. You have already told us the rate proposed to be charged between Finley and Jerilderie;—supposing settlers desired to send their produce to Sydney, could that be done on a payable basis? Yes; as a matter of fact the Finley people would pay only 3d. per ton more than the Berrigan people would have paid at the time that line was approved of. This is owing to the reduction of rates. When the Berrigan line was dealt with the cost per ton was 14s. 7d. from Jerilderie and 2s. 6d. from Berrigan to Jerilderie, making a total of 17s. 1d., whilst the present rate is 12s. 10d. from Jerilderie, 2s. 6d. to Berrigan, and 1s. 6d. to Finley, or 16s. 10d. as against 17s. 1d.
409. Are you aware whether sufficient wheat is grown in those districts to supply local requirements? Most decidedly. The great bulk of the wheat grown in those districts finds its way to the coast.
410. *Via* Sydney? Yes; *via* Sydney. But it is milled at various points along the line.
411. Does it find its way to Sydney in the shape of wheat or flour? As flour.
412. Do you know whether any quantity of flour is sent from the Sydney market to those parts of the country? There may be during a season like this, when the wheat crop has been comparatively short.
413. Only under those conditions? Yes.
414. You think, then, that the Sydney market would benefit considerably by the construction of this line? Yes; I think so.
415. But you think there would be a corresponding advantage given to the settlers in that district by their having facilities afforded them for trading with the city of Sydney? Yes; as a rule the conveyance of produce from different places is followed by the conveyance of stores to those places.
416. You think that the people there would purchase their supplies from the Sydney market? They would to a certain extent.
417. Do you think that the rates of carriage for this merchandise would not act prohibitively? No. As you will observe from my estimates, the rates are exceedingly low—an average rate of only 2½d. per mile added to the special rate for traffic going to Finley. It is really only a first-class rate.
418. You estimate there would be a loss of £835 per annum on this proposed line? Yes.
419. What is the estimated loss on the Jerilderie to Berrigan line? Practically the estimate of revenue is £10 over the annual cost. The estimated revenue is £3,083, and the annual cost is £3,073.
420. By the construction of the Jerilderie-Berrigan line the main line will receive a great advantage in the shape of extra traffic going over it? Yes.
421. Will that also be the case in the construction of this line? Yes; as a matter of fact this traffic will also pass over the Berrigan extension, and beyond that—that is to say, that wheat at the present time going along the travelling-stock route will give 1s. 6d. per ton on this proposed line, and 2s. 6d. per ton on the Berrigan to Jerilderie line.
422. Do you think the construction of this line would be the means of diverting any of the traffic which at the present time is carried over the Victorian railways? It might. But I think the principal consideration is, that Tuppal wool and stores—which are not included in my estimate—would mean an additional £225 a year revenue.
423. You appear then to have based your calculations on the production of wheat alone? Wheat, live stock, and other goods. I may say that our experience last year shows that the estimate of live stock would very probably be exceeded in any season approaching that of last year. We carried for one firm alone

J. Harper, Esq. 23 June, 1896.

250,000 sheep from stations on the Jerilderie line, and between Narrandera and Hay. I think that, of those about 80,000 came from the Jerilderie line, showing that in seasons, such as will sometimes occur here we should carry even more than the amount which I have estimated. I have only estimated 200 trucks of stock altogether for this line, and, practically, that is only 20,000 sheep.

424. Did you make any special arrangements as to the price to be paid for the conveyance of those sheep last year? No.

425. I believe the Commissioners have power to make such arrangements? Yes; if necessary.

426. If this line were constructed, is Tuppal the only station with the owner of which you could make special arrangements for the conveyance of wool? That is the only station where you could be successful in doing so. All the other stations, with the exception of those immediately bordering on the river, now send their wool to Sydney.

427. How many trains do you propose to run on this line? About three a week—the same as on the Jerilderie line. It might be necessary in the case of heavy live stock or wheat traffic to run more, but, as a rule, we should not run more than we do now on the Jerilderie line.

428. In your estimate you take into consideration an amount for the carriage of mails;—what does that amount come to? It is £12 per mile over the whole system.

429. Are you satisfied that the estimate of revenue is a fair one? Yes; I consider it is a fair one—not by any means an unreasonable one.

430. Not likely to be exceeded? Well, it might be if we got the Tuppal wool. That would mean £225 more.

431. Do you think that the estimate of working expenses might be exceeded? Of course that estimate is given by the Commissioners, but if the traffic became heavier, and necessitated increased expense in working, we should get a corresponding advantage in increased revenue.

432. *Mr. Clarke.*] I think you said that you are thoroughly acquainted with the whole of this district from personal observation? Yes.

433. You were there in company with the Commissioners? Yes. I have also been over the district by myself on several occasions.

434. Are there many settlers or farmers in the immediate locality of Berrigan and Finley? Yes; there are settlers the whole distance along the road, and for 7 or 8 miles back from the road, between Berrigan and Finley, and there are also a number of settlers between Finley and Tuppal.

435. What are the principal crops grown? Wheat. Some of the farmers have gone in for the cultivation of fruit and other crops, and most of the selectors who own land about Finley also have sheep as well.

436. Do they grow barley? Yes; but barley has been grown more for experimental purposes, I think, than for anything else.

437. You principally depend on the wheat for traffic;—where does it generally go to? Well, it is distributed along the whole of the Southern line. I have not a statement for this year, but I have one for last year which will give you a general indication of the principal centres to which it is distributed:—Darling Harbour, 5,600 tons; Granville, 2,196 tons; Wagga Wagga, 2,000 tons; Narrandera, 4,000 tons; and so on.

438. I suppose some goes to Goulburn? Yes; this year less went to Goulburn from that particular district.

439. Those are the chief intermediate markets on the way to Sydney? Yes.

440. Is the land which the settlers occupy in the immediate neighbourhood of this proposed line their own selected land, or does the land belong to large landowners? In the immediate vicinity of Berrigan, and for a distance of 8 miles out of Berrigan, in the direction of Finley, it is all in the hands of selectors who have selected on the runs originally, and have retained possession of their holdings.

441. The Tuppal run is, I suppose, chiefly in the hands of the proprietor? Yes.

442. Do you think that, in the event of this line being made, any portion of that run would be leased by the proprietor of that run, and worked either on the half-share principle or rental? I think a great deal of it would. A great deal of it is already, under existing circumstances.

443. It would be to the interest of the proprietor, I presume, to open up the land? Yes.

444. Instead of keeping it for grazing purposes? Decidedly; especially if he could realise 5s. an acre for it, as he was doing.

445. In that case, I presume it would make very little difference whether the land was retained in the hands of the present owner or thrown open for occupation by settlers? No. The only thing, as I pointed out before, is that unless the terms are very favourable the man owning the land himself would be likely to take more out of it than a man would take out of rented land.

446. And ultimately it would be in the interest of the landowners there to have it cut up? Oh, yes, decidedly. I heard that the proposal was to exchange the land. The evil of the system I saw when I first went there was that the land was let to a number of people in comparatively small holdings, and they had to farm every acre of it, and were practically exhausting it, but I believe the proposal now is to work it for a certain period, and then put it under lucerne, and give the men new land on which to carry on their operations. Owners who had 200 or 300 acres had to farm every acre each year.

447. What portion of the wheat and other cereals grown there would go to Victoria? That immediately on the Murray, I think, would go to Victoria. The farmers there would pay the rates, and I fancy even a heavy duty, rather than cart it.

448. It could be sent in bond either for export to England or to come back to New South Wales? Of course it could be, so far as the duty is concerned, but I do not think that it would come back into New South Wales. I fancy that the Customs regulation now rather restricts the possibility of doing that. It has to be "identified" wheat; it cannot be held at all.

449. Would the carriage to Melbourne be lower than the carriage to Sydney? No; not from this particular point. The carriage from Yarroweyah would be 15s. a ton, to which would have to be added from 20 to 24 miles of road carriage.

450. You think that the loss of £835 per annum would in a few years be reduced? Yes; I think there is very great hope of it in a district like that.

451. By increased settlement and larger quantities of produce or grain being sent along the line? Yes.

452. Are there any flour-mills in the immediate neighbourhood of Jerilderie? No. The one at Jerilderie is the only one in New South Wales until you get to Deniliquin and Narrandera. There is also one at Corowa, and one at Mulwala.

453.

J. Harper, Esq.

23 June, 1896.

453. But whatever wheat was ground into flour, except that required for local consumption, would naturally find its way to Sydney? Yes.
454. On the whole, you are of opinion that it would be desirable to have this line constructed, taking everything into consideration? Yes, I think so; taking into consideration the policy of opening up the country for settlement. I think it is a line that would create settlement.
455. From where do the people now generally get their supplies—machinery and everything of that kind? From Victoria, chiefly.
456. They have hitherto done that, even before the alteration in our tariff? Yes. Exceptionally favourable rates were given by the Victorian railway authorities. They differentiate, I think, as much as 46 per cent. in favour of people in that locality as against the people of Victoria.
457. *Mr. Fegan.*] From your evidence, I understand you to be favourably disposed towards the construction of this line? Yes.
458. On the ground that, although you admit it will not pay at the present time, there are hopes that in the very near future this line will not only pay the annual working expenses but also give a fair return, and be able to help the Jerilderie to Berrigan line out of the loss sustained at the present time? Yes.
459. Are the conditions of this line equal to the conditions of the Tamworth to Manilla line? No; I do not consider that they are so good, because the Tamworth to Manilla line has such a splendid district behind it to support it, and with no competition.
460. If this land were freehold, you would naturally support the construction of this line more keenly than you do at the present time? Most undoubtedly.
461. There is a drawback at the present time—the land not being freehold, it does not offer the same inducements to people who go and settle on it? No, it does not. The people who have their own land in that district have enough to farm profitably and properly.
462. Do you think that if this line were constructed to Finley it would be the means of inducing people there to get their supplies from Sydney instead of from Victoria? It would to a certain extent, but only to a limited extent.
463. I suppose, as a matter of policy, you cannot see your way clear to reduce the rates further, in order to give greater facilities to those people? No; we are not prepared to do as the Victorians do—differentiate against our own people.
464. What has been the most important factor in the development of that part of the country;—would you entirely put it down to the railway? No; Berrigan started the development—that is, the first portion of that country which developed—some five or six years ago. A number of enterprising young Victorians went there, took up land, and stuck to it.
465. Do I understand you to say that a great factor in the development of that part of the country is the fact that the Victorians have gone there and taken up the land? Yes; Victorians, South Australians, and Tasmanians have gone there, knowing how to farm, and seeing the quality of the land there, and desiring to have larger areas under better conditions than they could get in their own country.
466. Under ordinary conditions they considered it was favourable? Yes.
467. And with the railway, and their practical knowledge of farming, that district has been developed in the matter of agriculture? It is practically the granary of New South Wales as regards the production of wheat.
468. Is it not a fact that in connection with the proposal to construct the line from Jerilderie to Berrigan several representations were made as to the necessity of continuing the line to Finley? Yes; to the Public Works Committee.
469. At that time, did not a deputation wait on the Minister for Works, and ask him to continue the line to Finley? I have not seen the official records, but I think I have read in the reports that such was the case.
470. As has already been stated, there would, for a while, be a loss to the extent of £835 a year on this line? Yes.
471. I suppose you would not see your way clear to recommend the construction of this line unless you saw the possibility of its ultimately paying? No; if I were assured there would be a definite loss of that amount for ever and ever I would not have spoken of it in the terms I have. But I know the great resources of the district, and I have hopes that the line will eventually repay the trifling amount of loss that will be incurred in connection with it.
472. And with the greater amount of traffic you would give greater inducements to the people there? Decidedly.
473. It is only when you have a limited amount of traffic you have to draw a hard and fast line? The arbitrary line is drawn only until the railway pays, and of course when it pays the people there get every advantage that other people get on the through line.
474. Which is the chief product there? Wheat.
475. Is the land suitable for fruit-growing? Yes; I have seen splendid fruit there, and I think it will be a great dairying district.
476. Is much dairying done there now? No.
477. But you think there would be a development in that direction? Yes. On the other side of the Murray corresponding land is entirely used for dairying purposes.
478. Do you think it would induce some of our Victorian neighbours to become customers of ours? No. They manufacture so much themselves that I do not think we could expect them to become our customers, but the people in this district would, I think, find a market in our own colony, or would export. I believe it would be a good dairying district.
479. I suppose the land there will grow almost anything? Yes. The lucerne, where it has been properly cultivated there, does as well as any I have seen anywhere in the interior.
480. There is a good rainfall? Yes; 21 inches, which is quite enough.
481. *Chairman.*] Where is the Victorian rebate line in relation to Finley? The Victorian rebate line is, approximately, from Jingellic West in the direction of Savernake, and cutting the Jerilderie-Berrigan line about midway. North of that line the rebate is equal to 46 per cent.
482. Therefore, the country which you have described as fed by this proposed railway line is cut by that rebate line? Yes.
483. The northern part is subject to a rebate of 46 per cent., and the southern part to the Victorian rates? Yes.

J. Harper, Esq.

23 June, 1896.

484. To what class of goods does the rebate apply? It applies to everything the railways carry, except agricultural produce. It includes wool.
485. What would be the freight from Yarroweyah to Melbourne per ton of wheat? Fifteen shillings.
486. Is that the ordinary rate? Yes. I may state that in 1894 provision was made by the Victorian Railway Department whereby they gave a rebate of 15s. on wheat if grown within 15 miles north of the Murray, and a rebate of 4s. if grown more than 15 miles away; but within about six weeks after this rate was introduced such on outcry arose among the Victorian farmers that the Victorian Railway Department had to abandon it, and it has never been allowed since.
487. How much on wool? That would depend on where it was grown. It would be about 32s. 6d. per ton from Yarroweyah to Melbourne. That includes the rebate. The through rate from Yarroweyah to Melbourne would be about 42s.
488. Fifteen shillings is the ordinary rate for agricultural produce from Yarroweyah to Melbourne, and the rate for wool grown north of the rebate line described is 32s. 6d., and south of that it is 42s.? Yes.
489. According to your special conditions from Jerilderie to Berrigan and Berrigan to Finley, what would be the freight from Sydney to Finley for agricultural produce? 16s. 10d.
490. What would the land carriage from Finley to Yarroweyah be? About 12s. 6d. to 14s. a ton—probably 12s. 6d.
491. The Victorian railway has 1s. 10d. the best of you to Melbourne, taking the terminal points of the two systems as being Yarroweyah and Finley? Yes.
492. But the land carriage being 12s. 6d., the traffic for export would very likely split a little north of Tocumwal? Yes; about 8 or 9 miles from Finley.
493. Taking it for granted that the distance is 14 miles to Tocumwal, and 8 to Yarroweyah, therefore 4 miles north of Tocumwal the traffic is split? Yes.
494. What is the duty on wheat in Victoria? It is rather a curious thing that I have asked nearly every miller and custom-house agent in Sydney, and each one tells me something different. Three shillings a bushel on wheat was the last information I got—from Gillespie Brothers, who are Victorians, and should know—and £5 a ton on flour. But Wise Brothers told me 2s. a bushel on wheat and £3 a ton on flour. However, I think that Gillespie Brothers are correct.
495. Therefore, it follows that no wheat is likely to leave our own lines for consumption in Victoria? No.
496. Any that leaves the line will clearly be for export? Yes; I think that probably Gillespie Brothers meant 3s. per cental duty on wheat and £5 per ton duty on flour.
497. What is the rate for the carriage of wool from Finley to Sydney? We have a special rate for that.
498. What is the rate for the carriage of wool from Jerilderie to Sydney? We also have a special rate for that.
499. Well, from Wagga Wagga to Sydney? £2 18s. 6d.
500. Therefore, the freight from Wagga Wagga, which is a considerable distance nearer to Sydney than Finley is—over 100 miles nearer to Sydney—is more than the freight from Yarroweyah to Melbourne? Yes.
501. Therefore, if your rate to Wagga Wagga is a reasonable one, your rate to Finley would have to be materially lessened to compete with the Victorian railways? Yes.
502. What is the rate for general goods from Yarroweyah to Melbourne? Third-class goods, 90s. 8d.; second-class goods, 68s. 9d.; first-class, 55s.
503. Approximately a mean of 71s. 6d.? Yes.
504. Can you tell us your rate for general goods to Jerilderie? That would be £5 per ton. But then we carry certain items which are included in the class of goods carried on the Victorian lines—sugar, galvanized-iron, fencing-wire, and things of that kind—which we carry in truck loads of 6 tons each at £20, that is £3 6s. 8d. per ton.
505. Is that a fair comparison with the Victorian charge of £3 11s. 6d.? Yes; for those classes.
506. Could the New South Wales railways deliver general goods, if the line to Finley were constructed, about as cheaply as the Victorian line can deliver from Yarroweyah to Melbourne? I do not know that we could, but we might. It would be a question of readjusting the rates.
507. Is the case with regard to the two railway systems this: that you believe that the wheat for export will probably go to Victoria, and the wheat for home consumption will come along the New South Wales railways, whilst with regard to general goods it appears probable that you will be able to compete with the Victorian system, and that with regard to wool you could compete with the Victorian system only with a special agreement? Yes; that is precisely the case.
508. As you get west beyond Tuppal you commence to feel the influence of the Deniliquin-Moama line? Yes.
509. Can you tell us the rates for wool and general goods from Melbourne? They are all cutting rates.
510. You have already stated that the influence of the Deniliquin-Moama line extends beyond Tuppal? Yes; from anywhere in the neighbourhood of Conargo, and north of Tuppal, that line would control the wheat traffic as far as Tuppal, and Tuppal is about 14 miles from Finley.
511. Beyond that, you commence to feel the influence of the Deniliquin-Moama line? Yes.
512. Can we reasonably estimate the rates you have given to Yarroweyah as being similar to those from Melbourne to Moama? You may, for practical purposes, regard them as the same to Moama, and then you have the Deniliquin line to add to that.
513. If we add Melbourne-Yarroweyah to Moama-Deniliquin, we get a fair idea of what the competition would be? Yes.
514. The three competitors would be the Deniliquin line to the west, the Victorian system to Yarroweyah to the south, and the possibility of road carriage to Jerilderie in the north? Yes.
515. Are you prepared to express an opinion as regards the extension of this line towards the Rock? No.
516. If a line be eventually made from Finley to the Rock, this would form a portion of it? Yes.
517. You in your statements view it simply as a local line between Berrigan and Finley? Yes.
518. But it might eventually form portion of the Rock line? Yes; it might.
519. You are not in a position to express an opinion in regard to the possibility of that line being constructed? No.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

SECTIONAL COMMITTEE.

RAILWAY FROM BERRIGAN TO FINLEY.

REPORT.

THE Sectional Committee appointed on Tuesday, 14th July, 1896, to inspect, take evidence, and report with reference to the proposed Railway from Berrigan to Finley, have the honor to report to the Parliamentary Standing Committee on Public Works as follows:—

The Committee, consisting of the Hon. D. O'Connor, M.L.C., Frank Farnell, Esq., M.L.A., and Geo. Black, Esq., M.L.A., left the Redfern Railway Station by the 9 p.m. train on Friday, 17th July, 1896, and arrived at Berrigan at 1 p.m. on Monday, 20th July.

The Committee opened their inquiry at 2·15 p.m. on 20th July, at the "Federal Hotel," Berrigan, when Frank Farnell, Esq., M.L.A., was elected Chairman, and where various residents of the township and district, including farmers, storekeepers, station managers, and the local bank manager, were examined.

The Committee met again on the following day at 11 a.m., and took evidence up to 1 o'clock, and sat again in the afternoon until 4·30 p.m.

On Wednesday, 22nd July, the Committee, before leaving for Finley, inspected the route proposed for the line through the township of Berrigan, and were then driven to Finley, making a thorough inspection of the proposed route throughout, and arriving at Finley at 1 p.m. The Committee met on the same day at Burbury's Hotel, Finley, to take evidence. A number of witnesses, chiefly farmers and property-holders to the east, west, north, and south of Finley, were examined, the sitting lasting until 5 p.m.

The Committee met again at 10 a.m. on Thursday, 23rd July, and examined a number of witnesses, some from near Tocumwal and Deniliquin; and again at 2 p.m., when additional evidence was taken, and subsequently were driven by some of the principal residents through the district, in the direction of Deniliquin, and towards Jerilderie. An inspection of the proposed site for the railway station was also made. On returning to Finley further evidence was taken, and the Committee adjourned at 5·30 p.m.

On the morning of Friday, 24th July, at 9 a.m., the Committee met and decided to go to Tocumwal by a route some distance from the ordinary coach road, which would enable them to inspect more thoroughly the settlement in the district, and also a valuable granite reserve in the neighbourhood of Tocumwal, of large area, which might be utilised for ballast purposes. The Committee arrived at Tocumwal at 12 o'clock, and having made some informal inquiries there, left in the afternoon for Yarroweyah, where, at 3·30 p.m., train was taken for Seymour, which was reached at 8·30 p.m.

The Committee met at the "Terminus Hotel," Seymour, at 8 a.m. on Saturday, 25th July, to consider their report, and adjourned at 9 a.m., when train was taken for Sydney, the further consideration of the report being resumed on the journey, the Committee arriving in Sydney at 6·15 a.m. on Sunday, 26th July; the report being finally considered and adopted on Tuesday morning, 28th July.

The

The construction of the line from Berrigan to Finley has been recommended by the Railway Commissioners on these grounds:—(1) That, in view of the character of the country and the absence of made roads, the settlers of the district were entitled to improved means of communication; (2) That the special fitness of the land for agricultural purposes, and the construction of the railway from Jerilderie to Berrigan, with the hope of its extension to Finley, had largely increased settlement during the last eighteen months; (3) That with the construction of a railway to Finley still further settlement would take place, and a much larger area would be placed under crop, with the result that large quantities of grain and other produce would be carried over the feeder, and thence by the main trunk line to Sydney, the sole market for the district.

The evidence taken by the Committee confirms the anticipations and statements of the Railway Commissioners in every particular. Prior to the arrival of the Committee in the district there had been a very heavy fall of rain, and during their stay a slight fall was experienced. Under these circumstances the roads were found to be almost impassable, great difficulty being experienced in passing from one town to another, and from inquiries put to teamsters *en route* it was made evident that during such periods a team of twelve bullocks could only with extreme difficulty drag a load of 3 tons. Under such adverse circumstances the rates of carriage are very high, and therefore the development of the district is to this extent so much retarded. The Committee, therefore, are of opinion that the nature of the soil renders the construction of either a road or a railway an absolute necessity. The contour of the country being favourable to railway construction, and metal for road-making not being readily obtainable, while the character of the soil would make the upholding of roads very costly, the Committee are satisfied that a light line of railway would initially cost little more than a road, while its maintenance would cost considerably less, and its direct return to the State, growing with years, would in time recoup the Treasury for its primary expenditure and return a fair annual revenue.

With regard to the second ground of the Railway Commissioners' recommendation, the Committee find that the country has been recently invaded by a horde of intending settlers, chiefly from Victoria, and that while many of these have been enabled to settle in the district, principally by taking up land on the halves-system, a much greater number would ere now have made the district their permanent place of abode if land had been more easily available. In confirmation of this statement, it is in evidence that over 2,000 applications were made for seven blocks of land that were thrown open. In this connection, the Committee might point out that the Minister for Lands would wisely throw open for settlement some, if not all, of the water, timber, and stock reserves throughout the district. In particular might be mentioned the travelling stock reserve extending from Tocumwal to Jerilderie. Of this area, 40 miles long and 1 mile in width, at the utmost half would be ample for its gazetted purpose.

One thing has struck the Committee as being remarkable: In face of certain circumstances which were supposed to be prejudicial to the agricultural interest, the Committee have discovered, from the evidence of farmers, and the comparison of their statements with those furnished to the Sectional Committee who visited the district in January, 1895, that the increase of area of land under crop has been phenomenal. Hardly a witness was examined who had not, animated by the fresh facilities for transit about to be given by the construction of the Jerilderie to Berrigan railway, and in hope of the further advantages to be conferred by the extension to Finley, doubled his area under crop; many of the witnesses had trebled their cultivation area, some had quadrupled it, and some had quintupled it; and in no known instance has a diminution of the area under crop been made.

With reference to the third point, the evidence before the Committee, combined with the high opinion formed of the industry, "push," and hopefulness of the settlers in the district, lead them to believe that the mere calling of tenders for the Berrigan to Finley railway would result in every foot of land now available being immediately cleared for the reception of seed.

With regard to the departmental estimate of traffic, the Committee have no doubt that this has been in no way over-stated. On the contrary, the evidence goes to show that the number of passengers has been considerably under-estimated,

and

and that the returns from the carriage of wheat, unless bad seasons intervene, are likely from the first to be double the amount set forth in the departmental statement. Possibly the latter has been under-estimated because it was thought that wheat consigned from the neighbourhood of Tocumwal to Sydney would be carried *viâ* Melbourne; but it has been made evident that, with the construction of the proposed railway and an alteration of local business arrangements, little or any of the wheat-yield is likely in future to cross the Murray. Under favourable circumstances, as high a return as 34 bushels per acre has been obtained, and all this crop (except the small quantity locally consumed) would find its way over the railway to Jerilderie from an area which would extend on the westward 20 miles—that is, within 10 miles of Deniliquin; on the northward from 8 to 10 miles, in the direction of Jerilderie; on the eastward about 5 miles, or about one-third of the distance towards Berrigan; while towards the Border the whole country will be tapped to Tocumwal due south, and as far as Barooga on the south-east, and very nearly to the Deniliquin-Moama line on the south-west. This applies to stock as well as to cereals.

With regard to the inward traffic, it appears to be the custom of the residents in Jerilderie, Berrigan, Finley, and Tocumwal, even if their supplies be purchased in Sydney, to convey them, especially goods of a bulky or weighty character, by water to Melbourne, and thence by railway to the Border. Some of this traffic will, in all probability, never be diverted to the direct line from Sydney; but with more extended means of communication and a largely-increased and ever-growing export trade with that city, it would appear that old business associations will eventually be disregarded, and the capital city of this Colony become the overland depôt of supply for this district.

The Committee believe that this railway can be very cheaply constructed, the route proposed presenting no engineering difficulties, requiring no bridges, and being almost on a dead level, necessitating very light earth-works and only a few culverts.

Having regard to the course recommended for the proposed line the Committee are of opinion that some expense in the matter of severance might be saved, and the convenience of the settlers better consulted, in that one road instead of two would be crossed, were a slight deviation made from the proposed route by not leaving the main road at the corner of Robertson's section—No. 68—but by following a straight line until reaching the border of Phipps' holding, and thence making the deviation through Phipps' second paddock to the fenced road. In all other respects the surveyed route meets with the approval of the settlers, and has not been discovered faulty by the Committee.

Careful inquiry has been made into the *pros* and *cons* of the necessary resumptions. At the Berrigan end, those settlers who see no benefit in the railway being carried past them to Finley, and also those townspeople who think it would be to their detriment, will require to be compensated, not only for resumptions but also for the injury which would be caused to their properties by severance. By personal examination of those settled on the road frontages between Berrigan and Finley, it was discovered that the bulk of them, on both sides of the line, are prepared to give their land either free of cost to the State or in return for areas of corresponding value to be taken from Crown lands abutting on their properties. In cases where monetary compensation would probably be demanded, the land is worth from £4 to £5 an acre, and the Committee are of opinion that the total cost in such cases is not likely to exceed £100. In the matter of severance, for which a demand might be made in two or three cases, it is more difficult to arrive at an estimate, but the sum total in this matter cannot be a very large one.

Taking into consideration all these favourable circumstances, and having thoroughly weighed the *pros* and *cons*, and seeing that Finley is the natural centre of a large tract of arable country which may eventually become one of the most prosperous districts in New South Wales, the Committee have decided that its necessities and prospects entitle it to railway communication with the metropolis. If deemed advisable that this may be demonstrated without fear of failure, the construction of this railway need not be entered on until the Jerilderie-Berrigan line has had one season's trial to show the capabilities of the district.

The

The Committee have also decided that the possibilities of the line would be increased were the fine arable country on Tuppal Station resumed by the Government, prior to its construction, and thrown open for settlement, instead of, as now, being available for agriculture only on the halves or the leasing system. Were such a course followed the enhanced value given to the land by the facilities of railway transit might be partly utilised to recoup the State as rent, while the remainder of the enhanced value might be used as a further inducement to intending settlers.

Whether this railway be constructed soon or late—for inevitably it must be constructed—the Committee are of opinion that the spectacle of 50,000 bags of wheat awaiting transit on the proposed site of the railway station at Berrigan, and the knowledge that many of the granaries and woolsheds of the district are filled with products awaiting the completion of the line to that town, afford a valuable object lesson for those who have the drawing-up of railway contracts. If it be not deemed advisable by the Government to construct its own railways, then all contracts ought to be so worded that non-fulfilment of the conditions should be accompanied by heavy penalties so strictly enforced that these national works would not be dallied with for the purpose of increasing profits by delays which might result in getting either labour or material more cheaply than was possible when the specifications were made out, to the detriment of those who had entered into engagements based on the belief that the terms of the contract would be rigorously adhered to.

FRANK FARNELL,
Chairman.

Sydney, 28 July, 1896.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

RAILWAY FROM BERRIGAN TO FINLEY.

TAKEN BEFORE THE SECTIONAL COMMITTEE.]

MONDAY, 20 *JULY*, 1896.

[*The Sectional Committee met at the "Federal Hotel," Berrigan, at* 2·15 *p.m.*]

Present:—

FRANK FARNELL, Esq. (Chairman).

The Hon. Daniel O'Connor. | George Black, Esq.

The Sectional Committee proceeded to consider the proposed Railway from Berrigan to Finley.

Mr. William James Greggery, farmer and grazier, Berrigan, sworn, and examined:—

Mr. W. J. Greggery. 20 July, 1896.

To the Chairman: I am a resident of Berrigan. My sons have been residents here for 14 or 15 years. I was not exactly living in Berrigan, as it is now, at that time, for I had a little property further down which I sold, but my knowledge of this district dates back to 1881. I have a knowledge of the proposed route for this railway. In our application for the construction of a railway from Jerilderie to Berrigan we claimed 8 or 9 miles from Berrigan towards Finley as being *bonâ fide* settlement, the majority of the original selectors still being in occupation of the land. Over that 8 or 9 miles the settlement is pretty close. Beyond that there is a large estate which is worked on the share system. But although the area within 8 or 9 miles of Berrigan, towards Finley, is under a different class of occupation from the land between that point and Finley, I do not wish to convey to the Committee the idea that agriculture is not carried on quite as well on the other side of that area as it is within it; but in our application for the Jerilderie to Berrigan railway, we claimed that area of 8 or 9 miles as a supporter of the Jerilderie-Berrigan line. Up to within 8 miles of the township of Berrigan the people are free selectors, but beyond that point, towards Finley, they are land-holders, on the Tuppal Estate. I anticipate that the traffic from the area extending 8 or 9 miles from Berrigan would act as a feeder to the Jerilderie-Berrigan railway. Supposing that the proposed line from Berrigan to Finley were constructed, it would not be patronised by any of the settlers within 8 miles of Berrigan, because they would support the Jerilderie-Berrigan line. They told the Railway Commissioners that if a line were constructed from Jerilderie to Berrigan they would send their produce to Berrigan. People living within 8 miles of Berrigan, towards Finley, have not sent their produce to Berrigan, but to Jerilderie, by means of a cross-road that joins the Jerilderie-Berrigan road somewhere about Wonnamurra. Beyond the 8 miles pretty well all the traffic has been taken along the travelling-stock route. So a good deal of the traffic that used to go to Jerilderie will in future be diverted to Berrigan. My impression is that even without a railway from Berrigan to Finley, all the traffic within 10 or 12 miles of Berrigan will come to Berrigan. All the country for 8 miles towards Finley from Berrigan is good. I think that the average yield of wheat is from 15 to 17 bushels per acre. I believe there are very few areas that belong to the Crown that could be thrown open for settlement—that almost all the available areas between Berrigan and Finley are alienated. Supposing that the proposed railway from Berrigan to Finley were constructed, there is a very large estate—the Tuppal holding—which might be thrown open for settlement. This railway would run 8 or 9 miles through that holding. I think that this district first came into notice as an agricultural district after the passing of the Land Act of 1880. A few selections were taken up in 1881, and a small acreage was brought under cultivation. The result was so good that it induced people to go in largely for cultivation. One of the largest and earliest cultivators on the other side of Finley, Mr. McAllister, is now present. At Berrigan I think I myself was the first. In or about the year 1884 I had about 250 acres under cultivation. After the passing of the Land Act of 1880, the district came into prominence as being very well suited for agriculture, as was proved by the land which was brought under cultivation; selection took place very rapidly, and I am glad to say the majority of the people who selected are here now. With the change of proprietorship of the Momolong holding there came about a different feeling from that which had previously existed. The original proprietors of that holding were simply sheep-owners; but their successors seemed to favour agriculture, and under their auspices agriculture made a rapid advance in the district and has progressed since by leaps and bounds. The whole district is now a wheat field. I think there is a continuous course of settlement from here to Finley; I believe there is hardly a break, and it is the same on the eastern side, towards Corowa. With a favourable season, I think that there will be an immensely larger yield of wheat next season. We have also had some samples of flax grown here, and the experts have spoken very highly of it, and there is not the slightest doubt that if the irrigation proposals made by Sir Henry Parkes were carried out here, we could grow anything. We have the climate and the soil, and all we want is the water. We are subject to periodical droughts, which pull us back. Oats have been grown in this district with very great success; ten to eleven bags to the acre, I think is about a fair thing, when the ground is well cultivated. I believe that people are only too anxious

Mr. W. J. Greggery. 20 July, 1896.

to settle in the district. There have been many applications to private owners for areas in this district—I may say hundreds for each portion to be let. The applicants came principally from Victoria. I have seen the plan in connection with the proposed railway extension to Finley. The line will pass through a number of small holdings. I am not able to say whether the people who own that land are willing to give it free for the purpose of railway construction, neither am I prepared to answer your question as to whether that land might be acquired at a reasonable cost by the Government. I have not attempted to form an estimate of the traffic that comes to Berrigan at the present time from Finley and district. Just now the traffic is small, but in the summer months, and during grain time, the traffic to Berrigan will be very great after the construction of the line from Jerilderie to Berrigan. Hitherto it has been diverted by cross-roads, saving some mileage towards Jerilderie. I do not think that one of the crops grown in this immediate district is sent to Victoria, but down south, nearer Cobram, though the dilatoriness in connection with the construction of the line from Jerilderie to Berrigan a few have been sent lately to Victoria, also to Tocumwal—but that is a port. A quantity of wheat as well as wool is water-borne from Tocumwal, and of course we cannot compete with water carriage; and the natural inference is, that traffic will drift to where cheap carriage can be obtained. I have not considered the question as to whether it would pay the Finley settlers to send their produce to Sydney *via* Berrigan. That is outside my province; I merely look after myself. I am very sorry to say that most of the produce grown in the district last season is now stacked at Berrigan awaiting the opening of the Jerilderie-Berrigan Railway, which was to have been completed by 25th July instant. Its ultimate destination was Sydney. For wheat and other produce sent from this district, and the Finley district, to Sydney, Jerilderie has been the station of departure, excepting the year before last, when we got a concession from the Victorian Government, when our roads were very bad, which allowed us to send our produce through to Sydney—water-borne from Melbourne to Sydney—at the same rate as we could send it from Jerilderie. At that time the approaches to Jerilderie by road were really impracticable. There was no grass nor water, and consequently it would have cost more to carry water and feed teams than the produce was worth. At present produce is brought to Berrigan by teams—hired teams, as a rule. In times gone by we have suffered severely from fires, and people are always very anxious to get their produce off the land as soon as possible; and in order to do so they employ every available means at command to get their produce into a place of safety, and after finishing harvesting many go on the road and cart their own. The cost of the cartage, of course, depends on the distance. It is a mileage rate from here to Jerilderie. Immediately after harvest the charge was 1s. 1½d. per bag—that is, about 10s. per ton. People on the other side of the Eight-mile Point, towards Finley, got their produce carted to Jerilderie for 8s. per ton. I think it would be to their interest to patronise the Finley-Berrigan Railway, if they could get their produce carried to Jerilderie for 5s. or 6s. a ton. Of course if Sydney merchants held out sufficient inducements to people in this district to purchase their supplies in Sydney there would always be a return traffic. The condition of the roads between Berrigan and Finley and district wholly depends on the weather. With good weather, the roads are good; there could not be better, because the country is almost dead level, and you can take almost any quantity of loading you can get the vehicle to carry, in fact, I think the vehicles often succumb more quickly than the draught power, but if heavy rain comes the roads get correspondingly bad, quickly. About 50,000 bags of last season's wheat, nearly all from just around Berrigan, south of this township, and very little from Finley way, are now stacked at the proposed site for the Berrigan railway station. One of our greatest supporters is the Savernake district, as well as the southern district toward Cobram. There is much more wheat grown in that direction than Finley way. It was only after we found that the Government had accepted a tender for the Jerilderie-Berrigan railway, and that it was to be completed in July of this year, that people began to stack the wheat here, for there was always a doubt whether that railway would be constructed in time to deal with any of this wheat. In spite of all this, from about the beginning of the year to the end of the season, 50,000 bags accumulated here, and they are here now and some small quantities are still coming in. A stimulus was given to us in the first place by Sir Henry Parkes saying he would give us a tramway. When he was altering the tramway system in Sydney I was sent down as a delegate, and it was suggested that he should send one of the disused motors and some worn out rails for the use of this district, and from that day out agriculture has been going forward rapidly, and we have always looked forward to getting the railway which is almost now an accomplished fact.

To Mr. Black: Perhaps a little more than 50,000 bags of grain are now stacked at the proposed site of the Berrigan railway station. That wheat has come principally from the south and the east of Berrigan. A very large quantity of it has come from the district between Berrigan and Cobram; I think very little indeed of it has come from the neighbourhood of Finley. As this large quantity has accrued only from the carriage of wheat during two or three months, and in the face of a bad season, I think that it would be more than doubled or perhaps trebled in another season. There is an increased area under cultivation in the neighbourhood. I have gone from 500 to 2,300 acres, and I am only a small factor. I have noticed lately that a great deal of the storekeepers' and squatters' supplies has come to this district *via* Victoria. I think the bulk of their goods comes from Victoria. Simply because of the impassability of the roads it has paid them better to have their supplies water-borne from Sydney to Melbourne, and then brought on from Melbourne to the border by rail, and then carried from Cobram to Berrigan by team. The roads between Cobram and Berrigan are better than the present road from Jerilderie to Berrigan, because the construction of the railway has opened up new tracks, and they will not bear much traffic; the new tracks are not sufficiently solidified by use. The old track has been destroyed by the construction of the railway. The heavy portion of the traffic goes now chiefly to Cobram where there is a railway just across the river, whereas you have to go 4 or 5 miles after crossing the river at Tocumwal before you come to Yarroweyah. My argument is that the alteration of the road from Jerilderie to Berrigan caused by the construction of the railway has to some extent driven traffic to Cobram. The bringing of goods round from Sydney to Berrigan, *via* Melbourne, is not only a recent occurrence, because many facilities have been offered by steamboat proprietors and others to divert the carriage of those goods *via* Melbourne, and then the Victorian railway officials have given concessions which have been taken advantage of by our storekeepers, to their credit. I do not think it is a fact that you can land wheat in Melbourne from this district 2s. 6d. per ton cheaper than you can send it from Jerilderie to Sydney. I think the rates from Cobram to Melbourne and from Jerilderie to Sydney are about equal. New South Wales wheat is worth about 3s. 7d. or 3s. 8d. at Jerilderie and 3s. 11d. at Cobram, in bond. It is taken across the Victorian railways for export to Brisbane, West Australia, and other places. For want of a railway some of the wheat will have to be taken away by team. I have heard of some that is going away to-morrow from here.

Mr. W. J. Greggery. 20 July, 1896.

I suppose that most growers of wheat here would be satisfied with 3s. a bushel. I do not think there is much in it at a lesser price, although we have had to take less. From Berrigan to Cobram I think sleepers are just now being carted at about 13s. 6d. per ton, but that is of course a special rate. Wheat from near Cobram is generally carted to Berrigan at so much per bag, amounting to little less than 1s. per bag, but the rate altogether depends on the seasons. If there is plenty of grass and water you can get people to work their teams, or even when, like last year, there is a drought, but the price is 1s. per bag, I think, although I will not be sure on that point. I think that after the Jerilderie-Berrigan railway has been opened the bulk of the traffic of this district is likely to tend towards Sydney. I have reason to believe that the wool will be sent to Sydney. I know that there was a little doubt in the mind of a large owner here a few days ago, but that was simply owing to the non-completion of the railway. If he had been sure that the railway would be ready to convey his wool as soon as it was off the sheep, I am sure that it would have gone to Sydney straight. I think that, in order to see which market is the best, the squatters in this district, when they have two railway services practically to their door—one in each Colony—will be likely to pit the one against the other. Mr. MacFarlane promised to send all his wheat, 20,000 or 30,000 bags, by the Jerilderie-Berrigan line, but the Government have not acted up to their promise to have the line constructed by the 25th July. I do think the Government are to blame in this matter. They have supervising engineers, who should keep the contractors up to the mark. The construction of the Jerilderie-Berrigan railway was supposed to absorb a a large number of the Sydney unemployed. That was one of the reasons brought forward for having that line constructed, or, rather, perhaps I should say that the beginning of the construction of these cheap light lines was with the idea that they would absorb the unemployed; but since the Jerilderie-Berrigan line has been in course of construction I do not think that at any time have more than one hundred men been employed on it, and then for only a week or two. For the last two or three weeks, I think, only about twenty men have been employed on it. I know that the Government itself is not constructing the line, but that it has let a contract for the work; but I think that, on inquiry, you would find that the Government had power to step in, when it found the work was not going on, and do it at the contractor's expense, and thereby absorb the unemployed. I do not think that I have too high an opinion of the powers of the Government. Cobram railway station is about 23 miles from Berrigan, and the river is crossed by means of a punt. The bulk of the land in this neighbourhood has been held for pastoral purposes, but it is now held by comparatively small holders. There is a continuous line of *bonâ fide* settlement from here to Cobram. The land has been acquired by purchase, and is freehold. It was not bought by the present occupants from the Government, but from the original purchaser. Between Berrigan and Cobram there are some scattered portions of Crown lands available, but not a very large area in block. I am aware that it has been stated that the construction of the Jerilderie-Berrigan railway has been delayed owing to difficulty experienced in getting sleepers. They are now being brought from Cobram, on the northern bank of the Murray River—at least a portion of them are. I have no idea what the contractor's price for them is. There would be no difficulty whatever in getting sleepers for the proposed line from Berrigan to Finley, and we have a magnificent quarry of ballast here—equal to anything in the Colonies. It is decomposed granite, or granite pure and simple; there is granite detritus, and granite fit for any purpose. It is about a mile and a half from this place, at the furthest. The roads in this township are made of it. We have no blue-metal in Berrigan. At present the milling for the district is done in Jerilderie; but I think there is every probability of a mill being established here. From what Mr. Wise, of Jerilderie, has told me, I think he intends to establish a mill here next year. Six or seven years ago this place was a wilderness—wild scrub. I do not think that, even if a railway were constructed from Berrigan to Finley, any great quantity of traffic would be drawn to it from the border; but I think that the Jerilderie-Berrigan line will attract people from as far as the border. In fact, as soon as that line is opened it will be a through line from Victoria for squatters and other people travelling to Bourke and the back country. They will go through Deniliquin, and *via* Hay. They will save half a day even in going to Hay for business purposes by coming this way. They will come by coach from Cobram. That traffic will help to make the Jerilderie-Berrigan line pay. I do not think at present that there is any danger of that line being used as a feeder for the Victorian railways. I do not think that there is any danger of goods being carried from places between Jerilderie and Berrigan to the nearest point on that railway, and then being taken by team across the river to Cobram, or to Yarroweyah; every day's experience proves directly the contrary, because we are getting things water-borne from Sydney to Melbourne, and sent through Victoria to Berrigan. Of course. I suppose that for goods for sale the people in this district will take advantage of the best market, wherever it may be. I think that the majority of the settlers and townspeople in this neighbourhood have been Victorians; some at recent dates, and some a long time ago. I was a Victorian myself nearly fifty years ago. A man is no colonist at all if his sympathies are not with the colony he lives in. I think the people in this district are thoroughly good colonists, and New South Welshmen. We suffered from drought last summer. The previous drought was some years before that. We have had several bad droughts here; but, as applied to agriculture, we have never had a drought that has thoroughly devastated a crop. The droughts have been bad for grass and stock; but, as far as agriculture is concerned, they have not had any prejudicial effect. I do think that wheat which is favoured with a rainfall soon after being sown is largely interfered with by an ordinary drought. I think that wheat can stand a good deal of drought. Our average rainfall is 20 inches. Provided that that was fairly well distributed over the year, even pastoral pursuits would not be seriously affected. Our experience here is that if we get a heavy rainfall at one portion of the year it is at the expense of another. Of course the average is made up throughout the year, not doled out in modicums at a time. I am hardly prepared to answer your question as to whether, in the matter of delay in constructing the Jerilderie-Berrigan railway, it is a valid excuse that the contractors have been unable to get sleepers, I know it was quite possible to get sleepers from the Murray River in the summer months for the whole line, before any rain at all had fallen. I am not prepared to say that the contractors delayed getting their sleepers forward before the rain set in, because I understood from the contractors themselves that they were to have sleepers from another portion of the Colony, and that through some unforeseen occurrence—bad weather, or something of the kind—they were unable to get them, and had to come back here. Perhaps it was an error of judgment on their part. I am not prepared to sit in judgment upon them. I am not aware whether there has been a strike in connection with the construction of the Jerilderie-Berrigan railway. I have heard that the contractors for that line are also the contractors for the Moree railway; but, from my own knowledge, I cannot say. The Murray River is now running for navigation.

Mr. W. J. Greggery. 20 July, 1896.

navigation. About three weeks ago a steamer left Tocumwal with about 1,100 or 1,200 bags of wheat. I cannot say where that steamer was bound for; I merely saw a notice in the paper that such a boat had left. As a rule, when the market is favourable, large quantities of wheat as well as wool are despatched from Tocumwal by boat. I have not heard of any shipment at all from Cobram; in fact, I do not think that Cobram is classified as a port, but Tocumwal is. Tocumwal has a Custom-house officer and other luxuries. I am not prepared to speak with reference to a railway from Berrigan to Finley. I have advocated a railway from Jerilderie to Berrigan. A railway to Finley is outside my province; but that district is quite equal to this, and it altogether depends on whether the holdings are or are not permanent—whether that railway will or will not pay. If they are permanent, I think there is as much possibility of that line proving remunerative as there is that the Jerilderie-Berrigan railway will. The people of Finley have greater facilities for getting to places beyond the border than the people of Berrigan have, because they have a bridge across the Murray at Tocumwal, and the Victorian Government has made a road to Yarroweyah, where there is a railway station. The road between Finley and Berrigan is an average bush road; in fact, it is about the best road about here at the present time, because there is not much traffic on it. It is better than the road between Berrigan and Jerilderie. There is a road from Finley to Jerilderie. The distance is about 25 miles. The distance from Finley to Jerilderie is about equal to that from Berrigan to Jerilderie. It is only about 17 miles to Finley proper from here, and people living within 8 or 9 miles of Berrigan could not be better served than they will be by the Jerilderie-Berrigan railway; in fact, they would be as well served as if they had a railway to their own doors; but people further on would send their produce to the siding, and thus save a few miles. I do not think that the Finley residents would avoid Berrigan in order to go to Jerilderie. The road from Finley to Jerilderie is a pretty bad road, especially with heavy traffic, but some of the Finley people would still make use of the railway station at Jerilderie either for the despatch or the reception of goods. The Finley people have a great advantage; they have a travelling stock route, a mile wide, which they can go on pretty well as they please—one of the oldest and best stock routes in the Colony. I do not mean to say that when the Jerilderie-Berrigan railway has been opened people living at Finley proper will cease to make use of Jerilderie as their depôt and will come to Berrigan, but that people living within a reasonable distance of Berrigan will certainly come here. I do not wish to give my evidence with any bias against the Finley people, who perhaps have the same right to a railway as the Berrigan peeple have; but I think that some portion of the Finley residents would still continue to use the Jerilderie railway station. I think that Berrigan is the centre of the wheat-growing district in this portion of Riverina. There is a large area of land under cultivation. There is more cultivation east than west, The increased area under cultivation extends chiefly east and south. I think that the reason for that is increased facilities, On the other side of Finley there is a very large property held by one holder which has been kept pretty well intact. That estate—Tuppal—runs nearly 40 miles from here west, and west of Finley it has been held pretty well intact. I think that nearly the whole of the setttlers west of Finley are *bona fide* men who have got their original holdings, and there may be a few others, but the holdings east have been smaller, and I think the returns have not been perhaps so good as they used to be, and the people have determined to try some other plans of working their estates. That is merely my idea. I may be right or I may be wrong. Outside of Momolong there are several small holdings running nearly to Corowa, and a large number of those holdings have been thrown open lately under different systems of working. The Government has no doubt assisted to a great extent to make settlement somewhat easier there lately, but it is the private landowners themselves in that direction who have given the most facilities. The terms on which the large landowners permit people to cultivate their lands are various—the usual system is the halves system, but there are various terms under which the halves system is worked. I should think that some of the landowners get as high a return as 10s. an acre, The landowner provides seed-wheat and bags, and many other things—in nine cases out of ten he provides food and sometimes tobacco—and he has to wait twelve months, and if there is a bad season he may get nothing, but if there is a good season he may get 10s. or 15s. per acre. If there is a good season, there is nothing to prevent his getting back the things he has advanced, as well as, perhaps, 10s. per acre; if there is a bad season he loses what he has advanced and gets nothing in return. I think that if the ground is properly worked, and the occupier is a man who looks after it properly, the landowner should have a return of 10s. per acre. Ten shillings an acre would be a pretty fair rent for land that cost a £1 per acre; but, of course, it costs more than that to put it under cultivation. As a rule it is not the man who pays 10s. an acre who does the work. It is either done for him or he is allowed for it, which amounts to the same thing. Sometimes a man who goes in at 10s. an acre has to find everything. If he gets a good season he comes out alright; but if he gets a bad season he gets nothing and the landlord gets nothing. Seven shillings an acre is generally allowed for clearing the land. Ten shillings an acre is a pretty fair return, but the landlord has to provide seed and bags. Bags cost 4s. 2d. per dozen.

To Mr. O'Connor: The promise of a railway from Jerilderie to Berrigan induced people to take up land and cultivate it. This same result would follow railway extension to Finley, if there were the same position of affairs, but in this portion of the country there was a large quantity of Crown land available, and it is not so in Finley. The station property in the Finley district embraces 30 or 40 miles, by about 50 miles or more. The country between Berrigan and Finley is magnificent agricultural land. As to whether settlement would follow railway extension to Finley, it would all depend on the will of the owner of Tuppal Estate. The roads in the Finley district are fairly good—the usual bush roads. They are good in good weather, and they are bad in bad weather—it all depends on the amount of traffic. The expense of carriage is very considerable to the producer when the season is bad. Extension of the railway to Finley would be a great advantage to the producer. I do not think that the fact of some of the people here having originally come from Victoria interferes in any way with their loyalty to New South Wales or their desire to advance its interests. I think they are New South Welshmen thoroughly.

Mr. Emanuel James Gorman, auctioneer and farmer, near Berrigan, sworn, and examined:—

Mr. E. J. Gorman. 20 July, 1896.

To the Chairman: I am an auctioneer and a farmer. I am one of the oldest residents in the district. I have been here seventeen years.

To Mr. Black: As an auctioneer I handle everything I can—stock, land, grain, &c. I do a good deal of grain-buying, and hope to do more when the railway has been opened. Stock in this neighbourhood are chiefly despatched to Melbourne; I mean fat sheep. Last year, owing to the drought in other parts of

New

Mr. E. J. Gorman.

20 July, 1896.

New South Wales, a very large number went *via* Jerilderie to Sydney. There are not many cattle about here. The prices last year were better than they had been for years. Riverina was the principal supplier of Sydney last year. There was some feed here last year—natural grasses; very few of the sheep were artificially fed. One farmer near here fattened some on lucerne, but that was not the usual thing. It paid him very handsomely. He topped the Sydney market last January, with a small consignment. He got his crop by natural rainfall. An attempt to raise crops by irrigation was made by Mr. McFarlane, on the Murray, but I do not think it turned out successfully. He spent some thousands of pounds on a plant, and afterwards gave it up, because it did not pay. I can hardly say whether that was because of distance from the market. In my opinion irrigation would not answer in this climate to any extent. There is not sufficient demand for the produce. The prices are too low to pay for the labour that would be expended in irrigation, and the corresponding increase in produce would not justify the expenditure. In ordinary seasons we do grow sufficient chaff in this district for its requirements; but there was hardly enough last year. After the Jerilderie-Berrigan railway has been opened, I have no doubt that we shall try to sell any surplus chaff we may have. Whether a considerable area will be devoted to the growth of chaff for the Sydney market after the Jerilderie-Berrigan railway has been opened will depend solely on the prices. It might be better to let it run for wheat, for the cost of harvesting wheat is much less. The New Zealand and Tasmanian growers have a much larger yield, and can land their chaff more cheaply in Sydney than we could, even with a railway, under ordinary circumstances. If we could land chaff in Sydney for 15s. a ton, and could get £4 a ton for it there, that would be equal to about 2s. 9d. per bushel for wheat, on an average yield. It would pay to grow wheat here at from 2s. 6d. per bushel upwards. Many people, I think, would probably grow it at a lower price, but it would not be a very productive undertaking at much less than 2s. 6d. You can only get about four successive crops of wheat, and then the land requires a rest. If the land could continue as fertile, and you could keep on cropping it year after year, no doubt wheat could be profitably grown at 2s. per bushel; but, as matters are, that would not be a wise thing to do. As to what would be a good resting crop to follow wheat, chaff would be an improvement, but it takes a great deal out of the ground as well. Sheep-grazing is the right thing to follow wheat in this district. The soil here will grow potatoes under favourable circumstances, but not so as to compete with other districts; you may get an early potato crop here, and it may be a total failure—you cannot depend on it. The soil here is suitable for stone-fruits and grapes. The growing of these has been gone into, but it is not a profitable undertaking at present—there is not a very good market. The prices in Sydney and Melbourne are not sufficient to encourage anyone to go into it. I do not think it is a fact that the fruit consumed in all the small towns hereabouts is brought from the Sydney and Melbourne markets. There are a few growers round about here who kept Berrigan supplied last year, and also sent fruit to Jerilderie. The number of sheep that were sent from about here to Sydney, last spring and summer, was not very great; but a large number went from Jerilderie. I should say that considerably over 1,000 were sent during the year. If the railway from Jerilderie to Berrigan had been completed, some more might have been sent; but farmers here do not go in largely for fattening sheep—only the stations. I would not say that the station-owners to the west—Tuppal and other places—would not avail themselves of the railway for the conveyance of sheep to Sydney. Of course, some of them do avail themselves of it. I believe that a number of Tuppal sheep went to Sydney from Jerilderie. There must have been some feed on the travelling stock route. Of course, it is essential there should be a stock route to travel sheep on. There was a very good demand last year for export also, and it was just a toss up whether sheep should be sent *via* Sydney or Melbourne. Many buyers sent them to Melbourne. The Deniliquin Meat Freezing Works did it. There are meat-freezing works at Narrandera. They are not freezing at present, but the works have been in operation for a couple of years. I know the country in the neighbourhood of Finley. I have no doubt that if a railway were constructed from Berrigan to Finley the settlers and the trades people there would make use of it. Of course, they are a little more in touch with Victoria than we are, owing to the bridge at Tocumwal; but, otherwise, I think they would make use of that railway if it were made. As a business man, I do not handle to any extent goods bought in the metropolitan markets. When I have handled any of them, I have, up to the present, got them principally from Melbourne. The completion of the Jerilderie-Berrigan railway would cause me to transfer my custom to Sydney direct; but, if we found, after a good trial, that we could obtain our goods much cheaper from Melbourne, I do not know how far our patriotism would go, if it were a question of losing a lot of money yearly, or getting the goods cheaper *via* Melbourne; but, I think, on the whole, of course, Sydney would be better. The rates would have to be amended in some direction. At present the rates are very low on some things and very high on others. I think the Railway Commissioners will have to reconsider their tariff. I got a small consignment of fruit-trees from Sydney the other day, and the freight was £4 10s., which, I think, was very excessive. I do think that the lot weighed more than 15 cwt. That sum did not include road carriage; it was just the charge to Jerilderie. The Victorian railways do not give a considerable rebate on goods sent to Melbourne from this district; but, on goods sent from Melbourne to this district, we get a rebate of 20 per cent. over a certain distance. The Victorian railways give a rebate on wool sent to Melbourne, but not on anything else sent from this district. The rebate on wool amounts to the difference between 5s. 6d. and 7s. 6d. a bale, or something like that—a difference of about 30 per cent. If the New South Wales Railway Commissioners are to compete successfully with the Victorian railways in the carriage of wool to the deep water, they will have to carry it at very low rates. They are already competing with them in the carriage of wheat. The greatest quantity of the wheat grown in this district has hitherto been despatched to Jerilderie. I think that very much more goes to Sydney than to Melbourne, and that the quantity is likely to be increased when the Jerilderie-Berrigan railway has been finished. The acreage under cultivation has already increased very considerably, and, no doubt, that railway will influence wheat between here and the border. The proportion in favour of Sydney will be preserved, and possibly still further increased, after the completion of that railway.

To Mr. O'Connor: All things being equal, I have no doubt at all, that, as regards the trade between this place and Finley, Sydney would get the preference over Melbourne. As a matter of fact, the only objection that there can be in the minds of the people here to trading with Sydney is excessive rates. That matter being arranged in a satisfactory way, the people here would send the best of their produce to Sydney, and also buy in the Sydney market.

To the Chairman: I have a good knowledge of the surrounding districts. I have spoken to a few of the owners or occupants of land through which the proposed line from Berrigan to Finley would run. I think they

Mr. E. J. Gorman. 20 July, 1896.

they are prepared to take a fair amount of compensation for the land, unless through severance their farms are injured to any great extent by the railway. These men are within 4 or 5 miles of Berrigan. I have no knowledge as to who would be willing to give their land. I am only speaking of my own knowledge, as regards people living within 5 miles of Berrigan. The size of the holdings within that area is mostly from 500 to 1,000 acres each—some 1,280 acres. I notice from the plan that it is proposed to cut through some allotments in the town of Berrigan. I should hope that it would be considered unreasonable to expect the owners of those allotments to give their land for nothing, as I happen to have a few of those allotments myself. The price of land has gone up very considerably here during the last six months, and I think it would be unreasonable to expect people to sell it under its market value.

To Mr. O'Connor: Some of the owners ask as much as £25 and £30 for half-acre allotments, and in some cases more. It all depends on the situation.

To the Chairman: Of course, those allotments within the village area have been increased in value owing to the authorised construction of the railway from Jerilderie to Berrigan. As to whether there would be any difficulty in arriving at a reasonable rate to be paid as compensation to the holders of the larger areas between Berrigan and Finley, I cannot speak from personal knowledge; but, I believe that some of them, nearer Finley, are prepared to give their land without compensation. As to whether the proprietor of Tuppal Station is prepared to convey land, free of cost, to the Government, a conversation that I had with the owner's son leads me to think otherwise; but I do not know whether he was in earnest or not. He led me to believe that he did not at all favour the construction of a railway from Berrigan to Finley—that in the course of a few years most of the land at present leased would revert to him for grazing purposes, and in that case he did not want a railway. I do not think those were his real opinions, but that is the idea he gave me. As to whether the leasing of his land pays the owner of Tuppal Station better than using it as a sheep run, I believe he has had to make concessions. Of course, if he got the 5s. an acre which he was to get, unquestionably it would pay him; but, I believe that, owing to the bad seasons, he has given rebates to a number of his tenants, which amounted in some cases to 50 per cent. I believe that those areas were originally leased for five or seven years for 5s. an acre, with the right of purchase at £4 per acre; but some of the lessees threw up the land, and I believe it is now being farmed on the shares system—or, at any rate, a portion of it. As to whether some of those areas will revert to the proprietor of Tuppal Station, and will not again be put under cultivation, I should say from my own experience that the land would need a rest. It has been cropped successively I think four seasons, and by the time two more crops have been taken off it, I think it would not pay to keep it under cultivation, and it will of necessity go back to sheep. I do not know whether the present lessees will be prepared to buy it and run sheep on it at 4s. an acre; but I do not think it would pay at that price. I do not know the disposition of the proprietor of Tuppal Station as to inducing future settlement in the district. I know that he is a very wealthy man, owning nearly 500,000 acres, and is considered one of the most successful sheep-breeders in New South Wales, and is supposed to make more money out of sheep than any other man in Riverina. He gets a better return from sheep per acre; and, therefore, there would not be so much inducement to him as there would be to a less successful sheep-breeder to put his land under wheat. If he saw that it would pay him better to have the land farmed than to go in for sheep-growing, I have no doubt he would prefer to go in for farming, except that there is much more trouble and expense attending land under wheat, and even a good man in a strong financial position might prefer to get money out of his land in a less risky way, and, of course, there is less risk with sheep than there is with wheat. The lessees up to 7 miles this side of Finley have cultivated the land almost to its fullest extent; but the people 8 miles out are farmers who own their land and prefer to put under cultivation only a portion of the land, and to reserve the other for future agriculture. Those people who have acquired this land between Berrigan and the 8-Mile Point were mostly original conditional purchasers, but a few have bought from the original purchasers. I think that the great bulk of the land on Tuppal Station is as suitable for wheat-growing as the land in the vicinity of Berrigan. Some of it, near the river, is not so good round about Tuppal Homestead, 12 or 15 miles from Finley. As to the value per acre of that land in its natural state, without any cultivation, I may say that at present it is valued at £4 per acre freehold. I think that that is about the price at which the owner would be prepared to treat with purchasers now. If a railway went there he would probably want more money for his land. I should certainly say that the extension of the railway from Berrigan to Finley would enhance the value of that estate. As to whether the proprietor of Tuppal Station might reasonably be called upon to pay something on the betterment principle, towards the construction of the line, I may say that I approve of the betterment principle, but I would not like to say anything about it in this particular case. We have got the railway from Jerilderie to Berrigan without the application of that principle; but I think it would be to the interest of the whole Colony if a Betterment Bill were passed. I think the route selected for the proposed railway is a favourable one; it is the most direct route. I do not think that a deviation could be made by which Crown lands or further available lands might be secured. There is a very small portion of Crown lands still available; nearly all the Crown lands have been alienated. I know that Mr. Faulkner sold an immense number of wethers last spring and summer; but I am not quite sure whether they were from Boonoke or Tuppal, which is farther north. I know he sells large draughts annually from Boonoke; but I believe he did send a good number from Tuppal also. The Finley farmers, at the present time, send their produce to Jerilderie. A gentleman from Finley told me that at the present time he could get wheat carted from Finley to Jerilderie at 7s. 6d. a ton; and that, owing to the travelling stock route, they were in a much better position than we were, as we had a chain road on which there was no water, and very little grass. My place is 10 miles east of Berrigan, and I am satisfied with a railway to Berrigan from Jerilderie, as I think that 10 miles is a reasonable distance to cart wheat; but beyond my place, and immediately surrounding it there are twenty-one farmers holding an aggregate area of 51,000 acres. At present they farm about 12,000 acres. I think that will be increased after the railway from Jerilderie to Berrigan has been opened, because, of course, they have plenty of land to work upon. As a resident to the east, I think we are as much entitled to a railway as the Finley people are, but we did not set the same value on our own importance, or probably were not as public-spirited, and we were satisfied with the railway extension to Berrigan. The land is about the same quality, and I believe there are more *bonâ fide* settlers—more men who live on their own farms, and who have acquired the land direct from the Crown. Up to the present time I think that the pastoralists

pastoralists—the owners of Wonnamurra, Tuppal, Barooga, Momolong, and I think pretty well all the others—have obtained their supplies principally from Melbourne. The local farmers obtain their supplies principally in this township. I think that the storekeepers in this township obtain their supplies about equally from Sydney and Melbourne A good number of teams ply between here and Jerilderie, and a good number between here and Cobram. If the proposed line from Berrigan to Finley were to offer facilities by which the carriage of wheat would be much improved, I certainly think that the line would be patronised by the farmers living towards Finley. For the greater part of the distance, I know the route of a proposed railway from the Rock to Finley. That line, if constructed, would pass through Finley, and, if we had that alternative route, the question then would be which was the cheaper freight, *via* Jerilderie or *via* the Rock. I believe that the Rock is about 100 miles from here, and I am not sure that it would be the nearer route to Sydney. I believe it would be slightly. As regards the wheat which is grown in the district, a large quantity of it finds its way to the Sydney market as wheat, and a large quantity as flour. I believe that, owing to some alterations which the Railway Commissioners have made in the tariff, the country millers are now handicapped as against the city millers. Formerly they were put on the same level, and could send their flour and compete with the city millers; but now, owing to some alteration in the tariff, the city millers have an advantage of a 1d. per bushel over the country millers. So I have been told by Mr. Wise. That, of course, militates against the farmers, because they lose the benefit of competition. A great deal of the wheat produced in this district is ground into flour and consumed in the district, and it always goes to Hay and other places.

Mr. E. J. Gorman. 20 July, 1896.

TUESDAY, 21 *JULY*, 1896.

[*The Sectional Committee met at the "Federal Hotel," Berrigan, at* 11 *a.m.*]

Present:—

FRANK FARNELL, Esq. (Chairman).
The Hon. Daniel O'Connor. | George Black, Esq.

The Sectional Committee further considered the proposed Railway from Berrigan to Finley.

Mr. John Batten, farmer, Berrigan, sworn, and examined:—

To the Chairman: I reside close to Berrigan. I am a carpenter by trade; but I am farming at the present time. I have resided in this district four years.

To Mr. O'Connor: I have carried on farming ever since I have been here. I have a farm of 640 acres adjoining Berrigan. I know Finley very well. The soil is very good all the way from here to Finley. The farmers principally grow wheat, which averages from 14 to 18 bushels to the acre. The great question, so far as I am concerned, is whether an extension of the railway from Berrigan to Finley would develop that district to any considerable extent. I do not know what the owner of Tuppal Station would do; but, as far as I know, two-thirds of the land belonging to the owner of Tuppal Station, if not more, for 9 miles right up to Tuppal, would come in. Tuppal Station belongs to Mr. Faulkner. My idea is that if Mr. Faulkner were to lease his land to *bonâ fide* settlers, it would be a great wheat-growing district. But the question is whether he will lease his land on long terms, or lease it only for four or five years, and after that let it go back to grass again. It is, of course, a fine country. I have no idea what Mr. Faulkner's intentions are. He has leased some thousands of acres to several farmers, with the right to purchase; but what he is going to do beyond that I do not know. At the present time he is grazing part of his land, and cropping some of it on the share system. He has leased lots of it on the share system, but only from year to year. Occasionally the farmers may take it for three years; but a great many leases, I understand, are merely from year to year. In order that the district may be able to produce all that it is capable of producing the men should have the freehold. If I were cropping I would get the best crops I could, if I were there only for a year or two; but if a man has land of his own, or is going to purchase it, he will be anxious to keep it in good heart, and not work it out. If the owner of Tuppal Station were disposed to sell any of his land, I think he would be able to find purchasers for it at a fair price. I do not know what his opinion is. I am not aware whether he is at present offering any of his land for sale. I know the land about Berrigan. In point of wheat-growing, I think that the one land is as good as the other. My idea is that the great question is whether Mr. Faulkner will sell any of his land. It is beautiful land. There are a good many persons now engaged in farming land on Tuppal holding on the share system. There are also, I think, about six or seven freeholders there, just near Finley. There are some more west of Finley, further out again. There are several there, I think, who have leases with the right to purchase. The construction of a railway from Berrigan to Finley would produce settlement if the people could get land to settle upon. If the owner of a large run says, "I am going to keep sheep on it," of course settlement cannot increase there. If they could get the land to settle upon, there are thousands of acres of land on which people would be only too glad to settle, but if the station-owners will not sell, you cannot make them do so.

To Mr. Black: I have 500 acres under crop. My holding is 640 acres. I cannot increase the extent of my land under crop. After this year I must rest some of it. You cannot crop the same land every year, because it would run out. The largest area I shall be able to crop after this year will be about 400 or 500 acres. But all my land is suitable for cropping, and by resting 100 acres every year, and thus keeping the land in good heart, I shall be able to go on cropping. My principal crops are wheat and oats. Up to the present time we have had a sufficient local market for oats, but I think that after a few years, if there is a lot cultivated, we shall have to send oats to Sydney. At present we grow oats only for local demand. But I believe it would pay us to grow more oats and send some to Sydney, if we had railway communication with the metropolis. If we got 2s. a bushel for oats, I think it would pay us, or even 1s. 9d. a bushel, but not less than that. If a man has a farm of his own, it is very different from farming on the share system. The lowest I have ever sold wheat for is 1s. 11d. a bushel, but 2s. 3d. or 2s. 6d. is the lowest price at which I think any man could grow wheat and pay his way; but that would not pay him on the share system. I do not know any reason for the delay in constructing the railway from Jerilderie to Berrigan. We have had one of the best seasons that we have ever had since I have been here. There has not been a large quantity

Mr. J. Batten. 21 July, 1896.

Mr. J. Batten. 21 July, 1896.

quantity of rain. The contractors, I think, neglected to get the sleepers when they ought to have got them. That and not having sufficient men employed in constructing the line are the only causes of delay of which I know. There are no engineering difficulties at all in the way. It is simply like road-making. Any good business man would naturally have got his sleepers along the route at first. Whatever goods we want on the farm I purchase chiefly in this township. Hitherto machinery has come chiefly from Victoria—some from Sydney, but not much. Hitherto, we have not had very much communication with Sydney, and our strippers and harvesters and nearly all our ploughs have been made in Victoria. I do not think this has occurred because of the difference in rates for carriage. In my opinion the Sydney merchants have neglected this district. I have never had the representative of a Sydney merchant call on me since I have been here. The travellers have all been from Victorian merchants. I think that is the chief cause of the things being obtained from Victoria. We are a long way from Sydney, and the Sydney merchants do not force business this way. When the railway has been completed and the district is better canvassed on behalf of the Sydney merchants, I think that the balance of trade is likely to go Sydney instead of, as hitherto, to Melbourne. I see no reason at all why it should not. It is to the merchants' interests to send commercial travellers here to do business. I cannot answer your questions as to whether it may not be that the Sydney merchants believe that it is impossible for them to compete with the Melbourne merchants owing to the proximity of Berrigan to the Melbourne market, and its great distance from the Sydney market—I cannot answer that question, because I am not a merchant myself. But you will find as a rule that men in all parts of the world will deal in the cheapest market. That is my experience; and if the Sydney merchants wish to compete they must sell as cheaply as the Melbourne merchants. I think that the Sydney merchants will land goods as cheaply here as the Melbourne merchants, for at present the cost of carriage is £1 a ton from either Cobram or Jerilderie, the distance being 25 miles to each of those places, and the construction of a railway to Berrigan would make a lot of difference in the carriage from Sydney. It is true that the teamsters carry goods from here to Jerilderie at 10s. a ton, but that is in harvest-time, when the roads are good. At the present time, however, we pay £1 a ton. Of course, in summer-time, when the roads are good, a man could carry 10 or more tons, whereas he could not carry 8 now. The rates for carriage are regulated by the state of the weather. At the present time we can scarcely get goods carried from Jerilderie even at £1 a ton, but in summer we can get them brought at 10s. That is all we pay for wheat. It is impossible that during some portions of the year the local carriers will be able to offer better terms than the Railway Commissioners in making contracts for the carriage of goods. Less than 10s. a ton would not pay them. In fine weather they might have some chance of competing with the railway, but none in wet weather. The road from here to Cobram is not very good at present. In summer-time it is a fairly good road. At present it is a better road than the road between here and Jerilderie, because, of course, the road from here to Jerilderie is chiefly a new road, and that cuts up very much. But a road hardened by summer traffic is much better.

To Mr. O'Connor: There is a railway connecting Cobram with Melbourne. It is within half a mile of the river. The branch line goes right to Numurkah, close to the river. When I say that 2s. 3d. per bushel for wheat grown on freehold land would pay me, and nothing less, I mean 2s. 3d. clear at the railway station. The cost of carriage from the farm to the station would be at my expense. We have sent wheat all the way to Jerilderie for 1s. 11d. a bushel, and have paid 1s. a bag for the carting of it. My farm is only a mile from the proposed station, and it would cost me a penny a bushel to cart wheat from my farm to the station.

To the Chairman: During my residence in this district I have noticed an increase of settlement between Berrigan and Finley; five years ago scarcely any wheat was grown in that district. Now there are thousands of acres more under cultivation than there were then. Four years ago, on the road to Finley, there were only a few paddocks cultivated, but now, more or less, the land is cultivated all the way. The last five years it has chiefly been put under wheat. As to whether the farmers complain of being handicapped by the existence of bad roads, and the charges made by carriers for the conveyance of their produce, I may say that the people of Finley are in just about the same position as we were originally here. It costs them about 10s. a ton, in harvest time, to get their wheat to Jerilderie. They will be served a little by the line now in course of construction. They can reach Dickie's in 11 or 12 miles. There is a good road to Dickie's from Finley in summer-time. I am speaking of the township of Finley, and this side of it. Beyond the township of Finley the people would not be served at all by the Jerilderie-Berrigan line; and from anywhere this side of Finley I reckon the people could get to Dickie's, by going across country, in 13 miles. The construction of the proposed extension from Berrigan to Finley will lead to a greater development in and around the district of Finley, if the land be open for people to settle upon it. If Mr. Faulkner or the other owners of land will throw it open for settlement, there are thousands of acres of beautiful land. But I reckon that people living 5 or 6 miles this side of Finley, or at any rate the majority of them, will take their grain to Dickie's. I could not tell you the quantity of land in the Finley district under cultivation four years ago, and the quantity at present under cultivation; but I should think that in the four years the quantity has trebled. I think that the construction of the Jerilderie-Berrigan Railway has acted as an incentive to people to increase their areas under crop. In all parts of the district there are more under crop this year than there were last. Momolong Station this year has 10,000 acres under cultivation. I have not increased mine, because I have not sufficient area to do so. I think many of the commodities used by the farmers in the Finley district come from Tocumwal—I know from experience that a good many of the farmers trade with Tocumwal. I cannot answer your question as to whether, if the facilities of railway communication be granted to those people, they will deal in the Sydney market instead of the Melbourne market. My idea is that a man will deal in the cheapest market. I think that patriotism is not consideration enough to prevent a man from looking to his own pocket first. I think that if a Victorian offered a man here an article for 5s. less, and quite as good, he would accept the Victorian offer. I should do so, although I live in New South Wales. I am not a Victorian, and I never lived in Victoria, but that sort of thing is done all the world over. If the Sydney merchants will compete properly here with the Victorian merchants, they will get the trade, or at any rate part of it. The proposed route of the Berrigan-Finley railway goes across part of my land. According to the plan, it takes my best corner and cuts me off from the township. I do not know exactly how much of my land would be severed, but I should think that the line would cut 40 or 50 acres off that corner—it might only be thirty acres, I can only guess at it, for the line is really not exactly surveyed, it is only on paper.

After

After deducting the area required for the railway to run over, the balance would be quite large enough for cultivation purposes; the only thing is, that they would take the best corner off, and the township is surveyed so far that if otherwise I were in a position to sell suburban lots, I could not, as the railway would cut off the best corner. I should be served fully by the Jerilderie-Berrigan railway, and this Finley line would not benefit me, for I am within a mile of the proposed Berrigan station. In regard to the land required for the construction of the Berrigan-Finley line, my idea is that the Government should pay for the land at a fair valuation. I could not afford to give my land. I had to pay £4 2s. 6d. per acre for it in its rough state—for the whole of my land right through—and I reckon that that portion of the land through which it is proposed the line shall go is worth £7 an acre. I could get that for it at the present time. I believe that that land has been enhanced in value by the construction of the line from Jerilderie to Berrigan, because the township has grown. I bought that land from the Momolong Station owners and they are willing to sell any of their land at about £4 an acre. Mr. J. Batten. 21 July, 1896.

Mr. John McLellan, farmer, Berrigan, sworn, and examined:—

To the Chairman: I am a resident of Berrigan, and am a farmer. My farm is about 2½ miles outside the township of Berrigan. According to the plan, the proposed line from Berrigan to Finley would run for a mile along the road which is the boundary of our property. I shall not be served in any way by the construction of this line. It would not improve the value of our property, neither do I think it would injure it. In case it were determined to construct this line, I should be a claimant for compensation. There is always a certain amount of danger from fire from the railway running along the edge of any property. Yes, I do know that there is always a remedy for all cases of injury of that character that may happen. Some of my land is to be taken for the railway, but I do not know how much. That would depend on whether the line ran all on our land, or partly on the road. The road is a chain wide. Supposing that the land required were taken on the opposite side of the road to that on which my land is situated, 2½ chains would have to be taken from the people opposite me. It is only in case it be determined that 2½ chains shall be taken on either one side or the other of the road that a claim for compensation could come in. If it be determined that the land required shall be taken from my property, I shall have a claim for compensation, but if it be determined to take the line through the land opposite my property, the people opposite me will have a claim for compensation. We should want the market value of our land. I shall not be served in any way by the construction of this railway. I shall be served sufficiently by the Jerilderie-Berrigan line. I took up the land sixteen years ago. I selected it in its rough state. I have 1,100 acres. I am part proprietor of it. I think that the value of the land in that district, just round about where ours is, is about £4 an acre. I do think that my property has been enhanced in value by the fact of the Jerilderie-Berrigan railway being in course of construction. The average yield of wheat that we have had from our estate has been from 15 to 17 bushels an acre. At the present time we have 680 acres under cultivation. The proposed railway, if it were to follow the route laid down on the plan, would go through crop land all along. My valuation at £4 an acre was for the land in its rough state. In its improved condition, I should value it at £5 an acre.

To Mr. Black: I find a market in Sydney for my produce. I have not been in the habit of sending any portion of it to Melbourne. I buy my necessaries in this township. I think that the land in this district which is under cultivation requires a rest about every five years. I am not resting the balance of my land which is not now under crop—it has never been under crop. I do not suppose that I should put it under cultivation, unless we found that the construction of this proposed railway gave us a better market and an increased outlet, in which case we might increase the area of land under wheat. Then we should have a better opportunity of resting the other land. I think that 2s. 6d. per bushel is the lowest price that would pay me for wheat, and about 1s. 9d. for oats.

To Mr. O'Connor: In connection with the construction of the proposed line from Berrigan to Finley, the portion of my land that would be affected is under cultivation. I have not formed any opinion with regard to the scheme under consideration. In the evidence that I am giving, I am speaking merely from my own standpoint—as to how the construction of the line would affect me, and me only. I cannot say whether this proposed railway would be beneficial from a national standpoint. Mr. J. McLellan. 21 July, 1896

Mr. John Phipps, farmer, Berrigan, sworn, and examined:—

To the Chairman: I am a farmer. I reside to the west of Berrigan, about a mile out. I have 800 acres, of which about 510 are under wheat cultivation. I have not put the land to any other use but wheat cultivation since I have had it. I have had it only about twelve months. I bought it from Horsfall and Carington, at £3 10s. per acre. I know the proposed route of the railway from Berrigan to Finley. The construction of this line would interfere terribly with my property. It would go right across the two blocks. It would go through the very centre of a big block. According to the plan, about three quarters of the whole area would be left on one side of the line, and a quarter on the other, and of one paddock there would be only 15 acres left in one corner. The line would go mostly through cultivation. This railway would offer me no further facilities whatever. I should be sufficiently served by the line from Jerilderie to Berrigan. I certainly would not give any of my land to the Government for the construction of the proposed line from Berrigan to Finley. I do not know how many land-holders would be affected by the construction of this line. I do not know much of the district.

To Mr. O'Connor: I should want £7 per acre for any of my land that was taken, and I should also want compensation besides for severance. I do not know how much of my land would be required for the railway. Mr. J. Phipps. 21 July, 1896.

Mr. William Douglas Drummond, auctioneer and commission agent, Berrigan, sworn, and examined:—

To the Chairman: I am an auctioneer and a commission agent carrying on business at Berrigan. Prior to entering into this business we had a farm alongside the township, for the last seven years, until recently, when we sold it. Portion of the township is built upon it. The extent of the farm was about 700 acres, of which from 450 to 500 acres were under cultivation. We acquired the land by purchasing it from the original selectors. We paid £2 an acre for it in the latter portion of 1887. Land hereabouts has increased a great deal in value since then. The construction of the Jerilderie-Berrigan railway has Mr. W. D. Drummond. 21 July, 1896.

Mr. W. D. Drummond. 21 July, 1896.

had very little to do with the enhancement of the value of the land. We have not felt the effects of the construction of that railway yet. The land was worth as much three or four years ago as it is at the present time. The same price was paid for it then as you would get now, but there is no doubt that the existence of the railway would increase the value of land. Of course the original selectors, or at any rate a good many of them, did not know the value of the land. Soon after we came here a good many men who had been used to farming in Victoria came here. We went in pretty largely for farming and advertised the place a little, and others came from other parts, and the increase in production brought the district to the front, and, of course, people who now require land are prepared to pay a higher price for it, because they know for a certainty that the land is valuable. Increased railway facilities will enable the Berrigan farmers to get a little more profit on their produce—a difference of at least 1s. a bag for wheat, and it would amount to from £100 to £150 per annum to some of the farmers around here. I think that the production of wheat in this district during the last five years has increased fourfold, or more than that. There is no doubt that the prospect of a line being constructed from Jerilderie to Berrigan had a certain amount to do with an extra area being put under cultivation, but there would have been a very large area put under cultivation here without any railway, because of the demand for this class of land to grow this quality of wheat. The wheat yields are very good average yields, and the wheat is of good quality. It is consigned principally to Sydney and to country millers. Country millers last year bought a large quantity. I purchased about 25,000 bags of wheat last year, and the bulk of it went to country millers. The wheat which goes to country millers from this district finds its way principally to Sydney. The local demand is very small compared with the output of the mill at Jerilderie. therefore, the bulk of Mr. Wise's flour has to go to Sydney or some other large centres of population. The Railway Commissioners have made a difference in the freight between wheat and flour. The rate for wheat from Jerilderie to Sydney is I think, 13s. 7d. per ton, whilst the rate for flour is 15s. 9d. per ton, so that there is a difference of 2s. 2d. per ton, which practically means that the country miller is put out of the market until the city miller is supplied. Consequently, it does away with competition between the millers, and acts against the interests of the farmers. No representations on the matter have been made to the Railway Commissioners yet, but I certainly think that there should be, because, in a way, it affects the country millers, but it comes upon the farmers in the end.

To Mr. Black: The difference between the freight on flour and the freight on wheat acts prejudically only when the local miller has a surplus, not locally consumed, for which he desires to find a market in Sydney, but the bulk of the flour that is ground in the country mills is sent to Sydney or Newcastle, or some of those places where there is a large population. The local requirements are very small in comparison to what is sent away.

To the Chairman: Not very much flour is sent by the Sydney millers into the country. I think that the freight acts against their sending it into the country; but I am not clear on the point. I have a pretty fair knowledge of the district in and around Finley. It is all similar country to the land I was in occupation of a little while ago—good farming country. It is capable of producing quite as good yields as I have spoken of. The farmers in the Finley dirtrict are handicapped by having bad roads to travel over and by the rates for the carriage of their produce being so high. Of course, the more facilities the farmers have, the greater the chance they have of competing in the markets. There has been a large increase in the settlement in that district of late—mostly on the share system of farming. Provided that the land in that district is made available for settlement, I think that by giving further facilities to the farmers for the carriage of their produce, increased settlement in the district would be brought about—that is, provided that the squatter were prepared to sell his estate at a reasonable price and allow these people to become freeholders instead of only landholders. Some people may take up the land on the leasehold system. They have done it in the past and I suppose they will do it for a good while in the future; but, the settlement is not regarded as being so solid as it is where the farmers are freeholders. Of course, there is a large number of farmers west of Finley who own their own properties as well. As to whether I have ever known the farmers in the Finley district to be seriously inconvenienced by the fact of the roads being in bad condition, I may say that I know they were at an equal disadvantage with the farmers in Berrigan, in sending their wheat to Jerilderie. In giving our evidence before the last Sectional Committee who came here, we claimed 8 miles from here, west of Berrigan, as a supporter of the Jerilderie-Berrigan railway. If the proposed line from Berrigan to Finley be constructed, the wheat produced within the 8 miles limit, will be put on the line at an intermediate station between here and Finley, and the result of course will be that the quantity of wheat which we stated would come to the Berrigan railway station, will be reduced to that extent, and it will be credited to the Finley-Berrigan line. I do not think that a great proportion of the wheat that is produced within that limit of 8 miles will be conveyed on the Finley-Berrigan line—it will for a certainty be put on at an intermediate station. I do not think it is probable that there will be much stock traffic merely from Finley to Berrigan, but some stock might be sent along the proposed line for conveyance to Sydney. There was a very large stock traffic from Jerilderie railway station last year, and a large number of sheep went from this district and the Finley district, more especially from Mr. Faulkner's. They went to Sydney last year, and I presume that some will be sent again, if the market be favourable.

To Mr. Black: Flour requires more careful handling than wheat—there is more risk about it. The Railway officials use the same tarpaulins and the same trucks for flour; therefore, I do not think they take extra care with flour. They always put tarpaulins over wheat, because if the wheat got wet in transit, it would weigh so much heavier at the other end. From personal observation I do not think that the railway officials take much more care with flour, and I was at the station for two years seeing them loading every day. When I came here I came from Victoria. My brother came here to buy some sheep. The auctioneer said that he could not sell him any sheep but could sell him some land. He offered him land at from 31s. to £2 an acre, equal to land in Victoria which was then fetching from £6 to £7 an acre, and as we did not consider that the facilities offered in Victoria were sufficient to make up for the higher price of the land there, we came here and took up land and were the means of inducing at least a dozen others to do the same afterwards. At present there is very little difference between the cost of living here and the cost of living in Victoria, but it has been a good bit higher. As to whether we get a higher or a lower price here for our produce, I may say that on the average for the last seven years it has been in our favour. I am not sorry that I came here, on the contrary I am glad I came. I would not go back, anyhow.

To Mr. O'Connor: I believe that the extent of Mr. Faulkner's station is 170,000 acres, or thereabouts.

Mr. W. D. Drummond. 21 July, 1896.

I have not the slightest doubt that Mr. Falkiner would be willing to sell a large quantity of his land if he could sell it at a fair price, and that a good deal of it would be purchased. I have not any idea what area might be taken up. That will depend a good deal on the next season. I have said that the land in this place improved in value after it was decided to construct a railway from Jerilderie to Berrigan. I heard Mr. Greggery give his evidence here yesterday. I heard him complain about the manner in which the contract for the construction of that railway is being carried out. I think that Mr. Greggery had good ground for complaint. As to the reason offered by the contractors for their dilatoriness in carrying out that contract, namely, difficulty in obtaining sleepers, I say that they have no occasion to get any extension of time on that account. I say so for this reason: Messrs. Tuck Brothers, of Cobram, sawmillers, asked my brother to see if he could get them the contract for cutting the sleepers at Barooga. I was in Jerilderie at the time, and my brother told me to see Mr. Finlayson, one of the contractors. I did so, and asked him if he required any sleepers for the Berrigan end of the contract. He informed me that he would want 10,000 sleepers 5 miles north of Berrigan, and 10,000 sleepers 11 miles north. I wired to Messrs. Tuck Brothers, and they told me that they would cut the sleepers for 2s. 2d. at the mill, or would deliver them on the line, at the places stated, at 3s. 6d. 3s. 6d. delivered was a bit on the high side. I made inquiries from teamsters and I found that they could be delivered for 9d. a sleeper, or 2s. 11d. delivered on the ground. I told Mr. Finlayson so. I think that that was in January of the present year, or the beginning of February. It was very shortly after Mr. Finlayson came to Jerilderie. I am informed that the contractors are now paying 1s. 3d. for delivery alone; therefore, they are paying 6d. more for delivery now than they could have then got the sleepers delivered for. The non-completion of that railway within the contract time has inflicted a decided loss on those men who have held wheat here, and the Railway Commissioners may even now lose the freight on it.

To the Chairman: The number of men employed on the construction of the Jerilderie-Berrigan Railway, from time to time, has varied very largely. I have had occasion to travel once a week along the Jerilderie-Berrigan Road during the last two or three months, and I have seen as many as 120 or 130 or perhaps 150 men working, and at other times as few as 50. I do not know how many men are employed there at the present time; I cannot speak with regard to the last week or two. When I have seen the larger number of men employed they have been employed more particularly in connection with the earthworks.

To Mr. Black: I can tell the Committee at what price wheat can be remuneratively produced in this district in ordinary seasons. I know the price at which it can be done by contract, and it can be done at considerably less by farmers who use their own teams. For ploughing, harrowing, and sowing in this district I allow 8s. an acre, and I put down the harvesting at 5s. an acre, and the bags (four bags) at 1s. 9d. an acre, whilst the cartage to Berrigan from about 8 miles out would be about 6d. a bag, or about 2s. an acre, which would make the cost altogether by contract 17s. 3d. per acre. An average crop I put down at 15 bushels, at 2s. a bushel, which would make 30s. an acre, leaving a profit of 12s. 9d. as the return for the farmer; so that if a farmer having 320 acres let the work in connection with the whole of it by contract, he would get a return of 12s. 9d. per acre at 2s. a bushel; therefore, it would pay at 2s. If the farmer did without the intervention of contract labour, his profit would be more. Say that a farmer had under wheat cultivation 320 acres of land, worth £1,000, the interest at 7 per cent. would be £70, and that would leave him about £130 per annum profit on 320 acres under wheat. As regards the throwing open for pastoral purposes of large areas now held as freeholds, and the effect which the opening of a railway in proximity to such properties would have on the prospects of small men who want to lease or buy land from the squatters, I should think that land in close proximity to a railway is, from a farmer's point of view, worth at least £1 an acre more than land that is some distance from it. I think that the first effect of the construction of a railway on land fit for agricultural purposes, but now used for grazing purposes, would be to increase its sale value, and also its rental value—(I know that this last season the construction of the Jerilderie-Berrigan railway put 2s. an acre on land in close proximity to it)—thus to some extent preventing the small holders who are desirous of taking up agricultural areas from getting them at such reasonable prices. If the Government are desirous of settling people on the land in small holdings, I should certainly be in favour of the Government, prior to constructing railways through large freehold estates, enacting some provision which would enable them to resume those lands at their market value; and I am confident that the Government could, before the lines were constructed, purchase the land for fully £1 an acre less than they could afterwards, and the Government could let the land again at a more reasonable rate than the pastoral holder would be prepared to do. In such a case the enhanced exchange value arising from improved railway communication would become an asset of the State instead of an asset of the private landholder. I think that all through this district there is a large number of large areas which are eminently suitable for agricultural purposes and which are now held by private owners. I think that as regards any of the pastoral holdings right through this portion of the country, an arrangement could be made by the Government with the present owners for the Government to take over the land now at a price that would repay the State, and the Government would be able to let the land within a month after it became their property and get 6 or 8 per cent. interest on it. I know the Brookong Estate—the late Mr. Halliday's. I have been over it two or three times. Taking it as a whole, it is very good land. The greater portion of it is of such a character, and is so situated, as to be suitable for agricultural purposes. The only drawback that I could see was want of railway communication. I have heard on very good authority that the company that owns the Brookong Estate now is prepared to sell it at £1 15s. an acre. If a railway were made through that estate, or near it, and if it were cut up into blocks for agricultural purposes, I should say that its value would be increased by fully £1 an acre. I think that 640 acres would be sufficient for any settler. Anyone who cannot make a fairly good thing out of 640 acres would be a failure with a larger area. I think that Brookong Station consists of about 200,000 or 250,000 acres. If the whole area were taken up, it would accommodate about 400 settlers. If the Government were to resume that land I should not favour their selling it at all, but leasing it under the present homestead selection system. I have not figured it out, but presuming that the Government were to charge an additional 10s. an acre, because of the construction of a railway, and presuming that all the area were taken up, I suppose that the Government would reap a profit of about £128,000. Under those circumstances I am in favour of such a property becoming a national asset; but I am also in favour of the Government purchasing the land and letting it at a rate of interest which would pay for the borrowing of the money, and also a sinking fund of 2 or 3 per cent. towards paying off the liability which the Government incurred in buying the land.

Herbert

Herbert Royse Lysaght, Esq., Manager, Commercial Banking Company of Sydney (Limited), Berrigan, sworn, and examined:—

H. R. Lysaght, Esq. 21 July, 1896.

To the Chairman: I am manager of the Berrigan Branch of the Commercial Banking Company, of Sydney, (Limited). I have been in this district five years. During that time I have had very good opportunities of judging of the capabilities of the district. I have come into frequent contact with farmers throughout the district. I have a fair knowledge of the district which would be traversed by the proposed line from Berrigan to Finley. I have not a very large knowledge of the district beyond Finley which would be served by this line. I know it generally, but not in detail. I certainly do think that the facilities that would be afforded by the proposed railway to Finley would be availed of by people beyond Finley. During my residence in this district, I have found the farmers a very good class of farmers indeed. They have been very largely inclined to extend their areas from year to year. There has been a great increase in the production of wheat in the district, more particularly during the latter portion of that period. I should think that the average production of wheat during the last five years has been quite four times as much as it was before; therefore, it would be natural to suppose that four times as much land has been put under cultivation during that period. So far as my knowledge goes, every year during the last five years farmers whose land has been well farmed have had good average crops. I have heard them complain of the want of proper facilities or better convenience to get their produce to market. That has been one of the great drawbacks in this district so far. I do think that the proposed railway, if it were constructed, would be taken advantage of considerably by settlers in the district. I also think that if more land could be made available for settlement, increased settlement would take place on account of the construction of this railway. There is a great demand for land in this district, but more for leasing, or on the halves system than for genuine purchase. I think that the adoption of that system has been brought about simply by the fact of want of means on the part of the farmers to buy the land. They would all prefer to purchase it if they could.

To Mr. O'Connor: They take it on that system as the only alternative.

To the Chairman: I think that if terms were offered them to lease the land for a certain period, and afterwards to purchase it if they desired, those terms would be availed of, if the purchase money were not put at too high a figure. The value of land in its rough condition, at the present time, in this district, is about £3 an acre; that is, picked land—good wheat-growing land.

To Mr Black: Land that has been grazed and well manured by sheep for a number of years, I would put down at £3 an acre.

To the Chairman: The actual clearing and subdividing of the land, I suppose, would cost from 10s. to £1 an acre, according to the quantity of timber upon it, and therefore the amount of work to be done.

Mr. Lazarus Harris, store-manager, Berrigan, sworn, and examined:—

Mr. L. Harris. 21 July, 1896.

To the Chairman: I am the manager of the Berrigan branch-business of J. and H. Harris, storekeepers. I have been living in this district between seven and eight years.

To Mr. Black: I do not object to answer questions which only require general answers. Our business here is a branch of the Jerilderie business carried on by my brothers. The bulk of our goods is bought in Sydney. Some of those goods are conveyed from Sydney to Melbourne by water, and thence by rail to Yarrawonga, and thence to Berrigan by team. The goods intended for sale in Jerilderie are for the most part conveyed from Sydney to Jerilderie by rail. Only a small portion of them goes round this way to Jerilderie. That method of conveying our goods for sale in Berrigan will not be altered when the Jerilderie-Berrigan Railway has been completed—at least, not under present freight rates. Our goods do not now come *via* Melbourne because of the proximity of our Berrigan branch to the border, but because some goods—not all lines but only a few heavy lines—can be carried even to Jerilderie more cheaply *via* Melbourne than from Sydney direct. So far as we are concerned, the Jerilderie-Berrigan railway will act more as a feeder to the Victorian railways than to the New South Wales trunk line; therefore, so far as our business is concerned, any extension of the Jerilderie-Berrigan railway, either southerly or westerly, would feed the Victorian railways and not the New South Wales main line. I know the country towards Finley and around Finley. I think there is as much land under crop in the district at the present time as there will be in future years, even if a railway from Berrigan to Finley were constructed, unless the price of wheat went up considerably. My reason for thinking that, even with increased railway communication there would not be much increase in the area under crop is that most of the land around Finley is leased, some of it on the share system, whilst the other portion, I understand, is leased at so much per acre; and after four years' cropping I reckon that it will be thrown out of cultivation and new land will be substituted for it. I do not mean to say that there is not plenty of land around Finley fit for cultivation, for I think it is all good cultivation country. I do think that if there were a greater quantity of land available for settlement in the neighbourhood of Finley and Berrigan, at moderately low sale prices, or low rental, settlers would be likely to take it up, especially at the present price of wheat. Settlement is limited here to some extent because land rentals and values are rather high. I am not against the railway being carried on to Finley. I cannot say that, my interests being centred in Berrigan, I am not particularly in favour of the proposed railway. I reckon that Finley has as much right to a line as Berrigan. My candid opinion is that, after a year or so, wheat from Finley, instead of coming to Berrigan, will still go on to Jerilderie, or some intermediate station between Berrigan and Jerilderie; therefore, I do not think that even a good road would do much good to Berrigan in regard to Finley. What I mean is, that I think that if it were necessary to make a road, it would more aptly meet the requirements of the traffic by being made from Finley direct to Jerilderie. In the case of very heavy rains the roads are bad. They are bad at the present time.

To Mr. O'Connor: I have not formed any opinion from a national standpoint as to whether the construction of the proposed line from Berrigan to Finley would or would not be good for the Colony. To speak candidly, I have not given the proposed line a thought. I do not think that a man, speaking without any great preparation, would advocate anything against himself. The distance by road from Berrigan to Finley is about 15 miles. The land is about as level as the land between here and Jerilderie. The roads are very bad in wet weather, but for the past seven or eight years we have always managed to get our merchandise through, and there is very little wheat carting, unless by farmers themselves, during this time of the year. Although the roads are bad during a certain season of the year, we do not make

provision

Mr. L. Harris. 21 July, 1896.

provision for that by purchasing very largely during the dry seasons. At the present time we have more goods coming into Berrigan—during last week, and the present week, and next week—than during any portion of the dry season of any year. It is bad business for a person to buy largely in summer to carry him over the wet months, if it is possible for him to get the goods through at all during the wet months In importing a considerable proportion of our goods by way of Melbourne, we do it on the ground of economy. If facilities were afforded, on economic grounds we should communicate direct with Sydney; it is only on the grounds of the higher freight that we do not do so. I can safely say that land here was more valuable five years ago than it is at the present time. The low values of wheat and stock, I should imagine, have brought about the depreciation to a great extent. The proposed extension of the railway from Jerilderie to Berrigan had nothing whatever to do with it. Neither has it improved the value of land so far. Land that about five years ago was offered at £4 an acre, was put up, under the hammer, only a few weeks ago here, and only £2 5s. an acre was offered for it. That land is within 4 miles of the railway line, in the direction of Jerilderie. I cannot say that things are improving in regard to land values; taking that as an instance, I should think they were not improving. I should imagine that, after the construction of the railway from Jerilderie to Berrigan, things would improve, but so far it has not improved matters.

To the Chairman: If we take the floating population, I really think that three years ago there were very nearly as many people in Berrigan as there are at the present time. There was a large number of people camping about and going about. I think that three years ago the ordinary population of Berrigan was slightly under 100. I cannot tell you exactly how many buildings constituted the town or village of Berrigan at that time—approximately there may have been fifteen or less, or a few more. About five years ago there may have been from twelve to fifteen houses here, and the population was very close on 100. I should think that the population of Berrigan Village to-day is about 300, or it may be slightly over 300, and I should think that there are between forty-five and fifty buildings—there may be more. The incentive for increased settlement to take place has not been given since the proposal was made to extend the railway from Jerilderie to Berrigan. The increase of settlement in this district was started, I think, by the proprietors of Momolong holding leasing their property for farming purposes. I should imagine that that would account for the establishment of the different businesses here which have increased so much within the last five years. A great number of farmers came on to Momolong, and I really believe that that was the cause of so many places being put up here. Most of the Momolong farmers obtain their supplies from Berrigan, and a few of them from other places. The value of a half-acre town allotment at the present time depends on the position it is in. Some half-acre blocks here are worth from £180 to £200. Smaller blocks have been sold quite recently for over £100—far less than half an acre. I do not mean to say that five years ago those allotments would have realised the same prices they would to-day. The cause of the enhanced value is the increased population on the land surrounding this place.

To Mr. Black: I was referring to agricultural land when I spoke of the decrease in values.

To the Chairman: I believe that at the present time the Finley people obtain their supplies mostly from Tocumwal. Certainly they have a local source from which they obtain some of their supplies, but most of them speak of Tocumwal as being their business place. I have said that I thought most of the Finley produce would go to an intermediate station or to Jerilderie. As to where that intermediate station ought to be the only thing I can tell you is what I have heard farmers state, viz.:—that a road could be cut to the Berrigan Well, about 5 miles on the Jerilderie side of Dickie's. It is a hard matter to tell where there is a road in New South Wales, but I believe there is a road approaching there now, in fact, years ago I travelled along a road there. From 10 to 15 miles would be the average distance that a farmer round about Finley would have to travel with his produce to that station. I should think that 7d. a bag would be a fair price to pay for the carriage of wheat by team a distance of 15 miles. That would come to about 5s. 3d. a ton. Certainly there is not the least doubt that, if the proposed railway from Berrigan to Finley were constructed, the farmers would send their wheat by it if the carriage were cheaper than the carriage by road to that intermediate station. I have not heard what are to be the charges on the proposed line from Berrigan to Finley, but I have heard what are to be the charges on the Jerilderie-Berrigan line. In saying 7d. a bag I am averaging it according to the price at which wheat is being carried twice the distance. For instance, from here to Jerilderie wheat is carted for 1s. a bag, the distance being about 25 miles, and I reckon the cost at 7d. for 14 miles, which is a bit above the average. I do not think that the proposed line from Berrigan to Finley will have the effect of bringing more land under cultivation. I have travelled a good bit in this Colony, but I have not had very much opportunity of judging as to the causes of the development of our agricultural resources. In Victoria I have known of good agricultural districts—really first-class country—where, before there was railway communication, farming was gone into very largely, and when railway communication was established there, the country was all turned into sheep fields again. Therefore, whether the railway will or will not bring about more cultivation here, I do not know. At the time prices were very good for wheat, and it was nothing unusual for the people there to get from 30 to 60 bushels an acre. I do not think that the land there became exhausted. There was plenty of land there the same as there is here. I think that the prices of wheat were very fair throughout the time the people there were cultivating. A great number of the people who have settled here have come from Victoria. I think that the reason that brought them here was that the land was good, and they could get a larger area for less money. A good many of them have been very successful. I do not supply the farmers of Finley with very much goods. The places in Victoria to which I referred just now were around Casterton, in the western district of Victoria. The reason why we bring some of our goods from Sydney *via* Melbourne, is merely because of the difference in freight, therefore differential rates assist us very little. There are some lines in regard to which the differential rates do assist us, whilst in regard to others they do not. We have our own team, and we also employ carriers. I should decidedly not call the road from Jerilderie to Berrigan a fair road. I have a knowledge of the road between Berrigan and Finley, but I cannot speak much of it. I cannot say whether it is good or bad. I have usually travelled over it in fine weather. I have not formed any estimate as to what it would cost to make a good permanent road from Berrigan to Finley. There is a quarry within a mile and a quarter of this township. The material to be obtained from that quarry consists of granite and gravel, which makes an exceedingly good road for heavy traffic, and there is a very large quantity of it.

To Mr. O'Connor: At the present time an ordinary team could carry 5 tons. When speaking of 5s. 3d. a ton I am speaking of the time when 10 tons could be taken by a certain number of horses, and when the

Mr. L. Harris. 21 July, 1896.

the same number of horses could pull twice as much as at the present time. There are waggons on the road capable of carrying 20 tons. It would require twenty-four bullocks to pull a 20-ton waggon, or it would require about twenty-two horses. A load of 18 tons has been dragged from Finley to Jerilderie by twenty-four bullocks. I should imagine that it took them from two to three days. The charge at that time was 9s. a ton, therefore the total charge would be £8 2s.

To the Chairman: I do not know that I shall be affected in any way by the construction of the proposed line from Berrigan to Finley; but I have been informed that the line will go through my property. There are no pegs put down through my property, except those that I have had put in by a surveyor lately. As to whether I, as a patriotic citizen, am prepared to hand over whatever land is required in connection with the railway, my pocket is where my patriotism ends. I expect to be compensated for any injury that may be caused to my property. We have surveyed a portion of our land opposite the railway station into township lots.

To Mr. O'Connor: Our land happens to be in a different position from that of the land I have spoken of as having depreciated in value.

To the Chairman: I am not going to offer my land at the figure I originally gave for it. Everybody likes to make a profit.

Mr. Ernest Gedye, storekeeper, Berrigan, sworn, and examined:—

Mr. E. Gedye. 21 July, 1896.

To the Chairman: I am a general storekeeper in Berrigan—one of the partners in the firm of Gedye Brothers.

To Mr. O'Connor: I have been here three years last month. This locality has gone ahead very much since I first came here. So far as the town of Berrigan is concerned, the value of land has improved compared with what it was three years ago, and the population has much increased. I think that the construction of the railway from Jerilderie to Berrigan has had something to do with that. A man living 3 or 4 miles, or even a greater distance from this town, would receive benefit from the construction of that line. We get our goods principally from Melbourne. We buy them for both of our stores, our other business being at Cobram, in Victoria, and our Berrigan business being a branch establishment.

To Mr. Black: I do not suppose that we should buy nearly everything in Melbourne if we were to close our Cobram business. Goods intended for our Berrigan store come through Cobram. We drop a portion of them *en route* at Cobram. The carriers' charges for the conveyance of goods from Cobram to Berrigan would average about 15s. a ton—that is, taking good and bad seasons. We have not a contract with any carrier. We get goods carried for 10s. a ton in summer, and for £1 in winter; but, striking an average we get a mean of about 15s. a ton. As to whether the construction of a railway from Berrigan to Finley will have any effect, prejudicial or otherwise, on our business, and on the growth of this town, I may say that I have not considered the matter very much, but I do not think it would make any appreciable difference.

To the Chairman: We do get some of our goods from Sydney—certain lines, but not very many. We can get them cheaper in Sydney, but the freight from Sydney is very heavy, and that makes the cost of them about the same as that of the goods from Melbourne.

To Mr. Black: We do buy produce from the farmers here. We pay cash for all of it, and we buy only what we can sell over the counter again. We do not buy any bulky produce such as wheat or oats, but butter and eggs, and that sort of thing. If we should at any time buy and sell wheat or oats, and we found that our market for that was in Sydney, I suppose that Sydney would then also be our market of purchase.

To the Chairman: I only know from hearsay that the land is very good between Berrigan and Finley, and beyond Finley. I am not in a position to say whether the prices for farm land in this district have been maintained throughout the time that I have been here, or whether it has increased in value. I do not know that the value of agricultural land in this district, during the last three years, has depreciated. I do not think it ought to have done so. Land on Barooga Station, three, four, or five years ago, brought a very fair price. I should not like to say that the prices of land in this district have improved; I have not studied the question much. If the Berrigan-Finley district were a settled one, the construction of the proposed railway from Berrigan to Finley would be of great benefit to the farmers. If they were settled there, and had further facilities to send their produce to market, I think that the construction of this railway would be an incentive to them to place greater areas under cultivation; but I think that the settlement would have to be under a favourable and satisfactory system, instead of on the share system. The settlement in the district of Berrigan has increased whilst I have been here, as regards the halvesmen. Most of those people have come from Victoria, I think. I have found them ready to accept the terms offered to them to settle on the land—some of them have been very glad to get it, I think. I am hardly prepared to say whether that is because they cannot, as regards the price of land, carry on farming operations under such favourable conditions in Victoria as they can here; at any rate it is not likely that they would choose the worst colony to come and live and settle in. The soil is very good in this district, whilst perhaps the land at the places where they have been in Victoria is, to a great extent, worked out. I am not aware that some people have let areas in the Berrigan district to some of the settlers at an annual rental. I think that the land is let mostly on the share system. I have not heard of any cases where they are paying as high as 6s. or 7s. an acre per annum for the use of the land. It is possible that if the rates are modified, our firm may patronise the Sydney market direct by rail. There is no doubt that Sydney would get more than half our orders for goods, if the freights were at all reasonable.

Mr. John Jones, farmer, Berrigan, sworn, and examined:—

Mr. J. Jones. 21 July, 1896.

To the Chairman: I am a farmer residing 3 miles from the town of Berrigan in a north-west direction. I have 640 acres of leased land and 640 acres of purchased land. I have 1,000 acres under cultivation. All of this land is not bearing crop, but it is under cultivation—some of it is lying fallow. I acquired the first 640 acres by purchase from an original conditional purchaser eight years ago. I paid £3 an acre for it. For the other 640 acres I pay an annual rental of 5s. per acre to Roderick M'Donald, a landowner next to me. I acquired it on a seven years' lease, with the right of purchase at £5 per acre. I do not think that the values of land have depreciated at all since I purchased—I mean, that they have not depreciated from £3. As a matter of fact, there has been a lot of labour and money expended on the land and it has in a way depreciated in value, because, although a lot of labour and money have been expended

Mr. J. Jones. 21 July, 1896.

expended on the land, it is not worth very much more now. As a rule, the farming carried on here is systematic farming, and the farmers are very fair farmers. My average yield of wheat since I came here has been about 20 bushels per acre. I had 19 bushels last year. The year before the crop grew well, but it was a very rank crop, and the season was against us, and I did not get quite as much that year. There was more grown on the ground, but bad weather at harvest-time wasted it—we could not get it off. I send my wheat to Jerilderie. I shall not be served at all by the proposed line from Berrigan to Finley. I shall bring my produce to Berrigan. There will be no station on the proposed line from Berrigan to Finley which will accommodate me as well as Berrigan. I am not more than 2½ miles from the Berrigan railway station. During the last five years there has been a great increase in the settlement in the district. There has been a great demand for land—in fact, a demand that has been unsatisfied. The capabilities of the soil are pretty much the same throughout the whole district. I have every reason to believe that if areas were available on reasonable terms they would be sought after by agriculturists. I cannot say exactly what has been the increase in the number of settlers during the last five years. I know there has been a great increase, and I think that pretty well all the available land in this district has been put under wheat. For every block of land that has been thrown open lately, there has been a number of applications. At Corowa some time ago there were about 5,000 applications for about ten blocks.

To Mr. O'Connor: I could not say what was the area of the ten blocks, but I think the lot would amount to about 5,000 acres.

To the Chairman: Those applications came from a mixed lot of people. Some of the people who are working on the halves system here had applications in, but the applications were principally, I think, by people from Victoria, most of whom have worked out areas in Victoria. My produce has been conveyed to Jerilderie by team—not altogether by my own team. I have paid as much as £200 in one year for freight between here and Jerilderie—the average being from 9s. to 10s. a ton. Therefore there will be a considerable saving to me owing to the construction of the Jerilderie-Berrigan railway. I know the district round about Finley pretty well. I think the farmers there suffer much from the want of proper means of getting their produce to market. Every farmer suffers from want of railway communication. It is a big help to a farmer to have a railway near him. I know instances in which not having a railway near him means all the difference between a profit and a loss. Last season twelve months I could have made four times as much as I did if I had had a railway here. I am not prepared to say that the extension of the railway from Berrigan to Finley would bring about larger settlement in the district and bring more land under cultivation. I fancy that between here and Finley the land is pretty well settled on now. It is all under wheat between here and Finley. I cannot speak as regards the district beyond Finley, but I daresay that if favourable conditions were offered to the settlers there they would be likely to cultivate the land.

To Mr. Black: I run about 500 sheep on my land—sufficient for killing purposes. I could carry a sheep to the acre, and cultivate 500 acres—I mean over my whole area under cultivation. I should have to grow some feed for them in the shape of lucerne, and perhaps straw. The amount subtracted from the grazing area does not reduce the number of sheep I could carry—it has the opposite effect—but, although I have increased the grazing capabilities of my land, I have not increased the area under sheep, but have also 100 head of cattle and horses on the farm. I run the sheep over my land after I have taken off the crops, and also sometimes while the crop is growing. Lucerne grows very well here. It does not die out at all. It gets bare in summer time with heavy feeding, but the first shower of rain brings it up more quickly than any grass. It is difficult to eat it out. I think that lucerne is practically inexhaustible if you treat it properly. I have read about it on the Darling Downs being ploughed up after twenty years, and then coming up stronger than ever. It certainly is very hard to kill. My yield of hay per acre is about 30 cwt. We have not grown special hay crops, but from this time out we shall be growing special hay crops, and the chances are that we shall raise 2 tons to the acre. We sow it for a wheat crop and do not sow it very thick, and only cut margins round the crop for hay. I think we could grow wheat profitably at a selling price of 2s. 6d. a bushel, and oats at about 1s. 6d. I could not increase my cultivation area because I am cultivating up to the hilt now. I anticipate that we shall not grow wheat or oats for sale so much by-and-bye as we do at present, because we shall be going into other industries in which there will be more money. The district is very suitable for dairying, which would pay better than wheat-growing if we had railway communication by which we could send away the cream, milk, and butter. I have every reason to believe that the farmers will co-operatively start a creamery here—there is some talk already about starting one. We grow very good fruit here. As a matter of commercial speculation, the distance from market has, of course, not been an inducement to farmers to go largely into fruit-growing, in fact, if they go largely into fruit-growing here, they will have to go into the canning business. I think that peaches and apricots have the best prospects of success here. These fruits are used largely for canning in other places. This is a very good grape-growing district. There are not any wine-makers in this immediate district, but there are wine-makers not far away, and I anticipate that wine will be yet made here. America makes more out of her pigs than her wheat, and pigs do very well here. Many of the people in this district have been doing only preliminary work up to now, and they have only just got their places in working order, and have not had time to go into new industries. At present there is no market for pigs, but I think that if a man had money and enterprise enough to come here and start a bacon factory, it would pay.

To the Chairman: This district is suitable for raising turkeys. I think that the raising of turkeys is right enough as an adjunct, but you could not altogether make a living out of it.

To Mr. O'Connor: This district is not a "one horse affair" at all. I am quite sure that there are many industries which, if properly entered into with spirit and enterprise, and regulated with intelligence, would make this a very prosperous district. Not only is it possible to produce wine and fruit here, but also pigs, the raising of which is one of the most profitable industries in America, and in fact keeps up one of the greatest States in that country.

To Mr. Black: I gave evidence before the Sectional Committee that was here with reference to the Jerilderie-Berrigan railway. I then stated that I had a paddock of 400 acres ready to cut for hay, but as a matter of fact I did not cut that for hay. If the railway had been here I would have cut it for hay. I got a return of 15s. 6d. an acre off that for wheat, and it would have given me about £7 an acre if I could have cut it for hay. I got £5 a ton for chaff in Sydney last year. I do not think that wheaten chaff is principally bought to mix with oaten. But I do not know that people in Sydney mix them.

WEDNESDAY,

WEDNESDAY, 22 JULY, 1896.

[*The Sectional Committee met at "Burbury's Hotel," Finley, at 3 p.m.*]

Present:—

FRANK FARNELL, Esq., (CHAIRMAN.)

The Hon. DANIEL O'CONNOR. | GEORGE BLACK, Esq.

The Sectional Committee further considered the proposed Railway from Berrigan to Finley.

Mr. John Crowe, farmer, near Finley, sworn, and examined:—

Mr. J. Crowe. 22 July, 1896. *To the Chairman:* I am a farmer residing to the south-west of Finley, about 8 miles from here. I have been in the district twenty years last July. I and my brother have 3,200 acres, of which 480 acres are under wheat this year, and about 350 acres are laid down with lucerne. The balance of the area mentioned by me is used for grazing purposes. We generally shear from 4,500 to 4,600 sheep, and we have about 100 head of cattle and 50 horses. Taking the whole year round, our land, I think, is capable of carrying two sheep to the acre, without any other stock. The average yield of wheat from the area under cultivation has been about 16 bushels per acre during the last fifteen years. We have not had the same piece of land continuously under wheat cultivation, but we have had land that way for ten years and then put it under lucerne. We do not keep always on the same piece of land—not that the land will not allow it, but because it gets foul with wild oats and is not fit to grow wheat, and we then put it under lucerne, and use it for grazing purposes. If the land did not get foul with weeds and wild oats the wheat cultivation could go on for a generation. The wild oats is a sort of wild stuff that grows up; it is a very good fodder plant, but will not do with wheat. We have also sown oats, which do very well. I have got sixteen bags of oats to the acre. I have never tried growing barley, but my neighbours have, and have done well with it. There is not much demand for barley in New South Wales; and with the duty of 1s. 9d. we cannot do anything with it in Victoria, although there is a good demand for it there. It would not pay to grow it here and send it to the Victorian market on account of the duty. The price for wheat last season was very good. The year before the price was very light. We had to sell at 1s. 9d. and 1s. 10d., and that was a very poor price for wheat, for although we got four bags to the acre there was not much in it after all. This year the price was very good; we got from 3s. 9d. to 4s. If we always got 2s. 6d. a bushel for wheat we should do very well. I consider that, with the crops we generally get in this district, if we obtain 2s. 6d. a bushel for wheat in Jerilderie, we can live and pay our way. The wheat grown in this district is the best in the world. We plant the "golden velvet" and various other kinds of seed-wheat. We look for four bags to the acre, which is 17 bushels, and we consider that we have a fair crop when we get that, and if we get 2s. 6d. a bushel for it in Jerilderie we can live and pay our way. I have not tried an experiment with the Bræmar, the Tasmanian wheat. I never try much experiment with wheat—I use just the common wheat. My brother and I acquired the 3,800 acres by selection at £1 an acre; but interest comes in, and that takes a long time to rub off. We paid 5s. an acre down, and have to pay 1s. a year per acre until we complete the purchase. I do not know how long that will last, but it has lasted a long time. We have been paying it for twenty years. The payment of interest is a bit of a handicap. In Victoria the people pay 6d. an acre and get the land for 20s., but we really have to pay 40s. I suppose that the land on the other side of the border is now fully taken up; people who want land are now coming here from Victoria. We have 100 ballot-papers in for one block. When I started it cost me £2 10s. an acre for clearing. But now, thanks to bush fires and ringing, and the timber dying out, people can get the clearing done for 6s. and 7s. an acre; however, I have never got any done for less than from 10s. to 16s. an acre. When I get it done, I like to pay a man a fair amount for his work. There is no doubt that if some of the Crown lands or properties belonging to squatters were thrown open there would be a great demand for land for settlement in this district. I think the travelling stock route should be thrown open; I do not mean all of it, but let some intelligent man go along and say, "Here is good land enough for camping ground," and set aside a 320 or 640 acre paddock for camping in several places, and then chalk off the remainder of the travelling stock route in 320 or 640 acre blocks for settlement. If that were done, and if proper blocks were picked out for cultivation, there would be fifty applicants from Victorians, and in some cases there would perhaps be a hundred applicants for each block. I think that most of the demand for the land would come from people who are anxious to settle on the soil, and who are at present in Victoria. If those blocks were advertised there would be a regular rush from Victoria. I think that the capabilities of the soil here are much better—the country in Victoria is overrun and worked out. All the farming land in Victoria has been taken up and worked out, and it is going wild with rubbish; and they cannot grow a crop of wheat or barley on it unless they plough it three or four times to keep the rubbish down; but if they come here they obtain good soil, and get four or five years' good run off it. The people in Victoria are going in a good deal for dairying. The farmers there have large families, and a farmer can keep part of his family at home, and send part of it here. People who have six, seven, eight, or ten children, have, perhaps, four or five sons fit to come here, with money enough to take up land, and they take up land, and add to the population of this country. I do not want an inch of the travelling stock reserve, but it is nothing now except a sheep-walk, you may say, at 3d. an acre; although it is splendid country a mile wide and 40 miles long, and there might be 500 families settled upon it, all growing wheat. The travelling stock route extends from Tocumwal to Jerilderie. The squatters on each side of it eat it out. They get the use of it for 2d. or 3d. an acre. It is not put to the *bona-fide* purpose of being used as a travelling stock reserve. The squatters have command over all of it, and if a man is travelling with sheep the squatters have men and dogs to drive the sheep along, and knock them up. I think that a general benefit would be derived from the travelling stock route being thrown open for settlement to a certain extent, leaving perhaps a 640-acre paddock here and there to put sheep in at night to feed, and let them go along a three-chain road during the day. There is very little use for the travelling stock route here now, or at any rate there will be none, because when we get the railway we shall be able to trot our sheep to this place and put them in the trucks, and let them go away the same day. The same remarks apply to Berrigan and Jerilderie—we do not want the travelling stock routes to graze on now. Stock is not travelling, except perhaps some loafer hears there is good grass on it,

Mr. J. Crowe. 22 July, 1896.

it, and goes along loafing. I mean that it is not used as a *bonâ fide* stock route. I cannot say whether there are any other available Crown lands in the district, in the shape of reserves, which might be thrown open for settlement. I do not think there are any in close proximity to the town of Finley. We generally send our wheat to Jerilderie; it is sold to Mr. Wise. The wool goes to Melbourne. It goes over the river at Tocumwal. We send the wool to Melbourne, in preference to Sydney, on account of the cost of carriage. Of course, the cost of carriage 150 miles to Melbourne is less than the cost of carriage 400 miles to Sydney. I have never sent any stock to the Sydney market. I have generally tried to sell stock in the paddock; that has always been my motto. If a buyer comes along I sell in the paddock or the yard, and he takes the stock where he likes. There has been a wonderful increase of settlement in this district during the last five years. Five years ago there was only the Murray Hut here. The settlers have come mostly from Victoria and Tasmania. I think they are a thrifty lot of men, who work their farms in a practical way; in fact, I think they woke us up. Before they came we did not know what we had here. Naturally following the settlement, there has been a wonderful increase in the area put under cultivation, and, following that, there has been a great increase in the yield of wheat and other cereals. I think it has multiplied twenty-fold during the last ten years. Ten years ago very little wheat was grown in this district. When I had about 20 or 30 acres under wheat, I was considered a big farmer ten or fifteen years ago, but now men have 1,500 or 2,000 acres under wheat cultivation; therefore, there is a wonderful difference now. Lucerne does very well. Of course, at this time of the year lucerne does not show at all, because it will not grow in the frost, but in summer-time, if there are a few showers, you can put on five or six sheep to the acre. At present dairying is only carried on for home use, but I think it is possible that in future dairying may be carried on successfully in this district. 'Taking the year all through, the average rainfall is about 16 inches. My favourite average would be 14 inches, if we got the rain in the proper season. With a rainfall of 14 inches everything is better, because we have no foot-rot with sheep, nor rust in our crops. Those are the best seasons I have seen here. When we get a big rainfall the sheep die of foot-rot, or we get the rust in our wheat crops. Even if the proposed railway from Berrigan to Finley were constructed, if I could send my produce and wool more cheaply to Melbourne, I should most decidedly send it to Melbourne; but, if I could send it as cheaply to Sydney, I would send it to Sydney; but, if I could get a man to buy the sheep in the paddock I would sell them there, and let him send them where he liked. I would always make the best market I could for my own pocket. It is of no use anyone saying one thing to get a railway, and meaning another. Whichever market I considered I could make the most money out of, I should go there. So far as wheat is concerned, the proposed railway would be of material advantage to me, inasmuch as it would allow of the carriage of my wheat at a lower price than it costs me at the present time. I should have to send my wheat to Jerilderie, and it would be a great convenience to have the railway here. I should not have to pay half as much for carriage to the railway. If there were a Sydney buyer here I would sell to him if I thought that he was offering me a fair price for it, and if not, I would continue to send it straight to Sydney. It would have to go there. My wheat generally runs 17 bushels to the acre. Therefore, my wheat yield would be about 1,600 bags from the area I have under cultivation. It costs me £1 a ton for the carriage of my wool to Yarroweyah, and its carriage from Yarroweyah to Melbourne costs me 8s. a bale, or about £2 per ton; therefore, a ton of wool costs £3 for carriage from my place to Melbourne. I suppose that if the proposed railway were constructed, I could get my wool carted from my place to the Finley station and ready to be taken to Sydney for about 8s. a ton. If I could get my wool conveyed to Sydney as cheaply as to Melbourne, I should most decidedly patronise the proposed railway. There are a good many land-holders in close proximity to my farm. There is Macnamara's estate of 2,800 acres, which he has rented, and of which there are 1,500 acres, if not more, under crop. That is on the east side of my land. Then there are Burke Brothers and O'Brien, who have from 1,500 to 1,600 acres under wheat; then there are Laing Brothers adjoining my farm on the other side. They have 7,000 acres, of which a large area is under wheat this year. Then there is Mr. Hunt on the other side of the creek, and he has 200 or 300 acres under crop. That is between my place and Finley. O'Brien is only leasing his land from Macnamara, but Laing Brothers is freehold land, and so is Hunt's. These people would certainly avail themselves of the facilities that would be afforded by the railway, if it were constructed to Finley. I know that O'Brien and the Burkes sent their wheat in bond by rail through Victoria to Sydney, in order to save the road carriage to Jerilderie. They said it paid them to do that. But on account of the duty being knocked off, the Californian wheat came in so freely that it blocked the market in Sydney; that was the result of freetrade. I do know that this Colony has not been producing sufficient wheat for its own consumption. If the proposed railway were constructed to Finley, it would be the means of bringing a much larger area under cultivation and we should send plenty of wheat to Sydney. Wheat sent from this district for shipment to England has brought a cental more than any other wheat sent to Melbourne for years past. Mr. Brown, of Tuppal, has sent wheat to England, and has obtained 6d. more than that paid for any other wheat that went to England. I get my supplies from Tocumwal. I always deal in the local market, so that if what I get does not suit me I can send it back again. I do not know that I always deal in the cheapest market. I like good stuff, and if what is sent to me is not good I send it back again. The settlers round about me obtain their supplies mostly from Tocumwal, but most of those supplies come from Sydney, being brought in bond through Victoria. Both the storekeepers at Tocumwal deal chiefly with Sydney and get their things round in bond. The goods are purchased in Sydney and water-borne as far as Melbourne, and then brought by rail and team to Tocumwal. If the goods could be brought as cheaply this way from Sydney by rail, I am sure that the Tocumwal storekeepers would patronise the proposed railway instead of chancing the water carriage. I generally pay about 1s. 3d. per bag, that is 12s. 6d. a ton, for the carriage of my wheat to Jerilderie. The way we have to go in order to get to Jerilderie has never been surveyed, but I calculate that the distance from my place to Jerilderie is 33 miles. Agricultural land about here, in its improved state, sells at £3 5s. and some at £4 an acre. In its unimproved state, I think it would be worth 20s. an acre. My place is about 33 miles from Deniliquin. None of the farmers round about me patronise the Deniliquin-Moama railway—nothing goes there. After you get within 4 miles of my place, the country all belongs to Mr. Faulkner, the owner of Tuppal Station—about 28 or 30 miles belongs to him. It is all freehold. Mr. Faulkner and Mr. Landale have all the country from within 4 miles of me to Deniliquin. At certain times in the year there is a good deal of labour employed on the farms in this district. Of course, in harvest and shearing time we

Mr. J. Crowe 22 July, 1896. have to employ extra hands, and also at ploughing time. I do not send any hay or straw to market out of the local district. This year I could have sold all I had, and I could have sold a hundred tons if I had had it a little while ago, but I kept it in reserve, because I thought we were going to have a dry season, and I would not sell. I think now that I shall sell it. I believe that everyone else is cleared out, and there is no one but myself with any to sell. To grow oats and cut it up into chaff would pay me at £3 a ton. I am getting £4 10s. for it now. White oats do not do well here; but, 10s. a bag would pay well for Algerian brown oats, sold as oats. I have sold crops at 10s. a bag. I have got as much as sixteen bags per acre, but that was an extraordinarily good crop. The average yield is ten bags.

To Mr. O'Connor: As regards the travelling stock route, in my opinion all that is required is to have a camping ground of about 640 acres about every 6 miles. The arrival of farmers from Victoria and Tasmania has done a great deal to develop this district. They are mostly well trained farmers, and the way they have gone in for cultivation has woke us up. I have no idea what the carriage and freight on wool to Sydney may be at the present time. Therefore, I do not know whether I am paying more by sending my wool to Melbourne; but I think that the intermediate carriage between my place and Jerilderie would make the cost more by sending to Sydney. I know well the capabilities of this district. The construction of the proposed railway from Berrigan to Finley would to a certain extent bring about an increase in population here; if land were thrown open, and if Mr. Faulkner would continue to lease his land on the present terms, I believe that the population would increase fivefold or more. If the travelling stock route were thrown open in 320 or 640-acre blocks, for every block there would be 100 applicants, and I am certain that along the whole 40 miles between Tocumwal and Jerilderie every acre thrown open on that reserve would be taken up by *bonâ fide* men who wish to settle on the soil. There would be a rush for that land, and if it were all put up in one day it would be taken up.

To the Chairman: I suppose that the cost of the carriage of wool from my place to Jerilderie by road would be about £1 a ton. If the proposed Berrigan-Finley railway were constructed it would cost me 8s. a ton to bring my wool to Finley. I do not know what the Railway Commissioners' rate is for the carriage of wool from Jerilderie to Sydney; I have never inquired. I do not know that if I sent my wool *via* Jerilderie I should, according to my own statement as to the cost of carriage, reap an advantage of about 5s. a ton, but the question is would we meet with as good a market. As a rule, Melbourne is a better market for stock or wool than Sydney. We can pay a tax of 30s. a head on a bullock and then do better by taking it to Melbourne, than by taking it to Sydney. Not so much animal food is required in Sydney—people there are more refined. Cattle realise higher prices in Victoria than in the Sydney market, the advantage lately having been about 5s. a cwt., or about 30s. a head, which is about the amount of the stock-tax. Bullocks will fetch about £12 or £13 each in Melbourne. I was always hoping that the Victorian stock-tax would fall on the consumer; but unfortunately we have to pay it when we take our stock across the river. If the stock-tax were taken off, I am positive that we should get the same price for our bullocks in Melbourne, because they have not got enough bullocks there, and they must have something to eat.

Mr. William Doel, farmer, Tuppal, near Finley, sworn, and examined:—

Mr. W. Doel. 22 July, 1896. *To the Chairman:* I reside on Tuppal, about 18 miles from here.

To Mr. Black: I am a farmer, and I do a little grazing. My farm is north-north-west from Finley—right on the corner of Coree, Tuppal, and Hartwood. My market for wheat is Jerilderie, but this year I sold mostly in Deniliquin. I am nearer Deniliquin than Jerilderie, but Deniliquin is not generally a good market. This year, at the commencement of the season, it was a little better than Jerilderie. Farmers living near me do not send wheat to Deniliquin for shipment to Melbourne. The Deniliquin-Moama railway is a company's line, and the freight going that way is far more than it is going the other way. I cannot tell you what is the carriage of wheat on the Deniliquin-Moama Railway, for when I sold in Deniliquin I sold locally. Jerilderie is 32 or 33 miles from my place. A little while ago the cost of carriage to Jerilderie was 1s. 6d. a bag, but this year it cost me 1s. a bag. This was because the season was an exceptionally dry one, and there was good feed for the bullocks on the road, and a good track. If the proposed line were constructed from Berrigan to Finley, it would pay me to cart my wheat to Finley, and then send it by rail to Jerilderie. I could cart the wheat to Finley myself, leaving home in the morning, and being back again at night, and that would be a great saving. We have a waggon and horses, and we could utilise our own labour, whereas in sending wheat by road to Jerilderie we have to employ teams. Besides, the wheat would be more under our command. We would be with the wheat ourselves, and could sell it on the day we liked, whereas in sending it by road to Jerilderie we have to send it, and then go there at any time we can. Furthermore, in sending it by rail to Finley there would be less likelihood of damage in transit. Besides, this is a great district for fires, and we want to get the wheat out of danger as quickly as possible, and when we are sending it to Jerilderie there is a lot of wheat stacked in the paddocks when it ought to be at a railway station. I heard the evidence given by Mr. Crowe, and agree with what he said as to the capabilities of the soil in this district, and also as to the return at which it pays to grow wheat, chaff, and oats. I think that the soil in the direction of my holding is superior to that immediately around Finley. Some of my land is freehold, and some is conditional purchase. I bought it from the original selectors. I have altogether about 2,400 acres, of which 870 acres are under cultivation, while I graze the rest. I think that the majority of the farmers in this locality would make use of the proposed railway. I have never sent any wheat to the Melbourne market. I have sent only a few lambs and a few sheep there. If there were a railway from Finley to Jerilderie, thus affording me easy means of communication with the Sydney market, I think that I should try the Sydney market with my stock. I got sick of the Melbourne market last year. I was not quite so lucky as Mr. Crowe was in that respect. Last year I sent two truckloads of lambs—that would be about 240—to the Melbourne market.

To Mr. O'Connor: They fetched 2s. 4d. each.

To Mr. Black: The total amount I received paid for the trainage. I got £4 back for the two trucks. But I would not have taken less than 4s. each for the lambs on the ground.

To Mr. O'Connor: I have been in this district eight years, and I know it pretty well. If the proposed railway from Berrigan to Finley were constructed, I would gladly avail myself of it in sending away my produce. I think that every man in the district living by growing wheat and other produce on his farm would patronise the Finley railway. I am certain that the establishment of this railway would promote settlement.

To

Mr. W. Doel 22 July, 1896.

To the Chairman: I cannot tell the Committee exactly how much settlement in this district has increased during the last five years, but I can enlighten the Committee a good deal on that subject. I left Victoria about eight years ago and came here, and then it was a very rare thing to see anybody in this district with 100 acres under crop. There was a mill at Jerilderie, but it was a very rare thing to see a team going there. But since then I think that there has been more wheat carted to Jerilderie than to any railway station in Victoria. All this has been brought about since I came here eight years ago.

To Mr. O'Connor: And that would be much increased if the proposed railway from Berrigan to Finley were constructed.

To Mr. Black: I have nearly doubled my area under crop since the Sectional Committee on the Jerilderie-Berrigan railway took evidence here. It has been paying me to do so. When I first came here I purchased 1,280 acres, and since then I have purchased 470 acres and 570 acres. According to the report of that Sectional Committee, I held 2,400 acres, but since then I have purchased 470 odd acres. There are many people within a radius of 5 miles of my holding who would be benefited by the construction of the proposed railway to Finley. There is one neighbour who represents, perhaps, eight or ten ordinary farms. Mine is about the smallest farm, other farms are 3,000 and 5,000 acres, and those farmers with such a large quantity of land have re-let, and instead of there being only one farm you may say that there are twenty farms. Of actual proprietors there are not very many, but of farms there are a good few. There is plenty of land still available which is suitable for agricultural purposes. It is all suitable from here to my place—nearly 20 miles. I have been farming in the Goulburn Valley, Victoria, almost ever since I was a boy, and there is no country in that valley such as there is between here and my place. If this land were thrown open by the proprietor on favourable conditions, there could not help being a good deal of increase in settlement, for it is the finest district I have ever seen. The Goulburn Valley soil is red chocolate soil. I do not think there is much volcanic about it. The soil there is something similar to that in this district, but this is a little lighter, and more easily worked.

To the Chairman: No district could be more suitable for the carrying on of the dairying industry than this one is. The country in this quarter is really too rich for sheep. If we have a good season, we cannot stock it sufficiently. It goes too much to grass.

To Mr. Black: We have foot-rot here in places, but no fluke.

To the Chairman: When I came here eight years ago, there was no foot-rot here.

Mr. John Westerdale, farmer, Tuppal, near Finley, sworn, and examined:—

Mr. J. Westerdale. 22 July, 1896.

To the Chairman: I reside at Tuppal, and am a farmer. I lease 338 acres. I am satisfied with the conditions under which that land is leased to me. I have the right to purchase it at the end of the lease. I have 290 acres under cultivation. This year I am growing wheat principally, but also 6 acres of oats. I had barley in last year, but it did not pay me, on account of there being no demand in New South Wales for it. I have last year's barley now unsold. I send my wheat to Jerilderie. It costs me about 9s. a ton to send it to Jerilderie. My farm is 5 miles from Finley.

To Mr. Black: My farm is about 26 miles from Jerilderie.

To the Chairman: I should be greatly convenienced by the construction of the proposed railway from Berrigan to Finley. I should send my produce to this line. Last season my crop was close on four bags to the acre. I also had about 30 acres under hay. Under favourable conditions, so far as seasons are concerned, I should probably send over 1,000 bags of wheat by the railway from Finley. I should do it because it would mean a saving to me in carriage. Whether I shall or shall not purchase the holding I am at present leasing will depend on the seasons. My lease has two years yet to run. I took up the land intending to purchase it, and have made improvements with that end in view. My present intention is to purchase it. I now pay a rent of 5s. an acre. A man can farm successfully and pay that rent. I believe that he could also make it pay by purchasing the fee simple at £4 an acre, if railway facilities were afforded him. During the last three years I have noticed an increase of settlement in the district. I came from Victoria, because I found that I could do better in New South Wales. I found the capabilities of the soil here better, and that more favourable conditions were afforded me for taking up land. I find the Sydney market is better for me than the Victorian market was. I heard the evidence given by Mr. Crowe, and in the main I agree with what he stated in regard to the possibilities of development in the district, if the proposed railway be constructed.

Mr. William Kirkland, farmer, Finley, sworn, and examined:—

Mr. W. Kirkland. 22 July, 1896.

To the Chairman: I am a farmer, residing about 3 miles east of Finley. I have been a resident of the district about four and a half years. What induced me to come and settle in the district were the terms on which the land could be obtained, and the quality of the land. I have been engaged in farming operations all my life—before I came here, in Tasmania. I am now in occupation of close on 1,900 acres, of which about 1,100 acres are under cultivation.

To Mr. Black: I have not lately made any additions to my holding.

To the Chairman: I hold the land under a seven years' lease with the right of purchase. All my anticipations have been realised in regard to the capabilities of the soil, and so on. I have more confidence in the district now than when I first came here. Not the whole of the 1,900 acres are at my option to purchase at the end of the lease—about 100 acres of the land I rent from a neighbour. I cannot say that I have definitely the right to purchase that; I look to the 1,800 acres. I am satisfied with the conditions under which I have acquired the land, and I have every intention at present of purchasing at the end of my lease. I have gone on improving the estate with that object in view, just as if it were my own, in fact, I could not afford to do anything else but purchase. In my lease I have arranged that if I purchase I shall pay £4 an acre for the land, and I am satisfied that, even at that rate per acre, I can make farming pay. I feel the more assured in that opinion by the fact of there being a probability of a railway being constructed to this district, affording me further facilities for the carriage of my produce. It would lessen the cost of putting the produce on the market, and, therefore give me a larger margin of profit. At present Jerilderie is the only place I have to send grain to, and if a railway were constructed from Berrigan to Finley I should really save the whole cost of the cartage.

Even

Mr. W. Kirkland. 22 July, 1896.

Even if wheat did not realise the prices which it realised last season, which was a very good one, the saving in the cost of carriage would recoup me for the loss, provided it was not too great a haul. The surveyed line passes right along the end of my property. The original survey is on the opposite side of the road to me.

To Mr. Black: That is on the right-hand side coming from Berrigan to Finley.

To the Chairman: Mr. Breadon holds the lands on the opposite side. He is settled on his area under the same conditions as I am on mine. I am not aware that he raises any objection to the acquisition by the Government of the land required for the purposes of this railway. If it were proposed that a certain portion of my land should be taken for the purposes of the railway I should certainly offer no objection. I should be far more than recouped by the line being made. I consider that the first year would more than recoup me, supposing the land were my own in fee simple, and I gave it. At present we have to pay 1s. a bag, or about 9s. a ton, for the carriage of wheat to Jerilderie, and if the railway passed by my place I would do it almost with the same hands as I have in harvest. The expense of putting my wheat on the trucks would not amount to many pounds difference, whereas last year cartage alone cost me £160. The roads to Jerilderie are the usual bush roads, and very little rain, even in the summer time, stops all cartage. Last year and the year before there were several days when the teamsters did not hook up, and if there is a fall of rain it means the total stoppage of all cartage for a day or two. If, after the harvesting operations are over, a wet season sets in, an obstacle in the way of sending wheat and other produce to market is created by the fact of the roads being made impassable, thus causing delay. Of course, the roads, at that time of the year, do not remain so bad that you cannot transport produce at all; but their condition always causes delay. I have had conversations with nearly all of the people who are holders of areas of land under the same conditions as I am, in regard to the matter of giving the land required for the construction of this railway, and I think that none of them are opposed to the granting of the land. I also think that it is the intention of those people to purchase their holdings right out when the time comes. At the present time there are about eighty settlers within a 5-mile radius of Finley. There is no question that the construction of this railway would be an incentive to the further development of this district. Practically no produce is now sent from this district to the Melbourne market. A few settlers, just on the edge of the river, do send to Melbourne sometimes; but even last year people carted right from the river to Jerilderie. It is, of course, just a matter of the difference in the cost of carriage *via* Melbourne to Sydney. I wrote for information on that head last year before harvest, and the cheapest that I could get the carriage done for was 3s. a ton more *via* Melbourne, and thence by water to Sydney, than *via* Jerilderie to Sydney. Practically the cartage for me was the same to Yarroweyah as to Jerilderie; but for those situated on the river the cartage to Yarroweyah was less. The balance of my land which is not under crop I use for grazing purposes. I do not raise any stock, but I have been in the habit of buying grown sheep and fattening them. My land will carry one and a half or two store sheep to the acre all the year round. I never stock to that extent, for I generally stock with the intention of fattening. Sometimes I have shorn. If I were to shear sheep in future, in all probability I should send my wool to the Sydney market by this railway. I have never inquired as to the cartage of wool to Jerilderie, because in certain seasons of the year you cannot get teams to take wool to Jerilderie. The capabilities of this district for dairy-farming are very good. I had nearly a life's experience in dairy-farming before I came here, and I think that during the winter and spring months, at any rate, the capabilities of this district for dairy-farming are excellent; but there is no outlet for that industry now, owing to the want of cheap carriage—that is to say, in the matter of butter—such as the people have in Victoria. We have practically better land for dairying than that in the Goulburn Valley.

To Mr. O'Connor: I heard the evidence given by Mr. Crowe, and, generally, I agree with his evidence as to the value and possibilities of the land here. Whilst proceeding with my farming operations here, I have been so satisfied with the quality of the land that I determined that I would purchase it. If the land had not been so good I should some time ago have determined to refrain from the responsibility which I have incurred since with a view of purchasing the land.

To Mr. Black: I have expended so much capital and labour in improving the land that I consider I should be a considerable loser by not purchasing it. All the money that I have made out of it I have spent on it, looking forward to the purchasing of it. I could have withheld that money and kept it in my pocket. I have spent money on other improvements besides actually necessary ones.

To the Chairman: My average yield of wheat has been about 18 bushels per acre. Last year I obtained 4½ bags, the year before I had only 3½ bags, but the year before that I had 5 bags to the acre. If the seasons continue to be good, as last season was, I should probably send over 5,000 bags of wheat by this railway, and I am looking forward to putting more land under cultivation. I am clearing land now for more cultivation next year. It is probable that if the proposed railway be constructed, I shall, at some future date, put the greater portion of my land under cultivation. I might never put the whole area under cultivation. It would not be business-like to do so, because you want to look forward to the future, and there are other things to which I should look forward. At the present time we are so situated that wheat is really the only thing we can produce; whereas, if we had more railway facilities, we could produce oats, hay, and straw. This year I had a considerable quantity of straw on hand, and the market was good in Sydney, therefore I wrote for information as to the cost of railway carriage, and I also wrote to agents for full information as to the market; and if it had not been for the road-carriage to Jerilderie I should have sent some straw to the Sydney market; but I did not do so because I found that straw, being bulky, it would have cost me from 15s. to 18s. a ton, to get it to Jerilderie, and that expense would have swallowed up all my profit. If the proposed railway were constructed, I should send not only wheat, but probably also hay, straw, and oats by it. When I said just now that it would be unwise to place the whole area under cultivation at one time, I meant that I was guided by the fact that the land requires a rest at some period or other. No land, be it ever so rich, can go under cultivation for ever. Another thing is, that the land is likely to become somewhat foul after a few years' cropping, however careful you may be, and therefore wants either fallowing or resting. I have not yet considered what I should put in as a crop on what I may term exhausted land, but it would probably be lucerne. Lucerne grows excellently in this district. I have not seen it put in in a workmanlike manner in this district, and yet it is astonishing the amount of feed which it produces. I have had no experience in growing lucerne for hay. Nearly all the people who sow lucerne in this district grow it just for grazing purposes.

THURSDAY,

THURSDAY, 23 *JULY*, 1896.

[*The Sectional Committee met at "Burbury's Hotel," Finley, at* 10 *a.m.*]

Present:—

FRANK FARNELL, Esq. (Chairman).

The Hon. Daniel O'Connor. | George Black, Esq.

The Sectional Committee further considered the proposed Railway from Berrigan to Finley.

Mr. William Kirkland, farmer, Finley, sworn, and further examined:—

Mr. W. Kirkland. 23 July, 1896.

To the Chairman: Yesterday I gave the Committee some statistics from memory as to the increased settlement in the district which had taken place during the last few years; but I can now state more accurately the numbers constituting the increase. About the middle of last April statistics were taken throughout the district that was to be served by this proposed railway, to be put before the Minister for Public Works, and this is the gist of them: Yesterday I told you that I thought there were about eighty settlers. On counting them, I find the number of holdings is 102, and the area of those holdings, 75,000 acres. The land under cultivation in 1895 was 26,211 acres. The land under cultivation in 1896 is 36,336 acres. The wheat grown in 1895 amounted to 82,239 bags, whilst the sheep on the same holdings numbered 49,594. Of cattle there is only a small number—a few kept for domestic use—and it is not taken into account. Similar statistics were taken about five years ago, in respect of the same area, when there was an agitation for the construction of the Rock line. The document embodying those statistics has been mislaid, but speaking from memory, I should say that in the same area the quantity of land under cultivation then was 5,600 acres. I may state that these statistics were taken in respect of an area (with the exception of four holders) within 10 miles of Finley on the west, and (with the exception of some half a dozen holders to the south-east) within 8 miles of Finley on the east. In the event of the proposed railway not coming to Finley—that is to say that if either the Committee or Parliament decided to leave the terminus at Berrigan—fully 60 per cent. of the wheat grown on this area would still be carted to Jerilderie, whilst the remaining 40 per cent. would go to Berrigan. I think that I am well within the mark in saying that 60 per cent. of it would still be carted to Jerilderie; therefore the Berrigan railway would not benefit more than to the extent of 40 per cent. of that quantity.

To Mr. Black: As to the wool grown in the district, those 50,000 sheep represent, I suppose, an average of about one bale to the 100, or altogether about 500 bales. To a large extent the area in respect of which those statistics were taken is purely an agricultural country. Hitherto, I suppose the whole of the wool has been sent to Melbourne, and I must say that sheep-owners are conservative and hard to move; but I think that the matter of their pocket will decide which way they will send their wool in future. No doubt some of them would be influenced to some extent by how they stood with the Melbourne agents; but most of those landholders are not large sheep-owners, and are not likely to be involved largely with the Melbourne agents. In the event of a railway being constructed from Berrigan to Finley, I think that, in all probability, wool would be sent to Sydney. If the proposed railway were not constructed I think the wool would continue to go to Melbourne. Not being a wool-grower, I cannot speak personally.

Mr. John Blair, farmer, near Finley, sworn, and examined:—

Mr. J. Blair. 23 July, 1896.

To the Chairman: I am a farmer residing 6 miles east of Finley—nearly midway between Finley and Berrigan.

To Mr. Black: The land I lease is on the proposed railway route. The line would run about 2½ miles along the edge of that land. I have no voice in the matter of land being given to the Government, free of compensation, for this railway, but I should be only too pleased to see it done. My land is partly on the Tuppal Station, and the remainder of it is adjacent to the Tuppal land, under a different owner. If Mr. Faulkner were prepared to give the land, subject to my approval, I would most decidedly approve. I do not know the opinion of the other owner, Mr. Simmons, as to giving land; he is not living in the district. I have not heard that Mr. William Blair has a letter from Mr. Simmons in which he declines to give his land. If the proposed railway were constructed, I think it would be patronised very much by the selectors here. I think they would use it in dry weather as well as wet. I send my produce to Jerilderie. If the proposed railway were constructed, I think that I should have still further inducement to send my produce in that direction. I occupy 4,500 acres. Of that area I have let 970 acres for agriculture, and the remainder I hold myself. The bulk of the let-off area is under agriculture, and I personally cultivate 2,800 acres.

To the Chairman: The average yield of wheat from my cultivation during the last seven years has been from 3¾ to 4 bags an acre. The area is kept down a good deal by bringing in so much new land, which is often brought under cultivation rather late in the season, and that reduces the average yield. Last year I had, on 2,300 acres, an average of nearly 4 bags an acre. The prices have been such that a person could farm successfully, with the exception of one year when the price got below 2s., which was too low for any profit. I have always sent my wheat to Jerilderie. The road to Jerilderie has always been of such a character as would allow of safe transit, with the exception of a few days, when heavy rain came and the teams had to stay. But they resumed work afterwards, when the road got firm again; it was never impassable for any length of time. Last year I paid 10d. a bag, or about 7s. 6d. a ton for the carriage of wheat from my place to Jerilderie. I am 20 miles from the Jerilderie railway station. If the proposed railway from Berrigan to Finley be constructed, I shall certainly avail myself of the facilities that will be afforded for the carriage of all my produce. Every bag of it, so far as I know at present, will go by this railway. I could handle it with my own teams and save all the expense I am put to now in carting. I could save over £200 a year on wheat alone. This year my crop was about 11,200 bags, and I am looking forward to 11,200 next season. That shows a great increase in the produce of the area put under cultivation. Since I have been here the increase of settlement in the district has been very great indeed. I have been in a good position to notice it. I was the "bell-wether" of the Tasmanians, I may say. After I came away from Tasmania the others followed me, two years later.

There

Mr. J. Blair. 23 July, 1896.

There was very little cultivation here then. Neighbours of mine, who are farming largely now, had only 30 or 50 acres under cultivation then, and that was considered a great deal. They were satisfied with sheep-farming; but, when we started opening out a bit, they did the same, and the result is that the country is as you see it now. I was fortunate enough to get the agency from Mr. Faulkner, for the purpose of letting his land, and I was the means of influencing most of the other Tasmanians who are now here to come and settle in this district. All those people who have settled in this district since I came here have carried on the farming industry successfully. They are perfectly satisfied with the terms and conditions under which they hold their areas, on the leasing system, with option of purchase. I think it likely that when their leases are about to expire they will avail themselves of the provision which is incorporated in them for the purchase of the land. I could not name an exception. I think they are showing a *bona fide* intention in that direction by making improvements of a substantial character on the holdings. I do not think it is likely they would expend their money and labour in making improvements, and then allow the holdings to revert to the present proprietor. If the proposed railway be constructed, I shall avail myself of it for the purpose of getting supplies from Sydney and intermediate towns. I now get the biggest proportion of my things from Sydney, and I have to get them by coach from Jerilderie, or go to Jerilderie for them; therefore, the railway will be of material assistance to me in that respect. During a portion of the year the country about here is very good for dairying purposes. In the summer time it is rather difficult to make butter, on account of the heat; but we have plenty of grass, and cattle do well, and give immense quantities of milk and butter. People are talking of establishing a creamery at Tocumwal; there have been several meetings held, but they have never brought the matter to a head yet. We, in Tasmania, always carried on dairying, and when we came here there was hardly a cow. You could not get any butter. The first thing I did was to buy a few cows, as we could not do without them for the family, and they have been a great success. The soil here is capable of growing different kinds of fodder, but up to the present we have not tested it, except for lucerne. We have had so much natural grass that other fodder was not required. I have sown turnips, and mangolds, and one Tasmanian at Momolong, on land similar to this, has grown immense mangolds—they stood 18 inches out of the ground—and also turnips. If the proposed railway were constructed, and if under the conditions on which people have holdings at present further areas were thrown open, I think there would be a demand for the land and that it would be taken up. For every block that is to be let in this vicinity, there is a rush. People come from Victoria, and the only trouble is that there is not enough land put up at a time, and so many people are so often disappointed, as only perhaps four or five persons out of 500 or 600 applicants can get land. I have with me now some young men from Tasmania who are waiting for an opportunity to take up land. They have been in for several lots at Corowa and other places where it was thrown open but have not been successful yet and are still anxious to get land. I think that there is a *bona fide* intention on the part of the settlers in the Finley district to realise the anticipated results in regard to this railway if it be constructed. I am sure that the construction of this railway would lead to further development and a larger settlement taking place, and, naturally, as a consequence, a greater area would be put under cultivation. The mode of transit now is a handicap; but, bad as that is, people go for every available acre of land which is thrown open at the present time, and there would be a still greater inducement with the railway. I have considered the amount that it is likely would be claimed as compensation by those unwilling to give their land free in connection with the construction of this line. I do not see how anyone without severance could ask any more than £4, or perhaps £5 at the outside, per acre. There would be no necessity for the Government to go into an expense of thousands of pounds, as far as compensation is concerned. I think that the total amount of compensation would not be more than some hundreds of pounds. Several persons would give their land free. We calculated it at one time, and found that the quantity of land that might have to be paid for between Berrigan and my place came to 30 acres, and we always looked at the land from here to my place as being given free. I have heard that Mr. Faulkner would be likely to give the necessary land, if the tenants were willing. As regards making an alteration in the proposed route, so as to save payment of compensation, there is only one place where I can see a little alteration could be made, and that is just out of Berrigan. The surveyed line crosses the road in Phipps' land, where it severs two paddocks, whereas if it were continued to the end of the road and then came on to the other point of his paddock, it would cross only one paddock. I do not think there is any other corner that could be improved upon. There would be no material advantage gained by that, excepting preventing the severance of two blocks, instead of only one. That land is all held in one name.

To Mr. O'Connor: The greatest block against settlement is owing to sufficient land not being thrown open. So strikingly plain is that fact, that hundreds of people return to Victoria and elsewhere, grievously disappointed. I am alluding to land that could be thrown open by the Government.

To the Chairman: In reference to the statistics which Mr. Kirkland gave just now, and his saying that 60 per cent of the wheat grown on the area he mentioned would be available for the line from Berrigan to Finley, and that in the event of this line not being constructed, 40 per cent. would go to Berrigan, I think he is a long way from the mark. I think that my wheat is included in that to go to Berrigan; and I may state that I have ascertained from the carters who took my wheat last year the prices for carting this year; and it is my intention this year, and perhaps in future years, if there is no railway from Berrigan to Finley, to use the Jerilderie-Berrigan line for only a portion of my wheat—what I can cart with my own teams;—but the bulk of it would have to be carted by carriers, and I should send that to Jerilderie. I am in rather a peculiar position. I am claimed sometimes for Finley and sometimes for Berrigan, as regards railway carriage, and I just wished to make the statement that the biggest portion of my wheat, this year, will go by the carriers to Jerilderie, and what I can cart with my own teams to Berrigan I shall take there. I could not cart it all because there is so much of it.

Mr. Charles McAllister, farmer, near Finley, sworn, and examined:—

Mr. C. McAllister. 23 July, 1896.

To the Chairman: I reside 9 miles west of Finley. It is eighteen years ago since I first took up land here. I am a farmer, and I hold 6,400 acres. I acquired the land principally by purchase, some by selection. I have 3,500 acres under cultivation. Five hundred acres of that area I have myself, and 3,000 acres I have rented on the halves system—a system by which we mutually agree to work the farm to the advantage of each party. I graze the balance of my land—2,900 acres. The stock-carrying capacity of the country is about one and-a-half sheep to the acre. I shear my sheep,

Mr. C. McAllister. 23 July, 1896.

sheep, and send the wool to Melbourne. The only reason why I have sent the wool to Melbourne is because in the past I have been handicapped so far as regards facilities being afforded me to send it to Sydney. I have obtained as much as 75 bales of wool from my sheep, but I would not get as much now, since I have let the land. At present I would have 50 bales. If the proposed railway were constructed, I should send my wool to Sydney instead of to Melbourne, if I found I could send it to Sydney as cheaply. I have been in the habit of sending my wheat to Jerilderie. In sending it to Jerilderie I have been handicaped very often because of the bad roads, and the difficulty in the early days in getting teams. I have suffered absolute loss through not being able to get teams owing to the bad roads and a plague of mice coming and doing great damage to the wheat. My yield of wheat has been up to the average in the district. If the proposed railway be constructed I shall probably send about 2,000 bags of wheat by it, and I shall send that wheat *viâ* Finley to Berrigan if the railway be constructed to Finley. I am surrounded by many other settlers—principally the settlers on my own ground, immediately around me, but there are also other settlers at distances from me varying from 7 to 9 miles. They would all be benefited by the construction of the railway to Finley, because it would afford them further facilities to get their stuff to market. All of them will be only too glad to avail themselves of the opportunity of patronising this railway if it is afforded them. They appear to be perfectly satisfied with the conditions under which they continue on their holdings. I cannot say that during the last five years I have noticed an increased demand for land in this district for settlement purposes, as regards purchasing the land, but there has been a greater demand for leasing the land. I think that the reason why there is not a greater demand for the purchase of land is because the people have not got the ready cash with which to buy it. They prefer to lease the land, with the right of purchase, and have it on reasonable terms till such time as they are in a position to purchase. They do not grumble at the amount they have to pay per annum as rental. I am sure that the dairying industry could be carried on with success in this district. I know that the part of Victoria I came from is not at all as suitable for dairying as this district is, and yet there the industry carried on is pretty well all dairying. My place is 25 miles from Jerilderie. I know of some Crown lands which could be made available for settlement in the district; there is the travelling stock route from Tocumwal to Jerilderie which could be made available, and there are also a large area of Crown lands on Tuppal holding. I am not in a position to say what those lands are; but I think that at the time Tuppal holding was sold there were 29,000 acres of Crown land on it. I do not know whether that quantity includes roads or not. I think it is unnecessary to have so much land for the travelling stock route now, and if we were to get the proposed railway to Finley such an extensive travelling stock route would be still less necessary. There is not the slightest doubt that if the travelling stock route were made available for settlement it would be taken up immediately by settlers. The Crown lands on Tuppal Holding are scattered through the run, in different parts. Tuppal lies principally between here and Deniliquin. A great number of the people who would take up those lands if they were made available for settlement would patronise this railway. People living within 7 or 8 miles of Deniliquin now cart wheat to Jerilderie. There is no extensive market for wheat in Deniliquin, and they get a better price for it at Jerilderie, and all the wheat grown within 7 or 8 miles of Deniliquin goes to Jerilderie. The fact of the cost of carriage being so high on the Deniliquin-Moama railway has not so much to do with those people sending their wheat to Jerilderie, as the price they obtain for their wheat at Jerilderie. With the duty across the border, it would not pay them to send their wheat that way, in any case. I am satisfied that if the proposed railway from Berrigan to Finley were constructed, it would bring about increased settlement, and lead to an increased area being put under cultivation in this district.

To Mr. Black: I have increased my holding by 1,880 acres since I gave evidence before the Sectional Committee in January, 1895. I have acquired the additional land by purchase. I am very well satisfied with my prospects since I came to the district.

To the Chairman: And the same prospects are open to everyone else.

To Mr. Black: In the future I may, perhaps, make still further additions to my property. I think that very little of the wheat grown in the district goes to Tocumwal—only the wheat that is grown immediately about Tocumwal. I believe that Mr. Jeffries, of Tocumwal, buys wheat, but I do not know how he disposes of it. However, that wheat does not come from the district immediately surrounding Finley. It is more from the district around Tocumwal. I know that a great deal of the wheat grown halfway between here and Tocumwal goes to Jerilderie. If the proposed railway from Berrigan to Finley were constructed, I do think that wheat would be brought to Finley from as far south as Tocumwal. I think that the Finley line would largely tap the Tocumwal trade. Tocumwal is 15 miles from Finley, and I think that the Finley railway would tap that district as far as Tocumwal. I am not prepared to say whether it would tap it any further south. Finley is about 25 miles from Jerilderie. If the proposed railway from Berrigan to Finley were constructed, I should hardly think that the farmers 10 miles from Finley in the direction of Jerilderie would send their wheat to Finley, but those living 7 or 8 miles in that direction, if they were carting their own teams, might bring their wheat to Finley, as they would be able to come in and go back in the day. But if they had to pay carriers they would send their wheat to Jerilderie. I think that farmers distant 16 miles from Jerilderie, and therefore 9 miles from Finley would, in order to save 34 miles of trainage, prefer to cart their produce two-thirds of the total distance between Finley and Jerilderie, and take it to Jerilderie, rather than one-third and bring it to Finley. My opinion is that it would be only those farmers to the northward who were within 8 or 9 miles of Finley who would prefer to utilise the Finley railway station. Taking the route between Berrigan and Finley, the same remark will hold good. It would be only those nearer Finley than Berrigan who would use the Finley railway station. Those midway between Finley and Berrigan, I suppose, would take their wheat to Berrigan. I think that those within two-thirds of the distance from Berrigan to Finley would prefer to go to Berrigan, whilst those within one-third of the distance from Finley to Berrigan would prefer to go to Finley. On the western side of Finley, towards Deniliquin, the district would be tapped for 20 or 25 miles by the proposed railway. The total distance between Finley and Deniliquin is 40 miles, and I think that this railway would tap that district within 10 miles of Deniliquin, because the people there now come this way with their wheat. People living within 10 miles of Deniliquin go to Jerilderie, and they would affect a saving of about 10 miles if the proposed line to Finley were constructed. Finley is much nearer to them than Jerilderie.

Mr. Casimir Rowe, Manager, Springfield Station, near Finley, sworn, and examined:—

Mr. C. Rowe. 23 July, 1896.

To the Chairman: I am the manager of Springfield Station.

To Mr. O'Connor: I have been in this district two years last May. I have been the owner of sheep stations, and have been farming generally in Victoria. My knowledge is pretty extensive. I have been about ten years in New South Wales—in various parts of it—but principally on the other side of the Murrumbidgee, in the Merool district. I was many years in Victoria. My experience is extensive in regard to land and how it should be used, whether for pastoral or agricultural purposes. In my large experience I have not seen land much more suitable for cultivation than the land in this district, except, perhaps, the Warnambool country. I should favourably compare the land in this district with some of the most favoured portions of Victoria for agricultural purposes. I am sure that if facilities were offered here for settlement we should have a large population here in time. I heard Mr. John Blair give evidence this morning. I heard him say that people come here in very large numbers to acquire land and go away sadly disappointed at not being able to acquire it. That is true. I have experienced that myself. I think that there would be a sufficient number of people here in course of time to well support a railway between Finley and Berrigan, and that, instead of inflicting a loss on the Government, it would in a very short time be a paying line.

To the Chairman: The area of the Springfield estate is about 5,300 acres, of which 1,100 acres are under cultivation. There has been a great increase of settlement in this district during the two years I have been a resident here—it has increased every year. I think that that is likely to be much augmented if railway facilities are afforded settlers in this district, and provided that a larger area is thrown open for lease under one form or another. I think that the present travelling stock route is a great deal too large, and that half of it, at all events, would be sufficient. This is a good dairying country. It is rich in natural herbage, and a little addition of lucerne would make a certainty of it—lucerne growing in the summer months when you have not the natural grasses. I think that the whole of this district has a great future before it, if proper facilities are given the settlers to get their produce to market. I have heard the evidence given by most of the settlers who have given evidence here to-day. I think that they have pretty well stated the case. Their statements have been very correct indeed.

To Mr. Black: I have been taking the rain records here for Mr. Russell, the Government Astronomer, during the time I have been in the district, and I have also the previous records. The average rainfall of the district is 20 inches. I think that the rainfall last year was only 15 inches, or perhaps nearly 16 inches; but, in spite of that, we had very fine crops.

Mr. William Burns, selector, near Finley, sworn, and examined:—

Mr. W. Burns. 23 July, 1896.

To the Chairman: I am a selector residing about 6 miles out of Finley, between here and Berrigan.

To Mr. Black: The surveyed line for the proposed railway from Berrigan to Finley is on the other side of the road opposite my land, which is on the southern side of the road. If it were decided to take the proposed railway along my side of the road and to resume, say, a chain of my land, adjacent to the road, I would be willing to exchange that land for some Crown land which, I think, there is adjoining. I should be willing to give a narrow strip of land bordering the road if the Government in exchange would give me a strip of Crown land of corresponding width. There would be no difficulty about that. I have, as near as I can guess, a frontage of 105 chains to the main road. My block is only 69 chains wide, and I had to get it in length to make up 640 acres. My total area is 1,849¾ acres. I control the whole of that myself. One thousand acres of it is under cultivation now. I have increased the area under cultivation this season. I put 320 acres of new land in this season. So far the taking of the duty off wheat has not daunted me. Last year I got as much as seven and eight bags of wheat per acre. My wheat-yield last year averaged four and three-quarter bags all through. Eight bags make 32 bushels. In my worst year, my average has been about two and a half bags per acre. We invariably send our wheat to Sydney, *via* Jerilderie. When the railway from Jerilderie to Berrigan is completed I shall send my wheat to Berrigan, because it will be the nearest station, and if the railway were constructed to Finley I should send it to the Finley station, which is nearer still. I am only 6 miles from Finley. I should do my own carting.

To the Chairman: Taking the average for the time I have been here to be about five bags to the acre, I ought with 1,000 acres under crop this season to reap a harvest of something like 5,000 bags, if we get a good spring, and the railways would be charged with the conveyance of that, if not to Sydney, at all events to intermediate stations, *via* the Berrigan-Finley line. There has been a great increase in the area of land put under cultivation in this district during the last five years. There has been a great demand for land in the district. A lot of people come here and are unable to get land, and go away again. I know the travelling stock route between Tocumwal and Jerilderie—I do not think it is all required for that purpose. If it were thrown open in available areas for settlement it would soon be taken up—all that was offered. The settlers seem to be satisfied with the conditions under which they occupy their holdings, and I think they are farming successfully. It is seventeen years since I came here, and the country was very wild then. I had about 100 acres under cultivation five years ago. I thought that was a big area then. I think that it was the settlement in the district of practical farmers from Tasmania and Victoria which acted as an incentive to me to put a larger area under cultivation. I graze sheep, cattle, and horses, but I have not sent any to market lately. If I did graze them for selling purposes, I should send them to market by rail.

Mr. Alexander MacIntosh, farmer and grazier, Finley, sworn, and examined:—

Mr. A. MacIntosh. 23 July, 1896.

To the Chairman: I am a farmer and grazier, residing about 4 miles south-east from Finley. The area of my holding is 2,600 acres. I have been in this district going on for eight years. I purchased the 2,600 acres of land from the holder of it at that time. It had been selections. I have 700 acres under cultivation, and I use 1,900 acres for grazing purposes. The first year I was here I had 20 acres under crop, 40 the next, and so on. The average yield of wheat from the 700 acres is about four bags to the acre, or about 2,800 bags altogether. I send my wheat to Jerilderie, a distance of 27 miles. I have not sent any stock to market latterly. The tax put a stop to my sending stock to the Victorian market. I have never tried the Sydney market with stock. If I did go in for fattening stock for market, I should give

Mr. A. MacIntosh. 23 July, 1896.

give the Sydney market a trial, and, in sending the stock to market, I should avail myself of the facilities that would be afforded by the proposed railway from Berrigan to Finley, if it were constructed. If my anticipations are realised, and I get 2,800 bags of wheat off my holding, I shall send it by the proposed railway. There has been a great increase of settlement in this district during the last five years, and a greater area has been put under cultivation. There has also been a great demand for land in the district, and I think that areas would be quickly sought after if some were made available. I know the travelling stock route from Tocumwal to Jerilderie. It is hard to say whether it is absolutely necessary that that stock route should be retained. I think that half of it ought to be retained at any rate, and that the other half could be put to better use by being thrown open in suitable areas for settlement. I think that with an average yield of four bags to the acre a man could profitably carry on agricultural pursuits here and live comfortably, together with his wife and family, if he had about 300 acres. If a portion of the travelling stock reserve were cut up into areas of 320 acres each, that would be the means of encouraging *bonâ fide* settlement, and the settlers could successfully carry on operations; more particularly would that be the case if you gave them a cheaper means for the carriage of their produce to market. I have heard the evidence given by the other witnesses to-day, and in the main I agree with it. I consider that this district has such capabilities as to warrant anyone in thinking that it has a great future before it.

Mr. Alexander Lang, farmer and grazier, near Finley, sworn, and examined:—

Mr. A. Lang. 23 July, 1896.

To the Chairman: I am a farmer and grazier, residing 10 miles south-west from Finley. The area of my holding is about 7,500 acres, of which about 750 acres are under cultivation, whilst the balance is used for grazing purposes. On 6,750 acres I run a little over 12,000 sheep. The average wheat yield from the 750 acres during the last three years, taking one year with another, has been about four and a half bags per acre. Therefore, in all probability, if the season is as it has been in the past, I shall have about 3,500 bags of wheat from the land under cultivation. In the past I have sent my wheat to Jerilderie, a distance of about 35 miles. Last year I sent 1,000 fat wethers to the Sydney market. If the proposed railway from Berrigan to Finley were constructed, I would give the railway Department the benefit to be derived from conveying the 3,500 bags of wheat, and probably sheep as well. Last year my clip of wool amounted to 180 bales, and I hope to have more this year. Melbourne has been my market for wool. One reason why I sent it to Melbourne was because of the cost of carriage. If facilities were afforded for the conveyance of wool to Sydney at as cheap a rate as I can send it to Melbourne, in all probability the New South Wales railways would obtain the benefit of the carriage of my wool. I have never tried the Sydney market with wool, and it is quite likely that the Sydney market might prove to be a more remunerative market for me than the Melbourne market. There has been a great demand for land in this district during the last few years, particularly for leasing purposes. I think that the demand for land for leasing purposes is simply on account of the individuals not having sufficient capital at command to purchase the land right out. They are mostly small farmers, and they have not sufficient capital to buy a quantity of land. I think they are satisfied with the conditions under which they have their holdings. They appear to be a thrifty, practical lot of men. I have heard the evidence given by the several witnesses here to-day, and in the main I agree with what has been stated by them. I think that the statements they have made can be borne out in almost every instance. If the proposed line from Berrigan to Finley be constructed, it will bring about further development in the district, and I am almost sure that it will ultimately become a paying line. I think that every legitimate effort will be made on the part of the settlers in the district to make the railway a paying concern.

To Mr. Black: When I said just now that I sent 180 bales of wool to market last year, I meant that that was my total clip at this place. I shear all my sheep. Last year I shore about 10,500. I heard the evidence given by Mr. Kirkland, as to the number of bales of wool that could be obtained from 100 sheep. According to our clip the quantity averages about one-and-a-half to two bales per 100, in the case of grown sheep. Lambs do not average so much.

To Mr. O'Connor: The average weight of a bale of wool is 3¼ cwt.

To the Chairman: I do not dump my wool.

To Mr. Black: My property is situated in a south-westerly direction from Finley. I know the Tocumwal district. In the event of the proposed railway from Berrigan to Finley being constructed, I think that almost the whole of the produce of the Tocumwal district would come to Finley—from almost right into Tocumwal. I do not think it would go south from Tocumwal. It has not done so this last season.

To Mr. O'Connor: The value of wool, roughly, averages about 8d. on the station.

To the Chairman: That price pays very well. I may mention that it is my intention, if the proposed railway be constructed, to let most of my land for the coming season. It is probable that I shall let about 6,000 acres, and if that area were put under cultivation, it would, at four bags to the acre, yield about 24,000 bags extra. Besides, it would be the means of settling a number of farmers on the land. That amount would be a considerable item.

Mr. Charles Uphill, farmer, Pine Hills, near Finley, sworn, and examined:—

Mr. C. Uphill. 23 July, 1896.

To the Chairman: I reside at Pine Hills, about 18 miles west by north from Finley. The area of my holding is 4,600 acres. It was acquired by conditional purchase in the first place—not solely by myself, I have bought out some holders. I have been in this district nearly twenty-one years. I have nearly 900 acres under cultivation, and the balance, about 3,700 acres, is used for grazing purposes. I run from 5,000 to 5,500 sheep. My average yield of wheat is about four bags per acre. Of course, I get various quantities. Owing to the seasons and a diversity of circumstances, you perhaps cannot get it all in at the same time, and some of it is late, and sometimes when you are sowing there are changes in the weather which help to make the wheat start in a less robust condition. Various things will account for the difference. About 36,000 bags of wheat would come off the 900 acres in a good season. The prospects at present are good enough for it. I have sent my wheat to Jerilderie ever since the railway was opened to that town. Of course, I grew wheat long before that. I send my wool to Melbourne. The rate for the carriage of wool is somewhat of a bar to my sending it to Sydney. But I never seem to have come in touch with Sydney as regards the wool market. Having once started in Melbourne I have never had special inducements to go to Sydney, and I have never tested the Sydney market at all with wool.

Mr. C. Uphill. 23 July, 1896.

If the proposed railway from Berrigan to Finley were constructed, and the rate of carriage could be shown to be cheaper for the conveyance of wool to the Sydney market than to the Melbourne market, I should be disposed to try the Sydney market. I expect to have about 100 bales of wool this year. I shore that quantity last year. If it could be shown to me that I could send my wheat more cheaply by the proposed railway than by means of road carriage to Jerilderie I should patronise this line. My farm is 30 miles from Jerilderie. During the last few years the conveyance of my wheat to Jerilderie has cost me about 1s. a bag, or about 9s. a ton on the average, but in some previous seasons it has cost me 50 per cent. more than that. I heard the evidence given by the several witnesses here to-day, and in the main I agree with what has been stated by the settlers as to the capabilities of the district, and the increased demand for land, and the future that there is before the district; and also, the boon which the proposed railway would prove to the district, if it were constructed, and the extent to which it would be availed of by the settlers. I think that there is a fair prospect of the railway paying in the near future.

To Mr. Black: Since I gave evidence before the Sectional Committee in January, 1895, I have about doubled my area under cultivation. I think you may fairly say that during the last eighteen months the areas under cultivation in this district have been, as a rule, about doubled; in some cases there has been even a greater increase. It costs me from 9s. to 13s. 6d. a ton to send my wheat to Jerilderie, therefore if I could get my wheat to Jerilderie by railway, from Finley, for about 3s. 6d. or 4s a ton, with the cost of carriage to Finley added, I think I should save a little money. I have not calculated; but it appears to be so on the face of it; I might possibly save from 1d. to 1½ a bushel. I think that a railway to Finley would serve a great many more people than we anticipate. We hardly know what the future developments may be; but in the meantime, the construction of the proposed line would bring railway communication nearly 20 miles nearer to Deniliquin, where there is a considerable population. The Finley railway would tap the country all the way from Finley to Deniliquin, as regards passenger traffic. The Deniliquin people would come to Finley in order to take the train, whilst people living 10 miles this side of Deniliquin would also send their produce to Finley. Thirty miles of the area between Finley and Deniliquin would be tapped for traffic by a railway from Finley to Berrigan.

To Mr. O'Connor: I send my wool to Melbourne because no effort has ever been made on the part of people in Sydney to become acquainted with me, and induce me to send it to Sydney, and having once established a business connection with Melbourne I have continued it ever since. I was not aware that in the city of Sydney there are at the present time buyers from Germany, France, and America, purchasing wool to any extent every day for cash.

To Mr. Black: I think that people as far as Deniliquin would prefer to come this way, rather than to take coach to the railway at Hay.

Mr. George Robinson Jeffries, store manager, Tocumwal, sworn, and examined:—

Mr. G. R. Jeffries. 23 July, 1896.

To the Chairman: I reside at Tocumwal and am engaged as manager in connection with storekeeping, farming, and squatting. I have been at Tocumwal about twenty-five years, and have had an opportunity of seeing the district progress. I have noticed most decidedly an increase of settlement in this district during the last five years. I obtain my supplies chiefly from Melbourne, but some from Sydney. I have acted as produce agent for different people during the last four years. On two occasions the produce went round to Sydney, *via* Melbourne. I was then purchasing for Gillespie and Company. On the other two occasions—in the past season and the season previous to that—I acted as agent for Stratton and Company, of Moama. They bought the wheat and stored it in a store which we have on the bank of the river, and took it away when the river rose. We hold a station and a farm of a somewhat large extent, but the area which we had under crop this year was about 1,200 acres, a portion of it put in by ourselves and a portion on the share system. I think we have about 26,000 acres of conditional purchase and freehold, and probably about 30,000 acres altogether, out of which there are about 1,200 acres under cultivation. We shall shear about 40,000 sheep this year. Our clip of wool has always gone to Melbourne. We have never tried the Sydney market. Hitherto the carriage of wool from Tocumwal to the nearest railway station of the New South Wales railway system has always been a bar to our sending our wool to the Sydney market. As to whether I think it is possible or probable that, if the proposed line from Berrigan to Finley were constructed, it would be availed of by myself and others for the purpose of sending wool to the Sydney market instead of the Melbourne market, I may say that the matter would resolve itself entirely into a question of cost. I do not think there is any sympathy attached to it, either one way or the other. It is purely a question of saving 1d. one way or the other. It is quite possible that if the proposed railway were constructed I might test the Sydney wool market. I am certain that we could get the carriage of wool from our shed to Finley done as cheaply as to the nearest railway station in Victoria, and after that it would be just a matter of railway rates. Our clip of wool would probably be about 500 bales. We had over 500 last year. For the conveyance of wool from our shed to Yarroweyah railway station last year I paid 8s. a ton, and I expect to have to pay the same this year, and I think that the charge is 6s. 4d. a bale from Yarroweyah to Spencer-street railway station, Melbourne. About five and a half bales of greasy wool go to the ton, and of course more of scoured wool. We do not dump our wool at all; we just press it. The greasy wool goes about 3½ cwt., or something like that. I think that we could get our wool conveyed from our shed to Finley for about the same price as we pay for its conveyance to Yarroweyah, because the road to Finley is better. During the wool season, when you want to use the road to Yarroweyah, it is not by any means a good road. I know most of the settlers about Tocumwal. The year before last I bought about 6,000 bags of wheat from them for Stratton & Company, but this year I did not get more than 3,000, including our own. I think that the greater part of the wheat grown in and around Tocumwal last year went to Jerilderie. A little went across the river. Some of the people tried sending their wheat round to Sydney, *via* Melbourne, but I am sure they lost money by it. I have no doubt that if the proposed railway from Berrigan to Finley were constructed it would be patronised by the settlers around Tocumwal.

To Mr. Black: In saying that nearly all the wheat grown in and around Tocumwal last year went to Jerilderie, I intended also to convey to the Committee my opinion that, if the proposed railway had been constructed to Finley, possibly all of it might have come this way. There is a fair amount of settlement south-west of Tocumwal, and I have no doubt that the traffic from that district would come to Finley, because I think the people living in that district are nearer to Finley than they are to any Victorian railway station, for in order to get into Victoria they have to travel right up the river, and there is no cutting

off any points. On the south-east of Tocumwal you come on to the Barooga Estate, and I would not like to express an opinion as to what the Barooga people would do under the circumstances. Mr. G. R. Jeffries. 23 July, 1896.

To Mr. O'Connor: M'Farlane Brothers, are the owners of Barooga.

To Mr. Black: Barooga would be almost as near to Berrigan as to Finley. As to whether—the roads being equally good—the wheat from Barooga would or would not probably go to Berrigan, I am not aware what the Barooga people would do. I have little or no connection with Barooga or people living up that way, and I cannot say what their ideas are. I think that the duty on wheat going into Victoria is 1s. 10d. a bushel. Of course we never pay duty on wheat going into Victoria, because what we send is merely for transit over the Victorian railway lines to Melbourne, and shipment thence round to Sydney. Certainly no wheat that goes from New South Wales into Victoria is consumed in Victoria. I suppose they grow enough wheat of their own for their own consumption. They do not want New South Wales wheat, and they will not buy it. I believe that all the wheat from New South Wales which is carried over the Victorian railways goes into consumption in some colony other than Victoria. I do not think that a grain of wheat that crosses the border from New South Wales goes into consumption in Victoria. The price of Victorian wheat now, at Yarroweyah, is about 4s. 6d. This being so, would it pay the Victorians to buy New South Wales wheat and have to pay a duty of 1s. 10d. a bushel on it. Wheat in the Melbourne market is worth from 4s. 10½d. to 5s. a bushel now. I have not sold wheat in the Sydney market, but I think a good many of us would be glad to sell in Sydney at 4s. 6d. just now.

Mr. John Howe, farmer, near Finley, sworn, and examined:—

To the Chairman: I reside 16 miles west from Finley, on the Deniliquin road, and am a farmer.

To Mr. O'Connor: I have lived about 18 years in the district. The total area of my land is 1,820 acres, of which 280 acres are under cultivation. The other land I use for grazing purposes. I run about 1,600 sheep. I send my wool to Melbourne, and my wheat to Jerilderie. I send my wool to Melbourne because that is the nearest market for it. The construction of the proposed railway from Berrigan to Finley would induce me to send my wool to Sydney if the total cost of carriage to Sydney were not greater than to Melbourne. If the proposed railway were constructed, it would be more advantageous for me to send my wheat to Finley instead of to Jerilderie, and I think I should do so. There are two or three settlers near me. I think that they would be similarly disposed with myself to send their wheat to Finley. They now send it principally to Jerilderie. One sends his to Melbourne, I think. I know the travelling stock route between Tocumwal and Jerilderie. I do not think there is any necessity for that immense reserve for the purposes of a stock route. I believe that if a large proportion of it were thrown open for settlement, it would be taken up. My average yield of wheat is four bags to the acre. I know this district very well. It is a very good district for either wheat-growing or grazing. I think you could not better it. When I came to live here eighteen years ago, there were far more people here than there are at the present time—I mean, all round where I am settled, but not with regard to Finley. I refer to men who selected under the Act of 1876. They have sold out to the squatters. I cannot say whether it was to their advantage to sell out. I have not sold an acre of my land. I held it because I thought it was more advantageous for me to retain it than to sell it. Mr. J. Howe. 23 July, 1896.

To Mr. Black: I have selected 640 acres within the last six years, and in January, 1895, I had 1,280 acres—640 on Tuppal and 640 on Woperana—but now I have 1,820 acres. My daughter had a selection and she has transferred it to me.

To Mr. O'Connor: Within the last few years I have noticed an addition to the population around Finley, and a great increase in settlement. Whether if facilities of transit were afforded to induce people to come and settle here the population would increase depends on whether the owners of the land would let it out. If the land were for sale I have no doubt that more people would come and settle here, and some thousands of acres would be taken up. I believe that people are coming here every day looking for land. If we had a large population here, I think that instead of a railway from Berrigan to Finley being a burden on the State, it would pay well in course of time.

To the Chairman: My wheat yield is about 1,200 bags.

Reginald Ernest Glennie, Esq., Manager, Commercial Banking Company of Sydney (Limited), Tocumwal, sworn, and examined:—

To the Chairman: I am the manager of the Tocumwal Branch of the Commercial Banking Company of Sydney (Limited); I have held that position for four years. I was previously, for about two years, manager of the Commercial Bank at Berrigan. During my residence in the district I have had an excellent opportunity of coming in contact with many of the farmers and settlers. I have also had means of acquiring a knowledge of the development of the resources of the district and the settlement that has taken place during that period. I think there is no question that the settlers who have lately been the means of developing the resources of the district and increasing the settlement in it are a practical, thrifty lot of men. They are all very well-to-do, and, at the present moment, I should say they are all in a thoroughly sound financial position. The conditions under which they have taken up their holdings have certainly not been at all embarrassing to them. The settlement in and around Tocumwal is increasing day by day, and the demand for land is very great at the present time. There is no doubt that if lands were thrown open and made available for settlement they would be eagerly sought after. The experience of the last few months speaks for itself. The Government have thrown open certain lands lately, and there have been hundreds of applicants for every block. If the squatters or the Government were to throw open lands and make them available for settlement, I have not the slightest doubt that they would be very quickly taken up, even under conditions similar to those under which the present holdings are held. I know the travelling stock route from Tocumwal to Jerilderie. I think that that reserve is rather more extensive than is now necessary for the purposes of a travelling stock route, and that half of its area would be sufficient for those purposes. If the proposed railway from Berrigan to Finley were constructed, I think that the necessity for the travelling stock reserve, as such, would become less. If one half of that reserve were thrown open to intending settlers, there would be no difficulty about its being taken up. I am sure that every acre of it would be taken up even if it were ten times as large. My experience goes to show that as a wheat-producing district this district has few equals, in fact, I doubt if it has an equal as a wheat-producing district. I think that the soil is capable of producing any cereal—in R. E. Glennie, Esq. 23 July, 1896.

R. E. Glennie, Esq. 23 July, 1896.

in fact, it has been proved that it will. Up to the present time the majority of the Finley farmers have been in the habit of sending their produce to Sydney, *via* Jerilderie, which is the nearest railway station. The farmers close to Tocumwal, I think, with few exceptions, send their produce *via* Melbourne, and then round by water to Sydney. I think, that perhaps more wheat went to Sydney this year than during the previous year, but that was really owing to local circumstances, as the Tocumwal market this year was controlled, perhaps, by a firm who were not prepared to give such high prices as they were prepared to give the previous year. If they had been prepared to offer a fair price they would have got a much greater quantity of wheat than they did. Supposing that the proposed railway from Berrigan to Finley were constructed, I think that every bushel of wheat produced in the district between Finley and Tocumwal would travel over this line. With the increased facilities provided by railway communication being established between Finley and Berrigan, I have not the slightest doubt that the farmers in the Tocumwal district would avail themselves of this line, as it would give them a cheaper means of transit. I feel sure that the construction of this railway would lead to greater settlement in this district, and to a larger area being placed under cultivation. Most of my constituents holding land in the district have intimated to me that if the proposed line were constructed they would throw open large areas of land on reasonable terms. I feel sure that the effort of the Government to provide facilities for the carriage of produce to market will be appreciated by the settlers, and they will put forth every legitimate effort in order to make the line a paying concern. This year the increase of the area under crop in the Tocumwal district has been very extensive—for instance, Mr. Sugden, who unfortunately is unable to attend here to-day or he would have done so, had 800 acres under cultivation last year, and he has 4,000 acres this year. In the ordinary course of events that wheat would all cross the river at Tocumwal or Cobram.

To Mr. O'Connor: In the event of the construction of the proposed railway, I feel sure that every bushel of Mr. Sugden's wheat will be sent over it.

To the Chairman: Taking the average yield at 4 bags to the acre, there would be about 16,000 bags that would be conveyed by this railway for that gentleman alone. You have already examined Mr. Jeffries, who represents the executors of the late Edward Hillston. His cultivation this year has increased from 400 to 1,200 acres, and there has been a proportionate increase of cultivation throughout the district.

To Mr. O'Connor: I have no doubt that Mr. Jeffries would also send his produce by this railway.

To the Chairman: I should say that this year, within a radius of 6 miles of Tocumwal—that is, in the half circle—there are at present about 7,000 acres under cultivation, whilst last year there were only about 3,000 acres under cultivation.

Mr. Matthew George Hamilton, farmer and grazier, near Finley, sworn, and examined:—

Mr. M. G. Hamilton. 23 July, 1896.

To the Chairman: I am a farmer and grazier. I have resided in this district about sixteen years. I was previously at Deniliquin. I have 1,460 acres in this district.

To Mr. O'Connor: My holding is about 2 miles distant from Finley, north-west. During the last four or five years I have noticed a great improvement in this district. There were many settlers here when I first came, but they mostly sold out, and the land went back to the stations. During the last four or five years settlement has increased very much in this district. I have 460 acres under cultivation. My wheat yield is from 12 to 20 bushels per acre. I know this country very well. I have travelled along the travelling stock route from Tocumwal to Jerilderie several times. I do not think that all that area is required for a travelling stock route now. I think that half of it would be ample for that purpose, and that if the other half were thrown open for selection there would be applicants for it. I should be very glad to take advantage of the facilities of railway communication to send all my produce to Sydney. I am sufficiently familiar with the people of this district who are now compelled to send their produce by team to Jerilderie and Berrigan, to be able to say that they would be only too glad to abandon that primitive method of transit and send their produce by the railway. I was in the room this morning, during the time when most of the witnesses were giving evidence, and in the main I agree with the evidence given by them.

To the Chairman: 1,460 acres is the total extent of the holding farmed by my brother and myself. We selected most of that land when we first came into the district. At that time there was no cultivation in the district. We could not then make it pay, because we had no railway facilities. We took up the land for grazing purposes. We were previously farmers in Victoria. We have had what is termed the usual yield of wheat from our crop, and taking the average at four bags to the acre we should send about 2,000 bags of wheat to the market. Ever since we have been growing wheat here we have sent it all to Jerilderie. If the proposed railway be constructed, I am prepared to send our wheat *via* Finley. We have about 600 sheep and about eighty or ninety horses and cattle, and if I desired to do any business with the Sydney market I should be prepared to send my live stock by rail.

Mr. Arthur Westlake Sleeman, farmer, near Finley, sworn, and examined:—

Mr. A. W. Sleeman. 23 July, 1896.

To the Chairman: I reside on the Tuppal holding, and am a farmer. I hold about 670 acres, of which 300 acres are under cultivation. I have some conditional purchase land, and the other is rented. I am satisfied to make that my permanent place of abode under the conditions upon which I am at present carrying on agricultural pursuits. I send my wheat to Jerilderie, and I send stock to Sydney. During the last twelve months I have sent four trucks of sheep to the Sydney market, and also some to Melbourne. If the proposed railway from Berrigan to Finley were constructed, I would certainly patronise it by sending my wheat by it, but I think I should send my stock to the Jerilderie railway station, and thus save the freight on stock between here and Jerilderie. It would not pay me to bring stock to Finley and truck it to Sydney, because I am only about 30 miles from Jerilderie. I think that the farmers in the immediate vicinity of my holding are of the same opinion as I am. I believe that they would make an honest attempt to justify the construction of the proposed railway. I have heard some of the evidence given before the Sectional Committee to-day by other witnesses, and I think that in the main what has been stated is correct. There is not the slightest doubt that this railway would be a great boon to the Finley district, and would give a great incentive to the farmers to push on and put a greater quantity of land under cultivation. The area, I believe, would be increased every year. During the last three or four years I have noticed a great increase of cultivation in this district. I have been here twelve or thirteen years.

When

When I first came here I think that within a short radius of the Finley township there were only about 40 acres of land under wheat cultivation. I know the travelling stock route. I do not think it is necessary to retain the whole of that reserve for the use of travelling stock. If half of it were taken away I think that would be about a fair thing. I believe that intending settlers would readily seek after the remaining half, and if it were thrown open at a reasonable rental there would not be one acre left. If increased railway facilities were afforded to the district I have no doubt that in the first year after that reserve was thrown open more than half of the land made available for settlement would be under the plough. An area of 320 acres is sufficient for a man to make a start on; but as years go on it is not sufficient for him and a family. He then wants at least 640 acres. He would work 320 acres out in a short time, and if that was all the land he had he would have nothing to fall back upon. A man wants a sufficient quantity of land to enable him to give the area originally worked by him a rest for a time. Of course, a man who has not much money may work 320 acres better than 640 acres; but a man with a fair amount of means is better with 640 acres. There are no Crown lands near me, but there are some 7 or 8 miles away from me. If those Crown lands were thrown open for selection I think that every acre would be taken up, if this proposed railway were constructed.

Mr. A. W. Sleeman. 23 July, 1896.

Mr. William Tindale, publican, Finley, sworn, and examined:—

To the Chairman: I am a publican. I have been in this district about two years. The construction of the proposed railway from Berrigan to Finley would benefit me. I believe that the surveyed line passes through some of my land adjoining this township. I have 200 acres, and I think that the railway would traverse my land for nearly a mile, and would take off the whole of my frontage to the Berrigan Road. I should have a frontage to the railway, but there would be no thoroughfare to it except on my own property; whereas, if the railway were on the opposite side of the road, it would not interfere with any private land at all. A strip a mile long is a very long stretch of country to take from me, out of 200 acres. I suggest that certain Government land on the outside of my paddock should be given to me in exchange for the portion of land taken for the railway. If there were a road between my property and the railway it would be all right. If I were to get Government land of the same value in exchange for the land taken from me I should be satisfied. The land I speak of is my own property. I have not quite 100 acres under crop.

To Mr. O'Connor: This is the first year that I have cultivated any of my land.

Mr. W. Tindale. 23 July, 1896.

Mr. William Blair, farmer, Finley, sworn, and examined:—

To Mr. Black: I reside barely 2 miles east of Finley, in the direction of Berrigan. The surveyed line for the proposed railway passes through my land. I have sufficient knowledge of the proposed route to suggest one alteration, if not more, which I think it would be desirable to make. I have also a sufficient knowledge of the intentions of the landowners, portions of whose property will be resumed for railway making purposes, to give evidence as to whether they are or are not likely to give their land free. By continuing the railway line now being made from Jerilderie to Berrigan on past the township of Berrigan, and passing it on the right instead of turning off short and passing it on the left, I do not think it would be possible to effect a deviation that might save some portion of land resumption. The increased mileage would so add to the cost of the line as to make such deviation unadvisable. As to whether there could be any deviation in the proposed route in the neighbourhood of Berrigan, that would save severance, I may say that instead of leaving the main road at the corner of Robertson's section—No. 68—I would go on in a straight line until reaching the border of Phipps' property when I would make a deviation from the straight line through Phipps' paddock to the fenced road. By that means there would be a saving of one severance and the crossing of one road. The surveyed allotments through which the proposed line, according to the plan, runs in Finley were originally intended for township allotments, but instead of being sold by the Government they were reserved for railway purposes. They form a town reserve, which is Government land. The proposed line runs along the northern or right side of the road coming from Berrigan to Finley. It goes through one of Mr. Harris' paddocks, and he demands compensation for severance. Mr. Batten, the next holder, also demands compensation. Mr. Phipps, the next holder, also demands compensation. Mr. M'Lellan also demands compensation. We then come to the portions of Messrs. Reynoldson and Russell. I have not had any replies from those gentlemen yet as to whether they would want compensation. I believe that Mr. Quade would give his land. Mr. Simmons is not disposed to give his land. Leaving Mr. Simmons' property, we come on to the holding of Mr. Faulkner, Tuppal, which is chiefly rented from him for cultivation purposes. Mr. Faulkner has expressed his willingness to permit of the resumption of portion of his land for railway construction purposes free of cost, provided his tenants are agreeable. He wrote me some eighteen months ago, just before the Railway Commissioners were here, to that effect. That letter was embodied in the report of the Sectional Committee which took evidence in January, 1895, with reference to the Jerilderie-Berrigan railway. As regards the willingness of Mr. Faulkner's tenants, I may say that Mr. John Blair is willing to give his land. I believe that Mr. Giles is also willing. Mr. Breadon is willing. I am willing. The evidence of Mr. Tindale, the last witness, goes to prove that if the Government will give him land of corresponding value he will willingly permit of the resumption of some of his land. I think it would be possible by a slight deviation of the line before entering the Finley township residential area to save half of the proposed resumption on Mr. Tindale's frontage. Mr. Faulkner's land goes further on the south side of the road than on the north. I have a knowledge as to the feelings of the holders on the southern side of the road—that is on the left side coming from Berrigan. The railway of necessity would pass through Mr. Harris' property, and also that of Mr. Batten whichever side of the road it afterwards took, and also the property of Mr. Phipps. Mr. David Gillespie would not be willing to give his land. I do not yet know the intentions of Messrs. Reynoldson and Russell. On the southern side of the roadway there is a Government reserve, which might be utilised for exchange with Messrs. Reynoldson and Russell, to recoup them for their land resumed for railway purposes. The next holding is that of Mr. Cooper, and he is willing to give his land. I have a letter from Mr. Kilpatrick authorising me to say that he will give his land. The next holding is that of Mr. Burns. Mr. Burns in giving evidence before this Committee has declared his willingness

Mr. W. Blair. 23 July, 1896.

Mr. W. Blair. 23 July, 1896.

willingness to give his land, provided that he be recouped by the Government allotting to him a portion of Crown land equal in value to that resumed by the Government. We then come on to the Tuppal holding, and in this case Mr. Faulkner's conditions are similar to those mentioned in his statement with regard to the other route, on the other side of the roadway. Mr. Giles, one of Mr. Faulkner's tenants on this side, would be willing to give his land. Mr. Kirkland, in his evidence before this Committee, has stated without reservation that he is willing to give his land. I understand that Mr. Dent is willing to give his land, and so is Mr. Beveridge. If the railway were brought along on the southern side of the road, instead of the northern, it would not touch the property of Mr. Tindale at all. There would also be an advantage in constructing the line on the southern side of the road, from the fact that the Wait-a-While Water Reserve would be available for the compensation of Messrs. Reynoldson and Russell, whereas, on the northern side of the road, it would not be available for the compensation of Mr. M'Lellan, who holds the opposite frontage. I believe that the route on the southern side of the road would be the cheapest to the Government. There would be less resumption to be paid for and more land given. There are no circumstances in the contour of the country or natural obstacles that render the southern line inferior to the northern. Including a mile at the Finley end, from 6½ to 7 miles of the line on the northern side of the road would be subject to compensation for resumption—that is, independent of Reynoldson and Russell, who have not yet signified their intentions, and who, I therefore suppose, may desire to be compensated. About 4 miles of the line on the southern side of the road would be, to the best of my knowledge, subject to compensation—that is, independent of Reynoldson and Russell. The land abutting on that roadway is worth £4 to £5 per acre, and it would be fair to suppose that those who demand compensation would require about the market value for a strip of land, 1 chain wide, running along their frontages—they might require a little more. The cost of a piece of land a chain wide on the farms, outside town allotments, will not exceed £40 per mile; therefore, after all, the use of the southern route, instead of the northern, would only result in a saving of possibly £100 or £120. There is only one reserve situated along that road. I think that the area of the Wait-a-While Reserve is between 400 and 500 acres. In my opinion, if a siding for the railway is placed there, the greater part of that reserve will be necessary as a reserve. Some of it will be required for people who come there with teams. It is all good land, suitable for agricultural purposes. I know water reserve No. 1,044, now leased to Mr. Burns. He does not use it for cultivation purposes. I do not know whether he is not permitted to do so. I do not think that that reserve is necessary as a water reserve. In my opinion it should be added to the cultivation area available in the district. I assisted Mr. Faulkner to make out a return in 1895 relating to holdings adjacent to Finley, to the west, north, and east of the travelling stock reserve. The figures furnished then are applicable now, except that there has been a great extension of the areas of some of the holdings, and in every case of the acreage under crop. I believe it is a fact that during the eighteen months that have elapsed since that evidence was taken in 1895 some of the farmers in the district have doubled their area under cultivation; some have increased it threefold, some fourfold, and some fivefold. I have heard all the evidence that has been given before this Sectional Committee, and in the main I agree with it. As regards the statement that Mr. Kirkland made with reference to the area that is likely to yield revenue to this railway, I would point out that he did not include that portion of the district about which Mr. Glennie gave evidence—namely, 700 or 800 acres in and around Tocumwal. The produce of that land, in my opinion, would also be sent to this railway. I thought the evidence of Mr. Kirkland ought to be supplemented in that direction. I should also like to point out that very little evidence has been given about any crop except wheat. It has been stated by some of the witnesses that oats could be grown here, but I am sure that hay also could be very profitably sent to the Sydney market if the proposed railway were constructed. Hay being a bulky crop we have been prohibited from sending it to the Sydney market up to the present time owing to want of railway communication. At £4 for chaff in Sydney, it would pay us to grow hay in Finley and sell it in that market. I have been in the Goulburn Valley, Victoria, several times, and I know the capabilities of that district for growing grapes. I have tasted the wines made there. I am of opinion that this district is as much adapted for grape cultivation as the Goulburn Valley is. I would hardly like to say that this district is superior in that respect. I am not an expert in the cultivation of vines. With proper railway communication vignerons in this district would have quite as many advantages, if not better facilities, than people living on the other side of the river. There are some reserves on Tuppal station. When the Tuppal holding was sold, I believe there were from 20,000 to 30,000 acres of Government land on that holding, and very little of that has been alienated since. That land was set apart for water reserves, and timber reserves, and travelling stock camps, &c. It is now held under grazing lease. I think that the Government would act very wisely if they were to arrange to give Mr. Faulkner another area in substitution for those reserves and throw them open for settlement at as early a date as possible.

To the Chairman.] If the proposed line were constructed, and if those reserves on Tuppal holding were thrown open for settlement, I believe that the settlers over the whole of that holding would patronise this railway. I think that the Government well in the township of Finley contains an ample supply of water for railway purposes. I believe that in order to obtain a water supply the people hereabouts sink to a depth of about 140 feet. So far the Government well has proved to be of a permanent character.

Mr. George Dent, farmer, Finley, sworn, and examined:—

Mr. G. Dent. 23 July, 1896.

To the Chairman: I am a farmer residing about 2 miles from Finley, towards Berrigan. I hold 848 acres, of which 700 acres are under cultivation. My average wheat yield has been about four bags per acre. I grow about 2,500 bags of wheat. I should certainly patronise the railway if it were extended to Finley, because it would give me the cheapest means of transit. The proposed line would go through my land and I am prepared to give whatever land is required for the purposes of railway construction. I consider that I should be amply compensated by the extra facilities that would be afforded me by the extension of the railway from Finley; I reckon that I should get back the value of the land in one year. I most decidedly am of opinion that there would be a *bonâ-fide* attempt made on the part of the settlers in the district to make the line a paying one and justify the anticipations of the gentlemen who have given evidence before the Sectional Committee to-day.

Mr. George Reynoldson, farmer, near Finley, sworn, and examined :—

Mr. G. Reynoldson. 23 July, 1896.

To the Chairman : I am an auctioneer and a farmer residing at my farm half-way between Berrigan and Finley. I have occupied the farm about 8 years. My partner and I have altogether about 2,200 acres, of which about 1,800 acres are under crop. We acquired the land by purchase. The average wheat yield during the time I have been there has been fully four bags to the acre. We have sent our wheat to Sydney *via* Jerilderie—by team from here to Jerilderie. If the proposed railway be constructed we shall make use of it, in sending our wheat to the Sydney market. The balance of our land we use for grazing purposes. The proposed railway will go through our property, but I do not know the exact distance. I know how much the flying survey went through it, but I believe that the line at present proposed does not go through it in the same way.

To Mr. Black : I have land on both sides of the road.

To the Chairman : On whatever side of the road the line were constructed it would go through my land. In reply to your question as to whether I am prepared to hand over to the Government free of cost any of my land required for railway construction purposes, I may say that the land cost me £4 5s. an acre, and giving the land for nothing would, perhaps, come a little hard on me personally, seeing that I am only a reasonable distance from the present terminus at Berrigan. However, there is a little reserve, and I think that we could come to an arrangement with the Government. There is a reserved road passing through our land, and I think we could make an exchange with the Government. There will be no difficulty as regards the present proposal ; but I would not say the same in regard to the flying survey from the Rock, because it cuts up a block of land. We are prepared to give the land in connection with the present proposal, provided that the Government make a road which will suit us and also the public. We would give land on either side of the road so long as the line comes along the present road. There has been a great increase in the output of wheat in this district during the last four or five years. When I first came here I could not get any horse feed, and almost all the wheat that has ever been grown in this district has been cultivated since I came here. I believe that the mill at Jerilderie was started on the understanding that the farmers in this district would cultivate a certain area. During the last twelve or eighteen months increased areas have been put under cultivation, and I am sure that still greater areas will be put under cultivation if the proposed railway be constructed. I believe that every acre will be highly cultivated. I do not consider it is necessary that the travelling stock route from Tocumwal to Jerilderie should be retained to the full extent of its present area. I think that if it were made available for settlement it would be eagerly sought after. I cannot understand how it is of any good to any people at the present time except the pastoralists. If I were travelling sheep through it to-morrow there would be no feed for them, and I should want to get through it as quickly as possible.

To Mr. Black : I have a high opinion of the capabilities of the soil here, and I think it is suitable for the growing of vines. I have 8 acres of vines at my place, and I have proved that the soil is capable in that respect. I have both an orchard and a vineyard. Professor Braggato examined the soil before I planted my vines, and he said that it would grow grapes suitable for wine making. I planted the vines on his recommendation, as being suitable for wine-making, and up to the present time they have produced an exceptionally good grape, but I have not yet tested their wine-making capabilities. When I planted the vines, I did not expect to get much return from them, because I had not then sufficient capital to go into viticulture properly. Professor Braggato is an expert—he is professor at the Viticultural College that has been established at Rutherglen, Victoria. He was brought out from the old country by the Victorian Government. He came here and examined my place as an act of friendship towards me.

To Mr. O'Connor : I have not been disappointed with my vines.

To the Chairman : In my orchard I have grown brown plums, apricots, peaches, and apples. They have done well. My oranges and lemons have not done well, but I think that that is owing to neglect on my part. I have put in a couple of acres of oranges and lemons, but they had been frost-bitten on the station I obtained them from, and they were not successful in their growth. The dairying industry could be carried on with success here if we had the facilities of railway communication. I am carrying on the dairying industry in Victoria, just across the river, most successfully. There is only one thing I should like to add to my evidence. You, yourselves, have seen the district and the capabilities of the soil. We are asking you to recommend to the Government the construction of a line of railway at a low cost, and we say that the soil here will grow anything, and that all we want is encouragement to put it under cultivation. We will guarantee to give you as much cheap produce in Sydney as you may require if you will only give us the railway. We have the land, and with a railway we will feed you cheaply enough, and you will not have to go to California for wheat.

Sydney : Charles Potter, Government Printer.—1896.

RAILWAY FROM GRAFTON TO GLEN INNES.

No. 8.

Telegram from T. Bawden and J. Dillon, Esqs., M's.P., to The Secretary for Public Works.

Grafton.

Residents Glen Innes and Inverell very desirous that exploration for railway purposes in continuation of present exploration by Surveyor Francis—Grafton to Glen Innes—should be extended to Inverell and Warialda previous to inspection of any other route between Clarence and table-land. Please instruct Surveyor Francis to do this. Reply early so that arrangements may be made for guides to accompany him over country proposed to be explored. Very urgent.

Mr. Whitton.—J.R., B.C., 6/7/78.

Mr. Francis has received instructions, and made arrangements for examining the country in various directions between the Clarence district and the table-land of New England, and it would not, therefore, be desirable to explore the route suggested in the telegram until this work has been completed.—J.W. (*per.* W.H.Q.), 11/7/78. Under Secretary.

Inform.—J.S., 12/7/78. The Engineer-in-Chief for Railways.—J.R., B.C., 15/7/78. Mr. Francis to be instructed to explore for a line from Glen Innes to Inverell and Warialda, and to arrange with Mr. Bawden, M.P., of Grafton, for guides.—J.W. (*per* W.H.Q.), 28/8/78. Telegram sent to Mr. Francis, 28/8/78. Mr. Palmer. Instructions forwarded to Mr. Francis.—H.P., 29/8/78.

Sir, Department of Public Works, Sydney, 15 July, 1878.

In reply to your telegram of the 2nd instant, that instructions be given to the Railway Trial Surveyors to extend their explorations to the country in the vicinity of Inverell and Warialda, previous to the inspection of any other route between the Clarence and the table-land of New England, I am directed to inform you that Mr. Surveyor Francis has already received instructions, and made arrangements for examining the country in various directions between the Clarence and the table-land, and it would not, therefore, be desirable to explore the route suggested until this work has been completed.

I have, &c.,

Thomas Bawden, Esq., M.P. JOHN RAE.

No. 10.

A. Francis, Esq., to The Engineer-in-Chief for Railways.

Sir, Glen Innes, 17 July, 1878.

I have the honor to report that on my arrival at Grafton I placed myself in communication with Mr. Thomas Page, the Secretary for the Clarence and New England Railway League, who immediately set about making the necessary preparations for exploring a route between Grafton and Glen Innes. The route proposed by the guides furnished by the League commences at South Grafton, and accepts the original survey as far as B.M. 2 on the Newton Boyd Road, near the Waterview fence; then into Deep Creek, and follows the course of the creek to the Orara River; then up the Orara to its junction with Chambigne Creek; the route then follows the valley of the Chambigne Creek to its junction with a creek known as Stinking Creek, and having ascended Stinking Creek as far as it would afford a practicable gradient, it was proposed to tunnel through the Buccarumbi Mountain into a creek leading into the Nymboi River. Having reached the Nymboi River, it was proposed to cross it near its junction with the Little River; then follow up the valley of the Little River to Broadmeadows; then on to Newton Boyd, following generally the course of the Newton Boyd Road. From Newton Boyd to Glen Innes several different routes were proposed for examination. One was to connect the survey of the Little River with the original survey up the Mann River; then follow up the Mann River to its junction with Leather Jacket or Yellow Jacket Creek; then up the creek for about 5 miles, until the third crossing of the Newton Boyd Road was reached; then round by the Mann River and connect with the original survey somewhere about Surveyors' Creek, or cross the Yarrow and Mitchell Rivers from the neighbourhood of Surveyors' Creek, when it was supposed that an easy line could be obtained to the table-land of New England. Another project was to follow up the Henry River from Newton Boyd to its junction with Saddle Creek; then follow up Saddle Creek, which it was supposed would afford a line to the table-land.

From South Grafton the country by the Deep Creek presents no difficulties, and the route passed generally through good agricultural land. The first work of any importance on this route would be a bridge over the Orara River. Following the valley of the Chambigne Creek to its junction with Stinking Creek, we found the country favourable, the rise in the bed of the creek above its junction with the Orara—that is to say in 10 miles—being about 200 feet. The valley is open up to this point, and the banks of the creek have a gentle slope. The valley abounds in good timber, chiefly ironbark and spotted gum. On ascending Stinking Creek we found the bed of the creek rising at the rate of 110 feet per mile for the first two miles from its junction with the Chambigne Creek. Proceeding a mile further up the creek, we found its bed rising at the rate of 300 feet per mile and its rate of inclination still increasing; in fact, it was heading into the Buccarumbi Mountain.

From this point it was proposed to tunnel through the mountain. Having abandoned this project as impracticable, we proceeded to follow up the valley of the Chambigne Creek to its head in the range where it was proposed to tunnel through into Doboy Creek. From the junction of Stinking Creek up the

the Chambigne Creek the aneroid indicated a rise of 350 feet in a distance estimated at a little over 2 miles, when the country rose abruptly. The creek had here become narrow and crooked, and in about 40 or 50 chains more we had risen 525 feet to the saddle over Doboy Creek. This is the narrowest point known in the Buccarumbi Range, and a tunnel through it would probably be about a mile in length.

Following the course of the Doboy Creek to its junction with the Nymboi River, we found the country favourable. From the junction of Doboy Creek along the valley of the Nymboi River the country rises gently to Buccarumbi. The banks of the river on the east side (the side selected for the proposed route) are in many places rugged and precipitous, with a few bluffs, which it would be necessary to cut down to a gradient or tunnel through. There are about 5 or 6 miles of gently sloping bank. The creek crossings on this portion of the proposed route would be numerous and expensive.

The next important work on this route would be a bridge over the Nymboi River, near its junction with the Little River at Buccarumbi. After a careful examination of both banks of this river the balance of easy country (if any portion of this route can be said to be easy) appears to me to be on the same side as the Newton Boyd Road.

The distance along the Little River, from its junction with the Nymboi to Broadmeadows, is about 30 miles, and the whole of the country on this portion of the proposed route is of the most difficult description.

The banks of the river for many miles are very high and steep, and in many places perpendicular bluffs. The bends in the river are acute, and it would be necessary to tunnel through many of the spurs, and the creek crossings would be very numerous, and many of them very long and deep; in fact, nearly all the works on this 30 miles would consist of heavy cuttings, tunnels, and expensive bridges. I am of opinion that 30 miles of the section of the worst parts of the Mann and Yarrow Rivers would compare favourably with 30 miles of section along either bank of the Little River.

From Broadmeadows to Newton Boyd two tunnels would be necessary on this length, one commencing at about 60 chains from Carey's Accommodation House, at Broadmeadows, would be about half a mile in length; the other, about 3 miles from Carey's, would probably be a little shorter. After having passed these obstacles the country is easy to Newton Boyd. This route might then be connected with the original survey of the Mann River if required.

The next route explored commenced at B.M. 11, on the Mann River, near Newton Boyd. We had some difficulty in finding the original survey here, the surveyor who performed the work on this length having neglected to mark the line. We crossed the Mann River and followed its course up to its junction with Yellow Jacket Creek, then followed the creek to the third crossing of the Newton Boyd Road, about 5 miles up the creek. In this distance we had risen 740 feet in the bed of the creek. This was a point which the guides supposed could be easily made from the Mann River. The creek here became narrow and steep, and headed into the range. From this point a proposition was made to tunnel through a spur, then follow the course of the Mann River to Surveyors' Creek, and there connect with the original survey and accept the original survey up to Glen Innes; or from the neighbourhood of Surveyors' Creek cross the Yarrow and Mitchell Rivers above their junction with the Mann River, when it supposed that the difficulty of reaching the table-land of New England would be at an end. The objection to the first project was that it accepted the most objectionable portion of the original survey, the portion, in fact, which most needed amendment, and led into country which it was most desirable to avoid.

The second project, that of crossing the Yarrow and Mitchell Rivers from the altitude of the original survey, was simply nonsense, and if the Yarrow were crossed at a low level it would be impossible to rise out of it.

Up to this point the route explored is identical with a route proposed by Mr. Hook in a letter to the League at Glen Innes.

Mr. Hook thinks that a tunnel of about a mile in length, commencing in Leather Jacket Creek, and leading to a depression in the Kingsgate run, would dispose of the difficulty.

My impression is that Mr. Hook's proposed tunnel would lead to exceedingly difficult ground, from which it would be difficult to escape, except by connecting with the original survey somewhere on the Yarrow River.

With a view of discovering some less objectionable route, we returned to Newton Boyd, and explored the Henry River to its junction with Saddle Creek, about 5 miles up the Henry.

We found the Henry River practicable up to this point; but being deemed impracticable further up it was proposed to explore Saddle Creek, which it was supposed would afford a practicable line to the table-land.

Saddle Creek is a narrow, crooked gorge in the mountains, with sides so nearly perpendicular that neither horse nor man can possibly walk along them for any distance. The bed of the creek being also impracticable for several miles, we were constrained to examine this route from the top of a ridge forming the left bank of the creek facing towards the table-land on this ridge; we rose 1,650 feet in a distance estimated by the guides at about 2 miles.

Descending into the bed of the creek, at an estimated distance of 7 miles from its junction with the Henry, the aneroid indicated a rise of 1,530 feet above that point, about 218 feet to the mile.

We were then in a broken, impracticable mountain range, from which escape by any practicable route was impossible, and any further exploration in that direction was manifestly useless.

I then proceeded by tracks through the scrub, known to the guides, to Yarrow Creek Station, with the view of examining the country in that locality, and then on to Glen Innes to meet a guide who was to point out another route from the Mann River to Glen Innes.

The next route proposed for examination was by a creek known as Scrubby or Disscruby Creek. This creek junctions with the Mann River, about 3 miles below the crossing of the Newton Boyd Road. It was supposed by the guides that this creek would be of sufficient length to afford a practicable gradient to the table-land. It was then proposed to cross a low range and drop into a creek known as Dirty Creek; then follow Dirty Creek to a point on the Newton Boyd Road, about 20 miles from Glen Innes; then follow the general course of the Newton Boyd Road for about 8 miles; then to the Beardy River by a creek known as the Fifteen-mile Creek, and on to Glen Innes, following the general course of an old road from Glen Elgin.

The country between Glen Innes and the Scrubby Creek is favourable enough, but on ascending the creek from the Mann River we found a rise of 440 feet above the original survey in a distance of about 2½ miles.

At

At a distance of about 4½ miles from the junction we had risen 1,420 feet, and in about 7 miles we had risen 2,000 feet, and were on the table-land.

The fall from the table-land of New England, in the direction of the Mann River, is everywhere abrupt, and the distance varies from about 6 to 8 miles. In this distance there is a fall of about 2,000 feet. It is evident, therefore, that any attempt to make the descent by any leading creek or spur must prove a failure. The only way in which the descent from the table-land to the Mann River can be effected is by skirting along the range and crossing the creeks and spurs, and I see no better ground for this purpose than that over which the original survey is carried.

I think a little improvement may be made in the original survey in the neighbourhood of Stockyard Creek by lengthening the line above it, and crossing the creek at a lower level, and no doubt the line is capable of being improved in other places. The route between Grafton and Newton Boyd, explored by me, and described in this report, does not appear to me to possess any advantages over the route already surveyed; on the contrary, I am of opinion that a survey would prove it to be more costly, and from Newton Boyd to Glen Innes I consider the route already surveyed to be the only practicable one yet discovered.

I have, &c.,
A. FRANCIS.

Copy of this report forwarded for the information of the Minister. Memo. 78-458.—W.H.Q., 25 July. Read by Engineer-in-Chief. W.H.Q., 6/8/78. Mr. Palmer.—H.P., 7/8/78.

No. 12.

Minute by The Engineer-in-Chief for Railways to The Secretary for Public Works.

Department of Public Works, Railway Branch, Engineer-in-Chief's Office,

Sydney, 21 August, 1878.

Subject: Railway Trial Surveys—Clarence to New England.

I FORWARD herewith for the information of the Minister a copy of the report furnished by Mr. Surveyor Francis upon the route pointed out by the Messrs. Wright for a proposed line of railway from Laurence to Glen Innes.

W. H. Q.
(For the Engineer-in-Chief).

Submitted.—J.R., 21/8/78. Inform Mr. Wright.—J.S., 22/8/78. Messrs. Wright, 22/8/78. Engineer-in-Chief for Railways.—J.R., B.C., 29/8/78.

[*Enclosure.*]

The Engineer-in-Chief for Railways, Sydney,—

Sir,

Laurence, 6 August, 1878.

I have the honor to report that, in obedience to your instructions, dated 11th June, 1878, I met the Messrs. Wright at Glen Innes, and have explored the route between Glen Innes and Laurence, as pointed out by them.

This route leaves Glen Innes on the north side of the township, and passes close by the cemetery. It then follows the old Glen Elgin Road for about 12 miles, crossing the Beardy River a few chains north of the road, and passing through Devlin's conditional purchase at the Toll Bar Range.

The route then follows the general direction of the Grafton and Glen Innes Road to the crossing of Dirty Creek, about 21 or 22 miles from Glen Innes. From the crossing of Dirty Creek the route follows the general course of the Glen Elgin Road to a saddle about 2 miles south of Glen Elgin Station. From this saddle the route follows a direction nearly north north east through the Glen Elgin paddocks, and crossing a creek known as Black Mountain Creek; thence, in about the same direction, to the junction of Blower's Creek with the Rocky River. Crossing Blower's Creek, the route follows the valley of the Rocky River to the head of Bob Shaw's Gully, about half a mile past Aked's homestead on the Rocky River. The route then follows the general course of a track along Bob Shaw's Gully to Oakey Flat, about 37 miles from Glen Innes.

From Oakey Flat the route crosses a range dividing the counties of Clive and Drake; then in a direction about north north east for about 8 or 9 miles to the head of the Washpool Creek; the route then follows the Washpool Creek down to a selection of Mr. Ogilvie, near Lyonville; thence to Laurence, following the general course of a road from Lyonville to Laurence, crossing the Couldale Range a little north of the road.

From Glen Innes to Glen Elgin the country is comparatively easy, the only works of any importance on this portion of the route being a bridge over the Beardy River, and a cutting through the Toll Bar Range, about 12 miles from Glen Innes, and a bridge at the crossing of Dirty Creek.

From Glen Elgin to Oakey Flat the country is not so easy, being broken up into ridges and gullies. Besides the bridges over Black Mountain Creek and Blower's Gully there would be some expensive cuttings and bridges in Bob Shaw's Gully.

Oakey Flat is situate on the west slope of the table-land of New England. A creek, shown on the county map as Oakey Creek, flows from the flat into the Rocky River. On the north and east of Oakey Flat the country rises suddenly to the level of the table-land of New England. Below the junction of Oakey Creek the Rocky River is a succession of rocky falls, and is confined between perpendicular walls of granite. It was impossible then to get away by the Rocky River. A low place in the range, on the route proposed by the Messrs. Wright, was found to be 640 feet above Oakey Flat, at a distance of about a mile and a half from the flat.

The top of the range is flat, being, in fact, a portion of the table-land; it could not, therefore, be tunnelled. A portion of the 640 feet might possibly be made, perhaps half the height, by commencing the ascent earlier, but the balance would have to be attained by a zig-zag.

The country between the top of this range and the head of the Washpool Creek, about 9 miles, consists of broken granite ranges and deep creeks, which are crossed by the proposed route at right angles. At a range about 43 miles from Glen Innes there is a remarkable rock called the Haystack. To get through this range a tunnel, about 90 or 100 chains in length, would be required. About a mile further on the ground falls 270 feet in about 40 chains to Newman's Creek, and rises again 340 feet to Key's Gap, in about 70 or 80 chains. I see no possible way of avoiding this difficulty.

From Key's Gap the distance to the head of the Washpool Creek is about 1 mile, and the ground falls 70 feet. The saddle at the head of the Washpool Creek, about 47 miles from Glen Innes, is about 250 feet below the level of that township; up to this point then very little had been done towards making the descent from the table-land of New England.

At Mr. Ogilvie's selection on the Washpool Creek, near Lyonville, about 18 miles below the head of the creek, the country is very little above the level of the Clarence River, and would afford a practicable gradient for about 8 or 10 miles up the creek.

It was evident, then, that there must be a fall of at least 2,000 feet in the first 8 or 10 miles of the descent from the head of the creek.

It was impossible to examine this portion of the route, the country being covered with a dense scrub, so interlaced with vines as to render travelling through it an impossibility.

Three days fording rivers and creeks, scrambling over rocky ranges and tearing through scrub, by the way of the Rocky River and Solferino, brought the party again to the Washpool Creek, about 17 or 18 miles below its head.

In this distance the country had fallen 3,000 feet.

Further

Further exploration of this route was useless ; but as the remainder of the proposed route lay in the neighbourhood of the road to Laurence, I examined the country from the road.

At about 20 miles from Laurence the route crosses the Couldale Range. This range is broken and rugged, and could only be got over with very heavy cuttings and sharp curves.

It was raining heavily all the time the party were on this range, and our clothing and blankets were thoroughly saturated, and the other portion of the route having proved a failure, I did not think it necessary to spend more time in exploring a portion of the route that could not be connected.

It will be seen from this report that portions of the route proposed by the Messrs. Wright, namely, the crossing of Newman's Creek and the descent from the table-land by the Washpool Creek, are impracticable, and that other portions from Oakey Flat to Newman's Creek are by no means of that easy character described by those gentlemen in their letter to the Minister for Works.

I have, &c.,
A. FRANCIS.

No. 15.

The Engineer-in-Chief for Railways to The Secretary for Public Works.

Department of Public Works, Railway Branch, Engineer-in-Chief's Office,
Sydney, 13 September, 1878.

Subject :—Messrs. Wright's Claim.

On 15th May, 1877, Mr. Wright offered to mark out a line from Glen Innes to North Grafton if the Government would advance to him the sum of £60 to provide horses and procure provisions.

Messrs. Wright now claim £78 4s. 6d. for accompanying Mr. Francis from Glen Innes to Laurence, but their services were not of any value.

I therefore think that if the amount of £60, which was originally asked by them, be paid, they will have been liberally treated by the Government, considering that they failed to point out a better line than the one originally surveyed, and, in fact, were not acquainted with the whole of the country.

The sum of £20 was advanced to them before leaving Sydney ; the amount to be paid will, therefore, be £40, if the Minister approve of this suggestion.

JOHN WHITTON.

Submitted. Approved.—J.S., 18/9/78. The Engineer-in-Chief for Railways.—J.R., B.C., 19/9/78. Voucher certified.—W.H.Q., 20/9/78.

No. 19.

Petition from Residents of Tenterfield.

[Forwarded by John Dillon, Esq., M.P.]

To the Honorable the Minister for Public Works,—

Sir,

Chambers, Sydney, 29 May, 1879.

I have the honor to forward to you the enclosed petition, which I have received from the Chairman of a public meeting held at Tenterfield.

I have, &c.,
JOHN DILLON.

[*Enclosure.*]

To the Honorable the Minister for Public Works.

The humble Petition of the undersigned Inhabitants of Tenterfield and surrounding district,—

Showeth :—

That your Petitioners have for some time felt the want, which has been recognised by successive Governments for the last seven years, of an easy means of communication with Sydney and the seaboard generally.

That the necessity so long felt by your Petitioners, and recognised by the successive Governments of the country, is yearly increasing with the increase of the population and trade of the district which they inhabit.

That the population of this district is now estimated at 2,518 (exclusive of the rich and largely-populated district upon the immediate border), and that the farm holdings and conditionally purchased land in the district comprise an aggregate of 52,051 acres, of which 2,054 acres are under cultivation for wheat alone, and yield an acreage quantity of 41,735 bushels per annum, being at the rate of 20 bushels per annum to the acre, and that the total acreage under cultivation for all cereals and other crops is 3,669 acres ; and that, in the opinion of your Petitioners, a much larger area would be brought under cultivation if a market were provided by means of easy communication with Sydney and the non-wheat-producing districts of the Clarence and other districts lying between Grafton and Tenterfield.

That this district already carries on a large trade with the metropolis, which would be greatly increased if an easier means of transit were provided.

That your Petitioners learn, with pleasure, that the trial surveys for a railway between this district and the navigable waters of the Clarence, which have been in course of making for the last five years, have at length resulted in the discovery of a practicable and inexpensive route, namely, that pointed out by Mr. Marcolini, of Grafton, and approved of by Mr. Surveyor Francis.

That the route pointed out by Mr. Marcolini, and approved by Mr. Surveyor Francis, passes through a superior class of country, largely available for agricultural purposes, and abounding in minerals of a rich and valuable character.

That silver-mines have lately been discovered at Boorook, within 26 miles from Tenterfield, and within 10 miles from the proposed route, which promise to yield rich results, and to add considerably to the resources and population of this district.

Your Petitioners therefore pray that you will be pleased to take the premises into your favourable consideration, and that you will cause immediate steps to be taken to have a thorough trial survey to be made of the route abovementioned.

And your Petitioners, as in duty bound, will ever pray, &c., &c., &c.

For and on behalf of the inhabitants of Tenterfield, in public meeting assembled.

EDWARD R. WHEREAT,
Mayor and Chairman.

Acknowledge receipt, and state that its contents will receive consideration.—J.S., 30/5/79. Acknowledged, 3/6/79. Railways.—W.H., B.C., 3/6/79. The Engineer-in-Chief.—C.A.G., B.C., 3/6/79. Under Secretary.—J.W., 10/6/79. Put away. Seen.—J.S., 18/6/79. Railways.—J.R., B.C., 7/4/81. From surveyor's return.—J.S., 7/4/81. Mr. Quodling.—J.B., B.C., 8/4/81.

No. 20.

The Mayor of Grafton to The Secretary for Public Works.

Sir, Clarence and New England Railway Committee, Grafton, 1 September, 1879.

I have the honor, by direction of the above committee, to request that you will receive a deputation appointed to present you a petition adopted at an open air public meeting, held in this city on 29th June last, in support of the agitation now going on for the construction of a line of railway from Grafton to New England, and to request that you will fix some date that will suit your convenience to receive such deputation, and apprise me thereon, so that I may inform them.

I have, &c.,
THOMAS PAGE, Mayor,
Chairman of Committee.

Department of Public Works, Sydney, 10 September, 1879.

INFORM the Mayor of Grafton that the opening of the railway to Gunnedah, the pressure of public business, in addition to the various very important matters at present demanding special attention, will render the movements of the Minister uncertain for some time to come. Mr. Lackey, therefore, finds it difficult to fix a time that would be convenient for an interview by the proposed deputation. At the same time, state that it will be taken as a concession if the gentlemen interested will represent their views in writing, and that the Minister will then give this important subject his best consideration, and forward them a reply in lieu of the deputation. J.R., 10/9/79.

Railways.—W.H., B.C., 12/9/79.

Sir, Department of Public Works, Sydney, 11 September, 1879.

Referring to your letter of the 1st instant, requesting that the Secretary for Public Works will receive a deputation from the Railway Committee respecting the construction of a line of railway from Grafton to New England, I am directed to inform you that the opening of the railway to Gunnedah, and the pressure of public business, in addition to the various very important matters at present demanding special attention, will render the movements of the Minister uncertain for some time to come. Mr. Lackey therefore, finds it difficult to fix a time that would be convenient for an interview by the proposed deputation.

I am to state that it will be taken as a concession if the gentlemen interested will represent their views in writing, so that the Minister may give this important subject his best consideration, and forward them a reply, in lieu of the deputation suggested in your communication.

I have, &c.,
The Mayor of Grafton. GERALD HALLIGAN,
Acting Under Secretary.

No. 22.

The Mayor of Grafton to The Secretary for Public Works.

Forwarding a Petition from 1,650 residents of the Clarence River District, *re* railway, &c.

To the Honorable the Minister for Works, Sydney.

The Petition of the Inhabitants of the city of Grafton, and the Clarence River District generally,—

HUMBLY SHOWETH:—

That it is desirable and necessary, for the progress and development of the country, that a line of railway be constructed from Grafton to the table-land of New England.

That from the extensive area of rich agricultural land upon New England, it is urgently required that a line of railway be constructed from there to Grafton, to enable the large quantity of cereals and other produce grown to be done so with profit to the producers.

That your Petitioners desire that you cause a trial survey to be made over the route from Grafton to Tenterfield, pointed out by Mr. P. Marcolini to Mr. Railway-Surveyor Francis, and favourably reported upon by that gentleman.

That your memorialists desire to bring under your notice the length of time which has elapsed since the subject of railway communication between Grafton and New England was first brought forward, and that hitherto no steps of a practical nature have been taken by the Government to accomplish this work, which has now become a pressing necessity.

That, viewing the circumstances herein pointed out, your memorialists respectfully urge that you cause a sum of money to be placed upon the Estimates for the purpose of carrying out so important and desirable an undertaking.

And your Petitioners, as in duty bound, will ever pray, &c., &c., &c.

[*Here follow* 1,650 *signatures.*]

No. 24.

Extracts.

From *Daily Telegraph*, 15th November, 1879.

THE Minister for Works received a deputation, yesterday, from Grafton, who presented a petition for the construction of a line of railway from that town to the table-land of New England. The deputation was introduced by the Hon. J. Sutherland in the absence of the Member for the Clarence, and there were also present:—Hon. J. B. Watt, M.L.C., Messrs. J. See (of Nipper and See), M. Gottheelf, S. G. Davidson, S. A. Joseph (Montefiore, Joseph, & Co.), — Jamieson (Prince, Ogg, & Co.), T. Page (Mayor of Grafton), H. Maurice, W. Kinneen, and P. Marcoline. Mr. Page said there was no necessity to go much into detail on the subject, as the question of constructing a line had frequently been brought under the notice of the Government. He pointed out, however, that if such a railway as that asked for were made it would open up the whole of the wealthy New England district, and at the same time double the shipping

shipping in the Clarence River, without in any way injuring the port of Newcastle. It might be argued that when the northern line to Queensland was made, there would be no necessity for a line to Grafton; but the main northern line would not touch the districts he had referred to. He asked that the Government should give the matter early consideration during the present Session. The question of route would have to be decided by the Government. Mr. Marcoline said he had prepared a map of the district, showing what he believed to be the best route; and he had also brought a complete collection of specimens of the mineral resources of the country, which he would, if desired, place at the Minister's disposal. Mr. Lackey said it was not the first time that the desirability of making a line from the Clarence to the New England table-land had been under the consideration of the Government, it being ten years since the project was first started. Three surveys had been made, and he understood that another route had been found by one of the deputation. The point was, did the Government feel it their duty to recommend Parliament to expend the amount of money necessary for the construction of the line. For his part, he would see that the petition and the recommendations made should be laid before the Government when they were going through their railway projects for the coming year. He would, however, point out that the construction of the line would mean the introduction of a new railway policy, namely, that of connecting the coast with the table-lands in the interior, and if it were done in their case the southern districts would want the same privilege extended to them. He promised to lay the matter before the Government at an early day.

From *Sydney Morning Herald*, 15th November, 1879.

CLARENCE AND NEW ENGLAND RAILWAY.

A DEPUTATION, consisting of the Hon. J. B. Watt, M.L.C., Messrs. J. Sutherland, M.L.A., J. See, Gotthelf, Marcolini, Davison, Montefiore, Jamieson, Morrice, Kinnear, and Page, waited on the Minister for Works, with a view to advocate the construction of a line of railway from Grafton to the New England district. The advantages of the proposed line were set forth by the speakers, and in reply Mr. Lackey stated that this was not the first time that the necessity for the construction of a railway from the Clarence to the table-land of New England had been brought under the consideration of the Government, and two or three surveys had already been made. He did not know whether any information had been collected since in reference to a more desirable route than had already been surveyed. They wanted to know, he believed, whether the Government would feel it their duty to recommend to Parliament to vote the sum of money necessary to carry out the work. He could not say at the present time, but he could assure them that he would see that the representations they had made, as well as the contents of the large petition which had been presented to him the other day, were submitted to the Government for consideration at the time they were going through their railway proposals for the present year.

No. 25.

The Hon. Secretary, Clarence and New England Railway Committee, to The Secretary for Public Works.

Further respecting Railway Line, Grafton to Glen Innes.

Sir, Clarence and New England Railway Committee Rooms, Grafton, 2 March, 1880.

I have the honor, by direction of the Committee, to invite your attention to the petition forwarded to you on the 23rd September last, in reference to the subject of a line of railway from Grafton to New England, and also to an interview which a deputation from this district had with you on the 13th November last upon the same subject, and to request that this matter may be taken into your consideration, and to be informed whether it is the intention of the Government to include this line in the general railway policy to be submitted to Parliament this Session.

I have, &c.,
THOMAS PAGE,
Hon. Sec.

P.W.O., 15/3/80. End of month, 21/5/80. What reply should be given to Mr. Page?—J.R., 21/7/80. Railways, to resubmit when anything further is required.—J.R., 4/8/80. J.P., 5/8/80.

I have submitted this matter to the Cabinet. No decision, however, has been come to, nor will anything further be done till the Government are considering further railway projects, when this question will be again discussed.—J.L., 9/8/80.

No. 30.

Minute Paper.

Residents of Grafton—(Chas. H. Fawcett, M.P.)

URGING construction of a line of railway from the Clarence to the New England district

---

For Cabinet.—J.L., 13/10/80. Put with subsequent papers on the subject.—J.R., 6/1/83.

To the Honorable the Minister for Public Works, Sydney.

The Memorial of the undersigned, freeholders and other residents in the Clarence District, in public meeting assembled,—

RESPECTIVELY SHOWETH:—

That the districts of the Clarence, New England, and the Gwydir contain a population equal to about one-thirteenth of that of the whole Colony of New South Wales.

That the people of these districts have for upwards of ten years past urged upon successive administrations the necessity for proceeding with the construction of a railway from the Clarence River to the table-land of New England and the districts lying to the west thereof.

That,

That, in compliance with previous petitions, trial surveys and explorations have been carried out, proving the entire practicability of the proposal, and repeated promises have from time to time been made that this particular line of railway should be undertaken.

That those promises have not yet been fulfilled, to the grievous disappointment of the residents of these districts and the serious injury of local and national interests.

That since the agitation from this line of railway was first initiated, varied and powerful reasons have been submitted why this proposed line should be constructed more on national than local grounds.

That your memorialists desire to invite your attention to the many numerously-signed petitions and other papers that have been presented to yourself, your predecessors, and to Parliament upon this subject, and to submit that reasons more potent exist at the present time why a line of railway to connect the Clarence with the table-land of New England should be included in the Ministerial railway policy and submitted to the ensuing Session of Parliament.

That should this proposed railway not be proceeded with at an early date, your memorialists have great fears that the prosperity of the northern part of New South Wales will be seriously and permanently damaged, and its commercial connection with Sydney in a great measure severed.

Your memorialists, therefore, respectfully pray that you will take the premises into your most favourable consideration, and take such steps as may be necessary for including a proposal for a line of railway from the Clarence to New England in the Ministerial policy to be submitted to the first Session of Parliament, and that a sum of money sufficient to construct the first section (say) of 50 miles be placed upon the Estimates for the ensuing year to commence the work.

And your memorialists, as in duty bound, will ever pray.

Dated, at Grafton, this 23rd day of September, A.D. 1880.

W. J. HAWTHORNE, Mayor of Grafton,
Chairman at the Public Meeting.

Inform that I will have the memorial brought before the Government without delay.—J.L., 4/10/80. Mr. Fawcett, M.P., 4/10/80.

Extract from *The Sydney Morning Herald*, 21 January, 1881.

DEPUTATIONS—RAILWAY TO THE CLARENCE.

A LARGE deputation of Members of the Legislative Assembly, consisting of Messrs. See, Purves, H. H. Brown, J. Davies, C.M.G., H. Clarke, Farnell, Garvan, Myers, Proctor, Dillon, Carter, Ferguson, Fremlin, Burdekin, Fletcher, Kidd, Henson, O'Connor, E. Barton, Trickett, Fawcett, Murray, R. B. Smith, and Cameron, waited on the Secretary for Works (Mr. Lackey) yesterday, for the purpose of urging the immediate construction of a railway to connect the table-land of New England with the deep waters of the Clarence River.

Mr. See introduced the deputation, and said that they had attended in order to urge their claims for a line of railway from the table-land of New England to the ports of the Clarence River. The Government must be aware that there were a large number of steamers now trading to Grafton, which was 50 miles from the mouth of the river, thus giving a large extent of navigable waters; and as the Falls were to be cleared away, that would give them another 20 miles of navigation. This district was as rich in mineral, agricultural, and other resources as any other part of the Colony, and the expenditure of a sum of money in the construction of a railway would be a source of profit to the State, as well as have the effect of diverting a large amount of trade into its proper channel, which was now benefiting Queensland. He thought every Member of Parliament approved of the policy of constructing railways to the centres of population, so as to concentrate the trade to Sydney, and he did not think, in urging this scheme, that they were doing anything more than their duty to the people living in the neighbourhood. He quoted from a local newspaper the following list of exports from the district during 1880, which had been prepared by a gentleman who had carefully watched the statistics of the district for years:—Maize, sacks, 217,115; oysters, ditto, 1,424; bones and horns, ditto, 3,457; mineral ores, ditto, 31,005; ingots tin, 44,060; sugar, mats, 41,718; sugar, tons, 4,322; preserved meat, cases, 22,488; extract, ditto, 169; eggs, ditto, 1,969; wool, bales, 3,565; skins, bundles, 394; horses and cattle, 38; pigs, 1,371; poultry, coops, 1,019; hides, 19,656; tallow, hogsheads, 1,828; molasses, hogsheads, 2,495; spirits, hogsheads, 1,563; bananas, bunches, 145,840; sundries, packages, 3,496; spokes, 23,176; timber, feet, 587,131; piles and logs, 445; potatoes, sacks, 389; dried meat, sacks, 996; gold, parcels, 12; and also quoted the following:—"From the same source we gather that in 1880 no less than 4,719 saloon and 4,571 steerage passengers travelled by steamer to and from Sydney. From a return prepared by Mr. T. M'Kittrick, shipping agent for Messrs. Nipper and See's line of steamers at South Grafton, we find that during 1880 the enormous quantity of 35,556 packages of general merchandise were forwarded to the New England districts—an average of 125 tons per month—the whole of which has to be carried by horse and bullock teams; while an equally large quantity has been forwarded by Mr. P. Leyburn, South Grafton, agent for the C. and R.R.S.N. Company's steamers. So that the value of imports for New England, *via* Grafton, can be safely estimated at £1,000,000 sterling." This he thought quite sufficient to convince anyone that this line would be a profitable one. The principal portion of the existing trade, such as supplying storekeepers with their goods, was now effected by teams between the table-lands and Grafton; but this was a very tiresome and old-fashioned way of carrying on the business of the country, and he felt sure that the construction of this line would be one of the most paying to the Government, and would open up some of the most splendid country they possessed in the Colony. He did not advocate any particular line, leaving that more particularly to the Government as a matter of detail; but what he urged was that the Government should undertake a survey of the line, and place a sum on the Estimates for its construction.

Mr. Purves also desired to urge on the Government the claims of this portion of the Colony. It had often before been brought under their notice, and facts and figures had been adduced to show that the claims of this part of the Colony were deserving of serious consideration. He hoped the Government would see from the number of Members who had come on that deputation that their claims ought to be favourably

favourably considered. The construction of railways, he was glad to see, was being taken into consideration by the Government, and he hoped they would be pushed forward vigorously. The construction of this line would not only be of great benefit to the people living in the immediate districts concerned, but would be a national undertaking, because it would intercept the great amount of traffic now finding its way into the neighbouring Colony of Queensland. The day was rapidly approaching when main roads would be things of the past, when instead of constructing a main road they would at once construct a railway. Cheap communication with the sea would also open up much of the tin country, which was now unworkable on account of the heavy cost of sending the tin ore to Sydney. He hoped the Government would see their way clear to include this line in their railway policy, and that a commencement might very shortly be made with the line.

Mr. Fergusson also desired, as a representative from the district immediately adjoining the Clarence River, to urge upon the Government the desirableness of undertaking this work, and corroborated the statements of previous speakers as to the great value of the work, not only to the district, but to the Colony at large.

Mr. Fawcett said that his district might fairly be called the Garden of the Colony; but there was still room for a large population in it, which would be attracted if this line were made, as they would then have an outlet for their produce. He hoped that the Government would take the proper steps to have the necessary surveys made as soon as possible.

Mr. Murray endorsed the statements made by previous speakers, and pointed out that, although there might be a slight loss upon the line during the first year or two, this would in a very short time all be made up by the amount realised for the land that would at once be sold.

Messrs. Dillon, Proctor, Burdekin, and Henson also supported the object of the deputation, but brought no new arguments to bear upon the subject.

Mr. Farnell pointed out that every Government had been in favour of the construction of this line, the only question having been whether the time was opportune for its construction. He considered that the time had now arrived when this work ought to be carried out; and as a survey had already been made, he thought the Minister might very fairly lay the plans on the Table, and move the usual resolution authorising the construction of the work.

Mr. Lackey, in reply, said that the matter of the construction of a railway from Grafton to the table-lands of New England was not a new one at all. It had been under the consideration of various Governments, and large deputations had waited on different Governments asking for the construction of the line. To repeat the arguments so well used by so many members of the deputation in favour of the districts referred to would be simply going over ground which was admitted on all sides. It was well known that the character of the land on the Richmond as well as the Clarence was as rich as that of any part of the world. The question as presented to different Governments had not been whether or not there should be a railway constructed, but whether it should take precedence of other extensions; and it had been thought more desirable that the great trunk-lines to the south, west, and north should be pushed on before any great diversions were made from that policy. These trunk-lines now were being gone on with, and he did not think it would be a long time before they would be completed. He would remind the deputation that the proposal they were now making was to a certain extent initiating a new policy, and would not confine itself to the districts which had been named. They had other coast districts whose seaboard was contiguous to agricultural settlement and fertile land, which were likely to avail themselves of any conclusion the Government might come to. He might mention the southern district, where there was a fertile table-land, and the coast district of Bombala, and the township of Bega, Twofold Bay; and if a policy such as that now asked for were conceded they were sure to receive applications immediately for the purpose of connecting lands similarly situated with the coasts. He found that a survey was made some years ago from the Clarence River to the table-land of New England, which must have been more than a preliminary survey, because he had it that the line to be constructed would be a very difficult and expensive one. He would, however, give the deputation this promise—that he would take an opportunity of placing before the Government the representations they had made, and the reasons they had urged in favour of the proposals submitted, so that they might be considered at the very earliest moment the Government took into consideration the railway policy they were going to submit to Parliament.

The deputation then withdrew.

End of March, 1881. Resubmitted, 24/1/81.

No. 35.

The Premier to The Secretary for Public Works.

Minute for the Secretary for Public Works.

It was with much reluctance that I consented to the withdrawal of the estimate for the railway from Grafton to Tenterfield. The enormous cost of £2,400,000 for 131 miles of communication in a thinly-populated country alone weighed with me against the many prospective advantages of connecting the head of the Clarence River navigation by railway with the table-land of New England and the border districts between Tenterfield and Warwick. But I consider that connection so important to the future interests of the northern part of the Colony that I hope Mr. Lackey will at once give instructions for a further and thorough examination of the country to be made, to see if a cheaper line cannot be constructed. It may be that, irrespective of cost, the work, in view of the development of the capabilities of the northern river districts, ought to be carried out; but clearly, as a preliminary, we ought to spare no trouble to bring the cost down to the lowest estimate.

H.P.,

GRAFTON.

A COPY of a minute sent by the Colonial Secretary to the Minister for Works, in reference to the Clarence and New England Railway, and said to have been distributed amongst the members for the district, has been published here, and has been the topic of discussion ever since. General surprise is expressed at the course taken by the Premier, who has expressed himself satisfied of the claims of these districts to railway communication, being compelled, even reluctantly, to consent to the line being withdrawn. There is no faith in the proposed conference of the members for the district resulting in any practical good, and the general belief is that the minute is only another attempt to pacify the Northern Members until the Government scheme is adopted. The disappointment becomes more acute after the receipt of every additional item of information in regard to the action of the Government. The monster meeting to consider the position has been convened by the Mayor for Tuesday night, in response to a numerously-signed requisition.

22 March, 1881.

I HAVE the honor, by direction of a public meeting of over 1,000 residents of Grafton, just held, to inform you that they have decided unanimously upon the following resolution:—"That this meeting has learned with surprise and indignation that the Ministry have at the last moment withdrawn from the Loan Estimates all provision for the construction of any line of railway connecting the Clarence and New England, notwithstanding the promises made by them to our Members to make such provision."

Railways.—J.R., B.C., 24/3/81. May be put by, I presume.—CH.A.G., 31/3/81.

No. 38.

Telegram from The Mayor of Grafton to The Secretary for Public Works.

25 March, 1881.

AT a meeting of principal residents of Grafton, held this day, it was resolved that no railway line to New England will be satisfactory to the people unless the terminus is at Grafton, and they therefore request that the survey party may be instructed to re-examine the route to Glen Innes, with a view to its adoption, as being the most satisfactory to the people and beneficial to the country.—(Signed) J. H. Munro, J. Rea, F. W. Chapman, E. C. Lewington, S. See, C. Dickey, D. W. Munro, H. Whitford, F. Layton, G. Foott, J. Newell, R. Page, S. C. Lyons.

Telegram from The Editor, *Glen Innes Examiner*, to The Premier.

25 March, 1881.

To talk of the railway costing £18,000 per mile is absurd. We have a bushman who is prepared to point out an inexpensive line. As surveyors have arrived, communicate to *Examiner* office. Would Government give bonus? Reply.

Forward to Engineer-in-Chief.—CH.A.G., B.C., 4/4/81. Under Secretary for Works.—J.W., (*per* W.H.Q.), B.C., 29/4/81.

No. 40.

Telegram from The Mayor of Glen Innes to The Secretary for Public Works.

26 March, 1881.

YOUR instructions to survey Tenterfield route only causing great uneasiness here and westward. No line but Grafton to Glen Innes would be serviceable to Inverell and other important towns in the west. Tenterfield to Inverell land barren and rocky. Reply.

Railways.—J.R., B.C., 29/3/81. Engineer-in-Chief. My instructions are to survey a line from Grafton to Tenterfield, which is now being proceeded with.—J.W., 5/4/81. Under Secretary, B.C.

If surveyor's report warrant it, other surveys may be made before survey party return. The policy of the Government is to construct line from Grafton to nearest point of table-land to Queensland, but if the line to Tenterfield be found too expensive it is possible that the Government might see its way to adopt another route. At all events, I would like to hear from Engineer-in-Chief on the subject. Mr. Palmer for information.—J.W., 20/4/81.

The surveyors now in the district are engaged upon a trial survey of the route suggested by Mr. Marcolini, between Grafton and Tenterfield, and they have been instructed to report to this office any suggestions of other routes that may be made to them, so that reference may be made to reports of routes already examined before further surveys are recommended. I think it will be advisable to complete the survey now in hand before anything else is done, and as the surveyors complete their separate lengths of this survey, they can examine, and afterwards survey, if necessary, other routes that may be pointed out.—H..P, 22/4/81. The Engineer-in-Chief.

Under Secretary for Works.—J.W. (*per* W.H.Q.), B.C., 29/4/81.

Telegram from The Mayor of Glen Innes to W. J. Fergusson, Esq., M.P.

30 March, 1881.

At a large and influential meeting held here last night, attended by residents from all parts of the electorate, it was unanimously resolved that you should respectfully place before the Honorable the Minister for Works the following resolutions: "That it is desirable in the best interests of the Colony that a railway should be constructed from the navigable water of the Clarence to the westward, via Glen Innes, this route being the greatest benefit to the greatest number,"—proposed by Edwd. Grover, Esq.; seconded by Alex. Rogers, Esq., J.P., and carried unanimously, amidst great excitement. Second resolution: "That it would be a great national and profitable undertaking to commence forthwith the construction of a railway from Glen Innes to Inverell and westward, thus placing the important town of Inverell and others in the west within access of railway communication on completion of Great Northern Railway to Glen Innes,"—proposed by Samuel W. Burridge, Esq., J.P.; seconded by Alderman Utz, and carried unanimously, with great excitement and cheering, and with much hope the Government will accede to this just demand.

No. 44.

THE GRAFTON SUCCESS.

AN illustration of the proverb which teaches that perseverance and industry conquer all things is afforded in the case of the Grafton people. The inhabitants of the Clarence district strongly desire a railway passing through their territory. The want is a reasonable one, and should have been granted long ago. That it has not been is no fault of the residents of Grafton and its neighbourhood. If energy of purpose, and unceasing as well as intelligent representation, could have achieved the object in view it would have been accomplished. But, with an obstinacy which applied to other and more worthy purposes would have been highly creditable, the Government refused to see the matter in the necessary and more favourable light, and therefore the progress of the district has been retarded for want of a railway—or, more correctly speaking, because of the determination of the Ministry not to do justice to the inhabitants of one of the most important and rapidly progressive portions of New South Wales. Many efforts have been made, but hitherto unsuccessfully. When the last railway schedule was submitted to Parliament, the Premier announced that the Grafton and New England line had been originally included; but at the last moment it had been found necessary to eliminate it because of the great cost. In view of the character of some other lines that have been authorised, and in which the element of expense was not much considered, the excuse was rather lame; nor was the explanation deemed satisfactory by anybody. After such a rebuff some folks would have retired abashed from the contest. But the Grafton people are made of sterner stuff. Like the typical Briton, they don't know when they are beaten. They did not give way to despair, but with a full belief in the practical theology which teaches that Providence helps those who help themselves, determined to persevere and try again. As a matter of fact, they kept on trying, and have succeeded at last. The attempt to invite the Ministry bodily did not quite succeed. Nevertheless, the effort was not quite lost, for two Ministers, he of Public Instruction, and that other of Public Works, are at this moment doing a triumphal march through the rich and fertile territory of the Clarence and New England. "Everything comes to him who waits," saith the sage. The good people of Grafton have had, perforce, to wait for a railway. They have now got all, and more than they asked, or, at all events, the promise of it, which is the next best thing to it. In this case, at least, Ministerial promises will not, we venture to believe, be of the ordinary pie-crust order. A railway is wanted; the importance of the district warrants it, and it will pay. Under such circumstances the railway must be made. Sir John Robertson and Mr. Lackey have made a personal acquaintance with the district, and the latter, at all events, has seen the error of his and his colleagues' ways in not having given railway communication to such a lively, hospitable, and generally pleasing a community. He will correct the oversight as soon as possible. In short, Mr. Lackey has promised to fulfil all that has been asked of him, and what more can a Minister do? The pity of it all is that he did not make his visit some twelve months ago; he would have seen the same necessity then as now, while that which he has now promised would have been a year nearer of accomplishment. However, better late than never. If only half of what Mr. Lackey has promised is carried out within a reasonable time the Ministerial visit will have justified its inception and accomplished its mission. Sir John Robertson has had the opportunity of proving the advantages of the Public Instruction Act, at all events under his administration. How it has gathered to its fold all the stray lambs who were heretofore sporting the happy hours away in the gutter. Only about a thousand or so could be seen in the streets at one time, and therefore they must be going to school. A good many other remarkable things were mentioned by the genial old statesman, who is now engaged in the pleasant task of placating the good people of Grafton, and smoothing their ruffled feathers. The task could not have been entrusted to more capable or better hands. Among the good things the veteran Minister told his hearers was that Mr. Gladstone had been guilty of plagiarism, for the Irish Land Bill was almost a copy of his own Land Act of 1861. Perhaps the seemingly unreasonable opposition to Mr. Gladstone's Bill on the part of the Irish people is now accounted for. Sir John Robertson's Act was not an unmitigated success, and it is possible that some Irish land leaguer, with colonial experience, may have explained the matter to his colleagues, who object to repeating the experiment in respect to the land legislation of Ireland. Still, it will be admitted that it was not quite the right thing on the part of the Prime Minister of England to bodily appropriate the bright and personal ideas of our own Sir John. They are, it may be said, his sole property. No doubt Mr. Gladstone will hear of the matter again. In the meantime, the Ministerial visit has been a great success. In view of the part we have played in connection with the recognition of the claims of the people of Grafton and New England, we cannot be otherwise than sincerely glad of it, and we heartily congratulate the district on the measure of success that has attended their efforts.

From *The Sydney Morning Herald*, 18 June, 1881.

MINISTERIAL VISIT TO THE CLARENCE.

(By telegraph—from our own reporter.)

THIS morning the Ministers were waited upon by no less than eight deputations, the subjects brought under their notice being,—the proposed railway from the Clarence River to New England; removal of obstructions to the navigation of the river; water supply for Grafton; the Great Marlow Drainage Union; a new Public School at Carr's Creek; a Public School at Brushgrove; protection of the river bank at Brushgrove; and of the introduction of the principle of local option into the promised Licensing Act Amendment Bill. The deputations were introduced by Mr. John See, Member for Grafton, who, with Mr. J. M. Purves, Member for the Clarence, were present with the Ministers. Upon the subject of the railway the Mayor of Grafton said the people of the district knew as a matter of fact that the Government had intended to include the Clarence and New England Railway in their recent railway policy, but that they had thought it prudent to withdraw it for a time; and they understood that the matter was to be reconsidered before any other railway policy was submitted to Parliament. They did not, therefore, on this occasion, propose to speak upon the question in detail, but would abide by the decision of the Cabinet until the result of the surveys now being made was known and placed in the hands of the Ministers. The people of Grafton knew it was impossible for the Government to decide as to the best

best scheme to adopt; and it was quite probable that it would be necessary to examine other routes before the Ministers could come to any determination as to the proper railway to be constructed. They relied upon the competency of the Government engineers, and upon the gentlemen administering the Government to give this matter careful consideration, not as something local, but as something affecting the interests of the Colony at large. They did not wish to set up their claims for a local railway; they knew that when the Ministers dealt with a question like this they must look upon it from a national point of view, and from that point of view the deputation considered that the people of the Clarence and of New England were entitled to be considered. They were quite willing to leave the matter to the officers appointed by the Government to deal with it, and to the Government themselves as one which, from a national standpoint, affected the whole Colony; but they, at the same time, urged that additional effort would be made to complete the necessary surveys as soon as possible, so that the railway might be included in the next Railway Estimates submitted to Parliament by the Government. Other members of the deputation pointed out that the railway should be considered, not as a branch line, but as a main railway extending to and opening up the great western and north-western plains.

Sir John Robertson, in reply, advised the deputation to see that whenever the Government brought forward a project for this railway—Grafton, Tenterfield, or Armidale—they advocated the one line, and did not recommend different lines. There were plenty of people at the other end of the Colony who looked askance at this project, and unless the people of these districts went for one line they would get none.

Mr. Lackey also replied, and admitted that the subject was an important one, not alone to the Clarence and the table-land of New England, but important with regard to the interests of the Colony generally, because it was not now the immediate locality, but the public at large that benefited from the construction of railways. It would be impossible for the Government to be indifferent to the claims of the residents on this large and important river, or to the claims of those living westward of the Clarence on the table-land of New England. Their attention to the subject had been frequently called by the two Members for the district. He knew there had been some little irritation at the Government not including the estimate for the New England and Clarence Railway in the general Estimates submitted to Parliament last session, but he thought the Government had been entirely sincere in what they had done in this matter. At the time this question was being discussed by Cabinet they found the information at hand was too scanty to guide them in deciding upon the large estimate before them, and they felt it to be the better course to leave the matter over until more accurate surveys had been made, and more complete plans prepared. Since then the Government had been most active in endeavouring to obtain the necessary information. No less than four surveyors were at work between the Clarence River and the table-land, and he would give the deputation his assurance that no time would be lost in carrying out the work. He hoped that the result of the delay which had taken place would be the construction of the line at less cost than the original estimate, which was very large. No time would be lost, and the greatest possible energy would be shown in dealing with the question, believing, as he did, that the railway could not be confined to the people of these districts, but would form a part of the network of railways in this country upon which the prosperity of the people largely depended.

In replying to the other deputations the Ministers promised prompt and careful attention to the matters brought under their notice, with the object of doing, without delay, what the deputations desired. With regard to the works in progress at the entrance to the Clarence River Heads, Mr. Lackey said that arrangements had been made by which they would be carried on with much more expedition than had hitherto been the case, through the illness of the officer in charge of them for some time past. The deputation who referred to the principle of local option was from the Good Templars of the district, and they presented to the Ministers an address of welcome. The assurances given by Sir John Robertson and Mr. Lackey that the various wants of the people would be attended to, gave general satisfaction, and the Ministers were heartily applauded. At the termination of the interviews cheers were given for the Ministers and for the Members; and the visitors then walked round the town, inspected the public buildings, and received an address in the Court-house from the Magistrates.

No. 53.

The Mayor of Armidale to W. C. Proctor, Esq., M.P.

Dear Sir, Armidale, 15 July, 1881.

As requested by a public meeting, held in the Town Hall, on the 13th instant, I send you the resolutions unanimously passed *re* trial survey from Grafton to Armidale, and also to ask you to use your influence in obtaining same.

I am, &c.,
ALEXANDER RICHARDSON,
Mayor.

[*Enclosure.*]

1st Resolution,—
That, in the opinion of the meeting, it is highly desirable for the Government to cause a trial survey to be made between Armidale and Grafton.

2nd Resolution,—
That any line from Grafton should, from weighty and cogent reasons, come to Armidale.

3rd Resolution,—
That the Government be requested to cause trial surveys between Grafton and Armidale to be made with as little delay as possible.

The Hon. the Minister for Works, Sydney,—

Sir, 138, Pitt-street, 30 July, 1881.

I have the honor herewith to enclose a letter from the Mayor of Armidale, together with copies of resolutions passed at a public meeting at that place upon the subject of a trial survey for a railway between Grafton and New England.

I anticipate that there will be no objection to the reasonable request for a trial survey, seeing that it does not bind the Government to any definite action. But it might be as well to point out the very great probability of ultimately discovering a line between Grafton and Armidale which would in all the circumstances surrounding the case be deemed the best line from the deep waters of the Clarence to the table-land of New England. The

The line suggested, from Grafton to Armidale, would pass through and open for settlement a very large extent of land, which has been proved to be rich in minerals, and valuable timber and grazing and agricultural lands, unequalled by those on any other route.

This line, it is confidently believed, would be constructed at one-half the cost of a railway on any other of the proposed lines from Grafton to New England.

The gradients would be easier, the bridges and earthworks infinitely less costly, and material for construction more easily obtained than on any other route.

One of the chief objections to the other lines is the necessity of crossing the Dividing Range, which is avoided on the line from Grafton to Armidale.

The line would also afford easy access to the Kempsey, Nambucca, and Bellinger Rivers; and a line could be constructed at some future time from the Armidale line to Trial Bay, the distance not being more than about 70 miles.

The Armidale and Grafton line would also be a saving of distance of about 70 miles between Grafton and Sydney, as compared with the Glen Innes line.

There are other substantial reasons in support of the Grafton and Armidale line which, I think, it is at present unnecessary to mention, seeing that we only make the reasonable request of a trial survey, which will no doubt realise anticipations regarding costs, and justify the expenditure.

I have, &c.,
W. C. PROCTOR.

Railways.—J.R., B.C., 10/8/81. Forward to Engineer-in-Chief.—CH.A.G., B.C., 8/8/81.

Perhaps it will be better to wait until the completion of the present surveys to Glen Innes and Tenterfield before taking any steps to survey the line from Grafton to Armidale. The distance will be considerably more than to either of the other places named (Glen Innes and Tenterfield).—J.W., 12/8/81.

Under Secretary for Works, B.C., 13/8/81. Commissioner for Railways to see.—J.R., B.C., 13/8/81.

No. 55.

J. M. Purves, Esq., M.P., to The Secretary for Public Works.

Re Railway from Grafton to Glen Innes.

Sir, 88, Pitt-street, Sydney, 1 August, 1881.

Referring to the existing trial survey for the construction of a railway from Grafton to Glen Innes, I do myself the honor to suggest that with a view to a modification of the estimated expenditure, the same may be improved and worked up on the same basis as the Western line.

Trusting this will receive your favourable consideration.

I have, &c.,
JNO. M. PURVES.

Railways.—J.R., B.C., 4/8/81. Forwarded to Engineer-in-Chief.—CH.A.G., B.C., 8/8/81. The suggestion shall have every attention, but steep gradients should always be avoided when practicable.—J.W., 12/8/81. Inform.—J.L., 18/8/81. Railways.—J.R., B.C., 19/8/81.

No. 59.

J. See, Esq., M.P., to The Secretary for Public Works.

Dear Sir, Sydney, 18 October, 1881.

I have the honor to enclose a resolution unanimously carried at a late meeting of the Clarence and New England Railway Committee, held at Grafton, at which I was present.

I respectfully draw your careful attention to this matter, and also urge upon the Government the need there is that the surveys should be completed at once, in order that a sum of money may be placed on the Loan Estimates this Session for the construction of a line from Grafton to the table-land.

Will you kindly let me know what progress the surveyors have made, and all particulars you can in reference to this matter, and oblige.

Yours, &c.,
JOHN SEE.

Let Mr. See, M.P., be informed.—J.L., 19/10/81. Railways.—J.R., B.C., 21/10/81. The surveys are still going on, and when completed I will report.—J.W., 26/10/81. Under Secretary for Works.

Sir, C. and N.E. Railway Committee, Grafton, 11 October, 1881.

I have the honor, by direction of the above committee, to request that you would again urge upon the Government to push forward the trial surveys for a line of railway from Grafton to New England, in order that a line may be adopted, and provision made upon the Estimates during the present Session to defray the cost of its construction.

I have, &c.,
THOMAS DOYLE, Mayor,
Chairman.

John See, Esq., M.P., &c., Sydney.

Railways.—J.R., B.C., 29/10/81.

QUESTIONS AND ANSWERS.

Legislative Assembly, Friday, 21 October, 1881.

3.) RAILWAY FROM GLEN INNES TO INVERELL:—MR. MURRAY *asked* THE SECRETARY FOR PUBLIC WORKS,—Has the survey of railway line from Glen Innes to Inverell been commenced yet, and when is it likely the result will be known?

Mr. LACKEY answered,—The survey has just been commenced, and it will probably be completed in about three months.

Legislative

Legislative Assembly, Friday, 21 October, 1881.

(3) Mr. Murray *asked* The Secretary for Public Works.—Has the survey of railway line from Glen Innes to Inverell been commenced yet, and when is it likely the result will be known?

The survey has just been commenced, and it will probably be completed in about three months.—J.W. (*per* W.H.Q.), 21/10/81. Under Secretary for Works.

Legislative Assembly, Wednesday, 19 October, 1881.

(6.) Railway from Glen Innes to Tenterfield:—Mr. Fergusson *asked* The Secretary for Public Works,—When will tenders be called for railway works from Glen Innes to Tenterfield?

Mr. Lackey answered,—The working plans and sections are being prepared, and tenders will be invited for the works as early as practicable.

Legislative Assembly, Wednesday, 19 October, 1881.

(7.) Mr. Fergusson *asked* The Secretary for Public Works,—When will tenders be called for railway works from Glen Innes to Tenterfield?

The working plans and sections are being prepared, and tenders will be invited for the works as early as practicable.—J.W. (*per* W.H.Q.), 19/10/81. Under Secretary for Works.

Legislative Assembly, Tuesday, 30 August, 1881.

(6.) Railway from Glen Innes to Inverell:—Mr. Murray *asked* The Secretary for Public Works,—Have surveyors been instructed to survey the railway route from Glen Innes to Inverell; and, if so, when is it probable that the result of such survey will be known?

Mr. Lackey answered,—Instructions were given to the Engineer-in-Chief in April last for the survey of the route from Glen Innes to Inverell on the completion of the trial survey from Grafton to New England. The survey will be commenced in about a month:

Sir, Department of Public Works, Sydney, 29 October, 1881.

Referring to your letter of the 18th instant, on the subject of the trial survey from Grafton to the table-land, I am directed to inform you that the survey is still in progress, and so soon as it is completed a further communication will be made to you. I have, &c.,

John See, Esq., M.P. JOHN RAE.

No. 59A.

Extracts.

From *Sydney Morning Herald*, 6th December, 1881.

At a meeting of the Railway Committee, held to-day, a resolution was passed approving of the action of the Northern Members in taking exception to the omission by Government of all mention of the Clarence and New England railway. It was decided to hold a public meeting next Monday to petition Government to make provision this Session for a line of railway from Grafton to Central New England (Glen Innes); also to petition Parliament with the same object. Several speakers said they had heard on undoubted authority that the Engineer-in-Chief had plans and estimates prepared for the line, the cost not exceeding £14,000 per mile. Another speaker said that at the present time 300 tons of loading were at South Grafton waiting carriage to New England.

From the *Sydney Daily Telegraph*, 6th December.
