13117. But you had a conversation with Mr. Hickson about the price of £50 for bluestone pitchers before the tender was accepted? Yes.

13118.

C. H.  
Ohlfsen-  
Bagge.

17 Aug., 1896.

13118. Do you remember the effect of that conversation? Mr. Hickson said "We cannot help ourselves." He seemed to have a fixed idea that when a tender was given in, no matter what the prices were, we must pay according to those prices. In Victoria we did not do that. We used to send the tenders in such cases back to the contractors, with a request that they would remodel their prices, so that in the aggregate they would not exceed the sum total of the contract. If the contractors had not done that they would not have got the contract.

13119. You will see from the plan that there are twenty-four shafts in the main line of sewer? Yes.

13120. How many would there be in the branches? Four or five.

13121. Evidently that would take more than 12 yards of bluestone pitching? Yes, decidedly.

13122. When was the mistake found out? It was found out during construction. To the best of my belief, Mr. Davis one day told me that a mistake had been made in the quantities. I think he suggested on one occasion that bluestone concrete should be used around the manholes, so as to reduce the expenditure. I think he did his best at the time to reduce it.

13123. What actually took place after that;—what course did you take? To the best of my belief, we paid for pitching, where it had to be done, at the contractor's price.

13124. Were you compelled to do that? According to Mr. Hickson's idea, we were compelled to do it.

13125. The tender of Carter, Gummow, & Co., in connection with Contract 69 was a most startling instance of rigging, was it not? It was the greatest event of the kind in the way of tendering that I ever saw. It caused a sensation afterwards; and from that moment Mr. Hickson began making alterations in the schedule. There were, as far as I can recollect, one or two alterations before the matter was finally settled. We used to consult about the matter. He sometimes sent for me; and when the Board of Reference were appealed to they finally decided upon the latest mode of tendering. I recollect that, at the time, I said to Mr. Davis that this thing was not new to me, because, in 1844, all works in Germany were tendered for upon exactly the same kind of schedule, except that we had no specification, each item specifying the work comprised in it. The prices for the different kinds of work were published in a technical journal every morning. The contractors tendered at a certain percentage above or below rates, or at par. I thought at the time that the system might give us some trouble. At the same time, I think the schedules which were afterwards drawn were the best which could have been adopted, under the circumstances, with a view to prevent rigging.

13126. But there is no absolute obligation on the part of the Department to accept the tender if it looks suspicious? No; but they always do so here. The lowest tender is always accepted unless the contractor throws it up. In Victoria, if there were any incongruous prices in a schedule, the contractor would be expected to remodel it as I have already explained.

13127. Will you tell His Honor what experience you have had as an engineer, both at Home and since you came to the Colony? I commenced as an engineer in the North German Railway Department. Before I started I had, as is the invariable rule in Germany, to learn a trade belonging to the profession. I learnt the trade of a mason and bricklayer. It is necessary also to pass an examination, and in the evening when you have been at work all day upon the scaffolding you have to attend a technical school. Until you have passed your examination as *conducteur*, as it is called, you cannot be employed by the State. In the winter season you have to attend lectures at the University. In my case I attended lectures at Hanover and Kiel.

13128. After you became a master engineer, what works did you carry out? We built one of the lines through the Marsh-lands, 75 miles in length. I was then ordered to the Department of Inspector-General of Dykes. I ought to explain that these dykes protect the land from the German Ocean. I was there eighteen months, drawing all the railway crossings on the dykes according to instructions from the Dyke Department. I had afterwards to go back to the railway office and prepare the necessary work in connection with the dyke crossings. After I had been there for three years or so I went to Great Britain, and at Glasgow I was under Mr. Neil Robson, one of the principal engineers there, and I carried out some waterworks for the Duke of Hamilton. At the end of 1847 I went Home and entered the army, and at the end of 1848 I went with a number of others to South Australia. We chartered our own ship and I came to Australia, landing in Adelaide. There I started surveying and architecture, and on the discovery of the goldfields in 1851 I came to Victoria. I then went to Governor Latrobe with a gentleman who had once been Colonial Secretary in Adelaide, and I obtained an appointment as chief clerk of works on the goldfields. I there had to build all kinds of works, and I was engaged in that way for about eighteen months. The head-quarters camp, as it was called, was then abandoned, and I started practice in Melbourne. I was in practice there for about six years, and I then entered the Victorian Railway Department. I was on the eve of getting a good appointment there when some 200 officers of the Public Service were all turned out. During this time I had to do some work for the Chief Assistant Engineer for Public Works, and Mr. Wardell told me that he would endeavour to get me a good departmental appointment. He said I must pass the examination as a water and sewerage engineer, and I did so. I subsequently obtained an appointment as engineer for the Ballarat district, the best goldfields district in the Colony. During the time I held that appointment we constructed all the goldfields reservoirs. My reservoirs all stood, whereas reservoirs which had been built by other gentlemen all washed away. Finally they handed over to my charge the whole of the reservoirs, and I had to reconstruct those which had been washed away. I completed about forty-six schemes of water supply. Mr. Wardell told me not to go away, as there was plenty of work for a man of my stamp. He said, "Immediately I see a good appointment you shall have it." I remained in the Public Works Department, having very little to do in the old water branch, when the Chief Assistant Engineer one day asked me whether I would draw plans for a graving dock. I offered to do so, and I subsequently did that work. I afterwards went to the Ballarat Waterworks. I carried out those works, and following upon their completion came Black Wednesday, when I came to this Colony.

13129. Since then what have you been engaged in doing? I had letters of introduction to Mr. Copeland and Sir John Robertson, and I was promised the post of Resident Engineer on the railways. I was afterwards told that I was wanted at the Sewerage Office, and that I must go to Mr. Bennett.

13130. How long have you been in the Government service here? Fifteen years.

13131. During that time you have carried out a good deal of sewerage work? Yes.

13132. In carrying out the works you have enumerated, I suppose you have had considerable experience in concrete? I have during the whole of my life been engaged in large works, and when I say that, you can understand that I have had as much experience in concrete structures as any man living during that period could possibly have had. I have been continuously at work. I think I have built everything which could possibly be drawn.

13133.

C. H.  
Ohlfsen-  
Bagge.  
17 Aug., 1896.

13133. What is your opinion of concrete used in long lengths above ground in any sort of work? My experience is that if bluestone concrete of a certain thickness is put in it will stand better than sandstone concrete. I do not like sandstone concrete at all for sewerage work; but we have here not only to combat difficulty of construction, but we have also to keep in view the necessity of constructing the works as cheaply as possible. Frequently we have put in walls as thin as our calculations would permit of their being made, whereas we should in many cases have put them thicker except that it would have increased the expenditure upon the work very much.

13134. When you were last examined you spoke of a concrete aqueduct at, I think, Rose Bay? Yes.

13135. Did the concrete in that work crack? Yes. I was living at the time at Darling Point, and, speaking from memory, I took the sewer to be the Rose Bay branch. I remember Mr. Davis coming to me and saying "You ought to see that work." Not only was the archwork unsatisfactory, but we found that the lining of the sewer was practically sand instead of mortar. Mr. Davis was very much annoyed, because he said he had put there the best foreman he had. I remember his saying "It just shows how persons may be mistaken in these things." I said "Thank goodness the work is not underground, or you might never have seen it again." I think I am right in saying that the foreman was afterwards dismissed.

13136. What was the size of the cracks in the concrete work? There were not merely cracks; some of the work had tumbled down altogether. As regards the brick lining, I remember putting my penknife in and finding it all sand in the joints.

13137. Did you make the plans for Contract 101? Yes.

13138. Did you make them yourself? No; but I gave instructions for them to be made.

13139. What was provided in connection with that contract—what description of work? I have been thinking over Ahearn's contract since I was last here. I have made a few notes which may, perhaps, throw some light on the matter. They are as follows:

*Contract No. 101.*

For this contract Mr. Stayton also designed an embankment, as viz. :—

The low ground (area of Sewerage Farm) was to be raised 5 feet above high-water level with sand-filling, upon which he proposed to build the triplicate sewer, and this was to be covered with an embankment.

2. To build the sewer on this sand-filling would, however, mean constant settlement, sufficient to crack all the work.

3. To avoid this the sewer for this contract was designed to be carried by low flat 20 feet span arches on piers with stouter (abutment) piers at regular intervals. On completion of the sewer, a strip of the Sewerage Farm to be filled up on both sides of the sewer 5 feet high, and upon this the embankment covering the triplicate sewer to be raised.

4. Instead of this Mr. Hickson ordered the lower filling and the embankment to be left out, and the sewers (which were designed to be built of bluestone concrete) to be built the lower parts only of bluestone concrete, and the upper parts (the closing arch) of sandstone concrete, covered on top with a thin layer of asphalt.

5. The embankment was, therefore, erased on the contract plan and the asphalt covering substituted as ordered.

6. I informed Mr. Hickson at the time that the work would crack, but he said it would not.

7. Pile foundations were also designed to be executed upon all bad ground, but Mr. Hickson objected to any piling, as, in his opinion, simply a waste of money. I remonstrated with him, and at last he permitted me to provide for it in the specification and in the quantities, to be executed when ordered.

8. Therefore if Mr. Hickson did not order any pile foundation on bad ground the responsibility rests with him.

9. It has been reported to me that this work has cracked badly; if so, it is due to settlement, expansion, and contraction, for which Mr. Hickson and Mr. Davis are solely responsible.

13140. Supposing the piers have not sunk at all? Whether that be so or not the work has cracked.

13141. But supposing the piers have not sunk, what would the cracking be due to? The sandstone concrete and the bluestone concrete act differently. There is a different contraction and expansion in the two kinds of concrete. It was a mistake, I think, to put in the sandstone concrete, merely because it was cheaper. Even if the foundations had not given way the concrete was bound to crack from the unequal contraction and expansion of the two kinds of concrete.

13142. When you built the reservoirs at Ballarat, to which you have referred, at the time when the other reservoirs had washed away, of what did you construct them? There were earthen dams and some concrete embankments.

13143. Was there concrete with puddling at the back? No; it was pure concrete work.

13144. Did the reservoirs hold water? They were as tight as drums.

13145. What was the thickness of the concrete? In one case it was about 5 feet thick at the top.

13146. Will concrete hold water? If the work is properly done.

13147. Was the plan No. 101 which you see before you made under Mr. Stayton or under yourself? That is the plan as ordered by Mr. Hickson to be carried out. The work was to have been covered in with an embankment.

13148. Will you explain what alterations were made? The work was intended, as I have just stated, to be covered by an embankment, because, if the sewage farm were raised 5 feet, it would leave the work just on the surface, and, it being such a long structure, it was considered unsafe to leave it exposed to the weather unless it were constructed in a totally different manner. Mr. Hickson said it was plenty thick enough, and that we were far too extravagant. He therefore cut down the bluestone concrete at the top, and put in sandstone concrete in its place for cheapness. The side walls, if designed in accordance with similar work exposed to view at the farm, should have been 1 ft. 9 in. in thickness, whereas they are only 1 ft. 4 in.

13149. Did you draw the specifications for Contract 101? Yes.

13150. Why did you insert clause 175 as follows:—"In conjunction with the concrete surrounding sewer, where the latter is built upon arches and in embankments, the contractor to provide, fit, place in position, and wall in with the concrete, longitudinally, in each corner at top and bottom of concrete lining,  $\frac{3}{8}$ th inch diameter bond rods in 16 feet lengths, the ends to overlap 12 inches and tied together with binding wire, and, transversely,  $\frac{3}{8}$ th inch diameter bond rods  $4\frac{1}{2}$  inches above soffit of sewer of such lengths as to fit between the outer brick lining or as shall be directed, spaced 10 feet from centre to centre. The cost of providing, fitting, placing, and walling in, said bond rods to be included in the schedule price per cubic yard of concrete"? That clause was probably put in for safety's sake, with the view, possibly, of preventing the concrete from cracking.

13151. Do you think it would stop the cracking? It would have a tendency to prevent it from cracking.

13152. In the schedule signed by the contractor, you will find the following item, "Supplying and fixing hardwood round timber in piles, including the providing and fixing of iron shoes and other ironwork used in fixing same, as specified in clause 5, 7,400 lineal feet";—does that refer to the piling? Yes.

13153. Do you recollect why the piling was taken out? Mr. Hickson was dead against the piling. He said we had wasted a lot of money in piling in these works. I said "You had better allow us to put it in the specification, and then you can put it in where you like as you go on with the work. If you find

bad

bad ground you will have the specification there for the piling. Otherwise it will be an extra, and the contractors will be able to charge practically what they please." That being so, he permitted me to put in the clause.

13154. But it was not carried out? No; it was only to be carried out when ordered. It was left to Mr. Davis to report to Mr. Hickson. If he reported that piling was necessary, it would be done, and if he did not report that it was necessary, then it would not be done.

13155. You see that concrete is set down in the schedule as follows: "8,700 cubic yards of sandstone concrete, and 4,180 yards of bluestone concrete"; but the quantities actually were 10,190 yards of the former, and 3,416 yards of the latter? Yes; I see that the bluestone was diminished and the sandstone increased.

13156. But the increase was in greater proportion than the diminution? Yes.

13157. Why was that? That I cannot say.

13158. Would the sandstone be likely to be increased on account of the piling being done away with? That is very likely the case. They might have gone deeper with the foundations, and have put sandstone concrete in the bottom.

13159. What is the amount set down for piling? £1,480.

13160. So that there would not be a very great saving? No; it is better to be safe than sorry afterwards.

13161. In regard to the packing, you specified for concrete packing in certain cases, and afterwards the packing was changed to other material;—what was the object of specifying concrete for packing if other material would do? When sewerage works were started in Great Britain the work was constructed in a comparatively flimsy way. It was thought that, the sewers being out of sight, if they leaked a little it would not matter. In the streets of London there were various tunnels under the streets—some for water-piping and some for gas-piping, and so on—and it happened that when the men went down to repair the pipes and lighted a lantern, there was suddenly a terrific explosion. This was said to be due to defective tunnel work, and a great deal of mischief resulted. The repair necessitated the expenditure of a very large sum of money. The Americans built a large tunnel in rock under a lake, by means of which the waterworks at New York were to be supplied. That tunnel was similarly built—that is to say, there was a brick lining packed behind with sand. When the work was officially opened it was found that the water had gone into the sand packing, and that the whole tunnelling had collapsed. It cost several millions of dollars to rebuild the tunnelling in the proper way. It had been found out in England that slovenly-built tunnelling would not do for gas, water, or sewerage, and it was provided in consequence that the sewer should be bound to the sides of the rock, forming one watertight joint by means of concrete packing at the back. I remember that these accidents occurred in Mr. Bennett's time, and that he told me that we must be very careful in such matters. I do not remember at this moment the exact locality as far as the London work is concerned, but Mr. Bennett, I think, showed us the papers of the British Institute of Civil Engineers. There were also articles in the public press on the matter.

13162. About what date would that be? It would be about fourteen or fifteen years ago. It caused us to be very careful, and as a consequence we specified for concrete packing round the brick lining. When you build single-brick lining, it does not matter how careful you are, you will find that every joint will not be full of cement. For instance, in a small sewer, one bricklayer will be at work in front and the foreman will be seated behind him. The foreman will, perhaps, have half-a-dozen shafts to supervise. The brickwork lining is started from each shaft, and the foreman cannot be everywhere. The consequence is that if the bricklayer is not an honest man you will find numerous joints containing nothing at all, and if there is no concrete packing behind the brickwork you will find that the drainage over the sewer will form a water-way, and in course of time very serious trouble may arise. For instance, all our city sewers receive the sewerage from the old corporation sewers, and they are built very shakily in places—in fact, it was extremely difficult to intercept them. In a heavy storm, when those sewers were brimful, we received far more flood-water from them than our sewers were calculated to carry. Some of them, therefore, would be, under pressure, brimful; and, under those circumstances, if you had hundreds of joints without any mortar, and if you had no lining behind the brickwork, the sewer would collapse. It was found out upon one of the contracts that the contractor had left out the packing and had put in shale and other stuff in its place. Mr. Davis was a little annoyed about it, I daresay, and he made a handle of that incident to recommend to Mr. Hickson that the sandstone concrete packing behind the sewer lining was ridiculous. There was some correspondence on the subject, and I think the papers will show that the Minister was informed that sandstone concrete packing would not be introduced afterwards. I remonstrated with Mr. Hickson about this, and told him why we put it in. I told him that it had been put in on account of the terrible expenditure which had been necessitated in Great Britain and also in America from the absence of the packing, but he did not take any notice of my remonstrance. I remember writing a minute to Mr. Hickson about the matter, and he returned it to me without a single word upon it.

13163. *His Honor.*] I suppose you agree with Professor Warren that every joint is properly filled with cement mortar then the packing may be almost anything so long as it is substantial; but you want to provide for the risk, which you say is a very common one, of the bricklayer leaving some of the joints open? I do not agree with Professor Warren at all, and I never would. He was put into my office as a draftsman, and when the position of Professor at the University was advertised he asked me what I thought of it. I said, "By all means take it. I am afraid you will never be a civil engineer."

13164. *Mr. Parkes.*] Was he a calculator? That reminds me that we calculated the strength of the Bondi sewer at the point where it goes under the sandhills. Mr. Hammer, the chief draftsman, said to me "It will never do for one of us to do this work," and I agreed with him that we should all do it together, each in our own way, and then see what result we arrived at. I said to Professor Warren "You are a Dublin University man, you ought to be a good calculator." He said he was. Those who were making the calculation were Mr. Hammer, the chief draftsman, Professor Warren, Mr. Cardew, and myself. Mr. Cardew, I may mention, is a surveyor, and is a very good calculator. We all did this work together, and when we came to compare matters, Professor Warren was nowhere. He got stuck in the middle of the work. Mr. Hammer, Mr. Cardew, and I, came out very closely. I recollect that we calculated all the thicknesses of the sewer, and that one day afterwards Mr. M'Mordie came to me and said "Your sewer in the sandhills is gone." He asked me whether I did not remember that Mr. Bennett had in one instance reduced the thickness of the sewer considerably, and while we were speaking about that matter I was asked to go in and see Mr. Bennett. He said "Your Bondi sewer has gone." He told me the place, and

C. H.  
Ohlfsen-  
Bagge.  
17 Aug., 1896.

and I asked him whether he would allow me to go to my desk for a minute. I told him that, when he had proposed the alteration, I had regarded the matter as a very serious one, and I remember asking him if he would take the responsibility of reducing the thickness. He had said that he certainly would. On going to my desk, I found the memorandum, from which it appeared that on a certain day, at such and such an hour, Mr. Bennett had come to me, and we had spoken about the different thicknesses of the Bondi sewer, that Mr. Bennett had said that at a certain point he would allow 2 feet instead of 3 feet, or whatever it may have been. Mr. Bennett roared with laughter when I pointed this out to him, and said "That is where you have me. You had better put the thing to rights again."

13165. The schedule and specifications for Contract 79 were made out by you? Yes.

13166. Let me draw your attention to your minute of 13th of March, 1894, in connection with Contract 79A, which appears upon page 325 of the Parliamentary Return. Do you recollect that minute? Yes.

13167. You say in that minute "By way of comparison I have prepared an office estimate of the cost of this extension according to present prices, amounting, as per detail statement attached, approximately to £12,831 19s. 6d.";—if you turn to page 337 you will see the schedule of Messrs. Carter, Gummow, & Co.'s prices for Contract 79, an extension from Mount-street to the junction of Campbell and Jeffry Streets, with branches—I want you to compare that with the office estimate upon page 339; having done that, will you tell me whether the office prices were made up by you? Yes.

13168. Do you recollect how you made up that schedule? As I said before, I always consulted with Mr. Davis to ascertain whether prices had dropped down before we settled upon the schedule. We put down, not what the contractors would probably tender at, but what we thought was the value of the work. Of course prices have dropped immensely since then.

13169. Did you do this particular work yourself? I could not be quite sure.

13170. Did you take into consideration the schedule of No. 79 when you made this particular schedule? I may have looked at it. In any case of the kind I am quite sure that I should have consulted Mr. Davis, and should have asked him whether there was any alteration in the prices. We would probably go through the prices together.

13171. But would the amount of money set down here fairly represent the difference between blasting and guttering and gadding? Yes; gadding is very nasty work.

13172. Why did you put in a certain amount of money for guttering and gadding if you knew that it was not going to be done? In travelling over the surface we would come to the conclusion that the people from such and such a point to such and such a point would naturally object to blasting altogether, and that if any mischief were done it would possibly cost a tremendous lot of money for compensation. Upon that supposition we would put down guttering and gadding at that point. In another locality we might come to the conclusion that if injury were done there by blasting, the compensation might also amount to a considerable sum of money; but still the sewer might be at a certain depth, and in that case we might allow so much blasting with 2-inch charges of powder. In another case we might allow blasting with 4-inch charges of powder. A distinct clause would be put in so that we could use either blasting or guttering and gadding, as necessity arose. You must always in a contract like this put down a certain quantity.

13173. If you look at Contract 79, you will see that all the guttering and gadding work there was done away with in favour of blasting? That was very likely.

13174. Why was not the guttering and gadding work carried out? We always make provision for it, and if afterwards no one complained of the blasting, the work would be done by blasting. Of course, the work would be done as cheaply as possible.

13175. Ultimately, in the case of both 79 and 79A, blasting was used? That is very likely the case. Probably, if persons did not threaten us with lawsuits and so on, in that case blasting would be proceeded with. The contractors do not like guttering and gadding; it creates too much dust down below, and we have heard of a good many cases where men have died from consumption contracted while doing guttering and gadding work.

13176. *His Honor.*] Do you think that guttering and gadding is very much worse for the men than blasting? Yes.

13177. Where there is fair ventilation? Yes; it is always worse, because, it being done chiefly in small sewers, you have one man seated at the end of the work, and with the very best of ventilation, he must inhale the fine stuff from the gadding. All kinds of things have been tried, but it has been found that a certain number of men have died from the gadding when it has been carried out.

13178. *Mr. Parkes.*] This specification seems to be general; there are clauses in it which are never carried out; there are clauses in it for instance having reference to interpretation of terms, supplementary specification, and all sorts of things which are not carried out;—why not have a complete and definite specification for each work? That is what I have always advocated. I have been writing specifications since the year 1844. In Victoria we took the Crown Solicitor's opinion upon this matter, and he was of opinion that the specification for each contract simply described the work comprised in that contract—neither more nor less. Mr. Hickson, however, was very anxious to introduce novelties, and he said to me "Your specifications are far too long." Possibly they were long, but there was a rule in Victoria that if a man forgot anything, in the specification for a big job, which ought to have been contained in it, he was fined from £5 to £20. I have drawn specifications in Victoria for big jobs—graving docks, lunatic asylums, hospitals, fortifications, and numerous other works. I told Mr. Hickson that I had never been fined for any omission, and he said he could quite believe it. I was careful that my specifications contained everything which was necessary. However, Mr. Hickson said the specification should be shorter, and he asked me why I did not generalise. I asked Mr. Hickson how it was possible to do that when there were so many different descriptions of work to be done. I said it would make a book. All the different Departments, I believe, were requested to do the same thing, but they all protested. They did not like the idea. Mr. Hickson, however, was very peremptory. He once sent a specification back to me with a few words upon it to the effect that what he wanted must be done at once. I was very much puzzled as to how I could carry out what he wanted, but I finally completed the work and Mr. Hickson seemed satisfied with it. I believe the specification I drew has since been used in all the different Departments. After a time it was still thought too long, and Mr. Davis and others were asked to curtail it. I believe they did so, but it did not contain what, in my opinion, it ought to have contained.

13179. Is the form printed in the Parliamentary papers the curtailed form? Yes, I think so.

13180. How much greater was the original specification which you say made a book? It would be several pages bigger than the specification you have there.

13181.

C. H.  
Ohlfsen-  
Bagge.

17 Aug., 1896.

13181. Was there any reference to supplementary clauses and things of that kind? There may have been. It is quite possible that things may have been omitted. As I say, I do not like that form.
13182. You prefer a specification for every individual job? I do. It would not take us a very long time to prepare it, because if a work similar to the one already carried out were proposed the clauses in reference to it would be cut out of the preceding specification. It would not take very long to prepare the specification, although it might have cost a little more in printing.
13183. You think there should be a distinct specification for every work? Yes. It is impossible, in a general specification, to specify everything. If, for instance, you are constructing a sewer, you will find it necessary, in many cases, to add another specification.
13184. *Mr. Davis.*] How long did it take you to make the schedule to the specification which you say was so voluminous? A good deal of time. I had other work to do.
13185. How many months did it take you? It may have taken me three months for aught I know.
13186. The clause read by Mr. Parkes in reference to the bonding rods in Contract 101 was a general clause which would come in where it was considered that it would apply? I could not say. If it is in the specification, it may be a general clause.
13187. Do you know the practice in Victoria at the present time as to the system of tendering? I think there is in Victoria, from what I have seen, a schedule of prices.
13188. That is to say the contractors fix their prices? I could not tell you that.
13189. Was it before or after the receipt of the tenders for Contract 79 that you saw Mr. Hickson with regard to the big rates for shaft excavation? It was after receipt of tenders.
13190. With regard to Contract 69;—was it before or after the receipt of tenders that you saw Mr. Hickson with regard to the price of £50 per square yard for bluestone pitchers? If I saw Mr. Hickson it would always occur when the tenders were sent up to me. The tenders would come up to me from the Board. I then looked through them and recommended the acceptance of a certain tender. If I saw any incongruity in connection with a tender, I would direct Mr. Hickson's attention to it.
13191. Are you sure that you went to Mr. Hickson and pointed out to him this price of £50 for bluestone pitchers? Yes.
13192. You are sure of that? Yes.
13193. Why did you not put it in your recommendation? For the simple reason that Mr. Hickson told me that it was of no use objecting, and that we should have to pay the price given. He insisted upon the price in the schedule being paid. I suggested that the tenders should be sent back to Carter, Gummow, & Co., and that they should be asked to revise their prices, but he said that that could not be done.
13194. Do you not recollect that that matter arose in connection with the first certificate that was made out? Not at all; it arose immediately the tenders were sent to me for my recommendation.
13195. You will see from page 66 of the Parliamentary return that you sent in the eleven tenders, and recommended the acceptance of Carter, Gummow, & Co.'s tender of £45,207, and that in recommending the acceptance of that tender you pointed out certain slight irregularities? Yes, that may be.
13196. Was it not your custom to include in your recommendation anything which you had to say as to the tender which you recommended? Not at all.
13197. Why did you do it in that case? I forgot for the moment that a question had arisen in connection with the ironwork; but I remember that I consulted Mr. Hickson about the £50 per square yard for bluestone pitchers. I remember that when the tenders came up I called you in to see me about the matter, and I went down straight to Mr. Hickson with the tender. I told him that a price of £50 per square yard for bluestone pitchers had been sent in, and asked him what we were to do with it. He said, "It cannot be helped; we shall have to pay it."
13198. You are quite clear in your mind that you saw Mr. Hickson before you recommended the acceptance of the tender? Yes. I put in my minute that which I thought Mr. Hickson would be prepared to accept.
13199. Supposing other officers of the Department are prepared to swear that this matter was not detected until the first certificate came to be made out, will you still persist in saying what you do? The officers of the Department are at the present time labouring under a reign of terror, and I would not believe a single man in it.
13200. And upon that ground you stick to what you said? I do, most decidedly. I could have had many witnesses here if I had not thought that the unfortunate fellows might lose their positions.
13201. Have you tried to get them here? No; they offered themselves to me, but I declined the offer.
13202. Did they say they would not come because they were afraid of losing their positions? No; I said to them, "I could have obtained summonses for you, but I will not do such a thing, because if you love your bread and butter you would not state the truth."
13203. Will you give us the names of those officers? No, I will not.
13204. *His Honor.*] What is the reign of terror you speak of—does it arise from the operations of the Public Service Board? The position of matters is this. A Public Service Board has been appointed, and the only professional man upon the Board is Mr. Coghlan. We all knew in the Public Works Department that Mr. Barling was practically Engineer-in-Chief. We all knew it, because whenever Mr. Hickson told me of any change, he said, "Mr. Barling wants to do so-and-so." I should explain that Mr. Barling was originally chief clerk of the Harbours and Rivers Branch, and I say that it is a slap in the face of every professional man in the Service that they should be ruled by a gentleman who understands nothing about professional matters. Mr. Barling made a number of professional appointments, and I say it is a slap in the face to every professional man in the Service that he should be under his rule.
13205. What I wish you to explain is what you meant when you spoke of a reign of terror—did you refer to the action of the present Public Service Board or to the action of any other authority? I am dealing with things as they are at this moment. The Public Service Board has removed such a number of public officers as to practically bring about another Black Wednesday. In the Victorian case the Black Wednesday was the cause of about a dozen suicides among the Civil servants. Here so far it has caused only one. What I mean to say is this—that if you go through the Public Works Department at this moment you will not find a single man in it who has a happy feeling with regard to his position; they are terror-stricken. They do not know at what moment they may be turned out of doors.
13206. Then, in alluding to a reign of terror, you do not allude to the present heads of the Department but to the Public Service Board itself? I do not believe there is a head of a Department at this moment who does not shake in his shoes quite as much as do other officers in the service. 13207.

C. H.  
Ohlfsen-  
Bagge.  
17 Aug., 1896.

13207. *Mr. Davis.*] You mentioned that you were terribly afraid that Mr. Stayton was about to supplant you, and you went so far as to state that Mr. Barling intended to appoint Mr. Stayton in your stead—is that the case? I was not exactly afraid of Mr. Barling doing it, but I knew that he wanted to do it from the beginning. As far as I myself was concerned, at that time I could have got a better living outside. Even at the present time I can make a living outside where other people would starve.

13208. Have you any special grounds for making the assertion that it was proposed to put Mr. Stayton in your place? Mr. Stayton came to the office at the time to which I refer. I may mention that it was then considered a novelty to take into the work of the Department as many strangers as possible. Mr. Stayton was appointed by Mr. Bennett to make a report upon the western suburbs sewerage, and he came to me and asked me for all kinds of information about it. I said "How is it that you come here. You are supposed to have all the latest ideas at your fingers' ends. Why should you come to me for all this information?" He said "I am not such a fool as not to know that you fellows are doing the work, and that you have it at your fingers' ends, whereas I have not. How can I introduce anything which is new? I cannot show you anything which is new." Mr. Stayton is a good speaker, and he is a clever man in many senses of the term. He wrote a report and got my best men to help him to do so. I repeat that Mr. Barling, from all I know, intended to have Mr. Stayton in my position.

13209. Is not that a mere surmise on your part? I do not think so. At that time there was a Parliamentary party who went down to examine the sewage farm. At that party it was stated that Mr. Stayton ought to have charge of the work. Mr. Bennett said: "No; I am not aware that Mr. Stayton has carried out any work; but I know what Mr. Bagge has done in my own office. As long as I am alive Mr. Stayton shall not supplant Mr. Bagge." That is where my surmise comes in.

13210. But Mr. Barling had no connection with that? Mr. Hickson came to me and said "You know Mr. Barling says it is absurd to have you alone in charge of this work. All the responsibility rests upon you. There should be at least three Bagges." I consider that for a man like Mr. Barling, who was the chief clerk of another Department, to say that I was not competent to carry out this work, and to have the responsibility of it, was going rather too far, seeing that I carried out very extensive works. I consider that that matter alone affords quite sufficient ground for me to grumble about Mr. Barling's interference.

13211. Going back to the arches to which you have referred, will you tell His Honor where this branch sewer was at Rose Bay? I thought it was Rose Bay, but I have come to the conclusion that I must have been mistaken. You yourselves must know perfectly well where it is, and if you think I am wrong tell His Honor where you think the arches were which we saw. You drove me out to the sewer, and you know perfectly well where it is.

13212. *His Honor.*] Do you think you could point out the spot now;—there seems to be some doubt in your mind as to whether it was at Rose Bay or not? Yes; I have not the slightest doubt that I could point it out. I know I was living at Darling Point at the time, and that the work was out in that direction.

13213. *Mr. Davis.*] Was it part of the main sewer which comes above ground? No; it was a branch sewer going into the main Bondi sewer.

13214. A branch sewer in what district? I could not remember at this moment, unless I went over the ground and saw the sewer.

13215. On which side of the main sewer did it come in—was it on the northern side? I think so. If I went out to the place I could find it; I have not a shadow of a doubt of that.

13216. You think it was not at Double Bay? No, I think it was at Rose Bay.

13217. *Mr. Carter.*] Referring to the question of defective work of which you were talking just now, and which you presume is in Rose Bay—was it not, as a matter of fact, upon Double Bay, upon our contract going through the Chinese gardens;—do you not remember coming out and looking at some of that work? I recollect Mr. Davis coming to me in the office one day and telling me about the work to which I refer.

13218. *His Honor.*] In going to it did you drive down the new South Head Road? Yes.

13219. *Mr. Carter.*] Do you not remember that the work to which you refer is in the Chinese gardens upon the Waverley contract, and do you not remember that the cause of it was a faulty design on the part of the Department—there being insufficient foundations in bad ground;—do you not remember that the design was altered, and that they paid us for the foundations? I do not remember that. I remember that there was a great quantity of sand in the work that I saw, and I remember telling Mr. Davis that the centering had not been watertight.

13220. Referring to Contract 79 at North Shore, and the items for guttering and gadding, did you ever contemplate guttering and gadding at the depth at which that contract was carried out—250 from the surface? It was not all that depth.

13221. But a good deal of it was, was it not? The guttering and gadding was supposed to be done in the neighbourhood of shafts. When a shaft has been sunk, and when they begin blasting, there is a terrible concussion, which has been felt on the surface to such an extent that in some cases it has been known to blow out the fanlights of houses. We always allowed a certain amount for guttering and gadding.

13222. But you never contemplated that the whole contract should be carried out by guttering and gadding—say, 1½ mile? No; only a small quantity was given.

13223. So that if Mr. Davis tried to make us carry out all the work by guttering and gadding he was exceeding his power under the specification? It was not intended that the whole work was to be carried out by guttering and gadding. That is why I fixed a certain quantity. Supposing we had put down 360 cubic yards, and 1,000 yards were suggested, I would consider that it would be wrong to make the contractors do that quantity. That is why we fixed the quantity as nearly as we possibly could.

13224. Referring to financial matters, how did you arrive at the conclusion that the prices in connection with Contract 79 were fixed at a very high rate for the first few items for financial reasons? I am an old practical man in these matters, and I have dealt all my life with contractors, and when I saw this extraordinary rigging the only conclusion at which I could arrive is that which I have stated. I knew that money was tight at the time; I had heard so from outsiders; and I said to Mr. Hickson that the only reason for these prices was that the contractors wanted to raise money out of the items with which to carry on the work.

13225. Were you told that money was tight with us, as far as we were concerned, or that it was tight generally? Tight generally.

13226. You have no knowledge of our financial affairs? No.

13227.

C. H.  
Ohlfsen-  
Bagge.  
17 Aug., 1896.

13227. *Mr. Davis.*] How long is it since you were retired? I think it is very near a year ago.
13228. You had a difficulty in getting the question of compensation settled, had you not? Yes.
13229. In fact, it has been settled only within the last few months—is not that so? I received it a day or two over the three months after the 31st of January.
13230. In the meantime you bought a house at Minto? Yes.
13231. And you found that in order to carry out your ideas you had to make certain alterations to that house? Yes.
13232. Did you find any difficulty in carrying them out? Certainly. I will tell you how the matter stood. I met Mr. Snodgrass one day; he stuck me up in the street, and he said "I hear you are going to build out there. You take my advice and come to us for your building material. We will let you have it at the same price we give ourselves—that is wholesale. If you get it for yourself you will be taken in nicely." I said "I will think over it." Mr. Snodgrass then added "There is no obligation at all in the matter. You will get the material at the same price at which we get it ourselves." I said "What I should like is a good carpenter. The tenders I have got in are such extraordinary ones that I am afraid to tackle the work." He said "I will recommend you a tip-top carpenter. He has built houses for us, and so on." I said "All right." He sent me this carpenter. He was a smart fellow. I took him out there and he engaged other carpenters. The building was constructed of the material which I obtained from Carter, Gummow, & Co. at their prices. The prices were very moderate indeed—in fact, the people in the neighbourhood said that I should not be able to buy the material myself at the same prices. Afterwards, when I was building again, I went to Mr. Gummow, and he said "You will find that you have the material at the price which we paid for it. I had got into a fix because Mr. Barling did not pay me my money when it was due, and I had speculated with every penny of it. However, he kept me waiting, and I could not stand hat in hand in front of the offices of the Department waiting until it pleased Mr. Barling to pay me the money. I was not earning anything, and I had to lay out my money to make an existence for myself and family, and that I have done."
13233. But you got the material you required from Carter, Gummow, & Co.? Yes.
13234. Did they not in addition to that lend you money? When Carter, Gummow, & Co. gave me the material I said to them "You must wait until I get my money from the Government; if I get it on the 31st January I will pay you for the material on that date."
13235. But did they not lend you money? I worked on as far as I could; I had borrowed on my insurance policy, and I was stuck up. I had about another fortnight's work to do, and I said to the carpenter "You will have to clear out." He said "I am sure Carter, Gummow, & Co. will advance you £20." I said "I do not like to ask them for it." He said he would see them about it, and he did so. I gave Carter, Gummow, & Co. a promissory note for the £20 and for an amount sufficient to cover the cost of the material. The moment I got my money from the Government I went to Carter, Gummow, & Co., and paid them every shilling I had owed them.
13236. What did you repay to Carter, Gummow, & Co.? I paid them £150 for material and £20 for their loan—in all £170.
13237. What was the date when you made arrangements with them to get the material and money, amounting in all to £170? I could not tell you the exact date. I remember meeting Mr. Snodgrass once by accident, and he asked me what I was doing. I told him, and I said I had a great mind to do the work by day work. I remember his saying that it did not matter about the money, as they would let me have the timber and get the money when I got it from the Government.
13238. Did they charge you any interest? Not a 6d.
13239. Were they not, for some reason or other, very liberal and obliging. Yes. I believe they were actuated by no other feeling than this—that I had been in the Government service for a number of years, and that the least they could do for me would be to let me have the material at wholesale price. They deal in those things wholesale, and it was next to nothing out of their pockets; besides, when times are bad, they are a firm who like to keep things going, as it were.
13240. They did not expect to get any advantage from you by accommodating you? No; they never asked for it.
13241. *Mr. Parkes.*] When you bought this material, and got this carpenter from Carter, Gummow, & Co., had you left the Service? Yes.
13242. Did you ever have any financial transactions with them while you were in the Service? No.
13243. If their bank-book shows a cheque under date of April 2nd for £170, that would probably be for the payment of the money you owed them? Yes.
13244. How long was it before that date that you made arrangements with them for the carpenter and for the timber? It would be about four or five months before that date.
13245. It was only a business transaction after all;—you paid for what you had? Yes.
13246. During the time you were in the office no approaches of any sort were made to you? No.
13247. The firm had no favours to buy from you? No.
13248. And they would not be likely to pay you anything for calling attention to their rigged schedule? No; I should say that in no case did I speak a bad word, or anything of that kind of anyone, if I could possibly help it.
13249. *Mr. Carter.*] Mr. Parkes has put the transaction between us in the light of a business transaction—as a matter of fact, was it a friendly transaction or a business transaction? In one sense of the word it was a business transaction. When Mr. Snodgrass offered me a good carpenter, and offered me the materials at cost price, it was a friendly transaction.
13250. Did we not lend you our best carpenter;—were you not thoroughly satisfied with him? I was not. He spent about £50 more than he ought to have spent.
13251. Did we not guarantee your account at the timber merchants—you must remember that we do not deal in timber? That I do not know.
13252. Do we sell timber? No; but Mr. Snodgrass said "Get your material through us. You will get it cheaper than if you were to buy it yourself."
13253. *His Honor.*] As regards the packing of the lining of the sewer, in saying that it is very important that it should of itself be of watertight material, I understand you to say that that is principally, if not entirely, because of the chance of a joint here and there being left open in the brickwork? Yes.
13254. And it is, unfortunately, a peculiar weakness of the Australian bricklayer to leave joints open when he can? We calculate upon the brickwork being watertight, but, unfortunately, it is not always so.
- It

C. H.  
Ohlfsen-  
Bagge.  
17 Aug., 1896.

It is almost impossible to rely upon there being watertight joints in the brickwork, and the packing, of course, would cover any loose joint.

13255. If you were quite sure that every joint was actually full, then, as a general rule, any solid packing, whether watertight or not, would be sufficient? You must look at the matter in this light. If the sewer were built outside it would be surrounded by concrete, in order that it might hold itself up, and the moment the solid packing is taken away from the sewer you simply leave the  $4\frac{1}{2}$ -inch brickwork, and that is not sufficient.

13256. But any substantial packing that fills up the interspace between the outside of the lining and the tunnel walls would generally be sufficient if every joint of the brickwork were really full, would it not? No; it would not. The packing should be concrete.

13257. You think it is better that it should be concrete? Yes; of course, when I speak of open joints, it must be understood that even with the best supervision loose joints will creep in, and I think the  $4\frac{1}{2}$ -inch brickwork ought to be packed watertight up to the rock in which it is built.

13258. Even if the brickwork is absolutely watertight throughout? Yes. I generally calculate that single-ring brickwork will be watertight for from five to six years. I would never trust it of itself.

13259. Does the brick change its character then? No; but you must not forget that the mortar is not always of the consistency at which it leaves the mortar-box when it goes in between the bricks. Little faults will creep in here and there, and sometimes a joint is dry. Sometimes also the mortar is weaker in one place than in another. Take the case of stoneware pipes, the joints of which are filled with 1-to-1 cement. You can test the joint up to 50 lb. of pressure if good cement is used, but in the case of the mortar which is put into these tunnels you must remember that it is handled at the top and shifted about at the bottom. You cannot always rely upon its being of the proper consistency. Then, again, in these tunnels you have to consider the waterwear from outside drainage. That may become a very dangerous thing.

13260. Suppose the sewer is built in a tunnel of solid rock? Even in a solid rock it should be packed watertight, because you never know where a fissure may end, and it is a well-known fact that if you sink a shaft in solid rock, in the course of time, if there is any water-bearing fissure in the neighbourhood, it sucks and sucks the water in. Once water gets through it increases the cavity, and in course of time you might get serious waterwear round your sewers. Theoretically, packing may be deemed unnecessary here and there, but it is not so in practice. They found that out in Great Britain very much to their cost.

13261. *Mr. Parkes.*] Are there used in this country any porous bricks? Plenty. Ordinary building bricks will soak up from three to four times as much water as sewerage bricks.

13262. Will plastic double-pressed bricks keep water out? I cannot say, speaking from memory, what quantity of water they will soak up, but they all soak up some water. Of course, the finer the brick the less water it will soak up.

13263. Double-pressed bricks will not keep water out of a house? They ought to if the bricks are good.

Thomas Williams recalled and further examined:—

T. Williams.  
17 Aug., 1896.

13264. *Mr. Parkes.*] I want you first of all to explain the exact nature of your contract with the Water and Sewerage Board in connection with which you obtained some advantage;—in the first place, were there any bores put down? No; none whatever.

13265. Did the plan indicate the material through which you had to drive? No.

13266. Did any officer of the Department object to paying you your claim? No; but when the work had progressed to a certain extent, and when money had been expended up to the amount of my tender, they wanted to stop the contract.

13267. How many contracts have you carried out for the Water and Sewerage Board? About five or six.

13268. And this is the only case where you had an advantage? That is the only case.

13269. You had a dispute in this matter with the officers, had you not? No; except that they wanted to stop the work and not go on with some portions of it.

13270. There was an appeal to the Water and Sewerage Board? Yes.

13271. And was Mr. Hickson the strongest man at the Board for paying you your claim? I was told he was, but this is the letter I received:—"Sir—In reply to your letter of 7th instant, requesting that the necessary information might be furnished you in order to carry out the schedule of work enumerated therein in connection with your Contract 78, the construction of pipe-sewers in portion of the Borough of Glebe, I am directed to inform you that the Board of Water Supply and Sewerage have approved of your contract being carried out to the extent shown on the plan." I am told that Mr. Hickson proposed that I should be allowed to do that.

13272. Therefore, you have no ill-feeling towards Mr. Hickson? Certainly not. It would be rather the other way about.

13273. He has been your friend to the extent you name? Yes.

13274. With reference to your conversation which you are supposed to have had with Mr. Millner, where did you meet him? In King-street.

13275. What was the conversation? I do not remember it very well, but I think I gave it you as nearly as I can remember it when I was here on a former occasion.

13276. As a matter of fact, was it not Mr. Millner who gave you a lot of particulars about Government contracts which you gave to me? He was the first man who told me of the cutting of the storm-water drain at Johnstone's Creek by the unemployed. He used to pass my house nearly every time he went across in that direction, and he told me once that the unemployed were cutting a drain for Carter, Gummow, & Co. He told me that Mr. Davis was actually against the work being done by the unemployed, but that Mr. Hickson passed it.

13277. He said that Mr. Davis opposed it, and that Mr. Hickson passed it? Yes.

13278. Was Mr. Millner also the gentleman who gave you most reliable information—information which you most relied upon—as to the action of the Department with regard to Carter, Gummow, & Co.'s extensively-rigged schedule? Yes; he told me about that affair. He told me, also, with regard to Carter, Gummow, & Co.'s contract, that Mr. Davis condemned the use of the sandstone taken from the district in connection with the contract, but that Mr. Hickson also passed that.

13279. The conversation among the lot of you was one of general condemnation? Yes; Mr. Millner said he would not take the responsibility of doing it.

13280. How many more were present besides your two selves? When he spoke to me about the storm-water sewer there were only our two selves present, but Mr. Millner approached me last Saturday in Moore-street, and wanted to apologise for what he had previously told Mr. Davis. T. Williams.  
17 Aug., 1896.
13281. He came to see you last Saturday, you say? Yes.
13282. Did you, prior to the letting of Contract 77, or after the letting of that contract, have an interview with Mr. Gummow? Yes; it was after the work was started.
13283. What conversation took place;—did Mr. Gummow say anything to you as to the way in which he had arranged the schedule for the Monier work? No.
13284. You are sure of that? Yes; I do not remember anything about that.
13285. You do not remember any conversation with him about that? No; and that is the only conversation I have had with him for three or four years.
13286. Did Mr. Gummow at any time give you information as to how the lump sum of £15,500 was arrived at in connection with the Monier arches? No.
13287. *Mr. Davis.*] You have seen Mr. Millner pretty frequently then? Yes; he came across to where I was standing in Moore-street on Saturday, but that is the only time I saw him since the conversation in King-street, about which you asked me the other day.
13288. The conversation in King-street took place about how long ago? About two months ago.
13289. Did you see Mr. Millner on any other occasion at about that time? I do not recollect it just now.
13290. Did you see him pretty frequently at one time? Yes, while he was supervising the work at Johnstone's Creek. He then used to pass my house about three or four times a week.
13291. You say that you received information from him which you imparted to Mr. Parkes? He was the first man who told me anything about the cutting of the storm-water sewer by the unemployed at Johnstone's Creek.
13292. What did he tell you? He told me that the unemployed were cutting the drain, and that it was a great saving to the contractors.
13293. Did he say anything else about it? Well, after Mr. Parkes had brought the matter up in the House, by asking a question of the Minister, and after the Minister had replied that the work would cost about £70, Mr. Millner told me that it would cost nearer £400.
13294. When did he tell you that? A day or two after the Minister's reply to Mr. Parkes.
13295. Did he give you any other information which you handed to Mr. Parkes? No.
13296. Did he give you any other information which you did not hand to Mr. Parkes? I do not remember any just now. If you can mention any I may remember it.
13297. Was there anyone present at the interview which took place between yourself and Mr. Millner in King-street? Yes; I told you before that Mr. Wright, Mr. Ewing, and Mr. Madison were there. They four were standing together, when I came up. We were alone when Mr. Millner spoke to me about the cutting of the drain at Johnstone's Creek.
13298. When you made the remark respecting Mr. Hickson and myself, you say that Mr. Wright, Mr. Ewing, and Mr. Madison were also present? Yes.
13299. You know several of the officers in the Sewerage Branch, do you not? Only just through meeting them.
13300. Will you tell us those with whom you are most intimate? I am not intimate with any of them.
13301. You do not know any of them intimately? No, I only know them through meeting them casually.
13302. Did any other officer of the Department besides Mr. Millner give you information which assisted you in coming to the conclusion at which you arrived? I do not think so. I have heard men talking about different things, but when you say officers, I presume you mean engineers.
13303. I mean engineers or superintendents? Of course, I have heard your inspectors say a good bit. For instance, ex-Inspector Brown said he went to see you, and that you shook hands with him, and he was very much surprised at your doing so.
13304. Have you heard anything from any other inspectors besides ex-Inspector Brown? No; I do not recollect anything now.
13305. Do you know any of the engineers besides Mr. Millner? Yes; I have met them at various times—Mr. Smith and Mr. Rudolph, for instance.
13306. Do you know Mr. Smith? Yes, through meeting him.
13307. Do you know Mr. Rudolph also? Yes, I have just met him.
13308. Did Mr. Rudolph give you any information? No.
13309. Did Mr. Smith give you any? No.
13310. No information at all? No.
13311. You swear that? Yes.
13312. You had a talk about this Commission to him, did you not? It came up two or three times, but I do not think it was referred to particularly. I remember at one time talking to Mr. Smith about the Commission. I remember saying that if it had not been for the Monier business, and one or two things like that, the thing would never have cropped up.
13313. That is what you said, but what did he say to you? I do not remember his answer.
13314. He is not like ex-Inspector Brown? I do not think he said anything in particular.
13315. Would you tell us what occurred on Saturday in Moore-street? Nothing in particular occurred, except that Mr. Millner said that he was very sorry that he told you what you asked me about.
13316. What was it he said he was sorry for? To think that he should have repeated a conversation. He said that, I think, in the presence of Mr. Ewing, Mr. Madison, and Mr. Wright. The same party happened to be together again, and Mr. Millner said that from that time forth his mouth would be closed.
13317. *Mr. Parkes.*] You did not tell Mr. Millner that you contractors wanted to get Mr. Hickson and Mr. Davis out of the office? No.
13318. Would you have any object in such a course? No.
13319. As long as you have a fair chance of tendering that is all you want? All we want is a fair go.
13320. *Mr. Carter.*] Referring to the conversation which you say you had with Mr. Gummow, you say you had only one conversation with him in three or four years? Yes, as regards the works.
13321. I do not like to throw any doubt upon your statement, or to infer in any way that it cannot be true, but I suppose you are quite sure about it? Yes; I met Mr. Marr at the time at Johnstone's Creek, and he was going down to the crusher for a firebar.

- T. Williams. 13322. And you say that the only time that Mr. Gummow spoke to you in three or four years he spoke to you about his business secrets? There was not much business secrets at all, but the thing cropped up in connection about what Mr. M'Sweeney might say.
- 17 Aug., 1896. 13323. *Mr. Parkes.*] You did not quite understand my question, I think, in reference to the conversation you had with Mr. Gummow—was it after Contract 77 was let or before it? I think I have made a mistake in the name. I think it was with Mr. Snodgrass that I had a conversation. That was before the job was let.
13324. Your conversation, you say, was with Mr. Snodgrass? Yes.
13325. What was the conversation? He told me that he and Mr. Carter saw the schedule of quantities before they were printed in connection with jobs, and that they had them fixed up to suit themselves.
13326. Where was he when he told you that? He told me that one day in the tram after Contract 69 was let. That is the contract I am referring to particularly now. I think it would be about May two years ago. It was on the day when Mr. Carter, Mr. Snodgrass, and Mr. Davis had had an interview with Mr. Hickson about the bluestone pitchers.
13327. And what do you say Mr. Snodgrass said? He told me that they always saw the schedule of quantities before they were printed.
13328. Was there any conversation about Contract 77 at that time? No.
13329. Not about the Monier work? No.
13330. That was not specially referred to? No.
13331. *Mr. Davis.*] Are you sure Mr. Snodgrass was not chaffing? He might have been; he was often given that way.
13332. Was he sober? I think so. He had been with you that morning, and you would be the best judge of that.
13333. *Mr. Norrie.*] Did you believe him? I did not take much notice of what he said.
13334. *Mr. Carter.*] Mr. Snodgrass was very much given to chaffing? Very much.
13335. *His Honor.*] Is he a thirsty man? I do not think so.
13336. Is he a man who likes his whiskey? I think he knows enough to look after his business first. Whiskey might come in afterwards.
13337. *Mr. Parkes.*] He is one of the shrewdest men in the firm, is he not? He has the name for it.

John Moore Smail recalled and further examined:—

J. M. Smail. 13338. *Mr. Parkes.*] You produce a copy of the papers placed before the Water and Sewerage Board relating to the change in the system of tendering? Yes. I was requested to produce some papers relating to that matter when I was last here, and the papers which I will now read are copies of those papers:—

17 Aug., 1896.

Copy of Records, No. 94-43 (Sewerage), of 10/1/94.

Metropolitan Board of Water Supply and Sewerage, Sydney, 13 December, 1893.

COMPULSORY DRAINAGE—HOUSE CONNECTIONS.

I HAVE the honor to submit herewith a revised specification and schedule for the drainage of houses under the compulsory powers of the Act.

I would suggest that, in calling for tenders for such work in the future, a yearly contract should be entered into on the basis of a percentage above or below schedule rates, such rates to be fixed by the Board, as being more workable, and saving time in cases where it is a matter of urgency to proceed with the work.

Under the present system, where works exceed a certain amount, tenders have to be called, and delays ensue which would not take place if they were carried out in the manner suggested.

HENRY E. RIGGS.

Engineer.

Make alterations as directed, and resubmit on Friday.—J.M.S., 18/12/93. Mr. Riggs. Alterations made as directed.—H.E.R., 21/12/93. Engineer. Forwarded.—T.G., 21/12/93.

In view of legislation *re* recovery of costs of work carried out under the compulsory clauses of the Act, I recommend that an annual contract at schedule rates be let for the whole area under the jurisdiction of the Board. This course will simplify the work under this head, and economise clerical work. Before any district is operated upon, a list of properties, upon which notices have been served and not complied with by the owners, will be submitted to the Board for approval to carry out work. On Board approving, instructions, accompanied by plans, will be issued to contractor to proceed with work, the work will be inspected and measured up by the officer-in-charge of house drainage, and owners charged for same at schedule rates. The previous system was to call for tenders for a number of houses, but as soon as some owners found out that the Board intended carrying out the drainage of their properties they asked to be allowed to do it themselves. This was agreed to, and in nearly every case where plans were withdrawn the owners fulfilled their pledges. The withdrawal of plans from contract caused some trouble and complication, and to obviate same in the future a yearly contract at schedule rates is proposed.—J.M.S., 27/12/93. Secretary. Submitted to the Board.—28/12/93.

Deferred until next meeting, in the meantime Messrs. Hickson and Lander promised to look into the matter.—R.B., 28/12/93. Submitted to the Board, 6/1/94. Deferred. Submitted to the Board, 9/1/94. The report of the Engineer was adopted.—R.B., 10/1/94. Sewerage Engineer. Have specification printed and instructions shown in my minute to be carried out.—J.M.S., 10/1/94. Assistant Engineer. Noted.—T.G., 11/1/94. Mr. Riggs. Noted.—H.E.R., 11/1/94. Requisition for fifty copies of specification, &c., as per draft herewith.—T.G., 11/1/94. Clerk. Requisition made out.—J.R.M., 13/1/94. Have the copies of specification been printed?—T.G., 1/2/94. Clerk. The Act will shortly become law. I wish this matter pushed on.—J.M.S., 2/2/94. Assistant Engineer. The specifications are all ready and drawings.—T.G., 3/2/94. Engineer. Have list prepared for submittal to Board of properties to be dealt with, separating them into boroughs.—J.M.S., 7/2/94. Assistant Engineer. Mr. Riggs.—T.G., 8/2/94.

Sir,

56, Broughton-street, Glebe, 7 May, 1894.  
*Re* Contract 78, Glebe Sewerage, I have the honor to request that the levels, depths, and lines, of the sewers enumerated in the Schedule herewith, and forming part of my Contract No. 78, may be ascertained and set out, and the necessary data given to me in order that I may proceed with the works forthwith.

I have requested your Engineer to furnish the above information, but he refuses to do so, and states that he purposes calling for fresh tenders for the remainder of my contract.

Such being the case, I am compelled to apply direct to your Board.

To the President of the Board of Water Works and Sewerage.

I have, &c.,

THOS. WILLIAMS.

SCHEDULE OF SEWERS.

Parramatta Road; Old Parramatta Road; St. John's Road; Upper Road; Cross, Ross, Foss, Davis, Junction, Charles, Hereford, Alfred, Arthur, and Albert, Streets; Wigram-lane; Lines 17, 18, 19, 20, 21, 22, 23, 24, 25, 25A, 25B, 26 (part), 26B, A, AB, 35, 37, 38, 40.—T. W. The

The accompanying tracing shews the position of sewers enumerated in above schedule. Owing to the manner in which schedule of rates has been fixed the amount voted for the contract is not sufficient to complete the works. Area tinted pink in tracing being the portion for which an additional authority will be required, in this area, lines underlined in red in above schedule of sewers occur, and cannot therefore be set out; in reference to the other lines enumerated above, they have been allowed to stand over at the request of the contractor, but will now be set out without delay. It might be pointed out that the contractor tendered, according to schedule rates, to do the works at £2,376 per mile; this includes tunnelling and rock excavation; the works actually executed have cost £3,168 per mile; those portions not yet set out will cost about £2,428 per mile, whilst the portion tinted pink, in which there is neither rock tunnelling nor other expensive work, will cost £3,326 per mile; at fair rates this could be executed for half that amount or (say) £1,700 per mile.—T. G., 12/5/94. Engineer.

Contract Nos. 78 and 86, Glebe Sewerage.

Mr. Williams' reasons for my not giving lines on his Contract No. 78 are not correct. At his interview with me he was informed that some of the lines at western portion of his contract, shewn by pink tint on tracing, were to be proceeded with as I did not intend he should pick all the plums out of the contract. He was under the impression that his contract was to be considerably reduced; on this point I informed him that at least the contract would extend to aggregate amount of schedule. The lines shewn on tracing are being set out, many of which were not dealt with at contractor's request to District Engineer.

The crux of the complaint is this, that the contractor "rigged" his schedule on his knowledge of the district; and the result of the excavation turning out in his favour, he is under the impression that the Board would only extend the contract to the amount of such schedule. It is quite competent for the Board to strike out a number of lines of sewer under the terms of General Conditions, but it is questionable if such action would be equitable, as, in the event of the excavation turning out the other way, the contractor would be required to complete, as per plans.

The information obtained by the officers led to the apportioning of the excavation as 66 per cent. rock, and the balance in soil. In the absence of correct borings, it is impossible to correctly fix the quantity of each class of excavation.

The aggregate amount of contractor's schedule is £13,887; and, from careful inquiries, it is anticipated that the excavation item will be £3,000 in excess, or £16,887. The official estimate was £18,076, and the next highest schedule to Williams' was Carter and Gummow's, at £15,970.

The question to decide is whether the contract is "lump sum" or schedule. By the terms of contract and bond, it is the latter, and we are therefore bound by the schedule prices as well as the contractor. Under the circumstances I think it would only be equitable in this and adjoining contract, which is on all-fours as regards excavation, to complete the contract at the schedule rates on the same ground that if the schedule prices had turned out unfavourable for the contractor I would have called upon him to do the same.

Contract No. 86, R. and S. Butcher, is on all-fours with Contract No. 78, being let about the same time—September, 1892. Here, however, the rock excavation, of which 707 cubic yards have been executed, is 1s. per cubic yard, and excavation in soil 9s. The estimated excess on this contract will be about £1,350.

I would like to state that both contractors, pending the approval of the Minister of acceptance of contracts, carried out some lengths which were urgently required through rock formation at their schedule rates—3s. and 1s. per cubic yard, respectively, on which they lost considerably.

Some months ago I informed the Board that all contracts would be let on a different basis, viz., per cent. above or below schedule. This will effectually stop manipulating the schedule of contracts. In some instances where schedules have been so fixed the result has been unfavourable to the contractor, and resulted in a credit to the contract. I recommend that the schedule be adhered to on the foregoing grounds.

The Secretary.

J.M.S.,  
14/5/94.

Submitted to the Board, 15/5/94. The report of the Engineer was adopted.—R.B., 15/5/94. Inform. Informed No. 421, of 17/5/94. Sewerage Engineer. The contract to be carried out on lines laid down in contract, but economy is to be practiced in every instance. The lines on western side are to be pushed on without delay, and not left to the last.—J.M.S., 21/5/94. Assistant Engineer. Voucher No. 2,259, in favour of R. and S. Butcher, for £1,360, forwarded to the Treasury 15/8/94 for payment (5th progress payment).—M.G., 20/8/94. The Secretary.

There is one matter I should like to mention. Mr. Davis asked me a question as to a certain contract, and I was misled as to the date. In that respect I should like to amend my evidence. Mr. Davis alluded to Cook and Webb's contract. The copy which misled me showed that the date of letting was 28th March, 1895, whereas, as a matter of fact, it should have been 1894; so that the Government Construction Branch certainly got the first contract out under the new system. Our first contract under that system was not let until some time afterwards. I should like, also, to mention that, Mr. Hickson being a member of the Board and also Engineer-in-Chief for Construction, this matter was discussed by him and by me for some time. He had noticed in his Department, as I had in mine, that this manipulating of schedules was going on, and, as I mentioned in my evidence the other day, we tried to check it. I claim no originality for the new system.

13339. It had been in vogue for some time in your Water Branch, had it not? As a matter of fact, the Water Branch had carried out the system since 1888 in small contracts.

WEDNESDAY, 19 AUGUST, 1896.

James Morrison Dean sworn and examined:—

13340. *Mr. Parkes.*] What is your occupation? I am a partner in the firm of Alexander Dean and Sons, builders and contractors. J. M. Dean.

13341. Have you tendered on many occasions for Government work? Not on many.

19 Aug., 1896

13341½. Did you tender for sewerage contract 69? Yes.

13342. When you tendered, did you notice in the schedule the number of different kinds of excavation and other things of that sort? Yes.

13343. Did you take the schedule as being a distinct intimation that such work would be carried out? Yes; I understood that more or less of each item would be done.

13344. Did you understand that any item would be eliminated? No.

13345. Will you look at Carter, Gummow, & Co's. prices according to the schedule upon page 67 of the Parliamentary return;—you have seen those prices? Yes.

13346. Upon pages 133 and 134 you will see the 16th progress return? Yes.

13347. You will notice that in connection with items Nos. 8, 11, 12, 14, 16, and 19, of the excavation their prices were 27s. 6d. for each item? Yes.

13348. What prices did you put down for 8 and 11? 18s. for No. 8, and 25s. for No. 11.

13349. Will you look at item 16 and tell me what Carter, Gummow, & Co. put down for that? £2.

13350. What price did you put down? 12s.

13351. Were you prepared to carry out the work at that price? Yes.

13352. You are quite sure of that? Quite.

13353. Then look at item 36—squared bluestone pitchers;—what was your price for that? 30s.

13354.

J. M. Dean. 13354. Will you turn to page 105;—you will there see the following clause dealing with squared bluestone pitchers:—  
 19 Aug., 1896.

Squared bluestone pitchers, in channel bottoms, round manhole covers, ventilating-grates, valve-covers, and where ordered in any situation in the construction of these works, to be set in sand, in regular 9-inch courses, lengthwise across the channel, in the most approved bond, and in single-ring or course round manhole-covers, &c. All stones to be dressed and picked so as to ensure the joints all through not to exceed  $\frac{1}{2}$  inch in thickness. No stone to be less than 9 inches x 9 inches x 9 inches, but to be longer, curved, and radiated, as shall be directed.

Did you take it that the quantity would be regulated—that it would be more or less? Yes.

13355. What did you take the clause to mean? I took it to be provisional—that there was some uncertainty as to the quantity.

13356. Were you content with your price? Quite.

13357. Take items 23, 24, 25, 26, and 27;—what were your prices for those? You mean subducts. Our prices were 20s., 10s., 15s., 18s., and 20s., respectively.

13358. What did you include in those prices? The piping and the excavation.

13359. And the labour? Yes.

13360. You included everything in connection with the subducts? Yes.

13361. No portion of them went into any other items? No.

13362. Why did you put that price upon them? Because, from reading the specification, we took it that the excavation was included.

13363. Did you visit the site at all? Yes; my brother and I went out.

13364. Did you form any opinion as to whether the subducts were required or not? I cannot say that we did; but, the items being in the schedule, we took it that a certain quantity would be required. It is over two years ago now, and I cannot state the exact reason why we arrived at the conclusion we did. We took it, however, that, subducts being in the schedule, a certain number of them would be required.

13365. If you had known the true bearing of these items—that a certain number of them would have been eliminated as against others—would that have affected your tender? We should not have cared to take the risk unless we had certain knowledge given by the Department that such and such things would not be done.

13366. Did you ever experience tendering such as that of Carter, Gummow, & Co. in this case? This was the first tender we ever sent in in connection with sewerage work.

13367. What do you think of such tendering? I cannot understand it.

13368. Would you be likely to tender again where such tendering was allowed? We gave up tendering with the Water and Sewerage Department some time ago.

13369. Why? We thought we had not sufficient knowledge of sewerage matters.

13370. For no other reason? I do not think so.

13371. You could never come near the prices? No.

13372. But could you expect to come near the prices if tendering such as that of Carter, Gummow, & Co. were allowed? No, I do not think we could. We estimated a fair price, as we thought, for each item.

13373. Did you consider that you would be allowed to speculate on any of the items? No.

13374. Have you ever met with anything of this sort in private practice? No.

13375. And you have tendered upon schedules? Yes.

13376. Do you think that a tender such as that of Carter, Gummow, & Co. would be accepted by a private firm? I do not think so. I do not think a schedule would be made out in this way in private competition.

13377. When I drew your attention to the schedule some months ago, did you make any remark to me? I cannot say that I remember it; I may have done so.

13378. Did you not say that that accounted for your being unable to get Government work? Yes, I admit that.

13379. Are you aware, if your tender had been accepted upon the items upon which Carter, Gummow, & Co.'s tender was accepted, that, with all the additional work put in, you would be £800 less than they were in your tender? I understood so from seeing Mr. Thompson's quantities.

13380. In the original form of tender, would you have been able to beat them if your prices had been taken upon these special items? I do not think so.

13381. Not with reductions? I have not worked it out. I understand that we worked out at about £3,000 below; I was informed so.

13382. *His Honor.*] You never entertained the idea of, and you never had any experience in, what is known as schedule-rigging? No.

13383. That is outside of your line altogether? Yes; the whole matter of sewerage construction is outside of our line; but business was quiet, and we thought we would tender for sewerage work as others were doing so.

13384. You never heard of such a thing in any other line of tendering? No; it was totally foreign to our knowledge.

13385. *Mr. Davis.*] I suppose that before you put in your tender you looked carefully through the specification? Yes.

13386. Do you say now that you are under a misconception in regard to the subducts, and that therefore your price was higher than it otherwise would have been? Yes.

13387. That is your explanation of your price for subducts? Yes.

13388. What would you say with regard to item No. 21—timber and iron in excavation? We thought we were giving a fair estimate for that. We were high, as it happened, in comparison with the others.

13389. It being the case that you put an exceptionally high price upon timber and iron in excavation, and also upon subducts, and no doubt other things, would that not explain why you were generally out of sewerage-work contracts? These particular items I admit we were high in, but I do not think we were exceptionally high, taking the whole schedule.

13390. Take your item No. 1—excavation in shafts;—what was your price for that? 3s.

13391. What was Carter, Gummow, & Co.'s price? 9d.

13392. Take item No. 2—excavation, hard;—what is your price for that? 12s.

13393. And what is Carter, Gummow, & Co.'s price? 9d.

13394. So that you would be above them in soft and hard excavation? Yes.

13395. Look now at item 14—excavation in hard rock, heavier blasting;—what is your price for that? 20s.

13396. What was Carter, Gummow, & Co.'s price? 4s. 13397.

13397. So that in some cases your prices would be higher than Carter, Gummow, & Co.; in other cases they would be higher than you? We put in a fair price for each item, thinking that it would be carried out. J. M. Dean.

19 Aug., 1896.

13398. You put in such rates as you could live at? Yes.

13399. I suppose you will admit, from your knowledge of work in general, that, if a contractor has had special experience in any particular kind of work, he would have an advantage over other men who might have had special experience in other kinds of work? Most decidedly.

13400. Take your own case: you have had special experience in large buildings; and Carter, Gummow, & Co., from their special experience in sewerage matters, would have an advantage over you in sewerage matters? Yes.

13401. Do you not think that that explains a great deal? It may explain certain items. I admit that in regard to the two items to which you have referred—timber and subducts—Carter, Gummow, & Co. seem to have had better knowledge than we had. Of course, speaking generally, we give way to Carter, Gummow, & Co. in their knowledge of sewerage matters.

William James Millner sworn and examined:—

13402. *Mr. Davis.*] What is your position? I am a civil engineer.

W. J. Millner.

13403. What is your position in the Department? I am Assistant Engineer at the present time.

13404. In your official capacity, you frequently have to do with contractors? Yes.

19 Aug., 1896.

13405. And you come across contractors who are carrying out work as well as those who are not carrying it out? I do.

13406. Do you remember meeting Mr. Williams, the contractor, a short time ago? I do.

13407. Where was it? I met him several times.

13408. Do you remember how long ago it is since you met him in King-street? About two months, I should think.

13409. Who were present? Mr. Ewing, Mr. Madison, and Mr. Wright.

13410. What took place on that occasion between yourself and Mr. Williams? Nothing took place specially between myself and Mr. Williams. There was a general conversation with reference to the Commission.

13411. Did Mr. Williams express his opinion? Very decidedly.

13412. Did the others express their opinion? They had nothing to say.

13413. Did you express your opinion? I had something to say.

13414. Will you tell us first of all what Mr. Williams said, and in what connection? I cannot exactly relate all the conversation which took place. I know he wound up by saying that the only object he had in the thing was to remove Mr. Hickson and Mr. Davis from the Department.

13415. Did he give any reason for saying that? No; one thing led up to another.

13416. You positively swear that he did say that? Yes. He was talking on behalf of the different contractors. He constantly used the word "We." For instance, he would say "Our object," and then again, "We intend to get Davis and Hickson shifted," and so on.

13417. Did he say why? He did not give any definite reason. I said I thought he was bringing a lot of personal spite into the matter when he expressed himself in that way.

13418. Do you remember meeting Mr. Williams in the street last Saturday? Yes; he stopped me.

13419. Where was that? Opposite the Post Office, in Moore-street.

13420. What occurred then? There were some conversation. He said "I see you repeated to Mr. Davis the conversation we had"; and he added "I think you put it a bit stronger than what I said." I said I did not think so. He said he had not said what Mr. Davis had accused him of saying, but I told him that I had only related what had taken place.

13421. Did you lead him to suppose that you regretted having told me? He said he thought it was rather a mean trick to repeat a private conversation. I said that if he and the others considered it a private conversation, I regretted having mentioned the matter without first speaking to them.

13422. When you told me of it, did you not do so with the object of bringing the matter before the Commission when Mr. Williams was examined? I told you with the object of letting you know how the feeling stood.

13423. Did you not know that I was going to ask Mr. Williams about it? I said that if Mr. Williams were examined you might remember it.

13424. And after Mr. Williams' examination did you not ask me if I had asked him about the matter? I cannot say whether I did so or not.

13425. But it was with your concurrence that I asked Mr. Williams about the matter? Yes.

13426. When the Johnstone's Creek work was being executed you had to pass Mr. Williams' house on your way down to the work? Yes; I must have passed his house three or four times.

13427. You had charge of that work for portion of the time? I had.

14428. Did you see him frequently during that time? I might have seen him on about half-a-dozen occasions.

13429. Mr. Williams, in answer to question No. 13276, said:—

As a matter of fact, was it not Mr. Millner who gave you a lot of particulars about Government contracts which you gave to me? He was the first man who told me of the putting in of the storm-water drain at Johnstone's Creek by the unemployed. He used to pass my house nearly every time he went across in that direction, and he told me once that the unemployed were cutting a drain for Carter, Gummow, & Co. He told me that Mr. Davis was actually against the work being done by the unemployed, but that Mr. Hickson passed it.

What have you to say as to that? It is not true.

13430. Did you on any occasion have a conversation with Mr. Williams relating to the drain which was cut by the unemployed? Yes; we had one conversation, which I remember pretty well. He asked me about the cost of it. He said "I see they say it was £70, but I suppose five or six times that amount would be nearer the cost." I said "You know, Williams, you can make figures prove anything. You made them prove something to your advantage in the Glebe contract."

13431. Did you yourself say that the work, instead of costing £70, had cost £400; No; I never told him that.

W. J. Millner. 13432. Did you tell him that you would take the responsibility of the works being carried out? I do take all the responsibility.

19 Aug., 1896. 13433. Mr. Williams gave the following evidence,—

13278. Was Mr. Millner also the gentleman who gave you most reliable information—information which you most relied upon—as to the action of the Department with regard to Carter, Gummow, & Co.'s extensively-rigged schedule? Yes; he told me about that affair. He told me, also, with regard to Carter, Gummow, & Co.'s contract, that Mr. Davis condemned the use of the sandstone taken from the district in connection with the contract, but that Mr. Hickson also passed that.

13279. The conversation among the lot of you was one of general condemnation? Yes; Mr. Millner said he would not take the responsibility of doing it.

Is that true? No.

13434. Did you tell him that I had refused to sanction the cutting of the drain at Johnstone's Creek, and that Mr. Hickson, in spite of what I had to say in the matter, passed it? No; I could not have said that.

13435. Was it the fact? No; it was not the fact.

13436. Will you tell His Honor how the question of cutting the drain arose? It arose upon my recommendation to Mr. Davis.

13437. Then it was you who raised the question of cutting the drain first of all? Yes, I went to you and I said that it was not fair that the pumping should go on drowning the contract out. They were pumping and working alternately, and I thought it would be better for the pumping to stop until after that portion of the work was in, and that if they did not discontinue pumping some provision should be made to take their own water away without its being thrown on to the contract.

13438. Had the contractors made provision for dealing with the water on the contract? Yes; they had two steam pumps there.

13439. Was that ample to deal with all the water that would drain into their excavation? They kept that down all right.

13440. But would it deal with the additional water they got from the sand pumps? No, it would not.

13441. When you had reported the matter to me there was an end of it as far as you were concerned? Yes; you said you would see the Engineer-in-Chief and get him to go out and look at the work, and ascertain whether what I represented was reasonable. I remember that you went out, and when you came back you told me that the matter would be put all right.

13442. *His Honor.*] Did Mr. Hickson go out and look at the work? Yes, he went with Mr. Davis.

13443. *Mr. Davis.*] Did you at any time have a conversation with Mr. Williams as to the rigging of schedules? We had talked about it on several occasions. He prides himself very much upon the way in which he on one occasion rigged a schedule.

13444. Could you tell His Honor what you said to him in reference to that matter? I could not remember the words now.

13445. Did you say anything to him which he could make use of in the way he indicates? No.

13446. Where did you speak to him about the matter? It may have come up in conversation, but I cannot recollect where.

13447. Did you ever say anything to him as to the sandstone in the district being condemned by me and passed by Mr. Hickson? No; it never was.

13448. That would not be true? It would not be true.

13449. *Mr. Parkes.*] Have you known Mr. Williams for many years? Perhaps three or four years.

13450. You are a good friend of his,—you are companionable with him? No.

13451. How often did you see him during the time you have mentioned? Perhaps six or seven times.

13452. Six or seven times in all those years? Perhaps twenty times in the three or four years; it might be fifty.

13453. Do you ever go out to his house? No.

13454. Never in your life? I have never been inside Mr. Williams' house. I looked over his new house before the building was completed. Mr. Jenkins was there, and he asked me to have a look at it.

13455. Were you the engineer supervising Contract 69? Yes.

13456. During the whole construction? No.

13457. For how long? About fifteen months.

13458. That would cover all the earlier period of construction? Yes.

13459. Did you know Mr. Williams during that time? Yes; I knew him before that contract was started.

13460. When did you tell him about the £50 a yard for bluestone pitching? I do not know that I ever told him anything about that.

13461. Will you swear that you never told him anything about that? I will swear that I never did. We may have had some conversation in reference to the matter, because it has been a general topic of conversation.

13462. You were not the person who first told him about the matter? No.

13463. You are sure of that? Certain of it.

13464. Did you ever have a drink with Mr. Williams? I have.

13465. Have you had many drinks with him? I might have had half-a-dozen.

13466. You never got into any conversation with him on those occasions? Oh, yes, we had conversations.

13467. As a matter of fact, did you not tell Mr. Williams that the rigging of schedules was causing robbery? No; I do not think so.

13468. You never said anything about the rigging of schedules causing injury, and that it ought not to be allowed? I may have said that.

13469. Did you never give Mr. Williams any information about the North Shore contracts—did you ever speak to him about them? No.

13470. Were you ever on the North Shore jobs? No; I never knew anything about them.

13471. During the time you were upon Contract 69 did you ever complain about the contractors' men;—did you ever make any complaints? That is a big order.

13472. But did you have to find fault with the work? I did have to find fault with the work sometimes.

13473. To whom did you report it? I probably had it put right myself. I do not think there was any serious complaint which would need reporting.

13474. As to Contract 118, were there any other witnesses present when you had a conversation with Mr. Williams about that? I cannot say that there were.

13475.

13475. Were you two alone when you spoke to him about the drainage being done by the unemployed? W. J. Millner.  
He may have spoken to me about it.
13476. Was anyone else present? I do not think so.
13477. Where did that happen? I could not say exactly where it was. He might have been waiting for a tram, or I might have met him in passing down to work.
13478. When you had charge of the Johnstone's Creek work? Yes.
13479. Are you still in charge of the works there? Yes.
13480. How long have you been in charge? From the start.
13481. Was there any other Government Inspector there? Yes; Mr. Lougheed.
13482. Is he still in charge? No; the work is practically finished.
13483. Was he in charge of the conduct of the work? Yes; but he was away about a fortnight.
13484. But he was there with you—you were acting together? Yes.
13485. What did the drainage cut by the unemployed cost? I could not tell you; I have not any idea.
13486. How many men were working there? I do not know.
13487. Did you not see them? No.
13488. But you were on the job? No; I was on 118.
13489. But if they were working at Johnstone's Bay they would be within sight? No; they might be working perhaps a mile away from where I was.
13490. You have said that the water was flowing in from the contractor's works;—what part of the works were going on to allow the water to flow in? Down by the tramway.
13491. Were you not inspecting that part of the work? Yes.
13492. If you were down as far as the tramway would you not notice how many men were working at the drain? No.
13493. You never looked? No.
13494. Have you sent in returns of the work done on the job? Yes.
13495. Would you not report upon that particular matter? No.
13496. As to the conversation in which you say Mr. Williams said that he wished to remove Mr. Hickson and Mr. Davis, are you aware that Mr. Williams has done no work under Mr. Hickson and Mr. Davis? I remember asking Mr. Davis whether Mr. Williams had done any work under him, and I think he said "No."
13497. Then what object would he have in wishing to remove Mr. Hickson and Mr. Davis? I could not say.
13498. Did he say he had any object in view? No; but the reply I made to him was that we all knew that Mr. Parkes had a grudge against Mr. Hickson, but that I should like to know what they had against Mr. Davis.
13499. How do you know that Mr. Parkes has a grudge against Mr. Hickson? That is the general opinion outside.
13500. But how did you come to form it? From conversations I have had with a few people.
13501. Supposing Mr. Parkes does not even know Mr. Hickson? I do not know about that. I am giving the reply I made to Mr. Williams.
13502. But on what is it founded? It is not founded on anything; it is my own opinion.
13503. But how came you to entertain that opinion;—do you know me at all? I have never seen you before that I know of.
13504. How did you come to form such an opinion? What I say is that it is generally supposed that you have a grudge against Mr. Hickson.
13505. What reason would Mr. Williams have for wishing to remove Mr. Davis from the Department? I could not say.
13506. Did he assign any reason? He said something about the treatment which had been meted out to the O'Neills.
13507. But Mr. Williams has nothing to do with the O'Neills? That is what was mentioned in the course of conversation.
13508. As a matter of fact, did not Mr. Williams say that the smaller contractors wanted to get a fair opportunity of tendering for public works? He said they wanted freedom at the tender-box.
13509. Have you ever spoken to other contractors? Yes.
13510. About these same matters? Yes; I have had several conversations with them, and they have all had a chip in.
13511. What did they tell you? I cannot say at this moment what they said.
13512. Did they mention their object in coming to me? They said it was mainly to do away with the favouritism shown to Carter, Gummow, & Co.
13513. Have you ever heard any of the other contractors make remarks to the effect that they wanted to get rid of two officers of the Department particularly? No.
13514. Have you heard any reason which would lead you to suppose they would have an object in getting rid of these particular officers? No.
13515. Did Mr. Williams say in either of the conversations you repeated that he had any venomous feeling against Mr. Hickson or Mr. Davis? No.
13516. Do you not know that, as a matter of fact, Mr. Davis is looked upon as a fair administrator of contracts? Yes; I know that he is considered strict.
13517. But he is fair and impartial? Yes.
13518. Then would there be any object in removing him, as far as the contractors are concerned? That is not for me to say.
13519. But you have attributed certain remarks to Mr. Williams, and I want to know what reason he would have for the making of such statements? I remember asking him myself what he had against Mr. Davis.
13520. And what did he say? He mentioned that Mr. Davis had tried to crush the O'Neill's, or something to that effect.
13521. And that, as far as you know, is the only reason he would have? Yes.
13522. Where did you meet Mr. Williams last Saturday? I was going across Pitt-street, near the Post Office.

- W. J. Millner. 13523. Did you stop him, or did he stop you? I was half-way across the street, when he yelled out "Here, I want you." I then walked over to the footpath. He stopped me; I did not stop him.
- 19 Aug., 1896. 13524. *Mr. Davis.*] When was it that you left Contract 69. Could you give us the date? I think it would be about April of last year.
13525. Was the excavation finished at that time in the tunnels and open cuttings? Pretty well.
13526. Was it wholly finished in the tunnels? I think so.
13527. Had you to do with making the measurements for excavation up to April, 1895? I made all the measurements for excavation with Mr. Ewing.
13528. Did you make the measurements for the contract up to the date you have named? Pretty well, I think.
13529. Can you swear that the measurements you made were correct, and that they were put into the measurement book, and there calculated with a view to their transfer on to the progress vouchers? I think so. I am not sure whether they were put into the book, but I know that I made out all the details of the work. The final measurements were made with Mr. Gibbs some six or seven months afterwards. I remember that I went over there for a day or two.
13530. Do you recollect the branch sewer leaving the eastern branch at Emily-street? Yes.
13531. What was the size of that? 3 ft. 3 in. x 2 ft. 2 in.
13532. What was the tunnel driven in? In shale.
13533. Did you put any lining in in that branch sewer? Yes.
13534. What was it packed with? Muck.
13535. Who instructed that soft earth should be put in over the brickwork? I did.
13536. What was paid for the packing? It was actually not paid for at all. In making out the certificate Mr. Snodgrass said, "We will not bother about that; if we do not get it as filling we will get it as surplus material."
13537. That is, if it were not paid for as filling, it would be paid for as surplus material, which amounted to the same thing? Yes.
13538. It was not paid for as sandstone concrete packing? No.
13539. Could you explain why it was that the freestone pitching specified and included in the schedule was not executed? It was not actually in the contract.
13540. Where was it intended for? At a place near the railway—that is in connection with a culvert. The railway was being constructed and the culvert was wanted. The work was done by McSweeney, and it was cut out of Contract 69.
13541. Then Contract 69 was let during the progress of Contract 62—McSweeney's contract—and as the Marrickville-Enfield railway was being constructed across the Illawarra road, the question arose as to whether it would not be a saving of money to get that length of sewer constructed. Was not that the case? Yes.
13542. Was the culvert constructed? Yes.
13543. In conjunction with that culvert were freestone pitchers shown? On the drawing, yes.
13544. Would those be the freestone pitchers referred to in the specification and schedule of quantities? That is the only place where they would have come in.
13545. And would that be the reason why the freestone pitchers were not carried out in connection with Contract 69? Yes.
13546. Was there any idea at any time of putting these freestone pitchers round the manhole covers, or did the specification prescribe that they should be so placed? No.
13547. The specification provided for bluestone pitchers round the manhole covers? Yes.
13548. If a witness has said that during the progress of Contract 69, as regards the filling up of the sumps, lumps of wood and all kinds of rubbish were put in instead of sandstone concrete, what would you say as to that? The wood must have been put in unknown to me, if it were put in at all; but I do not think the statement is true; one lump of wood may have gone in.
13549. Why do you say that one lump of wood may have gone in? Because it could be easily covered up. It would be quite accidental if it did get in.
13550. As far as your knowledge goes, there was no rubbish or wood of any description put into the sumps instead of sandstone concrete? No; so far as I know they have been filled in properly.
13551. Have you any reason to doubt the integrity or fidelity of the inspectors who were supposed to be on the ground supervising the work? Of course, if the inspector were there it would not be allowed; and I certainly do not think they would go out of their way to have it done.
13552. *His Honor.*] But Mr. Davis' question related to the honesty and ability of the inspectors? I think you will find as good a class of inspectors in the Sewerage Department as you will find anywhere.
13553. *Mr. Davis.*] It would be their duty to be present while the concrete was being mixed and put into position in the sumps? Yes.
13554. It would be their duty first of all to see that the sumps were cleared of all timber and wood of every description before the concrete was put into position? Yes.
13555. You have every reason to believe that that was done? Yes; I myself saw some of the sumps filled in in Contract 69, so that I feel pretty certain about the matter.
13556. Do you remember a change being made in the branch sewer leading from Premier-street to Illawarra-road? Yes, it was changed.
13557. In conjunction with the alterations made, did you make a valuation of the centering that had been made and put into position by the contractors? Yes.
13558. Do you recognise your estimate, which appears upon page 131 of the Parliamentary return? Yes, that is my estimate.
13559. Will you tell his Honor how you arrived at the £16 and the £2 10s. included in the £37 10s.—did you measure up the timber yourself? We took a general valuation as to what it was worth. The cubic feet were not actually gone into. We took the whole thing as being worth so much.
13560. With whom did you value the work? I think Mr. Ewing, or perhaps Mr. Snodgrass, was present; at any rate, one of the members of the firm.
13561. If a witness has said that he made the valuation, and that the centerings were worth something like £5 or £6, would that be correct? No.
13562. Did Darcus, who was the carpenter on that job, as you know, make the valuation, or did you? I made the valuation, with the contractors.

W. J. Millner.

19 Aug., 1896.

13563. Had Darcus anything to do with it? He was not present at all.
13564. Did you get a valuation from Mr. Snodgrass? He wanted £25 for them, and I told him what I thought they were worth, and what I would recommend. I said "It is of no use your putting in a claim for anything more than that, because I would not recommend it."
13565. *His Honor.*] How was the £16 arrived at;—did you split the difference? We fixed a price which we thought was just and fair; there was no splitting the difference.
13566. How did you arrive at the £15 for the concrete in pats? We went by the number of gaugings that were put in.
13567. *Mr. Davis.*] Coming to the bluestone pitchers, will you tell his Honor when you first noticed that they were put down at £50 per square yard? At the time the first certificate was made out.
13568. What did you do when you observed that they were put down at such a high rate? I thought my copy must be wrong. Mr. Snodgrass, however, who was making up the progress voucher with me, assured me that the amount was right. I sent the matter into the office, and you said that I had made a serious blunder in charging £50 for the bluestone pitchers. You said that you had turned up your own copy, and that the amount given there was only 50s. You said that I would have to make out the return again. We sent down and got the bond, and saw that the copy given to Mr. Davis contained the amount of 50s., whereas in the other case it was given as £50.
13569. It was quite evident to you from what I said that I did not know the price was £50? Yes.
13570. Can you fix the date when this happened? It would be about July, 1894.
13571. That was when you had the conversation with me which you have just spoken of? Yes.
13572. *Mr. Carter.*] When any complaints were made, had you any difficulty in getting the contractors, either Mr. Madison, Mr. Ewing, or Mr. Forrest, to carry out the desired alterations? They always put things right without further trouble.
13573. Do you remember how many bluestone cubes were shown on the plan, and what was the area of each set? I could not say from memory.
13574. *Mr. Parkes.*] What was the size of the shaft opening, and what was the margin where these bluestone pitchers went;—were the manholes all circular? Not all; some were square.
13575. How many were there? I could not tell you.
13576. What quantity was taken for each manhole? There were 1.23 square yards of pitching at each manhole.
13577. You do not know how many shafts there were? I could not tell you from memory.
13578. Would there be twenty-four? I could not tell you. Up to the time I left, I think I paid for only sixteen or seventeen; I was not there until the finish of the job.
13579. What was the width of the pitching? About 9 inches.
13580. In the specification both sandstone and bluestone pitchers are specified to go in at the bottom of open channels? As far as the freestone pitching is concerned, that, as I have already explained, relates to a portion of the contract which was cut out; it was done before the contract was advertised.
13581. And why did it appear in the specification? The specification was written before the portion was cut out.
13582. As to the bluestone pitchers which were to go in at the bottom of open channels, where would they be? There were none.
13583. That was only probable work? Yes; we might have substituted bluestone for sandstone pitchers in the portion of the work which was cut out.
13584. Then there is a specification for valve covers where ordered—where would they be? In the outlet and inlet walls.
13585. You did not put bluestone there? That was done after I left.
13586. Did they put it in, do you know? I believe so; I could not say.
13587. The valve chambers would be the manhole covers? They are in the same chamber; they would be for raising up the penstock.
13588. No bluestone pitching was put into the bottoms of open channels? No. Pitching in that situation is shown only on the culvert which was carried out by Mr. McSweeney.
13589. How many sumps do you say you saw filled in? I did not inspect the work; I simply saw it going on as I was walking along.
13590. How long does it take to put in a sump? There would be six or seven mixings; it would take a couple of hours perhaps.
13591. Did you look at any in particular? No.
13592. Do you know Darcus? Yes; I know him from seeing him on the work.
13593. Did you make any measurements with him? No; all the measurements I made were with Mr. Ewing; I never made any measurements with Darcus. I do not deal with the men but only with the contractors.
13594. How are the measurements of a section of the tunnel made? We have a proper section of the sewer.
13595. That would be a drawing made before you started? No.
13596. The drawing was made then after you had given in the measurements? It would be made on the section and measurements. We put pats in all along the bottom of the sewer. A model of the sewer is then put in and the work proceeds round that. The measurements are taken upon that at every 10 ft.
13597. If you put your measurements in your inspector's book would you have any further record of those measurements;—for instance, when you give the contractor instructions as to what size you are going to pay him for each one of the sections of excavations, do you give him any written authority or plan? No.
13598. You simply measure the excavation as he has made it? We measure the excavation before the concrete lining is put in to see if it is up to size.
13599. There are no written instructions as to what you allowed;—there was no record kept of what you allowed? The plan would be made at the time.
13600. What plan is that? I saw it here yesterday. It is made during the progress of the work, as each different part was done. The sections would be plotted before the excavation was finished.
13601. Where is the record as to where the sections were plotted? I do not know; I left them behind me.
13602. But there were such records? Yes.
13603. Did you take the sections yourself? Yes, I took the sections.

13604.

- W. J. Millner. 13604. Did you send in a rough section to the Department? I gave the man who made the drawing rough sections.  
 19 Aug., 1896. 13605. In your own hand? Yes.  
 13606. What would they be on? They were on some sheets of paper, as far as I can remember.  
 13607. *His Honor.*] I understand that as you went along the sewer it was for you and the engineer, who is your superior, to determine what the size of the lining should be? When we get the shaft sunk, and we start driving, we generally instruct the contractors what lining he is to drive for. We take notice of the rock, and if we think that one-ring lining is enough we order them to drive proportionately.  
 13608. You allow then a certain margin of packing round the lining? Yes, a 3-in. margin.  
 13609. And all that they put in in excess of that is put in at their own loss? Yes.  
 13610. That is, they are not paid for it? No.  
 13611. Then what is your object in measuring if a drive has been put through after instructions? We do not give them 3 inches if it does not go to that. They are allowed only 3 inches. If it went to 2 inches, or 1 inch, that is all they would get. A portion of this particular contract was in such easy ground that the driving was very neat in places.  
 13612. What was the object of measuring the drive? To get the sections.  
 13613. What you want to see is not how little but how much the contractors have excavated? Yes.  
 13614. If you find they have excavated up to a certain amount and, then, beyond that limit, the excess excavation is at their own loss? Yes.  
 13615. So that you do not go into the maximum extent to which they have excavated? We take it just to show that we have given the measurement as we found it.  
 13616. What I mean is this—if you told the contractors to excavate 4 x 5, then anything beyond 4 x 5 would not be paid for in any way. If, under those circumstances, a contractor had knocked out a hole running 2 or 3 feet in, you would have no object in measuring that? No. We might just measure the section to show what it was. The driving might be very tight in another place, and that would make up for it. One section might be tight and another large. We do not say that the limit is to be 3 inches in any particular spot. We say that the quantity is not to exceed that.  
 13617. Your principal object in measuring is to discover that the contractor has excavated enough? Yes; to see that there is room for the lining.  
 13618. *Mr. Davis.*] As to the margin—the 3-inch margin is a new idea? Yes.  
 13619. Is there a clause limiting the packing in Contract 69? Yes; I think there is a 3-inch maximum.  
 13620. Will you look at clause 63 of Contract 77? Yes, I see that.  
 13621. Provision is made in that clause for limiting the concrete packing, over and above the excavation ordered, to the extent of 3 inches, is it not? Yes.  
 13622. Do you find that clause in Contract 69? The specifications do not appear to be the same.  
 13623. You think that clause 80 of the schedule to the specifications connected with Contract 69 limits the packing to 3 inches? Yes.  
 13624. *Mr. Carter.*] As to the measurements—did Darcus, the carpenter, ever assist you in your measurements? He never made any measurements with me in the tunnel.  
 13625. If he says he poked a measuring stick up into the deep places and left out the shallow ones he would be wrong? He might have measured the chamber excavations; after I left there was nothing but No. 1 shaft to be measured.  
 13626. *Mr. Parkes.*] On what date did you leave? I think it was about April, 1895.  
 13627. All the excavation was done then? I think it was done.  
 13628. *His Honor.*] Do you remember anything peculiar in the history of the bluestone pitchers after it was discovered that they were to be charged at the rate of £50? No; I do not recollect any.  
 13629. Was there any order—I mean, as to the way in which the manhole rings were to be put down? No; I do not remember anything special.  
 13630. Did you hear that Mr. Davis had made a suggestion that special bluestone concrete should be used instead of bluestone pitching? Yes.  
 13631. Do you remember hearing that Mr. Hickson had made any order upon that? I think the papers were sent to me in reference to that matter.  
 13632. Do you remember looking up the matter to see how many pitchers were shown upon the plan? It was looked up in the office, but not by me.  
 13633. Of course you have no idea as to how that 12 yards got into the schedule? No; that is an office matter.  
 13634. Do you remember it's being discovered that it was a mistake? Yes.  
 13635. Was it discovered in the office, or was it by you? It might have been by me; I could not say; when we came to make up the returns, we found that we should run over the quantity; the price of £50 being discovered by Mr. Davis made him look into the matter.  
 13636. You were not on the contract up to the final payment? No.

William Gilliver recalled:—

- W. Gilliver. 13637. *Mr. Parkes.*] With regard to clauses 16 and 17 of the general conditions I suppose you know them by heart? I have every reason to know those particular clauses. (*Vide Appendix No. 36.*)  
 19 Aug., 1896. 13638. Take also clause 36, which appears on page 120 of the Parliamentary return; I suppose you know that and the other clauses there very well? Yes.  
 13639. They occur in most contracts of the Government? Yes; in the Sewerage Branch.  
 13640. How do you, as a contractor, interpret those clauses? My contention has been this—that the Department could not alter the character of our work. We say that when we take a contract, with signed plans and specifications, we should be allowed to do the work. If you turn over to the tender form, I think you will see that that bears out my contention. For instance, it says “And we do hereby agree that any additions to or deductions from the said work shall be paid or allowed for, as the case may be, at and after the rates or prices mentioned in the schedule of quantities and prices annexed hereto, or if not in schedule at a price to be agreed upon at the time.” I take that to mean that if there is any variation of the contract the prices must be fixed by the clause in the contract which gives the Department power to call in an outsider to do the work if the contractor and the office cannot agree about the price.  
 13641.

13641. Have these clauses been used with an opposite effect against you? Yes.

W. Gilliver.

13642. Will you describe in what way? That is what we objected to in connection with the Rookwood contract. The plans which I now exhibit are a plan of the original work and a plan of the substituted work. I have said on a former occasion that the bridge on that contract was held in abeyance. The bridge was the only means we had of getting our material from the railway station without incurring an additional mile of cartage.

19 Aug., 1896.

13643. Had you a good price for a bridge? A very fair price; but it was not altogether the loss of profit on the bridge, but the additional loss on cartage.

13644. Who instructed you that the bridge would be knocked out of the contract? We had a letter from the Engineer-in-Chief. In the first place, after we had sent in a complaint, Mr. Davis told my partner, Mr. Curtis, that it was not likely that the bridge would be built, and that it would have to be left in abeyance for the time being. The following are copies of letters which we wrote to the Department in connection with the matter:—

J. Davis, Esq., Supervising Engineer, Sewerage Department, Sydney.

Dear Sir,

24th July, 1894.

As we are now ready to take on the work at creek, in connection with laying the iron pipes, we shall be glad to know if the piers shown on sketch sent us are to be built of sandstone or bluestone. We should also like you would fix a price for same, together with the excavation for piers. As you are aware, this class of work is entirely outside of our contract, which says, "if no price in Schedule, at a price to be agreed upon." Building these small piers will be very expensive, the whole requiring timbering, and, when complete, no measurement in them.

We are, &c.,

GILLIVER & CURTIS.

J. Davis, Esq., Supervising Engineer for Sewerage.

Sir,

August, 1894.

We beg to acknowledge the receipt of your letter of the 9th instant, wherein you say the Engineer-in-Chief has decided to support the pipes by means of piles and braces, as shown on contract drawings. Will you please say if we are to build the bridge complete, as per drawing in detail for same; or do you mean us to build only the centre piles and headstocks. If only the latter, we think you would not ask us to do it at Schedule rates for piles, as when we tendered we clearly understood the bridge was to be built as per detailed plan.

Yours obediently,

GILLIVER & CURTIS.

J. Davis, Esq., Supervising Engineer, Sewerage Construction, Public Works Department.

Sir,

15th August, 1894.

We duly received, through your Mr. Smith, your letter of 13th instant, wherein you say, respecting the erection of the bridge, you were informed at the commencement of your contract that this work was not to be done. We admit your telling our Mr. Curtis it was doubtful if the bridge would be built. In the face of this, how can you expect us to erect a part—the most difficult—of the bridge at our schedule for piles, girders, &c.? We have no objection to build any portion if you will give us a price that will even cover the actual cost. We think that Mr. Hickson, the Engineer-in-Chief, would not ask us to do this work without an increased price. We might as well be asked, in fairness to us, to build the invert of tunnel only as this part of bridge, more especially in the face of the fact of your saying it was not to be erected.

Yours faithfully,

GILLIVER & CURTIS.

J. Davis, Esq., Supervising Engineer, Sewerage Branch, Department of Public Works.

Sir,

21st August, 1894.

Your letter of the 20th instant duly to hand, wherein you direct us to erect piles for pipe supports across creek.

We will at once take the work in hand and build as you direct; but it is understood that we do it under protest—our contending that you are entirely departing from contract. We have signed to do the work in accordance with plans and specifications, and amongst others we signed plans of bridge; and, by your directing us to build a *portion only*, you are, in our humble opinion, entirely altering the character of the work we contracted to do. We need hardly point out that the portion of bridge you have instructed us to build is the most expensive portion, and consider that it is beyond any doubt unfair to us, except at a price to be agreed on, as per contract for work outside of Schedule.

We are, Sir,

Yours obediently,

GILLIVER & CURTIS.

Mr. W. Smith, Resident Engineer.

Dear Sir,

25th October, 1894.

Can you make it convenient to call here at once. The piers of brickwork in creek are at a standstill, owing to the whole of the bricks having to be cut by your inspector's order. We would not do the labour for the 60s. per cubic yard, much less find the material.

We understood that Mr. Davis arranged with us that the piers were to be built perpendicular.

Pending your arrival, we have stopped the work, as we cannot conceive that you can expect us to do the work in this way.

Yours truly,

GILLIVER & CURTIS,

(per G. B. S.)

13645. Was the bridge built after the contract was completed? It is in course of construction now. The Secretary for Public Works gave the local Council £100 towards the erection of it.

13646. So that in that case the Engineer-in-Chief did alter the contract? Yes; he wrote to us and referred to the clause in the contract giving him the power to do so.

13647. Clause 16 I suppose he meant? Yes.

13648. That is the clause quoted by Mr. Hickson? Yes.

13649. Do you know of any other instance of the kind? Yes. Upon the same contract the plans will show concrete round the earthenware pipes. Afterwards we put in the top with concrete and left the bottom out. That was entirely different from the contract plan.

13650. *His Honor.*] Was the bottom portion filled in with different material? No; the pipes were bedded in earth in the usual way.

13651. *Mr. Parkes.*] One of the letters from the Engineer-in-Chief to which you refer would be as follows:—"Gentlemen,—In reply to your letter of 15th instant respecting the supports for carrying the cast-iron pipes across the creek, I have the honor to inform you that the matter has again been laid before the Engineer-in-Chief, and he directs me to state that he does not agree with you that an injustice is being done you in asking you to do work which was specified and is included in the Schedule of prices attached to the contract. Will you therefore please carry out the work as directed.—Yours obediently, J. DAVIS."

Another one was in these terms:—"Gentlemen,—In reply to your letter of 24th ultimo as to the price as arranged for the concrete and excavation required for the piers under the cast-iron pipes at the crossing of the creek I have the honor to inform you that, as you appear not disposed to carry out the work referred to at Schedule rates for concrete and excavation, the Engineer-in-Chief has decided to support these pipes as shown by the contract drawing, viz., by means of piles and braces, prices for which are included in the Schedule

- W. Gilliver. schedule attached to the contract. Will you therefore please execute the work accordingly. I have the honor to be, gentlemen, your obedient servant, J. DAVIS." Yes; we should have had to get a pile engine, ram, &c., at a cost of £60 or £70, and £1 a foot would not have paid us for that portion of the work.
13652. Was clause 16 the clause upon which that decision was made? Yes, I take it to be so. I may say that I remember seeing Mr. Davis personally more than once about the matter, and pointing out the additional expense to which we were put in carting the material. The bridge was to be left in abeyance until the contract was completed. I think we put in a claim of £80 for extra haulage on account of the non-erection of the bridge, and a sum of £40 for loss of profit. The other claims were allowed by Mr. Davis as far as he could allow them, but I went to see the Engineer-in-Chief, and he disallowed these. I had not an interview of more than one minute's duration with him. He had apparently made up his mind what he would do in the matter.
13653. Did he state the clause under which he acted? He told me that he had thrashed the matter out previously and was tired of it, or something of that kind.
13654. And he would not sanction it? No; his mind was apparently made up.
13655. *Mr. Davis.*] You are an alderman of Rookwood? Yes.
13656. So that you know a good deal about this bridge apart from the fact of your being a member of the firm of Gilliver and Curtis? Yes; I have been living in the district for the last ten years, and I know pretty well the whole country round there.
13657. Do you know what was the object of leaving out the bridge? To save expense, I take it.
13658. You did not gather that the motive was to oppress you? No. We were perfectly satisfied that the bridge would be left out after Mr. Hickson had given his decision; but at one of the meetings of contractors which took place at Mr. Parkes' rooms, I heard one of the contractors say that the Engineer-in-Chief had allowed Carter, Gummow, & Co. to do the whole of the bluestone pitchers upon Contract 69 at £50 per square yard. Then the bridge came into my mind. The rule I go on in the matter is, that what is good for one contractor is good for another. I take it that all contractors should be dealt with fairly and justly.
13659. Did it not occur to you that the cases of the bridge and the bluestone pitchers were rather different? Not in the slightest; you could have substituted bluestone concrete round the manhole covers. There is a place on the Parramatta Road upon which there is probably more traffic than upon any other road in the Colony, and in the centre of the road there is a manhole cover with special concrete round it.
13660. Did you regard the two cases as being parallel? I regarded them as being on all fours; one decision being given as regards one contractor, and a directly opposite decision as regards another.
13661. You would say, would you not, that the clause to which Mr. Parkes referred gave the Engineer-in-Chief power to alter or substitute work where in his judgment that was necessary? That was his rule with us.
13662. Is that your opinion? He has done so with us; but there has been a decision given by the full court in Queensland, and that is why I have written so strongly about the matter. The point was referred home, I think. It was decided there that the Government had no power to alter a contract once the plans and specifications were signed. That is what was running through my mind at the time I wrote so much about it.
13663. Have you ever compared the Queensland contract with the contracts you have had under the Sewerage Department? Only in my mind.
13664. So that there might be substantial differences? I have the specifications belonging to some Queensland contracts, but I have never actually compared the two.
13665. Then there might be a substantial difference? There might be.
13666. Would you consider it a legitimate use to make of the clauses to which you have referred, to take advantage of the prices that are given in the schedule, and to execute work at a low price or at a high price, just to suit the Department? I do not think for one moment that you would do it. You have always give us fair play. I believe you are a perfectly straight man. I do not want to flatter you, but I think you are an honest man. That at all events is my experience of you. You have allowed us in the seven or eight contracts we have carried out fair play. There is no doubt in the world about that; but what I say is that, as regards the decisions of the Engineer-in-Chief, what is good for one contractor is good for another.
13667. Coming to the bridge itself, when it was decided not to construct the bridge, and you received the first sketch—taking the concrete prices, you wanted a special rate for concrete? Yes.
13668. And then the Department, in order that we might get our pipes supported in such a way as to cover the contract, ordered you to revert to the piles—is not that so? You were very undecided about it. In one case you sent us a sketch for the building of concrete piers with six piles.
13669. And the second time you got instructions as to supporting the pipes it was with piles? Yes, the letters will show what happened.
13670. Coming to the brickwork, was it not put in at your suggestion so as to get over the difficulty? We had £3 a yard for brickwork, and I think there were 8 cubic yards when it was cubed out. We wanted to get the contract completed. I suppose you know that we are not in the habit of being behind-hand with any contract we take up. We always wish to be beforehand, instead of coming cap-in-hand to the Department to ask for an extension of time. I remember writing to you and saying that we would go on with the work at once, but that we considered that you were departing from the contract.
13671. But in regard to the brickwork, was it not put in in order to get over the difficulty? I think Mr. Smith and yourself suggested the brickwork in the first place.
13672. And you concurred? Yes, under pressure.
13673. I would like to ask you one more question about Mr. Hickson. Did not Mr. Hickson treat you fairly when he considered your proposal to take on the extension of Contract 70, amounting to almost as much as the original contract? We asked to be allowed to do the extension. As to the Parramatta contract, our price was 20·78 per cent. below schedule, and we offered to take the extension of it because we were on the ground, and we had men there we did not know what to do with. We were prepared to take it on, but you would not give it to us, and called for tenders. We tendered at 10 per cent. below and got the contract. My object in writing to you was that we had a good deal of plant on the ground, and also men. I believe myself that if tenders had been invited we should have got from 15 to 20 per cent. more for the work.

13674. It answered your purpose to get the extension, and Mr. Hickson recommended it? Yes; we said he could do it more cheaply than anyone else. W. Gilliver.  
19 Aug., 1896.
13675. That occurred after the bridge was cut out of the Bookwood contract? Yes; the bridge was in abeyance. From the time the tender was accepted by Mr. Lyne up to sketch you sent us the bridge was in abeyance. We did not know whether we should have to build it or not. You had told Mr. Curtis, I believe, that it probably would not be built.
13676. *Mr. Carter.*] When you put in your claim against the Government, or when you entered your protest regarding the bridge, there was a very large sum of money involved? No; directly and indirectly, probably £200.
13677. Taking the bluestone pitchers on our contract, a very much larger amount would have been involved there? But instead of your having 12 yards as specified in the schedule, you were allowed four times that quantity.
13678. Suppose the amount of profit involved in the bluestone pitchers amounted to £2,000, and you had been in our position, would you then have dropped your claim so easily as you dropped it when it had reference to the comparatively small amount of £200? We never dropped it. The matter was left in abeyance until the contract was complete. Then we put in our claim for extras and loss of profit on not building the bridge and approaches, and extra cost of cartage through the non-erection of the bridge; but we got nothing in connection with the bridge.
13679. Eventually you dropped it? We were wiped out.
13680. Is it not often the case with all contractors that as regards small amounts the Department often tries to bluff us out of them? I cannot say that. I have nothing to complain about in that respect—absolutely nothing.
13681. But do they not often try to bluff us out of small amounts? No; as regards the Harbours and Rivers, Railways, and Sewerage, Departments, I have nothing to complain about, but I do not think it is fair for the Engineer-in-Chief to give one decision for one firm of contractors and one decision for another.
13682. You see that 12 yards of bluestone pitchers are provided for in the schedule, but it has been proved that we were only paid for the exact quantity shown upon the drawing;—which would you claim upon in such a case, the drawings or the schedule? But the question is, were they in the drawing when you tendered. It is easy to fix up these matters you know.
13683. I mean the drawing that we signed? If there are the number you say in the drawing, how is it that there are only 12 yards shown in the schedule. That is not our experience. I do not want to do you any harm. I am merely fighting a principle.
13684. *His Honor.*] Supposing the larger number were shown in the original drawing, and that only twelve were shown in the schedule? My experience is this—that the quantity shown upon the drawing would be the quantity shown upon the schedule.
13685. Supposing a mistake were made? I do not know anything about that.
13686. Supposing that such a mistake had occurred and had been admitted, would you not claim to be allowed to carry out the quantities according to the drawing, and not according to the schedule? It is not for me to say what I would do.
13687. *Mr. Parkes.*] Did you ever notice, in the specification, clause 113, which is as follows:—
286. It is hereby expressly understood that the contractor is bound to completely and thoroughly inform himself of every circumstance connected with or relating to the work, and of the correctness or otherwise of any information contained in or supplied by the drawings or specification; as he shall have no claim on account of any errors, omissions, or inaccuracies, that may be found in these documents after the contract shall have been signed, and since he has to provide in his tender for every contingency that may arise.
- The contractor must himself compare the copies of drawings and specifications supplied to him, under clause 4 of the general conditions, with the original, as no claim will be allowed for any errors therein.
- ? I always thought that under the contract the department could practically make a contractor do whatever they like.
13688. Under this remarkable clause? Yes.
13689. There is plenty of provision to safeguard the public? Seemingly so.

Joseph Davis recalled and further examined:—

13690. *Mr. Parkes.*] Mr. Bagge, in his evidence, spoke of an aqueduct carrying pipes at either Rose Bay or Double Bay which he once inspected with you;—can you locate the work to which he refers? I do not know to what he refers; there is nothing of the kind at Darling Point or at Rose Bay. J. Davis.  
19 Aug., 1896.
13691. But do you not remember going out with him to see an aqueduct? I have been out with him many times; we have frequently been out together.
13692. But do you not remember going to one particular work at Double Bay? There is a short length of the Waverley and Woollahra branch sewer constructed on arches at that point.
13693. Did you go to see that work with Mr. Bagge? I remember going there with him on one occasion; when we got there we found that improper bricks were being used, and, what was more, we found that these bricks were laid on the centres with the intention of grouting the joints, no compo. being used; whether Mr. Bagge refers to that or not I do not know.
13694. Were those arches cracked? One of the arches had cracked a little; that, I think, was due to contraction.
13695. Was the work taken down? Yes; the brickwork I have spoken of; I forget now who the Inspector was; I know that the matter was fully dealt with; the bricks were condemned, and were finally taken off the works.
13696. Were the arches taken down and rebuilt? I do not think so—in fact, I think I am quite right in saying that they were not; I think a crack occurred at the end of the aqueduct. I will tell you to the best of my recollection what took place. There were four arches of probably from 15 to 20 feet span; they were finished on to the southern side of the valley, where there was a tunnel; the tunnel was the last part of the work, and after it had been finished the balance of the aqueduct was put in; it was at the junction that the crack occurred; the crack developed a long time after the junction was made, and before the embankment was put over. I do not know whether that is what Mr. Bagge referred to. What I think he refers to is something which occurred in the culvert at that same place.

- J. Davis. 13697. What occurred there? On the upper side of the sewer, to enable the drainage above the embankment to pass under the sewer, there was a culvert. The portion of the culvert on the up-stream side was built upon rock, but on the lower side of the sewer, on the down-stream side, the foundation was exceptionally bad. A portion of the culvert, therefore, was built upon rock, and the balance of it was built upon very bad ground.
13698. Which contract was that? Contract 53—Carter & Co.'s. The best job possible was made of the foundation before the culvert was put in. There was a lot of rubble from the tunnel put in to consolidate it, and the culvert, which was very light, was put on, and stood all right until the embankment was put on. When the bank was put on, it proved too much for the foundation, and it settled a little in one corner, causing a crack near the springing of the arch.
13699. Had that to be pulled down? I believe a portion was taken down; but it was not done at the contractors' expense. The contractors had absolutely nothing to do with it. If it were taken down it would be done at the expense of the Department; but I would not be sure now of what was done in the matter. The thing happened a long time ago, and I should have to look at the papers before I could say positively what did happen.
13700. Was not the greater portion of the aqueduct carrying the pipes taken down and put up again? There were no pipes; it was simply a concrete structure, with the exception of the arch of the sewer, which was of brick.
13701. It was what you would call an egg-shaped sewer, and would answer the same purpose as a pipe? Yes.
13702. Was it not taken down and put up again? Not to the best of my recollection: very little, if any, was taken down. To the best of my belief the work done was of a very trifling character, and would not have amounted, as a whole, to more than a few shillings in value. That is the only place to which I think Mr. Bagge can refer, although I admit that from the description of the work which he gave I cannot identify it.
13703. *His Honor.*] Was there never any question of bad mortar in connection with this particular work? There was the bad brickwork of which I have spoken.
13704. Would that be bad bricks or bad mortar? Bad bricks—they were not properly jointed. They were simply laid upon the centering with the intention of pouring the grouting on to them. That is not bricklaying at all.
13705. *Mr. Parkes.*] Were the arches cracked? They were all right with the exception of the crack to which I have referred, at the junction.
13706. *His Honor.*] The brickwork to which you have referred was in the same arches? Yes; there were four arches, I think, going across the valley where the sewer crosses the Chinese gardens, just below the Edgecliffe Road.
13707. And it was in the building of these arches that defective work was found—defective bricklaying work, bad bricks being used—there being grouting instead of trowelling? Yes; but I think you misunderstand. The defective brickwork was not in the arches themselves, but in the arch of the sewer. The arches themselves were of concrete.
13708. *Mr. Parkes.*] Mr. Bagge said that sand had been used instead of cement, and that the arches were taken down? Yes; I have heard him give his evidence.
13709. *Mr. Carter.*] Do you remember exactly where the defective brickwork occurred—did it not occur some hundred yards further on towards the Bondi sewer instead of in the arches of which you have spoken;—as a matter of fact, was not the defective work in an open cutting, and not in an embankment at all? The sewer from the main Bondi sewer up to the valley is treated in the same way, and I should not like to say at this moment where the bad work occurred—whether over the arches or in the sewer leading up to the arches.
13710. You do not remember definitely whether the defective work of which you speak was in the open cutting? It may have been in the open cutting leading up to the arches, but it does not make any difference, because the brickwork had nothing whatever to do with the arches; it was part of the sewer.
13711. As to the arches themselves, the whole thing was a trivial matter? A very small affair.
13712. So small that we have all forgotten about it? Yes.
13713. *His Honor.*] Do I understand that all the arches are covered up with an embankment? Yes; the failure of the culvert was entirely due to the foundation. The difficulty was to know what to do with it without going to a good deal of expense in piling. The arch that carried the sewer corresponded with the arch of the culvert on each side of it.
13714. Then the culvert extended out from the sewer—from one of the arches bearing the sewer to the edge of the embankment? Yes, to form a waterway.
13715. *Mr. Carter.*] You do not remember the inspector who had to do with the defective brickwork? I believe it was McDonald; but I would not like to say positively.
13716. You may recollect, perhaps, that the grouting was carried out by the inspector's orders, and that there was some trouble about it afterwards? I think it was Hamilton who was doing the work now I come to think of it; he has not since been in charge of work of that description.
13717. Did the Department sack him? I believe he was suspended, but he was finally brought back at about half money and given work of a very inferior kind.
13718. You do not remember whether he actually ordered the work to be done in the way in which you found it, in opposition to the bricklayers' wishes? I believe the whole responsibility lay with him. First of all, he had passed the bricks; and, so far as the bricks were concerned, therefore, we were in the contractors' hands. Then he ordered the work to be done in the way I have described. Of course, the contractors were not to blame, except that their men traded on the man's ignorance.
13719. *His Honor.*] What was the matter with the bricks? They were very rough, to begin with. They were badly made, and the material in the bricks themselves was really bad; they were third or fourth rate bricks.
13720. Were they radiated bricks? Yes, specially made for sewer work.
13721. *Mr. Carter.*] Suppose we had taken a determined stand against the alteration of this particular piece of work, should we not have been justified in doing so, seeing that your inspector had passed it? Not only did the inspector pass the bricks, but I think the papers will show that he went to the brickyard and passed them before they left the yard. I made a recommendation that the bricks should be condemned in

in spite of the fact that we were in the contractors' hands. I felt so very strongly about the quality of the bricks that, let the consequences be what they might, I thought they ought not to be put into the work.

J. Davis.  
19 Aug., 1896.

13722. *His Honor.*] Were they not put into the work? No.

13723. Was any compensation paid to the contractors? To the best of my recollection none was paid.

13724. *Mr. Parkes.*] Were the contractors paid for alterations to the culvert or bridge or arches? Not for alterations as far as the culvert itself was concerned. To the best of my recollection we did that ourselves.

13725. *His Honor.*] What Mr. Bagge says is this, that he recollects your taking him out to show him some concrete arches to see how well they would stand, but that when you got there you found something wrong with the work. You cannot remember anything of that kind? I think myself that Mr. Bagge has muddled the two things together. He has the brickwork mixed up in his mind with what occurred at the culvert. I remember that he did go out with me, and, as regards the brickwork, he quite agreed with what I did; furthermore, I remember that he went out to look at the culvert. I wanted his opinion as to the cause of what had happened, although it was a little matter, still it was a failure in the work; and I regarded it as important to get his opinion as to the cause of the failure.

John Carter, recalled and further examined:—

13726. *Mr. Parkes.*] In questioning Mr. Bagge on the last day on which the commission sat you asked him if he did not recollect the collapse of a culvert on a work of yours, and whether the department did not pay the contractors for it, because it was due to their faulty design. Can you give any explanation of that matter? The thing explains itself. What I had in my mind was this—that some five or six years ago there had been some trifling dispute over this particular culvert. I was under the impression that we substituted concrete foundations under one of the piers, and that we were paid for it. I am not positive upon the point.

J. Carter.  
19 Aug., 1896.

13727. Was it in an aqueduct? There were a series of small arches carrying the sewer across a small creek in Double Bay Valley.

13728. What happened? One of the abutments or piers of the arches and culvert at the creek settled a little owing to the soft foundation.

13729. Were the arches cracked? No.

13730. Did not the settlement crack the arches? Not that I know of; it may have done so after I last saw the work.

13731. Was the work all taken down again? No; certainly not.

13732. How much was taken down? Nothing; a little sandstone or bluestone concrete was put under one of the piers to give it a bearing on the muddy foundation.

13733. *His Honor.*] Was it a pier of the culvert only? For one corner of the culvert. It acted as a sort of pier for the arches above.

13734. Was it part of the pier that carried the sewer, or was it a pier which carried the culvert and the bank? I am referring to the culvert. I know nothing about the arches at all, that is from the point of view of bad work. I do not believe anything did occur as to the arches. As to the defective brickwork I am positive that the brickwork which was condemned by Mr. Davis was 100 yards further on, and had no connection with the arches.

13735. It was further to the north? Yes.

13736. Does not the aqueduct come very near the main sewer? It is 15 or 20 chains away.

13737. This sewer meets it at right angles? Yes; I think Mr. Bagge referred to the arch of the sewer when he spoke of defective work. I do not think he referred to the arches in the valley at all.

13738. What was wrong with the brickwork? It was simply filled in with grouting. Mr. Bagge said something about picking it out, and I quite believe that he could.

13739. Was that altered? Yes.

13740. Were you paid for it? No.

13741. How came the grouting to be done? I think it was done by the consent and instructions of the supervising inspector, who was ignorant of that particular part of the work. We were in the position of having brought passed material to the ground, and having carried out the work according to the inspector's ideas. Afterwards the work was condemned, and we replaced it at our own cost.

13742. Were not your men trying to play a trick on the inspector? It is very likely that they took advantage of his ignorance, but they did as he told them. Personally, I know nothing about the matter.

13743. *Mr. Parkes:* It is possible to put bricks in position dry and grout them up afterwards? Not in tunnel work.

13744. Not if you had your centre underneath the arch? I only say that I am not a practical bricklayer, and know nothing about those matters.

13745. *His Honor:* Who was in charge of that part of the work for you? Mr. Snodgrass.

13746. In personal charge? Yes. Mr. Forrest would also be there; he might remember something that occurred.

13747. It may be that Mr. Forrest and Mr. Snodgrass took advantage of the inspector? It is very probable. It is only human nature that if they struck an ignorant man they would take advantage of him as much as they possibly could.

Edward Hungerford recalled and further examined:—

13748. *Mr. Parkes.*] You have made inquiry at my request concerning the claim paid to M'Namarra, the wool scourer, in connection with Contract 72. Will you describe how that claim for stoppage of water-flow came up? I do not think I can. It was a Harbours and Rivers matter, and had no connection at all with Contract 72.

E. Hungerford.  
19 Aug., 1896.

13749. But it was owing to the work upon Contract 72? I do not think so.

13750. The matter was contained in the portfolio comprising the papers in connection with No. 72? The Contract 72 papers were called for in connection with the Harbours and Rivers case; but the case, as far as I know, was in connection with the Shea's Creek canal.

13751. But it was in connection with Contract 72 that the stoppage of flow took place? I could not say anything as to that. That is a matter for an engineer.

13752.

E.  
Hungerford.  
19 Aug., 1896.

13752. But do not your papers show it? I have not the papers, but I asked the Crown Solicitor whether anything had been paid, and he said that nothing had been paid yet, because there were certain counter-claims to be settled.

13753. Have you a statement in connection with the amount of costs which has already been paid in connection with the case? The only statement which I am able to make in connection with the case is contained in the document which I handed you this morning, and which is as follows:—

|               |                     | MACNAMARA v. THE QUEEN. |    |    |              |                     |            |
|---------------|---------------------|-------------------------|----|----|--------------|---------------------|------------|
|               |                     | £                       | s. | d. |              |                     |            |
| 1894.         |                     |                         |    |    | 1895.        |                     |            |
| June ...      | Crown Solicitor ... | 500                     | 0  | 0  | March ...    | Brought forward ... |            |
| " ...         | J. Robertson ...    | 26                      | 5  | 0  | December ... | Crown Solicitor ... |            |
| July ...      | E. Beadell ...      | 1                       | 0  | 0  | " ...        | Sir J. Salomons ... |            |
| " ...         | Crown Solicitor ... | 1,000                   | 0  | 0  | " ...        | J. Garland ...      |            |
| " ...         | T. Houghton ...     | 12                      | 12 | 0  | 1896.        |                     |            |
| September ... | Crown Solicitor ... | 300                     | 0  | 0  | February ... | E. Barton ...       |            |
|               |                     |                         |    |    | April ...    | Crown Solicitor ... |            |
|               |                     |                         |    |    | " ...        | J. Garland ...      |            |
|               |                     |                         |    |    | June ...     | Rowe and Curtis ... |            |
|               |                     |                         |    |    | " ...        | H. S. Williams ...  |            |
|               | Carried forward     | £1,839                  | 17 | 0  |              | Total               | £6,142 2 7 |

These are the amounts which have passed through the books of the Works Department. Most of them have been placed to the credit of the Crown Solicitor for meeting law expenses.

13754. They are all legal claims? The Crown Solicitor is the only man who could say that.

13755. What money has been paid to Macnamara? None yet.

13756. The case is still in litigation? At your request, I asked the Crown Solicitor this morning whether anything had been paid, and he said that nothing had been paid yet.

13757. Did you get information as to whether the case was settled? He said he could not reply to that question, because the clerk who dealt with the matter was out.

13758. There is no further information you can give me on the point? No; it had nothing whatever to do with sewerage matters, so that it never came under my notice.

Joseph Davis recalled and further examined:—

J. Davis.  
19 Aug., 1896.

13759 *Mr. Parkes.*] Clause 83 of the specification, upon page 92 of the Parliamentary Return, is as follows:—

In all cases where a greater thickness of lining, or a greater cross-section area of tunnel or shaft, is ordered to be executed, from whatever cause, after the length of tunnel or shaft in question has been excavated to the profile ordered in the first instance, the excess of excavation so ordered shall be paid for at schedule rates for tunnel or shaft excavation as the case may be, and as the Engineer shall classify and direct at the time. If such extra excavation, in the opinion of the Engineer, shall require special timbering and shoring, the same shall be dealt with in strict accordance with clause 114.

Turn now to clause 114, upon page 95, you will see that it is as follows:—

*Shoring, Timbering, Piling, Temporary Bridges, &c.*—During the excavation for sewers, buildings, piers of aqueduct, abutments, storm-water channels, shafts, cast-iron cylinders, &c., the contractor to adopt every precaution, and provide all materials, as planking, strutting, shoring, timbering, piling, sheet-piling, all packing materials, as straw, asphalted felt, bags, tarred gasket, puddle, &c., and all labour; and carefully execute, at his own cost (unless where otherwise specified), all piling, sheet-piling, &c., as shown on drawings; and, where ordered, and wherever considered necessary by the Engineer, and to his entire satisfaction, all sheet-piling, temporary scaffolding, staging, bridges (over rivers, creeks, water-courses, and open drains, underneath lines of railways, tramways, streets, or footpaths, so as to ensure during the period of the contract the undisturbed traffic and flow of water as the case may be in all channels, drains, water-courses, creeks, or rivers, and the undisturbed traffic along all railways, tramways, streets, &c.), and strong shoring, and in sandy, water-charged, or loose soil, close timbering, piling, and sheet-piling; and provide all appliances, and have all packing materials, as above enumerated, close to where they are required, and with the same carefully and securely close up and pack against the outside of the timbering all joints and open spaces between poling-boards, sheet-piles, or wedges, wherever they occur, and caulk open joints where directed, and execute whatever may be required to prevent any buildings, or other superstructures, road and other surfaces over and adjacent to the line of sewer, from settling, cracking, being shaken, slipping, or falling in, and to prevent any portion of the floors, sides, roofs, and end faces, of excavation, beyond the exact cross sections and dimensions determined on, from slipping, falling, running in, or being forced through joints and open spaces in the timbering and sheet-piling, and maintain said timbering, piling, shoring, temporary bridges, &c., where and when directed, till completion of the works, to the entire satisfaction of the Engineer.

What is the meaning of those two clauses? Clause 83 has reference to cases where, after the tunnel is driven, it is found necessary for some unforeseen reason to enlarge the tunnel. Clause 114 deals generally with shoring, timbering, bridges, and so on—work which has to be done by the contractors at their own expense unless the engineer for some reason or other thinks it impracticable to withdraw the timber which has been put in. He may order it to be covered up, and in that case it is paid for at schedule rates.

13760. Where is the clause which says that it shall be paid for? Clause 115 on page 96. You must take that clause in conjunction with clause 116.

13761. But you seldom withdraw the timber? It is very difficult and dangerous to withdraw it in the case of tunnelling, and in that case it has to be paid for. In the case of open cutting it is usually withdrawn, and in that case it is not paid for.

13762. Clause 284, which appears upon page 113 of the Parliamentary Return, is to this effect:—

It is to be distinctly understood that, on completion of the works, the Engineer shall have the power of ordering and having the main sewers, or portions of same, &c., closed, in such order as he shall direct, and the whole of the sewers and aqueduct tubes, &c., filled with water for such a time as he may deem necessary, for the purpose of testing the works; and any injuries, faults of whatsoever description, leakage, breakage, &c., of valves, tubes, pipes, iron, masonry, brickwork, concrete-work, &c., caused by or detected in consequence of such testing to the work, of every description, joints, &c., shall be at once repaired, replaced by new work where ordered, and made good. The whole expense incurred, in plant, materials, and labour required to replace with new work, effect repairs, and make good, any faults, leakage, damage or injuries to any portion of the works, shall be borne solely by the contractor; and after the completion of these repairs, replacing with new works, and making good any damages, injuries, faults, &c., the whole of the works shall again be tested, as before described, until they shall have been proved perfectly watertight, sound, clean, and in first-class working condition, to the entire satisfaction of the Engineer. If the result of the test or examination be satisfactory, the work will be formally taken over by the Engineer, who will issue a certificate to that effect, whereupon the period of maintenance shall begin.

Is that test ever carried out? Yes.

13763.

13763. Was it carried out in the case of Contract 69? There was no necessity for it, I think, but I would not be sure. I was not in charge at that time. The only case where it would apply in that contract would be the syphon at the Illawarra Road. It is probable that that may have been tested.

J. Davis.  
19 Aug., 1896.

13764. Is not the clause to apply to the whole of the work? There is a qualification giving the Engineer power to order. The object is to test aqueducts and things of that kind which would be above ground. All those tubes at Arncliffe, for instance, were tested.

13765. Was 101 tested? That I do not know; it was taken over while I was out of the Sewerage.

13766. What quantity of water would be over each of the arches supposing the sewer were full? I could only give you the quantity approximately at a moment's notice; but, as a matter of fact, the sewer never would be full. I suppose you mean the quantity when the sewer is charged up to the flow line?

13767. What is the meaning of clause 286 of the specification upon page 113 of the Parliamentary return;—does not that throw the responsibility upon the shoulders of the contractor of accepting any incongruities in the plan and specification? I think the whole intention of the specification, from beginning to end, is to put everything possible upon the shoulders of the contractor. The question is whether some of these clauses do not almost nullify themselves by their severity. You would have to take into consideration in conjunction with a clause like that what was equitable and just.

13768. Would not that clause assist you in equalising the payment in the case of such an extravagant charge as £50 a yard for bluestone pitchers? It might be brought forward as an argument.

13769. But would it not hold good if you used it? Really I do not know. It might be my opinion that it would or that it would not, but I do not know that that would make very much difference. That, I think, is rather a question of law.

13770. But you have to administer the contracts? I would go strictly according to the specification until I was stopped, consistently with doing what would be equitable and right. I do not see how you could have any other clause than that one in the specification. No doubt it is a very severe clause, and the object is to put the responsibility on the contractors.

13771. You know the clause dealing with bluestone pitchers, on page 105 of the Parliamentary return? Yes.

13772. You, and also Mr. Hickson, have said that you had the power to do almost exactly what you liked in that matter? It means that we have the power to have them put in any other situation than the places mentioned by the specification.

13773. There is no reason why you should not have declined to order them to be put round the man-holes? That is another question. The specification specially states that they are to be put round the manhole covers, and the drawings with the exception of a few instances show it.

13774. Coming to clause 72, when that contract was started, if anything occurred, according to this specification, by which the channel which the contractors had excavated were filled by flood-water, the responsibility would lie upon the contractors, would it not? Yes and no; I would say both; but, speaking generally, certainly yes. The contractor would have to take all the responsibility of completing the work in accordance with the plan and specification, and handing it over to the department in perfect trim as far as it could be perfect, but circumstances might arise which would modify that to some extent.

13775. But do you not throw the entire responsibility upon the shoulders of the contractors according to your specification? Yes; the intention is to put all the responsibility we can upon the shoulders of the contractors.

13776. What clause is that? I think you will find it in the general conditions.

13777. Do not those clauses make it imperative upon the contractor to make good any damage from flood-water? Any ordinary damage, certainly.

13778. Was this not a case in which, owing to the carelessness of the contractor, his trenches were filled? Not to my knowledge.

13779. Was not a certain length filled up with flood? Not to my knowledge.

13780. Were you supervising engineer when this work was carried out? Yes.

13781. Who was the engineer in charge of the work? There were two or three men in charge, but I know all about it.

13782. Was there no correspondence about the silting up of the channel? There was no correspondence about the filling up of the channel, but there was correspondence with reference to the deposit of some earth in a channel running along the line of the Shea's Creek canal.

13783. But it was in a sewer channel, was it not? It was in work excavated by Carter & Co.

13784. For a sewer channel? As an outlet for the channel.

13785. The flood filled up the trench? No; I do not say that it filled it, but it deposited a small quantity of earth in the bottom of the channel excavated.

13786. For what length? Principally at the ends, but the channel would be affected for 20 chains or so.

13787. There is a clause in the specification of 72 Contract—clause 4, upon page 152 of the Parliamentary Return, which is as follows:—

The contractor is to execute in like manner and with the same quality of materials, as provided for the works expressly mentioned in specification and drawings, any extensions, additions, deviations, alterations, or extra works, which the Engineer may require by an order in writing.

The work executed under this clause will be measured up and paid for at schedule rates in the same manner as provided for the other works under this contract; and, if it comprise any work not specified in contract and in schedule of prices, a special agreement shall be made between the Engineer and the contractor, and signed, at the time of giving the order for such work.

In case the above-named parties shall be unable to agree on the value of such extra work, the Engineer shall be at liberty and fully authorised to have it executed by whomsoever he may think fit.

No extra work, extensions, or any additions, deviations, or alterations whatever, which may be claimed by contractor, will be recognised or admitted under any circumstances, if done or executed without, or contrary to, an order in writing from the Engineer as aforesaid, and the production of such order shall be a condition precedent to contractor's receiving payment for them.

The Minister, or the Engineer acting on his behalf, may from time to time by writing under his hand require the omission of any particular portion or part of the works described in the specification or shown on drawings; and the contractor shall have no claim for loss of profit, sustained damage, or other compensation, on account of any such omission.

You could, according to that clause, take out a portion of the work? It is a general clause, such as you will see in all public works contracts.

J. Davis. 13788. Take clause 3, upon page 141 :—  
19 Aug., 1896.

3. It is to be understood that the lower 13 or 27 chains of the channel shall not be constructed until the Engineer gives a written order to that effect; and the Engineer shall have the power to suspend the execution of these portions of the work, or any other part of the contract, or to reduce the length of the contract by the extent of the said 13 or 27 chains, or any other part of the sewer shown on the drawings that he may consider necessary, and the contract shall not thereby be invalidated, nor shall the contractor be entitled to any compensation on account of such temporary suspension of any part or parts of the contract or permanent reduction of same.

What do you say as to that? That is partly special and partly general. The special part of it refers to the lower part of the channel. The general part of it is simply a reiteration of what you have read from the general conditions.

13789. *His Honor.*] What is the reason of funds at the time these contracts were advertised. We did not know what the tenders would be, but we knew what the estimate was. We knew that the estimate was higher than the funds at our disposal to cover the work, and that proviso was put into the contract to reduce it when the tenders came in, supposing the tenders were for a greater amount than we had money to cover. That is the reason why 13 and 27 chains at the lower end of the channel were mentioned.

13790. How is it that 13 and 27 chains were the special lengths provided for? Mr. Bagge, at the time the specification was drafted, thought that either 13 or 27 chains might be omitted. If we got a very favourable tender in, it was thought that we might have done the whole of it. If not, then we could omit the 13 chains. If we got a very big tender, involving a large expenditure, then it would be necessary, in order to bring ourselves within the amount which we had in hand, to omit the 27 chains at the lower end of the channel.

13791. These lengths represented particular points? Yes, they were supposed to discharge at convenient spots.

13792. *Mr. Carter.*] Referring to Mr. Parkes' question as to the responsibility of contractors for damage done by storm-water, or anything of that kind, suppose your Department, or the Harbours and Rivers Department, came along and pumped the whole of our works full of silt and water, could you reasonably ask us to take the responsibility of all that, and to clean it out from time to time? I do not think it would be a reasonable thing to do.

13793. So that you would have no right to interfere with the land in the neighbourhood of where we were working until our contract was completed;—you would have to leave it practically in the same condition as when the contract was signed? Yes. Speaking as a layman, I think that if we did anything, and damage resulted, there might be another way of looking at it. You would have an action at law against us the same as would any other individual.

FRIDAY, 21 AUGUST, 1896.

Richard Green sworn and examined :—

R. Green. 13794. *Mr. Parkes.*] What is your occupation? I am working at anything I can get just now. I do bossing sometimes.

13795. Have you had any experience of working in sewers? Yes; I have been working in sewers on and off between seventeen and eighteen years.

13796. Have you worked in sewerage works in any other colony besides New South Wales? I was working four-and-a-half years in Christchurch, New Zealand.

13797. Where have you been working mostly? I did some work for Mr. Rhodes, at Alexandria. Before that I was bossing on the sandhills. I was also bossing for Wilmott and Morgan for nearly three years off and on.

13798. In the formation of sewers is concrete a good material, unless it be of a very superior order? It is all right if it is properly mixed. Then, no doubt, it is a good thing.

13799. In the formation of a sewer is it better to put in an invert of concrete with an arch of brick, or what do you think? If you put concrete into a sewer great care must be taken in the way in which it is put in. You must not let one lot of concrete stand and then put another concrete on the top of it, because if you do that the two pieces of work will never unite, and you will probably have a leak.

13800. Do you know of an instance of defective concrete work in sewerage construction? I remember that at Bondi, under Mr. M'Mordie, the concrete gave way at the springing to such an extent that Mr. M'Mordie could put his rule right into the work.

13801. What was done in that case? It sank below the foundations, and we put a good body of concrete in, as much as we could get in back to the timber to make it solid again.

13802. It is necessary, in your opinion, to have the most superior kind of concrete for sewer construction? Yes. Bluestone is supposed to be stronger than sandstone, because of the porous nature of the sandstone. It would take more cement in the case of sandstone than in the case of bluestone concrete, unless the sandstone be very hard.

13803. You think the sandstone would absorb more cement? Yes; because it is more porous.

13804. Have you any idea what quantity of concrete a man ought to mix in a day if he mixes it properly? He must be a good man if he mixes a gauge in an hour.

13805. Will you describe the method of mixing which you have generally seen adopted? The stone is turned out of the gauge-box, and the sand and cement added. The material is then turned over twice dry and twice wet. It is then removed from the board to the place where it has to go into the work. He must be a good man who will mix the gauge in less than an hour. A man ought to put about 8 yards in position, but a good deal depends upon what the work is like.

13806. Have you ever known instances where excessive returns have been made of gaugings? I do not know any more than this. The Inspector on the works will take a note of what is done in the way of concreting—that is to say, how many gaugings have been done in the day's concreting. That, I believe, is entered in the Inspector's book every night.

13807. Do you know whether it is the custom in sewerage contracts to pay men extra if they manage to get in a greater number of concrete gaugings than could be fairly done? A strong man at the board will get another sixpence. I have seen a leading man at the board get a little extra in that way.

13808.

13808. Does he get that for putting in improper material? No doubt the contractors do not give it to him for nothing. R. Green.
13809. Did you work upon any part of Carter, Gummow, & Co.'s contracts? I worked on the Glebe job, but I had nothing to do with the concrete there. I worked also on the Camperdown job. 21 Aug., 1896.
13810. Have you seen concrete mixed on any of their jobs? I have seen them putting it down on several occasions on different jobs on which I have not been working.
13811. Did you notice whether, on those occasions, the concrete was well mixed? I have seen it in many cases turned twice dry and then shovelled down the shaft.
13812. You say you have worked at the Glebe? I worked there under M'Lean. I and some others sank the shaft at the top of Bay-street. Then I went to work at Camperdown and sank a shaft for Mr. Gummow there. He then wanted us to start a drive at 25s. a yard, but we would not go at that price. Two of the men working with me at that job have since died. We then went back to the Glebe to work, and we sank a shaft at Lillie Bridge Hill, and later on I went back to the Glebe. I know nothing about the concrete on that job, except that I have heard it said that a piano-case was put into the bottom of one of the sump holes.
13813. It is customary to fill the sump-holes with concrete? They are supposed to be sunk 6 feet deep. I do not know about the filling of them afterwards.
13814. Do you know of any case where they have been filled with concrete? Well, I have heard it said that they are filled up with rubbish; but I cannot prove anything of the kind. I do not know anything about it.
13815. Did you ever hear of a man named Coyle speak of the way in which he had filled up a sump-hole? No; I do not think he was on the concrete.
13816. Did Coyle ever tell you that defective work was done? No; a man named James once said something to me about it, but I cannot prove anything.
13817. In the case of Contract No. 72—the Shea's Creek job, do you know how they mixed the concrete? I was not working there; but not being at work at the time I was often over there, and I saw a lot of dirt and stuff being shovelled up with the stone which went in with the concrete.
13818. Have you a good knowledge as to how concrete ought to be mixed? Yes. I take it that my experience of twenty or thirty years ought to tell me how concrete should be mixed.
13819. How was the concrete mixed, in your opinion, on the Shea's Creek job? I have no fault to find with the mixing. What I find fault with is the kind of stuff which was put into the concrete. You know that when sandstone is broken a lot of it goes very small, almost like sand. The stuff was shovelled up from the ground where it had been broken, and with it was a lot of sand and dirt.
13820. What effect would that have upon the cement? Well, there would be more sand in the work than there ought to be to begin with, to say nothing of the dirt; and the sand, I should say, would take the strength out of the cement in any case.
13821. Have you noticed whether, as a rule, there are experienced men on these works as inspectors? A man named Andrews was inspector at Camperdown. He is a bricklayer by trade. There was also quite a young fellow there who was inspector. He was certainly not an experienced man—in the case of miners, anyway.
13822. In the contracts in which you have worked, has special care been taken to have good work put into the sewers? As regards looking after the work, I have nothing to say against the inspectors. I have nothing to say against them as a rule, but you cannot expect, for instance, a man who does not know anything about shooting to know whether a man has enough stuff in a hole to shift the ground or not.
13823. But is the concrete that goes into these sewerage works always of the best? No doubt the Emu Plains gravel makes the best concrete you can have.
13824. But what do you think of the sandstone concrete which you have seen generally used? As I have said, I have always understood that sandstone concrete, on account of its spongy nature, should have more cement put into it than you would put into bluestone concrete.
13825. Can you give us any idea from conversation you have heard as to the shaft at the bottom of which the piano-case would be likely to be found? That is only talk. I have no proof of it.
13826. Who is the man who is supposed to have put it down the sump-hole? I do not know who did the concreting on that job. Coyle was there fetting, but I do not know whether he had anything to do with the concreting or not. I was not on the job a great while.
13827. Have you any men in your gang at Katoomba who have been working for Messrs. Carter, Gummow, & Co.? There are men who have been doing sinking for them, but none, I think, who have done any concreting.
13828. Do you know of any men who have lately gone on to the works upon which you are now engaged who have been working on Carter-Gummow's contracts? There is a man named George Somers.
13829. Where did he come from? He was doing sewerage work. I believe he was gauging for bricklayers for some years. He has been working at Woodford for some time. He is working in the cutting above me now.
13830. Have you noticed whether concrete which has been put in the sewers shrinks or not? I do not know about its shrinking, but concrete which has lain any time has not the same tendency to set which it would otherwise have.
13831. Have you noticed whether sandstone concrete shrinks more than bluestone concrete? I have not had sufficient experience to speak as to that.
13832. *Mr. Davis.*] Where are you working now? At Katoomba.
13833. When did you come down? Last night.
13834. Specially to give evidence? Yes; on summons.
13835. Referring to the shooting, and your objection that some of our inspectors are not able to properly supervise it. Suppose a clause of the specification provides that a certain charge of compressed powder, and no larger charge than that, shall be put into a hole, would not most of our inspectors be intelligent enough to know when such a charge was put in? The young fellow to whom I refer never used to come down to see us in any case. Andrews had not had any experience in shooting. It was the first contract he was on where shooting had taken place.
13836. Would it take a man very long to know whether a 4-inch or 6-inch charge of compressed powder were used? Sometimes when there is an insufficient charge it makes a loud report, and an inexperienced inspector would, perhaps, think that there was a greater charge than there ought to be. 13837.

- R. Green. 13837. You think that, at all events, an inspector would be able to tell whether there were two or three plugs in or only one? I should think so.
- 21 Aug., 1896. 13838. As to the forking, which you say did not take place upon Contract No. 72, supposing the metal is not specified to be forked? If it is not specified to be forked they would not be doing wrong in shovelling it.
13839. As to putting the concrete down the shafts, you said that it was usual to turn the material twice dry, and then put it down the shaft without turning it wet? Yes; I have seen that done.
13840. Do you not think that if concrete which is being put down a particular shaft has to fall, say, from 70 to 100 feet, that that would be a good way of mixing it? No doubt the stones fly all over the ground when it gets down the shaft. In many cases the concrete has not the labour put into it which it ought to have. I worked at concreting for Lemon and Spencer. Reid, who was the inspector there, made us turn it over twice dry and twice wet, and it was then put down the shaft. But in hundreds of cases I have seen it done the other way.
13841. Have you ever examined the concrete when it got to the bottom of a shaft? I have seen it, but I have never examined it.
13842. Have you not noticed that the sand, cement, and stone have been thoroughly incorporated? There is no doubt about there being sand and cement, but the stone, as I have said, would fly about all over the place.
13843. When you said that the contractors paid a little more to a man supposing he were a strong man at the concrete board, what did you mean;—did you mean us to infer that he got the extra money for doing extra work? They would be given an extra 6d. to push along, and get as much done as they could.
13844. As to the Bondi sewer, do you know what caused the trouble there? Pumping underneath it, I think.
13845. That caused a settlement, you think? Not only that, but if concrete stands for three or four months, and you then put new concrete on the top of it, it never unites properly.
13846. You think there is no union between new concrete and old? That is so.
13847. As to the crack of which you have spoken, and into which you say Mr. M'Mordie put his rule, at the springing of the arch, you think that that was caused through settlement? Yes.
13848. *His Honor.*] The sewer was constructed in sand? Yes.
13849. *Mr. Carter.*] Did you ever work for us—concreting? No.
13850. So that you know nothing from actual experience of what occurred upon our works as to that particular class of work? No.
13851. As to that historical piano-case, I should like to ask you a few questions? I do not know anything about it.
13852. Would it not be rather a difficult matter to get it down the sump hole in the first instance? You could get it down a 6 foot by 6 foot shaft all right, and you know that it would take up the room of two or three yards of concrete. You could get a piano-case for 7s. 6d. perhaps.
13853. Do you not know that we are paying 15s. for them, and that they are being sold by one contractor to another for £1 each? You ought to be able to get as many as you want for £1 each.
13854. They are kept on the jobs for tools? Yes.
13155. As a matter of fact, what you have heard about the piano-case is merely hearsay;—it is only talk? Yes.
13856. As to the shovelling of metal on the Shea's Creek job,—do you not know that it was broken on clean, short grass? Yes; but as it is broken it makes a lot of sand, and when the men come to take it up they take up a lot of rubbish with it. If you go there now you will find that the place is full of holes where the stone was broken and shovelled up.

Joseph Davis recalled and further examined:—

- J. Davis. 13857. *Mr. Parkes.*] As to Contract No. 53, was there any condemned cement upon that contract;—I mean the contract referred to by Mr. Bagge the other day? The contract was in the course of construction for over two years, and I think it is probable that during that time there might be a good deal of cement that would be condemned. On one occasion I remember that they had some Kangaroo cement on the job at Double Bay, if that is the contract to which you refer. The first lot delivered on to the work was approved, and the second lot was condemned. I remember that distinctly. It is very likely that some of the other cement was condemned.
13858. But was there not some cement condemned about the time the bricks which have been referred to were condemned? It would be impossible for me to say now.
13859. I mean about the time the aqueduct was built? It would be impossible to say without referring to the papers.
13860. Have you any correspondence with reference to defective work on Contract No. 53? It is possible that Carter & Co. may have written as to the condemnation of the bricks; I think they did.
13861. Did they write in reference to the condemnation of the cement? It is not usual to do so. The cement would be submitted for testing. If it passed the test, well and good; if it did not pass the test, it would be condemned, and would be ordered to be removed from the work.
13862. Is there any correspondence in the office at all with reference to Contract No. 53? There would be no correspondence about the brickwork itself, because that was pulled down and the bricks were condemned, and taken off the work. There would be something about the bricks, either in the journal or in the papers.
13863. Was the cement which was condemned taken from Carter and Gummow's works to one of the Water and Sewerage Board's contracts? Not to my knowledge. I do not know the condemned cement to which you refer.
13864. Did you not condemn some cement upon the contract about the time you condemned the bricks? I have already said that no doubt there would be cement condemned during the course of the contract, but to what extent, and on what dates, I could not say without looking up the information.
13865. Will you obtain for the Commission all the information you can as to the condemned cement? I will endeavour to do so.
13866. Would the intimation to the contractors about the bad bricks be in writing? The bricks were condemned, but whether the contractors were informed verbally or in writing, I do not know. They would probably be informed in writing.
- 13867.

13867. And would they also have been informed of any alteration you wanted them to make in the grouting of the brickwork? That was done in violation of the contract.

13868. But your intimation to them would be in writing? I should have to look into the matter before I could say.

13869. *His Honor.*] If an engineer hears that something is going on in connection with a contract, and if on going out to the work he finds that there is something wrong, and there and then gives a verbal order in reference to the matter, would there be afterwards any letter written? In some important cases there would be. In other cases an entry might be just made in the journal. It would be impossible to keep a record of everything that occurred in connection with a contract.

13870. Anything important, however, would go into the journal, you think? Yes.

13871. The journal would virtually contain a history of the whole thing? Yes. In this case, I think, the journal would be found to give Mr. Parkes the whole of the information he wants concerning the bricks.

13872. *Mr. Carter.*] Referring to condemned cement, you are aware that sewerage contractors purchase cement at the merchant's risk—that is to say, it has to undergo the Government test before the contractor actually takes possession of it? I believe that they purchase the cement provisionally.

13873. So that if it is condemned the merchant would be at the expense of carting it back to the city? Yes.

13874. It would not, therefore, be to the advantage of the contractor to try to use it? No; I have always understood that what you say is the custom among all the contractors.

J. Davis.  
21 Aug., 1896.

George Christie recalled and further examined:—

13875. *Mr. Parkes.*] You have prepared a statement setting forth facts relating to the financial position of the sureties in connection with Contract 77, as illustrated by affidavits and by information which has been tendered to the Commission, showing also their position at the time at which they became sureties, and their position at the present time? Yes. I have prepared the following report:—

G. Christie.  
21 Aug., 1896.

MEMO. NO. 19.

RELATIVE to the financial position of Messrs. James Gillan and George Forrest on 16th May, 1895, on which date they gave separate bonds in the penal sum of £6,000 each in connection with the maintenance of the works comprised in Contract No. 77.

(a) The clause of the "supplementary specification" under which these bonds were required is as follows:—

The contractors shall continue to maintain the said works at their own cost after the period of maintenance set forth in the general conditions for a further period of three years, computed from such date, to the satisfaction of the Engineer, whose decision shall be final and conclusive upon all points concerning workmanship and materials, and the permanency and durability of the said works; and the contractors shall enter into a bond to Her Majesty the Queen in the penal sum of £12,000, and find two sufficient sureties to enter into separate bonds in the penal sum of £6,000 each, to secure the removal of so much of the said works as shall have been constructed on the "Monier system," if the Engineer shall be dissatisfied with the same at any time during the said periods of maintenance, and to re-erect and construct the said works at their own cost and expense in accordance in all things with the specification, schedule to specification, and plans therein referred to; within thirty-nine weeks from the date of being called upon so to do.

(b) The bonds were completed on 16th May, 1895, and the statutory declarations made by James Gillan and George Forrest were as follows:—

*Statutory Declaration.*

I, JAMES GILLAN, of Dulwich Hill, in the Colony of New South Wales, householder, do hereby solemnly declare and affirm that I am possessed of property to the value of £6,000 sterling and more, and that such property consists of cash at bankers, freehold and other property. And I make this solemn declaration as to the matters aforesaid according to the law in this behalf made, and subject to the punishment by law provided for any wilfully false statement in any such declaration.

Taken and declared at Sydney this 27th day }  
of May, 1895, before me,—

JAMES GILLAN.

HAROLD F. NORRIE, J.P.

*Statutory Declaration.*

I, GEORGE FORREST, of Marrickville, in the Colony of New South Wales, householder, do hereby solemnly declare and affirm that I am possessed of property to the value of £6,000 sterling and more, and that such property consists of—Freehold property, £5,700; cash in bank, £300 sterling. And I make this solemn declaration as to the matters aforesaid according to the law in this behalf made, and subject to the punishment by law provided for any wilfully false statement in any such declaration.

Taken and declared at Marrickville, this 1st day }  
of June, 1895, before me,—

GEO. FORREST.

ROBERT ANDERSON, J.P.

(c) A statutory declaration made by James Gillan, in Adelaide, on 17/7/96, was put in evidence on 31/7/96. This declaration is as follows:—

IN THE MATTER OF THE PUBLIC WORKS INQUIRY COMMISSION.

I, JAMES GILLAN, of Clarendon, in the province of South Australia, contractor, do solemnly and sincerely declare as follows:—

1. All the property now beneficially held by me is of the value of not less than £6,000, as I verily believe, and consists of the items following, that is to say:—

|  |                |
|--|----------------|
| In the Bank of New Zealand at Adelaide .....   | Approximately. |
| In the Bank of New Zealand at Sydney .....   | £550 0 0       |
| Bank fixed deposit receipts and interest .....   | 115 0 0        |
| Personal effects in South Australia, including furniture, piano, horse, harness, and sundries—market value ..... | 1,015 0 0      |
| Six shares in Adelaide prospecting syndicate—market value .....  | 300 0 0        |
| Shares in Town and Country Building Society, Sydney—market value .....   | 60 0 0         |
| Money due me by Carter, Gummow, & Co., for money lent .....  | 50 0 0         |
| My interest as partner of Carter, Gummow, & Co., in the surplus assets of that firm .....                        | 1,000 0 0      |
|  | 3,100 0 0      |
|  | £6,190 0 0     |

2. My personal liabilities, exclusive of my liability (if any) under the bond for £6,000 executed in or about the month of May, 1895, do not exceed £20 to the best of my knowledge, information, and belief.

3. There are no mortgages or bills of sale on any of my said property.

And I make this solemn declaration conscientiously believing the same to be true, and by virtue of the provisions of an Act made and passed in the sixth year of the reign of His Majesty King William the Fourth, intituled "An Act to Repeal

G. Christie. Repeal an Act of the present Session of Parliament, intituled 'An Act for the more effectual Abolition of Oaths and Affirmations taken and made in various Departments of the State, and to substitute Declarations in lieu thereof, and for the more entire suppression of Voluntary and Extra-Judicial Oaths and Affidavits, and to make other provisions for the abolition of unnecessary Oaths.'

21 Aug., 1896.

JAMES GILLAN.

Declared at Adelaide the 17th day of July, 1896, before me,—

WM. HENDERSON,  
Notary Public.

The total of the eight items which comprise the property stated by Mr. Gillan to be held by him on that date amounts to £6,190; but of this sum £4,100 was due to him as a partner of Carter, Gummow, & Co. Of the remaining £2,090, £910 consists of cash and personal property definitely outside of this Colony. As to the bank fixed deposit, £1,015, it is not stated where or with what bank that amount is invested. The only definite items of property in New South Wales are thus (according to his declaration) reduced to £115 in the Bank of New Zealand, Sydney, and shares in the Town and Country Building Society set down at £50.

(d) From the attached statement furnished by the Bank of New Zealand, Sydney, it would appear that, at the date of the execution of the bond, James Gillan had a credit balance with that bank of £48 13s. 6d.

(e) It will be noticed that Mr. Gillan's statutory declaration, made in connection with his bond, is dated 27/5/95, whereas his bond is dated 16/5/95, eleven days previously.

In that declaration he says that his property consists of "cash at bankers, freehold and other property." But Mr. Gillan's declaration, dated Adelaide 17/7/96, does not include in his assets any freehold property. Furthermore, in his declaration of 27/5/95, Mr. Gillan is described as "of Dulwich Hill, in the Colony of New South Wales, householder," though at that time he was resident at Adelaide.

(f) It will also be noticed that Mr. George Forrest's statutory declaration, in connection with his bond of 16/5/95, is dated some sixteen days subsequently, namely, on 1/6/95.

(g) Mr. Forrest gave evidence before the Commission relative to his declaration on 26/6/96 and 3/7/96. In that evidence he stated that he had an interest in a property known as "The Lodge," at North Shore, and that he owned certain property at Dunedin. Subsequent evidence has shown that "The Lodge" at North Shore is valued at £7,500, is mortgaged for £4,500, and that the title is in the names of John Carter, D. G. Snodgrass, and George Forrest. The records of Mr. Carter & Co's banking account show that the deposit on the purchase of this property was paid with partnership money, and that the proceeds of the further mortgage were placed to the credit of the partnership account on 10/4/95.

(h) Following on Mr. George Forrest's statements in evidence regarding his New Zealand property, a letter was written from the Commission to the Town Clerk, Dunedin. To this a reply dated 25/7/96 was received, as follows:—

Town Clerk's Office, Dunedin, N.Z., 25th July, 1896.

B. Harry Friend, Esq., Secretary, Public Works Inquiry Commission, Chief Secretary's Office, Sydney, N.S.W.—

Sir,

I have the honor to acknowledge the receipt of your letter of the 2nd instant, making inquiry as to the property of Mr. George Forrest, in Macandrew Road and George-street, Dunedin.

In reply, I beg to inform you that, as Macandrew Road is in the suburban borough of South Dunedin, I have forwarded a copy of your letter to the Town Clerk thereof, and asked him to kindly reply to you direct.

There is no record in the city rate-books of any property owned by Mr. George Forrest, but as there is a possibility that he may be the owner of land which is leased for a term of years, which would cause the lessee's name only to appear in our books, I would suggest that further inquiry be made by you from the Commissioner of Taxes, Wellington, whose records for general taxation contain fuller details than the city books, and who would also supply particulars of any taxation charges upon the property. Information as to titles can best be furnished by the Lands Registry Office, which is also a Government Department.

I may mention that the description of the sections as being "at the corner of George-street and the main street in which the tramline runs" is slightly misleading, in that George-street is itself portion of the main route of the city tramway. I may also add that there is no vacant section at all in the portion of George-street through which the tramway is laid, and but three or four altogether in the remaining part of the street where there is no tramline.

I have, &c.,

WM. B. BAYLEY,  
Town Clerk.

It is stated in the above letter that the inquiry has been passed on to the Town Clerk, South Dunedin. From this latter official a reply dated 31/7/96 has been received: it is as follows:—

VALUATION of Mr. George Forrest's property in South Dunedin, New Zealand.

South Ward.

|   |       |
|---|-------|
| Section 12, Block X, containing 1 rood, situate in Macandrew Road, Borough of South Dunedin; on which is erected a 6-roomed dwelling house: valued at £325, made up as follows, viz.—land, £100; house, £225..... | £ 325 |
| Section 13, Block X, containing 1 rood, situate in Macandrew Road aforesaid, on which two houses, of three rooms each, are erected: valued at £200, made up as follows, viz.—land, £100; houses, £100.....        | 200   |

East Ward.

|   |      |
|---|------|
| Sub-division of Sections 1, 2, 3, 21, 22, 23, 24, 25, Block VI.—  |      |
| Allotment 4, situate in main street, South Dunedin, in name of Elizabeth Forrest, wife of the said George Forrest, containing 5·27 poles, vacant: valued at .....                                       | £ 20 |
| Allotments 24, 25, 26, George-street, South Dunedin, also in name of Elizabeth Forrest, on which are erected two 4-roomed cottages: valued at £245, made up as follows, viz.—land, £45; houses, £200... | 245  |

£790

South Dunedin, THOMAS R. DODDS,  
31st July, 1896. Valuator of the Borough of South Dunedin, under the Land and Income Tax Act.

The whole of the property in Mr. George Forrest's name, in Dunedin and South Dunedin, as disclosed in these letters, is—

|                                 |       |
|---------------------------------|-------|
| Block X of section 12 .....     | £ 325 |
| and Block X of section 13 ..... | 200   |
| Total.....                      | £525  |

(i) At the date when Mr. Forrest made his statutory declaration, there was to his credit with the Bank of New Zealand, Sydney, the sum of £310 3s. 4d., as shown by the accompanying statement furnished by the bank.

It would thus appear that on 1/6/95, when Mr. Forrest stated in his statutory declaration that he was "possessed of property to the value of £6,000 sterling and more, and that such property consisted of freehold property, £5,700, cash in Bank, £300 sterling," he was not possessed of the freehold property so declared, as the only freehold property in his sole control was that in South Dunedin, valued at £525.

(j) The following is an extract from Mr. Hickson's minute of 5/4/95, as it appears on page 209 of the Parliamentary Return:—

"Messrs. Carter and Gummow ask that their own 'personal sureties for the amount named,' i.e., £12,000 (an amount which they do not dispute), 'should be taken for its completion and maintenance, and as a sufficient guarantee for the proper carrying out of the work.'

"They go on to say that they are 'a firm of sound financial standing, well and favourably known to the Department as contractors.' This is quite true; they are a firm in which I have every confidence. They have done a great deal of work under me, and I can testify that their aim always has been to turn out the very best class of work possible. At the same time, misfortunes happen the very soundest firms of contractors, and the Department must look a little way into the future. Their own bond for £12,000 would be really of no use if they were unfortunate enough in the meantime to become bankrupt."

"I think, therefore, it is right that the sureties should be insisted upon. They give the names of two men, Mr. George Forrest and Mr. James Gillan. From inquiries made, I believe these men to be financially sound; and I think if their names were accepted as the sureties in the penal sum of £6,000 each the Department would be secured as far as it is reasonably possible to be." G. Christie.  
21 Aug., 1896.

(k) Messrs. Carter and Co.'s and Messrs. Carter, Gummow, and Co.'s joint financial position at the period when this contract (No. 77) was entered into is dealt with in my memo. of 10/7/96, as it appears in printed evidence, page 232. It was at this period, namely, on 18/6/95, that Messrs. Carter, Gummow, and Co. borrowed the sum of £2,000 from Mr. S. H. Weedon.

(l) In the event of the works constructed on the Monier system under this contract having to be removed, and Messrs. Carter, Gummow, and Co. failing financially, the small amount of assets which Messrs. James Gillan and George Forrest have outside of the business would (if not absorbed in meeting the firm's engagements) be only very inadequate security for the fulfilment of their bond.

21/8/96.

GEO. C.

Bank of New Zealand,  
Sydney, 30th June, 1896.

T. E. CORKILL,  
Assist. Accountant.

13876. The papers submitted to Parliament show, do they not, that the declarations of the two sureties were taken some time after they had signed the bond? Yes; the two declarations are here. The bond appears to have been completed on the 16th May. The declaration taken in the case of Mr. Forrest is on the 1st June following, and in the case of Mr. Gillan on the 27th May following.

13877. Was the bond in the case of Mr. Gillan's surety originally in the handwriting of Mr. Carter? The form of declaration, other than the printed matter, is filled in by a clerk. Then Mr. Carter's writing is as follows:—"Cash at bankers; freehold and other property." The declaration was made before Mr. Norrie.

13878. It is not filled in with the handwriting of Mr. Gillan? No.

13879. Upon page 305 of the Parliamentary Return there is a document relating to the substitution of blasting for guttering and gadding, and on pages 317 and 318 there are further papers dealing with the same matter;—you have prepared the report, from which it appears that a clear advantage was given to the contractors by this substitution? Yes; it is as follows:—

## MEMO No. 20.

STATEMENT of the gain to Messrs. Carter & Co. consequent upon the rearrangement and substitution of schedule items, Contract No. 79.

(a) Reference is made to my memo. No. , given in evidence 22/7/96 (page 297), and to Messrs. M'Creddie and Thompson's report in evidence 24/7/96 (page 306). The total amount of benefit to the contractors as per that report of Messrs. M'Creddie and Thompson is as follows:—

| Schedule Item—       | £      | s. | d. |
|----------------------|--------|----|----|
| No. 1                | 545    | 2  | 11 |
| 5                    | 90     | 5  | 0  |
| 10 to 15 (inclusive) | 235    | 10 | 10 |
| 17                   | 319    | 11 | 3  |
| 20                   | 360    | 0  | 0  |
| 4                    | 1,680  | 7  | 5  |
| Total                | £3,230 | 17 | 5  |

[Mr. Davis objected to Mr. Christie's reading his memorandum dealing with Messrs. M'Creddie and Thompson's report of 24/7/96, upon the ground that he considered that it was based upon a false assumption.]

Mr. Christie.] In preparing evidence for the Commission I have been very careful not to submit anything that would tend in anyway to mislead, and I have in this case gone carefully into Messrs. M'Creddie and Thompson's evidence and the Commissioner's examination thereon. There is only one item in which the schedule of 79a was referred to, and that is a fair comparison.

[His Honor said he would allow the memo. to go in as evidence, but he would at the same time direct that a note be taken of Mr. Davis' objection.]

[Mr.

G. Christie.  
21 Aug., 1896.

*Mr. Christie.*] The following papers have reference to this matter :—

GEO. C.

The papers are as follows :—

Supervising-Engineer Davis to The Engineer-in-Chief for Sewerage.

*Minute Paper.*

*Subject* :—Contract No. 79—North Sydney Outfall Sewer.—Driving of Tunnels.

Department of Public Works, Roads and Bridges and Sewerage Branch,  
Sydney, 19 May, 1892.

THE tunnels from some of the shafts on this contract will be commenced in a few days, and it is, therefore, necessary that it should be settled how they are to be driven, whether with 4-inch charges of compressed powder, 2-inch charges, or without blasting.

With a view of arriving at the method which would give the least annoyance to the residents in the vicinity of the sewer, consistent with economy, I have made comparative estimates.

The excavation by "guttering and gadding" will cost 3s. per cubic yard more than with 4-inch charges of compressed powder, but, as it is impossible to drive the tunnel by blasting to the exact size desired, considerably more concrete has to be used in lining when the driving is done by blasting than when done by "guttering and gadding;" and, taking this into consideration, I estimate it will cost about £1,250 less to do the tunnels without blasting compared with doing it with 4 inches of powder.

The 2-inch charges, with the extra supervision that would be required, would be the most costly of any.

I wish, however, to point out that while it would save annoyance and money to drive the tunnels without explosives, it would take longer to do the work.

J. DAVIS.

Messrs. Carter & Co. have undoubtedly fixed their schedule prices speculatively to increase their profits on the contract as much as possible, and, if so, to the loss of the Department. Mr. Davis seems, therefore, justified in the suggestions made, as they would likely cause a saving of £1,000, and clause 55 of the specification is, no doubt a saving clause against speculative prices.—C. H. OHLFSEN BAGGE, 19/5/92. The Engineer-in-Chief.

Ask contractors to see me on Thursday morning.—R.H., 23/5/92. Messrs. Carter & Co., 23/5/92.

While I think the Department would hardly be justified in adopting this unusual method of carrying out the work, it is very clear we should aim at getting our work done as economically as possible. Blasting may, therefore, be allowed on the understanding that the average allowance of 4 inches for concrete packing over and above specified size of tunnels be reduced to 2 inches.—R.H., 26/5/92. Mr. Davis.

Contractors informed. Copy of letter attached.—J.D., 27/5/92.

Supervising-Engineer Davis to Messrs. Carter & Co.

Gentlemen,

42, Elizabeth-street, 27 May, 1893.

Referring to the conversation which your Messrs. Carter and Snodgrass had with the Engineer-in-Chief respecting the mode of driving the tunnels in your sewerage contract No 79, and to your verbal agreement that on condition you were allowed to do the tunnel excavation under item No. 3 of the schedule of prices, by blasting with 4-inch charges of compressed powder, you would not ask to be paid for more than 7 inches of lining, such 7 inches to include the 5-inch thickness of cement rendering, I am directed to inform you that the Engineer-in-Chief has approved of the above agreement, without prejudice to his right, under clause 55 of the specification, to order the excavation to be taken out otherwise should he deem it necessary to do so.

The cross-sections will be taken in the usual manner, and you will be paid for the excavation ordered, and for a maximum of 2 inches of concrete lining in excess of the excavation ordered.

Would you kindly write, intimating your acceptance of this arrangement.

Yours, &c.,  
J. DAVIS.

Messrs. Carter & Co. to Supervising-Engineer Davis.

Contract No. 79, North Sydney Outfall Sewer.

Sir,

Box No. 10, North Sydney Post Office, 2 June, 1892.

In reply to your letter of the 27th May, we hereby agree to accept the terms of the same, viz. :—That the excavation (tunnel) on the above contract shall be carried out under item No. 3 in the schedule of prices, and that the lining shall be paid for to a maximum thickness of 2 inches over plan dimension, making a total thickness of 7½ inches instead of 7 inches as set down in your letter.

We are, &c.,  
CARTER & CO.

This is according to contract drawings.—J.D., 6/6/92.

Messrs. Carter & Co. to Supervising-Engineer Davis.

Sir,

Box No. 10, North Sydney, 10 August, 1893.

Referring to our letter of 2nd June, 1893, in which we accept a maximum thickness of 2 inches over plan dimension as the quantity to be paid for lining tunnel on Contract No. 79, North Sydney sewerage, we beg to state that this was agreed to on the supposition that the ground would admit of such dimension being practicable.

In this contract, as in some others of a similar character, notably Contract No. 53, Waverley sewerage, the ground met with is of such a nature as to render it impossible to keep within the usual limits.

The 2 inches referred to was fixed as being 2 inches less than usually works out as an average cross-section, but owing to the foregoing reason, and to unavoidable errors in the alignment, we ask to be allowed cross-sections equal to those of Contract No. 53, less the 2 inches which was intended to be deducted.

We are, &c.,  
CARTER & CO.

Register and connect papers.—J.D., 9/8/93. Previous papers 92/1,216 herewith.—F.C.P., 10/8/93.

Supervising-Engineer Davis to The Engineer-in-Chief for Sewerage.

*Minute Paper.*

*Subject* :—North Sydney Outfall Sewer, Contract No. 79—Contractors write asking that the question of thickness of lining in tunnel should be reconsidered.

Department of Public Works, Roads and Bridges and Sewerage Branch,  
Sydney, 14 August, 1893.

IN June of last year, at the time the tunnelling was commenced on this contract, the contractors undertook, if they were allowed to do the excavation under item No. 3 of the schedule of prices, they would not require payment for more than 7½ inches lining, or a margin of 2 inches over the cross-sections of the tunnel excavation ordered. The

The tunnel excavation is nearly finished, and the first length of about 18 chains of lining is in progress. The contractors now write asking that the question of the thickness of the lining to be paid for should be reconsidered.

They allege that the ground met with in the tunnels was of an exceptional nature, and similar to that on the Waverley and Woollahra branch sewer (Contract No. 53), and they therefore desire that they be allowed cross-sections equal to those paid for on that contract, less 2 inches.

The rock in the tunnels at Waverley and North Shore is certainly alike, and a number of "floors" and "faces" were met with at both places which materially increased the area of the tunnels. The cross-sections, as a consequence, were unusually large at Waverley, the average margin of the lining over the excavation ordered being about  $5\frac{1}{4}$  inches. Difficulties of the same nature have been experienced at North Shore, and the cross-sections are likely to work out equally as large as the Waverley ones.

The papers show that when the agreement was made it was thought that there would be no exceptional difficulties to be encountered in the driving, and that the lining would not exceed the cross-section of excavation by more than 4 inches. On this understanding Messrs. Carter & Co. offered to forego 2 inches of the lining if they were allowed to do the excavation as they desired. The question now arises whether (seeing that the rock has proved to be similar to Waverley) they should have the agreement modified so as to be paid on the basis of that contract.

It was evidently the intention of the Engineer-in-Chief for the contractor to bear the expense of 2 inches of lining, and the contractors ask that by regarding Waverley and North Shore as parallel cases this should be done.

I therefore beg to recommend that the 2 inches to margin of tunnel-lining be increased to  $3\frac{1}{4}$  inches in thickness.

J. DAVIS.

For the consideration of the Engineer-in-Chief.—C. H. OHLFSEN-BAGGE, 15/8/93. Messrs. Carter & Co. informed.—J.D., 21/8/93.

The 2 inches was decided upon on the assumption that the average allowance for concrete-packing was 4 inches. As it is now stated this really works out at  $5\frac{1}{4}$  inches, Mr. Davis's suggestion is only fair and equitable, and may therefore be adopted.—R.H., 15/8/93.

Supervising-Engineer Davis to Messrs. Carter & Co.

Gentlemen,

Department of Public Works, Sydney, 21 August, 1893.

I have to acknowledge the receipt of yours of the 10th instant, stating the nature of the ground through which the tunnels have passed is not what it was anticipated, and that therefore the maximum thickness of 2 inches over the cross-section ordered for the excavation (see my letter 27th May, 1892) is not sufficient, and asking that, as the nature of the rock is similar to that passed through in the tunnels of the Waverley and Woollahra branch sewer, the case be regarded as parallel, and that you be allowed the cross-sections equal to those on that contract less 2 inches.

In reply, I have to inform you that the Engineer-in-Chief has decided, on account of the nature of the rock, to modify the agreement, contained in my letter of 27th May, 1892, to the extent of increasing the margin of 2 inches thickness of lining, over the cross-section of excavation ordered, to a maximum of  $3\frac{1}{4}$  inches. Otherwise the terms of the letter to remain unaltered.

It is also to be understood that this additional allowance in the lining is to cover the cost of any extra concrete which will be required through unavoidable errors in the levels and alignments of the tunnels, including those between shafts Nos. 3 and 4.

Will you please accept this modification of the agreement previously made respecting the lining of the tunnels, in writing.

I have, &c.,

J. DAVIS,

Supervising Engineer.

Messrs. Carter & Co. to Supervising-Engineer Davis.

Sir,

Alfred-street, North Sydney, 28 August, 1893.

We have the honor to acknowledge your letter of 21st August *re* maximum of lining to be allowed in tunnels on Contract No. 79, North Sydney Sewerage, and to inform you that we agree to accept the same according to the terms of your letter.

We have, &c.,

CARTER & CO.

Please put with other papers.—J.D., 30/8/93.

13880. With reference to the advances on cement, which are made on a sort of bill of sale, is there, in the Parliamentary papers, or in any of the papers before the Commission, any minute showing that these transactions received Ministerial approval? I have not been able to discover any.

13881. Will you see what these papers contain? They are agreements under which certain advances were made to the contractors in respect to Contracts 79, 79a, and 69.

13882. Are these the agreements referred to in your previous report, when you said they were a risk to the Government? Yes; they have been referred to in one of my previous reports.

13883. They have received no Ministerial sanction? I have searched through the papers to see if there was any such sanction, but I have not succeeded in finding any. As far as I can see, the highest authority is that of Mr. Hickson.

13884. Will you read the letters which you referred to in Messrs. Carter, Gummow, & Co.'s memo. of 15/7/96, which appears upon page 255 of the Parliamentary Return? These are the documents referred to. I may explain, with reference to one of them, that there is an inaccuracy in the date—the figures "12" are apparently wrong. I ought to explain that there are the following pencil memoranda which do not appear in the printed paper No. 3 in the Parliamentary Return, they having evidently been ignored by the printer. "Will Mr. Mitchell see me with tender papers, 30/12/91." That, I understand, is in Mr. M'Lachlan's handwriting. Then there is this minute, "Will Mr. Hickson kindly see me about this at his convenience, 13/6/91." The next one is "Three contracts submitted.—F.C.P., 14/7/91" Then they are resubmitted on 27/7/91. Finally there is this minute, "The question of funds not yet decided; to be held over for one month." I ought to explain that the words "for one month" are somewhat doubtful. It is rather difficult to decipher the pencil-marks. The date in paper No. 4 should be 7/9/91.

ORIGINAL Papers in connection with Contract 79, referred to in memo. given in evidence on 15th July (page 255).

91/1,524.—List of tenders received for Contract 79.

91/1,523.—Letter—Carter & Co., and Gummow & Co., to President of Tender Board, 10/6/91, protesting against acceptance of Bond and Hudson's tender.

91/1,991.—Letter—E. M. Clark, M.P., to Minister for Works, 30/7/91, urging that the work be proceeded with.

91/2,099.—Letter—Same to same, 18/8/91, again urging that work be proceeded with.

91/2,373.—Letter—Bond and Hudson to Minister for Works, 28/9/91, withdrawing tender.

92/118.—Minute—*Précis* of case up to withdrawal of Bond and Hudson's tender, 29/1/92.

Minute—Chief Clerk to Tender Board, 23/2/92—withdraw notice inviting fresh tenders.

91/2,373.—Letter—Under Secretary to Carter & Co, 10/3/92, notifying acceptance of their tender.

G.C., 21/8/96.

The

G. Christie.  
21 Aug., 1896.

The papers are as follows :—

Schedule of Tenders received by Tender Board.

Wednesday, 10 June, 1891.

LIST of Tenders received for construction of the North Shore Main Outfall Sewer, from near Long Bay to Mount-street.

D. C. M'LACHLAN, 10/6/91.

I recommend acceptance of Bond and Hudson's tender at schedule rates.—R.H., 10/6/91. Under Secretary.  
J. BARLING, Vice-President of Tender Board.

Messrs. Carter & Co. and Messrs. Gummow and Gillan to the President of Tender Board.

Sir,

Sydney, 10 June, 1891.

We have the honor to enter our protests against the acceptance of the tender of Messrs. Bond and Hudson for Contract No. 79, North Shore sewerage, on the following grounds :—

1. That the tender of Messrs. Bond and Hudson for Contract No. 56, Potts' Point sewerage, was accepted by your Board and not taken up by them.
2. Upon fresh tenders being called, the tender of Mr. G. E. Hudson was the lowest, but was not accepted by the Board, in accordance with their Rules and Regulations.

Upon these grounds we, as tenderers for the North Shore sewerage, beg to protest against the tender of Messrs. Bond and Hudson being now accepted.

We have, &c.,

GUMMOW AND GILLAN.

CARTER & CO.

Herewith.—J.C.P., 10/6/91.

Let me have papers *re* Bond and Hudson's tender for Contract 56.—R.H., 10/6/91.

Mr. Hickson for report.—J.B., 10/6/91.

In January, 1890, C. S. Bond (afterwards Bond and Hudson) tendered for Sewerage Contract No. 56 at a ridiculously low figure, and, as anticipated, had to throw up the contract and forfeit deposit. They were the lowest again when fresh tenders were invited, but did not get the work, they being ineligible under the Tender Board Regulations, clause 14. The same firm now (some sixteen months later) are the lowest tenderers for Sewerage Contract 79, and it is contended by the writers of the within letter that their tender should not be accepted. I cannot recommend that this course be taken. It is true, under clause 14, they can be excluded from competing for other works at the pleasure of the President; but in all fairness there must be some limit (when no fraudulent action has taken place) to this prohibition; and it seems to me, after sixteen months, all bar to their tendering should be removed. See recommendation on face of tender.—R.H., 10/6/91. Under Sec.

Will Mr. Hickson kindly see me about this at his convenience.—J.B., 13/6/91.

Re-submit with the other tenders held in abeyance.—J.B., 10/7/91. Contracts submitted.—F.C.P., 14/7/91.

Re-submitted.—27/7/91. Question of funds not yet decided. To be held over for ten days more.

Re-submit when we deal with the tender.—J.B., 30/12/91.

Mr. Mitchell see me with the tender papers.—30/12/91.

E. M. Clark, Esq., M.P., to the Secretary for Public Works.

Sir,

Parliament House, Sydney, 30 July, 1891.

I understand that tenders were accepted some time ago for the outfall sewerage to Long Bay, St. Leonards. The successful contractors were, I understand, Messrs. Bond and Hudson; and, as the work is a very urgent one, I think they should be compelled to go on with the work.

Trusting you will hurry the matter on.

I have, &c.,

EDWARD M. CLARK.

Resubmit with the tender, which I do not think has been accepted.—J.B., 3/8/91. Tenders for Contract No. 79 (91-1524) and all previous papers submitted, 13/7/91.—R.H., 3/8/91. All papers herewith.—D.C.M'L., 4/8/91. To stand over.—J.B., 7/9/91. Roads, B.C. Seen.—R.H., 8/9/91.

E. M. Clark, Esq., M.P., to the Secretary for Public Works.

Sir,

Parliament House, Sydney, 18 August, 1891.

I shall be glad to know how far the matter of proceeding with the "outfall sewer to Middle Harbour," in my electorate has progressed.

I might say I wrote you on the matter a fortnight ago.

Yours, &c.,

EDWARD M. CLARK.

91/1,991, and all previous papers, sent Under Secretary, 4/8/91. Tenders are awaiting acceptance; amount, £36,900, loan.—J.B., 19/8/91. Submitted.—J.D., 19/8/91. Inform must stand over until the question of further loan expenditure has been determined.—B.S., 21/8/91. Inform to-day.—J.B., 21/8/91. E.M. Clark, Esq., M.P., 21/8/91. Seen.—R.H., 24/8/91.

Messrs. Bond and Hudson to the Secretary for Public Works.

*In re* Contract No. 79, Sydney Sewerage Works.

Dear Sir,

88, Sussex-street, Sydney, 28 September, 1891.

On 10th June, of this year, we had the pleasure of submitting a tender for the above works, and, we believe, were successful in being the lowest tenderers.

We have been anticipating the acceptance of our tender for some months, but, not hearing from your Department, we have, in the meantime, entered upon other obligations, and must consequently respectfully ask you to permit us to withdraw our tender, and to return us the deposit attached thereto now lying in your hands, viz., £369.

We are, &c.,

C. B. BOND

(BOND AND HUDSON).

How does this matter stand?—D.C.M'L., 30/9/91. Messrs. Bond and Hudson's tender was recommended for acceptance on 10/6/91. Papers herewith.—F.C.P., 1/10/91. Return deposit.—J.B., 2/10/91. Accountant to return deposit, 2/10/91. I recommend that fresh tenders be invited.—R.H., 6/10/91. Under Secretary. Submitted.—J.B., 9/10/91. Approved.—W.J.L., 22/2/92. Insert notice, 22/2/92. Notice to *Gazette*, 22/2/92. Tenders for 9th March, 1892.

Since writing my minute of 6/10/91, complications have arisen with Carter & Co., *re* their Contract No. 72 having been stopped. They have made large claims on this account, some of which no doubt could not be entertained, but on some items they have made a good case. They are prepared, if they obtained this work, to waive all claims on No. 72. As their tender is a reasonable one, and some £3,600 below the estimate, I think it might fairly be accepted. If this course were adopted, work would be given at once to a large number of men.—R.H., 23/2/92. Under Secretary. Important.

As Mr. Hickson thinks Messrs. Carter & Co. could make good a claim for something like £2,000 as compensation on Contract 72 (Moni-street, partly), should they be willing to forego this claim, their tender may be accepted for construction of the main outfall sewer, North Sydney—£39,890, as worked out at schedule rates. If this firm will not agree to the condition imposed, fresh tenders to be invited.—W.J.L., 23/2/92.

Mr. Hickson.—D.C.M'L., for U.S., B.C., 23/2/92. Please see me with Messrs. Carter & Co.—J.B., 23/2/92. Mr. Hickson.

*Précis*

*Précis* of case up to return of Messrs. Bond and Hudson's deposit.  
Department of Public Works, Roads and Bridges and Sewerage Branch, Sydney, 29 January, 1892.

G. Christie,  
21 Aug., 1896.

*Minute Paper.*

*Subject*:—North Shore Outfall Sewer, Contract No. 79, Sydney Sewerage Works.

TENDERS were received on the 10th June, 1891, for this work, that of Messrs. Bond and Hudson, at £37,254 10s., being the lowest. On the same date Messrs. Carter & Co. and Messrs. Gummow and Gillan conjointly wrote in protesting against the acceptance of Bond and Hudson's tender, as that firm had, on a previous occasion, thrown up a contract; but the protest was not allowed on account of the lapse of time, and as no fraudulent action had taken place; their tender was therefore recommended for acceptance.

On 28th September, 1891, Messrs. Bond and Hudson wrote in asking for the return of their deposit, and to be allowed to withdraw their tender, owing to the delay in acceptance of same, and their having entered into other large engagements.

The deposit was returned accordingly on the 7th October, 1891.  
The Engineer-in-Chief for Sewerage.

F.E.P., 29/1/92.

The Chief Clerk to The Tender Board Clerk.

Department of Public Works, Sydney, 23 February, 1892.

*Minute Paper.*

*Subject*:—Main Outfall Sewer, North Sydney.

WITHDRAW notice inviting tenders for the above.

Done, 23/2/92. Put with the papers, 25/2/92.

The Under Secretary for Public Works to Messrs. Carter & Co.

Sirs,

Department of Public Works, Sydney, 10 March, 1892.

I have the honor, by direction of the Secretary for Public Works, to inform you that your tender, dated 10th June last, is accepted for construction of the North Shore Main Outfall Sewer, from near Long Bay to Mount-street—Contract No. 79, Sydney Sewerage—at your schedule of prices.

The work is to be carried out in strict accordance with the several contract exhibits relating to this contract, and to be completed within twenty-four months from this date.

I have to refer you to the Commissioner for Roads for further information, and to request that you will call upon the officer in charge of Bonds and Contracts at this office, for the purpose of executing the necessary documents for the due observance of your contract.

I am, &c.

J. BURLING,

Under Secretary.

13885. As to the retention money upon Contract No. 72; in that case, as in the other contracts, the Parliamentary papers show that some portion of it was returned? Yes.

13886. In what position did the return of this money leave the Government? Upon certificate No. 9 of 20/1/92, £930 was returned; upon certificate No. 11 of 9/6/92 a further sum of £500 was returned; and upon certificate No. 15 of 23/9/92 a further sum of £330 was returned.

13887. Up to the time when the temporary stoppage of the works took place on Contract No. 72 what was the money held in hand? Upon the certificate prior to the return of any money there were £1,804 in hand.

Joseph Barling recalled and further examined:—

13888. *Mr. Parkes.*] As to Contract No. 79, which was let upon the 10th March, 1892; that contract was let, evidently after some considerable delay, to Messrs. Carter, Gummow, and Co., the former successful tenderers, Messrs. Bond and Hudson, having withdrawn their tender;—do you remember what actually took place in regard to the negotiations at that time? The only thing I know about it, as far as my recollection will serve me, is the receipt of a letter on the 28th September, 1891, which appears upon page 270 of the Parliamentary return, and which is in these terms:—

J. Barling,  
21 Aug., 1896.

Dear Sir,—On 10th June of this year we had the pleasure of submitting a tender for the above works, and, we believe, were successful in being the lowest tenderers. We have been anticipating the acceptance of our tender for some months, but not hearing from your Department, we have in the meantime entered upon other obligations, and must consequently respectfully ask you to permit us to withdraw our tender, and to return to us the deposit attached thereto now lying in your hands, namely, £369.

We are, &c.,

C. B. BOND

(Bond and Hudson).

That was at once acceded to. I would first draw attention to the fact that this tender was received on the 10th June, and on the 2nd October, nearly four months after its receipt, the deposit was returned. The reason the work was kept over was the extreme financial difficulty the Colony was undergoing. Our loan money was practically exhausted, and the proceeds of the loan which had been floated had been hypothecated. The whole thing is a matter of history, but I may refer you to the speech made at the time by Sir George Dibbs, who had then taken up the Government. You will find it recorded in *Hansard* of the 8th December, 1891, page 3413, as follows:—"I will read to the House a few items from the document laid upon the Table this afternoon by the Colonial Treasurer. Honorable Members will then see whether it will take three or four years to cover this amount of £4,208,000. We have not a farthing to our credit here, nor have we a farthing to our credit in England; and there will have to be a balance to our credit in both places on 1st January. With a liability of £4,000,000, in addition to a deficit of £600,000 in the Consolidated Revenue Account, we have to face a very great difficulty." That will serve to show you the financial difficulties the Colony was then undergoing. Previous to the date of the return of this deposit a somewhat similar difficulty had occurred. A gentleman named Frogley, who had put in a tender for some work—it is not important at the present moment what it was—wrote a letter from Wickham, under date 20th June, 1890, in which he complained of the long time which had been occupied in settling the matter of his tender. With reference to his preliminary deposit, he said he did not like to withdraw it, because he was afraid that that might jeopardise his tender. I wrote upon that: "This is quite a mistake, for if he had written he would have got his deposit without injury to his chance of getting the contract. Perhaps, however, it would be as well to make a rule, that in the event of any tender not being accepted within a month, all deposits shall be returned." That rule was acted upon. When application was made

J. Barling.  
21 Aug., 1896.

made for the return of the deposit in the case referred to, as the Government were not ready to accept the tender, not having the money with which to do so, the deposit, under that Ministerial rule, was returned. The matter was at once submitted to the Minister, Mr. Young, and he could not deal with it on account of the financial difficulty. When Mr. Young left office the papers were returned to me, and were not dealt with for the reasons I have stated until the 22nd January, 1892, when Mr. Lyne approved of fresh tenders being called. That is to say, that, dating from the time of the receipt of the tender, the Government were not ready to deal with the tenders for a period of nearly eight months.

13889. The Department did not send to Bond & Hudson to see if it could induce them to abide by their tender, although they had had their deposit returned? I do not exactly remember now what was done, but the main thing is this—that the Government were not ready to deal with the matter.

13890. Do you know that Mr. Hudson made repeated application to your officers to know whether the Department were going on with the contract? I should think that that would probably be so, although I do not remember seeing him myself. I may have done so, but I do not think I did.

13891. Were the matters in connection with Contract No. 72 put before you? I saw the claim, but it was not decided. I did not go into the matter at all.

13892. What conversation did Mr. Hickson have with you about it? I do not think he had any conversation with me about it at all—at least I do not remember any. The facts of the case are these, as far as I can remember them. Mr. Lyne directed that tenders be called, and we took action upon the matter. What took place then I cannot tell, but I believe, as far as I know, that it was this—that Mr. Lyne sent to Mr. Hickson, and had a conversation with him which led to the acceptance of Carter, Gummow, & Co.'s tender. That was the result of an interview which took place between Mr. Lyne and Mr. Hickson, at which I was not present.

13893. Do you know the effect of it? What I remember is that Mr. Hickson sent down a paper which he noted "important," embodying, as I took it, the result of his conversation. The paper merely came through my hands to be sent on to the Minister, committing to writing the arrangement which Mr. Hickson and Mr. Lyne had come to in the matter. [*Vide Appendix No. 79.*]

13894. That would be the paper dated 23/2/92? Yes.

13895. Did Mr. Lyne send for Mr. Hickson? I understand Mr. Hickson to say that he did, although I cannot speak positively upon that point. He did not go with my knowledge; and, except in the way I have described, I had nothing to do with the matter.

13896. Do you know whether Mr. Hickson's minute of 23/2/92 was written before Mr. Lyne's minute of the same date? No, I think not. What I understand to have taken place was this—of course Mr. Hickson can correct me if I am wrong—after Mr. Hickson had seen the Minister he went upstairs immediately and wrote that minute, which was sent in by me to the Minister as being the result of the interview which had taken place between himself and Mr. Hickson.

13897. The Minister then wrote this further minute of 23/2/92? Yes.

13898. But I presume you would not have agreed to Messrs. Carter & Co. having this contract without tender had you known that Bond & Hudson were willing to take it up? Certainly not. Most certainly not—it would have been a wrong thing to do.

13899. If you had known at that time that Bond & Hudson had been bought off by Messrs. Carter, Gummow, & Co., would you have accepted Messrs. Carter, Gummow, & Co.'s tender? I should say most certainly not.

13900. Is not the system of re-tendering generally adopted? It is often done, but it is very often not done, because, when there is no suspicion of any collusion, it is thought fair to the second tenderer—if his tender be below the office estimate—to give him a chance of doing the work. It is thought an unfair thing to a contractor, after his price has been exposed, and after he has gone to a large expense in preparing a tender, to throw him aside just simply on account of a mistake which the first tenderer may have made. I quite admit that it is a system which deserves the very greatest care in its administration. Only in cases where there is no suspicion of collusion, and where the tenderer is below the office estimate, should the work be given to the second tenderer. A good many instances could be shown where it has been done.

13901. Supposing there is no more than one tenderer below the office estimate? You would naturally take the second tenderer.

13902. But have they not all a right to a fair show? I should hardly think that No. 3 could urge a claim as against No. 2 any more than No. 4 could urge a claim as against No. 3, and so on. The matter is one which is always decided by the Minister, but I admit that in dealing with anything of the kind the greatest caution should be exercised.

13903. What would there be to prevent contractors from setting up bogus contractors, and from buying one another off? The system requires the utmost care, there is no doubt about that.

13904. Where does the unfairness come in to the second tenderer if his tender is not accepted? Suppose the first tender is a perfectly bogus one—a tender which showed that the contractor had taken no care at all in the matter, that it was a mere speculative tender, that it was really not a serious offer—it would seem rather unfair, in such a case, to throw out the second tenderer; but, as I say, the matter is left to the option of the Minister. I am sorry to see from the papers that in this case there has apparently been collusion; but the office was in absolute ignorance of it.

13905. The minute which has been referred to under date of 30/12/91, was considerably after Messrs. Bond & Hudson had withdrawn their tender? Yes.

13906. [*His Honor.*] Will you look at page 270 of the Parliamentary return;—you will see there a minute by yourself, under date 30/12/91: "Re-submit when you deal with the tenders." The question is how that comes to be so long after the former dates given? That seems to be a little bit out of its place there; the minute is easily explained. I was well aware that we were not able to deal with the tenders on account of the financial difficulties of the Government.

13907. That paper must have come before you again on the 12th? It may have done so; I cannot remember, it is so long ago. When you recollect that this happened five years ago, it is not very much to be wondered at that I should not remember an incident of that kind.

13908. [*Mr. Parkes.*] Would it not have been a fair thing to re-tender this contract when there was a difference of nearly £3,000 between Bond & Hudson and the next tenderer? I submitted it for fresh tenders to be called and the Minister approved of that being done, and it was only when these other considerations, with which I had nothing to do, came in that another course was taken. 13909.

13909. Was it your belief as Under Secretary that fresh tenders should be called? Speaking for myself, I would rather have seen fresh tenders called, but I can quite understand that if a claim were submitted for delay in the carrying out of Contract No. 72 it may have been the wisest thing to accept the tender of Carter, Gummow, & Co. In the other case, however, as I explained, I was not present when that was arranged. J. Barling.  
21 Aug., 1896.

13910. Supposing the claim in connection with Contract No. 72 were untenable? Then I most certainly think that a better way would have been to call for tenders. [*Vide Appendix* No. 33.]

13911. You said that that claim was never put before you? I think I said that I had seen it, but that I had never dealt with it.

13912. Did you have any discussion about the matter at all? I do not remember it.

13913. The claim was simply shown you? I remember seeing the paper, and I suppose it must have passed through my hands.

13914. Did you form any opinion upon the claim? No; it naturally would go to Mr. Hickson.

13915. Did it go to Mr. Young? I cannot say, but the papers will show whether it did or not.

13916. Do you know when Mr. Young left office? On the 22nd October, 1891. He had only held office then a very short time.

13917. Do you recollect whether the matter went before Mr. Lyne? That I cannot remember. I do not think it was ever reported upon by Mr. Hickson to me, but he evidently must have discussed the whole matter with Mr. Lyne at that interview, because it is referred to in Mr. Lyne's minute. I was not present at the interview, however, and I cannot say what was said. I may be mistaken in the dates, because I am speaking entirely from memory.

13918. With regard to Contract 77, and the substitution of the Monier arches, had you anything to do with the sureties? I think I explained that I had nothing to do with the sureties, except that it was reported to me by Mr. Hickson or Mr. Darley that they were sufficient sureties.

13919. Do you recollect what took place in connection with the letting of Contract No. 72? I cannot say that I have a clear recollection of the contract, except, as far as I remember, that there was power taken in the specification to omit or delay certain portions of the work.

13920. Do you know why? On account of there not being sufficient funds, I think.

13921. Do you recollect whether the contract exceeded the funds at your disposal by £5,000? I do not remember the amount, but I believe the funds we had were not sufficient.

13922. When the contractors took up the contract, you understood that you were to expend only the vote? I do not know that. I think, as I have said, that there was an understanding that if there was not sufficient money we could cut out the lower portion of the work. Instead, however, of cutting out the lower portion, we cut out, for the time being, the first portion.

13923. Did you not give the contractors extra work? I do not remember the case sufficiently to answer that question.

13924. Was that contract submitted to you before it was signed? No; the work is not done in that way. I should not go into the details of the matter at all. As I explained before, the Works Department has to deal with from 3,000 to 4,000 contracts annually—in railway construction, in the construction of public buildings, in the erection of wharfs and docks, and many other works quite apart from sewerage contracts. No one man could possibly take in the details of the whole of those contracts. The Under Secretary of the Public Works Department, in dealing with works of this sort, is not like the head of a private office, where everything sometimes goes through the hands of one person. We are dealing in this case with a great office of State, and it would be impossible for any one man, even if he were an engineer, to go into all the details.

13925. But you would have to go into the question of finances? Undoubtedly I should see that the contract was not let if we had not sufficient funds for it.

13926. You would see that it would not exceed a given amount without provision being made? I should see that in the acceptance of the tender we would not overrun the amount, but I have nothing to do with the matter afterwards. The papers would not come through my hands. I am not the accounting officer for payments on account of contracts. I submit the tenders to the Minister, and it is my business to see that we do not enter into obligations which we have not the money to fulfil. When it comes to the carrying out of the contract I have nothing to do with that. That is left to the heads of the engineering branches.

13927. Did you see that there was provision in this particular case? It was probably reported to me that arrangements had been made by which the Government would have to cut out certain portions of the work in order that the funds at our disposal might not be exceeded. Unless a legal question arose, I do not suppose I should see the plans and specifications.

13928. I suppose you would instruct your officers to make provision for the contract? In submitting the matter to the Minister, I should so submit it that he would not be committed to an expenditure for which funds had not been provided. That is the full extent to which I should go.

13929. As to the letting of Contract 79a, we do not appear to have any papers relating to that matter beyond the letter of Mr. Clark asking that the work might be proceeded with on account of the want for work in the district;—there must be further papers in connection with the matter? Not that I am aware of. If there are further papers they are unknown to me. As I explained before, with reference to the papers put before Parliament, it was impossible for me to have gone into the matter personally, but I gave instructions that all the papers should be put in, and I understand that that was done. It was only when you delivered your speech that the idea suggested itself to me that some papers may have been omitted, but I am perfectly certain from what I know of the officers that if any have been omitted they have been omitted purely from mistake and nothing else.

13930. Did any correspondence further than appears in the papers pass between the Minister and any officer of the Department (say Mr. Hickson) in reference to this matter? No; I do not think so. It was arranged, I think, between Mr. Lyne and Mr. Hickson at a personal interview, at which I was not present; therefore I cannot speak as to what took place. Mr. Lyne sent to Mr. Hickson, owing to personal efforts which were made by Mr. Clark, to get the work proceeded with. The main thing, I understand, which influenced Mr. Clark was that Contract No. 79 was about completed, and that if other work were not found a large number of men would be thrown out of employment. Mr. Hickson was anxious to have the work re-tendered; but if that had been done there would have been a gap of six weeks, and in the meantime the men referred to would have been out of employment. I suppose it was

- J. Barling.  
21 Aug., 1896.
- the representations which Mr. Clarke made to Mr. Lyne which induced him to consent to the extension being given to Messrs. Carter, Gummow, & Co.
13931. Did no correspondence at all dealing with the matter pass through your hands? I do not think so. If so, it ought to have been printed with the papers. I can quite understand why there should be none there, because the matter was arranged verbally, as far as I know.
13932. Did Carter, Gummow, & Co. and Mr. Clarke have any interview with Mr. Lyne? Mr. Clarke may have had many interviews with him on the subject, but he had no interviews with me that I know of.
13933. As to Contract No. 69—the Marrickville contract—were the Schedules ever put before you? Before tendering—certainly not. That is a thing I have nothing whatever to do with.
13934. You are the Chairman of the Tender Board;—what are the proceedings of the Board in such a case? The practice of the Board is this: The Board comprises the engineering heads of branches, and they bring their tenders with them. Each officer takes charge of his own tenders, and he reads out a tender for so-and-so, the lowest tender, the estimate being so-and-so, recommending that the tender be accepted. That is generally put to the Board, and passed without a word, when the lowest tender is recommended, and when the amount is below the estimate. It is utterly impossible for anything else to be done. Each member of the Board has his own whole branch to attend to, and it would be impossible for members of the Board to go into details. Even if they were all engineers they could not do so.
13935. You said in your report that members of the Board did go into details? So they do, whenever there is any question. I think, if you look carefully into the part of my report to which you refer, that you will find a modifying clause. Details do sometimes come up when there are critical questions to be considered, and then the utmost care is given to the case; but when a member of the Board says "This is the lowest tender, and it is below the estimate," there is no question to go into. If a question arises from which it is evident that there is a necessity to go into the matter, it is always most carefully gone into by the Tender Board.
13936. But the acceptance of the tender is left to the head of the Department—to the recommendation which he makes to the Board? Yes; it would be impossible for anything else to be done. The Board is constituted to be an advisory Board to the Minister, and among themselves in questions of difficulty. The Board generally give up their own private time to the carrying out of their functions, and no fees are attached to the work. The Board generally have to sit after office hours.
13937. The object of the Board is to secure the proper consideration of everything which goes before the Minister? Any question which requires consideration. If the Board went into every matter, whether any question has been raised in reference to it or not, the thing would be found to be utterly impracticable. Few people appear to realise the magnitude of the work which is carried on by the Works Department. I have heard a great many remarks as to why this and that is not done, but as a rule it would be utterly impracticable to give effect to these suggestions. You would require, not only divisions, but many sub-divisions to carry out the work as some persons think it ought to be carried out.
13938. You mean that there is too much for one Under Secretary? I do not mean that at all; but the Under Secretary must depend upon the officers of the Department. By no other arrangement can the work of the Department be carried out.
13939. Suppose the head of the engineering department had drawn your attention to the Schedule of Messrs. Carter, Gummow, & Co. in connection with Contract No. 69, would you, as a member of the Board of Reference, have accepted it? You mean as to anything improper in it?
13940. I mean as it was sent in? It would be considered by the Board of Reference.
13941. But I ask you whether, as a member of the Board, you would have accepted the tender, had your attention been directed to the Schedule? I have not gone into that matter.
13942. Take the item of £50 per square yard for bluestone pitchers? I could not have gone into that matter. If Mr. Hickson, however, had said, "This is an improper amount," I should have taken exception to it. It would take me a couple of days to go through the Schedule properly. You will see, therefore, that it would be utterly impossible for me to give my attention to such details.
13943. If you were building a house, would not that price strike you as being too much? I do not go into a single detail of that kind. It would be utterly impossible for me to do so.
13944. You depend for everything of that kind upon the heads of the branches of the Department? Undoubtedly.
13945. *His Honor.*] The question is whether, if your attention had been called by one of the heads of the Department to this particular item, you would have agreed to the acceptance of the tender? If my attention had been directed to it as a member of the Board of Reference, then of course exception would have been taken to the tender.
13946. And the Tender Board would then have gone into the question? Undoubtedly.
13947. *Mr. Hickson.*] When were you appointed Under-Secretary for Public Works? In 1888.
13948. At that time I was in Newcastle? Yes.
13949. I think you were mainly instrumental in having me appointed Acting Engineer-in-Chief for Harbours and Rivers? I was. I recommended you to Mr. Bruce Smith.
13950. After that you were mainly responsible for my appointment in connection with the sewerage works? I was.
13951. You are now a Member of the Public Service Board? Yes.
13952. Since you have become a member of that Board you, with your colleagues, have approved of my being made permanent head of the Department? Yes; certainly.
13953. During the whole of the time that I have been in Sydney, since 1888, you and I have been in close touch? Yes, on all official matters.
13954. Hardly a day would pass when we would not see one another about various matters? Yes.
13955. Did you ever consider, for a moment, that I was prejudiced in favour of any particular contractors with the Works Department? Never.
13956. Was there ever anything which would indicate such a state of things to you? Nothing ever indicated to me that you favoured one contractor more than another.
13957. I suppose that if such a thing had crossed your mind, you would have objected to my being made permanent head of the Department? Certainly.
13958. Let me direct your attention to page 254 of the printed evidence—to the last few lines of Mr. Christie's report upon that page;—will you read the report, and tell me whether you know of anything which would warrant Mr. Christie in making such a statement? Not the slightest. 13959.

13959. Have you explained how these papers were prepared for Parliament? Yes. I explained on a former occasion that I directed that all the papers asked for in the motion should be carefully supplied.
13960. To whom could Mr. Christie have referred when he said papers were knowingly withheld;—had I anything to do in connection with the preparation of the papers? No; I do not think I had any conversation with you on the subject. Mr. Davis was the officer who principally dealt with the papers. I think he more particularly prepared them, and they were afterwards checked, I think, by Mr. Hungerford.
13961. Then you cannot account for Mr. Christie's coming to such a conclusion as that stated? No; I cannot.
13962. As a matter of fact, a few papers were left out? Yes; but I have not the slightest doubt but that they were left out by accident.
13963. You will find at page 259 of the evidence a list of the papers omitted in connection with Contract No. 72? These papers were not asked for. They relate to the Alexandria and Erskineville contract. When the matter came before me I gave instructions for papers to be prepared. When I first looked at the matter I thought that the Marrickville contract was referred to. I myself do not know the contracts by their numbers, and I gave instructions that all the papers should be included. The clerks told me that the papers could not be found. They said they had been left at the Court, they thought; and I was wondering what could be done, when Mr. Davis came to me and explained that the papers related to a contract altogether different from that referred to in the motion; that the motion referred to the Marrickville contract, whereas the papers for which we were searching related to the Erskineville and Alexandria contract. Inasmuch as the bond was referred to in connection with Contract No. 79, it was thought, however, that the papers we had should be put in. There is not a single paper or memorandum, not a single word of mine, that I could have the slightest wish to keep back from Parliament or this Commission.
13964. You said that the number of contracts dealt with by the Public Works Department annually was between 3,000 and 4,000;—do you not know that last year we had 5,050 contracts? I am very glad of the correction. I merely mentioned the matter without having gone into the matter carefully.
13965. Would you be surprised to hear that within the last two years the Department has dealt with over 10,000 contracts? I was not aware of that.
13966. *Mr. Parkes.*] With a perfect system, does it matter whether there are 500,000 contracts or 5,000 contracts? Certainly not; but the persons who finally deal with the contracts cannot possibly go into all the details. There ought to be such a system that when the matter comes up finally the head officer can accept the certificate of the engineer, or of his subordinates.
13967. In other words, if one Under Secretary is not enough for the work he should have an assistant? The Under Secretary, as far as engineering matters are concerned, must accept the reports of the engineers of the Department, and so also must the Minister.
13968. In a well-regulated office pressure of work is no excuse for mistakes? No. There may have been an unusual pressure of work at particular times, and then, as in all human undertakings, mistakes may have been made.
13969. *Mr. Hickson.*] With regard to the number of 5,050 contracts, do you happen to know how many of those pass through my hands? I should say the larger part of them.
13970. Would you be surprised to know that the number is 4,500? No; I should not be surprised at that.
13971. Following up your own argument, I suppose it would be physically impossible for me to examine the details of all these contracts? Yes.
13972. I have to accept the reports of my subordinates? Yes.
13973. *Mr. Parkes.*] Members of Parliament have also to deal with things generally;—they do not know the details of all these contracts? No; but in preparing papers the rule is to liberally interpret the motions of Members.
13974. When the motion refers to copies of papers and correspondence in connection with contracts at Marrickville, and when there are three contracts at Marrickville, why are not all the papers given? No. 72 was not at Marrickville at all. It was at another place altogether. It turned out to be at Alexandria and Erskineville. Of course, I merely took the explanation given to me.
13975. Is not that only a quibble? No; it is a different contract altogether.
13976. Marrickville extends all over the lower portion of the contract? Not that I am aware of. I was informed that it had nothing whatever to do with it. I say, with due regard for the solemnity of the occasion, that my anxiety was to give every possible information in my power. There is not a scrap of paper, there is not a single document, there is not a single conversation in which I have taken part, but which could be exhibited and reproduced to the whole world, as far as I am concerned. I would not mind the whole world seeing and knowing all that I have done in administering the Department. I have had over thirty-six years in the Government service. I have held some of the highest posts under the Government, and I think my word ought to be taken.
13977. If the papers connected with Contract No. 72 bore materially upon one of the other contracts, surely they should be put in? All the papers that did bear upon that contract were put in. The tender was put in, the final certificate was put in, the bond and contract was put in. It was intended that the bond should go as an Appendix, because it was recited in connection with Contract No. 79. Had it not been recited there none of it would have gone in.
13978. You put in part of the papers only? We put in only the papers referred to in the motion. We put in the other papers, as I have just explained, because the bond was recited in connection with Contract 79. It was really intended to go in, not as part of the papers generally, but in the shape of an Appendix.
13979. Was the claim not referred to? Yes; the full amount of it was given.
13980. But not the particulars? The amount was given. It was put in incidentally to Contract No. 79.
13981. But if it were worth mentioning at all the whole papers should have been put in? Supposing that all the papers had been put in in connection with Contract No. 72 there would have been almost as many papers again as are contained in this return.
13982. But I mean the papers bearing on the claim? I honestly thought that we had put in everything that could be fairly asked for—in fact, more than could be fairly asked for. There is not a single paper in connection with that work that I could have any wish to keep back from you or anyone else. There is  
not

J. Barling.  
21 Aug., 1896.

J. Barling.  
21 Aug., 1896. not a single thing in connection with these contracts which I would mind you or the whole world knowing. I notice that Mr. Bagge, a former officer of the Department, made some remarks about myself which, I think, I can afford to look over. I wish to say with regard to Mr. Bagge, however, that during the whole time that I was Under Secretary I do not think I ever had one unpleasant word with him, nor do I think I ever had one unkind thought with regard to him. It was not often that I saw him. He was not retired upon my recommendation, but on the recommendation of the Engineer-in-Chief, in which I concurred. He is an old gentleman—I think he is over 70 years of age—and he has arrived at that time of life when it is regarded as natural that a man should retire. He had rather less than fifteen years' service, I think, and he went out with a gratuity of £800 or £900 and six months' leave of absence.

13983. *His Honor.*] Before he retired, had his memory begun to fail at all? I did not see him often enough to be able to form an opinion as to that. But sometimes when I have sent for him I have found it somewhat difficult to make him understand things which I have explained to him, he being so very deaf. I think that if you ask Mr. Young, the present Minister, you will find him of my opinion.

13984. Mr. Bagge was a good officer? Yes, in his day; but I think he has passed his day so far as active service is concerned.

Joseph Davis recalled and further examined:—

J. Davis.  
21 Aug., 1896. 13985. *Mr. Parkes.*] With a register so perfectly kept as that produced, and with so copious an index, it would be impossible to miss a letter, no matter what Branch of the Department it might be in, you would think? If that register were examined it would indicate what papers were in existence with reference to any particular contract or any particular subject.

13986. In any part of the Department? I do not know that it would indicate where they were; but it would indicate whether they had been registered or not.

13987. *His Honor.*] Do I understand that that is a register of all the papers in connection with each particular contract? Yes; all the papers when they are received by the Branch are sent to the record office, and are there recorded. They are then issued to the officers concerned.

MONDAY, 24 AUGUST, 1896.

William Caughey sworn and examined:—

W. Caughey.  
24 Aug., 1896. 13988. *Mr. Parkes.*] What is your occupation? I am a dealer at present.

13989. Were you a labourer previously? Yes; I was a sewerage miner and labourer both.

13990. Have you worked on many of the sewers? Yes, on a good few.

13991. Have you ever worked on Carter & Co.'s works? Yes.

13992. Which works? In Victoria-street, at Waverley, at North Shore, and at the Glebe.

13993. In connection with the works at Waverley, do you recollect any material being condemned there? No.

13994. Do you recollect any material being put in the works there which was not good material? Into the sumps.

13995. At Waverley? At the Glebe.

13996. Not at Waverley? No; I never had anything to do with concrete at Waverley.

13997. Did you ever have to do with the mixing of cement for brickwork there? No.

13998. You do not recollect a portion of the work having to be taken down on account of the bad brickwork? In Waverley I heard of it, but never saw it.

13999. Do you know what the work consisted of? No.

14000. You never saw it? I do not recollect what it consisted of there. All I know is that it was brickwork.

14001. You do not know whether any brick arches were taken down? I could not say.

14002. At the Glebe, did you do any of the concrete work for the sewers? Yes.

14003. You did some of the concrete? I did some of the concrete for the sumps, perhaps.

14004. How was it mixed? Not too well. The gauges were rather filled over, and sometimes a bit more was thrown in than ought to have been.

14005-6. There has been evidence given here—heresay evidence certainly—that a piano-case was put down one of the sumps;—do you know anything about it? No; I don't think such a thing was put down a sump. I don't think a piano-case would go into a sump properly.

14007. Did you build many of the sumps at the Glebe. A few in Derwent-street, such as No. 12 and No. 11, and down as far as No. 10.

14008. How were they filled up? No. 11 was filled up very badly in the bottom.

14009. What was it filled up with? Principally big stones in the bottom, but not a great quantity altogether; you might say 2 feet of it was thrown in roughly.

14010. In the others, what sort of material was put in? Principally metal.

14011. Did you do any of the invert between No. 12 and No. 13? No. We put down the pats for the labourers to start on.

14012. Do you recollect what height they were above the surface? I could not exactly say. Some varied a little. In some places the level was a little bit lower, and that was filled up mostly with concrete.

14013. What was the bed of the foundation of the sewer, rock or shale? Principally shale. It is all shale from No. 12 down.

14014. Do you recollect about the average height of these pats? I could not say exactly their average height.

14015. Were they 6 inches? Some of them might come to 6 inches, some to 5 inches, and some to 7 inches.

14016. Any less than 6 inches? I would not be certain.

14017. Was the concrete put in to form the invert good? Mostly what I have seen put there was. I never did any of the concrete along the invert from No. 12 to No. 13. I never mixed any concrete for them.

14018. Where did you mix concrete for? No. 8.

14019. Was that good or bad? Part of it. Some gauges went down properly, and some did not.

14020. What would you call a bad gauge? Say about a dozen shovels overfull.

14021.

W. Caughey.  
24 Aug., 1896.

14021. Was all the work done by shovelling? Where it was badly mixed.
14022. Did you see any of the sandstone and the sand for the concrete sifted? No.
14023. Was it screened? I never saw any of it screened.
14024. Was there a screen on the job? Not where I was.
14025. How was it mixed together? The gauge was filled with white metal, and then the sand and a cask of cement would go on the top.
14026. Was it screened metal? It may have been screened before it came there.
14027. Was not the sandstone-metal screened? It was not screened on the job. It may have been screened before it came there, but not at the shaft.
14028. How was it taken out of the heap—shovelled or forked? Shovelled at the shaft.
14029. How was it lifted before it came there? I could not say.
14030. It would have to be tipped by the cart? Yes, at the shaft.
14031. And then shovelled? Yes.
14032. Do you know where it came from? I could not say exactly where. It came from different places all round.
14033. It did not come from the job itself? I could not say exactly.
14034. Was it brought there ready mixed? Not ready mixed.
14035. Where did the sand come from? I could not say where. It was fetched there in carts, but I could not say where it was fetched from.
14036. Did you work on the Annandale job? No.
14037. What shafts did you work in besides Nos. 11 and 12? I put the pats between Nos. 12 and 13.
14038. What else did you work at? At the driving.
14039. You were a miner? Yes. I was doing that. At the latter end, I was scabbling.
14040. Was the work blasted or taken out by gadding and guttering? It was all blasted along the Glebe job.
14041. In the shale? In the shale and in the rock—all bar the muck.
14042. In scabbling you went after the blasting? Yes.
14043. What was about the average of the margin left from the inside of the sewer to the side of the excavation? I could not recollect perfectly; we always had to measure from the centre line. We marked it along with a stick; we went along from the line up with a stick. We had one for the top, one for the bottom, and one for the sides; we took it off according to that measurement. It is a good while since I was on that job. The last job I worked on was at North Shore.
14044. Who gave you the measurements in the Glebe contract? Generally, the carpenter, by Mr. Reid's instructions.
14045. Was he the manager? Mr. John Reid, manager for Carter & Co.
14046. Do you know Mr. Chiene, the engineer? Yes.
14047. Was he the engineer on the Glebe job? Yes.
14048. Did he ever have a conversation with Jack Reid or work with him? I suppose he had a word with him, but I could not say.
14049. Do you know Jack Reid very well? Yes.
14050. Did you ever have any conversation with him on the Glebe job? I have spoken to him on the job when he was general manager—on the top mixing concrete and such like.
14051. Did you know a man named Goddard who was on that job? Yes; I think his name was Harry Goddard.
14052. Did you ever hear Reid and Goddard have a conversation? No.
14053. You don't know whether Goddard ever threatened to expose any bad work? I could not say.
14054. You never heard such a remark made? I do not recollect anything of that.
14055. Was Reid a man who insisted upon your doing good work or asked you to do bad work? No. After the mixing of the concrete, we had a man who was supposed to be over us, and we had to go by his instructions.
14056. Who was that man? He is not alive now. It was George Humphreys. He was the man I worked under principally then.
14057. Would he instruct the men to do good work or bad? He would start doing inferior work, and we would have to do the same.
14058. How many sumps did you work on? Only No. 11 and No. 12.
14059. At which one were the stones put down? No. 11.
14060. What was put down in No. 12? It was pretty fair; not so much stone went into that.
14061. What would be the thickness of proper concrete in the form of the invert for the sumps? From the top of the stone in No. 11 to the top of the sump, I daresay there would be 4 feet of concrete, or so. Sumps are supposed to be 6 feet deep.
14062. Did you ever work at Annandale? No.
14063. Or at Johnstone's Creek? No.
14064. I suppose the Glebe was the last job you worked on? No; at North Shore.
14065. Did you ever notice defective work on any other of Carter & Co.'s jobs? No.
14066. Was the concrete generally of the description you stated on the works—on the Glebe job, for instance? At the points where I was working it was.
14067. On the other works? I could not say. I never had anything to do with them.
14068. It was your only experience of concrete? Yes.
14069. Who was the Government inspector for the Glebe job while you were there? Mr. Gledhill, I understood.
14070. Would he be at hand when you were putting in too large stone? No; there were inspectors under him.
14071. How many were there altogether? I do not remember the name of the one who was mostly along with us.
14072. Was it Corpe? No.
14073. Was his name Dick? Yes.
14074. Was it Dick Eyre? I could not say; his name was Dick.
14075. What other inspectors were on that job? I could not say.

- W. Caughey. 14076. Who was the resident engineer supervising over all? I think Mr. Rudolph was.  
 24 Aug., 1896. 14077. Did he go much to your works? Yes; he used to be along pretty often. Of course he might be there many a time when we were underneath at tunnel-work and we never saw him.  
 14078. Did you do any of the filling at the back of the shafts? A little.  
 14079. What was put in there? Most of it stone, as a lining behind the work.  
 14080. Any concrete? In places.  
 14081. Do you mean stone without concrete? In large openings there would be stone put in and concrete put over the top—that is, towards the surface.  
 14082. What shafts were these;—Nos. 11 and 12? That was No. 8, if I do not make a mistake.  
 14083. Would it be No. 9? I could not tell exactly whether it was No. 8 or No. 9. I think it was No. 8. I only filled up one or two, but I would not be certain.  
 14084. As far as the cement is concerned, do you know where they got this cement from? No.  
 14085. When the barrel was brought on to the works, what was done with it? Principally smashed up and taken away. All the barrels I had anything to do with were.  
 14086. Did they have the ends in them; were they complete barrels? No; they were all cut right along. We used to take them away and give them to children about.  
 14087. When they were brought to you were they intact? They seemed to be all solid and complete. All the casks I ever cut seemed to be as if they had come from the town or the bond.  
 14088. In that invert of the Glebe sewer did they ever mix up shale with the concrete instead of bluestone? I never saw shale mixed up.  
 14089. Would the deepest portion of the batch you put in be 7 inches? I could not say exactly. We had the measure there, but it has run out of my head. We always put them along to the right height. They were not all of the same height.  
 14090. Did the Government inspectors fix the height of these pats? Mostly. The inspector generally saw that we had the level of them.  
 14091. Did they fix the depth of the filling? Not that I am aware of.  
 14092. *Mr. Davis.*] With regard to the shaft filling;—you spoke of the shale and other soft material you put between the brickwork and the shaft excavation? Yes; it was stone and such-like round about the shaft.  
 14093. The ordinary filling? Yes.  
 14094. You did not refer, then, to the concrete? No.  
 14095. As a matter of fact, pretty well all the shafts at the Glebe are small brick shafts, and then the space between the outside of the brickwork and the inside of the excavation of the shaft is filled up with that kind of material? I could not say. It was a little bit I did. I could not be sure whether it was No. 8 or No. 9.  
 14096. The shafts you referred to were done in that way? Yes.  
 14097. The pats you spoke of were put in between Nos. 11 and 12;—what were they put in with? Concrete.  
 14098. What kind of concrete? Proper concrete.  
 14099. What was the stone which was used to make up the concrete? I believe it was bluestone.  
 14100. Did you mix it? I helped to mix it.  
 14101. On the job? On the job.  
 14102. Did you put in the pats? The pats were put in, I understand, in the proper material.  
 14103. Were you working at the pats below or mixing concrete on the top? I did both.  
 14104. You were sometimes on the surface and sometimes below? Yes.  
 14105. So that you had an opportunity of seeing what kind of concrete was used? Yes.  
 14106. In that concrete was the proper quantity of cement put? Yes. All the pats I put in were put in with the proper material as far as I was aware.  
 14107. Did you see any of this bad filling you spoke of in sump No. 10? No.  
 14108. Did you see any bad filling in sump No. 12? There were other men working there, and I was down by No. 11 sometimes.  
 14109. Did you see any of it put in No. 12? Yes.  
 14110. What was it you saw there? A kind of shale and stone in the bottom.  
 14110½. Was this left in the bottom of the sump, or was it put in? It was put in.  
 14111. Where was the shale got from? Round the shaft.  
 14112. Was it flung down the shaft from the top? It was thrown down the shaft.  
 14113. Before you started to concrete? Yes.  
 14114. Was that what occurred at shaft No. 11? Yes.  
 14115. Not at No. 12? At No. 11 and No. 12.  
 14116. To a greater extent at No. 11 or at No. 12? At No. 11, I think.  
 14117. How much of that shale would be flung down from the surface into the bottom of the sump before you started to concrete? It might be a foot or 18 inches. I do not know that it would average that much all over.  
 14118. How did you see it done—with shovels or with the hand? With the hand.  
 14119. Large pieces? Large pieces—that is, lumps about the size of my head, and so on.  
 14120. What size was the shaft? 5 feet x 6 feet.  
 14121. The depth of the sump—6 feet? They were supposed to average that.  
 14122. What you say is that a small quantity of shale, to the extent of 9 inches or a foot, was put in before they started to concrete? It might come to a foot, or it might come to 18 inches.  
 14123. You did not go down to see how it was? No.  
 14124. Was the inspector present when that occurred? No.  
 14125. How was it you came to do it? We did that when it was over the time.  
 14126. You mean after hours? Yes. I would not swear whether it was done after time in No. 12, or whether he was up at No. 11.  
 14127. You were ready to start concreting? Yes.  
 14128. Before you put the concrete down you put the shale down? Yes.  
 14129. The inspector knew nothing about it? No.  
 14130. How was it you came to do it? The man who was over us was supposed to order us what to do.  
 14131. *His Honor.*] Who was that? He is dead. It was Mr. Humphreys. 14132.

14132. *Mr. Davis.*] Did he order you to put down the shale? Yes. He says, "Put this stone in,"— *W. Caughey.*  
and when you are doing things like that you do not speak too plain.
14133. A kind of a wink was as good as a nod to a blind horse? Yes. 24 Aug., 1896.
14134. Did you do any concreting at the Glebe except in the pats between No. 11 and No. 12 shafts, and the sumps at No. 11 and No. 12 shafts? I mixed some metal at No. 8. I mixed some on the top and sent it down for the invert:
14135. You helped to mix that concrete? Yes.
14136. That was bluestone? Yes.
14137. What was put in the sumps Nos. 11 and 12? Sandstone was put in No. 11 and No. 12 on top of the faulty stuff in the bottom. There is supposed to be white metal concrete in the bottom of the sump.
14138. After you had got so much white metal in, you started to put in bluestone? I only put in white metal.
14139. You told us just now the way you did it—you put in a few extra shovelfuls into each gauge? That was at No. 8 shaft.
14140. That did not occur at No. 11 or No. 12? No. It did occur at No. 8.
14141. How many shovelfuls did you put in extra to the gauge? Sometimes it might be a dozen; sometimes it might be less.
14142. You piled the box up a little bit, I suppose? Yes.
14143. Did you put any extra sand in it? It might be a shovelful or so.
14144. It was not the custom to get a straight edge and level the stuff off, was it? No; you were supposed to fill the box level.
14145. You were supposed to fill the box level and then to leave it; but the inspectors never split straws, did they? No.
14146. What you say is that a few extra shovelfuls went on top of the gauge-box; you made it round instead of, as you thought it should be, flat? Yes.
14147. You say that a piano-case or a piano could not possibly be put into a sump? I do not consider a piano-case would go down a sump properly.
14148. It is too big to go into a sump? It would not fit properly in a sump, I think.
14149. *Mr. Carter.*] It would be a very difficult matter to put a piano-case down in any case? Yes.
14150. Considering the size of the shaft, a piano-case could not be put down without being lowered into the sump with proper tackle? No; I do not consider a piano-case could go down very well.
14151. You never received any instructions from any member of the firm of Carter & Co. about putting in a little defective work or throwing boulders down? Never.
14152. Or from Mr. Reid, their manager? No.
14153. You did it entirely, if you did it at all, on your own responsibility? Practically the responsibility rested with the man who was over us.
14154. *His Honor.*] You say there was never a Government inspector about when you were doing what you thought was bad work. There was no inspector about at the time. His eyes were off us when anything like that was being done.
14155. *Mr. Parkes.*] Used you to work late at night and early in the morning? When I was at work early in the morning it was mostly for scabbling in that line.
14156. You never came early in the morning in order to get the defective work in? Never.
14157. You did it late at night? I did it late at night. That is how the sumps were done.
14158. You said that proper cement was mixed for the pats between No. 11 and No. 12; what was the balance of the material that went down; a pat would not be very thick;—what size is a pat? It would be 8 or 9 inches across.
14159. How far distant would they be spaced? I would not be certain.
14160. What was your levelling rod? They were just these common boning-rods.
14161. What distance would it be? I do not recollect exactly.
14162. Would they be 10 feet? I do not think they were 10 feet.
14163. Were they 6 feet? That would be about it. I could not say whether it was 5 feet or 7 feet. It was not 10 feet.
14164. Did you put in the filling? No.
14165. *His Honor.*] When you spoke of the pats being of a certain thickness, what sort of ground were you working in then? It was pretty firm shale.
14166. *Mr. Parkes.*] Was there a piano-case kept on that job as a tool-box? There were a number of piano-cases for us to keep our tools in at most of the shafts.
14167. I suppose they could break up a piano-case and drop it down, supposing it was too big to go down? It could be broken up and put down. I never saw it done.
14168. What are the dimensions of a piano-case—they are only about 4 feet high, are they not? A piano-case might be 2 ft. 6 in. wide and 4 ft. 6 in. or 5 feet long.
14169. What would your shaft be? It would be about 5 feet x 6 feet.
14170. It could go down the shaft? If it was lowered down properly; but if thrown down from the top it certainly might jam against the sides.
14171. *His Honor.*] It would go down end on? It might jam against the sides. I do not think much of that.
14172. It would do as well as the stones and lumps of shale as big as your head once it got down? Once it got down it would.
14173. I do not quite understand what you mean as regards the concrete at the top of the shaft;—was the filling at the back of the brickwork stone? I mean when it comes near where the casting comes they generally put concrete round that.
14174. *Mr. Davis.*] It is put on to the brickwork? It was just thrown round the top behind the brickwork.
14175. The concrete forms the top of the shaft? Yes.
14176. *His Honor.*] The foundation of the pitchers, I suppose? The shaft I principally allude to is No. 11.
14177. *Mr. Parkes.*] What is the size of the stones put at the back of the shaft—large stones? Sometimes a shaft is pretty wide, and the stones might be the size of your head.
14178. Would it be of the shape of spalls? Some of it might be round, some of it might be 3 inches, and some of it might be 2 inches.

- W. Caughey. 14179. What is the earth surface on the bank—is it shale? No. 8, I think, was shale.  
 14180. Shale at the back of the stone? I could not say.  
 24 Aug., 1896. 14181. What is the nature of the earth above the layer of shale? I cannot say.  
 14182. How far up does the shale go? I could not say exactly. Some of these shafts, No. 8 and No. 9, I think, were all shale.  
 14183. What is the thickness of the brickwork—9-inch? I could not say.  
 14184. Is it built in cement? Yes. I never had anything to do with the mixing of the cement for brickwork.  
 14185. What is the depth of the shafts, No. 11 and No. 12 from the surface? I forget the depth.  
 14186. Twenty feet or 30 feet? More than 30 feet.  
 14187. Is it 50 feet? I think No. 12 must be about 50 feet, but I would not be certain.  
 14188. What is there at the bottom of the shaft above the roof of the sewer—any concrete? I could not say.

William Burcombe sworn and examined:—

- W. Burcombe. 14189. *Mr. Parkes.*] What is your calling? I am a contractors' carter.  
 24 Aug., 1896. 14190. Did you draw the material for Contract 79 on North Shore? Yes.  
 14191. Did you draw it all? Mostly all.  
 14192. That was a contract of Mr. Carter's? Yes.  
 14193. What material did you draw? I carted cement.  
 14194. Did you draw the whole of the cement? No.  
 14195. You carted a great portion of it? Yes.  
 14196. Do you know who else carted the cement? A man named Booth carted some.  
 14197. Who else beside yourself and Booth carted cement? J. Molloy.  
 14198. Were you three the only people who carted cement? No; there was also a man named Walsh.  
 14199. Would that be the lot? Yes.  
 14200. Were they working for you? Walsh was working for me.  
 14201. Booth was not? No.  
 14202. Where did you generally cart it from? From a good many places. I have carted a considerable lot from the foot of the hill at Milson's Point. I have carted cement from St. Leonard's Station; I have also carted cement from Shea's Creek.  
 14203. How much did you cart from Shea's Creek? I could not say how much. I carted a considerable lot from Shea's Creek.  
 14204. How much sand? I could not say. I never kept any books. I could only guess it. I made a memorandum from day to day, so as to know how to get my money.  
 14205. How many weeks were you carting? I had two double teams each drawing twelve casks. I suppose they were carting on and off for about three weeks.  
 14206. *His Honor.*] How many loads a day did you draw? Three loads a day and 12 casks in each load.  
 14207. *Mr. Parkes.*] Do you keep books? I do not keep any books except from day to day, in an ordinary school exercise-book.  
 14208. Could you produce these books? No; except for just the ordinary work I am doing at the present time.  
 14209. When you were carting from Shea's Creek which way did you go? I did not cart myself. I did not go myself. The men always took the shortest way. I could not say what way they would go.  
 14210. Did they go over in the punt? Yes.  
 14211. Did you cart sand? I carted a considerable lot of sand.  
 14212. Where from? I carted a lot of sand from Bourke-street.  
 14213. Did you cart any sand from Mossman's Bay? No; from Balmoral I carted a lot of sand.  
 14214. Did you ever cart any sand from the beach at Mossman's Bay? I did not cart sand from there. I am sure Booth carted sand from there.  
 14215. Have you no books at all which you could produce? No.  
 14216. How were you paid? Every fortnight.  
 14217. In what? In notes.  
 14218. Not by cheque? No.  
 14219. How much were you paid, roughly? Well, I have had as much as £40 and £50 a fortnight.  
 14220. You were never paid by cheque? No; I have been paid by cheque a small amount casually.  
 14221. At odd times? Yes; but very seldom.  
 14222. Did you give a receipt for your payments? No; I would not give any receipt.  
 14223. How did you render accounts to Carter & Co.? By ordinary bills.  
 14224. Were you not asked to receipt these accounts? No.  
 14225. Never? Never.  
 14226. On no occasion were you paid by cheque for a full fortnight's carting? Never.  
 14227. In what way did you appear on the pay-sheet? I suppose I appeared as an ordinary working man on the pay-sheet.  
 14228. In your own name? Yes.  
 14229. Did you sign any pay-sheets? Never.  
 14230. Not for your money? No; I always got my money handed to me at the door.  
 14231. You never signed a receipt? No.  
 14232. You got £40 without giving a receipt? Yes.  
 14233. *Mr. Davis.*] Can you remember when it was you carted that cement from Shea's Creek to Contract 79? No.  
 14234. Do you remember the work being stopped at Shea's Creek between Mitchell Road and the bottom of M'Donald-street? Yes.  
 14235. Was it about that time? It was.  
 14236. Do you remember what cement it was you carted? No.  
 14237. You do not remember the brand? No.  
 14238. What you say is that you had three double-horse drays carting for about three weeks, and that each dray would take twelve casks at a time, and would make three trips a day? Yes.  
 14239. *Mr. Carter.*] You have been working for us a long time? Yes. 14240.

14240. At day-work, piece-work, and every other sort of work in the carting line? Yes.  
 14241. You are always carting cement from one contract to another? Yes.  
 14242. Also material of various kinds? Yes.  
 14243. When we ran short of material on one job you went yourself or sent someone else to another job for material in order to keep us going—that is a fact? Yes.  
 14244. You say you were never paid by cheque? Yes.  
 14245. You always got your money at the door like other men? Yes.  
 14246. The other carters got their money in the same way? Yes.  
 14247. You were paid fortnightly? Yes.  
 14248. Did you ever know anyone to give a receipt for wages or for work done on our contracts? No.  
 14249. Or on any other contract apart from our contracts;—on Mr Pritchard's or anyone else's? No.  
 14250. Contractors do not take receipts from their workmen? No.  
 14251. Regarding the sand supposed to have been carted from Mossman's Bay;—are you sure that Booth carted it from Mossman's Bay? He carted crushed stone, and that is where I think he got it.  
 14252. All the sand you carted was from Balmoral Beach and Bourke-street? Yes.  
 14253. *Mr. Parkes.*] Did you ever cart cement from North Shore to any other contract? No.  
 14254. You never carted cement from there to Annandale? No; I never carted cement from North Shore to Annandale.  
 14255. Did you never cart cement from North Shore to Johnstone's Creek? No.

W.  
Burcombé.  
24 Aug., 1896.

George Christie recalled and further examined:—

14256. *Mr. Parkes.*] When your evidence was interrupted the other day you were reading a number of compilations of papers. With reference to papers omitted from the Parliamentary return, was there any difficulty in finding out where those papers were by the books in the Government office? No.  
 14257. Have you perused the index to the register and the register kept by the Department? Yes.  
 14258. Is every paper there carefully minuted? Yes.  
 14259. Will you explain to His Honor the nature of the index and the register? I may say that, in the first place, I have extracted from the index, as regards Contract No. 72, for the purpose of placing it before His Honor, this list of papers, being a total number of 106 papers. In my previous evidence I merely enumerated fifteen papers, which, perhaps, were considered the more important of the papers.

[*Mr. Davis inquired of His Honor whether, seeing that Mr. Parkes did not ask for these papers, it was competent for Mr. Christie to go further into the matter.*

*Mr. Christie stated that the fifteen papers he originally submitted connected Contract 72 with Contract 79, and that these particular papers were material to Contract 79.*

*His Honor said he would admit the evidence.]*

*Mr. Christie:* All the papers originally submitted in connection with Contract 72, in the Parliamentary return, are numbered there 1, 2, 3, and 4, and they appear in the registers. The other documents, which are not included, are as per this list. The mode of procedure, which it would seem would be the correct procedure in taking out documents for a Parliamentary return, would be, first, to refer to this index, and from that to get a schedule of all the papers referring to that contract—(the papers, I understand, of each contract have been put away in various bundles)—then to refer to the bundles, and check over the papers which exist there with the papers as per this list. By so doing, a full list of the papers can be obtained, and their whereabouts can also be ascertained. A registration of the papers in connection with Contract 72 first appears at page 46 of index No. 3, which is the index to register No. 3. The documents in register No. 3 are recorded with progressive numbers, commencing with No. 1 of each year, and the papers are numbered as regards Contract 72, commencing with the year 1891. The first number which appears to be indexed and recorded in the register reads as follows: "Progressive No. 91-151; when registered, January 23; from whom, C. H. Bagge; date, 22/1/91; nature of application and representation, Advertisement, Contract No. 72, Munni-street." There are columns for the issue and return of the papers marked "Referred to whom, and when." This shows that the papers had been issued out on 23/1/91, and returned on 27/1/91. Following on in the same way the whole of these papers in connection with Contract 72 have originally been entered in the registers, and have been indexed in the indices. Where the papers in any case have been issued there is a record of their issue, showing to whom they have been issued, so that at any time if a paper is called for the person keeping the registers can turn up and give information as to the person in whose possession the papers are.

14260. *His Honor.*] If they are not shown to have been returned? Yes.  
 14261. And if they are shown to have been returned they ought to be found in the bundle? Yes.  
 14262. *Mr. Parkes.*] With reference to Contract 79, will you turn up the index? Contract 79 is in No. 4 register.  
 14263. Does that appear to be kept as fully as the others? Yes.  
 14264. And in the same form? Yes.  
 14265. With regard to Contract 77, will you turn up the index? It commences in No. 5 index with registered paper No. 170—"Advertisement." Then follows 316 "Tenders"—and goes on in the same way as the others.  
 14266. It seems to be kept in just as complete a manner as the others? Yes.  
 14267. So that, never mind where the papers referred to in all these matters might be, they could be obtained? The system is planned to be complete, so that all the papers can be produced.  
 14268. *His Honor.*] Do these books go in years? No; a register is used until it is filled up; a new index is started with each register; No. 3 index applies to No. 3 register, and so on.  
 14269. All the contracts come under the letter "C"? Yes.  
 14270. The numbers you pick out as they go? Yes.  
 14271. *Mr. Parkes.*] The letters are kept in a similar fashion? The letters written by the Department are copied in the letter-book, and are indexed more particularly to persons than to contracts. This seems not to be quite in keeping with the registers. In some of the letter-books they have been registered by reference to contract. The system has not been uniform as regards the letters from the Department.

G. Christie.  
24 Aug., 1896.

G. Christie. 14272. Have you prepared the papers in connection with the claim of M'Namara, the wool-scourer, for damage done to him by the withdrawal of water from his dam? These papers have been picked out; they are not quite put in proper order.

24 Aug., 1896.

14273. Will you first read Mr. Waller's report on the scheme? Yes; it is as follows:—

WALLER, T. F.

REPORT on claim made by H. Macnamara for damage through Sewerage Works, Shea's Creek.

70 Pitt-street, Sydney, 5th March, 1892.

MACNAMARA'S CLAIM v. SEWERAGE BOARD.

Sir,

Agreeable to your instructions I, on the 1st instant, in company with Messrs. Hickson, Davis, M'Elhone, and Wilson, visited Mr. Macnamara's wool-scouring premises, inspecting the dam, as also Shea's Creek, the "storm-water channel," the bed of the old creek, and the dam belonging to the wool-scourers above Mr. Macnamara's works, and on the same creek marked "C" on plan, also the land intervening between Macnamara's dam and what is known as the "earthen drain."

I subsequently revisited the ground so as to make myself more thoroughly acquainted with the matter in dispute, and the effect, if any, caused on the water supplying Macnamara's dam by reason of certain works undertaken by the Department, and I now append my report, with sketch plan, which I trust will be found explanatory and satisfactory.

Should you desire any further information I shall be happy to supply it, as also to wait on you with Mr. M'Elhone, as I understand from that gentleman that he expects you will interview him after receiving my report.

I have, &c.,

T. F. WALLER.

The Hon. the Minister for Works, Sydney.

Ack., 8/3/92. Register and re-submit with other papers, 7/3/92. Done, 8/3/92. P.P., 92/2/81 herewith. Submitted.—J.B., 11/3/92. Seen; Mr. Waller's report appears very conclusive, and shows that Mr. Macnamara has no claim upon this Department.—W.J.L., 12/3/92. B.C., Mr. Hickson to see.—J.B., 14/3/92. Seen.—R.H., 14/3/92. Should not Messrs. Williamson and Williamson be informed?—R.H., 15/3/92. Under Secretary for Public Works. Best to do so.—J.B., 15/3/92. Approved by Minister, Order No. 1,221.—D.M'L., 19 Mar., 92. J.B. Inform.—J.B., 21/3/92. Messrs. Williamson and Williamson, 24/3/92. These papers should go to the Crown Solicitor with 94-2,805, H. and R.—R.H., 29/3/94. Under Secretary.

MACNAMARA'S CLAIM v. SEWERAGE BOARD.—SUMMARY OF REPORT.

*Storm-water Channel.*—No damage has been caused to Mr. Macnamara by its construction, but rather a benefit, as the sewerage water is now under control, as it can be connected to, or cut off from, the dam as may be considered most advisable.

2. No additional sewerage water has been introduced into "storm-water channel."

3. "Storm or surface water," the result of rain, can still be conducted to Mr. Macnamara's dam, which will be, as heretofore, mixed with sewerage.

*Shea's Creek.*—The statement that the supply to Mr. Macnamara's dam from this creek is in any way interfered with by the "storm-water channel" is contrary to facts and cannot be upheld.

*Earth Drain.*—The statement that this drain, which extends between the "storm-water channel" and the canal, drains Mr. Macnamara's dam is also groundless, as the original surface of this drain is some feet lower than Mr. Macnamara's dam, and cannot therefore be upheld. I, therefore, find that the only loss sustained by Mr. Macnamara by reason of and during the construction of the "storm-water channel" is the loss of sewerage water, totally unfitted for wool-scouring purposes, and of some of the "storm-water" which might have fallen during the construction of the "storm-water channel," but which "storm-water" would have been of little (if of any) service to Mr. Macnamara, as it would have, under any circumstances, been mixed with the sewerage water. The surface or rain water lost (if any) could not have been of much value, and the amount of such surface or rain water would depend entirely upon the season. For confirmation of remarks in this summary, *vide* my report and sketch plan attached.

T. F. WALLER.

MACNAMARA'S CLAIM v. SEWERAGE BOARD.—REPORT.

*Storm-water Channel.*—Owing to storm-water channel completed by the Sewerage Department, and filling up and levelling in some cases of the creek or watercourse, as also the deepening of the said creek or watercourse in such cases where it is made use of for the "storm-water channel," the sewerage water, as also the "storm-water" conveyed by the creek or watercourse to Macnamara's dam, has undoubtedly been diverted from that dam during the carrying out of the work up to date; but it must be borne in mind that the water so diverted would have been always sewerage water, except at such times when heavy storms took place and the sewerage water would be mixed with rain water, and in my opinion the sewerage water was not and is not fit for wool-scouring purposes. By a system of "stop-boards," marked "B" on plan attached, the sewerage water can be held until it rises sufficiently high to re-enter the old bed of the creek at the point marked "stop-board" on the plan: and by the drain pipes which are connected with the sewer on either side the storm-water in the catchment area north of Macnamara's dam, and which would naturally have flowed into the creek before it was interfered with, will now be drained into the storm-water channel and mixed with the sewerage water, and can eventually be conducted by means of the "stop-boards" into the old course of the creek to Macnamara's dam. In fact so far from the storm-water channel having permanently injured Mr. Macnamara, or cut off the water from him, it has had the contrary effect; inasmuch as it is now possible to prevent the filthy sewerage water going into his dam, or if he desires it he can obtain it, as well as any storm-water which may fall, in even greater quantities than before. The "stop-boards" are not in position, but will be placed immediately Mr. Hill's authority is obtained. Any loss, therefore, which Mr. Macnamara may consider he is sustaining is not attributable to the Department, but rather to Mr. Hill, and is plainly a matter to be settled between Mr. Macnamara and Mr. Hill. For my own part I do not think that the Department or Mr. Hill would be benefiting Mr. Macnamara by sending the sewerage water down to his dam.

*Introducing of new sewerage water into storm-water channel.*—Examination, as also the statements by Messrs. Hickson and Davis, satisfy me that the claim advanced, that extra and more objectionable sewerage matter has been introduced into the "storm-water channel" than previously found its way into the old creek or channel *cannot be upheld*.

*Shea's Creek.*—The contention that the Department has diverted the water from this creek is absolutely untenable, inasmuch as Shea's Creek is carried over the "storm-water channel" at the point where it intersects the creek, and the concrete flume now forming a portion of Shea's Creek is of the same size as the original creek, and therefore no stoppage or obstruction to the flow of water exists.

*Earth Drain.*—The statement that the earth drain which continues from the "storm-water channel," at the point marked "D," *vide* plan, is quite incorrect, for the natural fall of the water is to the "open earth drain"; and whether it was there or not, the water would not find its way to Macnamara's dam, as the cross-section levels taken by the Department show that the surface of the ground or bank of the earth drain is considerably, say 5 feet, below the level of the dam. If there is any water in the catchment area west of the "earth drain" which would, owing to the contour of the ground, naturally find its way into Macnamara's dam, it will so continue, as the drain will not interfere with it.

The statement that there is a short supply of water in Macnamara's dam and in no way equal to that contained in Eves' dam, which is above him on Shea's Creek and marked "C" on plan, is quite correct; but it is not correct to saddle the Department with being the cause of the scarcity of the supply. Examination shows the following to be at least some of the causes fairly attributable for the scarcity of water in Macnamara's dam:—

1. Large quantities of water are intercepted by Eves and others living above Macnamara, who only allow their surplus water to continue down the creek.
2. Irrigation by Chinese gardeners, who systematically divert the water from Shea's Creek subsequent to its leaving the flume and re-entering the creek.
3. The dirty state of Mr. Macnamara's dam, which has been allowed to silt up to a considerable extent, owing, beyond a doubt, to the sewerage water which previously found its way into the dam.
4. The leaky condition of the dam, which allows two streams of water to escape, the volume escaping at time of inspection being, I should judge, quite sufficient, if retained, to amply supply Mr. Macnamara's dam.

T. F. WALLER.

14274.

14274. You have a copy of the claim put in by McNamara—the number of the paper is 92-42? It does not seem to be amongst these papers. G. Christie.

14275. According to that report by Mr. Waller, does it not seem that the claim was made on account of Contract 72? The papers are with Contract 72 papers. They are dealt with as Contract 72 papers. 24 Aug., 1896.

14276. But regarding Mr. Waller's first report, does it not seem that claim is made in connection with Contract 72? If I had his plan I could say definitely, but the inference to be drawn from these papers is that it is so.

Joseph Davis re-called and further examined:—

14277. *His Honor.*] You desire to make an explanation with reference to Mr. Waller's report on the claim put in by Mr. McNamara? I do. This was not the first report or paper in connection with this case. Some eighteen months previously Mr. McNamara got an injunction out and stopped the construction of the Shea's Creek canal just below his works. Mr. Waller's report really arose out of that, although the immediate occasion of it was the construction of the storm-water channel which came on twelve or eighteen months afterwards. The two things were mixed up. J. Davis. 24 Aug., 1896.

14278. *Mr. Parkes.*] Was this cost of £6,800 charged against the Shea's Creek relief works? It was charged against the Shea's Creek canal.

14279. That is the Shea's Creek relief works;—would it not have been proper to have charged it against this contract? I do not know. The case arose from the canal primarily.

14280. From No. 72 Contract? No, from the Shea's Creek canal.

14281. In what way? Before the channel was thought of.

14282. Where are the papers to show that? I cannot tell you where the papers are. I know that is the fact. The first thing done by Mr. McNamara was to apply for an injunction against the Department to stop the Shea's Creek work on account of the loss of water he was sustaining at his dam; and the injunction was granted.

14283. *His Honor.*] This Shea's Creek work was the straightening, deepening, and regulation, of the channel of Shea's Creek? It was an entirely new channel. It is really a canal 200 feet wide.

14284. Representing Shea's Creek? Shea's Creek at that point is no creek at all. It is simply swampy land.

14285. It is an old mangrove swamp, I suppose? Yes; there is no defined creek when it gets into the level. That was the way in which this case originally arose.

14286. *Mr. Parkes.*] Then, when the storm-water channel—that is Contract 72—was commenced, Mr. McNamara made certain representations through Mr. McElhone? I do not know whether they were made in writing or not.

14287. According to your register, on 6th January, 1892, a complaint was made that water was being drawn from McNamara's woolwashing dam at Shea's Creek, Alexandria? Yes; it was merely a complaint. There was no formal claim made at that stage.

14288. *His Honor.*] What had become of the old complaint by Mr. McNamara at that stage? The injunction was still in force.

14289. The issue had not been tried? No.

14290. The issue was tried after Contract 72 was begun? Eighteen months or so afterwards.

14291. Were these works then made material evidence in the case—did they come in as aggravating his claim? Yes.

14292. The original claim being founded on the making of the original channel? I do not know that he had any claim at that stage. What he complained of was that he was likely to have one, when he got out the injunction. Then a channel was constructed, and Shea's Creek was continued afterwards. They moved in the Court to get the injunction dissolved, and they succeeded, and then they proceeded with the canal work.

14293. That was before Contract 72 was begun? Contract 72, at that stage, was finished.

14294. Were the Shea's Creek canal works in abeyance from the time the injunction was first taken out until the time it was dissolved after the beginning of Contract 72? That is the case.

14295. Contract 72 only came in as a sort of incidental head of the damage done? It aggravated the case, so Mr. McNamara said. The two were mixed up together, and I do not think it would be possible to separate one from the other, because they were taken together in the Court.

14296. *Mr. Parkes.*] Is the case settled yet? I do not think the money has been paid to Mr. McNamara. I think there is some adjustment to be made before the amount of the award is given.

14297. *His Honor.*] Did Mr. McNamara succeed on the trial of the issue? Yes, he succeeded in getting from the jury £10,000, which was reduced on law points to £3,000 odd.

14298. The final result was that £3,000 was allowed by Mr. Justice Owen to stand as the judgment of Mr. McNamara against the Department? Yes. Then there was a point as to whether it should go to the Privy Council. I think it did go before the Full Court, and that point eventually was given up.

14299. *Mr. Parkes.*] What was the total legal cost paid to Mr. McNamara? That I could not tell you.

14300. Did it exceed that £6,000? I do not know the amount that was paid.

14301. Mr. Hungerford said he would get that information by to-day—has he got it? I do not know.

14302. Mr. McNamara had another claim for damage done by smoke? Yes, at the time the original channel was being cut along the site of the canal.

14303. Did he succeed in that case? He did not press it, I believe. It was against the contractors. I never heard of any money being paid. The fact is it would be rather difficult to prove any damage. What he alleged was that the smuts from the fires they were making to burn off the reeds were deposited on some wool he was drying in a paddock.

14303½. Is this case cleared up? I do not think so.

14304. It is still hanging fire? I suppose he has abandoned it, or we should have heard something about it.

14305. *His Honor.*] What contractors were these? Carter & Co.

14306. For what contract? For the storm-water channel—that is, Contract 72.

14307. *Mr. Parkes.*] You wrote a minute on the 1st May, 1891, stating that the contractors were liable for this damage? I presume I would say that. I have not seen the minute for many years.

14308. Here is Mr. Carter's reply; will you read it? This reply is dated April 28, and my minute, which is dated 1st May, seems to have been made on that letter.

14309.

J. Davis. 14309. What does Mr. Carter say to that? He says in his letter:—

24 Aug., 1896. We have the honor to acknowledge the receipt of your letter of April 28th, *re* damage caused by fires at Shea's Creek, Contract 72, and, in reply, to state that we recognise no liability in the matter.

That was his view, and my view was different from that.

14310. The case is not settled yet? I do not know.

14311. Has the final voucher of Contract 72 been paid? Yes. [*Vide Appendix No. 54.*]

14312. *His Honor.*] Do I understand that the work on the part of Contract 72 which was alluded to in the original contract as the parts which might have been cut out was done? Yes.

14313. That part of the contract was completed? Yes. It was the upper portion where the question arose later on, when the funds were exhausted.

14314. *Mr. Parkes.*] There was a letter written by a resident of Macdonaldtown complaining that brick spalls from an old house which had been pulled down were being put in the concrete instead of stone, and there is a minute of yours with regard to that letter;—do you recollect the case. Yes.

14314½. The paper is 92-1,166? I do not remember the old house, but I remember the brick spalls.

14315. Will you read the letter? The letter, which was addressed, I presume, to Mr. Darley, was in these terms:—

I hope that you are cognisant of the fact of Messrs. Forrest and Carter's contract of continuation of concrete sewer, *via* Macdonaldtown, the above firm of contractors are building with old rubbish of bricks instead of stone, as was in the case of Messrs. Parry and Farley. As a property-holder of the borough I enter my protest. Hoping that you will see at once into this important state of affairs I will withhold my name and address.

I do not observe anything in the letter about an old house.

14316. I presume the spalls came from one of the houses that had been pulled down;—can you give the particulars of this case? I can tell you that they were vitrified bricks.

14317. Will you read your minute on that letter? My minute is as follows:—

The broken bricks referred to are far stronger than the ordinary sandstone which we use in our concrete works. They are vitrified, and are, in my opinion, equal to bluestone.

That I say now.

14318. Were did they get them from? I could not tell you what brickyard they got them from. There is a brickyard close at hand. They were very hard-burned bricks. The bricks had been exposed to the fire to such a degree that they had run together and resembled bluestone more than sandstone.

14319. *His Honor.*] Were they kiln-lining bricks? They were bricks which would be in the flue of the kiln.

14320. *Mr. Parkes.*] Don't you think the Government ought to have had the benefit of the difference between the cost of these bricks and the cost of the metal which ought to have been used? I should say myself that the bricks would cost as much as the metal.

14321. More than bluestone? I should say they would cost as much as sandstone.

14322. Sandstone would have had to be carted? These bricks would have had to be carted from the brickyard.

14323. If they were vitrified bricks they would be only waste? Yes. I do not know whether the contractors had to pay anything for them—probably not; but they might have.

14324. *His Honor.*] How were they broken—with a machine or with a hammer? They were knapped. It was an advantage to the Department to get these bricks, as they made better concrete than sandstone would.

14325. *Mr. Parkes.*] Paper 92-1,416 is a letter from the Council Clerk of Alexandria objecting to the contractors using their stone bridge or culvert;—can you explain the matter? I remember the case very well, but I cannot quite call to mind what was done. I do not know that it was their bridge. I think it was a Government bridge.

14326. Will you read the correspondence? Yes. It is as follows:—

|   |   |
|---|---|
| <p>Sir,<br/>I am directed by resolution of Council to ask whether Contractor Forrest, who is constructing the Munnistreet Stormwater Sewer from Macdonaldtown through Mitchell Road, <i>has any right under his specification to the stone which the Mitchell Road Bridge was constructed of.</i> It appears that he exercises that right in face of the Council's letter to him, cautioning him against in any way disposing of same. What is the usual practice in your Department in matters of that sort? An early answer will oblige.<br/>J. Davis, Esq., Engineer for Sewerage,<br/>Harbours and Rivers Department, 42, Elizabeth-street, Sydney.</p> | <p>Town Hall, Borough of Alexandria, June 21, 1892.<br/>I remain, &amp;c.,<br/>M. J. MADDEN,<br/>Council Clerk.</p> |
|---|---|

Department of Public Works, Roads and Bridges and Sewerage Branch, Sydney, June 27, 1892.

MINUTE PAPER.

Subject:—Contract No. 72. Shea's Creek Stormwater Sewer. Bridge at Mitchell Road.

It has been the custom, unless provision was specially made in the specification, for the contractors doing the work to have for their own use any old materials which they might have to remove in order to execute the new work. In the case of the bridge at Mitchell Road, as there was nothing in the specification about the ownership, I think the contractors should be allowed to make whatever use of it they think fit.

Under clause 50 of the specification, I think we might ask the contractors to cart this bridge or any other material to any place we decide upon; but it would be rather straining the clause to use it to apply it to the ownership of the bridge in question.

I recommend the Alexandria Council be informed in terms of the first paragraph of this report.

Mr. Bagge.

J. DAVIS.

For the approval of the Engineer-in-Chief.—C. H. Ohlfsen-Bagge, 28/6/92. Write.—R.H., 28/6/92. Council Clerk, Alexandria, 29/6/92.

Copy, Letter Book No. 5 (269), marked D, page 175.

Sir,

29 June, 1892.

In reply to your letter of the 21st instant, asking whether the contractors for the stormwater sewer from Munnistreet to Shea's Creek have any right to the stone which they have taken out of the Mitchell Road Bridge, and what the usual practice is in this Department in matters of the kind, I have the honor to inform you that it has been the custom, unless provision were specially made to the contrary in the specification, for contractors to have for their own use any old materials they might have to remove in order to execute a new work. In the case of the Mitchell Road Bridge, as there is nothing in the specification about the ownership, the contractors are entitled to make whatever use of the old materials they think fit.

I have, &c.,

ROBT. HICKSON,

Engineer-in-Chief for Sewerage.

Council Clerk, Alexandria.

14327.

14327. There is a difference between your minute and the letter which was sent to the Council Clerk. In your minute you say, "I think the contractors should be allowed to make whatever use of it they should think fit," and in the letter you say, "The contractors are entitled to make whatever use of the old materials they think fit"? That is simply to make the letter readable, I presume. It is Mr. Hickson's alteration. J. Davis.  
24 Aug., 1896.

14328. Did they make concrete of the old material? No; I do not think so.

14329. What did they use it for? As far as I remember, they used it for the pitching of an inlet over Mitchell Road, to allow the local drainage to get into the sewer.

14330. Ought not the Government to have had some advantage from that? I think we had. I think we simply paid for labour, and the material went in for nothing.

14331. You paid for the full quantity of concrete—where is the item? I think this inlet was done by day labour, as far as my recollection serves me, and that the stones from that bridge were used in this inlet.

14332. Can you give definite information on the matter? I could by looking at the measurement-book, perhaps. It occurred four years ago.

14333. Paper 92-1,399 is a letter from Mr. Weedon about the silting up of the open outlet from the storm-water channel, Contract 72;—will you read it? The letter is as follows:—

Public Works Department, Sewerage Branch, Sydney, 16th June, 1892.

CONTRACT No. 72.—Silt in Open Outlet from Storm-water Channel.

Sir,

I have the honor to furnish herewith cross-sections of above outlet, on which the silt to be removed is shown in red. The top of the concrete channel is 12 ft. 3 in. wide, and the bottom width of the outlet, as shown in red, is 12 ft. 0 in. down to the 22nd chain, from which point the full width of the old work (as it now stands) will be cleared out; the original bottom was 21 feet wide.

The total quantity of excavation by the cross-sections, allowing an average area of 6.32 square feet between 33.50 and 38.28 chains (the end of the outlet, which was covered with water, and therefore I could not see what silt was laying in it), is 1903.33 cubic yards, giving 2.26 cubic yards to the yard forward.

I have, &c.,

STEPHEN H. WEEDON,  
Resident Engineer.

J. Davis, Esq., Supervising Engineer.

14334. Will you now read the minutes on that letter? The minutes are as follows:—

Since the earth which was reported in June of last year (91/1527), was washed into the open channel, which was excavated along the line of the proposed Shea's Creek canal as an outlet for the Shea's Creek to Munni-street storm-water sewer, there has been no proper outlet for the sewer. To give an outlet, as shown on the accompanying cross-sections, it will be necessary to excavate about 1,900 cubic yards of earth, which will cost at schedule rates:—

|  | £    | s. | d. |
|--|------|----|----|
| Ex. 1,900 cubic yards, at 2s. 6d. ....                               | 237  | 10 | 0  |
| Surplus material, 1,900 cubic yards at 6d.; half-price filling ..... | 42   | 10 | 0  |
| Total .....  | £280 | 0  | 0  |

I recommend that this be done.—J.D., 17/6/92. Mr. Bagge. For the approval of the Engineer-in-Chief.—C. H. OHLFSEN BAGGE, 20/6/92. Stand over for the present.—R.H., 20/6/92.

14335. Have the contractors been paid for the clearing out of that silt? No.

14336. They will not be paid? No; they did not do the work.

14337. Who did the work? We did.

14338. After the contract was done? Some time after. I do not know how long after. It was done by daywork. It did not cost as much as this, because these rates were a little high.

14339. Was not the contractor, under the specification, compelled to take that risk? I do not think so; I think it was an extraordinary risk which would not be included in any clause of the contract.

14340. How long did it remain unattended to? I suppose it must have been twelve months.

14341. It remained for twelve months unattended to? It was that time in the state described by Mr. Wheedon in this minute.

14342. Before it was attended to? Before it was cleared out.

14343. That was during the time Carter & Co.'s contract was on? Part of the time.

14344. Was it cleared out after you signed the final certificate? I cannot say positively; but I think it was.

14345. It was cleared out after you finally paid them? At any rate, I know they did not do it.

14346. Here is a curious thing I would like you to explain. In carrying out this contract, what was the length of that relieving channel you had to excavate? I think it was 50 chains, or thereabouts.

14347. That never was filled in again—it was simply an open channel? An open channel.

14348. When you signed the contract with Messrs. Carter & Co., there were 26,200 cubic yards of excavation, as stated on page 139 of the Parliamentary return? Yes.

14349. That, ultimately, was paid for as 53,410 cubic yards;—did that 50 chains make up that difference? That was the case.

14350. It made up the whole of that difference? Yes.

14351. What was the length of the original contract? I will have to look at the plans if you want to know precisely.

14352. Will you get the information? Yes.

14353. There was no filling done to that channel; it was left open? Yes.

14354. The filling is 12,000 cubic yards of the original contract, at 1s. a yard, and that is increased to 27,961 cubic yards;—where is that filling? I would have to look in the measurement-book as to that. I could not tell you at this moment.

14355. Does it not seem an enormous increase on the filling? I do not know. There was a great deal of work there which had to be done. I know Mr. Hill was most particular that all these little depressions in every direction should be filled up. He had his ranger there constantly, and we had to do what he told us to do in that way. He insisted that any depressions which would be likely to be filled with water after we had finished the work should be filled up with the excavated material.

14356. At any distance from the contract—all over his paddocks? Within a couple of chains of the side of the channel.

14357.

J. Davis. 14357. It was a really good contract at 1s. a yard? I do not think so. I think it would be worth that to put it in a cart and take it away.  
 24 Aug., 1896. 14358. Paper 92-2,000 relates to repairs to invert of sewer, recommending that brickwork be substituted for the concrete;—will you read your minute? Yes; it is as follows:—

Department of Public Works, Roads and Bridges and Sewerage Branch,  
 Sydney, 8 September, 1892.

## MINUTE PAPER.

*Subject*:—Contracts Nos. 72 and 75, Shea's Creek Sewer. Further, with reference to repairing rendering in invert of sewer, which was washed away in March last.

WHEN the sewer was finished from the eastern boundary of the Macdonaldtown Park to the open concrete channel below Mitchell Road, a length of about 44 chains, the storm-water had to be turned through before the rendering in the invert of the sewer had been allowed time to harden. It was absolutely imperative that the water should be turned when it was, because, in consequence of the flood-water not having a proper channel, properties were being damaged. Through this, large quantities of the rendering were washed away, and before the work can be considered perfect, or in such a state that it can be taken over from the contractor, the invert must be repaired.

I saw Mr. Snodgrass (Messrs. Carter & Co.) and Mr. Farley (Messrs. Parry and Farley) this morning on the ground. They appear to think that there will be considerable difficulty in keeping the water off the invert of the sewer a sufficient length of time to admit of the rendering hardening, so as to resist the wash of the water. With this I agree.

In order to get over this difficulty they propose that 18 inches of the sandstone concrete be cut away along the invert of the sewer, and brickwork be substituted. The contractors, I understand, are willing to turn the water out of the sewer to enable them to effect the repairs, cut out the concrete, and substitute brickwork, provided they are paid for the brickwork at their schedule rates. This would make the extra cost as follows, viz. :—

|   | £    | s. | d. |
|---|------|----|----|
| Messrs. Carter & Co., 17 cubic yards, 80s. ....     | 68   | 0  | 0  |
| Messrs. Parry and Farley, 23 cubic yards, 61s. .... | 70   | 3  | 0  |
|   | £138 | 3  | 0  |

Considering that the contractors were obliged to use the sewer before it was properly finished, and as a consequence the repairs are necessary, and that the brickwork would make a more durable job than the sandstone concrete and rendering it is proposed to remove, I would recommend that the proposals made by the contractors, Messrs. Carter and Co. and Messrs. Parry and Farley, be approved.

J. DAVIS.

Mr. Bagge.

Approved.—R.H., 9/9/92. Messrs. Carter & Co., and Messrs. Parry & Farley, informed.—J.D., 10/9/92.

This work has now been finished, and vouchers are being prepared; but in the case of Parry and Farley I understand that Mr. Farley waited upon the Engineer-in-Chief and pointed out that their price for brickwork was only 61s. per cubic yard, against 80s. paid to Carter & Co., and asking that they be paid at the same rate as Carter & Co. Will the Engineer-in-Chief please say whether Parry and Farley's brickwork is to be paid at 61s., their schedule rate, or 80s., Messrs. Carter & Co.'s schedule rate.—J.D., 28/11/92.

As the schedule rate (61s.) is a low price, and the repairing referred to in the within minute is something beyond the ordinary brickwork, as it includes excavating some of the cement work, I approve of the schedule rate for this special item being increased by 25 per cent.—R.H., 23/11/92.

Mr. Weedon to include in voucher.—J.D., 28/11/92. When once storm-water and household-water has passed for a time over concrete work, rendering will not bond with concrete; hence the brick lining would certainly be the best and only remedy. I therefore recommend Mr. Davis' proposition to the favourable consideration of the Engineer-in-Chief.—C. H. OHLFSEN BAGGE, 9/9/92. The Engineer-in-Chief.

14359. Was hydraulic lime used in that concrete? No; Portland cement.

14360. It was all Portland cement? Yes.

14361. Was hydraulic lime ever used on these sewers? I think a little has been used at Botany, but not very much. It was used very largely at Potts Hill reservoir.

14362. It did not answer the purpose? It is a matter of opinion.

14363. Did it not come to grief? I do not know very much about it.

14364. It was not used in this case? No.

14365. Ought not good concrete rendering, if allowed twenty-four hours to set, to withstand the slow running of water? Not with the velocity there is in that sewer.

14366. What is the fall in that sewer? It is a high velocity.

14367. One in 1,000? No, 1 in 500.

14368. Would that be sufficient to wash away that material if it was good? Yes. It is not merely the wash of the water, but this sewer drains the Eveleigh running yards, and a large quantity of clinker is brought down in the water and rolls over and over in the invert of the sewer, pulverising the rendering and concrete too, and then they get washed away. In my opinion, that was really the cause of damage. Although I may not have said so in my minute, that was in my mind when I recommended that brickwork should be put in. Although the water might have been kept off for twenty-eight days—and certainly it would have been necessary to keep the water off for twenty-eight days to allow the cement to harden—I was afraid that the clinker from the running sheds would have pulverised the cement a second time and that the very same thing would have occurred. On the whole, seeing that the contractors were willing to bear a large proportion of the cost themselves in turning out the water and cutting out the concrete, I considered it was a fair and reasonable concession to make to pay for the brickwork.

14369. Paper 91-3,024 is a letter written by Mr. B. C. Simpson, on 10th December, 1891;—will you read the letter? It is as follows:—

My dear Sir,

113, Phillip-street, Sydney, N.S.W., 10 December, 1891.

Messrs. Carter & Co. have again seen me respecting their claim for compensation on account of the withdrawal of the most profitable portion of their Sewerage Contract No. 72, concerning which claim I wrote to you on the 19th October.

Mr. Piper, of your Department, called on me on the 3rd ultimo, and stated that you agreed with him as to the contractors' right to complete their contract; but, pending this completion, Messrs. Carter & Co. allege that they are being put to continued expense, and desire that a settlement of the question should be arrived at.

They appear to want only what is fair, which I am quite sure you will be willing to give them, and I shall be pleased if I can assist in a satisfactory settlement. I shall be glad to call on you at any time that will be convenient to you.

Yours, &amp;c.,

B. C. SIMPSON.

R. R. P. Hickson, Esq., Engineer-in-Chief for Sewerage, Sydney.

Ask Mr. Simpson to call on Monday at 11 a.m.—R.H., 11/12/91. Mr. Piper. B. C. Simpson, Esq., 11/12/91.

14370. There is no doubt from that letter that the intention of the Department was to convey to Messrs. Carter & Co., as early as December, an intimation that this contract was going on;—was not that so? It appears that Mr. Simpson understood something of the kind from the portion of his letter where he says that

that Mr. Piper stated that Mr. Hickson agreed with him as to the contractors' right to complete their contract. I cannot tell what was in his mind, except that the completion itself was evidently before him. 14371. There is a minute by Mr. Griffith, in connection with Contract 79, making inquiries into Bond and Hudson's tender;—that minute was not included in the Parliamentary return? I cannot say until I see the minute.

J. Davis.  
24 Aug., 1896.

14372. Will you make a memorandum of the minute? Yes.

14373. There is a minute in regard to the same contract by Inspector Wagg, *re* Reid's dismissal;—will you get the minute? Yes.

14374. In Contract 77 there was a claim of £7 paid to Dickson for damage done to his house by blasting, out of petty cash, lately, by your authorisation—was not that so? Not to my knowledge.

14375. Was not that amount paid out of petty cash? Not to my knowledge.

14376. Will you get that minute too? I do not know of any such minute.

14377. The date of the minute is 26th February, 1896; in the 79 portfolio, on 26th August, 1895, there are minutes from yourself and Mr. Griffiths, backwards and forwards, authorising Contract 79A to be let without tender, and ultimately there is a minute, but these papers cannot be found anywhere;—were such papers in existence? Not to my knowledge. I do not remember ever to have had any communication with Mr. Griffiths on the subject.

14378. I would ask you to look up these papers, bearing date 25th August, 1895? I will see if they are in existence.

14379. The papers are in the portfolio, for I made a memo. of them;—if you recollect I asked you on a former occasion about a claim by Arnold for blasting work;—that was paid? I believe it was. It has to be deducted from the contractor. In all these claims the public have the right to sue the Department, and we, on the advice of the Crown Solicitor, have our redress with the contractors.

14380. Have you done that in every case? I believe so in every case. As a matter of fact, very few claims for blasting have been paid by the Department. I think Arnold's is the only one. There is another case which has been dealt with during the last few days. I do not remember the name.

14381. What about Shell's case? He sued the contractors, and the contractors paid him, I presume. We have not paid the contractors.

14382. Have you finally settled the contract? Yes.

14383. There is no chance of the contractors having a claim upon you? The contractors think they have a claim still for that amount of money.

14384. That is not yet settled then? It is not. It is settled, in so far as the claim made by the contractors for a refund of the amount of damage paid was refused by the Department.

14385. Are they demanding payment now? They wrote about five months ago.

14386. In these papers you recommended that it should be paid, according to the minute which was read on the last occasion you were examined? I do not think I recommended it. As far as I remember I thought it was a fair thing.

14387. A reasonable claim? Yes; but I do not think I recommended it.

14388. Referring to Contract No. 79A, in the voucher, which appears in the Parliamentary return on page 372, there is this item: "First advance on difference between lump sum and value of work at schedule rates, £2,000"? I can explain it, still I had nothing to do with the work at that time. It is the difference at that time between the measurements which had been made and the working them out at schedule rates and the lump sum.

14389. Did you make that distinction throughout the certificates to contractors? I do not think so. It was dropped in the end; £12,534 19s. 2d. was paid.

14390. It says, "First advance on difference between lump sum and value of work at schedule rates";—was there another advance made them? That advance of £2,000 was made.

14391. At what date? On 23rd December, 1895.

14392. Was there no advance made before that? That was the first, according to this paper.

14393. Does it not appear in other certificates before this? It might have done so; but it would only be £2,000 in the end.

14394. What gave them a title to be paid on that? As I have already explained, the quantity at schedule rates worked out to a certain amount—£11,563 8s. 6d.; and the lump sum they were entitled to for the work was £12,534 19s. 2d. It seems that Mr. Griffiths and Mr. Darley, at the time the certificate was made out, assessed that the value of work done on the contract up to that date was £13,700, in view of the fact that they were to get ultimately £14,331 1s. 4d. for the whole of the work.

14395. As a matter of fact, they made a substantial profit on that job? I think that £2,000 is the amount. The work when finished, worked out at schedule rates, would have come nearer £14,331 1s. 4d. than £13,500. There would not have been a difference of £2,000 between the contract as worked out at schedule rates and the lump sum.

George Christie recalled and further examined:—

14396. *Mr. Parkes.*] You have prepared a list of the additional papers relating to Contract 79A, which were omitted from the Parliamentary papers? Yes.

G. Christie.  
24 Aug., 1896.

14397. Will you indicate the nature of the papers, which I will ask His Honor to admit as Appendices? Paper 94-1,471 is a letter from Jones and Jones, solicitors, *re* claim of Foster against the Metropolitan Board of Water Supply and Sewerage. That was followed up by 94-1,497, a minute of J. Davis in reference to alleged damage by blasting; paper 94-1,356 is Jones and Jones' preceding letter of 3rd August with reference to Mr. Robert Foster's claim; paper 94-1,497 is a further minute of Mr. Davis on 25th August, 1894, *re* Jones and Jones' correspondence; paper 94-998, dated 12th June, 1894, is a minute from J. W. Boys, Contract 79A, North Sydney, relative to the complaint of workmen not receiving their wages, and Mr. Davis' minute of 12th June, 1894, thereon; paper 94-307 is a letter from Carter & Co. on 1st July, 1895, asking for an advance of £3,000 from the retention money, with further minutes therein; paper 95-830, dated 28th August, 1895, is a minute of T. Griffiths, approving of extension of High-street branch at schedule rates.

14398. These are the main papers relating to Contract 79 which were left out of the Parliamentary return? Yes; there are other papers, but these are papers of an important character which should have been included in the return.

14399.

G. Christie. 14399. In connection with Contract 79, there are certain papers which are omitted from the Parliamentary return? Yes. I think these papers were read at the last sitting of the Commission. There are certain papers in Contract 79A which are in the Parliamentary return, but which have not been read.  
 24 Aug., 1896. 14400. Do you produce the papers relating to Contract 72 which were omitted from the Parliamentary return? I do.

J. Davis recalled and further examined:—

J. Davis. 14401. *Mr. Parkes.*] Is this a letter from Inspector Wagg? Yes.  
 14402. What contract does it refer to? Contract 79.  
 24 Aug., 1896. 14403. Will you read the letter? Yes; it is as follows:—

Sir,  
 Sewerage Works, North Sydney, Contract No. 79, 16/11/93.  
 I beg to report that when filling in No. 8 shaft around the brickwork, some feet high, the workmen were putting in some very large stones with the muck. I told them to throw them on one side. They broke them up instead. Reid, the contractors' manager, told them to put them down as they were. I objected, and he became very abusive and openly defied me. The work also being improperly rammed, I objected to any more being done unless done as I requested. This man openly defies all the Inspectors. I have known an Inspector wishing to go below and the engine-driver hiding in the bush and dodging the Inspector, thus preventing him inspecting the work. The driver, when asked the next day about his conduct, admitted the fact, but said he was acting under instructions. Some measures ought immediately to be taken with this man, who really carries things too far, openly defying the Inspectors, and also tells the workmen to take no notice of us whatever.

J. W. T. Boys, Esq., Resident Engineer.

Yours, &c.,  
 INSPECTOR WAGG.

14404. What did you write upon that letter? I wrote this minute:—

Department of Public Works, Roads and Bridges and Sewerage Branch,  
 Sydney, 18 November, 1893.

MINUTE PAPER.

*Subject:*—Contract No. 79—North Shore—Inspector Wagg's report *re* Reid's conduct.

UPON Mr. Boys handing to me Inspector Wagg's report, I arranged for a meeting with the contractors on the following morning, which took place in the presence of Mr. Boys, and Inspectors Wagg and Fowle.

The contractors admitted that Reid was entirely in the wrong in the course of conduct he had pursued, and stated that they had already rebuked him for it, and would further do so. I gave them to understand that as Reid was acting as their foreman he must at all times be willing to carry out any reasonable request the Inspectors made to him, and unless he did this, if it was only for the purpose of maintaining discipline, he must be removed. But beyond this such conduct as Reid has been guilty of could not for one moment be allowed. The Inspectors must be supported in their endeavours to get the specified quality of work executed on the contract, and if this man Reid does not mend his ways, or if he shows any more insubordination, the matter must be at once reported. Will Mr. Boys kindly note this.

J.D.

Mr. Boys. Noted and returned, 20/11/93. J.W.T.B. Put away.—J.D., 22/11/93.

14405. This man Reid seems to have been somewhat of a nuisance to you all through, does he not? I would not go as far as that, but still he was a man I did not care very much about.

WEDNESDAY, 26 AUGUST, 1896.

Thomas Wright recalled and further examined:—

T. Wright. 14406. *Mr. Parkes.*] Do you desire to make a statement as to what took place yesterday, when an examination was made of the invert of the storm-water sewer on Contract 6i? I do. I do not think the trial was a fair trial. I find by talking to two men (one of them is at the Post Office), who have a great knowledge of this matter, that, if the material was there, in place of taking about an hour and a half it would take about six or eight hours to hunt through these things.  
 26 Aug., 1896.

14407. *His Honor.*] To do what? To put these four holes in. If the quantity of concrete was there, in place of taking an hour and a half, which they took, it would take six or eight hours to bore the four holes they bored yesterday. They commenced them after 11 o'clock and they were done after 1 o'clock, and at the time you were away they did nothing at all.

14408. Did you not go in and sound the depth of the holes? They are not through the concrete yet. You think they are in concrete, but there is no concrete there. When they drove the drill down they kept a piece of metal in front of the drill right through. I know what the bottom is there; it is a nice black, loamy, tough kind of soil. I believe they could go out to-day and get 18 inches of concrete there. I spoke to four men this morning, and one of them says that he cannot put a hole through bluestone in less than three hours. The concrete you saw was as hard as any bluestone. The first hole they put in was 11½ inches, the second was 10½ inches, the third was 9½ inches, the fourth was 9 inches. It runs 3 feet 6 inches. I can drive a hole which any two men in New South Wales can do. If they had spent six or eight hours putting in holes you might suppose the stuff is there; but the stuff is not there. I am confident that it is not. I could see by the way the drill worked that they were keeping stuff in front of the drill and following it down. The hammer was only 2½ lb. or 3 lb. weight. It would hardly make a mark in the concrete at all. There was no room to strike it. One man would have done more than two with a single hammer, because there is not room for the two. With a 7 lb. hammer he would have drilled as quickly as with two. I think that if a piece was cut out by some independent man, or by two men not interested in the matter at all, it would be more satisfactory. If you looked at these men they shook; and when you see a man trembling he is doing something which is not right. I know the drill was not worked right. I have not been in the employ of the Government for twenty years, concreting and cutting holes, without knowing what it is. I know I could not do it. For over twenty years I have been at concrete—at the fortifications at Botany, and at several other places—and I know the dodges they can work with the drills. That stuff all went down in front of the drill.

14409. *Mr. Parkes.*] Do you want a small section cut out? Yes.

14410. It is as easy to cut out a bit as to bore a hole in it? If I had got a hole through you could have gone in underneath and seen it; I am confident that the stuff is not there. The man in the Post-office says it could not be done by them in less than six hours.

14411. Is there anything underneath that concrete? I do not know.

14412. Is there any other bottom? In two places—one near where the office was—I believe they put in some dry coarse sandstone.

14413.

14413. Did they put it in the bottom where you say the thinness is? I do not think so. I think the place I mean is there yet; to the best of my belief it is there. T. Wright.  
26 Aug., 1896.
14414. *His Honor.*] The bottom where you say it was then is black sand? It is all black soil until you get to the office, and there it is white sand.
14415. That is, black sand in the Chinese garden? It is more like black loam; the drill would punch through there. It would be like pushing something through a piece of tough cheese. You would think it was doing a lot of work when it was doing nothing at all.
14416. *Mr. Parkes.*] Do you mean that down the small space of the drill-hole they push metal ahead of it? On the bottom side of the concrete it is rough, and that follows in front of the drill. They can keep that in front of the drill until they go as far as they like.
14417. Is it not possible that you have been mistaken in your idea? I do not know. I cannot see how I could be. Unless there are fairies or witches in New South Wales, I do not know how it could be done in the time. It must be there.
14418. *His Honor.*] Don't you think that you may have mixed up the places? No. There was a man-hole there at one time. I think it was at the bend. I went in one day to the plasterer, and he could not get the invert made straight with a straight edge. He was picking it, and he said to me, "Tom, this is very thin; I am afraid of going through it."
14419. How far from the mouth is the man-hole? I was asking yesterday. I could not find it. It was only put in as a convenience for putting down the stuff, and it was built up again. I do not know where the plasterers are.
14420. *Mr. Davis.*] You were not working the whole of the time at Alexandria? No.
14421. Part of the time you were working at North Shore? Yes.
14422. Does it not occur to you that, while there might have been something wrong in the way you have indicated, it is possible that during your absence at North Shore it might have been put right? It might have been.
14423. That is where the mistake has arisen? It might have been put right, but I firmly believe it was not.
14424. It might have been? I do not think it was; I firmly believe it was not done.
14425. Supposing there was a little mistake made in the levels, and when you came to set the ribs you discovered that mistake—and remember it occurred six years ago—and then you went to North Shore and this thing was put right, as it appeared yesterday was the case, for we found the concrete all right;—do you think it is possible that it might have been done? It could have been done, but I do not believe it was done? At the first hole I was satisfied that the thing was not there when they went down 11½ inches. I know Jim Rogers would not put in 11½ inches for 9 inches. It was not through the metal then. In the last hole it sounded as if it was striking bell metal.
14426. This place where you say some dry sandstone was put in was near the office? Yes.
14427. The office was nowhere near where we put these holes yesterday? No.
14428. So that the dry sandstone which was put in the concrete could not have been what we were drilling in yesterday? No.
14429. Are you satisfied that what we were drilling in was concrete? I am satisfied there was concrete on the top; it was not all through. I am satisfied there was a bit of bluestone on the top.
14430. You did not say anything about this yesterday? I did not think it was any business of mine to speak.
14431. *His Honor.*] You were there with every opportunity to see if the holes were properly done?
14432. *Mr. Carter.*] Did you ever work for two consecutive days at the Alexandria sewer? Oh, yes! and more than that.
14433. You are quite sure that you worked for two consecutive days? Yes. I used to go with Billy Allen.
14434. You are quite sure that you worked there for two days at a stretch? Yes, and more than two days. I was paid there two or three times. I do not think I was away a day from Alexandria until it was nearly finished, when I went to North Shore.
14435. Where did you make the ribs for the job? I made them on the ground.
14436. You did not make them in Webb's yard? I did not make the centre in Webb's yard.
14437. Don't you remember that Mr. Snodgrass and myself marked out the centres for you on a door in Cook & Webb's yard? I think he marked out the centre to take the mould for the two other places, I took the mould, and it was shifted over to Alexandria.

Thomas Williams recalled and further examined:—

14438. *Mr. Parkes.*] Do you recollect ever being shown a letter, stating that it was supposed that the condemned cement had gone from Contract 53 to your contract, and which was supposed to have been written to Mr. Smail, of the Water and Sewerage Board? I remember—I think it was in 1891—getting word to go to the District Engineer's office, and Mr. Cook showed me a letter stating that fifty casks of cement were shifted from the sheds at Waverley to my work. He asked me if I knew anything about it, and I told him no. T. Williams.  
26 Aug., 1896.
14439. That was from Carter & Gummow's job? Yes; I think it was Contract 53.
14440. You said "No, it did not go to you"? Yes.
14441. Did you remonstrate with Mr. Rogers, who was a partner in the firm of Carter, Gummow, & Co.? Yes. I saw him some time afterwards, and I asked him how he came to say that I had taken cement.
14442. What did he say? I think he told me that Mr. Davis happened to go on the job, and asked him what had become of this cement, and he said "Williams has taken it." I said "How did you come to do that, Rogers?" "Well," he said, "I did not know what to tell them." I think he said they put it from the casks into bags on the Sunday.
14443. Did he say it was used on the job? Yes, he told me they put every shovel of it on the job.
14444. You know Mr. Rogers very well? Yes.
14445. You have had lots of communications with him? Yes.
14446. You could believe him as regards what he stated? I think so, because the cement never came to my work. Of course, upon my telling Mr. Cox that I never saw anything of it, he initialled the letter and sent it back.

- T. Williams. 14447. That is the letter from Mr. Davis? The letter from the Construction Department.  
 14448. It was initialled and sent back to them? I think so.  
 26 Aug., 1896. 14449. *Mr. Carter.*] How do you purchase cement—at the merchants' risk or at your own risk? Certainly I have purchased at the merchants' risk.  
 14450. If it does not pass the test the merchants have to take it back at their own expense? I think so.  
 14451. Would you consider then, that it would be any advantage at all to the contractors to use the condemned cement? I do not think so.  
 14452. What reason do you think Mr. Rogers had for saying such a thing? The only reason he could have would be that it would delay the work.  
 14453. You are never short of fifty casks of cement while three or four contracts are going on? That is all I know about it. The documents should be here.  
 14454. *Mr. Parkes.*] I presume that if the contractor happened to have paid for his cement it would have to be used? Oh no! he buys it on the understanding that it has to pass the test.  
 14455. Does not all that depend upon an agreement being made? I do not know. I have always bought on the understanding that it must pass the standard test, and if it did not pass that test they have taken it away.  
 14456. As a matter of fact, it would be possible for a contractor to make arrangements with a seller to deduct a good portion of the cost of that cement? I do not know.  
 14457. Would it not be possible for him to do so? I could not answer that question. Of course, anything is possible.  
 14458. I suppose he who sells the cement would be willing, rather than take it back, to sell it at half-price? I could not answer that question.  
 14459. *His Honor.*] What becomes of the cement, which does not pass the Government test, in the market? Sometimes cement which comes out of a ship will not pass the test, but if you allow it to stand for a few weeks it gets all right.  
 14460. Then it is put to the test again, and it may pass? Sometimes.  
 14461. If cement is all bad, what becomes of it in the market? I do not know.  
 14462. Do you know whether private builders trouble themselves about tests or not? I do not know.  
 14463. *Mr. Carter.*] You know the test is a very severe one? Yes.  
 14464. What will not pass the Sewerage Department, very often, in fact repeatedly, will pass the Railway Department? I have had no experience of the Construction Branch or the Railway Department.  
 14465. You know, as a matter of fact, that the test is a very severe one? Yes, I think so.  
 14466. It is about the severest test in the Colony. I think it is pretty severe.  
 14467. Very often what you or I, or any practical man, would term good cement, is rejected under that test? I cannot tell good cement from bad. I think the test is the only thing to tell its quality, and then I do not think you can always arrive at its quality.

---

John Brown sworn and examined :—

- J. Brown. 14468. *Mr. Parkes.*] What is your occupation? I am unemployed at present.  
 26 Aug., 1896. 14469. Were you at any time employed by Carter, Gummow, & Co.? No.  
 14470. Were you never upon the Glebe job? I was Government inspector at the Forest Lodge job.  
 14471. While you were inspector there for the Department, did you ever notice any defective work being done? None whatever.  
 14472. In no case? No.  
 14473. What part of the job were you working on? I was mining inspector.  
 14474. You were not working on the concrete? No; I was only working in the tunnels.  
 14475. Do you know Mr. Thomas Williams, the builder? Yes.  
 14476. Did you have a conversation with him lately? No, not lately.  
 14477. You did not tell him, did you, that the Glebe sewer was worse than Bare Island? No, never.  
 14478. You never said such words to him? No.

---

Thomas Williams recalled and further examined :—

- T. Williams. 14479. *Mr. Parkes.*] Do you know John Brown, the last witness who came in here? Yes.  
 26 Aug., 1896. 14480. Have you had a conversation with him lately? Yes; some three or four weeks ago.  
 14481. When he came back from Brisbane? Yes.  
 14482. Did he make any remarks to you concerning the Glebe sewer? No, not then. I had heard them before he went to Brisbane.  
 14483. *His Honor.*] How long ago was that? It was just before last Christmas.  
 14484. *Mr. Parkes.*] What did he say during that conversation? Well, I do not like repeating what has been said.  
 14485. You must give the evidence here, Mr. Williams? He told Mr. Ewing and myself the Glebe job was rottener than Bare Island.  
 14486. *His Honor.*] That is the Glebe sewerage job? Yes.  
 14487. *Mr. Parkes.*] Did he give you any detailed reasons for coming to that conclusion? No, I do not remember anything in particular. I remember his saying that in the presence of Mr. Ewing.  
 14488. Was anyone else there besides Mr. Ewing? No.  
 14489. Did he not give any description of any defective work? I think that was his meaning.  
 14490. *His Honor.*] Did he indicate the particular kind of work? No.  
 14491. *Mr. Parkes.*] Did you make any comment on his remarks? No, I do not think so.  
 14492. It happened in general conversation? Yes.  
 14493. Did Mr. Ewing hear it? Yes.  
 14494. *His Honor.*] How did the conversation arise? We were talking of Mr. Parkes bringing the thing before the House.  
 14495. In what street? In Market-street, near Pitt-street.  
 14496. Did Brown come up when you and Ewing were talking, or did you all meet before this occurred?  
 We were all together before this happened for half an hour. 14497.

14497. Shouting for each other? No, I do not think we are shouting men; it was a general conversation about these charges which Mr. Parkes was bringing up in the House. T. Williams.  
 14498. And out of that this conversation arose? Yes. Of course Mr. Brown has always been a bit bitter to think that he was badly treated by the Department. 26 Aug., 1896.
14499. Was he dismissed then? He seemed to think so.
14500. Had you a former conversation with him in which he mentioned the action of the Department in getting rid of him? I heard him talking about the way he was treated. I cannot remember exactly the conversation.
14501. Had he been out of work then for some time? Yes, he must have been out some time, but I could not tell you how long.
14502. When he said the Glebe contract was worse than Bare Island, did you or Mr. Ewing put any questions to him as to what the nature of the bad work was? I do not think so.
14503. Do you remember what you or Mr. Ewing said to him? I do not recollect.
14504. Did you chaff him, for instance, about it? I suppose there was a bit of chaff going on.
14505. He had been in charge of part of the work on the Glebe contract? I think so.
14506. You knew that he had been in charge of the work? I did not know at the time that he had been in charge of that job.
14507. Not at the time this conversation took place? Not before then.
14508. Did you not say "How do you come to know this?" or make any remark of that kind? No.
14509. You mean to say that you just allowed what he said to pass by? I do not remember what happened.
14510. You have seen him since then? Yes. I saw him after he came back from Brisbane. I think I said that in my previous evidence.
14511. Did any conversation of the same kind then take place? No.
14512. *Mr. Davis.*] Was it said in a jocular tone—were you joking with each other at the time? No; I do not think so.
14513. You took it seriously? It was no business of mine, and I did not take much notice of it.
14514. You took him to mean what he said? I could not help noticing what he said. You do not very often hear such expressions.
14515. *Mr. Parkes.*] Has not that Glebe job been a topic of conversation amongst contractors and Government inspectors for some time? I think that has been referred to a good few times; still I cannot remember any conversation about it in particular.
14516. Have you heard workmen speak about it? No.

John Brown recalled and further examined.

14517. *Mr. Parkes.*] Do you recollect meeting Mr. Thomas Williams, the builder, before you went to Brisbane? I met him many a time on the street. J. Brown.  
 14518. Did you go to Brisbane about Christmas time? No, I went in April last. 26 Aug., 1896.
14519. How long were you on the Glebe job? About 8 months, I suppose, at a rough guess. I could not tell you without looking at my book.
14520. Was any concrete done during the time you were there? I had nothing whatever to do with the concrete.
14521. You had only to inspect the blasting? That is all.
14522. What did the cut run through—shale, rock, or what? Shale—in some places rock and sandstone.
14523. Was it taken out to the full dimensions required by the plans? Yes.
14524. Everywhere? Yes.
14525. In your conversation with Mr. Williams, which you had before you went to Brisbane, did you not make a remark to him that the Glebe sewer was as bad as, or worse than, Bare Island? No, not that I am aware of.
14526. Do you recollect ever meeting him? I have met him many a time.
14527. I mean did you meet him on a special occasion before you went away? No; I saw him every time I came to town.
14528. Did you ever meet him with Mr. Ewing? I have met them many a time together, because they are always together.
14529. Did you then make any remark which might be interpreted to bear that meaning? Not that I am aware of.
14530. Did you ever make any remark about the Glebe sewer at all? If I did I do not remember it.
14531. Can you not recollect whether you did make some remark about the Glebe sewer;—just think awhile? I do not remember.
14532. How did you come to leave the Government employ; did you resign? No; I was suspended.
14533. Why? Mr. Davis discharged me because he found on top of one of the shafts about two buckets of concrete in which he reckoned there was not sufficient cement. That is why I was discharged.
14534. Whose job was that on? O'Neill's job.
14535. What time did that take place? On 5th November—two years ago.
14536. Have you been in the employ of the Government since? No.
14537. Have you any ill-feeling towards them for your dismissal? I have none whatever.
14538. Did you ever make an application to get back? Yes.
14539. Did they entertain it? Yes.
14540. But they did not grant it? I was reinstated twelve months ago.
14541. Where? I have not been employed by the Government. I was reinstated by the Minister, but I have not yet been started.
14542. You are now eligible for reappointment? Yes.
14543. On whose recommendation? I could not say.
14544. *Mr. Davis?* No; Mr. Davis discharged me. I think it was on somebody else's recommendation.
14545. *His Honor.*] Supposing that Mr. Williams has positively sworn that you did state to him in the conversation you had in Market-street, a little time before Christmas last—Mr. Ewing being present—that the work at the Glebe, that is, the sewerage work at the Glebe, was as bad as Bare Island, or worse than Bare Island? I never said so. 14546.

- J. Brown. 14546. Do you say that he has told an untruth? I cannot say; I never said so.  
 14547. Are you sure that you did not say so? I am certain.  
 26 Aug., 1896. 14548. You did not like being dismissed;—did you not think that you had been unfairly treated when you were dismissed on Mr. Davis' recommendation? So I was ill-treated.  
 14549. Was not this rankling in your mind for some time? No.  
 14550. You knew last December that Mr. Parkes had asked certain questions and brought certain matters out in the House? Yes; I saw it in the papers.  
 14551. That formed the subject of conversation, did it not, amongst a good many of the contractors? I suppose it would do so in town.  
 14552. If you met a contractor, or if you met two or three contractors together, this topic of conversation was sure to crop up about that time? Most likely it would.  
 14553. Do you not remember its cropping up on one occasion when Mr. Ewing and Mr. Williams were present? I do not remember the occurrence at all.  
 14554. You positively swear that you did not say anything about Bare Island? I say that I do not remember anything of that kind cropping up.  
 14555. You see Mr. Williams would not be likely to invent Bare Island if it was not mentioned? I am not responsible for what Mr. Williams says.  
 14556. Did you not hear remarks about the nature of the concrete work which had been put into certain parts of that Glebe concrete? You hear lots of remarks.  
 14557. You did hear remarks when you were working on the job? I did not see anything wrong.  
 14558. You did hear remarks? Not that I am aware of on the job.  
 14559. Did you hear anything about sumps having been improperly filled up? No; nothing at all. Perhaps the contractors would not speak to me like that because I was connected with the Government at the time.  
 14560. I mean afterwards? You can hear any amount of things talked about.  
 14561. *Mr. Davis.*] I suppose there has been a great deal of idle talk about these sewerage contracts on all hands? I suppose so.  
 14562. You have heard a good deal of it? I have.  
 14563. Even supposing you cannot recollect having said anything to Williams with reference to the Glebe job, you were on the work at the time, and were in a position to see whether, from your own knowledge, there was anything wrong? I never saw anything wrong.  
 14564. *His Honor.*] Did the other inspectors ever have any conversation with you in which they mentioned that they had suspected or seen anything wrong? No.  
 14565. Nothing at all? No.  
 14566. *Mr. Parkes.*] Did you see any concrete work going in at all? I suppose I have seen concrete work going in; passing up and down the street, I was bound to see that.  
 14567. What do you mean when you say, "passing up and down the street"? Going from one shaft to another on the street.  
 14568. Did you superintend the concreting? No; I had nothing to do with it.  
 14569. *His Honor.*] You knew something about concreting before this? Yes.  
 14570. When you were passing the concrete box as concrete was being mixed, was there anything which struck you about the concrete—about the mixing or the proportions, or the nature of the metal which was put in? No; as I said before, I never saw anything wrong.  
 14571. Nothing wrong at all? No.

Joseph Davis recalled and further examined:—

- J. Davis. 14572. *Mr. Parkes.*] In connection with the Contract 53 at Waverley, and the defective work which was done there, will you read your letters with regard to the dismissal of the inspector? My minute is as follows:—

A SHORT time ago a quantity of bricks were specially made by Messrs. Hart and Gallagher for use on Contract No. 53, but when the first were delivered I found that they were a mixed lot, and only a part of them would do for our work. To save the contractors the expense of carting bricks from Petersham to Waverley which might afterwards be condemned, I arranged with the contractors to have them sorted at the brickyard. I accordingly instructed Inspector Hamilton, a few days ago, to go to Messrs. Hart and Gallagher's yard, and select any bricks, for use in the works, which were up to the required standard. Inspector Hamilton has committed an error of judgment in the bricks he has selected, as I find that the bulk of the bricks delivered are so inferior that they are totally unfit for our work, and I have, therefore, refused them.

Mr. Bagge and I had occasion to visit the work in progress on this contract this afternoon, and we found that, although Inspector Hamilton had nothing whatever to do except to look after one bricklayer and one plasterer, he was allowing the bricklayer to build the arch of the sewer in a most disgraceful manner. The bricks, where they were supposed to be bedded, were hollow, and several courses in the crown were being laid dry, with the intention, it is said, of grouting the joints afterwards. The mortar being used was not, I am satisfied, the specified mixture, and the bricks were those described above.

I am exceedingly grieved to have to report Inspector Hamilton, as I had every reason to believe that he was an industrious, trustworthy man, but I should not be doing my duty if I did not do so.

I have had the brickwork complained of taken down, and I have given instructions that the inferior bricks are not to be used.

Mr. Hamilton entered the Branch about two and a-half years ago at 10s. per day, and has gradually risen until now he is ranked as a First-class Inspector, at 15s. per day.

It must remain for the Engineer-in-Chief to decide what punishment, if any, shall be inflicted, but I am inclined to think that Inspector Hamilton should be suspended, and asked to show cause why he should not be dismissed from the Service. This may appear to be severe punishment; but if these men, who have to be trusted so largely, cannot be depended upon, they are worse than useless.

14573. Will you now read Mr. Bagge's minute? It is as follows:—

In forwarding Mr. Davis' report, with which I fully agree, I am at the same time of opinion that inspectors who in such an unaccountable manner non-fulfil their duties must be considered useless to us—in fact, far worse than useless.

Mr. Hickson then writes:—"I quite concur with Mr. Davis. Write to Mr. Hamilton accordingly."

14574. *His Honor.*] What was the "accordingly";—was he sacked? I do not know, your Honor; perhaps the letter is here.

14575. *Mr. Parkes.*] The letter is not here; the papers have not been supplied in a completed form? Then it must be in Mr. Hickson's letter-book.

14576. *His Honor.*] Do you recollect, Mr. Davis, whether he was dismissed or not? I believe he was; I would not be positive, as I have not seen the papers for six years. 14577.

14577. *Mr. Parkes.*] If you will read your minute of October 31, 1891, it will settle that point? The minute is as follows:—

J. Davis.  
26 Aug., 1896.

THREE months ago Inspector Hamilton's pay was reduced from 15s. to 10s. per day, on account of allowing very defective work to be done in the Waverley and Woollahra branch sewer. He has since been employed at the Glebe supervising brick-work and concrete, under Inspector Gledhill —

14578. That was on Mr. Carter's job again? Yes.

— and there has been no complaint; but, considering the serious way Inspector Hamilton failed to discharge his duties, I cannot recommend for the present that he be reinstated.

Mr. Hickson writes—"Inform that at present I do not see my way to grant Hamilton's request."

14579. Then Mr. Hamilton was not unacquainted with the construction of works? Oh! no; he had had a good deal of experience in India, where he was engaged on public works for some years.

14580. He had been two and a half years in your employ before this happened? So it appears from that letter.

14581. Here is a letter which shows that he did not do this work through ignorance? This is before that time.

14582. It is his first application to the Department;—will you read the letter? The letter, which is addressed to Mr. M'Mordie, is as follows:—

Sir,

No. 2, Tivoli-street, Paddington, Sydney, 30 April, 1889.

I hope you will kindly forgive me troubling you once more.

I am trying very hard to push my tea, and earn an honest living out of it, and if I could get it to take, would do very well; but it has not taken as yet, and although the gentleman from whom I import it has offered to assist me, still I will not be able to hold out, as I am near the end of my resources already, and, in consequence, am obliged to appeal to you once more for another chance in the Public Works Department. If you give it me, you will find I will appreciate it, and for which I shall ever feel thankful.

I am very sorry for not having listened to the advice you gave me four years ago, and remained in the Department. I trust you will kindly look over that, and give me one more chance.

I beg, &c.,

H. M. HAMILTON.

I may say, in explanation of that letter, that Mr. Hamilton in about 1884 or 1885 was in the Department for a short time, resigned, and went back to India; and then, his health or his wife's health breaking down, he returned and did something in the tea way for a time, and finally got back into the Department.

14583. There is no doubt that he was not an inexperienced inspector? Oh dear, no; I would not say that. Just at the time the bad work he did was executed, he seemed to be in a dazed condition. I could not quite make out the man.

14584. *His Honor.*] He had not taken to drink? He was a perfectly sober man. Whether it was through being in a tropical climate for so many years, or whatever it was, he seemed to me to be physically deficient in some way or other.

14585. *Mr. Parkes.*] Where is he now? He is employed in the Department.

14586. Still as an inspector? No.

14587. What is he doing? He is in charge of the cement in the bonds.

14588. Is he still in a dazed condition? We all get times of indisposition.

14589. He would have to have his eyes skinned to be in charge of cement? Yes.

14590. *His Honor.*] Did he come right again? He is all right now. I always felt the man was not altogether to blame. He seemed to me not to know what he was doing at that time.

14591. He was not putting into practice any peculiar Indian experience of his in bricklaying? I do not know.

14592. *Mr. Parkes.*] I wish you now to read the whole of the correspondence in connection with his reinstatement;—will you read the first letter? It is as follows:—

Your No. 91-1,871 of 17 July, 1891.

To R. F. Hickson, Esq., C.E., Engineer-in-Chief for Sewerage,—

Sir,

No. 2, Tivoli-street, Paddington, Sydney, 17 July, 1891.

With reference to the unworkmanlike manner in which Messrs. Baggé and Davis found the arch of the sewer being constructed, I beg to acknowledge that it seemed very careless on my part to allow such work.

The bricks are a little large, and I allowed a little less mortar in the joints in consequence. I am sorry that it escaped my notice that some of the joints were not quite filled, which was an oversight on my part. The bricklayer is a very careful and good workman, and would not, I am certain, willingly do bad work. And as to the grouting-in of three courses in the crown of the arch, I allowed this to be done, as the grout was not so thin as to find its way out of the joints.

With reference to the bricks selected by me not being up to the Departmental standard, I beg to say that I was aware of this, and that out of all I selected I believe I could hardly find one brick that would be; and that I understood the Department was aware that the best of the bricks in Messrs. Hart and Gallagher's yard would not come up to Departmental standard, and that I was to select those nearest to it, which I did—the best I could. The bricks were very dusty with ashes, &c., and it was difficult to distinguish good from bad in that state. Several loads of bricks brought on the works, I feel certain, were not of my selection.

I beg to state that I have always used the utmost care in the construction or repairs of any works I had to look after, and I beg to refer you to Mr. Davis as to my competency to have charge of work.

I further most humbly beg to state that I have not from want of knowledge, nor from carelessness, or any other cause, allowed work to be done and materials to be used contrary to specification further than what I have stated.

Knowing that I am in fault, I most humbly beg you will be so good as to forgive me this time, and I faithfully promise that nothing of the kind shall ever happen again.

Yours, &c.,

H. M. HAMILTON.

14593. Has Mr. Hamilton been reinstated in his former position? No.

14594. He has never been reinstated? Not as a first-class inspector.

14595. Did he ever receive his full salary? No.

14596. What is he now receiving? 7s. or 7s. 6d. per day.

14597. You may as well read all his letters, as you have read one of them? The next letter is as follows:—

To R. F. Hickson, Esq., C.E., Engineer-in-Chief for Sewerage,—

Sir,

3, Tivoli-street, Paddington, Sydney, 22 October, 1891.

I beg to state that I was suspended on the 17th July, 1891, *vide* your letter, No. 91-1,871, of same date, and on the 21st of the same month I was degraded and placed on 10s. a day.

I was sent to Contract No. 65, and told off to look after the bricklayers and plasterers, which I have been doing; and, if you will kindly inquire of the resident engineer and the inspector in charge, you will find that I have paid strict attention to my work, and done it to the entire satisfaction of my superiors.

I

J. Davis.  
26 Aug., 1896.

I beg to say, which you will find from inquiry, that I have always been strictly sober and attentive to my work—working early and late when required of me.  
I sincerely promise you that I will not again give cause for my supervision of work to be found fault with.  
I beg to remark that if I had not met with the accident to my leg on the Macdonaldtown storm-water sewer, I would not have met with the misfortune that caused my suspension, and by which I am a loser, on this date, of £21 15s.  
I trust you will be good enough to consider that I have been sufficiently punished, and kindly reinstate me in my former grade of first-class inspector on 15s. a day.

Yours, &c.,  
H. M. HAMILTON.

14598. Did he make a further application? The next application he made reads as follows:—

R. F. Hickson, Esq., C.E., Engineer-in-Chief for Sewerage,—

Sir,

3, Tivoli-street, Paddington, Sydney, 25 February, 1892.  
With reference to your No. 91/2,668 of 5th November, 1891, I beg to state that it is now over seven months since I was degraded, and that I have worked hard to regain what I lost. May I request you will be so good as to reinstate me in my former position of first-class inspector.

Yours, &c.,  
H. M. HAMILTON.

I cannot recommend this application to the favourable consideration of the Engineer-in-Chief, as I do not think Inspector Hamilton, compared with the other inspectors, is entitled to rank as "first-class."—J.D., 26/2/92. Mr. Baggé. C. H. Ohlfsen-Baggé.—26/2/92. Inform.—R.H., 29/2/92. Mr. Davis.—F.C.P., 29/2/92. Inspector Hamilton informed.—J.D., 2/3/92.

Then, on 23rd February, 1892, he wrote the following letter to myself:—

J. Davis, Esq., C.E., Superintending Engineer of Sewerage,—

Sir,

3, Tivoli-street, Paddington, Sydney, 25 February, 1892.  
I beg to forward, through you, my application to Engineer-in-Chief, to be reinstated to my former position of first-class inspector, which I hope you will give your kind consideration and forward on.

Yours, &c.,  
H. M. HAMILTON.

14599. Will you now read his former applications? They are as follows:—

To J. Davis, Esq., C.E., Sewerage Department, 80, Bathurst-street, Sydney,—

Sir,

No. 2, Tivoli-street, Paddington, Sydney, 6 April, 1889.  
Having heard there is a vacancy for an inspector of works in the Sewerage Department under you, I most respectfully beg to offer myself a candidate for the post.

You may rely upon me that I shall not be wanting in my endeavours to give satisfaction to those under whom I may be placed.

Yours, &c.,  
H. M. HAMILTON.

Mr. Hamilton applied for employment about four weeks ago, through Mr. McMordie, and as there was no vacancy at the time the Engineer-in-Chief ordered his name to be registered. As McKay has been dismissed there will be a vacancy for an Inspector when work is commenced on Contract No. 47, and resumed on Contract No. 42, Paddington, which will probably be in a few days. Mr. Hamilton served under me at Rushcutters' Bay some four years ago, and he was found to be a steady, reliable man.—J. DAVIS, 8/4/89. The Engineer-in-Chief for Sewerage, &c., &c.

Mr. Bennett writes something on that minute. I do not know what it is, but I think it is "resubmit." Then there is a letter on 19th February, 1889? It is addressed to Mr. McMordie in these terms:—

450, Oxford-street, Paddington, 19th February, 1889.

D. McMordie, Esq., C.E., Superintending Engineer, Government Sewerage Works,—

Sir,

I beg most respectfully to offer myself a candidate for employment in the Department under you.  
I shall do my utmost to give satisfaction in whatever post you may place me, and feel very grateful, if you will kindly assist me.

I am in possession of first-class testimonials, and beg to refer you to Mr. A. F. Watson, District Engineer, Bathurst, to whom I am well known.

I beg to remain, Sir,  
Yours obediently,  
H. M. HAMILTON.

I have informed the applicant that there is no vacancy. He was employed in the Department some years ago as an inspector, and resigned. He is a steady man.—D. McM., 20/2/89. Engineer-in-Chief.

Mr. Bennett writes, "Mr. McMordie to see me," and then something follows that; but I do not know what it is. The next document is a memorandum by Mr. McMordie on 18th July, 1885, in these terms:—

INSPECTOR Hamilton has resigned; a sub-inspector will be required to fill his place on brick and concrete work.

On 8th March, 1885, Mr. Watson writes to Mr. McMordie the following letter:—

My dear McMordie,

Bathurst, 8th March, 1885.  
This letter will be handed to you by an old Indian P.W.D. overseer, Mr. H. M. Hamilton, who served under me in Bengal and writes that he has just arrived in this Colony. I have no vacancy in this district, but I thought if you would kindly tell him where to see any of the contractors under you in the drainage works he could then ask them to give him something to do.

Mr. Hamilton had charge of a subdivision with a great number of buildings to look after, from a princely palace to a gaol, and including the fine double-storied barracks at Bahnpore which Sir Hope Grant said, and justly, I think, were the finest buildings of the class in India—

14600. *His Honor.*] It is hardly necessary to read all that letter, as it is simply a recommendation to Mr McMordie? Very well, your Honor. Then there is a letter to Mr. Hamilton which finishes the correspondence.

14601-2. *Mr. Parkes.*] There is no doubt that Mr. Hamilton was a capable man? I believe him to be a fair inspector. He certainly is a very sober, trustworthy, industrious man.

14603. There can be no question that Messrs. Carter & Co. were not imposing upon his ignorance—that they did not trick him to do wrong work? I should not say that. I should say what I said before. That was always my notion about him. I never distrusted him. I felt that he was either mentally or physically incompetent at that particular time.

14604. If bad work was being done at that time, it was being done by imposition? Workmen were certainly taking advantage of Hamilton. There can be no question that they were.

14605. Was it difficult to find out that bad work? It was all in the open. Anyone walking by could see it at a glance.

14606. There was no difficulty in finding it out? No.

14607.

14607. The contractors themselves could see it? If they had been there, certainly. I had no difficulty in finding it out. As soon as I got to the work I noticed it, and I called Mr. Bagge's attention to it.

14608. *Mr. Carter.*] Referring to this supposed defective work, you say that it was quite easy for anyone to see it? Yes. J. Davis.  
26 Aug., 1896.

14609. It was, in fact, a covered sewer built on top of an embankment, and it was open to everyone's inspection? Yes.

14610. So that the contractors, if they knew anything about it, would be running great risk in allowing such work to go on? I should say so. I do not blame the contractors so much. I know what the men are. A man may be a very good workman. If a man is doing something every day in the week, and every week in the year, he sometimes gets careless, and wants bringing up to the mark. The only way to do it is to keep him under proper control.

14611. It was three-ring work? It was two-ring work.

14612. This grouting would occur in the back ring, I suppose? I am not sure whether it was in the first or the second ring. It was on the crown, where they could grout. It was not on the sides, where they could not grout.

14613. Referring to the question of culling of bricks at the brickyard, was not that a concession to the brickmaker, not to the contractors? I do not know. We regarded it as a reasonable thing to do under the circumstances. The bricks which were brought on to the ground—I remember now I see that memorandum—were not up to the standard, and we have a clause in the specification which allows the bricks to be picked, and the unsatisfactory ones are thrown aside to be carted away, and the approved ones to be used in the works. But, seeing it was evident that the kiln of bricks from which these were taken were all mixed together—I do not know whether the brickmaker asked for it or not, I expect he did—I instructed Inspector Hamilton to go to the brick works and get these bricks culled to save the defective ones having to be carted to Woollahra, and then taken away again.

14614. You are aware, I suppose, as a matter of fact, that any loss which accrues through defective bricks being brought on to the ground always falls on the brickmaker? I cannot say that I know it of my own knowledge, except from what I have understood. I understood that contractors generally buy their materials in that way, leaving the supplier to take the risk whether they pass the Government test or not. I do not know of my own knowledge whether that is the case in this particular instance.

14615. *Mr. Parkes.*] If a workman is doing defective work, and he is paid by the day, what benefit does he get from that defective work? I should say from experience, in nine cases out of ten where workmen are discovered to have done defective work they do it simply to save their own bones.

14616. How would it save their own bones? Because they are idle.

14617. But a workman, if he does defective work, saves time? Not always.

14618. If he is doing quick defective work he is cutting his own throat? That may be so in certain cases, but not always.

14619. If he were doing work to ease himself, it would be simply that he might loaf away the time? Yes.

14620. How would he ease himself? In mixing up cement or mortar, for instance.

14621. Will you say in what way? Suppose he does not put the cement into a batch, he has to mix it all the same.

14622. How does he save his bones? In a case like that, unless it would be a question of fetching more cement, it would be clearly to the interest of the contractor.

14623. Supposing the cement is carted to the mixing board, does the labourer gain any benefit? I should say not, if the cement were there to be used.

14624. In mixing concrete does he gain anything, and if he puts in more metal and sand than he ought to do, and less cement, how does he gain there? I do not say that he would.

14625. Can you point out any way where a labourer will save his own bones by doing defective work? Certainly; in dozens of ways.

14626. Will you say one way? I am satisfied that that man Dawson left that hole at North Shore either through malice or idleness. The saving to the contractor is so trifling that it seems to me it must have been that which induced him to leave the hole.

14627. Have you instructed your inspectors to blackball men off Government works who have given evidence before the Commission? I have not spoken to the inspectors about men who are giving evidence here.

14628. Are you aware that the contractors are blackballing all the men because of the inspectors? I have heard nothing whatever about it. No instructions have been issued as far as I know. The inspectors have nothing whatever to do with the men. I should be very sorry to hear that they had anything to do with the workmen except in the way of administering the specifications.

14629. Will you see that as long as a man is not a bad workman he shall be allowed to get employment on Government works irrespective of his giving evidence here or not? I would like you to say precisely what you mean. I am not going to enter into any undertaking.

14630. Will you give us an assurance that men will not be blackballed from the works for giving evidence before this Commission? I certainly will give no instructions one way or the other. I have nothing whatever to do with the matter. It is a matter for the contractors. We have nothing whatever to do with the workmen.

14631. *His Honor.*] As far as filling joints is concerned, what is your experience of bricklayers. Suppose you instruct them to fill all through joints in brickwork perfectly, will they carry out your instructions? They will not. I have always said about bricklayers that their trade consists in doing the hypocrite. They will not properly butter their bricks; and do what you may, if you take up the brickwork, in very likely 50 per cent. of it, although it may be fairly bedded, you will find some part in the hollow of the brick where the mortar is not rubbed home. We have had some trouble, especially in the tunnels, in getting really solid work done. When the tunnels were first started, about twelve years ago, I had lengths of brickwork taken down repeatedly, simply because of the hollow joints. That was the only way in which we could get the work done at all satisfactorily. The men got to know that the joints were examined and raked out after they had finished a length, and that if they were not solid the work would be taken down. That meant that the contractor would be the loser, and that they would be discharged. That is the only way we can get anything like approaching good work done.

- J. Davis.  
26 Aug., 1896.
14632. Is every length of brickwork lining in the tunnel inspected for joints after it is laid? Yes. It is the inspector's duty after the centres are struck, while the brickwork is green, to examine the joints.
14633. How does he do it? If he goes to the work immediately the centre is struck, and the joints are not filled in, it will appear.
14634. Before there is any pointing done? Yes. Sometimes from the difficulty of getting a brick into position a bricklayer cannot properly bed his brick; sometimes he has to put mortar on the brick and put it into position in that way. In these cases the inspector, who is a practical man, endeavours to help the workmen, but where he sees carelessness on the part of the workmen it is his duty to report the matter so that the work can be taken down again. That repeatedly occurs. I know that in my own experience—not more in connection with Carter & Co. than in connection with any other of the contractors—I have had to have chains of concrete taken down after it has been in perhaps a fortnight or three weeks.
14635. Chains of concrete? Chains of concrete are taken out of the tunnel.
14636. What was that for? The concrete did not properly set for some reason or other. Sometimes we have been able to discover the reason, but at other times we have not. Inasmuch as it did not set we had it taken out.
14637. Can you say, supposing the inspectors do their duty fairly well, that all the lining of the tunnels has full joints throughout? Yes, I would say that, because the arch of the sewer is the only place where anything could happen, and in the majority of cases almost 99 per cent. of it would be either  $4\frac{1}{2}$  inch or 9 inch work—probably 90 per cent. of it would be  $4\frac{1}{2}$  inch work. That is very easily inspected. The packing over the arch has always given us the trouble, and if the inspector's back has been turned we find the workmen have been only too ready to take advantage of it.
14638. In relation to the necessity for watertight packing, I understood Mr. Bagge to say that one principal reason why it was necessary to have watertight packing was because of the great uncertainty of having the joints of the brickwork regularly filled;—as to that reason, can you say whether he is right or whether he is mistaken? I think the joints on the whole would be filled. I have examined a good deal of the work after it has been finished, and I find that in the majority of cases the joints have been fairly filled. I take that which we examined six weeks ago at North Shore. Although the bricks were very much radiated—I suppose there was as much as three-fourths of an inch of a wedge on the brick—it was probably three minutes before the man, using a 5-lb. hammer, could drive out one of those bricks. There was nothing behind the brick—indeed, I said to Dawson, "That is solid," but it was hollow all the same. It was simply that the brick had been properly bedded, and the adhesion of the brick to the mortar prevented it from going back.
14639. Did you find in this case that the brick would drive out whole, or did it generally break? In this case it broke.
14640. Showing that the adhesion of the cement was greater than the adhesion of the brick? I was astonished.
14641. *Mr. Parkes.*] Was it an iron hammer he used? Yes; he was belting away at the brick for three minutes before he got it to move.
14642. *His Honor.*] Driving directly on the brick? Yes.
14643. The brick finally broke? It smashed up before it would come.
14644. That would indicate that the adhesion of the mortar to the brick and to itself was greater than the adhesion of the brick to itself? That is the case. As far as the brickwork is concerned I have no difficulty whatever in speaking in the most confident way as to it. As regards the packing, I am not at all surprised to find that there was a hollow at North Shore.
14645. Why do you say that? Because I know the difficulty we have always experienced in getting the tunnels packed. Whether the men believe in it or not I do not know, but the moment the inspector's back was turned, if they had a big hole to fill, they would, if they could, get a bar of concrete across the tunnel, so that the inspector could not see that there was a vacant place behind. For that reason the inspectors used to get bars and push into the concrete and see whether there was not any hollow place.
14646. Did they often bowl the men out in that way? They have in several cases.
14647. It is a common fact that it is one of the most difficult things to get bricklayers to fill joints, especially vertical joints? It is so. They always seem to have an idea that if they could put a little mortar on the arrise of a brick that is all that is required in a vertical joint.
14648. In ordinary brickwork are bricklayers paid by the thousand or by time? The contractors are not allowed to sublet the sewer works.
14649. So that they are paid by time? Yes.
14650. In ordinary building are bricklayers usually paid by time or by the thousand? In most cases by the thousand.
14651. So that it is an object to them to get through their work as quickly as possible in ordinary brick-laying? Yes.
14652. That cultivates, I suppose, the habit of leaving open joints? I think so.
14653. The habit, being cultivated, is so strong that, even though they are paid by time, they will indulge in it? It always appeared to me that it is so.
14654. *Mr. Parkes.*] This is the first time I have heard of bricklayers being paid by the thousand? I do not know. I know that vertical joints in brickwork are nearly always open. Our specification says that the bricks are to be rubbed home, but the difficulty is to get the men to believe that it is necessary. When they do not believe a thing, the first time they have a chance they will take advantage.
14655. *His Honor.*] They seem to be under a rooted impression that vertical joints may be left open? That is my opinion.
14656. They will only go in for filling the bed joints? Yes.

Christian Herman Ohlfsen-Bagge recalled and further examined:—

- C. H. Ohlfsen-Bagge.  
26 Aug., 1896.
14657. *Mr. Parkes.*] You did not know when you were here last time that the contract which Mr. Davis took you out to see was one of Carter & Co.'s contracts? I did not.
14658. But you do know now that it was? I do.
14659. Having had a look at the plan and longitudinal section of Contract 53 on the easel, do you recollect distinctly going out with Mr. Davis to see this work at Contract 53? Yes, we did go out. Mr. Davis.

Davis called upon me—I think it was in the afternoon—and said “You have never seen the arches on this contract; you ought to come out and see them.” I said “All right,” and he took me out. We drove out; and, when we came to these arches, to his horror and astonishment they had collapsed. Several of the arches had come flat down. Pieces of the arches had tumbled out. I took my penknife out of my pocket and scratched, and found that instead of cement mortar being there it was sand. I said “It is no wonder that this thing has tumbled down. Their centerings could not have been watertight, and the moment the water comes out it takes the cement with it.”

C. H.  
Ohlisen-  
Baggé.  
26 Aug., 1896.

14660. Would not that leave a good cement coat on it underneath;—it would not all escape? No; if the centerings are not watertight, when you put concrete on to the centering, the water in the concrete will ooze gradually out and take the fine cement with it and leave a quantity of sand behind. Of course, there is a shadow of cement left in the mortar; but extremely little. It collapsed on its own account.

14661. Are you of opinion that defective work was in the arch? I am of opinion that the work was downright rubbish.

14662. Will you describe from the plan the number of the arches that were broken? It is extremely difficult now to say how many of these arches [pointing to Plan No. 2] tumbled down. There were two or three of these arches gone—there may have been at least three of them defective; there might have been more; I cannot recollect distinctly, but one or two arches had collapsed flat. Large pieces had tumbled out.

14663. Were you the first that discovered that? We came there together and jumped out. Mr. Davis wanted to show me this work as a piece of work which I ought to see, and to our utmost mutual astonishment we found the thing had collapsed through bad work. Mr. Davis was awfully taken aback, and he said to me “I have had one of my best foremen. However this has occurred is a perfect riddle to me—I cannot understand it.” We went along the work, and at the lower end, where the sewer was being built, to his horror he found the brick lining was set in pure sand. Of course the work has been repaired. I knew that he would see to that at once. But I said to him “What a lucky thing that this work did not occur underground, where it might never be seen.”

14664. How much of the brickwork was defective? To the best of my memory I fancy there was a length of about 50 feet or so which was bad. I cannot distinctly recollect how far it was bad; I can only assure you that both of us were horror-struck to see such a piece of work done in open daylight. We were thoroughly astonished. Mr. Davis looked ghastly pale when he saw it. He was wholly taken aback, and no wonder he was.

14665. Did you go to see what the work was like in the tunnels? No, we did not. We examined these arches. Mr. Davis, I think, went to the tunnels, but I do not recollect whether I went there. I do not think I did. We looked at these concrete arches and the continuation of the sewer. Mr. Davis was very much shocked, and he took immediate steps to have the foreman removed and have the work no doubt repaired.

14666. What was the cause of the defect of the packing—was it that the grouting had not been put in, or that sand had been put in without sufficient cement? The cause was either that the contractors built that work on open centerings where the water could escape, or bad concrete had been put into the arching—it was either one or the other. It is very difficult to say which was done, because further on the brick-lining of the sewer was set in pure sand. He took bricks out and said “Good God, it is shocking.” It is pure sand.

14667. Who said that? Mr. Davis. He was thoroughly taken aback.

14668. Did you ever go out with Mr. Davis to see work on any other contract? Yes. He frequently took me out whenever there was anything to be seen. He used to come to me and say “Come out, I want to show you so-and-so.”

14669. Do you recollect ever finding defective work in a similar manner? I recollect—I think it was at Alexandria Park—the sewer was being extended and a new junction had to be built. This sewer carried a tremendous lot of water, and at this junction in order to bring that new upper sewer into it, the invert was built in a kind of ogee form. With sand and road metal coming down there was a tremendous scour on the invert. This invert therefore was to be built with  $4\frac{1}{2}$ -inch brick lining to resist the scour of stones and things coming down. It was a particular piece of work which ought to be done well. We put brick lining in these inverts, because the corporations, when a storm comes on, open the gratings in the streets, and let all the rubbish, stones, and all, come down, which they should not do. Instead of cleaning out the gratings they open them and let everything pass through. You will see large stones coming down with a tremendous velocity and tearing everything to pieces. When Mr. Davis went down to this sewer he said “Are you coming down?” I said “No; I have seen that before.” He went in, and all of a sudden he called out “Mr. Bagge, Mr. Bagge.” I jumped out of the buggy, and I asked “What is the matter?” “Come down here,” he said. I went into this sewer, and this brick lining, which should resist this scour, was set in dry sand. That was a similar case. It was done in broad daylight. He had thought he had a good foreman there. It was a work which had to be done in a most particularly careful manner.

14670. Do you recollect whose contract it was? I do not.

14671. Was it Parry and Farley's job? I could not positively swear whose it was.

14672. Might it have been at Macdonald Park, which is in the same district? It might have been there; it was by a pure accident that we drove past there. He said to me “I must go down and look at this.” I wish to say here that I do not look upon these things as trivial, when I see 50 or 60 feet or more of the sewer built in such a bad manner, and it is just by accident that it is seen. If it had been underground it might not have been seen at all; it might have collapsed in a year's time, and tumbled to pieces. It simply shows what an amount of supervision it takes to prevent these things occurring.

14673. You are of opinion that contractors should not always be trusted? I do not think that contractors should be trusted. They should be supervised, and they should have no chance of doing this; because if the work is of a very important nature, and it collapses, it might do very serious injury. For instance: on the Continent, if a dyke gives way, and it is shown that it was done by carelessness or want of supervision, the engineer can get up to twelve years on the road. These dykes protect valuable lands down below. It is a very serious matter in the case of a dyke.

14674. *His Honor.*] Do they hang the contractor or guillotine him? If any man is seen by a farmer to injure a dyke the farmer is entitled to shoot him. If a large reservoir at the head of a gully is done badly it may be the cause of drowning a lot of people.

14675. *Mr. Parkes.*] I suppose the dykes are built all right? Yes.

C. H.  
Ohlfsen-  
Bagge.

26 Aug., 1896.

14676. Are you sure that the cement was bad in this brickwork? I am quite, positively sure, that what I saw had next to no cement in it.

14677. Did you examine any other portion of that sewer? No, we just went across the gully. When we saw the arches in this terrible state we went lower down, and we saw the brick-lining all set in pure sand.

14678. I am referring to the contract at Macdonald Park, did you see any further defective work? No. We simply happened to pass by when Mr. Davis said "Ob, this is that junction; I must go down and have a look at it." He jumped off the buggy and looked at it, because he knew it was a bad place and wanted to see it.

14679. Do you recollect the invert of the sewer in that district having to be taken up and brickwork put in? That was this identical place at Macdonald Park.

14680. Had the invert to be replaced for any distance? As far as I recollect we were building an extension there, and this extension caused this junction to be rebuilt, because the extension came in at a different level. The scour was so tremendous that it washed away the concrete of the first temporary inlet, and, therefore, we decided upon brick-lining this sewer, to protect this invert for a certain length, with 4½-inch lining on edge set in cement.

14681. Was that invert built in that fashion for any distance in the extension of the sewer? It would be built long enough to receive the scour of the water. For instance, if the water comes down in an ogee form like that, it takes a certain distance before it runs quietly at the lower end. Consequently this distance—60 feet, or whatever it was—would be built with brick lining on edge from the top right down. You have to watch and see how far the scour will go. The velocity is continued until dead water comes and banks it back, and it finds its own level. It forms a kind of a wave when it banks back. You must gauge that point where the water runs quietly. It has to be protected.

14682. Do you recollect whether the whole of that brickwork was defective or not? That brickwork was built in sand.

14683. For any length? No, only for the length of that junction.

14684. Is that the only portion you looked at? Yes; we were passing it. I did not intend to go down at all.

14685. Is it your experience, as regards sewer works underground, that contractors will try to get out of putting in the full amount of cement? My experience is that if you do not supervise that work you cannot rely on it. My experience is that they will do you wherever they can; not so much the contractors themselves, but their men are so impregnated with the idea of "doing" you that they cannot get out of it. If you ask a contractor to lend you for private work half-a-dozen of his men, and you pay them tip-top wages, these fellows will do you.

14686. According to this plan, it seems to have been executed in concrete? Yes; that is concrete underneath. I believe the part tinted indigo was washed out; it was the first temporary inlet.

14687. By that plan it seems that the whole of the invert was altered? No; only for a certain distance, as far as I can recollect. It was originally a temporary concrete inlet; then the concrete was washed away, and brick was substituted for the invert of the new junction.

14688. In the contract adjoining that which you are looking at, and which was Carter, Gummow, & Co.'s contract, do you recollect the invert being washed out of that sewer? It might have been, but I cannot recollect that it was.

14689. You cannot recollect whether it came before you? No!

14690. According to this plan it is at Swanston-street, on Contract 75? Yes.

14691. *Mr. Davis.*] Do you remember, when you made the designs for Contract 75, whether it was a brick or concrete ogee you provided for at Swanston-street, the place you have indicated? That I could not tell you, unless I saw the plans. I fancy we put in brick lining afterwards. I fancy there was an alteration in connection with the continuation of the sewers.

14692. Do you remember, as regards the ogee shown on drawing No. 1, Contract 75, whether you showed it originally on the contract drawings? The first junction, to my recollection, was with an existing culvert and built of concrete, and that was thoroughly scoured away. That was why we introduced the brick lining.

14693. The drawing No. 3, showing the brickwork, is the one you speak of showing the brick lining? Yes.

14694. Do you see a dotted line on the plan running down to the ogee? Yes.

14695. Would not that be the invert of the sewer as shown originally? It might have been.

14696. And then, when you altered the ogee and put brickwork in, you flattened it out a bit? Yes; that might have been.

14697. Does that call it to your mind? I think this sewer was originally connected temporarily with an existing culvert and built of concrete.

14698. Do you remember whether the concrete cut away, and brickwork was substituted by day-work? That I do not remember. All I recollect is that we put brickwork in here when the alteration and extension of the sewer took place; we made the junction differently. I am under the impression that this was built in connection with the sewer extension at the time. We came to the conclusion that we would use brick lining. When we made these additions we took advantage of the opportunity to put in brick lining.

14699. You do not remember whether it was done by day labour or by contract? No.

14700. Do you remember on the occasion of your visit to Waverley, when you say we discovered that very defective work, whether at the same time we, as you say, discovered the cracked arches? Yes.

14701. On the same occasion? Yes; you walked along the sewer and said "Good God, they have put in all these bricks in sand."

14702. You would not say I was in the habit of making use of such language as that? Well, Mr. Davis, you were a very strange gentleman as regards the language. You might see a lot, but I am very doubtful whether your way of seeing a thing will lead you much further than my way of seeing it. I believe when we go to the next world I am just as ready as you are, for all I know.

14703. Do you remember a report with reference to the bad brickwork;—do you remember my reporting bad brickwork to you after we went out there? That is very likely. I am sure you would have repaired it instantly.

14704. Do you remember whether I mentioned that these arches had collapsed in that report? These arches were built of concrete, not of brickwork.

14705. Do you remember whether I mentioned the concrete arches having collapsed in the report I wrote as to the brickwork? That I cannot tell you. I do not know whether I have seen your report at all, because most of your reports, unless I saw them quite accidentally, went straight to Mr. Hickson.

14706.

14706. If these arches were cracked as you have described—and it is no trivial matter, as you say, if they did—do you think it would be reasonable that I should mention in the same report this fact in conjunction with the bad brickwork you say we discovered? In the first instance you would not report to me at all, unless it was a miracle. You stood directly under Mr. Hickson. Mr. Hickson took the supervision so clean out of my hands, and you were his assistant in the supervision. You did not write any reports to me; you wrote directly to Mr. Hickson, and if you showed me a report I took it as an accident.

14707. If so serious a failure had occurred as the collapse of three concrete arches, and this failure took place at the same time as the defective brickwork you have called attention to, do you think it would be reasonable if I reported the defective brickwork that I should report the collapse of the arches?—

*His Honor.*] That question is one which anyone could answer. It is an argument.

14708. *Mr. Davis.*] Did you report the collapse of these arches? No; you were the supervising officer. You recollect that three Bagges were wanted. The work was decided on; you and Mr. Hickson were in charge of that work. I had practically nothing to do with it. You took me kindly out for a drive to show me a thing when you wanted to know something.

14709. If you did report on bad brickwork would you be likely to call attention to the collapse of the arches at the same time? I have not reported in the matter.

14710. If you did would you be likely to do so? If I reported on the one I would have reported on the other, most decidedly. What you have done is a different thing.

14711. Are you satisfied from a perusal of the report I have just handed to you that it refers to the defective brickwork at Contract 53, of which you have spoken? It expresses what occurred incorrectly. I must have overlooked it at the time. It says:—"Mr. Bagge and I had occasion to visit the work in progress on this contract this afternoon, and we found that although Inspector Hamilton had nothing whatever to do except to look after one bricklayer and one plasterer, he was allowing the bricklayer to build the arch of the sewer in a most disgraceful manner." This does not refer to the concrete arches at all. It simply refers to the arch of the sewer. You did not report it at all. You simply recommended in this report that a foreman be dismissed on account of bad work done in that sewer. You did not report at all about the concrete arches. You got them repaired. You knew the contractors were at fault, and I have not the slightest doubt that you simply thought in your own mind, "It is no use reporting it; I will have it mended at once at the contractor's cost; they have done bad work and they must put it to rights again"; but the brickwork in the sewer being set in sand—you used as a sufficient reason to recommend the man's dismissal.

14712. Did the report pass through you? It did. That was my minute.

14713. Did you say, when forwarding it to the Engineer-in-Chief, "I fully agree with Mr. Davis' report"? I say here—"In forwarding Mr. Davis' report, with which I fully agree, I am at the same time of opinion that inspectors who in such an unaccountable manner nonfulfil their duties must be considered useless to us—in fact far worse than useless." It is perfectly correct in one sense, but it simply deals with the sewer. It leaves out the arches. It never touched on the arches. It has nothing at all to do with the arches. If you had written another report about the arches it would have been a different thing. That report and my minute are quite correct, but they refer only to the sewer and the inspector's misconduct.

14714. Don't you think, Mr. Bagge, it would be like you when forwarding this report to the Engineer-in-Chief to call attention to further alleged defective work? No. You were very shrewd in these matters, you know. You knew that I would not do anything like that which would throw a slur on your character. You would hide it in the most clever and delicate manner, Mr. Davis. You know the contractor had to do these arches over again. It was in your power simply to say "Take them down and rebuild them," and no doubt you did. That work was thoroughly bad work. There was not a speck of cement in that stuff, for I stuck my penknife into it and scratched it. You were very shrewd, sir; I know you too well.

14715. *Mr. Carter.*] If the work in Double Bay was so horribly bad, why were not some steps taken to punish the contractors;—why were they not debarred from tendering for six or twelve months? I had nothing whatever to do with that. I simply state a certain thing. Mr. Davis took me out to show me these arches. We only came to see these arches, and to our astonishment we found them thoroughly bad.

14716. Considering this work was so bad, why have you repeatedly spoken, if I may term it, so very highly of the integrity and business-like way in which Carter & Co., and Carter, Gummow, & Co., have carried out their contracts—in view of this language you state that it was so horribly bad that it collapsed? I simply spoke about these arches, which were thoroughly bad, and that has nothing to do with any other traits of your character.

14717. If we did wrong in one case you should remember it? It has nothing to do with it. Mr. Gummow asked me one day about that outlet chamber at Bondi Sewer. It was a good piece of work, and I told him so. I know Mr. Gummow is a very clever fellow; and I know Mr. Snodgrass is a very clever fellow; but I know if you do not look after the work it is your own fault. That is my feeling, but it does not detract from your cleverness or your partner's cleverness.

14718. I spoke of integrity? I have not used the word integrity.

14719. You have many a time to me personally? I have not seen it then.

14720. Do not you remember saying such a thing to me? I do not remember saying such a thing to you, to the best of my recollection; I always considered yours a good firm; but at the same time I would consider any engineer who would trust any firm of contractors without doing his duty and carefully supervising the work a tremendous fool.

14721. Regarding Mr. Davis' report, do you think your memory of the facts that occurred then is as good after a lapse of five years as it was at the time? When I am taken out of my office to a special exhibition of a nice piece of work, and instead of seeing this nice piece of work we see a dead collapse, and both of us are thoroughly astonished, I never forget a thing like that.

14722. You did not put it in the report at the time? I had nothing at all to do with the report. I did not report on these matters at all. Mr. Davis wanted to dismiss or punish this man for not doing his duty. He did not report on the arches at all. He knew you had to rebuild them. There was bad work, and you could not deny it. It was simply a matter of form with him. But, as regards the brickwork, he must give an excuse to the chief to get rid of the man who allowed bad work to be done. That is why he referred to that sewer, and that is why he did not refer to the arches.

14723. Are you sure the arches ever collapsed? Yes; they flopped down. They were as flat as a pancake. Large pieces tumbled out. There was no mortar in it; there was sand in it. Whoever built them I do not know at this moment.

14724.

C. H.  
Ohlfsen-  
Bagge.  
26 Aug., 1896.

- C. H. Ohlfsen-Bagge.  
26 Aug., 1896.
14724. If Mr. Davis omitted to report these arches, don't you think it was your duty to do so? No; it was not. They appointed three Bagges—it was done by either Mr. Barling or Mr. Hickson—and they got these three Bagges and one of them to supervise their work under the personal supervision of Mr. Hickson. I consider that third Bagge was their own doing, and they are responsible for it. They had their three Bagges. If they had the old Bagge by himself it would not have occurred.
14725. *Mr. Parkes.*] Have you any recollection of any report being sent in by Mr. Davis other than that letter? Unless the matter was referred to me a good number of these reports I would never see. They would never come to me at all. He speaks about the bricks, but he does not speak about the arches at all.
14726. Do you recollect whether these arches were changed from concrete to brick? I have not the slightest idea. I have not seen the work since then.

Mr. Joseph Davis recalled and further examined:—

- J. Davis.  
26 Aug., 1896.
14727. *Mr. Parkes.*] Are these arches on Contract 53 constructed at the present time of brick or concrete? Concrete.
14728. Is it a fact that one or more of them were taken down and rebuilt? It is absolutely false.
14729. They were not taken down and rebuilt? No.
14730. Were they repaired? I think they were to the extent I said in my previous evidence. A crack occurred at the southern end of the aqueduct, if you can call it an aqueduct, simply through the first part of the work being carried out some months, unavoidably, before the tunnel was lined and the concrete joined to the aqueduct.
14731. Did Mr. Bagge complain to you out on the site about the material in the arches? Mr. Bagge is entirely mistaken.
14732. Did he complain to you about the material in the arches? I would not pretend to say what Mr. Bagge might have said at the time. I say absolutely that Mr. Bagge is entirely in error as to these arches.
14733. Did you and Mr. Bagge look at the arches? I am not sure that the arches were turned at the time that brickwork was condemned.
14734. Did you at any period go with Mr. Bagge to see the arches? I might have done so. I was frequently out with him—almost every week; sometimes two or three times a week.
14735. Were you out more than once at these points with him? Probably.
14736. Will you swear that you were not out there more than once with him? I think we were out there several times.
14737. Did he at any time show you that there was bad material in the arches? I do not see how he could.
14738. Did he? You are asking me to say—
14739. A man's memory is not as defective as that; you can easily say whether he did or not? To the best of my recollection, no.
14740. Did he ever stick his penknife into the arches? To the best of my belief, no, when I was present.
14741. He never said a word to you about the defective arches? Not to the best of my belief.
14742. *Mr. Carter.*] As a matter of fact, were the arches ever defective? Not to my knowledge, unless you can regard the crack I mentioned as a defect. There was a defect at the culvert, and I believe Mr. Bagge went to look at that with me. The only explanation I can give of the evidence which he gave this morning, and previously, is that he has in some way or other confused the culvert in his mind with the arches. To me it is unaccountable, that he could have said what he has said this morning.
14743. *His Honor.*] What is your recollection about the ogee invert of that sewer? When the contract was let the ogee was shown on the design in concrete, and very steep. It was finished and rendered, but a storm came on and a large quantity of ashes and clinkers were brought down from the Eveleigh sheds. That scoured to a very great extent the ogee away, left holes all the way down the ogee, and the invert of the sewer, probably from 4 to 6 inches deep. It then became a question what would be the best to be done. The work had not been taken over, but it had been finished by the contractors, and finished satisfactorily. Mr. Bagge took the matter into consideration, and then prepared another design, flattening the ogee, and saying that vitrified bricks were to be put in for a certain distance in the invert of the sewer and above and below the ogee. The concrete had to be cut away. In some places it was cut right away below the invert of the ogee, and when this was done the brickwork was inserted. That brickwork and all the alteration in connection with the ogee was done by day labour, to the best of my recollection; certainly it was no part whatever of the contract.
14744. Do you remember the occasion Mr. Bagge speaks of when you found, as he says, that these bricks instead of being laid in cement mortar had been bedded in sand? Since Mr. Bagge has been speaking this morning, I have got some idea that something of the kind did occur, but it has not taken any very definite shape in my mind. It is possible that while the brickwork was being done a storm would come on, and if it did come before the compo. in between the bricks had time to set, the effect would certainly be the washing away of the cement; but otherwise I do not see any reason for supposing that it was the intention to do bad work, because, as I have already said, to the best of my recollection the work was carried out by day labour, and the materials used were paid for by the Department.
14745. *Mr. Parkes.*] Surely that does not require to be a matter to the best of your recollection;—you must remember whether it was so or not? You must bear in mind that a number of these things were going on at the same time, and I would not like to swear by my memory always.
14746. The matter of being paid by day labour or by the contractors could not escape your mind? I do not know that, when you are carrying on £200,000 or £300,000 worth of work in the year.
14747. *His Honor.*] Can you fix the date of the inspection? No.
14748. Do you not keep a diary? If I look up the diary I may be able to fix the date in that way.
14749. You have kept a diary on all these jobs? A journal.
14750. Have you looked over the journal for the purpose of discovering what took place on the occasion Mr. Bagge speaks of in Contract 53, at Waverley? Yes; I did. The papers which have been put in this morning were referred to as giving an explanation of what occurred.
14751. As to the other one, can you look it up in your diary? I will see what occurred. 14752.

14752. If you can fix the date, the weather at that time might give some clue to it? I have given certainly the best explanation I can give. J. Davis.  
26 Aug., 1896.

14753. *Mr. Parkes.*] You can give us the accounts of the day labour or the contract. It would settle that point in no time. You would not have your vouchers? I can settle that by referring to the books.

Christian Herman Ohlfsen-Bagge recalled and further examined:—

14754. *Mr. Parkes.*] Mr. Davis says you are entirely in error; that you did not find defective work in the arches;—is that so? I simply assure you that I have not a shadow of doubt about these arches being built thoroughly bad. I stuck my penknife into them. I showed Mr. Davis that there was no mortar in it. The sand simply rolled out. They were that open that they tumbled down. The bad brickwork was an after consideration. C. H. Ohlfsen-Bagge.  
26 Aug., 1896.

14755. *His Honor.*] What became of the wreckage of these arches? That I cannot tell. Mr. Davis would have it removed and put to rights again at once.

14756. *Mr. Parkes.*] Do you mean that they were big particles or just the arrises broken off the arches? One or two of the arches, I recollect, had gone flat down. A large lump, three or four feet, dropped down clean out of one arch.

FRIDAY, 28 AUGUST, 1896.

Edward Hungerford recalled and further examined:—

14757. *Mr. Parkes.*] In your previous examination with reference to Shea's Creek you undertook to get some information as to the details of the claim made by Messrs. McNamara & Co. on the Government in connection with Contract 72; have you seen the Crown Solicitor? I could not see him, but I telephoned up to his office and received this reply by telephone—that the action was brought against the Department in connection with the Harbours and Rivers Branch for diverting a channel out of its natural course; that the defence was that the Department simply restored the channel into its original course; that the jury found for Mr. McNamara; that the verdict was £3,000; and that the plaintiff's costs amounted to £1,057 2s. 11d., and the defendant's costs to £1,807 18s. 6d. E. Hungerford.  
28 Aug., 1896.

14758. What is the total cost of that claim? As far as the Crown Solicitor's people are concerned, £5,865. The verdict was £3,000; the plaintiff's costs, £1,057 2s. 11d.; and the defendant's costs, £1,807 18s. 6d. Then £320 was paid into Court as a deposit, and that has been repaid to the Treasury.

14759. What is the full total? £6,185 1s. 5d.

14760. Was that the amount you stated to the Commission the other day? Very nearly; but of course there was some expenditure by the Harbours and Rivers Branch which is included in the former return.

Joseph Davis recalled and further examined:—

14761. *Mr. Parkes.*] Will this general plan of the sewerage show the location of Contract 72? Yes. J. Davis.  
28 Aug., 1896.

14762. Will you point it out to His Honor? The concrete portion of the sewer extends from Munni-street, in Erskineville, formerly Macdonaldtown, to the swamp, originally Shea's Creek, but now the site of the Shea's Creek canal. The original channel extends from the last-mentioned point to within about 20 chains of Ricketty-street.

14763. Is that the earth channel forming an outlet to Contract 72? Yes.

14764. Does it run parallel with the Shea's Creek ship canal? In the centre of it. At the time the channel was cut the canal only came up to between McNamara's works and Ricketty-street. Now the canal has been extended up beyond the outlet of the concrete channel which was constructed in Contract 72.

14765. It has swallowed up your smaller channel? Yes; the excavation which was done in Contract 72 formed part of the excavation for Shea's Creek canal.

14766. Not for the whole width? No.

14767. *His Honor.*] I notice that the levels are different;—how do they join now? The levels are different. At present there is no junction. Your Honor may have observed the other day that there was a temporary channel running down on the west side of the canal, and into that small channel the concrete channel discharges. Ultimately it will discharge into the canal.

14768. But does this small channel end off and spread out? It goes into the canal finally, but at present the channel is there to carry away all the drainage to enable the canal to be excavated.

14769. Where does this small channel discharge? I could not say positively; I think it comes out below Ricketty-street. All the drainage from the swamp and high lands above is at present collected in this temporary drain, and discharged below the work which is in progress in the canal.

14770. To keep the canal as dry as possible? Yes.

14771. This drain also takes the drainage from above? Yes. It takes all the drainage above the canal, and all the drainage from Surry Hills.

14772. Where does it head? It goes up as far as Paddington Town Hall.

14773. Is it a storm-water sewer? No.

14774. I mean, does this open cut extend above the junction? Yes; it simply goes above the head of the canal.

14775. Some distance up? About 20 chains above the present outlet of Contract 72.

14776. Where did Contract 72 begin originally at the bottom—was the end of the concrete work the starting-point? Yes; but, to give a proper outlet to that, it was necessary to cut an earth channel 50 chains long, so that anything might be drained away. The channel was cut on the site of the proposed canal, and the original channel has now become a part of the canal itself.

14777. The line of the canal is some distance away from the original channel? The concrete channel will discharge into the canal when they are ready for it.

14778. That is when the whole width is cut? Yes.

14779. If I remember aright, the cutting of the canal passes this point, and reaches further up? About 20 chains further north than the present outlet of the concrete channel.

14780. The explanation is that the whole width is not cut? It is not finished off yet. 14781.

- J. Davis. 14781. The east side is battered down and finished? Yes; they are working on the other side. While that is being done, the water is excluded in the way I have described.
- 28 Aug., 1896. 14782. Mr. Weedon's letter, which was printed at page 450 of the evidence, is headed "Contract No. 72—Silt in open outlet from storm-water channel";—what is he alluding to when he speaks of the open outlet in the storm-water channel? He refers to the earth channel running down towards Ricketty-street. The first work which was done on Contract 72 was the cutting of that earth channel.
14783. That did form part of Contract 72? Yes; it was paid for under Contract 72. After that had been finished some little time, and the work was proceeding above in the concrete channel, a very heavy storm came on. The woolwashing people had a series of dams right up Shea's Creek into Surry Hills, but they had no weirs. When their dams get full they open the sluices and pass it on to their neighbours; and so it comes on until there is such an accumulation of water that the channel which used to carry the water from the head of the swamp round to MacNamara's could not carry it, and the water would overflow into the swamp. That had the effect of scouring out large quantities of earth above the point where the concrete channel discharges, or did discharge, into the earth channel. The effect of that was to deposit this earth in the earth channel. That is what Mr. Weedon refers to.
14784. Was that a sudden remarkable rainstorm? It was very heavy; but I think what did the damage was the system which these men had of opening their flood-gates.
14785. Clearing out their silt whenever they get a chance? Yes. It is simply like the bursting of a dam in a way. The water comes down on to the swamp at such a rate that no channel would take it.
14786. Each man clears out his rubbish—that is, the silt deposited in the bottom of his dam—on to the land down below? Yes; that is what caused the damage.
14787. What is the "old work" which Mr. Weedon alludes to in his letter? I think the gist of his minute is that, in the first 20 chains of earth channel below where the concrete channel joins the earth channel, the silt to which I have referred as having been washed out after a storm was deposited then. Below the 20 chains the channel was as it had been excavated, and no silt had been deposited—that is to say, that the storm had no effect upon it.
14788. The original bottom was 21 feet wide at the cutting? That was the width of the original channel which was cut along the centre of Shea's Creek canal.
14789. It is not very clear from this letter? I should be very glad to make it clear to your Honor.
14790. Mr. Weedon says: "The top of the concrete channel is 12 ft. 3 in.";—that is the end of the concrete channel? Yes; and the bottom width of the outlet.
14791. "And the bottom width of the outlet, as shown in red, is 12 feet";—that is the same outlet, I suppose? The bottom of the outlet after the silt had been deposited was 12 feet. It had formerly been 21 feet.
14792. Had the sides fallen in? I think it was wholly due to the depositing of silt which had been washed out of the swamp above the point I have indicated.
14793. That would reduce the depth, but how could it reduce the width? In this way: the velocity in the centre of the earth channel would be considerably more than on the sides, and the tendency of that would be to cause the silt to deposit in the angles at the bottom of the channel; where the slopes meet the bottom of the channel: the effect would be to deposit the earth there, and that would reduce the width—in fact I know that is what did occur.
14794. Mr. Weedon goes on to say: "From which point the full width of the old work, as it now stands, will be cleared out";—by the old work he meant the channel as it had originally been cut? That is so.
14795. Not old except in the sense of original work? Yes.
14796. "The original bottom was 21 feet wide"? Does that mean the bottom of the channel as originally cut? Yes. I can quite see that that letter of Mr. Weedon's presupposes knowledge which an ordinary reader would not have.
14797. He says: "The total quantity of excavation by the cross-section, allowing an average area of 6'32 square feet"; that is the area of the section of the siltage I suppose? Yes. When the cross-sections were taken, after the silt was deposited, it was found that that quantity of silt was to be removed in order to restore the channel to 21 feet wide in the bottom with the slopes as they were originally.
14798. *Mr. Parkes.*] With reference to Contract 53, did you not have to dismiss another inspector besides Mr. Hamilton on that work? Yes. There was some trouble with another inspector before that. I am not sure whether he was dismissed, but there was some trouble over him. He was either disrated or dismissed.
14799. What was the nature of the trouble? I do not know how it came to my knowledge. As far as I remember, he had been taking "nips" with the contractor—a man named Rogers.
14800. Did he not omit to get the packing put in that contract properly? That was another case. When I referred to the "nipping," I referred to a man named McDonnell.
14801. Was there not another man who got into trouble? There was another case, but I cannot remember his name.
14802. Was his name Vincent? Yes.
14803. Was he dismissed? He was disrated.
14804. What was he disrated for? The sum and substance of it is, that the bricklayer deceived him. Vincent ought to have been sharper, but the bricklayer certainly deceived him. The bricklayer allowed Vincent to suppose that he was going to pack a length of arch after lunch time. Vincent went away to get his lunch and went on to the surface. During the lunch time another officer went through the tunnel and examined the packing, and found that the bricklayer or a labourer had left a hollow space. Then Vincent, of course, was called to account for this thing, and that is the way he explained it. He was evidently taken advantage of.
14805. Do you recollect what size that space was? I could not tell you now.
14806. Was it 9 feet? It is possible. I could not tell you now; I can only tell you what I remember of the case.
14807. Do you remember the name of that bricklayer? No.
14808. Was his name Rydleberg? I believe it was. He was discharged.
14809. Has he not been working on Carter, Gummow, & Co.'s works since then? Yes; he was discharged for twelve months, and then Carter & Co. wrote asking that, as he had been punished to that extent, he might be allowed to work. It was considered that the punishment meted out to him was sufficient, and he was brought back again. He was an exceptionally good bricklayer, but evidently too anxious to get on with work to do it properly.

William Allen sworn and examined :—

14810. *Mr. Parkes.*] What is your occupation—a labourer? Yes.  
 14811. Where are you working now? I am working for Mr. McSweeney, at Stanmore.  
 14812. Did you work for the firm of Carter, Gummow, & Co.? Yes.  
 14813. On what contracts did you work? I worked at Waverley, North Shore, and Alexandria.  
 14814. Did you ever work on the Glebe contract? No.  
 14815. What were you doing at Waverley? I was concreting for a bit.  
 14816. What was the class of concrete put in there? Sandstone concrete, bluestone concrete.  
 14817. Was it mixed up to the full proportions? Yes.  
 14818. In every case? Yes, as far as I know.  
 14819. Did they put in the full quantity of cement? Yes.  
 14820. Did they pack all the drums over the arch with concrete? I know nothing about that.  
 14821. You were only mixing? I was in the invert.  
 14822. Putting it in? In the bottom.  
 14823. You were not mixing it up? I was ganger there at that time.  
 14824. You saw it going in? Yes.  
 14825. Did you see it mixed up? Yes; I have seen it mixed up.  
 14826. Was it all properly mixed up? Yes.  
 14827. What other work did you say you were employed at? I have worked at North Shore.  
 14828. Did you have some trouble with Carter, Gummow, & Co.? No.  
 14829. They sent you to North Shore to work? They sent me there to work.  
 14830. Was it Contract 79 or Contract 79A? I could not say.  
 14831. Was it the first contract they did? I worked on both.  
 14832. Did you see any defective concrete going in there? No.  
 14833. Was the packing all properly done on those jobs? Yes; what I did was.  
 14834. What portions did you work in? In different parts of it.  
 14835. Do you recollect what particular portions? I worked between No. 1 and No. 2 of the first contract.  
 14836. Did you work on the second contract? Not down below; only at driving.  
 14837. You never worked at the Glebe at all? No.  
 14838. Did you work on the Alexandria contract? Yes.  
 14839. Was that all properly done? Yes.  
 14840. All the concrete was properly done as far as you know? Yes.

W. Allen.  
 28 Aug., 1896.

Edward Moore sworn and examined :—

14841. *Mr. Parkes.*] Are you a labourer? Yes.  
 14842. Did you ever work at Contract 118—that is one of Carter and Gummow's contracts at Johnstone's Creek? Yes.  
 14843. What were you doing there? I was turning concrete over.  
 14844. Did you see the mixing of the concrete? Most of it.  
 14845. Was it mixed of full proportions? Yes.  
 14846. What was the cement used there—was it bag cement or cask cement? Both.  
 14847. To any extent, how much cask cement was used? I cannot remember.  
 14848. How much bag cement was used? I could not tell you. Sometimes we might have a day on each.  
 14849. What time were you working at concrete? From July to about December on both jobs on and off. I think I was two months at Johnstone's Creek.  
 14850. Were you working there after December? No.  
 14851. Were you mixing concrete in December? No; I was on the Monier job.  
 14852. Were you mixing concrete there? Yes.  
 14853. Was bag cement used there? No; cask cement.  
 14854. Were the casks all complete when they came to the cement board? Yes.  
 14855. You left in December? Yes.  
 14856. You did not go back there? No.  
 14857. Do you know whether the full complement of cement was put in the concrete which went into the Johnstone's Creek channel? As far as I know while I was there.  
 14858. Did you see it mixed? I was one of the mixers. I had nothing to do with putting the cement on. There were men there for doing that.  
 14859. How did they gauge the various material? 20 feet of sandstone, 8 feet of sand, and 4 feet of cement.  
 14860. That is the way they gauged them? Yes.  
 14861. Had you a gauge-box to do that in? Yes.  
 14862. When the bag cement was used did it come to you in casks or in bags? In bags.  
 14863. You broke the bags? We cut them.  
 14864. You cut them on the slope? I did not.  
 14865. But the foreman would? No.  
 14866. How many bags would he cut on each heap of material? Three.  
 14867. Would you see the amount of stone put in? I had my own work to look after. I did not have much time to look around at others.  
 14868. How long did you work at the concrete? About two months, I think, at Johnstone's Creek.  
 14869. Constantly? Yes; but not all the time at concreting. I was running the muck work too.  
 14870. Could you tell us the names of some men who worked with you? I could not give you their names. I only knew them as Jim or Tom, or the like of that.  
 14871. You did not know their surnames? I knew some of them who were on the board.  
 14872. Do you know any man who has left since January who worked with you? No; I have not seen any of them since I left.  
 14873. Was it the pier work you were doing on the Monier contract? The abutments.  
 14874. Not the arches but only the abutments? Yes.

E. Moore.  
 28 Aug., 1896.

14875.

- E. Moore.  
28 Aug., 1896.
14875. Do you recollect what sand was used? No.  
14876. Was it crushed sandstone? I do not think so. I think it was carted. The sandstone was crushed.  
14877. Do you know where it was carted from? I could not tell you.  
14878. Was it crushed by a crusher on the works? No; not the sand.  
14879. What became of the sand that came out of the crusher—was that never used? I think it was used on the stormwater channel.  
14880. It was not used on the other job? No.  
14881. Where did the white metal come from which went into the crusher? I believe it came from Pymont.  
14882. Did any come out of the tunnels? Not to my knowledge.  
14883. You did not see any come from the tunnels? No.  
14884. It came from Pymont? I believe it did.  
14885. Did any of it come from Annandale? I could not say. I believe there were quarries there. I could not tell you whether it come from there.  
14886. You do not know really whether it did all come from Pymont? No.  
14887. *Mr. Carter.*] You do not bother yourself about where the material comes from particularly? No.  
14888. It is your business to work it up? Yes; as long as I get my money on Saturday I am satisfied.  
14889. You haven't much time to be looking around and wondering where the stuff is coming from? It is not my business to do that. There are men paid for doing that.

Varney Parkes sworn and examined:—

- V. Parkes.  
28 Aug., 1896.
14890. *His Honor.*] You desire to make a statement to the Commission? I do. In June, I think, 1891, I was a candidate for the electorate of East Sydney in the Legislative Assembly; and during that contest the city was in a somewhat disturbed state, as far as the property owners were concerned, as to the inroads made upon properties by the Water and Sewerage Board. The sewerage system of the city was being constructed, and a great number of the sewers had been completed. There were constant comments amongst the people with whom I had to do—electors and workmen, contractors—as to the defective method in which the sewers were being put down. That was the first intimation I received of such information as I afterwards obtained. I did not pay a great deal of attention to it at the time; but I came to the conclusion that to put an end to these rumours, even supposing they were not true, the public works should be managed on a different scope altogether. When I was elected, the late Sir Henry Parkes, my father, sent for me and said that he was taking into consideration the matter of appointing me as Minister for Works, Mr. Bruce Smith going to the Treasury. I then mentioned these rumours I had heard of defective and costly works, and told him that anybody who was Minister for Works must put on a new footing altogether the Department, that he must establish a Board of Works and dismiss the officers of the Department, and only retain the heads as advisers and as consulting engineers, with a small staff, the Board being responsible to the Treasury, to manage the whole of the outlays on public works. Mr. J. H. Young became the Minister. After that, I followed up the information which I had obtained. I had in my employment an inspector of works whose name was Webster, and it was he who gave me this information. He said that Mr. Hickson, when he was employed at Adelaide, as an officer in charge of public works, had had misfortunes with those works which had put the Government of South Australia to a considerable loss of money. I made further inquiries about this matter, and I found that Mr. Hickson's works had come to grief in that colony. Then I became a little suspicious, seeing that he was controlling the sewerage works, whether the works were being constructed properly. After that I spoke to various Members of Parliament, Mr. Carruthers being one of them, about the establishment of such a Board of Works. We then tried to establish a society called the National Works Economic Society, the object of which was to govern the expenditure of public money, and to build up the basis of a National Board of Works. That brought about me certain contractors who gave me certain information. In every case I made an effort to find out the truth of their information. Of course, I found out that a good deal of it was false, and that some of it was true. I gave notice of a motion in the House during 1893 or the early part of 1894 to this effect, "That a Select Committee be appointed to inquire into the methods of contracting in connection with the letting of works by the Public Works Department. It was pointed out to me by the members of the Reid Administration that this really would be a vote of censure on the Government, so that my motion never saw the light of day beyond the preliminary notice. But I had a sort of indefinite promise from Mr. Reid, on consultation with him, that a Bill to establish a Board of Works would be considered. After the election of 1894, I gave notice of another motion dealing more particularly with the matter, and asking for a Select Committee to inquire into the constitution of the Public Works Department with the object of making reforms. The reason why I moved these motions was that the comments in the city amongst the builders and contractors were very serious with regard to this method of contracting by schedule—of obtaining tenders from these schedules; and that report about the schedules of Messrs. Carter, Gummow, & Co., was about the city certainly as early as the early part of 1894. All this information I did not act upon or make any very great efforts to find out the truth of until, in October, 1895, contractors Williams and Maddison called upon me and laid before me the whole of these statements which have appeared in my speeches. They told me in the first place that Mr. Maddison had been a member of the firm of Carter, Gummow, & Co., that Mr. Maddison had knowledge, which knowledge they assured me of, that Mr. Hickson's son was connected with the firm after their leaving it. I asked them to assure themselves of all these facts, because without a doubt they would have to go before some tribunal, where they would have to give evidence on oath, and even then I declined to take up the matter from them unless they brought a greater body of contractors who could vouch for the facts which they had placed before me. They then brought in other contractors. These other contractors, each of whom made statements to me, told me about the schedule of Contract 79, the schedule of Contract 69, and of Contract 72. They told me about conversations which Mr. Carter, Mr. Gummow, and Mr. Snodgrass, had had with them, very likely boasting statements, but some of which certainly have been established with the light of truth by subsequent evidence which has been given before this Commission. They also told me of the letting of Contract 77 on the Monier system. They put it to me in such a way that it certainly

certainly appeared to me to be a very improper way of contracting. When I heard of this intimation of a contract, a plan of which and the estimate of which had been given by the builders, and that they had obtained a schedule, I recollected my conversation with Mr. Webster, and that it was of a somewhat similar nature; that in a former case in Adelaide the trouble had been that the contractor had there introduced his own plan and his own specifications and his own tender. After I heard of these particulars from these contractors, there were workmen who brought me tales, some of which they will not substantiate on oath. It is useless for me to state their names, as they did not appear before this Commission. Two or three others who did give me information have given evidence before this Commission, particularly Dawson. I was very careful to make sure that there was something in this before I moved; and, in the first speech I made in Parliament concerning Carter and Gummow's relations with the Public Works Department, I only asked for a Committee to inquire into this matter; but, although my motion asking for a Committee or Commission ran through the business paper, on no occasion could I get the Minister for Works to give me even half-an-hour's opportunity of passing it. While I was waiting for that opportunity I moved for certain papers to be placed on the Table of the House. These papers clearly bore out at least the gist of that information which had been given to me. I could see that the papers were not complete, and that there must be a considerable amount of information which ought to be obtained by a Commission before the matter was allowed to rest. I also looked up the Parliamentary records to sift these rumours of the Adelaide misfortunes of Mr. Hickson. I found out that the Parliamentary papers of South Australia contained virtually the fullest information on this subject, which bore out what had been told me pretty clearly. So I thought, in the interests of the public, with the knowledge which was before me, that I was compelled to place it before a Commission. With regard to the various contractors who waited upon me in the matter, I can give the clearest information if necessary. In the first place, Mr. Williams and Mr. Maddison waited upon me. I said I would not take Mr. Maddison's statement unless it was backed up by Mr. Ewing, who he said was present. Then, on the second occasion, Mr. Ewing came with the rest of the contractors of whom I had spoken—I suppose ten or twelve of them. The gentlemen who were present were Mr. Gilliver, the Butchers, Mr. Williams, Mr. Ewing, one of the O'Neills and his partner, Mr. Rogers, who was a partner in the firm of Carter, Gummow, & Co., Mr. Benjamin Rhodes and his partner, and several others. After I got their information upon these particulars—all the particulars I have placed before this Commission were practically placed before me at that time—I asked the Minister for Works privately to have an inquiry into the matter which would have avoided altogether publicity; but he would not consent, and he accused me of having a personal grudge against Mr. Hickson. I would like to say, your Honor, that, instead of having a personal grudge against Mr. Hickson, I do not think I ever saw him before I became Chairman of the Public Works Committee, but perhaps once when I went to see him in connection with a bridge over George's River at Liverpool; so that I had no ill-feeling towards him. But when the Public Works Committee was being elected in 1894 I made an effort to get on that body, with the object of trying to use that position to see whether the Government did make up their estimates on a schedule form, and on an unreliable form, as I thought it was. It was there I came into contact with Mr. Hickson. I felt convinced that the work which was placed before that Committee, the prices put upon the work, and the method of estimating, showed that very grave extravagance was being carried out. But more than that, it was in my mind, from the evidence which was adduced, that Mr. Hickson had put an extravagant cost on the bridge with the object of pressing a scheme for the resumption of the head of Darling Harbour on the Committee. With all the knowledge I had of the different matters, with the knowledge I told you I have had, that was the only impression which was left on my mind; but it was not one of personal hostility. I do not think I have at any time shown towards Mr. Hickson personal hostility, and certainly not from any grounds which he could have given me, because towards me he has been always most courteous in all explanations. On matters where I have written to his Department, I have always received a courteous answer and business-like treatment. The information I have put before you is the reason of my moving for this inquiry. And as to the motives—if I am to be examined as to the motives—the motives were nothing but those which would come to any man in public life, who felt himself compelled to act upon information which was placed before him.

14890½. *Mr. Smith.*] Who is this Mr. Webster? He was, I believe, a resident of Adelaide.

14891. He was in your employment? Yes.

14892. How long? I suppose he was in my employment for about three years, perhaps.

14893. When? That would be from 1890 to 1892.

14894. Do you know where he is now? I really do not know.

14895. When did you see him last? He supervised the building of a bank at Brewarrina for me, and that is the last I had to do with him. I expect after he came away from that work he left me. That is the last I saw of him.

14896. What was he? An architect.

14897. You do not know whether he is in the Colony? I really do not know.

14898. Have you made any inquiries for him? No.

14899. You did not think, as you were going to mention his name here, that it would be advisable to know where he was? No; I had no need to bring him here, because the information which I had from him was to be obtained more fully from our own Parliamentary records.

14900. From our own Parliamentary records? No; I mean from the records of the South Australian Parliament, which we have in our Parliamentary Library.

14901. Did you make a note of these records you are referring to? I could tell you of them.

14902. Will you kindly tell us? The Votes and Proceedings for the years 1879 and 1880, and the speeches upon the Public Works trouble of the year 1879.

14903. This information which you got from them rests entirely on speeches? No; it rests upon a Commission before which Mr. Hickson himself gave evidence. It rests upon his evidence.

14904. Was there anything else besides what you have mentioned there? I can give you details if you wish it of what is contained in them.

14905. I do not want to hear what was in them. Was there any other book that you referred to containing information on this matter? No; those are the books.

14906. It was in 1890 that Webster came to you? It was perhaps in 1889.

14907. Was he in this Colony before then? I really could not tell you.

14908. Did he bring any reference when you took him in? I do not think he did. I was joint architect for the

V. Parkes. construction of the Australian Mutual Provident Society's Office at Adelaide, and I think he came to me through some architect there recommending him.

28 Aug., 1896. 14909. What was he there? I really could not tell you.

14910. You do not know? No.

14911. You do not know what his antecedents were? No; he came to me, and he seemed to be a man who knew his profession, and I placed him on the job.

14912. So that you do not know anything about his antecedents before 1889? No.

14913. And since 1892 he has vanished from your sight altogether? I expect he could be found.

14914. *His Honor.*] I do not understand that he gave you any more information than you say is contained in the Votes and Proceedings of the House of Assembly of South Australia? Not so much.

[*His Honor to Mr. Smith: The presence of Mr. Webster is immaterial. He would not be of any use if he were here.*]

14915. *Mr. Smith.*] I think you said you were the Chairman of the Public Works Committee when Mr. Hickson was examined? Yes.

14916. I think you said that Mr. Hickson was trying to force on the Committee a scheme, showing that the alternative scheme was so expensive? Yes, I did.

14917. *His Honor.*] It was a substitution, by a closing up of the head of Darbour Harbour, for a Pymont Bridge? The question at issue was a new Pymont Bridge or a closing up of the head of Darling Harbour.

14918. *Mr. Smith.*] I think you went to considerable trouble in getting outside evidence of experts? Yes.

14919. You went to a great deal of expense too? £110. That does not seem a very great deal.

14920. In fact, there was a little trouble on the Committee about your having done that without having consulted the members of the Committee? Yes; but I did not do it without consulting them. They only complained of its costing that.

14921. Referring to the minutes of your proceedings on the 7th November, 1894, I think a resolution was passed that the Committee proceed to consider the evidence with a view to reporting on the subject to the Legislative Assembly? Yes.

14922. I think a timber bridge was to be recommended? Yes.

14923. Then, I think, you will find that, by consent, on 13th November, the chairman—that is, yourself—addressed the Committee? Yes.

14924. After your statement a resolution was passed to reopen the inquiry in consequence of the statements you made? Yes.

14925. Then I think you will find that on the next day Mr. Hickson was further examined? I believe he was.

14926. You remember that you cross-examined him on 14th November as to some supposed contradictions in his evidence? Yes.

14927. He was cross-examined at great length by you? I believe so.

14928. And Mr. Darley was examined too? Yes.

14929. Then finally the report is drawn up, and after the examination on the 15th November you resigned? Yes.

14930. Somewhere about that date? Yes.

14931. A report is drawn up on 21st November in which this passage occurs:—

The resolution which contains the present Committee's decision in their inquiry was passed on Wednesday, 7th November, but at the next meeting of the Committee, in consequence of certain statements made by the Chairman in condemnation of the proposed timber bridge approved of by the Committee, it was decided to reopen the inquiry for the purpose of further examining the Commissioner and Engineer-in-Chief for Roads and Bridges, and examining the Engineer-in-Chief for Harbours and Rivers. These officers were accordingly called before the Committee, and closely questioned on the points which had been raised by the Chairman. The evidence dispelled all doubt as to the stability of the bridge as designed, and confirmed the Committee in their decision to recommend its construction. The Commissioner and Engineer-in-Chief for Roads and Bridges pledged his professional reputation that the bridge will be thoroughly suitable,—perfectly safe, containing no structural defects, and serving the probable traffic between Sydney and Pymont. He would prefer, he said, an iron bridge; but he recognised that it may not be desirable at the present time to erect such a bridge, seeing that his estimate of its cost is £220,000.

? Yes.

14932. That is substantially a correct account of what took place according to the minutes we have gone through? Well, it is what took place at the Committee.

14933. The Committee, whatever view you may have taken of Mr. Hickson's evidence, based their report on the evidence of those two officers? Yes.

14934. They did not agree with you at all events in your view of his evidence? Of course that was only the report of the majority. You must remember that four members of the Committee took the same view as I did.

14935. Then I think you stated afterwards that your reason for leaving the Committee was that you considered that the Committee was going more for the salvation of the officers of the Department than for the salvation of the public interest—was not that the expression you used? I believe I did say that. I said that the Committee instead of trying to economise in the cost of the works took the evidence of the Departmental officers to sustain them in everything, eliminating altogether that of independent witnesses, and that, therefore, they were more looking to the salvation of public officers than to the interests of the country.

14936. Did you say this:—

I always thought the Committee was sworn to the salvation of the public funds, but I find the majority of the members are only bent upon the salvation of the interests of the official heads of departments.

? I believe I did.

14937. I think it was a majority of 9 to 4? I think so.

14938. Although there was that fullest inquiry, and that judicial finding on the inquiry, I think you afterwards told the House and the country that Mr. Hickson's evidence on that occasion almost amounted to perjury? I said—

14938½. Did you or did you not say that? It would be better if you would read my Parliamentary speech and ask me on what appears there.

14939. Will you answer my question whether you did say that? I will tell you exactly what I said by looking at the speech.

14940.

14940. I ask you whether you remember having said that? What I recollect having said is that Mr. Hickson's contradictory evidence amounted almost to perjury—if I recollect aright.

14941. I will read you what you did say :—

V. Parkes.  
28 Aug., 1896.

The evidence was so inconsistent and so varying, that having been given on oath, it almost amounted to perjury.

? That is practically the same.

14942. You think in face of what took place there you were justified in making that statement to the House? I did, indeed. I thought I was absolutely justified.

14943. Do you think that is a fair discharge of your duties as a representative of the people? —

*His Honor (to Mr. Smith).] We are going a good deal outside the question now. Mr. Parkes is not in any sense on his trial before this Commission. If Mr. Parkes had narrated facts which were material to this inquiry, some latitude might be allowed in cross-examining him as to his credibility. That question does not arise at all now. As to Mr. Parkes' action as a Member of the House, it is going too far for us to go into that matter.*

*Mr. Smith.] I submit, your Honor, that this statement of facts has been made in such a reckless way that I am entitled to show what this witness considers to be a fair way.*

*His Honor.] I say that that is going outside the question altogether. Mr. Parkes did touch upon his motives, but it was only to a very slight extent. As I have all along said, they are utterly immaterial. I do not wish to go into questions which are not essential when there is so much to consider which is essential.*

*Mr. Smith.] I will be as short as I can, your Honor. That seemed to me to be a distinct charge of almost perjury.*

*His Honor.] It may be well-founded or it may be ill-founded; but the motive which induced the charge being made is immaterial.*

14944. *Mr. Smith.]* When was young Mr. Hickson's name first mentioned to you, and by whom? It was mentioned to me the first time by Williams and Maddison.

14945. When? Somewhere about the 20th September.

14946. That, I suppose, would be shortly before you asked that question in the House on 19th September? What question was it?

14947. On 19th September, 1895, Mr. McCourt, for Mr. Parkes, asked a series of questions referring to certain contracts; but the principal questions are the following :—

(7.) What connection has a Mr. Hickson with this firm or with the works? (8.) Is this Mr. Hickson a son of the present Engineer-in-Chief?

Mr. Young's answer to these questions was as follows :—

(7.) He is engineer to the contractors. (8.) He is the son of the Engineer-in-Chief for Public Works; but the Balmain contract referred to is being carried out under the supervision of the President of the Water and Sewerage Board and Engineer-in-Chief for Sewerage Construction, Mr. Darley. In the case of the other contract referred to, namely, the sewerage works at North Sydney, which was carried out under the supervision of the Engineer-in-Chief for Public Works, I am informed that Mr. Hickson, junior, had no connection with the work, being at that time in South Australia.

These two questions were asked by you? Yes.

14947½. You did not take that answer from the Minister as true, did you? That was on 19th September. I must have asked these questions within a very short space of the time I received the information, but if I asked these questions at this date I must have received the information from Williams and Maddison in August before that, because before I asked those questions I saw the other contractors. The reason why I did not take this answer—

14948. I did not ask you for a reason; I asked you, as a matter of fact, if you did or did not take that answer as correct? I did not take it as correct.

14949. In fact, in your first speech, on the 26th September, on this matter, you said: "I asked the Secretary for Public Works last week what connection Mr. Hickson had with the firm and with this work. I was told that Mr. Hickson was the engineer to these contractors"? Yes.

14950. Did you go on to say: "But I am informed upon the most reliable authority, that of a Mr. Maddison, the contractor who has left this firm, that Mr. Hickson took the position as a partner in the firm, he being a son of the Engineer-in-Chief"? Yes.

14951. Did you have any statement in writing from this Mr. Maddison? No. I did not accept this. I said to him, as I said to all those who came to me and urged me to get this Commission, "If you urge for this Commission you must be prepared on oath to state what you state here," and they said, "We are."

14952. Who said that? Maddison and Ewing. I felt convinced and I thought to myself that if a Commission or Parliamentary Committee was granted certainly the truth would come out.

14953. Then you go on to say :—

Now, it is an unfortunate position that this firm should have been allowed contracts under such circumstances as these; their engineer having to communicate with his father, who is in a position in the Public Works Department, in which he could grant all sorts of concessions. This firm are the only contractors who, during the last twelve months, have received these numerous concessions. I have it upon the authority of Mr. Maddison, who has undertaken to produce a copy of the telegram, that a wire was sent in March, 1894, by one of this firm of contractors, Mr. Carter, to another member of the firm, Mr. Gummow, who was then in South Australia, to this effect: "Mr. Hickson must be taken into the firm at any cost."

Do you remember saying that? Yes.

14954. Did Mr. Maddison then tell you that a telegram had been sent to the effect mentioned here? He did, undoubtedly.

14955. You know that he denied it here on oath? I have heard it denied; but I have heard a good many things denied on oath here.

14956. At all events, you find now that he is not the reliable authority you thought he was—is not that so? Of course, I heard his denial of some matters on oath, but Mr. Maddison since he gave me that information fears that he is in the position of one of these contractors.

14957. How do you mean? He becomes one of the firm of contractors by his former association, and that is the trouble.

14958. So he has come here and perjured himself—is that what you mean? What I say is this—

14959. Is that what you mean? What I say is this—by denying what he said before—

14960.

V. Parkes.  
28 Aug., 1896.

14960. Answer my question—yes or no?

[His Honor to Mr. Smith: Mr. Parkes is explaining that something was said to him before, and that something else has been said on oath; and the conclusion draws itself. It is one of those questions which I generally stop Counsel from asking.]

He might have given me a wrong statement there and given me a correct statement here.

14961. Mr. Smith.] You find out now, Mr. Parkes, that he is not a reliable authority? That seems to be so on some points.

14962. There is no doubt, is there, that this reliable authority is absolutely unreliable;—answer no or yes? I must say that his statements look to be unreliable on some points.

14963. This was the authority you were setting up against the official information you had received? Yes; but you must change the position of time.

14964. Then we come to the next paragraph:—

It was about this time that Mr. Hickson left the Department, as his father said, on the score of retrenchment, and took up his position as an alleged partner in this firm; or, as I have been informed by the Minister, their chief engineer.

Who told you that? Of course I gained that information from these contractors too.

14965. You told the House that Maddison had not got his telegram—that a copy could be got from the Telegraph Department? Yes.

14966. Had you made any inquiries there? I have, and I find that they destroy their records after twelve months.

14967. When did you make these inquiries? I made these inquiries after this Commission sat, with the object of producing the telegram as evidence here.

14968. Not till then? No; it is a remark which any man might make.

14969. You made inquiries, and you found the records were destroyed? They destroy them after twelve months, they tell me.

14970. Did you ever ask Mr. Maddison to fulfil his undertaking, and get that copy for you? When the Commission was granted —

14971. Did you or did you not—answer straight? When the Commission was granted —

14972. I do not want to know about the Commission. I ask you did you or did you not ever ask Mr. Maddison to fulfil his undertaking;—say no or yes, and explain afterwards? When the Commission was granted I asked him to fulfil his undertaking—to go before the Commission and give his evidence and produce his facts.

14973. It was not until the Commission had been appointed that you asked him that? That is so.

14974. You go on to refer to Contract 77—but I do not want to go into that matter now—and then you refer to the letting of Contract 79A without a tender. You refer to Mr. Hickson's minute of the 22nd March, 1894, and to his subsequent minute of 29th March, 1894; and after reading the minutes you say:—

This was on the 30th March, 1894. How sudden a change? It is not the Minister who has to do with this. The Minister is generally led by the Head of the Department, it does not matter whether it is the present or the last Minister. The Heads of these Departments ought to be above reproach. There ought to be the greatest possible check put upon them. When we see a rapid change like this in a minute in a few days, after a son of the gentleman concerned has taken office under the contractors, then there is some suspicion.

You said that, did you not? It is in the speech, I believe, if you read it correctly.

14975. You told the House then that this second minute of Mr. Hickson's, which you say is a change on his former one, was written in consequence of or in connection with the fact that his son had been taken in as a partner? Are the minutes in *Hansard*?

14976. The minutes are printed in *Hansard*, at page 1201? I forget what they were. It is quite possible for a man who knows anything about affairs and who gathers partial information to make an error. It is very possible that they appeared in that form to me, because they are contradictory.

14977. You think they are contradictory? Yes.

14978. At all events, Mr. Parkes, you told the House that it was a matter of suspicion that this change of front on Mr. Hickson's part took place at the very time his son was taken in as a partner? Yes.

14979. It now turns out that your premises were absolutely false;—isn't that so. Had you the definite information at that time that Mr. Hickson, junior, was taken in as a partner? Of course, in making my speech—

14980. Did you have any definite information, or did you not? Sufficiently far to guide me in my speech.

14981. In dealing with the other answer which the Minister gave, you said that Mr. Hickson, junior, had no connection with the contract at North Shore, being at that time in South Australia, and you go on to say—

But Mr. Hickson has been going backwards and forwards between here and South Australia.

Who told you that? Undoubtedly I was mistaken there. I was told by those who waited on me.

14982. Do you remember who told you? The contractors generally. I could not tell you the individual contractors who did. It might have been Mr. Maddison or it might have been Mr. Ewing.

14983. There has not been one word of evidence adduced here that anybody told you that? After all the point is not very material.

14984. From your point of view it is not very material whether he came backwards and forwards? At the time I made my speech it was in my mind that he examined all the work. In the light of his evidence I see he did not.

14985. At that time you were under the impression that he was looking after all their works? Yes.

14986. You remember the House adjourned in December? Yes.

14987. And shortly before the adjournment certain papers were laid on the Table of the House? Yes.

14988. The Minister ordered the laying of the papers on the Table on 19th December, 1895? Yes.

14989. Does Mr. Hickson say, at the bottom of page 2 of the Parliamentary paper—

My son is not now, nor ever was, a partner in the firm, and as he happened to be in Adelaide, and, as far as I know, knew nothing about the firm's transactions in Sydney, he did not communicate with me, either directly or indirectly, in connection with the firm's business.

Yes, he does; but what about that?

14990. You see there that you have Mr. Hickson's denial? He says his son is in Adelaide "now," but his son was up here from at least August.

14991.

V. Parkes.

14991. We will have the whole of the answer—

I know nothing about the telegram alleged to have been sent in connection with the appointment of my son, having heard of it for the first time in Mr. Parkes' statement, and cannot understand how it could have been sent, seeing that my son left the Department in April, 1893, and that the telegram of March, 1894, is said to have been sent when he had already been in the employ of the firm for nearly twelve months.

When you saw that, did it occur to you then to make inquiries about that telegram? No, it did not.

14992. Did you make any inquiry at all about it? No, because I intended to force this to a Commission, and I intended when I got that Commission that I should obtain all the evidence properly. You must remember that when you go privately to obtain information from a public department, you have very little chance of getting it if it causes trouble; but if the Commissioner ordered the production of this document it would be produced. I applied to the Postmaster-General for information as to how I was to get this telegram, and then I intended to ask His Honor to give an order for its production here; but the Minister informed me that every telegram in the Department was destroyed on the expiry of twelve months. What was the good of my going any further then. As to getting information of a detailed character like that I never attempted to do so. I wanted to force this matter to a Commission. If I was wrong I was wrong; but the information I received was sufficiently strong. I am quite willing to admit wherever I am wrong; but, in any case, you see at once that it is only a statement of what is said to me. It is asking for an inquiry to see whether the contents of that speech are correct.

14993. Although you had the undertaking of Maddison to produce a copy of the telegram, it did not occur to you to fulfil that undertaking? It did.

14994. It did not occur to you before May? No.

14995. Although you had distinctly a denial of the truth of his statement? You know when I got—

14996. Is it not so? Yes; but that report, although it was laid on the Table of the House on 19th December, I did not get until about six days before I made my speech.

14997. Your second speech? No.

14998. You did not have it in your hand? No; in fact, it was a Member of the House who showed me the report, otherwise I should not have known about it.

14999. When you did see it you made no attempt to see who was right? No; I left everything to be cleared up by the Commission. You will see that I commented on it in my second speech.

15000. At the time you made your second speech, you had made no further inquiries at all? Not on this point.

15001. Did you see Mr. Maddison? Yes; I had many conversations with him on the matter.

15002. After you had seen the paper, and before you had made your second speech on 12th May, had you seen him? I could not tell you.

15003. You cannot remember whether you confronted him with what Mr. Hickson had said? No. All I know is the moment the Commission was granted—

15004. I am not taking about the Commission at all? It is the only way in which I can explain it to you.

15005. All I want to know is whether, between the reading of that answer by Mr. Hickson and the making of your second speech, you made any inquiries at all? There were only six days in the meanwhile, and I did not. The reason why I did not do so was because I spent all my time in hurrying through to get this Commission granted. I used every effort to do it. After the Commission was granted I sent for all the witnesses who had given me information, and said, "Well, now you must prepare your material." I informed Maddison, amongst others, that he must get the particulars he had given to me.

15006. Without making inquiries you told the House in your second speech that Mr. Hickson's statement was untruthful from beginning to end? Where did I say so?

15007. It is reported in *Hansard* at page 24? Did I say in this particular detail?

15008. You said, "Let me take up this report of the Engineer-in-Chief; it is untruthful from beginning to end"; and you go on to deal with it in the very first sentence. Without making any inquiries you made that statement to the House? Where did I comment on Mr. Hickson's son in that speech?

15009. In fact, you complained very much to the House about this statement being put before the House about the time it was put before the House, and the manner in which it was put before the House. You thought it was intimidating Members of Parliament to do it? No. I say—

15010. Did you not say there would be intimidation if this sort of thing was allowed? Read the words I used, and I will answer as to them.

15011. You said in your speech:—

I want to point out to hon. members that under the course pursued the Engineer-in-Chief is allowed to come into this House as if he were a member of it, and abuse an hon. member who attempts to challenge his conduct as a servant of the State. If that is to be allowed the privileges of every hon. member are gone. The Engineer-in-Chief says:—Although it may be thought, as, indeed, it has been said, that I am making too much of this matter, and that no one really takes any serious notice of these statements, I need hardly point out what a serious matter it would be if they were believed.

? I did.

15012. Again on page 37 you say—

Nothing can so drag the privileges of Parliament through the mud as to allow of any intimidation against hon. members stating here their free thoughts on all subjects.

? "Without reflections being made on them," I should have added.

15013. You complained then of these papers being laid on the Table in this way? Of their being laid on the Table on the last day of the session and as a Report on Public Works.

15014. How can you say it was an attack on you? Because of the first paragraph. While I was asking for a commission, which could have been granted on the following day, in the month of October, the Government blocked in every way the motion; and at the end of the session, when the motion could not come on, the last thing which was done was to put this report on the Table of the House; then would come a recess of, it might be, six months for all we knew, and it would have to remain there as a record of the House, and with that comment of Mr. Hickson contained in it.

15015. It did not occur to you then, after having made certain definite charges on certain facts against Mr. Hickson, that it was only a fair thing to give Mr. Hickson the earliest opportunity of replying to those charges? He ought to have had it. It was not my fault that he had not.

15016. In this speech, at page 24, you said:—

I can prove by statutory declaration that he came over twelve months before with Mr. Gillan, one of the contractors.

? Yes.

15017.

- V. Parkes.  
28 Aug., 1896.
15017. Where is that statutory declaration? I had not one.
15018. You indicated it? No.
15019. Who made it? One was not made. It was one undertaken to be made.
15020. You said, "I can prove by statutory declaration." You meant that some other reliable authority had said that he would make one for you;—who was that? That was, I think, Dawson. I am not sure whether it was Dawson or whether it was Ewing; it was one of them.
15021. You never got that statutory declaration? No. It is of little or no value. It was not worth while.
15022. You did not consider it a very important statement? Nor does it matter very much at what time he came up.
15023. We know, as a fact, that he did not come up at all except on a holiday? The evidence establishes that fact.
15024. Then you said again here, distinctly, Mr. Hickson's son came up from Adelaide with Mr. Gillan to sign that bond? Yes.
15025. Who told you that? Maddison and Ewing told me that. If you were to read on further and ask me whether I made a statement as a continuation of that you will see the reason why.
15026. After that speech you say you made no inquiries at all until the Commission was granted? I think the Commission was appointed within three or four days of that speech—certainly within a week.
15027. I think the Commission held its first sitting on 27th May; did you make any inquiries before that date? No.
15028. You made no inquiries before 27th May as to the evidence to be adduced? No; except as to preparing the evidence.
15029. Did you make any inquiries with regard to young Mr. Hickson;—did you see either of these witnesses, and find out whether they could substantiate their statement? I told you that I waited until after the Commission was appointed.
15030. On the first day, did you make any inquiries? I sent for all the witnesses to ask them if they were prepared to make their statements.
15031. Did you press them on the truth or otherwise of this charge about Mr. Hickson? No.
15032. You made no specific inquiry about that? No; I was convinced in my own mind that they were correct. I was convinced that everything would come out exactly as they said.
15033. In spite of this distinct denial given officially twice? Yes; but there are many things in this denial which would lead one to doubt it.
15034. It would depend upon who the one is, perhaps? Yes.
15035. At all events you made no specific inquiry, although the truth of Maddison's statement had been absolutely contradicted before 27th May? I made no inquiries for this reason—that there are two statements, and the Commission would elucidate the truth.
15036. On the first day the Commission sat, I think you formulated some charges, which you called—  
Charges made in the Legislative Assembly of New South Wales as to improper conduct in connection with contracts of Carter, Gummow, & Co., and referred by the said Legislative Assembly to a Royal Commission for inquiry and report.  
? Yes.
15037. One of those charges was—  
That Robert Hickson, while being an officer of the Crown, viz., Engineer-in-Chief for Public Works, did act collusively with his son, George Hickson, a partner of the firm of Messrs. Carter, Gummow, & Co., by which the said George Hickson obtained wrongly money belonging to the Crown.  
Yes; but I withdrew that charge.
15038. On the 15th June you withdrew that charge? Yes.
15039. And on that date you formulated this charge:—  
That Robert Hickson, while an officer of the Crown, viz., Engineer-in-Chief for Public Works, did allow of undue concessions being granted to Messrs. Carter, Gummow, & Co., contractors for sewerage works in the Colony of New South Wales—his son, George Hickson, being an interested party in the firm of Messrs. Carter, Gummow, & Co.  
? Yes.
15040. What took place between the 27th May and the 15th June which induced you to alter the form of your charge? In the first place I thought the charge was worded in too harsh a manner, and in the second place, on the day before Maddison and Ewing came here, from their conduct they seemed to me so very anxious to get out of the affair altogether, because they were going to be brought in on defective work with the other contractors, that I was doubtful whether they would give me such full particulars as formerly.
15041. I suppose that was the first time when you began to find out that your authority was not reliable; is that so? I really thought at the time that they would become adverse witnesses from the fear of being associated with the defective work.
15042. So you thought it wiser to alter the form of your charge? Mr. Hickson objected to his son's coming up first of all. I never intended to put in this charge at all. I put it in in the first place with the object of getting full and truthful information before the Commission from young Mr. Hickson. He would not have come back without a pretty strong charge being made.
15043. It was a pretty strong charge of dynamite? That charge was put in really with the object of inducing Mr. Hickson to fetch his son back here to give information. It was on information, which I considered to be so conclusively true, at the time, that it would be sustained. You must remember that I did not put this charge in until after I saw that Mr. Hickson, junior, would not come to the Colony. I thought it was absolutely essential to have him here, and therefore I put the charge in. If he had been coming I would not have made any charge at all; I would have taken the matter in Maddison's and Ewing's evidence and not made a charge. I asked His Honor too.
15044. At all events the main reason was that when you saw Maddison here, just before you called him on 15th June, you began to see that he was wavering;—is that the reason why you altered the charge? That is another reason I intended to alter the charge all along.
15045. What did you put it in for at the start? I made the charge in the strongest language with the object of inducing Mr. Hickson to fetch his son back.
15046. You think that is a proper thing to do—to bring a serious charge like that of corruption against a public officer and leave it standing on the records of this Commission for upwards of three weeks with that object? I was under the impression that I had absolute evidence to sustain it. It was a matter of kindly feeling to Mr. Hickson which made me not put it in in the first place.
- 15047.

15047. What do you mean? It was a consideration for Mr. Hickson's feelings; I thought his son would not be here. V. Parkes.
15048. You say then that this charge was substituted on the 15th June, after you had had an interview with Maddison, previous to his examination here? Yes. 28 Aug., 1896.
15049. Then what took place at that interview induced you to alter the charge? Yes. They came to me and protested that bad work was being entered into; that their names had been inserted in the Commission; and that they were making a "whip for their own backs."
15050. Did you ask them whether it was true what they had stated before with regard to young Mr. Hickson? Yes.
15051. Why did you alter the charge if they still stuck to their statement? I never intended to put in that charge till I had the information. I put it in strong in order to induce his father to fetch him here.
15052. Did you take legal advice; did you consult Mr. White or any other solicitor with regard to that charge? Yes.
15053. Were you advised that it might amount to libel? No; he advised me that I could make my charges as definite as I wished; that, in order that the Commission might obtain the truth, this charge might be made as full as possible.
15054. Nothing further than that? No.
15055. Mr. Hickson, junior, was examined here on the 17th June, and this substituted charge was put in on the 15th June, two days before. It was known at that time that he would be here. Was not that the reason that you thought it advisable to pull in your horns? No; that was not the reason. I was never more surprised than I was at the evidence that was given. I was fully convinced that the facts I had stated were true.
15056. You heard young Mr. Hickson's evidence? Yes.
15057. He swore here what was the extent of his interest in the firm, viz., a salary of £5 per week? Yes.
15058. You once thought he got a travelling allowance? Yes.
15059. You heard the evidence of Mr. Carter confirming that? Yes.
15060. You heard Mr. Gummow, too, I believe? Yes.
15061. You still think there is a shadow of a doubt that Mr. Hickson, junr., had any interest in the firm beyond that? It is not for me to judge of the evidence, but I have a doubt.
15062. In the face of the books you say that there is a shadow of a doubt? I do. If Mr. Carter and Mr. Gummow had not given their evidence I would not. They made a statement in their evidence which does leave me in doubt now.
15063. When this substituted charge was put in you were required to put in particulars of the "undue concessions"? Yes.
15064. You included Nos. 1, 2, 3, 4, and 7, of the charges on Contract 69? I did.
15065. And certain others and Nos. 1, 2, and 4, of Contract 79A? Yes.
15066. In this charge you say:—
- That Robert Hickson, while an officer of the Crown, viz., Engineer-in-Chief for Public Works, did allow of undue concessions being granted to Messrs. Carter, Gummow, & Co., contractor for sewerage work in the Colony of New South Wales—his son George Hickson being an interested party in the firm of Messrs. Carter, Gummow, & Co.
- Do you mean to charge from that that, because George Hickson was an interested party, these "undue concessions" were made? What I mean is that Mr. Hickson's son, having an interest with the firm as long as they had Government contracts, was kept there. It seems that during the period he was there. This is not for me to judge; it is for the Commission to judge.
15067. All I want to know is the meaning of this charge;—do you mean to say that, because Mr. Hickson, junior, was an interested party, therefore "undue concessions" were made? I conceived it to be so.
15068. You had not quite said whether that is what you do mean? From information I had I conceived it to be so.
15069. That is the way you want to put in before the Commission? As far as I could see that was so.
15070. You say that one of these "undue concessions" on Contract 79A was "with allowing defective work to be done by which a loss is sustained by the Crown";—you say that was done because young Mr. Hickson had an interest in this firm;—is that your charge? Yes; in a way.
15071. Is it or is it not? In a way.
15072. It is, in a general way, a charge? I would be acting the part of the Commissioner if I were to proceed with a reply.
15073. *His Honor.*] The question is not on what has transpired since, but on what was in your mind when you defined the charges in that way? It was in my mind that that was so.
15074. *Mr. Smith.*] That this defective work was allowed to be done because young Mr. Hickson was associated with this firm? Yes; because contractors known to do defective work once should not, I hold, be allowed to have a second contract from the Department.
15075. What was the defective work you had in your mind with regard to Contract 79A? In that case I thought I should be producing, and I have produced, evidence that there was a deficient quantity of material put in the contract.
15076. Was there any evidence besides the evidence of Dawson which you had in your mind? Yes; there is the evidence of Reid, the Inspector.
15077. Of Reid, the Inspector, and Dawson, and who else? I think those are the two.
15078. What had Reid to do with Contract 79A;—did he lead you to believe that he had anything to do with it? I thought you said Contract 79. I think Reid was an Inspector for Contract 79A.
15079. Did you get any statement in writing from Reid? No; but I got a statement from him.
15080. It was a verbal statement; was there anything else;—in fact, Dawson is the only one who has given evidence about Contract 79A? No; there was nobody else.
15081. Do you mean to tell the Commission that you charge Mr. Hickson with allowing that defective work which Dawson told you of because of young Mr. Hickson's interest in the firm? I was wrong in saying that there was not another witness. You must remember that Hansen, who was to give evidence, did give evidence before the Commission. He was dismissed from the job, and I had him in mind.
15082. You had Hansen in mind;—what did he tell you, then? Before the Commission?
15083. At the time you framed this charge? Hansen did not tell me anything.
15084. What had you in your mind? I had been told that Hansen had done this defective work.

V. Parkes. 15085. Was there anybody else besides Dawson whom you had seen, and Hansen whom you had in your mind? Yes; Reid had told me that he believed there was defective work on that job, and that if he had been retained as the inspector he could have prevented it.

28 Aug., 1896.

15086. Was there anyone else who told you about this defective work? No.

15087. Why did you arrive at the conclusion that this defective work had been allowed because young Mr. Hickson was associated with the firm? I must admit that, in asking me to fix these charges, you set a fair trap for me.

15088. Not a bit? In the first place, I hurriedly enumerated those without looking at that; but I hold all the same that the head of a department, when he knows that a contractor has once done defective work, should take very good care that he does not do it again, and should see that an inspector who is preventing it is not removed from the work.

15089. Do you say, with regard to this, that I set a trap for you? It looks very much like it.

15090. You think, then, that when I applied for these particulars of this vague and general charge, and His Honor ruled that it was a reasonable request, I was setting a trap for you? I did not at the time see your object, but I see it now.

15091. You do not think it was a reasonable thing, when a vague and vast accusation of this kind is made, that the man who lays the indictment, as it were, should be pinned down to particulars? Is it a vague and vast accusation?

15092. *His Honor.*] Now, Mr. Parkes, you have not answered that question so far as it requires an answer? I do not think it is a reasonable thing—not before a Commission on public matters.

15093. *Mr. Smith.*] You think that a man ought to be allowed to make this general accusation and not specify what he means? I think he ought to have the fullest scope for his charges.

15094. In asking you for these particulars you think you were limited in that scope you are entitled to? I think you meant to limit it in some manner for your own objects.

*His Honor (to Mr. Parkes): Remember you are not bound down by these specific charges, as I told you at first.*

*Mr. Parkes: Yes, your Honor.*

15095. *Mr. Smith.*] With regard to Contract 79A, did you not know at the time the charge was framed that this contract was not under Mr. Hickson at all? No, I did not.

15096. This defective work was not done until December, was it? But I did not know that Mr. Hickson had not control of this work.

15097. You did not know that? I do not know at the present moment that he had not.

15098. Although you heard the evidence here? I must not be the judge of the evidence.

*His Honor.*] Of course, Mr. Smith, the contract ran for a time after the change took place. It began before the change took place.

*Mr. Smith.*] But we have the evidence of Dawson, your Honor.

*His Honor.*] It is hardly fair to put the question in that way. When Dawson got in the box it was cleared up, with considerable difficulty too, what date he intended to refer to as the date on which he said he knew defective work was done.

15099. *Mr. Smith.*] I think I will leave Mr. Hickson, junior, alone now. I want to ask you, Mr. Parkes, one question which does not appear to be a charge formulated. In your first speech, on 26th September, at page 1198 of *Hansard*, you said:—

There is a set of contractors whose names or titles are Messrs. Carter, Gummow, & Co. They contract for various works in this country; at present most of them are about Sydney. This firm of contractors are identified with the Government in the most suspicious fashion.

I want you to tell the Commission what you meant by the word "Government"? The Government Department.

15100. Do you mean that this firm of contractors is identified with the Ministerial Head of that Department? No.

15101. You do not mean that? I do not know whom they are identified with. It is a general statement. How is it possible for a Member of Parliament to obtain the exact facts of a case. In a speech, he is bound to make general statements; and, on the information I had, it was a justifiable remark to make.

15102. Have you, Mr. Parkes, any more evidence to produce? There is some overlapping evidence which I have not been able to obtain, but which I asked His Honor if he would allow to be brought in.

15103. Have you any other evidence on which you base that charge of this firm of contractors being identified with the Government other than what you have called here? Yes; there is a good deal of evidence which might at any moment be available. During the time I conducted my case the Department, through yourself, brought in evidence which was not objected to; and I intend to ask His Honor to allow me, should I get any evidence which has not been available to me, and which I had before me when I made that speech, to allow me to submit it; and I do not think you can take exception to it.

15104. I certainly shall not object—that is, on this particular charge of this firm of contractors being identified with the Government in a suspicious manner;—how many of these deputations waited upon you? I suspect there were four or five.

15105. Were they all before the first speech was made? That I could not tell you; I cannot quite recollect.

15106. But Williams and Maddison were the prime movers in the thing? They were the first two who approached me. They said they had been requested by a number of smaller contractors, who had no opportunity of tendering, to come and see me. They put the statements before me. I asked, "Who are these other men?" and they enumerated certain firms. I told them to bring them to me.

15107. Do you know why they came to you? They told me the reasons, and the reasons are before the Commission.

15108. In fact, you were known to be a man who was very much against the present system of administering this Department? Yes.

15109. You have told us this morning that these two induced you to table the motion? Yes. They asked me in conjunction with other contractors to bring the matter before the House.

15110. I think besides that there was that notice of motion you gave in April, 1892? Yes.

15111. Which was referred to in the evidence of Mr. Davis the other day? Yes.

15112. Your idea in April, 1892, was to abolish all the professional officers? Yes, and to establish a national Board of Works. V. Parkes.

15113. These contractors came to you, I suppose, knowing that? I could not tell you.

15114. Williams and Maddison were the chief prime movers, and they brought the others? They were the first who waited upon me, others came afterwards.

15115. We have had half-a-dozen of them here;—we have had Butcher, Ewing, Gilliver, Rhodes, and Williams? Yes.

15116. You mentioned O'Neill;—he was one of them, wasn't he? I really could not tell you at this moment whether he was present at that deputation, but he was with me. They were rather straggling deputations.

15117. When did you last see O'Neill? I saw O'Neill after I had made my speech in Parliament the last time.

15118. Why did you not call him? Because he went back on everything he told me. I looked upon him as being an unreliable man.

15119. Then his tale was not true? How about Rogers;—has he gone back on you? I never called Rogers, because I am not quite sure whether his evidence was material. There is nothing in question on which he could give any evidence.

15120. I think Crosbie was mentioned by Gilliver;—do you know him at all? I do not know him. He might have been in the room.

15121. You referred to Mr. Carson in Gilliver's evidence;—you suggested his name to Mr. Gilliver? I do not think so.

15122. These are the questions I referred to:—

5274. You have named eight or nine of them? Yes. In addition to those I have named, there were Crosby and others—in fact, pretty well all the small contractors. There are three contractors who are not on a footing with us—M'Sweeney, Carter, Gummow, & Co., and Ahearne.

5275. What about Carson? He is engaged upon a railway. The balance present would be the small fry contractors.

That is a humorous remark. I wanted to know whether Carson was amongst the great contractors.

15123. *His Honor.*] He was the remaining sewerage contractor whom you remembered? Yes.

15124. *Mr. Smith.*] Carson was not one of those who attended the deputation? I never supposed he was. It completed the list. It was not worth while to report the question.

15125. There are no others, Mr. Parkes, whom you remember? No; I cannot remember now; but if you wish to have the names I can give you the names, because I entered them up.

15126. You have a list of the names of the small fry that Mr. Gilliver talked of? There is sure to be a list in the office.

15127. Each one of these contractors had his grievance, I think;—hadn't he his complaints when he came to you? Yes.

15128. They all came with complaints, one and the other? Yes.

15129. They were all men with a grievance? I do not know whether you can say a grievance. They all had some information.

15130. For instance, there is Mr. Maddison, who said the grievance of the contractors was that they had not a fair go at the tender-box? Yes.

15131. There were similar complaints? Yes.

15132. In fact, they were very jealous of Carter, Gummow, & Co., weren't they? I cannot tell you.

15133. But didn't they say that Carter, Gummow, & Co. were in the swim, and that they were not, and that they were determined to burst up Carter, Gummow, & Co.? No. They said to me, "You understand construction work, Mr. Parkes. You have taken some steps in connection with the Works Department, and you took some steps on the Public Works Committee. We can give you some information of something which has been done wrong in connection with the Sewerage Department, and if you like to listen to it you can correct it as it ought to be corrected." That is about the gist of what they said. I might add to that that they asked me to get this corrected without bringing Mr. Hickson or Carter, Gummow, & Co. into trouble.

15134. They did say that they wanted to burst up Carter, Gummow, & Co.? No, they did not.

Did you say in the House:—

What they say is, "If Carter, Gummow, & Co. are clever enough to get this contract, that is all right; but we want also to be in this sort of swim. They are in the swim at the present time, and we want to burst them up."

You said it? If that is the correct reading.

15135. Although the contractors never said one word of that to you, that is so? After they put before me a considerable amount of detail, I was justified in saying that.

15136. You were justified in saying that, although they never said they wanted to burst up Carter, Gummow, & Co.? They said they wanted to put a stop to Carter, Gummow, & Co.'s manœuvring of the contracts into their own hands.

15137. You told the House that these contractors had said, "We want to burst Carter, Gummow, & Co. up";—they never told you that? No.

15138. So that that statement is untrue? It is incorrect.

15139. *His Honor.*] Not in so many words? No. If you read that literally, it is incorrect; but the inference is that they wanted to put a stop to that firm's receiving contracts in the manner in which they were doing.

15140. You understood that the contractors wanted to spoil their little game? That is it.

15141. *Mr. Smith.*] You could see that they wanted, if they did not want to burst them up, to spoil their little game? Yes; and I want to spoil a lot of them.

15142. You could see that that was their object—that they wanted to spoil their game, and that they had all these grievances? I suppose that they wanted to have some justice done.

15143. That is what you understood, broadly, to be the position? I understood that they wished to have a proper state of affairs, seeing that they were getting the worst of it under the system. They wished to have a proper state of affairs, in order that they might come in. If a proper state of affairs ruled they thought they would have a better show.

V. Parkes. 15144. Seeing that, did it not then occur to you that, with men coming to you with a grievance like that, it would be just as well to sift their statements thoroughly before you ventured to speak on them? Yes; but you must remember, Mr. Smith, that a Member of Parliament, when he hears a number of things from a number of men whom he knows himself to be pretty astute and pretty cunning, and which coincide with other information he has, and after he gets a number of papers placed on the Table of the House which corroborate it to a certain extent, is justified in asking that there be an explanation and a clearing up of the matter. Otherwise no public man would ever do his duty.

28 Aug., 1896.

15145. One of the first matters you mentioned in your first speech is the letting of Contract 79A. There was this minute by Mr. Hickson of 22nd March, 1894, and his further minute of 29th March, 1894. You were in the House when Mr. Lyne made his speech, I suppose? What speech?

15146. On this motion of yours in which he refers to this particular contract? I was not in the House.

15147. I suppose you took the trouble to read his speech? I never did.

15148. You never read his speech? No.

15149. Before you formulated these charges, you never read his speech? No. The only thing I ever saw of his speech was a comment at the bottom that he did not know that Mr. Hickson's son was employed by the contractors.

15150. One of the charges in regard to Contract 79A is:—

Inducing the Minister on the plea of urgency to let the above contract to Carter, Gummow, & Co. without tendering, by which loss was sustained by the Crown.

The Minister referred to was Mr. Lyne? Yes.

15151. You knew that, and yet you did not take the trouble to read his speech on this particular matter before you formulated that charge? I —

15152. Did you or did you not? No, I did not read his speech. I would like to make an explanation here. I spoke to Mr. Lyne privately about this matter. He said to me, "I forget the incidents of the case, but I must have acted upon the recommendation of my officer. But why don't you get the papers." I pointed out to him that the papers were not in the Parliamentary return; and the first thing I did when the Commission obtained the papers from the Public Works Department was to look for these papers. I found a minute from Mr. Davis, written to Mr. Griffiths, of the Water and Sewerage Board, stating that all the papers in connection with the letting of Contract 79A are lost, and therefore the certificate on which the contract has to be paid will have to be made out without them. You will find that amongst the papers. So that, really and truly, if I had read Mr. Lyne's speech, I should have had to wait until the information came before the Commission before getting the fullest facts.

15153. If *Hansard* is correct you were in the House when Mr. Lyne made his speech? In what way?

15154. In the next column but one, page 1209, referring to Johnstone's Creek, Mr. Lyne says,—

I presume that what is referred to is the sewerage work further up in Johnstone's Bay, which comes down from the head of the creek; but that has nothing whatever to do with the work that is going on upon the mud flats at the output at Johnstone's Bay. I may be wrong in gathering what the Honorable Member referred to, but I took it that he meant—

You interjected here, "The stormwater canalling"? I might have been there at the former portion of his speech, or might have just come in then; but I certainly did not hear the whole of his speech.

15155. You did not take the trouble to read it in *Hansard*? As a matter of fact, the only speeches I did read were Mr. Reid's and Mr. Young's.

15156. This is rather an important matter, isn't it? Yes.

15157. Is not a charge of inducing the Minister to let a contract in an improper manner rather an important matter? Yes; it is a general charge.

15158. I think it is a specific charge, isn't it? It is a charge founded upon finding information. Of course I laid before His Honor these charges with the full conviction that there was evidence amongst the papers to sustain them, from former knowledge; but they were never intended to hold absolutely good. They might be varied, and if they are wrong in any way I say to you "Produce these papers."

15159. That is not the point;—you made a charge without taking the trouble to find out what the Minister had said in his place in the House on the matter? I did it with the knowledge that there were papers in connection with the letting of this contract, and I asked you to let us have these papers.

15160-4. I do not know what papers you refer to? Where is the correspondence?

MONDAY, 31 AUGUST, 1896.

Varney Parkes recalled and further examined:—

15165. *His Honor.*] There is no other evidence which you wish to give before your cross-examination is continued? No; but I wish to correct my evidence in two particulars. I was speaking on Friday of inquiries I had made. I wish to say that I did ask your Honor to make inquiries of the Postal Department, and that you received this reply:—

V. Parkes.  
31 Aug., 1896.

[Urgent.]

Sir,

Postal and Electric Telegraph Department, General Post Office, Sydney, 23rd June, 1896.

With reference to the request made by you in your communication of to-day's date to be furnished, for the use of the Public Works Inquiry Commission, with copies of any telegrams which may have been sent by Mr. John Carter, of the firm of Carter, Gummow, & Co., to Mr. Frank Moorhouse Gummow, or to Mr. James Gillan, in Adelaide, during the months of April, May, or June, 1893, and to your inquiry by telephone respecting the matter, I have the honor to inform you that all telegraphic messages are only kept for one year, after which they, as well as any tapes on which they may be recorded, are destroyed.

It is therefore regretted that your request cannot be complied with.

I have, &c.,

S. H. LAMBTON,  
Deputy Postmaster-General.

The Secretary, Public Works Inquiry Commission, Chief Secretary's Office, Sydney.

That contains the same information as I gave in my evidence. In the other case I said I received information from Reid, the Inspector. I find that I did not receive information from him prior to the Commission being appointed. He called upon me and spoke to me about matters, but he declined to give me any information, except to state that he could give information, and I did not get that information until he appeared as a witness here. I want to correct my evidence in that respect in justice to him, though I knew from other people that he was going to give certain information.

15166. *Mr. Smith.*] Do you know the Christian name of that Mr. Webster? I do not.

15167. You cannot tell us his Christian name? I could to-morrow, by looking up his letter.

15168. I think when the Commission adjourned on Friday we were on the speech of Mr. Lyne, and you stated that you did not hear the whole of that speech? I do not think I did. I do not recollect it.

15169. Especially that portion which refers to Contract 79A? I will tell you why I do not think I heard the whole of it. In looking at the paper next morning I looked at the tail end, and I saw a paragraph in which Mr. Lyne said he did not know that Mr. Hickson's son was connected with the firm, and that is the only thing I saw of it that I can recollect.

15170. At all events, you were in the House during a portion of the speech? That is apparent.

15171. You were there just before he spoke, apparently? There is no doubt I was there during the first portion of his speech.

15172. But you were there when he referred to Contract 79A? I do not think so. If I was I did not hear him.

15173. After referring to Contract 79A, Mr. Lyne, at page 1208 of *Hansard*, goes on to say:—

If I remember rightly, on that occasion, I should state in fairness to the Engineer-in-Chief for Public Works, I do not think that he advised me to do this work. I think that his advice to me was in accordance with the minute which has been read to-night, and that was, if anything, against doing the work in this way. But I considered that I was justified in the course I took, and I therefore took it. I am responsible for it, and I am satisfied that the work is well done.

You do not remember hearing Mr. Lyne say that? No; but I recollect that conversation in which he said to me, "You will find all the information concerning that in the papers." I have the document, which I referred to, about these papers. The document is as follows:—

Department of Public Works, Engineer-in-Chief's Office, Sydney, 28 August, 1895.

MINUTE PAPER.

*Subject.*:—Contract 79A, North Sydney Sewerage.

As these works have exceeded the estimated cost, it would be as well to have the papers approving of the extensions in High-street at schedule rates.

T. GRIFFITHS,  
Supervising Engineer, Metropolitan Sewerage Construction.

Engineer-in-Chief, Metropolitan Sewerage Construction.

Mr. Adams.—Obtain and attach papers.—C. D., 28/8/95. I have tried to get these papers from the Works Department, and was told they cannot be found.—S. ADAMS, 28/8/95. The Engineer-in-Chief. Are the papers with the Board? Let me see the contract documents.—C. D., 29/8/95. The Under Secretary, Public Works. Mr. Davis for papers required by Mr. Darley.—Jno. P., 29/8/95. On inquiry I find that the bond referred to was handed over to the Metropolitan Board of Water Supply and Sewerage, with others, on 28/6/95.—T. P., Principal Assistant Engineer, Country Towns Water Supply and Sewerage, 3/9/95. Engineer-in-Chief, Metropolitan Sewerage Construction. As the papers cannot be found we must pass in the voucher without them.—C. D., 5/9/95. Vouchers herewith.—T. G., Supervising Engineer, Metropolitan Sewerage Construction, 7/9/95. Engineer-in-Chief, Metropolitan Sewerage Construction. Voucher for £194 15s. 2d. forwarded to the Treasury on the 10/9/95.—S. A.

I presume they never have been found.

15174. I am not referring to any papers which cannot be found; I want to draw your attention to the papers which are before the Commission;—you say that Mr. Lyne said that it was on his responsibility that this extension was ordered? That is so.

15175. And he says that a reference to the minute will bear that out? He says so here.

15176. At page 1201 of *Hansard* do you see Mr. Hickson's first minute of 22nd March, 1894? Yes.

15177.

V. Parkes. 15177. It is a minute by Mr. Hickson substantially to this effect—that he cannot recommend that the contract be carried out as an extension at schedule rates? I rather think not seeing that the work is 50 per cent. cheaper.

31 Aug., 1896.

15178. You need not interrupt me, Mr. Parkes. Is that not so? Yes.

15179. But he goes on to say "I believe, however, if tenders were invited we could get the work done under the office estimate." That is so? Then I say why—

15180. Never mind what you say. Answer my question? Yes; but anybody may write a minute like that. A man who writes a minute like that—

15181. I would ask you not to go off. I want to deal with the minute as it stands. That is the effect of it? Yes.

15182. He does not even recommend the calling of tenders for the work. He simply says "I believe if tenders are called the work will be done under the office estimate"? I should take that as a recommendation.

15183. You go on to say "It was about this time that Mr. Hickson, junior, became a member of the firm"? I did.

15184. That of course we know is not the case? No, I was in error.

15185. Then you go on to refer to Mr. Hickson's minute of 29th March, which begins in this way—"Referring to the Minister's intimation this morning that he was prepared to let Messrs. Carter & Co. carry out this work as an extension"—that is what he says? Yes.

15186. So that he clearly refers there to an intimation which he had had from the Minister? Yes; but I should have thought that he would have protested if he knew that the work could be got cheaper than the office estimate.

15187. So you see that Mr. Hickson refers to a distinct intimation which he had from the Minister to a certain effect? Yes.

15188. I suppose an intimation coming from a Minister of the Crown in charge of a Department amounts to an instruction to an officer? You must remember—

15189. Does it or does it not? It is a matter of opinion—I could not say that it is.

15190. Would you not think so? I could not tell you; but from Mr. Barling's evidence it is quite clear that Mr. Hickson and Mr. Lyne had private interviews about this matter.

15191. I am not talking about private interviews. I am referring to the minute now. The intimation was to the effect that Mr. Lyne was prepared to let Carter carry out the work as an extension, provided that they agreed to do so for the Departmental estimate? Yes.

15192. This concession to do it is an extension of the existing contract at the schedule rates, but they were to come down to the Departmental estimate—that is clear, is it not? Yes. But the Departmental estimate is about a fair proportion of the other because it is a cheaper contract.

15193. Then Mr. Hickson goes on to say—"I had an interview with Mr. Carter, who is prepared on the part of his firm to comply with the Minister's decision"—is that not so? Yes.

15194. So you see that the minute itself says that that was the Minister's decision which Mr. Hickson was instructed to communicate to these contractors—is that not plain? Yes, it looks to be so.

15195. That being the concession, how do you charge Mr. Hickson with a sudden change as you do in the next line? It is a sudden change, comparing these two minutes together. One cannot comprehend a man who writes a minute so positively as that first minute being so weak as to give away his position by writing the other, if they were sincere minutes; and they appeared to me not to be sincere minutes.

15196. That is your explanation? Yes.

15197. But it is quite clear that you were in error as to your premises, namely that Mr. Hickson came into the firm between these two dates? Yes.

15198. That might have had something to do with coming to the conclusion which you still hold—is that not so? No, it is not indeed.

15199. But in spite of the removal of that error from your mind, you still think that that is the effect of these two minutes fairly read together? Yes; because I think Mr. Hickson should have understood—in fact I take it that it is required by the Public Works Act—that all public works must be tendered for. It showed a compliance on his part to the Minister's will which to my mind is not the action which he should have taken.

15200. I suppose you knew as a matter of fact that it was not an unusual thing to grant extensions of contracts to contractors without tendering? I think it is, and ought to be.

15201. Is it, or is it not,—do you know of any others? I do not know of any others, except one; in fact, you will see that I moved for a return of these contracts. I only know of one granted to Gilliver, and another granted to somebody else.

15202. One of these men who waited on you with this grievance—that they had not a fair cut at the tender-box—himself admitted that he had a large extension of a contract without tendering? Yes; but he explained the reason why.

15203. That was Mr. Gilliver? Yes.

15204. That was the Rookwood contractor? Yes; but he explained the reason why. He did not receive this extension at office rates, but at competitive rates. This extension is given at office rates, and that is the difference.

15205. At page 1201 of *Hansard*, referring to the North Shore contract, you said:—

They received their contract under a schedule tender, and their sureties, as usual, were those of their own firm.

Did you say that? Yes; it is an error.

15206. In this case, I think, there was a cash deposit of £2,000? It is an error, which I freely admit.

15207. To that extent it is misleading the House? That was my information at the moment, but there was no intention of deceiving the House.

15208. But you say "as usual"? Yes.

15209. Now we come to Contract 77, which relates to the Monier arch. At page 199 of *Hansard* you say:—

Fifteen firms of contractors tendered for the works at Balmain at schedule prices, and the lowest tenderer was the firm of Messrs. Carter, Gummow, & Co. These contractors sent in a price ridiculously low as compared with the fourteen other firms tendering. Their tender was 28½ per cent. under the schedule prices. The next was 18½ per cent.

You said that? Yes.

15210. That is not so, having regard to the next tender being 18½ per cent.? No; but you must remember— V. Parkes.  
31 Aug., 1896.
15211. There were two between, were there not? You must remember that I was speaking in the House, not from official documents, but from information which I had received. I cannot get at official documents.
15212. You had been told that the next tender was 18½ per cent.? I presume so.
15213. But that is not the case, we now find? No; 25½ per cent. McSweeney's was.
15214. Would you call McSweeney's a ridiculously low price? I think it was a low tender.
15215. A ridiculously low one? A low tender for that work.
15216. It was not only Carter, Gummow, & Co. who sent in ridiculously low estimates, but McSweeney did the same? Yes; he sent in a low tender, seemingly.
15217. At the bottom of page 1200 you quoted the minute of Mr. Hickson as to not taking out the quantities? Yes.
15218. And then you went on to say:—  
The sole reason was that quantities so much less would have been shown, and instead of the contractors making a profit of £2,000 they would have been cut down to a proper estimate of the value of the work.  
Did you say that? Yes.
15219. Did anybody tell you that the sole reason for not taking it out was as alleged by you there? The contractors who came to me said that they looked at the nature of the work—that they had looked into the work, that they had themselves taken out the quantities roughly, and that they were convinced that they could have done the work at £3,000 less than Carter's price.
15220. Did they say that the sole reason for not taking them out was as you stated there? What?
15221. To avoid showing the quantities so much less? No; I put that in myself. That is my own opinion.
15222. There was no evidence about that—that was your own inference, or the conclusion you drew from the statements made by the contractors? That is my own opinion, because I cannot understand why there should have been any hesitation about submitting it to the Minister in the schedule form.
15223. You came to that conclusion although you had the minute before you stating how it came about? Yes.
15224. With regard to this Monier system we have heard so much about, when you made your first speech in September, had you seen a specimen of this work anywhere? No.
15225. Had you seen a specimen when you made your speech in May? No.
15226. Had you read anything about it in any of those authorities which have been referred to here? I think I have.
15227. At that time. In September you had? Yes.
15228. Can you mention any one authority you had referred to on the matter? No; I cannot now from memory—in fact, I think I received an invitation from perhaps Mr. Carter and some others to go and look at the tests of it at one time.
15229. But you did not accept the invitation? No.
15230. Had you read any of the authorities such as were referred to by Professor Warren? I admit that I knew practically nothing as to the patent except the materials.
15231. I think in your speech in May you gave a graphic description—perhaps I ought to say a description—of this Monier system, although you say at that time you knew nothing about it? I did not give a graphic description.
15232. I withdrew the word graphic in obedience to the suggestion of His Honor this morning. You gave a description of the system, although you admit now that you knew nothing about it? But I did not give a description. I simply gave the object of it.
15233. You did not tell the House what the best description of it was then, did you? I simply gave an explanation of the object of it. I told the reason why the rods were inserted—that is, to make the structure light. I think you will see that is the meaning of what I said. I think I illustrated my remarks. I said, "If walls of houses were not strong enough, or the roof was too strong for the walls, it would need to be bound with iron rods. The iron gave strength to the thrust."
15234. At page 30 of *Hansard* on 12th May, 1896, you said—  
Yet the Government, under the Secretary for Public Works, allowed the contractors for a saving of £250 to substitute a scheme of their own consisting of cement arches which would not stand unless supported by tie-rod iron. The best description I can give of that to Hon. Members is to take this Chamber, and to suppose that the walls are so weak that they cannot sustain the roof, and the weight of the roof is sufficient to push out the walls. The first thing to be done under such circumstances would be to put in iron tie-rods. These arches are so weak that they cannot sustain themselves, and have to be tied with iron tie-rods. That is what the Minister allowed the contractors to substitute for his own good, permanent, plan.  
That is what you said? Yes.
15235. There you give the House what you call the best description of this system that you can give? Yes, that I knew of at the moment.
15236. And then at page 31 you go on to say—  
This patent with regard to the Monier arch, this useless, risky thing, was invented in Germany thirty years ago for ornamental work in gardens, and it was never intended for such work as I am referring to.  
Is that so? Yes, but I admit that I was in error there.
15237. I suppose you were equally in error when you told the House further on, "The Minister accepts this Cheap John thing on a report of that description"? No. What I meant there is that it is a cheaper construction than the office design, whereas, practically, the Government are paying for it the cost of the office design. It is rather strong language, I admit; but, of course, in speaking in the House one does not often use the very mildest language.
15238. Apparently not, or the most accurate language? I do not think that comment ought to be made. I might add that in the House of Assembly, unless a speech is made very emphatic, you will never get a Government to act upon it. It takes something to move an apathetic Government.
15239. You told us here on Friday that one of the reasons for making that charge in regard to Mr. Hickson so strong was that you wanted to induce young Mr. Hickson to come over? I would like to explain that. Young Mr. Hickson was a most essential witness to this inquiry. His father said that he did not wish him to come over—in fact, there was an objection to his coming over. I had certain information concerning him which I thought would be brought out in evidence. Now, in the first place I made up my mind not to put a charge in at all, but simply to bring evidence without putting in any charge, because it is not a nice thing, in regard to anybody's feelings, to put charges in that way. But when it seemed

V. Parkes. seemed to me that the inquiry in my case would fall to pieces if this witness did not appear, I worded that charge on just exactly what I thought the evidence would bear out—perhaps a little too strong. I withdrew that charge and substituted another. I substituted that charge more for that consideration than anything else.

31 Aug., 1896.

15239½. It was partly, then, as you said, with the object of making young Mr. Hickson attend? That was one of the objects.

15240. When you made these charges of corruption in the House, had you a similar object in view, namely, to move the Government to grant a Commission;—was that part of the reasons why you made these charges of corruption? No.

15241. Did you put that in as a means for asking the Government to give you this Commission? No; I believed that such was taking place.

15242. At page 1199 of *Hansard*, on 26th September, 1895, you said:—"I am assured by other contractors that whereas Messrs. Carter, Gummow, & Co. obtained a contract at £15,500, they would have been willing to carry out the job at £12,500 to £13,200, effecting a saving of from £2,300 to £3,000";—do you know who these other contractors were? Yes.

15243. Will you mention their names? There were very few of them there who did not uphold this.

15244. I only want to know whether you can tell me the names of them or not? I cannot tell you the definite ones.

15245. Was it Maddison? No.

15246. Was it Williams? I think Williams was one, but I could not be sure.

15247. Was it Gilliver? He was one of them. I am sure he said there would be a saving on the job.

15248. At this time you did not know anything about the Monier principle? I knew as much as was explained to me.

15249. By these contractors? Yes.

15250. By Mr. Gilliver, for instance? Yes; and from a definite knowledge I had previously.

15251. You heard the evidence of Mr. Gilliver as to what he said of the nature of the Monier work, did you not? Yes. I think he sustained in evidence what he had told me before.

15252. With regard to that statement as to the next tender being 18½ per cent. below the other, had you the paper in your hand at that time? What paper?

15253. The paper showing these tenders? No.

15254. Had not the Minister handed it to you? No.

15255. Are you sure of that? The Minister declined to give me any information when I saw him about this matter.

15256. What were the papers you were reading from during the September speech? I was reading entirely in this speech from notes that had been given to me by the contractors.

15257. And also from official papers? Where could I get them from?

15258. That is for you to say—does not your speech say it? What does it say?

15259. There is a minute set out *in extenso* at page 1200;—you evidently had the papers before you? That seems to be so.

15260. Are you not reading from official papers all the way through that speech? Let me see if there was a previous motion. I am wrong there. I asked a series of questions, and in answer to these questions Mr. Young had given me certain extracts from the papers, and that is what I am reading from. I do not think they included the tenders at all.

15261. You do not think the papers before you included a list of the tenders or the tenders themselves? No; all the papers I had were extracts given to me—extracts taken from that paper which was not printed at that time. It was not laid on the Table until the 9th October. I must have got these particulars from the Minister.

15262. *His Honor.*] You could not have had these particulars? No; the Minister must have failed to give me the tenders.

15263. *Mr. Smith.*] You say that when you made that speech you did not have either paper No. 2, as printed in this return, containing the list of tenders, or the tenders themselves—is that your evidence? One of the contractors told me.

15264. Will you answer my question in regard to the papers;—do you say that when you made that speech in September, you did not have either paper No. 2 or paper No. 3, printed in the return containing a list of the tenders, or the tenders themselves? I say I had extracts from them, but I had not the tenders. I could not have had them, because they were not laid on the Table of the House until the 9th October.

15265. I am not talking about the printed papers, but about the original papers? You will see, Mr. Smith, that they were laid on the Table of the House on 9th October, 1895.

15266. You say that you had not either of these papers? I could not have had them.

15267. Although you had the papers from which you have read these long minutes relating to these works? These must have been extracts which Mr. Young had given me, or extracts I had taken from some statements which he had given me. I should like to point out in my evidence that I was told by the contractors that Mr. Carter and Mr. Gummow had both stated that they made their tender low purposely because they had this Monier arch assured to them.

15268. Did they say that to you? No; Carter and Gummow did not.

*Mr. Smith:* Then I object, your Honor, to that going down.

*His Honor:* As you are now cross-examining Mr. Parkes as to the state of his mind, of course he is entitled to say what information he received from any source.

15269. *Mr. Smith.*] Who were the contractors who said Carter and Gummow had said this thing? I think it was known amongst a lot of them. It seemed to me that it was.

15270. Can you mention the name of any man who said it? I think Williams said it.

15271. Did Maddison say it? I am not quite sure.

15272. Did Gilliver say it? I am not quite sure. It would be difficult for me to tell you definitely who did say it, but they all seemed to know about it.

15273. They all seemed to know about it, but you are not able to say definitely who it was who said that? No; unless it be as I say that Williams was one of them.

15274. With regard to Contract 118, you told the House that one of the concessions granted to this firm of contractors was the draining the water off the land for the contractors? Yes. 15275.

15275. Did you know at that time that this land had become flooded by the action of the Government themselves? I did not know, but it did not matter very much, because—

V. Parkes.

15276. From your point of view, it did not matter very much? No; because the contractors said it was provided in the specification that they were to unwater the work themselves whatever the contingency might be. I know myself that when a contract is let to two contractors one is not supposed to hinder the other; and a provision would be made by wise management to unwater the work at the expense of the contractors, so that there should not be an addition afterwards. This was a clear thing to me, and I made mention of it just as it was made to me.

31 Aug., 1896.

15277. So that, from your point of view, it did not matter a bit whether this water was taken on to the land by the Government or came from an outside source? Because the contractors were bound to unwater it.

15278. That was the conclusion you arrived at? The conclusion I arrived at was that if it was in the specification that they had to keep their works free from water and take all liabilities they would have to do so.

15279. You know that it was caused by the sand-pump dredging at Rozelle Bay? I do not know anything of the sort.

15280. If you did know that, it would not alter the conclusion you arrived at, viz., that this was a concession to the contractor? I think the contractors should have done their own unwatering.

15281. What were those contracts you referred to on page 1200? While speaking of that matter I may as well tell you of a parallel case. On a northern river—I think it was the Macleay—a contractor had to narrow and deepen a channel. There were deposits of perhaps a million years accumulation up in the river. By deepening that channel the scour brought all the sand away, perhaps it would take 100 years to fill it up; but an obligation on the contractor was to leave that channel at a certain depth. It would be simply impossible if the man stopped there for the rest of his life and his children were to stop there after him to keep that sand which has been backed up by nature from coming into that channel. Yet Mr. Hickson ruled that it was his duty to make provision against that most extraordinary thing, and the contractor had to throw up the contract.

15282. What contract are you referring to? It was a contract taken by a man named Ford; it might be at Lismore. I recollect the incident because I went with the contractor to Mr. Hickson to get his explanation, but he ruled that the Government contract could never be altered; and that since this man had taken this obligation, although it could not be performed, he must carry it out or throw up his contract.

15283. You think this is a parallel case? Yes.

15284. Turning to page 1203 of *Hansard*, what were the contracts you were referring to when you said As far as I am informed there was a contract of £31,000, another of £10,800, and another of £11,000, all let without tender.

? I was wrong in the information which I received. I think you will find that I corrected that statement in my second speech. There were three contracts let; but I was wrong in the amounts.

15285. You corrected that in your second speech. You said that there were three contracts, namely, £1,200, £2,000, and £12,000. What were these contracts? In 79A there is a further extension let of £1,800, and in Contract 79 there is an extension of £1,200. They are to be found in the Parliamentary papers.

15286. So that, as a matter of fact, all these contracts, it turns out, which were let without tender were extensions to one or the other? They were nevertheless contracts.

15287. They were extensions;—is not that so? No; they were branches to contracts. They were not by any means extensions.

15288. Neither of them? No; they were separate contracts, which could be carried out by separate contractors. Take this one which the Government accepted at £1,800. Of course it was readjusted afterwards, but let me show you how the total was made up. At page 369 of the Parliamentary return you will see how Mr. Weedon makes it up:—

767 lineal feet rock tunnelling complete at 36s. per lineal foot; 100 lineal feet rock tunnelling at 27s. per lineal foot. why should they adopt the contract by the lineal foot, when it was paid for by the cubic yard?

15289. You had better call Mr. Weedon and ask him? This contract if let by tender would, I guarantee, be done for about £1,000.

15290. At all events, these three contracts which you at first stated at that very high figure turn out to be either extensions or branches? They are by no means extensions. They are distinct branches.

15291. With regard to Contract 69, at page 28 of *Hansard*, on the 12th May, 1896, you say:—

I will prove that the most defective work has taken place upon this job.

You say that? Yes.

15292. What defective work were you alluding to then? I had evidence then, and was assured of further evidence, of defective work on Contract 69. I brought two witnesses out of some others.

15293. Are you referring to Benson and Darcus? Yes.

15294. Were there any other witnesses besides them at that time? That is one question, your Honor, which I should like to be allowed not to answer. I am trying to get a certain witness. I may at any time put my hand on a witness, and I do not like to anticipate.

*His Honor:* Mr. Smith is not asking you to give the name of the witness; he is only asking you to say if you had any more informants.

15295. *Mr. Smith.*] What is your answer, Mr. Parkes? I had other informants.

15296. You would prefer not to mention any names? You can see that, if I give away the names of the witnesses, I jeopardise any chance of producing them.

15297. I suppose your objection to mentioning their names holds only at this stage? You can ask me this question if you like at the latter end of the inquiry.

*His Honor:* It is quite legitimate for Mr. Parkes now to decline to give the name.

*Mr. Smith:* I do not want to leave a suspicion of a suspicion behind.

*His Honor:* What Mr. Parkes says is that he had some information. It is assumed that he has been doing his best to procure the attendance of those who gave it to him. He has not succeeded; he may succeed in the future, and if he does he will ask the leave of the Commission, if it is not terminated, to produce the witness, and, of course, I will grant leave.

V. Parkes.  
31 Aug., 1896.

15298. *Mr. Smith.*] I suppose you would not consider the evidence which Benson gave as very important? I would. It is a very essential point. I have found that, where defective work is to be found in a small degree, you will find it everywhere. A conscientious contractor is a man who thinks of the risk to his business, and he is scrupulous in his work. If ever you catch a contractor doing defective work in small things, you may rely on it that he will do so in large things. If you find one instance of a defective joint in an iron pipe where the pressure is great, and the position important, you do not know how much of similar defective work there may be.

15299. The same with Dawson? I think he said there was too much stone shovelled into the concrete? Yes.

15300. In the same way you think that might be an indication of bad work throughout? There is other evidence which you are not citing. You are citing these two men, but there is other evidence.

15301. Which you have not called? Which I have called. For instance, there was the evidence of the shortage of cement, which I presume you will explain away, and the purchase and use of cement in these three works.

15302. When did you get that evidence about the shortage in the purchase of cement? I can tell you that amongst workmen in the city of Sydney it is a common thing for the men to talk about the way cement structures are carried on. Every man will tell you, I do not care where he is about the city of Sydney, that he can get a shilling a day extra if he can save a cask of cement every day. It is a bargain. It is a common thing. It is a matter of common talk amongst the men.

15303. It is on this common talk you based this charge here—is that it? I have myself—

15304. It is on this common talk that you base this charge, and say “I will prove it”? I did not base it on that. I based it on evidence which I have brought, and evidence which I will bring.

15305. In dealing with Contract 69 you gave the House certain figures. At page 28 of *Hansard* you say:—

Let me show hon. members how the case stands as regards this Contract, No. 69. The tenders sent in were Carter, Gummow, & Co., £45,207; John Ahearn, £47,061; Kerle and Kerle, £52,735; H. McKenzie and Sons, £53,505; J. F. Carson, £57,239; Dean and Sons, £58,165, and so on. The completed work was much less than in the computed schedules, but Carter & Co. were paid £52,400 instead of £45,000, or £7,400 over. They were paid, for instance, upon schedules numbered 1, 8, 12, 16, 19, 22, and so on. Supposing other contractors had had the same schedules passed for them to do the work under, there would have been a saving in the case of Ahearn, of £11,600; in the case of Kerle, of £5,000; in the case of Carson, of £10,052; in the case of McKenzie, of £8,700; in the case of Holloway Bros., of £5,700; in the case of Dean & Sons, of £4,520.

You said that? Yes.

15306. Did you make out these figures or calculations yourself which you gave to the House? No. There is no doubt that I looked through them.

15307. Who made them out for you? But you must remember—

15308. Will you answer that question?

*Mr. Parkes to His Honor: Do I need to answer that question?*

*His Honor: I think that is a fair question to ask.*

15309. *Mr. Smith.*] Who made them out for you? They were worked out by my instructions and on my basis.

15310. By whom? They were worked out by an officer in my employ.

15311. You mean in your regular employ? Yes.

15312. What is his name? It was a lady, who does all the work of the office. I have a lady as my private secretary, because she can do more work, and do it more accurately, than the boys can.

15313. I think you called Mr. Thompson here on this matter as a witness? Yes.

15314. His figures show that in only two cases would there have been a saving? Yes.

15315. These cases being Holland and Mackenzie's—is not that so? No; you are wrong in saying a saving. It is not a saving; it was a reduction below the ultimate cost to the country of Carter's work. On nearly every one of these contracts except three you will see a saving.

15316. I am only using your own words;—you told the House that there would have been a saving? A saving to the country.

15317. In all these cases a saving of so much? There would have been a saving of money if these tenders had been accepted.

15318. It turns out on Thompson's evidence that in only two cases there would have been a saving? Yes; but nevertheless in a number of cases they are greatly reduced.

15319. At all events, in regard to these cases mentioned, it turns out that there would be only a saving in two? But Mr. Thompson is working on the final payment, and on a very different basis from what I was working on. I was working on this basis, that if the information placed at the disposal of the contractors had been used, and certain schedules for heavy blasting rock which were put in had been left out, these contractors would have tendered on what was really the nature of the ground which was shown by the bores; or, as Mr. Holland told you, with the information so acquired they would have been able to do the work as it finally turned out at a certain price.

15320. Is Mr. Thompson working on a wrong basis? He is working on a more accurate basis than I was.

15321. It turns out that there would be a saving only on the two? Yes; but they are enormously extravagant prices under any circumstances.

15322. After giving these figures, which you say were prepared in the way you mentioned, you say at page 28 of *Hansard*:—

Will Honorable Members dare to say that there was not some collusion between some officers of the Department and Carter & Co., in order that they might fix their schedules?

you said that? Yes, I did, and I maintain it still. They never could judge on the prices given by this schedule. No man could have made up a schedule like this without some officer of the Department had given him information. I am as sure as I am alive that the schedules could never have been made up unless the man who tendered stood to be ruined by this schedule.

15323. On these figures you ask the House whether any honorable member would dare to say that there was not some collusion? Yes; for very good reasons. While this was apparently a cheap tender it was a very costly one.

15324. It turns out from Mr. Thompson's figures, which are made out on a more accurate basis, that your figures were not to be relied upon for that purpose? No. His are taken out on a different basis. Another thing is that his figures back-up exactly my contention in the House.

15325.

15325. On his evidence, will you dare to say now that there was collusion? I am not the Commissioner; but if you ask me if it appears to me that there was, I will say that it does appear to me that there was.
15326. You think that is a fair inference to draw, having heard his evidence? It appears to me that an assurance was given to these contractors that certain items would be paid to them.
15327. That is what you mean? Yes; because this is not rigging a schedule. Rigging a schedule is taking adventurous risks in adjusting all items. Where you get 27s. 6d. repeated constantly, they must have known the items. They would not have taken these risks if they had not known something about it. I will point out another thing: The item of timber is 9,000 feet in the schedule. According to item 21, at page 62 of the Parliamentary return, it was increased. The timber paid for is 9,800 feet; so that the excavation in this soft ground must have been calculated for; yet there is not the corresponding quantity in this. There is a great deficiency in the quantities of excavation if that timber was correct.
15328. The same thing in regard to the subducts in this contract? Yes.
15329. Referring to the subducts, I think at page 29 of *Hansard*, you asked the House this question—"Will hon. members tell me that this was not a prearranged affair"? Yes; soft ground requires subducts.
15330. You have heard the evidence given here about the subducts? I have.
15331. And you still think it is a prearranged affair? It has not shaken my belief a bit; because, as you see, they have dispensed with subducts. If subducts are dispensed with in hard rock, that is all right; but here was the soft ground, and the very wet nature of the ground is seen from the flow coming from it now. If subducts were to be used anywhere, this is the nature of ground in which they should have been used. When anybody looked at this schedule, knowing that low bed of the Marrickville bottom, they must have known that water would have come in upon them. The water was coming in while the work was going on. If they had not information that these subducts would not be put in, they never would have put the price of a penny in their schedule.
15332. That is what you say, having heard all the evidence? Yes, unless they were mad. The evidence goes to show that they did not carry these sewers through rocky bottoms. Why are subducts to be used at all if they are not to be used in watered ground?
15333. Is Dawson the man you refer to, in your second speech, when you read a declaration? Yes.
15334. I think, in the declaration, he did not mention that he had done this bad work wilfully? No; he told me that he had been instructed to do it by the contractor's manager.
15335. He did not say that he had done it wilfully, with others, behind the back of the inspectors? No. I asked him whether he did it, and he said a man, if he wanted to hold a good place and continue on a sewerage contract, must pinch here and there. He told me, in fact, that he would have been discharged from the work if he was not able to do this.
15336. Did he say anything about the Government inspectors? Yes; he said the Government inspectors were a lot of men who were quite incapable of keeping the men from doing wrong.
15337. Did he tell you that he had done this behind the back of the Government inspectors wilfully? He said there was no inspector to see the work—that it could be done as much as he liked.
15338. I think he stated behind the back of the inspector? He said there was no inspector there to see the work.
15339. You heard his evidence here? Yes; I am not quite clear, but I think his evidence was what he told me.
15340. It was as you have just stated it to be? I have not the evidence to compare it.
15341. It was done under the instruction of the contractors' manager? That is what he told me.
15342. And that the Government inspectors were not there to see him do it? He said the Government inspectors were not there.
15343. How did you come to make out that it is a concession on that evidence? I do not mean exactly that it was a concession directly; but, of course, there are some of these charges which I gave you in that letter which I will withdraw. In this particular instance I looked upon it in this way: I thought it was a mistake to take Inspector Reid from that work. If this bad work was going on, and Inspector Reid was upon the adjoining contract, and could have come on to this contract, he would have prevented it.
15344. Did Dawson tell you that Reid had been dismissed—did he mention that among other things? No; he told me that an Inspector Reid had formerly caught him doing bad work, and that at Carter's request he had been removed from the job.
15345. That is what Dawson told you? Yes.
15346. I think you tried to get Dawson work? I have got him work.
15347. Since he gave his evidence here? I tried to get him work, and I got him work.
15348. On a Government contract? I tried to get him work on a Government contract.
15349. But they would not have him? He is blackballed everywhere, I believe.
15350. I suppose he would be, would he not? I do not know about that. I do not think it was his fault if he was compelled to do the work.
15351. You think a man who has admittedly done wilfully fraudulent work is a fit man to employ on a Government contract;—is that so? No; but the same man might, if he was allowed to do the work himself, without being pressed to do bad work, do exceedingly good work; and the fact that Carter, Gummow, Co. kept him for eight years on the job shows, either that he was doing defective work in their interest, or that he was a good worker.
15352. Having heard his evidence, you still think that he is a proper person to employ on a Government contract? Yes; I think the man has a right to get on a Government contract. He has admitted his fault, and certainly would not do the same thing again.
15353. At page 1198 of *Hansard*, in your first speech, you set out there a notice of dissolution of partnership? I did.
15354. You see it is dated 1st April, 1895? Yes.
15355. It sets out that the partnership lately subsisting between certain undersigned persons is dissolved? Yes.
15356. Do you see Mr. Hickson's name amongst the names? No; but supposing he was a partner, would his name be amongst them?
15357. I only want to know whether your attention had been drawn to that? Yes.
15358. You relied on that for evidence to a certain extent for your own purpose? I relied upon that as evidence that the two sureties, Forrest and Gillan, were belonging to the firm of contractors.

- V. Parkes. 15359. Having read that, you informed the House upon the same day that Hickson was a partner? Did I say a partner, or did I say I was told that he was a partner.
- 31 Aug., 1896. 15360. At page 1201 you said that it was about this date that young Mr. Hickson was taken into the firm? That might be as an employee.
15361. That he became a member of the firm? I said that.
15362. At all events from that notice he was not a member of the firm? No. But you see if a firm is split up to become contractors and sureties, and sureties and contractors, alternately, you do not know who may be in it.
15363. *Mr. Andrews.*] Do you remember when you first saw Dawson? He came to me I think in the early part of March, 1896. I do not think I ever saw him in my life before March last. When he first came to me he told me about the defective work—he also told me about defective work elsewhere by other contractors, but he could not be sure that he could locate it. I said to him, “Unless you can do something definite do not give me any information at all. Unless you can absolutely prove it, do not give me any information.” He told me of the spots he could absolutely prove where there was defective work. And the spot which seemed to me to be the most conclusive and most extravagant was that North Shore work. I said to him, “An informer will have to be a very courageous man, and unless you are able to withstand all the calumny which will be cast upon you, and the blackballing you will get, you had better not give evidence at all.” He said, “I have seen so much bad work done that I think it is the duty of a working-man, even if he brings himself into trouble—and mind you, I told him at the time that he might get into trouble for doing bad work—to tell the honest truth about these things.” I sent him away to reconsider the matter, and then he came to me a second time, and I got Mr. White to draw out a declaration, which Dawson signed. I took it then that it was very conclusive that he was correct. He said it would be very difficult to locate the exact spots, but these ones he could locate, because they were near the shaft, and he noticed them when he was doing it. He was astonished himself at their audacity.
15364. Do you know whether he ever called at your office before that? Never.
15365. Did you ever write him a letter after that? Yes.
15366. Have you any idea what the date of that letter was? No.
15367. I understand that you object to give the names of other workmen who have told you about defective work? At the present moment.
15368. Have you subpoenaed them? I do not think so.
15369. Can you tell us how many there were? There was not a great number of them.
15370. Were there a dozen? I have had information from more than a dozen. When asked to come before this Commission they said, “No; they would sooner cut their throats first.”
15371. Do you know whether they were Carter and Gummow’s men? Yes; a good number of them worked for Carter and Gummow.
15372. The others were not? Yes.
15373. They have only given hearsay evidence? You must remember that it is a very difficult thing to obtain evidence at all. There is no doubt that two-thirds of these contractors who gave me information are sorry. You must recollect that it is not so easy to obtain information; and, although these men, in the first part of the inquiry, were very anxious to give information and all that sort of thing, the moment they saw how one witness was treated, and when it was pointed out to them by a fellow-workman the difficulties they were in, they would not come.
15374. What do you mean by the phrase, “How one witness was treated”? I mean that, when that man, or these other men, go to a contractor’s job, the man shakes his head and says, “Oh! no; the Government inspector here will never have you on this job.” If you would like I can give you the letter written to me by Dawson explaining the position he is in.
15375. You said a minute ago that the contractors, when they saw how the inquiry was going, objected to give evidence too? They all got very timid about it.
15376. Did you ever promise them, before the inquiry started, that you would not say anything about defective work? No; I did not promise them, but I will admit that I did not try in any way to cast them off. I did not try to intimidate them. I kept my own counsel about the defective work.
15377. Do you not know, as a matter of fact, they complain that you have got information from them, they relying that you would not bring the question of defective work before the Commission at all?—
15378. Mind, I do not say that you did it? It might be so; but I should consider it my duty to do it, irrespective of whether they complained or not.
15379. I understood you to say on Friday that Maddison and Ewing would not substantiate on oath what they told you, because they thought that by giving that evidence they themselves might get into trouble—that is, become pecuniarily responsible? I did not put it quite in that form. I said that, judging from their manner—and, mind you, they had protested that I was bringing up defective work—I came to the conclusion that I could get no willing evidence from them.
15380. Are they the only contractors whom you have to complain of in that way? A lot of them.
15381. Of the lot? Yes.
15382. Not only of Maddison and Ewing, but of all of them? Yes.
15383. You often talked in speeches, and here, I think, representing these as fourteen contractors? Yes.
15384. Do you not know, as a matter of fact, that they are mostly all partners—that there are about three firms? They must be about the only firms in the city that divide all the work.
15385. That might be;—you do not know that? If such is the case—
15386. The fourteen reduces these down to about three firms? If such is the case, and it was known, the Department long ago ought to have put an end to this sort of tendering. I do not know that they are.
15387. You said in answer to a question on Friday that it was either Dawson or Ewing who told you that young Hickson came over here with Gillan from Adelaide;—can you remember now which it was? I think many spoke to me about it as well. I have thought that matter over. I really think that both Maddison and Ewing and Williams told me that. But with regard to that matter of his coming over, I mentioned that, not with any object of making that a point, that there was anything wrong about his coming backwards and forwards, but with the object of showing that Mr. Hickson must have known through his son that Gillan was a partner in that firm.
15388. But your information was wrong on that point, and they did not come;—what I want to find out is, which of these told you, if you can remember it? I think I was told by the lot of them—Ewing, Dawson, Williams, and Maddison. At the same time I do not wish it to be thought that Dawson ever came to me with these contractors, because he did not. I kept them all well separated. 15389.

V. Parkes.  
31 Aug., 1896.

15389. It is likely that Dawson would tell you—I mean, how would he know;—he was supposed to be a workman on North Shore, wasn't he? Yes; but these workmen do not walk about with their eyes shut. They know what is going on on a contract.
15390. Do you think that he ever saw Gillan? If he was eight years with the firm I expect that he did.
15391. But he was not? How long was he?
15392. He was eight years with Carter & Co.? I presume he would know Gillan.
15393. On Friday you also said that if it had not been for the evidence of Carter and Gummow you would have believed that Mr. Hickson was not a member of the firm, and of that evidence you are now doubtful? Yes.
15394. Will you point out what part of the evidence convinces you of that? I could tell you generally.
15395. Will you do so? Mr. Carter's admission that young Mr. Hickson had conversations with him.
15396. Mr. Gummow's admission? Yes, and Mr. Carter's too. Yes, and also Mr. Gummow's statements of his proceeding to Mr. Hickson to report how his son was getting on, and other things, which led me, or which do lead me, to suppose that they were on a very close acquaintanceship. If young Mr. Hickson, as Mr. Carter stated, was constantly conversing with him about his becoming a partner, it seemed to me that it was very likely that he might have the promise of a partner's interest.
15397. You stated that the evidence of Carter and Gummow lead you to believe now that young Mr. Hickson was a partner? I should be glad if you will allow me to look over this evidence, and to ask me that question on Wednesday. There was something which occurred when Mr. Carter gave his evidence which led me to say that, and if you will wait till Wednesday I will tell you what it was. If I can look through the evidence it will refresh my mind.
15398. Another reason you gave for imagining that he was a partner was that they had not kept books? Yes.
15399. Do you think the simple fact of keeping books will show that? I do.
15400. How? Because the partners' interest must be shown in the books.
15401. Why? In the bank-books, which are given, the salaries of each member of the firm, including young Mr. Hickson's salary, run through them uniformly. There are cash sums—very extensive cash sums—constantly drawn out, where there are no means of tracing, which could not be kept in hand unless there were some books to keep them. In looking through the bank-books you can account for perhaps a half of the money, but for one-half at least you can never account without there were books. You cannot tell where these papers are, or what became of the money; you can see clearly that the sums go to Maddison, Ewing, Rogers, and Snodgrass, when they leave, but you cannot account for the others. It appears to me to be impossible to carry on a business without books. You could conduct a small business without books, but not an extensive business where there are so many claims and cross-claims, liabilities in actions at law, and all sorts of things which absolutely make it necessary to keep books.
15402. Have you had a large experience with contractors? Yes; a good experience.
15403. Don't you know that it is almost the universal thing for them not to keep books? No; I know that the large contractors I have had to deal with have been most scrupulous in keeping books and also keeping a clerk to keep the books.
15404. It is totally different from my experience? I know very well that I have called upon contractors at times to produce books to establish their charges, and they have done so. At all events, in regard to that, I asked a great number of contractors and they told me that they do keep books, most of them. Small contractors such as Gilliver—but he is not a small contractor—keep a set of books.
15405. Gilliver destroys them immediately after he finishes his jobs? I do not know that.
15406. He said so? No. He said he destroyed his pay-sheets.
15407. He said he destroyed his books? He does not destroy his ledgers. There is no business in the world so difficult as a contractor's as far as the financial matters go. A storekeeper could better keep his accounts going without books than a contractor.
15408. In this investigation you say you could trace what Maddison and Ewing got as their share of the partnership? I cannot trace that exactly, but I can see where they got sums to leave the firm—such as £1,500 in one case, £1,000 in another, and £2,000 in another case.
15409. Does that not show that they only got a sixth of the profits? A seventh.
15410. Does it not? Yes; but that might be a seventh on Contract 69.
15411. Was it not a seventh on all the profits earned up to that date? I understood from Maddison and Ewing that they received £1,500 as their share of the profits on Contract 69, and I think the bank-books will also bear that out.
15412. They got no profits on Contract 79A? On Contract 79 I presume they would, but not on Contract 79A. Perhaps it might have been the profits on both Contract 69 and Contract 79.
15413. And Adelaide? Adelaide is a separate account as far as we can see in the bank books.
15414. Still they got their share of the profits? I do not know that they did.
15415. They never complained to you that they have not? No; but they told me, if I recollect aright, that was what they had to draw out of Contract 69.
15416. If they got their one-seventh share of the profit, where was Mr. Hickson's share of the profit to come from without he was paid by the other partners? I could not tell you that. As I say, you cannot trace one-half of the money that was paid into the account of Carter, Gummow, & Co.
15417. Do you think the partnership would be of this style—that Maddison and Ewing were to get a seventh and the remaining partners were to pay Hickson his share of the profits? Yes. But how do I know that it is a seventh? I only said a seventh because there happened to be seven members in the firm as put down here.
15418. As a matter of fact, did Mr. Christie report to you that there was a seventh—that they got their share of the profits, and that it was a seventh? He did not report anything at all about it. I instructed Mr. Christie to try and find out exactly what were the profits on these various contracts, and he found that one merged into the other; that with the pay-sheets drawn out as you are doing in Contract 77 and Contract 118 it was simply impossible to tell what the profits were. That is another reason why he came to the conclusion that there must be books, because you must separate these contracts.
15419. Since the start of the Commission you have seen the work at Johnstone's Creek on the Monier system? Yes.
15420. Do you still consider that the expression you used in your May speech, that the irons were to keep the defective arches from falling, is correct? In a certain way it is, because the iron is the strength. It would be no good without the iron.

- V. Parkes. 15421. Is not that what is claimed as an advantage of the system? Yes.
- 31 Aug., 1896. 15422. What you call in that speech defective arches is one of the beauties of the system? I did not say defective arches. I said as the structure was made light enough not to be self-sustaining it would need iron as an assistant.
15423. In that speech, at page 30, I understood you to say that these rods were simply used to protect the defective arches? The illustration was a long span with a fair weight, and insufficient sustaining strength with it. It is not a very good description. Very likely I could have used a better one. I used it because it happened to be convenient.
15424. *His Honor.*] The real fact is that at the time you suggested this simile or analogy you did not know what the Monier system really was? No, I did not. I knew its application, but I know that the iron went into the compo.
15425. You had not thought out its real scientific action? No, it was only the bearing of the thing that I wanted to point out. The point I was making was that if these iron rods rusted or became defective, with everything dependent upon them, the structure then was at hazard. It is quite true that I did not understand it then as I understand it now.
15426. *Mr. Andrews.*] The lightness was supposed to be one of its beauties? Yes.
15427. And a saving of material? Yes, of course economy is the chief thing.
15428. In regard to Contract 69, in reply to Mr. Smith this morning, you stated that the schedule was so filled up that it conveyed to your mind the impression or the certainty that they must have had inside information? Yes.
15429. Is it not possible that a man with a good local knowledge and a large experience of these works would be able to gauge what that schedule represents? Yes; but everybody has a local knowledge of Marrickville.
15430. Everybody cannot apply it? There is the bore put down at, say, every 100 yards. Every shaft goes right through the shaft excavation until it comes to the rock. There can be no doubt about the information to be had. Supposing everybody knows that. There is no contractor in the city—not one of those who were tendering—who did not know that it was a Wyanamatta shale country. Where the rock crops up there it is seen in the hillocks. No one could make a mistake about it. The plans are accurate as far as they go. The work carried out was the same. Anybody who put in £50 for the item “bluestone pitching” must have had it in their minds that such a thing could never be accepted; that it would be sent back.
15431. It was accepted? Exactly. I will ask you, Mr. Andrews, whether you or any reasonable man would expect that tender to be perused and accepted upon these items.
15432. Notwithstanding these bores, do you not think that a tenderer may have local knowledge which would assist him in making up that contract? I do not think that anyone has a special local knowledge of that district. There is Mr. McSweeney who tendered. Mr. Ahearn is doing work out there. Have Carter & Co. a better knowledge than these men.
15433. Is it not a fact that one man from certain data will be able to give a better estimate, or a better calculation of what will result, than another? That might be in the ordinary way. He might put in a rational profit of say 15 or 20 per cent. on an item. But when it comes to putting on 500 per cent., or 200 per cent., and reducing others correspondingly, it would never do. There could have been no calculations made at all. It is clear that the other men did calculate, but in this case there could not have been any calculation at all. That is why I say there is a suspicion. Take, for instance, at page 67 of the Parliamentary return, item 12, the Government put down excavation (soft)—this is where blasting is used in the tunnel—at 10s., but Carter & Co. put it down at 4s. The Government put another item, “excavation less hard,” at 10s., but Carter & Co. put it down at 40s. It seems curious that they are paid. Why not have “heavy” with “less hard”? They are all paid on that 40s. The two items seem the same. Would any contractor venture to put 4s. there when the Government could have availed themselves of their right to pay them at that 4s.
15434. I want to know whether local knowledge would not account for that difference? No; it would not account for the schedule.
15435. Do you not know, as a matter of fact, that in any branch of life special knowledge will allow men to do work considerably cheaper than others and yet make a profit? Yes, that would be all right if special knowledge allowed them to so tender that they could do work cheaper, but when special knowledge or special information, or whatever it may be, allows them to so arrange a price that comes out dear, then all may be wrong. For instance, how would you like to pay 27s. 6d. a yard for soft excavation?
15436. Would not their knowledge help them so that they could see that the charges they make on one would pay for the smallness on the other? No, it would not. For instance, take items 12 and 16, at page 76, in the Parliamentary return:—
- Excavation in road surfaces, soil, clay, pipeclay, shale, and soft rock only, where, in the opinion of the Engineer-in-Chief, blasting is unnecessary, 130 cubic yards at 4s.
- Less hard excavation in road surfaces, soil, clay, pipeclay, loose and jointy shale, and soft rock, where, in the opinion of the Engineer, blasting is unnecessary, 170 cubic yards at 40s.
- Practically the same—40s. When the payment takes place, the 130 at 4s. is reduced to 91, and the 170 at 40s. is increased to 539.
15437. Would not their prior local knowledge allow them to judge that that would be the result? What you mean is that their local knowledge would allow them to set a trap easily.
15438. No, I mean what I say. Would not their local knowledge allow them to judge whether the schedule was likely to be increased or decreased? No; this schedule suggests that they had no local knowledge—that they had not gone near the site.
15439. Are you prepared to say they had no local knowledge? No.
15440. Why do you say that? I am to judge from this schedule.
15441. You swear distinctly that a man having a local knowledge could not tell whether the items were likely to be increased or decreased? He might be able to tell that to a rational extent, but not to the extent this has been done.
15442. What do you mean by stating what improper concessions you think Carter, Gummow, & Co. have obtained have been proved before this Commission? That is for His Honor to say.
15443. *Mr. Smith.*] You referred this morning to some papers that were missing—I mean the papers approving of the extension of High-street at schedule rates. You referred to a memorandum which is dated 28th August,

August, 1895, being a minute by the supervising engineer. Following that minute there were other minutes, and then you referred to this one: "As the papers cannot be found, we must pass in the vouchers without them," signed by Mr. Darley on 5th September, 1895. Are not these missing papers you refer to the same as paper No. 23, printed in the Parliamentary Return at page 370? Yes, I think you are right. These papers refer to High-street, and not to 79A.

15444. It appears they were missing for a time, and have since been found and printed with the others? You are right, and I am in error. These papers refer to High-street; but that does not get over what I say, that there ought to have been some authorisation of this work more than the minutes which are placed in this paper. I was led, by what Mr. Lyne said, to suppose that there were, but in that case I was wrong.

15445. When you say, "By what Mr. Lyne said," you mean what was said in that conversation you had with him? Yes; in fact, he was looking over the documents himself and he said, "Show me where the correspondence, as to letting that Contract 79A, appears in these papers"? I showed him this, and he said, "That was not all that took place; where are the other papers;—if you get the other papers, you ought to be able to see exactly what the transaction was." It was not quite clear in his mind. He had forgotten.

15446. *His Honor.*] After that cross-examination, Mr. Parkes, do you wish to add any evidence, as far as any re-examination of yourself is concerned? No, your Honor, I have nothing further to add.

---

WEDNESDAY, 2 SEPTEMBER, 1896.

Varney Parkes recalled and further examined:—

15447. *His Honor.*] I understand that you wish to make an explanation as to your answer to question No. 14955? Yes. The reply which I should have given to that question was that I did not hear Mr. Maddison absolutely deny having told me that the telegram referred to had been sent, but that I had heard him partially deny it.

15448-9. That is all you wish to say as to that? Yes.

15450. *Mr. Smith.*] You say now that a partial denial was given by Mr. Maddison of the statement you attribute to him? Yes.

15451. At all events, you heard him say this: that up to 1895 Mr. Hickson, junr., was not a partner in the firm to his knowledge? Yes, I heard him say that, and I do not think that in my speech I said any more.

15452. Then Mr. Maddison was asked, "Did you ever make a statement to the effect that Mr. Hickson, junr., was a partner in the firm?" and his reply was "Certainly not"; you heard him say that? I heard him give that evidence.

15453. He was then asked this question: "Never to anyone?" and he said "Never"; he also said that if that statement had been made upon his authority it was untrue. You heard him give that evidence? Yes; I heard him give that evidence, but my answer to that is this: That in his evidence he did not deny that he had given information indicating his belief that young Mr. Hickson was a partner after he left.

15454. At all events you heard him say that he did not undertake to obtain a copy of the telegram referred to? I did hear him say that.

15455. *His Honor.*] Do you wish to add anything after that cross-examination? Yes. Mr. Maddison was requested by me to obtain a copy of the telegram. He asked me by what means he could get it. I told him that he could do so by application at the Post Office. It was understood that on making that application he would be able to get a copy of the telegram. It was also understood that when the proper time came I would assist him in getting it. Mr. Maddison was positive, at the time, of the existence of the telegram, and he said that its existence could be proved if a search were made at the General Post Office.

15456. Neither of you knowing at the time that after twelve months telegrams would be destroyed? No; we thought a record would be kept of every telegram.

15457. *Mr. Smith.*] What do you mean when you say it was understood that Mr. Maddison would obtain a copy of the telegram? I mean exactly what I say.

15458. But he denies having ever undertaken to produce a copy. According to you, therefore, in making that denial he cannot have been speaking the truth? That is rather a hard way of putting it. A man might say, for instance, that he would identify a telegram if it were put before him, or that he would make every effort to obtain a copy or to assist in obtaining a copy of it, or that he would give the necessary information to assist in getting a copy. He might say, for instance, that he was so positive of the telegrams being in existence that he would be prepared to render every assistance in getting a copy of it.

15459. Do you still say that Mr. Maddison undertook to get a copy of the telegram? Yes; but, in answering that question, I desire to make this explanation, that in undertaking to get it he could only undertake to avail himself of every means at his disposal. What he said amounted to this: That, if such a thing were obtainable, he would get a copy. I remember distinctly asking him whether the telegram could be produced, and I remember his saying that it could, and that he could get a copy.

15460. When, therefore, he says that he did not enter into such an undertaking, he is not speaking the truth? As far as I know he is not speaking the truth.

15461. That is what I mean when I say that you now find Mr. Maddison not to be the reliable authority which you told the House he was? What I perhaps ought to have said was that I had an assurance of the existence of the telegram

Joseph Davis recalled and further examined :—

- J. Davis. 15462. *Mr. Hickson.*] How long have you been in the Government service? Thirteen years.  
 15463. You have been connected with sewerage works during the whole of that time? Yes.  
 2 Sept., 1896. 15464. It was I, I think, who placed you in charge of all sewerage contracts in 1890? Yes; at the beginning of 1890.  
 15465. And you held that position until the reorganisation of the Department in April, 1895? Yes.  
 15466. When the sewerage works were handed over to the then President of the Water and Sewerage Board, Mr. Darley? Yes.  
 15467. You were at that time appointed Principal Assistant Engineer for Country Towns Water Supply and Sewerage? Yes.  
 15468. And you held that position until April of this year? Yes.  
 15469. You then went back practically to your old position? Yes.  
 15470. For how long? For three months.  
 15471. And then on the reorganisation of the Service generally by the Public Service Board you became Engineer-in-charge of all sewerage works in the Colony? Yes.  
 15472. You are really at the head of the branch? Yes.  
 15473. You are also a member of the Board of Reference? Yes.  
 15474. And you are a member of the Institute of Civil Engineers? Yes.  
 15475. *Mr. Smith.*] In regard to Contract 69, let me direct your attention to two of the charges which have been made by Mr. Parkes—one charging the Department with manipulating the schedule of Messrs. Carter, Gummow, & Co., the contractors, so as to give them an advantage over the Crown by paying them on the extravagant items of charge, and conceding those items upon which they had a losing price, and in defiance of the terms of Messrs. Carter, Gummow, & Co.'s contract with the Crown; the other charging them with paying to the contractors large sums of money which they—the departmental officers—were not compelled to pay under Carter, Gummow, & Co.'s contract with the Crown. They are two of the charges affecting Contract 69. I believe you have gone into those matters? Yes, carefully.  
 15476. And you have drawn up a short statement of the facts relating to them? Yes.  
 15477. The three items chiefly referred to are the bluestone pitching, the cement rendering, and the omission of the subducts? Yes. I am not sure about the cement rendering, but I think that is also referred to.  
 15478. You have gone into these several matters? I have; and I have put down on paper my ideas in reference to them. I thought that would be the most convenient way of putting my views before the Commission.  
 15479. *His Honor.*] I understand that what you have prepared is a short statement of fact—that it is not an argumentative statement? Yes; I have abstained from argument as far as possible.  
 15480. *Mr. Smith.*] Will you read the memorandum you have prepared? Yes; it is as follows :—

MEMORANDUM NO. 1.—CONTRACT NO. 69.

*Speculative Tenders.*

It has been the practice, from the inception of the Sewerage Branch, about fifteen years ago, up to the beginning of 1894, to accept the tender which worked out to the lowest total sum, taking the probable quantities—given in the schedule—and the rates per unit stated by the tenderers. This system gave opportunity for much speculation on the part of the contractors. The idea which appears to have actuated them in preparing a tender was to place on such items as they thought were likely to be increased in quantity during the progress of the work, over the probable quantities in the schedule, a higher price than the true value of the work. On the other hand, if they thought there was likely to be a corresponding decrease they put a merely nominal price. By this means the total sum of a tender was kept down, and if the tenderer's speculation proved to be correct the contract, being a schedule rate one, would work out, when the final voucher came to be prepared, in the contractor's favour—the total sum being in excess of the total amount of the tender at schedule rates. Sometimes, however, as in all such ventures, the suppositions of the contractor have proved to be wrong, and he has suffered accordingly.

In the contract under consideration, it was known when the tenders were accepted that there would be three descriptions of ground through which the tunnels and shafts would pass, viz., soft ground requiring timber, shale, and hard rock. But what proportions of the shafts and tunnel would be in one or the other it was quite impossible to say. This could only be ascertained when the work was carried out. Full provision was made in the contract for varying the cross-sections of excavation and lining to suit the different kinds of ground passed through. The nature of the strata increased or decreased the dimensions of the excavation and the brick and concrete lining. When, therefore, the ground proved to be soft, and the excavation was increased in size and the lining in thickness, the quantities were necessarily increased; when hard, they were decreased.

When the survey for this sewer was made borings were taken along the line of sewer, through the soft ground, down to that of a harder nature. Below this it would have been too expensive to go. Any strata, therefore, below the bottom of the bore might prove to be hard or soft shale, or rock, and it would have been more or less assumption to say what proportion of these three materials would be met with in the excavation.

It has been the practice on this and other contracts of a similar kind to determine the cross-section of excavation when the tunnel was being driven, in order to suit the kind of lining to the circumstances. If the tunnel be in rock it is usual to excavate it 10 inches wider and 10 inches higher than the internal dimensions of the sewer, to admit of 5 inches in thickness of brick and concrete lining being put in. In shale hard enough to require blasting, but which when exposed to the air disintegrates, the tunnel is excavated for 10 inches in thickness of brick and concrete lining; whilst in softer material, requiring the use of timber, the excavation is taken out very much larger, and paid for in conformity with the specification to the outside of the timber. To give an idea of the different cross-sections for these three descriptions of sewer, I have prepared an estimate of the cost per chain at schedule rates, of excavation in rock, hard shale, and soft ground, respectively, for a 5 ft. 1 in. x 4 ft. 1 in. sewer.

|   | £   | s. | d. |
|---|-----|----|----|
| Ground which will admit of 5 in. lining being put in, using 57·5 cub. yds., at 27/6 | 77  | 9  | 7  |
| Do 10 in. do 73·9 cub. yds., at 27/6  | 101 | 12 | 3  |
| Ground requiring timber, 174·4 cub. yards, at 27/6 ... ..                           | 239 | 16 | 3  |

It

It is not difficult, therefore, to see why in this particular instance (Contract 69) the tunnel excavation should have been so materially increased, compared with the quantity given in the schedule. It was thought, when the Contract drawings were prepared, that the tunnel (in more or less hard ground) would have been in hard shale, whereas it proved to be ground requiring timber, and as a consequence the quantities given in the schedule for this kind of work proved to be much below what was expected. Indeed, it was quite impossible to say before the work was actually carried out what quantity of excavation of any particular description there would be. It is evident that if results did not turn out as the Department expected they did not turn out quite as Messrs Carter, Gummow, & Co expected either, or they would not have put such a low price on timber, by which, as it turned out, they lost heavily. They evidently speculated on a two-ring brickwork section that would stand without timbering. The schedule of quantities and prices attached to the contract provides for probable quantities only, and in the office estimate the prices were fixed to vary with the value of the work.

J. Davis.  
2 Sept., 1896.

From my own knowledge, it has been the habit for a number of years for tenderers to take advantage of the uncertainty referred to. No doubt in the case of Contract No. 69 the speculation assumed serious proportions. When Mr. Hickson saw the pitch it had reached, as indicated by that contract, he decided to adopt an entirely new system, which has since been introduced, where applicable, in the other branches of the Department of Public Works, and also by the Board of Water Supply and Sewerage, and, I understand, by his advice, by the Melbourne Board of Water Supply and Sewerage, where the same difficulty was being experienced. The tender for Contract No 69 was received on the 27th December, 1893, and the first tender under the new system was received in March, 1894; no time, therefore, was lost after the receipt of the tender for Contract No. 69 in adopting the new system. For some time before the change of system was decided upon it was unusual for a tender to be received which was not speculative to a greater or lesser degree

*New system of Tender.*

In inviting tenders for contracts now, no probable quantities are given in the schedule of prices, but a fair and reasonable rate is attached to each item of work, and the tenderers are asked to say whether they are prepared to carry out the work at the prices named, and if not, taking the rates as a whole, what percentage above or below the printed prices they are prepared to do the work for. The result of this has been to effectually prevent what was so glaring and objectionable a feature in the old system.

*Tenders for Contract No. 69.*

An examination of the eleven tenders submitted for this Contract (see printed papers, page 6) will show that Messrs. Carter, Gummow, & Co, were not alone in manipulating their prices. In the following table some of the conspicuous instances have been selected —

| Item | Office Estimate | Kerle and Kerle | Justin McSweeney | Holloway Bros | A Dean and Sons | Langtree and Owen | John Ahearne | Parry and Farley | T Stewart & Co |
|------|-----------------|-----------------|------------------|---------------|-----------------|-------------------|--------------|------------------|----------------|
| 6    | 50/-            | 25/-            |                  |               | ...             | ...               | 18/-         | 40/-             | 30/-           |
| 7    | 40/-            | 23/-            | 3 1/6            |               | 18/-            |                   | 15/-         | ....             | ...            |
| 8    | 30/-            | 23/-            |                  |               | 18/-            |                   | 16/-         | ....             | 50/-           |
| 9    | 60/-            |                 |                  |               | ..              | 42/-              |              | 38/-             | .....          |
| 10   | 55/-            | 35/-            | 35/-             | ..            | 25/-            | 41/-              | 18/-         | 33/-             | ....           |
| 11   | 45/-            |                 | 35/-             |               | 25/-            |                   | 19/-         |                  | ....           |
| 12   | 10/-            |                 |                  | 30/-          |                 |                   | ..           | 25/-             | 80/-           |
| 13   | 40/-            |                 |                  | 30/-          | 20/-            |                   |              | ..               | .....          |
| 14   | 30/-            |                 |                  |               | 20/-            |                   |              | ..               | ....           |
| 15   | 50/-            |                 |                  |               | ..              |                   |              | ..               | 80/-           |
| 16   | 10/-            |                 |                  | 30/-          |                 |                   |              | 25/-             | 80/-           |
| 17   | 40/-            |                 |                  |               | 20/-            |                   | 20/-         |                  | 100/-          |
| 18   | 35/-            | .....           |                  |               | 20/-            |                   | 18/-         | ....             | .....          |
| 19   | 30/-            | ....            |                  |               | 20/-            | .....             | 18/-         | ....             | .....          |
| 20   | 1/-             |                 |                  |               |                 |                   |              | ....             | .....          |
| 21   | 2/-             | -1              | -3               | 5/-           | 6/-             | 1/-               | ....         | 4/-              | -6             |
| 22   | 15/-            | 1/-             |                  | ...           | ...             |                   | .....        | ....             | -1             |

That the same sort of speculation occurred in other cases may be gathered, for instance, from Contracts Nos. 80 and 83. In No 80, Messrs. Parry & Farley's price for item 3, the equivalent of No. 9 above, was 110s. In Contract No 83, O'Neill & Co's. prices for items 6, 7, 8, the equivalent of 6, 7, 8 above, were 22s. 6d, 21s., and 21s., and for 9, 10, 11, and 12, the equivalent of 12, 13, 14, and 15, 4s. 6d., 20s, and 22s 6d. For timber left in tunnels (21 above), they had 6d, for cement facing, 4s., and for every further 1/4 mile lead to spoil, 1d.

With the exception of Mr. John Ahearn's tender, and perhaps Messrs. M'Kenzie's and Sons, Messrs Carter, Gummow, & Co's proved to be the best that could have been accepted. This will be seen to be the case if the attached schedule be examined, which I have prepared, showing the actual quantity of the work executed, computed at the rates attached to the several tenders.

The totals are as follows —

| No of Tender |                                  | Cost of work actually executed at different tenders received | Amount of Tender. |
|--------------|----------------------------------|--|-------------------|
|              |                                  | £ s d  | £ s d.            |
|              | At office prices .. ..           | 63,831 11 5  | 64,420 6 5        |
| 1            | „ Carter, Gummow, & Co.'s prices | 54,320 7 7   | 45,207 3 11       |
| 2            | „ John Ahearn's prices           | 47,459 6 6   | 47,061 3 0        |
| 3            | „ Kerle and Kerle's prices       | 56,864 4 8   | 52,735 10 9       |
| 4            | „ M'Kenzie and Sons              | 51,16 13 11  | 53,523 6 0        |
| 5            | „ J McSweeney's                  | 59,175 2 4   | 54,636 7 7        |
| 6            | „ Holloway Bros                  | 54,593 10 10   | 55,752 9 6        |
| 7            | „ J. F Carson's                  | 56,232 16 3  | 57,230 0 9        |
| 8            | „ A Dean and Sons                | 57,287 1 10  | 58,168 0 2        |
| 9            | „ Langtree and Owen's prices     | 66,371 9 9   | 59,676 14 0       |
| 10           | „ Parry and Farley's             | 66,695 6 6   | 63,095 11 11      |
| 11           | „ J. Stewart & Co.'s             | 75,404 17 6  | 68,173 10 11      |

J. Davis.  
2 Sept., 1896.

By a reference to the final voucher for this contract, it will be seen that items 1 to 10, being grouped into two rates, were condensed into two items, namely 1 to 4, at 9d., and 5 to 10, at 27s. 6d. Had the contract been carried out by any of the other tenderers, it would have been necessary to apportion the relative quantities to these ten items. It will be impossible to do this now, as the data, being unnecessary, were not recorded. The value of the work at the rates of the several tenders given in the above table is, therefore, not absolutely determinable. But, at all events, there are sufficient data to show that in two of these cases only (namely, Ahearn and Mackenzie) would the amount worked out have been under that of Carter, Gummow, & Co. In all other cases the amount payable would have been greatly in excess of the amount payable to Carter, Gummow, & Co.

It is scarcely necessary to point out that the reason why Messrs. Carter, Gummow, & Co.'s final voucher exceeds their tender, whilst the valuation of the work at the rates of either J. Ahearn's or Mackenzie and Son's tender falls below it, is due to speculation on the various items for excavation. The range of opinion upon this point, as exhibited in the tenders, shows the problematic nature of such estimates. If the average opinion be taken in order to arrive at a valuation of work—and this seems to be the only method to adopt under the circumstances—then the matter would stand thus:—The mean of the tenders, £55,933, and the mean valuation of the work as finished, computed at the various tender rates, £64,555. The office estimate was £64,420, and the value of the work, as executed, at the office rates, £63,831. Before the work was undertaken, therefore, and in the absence of the knowledge that has since been gained concerning the nature of the ground, a fair average value for the contract was fixed by the Department, at £64,420. Results have shown the average valuation of the finished work—made by eleven experts, under the most unprejudiced circumstances—is £64,555. In the light of this it may be fairly questioned whether Mr. Ahearn could have carried out the work at a sum of £16,961 below the office estimate, or below Carter, Gummow, & Co. Contractors do make mistakes sometimes, and suffer loss thereby, as admitted by Mr. J. Young (page 360, Q. 11779).

From the commencement of the sewerage works in Sydney and suburbs up to the change in the system of tendering, twenty contracts were let in which tunneling occurred. Ten of these have been carried out by Messrs. Carter, Gummow, & Co., or some member or members of that firm. There are not, therefore, many contracts other than those carried out by those contractors to which reference can be made. For many years very little speculation of the nature described was indulged in, but latterly the practice had greatly increased.

The speculative method of preparing tenders has not been confined to contracts comprising tunneling. Wherever the nature of the work has made the probable quantity uncertain, contractors have fixed their prices with a view to getting the minimum total sum for their tenders, and the maximum total sum for their final voucher. Notably amongst these might be instanced Contract No. 64 for the Main Western outfall aqueducts. At the time this contract was prepared it was impossible to say what kind of foundation would be found for the piers. It was thought that for about half the number of piers the foundations would be satisfactory without piling, and the probable quantity for piling was fixed accordingly. Considerably more piling, however, was necessary, and, as a consequence, the 40,000 cubic feet of timber in schedule was increased to double that quantity in the final voucher, and as the price was high (5s. per cubic foot) the contractor made double the profit he otherwise would have done. If the other classes of work on the same contract had been increased the result would have been different. For all that was known to the contrary when this contract was let the same thing might have happened as happened in the aqueduct contract across the Sewage Farm, in which, acting upon previous experience, a liberal quantity of piling was included in the schedule; but it turned out that a sufficiently good foundation was obtained for the piers without piling, and none therefore was paid for.

Preference is given to schedule rate rather than lump sum contracts for work of this description, especially for sewers in tunnel, because it would be unreasonable to expect a contractor to take the risk of stating a definite sum for which he would be prepared to carry out a practically unknown quantity of work.

The risk would be a heavy one and would naturally have to be paid for in proportion. Besides, there would be no check upon the final cost, and no way of arriving at an estimate of the value of the work. To prevent extravagance and secure economical administration in the Department it was necessary to take out preliminary quantities as accurately as circumstances might allow. It was deemed expedient to furnish the tenderers with these quantities in order that the tenders might be comparable with the office estimate. For many years the system worked very well, but at length its weakness was discovered and taken advantage of by the contractors.

The propriety of accepting a tender—based on high or low rates not representing the value of the work to be done—might be questioned; but it must be remembered that it has been invariably the practice to accept the lowest tender, without regard to the way in which the tenderer has fixed his rates, unless for some reason he has been disqualified. Indeed it is difficult to say what could be done otherwise than by altering the system of tendering.

The Department could not have rearranged the rates in a way that would have been satisfactory to any tenderer. Assuming, however, that this had been possible, it would have exposed the Department to really serious charges. If fresh tenders had been invited, it is highly probable that the same description of tender would have been received a second time. The only course, therefore, was to alter the system when it became manifest that it was subject to such grave abuses. This was done by Mr. Hickson, and tenderers were not permitted to arrange their own rates, as far as the Sewerage Branch is concerned, after March, 1894. Moreover, it must be borne in mind that, at the time the tender for Contract 69 was accepted, no one could say (except in the case of the pitching) whether the speculative rates fixed by Messrs. Carter, Gummow, & Co., especially in respect to the excavation in tunnels, would work out in the end for or against them.

#### *Subducts.*

This also applies in the case of subducts—because if the tunnel had proved to be wet, in so far as the pipes were concerned, the subducts provided for in the schedule would have been constructed. As it turned out, however, they were not required—not that it affects the question very much—as Messrs. Carter, Gummow, & Co.'s prices for subducts (although apparently low), when taken in conjunction with  
the

the excavation for the subducts, which is specified to be paid for at schedule rates, are probably set down at about a fair value, and are about the same as the other tenderers, as the following statement will show:—

J. Davis.  
2 Sept., 1896.

*Cost per lineal yard of Subducts, including Excavation.*

| Tender.                    | Item 24. | Item 25. | Item 26. | Item 27. |

| J. Stewart & Co.....       | 1 9 4    | 1 11 7   | 1 3 0    | 1 6 0    |

If the tunnel is found to be so wet that the concrete, before it has time to set, would be damaged by the quantity of water passing along the bottom of the tunnel, subducts are used, but not otherwise. A tunnel that is dry, it is obvious, does not require any such provision. As it is impossible to say whether a tunnel will be wet or dry, before the excavation is carried out, it has been the practice of the Department in all tunnel contracts to provide items in the schedule covering the construction of subducts. Whenever it is possible to dispense with them they are not constructed, because in time they prove a source of weakness to the foundations of the sewer. Being laid with open joints, in order to admit the water, it is found that the soil creeps into them, no matter what precautions may be taken to keep it out, thus forming cavities under the sewer. In a part of the Bondi sewer driven through the sand the sub-ducts brought away so much of the foundations that a length of 8 ft. 6 in. x 7 ft. 6 in. sewer showed signs of failing some time after it was finished, and had to be strengthened. In this case every precaution was taken that experience could suggest in the way of boxing, &c., to keep out the sand.

*Items included in Schedule—but not often used.*

The uncertainty of the nature of the ground and other circumstances connected with the construction of sewerage work makes it expedient to provide in the schedule items for work which may possibly be necessary, in order to obtain prices for them. By this means a check is kept upon exorbitant extras; for contractors, if not tied down to prices at the time of tendering, would afterwards quote very much higher rates for extras.

*Final voucher.*

The foregoing fully explains why the quantities returned in the final voucher are so different from those in the schedule attached to the contract. It may, however, be necessary to give some explanation on several items.

The quantity returned for Item 1 is practically the same as that given in the schedule attached to the contract, although the price (9d. per cubic yard) is low, and represents probably 30 per cent. of the true value of the work. The parts of the tunnel paid for under Items 8 and 11 exceed the quantities provided for in the schedule, because the nature of the ground passed through required a larger cross section of excavation than was anticipated. The quantity of tunnelling estimated to be done was 9,580 yards, whereas the actual quantity was 14,373 cubic yards, or a difference of 4,793 cubic yards, which, at schedule rates (£1 7s. 6d. per cubic yard), amounts to £6,590. The tunnel excavation, therefore, is responsible for the major portion of the excess of the final voucher over the tender. I would point out also that this increased amount for excavation is not in any way due to payment at an exorbitant rate. £1 7s. 6d. per cubic yard on these items is not a high one, as may be seen by comparing the tenders, especially if due allowance be made for the low rate on the first four items.

The only item in shaft excavation which calls for remark is No. 16, where the quantity in the schedule is exceeded. This is due to the soft nature of the ground, which necessitated timbering, and consequently a larger sectional area of excavation than was anticipated.

It should be noted that the schedule rate for timber ordered to be left in open trenches and tunnels (Item No. 21) is put down at 1d. per cubic foot. As before mentioned this rate is absurdly low. The usual price for work of this description is 2s. per cubic foot, and, as the quantity given in the schedule has been exceeded, the contractors have been paid £950 less than they would have been paid had they tendered at the value of the work.

With regard to Item No. 36 for bluestone pitchers round manholes, the probable quantity given in the schedule is 12 square yards, whereas if all the manhole covers were to be pitched the quantity would work out to about 35 square yards. Messrs. Carter, Gummow, & Co. before putting in their tender evidently discovered this, and came to the conclusion that if all the manhole covers were to be pitched the quantity given in the schedule would be greatly increased. They accordingly put an extremely high price down for the work. The specification provided that these pitchers were to be put round all manhole covers, but after the tender was accepted, and the work came to be carried out, attention was called to the small quantity provided for in the schedule; and it was also pointed out that, while in the specification this provision was made, pitchers were not shown on the contract drawings to be put round all the covers. The Engineer-in-Chief (Mr. Hickson) took advantage of this, notwithstanding the strong protest on the part of the contractors, and decided that only those pitchers were to be carried out that were shown on drawing, and instructions were given to the officer-in-charge accordingly [see Parliamentary Papers, page 125, No. 17]. Before, however, the contract was completed, Mr. Darley was appointed Engineer-in-Chief for Metropolitan Sewerage Construction, and the works were taken over by him, and another Resident Engineer put in charge, who appears not to have known of Mr. Hickson's decision; and the contractors pitched, with two exceptions, the whole of the manhole covers, and were paid for them in the final voucher

Since

J. Davis.  
2 Sept., 1896.

Since the inauguration of the Sewerage Branch in November, 1879, up to the present date, 117 contracts have been let and completed, with the following result:—Amount of tenders worked out at schedule rates £1,440,225. Total amount of final vouchers, £1,433,186. Showing that the amount of the tenders worked out at schedule rates has exceeded the amounts of final vouchers by the sum of £7,039, or a saving of that amount in about one and a half million pounds worth of work. It will therefore be seen that, although speculative tendering has been in vogue for sixteen years, while in some cases the quantities at schedule rates worked out to more than the amount of the tender, the opposite occurred quite as frequently.

I should like to add, with regard to the bluestone pitchers, that it is usual, when a contract is let, to forward to the supervising officer a schedule of prices, which is really a copy of the contractor's tender. At the time Contract 69 was let that was done. I received a schedule, and in that schedule a clerical error was made. As it happened it proved to be rather a serious one. The clerk, instead of putting down £50 opposite the item of bluestone pitchers, had put down 50s. per square yard. It was not until the beginning of May that I discovered that there had been a mistake. So that from December until May I was carrying out the contract upon the assumption that the bluestone pitchers were to cost the Department 50s. a square yard and not as it turned out £50 per square yard. (*Vide Appendix No. 81.*)

15481. This speculative tendering by contractors is no new thing at all? No; it is in vogue to a greater or less degree, not only in all the public departments in New South Wales, but from what I can understand, and what I have been able to gather from my own experience, much the same state of things exists all the world over.

15482. The only way to put a stop to it was by adopting a new system, and that has been done? That is the case.

15483. Contract 69 was dealt with in the ordinary way;—although it afforded a glaring instance of the operation of the old method, the contract was dealt with in the ordinary manner? Yes; the practice of the Department when tenders were received was to make out a list of the whole of them. This was forwarded to Mr. Bagge. He prepared a schedule of the tenders, and in sending on his recommendation to Mr. Hickson, if he found anything he did not approve of in the tenders, it was his duty to call attention to it. He does not appear to have taken that step in this case; and, unless Mr. Hickson's attention had been called to the matter in that way, I do not see how he could have known of it.

15484. At all events, no exception was made in this case in the way of dealing with the tender? No; except in regard to two minor matters which Mr. Bagge pointed out, and which Mr. Hickson thought were of no consequence. They appear in the Parliamentary papers.

15485. So far as you have been able to find out, there is nothing to show that any undue concessions were made to the contractors in respect of this contract? There most certainly were no undue concessions.

15486. I should like you to explain another matter: Mr. Parkes told us on the last sitting day that he had not the slightest doubt that these contractors must have had private information from the office before they sent in such an absurd schedule;—I should like to know what you have to say as to that? The only information I can think of which would have been of any use to the contractors was in the nature of getting a hint that a mistake had been made in the probable quantities in respect of the bluestone pitchers. Their attention might have been called to that. I do not say that it was, but it is possible that that may have been done. As to anything beyond that, I do not see how any one of the officers could have helped them. These contractors are men of experience, and in going through the probable quantities it may have struck them at once that they were wrong. For instance, there are over thirty man-holes; and as it takes more than a yard of bluestone pitching for each man-hole, it was evident that the 12 yards were wrong.

15487. The fact was, that the plan showed thirty-two man-holes, and anyone who saw the plan would come to the conclusion at once, on comparing it with the schedule, that an error had been made? Yes; they might do that without any assistance whatever from the officers of the Department.

15488. It is a mistake which anyone going carefully into the matter would have seen? Yes.

15489. The same information upon this point was open to all the other contractors who tendered? Yes.

15490. Is there anything else of any possible use to tenderers which could have been suggested by anyone inside the office—can you imagine anything else? No. Of course in the carrying out of the work it might be said that they had someone in charge of it who worked with them. I know that during the proceedings of this Commission it has been left to be inferred that that is the case. I swear absolutely that in regard to Contract 69, taking any of the items, the same practice was observed in regard to the excavation, for instance—in regard to the subducts, in regard to everything, that was observed upon contracts let to other contractors.

15491. Let me go one step further: Suppose, for a moment, that this firm of contractors had a paid agent in the office, what would be the value of his information—what facts could he have given to the contractors which would have assisted them? He could have given them no information, except by way of calling their attention to a clerical error of the description I have named.

15492. In fact, the whole of the information at the disposal of the Department, or any of its officers, was put before the contractors in the probable quantities? Yes; it was the office idea of the probable quantities of the work. The difference comes in this way: The contractors would take out the quantities for themselves, and they would say, in regard to a particular item, "We do not agree with the office. From our experience and local knowledge, we do not agree with the office as to this probable quantity." They would, from their experience and local knowledge, prepare a schedule of probable quantities, independent of the office quantities, and base their prices upon that schedule, instead of on the probable quantities given by the office.

15493. *His Honor.*] Did it turn out in the sinking of the shafts, after all, that beds of clay or soft shale were found underneath bands of fairly hard sandstone? No. What I say is this: that borings were taken along the line of sewer; and in the majority of cases, where you came on to hard sandstone with your bore, you might be sure that you would get no soft ground below it; but in regard to shale, you may come on to fairly hard shale, and we would then say "That is as far as we need go." The nature of the shale below may differ. It is most difficult to say from the bores what the shale may turn out to be. It may prove so hard as not to require timbering, or it may prove to be so jointy and soft, when the air operates upon it, that it will be absolutely unsafe for workmen to sink shafts in it unless they are timbered.

That

That accounts for the difference between the sectional area of excavation in one case and another. It affects the quantities in that way. J. Davis.

15494. Do you say that boring is too expensive for the Department to feel justified in putting the bores right down to the level of the sewer through apparently hard shale? Yes. If the shale proves to be very hard we do not go on. It is too costly; but if we can do the boring in the shale at a moderate cost we go on to below the invert of the sewer. The drawings which are already in evidence will show that we do not stop on the top of the shale, but that we go through it to what we consider very hard shale, which it might be too expensive to bore through. 2 Sept., 1896.

15495. In this case you did stop on the top of the hard shale? Not in every case.

15496. Otherwise there would not have been the same opportunity for the contractors to speculate successfully on the softer shale underneath? I would not like to speak positively as to that without examining the longitudinal sections. I am speaking now as to the general practice of the office. (*Vide Appendix D.*)

15497. *Mr. Smith.*] To come to another charge by Mr. Parkes affecting the Department—I mean Charge 2;—he there charges the Department with allowing a contract to be taken up by Carter, Gummow, & Co. with an insufficient bond, and with ultimately breaking that bond by remitting the retention money;—you have examined that matter, and you have a short statement of facts with regard to it? Yes; I have made a statement with regard to the sureties, and also the retention money, and the returning of the fixed deposit upon Contracts 79 and 79A. That is a kindred matter, and I have dealt with the whole of these subjects, therefore, in memorandum No. 2.

15498. I understand that your memorandum No. 2, then, will deal with the fifth charge as to Contract 79, which is of a similar nature? Yes; Contract 79A is also involved. First of all I deal with the sureties. The memorandum is as follows:—

#### MEMORANDUM No. 2.—SURETIES.

WITH regard to sureties having been accepted in lieu of the usual fixed deposit on Contract No. 69, the concession was granted owing to the tender having been accepted subject to the contractors being paid in Funded Stock, under the Funded Stock Act of 1892, in lieu of cash, the contractors having verbally represented to the Minister that it would be a hardship to ask them to provide the cash security required by the General Conditions, when they were not actually being paid in cash for the work. Several other contracts were accepted about this time on the like condition, and in each case personal security was accepted in lieu of the usual cash deposit. (See the list of contracts handed in to the Commission by Mr. Norrie when giving evidence on 3rd July, 1896, Q. 7224, and Appendix No. 66.)

In all these cases, inclusive of Carter, Gummow, & Co., a personal security was accepted in the penal sum of 10 per cent. on the amount of the contract, as against the 5 per cent. cash deposit provided for in the General Conditions.

At the time Carter & Co.'s sureties were accepted it was not known that Parbury, Henty, & Co. were to supply the cement—not that it makes any difference. Mr. Scrutton's firm did not supply the iron. It was obtained from Mort's Dock Engineering Co.

#### *Retention Money.*

It is not admitted that the Minister cancelled the bond in connection with Contract No. 69 by returning a portion of the retention money, nor that the contract was in any way broken. Upon the return of the £1,000 referred to in Mr. Parkes' speech of 12th May, 1895 (page 28 of *Hansard*, and page 127 of printed papers), the Department still held £1,300, in addition to the personal securities already referred to, for the due completion of the contract. It was therefore considered that the Department was amply secured, and perfectly safe in returning the £1,000 to the contractors.

It has been the practice of the Department to return portions of the retention money held on contracts where it was found that the Department was otherwise amply protected, it being the desire to assist contractors as far as could be legitimately done, and not to in any way harass or inconvenience them, so that the return of the sum in question to Messrs. Carter, Gummow, & Co. was only uniform with the general practice. The General Conditions provided that the clause relating to the cash security and retention money, in common with any other condition of the contract, may be varied by the Minister (*see clause 27*).

The General Conditions now in use provide that should the Minister, at his discretion, make any payments out of the retention or deposit money to the contractors, the action shall not in any way prejudice the Minister's rights under the contract, or be taken as an admission of any claims made by the contractor, so that, although formerly the Minister impliedly reserved to himself the right, under clause 27 of the General Conditions, to make these payments, he has since expressly provided for his so doing. I may mention, for instance, that on the 13th March, 1893, the Minister returned to Mr. O. McMaster, the contractor for the Milson's Point Railway extension, the sum of £1,500 retention money; and in October of the same year, to Mr. Justin McSweeney, the contractor for the tramway from King-street to Ocean-street, the sum of £2,000. Messrs. Proudfoot & Co., the contractors for the railway from Marrickville to Burwood-road, also received a portion of their retention money.

With respect to the retention moneys on Contract No. 79, regarding which Mr. Christie gave evidence on 22nd July, 1896, the explanation is that 5 per cent. only was kept back, so as to preserve uniformity of practice, the new General Conditions, providing that the maximum amount of retention money should be an amount equal to 5 per cent. on the amount of the tender, being at that time incorporated in the greater number of the contracts then being let. The contractors having, on the 28th December, 1893, represented that they would experience some difficulty in making satisfactory arrangements for the disposal of the Funded Stock, with which it was proposed to pay them for Contract No. 69, which was accepted on the 11th of that month, and having asked for assistance in the matter of making financial arrangements by the return of the retention money on Contract No. 79, amounting to £2,000, the Minister, in consideration of the contractors, having shown their willingness to meet the Department (with regard to the acceptance of payment for Contract 69 in Funded Stock), agreed to grant their request, and the £2,000 was accordingly returned to them. The work then remaining to be done on Contract No. 79 did not exceed £4,000, against which the Department held the contractor's deposit of £2,000 for its completion.

*Fixed*

J. Davis.

*Fixed Deposit—Contract 79 and 79A.*

2 Sept., 1896.

In June, 1894, when the whole of the works comprised in Contract 79 had been practically finished, and there only remained the extension (Contract 79A) to be carried out, the question of the fixed deposit was brought forward for consideration. It was not thought necessary to retain £2,000, and the contractors were allowed to substitute another fixed deposit, for the sum of £650, for the works comprised in the extension. In addition to this, the sum of £531 10s. 6d. was held until the expiry of the maintenance period set out in the main contract.

Fixed deposits were frequently returned to contractors prior to the expiration of the maintenance period, so often in fact that the clerk in charge of bonds and contracts had a form struck off to meet such cases; but every case was considered on its own merits. I attach a list hereto showing some instances in which this practice has been followed.

## FIXED Deposits, &amp;c., returned before Completion of Contracts.

| Date.            | Work.   | Contractor.               | Amount.    |

I give this list so that it may be shown that Messrs. Carter, Gummow, & Co. were not treated differently from other contractors carrying out larger or smaller works, as the case might be, and that no concessions were made to them which were not made to other contractors in like circumstances. (*Vide Appendix No. 62.*)

15499. You have dealt with the advances made to the contractors on the three contracts you have just mentioned, 69, 79, and 79A? Yes; I have dealt briefly with them.

15500. Those are the matters referred to in Charge 4, affecting Contract 69, in Charge 10, affecting Contract 79, and in Charge 2, affecting Contract 79A? Yes; I have prepared the following memorandum:—

MEMO. No. 3.—RE ADVANCE ON CEMENT MADE TO MESSRS. CARTER & CO. ON CONTRACTS NOS. 69, 79, AND 79A. (*Vide Appendix No. 67.*)

WITH regard to the advances on material in connection with Contract No. 69, the Minister approved of the advance of sums to the extent of £1,000; but, as shown in Mr. Christie's evidence, page 382, this authority was only availed of to the extent of £450.

The minute written by me, and given on page 366 in the printed papers, does not contain the Departmental rule, but relates simply to Contract No. 79A. As a matter of fact, there is no rule of the kind in existence. The practice on Contract 79 was to advance at the rate of 16s. per cask, that being the schedule rate for one cask of Portland cement attached to the contract; and on Contract 79A at the rate of 75 per cent. of the market value of the cement—that is to say, 75 per cent. of 12s. 6d. per cask, which amounted to 9s. 4½d.

With regard to the high rate of advances made on Contract 79, the very expensive plant which the contractors had on the ground for the purposes of the work was also taken into account. This plant was probably worth £3,000; and, in addition, they had large stocks of bricks upon which no advance had been made. It must, however, be borne in mind, when reading Mr. Christie's figures, that the advance made in any particular month would either be reduced or increased in the next month, according to the quantity of material on the ground, and that the second advance would not be an addition to the first one; but the first one in the recapitulation attached to each voucher would not appear except in the money paid to the contractors, so that at no time was there a greater sum than £2,160 advanced on material. Mr. Christie's table should, therefore, be read as follows:—

- On the 13th progress return the sum of £720 was advanced.
- On the 14th progress return the advance was renewed.
- On the 15th progress return the advance was reduced to £696.
- On the 16th progress return the advance was increased to £1,360.
- On the 17th progress return the advance was increased to £2,160.
- On the 18th progress return the last advance was renewed.
- On the 19th progress return the advance was reduced to £1,760.
- On the 20th progress return the advance was reduced to £1,280.

15501. The security taken from the contractors included not only the cement, but also the plant and material? Yes; the moment the material and plant come on to the site of the works they become the property of Her Majesty, so that if at any time the contractors throw up the work they fall into the hands of the Department.

15502.

15502. Besides that, I think there was a special agreement with regard to material? Yes; that was more to cover the question of the cement being perhaps not technically on the site of the works. In some cases, as in the case of 69 and also 79, some of the cement was stored on private property, and although it was to all intents and purposes on the site of the works, still it may have been questioned, and for that reason this special agreement was taken from the contractors. J. Davis.  
2 Sept., 1896.

15503. So as to get security over the material wherever it might be? Yes.

15504. It was the common practice of the Department to make these advances to contractors in order to assist them? It is quite the usual thing.

15505. Mr. Christie, in his evidence upon page 380, refers to the application of Holloway Brothers, of Goulburn, who wrote to the effect that they were desirous of tendering for Contract 69, Sydney Sewerage, but that the cash deposit stood in their way. They asked whether the Department could not accept a less cash deposit in their case—say, £1,000 and sureties for the balance. The answer given was that the Minister could not consent to any reduction in the cash security required. That application was made before the tenders came in? Yes; on the 4th November, 1893, whereas tenders were received in December.

15506. It was dealt with before the tenders were received? Yes; it was referred to the Board of Reference and dealt with by the Minister before tenders were received.

15507. And it was after tenders had been received, and after Carter, Gummow, & Co.'s tender had been accepted, that the arrangement was made with them with regard to funded stock? Yes; the Minister, in accepting the tender, stipulated that the contractors were to be paid not in cash but in funded stock. That was made a condition of the acceptance. At the time Holloway Brothers wrote no one had any idea of the contractors' being paid in funded stock, and it was because the contractors were paid in funded stock that the personal security was accepted in lieu of cash deposit.

15508. It was because the contractors had met the Minister by taking funded stock that the arrangement was made for personal security in lieu of a cash deposit? Yes.

15509. Now that we are upon this subject, I might perhaps deal shortly with the several charges relating to the withholding of papers from Parliament. Those charges affect Contracts 69, 72, 79, and 77. Take Contract 69. Mr. Christie has pointed out that the two letters to which I have just referred—the letter from Holloway Brothers, of Goulburn, and the answer—were not printed in the Parliamentary return;—how do you account for that? It is very probable that at the time I selected the papers for the Parliamentary return I left out the two papers to which you refer, as being of no importance—that is to say, of no importance in regard to Mr. Parkes' inquiry.

15510. The application having been made before the tenders were sent in? Yes. I might explain that when the papers were asked for, Mr. Barling asked me to see that all the papers relating to the matter in question were sent on to the House. The record clerk got the papers together in a private room, and I then went through the whole of them and selected those which I thought would be pertinent to the matter, and which Mr. Parkes would be likely to require. It is quite possible that in regard to Holloway Brothers' letter I put it aside as not likely to be required.

15511. It related to a matter which occurred before the tenders came in? Yes; it did not seem to me to affect the matter of Carter, Gummow, & Co.'s contracts at all.

15512. Will you take the next four items referred to in Mr. Christie's memorandum upon page 380;—what do you say as to the omission of those papers from the Parliamentary return? They were not in the bundle, and I did not know of their existence. It is evident from the date of the last letter that they would be away at the time with the Water and Sewerage Board. They were certainly not in the bundle. I can say absolutely that they were not intentionally left out; they were left out quite by accident.

15513. With regard to Contract 72, those papers were not asked for, I believe, in the order of the House? No; the matter was considered by Mr. Barling, and it was decided that with certain exceptions those papers should be left out. I believe there was a difficulty in getting the papers; they were mixed up with M'Namara's claim. Mr. Barling was first of all under the impression that the papers were asked for, but I assured him that they were not. I remember reading to him the terms of the order, and telling him where the contract was. I pointed out to him that it could not by any means be covered by the terms of the order. Mr. Barling said, however, that in view of the fact that Contract 72 was mixed up with No. 79, and that Contract 72 was cited in the agreement made between the contractors and the Department in respect of No. 79, it would be well, at any rate, to give the contract itself and the final voucher. They were put in accordingly. That is the reason why those particular papers were put in. (*Vide Appendix No. 68.*)

15514. Then with regard to Contract 77, the charge is the plans were withheld;—what have you to say as to that? To begin with, plans were not asked for. I do not myself understand the term "papers" to mean "plans." The motion winds up with these words, "including the specification, schedule, &c., for original contracts." There is no mention of the plans. That matter, also, was discussed at the time, but we considered that as plans were not called for, it would be very wrong to send them along to be printed at such a serious cost.

15515. I suppose the expense would have been very great indeed? Yes; of course the expense of printing weighed with us at the time the papers were sent forward.

15516. At all events, in preparing the papers for Parliament every care was taken, and there was absolutely no intention to leave out anything at all which was material? Yes, every care was taken. A clerk was engaged exclusively upon the work of getting the papers together for fully a fortnight. Then, under my direction, the papers were selected. I used my discretion as to what papers should be sent on and what papers should not be sent on. I thought I included every paper that would be likely to be required.

15517. With regard to Contract 72—and charges 1 and 2 affecting that contract,—in the first place, the Department are charged with paying away large sums of money to the contractors which the Departmental officers were not obliged to do under the contract conditions, and with settling a claim without a proper test as to the liability of the Crown for a sum of £4,050 9s. 6d., by granting the contractors a preference over other contractors, and by not re-tendering for the contract, when in the interests of the Crown it was the clear duty of the Departmental officers to do so. In the second place, the Department are charged with granting the contractors concessions in payment upon the contract by which the Crown was the loser.

J. Davis. loser;—you have made a memorandum dealing with those matters? Yes; I have a statement of fact as to those matters which I will read. It is as follows:—

2 Sept., 1896.

MEMO. No. 4.—CONTRACT No. 72.

*Stoppage of Work.*

WHEN the channel was finished, or nearly finished, up to the foot of McDonald-street, all the money available for the work had been expended. The Engineer-in-Chief then wrote, on the 13th October, 1891, giving the contractors notice that it was intended not to construct the channel beyond that point. He referred to clause 3 of the specification, which is virtually a repetition of the last paragraph of section 4 of the general conditions, hoping that it would put the idea of a claim out of the contractors' heads. Mr. B. C. Simpson, however, forwarded a claim on behalf of the contractors, stating that, in his opinion, the general clauses referred to did not contemplate such a large portion of the contract not being carried out. Money was, however, voted for the continuation of the work, on the 1st April, 1892, and the contractors, Messrs. Carter & Co., were then instructed to resume and finish it. The contractors, therefore, would most clearly have been entitled to compensation for stoppage of work from October to April, a period of six months, in accordance with the fifth paragraph of the tenth section of the general conditions.

When Mr. Lyne wrote his minute of 23/2/92, in which he states, after having seen Mr. Hickson, that Carter & Co. would, in all probability, be able to make good a claim for something like £2,000, as compensation on Contract 72, the compensation referred to was for this stoppage of work.

A similar case to this occurred on the sewerage works at Bondi (contractors, A. J. Smyth & Co.) in 1884. The works were stopped on account of the representatives of the Cooper family having obtained an injunction, and, although they were only suspended for a period of about two months, the contractors were paid, on the advice of the Crown Solicitor, the sum of £3,000 as compensation. In the present instance, it must be borne in mind that no compensation was paid, and that it was merely thought that the contractors might be able to sustain a claim of upwards of £2,000 for the suspension of the work from October, 1891, to April, 1892. If it had come to a question of actually paying a sum for compensation, the papers would most unquestionably have been sent to the Crown Solicitor.

*Difference between Final Voucher and amount of Tender.*

The difference between the amount of the tender accepted and the amount of the final voucher (£20,650 and £25,264 19s. 4d. respectively) arose through additional excavation having to be carried out at the outlet of the channel along the site of the proposed Shea's Creek canal. When the contract was let, it was thought that there existed a suitable outlet for the channel into the swampy ground below Mitchell Road, but it was afterwards found that it would be prudent to continue the channel from Mitchell Road to Shea's Creek, and cut an earth channel along the site of the proposed canal, in order to give a proper outlet for the storm-waters draining to that point. Provision had been made in the specification (clause 3) giving the Engineer power to omit 13 or 27 chains of the lower portion of the channel, but for the above reasons this specific clause was not made use of.

*Wrought-iron Girders used in construction of Channel, Contract 72.*

In Contract No. 72 wrought-iron girders were included for covering a junction, and for the construction of a flume where the Shea's Creek crosses the concrete channel. Mr. Hill, agent for Mr. Cooper, the owner of the land through which the sewer passes, after the tender was accepted, would not allow the work to proceed unless a certain length of the channel were covered through a sandhill, which lay between the Macdonaldtown Creek and Shea's Creek; but he stated that if this were done he would allow the work to go on without compensation. It was contemplated that, in the ordinary course, compensation would have been paid for the land through which the channel passed, and this being the case, it was considered that, as the additional work asked for by Mr. Hill, which included these girders, would only involve an expenditure of about £600, and save not only a stoppage of the work but also a large sum for compensation and severance, the best plan would be to comply with his request. The channel was accordingly covered with girder iron and jack arches, and paid for at schedule rates.

15518. With regard to the charge of defective work upon Contract 69, can you tell us anything about the evidence which was given by Benson and Darcus? I think Mr. Griffiths could speak more positively as to that, I think it would be better to leave that matter to him.

15519. Those were the only two witnesses as to that matter, excepting that Mr. Parkes made a general reference to what he called "the talk of the town"; for instance, in reply to question 15,302, he said, "I can tell you that amongst workmen in the city of Sydney, it is a common thing for the men to talk about the way cement structures are carried on; every man will tell you—I do not care where he is about the city of Sydney—that he can get a shilling a day extra if he can save a cask of cement every day";—I suppose it is a fact, well known to the Department, that contractors generally want a good deal of watching in the matter of cement? If they did not there would be nothing for many of us to do.

15520. It is well known in the Department that it is a thing you have to watch pretty closely, no matter who the contractors are? Certainly.

15521. What arrangements are made to ensure the right quantity of cement being put into the work in these sewerage structures? The specific arrangements which are made are these: Where brickwork and concrete are carried out, there is first of all a chief inspector, whose business it is to overlook the whole of the work. In addition to that, where concrete is being done, an overseer is put on to watch every gauge made. Every gauge of concrete that is measured is under the immediate supervision of an overseer, whose business it is to see that the gauge-box is properly filled, and that the proper quantity of cement is put in. He is there for that and no other reason. He has no discretion. He has simply to see that the specification is complied with in that respect, and at the end of the day he gives to the principal inspector the quantity of cement which has been used in the concrete or brickwork, as the case may be. The principal inspector then returns the quantity to the head office. In addition to that, what might be termed the general arrangement is this: There is a resident engineer, whose business it is to be about the contracts generally during the whole of the day. He is supposed to see that the inspectors do their duty; and, being a man of experience, one glance at the concrete, whether it is in process of being mixed or in position, would tell him roughly—not perhaps accurately, but still roughly—whether the proper quantity

quantity of cement was being used in the work. Over and above that there is what the Department call the supervising officer. His business is to go round the whole of the contracts. He being also a man of experience is able to tell whether the right thing is being done; so that it seems to me that to say that the proper quantity of cement has not been put into the work amounts to saying that the inspectors have been got the better of by the contractors. There is no other possible explanation. You are limited to that. As far as the Department itself is concerned it provides ample supervision.

J. Davis.  
2 Sept., 1896.

15522. The instructions to the inspectors are very strict, and they are allowed no discretion? No discretion whatever. If it is found that things are wrong—and evidence of that has been brought forward during the sittings of the Commission—the inspectors are dealt with, and dealt with very severely too.

15523. If any such matter is brought before the engineer-in-charge I suppose he reports it? He reports it, and then action is taken. In addition to all that, we have an absolute check in the quantity of cement brought on to the ground; so that on the termination of a job we know absolutely whether the cement brought on to the ground tallies with the quantity of cement which has been returned by the inspectors, and what would be the proper quantity of cement to be used in the work; so that we have a check on every hand.

15524. I might ask you this question in a general way: it has been suggested that concessions were made to Carter, Gummow, & Co. with regard to an alleged shortage of cement; I should like to ask you whether, in regard to any of the contracts which have been referred to, the Department, through its officers, had any knowledge whatever of any shortage of cement? None whatever.

15525. If they had had, the man who passed the work would have been called to account at once? Certainly.

15526. As to the alleged defective work upon Contract 60, I believe you have discovered a minute which was written by Mr. Bagge? Yes; it is a minute dated 22nd January, 1891, and it is with reference to charges of the witness Wright. It is as follows:—

Mr. T. Wright brings two distinct charges, viz., drunkenness and allowing the contractors to use condemned cement, against Mr. O'Hanlon and Inspector Inwood.

The first was fully inquired into on the 14th October, 1890, when Wright withdrew all charges against Mr. O'Hanlon, but repeated his charge of drunkenness against Inspector Inwood, who, as his conduct appeared to have been somewhat indiscreet, was disrated for some time. He has since, on account of his subsequent exemplary conduct, been reinstated.

With regard to the second charge, Wright, on the 14th instant, wrote to Mr. Davis, accusing Mr. O'Hanlon and Inspector Inwood of being the cause of his dismissal from the employ of Messrs. Carter & Co., contractors for Contract No. 60, North Shore, and of allowing these contractors to use condemned cement.

Mr. Davis, on inquiry, finds that the contractors dismissed Wright for using very abusive language; and, with regard to the cement, the whole of the cement used on the contract up to the 11th October, 1890, amounted to 212½ casks, consisting of fifteen casks of approved cement obtained from another contract in order to start the work, and about 200 casks tested and approved on the 31st July last. The charge of allowing condemned cement to be used cannot, therefore, be substantiated, unless the cement in the contractor's store-room had been changed at night for slightly-damaged cement of the same brand. This, however, would be very dangerous and unprofitable for any contractor to attempt; and I do not believe that Messrs. Carter & Co. would lend themselves to such a proceeding.

The impression made by T. Wright at the inquiry on the 14th October last was that of being a very abusive and vindictive person, and I believe he has now preferred these charges for the purpose of annoying the contractors (his late employers) and the Department.

C. H. OHLFSEN BAGGE,  
22/1/91.

15527. With regard to charge No. 7 in connection with Contract 79—I mean the charge of improperly paying an amount of £350 6s. 8d. to the contractors for removing material, which work they never performed—I believe it is dealt with by papers 95, 96, 97, and 98, which appear upon pages 329 and 330 of the Parliamentary Return? Yes. The papers are as follows:—

The Council Clerk, North Sydney, to Supervising-Engineer Davis.

Sir,

Borough of North Sydney, Town Hall, 31 July, 1894.

Referring to the conversation between yourself and the Mayor yesterday with respect to the removal of ballast from the sewer shafts at North Sydney, I am directed to request that instructions may be given to the contractor to remove this surplus ballast to such places in the borough as may be pointed out by the Council. This ballast is extremely valuable to the borough, and for some time past the Council has been removing and using it for municipal purposes. This has been done by arrangement with the contractor, the Council being unaware that, in terms of his contract, the contractor had to remove it where directed; and the rates paid by the Council for such removal have been 7½d., 10d., and 1s. 3d. per load.

The Mayor understood, during his conversation with you yesterday, that your Department had also paid the contractors for removing it, and if such be the case it would appear reasonable that the Council should be refunded the amount of £123 9s. 4d. which it has also paid for the work.

This, however, is not put forward as a claim; but the Mayor will be glad if you can inquire into the matter, and if, upon consideration, you think it a fair suggestion, that you will allow the amount to be refunded to the Council.

Having now ascertained the exact position of the contractor in this matter, the Mayor has directed that no more material be removed at the cost of the Council, and he will feel obliged if instructions can be given to the contractor to remove all such surplus material to places to be pointed out by the Council, and which will be within reasonable distance of the works.

I have, &c.,

W. BARNETT SMITH,

Town Clerk.

Register.—J. D., 3/8/94.

On the 30th ultimo the Mayor and another gentleman called upon Mr. Bagge with reference to this question of the spoil, and I was asked to see them. I told them that, in accordance with the terms of the contract, the contractors (Messrs. Carter & Co.) had to remove the surplus material from the shafts to such places as they were ordered, and that they were paid at the rate of 1s. per cubic yard. I do not see what we have to do with any private arrangement which the contractors may make for its removal. We do not require the spoil, and Carter & Co. have disposed of it as they have thought proper, and I was not, therefore, aware that they were receiving payment from the local Council. The question that now arises is whether the request of the Council can be complied with. We have full power under the contract to ask the contractors to deliver to such places as the Council may point out to us from time to time, and it would not entail any extra cost to us, provided the tip was within half-a-mile of the shaft or open cutting, as the case might be. It will give a little trouble, but I am inclined to think that the Council's request should be acceded to.—J. D., 6/8/94. Commissioner and Engineer-in-Chief for Roads, Bridges, and Sewerage.

The Mayor of North Sydney did call here respecting this matter, when I called Mr. Davis in, and his suggestions I beg now to recommend to the consideration of the Engineer-in-Chief.—C. H. OHLFSEN BAGGE, 6/8/94. Engineer-in-Chief.

J. Davis.

2 Sept., 1896.

The Engineer-in-Chief for Sewerage to Supervising-Engineer Davis.

*Minute Paper.**Subject:—*Council Clerk, North Sydney—Application for Surplus Material.Department of Public Works, Roads and Bridges and Sewerage Branch,  
Sydney, 7 August, 1894.

INFORM Council as no application was made for the surplus material, and, as it was not required by the Department, contractors were allowed, as is usual in similar cases, to dispose of it as they thought proper, no questions, of course, being asked as to payments for same.

Before contractors can be instructed as to placing material in situations suggested by the Council it will be necessary for the Council to specify the exact spots where the material is required, as the Department will not pay a greater distance than the minimum specified, viz.,  $\frac{1}{2}$  mile. R.H., 8/8/94.

Contractors and Council Clerk informed, 8/8/94. Mr. Weedon to see.—J.D., 9/8/94. Seen.—S.H.W., 11/8/94. File.—J.D., 11/8/94.

The Council Clerk, North Sydney, to The Engineer-in-Chief for Sewerage.

Sir,

Borough of North Sydney, Town Hall, 10 August, 1894.

I am directed to acknowledge the receipt of your letter, dated 8th instant, on the subject of ballast from sewer-shafts, North Sydney, and to inform you that a further communication will shortly be made to you, this being merely an intimation that your letter has been received.

I have, &c.,  
W. BARNETT SMITH,  
Town Clerk.

The Council Clerk, North Sydney, to The Engineer-in-Chief for Sewerage.

Sir,

Borough of North Sydney, Town Hall, 14 August, 1894.

In reply to your letter, dated 8th instant, with reference to the surplus material from sewer contract in this borough, I am directed by the Mayor to thank you for your attention to the matter, and to request that the material may be deposited at the junction of Arthur-street and Lavender-street, or in Miller-street, opposite St. Peter's Presbyterian Church, subject to the conditions mentioned in your letter.

With reference to the suggested refund of £123 9s. 4d., I am directed to point out that this money was not paid to the contractors, as you seem to consider, but to men specially employed by the Council.

The Mayor will feel obliged if you can, therefore, see your way clear to refund to the Council the amount in question.

I have, &c.,  
W. BARNETT SMITH,  
Town Clerk.

Arthur and Lavender Streets would be within half-a-mile of all the shafts, and Miller-street, opposite St. Peter's Presbyterian Church, also, excepting the shaft in Campbell-street, the material from which could be taken to Arthur and Lavender Streets. The contractors might be instructed to deliver the surplus material to these places. The Council appear to have made special arrangement with Messrs. Carter & Co.'s draymen, to deliver the surplus material where they required it. I cannot see what power we have to call upon these men to repay the money to the Council, even supposing it would be advisable to do so, which I very much question.—J.D., 17/8/94. Engineer-in-Chief.

Approved.—R.H., 17/8/94. Mr. Weedon to see that the surplus material is delivered to the places named.—J.D., 21/8/94. Mr. Weedon.

The contractors are stacking the balance of the spoil from tunnel for purposes of refilling. It is doubtful whether there will be any more surplus material on this contract.—S.H.W., 22/8/94. Mr. Davis.

Seen. File.—J.D., 24/8/94.

15528. Will you turn now to Contract 77;—with regard to the cost of that portion of the work which is Monier-work, I believe you have made a calculation? Yes; it is as follows:—

## NO. 5.—MEMORANDUM AS TO COST OF "MONIER" WORK ON CONTRACT NO. 77.

| Description of Work.  | Unit.        | Quantity arranged by Messrs. McCredie, Thompson, & Davis. | Rate.               | Amount.              | Amount.     |
|---|--------------|---|---------------------|----------------------|-------------|
| Monier structure .....  | Cub. yards   | 1,533   | £ s. d.<br>*3 16 10 | £ s. d.<br>5,889 5 6 |             |
| Ironwork, excluding grill .....   | Tons .....   | 18.2  | 20 0 0              | 364 0 0              |             |
| Expansion joints .....  | Each .....   | 140   | 1 10 0              | 210 0 0              |             |
| Rendering, 1 to 1 .....   | Sq. yards... | 10,625  | 0 1 10              | 973 19 2             | 7,437 4 8   |
| Bluestone concrete in piers, &c. ....   | Cub. yards   | 158.213   | 2 10 0              | 396 13 4             |             |
| Sandstone concrete in piers, &c. ....   | "            | 1,350   | 1 8 0               | 1,890 0 0            |             |
| Cement facing, 2 to 1 .....   | Sq. yards... | 1,016   | 0 2 3               | 114 6 0              |             |
|   |              |   |                     | 2,400 19 4           |             |
| Deduct 28½ per cent. in accordance with tender .....  |              |   |                     | 684 5 6              |             |
|   |              |   |                     |                      | 1,716 13 10 |
| Sewer in tunnel, common to both aqueduct designs, deducting 28½ per cent. in accordance with tender (see attached sheet). |              |   |                     |                      | 6,340 9 11  |
| Total .....   |              |   |                     | £                    | 15,494 8 5  |

\* Mr. Bagge's estimate for this class of work, made in connection with Contract No. 112, was £4 and £4 10s. per cubic yard (see Parliamentary papers).

QUANTITIES

QUANTITIES common to "Monier" and Departmental designs in tunnels, roadways, &c., &c., not including aqueducts (30·02 chains aqueducts).

J. Davis.  
2 Sept., 1896.

| Item.     | Description of Work.      | Unit.              | Quantity. | Rate.   | Amount.    |

15529. In making this estimate you have worked upon the quantities arranged by Mr. McCredie, Mr. Thompson, and yourself? Yes; and I have used the schedule rates as far as they apply, deducting the 28½ per cent., so that it narrows it down to the price per cubic yard of the Monier structure.

15530. Your figures show that the cost of the work, calculated upon that principle, would be £15,494 8s. 5d.? Yes.

15531. Which is substantially the same as the amount for which the contract was let, namely, £15,500? Yes.

15532. I suppose it took you a considerable time to work out these quantities? Yes.

15533. You have spent a good deal of time over them, and you have employed others to assist you? Yes.

15534. It is not a thing which has been done in a day or two? No. In all probability, if an estimate had been made by Mr. Bagge at the time the tender was accepted he would have made it more. If the contract had then been referred to Mr. Bagge for an estimate, then, judging from what he did a few months previously in the case of another work, his estimate would have been considerably more than mine.

15535. With regard to Contract 118, there is a charge made by Mr. Parkes to the effect that the contractors were allowed to have the benefit of labour performed by the unemployed, paid by the Crown, in draining their works, for which drainage the contractors had to take the responsibility under their agreement with the Crown. Some evidence has been tendered with regard to that matter. Can you offer any explanation? The first I heard of it was very early in the progress of 118. Mr. Millner, the officer-in-charge, came to me one morning—he has already given evidence on the point—and he said that it was impossible for Carter, Gummow, & Co. to proceed with their contract at the same time that the reclamation was being proceeded with. It was pointed out that the sand-pumps which were working there, throwing up sand and water, were flooding the channel.

15536. *His Honor.*] Were they throwing sand and water on to the land side of the retaining bank? Yes. The first thing done at Johnstone's Bay was to construct a dyke. That formed the outside limit of the reclamation seaward, and then the sand-pumps were sent there, and they threw up sand on to the inside of the wall.

15537. They were working on the outside and throwing up on to the inside? Yes.

15538. And with the sand a lot of water would be thrown up? Yes; probably 95 per cent. of what the sand-pumps threw up would be water. That must find its way back again into the bay.

15539. By the channel of the creek? Yes; supposing the channel to be in existence. But in this particular case there was no channel. The reclamation had virtually blocked the original channel, and, as a consequence, as the water was thrown up by the sand-pumps on to the reclaimed area it certainly flowed off towards the bay, but it also flowed off towards Carter, Gummow, & Co.'s works.

15540. And backed up the whole creek? Yes. Carter, Gummow, & Co. could not proceed with their work. Mr. Hickson and I went out one morning to look at it. We saw the man in charge of the reclamation, and Mr. Hickson instructed him to cut a channel, which is usually done in all such cases, to allow the water to find its way back again into the bay, instead of part of it going towards Carter, Gummow,

J. Davis.  
2 Sept., 1896.

Gummow, & Co.'s works. The men were put on to do this work. I ought to explain that Carter, Gummow, & Co. had two pumps which were quite sufficient to deal with the water which they could be legitimately asked to pump out of their works, but they had made no provision to cope with the water from the sand-pumps, so that it meant this, that, unless something were done in the way of cutting a channel, Messrs. Carter, Gummow, & Co. must stop their work, or the reclamation works must stop. One or the other had to be done.

15541. *Mr. Smith.*] The clause referring to the unwatering of the contract is, I think, clause 85, which appears on page 409 of the Parliamentary Return? Yes; it is as follows:—

85. All water, which, during the progress of the work, may drain to excavations, to be properly, effectively, and continually pumped out, and the whole to be kept dry until after the completion, setting, and hardening, of all brick and concrete work and pipe sewers, at the sole cost of the contractor. The greatest care to be taken to prevent running water passing over any of the brick, concrete, and pipe-work, until it has set perfectly hard; any concrete, mortar, and cement jointing, exposed to wash of water must be taken up at once, and replaced by fresh concrete, mortar, and jointing, at contractor's expense.

15542. Look now at clause 83, upon the same page? Yes; that is as follows:—

83. During the construction of these works the contractor shall, at his own cost, do all work which may be required for the effectual diversion of surface-water, subsoil-water, and storm-water, across and beyond the site of the works, to keep the trenches free from water during the whole time the works are in progress, and in preventing any injury to the works by floods or any other causes.

You will see that the one clause deals with sewage, and that the other deals with water.

15543. You and Mr. Hickson did not consider that these clauses applied to a case where the water was really brought on to the site of the works by the Department itself? Certainly not. The first clause deals with surface-water, subsoil-water, and storm-water, and by no stretch of imagination could you bring under that clause sea-water which was pumped on to the contract by sand-pumps. The second clause to which you have referred me deals with sewage.

15544. *Mr. Carter.*] Referring to the matter of personal securities, with the exception of Contract 69 and Contract 77, where both securities were given, were personal securities ever accepted for any of our work by your Department? No, not to my knowledge. There was a special reason for it. It has not been the practice of the Sewerage Branch, although it has been the practice of the Roads and other branches, to accept personal securities. In the case of the Sewerage Branch, we have always taken a fixed deposit.

15545. A different course was taken in the case of Contract 69 only, on account of our taking Treasury bonds in payment? Yes, that was the reason—the only reason.

15546. Referring to the question of the disposal of surplus material, do you not as a rule throw the onus of taking the necessary steps for that on to the contractors? Yes.

15547. It is often a difficult matter to deal with? Yes.

15548. Consequently the contractors are permitted, as you said this morning, to dispose of the surplus material as they think fit, providing you do not want it for any special purpose? Yes, that is the practice, not only in the case of sewerage works but in the case of every public work, I believe.

15549. *Mr. Smith.*] As to charge No. 3, affecting Contract 79, that of manipulating items in the schedule of Messrs. Carter, Gummow, & Co., so as to increase the profits of contractors to the loss of the Crown, you have, I believe, made a short memorandum? Yes; it is as follows:—

MEMO. No. 6.—SUBSTITUTION OF BLASTING FOR GUTTERING AND GADDING, &c. (*Vide Appendix No. 71*).

When the shafts were sunk to the level of the tunnels, and the contractors were about to start driving, comparative estimates were made for the different modes of excavating the tunnel provided for in the schedule. Although the price for guttering and gadding was somewhat above that for blasting—taking into consideration the fact that if the tunnels were driven by the latter means they could not be taken out to the precise size required, and therefore more concrete would be used in the lining than if the excavation were done by guttering and gadding—it was found the Department would effect a saving of about £1,250 on the whole length of the tunnels, if they were taken out without the use of explosives. The contractors saw the Engineer-in-Chief in my presence respecting the matter, and offered, if they were allowed to do the excavation by the use of 4 inches of compressed powder, to allow an equivalent to the above sum in the quantity of concrete paid for. On these conditions the Engineer-in-Chief approved of the excavation being done by blasting, and the work was carried out accordingly; and in the final voucher the concrete which was included was reduced equal to £1,302 9s. 8d., as the following statement will show:—

|                             |     |     |     | <i>Sandstone packing in tunnels paid for.</i>     |             |         |       |
|-----------------------------|-----|-----|-----|---|-------------|---------|-------|
| Total amount                | ... | ... | ... | 13,255  | 96          |         |       |

*Final*

*Final Voucher.*J. Davis.  
2 Sept., 1896.

When the whole of the work was finished, including the small extension at Ernest-street, which cost £1,220, another at the outfall, Long Bay, and some work in connection with the reticulation at Maclean-street, the total cost of the contract amounted to £40,023 10s. 3d. The amount of the tender for Contract No. 79 alone was £39,890. It will, therefore, be seen that there was a considerable saving on the contract. (*Vide Appendix No. 72.*)

*Ernest-street Branch.*

The Ernest-street Branch Extension was carried out in order to intercept the sewage from a large district (which had been reticulated) and divert it into the main outfall sewer at the earliest possible moment. In addition to this the work was more economically performed in conjunction with Contract No. 79 than it otherwise could have been at a later date.

*High-street Branch.*

An extension was also given in conjunction with Contract 79A, called the High-street Branch. This was also constructed, as it was urgently needed to enable a district to be reticulated. It was found that by carrying out this branch in conjunction with Contract No. 79A, a less number of shafts would be required, and the cost would, therefore, be correspondingly reduced.

It is not infrequent for extensions of contracts to be made to suit the convenience of the Department. The following might be instanced as examples:—

Rookwood Cemetery.  
Rushcutter's Bay Stormwater Channel.  
Stormwater Channel, Burwood.  
Long Cove Creek Stormwater Channel, Ashfield.  
Long Cove Creek Stormwater Channel, Henson-street Branch.  
Outfall Works at Bondi.

Indeed it may be said that it would be difficult to find any contract of magnitude to which, during the progress of the work, circumstances did not require some extension to be made.

15550. *Mr. Carter.*] In your experience of our firm, as an officer of the Department, can you remember any instance of what may be termed an undue concession being granted to us—that is, a concession which has been refused to any other firm of contractors? No.
15551. I mean in the way of advance on material, refund of retention money, or in any other way that might be suggested? No; I do not think so.
15552. We have been on exactly the same footing as have other contractors? Yes, most decidedly, as far as I am concerned.
15553. *Mr. Smith.*] And also as far as Mr. Hickson is concerned? Yes; I never observed anything in Mr. Hickson's conduct to lead me to suppose that he thought of Carter, Gummow, & Co. in a way different from that in which he thought of other contractors.
15554. *Mr. Carter.*] As to the advances on cement—is it not a fact that other contractors received that concession, if it can be called a concession, much earlier than we did? It has been the practice to advance on material since I have been in the Sewerage Branch—a matter of thirteen years.
15555. We were refused advances on material on more than one occasion when other contractors had obtained them? I know that for some years it was a practice to make advances on material. It was discovered, however, that it caused so much trouble that the practice was discontinued. We used to give advances on plant as well, and that practice was also discontinued. The matter was afterwards reconsidered, and it was thought to be only a reasonable thing to make the advance. Your firm of contractors have not been specially dealt with since the resumption of the practice of making advances.
15556. *Mr. Parkes.*] Upon what date was the practice of making advances on material discontinued in the first instance? I could not give it to you just now, but I could get it.
15557. When was it resumed? It was resumed probably four years ago.
15558. Could you get the exact dates of the discontinuation and the resumption? Yes.
15559. You have not made the Commission acquainted with details showing how you make out the value of the Monier work in Contract 77;—could you supply those details? I have them. I dare say that if necessary I could put them in.
15560. *His Honor.*] At all events you could prepare yourself by reference to your notes to answer any questions as to the details which Mr. Parkes may see fit to ask you at the next meeting of the Commission? Yes.
15561. *Mr. Parkes.*] With reference to allowing this firm of contractors to put in personal securities when they had undertaken to receive payment in funded stock, how many cases do you say there were in which personal sureties were accepted? There are a number of cases. I should think there would be a dozen in the Sewerage Branch alone. Mr. Norrie handed in a list of them.
15562. But at the particular time at which Messrs. Carter, Gummow, & Co. received this concession there were three cases? There were three tenders accepted at the same time, but there were a number of others afterwards accepted on the same condition, and in which the contractors were allowed a like privilege.
15563. But I mean at that time? On that occasion, that is so.
15564. Mr. Gilliver sent in the name of his son as a surety? I could not say.
15565. Do you know whether his son was rejected as a surety? I could not tell you; I should have to look that matter up.
15566. Mr. M'Arden was proposed as a surety for Mr. Ahearne, was he not? Yes.
15567. And was Mr. M'Arden objected to? I think he was not exactly objected to, but Mr. Hickson said that inquiry should be made as to his financial stability.
15568. Were inquiries made as to the financial stability of the sureties in both Gilliver's and Ahearne's cases? I do not think there were any inquiries except such as would generally take place—those which Mr. Darley explained to the Commission were generally made in the case of personal sureties. I do not think there was any inquiry beyond that.

J. Davis.  
2 Sept., 1896.

15569. Were those two contractors, Mr. Gilliver and Mr. Ahearn, not called upon to come to the office and were they not questioned about their sureties? Mr. Ahearn was.
15570. Was not Mr. Gilliver asked? I should have to make inquiry about that.
15571. Did not Mr. Gilliver himself protest to you that his son was a man of property, and that he could prove it? He did not.
15572. Did he not do so to Mr. Hickson? He may have done so to Mr. Hickson, but he did not do so to me.
15573. Did you not hear of his son's being objected to on account of his relationship? No; I know that Mr. Gilliver has a son who is employed by the firm of Gilliver and Curtis on their contracts. Further than that I do not know anything about him.
15574. Were any inquiries made as to Henty and Scrutton as sureties for Messrs. Carter, Gummow, & Co.? I scarcely think there would be any. It would be unnecessary in a case like that. They were merchants of standing, and would be accepted without inquiry, I take it.
15575. Had you the firms as sureties? By inquiry we could not get to know much more of them and of their position than we knew already.
15576. What did you know? We knew of the firm of Parbury, Henty, & Co., of which Mr. Henty was a member. We knew that they were in a large way of business as merchants, and the same thing of course applies to Mr. Scrutton.
15577. But you had the individuals, not the firms, had you not? I am only a layman, and it is possible that I may have made a mistake in supposing that if we had members of the firm we had the firm itself. I am told that that is not the case.
15578. But were any inquiries at all made as to these securities? I should scarcely think there would be any.
15579. As to Contract 72, is it not a fact that work was done on that contract up to February, 1892? Do you mean the lower portion of the work?
15580. I mean any portion of the contract? It was going on almost to the end of 1892, I think.
15581. But a stoppage took place in 1891, did it not? In October, 1891, the contractors were informed that they would not be allowed to proceed beyond a certain point.
15582. But the work was going on all the same? It was being brought to a conclusion.
15583. It was not actually stopped? Notice was given in October that the work would not be continued beyond Macdonald-street, but the contractors between October and the date on which the work may have been finished would have had to continue work.
15584. It was in the contractors' hands in April, 1892, was it not? I do not think it was ever out of their hands until it was finished, and that was at the end of 1892.
15585. There was not any actual stoppage of the contract? Yes; it was stopped, as I say, from October to April.
15586. Were they working during that time on the part of the contract you speak of? There was no work done on the contract between the foot of Macdonald-street and Munni-street between October and April.
15587. Was work done on other portions of the contract? It was being brought to a conclusion, as I have already explained.
15588. Work was being done on other portions of the contract? Below the foot of Macdonald-street.
15589. Vouchers, as a matter of fact, were paid up to the end of April, were they not? It may be so, or not. I do not know without referring to the vouchers, but that would not necessarily mean that the work was in progress.
15590. But a voucher was paid in January and another was paid at the end of February showing an increase of work;—that work must have been done between January and February? Not necessarily at all. At the end of a work of that nature there are always a number of things left to be squared up when the work is finished.
15591. As a matter of fact there was no cessation of the work upon the contract. There was only a notification of one end being taken off? There was a cessation of work upon the upper portion of the contract.
15592. But not all over the works? I have explained that notice was given to the contractors in October 1891, and under that notice they were not to proceed with work beyond the foot of Macdonald-street.
15593. But they were going on with the other portions of the contract? They had to finish up to the point beyond which they were informed they were not to proceed.
15594. There was never any real discontinuance of work. They did not leave the job? The job was finished to the foot of Macdonald-street, and then, as I had stated, nothing was done until the beginning of April, when they were instructed to proceed with the upper portion.
15595. Were they not going on with the lower portion during the months of January and February? I think the work on the lower portion would be finished in November or December. It may have been that at the latter part of December there would be a little bit of rendering to repair, but I think the bulk of the work was finished in November.
15596. Will you swear that no work was done in January or February? If you want definite information about it I will look it up and give it to you.
15597. But will you, yourself, swear that no work was done in January or February? I would not like to swear about that without refreshing my memory, but what I will swear is this—that the contractors received notice in October to discontinue the work at the foot of Macdonald-street, and that there was very little done after that. They were working about Mitchell's Road, and there could be only a little bit of concrete to do before they got to the foot of Macdonald-street, when they would have to cease.
15598. On what date was the extra channel which was cut given to them? To what do you refer?
15599. I mean the channel that made an opening from the canal to Shea's Creek? That was the first thing that was done.
15600. It was not in the first contract? Yes; it is shown in the contract drawing.
15601. Was it part and parcel of the contract? Yes.
15602. Was it signed for as part of the contract? To the best of my belief—yes.
15603. Was it not afterwards referred to as extra work? I think it was not included in the probable quantities given in the schedule, and it increased the contract to that extent.

15604.

15604. The original contract as signed was £20,000? That was working it out at schedule rates, but we took power to reduce it. J. Davis.
15605. When you started them with an extra piece of work which was supposed to be taken off and not constructed? No. 2 Sept., 1896.
15606. For instance, in Mr. Bagge's explanation of the reason why Parliament was asked for an extra amount of £9,000, he states that when this contract was let he found that there was no opening—that it was filled with deposit;—was not that so? I do not know to what you refer.
15607. If you look at the schedule of Contract 69, you will see an item of 9,000 cubic feet of timber—is not that so? Yes.
15608. And the whole of the timbering paid for was 9,000 cubic feet? Yes.
15609. So that it was anticipated that the large excavation would be done, was it not? I do not think so. It could not have been, or greater provision would have been made in the excavation.
15610. How comes it that provision was made for that amount of timbering? It must have been measured off some how.
15611. What was it measured off? It was an approximate amount. No one quite knew how much timber would be ordered to be left in. Take the shafts for instance. The shafts might be in soft ground and yet the timber might be withdrawn, and in that case the timber would not be paid for. So that you cannot draw any comparison between the excavation in soft ground and the item of timbering, for that reason.
15612. But are not the quantities of the schedule measured off any definite thing? The timbering is purely a problematical item. Supposing you have soft ground, it does not follow that you will have to pay for the timbering. You do not pay for the timbering wherever there is soft ground. You pay for whatever timbering it is necessary to leave in.
15613. *His Honor.*] It is principally in the drives that the timbering is left in? In the case of the tunnels we have to leave it in.
15614. It is not left in so much in the case of the shaft? No.
15615. Even though the ground be soft? No; it is put in in such a way that it can be withdrawn.
15616. And as a matter of fact it generally is withdrawn? Except in the case of deep shafts. There might be a little danger in withdrawing it in such cases. Even then, however, it is sometimes withdrawn. In the case of open cuttings it is invariably withdrawn.
15617. However soft the ground? Yes.
15618. The Department prefer to have the timber withdrawn rather than covered up. If it is practicable and safe to have the timber taken out of the ground and the ground filled in solid, the Department prefer, as a rule, that that should be done? Yes; because the timber must eventually rot. It is, therefore, never left in unless it is absolutely necessary to do so.
15619. *Mr. Parkes.*] The difference between schedule and the actual payment is something like 6,000 cubic yards in the tunnel and excavation? I said something of the sort in my memorandum, I think.
15620. The contract was let on 8th January, 1894? The tender was accepted on 27th December, 1893—that is the time the contract was let. The date of completion is taken from the date of the acceptance of the tender. That is the time from which we date the duration of the contract.
15621. Not from the time the contractor signs? No.
15622. Suppose you accept a tender and the contractor does not sign the contract for three months? That is his fault. To begin with, we would not allow it to go for three months. The contract would be cancelled. Of course, if the contractor withdraws there is a formal cancellation.
15623. On 18th January, 1894, you wrote the letter which appears upon page 123 of the Parliamentary return, enclosing a list of the sizes of the shaft excavation. Upon the margin of that letter you figured all the sizes of the various sections requiring timber, did you not? Yes; that must be so.
15624. You figured the exact size of the timbering in the letter, a copy of which I now produce? I do not know that I figured the exact size.
15625. Is not the copy I produce an exact copy of what you wrote? It seems to be so.
15626. Is not the size of each section requiring timbering given in the margin? Yes; but they are very indistinct in this copy.
15627. You can read the figures distinctly enough, can you not? Not in the case of the third section—it is obliterated.

FRIDAY, 4 SEPTEMBER, 1896.

George Christie recalled and further examined:—

15628. *Mr. Parkes.*] You have obtained information as to the value of properties in the name of Mr. George Forrest in New Zealand? Yes. I have obtained full information from the Land and Income Tax Department as to the freehold property held by Mr. George Forrest in that Colony. G. Christie.  
4 Sept., 1896.
15629. How did you obtain that information? Through Mr. J. C. Gavin, who is the Deputy Auditor-General of New Zealand, and a personal friend of mine. He has forwarded me an official letter, signed by Mr. John McGowen, the Commissioner of Taxation. I have prepared the following memorandum, dealing with the matter:—

MEMO. No. 21.—*Re Mr. George Forrest's Property in New Zealand.*

(a) Since giving evidence on 21st August relative to the financial position of Messrs. James Gillan and George Forrest in connection with their bonds, Contract 77, as per my Memo. No. 19, I have obtained a statement of the real property assessed in the name of Mr. George Forrest by the Land and Income Tax Commissioner of New Zealand.

(b) This statement is contained in a letter of the Commissioner (Mr. John McGowen), dated Wellington, 21st August, 1896, and is addressed to Mr. Gavin, the Deputy Controller and Auditor-General of New Zealand, whom I have asked to obtain the information.

(c) The properties enumerated in this statement correspond with those in the certificates of the Valuator of the Borough of South Dunedin, and also include one additional property in another Borough.

This additional property is of the value of £28, and is described as follows:—"In the Borough of St. Kilda, a vacant allotment, sec. 7, blocks 13, 20 poles; value, £28."

The letter is appended hereto.

4/9/96.

GEO. C.  
The

G. Christie. The letter is as follows :—  
4 Sept., 1896.

Dear Mr. Gavin, Land and Income Tax Department, Wellington, 21 August, 1896.  
Referring to your inquiry as to the real property assessed in the name of Mr. George Forrest, of Sydney, I find that the only land assessed to that gentleman is as follows :—  
In the Borough of South Dunedin, sections 12, 13, block 10,  $\frac{1}{2}$  an acre, £525 (which value includes two cottages assessed at £325, the land representing the difference); in the Borough of St. Kilda, a vacant allotment, section 7, block 13, 20 poles, value £28. There is no property in George-street, Dunedin, assessed in the name of Mr. Forrest; but I find that in George-street, South Dunedin, there is a vacant allotment, section 4 of block 6, 5 poles, valued at £20, and sections 24, 25, and 26, in the same block, 16 poles, valued at £245, the house on which is worth £200—the land representing the difference; but these are assessed in the name of Mrs. Forrest, and the locality is entirely different, being miles away from George-street, Dunedin, which is one of the principal streets in the city.  
There is no secrecy with regard to the assessment of real property, and you are therefore perfectly in order in making the inquiries you have made. Your correspondent evidently does not know the Land Tax Department in New Zealand, or else he would have known that any such inquiry from New South Wales would have been attended to with the utmost promptitude. The "Tasmania" leaves this afternoon at 3 o'clock, due in Sydney on the 28th instant. The direct steamer left on Wednesday, and perhaps, therefore, you had better send your letter by the "Tasmania."  
Yours, &c.,  
JOHN M'GOWEN,  
Commissioner.

William James Millner recalled and further examined :—

W.J. Millner. 15630. *Mr. Davis.*] In conjunction with Mr. Thompson, acting on behalf of Mr. Parkes, you have made an examination of the Alexandria Park sewer? Yes.  
4 Sept., 1896. 15631. When did you make that examination? On last Friday and on last Tuesday.  
15632. Will you tell His Honor what occurred on Friday last? We met Mr. Wright out there, and he selected a spot where a hole was put down. We made one hole a foot right round to a depth of over 8 inches, and we found concrete at the bottom and right through. We commenced another hole, but we did not finish it that night. We went back on the Tuesday morning, and we then got down to a depth of 6 inches in the second hole. Afterwards, according to instructions, we went down a further 3 inches.  
15633. How far was the first hole from the outlet? About 10 feet.  
15634. How far was the second hole from the outlet? About 30 feet.  
15635. In either case did you go through the concrete? No.  
15636. What was the class of concrete that you passed through? It was all blue-metal concrete.  
15637. Do you consider it good and satisfactory work? Yes, it was as sound as a bell.  
15638. *His Honor.*] How far from the centre of the invert were the holes you made? They were made right in the centre of the invert.  
15639. *Mr. Parkes.*] What is your position in the Government service? I am Assistant Engineer for Sewerage.  
15640. When did you get in the Government service here? About seventeen years ago.  
15641. Where were you previous to joining the service of the Government of New South Wales? I was in the service of the Government of South Australia.  
15642. What position did you occupy there? I was in the Engineer-in-Chief's office.  
15643. In what branch—are there not branches to that office? The whole office was under one man when I was there.  
15644. On what date did you leave South Australia? Seventeen years ago.  
15645. Do you remember the month? I left there shortly after the Christmas holidays, I think, and I arrived here early in January.  
15646. Why did you leave South Australia? I left of my own accord.  
15647. Did you resign? They were advertising for men over here. I saw the advertisement, and came over. I came on a holiday.  
15648. But did you resign from the South Australian service? I did.  
15649. You sent in your own resignation? Yes.  
15650. What were you doing there? I was on railway or water works—just as they had work for me to do.  
15651. Was there any trouble about public works in Adelaide at the time you left? Not that I know of.  
15652. Was there any Board of Inquiry? I could not say.  
15653. Do you not recollect some disturbance in connection with public works there? No.  
15654. Did you get work here immediately? I applied to Mr. Whitton, and on the strength of my testimonials he gave me a position.  
15655. In what position did you make a start? As a surveyor in the Railway Department.  
15656. When did you come to the Sewerage Branch? At about the time of Mr. Bennett's death.  
15657. After Mr. Bennett died? Yes.  
15658. What was the first thing you did in the Sewerage Department? I set out the western suburbs branch.  
15659. Did you know Mr. Hickson when he was in Adelaide? I did not.  
15660. What contracts have you been on in the Sewerage Branch? I was on Contract 62.  
15661. Whose contract was that? M'Sweeney's.  
15662. And after that? On contract 64—Carson's contract.  
15663. And after that? On No. 101—Ahearne's.  
15664. After that? I think I was on some works between those contracts. I was on No. 69—Carter, Gummow, & Co.'s.  
15665. And after that? After that I was on No. 118—also Carter, Gummow, & Co.'s.  
15666. Did you ever take a commission to back horses for a contractor? No.  
15667. Are you sure of that? I have backed horses.  
15668. For a contractor? Yes.  
15669. That contractor was the owner of the horses, was he not? I could not say.  
15670. You were paid a commission for doing it? No.  
15671. Are you sure of that? Quite certain.  
15672. *Mr. Davis.*] Were you working under Mr. Hickson in South Australia? No.  
15673. You did not know him there? No.  
15674. After you left the Railway Department you were employed by Mr. Bennett? Yes.  
15675. On what work were you engaged with Mr. Bennett? On the Centennial Park work.

15676. When you had finished that work did Mr. Bennett make any promise to you? He told me that I was to be transferred to the Sewerage Branch. W.J. Millner.
15677. So that when you were brought into the Sewerage Branch it was simply in fulfilment of a promise which Mr. Bennett had made to you before his death? Yes. 4 Sept., 1896.
15678. Did you hear of any public works trouble in Adelaide before you left that colony? I do not know of any.
15679. Did you hear of any commission having been appointed to inquire into any public works in South Australia? No.

Joseph Davis recalled and further examined:—

15680. *Mr. Parkes.*] When you prepared the papers in connection with these contracts for presentation to Parliament did you do so with the object of their being printed? I did not know whether they were to be printed or not, but I assumed that probably they would be. J. Davis.
15681. Do you not know that when papers are moved for they are wanted for the perusal of Members of Parliament? I do not know for what purpose they are moved for. The member who moves for them would be more likely to know why they are wanted. All that I was concerned with was that papers were asked for, and I took care that all the papers which I thought would be required were sent forward. 4 Sept., 1896.
15682. But when the House makes an order that certain papers be produced, do you not take into consideration the fact that the papers are to be printed? I have already said that I took care to send forward in this particular instance all the papers which, to the best of my belief, were required.
15683. Would it not appear to your mind that the object of asking for the papers would be to see exactly what they were? Of course I assumed that those who asked for them knew what they wanted.
15684. But when Parliament is asking for information from a Government Department, do you not think the fullest information ought to be supplied? Certainly; and in this case I believe it was done. I do not think that anything was knowingly kept back from this return.
15685. Supposing the contract plans were kept back? Those were not regarded as being asked for.
15686. But, seeing that contract plans are the very essence of a contract, ought they not to have been included? If they were asked for, certainly; but in this case they were not.
15687. But, when a motion is made asking for papers generally in connection with contracts, ought not all the vital papers to be supplied? If a general motion had been made, then no doubt one could have used one's discretion a little bit; but in this particular instance there was not a general motion. The motion asked for specific things.
15688. But where do you get any right to exercise discretion in the placing of papers before Parliament? I did not say that I had any right to exercise a discretion. What I say is, that when we are endeavouring to comply with an order of the House we must of necessity use our sense.
15689. The order asked for copies of all papers and correspondence in connection with certain contracts. Ought not all the papers, therefore, to have been supplied? Yes, and they were.
15690. But would not the plans be papers? I do not regard them as papers, and I do not think they are usually regarded as papers.
15691. You used your discretion as to what you would give to Parliament? No, not at all. We gave Parliament what was asked for.
15692. Coming to Contract 72, the plan I place before you is marked "Drawing No. 1"—is that a tracing of the work as completed? I should have to compare the upper portion of the work with another plan already put in before I could speak positively to that.
15693. Does not that plan cover the whole of a contract? Yes; but the upper portion was slightly modified, and I am not sure whether this plan shows the modification or not. Speaking generally it is a correct plan.
15694. Will you point out at what points the signed contract commenced and ended? The contract commenced at Union-street and terminated below M'Namara's dam.
15695. I mean the contract signed by Messrs. Carter & Co. in the first instance? I believe that that was what was signed for, but I would not be positive. The contract drawing would show it precisely. This is not the contract drawing.
15696. *His Honor.*] What is the drawing now before you? It is supposed to be a tracing of the contract drawing. The only question is whether the proposed canal was shown as it is shown here.
15697. *Mr. Parkes.*] Will you point out where the extra piece of work was? I do not say that there was extra work.
15698. What was the total sum of the contract that was signed for? The total sum was really not in existence, because it was a schedule-rate contract. No one therefore could say precisely what the total sum would be until the work was carried out. It was not a lump sum contract.
15699. What was the amount of work signed for in the first instance? It was a schedule rate contract. Therefore no lump sum came into question except for the purpose of estimate.
15700. Will you kindly produce the original contract drawings? I was under the impression that they had been put in.
15701. *His Honor.*] Is the channel shown upon the tracing before you part of the original contract? I am under the impression that this plan shows the modification to which I referred just now in the upper portion of the contract from the foot of Macdonald-street to Union-street.
15702. *Mr. Parkes.*] It is a contract plan, is it not? It is a plan which was prepared some time at the beginning of 1892, after the contract had been carried out up to the foot of Macdonald-street.
15703. In giving your evidence on Wednesday you said in your Memorandum No. 4:—"When the channel was finished or nearly finished up to the foot of Macdonald-street all the money available for the work had been expended. The Engineer-in-Chief then wrote on 13th October, 1891, giving the contractors notice that it was intended not to construct the channel beyond that point." Now, if all the money was expended was not the contract complete? When I say that all the money was expended it must necessarily mean from the context that it would be absorbed by the time the work up to the foot of Macdonald-street was finished.
15704. Was that the amount of the contract which was signed for? I think I have already said many times what was included in the contract, and I have also explained that the contract was a schedule-rate contract. 15705.

J. Davis. 15705. But what was the total sum of the contract? I have already said that it was only for the purposes of estimate that a total sum existed; it was a schedule-rate contract, not a lump-sum contract.  
4 Sept., 1896. 15706. Therefore it might have gone on for 20 miles? Therefore it might have included all that was shown in the drawings.

15707. Was there not in your specification a description of the extent of the contract? There is a description of the extent of the contract generally at the beginning of the specification.

15708. You say:—"The Engineer-in-Chief then wrote on the 13th October, 1891, giving the contractors notice that it was intended not to construct the channel beyond that point." He referred to clause 3 of the specification, which is virtually a repetition of the last paragraph of section 4 of the general conditions, hoping that it would put the idea of a claim out of the contractors' heads." That is how you explain that letter? To what explanation do you refer?

15709. I mean "hoping that it would put the idea of a claim out of the contractors' heads"? You must know, as you have read through these general conditions and the contracts generally, that there are a number of clauses that might very properly be cited in a letter, and that it might, in the opinion of the officer who wrote the letter, be that they would apply. That would be a question to be tested afterwards—whether they did apply or not.

15710. If you will look at paper No. 2, upon page 135 of the Parliamentary Return, you will see a reference to the schedule of prices? That is the way in which all these contracts are accepted. No lump sum is introduced. The Minister accepts the schedule rates for the work in question.

15711. And you may extend the contract as many miles as you like? I do not say that. If you think that a reasonable construction to put upon what I say, I must leave it for you to do so.

15712. Mr. Barling, on the 28th February, 1891, wrote the following letter to Carter & Co. :—

Sir, Department of Public Works, Sydney, 28 February, 1891.  
I have the honor, by direction of the Secretary for Public Works, to inform you that your tender, dated the 18th instant, is accepted for Contract No. 72, Sydney Sewerage, Construction of a Stormwater Sewer, Munni-street to Shea's Creek, at your schedule of prices.

The work is to be carried out in strict accordance with the several contract exhibits relating to this contract, and to be completed within eight months from this date.

I have to refer you to the Commissioner for Roads for further information, and to request that you will call upon the Officer in Charge of Bonds and Contracts at this office, for the purpose of executing the necessary documents for the due observance of your contract.

I am, &c.,

J. BARLING,

Under Secretary.

Is not that virtually an acceptance of a certain amount of work, limited to the distance between Munni-street and Shea's Creek, for the sum of £20,650? It is not. No such sum is referred to in the letter.

15713. But is not that the total sum of the contract? No. There is no total sum in existence, except for the purposes of estimate.

15714. Was not a schedule of tenders submitted to the Engineer-in-Chief on 18th February, 1891, containing this information:—"No. of tenders received, 12; amount of lowest tender, £20,650; name of lowest tenderer, Carter & Co." Then follow a list of the tenders, and finally there is this minute by Mr. Hickson:—"I recommend acceptance of Carter & Co.'s tender at schedule rates"? That is so. It distinctly states that the tender is accepted at schedule rates, and not at what you seem to think, namely, a sum of £20,650. That sum exists, as I said before, simply for the purposes of estimate and comparison.

15715. *His Honor.*] For the purpose, I understand, of determining who is to get the contract? Exactly—for a comparison of tenders.

15716. *Mr. Parkes.*] I will ask you now to read some correspondence which took place in relation to this contract—for instance, there is a letter signed by Mr. Hickson, and dated 13th October, 1891, informing the contractors that the work is to terminate at the foot of Macdonald-street? Yes, that is so.

15717. Will you now read this minute of the 23rd October, 1891? Yes; it is as follows:—

Two sums of £15,500 and £8,500 were voted for a storm-water sewer in Macdonaldtown, and the subsequent continuation of same to Shea's Creek.

To complete same, two amounts of £18,764 and £6,500 will be required, leaving a deficiency of £1,264.

It is absolutely necessary that these two works should be joined, otherwise neither of them would be of any use.

Pending, therefore, another Loan Vote, it is requested that this amount be made available from the Treasurer's Advance Account next year.

A further extension of Contract No. 72 was contemplated when tenders were invited, amounting to about £7,000.

This work is also very necessary, and to cut it out of the contract now (though, perhaps, strictly speaking, we have the power) would be very unfair to the contractors, as it is by far the easiest portion of their work, and one which they expected to make some money upon, and, in fact, pick up the losses which they have made on the heavier portion of the contract.

The contractors have approached me in connection with this matter, and I am of opinion if the £7,000 cannot be granted they will in equity have a claim on the Department.

For the Commissioner,

E. A. NARDIN.

Under Sec.

It is signed for the Commissioner by Mr. Nardin. He may be a very good officer as a Roads officer, but he certainly knew little or nothing about sewerage matters; and I do not know how he came to sign that letter.

15718. I will now ask you to read this minute of Mr. Hickson's, dated February 5th, 1892. It is as follows:—

TENDERS were opened in February, 1891, for sewer from B to E, the lowest being that of Messrs. Carter & Co. for £20,650 (at per schedule rates).

This tender was accepted on the understanding that the cost of the work be reduced so as to bring the cost of the work within the amount allowed without reference to the Public Works Committee.

At the commencement of the contract the sum of £15,500 was available, and this was proposed to be expended on the work between the Mitchell Road and Munni-street (C to E on sketch), a clause allowing a reduction of the work, A to C, being inserted in the specification.

On starting the work, however, it was found that there was no outlet to the sewer at Mitchell Road at C, and a channel had to be cut along the proposed course of Shea's Creek Canal (A to B), at a cost of £4,000, to provide an outlet, and the sewer continued from Mitchell Road (C) to the commencement of the outlet channel (B), at a cost of £8,000.

This unavoidable construction of the sewer in the first instance, from A to D, exhausted the funds, and that portion of the work from the Macdonaldtown Park junction at D to the point of commencement at Munni-street (E), which formed part of the original contract, has had to be omitted for the present.

ROBT. HICKSON.

15719. That minute contains a sketch? Yes, explanatory of the minute.

15720.

15720. *His Honor.*] Does not it show that the starting point of the original contract was point B in the sketch? No; the earth channel extends for about 50 chains down the centre of the Shea's Creek canal, which is also shown on the contract drawing, and which is, therefore, comprised in the contract. At the same time the quantities of the earth channel were not comprised in the sum of £20,650.

J. Davis.  
4 Sept., 1896.

15721. But can the earth channel be called a storm-water sewer in any sense? No; it was a temporary channel cut in anticipation of the canal.

15722. The contract is for the construction of a storm-water sewer from Munni-street to Shea's Creek? I am afraid that we had not used the word "sewer" or "channel" quite in the way in which you use it. As you will observe upon drawing No. 1, instead of sewer the word "channel" is used. The earth channel would certainly be covered by that. Mr. Barling, in writing his letter, seems to have used the word "sewer" instead of the word "channel."

15723. Where would you say that Shea's Creek began? I could not answer the question as to where Shea's Creek would be originally; at the termination of the contract there was no creek. It would be down near Ricketty-street. I am inclined to think that the term "Shea's Creek" has been used in a more or less vague and indefinite way. The idea was to get an outlet for the Munni-street storm-water channel, and it was considered to be Shea's Creek.

15724. *Mr. Parkes.*] Upon page 141 of the Parliamentary Return you will find a paragraph as to the extent of the contract? Yes; it is as follows:—

2. The works comprised in this contract consist in the necessary excavation, shoring, timbering, piling, unwatering, concrete, brickwork, stonework, rendering, refilling, pipe-laying, carpenter's work, ironwork, pitching, paving, ballasting, metalling, leading surplus materials to spoil, &c., required in the construction of the following, viz. :—

|                      |              |              |   |
|----------------------|--------------|--------------|---|
| From Shea's Creek to | 20 chains    | open channel | 11 ft. 6 in. x 7 ft. 6 in.  |
| "                    | 20 chains to | 28 "         | oval sewer 10 ft. 6 in. x 6 ft. 6 in.   |
| "                    | 28 "         | to 39·12 "   | " 10 ft. 6 in. x 6 ft.  |
| "                    | 39·12 "      | to 39·77 "   | junction of two creeks, with flat concrete decking between wrought-iron rolled girders. |
| "                    | 39·70 "      | to 48·17 "   | oval sewer 7 ft. 2 in. x 6 ft.  |
| "                    | 48·17 "      | to 58 "      | circular sewer of 6 ft. internal diameter.  |
| "                    | 58 "         | to 62·50 "   | " of 5 ft. 10 in. internal diameter.  |
| "                    | 62·50 "      | to 66 "      | " of 5 ft. 2 in. internal diameter.   |
| "                    | 66 "         | to 72 "      | " of 3 ft. internal diameter.   |
| "                    | 72 "         | to 76·58 "   | " of 2 ft. 6 in. internal diameter.   |

15725. Do not those dimensions correspond with the plan? As far as they go, but they do not include the lower portion that I have referred to. The paragraph goes on to say, "And all other works in connection with those herein enumerated."

15726. Where do you find that? Lower down in the same clause, so that although the channel is not enumerated it is at the same time comprised.

15727. Does not that denote the extent of the contract? Generally, yes; but it does not include the lower portion.

15728. Will you read this paper, dated 3rd October, 1891? Yes; it is as follows:—

THE amount of tender for Contract No. 72 was £20,650, but it was accepted conditionally upon the contract being reduced by £3,000.

It is advisable that Contract No. 72 should be continued so as to give an outlet to Contract No. 75.]

|   |         |    |    |
|---|---------|----|----|
| The cost of doing this will be .....          | £18,764 | 4  | 10 |
| Deduct amount paid to date.....               | 9,680   | 13 | 9  |
| Amount required to finish to Contract 75..... | 9,087   | 11 | 1  |
| Amount available from vote.....               | 5,754   | 0  | 0  |
| Balance to be provided .....                  | £3,333  | 11 | 1  |

I beg to suggest that this amount be paid from the following votes, viz. :—

|  |        |   |   |
|--|--------|---|---|
| (1.) There will probably be a balance of £2,000 from the Macdonaldtown Storm-water Channel Vote, after that channel has been paid for, which might be used for Contract No. 72, which is part and parcel of the same work..... | £2,000 | 0 | 0 |
| (2.) The following amounts, being balances left from votes from the undermentioned storm-water channels, might also be used for this purpose :—  |        |   |   |
| University storm-water channel .....   | 131    | 0 | 0 |
| Phillip-street, Alexandria, storm-water channel .....  | 815    | 0 | 0 |
| Pymont Bridge Road, storm-water channel .....  | 265    | 0 | 0 |
| Alexandria Park, storm-water channel .....   | 57     | 0 | 0 |

Mr. Bagge.

£3,268 0 0

(Signed) J. DAVIS.

That is supposed to be a copy of a minute of mine.

15729. It is your minute, is it not? It is a copy of it.

15730. Is it not signed by you? No; it is supposed to be a copy of my minute.

15731. It is your production? It is supposed to be a copy of it.

15732. *His Honor.*] But the original is your production? Yes. I say that this purports to be a copy of my original minute.

15733. In whose writing is it? In the writing of a man named Young.

15734. *Mr. Parkes.*] Was he not your clerk? Yes.

15735. *His Honor.*] For what purpose has this copy been made? I have no idea.

15736. *Mr. Parkes.*] Where would the original be? I do not know even that.

15737. *His Honor.*] Do I understand that the signature and everything is a copy, and that the document is not actually initialled by you? The document attached to it is initialled by me. It is a copy of the completed work upon Contract 72. The paper itself simply purports to be a copy of my minute.

15738. *Mr. Parkes.*] Is there any minute attached to it? There is a little minute by Mr. Hungerford, under date of 21st November, 1891. He says:—"91-2,424. Not returned from Works Department." I do not know what that refers to at all.

15739.

J. Davis. 15739. Does not that document show that you limited the contract in order to keep it from the clutches of the Public Works Committee? I do not think I mentioned the Public Works Committee.

4 Sept., 1896. 15740. Do you not mention that it is reduced? The amount of the tender for Contract 72 was £20,650, and that amount was reduced by £3,009.

15741. But was it not reduced so that it would not go before the Public Works Committee? I cannot tell you that.

15742. Will you read this minute, under date of October 28th, 1891? Yes; it as follows:—

On the Loan Estimates for 1890 the following votes were taken:—

Macdonaldtown Park Stormwater Sewer, from Swanson-street to Ashmore-street; thence from Ashmore-street to Macdonald-street—£8,500.

Stormwater Channel from Munni-street, Newtown, through Macdonaldtown Park to Shea's Creek—£15,500.

The work comprised in the first item is shown on the accompanying plan marked "A" to "B." It is being carried out by Messrs. Parry and Farley, and is nearly completed. The cost will be about £6,500, leaving a balance on the vote of about £2,000.

The work comprised in the second item is now being carried out by Carter & Co. Its position is shown on plan starting from point "C," and it is intended to terminate at "E," supposing sufficient funds are at disposal for the purpose, the contract being a schedule one. It was found during the progress of this work that an earthen drain was required from point "C" to "F" on plan, running along the course of Shea's Creek Canal. This work was one which it was first understood would be carried out by the Harbours and Rivers Branch in connection with the canal works, but it was subsequently decided to include the work in the Roads Branch Contract. This earthen drain will absorb £4,000 of the money, leaving a deficiency on the vote of something like £9,000. The contract of Messrs. Parry and Farley has been shown as terminating at point "B" on plan, and a small gap has been left between "B" and "D," which it is estimated will cost £1,264 to complete. This can be paid for out of the balance available on the £8,500 vote. It will be seen, therefore, that a further sum of £9,000 will be required to complete the whole of the work from "E" to "F." Of this sum £4,000 is required on account of the earthen drain referred to, and which was not contemplated when the work was undertaken, and the balance, £5,000, is required to complete the work up to "E." In other words, the £9,000 represents "extras," not contemplated when the contract was let.

It is represented that the matter is so urgent that the Minister is asked whether special arrangements cannot be made to permit of this work being proceeded with, in anticipation of further funds being voted. None of the additional sum will be required until next year. This further amount will bring the cost of the Munni-street sewer to about £25,000. (Vide Appendix J.)

J. B.

15743. That is accompanied by a plan? Yes.

15744. What are the minutes upon the paper? There is this minute: "The tender of Carter & Co. at their schedule prices originally amounted to £20,657; but as that exceeded the limit of £20,000 provided by the Public Works Act it was decided to reduce the work to the extent of £3,000." Then there is this minute: "Resubmit as soon as Estimates are passed."

15745. Does not that clearly indicate that the contract was within certain limits, and that there was a certain amount of extras upon it? At the time the contract was accepted Mr. Bruce Smith stipulated that when the work was finished it was not to exceed £17,000.

15746. Did you tell Mr. Bruce Smith that you were taking funds from votes for other contracts to pay for the extension of this work? I did not; and no money was so taken.

15747. What is the meaning of that minute of yours indicating where the money was to come from? It was written in good faith. It was my idea, but it was never acted upon.

15748. Where did the money come from which made up the vouchers which were paid prior to April, 1892, making a sum of £17,000? The amount was available, as far as I can remember, from the original vote.

15749. But the original vote was £15,500? Yes.

15750. Upon April 2nd a Loan Bill freed another £9,000 referred to in your minute? Yes.

15751. Where did the money come from which was paid in January and February, 1892, to make up the £17,000 represented by the vouchers? You say it was paid, but I should have to look up the vouchers myself before I could say.

15752. For instance, on 3rd March, 1892, a payment was made, making a total payment of £16,381—is not that so? No.

15753. Then will you explain it? From that amount of £16,381, there are overtime penalties deducted.

15754. For how much? £240.

15755. But the balance exceeds the £15,500, does it not? It exceeds the £15,500 by about £600.

15756. Where did the excess money come from? It must have come from somewhere. I think I can explain it. The £600 would be taken probably from the Macdonaldtown Park sewer vote, inasmuch as portion of the Munni-street work would be part of the Macdonaldtown Park work. The junction and a portion of the sewer at the foot of Macdonald-street is really part of the Macdonaldtown Park sewer. For that reason I have no doubt that a portion of the money would be taken from the Macdonaldtown Park sewer vote. I think if you refer to the head of that voucher you will see that the excess money was taken from the vote of £8,500 for the stormwater channel at Macdonaldtown Park.

15757. The voucher I now hand you shows a total of £18,605 of the work performed, does it not. Yes.

15758. That exceeds the contract amount, does it not? No.

15759. Not the original contract amount? No.

15760. How is that? Because, as I already explained, there is no contract amount.

15761. There is no finality at all to the matter? There is no contract amount.

15762. But there must be some finality to the contract? It is reasonable to suppose that there would be.

15763. The amount of £18,605 would have to be paid? I presume it was paid eventually.

15764. The contract was going on in January and February, was it not? You asked me about that on Wednesday, and I think I then answered your questions pretty fully.

15765. The contract was going on in those months? I said on Wednesday what I say now—that in October a letter was sent to the contractors that they were to terminate the work up to the foot of Macdonald-street. They had to finish the work up to that point before they stopped.

15766. Will you read your minute of November 14th, 1892? Yes; it is as follows:—

WHEN this contract was finished from Shea's Creek to the foot of Macdonald-street the contractors were informed, in accordance with the terms of the contract, that they were not to proceed beyond that point. Afterwards a further sum of £9,000 was voted, and the Minister decided to allow Messrs. Carter & Co. to complete the contract to Munni-street, and they were given until the 18th August (four months) to do this. The contractors have lost no time since they received instructions to proceed with the work, and I am therefore of opinion that the four months was scarcely sufficient time to do the work in.

The contract was finished on 22nd September, or five weeks overtime, and the contractors have therefore been fined five weeks at £20 = £100, which sum they now ask should be remitted, and for the reason stated above I beg to recommend that their request should be granted.

J. D.

Mr. Bagge.

15767.

Mr. Hickson wrote this minute on the same date:—"I recommend that the fines be remitted. The time given (four months) was too short." Mr. M'Lachlan says "list," and then the matter is approved by the Minister, Mr. Lyne, on 19th November, 1892, and Carter & Co. were informed. 15767. Will you now read the letter of the Council Clerk of the Municipality of Macdonaldtown, dated February 24th, 1892, to the Under Secretary for Public Works? Yes; it is as follows:—

J. Davis.  
4 Sept., 1896

I have the honour, by direction of the Mayor, to ask you to be good enough to inform me if the Hon. the Minister for Works will be pleased to receive a deputation from this Council on the subject of the stoppage of the construction of the storm-water sewer along M'Donald-street to Munni-street.

Trusting that the Council's application will be favourably received.

I have, &c.,  
WILLIAM F. BRAY,  
Council Clerk.

Mr. Barling wrote upon that this minute "May perhaps be informed that there is no need for a deputation, and that as soon as the additional money required is voted the work will be proceeded with." That was approved by Mr. Lyne on 5th March, 1892.

15768. Mr. Baggé wrote a minute on 21st November, 1891, which I will ask you to read? Yes; it is as follows:—

These three letters, 91/2,793, 91/2,802, and 91/2,816, all refer to the same subject, namely, the extension of the Shea's Creek storm-water channel from the Macdonaldtown Park branch channel, along Macdonald-street to Munni-street.

I quite agree with the writers that the work is most important, and the question of constructing this extension is now before the Minister [see papers, 91/2,424] for the purpose of procuring funds.

C. H. OHLFSEN-BAGGE.

15769. Will you read the following minute by Mr. Hickson under date of April 5th, 1892? Yes; it is as follows:—

Now that the necessary funds (£9,000) are voted for this work, I should be glad to have authority to continue the sewer, which was stopped some months ago for lack of funds. The contractors have kept some of their plant and a lot of material on the ground, there is nothing therefore to prevent the work, which is much needed, being gone on with at once and thus provide employment for a considerable number of men.

ROBT. HICKSON.

Mr. Barling says upon that "Some agreement as to time should be made, I think." That is approved by Mr. Lyne on 6th April, 1892.

15770. Here is a minute by Mr. Weedon which I should like you to read. It is dated 31st December, 1892? Yes; it is as follows:—

I have the honour to forward to you herewith a statement of Contract No. 72, giving the original contract amount, and also the final amount for the completed work. The difference between the amounts shows that the cost of the work exceeded the original contract; this was occasioned by extra works that had to be undertaken, which were not contemplated when the contract was let [see Minute Papers 91/2819—21.11, 28th October, 1891, and 5th February, 1892], the most important of which were—first, the cutting of an open outlet (of over half a mile in length) from the termination of the concrete channel to the canal in Shea's Creek; secondly, covering the open concrete channel with jack arches where it passed through the sand-hill near the outlet. An extra grant of £9,000 was made to meet the above.

Yours, &c.,  
STEPHEN H. WEEDON,  
Resident Engineer.

Attached to that is a statement of the final quantities.

15771. Are there any minutes on that? Yes; there is a minute by myself, "Forwarded with final certificate." That is dated 31st December, 1892. Mr. Hickson says "Seen" on 3rd January, 1893.

15772. Will you read the following minute under date 13th March, 1891? Yes; it is as follows:—

It has just come to my knowledge that in carrying out the works of the the Munni-street to Shea's Creek Sewer, a part of which is along the centre line of the proposed Shea's Creek Canal, and is itself an open channel, the material from the open channel is being disposed in such a position as in the event of the Shea's Creek Canal being extended to Buckland-street the whole of their material will have again to be moved: it may be possible that this material can be so disposed as to make one moving sufficient: I would suggest that the Engineer-in-Chief for Roads and Bridges' attention be drawn to the matter.

GEO. TILLET,  
For Engineer-in-Chief.

That is addressed to the Engineer-in-Chief. Whether it was sent on to him or not I do not know.

15773. In connection with that sewer, the contractors received 2s. 6d. a yard for excavation, did they not? Yes.

15774. Is not the excavation entirely through sand? No.

15775. What is the excavation at that end of the canal? It is soft excavation; not sand.

15776. What is it composed of—shale? No; it is soft excavation.

15777. Is it not sand? No.

15778. Is it not the same as the bed of Shea's Creek? What part of Shea's Creek do you speak of?

15779. Is it not the same kind of ground that you will see at the excavation in the bed of the Shea's Creek canal? The upper portion of the ship canal will be the same as that channel, but not the lower portion. The lower portion of the ship canal is in sand.

15780. Mr. Tillet in writing that minute says that the contractors are depositing their spoil within 25 feet of the channel, and that that would be in the way of the ship canal excavation—I want to know whether the contractors were paid the shilling in addition for filling, for putting that spoil along the bank? No. I think you will find some minutes of mine in connection with the same thing. I wrote the following minute, dated 16th March, 1891:—

Before this work was commenced last week I saw the importance of not only cutting our channel in such a way that ultimately it would form part of the proposed canal, but also that the earth excavated should be so deposited that it would not have to be moved a second time. I therefore asked Mr. Boys to see Messrs. Tillet and Williams of the Harbours and Rivers, and ascertain from them what distance from the side of the canal they would require the excavated material deposited, so as to be clear of their work.

Mr. Boys understood that if we kept 25 feet outside of the edge of the canal there would be sufficient room for the canal banks. I gave our contractors orders accordingly.

Since

J. Davis  
4 Sept., 1896.

Since receiving Mr. Tillett's minute I have seen him, and he informs me that there will probably be an excavation 736 feet wide, thus:—

at the point where our storm-water channel joins the line of canal.

The ground is of such a soft nature that I do not think it practicable to move our excavated material clear of the 750 feet proposed canal resumption, except at great expense, and as it does not appear that the cross section of the excavation for the canal is definitely settled, I recommend that our contractors be allowed to go on depositing the earth parallel with the canal, leaving 25 feet from the edge of the canal for the future bank.

J. DAVIS.

That is addressed to Mr. Bagge. He sends it on to the Engineer-in-Chief, who says, "I should be glad if Mr. Tillett would see me about this." There is then another minute by Mr. Hickson, "Arrangements made with Mr. Tillett as to the disposal of this material." I am then asked to note that, and I initial it.

15781. Did the shilling a yard apply to that? I have already said that it did not.

15782. In the final payment upon Contract 72 there is an increase on filling; what do you call filling, to begin with? The specification would define that.

15783. But I want you to define it? I should have to go to the specification.

15784. Can you not define it, speaking from your experience as an engineer? My experience as an engineer teaches me that I should not go outside the two covers of the specification.

15785. Do you not go outside the two covers of the specification? I endeavour never to do so.

15786. Have you never done so? I cannot say that I have never done anything wrong, but the proper thing to do is to administer the specification. It is put into our hands to administer, and in regard to this matter of filling you must take what the specification says in regard to it.

15787. Has your evidence before the Commission been that you have stuck absolutely to your specifications? Yes.

15788. Has that been the effect of your former evidence? Yes.

15789. What is the filling in this case? You will find the definition of refilling in clause 55, upon page 145, of the Parliamentary return. Clause 60 gives what is comprised in the price for one cubic yard of filling.

15790. Did the contractors receive 1s. a yard for filling for putting the spoil 25 feet from the bank? No.

15791. What became of the spoil of the canal? It was put as the minute that I have just read—the minute of the 16th March—indicates.

15792. Where was it put? As that minute indicates.

15793. What does the minute say? I think 25ft. from the edge of the proposed canal.

15794. And did the Harbours and Rivers Branch remove it again? I do not know what happened afterwards.

15795. The Harbours and Rivers Branch excavated the ground where it was deposited? I do not think so, I believe that after we had drained the swamp a period elapsed before the ship's canal was brought up to that point. I suppose a couple of years elapsed. The swamp being drained Chinamen started to cultivate upon the soil we had put there—in fact, they had some nice gardens there, and it was not until the ship canal was put into operation that the gardens were abandoned.

15796. Do you call that the losing end of a contract where the contractors were receiving 2s. 6d. for excavating soft material, and where they deposited it at 1s. a yard? It was a very nasty end of the contract.

15797. But do you call that the losing end? I should say it was a very nasty, and, therefore, an expensive end. It was simply a swamp.

15798. But the material was not difficult to remove? It was most difficult to remove.

15799. *His Honor.*] It was soft to excavate? If you could get it into the barrow. They had to use planks to stand upon; it was a very nasty place.

15800. You mean that it was in a state of sludge? Yes; I tried to go across myself, and I know that if you put your feet off the reeds you did not know where you were going to.

15801. In dry ground what would be a fair price for excavating the same sort of stuff? I suppose that if it were dry a shilling a yard would cover it pretty well.

15802. That would be a good price, would it not? I do not know that it could be done for much less if you take plant and profit into consideration.

15803. But excavation for large tanks has gone down to 6d. and 9d. in soft ground? Yes; we are getting excavation done for 7d. now, but you have to take everything into consideration.

15804. *Mr. Parkes.*] Will you read your minute of 23rd May, 1891? Yes; it is as follows:—

The ground between the outlet and 4 chains is so bad that it will be necessary to strengthen the concrete for this length. I propose to put in an additional 12 inches of sandstone concrete, and under this 12 inches of quarry refuse, as shown on the attached sketch.

The extra cost will be as follows:—

|   | £   | s. | d. |
|---|-----|----|----|
| Sandstone concrete, 145 cubic yards, at 34s.....    | 246 | 10 | 0  |
| Excavation, 290 cubic yards, at 2s. 6d. ....        | 36  | 5  | 0  |
| Quarry refuse, filling 145 cubic yards, at 1s. .... | 7   | 5  | 0  |

Total ..... 290 0 0

J. DAVIS.

Mr.

Mr. Bagge wrote upon that the following:—"I beg to recommend Mr. Davis's proposition to Engineer-in-Chief's favourable consideration. Mr. Davis intends to have the layer of quarry refuse well rammed, and the concrete up to invert in specified layer of long lengths finished before the sides are built, so that all may settle gradually." Mr. Hickson approved, and Carter & Co. were informed.

J. Davis.

Sept., 1896.

15805. Mr. Weedon wrote a letter concerning some filling in the canal. He says, "The total quantity of excavation by the cross-sections, allowing an average area of 6'32 square feet between 33'50 and 38'28 chains?" Mr. Weedon referred there not to the canal but to the earth-channel which was cut on the site of the proposed canal, and the chainages referred to are those measured from below M'Namara's dam upwards, taking the point below M'Namara's dam as being 0.

15805½. *His Honor.*] What do the three close parallel lines on the tracing represent? They are drains.

15806. *Mr. Parkes.*] In one of your memoranda you referred to clause 4;—will you read the 5th section of that clause, which appears upon page 152 of the Parliamentary Return? Yes; it is as follows:—

The Minister, or the Engineer, acting on his behalf, may, from time to time, by writing under his hand, require the omission of any particular portion or part of the works described in the specification or shown on drawings; and the contractor shall have no claim for loss of profit, sustained damage, or other compensation on account of any such omission.

But I referred to section 4.

15807. Will you read the special clause 3 which appears upon page 141 of the Parliamentary Return? Yes;—it is as follows:—

3. It is to be understood that the lower 13 or 27 chains of the channel shall not be constructed until the Engineer gives a written order to that effect; and the Engineer shall have the power to suspend the execution of these portions of the work, or any other part of the contract, or to reduce the length of the contract by the extent of the said 13 or 27 chains, or any other part of the sewer shown on the drawings, that he may consider necessary, and the contract shall not thereby be invalidated, nor shall the contractor be entitled to any compensation on account of such temporary suspension of any part or parts of the contract or permanent reduction of same.

15808. You say that that clause is simply a repetition of clause 4;—how do you make that out? It is, with the exception of a special part of it, referring to the 13 and 27 chains.

15809. Can there be any chance of a man signing that contract having any claim? There would be no chance whatever if the clause were put into operation with regard to the 13 and 27 chains. Then, with regard to the general clause, it would be a question as to how far it would be equitably operative.

15810. But if you were a private individual, and had made special provision for cutting your coat according to your cloth, as it were, and a man made a demand upon you in violation of such a clause as that which you have read, what would you have considered—would you think he ought to be paid? As I said before, it is just a question as to how far that clause should be availed of—to what extent. But, at the same time, if it is in reference to the upper portion of the channel, I say at once that it does not come into the question.

15811. Why? Because that portion of the channel was constructed by Carter & Co. It was not omitted. At the time the letter was written it was intended to omit it altogether. We did not know whether the Minister would sanction any more moneys being voted, and it was intended to omit that portion, but virtually in the end it amounted not to an omission, but to a suspension of the work.

15812. Was there any doubt at all but that the contract would go on? I think the papers you have asked me to read show pretty clearly what the intention of the Department was.

15813. No doubt they do, and it was that Carter & Co. should continue the contract? That when money was available the contract was to be continued; but you will find no such statement as that until a certain date, when the Minister virtually approved of £9,000 being put upon the Estimates. It was then decided to complete the contract.

15814. In the meantime the portion they had in hand was being constructed? The portion to which you refer was omitted in the first instance, but when money was likely to be available it resolved itself into a suspension, so that, whether the clause of which you are speaking applied or not, it refers only to the first part of the transaction, and not to the second—suspension being a totally different matter.

15815. As a matter of fact, you gave the contractors extra work which would make up for the piece of canal that ran down Shea's Creek? No. I do not say that we did. In the correspondence it may have been put in that way for convenience sake, but at the same time it could not be regarded as an extra. It was all embodied in the work.

15816. When the officers of the Department were making arrangements for that extra work, why could they not have made definite arrangements if they anticipated that there was going to be any claim for the cutting off of work? I do not admit that there was any extra work.

15817. In your memorandum, No. 4, you say, "When Mr. Lyne wrote his minute of 23/2/92, in which he stated after having seen Mr. Hickson that Carter & Co. would in all probability be able to make a claim, &c."? You must bear in mind that that is not an extract.

15818. But it has the intent of an extract, and it is not an absolutely correct statement? You will see what Mr. Lyne said if you refer to the minute.

15819. Mr. Lyne says, "As Mr. Hickson thinks Messrs. Carter & Co. could make good a claim for something like £2,000 as compensation on Contract 72, &c.," but you say in your memorandum that Mr. Lyne stated that Carter & Co. would in all probability be able to make good a claim;—he does not say that in his minute? I confess that I do not see much difference. They are different words, certainly, but the meaning, as far as I can see, is precisely the same. I think I have fairly represented what Mr. Lyne said.

15820. Except that you throw the responsibility on to Mr. Lyne. You heard his evidence, and you heard him say that if Mr. Hickson had not told him that the claim was a valid one, he would not have let Carter & Co. have the contract? I do not think he said that.

15821. He said, I think, that he acted in the matter entirely upon the recommendation of his officers? He said, as far as I can remember, that he might or might not have seen the claim, but that before he wrote his minute he was perfectly satisfied on the point.

15822. Let me refer you to Mr. Lyne's answer to question 9180. He there says that the chances are that the claim was put before him, and that he should have imagined that he obtained particulars of the claim. At all events he must have been satisfied that Mr. Hickson had had particulars of the claim before him. It would seem from that answer that Mr. Lyne was not the originator of the acceptance of the tender? I take Mr. Lyne to mean that, after seeing Mr. Hickson, he wrote a certain thing—that he did not write it apart from Mr. Hickson.

- J. Davis.  
4 Sept., 1896.
15823. Would it not have been better for you to quote the Minister's minute? These minutes are quoted so frequently that it seems almost superfluous to quote them again and again when there is not absolute necessity to do so.
15824. You say also in your memorandum No. 4:—"A similar case to this occurred on the sewerage works at Bondi, contractors, A. J. Smyth & Co., in 1884? The works were stopped on account of the representatives of the Cooper family having obtained an injunction, and although they were only suspended for a period of about two months the contractors were paid on the advice of the Crown Solicitor the sum of £3,000 as compensation."
15825. Upon that particular contract, was there any anticipation before it started of the stopping of any part of it? I do not see what that has to do with it.
15826. *His Honor.*] But was there in point of fact? I think the case speaks for itself.
15827. *Mr. Parkes.*] What I want to know is whether there was any idea of stopping the works when they were first commenced; are the cases at all similar in that respect? They are two cases of suspension of work from different causes. They are dissimilar as far as the reason of suspension is concerned, but not otherwise.
15828. In the case of the contract at Bondi the works were stopped during the course of construction by another party taking action—is not that so? They were stopped by the Supreme Court.
15829. And in the other case the works were stopped because there were not sufficient funds? Yes.
15830. Which was known when the contract started? I do not quite know how to answer that. It was known—if you mean that—that we had not more than £15,500 and £8,500 for that particular work.
15831. And you made provision that the contract should not exceed that amount? We made provision for the reduction of the £20,650 by £3,000. I have already explained with regard to the upper portion of the work that it was perfectly proper and justifiable to take a portion of the vote of £8,500 for the Macdonaldtown Park sewer.
15832. From another contract—from Parry and Farley's? Parry and Farley's contract was paid from the vote of £8,500, and part of Carter & Co.'s contract was also paid from that vote.
15833. Will you now turn to your memorandum No. 6, dealing with the substitution of blasting for guttering and gadding upon Contract 79. Will you explain the figures by which you show that a saving is made? You say, "On these conditions the Engineer-in-Chief approved of the excavation being done by blasting, and the work was carried out accordingly, and in the final voucher the concrete which was included was reduced equal to £1,302 9s. 8d." I do not quite know what explanation you require beyond that statement. If you will indicate what explanation you require I shall be glad to make it.
15834. Will you explain where a reduction equal to £1,302 9s. 8d. comes in? The actual sandstone packing carried out at schedule rates amounted to £1,495 13s. 9d., and the sandstone packing paid for amounted to £790 3s. 3d. The difference between what was actually carried out and what was actually paid for represents a sum of £705 10s. 6d. Then, as regards bluestone concrete in the sewer actually carried out at schedule rates, the amount was £4,012 18s. 1d., whereas the bluestone concrete in the sewer actually paid for amounted to £3,415 18s. 11d., or a difference of £596 19s. 2d. If you add that to the amount of £705 10s. 6d. you get the total of £1,302 9s. 8d.
15835. Will you explain in detail how you make up these items? Do you mean how we arrived at the quantities stated in this summary?
15836. Yes, taking the schedule of the contract? First of all, when the tunnel was driven before the lining was put in, cross-sections were taken of the excavation, and they indicated that in the case of sandstone packing there would be required 797·70 cubic yards, and in the case of the bluestone concrete 1,433·18 cubic yards. But, in accordance with the Engineer-in-Chief's decision, only 421 cubic yards in the case of the sandstone packing, and only 1,219 yards in the case of the bluestone concrete, were paid for. The difference makes up the amount of £1,302 9s. 8d.
15837. These quantities are in excess of the items as shown on the final voucher? The £1,302 9s. 8d. is not included in the final voucher.
15838. Therefore, if the final voucher has 1,872 yards of sandstone concrete the contractors were paid an excess amount? That is correct.
15839. The 421 cubic yards of sandstone packing was paid for in excess of the contract, was it not? No.
15840. Then why do you say that the sandstone packing actually paid for was 421 cubic yards? It was paid for in conformity with the contract.
15841. But in excess of the 1,872 cubic yards? It is included in that.
15842. Is it not an extra over and above the amount anticipated in the contract? I do not follow your question.
15843. The sandstone concrete in the schedule prepared by the Government was given as 1,020 yards, was it not? Yes.
15844. And it was finally paid for with an increase of 850 yards? The final voucher included 1,872 cubic yards.
15845. Therefore there was an extra upon the sandstone packing, between the estimated amount and the actual payment, of 850 yards? Yes.
15846. Upon what is your calculation based when you say that there is a difference of only 376 cubic yards? I say there is a difference of 376 cubic yards between the sandstone packing actually put into the sewer and the sandstone packing actually paid for.
15847. Will you produce, for the perusal of the Commission, the detailed figures upon which you worked out this return? Yes.
15848. I will also ask you to produce the details of your calculation on the value of the Monier work in Contract 77? I can produce the figures in both cases if necessary, but I can explain how I arrived at the results in cross-examination.
15849. Will you put the figures in tabulated form? I can do so if His Honor thinks it necessary.

MONDAY, 7 SEPTEMBER, 1896.

Joseph Davis recalled and further examined:—

15850. *His Honor.*] You desire to make a statement? Yes; before Mr. Parkes resumes his cross-examination I should like to refer to one matter of which I spoke on Friday last, with reference to the placing of plans upon the Table of the House. I was asked by Mr. Parkes this question:—"Supposing the contract plans were kept back?" I said in reply that they were not regarded as being asked for. I find, on reference to *Hansard*, that Mr. Young, the Minister, thought precisely as we did in the office, because, speaking in reply to Mr. Parkes in the House, he said "As a matter of fact, the honorable member did not move for plans at all."

J. Davis.  
7 Sept., 1896.

15851. *Mr. Parkes.*] I presume he received that information from the office;—I presume he referred to you in the matter? I did not give him any information, and I do not think anyone else did. I think Mr. Young's statement was the result of his own reasoning in the matter.

15852. In connection with Contract 69, you say, in your memorandum No. 1, "It was known when the tenders were accepted that there would be three descriptions of ground through which the tunnels and shafts would pass, viz., soft ground requiring timber, shale, and hard rock." Further down you say "It is not difficult, therefore, to see why in this particular instance (Contract 69) the tunnel excavation should have been so materially increased compared with the quantities given in the schedule. It was thought, when the contract drawings were prepared, that the tunnel in more or less hard ground would have been in hard shale, whereas it proved to be ground requiring timber, and as a consequence the quantities given in the schedule for this kind of work proved to be much below what was expected;"—but you must have anticipated the nature of the ground? We anticipated that it would be shale. The borings showed that.

15853. This contract was let on what date? The contract was signed on 22nd January, 1894, but the date of the letter of acceptance is 27th December, 1893.

15854. On the 18th January, 1894, you wrote a letter fixing the cross-sections, did you not? Yes; as far as they could be fixed at that date.

15855. But are they not the cross-sections on which the contract was actually carried out? They were fixed at that date. They may have been modified slightly after that. Generally speaking, no doubt those are the sections.

15856. Your measurements there are to the inside of the timber, are they not? It does not say in the letter, as far as I can see.

15857. The drawing I hand you, No. 32, is the plan upon which the work was actually paid? It is supposed to show the work as actually paid for; but I observe that there is only one polling-board shown on the plan. The polling-boards overlap each other. Whether that was taken into consideration in plotting these sections or not, I do not know.

15858. Take your letter of 18th January, 1894, which appears in the Parliamentary return—what is the largest section given in that communication? The section of the sewer, 6 ft. 8 in. x 5 ft. 8 in.

15859. That corresponds with the section of the 6 ft. 8 in. by 5 ft. 8 in. sewer shown upon this drawing, does it not? Yes.

15860. What is the size of the next section? Five feet 2 in. by 4 ft. 2 in.

15861. Does that correspond with the drawing? Yes.

15862. What is the next? Five feet 1 in. by 4 ft. 1 in.

15863. Does that correspond with the plan? It corresponds with it as far as the internal measurement of the sewer is concerned.

15864. That is the plan upon which the contract was measured and paid? I do not say that.

15865. You said so in your former evidence;—you produced this as the plan upon which the contract was paid? I said that this plan was supposed to correspond with the measurements, but that, as I had not compared them, I was not in a position to say whether that was so or not.

15866. Did you not say that this was the plan upon which the contract was paid? No, I did not. What I said then I say now.

15867. *His Honor.*] What is the date of the making of that plan? It is dated 6th December, 1895.

15868. *Mr. Parkes.*] This plan was made after the contract was completed? It was finished after the contract was completed.

15869. The measurements correspond with those which were given when the contract commenced? The measurements contained in my letter of 18th January, 1894, are those sent to the contractors for their guidance; but they were subject, and necessarily so, to alteration during the progress of the work.

15870. To make these cross-sections you must have anticipated the kind of ground that would be met with? I anticipated that these cross-sections would apply to certain kinds of ground, but what lengths of the different kinds of ground would be met with was another matter. I did not anticipate that.

15871. *Mr. Smith.*] This plan was made under Mr. Darley? Yes.

15872. *Mr. Parkes.*] In your memorandum No. 1 you also say, "When Mr. Hickson saw the pitch it had reached (referring to the speculation in tendering), as indicated by that contract, he decided to adopt an entirely new system, which has since been introduced, where applicable, in the other branches of the Department of Public Works and also by the Water Supply and Sewerage";—have you any documents connected with that change of system? Of what description?

15873. Minutes, letters, instructions—are there no records? I think I have already said in my evidence that the only instruction I can remember being issued by Mr. Hickson was one upon a sheet of note-paper which was sent to Mr. Bagge, but whether that was registered in the usual way or not I am not in a position to say. The instruction, I know, was given.

15874. Were there any other documents besides that? Not in connection with the initiation of the system.

15875. You say further on in your memorandum, "Before the work was undertaken, therefore, and in the absence of a knowledge that has since been gained concerning the nature of the ground, a fair average value for the contract was fixed by the Department at £64,420. Results have shown the average valuation of the finished work made by eleven experts under the most unprejudiced circumstances is £64,555";—who were those eleven experts? The tenderers.

15876. You call them experts? I would, certainly.

J. Davis. 15877. You say that the office estimate was £64,420, and that the value of the work, as executed at the office rates, was £63,831, but there were a great number of items which were put into the office estimate which were altogether eliminated? There were a number of quantities put into the schedule which were not carried out.

7 Sept., 1896.

15878. Which went to make up the sum total? Which were included in the office estimate.

15879. But they go to make up the total of the estimate? Yes; but you must remember that the whole of these quantities in some cases were not carried out, there being no necessity for them. On the other hand there was a necessity in some cases for increasing the quantities. You have to take the one against the other. What we say is this, that the office idea of the value of the work was £64,420; and that, taking the opinion of the eleven experts of whom I have spoken, proves to be practically correct.

15880. The habit of the Department, then, is to fill their estimates with every probable quantity of material and labour, whether it be adopted or not? The habit of the Department is to make provision for the different kinds of work that are likely to be carried out in any contract. The working of it out may result in this—that some of the items may not be required. On the other hand, some of the items may be increased, and you have to put the one against the other.

15881. You make this statement: "Since the inauguration of the Sewerage Branch in November, 1879, up to the present date, 117 contracts have been let and completed, with the following result:—Amount of tenders worked out at schedule rates, £1,440,225; total amount of final vouchers, £1,433,186";—no definite conclusion can be drawn from that, judging from what you now say? A very definite conclusion. To begin with, although the contractors take advantage of the uncertainty of the probable quantities, and in many cases put in fancy prices and in other cases put in absurdly low prices, on the whole, although we have these large and small prices to contend with, and although the quantities in the schedule have to be adjusted to the work as it is carried out, there was a saving to the Department, upon the old system, of £7,000 in £1,500,000; so that it is pretty evident from that—it is pretty conclusive—that the Department did not lose in the past. What it might have done in the future, if the system had not been changed, is another thing.

15882. When you take out some items and increase others, how can you tell whether a contract has been expensive to the country or otherwise; it may come out at a certain sum total, but when you change the items, how is it possible for you to say whether the contract has been an expensive or a cheap one; take Contract 79; a certain number of items were eliminated from that and some were put in, still the total comes out at practically the same? I think we are talking a little at cross purposes. When you speak of elimination, I do not for a moment admit that there has been elimination. I say that in preparing our contracts we have, to a certain extent, to work on problematical lines. We have to provide for every emergency that may arise. We have to put in items which may be required or which may not. In some cases items may be reduced, in other cases they may be increased; but taking everything into consideration, and in spite of the fact that contractors have speculated to some extent—and more especially immediately before the change of system—we have been £7,000 to the good in work of an uncertain nature amounting in value to £1,500,000.

15883. It would be all right if the range of prices put to each schedule were correct, but where the range of prices rises sometimes as much as 100 per cent., and where in other cases it is lowered 200 per cent. you cannot tell what the total is as far as the saving to the country is concerned? Yes; you can. I think the evidence I have just given in answer to your question is conclusive on the point.

15884. That is what you think? That is my opinion.

15885. In your first memorandum dealing with Contract No. 69 you also say, "The uncertainty of the nature of the ground, and other circumstances connected with the construction of sewerage works, make it expedient to provide in the schedule items for work which may possibly be necessary, in order to obtain prices for them. By this means a check is kept upon exorbitant extras, for contractors, if not tied down to price at the time of tendering, would afterwards quote very much higher rates for extras." You have a clause in your specification stating that extras shall be paid for according to the value put upon them by an arbitrator if the Government engineer's estimate is not accepted by the contractor—is not that so? I do not think so.

15886. Look at clause 16 relating to extras, which is printed upon page 116? Yes; but the question you asked me was in reference to the arbitration clause, I understood.

15887. But take clause 16? If you take that clause, my answer to your question would be slightly different.

15888. Would it not be preferable to allow the extra work to be valued and paid for under clause 16, and also under your arbitration clause, rather than to allow it to remain to be paid for as a fixed extra, when you see that contractors' schedules are sometimes accepted with items 500 per cent. above value? I would say first of all that the arbitration clause has very little to say in the matter, because before you can put the arbitration clause into operation, the amount in dispute must be over £500. Then, secondly, as to clause 16, relating to extra work, the omission of work, and so on, if the engineer and the contractors cannot agree as to the rate to be paid for any particular work, it is within the power of the engineer to omit that work altogether from the contract. It would, however, be most inconvenient, and almost impossible. Take subducts. How would it be possible to call in another contractor to carry out subducts?

15889. You are now departing from my question. You say in your memorandum, "By this means a check is kept upon exorbitant extras, for contractors, if not tied down to price at the time of tendering, would afterwards quote very much higher rates for extras." I say that when you are compelled by your contract to pay the contractors extras 500 per cent. above value if they happen to put that price into their schedule, would it not be better to leave those extras to be paid for according to their reasonable value? I think the proper way is to include in a schedule every item that is likely to be required in a contract. That is the most economical, and certainly the most business-like way of dealing with the matter. I again say that in my judgment, gathered from my own experience, in connection with contractors, certainly the Department would be at a decided disadvantage if they had to arrange rates for any particular kind of work after the contract had been let.

15890. In the same memorandum you also say, "And it was also pointed out that, while in the specification this provision was made, pitchers were not shown on the contract drawing to be put round all the covers. The Engineer-in-Chief, Mr. Hickson, took advantage of this, notwithstanding the strong protest on the part of the contractors." There is no strong protest on the part of the contractors disclosed by the Parliamentary papers? It was a verbal protest made in my presence.

15891.

15891. And what was the nature of it? They considered that, seeing that they had Contract 69, and that the specification required from them pitchers round every manhole cover, it was only fair and equitable that they should carry out the work in accordance with the specification in spite of the fact that the Department would have to pay very heavily for the pitchers.

J. Davis.  
7 Sept., 1896.

15892. *His Honor.*] Who was present on that occasion? Mr. Carter, I think, was the only representative of the contractors. I am not quite sure upon the point. It is possible that Mr. Snodgrass may also have been there.

15893. Who else was there? Mr. Hickson and myself.

15894. Where did the interview take place? In Mr. Hickson's room.

15895. Will you repeat as nearly as possible the actual conversation which took place to the best of your recollection. First of all can you tell us how the meeting came about? To the best of my recollection, in May, 1894, as I have already explained to the Commission, it was discovered that £50 per square yard had to be paid for these pitchers. I immediately wrote a minute, which is given in the Parliamentary papers, and I think Mr. Hickson then instructed that Carter & Co. might be asked to call. They knew that the matter was being taken into consideration, and they did call, and they saw Mr. Hickson in my presence. Then it was that the whole matter was discussed. My position—and I put it down in writing—was this—that if the contractors got the 12 square yards given in the schedule they would certainly not be dealt hardly with. Mr. Hickson thought that, although the schedule did mention 12 yards, that was only a probable quantity, and that as the drawings showed 32 square yards the fairest way would be to allow the contractors that number. He made that suggestion, and to that the contractors eventually agreed.

15896. When Mr. Hickson expressed that opinion did the contractors press the matter further, or were they inclined to accept his suggestion? They thought they were entitled to the whole in accordance with the specification, but Mr. Hickson said that he would not go any further than he had indicated, and the contractors finally agreed to that.

15897. Was there much discussion as to the balance—the difference between the amount shown upon the plan and the amount calculated from the specification? No; I do not think there was a very great deal said. Mr. Hickson thought the course he indicated was the fairest one to adopt.

15898. The contractors strenuously objected, I suppose, to their being tied down to the 12 yards? Yes; very strongly. They thought that would be a most unfair and unjustifiable proceeding. Mr. Hickson, taking into consideration the low rates they had upon other items, thought that although the price for the pitchers was absurdly high they ought to have the advantage of it.

15899. Did the interview take place between the 9th—the date upon which you wrote your minute—and the 11th—the date upon which Mr. Hickson wrote his minute—or after? Between the two dates. I think it was on the 11th. I think it very likely that Mr. Hickson would put his decision down on paper at once. That was his usual practice. My impression is that Mr. Carter was asked to call. It is probable that, when I submitted my minute of 9th May, Mr. Hickson would ask me to write to the contractors or to telephone to them, asking them to call. But there is no record of that.

15900. Do you remember whether or not Mr. Hickson expressed his opinion as to the price of £50 a square yard for the pitchers in the presence of the contractors? He foresaw that we were in a fix. Notwithstanding what Mr. Bagge said in his evidence, this price of £50 per square yard was not known to exist, except to the contractors, until the contract had been in force for some time. It was due, I think, entirely to the clerk who wrote out the schedule from the original. When a contract is signed, Mr. Norrie sends it in to me, and I get a number of copies made from the schedule attached to the contract. In some unaccountable way the clerk put down opposite this particular item £50 instead of 50s.

15901. The clerk must have assumed that £50 was a mistake? I knew nothing about it until the price was challenged by the contractors. I sent for the bond immediately, and I then found that 50s. was wrong and £50 correct.

15902. Do I understand that Mr. Bagge was the only officer of the Department who would have gone through the schedule, and who would, therefore, be likely to have noticed the error? He was the only officer who would do anything of the kind. He had that duty wholly and solely to himself. The tenders when they were received by the Tender Board were put into a list. They were then sent on to Mr. Bagge for report. He then would submit them to the Engineer with his report, and, unless he called attention to any enormity or anything out of the way in connection with any particular tender, it would go on for acceptance.

15903. He never did call attention to this item of £50? Not so far as I know. He certainly did not say anything to me. He spoke to me of the two small matters which he mentioned in his report, and which Mr. Hickson thought of no importance. If you turn to page 66 of the Parliamentary return, you will see that he says:—

Messrs. Carter, Gummow, & Co., being the lowest tenderers for the construction of the Western Suburbs Main Eastern Branch Sewer, Contract No. 69, I beg to recommend acceptance of their tender, amounting to £45,207 8s. 11d., at schedule rates, on condition that they fill in and initial in their tender the average price per ton for all irregular castings, weighing in all 33 tons 12 cwt. 3 qrs. 12 lb., and the average price per ton for all cast-iron pipes, weighing in all 783 tons 8 cwt. 2 qrs. 27 lb.

Mr. Hickson writes upon that "Not necessary." I remember Mr. Hickson's seeing me about the matter and discussing whether it would be necessary to get the alteration made. Mr. Hickson came to the conclusion that it would not be necessary, and he then recommended Carter & Co.'s tender for acceptance.

15904. When the interview took place, according to your recollection, it had only just come to your knowledge, and, as far as you could see, it had only just come to Mr. Hickson's knowledge, that those pitchers were scheduled in the tender at £50 per square yard? Yes; I positively swear that.

15905. Do you remember whether Mr. Hickson did or did not say something to the contractors, when they came, in relation to that matter? In the first interview in regard to the pitchers, I submitted my minute to Mr. Hickson. He thought that we should have to consider the fact that it was a schedule rate, and that, although it was a very high one, there were also low ones in the schedule. He did not say positively, then, what he would do until he had seen the contractors. That was the first conversation I had with him in reference to the matter.

15906. Did it not strike everyone that it was a little trick on the part of the contractors—that they had taken advantage of a mistake made in the schedule—12 yards being substituted for a larger number? That was very clear.

15907.

J. Davis. 15907. That being so, were no strong comments made by anyone at the interview as to the impropriety of that course? I dare say there were; but I do not recollect the precise words used.

7 Sept., 1896. 15908. Did Mr Hickson, or did he not, show any indignation? I do not think he did. He regarded the matter in this way—that, the contract having been accepted, the Department, as a matter of business, was committed to it, and any expression of indignation, as you put it, or anything else of that kind, ought to have been used before the tender was accepted, not afterwards.

15909. It would be admitting that the Department had made a mistake? Whether the Department made a mistake or not, he put it in that way. I know, from what he said, that he was of opinion that anything which had to be said on the point should have been said before the tender was accepted.

15910. *Mr. Parkes.*] You say:

The Engineer-in-Chief (Mr. Hickson) took advantage of this, notwithstanding the strong protest on the part of the contractors, and decided that only those pitchers were to be carried out that were shown on drawing, and instructions were given to the officer-in-charge accordingly [see Parliamentary Papers, page 125, No. 17]. Before, however, the contract was completed, Mr. Darley was appointed Engineer-in-Chief for Metropolitan Sewerage Construction, and the works were taken over by him, and another Resident Engineer put in charge, who appears not to have known of Mr. Hickson's decision; and the contractors pitched, with two exceptions, the whole of the manhole covers, and were paid for them in the final voucher.

With regard to that, how comes it that the vouchers which were paid prior to the work going over to Mr. Darley showed 17 square yards? I do not know that that is the case; but, supposing the quantity to be 17 square yards, the explanation is very simple. There would be only that quantity carried out at that time. The bluestone pitchers would be almost the last thing that would be done on the contract.

15911. If in the voucher just before the work was handed over to Mr. Darley 17 square yards are shown, that would show that Mr. Hickson and your Department intended to pay the item right through, does it not? I do not quite understand the question.

15912. What I mean is that the 17 yards exceeds the 12 given in the Schedule? Yes.

15913. *His Honor.*] Ultimately 35 yards was the quantity paid for? Yes.

15914. Two manholes in addition to that number were shown upon the plan which were not pitched at all? That is so.

15915. *Mr. Parkes.*] With reference to the retention and fixed deposit money being returned to the contractors, you give a list showing that two contractors in the Sewerage Department, five contractors in the Railway Department, one in the Telegraph Department, one for the Agricultural College, and so on, going right through the other Departments, were dealt with in this way;—were the two cases in the Sewerage the only two cases in that Department? I do not say that. I asked the clerk in charge of the fixed deposits to make a list representing the general practice of the Department. I do not say by any means that this list exhausts the number of cases.

15916. But did you not say before His Honor that they were in the Sewerage Department alone? I did not say that these were the only cases. What I say is, that it is a fair representation of the practice of the Department.

15917. But can you prove the existence of any other cases in the Sewerage Department? I do not know that I could. I might be able to do so.

15918. Can you prove any cases beside the two which I have enumerated in this list? I do not know.

15919. Do you know of any other cases? I do not remember any.

15920. I will ask you to produce a list of any further cases that may exist? I will do so. Remember that I am speaking now of fixed deposits only, not of retention money.

15921. Can you prove the existence of any other cases? I asked the clerk in charge of fixed deposits to supply me with a list representing fairly the practice of the Department, and this is the list with which he supplied me.

15922. *His Honor.*] If any other cases can be found to have existed in the Sewerage Department will you produce them? Yes.

15923. *Mr. Parkes.*] The clerk who prepared the list appears to have gone all over the Department? My intention was to show that what was done in one case was done in another, and that we were dealing with Carter, Gummow, & Co. in full unison with our practice as regards other contractors.

15924. The railways have nothing to do with the Sewerage Department? I am speaking now of the Department of Public Works. What Mr. Deane has done in the Railway Department, Mr. Hickson has done in the Sewerage Department. What Mr. Vernon has done in the Architect's Department, Mr. Hickson has done in the Sewerage Department. What has been done in the Post and Telegraph Department—altogether another Department, I admit—has also been done in the Sewerage Department.

15925. The other day I asked you for some information with reference to the sureties in the case of Gilliver and Ahearn; have you that information? Yes; the papers are here now, I think.

15926. In the case of Gilliver, did you not object to having his son as a surety, although Mr. Gilliver assured the Department that his son was a man of independent property? Gilliver and Curtis wrote to Mr. McLachlan, as Chief Clerk of the Public Works Department, on 28th December, 1893, as follows:—"Sir,—We have the honour to submit Mr. Henry J. P. Gilliver and Henry S. Gilliver as sureties for our Contract No. 97, Rookwood Cemetery drainage, first division.—We are, sir, yours obediently, GILLIVER AND CURTIS." Mr. McLachlan refers that letter to Mr. Hickson, and asks if the names are satisfactory. Mr. Hickson evidently sees Mr. Gilliver between 29th December, 1893, and 2nd January, 1894, and he writes: "I saw Gilliver and Curtis, who are to submit another name." Then, on the same dates, Mr. Hickson wrote: "The names of Messrs. R. C. Watkins and H. L. Gilliver might be accepted." Mr. Barling writes, "Accept." That is the history of the case as far as it appears from the papers.

15927. Mr. Gilliver's son was accepted? Mr. H. L. Gilliver was accepted.

15928. In the case of Ahearne's contract, what was done? On the 31st January, 1893, Mr. Ahearne wrote to the Under Secretary for Public Works as follows:—"Sir,—I have to submit, for the approval of the Minister, the names of the following gentlemen as security for my Contract 101, main outfall sewer, viz., Henry Hudson, Darling Point; Hugh M'Ardle, Sydney.—I am, sir, your most obedient servant, JOHN AHEARNE." I ought to explain that Mr. M'Ardle's address was given originally as Brisbane; but the word "Brisbane" has been crossed out, and the word "Sydney" substituted in different ink, the alteration being initialled by Mr. Ahearne. Mr. Hickson says: "I recommend that Mr. Ahearne be asked if Mr. M'Ardle has property to the value of the penal sum required in the Colony; if not, he should be asked to give a name of some one who has." Mr. Barling writes "Ask"; and Mr. McLachlan writes "Mr.

Ahearne

Ahearne states that Mr. M'Ardle is a large property owner in this Colony." Mr. Barling then says, "This seems to be all right." The matter is referred to Mr. Norrie, and Mr. Hickson then says, on the 8th Jany., 1894, "Yes." That is the history of that matter as it appears from the papers.

J. Davis.  
7 Sept., 1896.

15929. *His Honor.*] The form of undertaking which you now produce is the form which is now used? Yes.

15930. Can you fix the date of the initiation of the system? It has been in vogue for a great number of years. To the best of my belief it has always been the practice more or less to meet the contractors when they made an application of this description relating to a fixed deposit, so long as the Department do not incur any risk.

15931. It was Mr. Norrie's idea to put this undertaking into a printed form for convenience sake? Yes.

15932. *Mr. Parkes.*] Coming now to the advances upon cement to Messrs. Carter, Gummow, & Co., why do you, in dealing with the advances on material in your memorandum No. 3, take Contract 69 as the first contract, when Contract 79 bore a prior date? There was no particular reason.

15933. Mr. Christie's report deals with the contracts in the order of their date;—why did you take Contract 69 first? I expect, because 69 stands before 79 in the order of the contracts. I do not know of any other reason.

15934. *His Honor.*] You are referring to their numerical order? Yes.

15935. *Mr. Parkes.*] Was there any Ministerial authority obtained for the advance in the case of Contract 79? That I could not say; if there was I presume it would appear in the papers.

15936. If it is not in the papers would there be any? There might be, but it is not probable.

15937. In the case of Contract 79, your certificate shows that the advance is not on the material, but that cement is stipulated; you say in your memorandum that the contractors receive a large advance because they had plant to the value of £3,000 on the ground? I do not say "because," I say that, in giving the large advance which was given on cement, that was taken into consideration.

15938. You took into consideration the plant? Yes.

15939. But your specification says that the plant is to be held as security by the Government, does it not? No.

15940. Are you sure there is not a clause to that effect? Yes; I think you are referring to clause 8 of the general conditions.

15941. The clause I refer to is clause 14; is it not evident that the plant is held as part of the security of the Government under the contract? I think that in making an advance as we did in the case of the cement, it would be taken into consideration that the plant was the property, in accordance with the contract, of Her Majesty.

15942. Ought the plant to be taken into consideration at all; that is the question? All I have to say is that it was in this instance. The plant was there. It was security in addition to the fixed deposit. In addition to plant we had a large stock of material, and in making the advance upon the cement the whole circumstances connected with the securities were taken into consideration. That would be done in all cases.

15943. But the clause to which I refer says that the material is the property of Her Majesty, until the completion of the contract? Well, the material is advanced upon this month, but it would be in the work next month, and paid for.

15944. But as to the plant? I am talking of the material.

15945. The greatest amount you had authority to advance as regards the material, was £1,360, was it not? £1,360 is the amount named in the agreement upon page 317 of the Parliamentary papers.

15946. Yet you advanced to the extent of £2,160; that is the fact, is it not, according to your own evidence? It appears to be so.

15947. *Mr. Smith.*] The agreement was to cover future advances besides the £1,360? Yes.

15948. *Mr. Parkes.*] You said in your evidence that the Department kept the most complete check upon the cement that went to various contracts? Yes.

15949. Do they test every parcel of cement that goes to a contract? Yes.

15950. What about the cement which is shifted from one job to another? That is tested.

15951. But how do you know that it is the same cement that is moved? We take care to know.

15952. But how do you find out. Take the Marrickville contract and the Johnstone's Creek contract. Supposing cement is taken from the one job to the other, how do you know that they may not have taken cement which has never been tested? I do not quite understand you. I have already said that if cement is tested upon Contract 69 we know it to be tested. Suppose the cement goes to Contract 77 we know that the tested cement leaving Contract 69 goes to that contract.

15953. Suppose that cement is moved from Johnstone's Creek to Marrickville, is it tested again when it comes on to the Marrickville contract? It is tested at Johnstone's Creek—taking that contract for illustration—and, if the cement goes to the Marrickville contract, it is known when it goes to that contract that it is approved cement.

15954. How do they know that? It does not leave the control of the Department at any time.

15955. Suppose the contractor shifts it? It would be just the same.

15956. But cement may be brought upon one job which has not been taken from another. How would you know that? We should know in this way—the cement which would leave the Johnstone's Creek contract would be branded with the Departmental brand, and marked. In addition to that, apart altogether from the delivery of the cement, the officer at Johnstone's Creek would communicate with the officer at Marrickville the fact that certain cement was going to the Marrickville contract. The communication would be to the effect that so many casks of cement had left the Johnstone's Creek work, and that it had been branded in a certain way on a certain day. That cement would go to Marrickville, and it would be accepted on that certificate.

15957. It would not be shifted without the knowledge of the Department? What I say is that cement, after it is approved, is kept in the hands of the Department until it is used, and if it is not in the hands of the Department during the whole of the time, from its approval until it is put into the work, it is not accepted as approved cement. If it leaves the control of the Department at all it is not accepted as approved cement.

15958. Your tests on Contracts 79, 69, and 79A, according to your test book, and your certificates, amount to 11,740 casks—would that be a proper record? I do not know what you are speaking from.

15959. The list is taken from your record book, and in conjunction with the evidence of Mr. Roberts, who tested

- J. Davis. tested the cement. These documents show that 11,740 casks of cement were tested for these three jobs;—  
 7 Sept., 1896. that would be the full amount? I do not say so. I do not know what you are reading from.
15960. It has been put in in the evidence of Mr. Christie—you will find it upon page 294 of the evidence—you will see there a tally of the certificates signed by Mr. Hickson for the whole of the cement which passed the tests for these three jobs, amounting in all to 11,740 casks;—I suppose your books would be right if they tallied with the sheets of the inspectors' returns? What have the inspector's return sheets to do with it?
15961. These tests of yours will be reliable as to all the cement which went on to these jobs? It will be reliable as far as they go.
15962. You have said in your evidence that nothing wrong can occur because your check is so absolutely complete? That is what I say now. I do not refer to the check by Mr. Christie. I mean the check to which I referred in my evidence.
15963. What is that check? I described it very fully.
15964. In your former evidence you have given a full description of it? Yes.
15965. And you said then that every portion of cement was tested when it went on to a job? I say so now.
15966. So that the test-book is accurate; and according to that the record produced by Mr. Christie is also correct? I say it is not.
15967. Why? Mr. Christie's record is a copy of the certificates as they appear in Mr. Roberts' book.
15968. It is a copy of the certificates issued and checked by Mr. Roberts' book—would that not be correct? No.
15969. Why not? Because they represent the thing only as far as it goes.
15970. How much further can it go? It may go to any extent.
15971. In what way? What I say now is what I said before—that the inspectors' returns made upon these contracts fairly represent the quantity of cement—I do not say to within 5 per cent.—used upon the contracts, let it come from where it may. If Mr. Christie's statement here does not show that quantity then I say that his statement does not go far enough.
15972. But Mr. Christie's statement is not a return from the inspector's reports; it is a return from your certificates and test-books? I understand that; and I say that, although that may be so, it does not go far enough if it does not go as far as the inspectors' returns which you have had.
15973. Supposing the inspectors' returns show that 13,000 casks were delivered on these three jobs, would that be correct? The inspectors' returns would, to within 5 per cent., fairly represent the quantity of cement used; but half a cask of cement is used here, a full cask there, and three-quarters of a cask in another place. They would have to collect all these small bits of cement together, and make out a total. You can easily understand that, in making that up, they might be a little out.
15974. How can you account for a discrepancy of 2,000 casks between the inspectors' returns and the certificates? I do not say that there is a discrepancy. I have not seen any evidence as to the inspectors' returns. (*Vide Appendices Nos. 31, 38, and 55*).
15975. Have you not made up the inspectors' returns? Necessarily I know what the inspectors' returns are.
15976. Do they not amount to 13,000 casks? I do not know.
15977. Did you not give me all the inspectors' returns and books? I believe you have all the information for which you asked.
15978. And if I have gathered the information without any break of date from these books and returns, would it be correct? I should like to hear the evidence given. I should then be better able to answer the question.
15979. Accepting the return as correct, can you tell me how the discrepancy of 2,000 casks would occur, speaking with reference to Contracts 79, 79A, and 69? I think I can account for it in more ways than one. I will take one. At the time work was suspended on Contract 72 there must have been from 3,000 to 4,000 casks of approved cement upon Contract 72. A portion of that cement, from evidence which has been given to this Commission, to the extent of, say, 2,000 casks, was carted from Contract 72 to Contract 79. That would be one way of accounting for it. That may have occurred in the case of other contracts. I know that it was the practice of Carter, Gummow, & Co., and of other contractors, in order to keep their works going, to move approved cement from one contract to another, so that it is difficult to say how much cement would be taken from one contract and how much from another.
15980. The 2,000 casks you have mentioned would make up the discrepancy? I do not say that there is any discrepancy. You are pleased to call it so.
15981. If a discrepancy did exist, that would account for it? I do not know if it would. It might or it might not. You want me to be definite, but I cannot be definite because evidently you have not all the facts before you.
15982. But have you not carefully taken out this very return I am speaking of? Yes, necessarily so.
15983. Therefore you have no excuse for speaking indefinitely? I can speak as definitely as your questions will admit of, and I am endeavouring to do so.
15984. Do not the returns of your inspectors show that 13,000 casks was the number used in connection with these three contracts? I could not tell you without looking the matter up.
15985. Will you produce the returns? I will look up the returns of the quantities actually used in these three contracts.
15986. *His Honor.*] The testing of cement for a contract does not prove conclusively that the cement is used on that contract, as it may pass through one contract to another? Yes; there is another thing which Mr. Parkes leaves out of his calculation in referring to Mr. Christie's statement, and it is this—he tabulates what, I have no doubt, he finds in the test-book as tests made for these particular contracts. He forgets altogether that it is the practice of the Department to pass cement in bond, irrespective of where it is used. The cement is carted from the bonded store to the contract, and in that way would not show in the test-book at all. Suppose 1,000 casks of cement are tested in bond, they would be issued from the bond to a particular contract where they might be required.
15987. How do they appear in the test-book? They do not appear there at all. You might have 10,000 casks tested in bond, and they might be distributed, perhaps, all over the Colony.
15988. Would it not appear in the test-book under some heading? As tested in a certain bond for a certain merchant.
- 15989.

15989. But not relating to any particular contract, on the face of the test-book? No; as I say, it will be possible for 10,000 casks of cement to be sent all over the Colony for different purposes. We test for the Military Department, and for the Mines Department, and for all branches of the Public Works. They will get any cement they require from time to time from some of the large parcels of cement which had passed the test. Any Government contractor, for instance, might go to an agent for a particular brand of cement and buy of him cement which had been passed. J. Davis.  
7 Sept., 1896.

15990. Will you swear that your certificate sheets do not correspond with the certificates that you issued to the contractors? We issue no certificates to the contractors. I am speaking of cement certificates. If a contractor requires a certificate he has to pay for it in the usual way. The agents often ask for certificates. They will often ask for a test to be made and they have to pay for the test and certificate in conformity with the scale of prices approved by the Minister.

15991-2. *His Honor.*] A good deal of cement is passed for merchants before it is actually sold to any contractor? Yes. I will explain the process. Take Parbury, Henty, & Co., perhaps the largest cement importers—at all events they have been in the past. They come to us when they get a cargo of cement, and say, "We have 10,000 casks of such and such a brand of cement in bond. We propose to use 5,000 casks on public works." We say, "Very well; we will test it." We send down a man and take samples. They hand to us, as a matter of good faith, the bond certificate. We hold this bond certificate. If the cement is in a store we put our own lock on the store, and we retain possession of the cement until the tests are completed. When the tests are completed we say we will accept or reject the cement, as the case may be. If we reject the cement we hand back to the merchants their bond certificates for them to do what they please with, and from that time we have nothing to do with the cement. If we approve of the cement the bond certificate is handed to our storeman, and he attends from time to time at the bond and brands the cement as it leaves. We issue with the cement a delivery note to the officer to whom the cement is going, and by that means we keep control over it from the time samples are taken until it is in the work.

15993. The casks are not branded until they go out? No; we could not brand them before we have approved of the cement, and we could not brand them afterwards until they are leaving the bond, because they are all piled one on the top of another.

15994. You have no opportunity of handling each individual cask until they are handled on leaving the bond? No.

15995. *Mr. Parkes.*] Here are certificates, which have been found in the portfolios of the various contracts, which correspond with the contents of Mr. Roberts' book; I will ask you to read that application to the office? Yes. "Sample of cement to be tested has been forwarded to you; brand, Red Cross; manufactured by Wouldham Cement Co., London, and selected by Messrs. Carter & Co. from a parcel of fifty casks, to be used on Contract 79 by Messrs. Carter & Co., contractors.—(Sd.) J. W. T. BOYS, Officer Superintending Contract." In that case it should not be cement selected by Messrs. Carter & Co., but cement selected by Inspector Lougheed.

15996. Will you read the heading on this certificate? Yes. "Sample of Portland cement selected by a Government officer on 2nd April, 1894, at Contract 79 from a shipment of fifty casks manufactured by the Wouldham Cement Co.; brand, Red Cross; contractors, Carter & Co." (*Vide Appendix No. 38*).

15997. The other certificates I hand you also apply to cement going to Contract 79? They appear to be certificates in respect of cement which was stored on Contract 79.

15998. The certificates I now hand you are for parcels of cement stored on Contract 69? Yes; in so far as they relate to cement.

15999. Do they relate to anything but cement? Yes.

16000. They are all signed by Mr. Hickson, and countersigned by yourself? One is signed by Mr. Bagge, one is not signed, and the rest are signed by Mr. Hickson.

16001. There is no doubt that if they correspond with the purchases from the merchants and the deliveries they must be correct? If what correspond?

16002. If these certificates of test upon the ground correspond with the deliveries of the purchases of cement from the merchants by Carter & Co., they must be correct? The certificates themselves are correct enough.

16003. Is it not the fact that in your certificate book you mark every item of cement to whatever contract it is going? I have already said that we do not.

16004. Then why do you put at the head of your certificates 500 bags, 180 bags, 620 casks, and so on? At the time the sample is taken those quantities would be where the certificates say they are, but beyond that the certificates do not go. After the cement is approved it may be used in one place or it may be used in another.

16005. No perfect check could be kept then? There is an absolutely perfect check, and the proper quantity of cement, moreover, has been used in the work.

16006. The perfect check to which you refer is contained in the returns of the inspectors? That is one of the checks. That would be a check as far as it goes; but there are a number of checks.

16007. What other checks are there? There is the measurement of the concrete.

16008. How do you make up those measurements;—what is your standard measurement? It varies—there is no standard. There are two or three things to be taken into consideration in coming to a conclusion as to the quantity of cement that should be used in any particular concrete work.

16009. But you have a standard have you not? No; it would be utterly foolish to attempt such a thing.

16010. Then how can you rely upon your measurements? You must take the circumstances into consideration before you can say what quantity of cement would be used in any particular work. The question of the dryness or otherwise of the concrete, for instance, makes a difference of, perhaps, 7 per cent. Then there is the position of the concrete to be considered. In some cases it has to be put in vertically, and in other cases horizontally. Everyone who has had to do with concrete also knows that you can make as much as 10 and 15 per cent. of difference in the ramming; then the smallness and the shape, generally, of the stones has to be taken into consideration, so that for anyone to say that you can have one standard, and make it apply to any piece of concrete work, is simply folly.

16011. Have you the particulars as to how you made up the cost of the Monier work in Contract 77? I have some notes here. I have taken the cost of the material by itself. I have taken the cost of the labour, the cost of the timber, ironwork, supervision, and plant, and I have added 10 per cent. for profit. I have left out of the question what might be fairly allowed for guarantee, or patent rights.

J. Davis. 16012. Will you read the particulars? Yes. They are as follow:—  
7 Sept., 1896.

## JOHNSTONE'S AND WHITE'S CREEKS AQUEDUCTS.

Estimate of cost per cubic yard of Monier Structures.

|  |   | £     | s. | d. |
|--|---|-------|----|----|
| 1. <i>Cost of Labor.</i>                         |   |       |    |    |
| Labor in building                                | 17 spans of aqueduct, at 63/16/- per span .....                       | 1,084 | 12 | 0  |
| "  | " 42 small end arches, at 3/4/- .....                                 | 134   | 8  | 0  |
| "  | " 574 lin. feet of carrier at ends, at 19/15/- per 82 ft. 10 in. .... | 136   | 17 | 2  |
| Estimated cost of labour in both aqueducts ..... |   | 1,355 | 17 | 2  |

Cost of labor per cubic yard would then be  $\frac{£1,355 \text{ 17s. 2d.}}{1,533 \text{ cubic yards}} = 17/8.$

2. *Cost of timbering, including labor in making, ironwork, &c.*

|   |  | s.     | d. |
|---|--|--------|----|
| Timber in ribs of main centering, &c., 13,248 superficial feet, at 29/- ..... |  | 3,842  | 0  |
| " trestles, &c., 25,776 superficial feet, at 12/- .....                       |  | 3,093  | 6  |
| " lagging, boxing, &c., 30,100 superficial feet, at 14/- .....                |  | 4,214  | 0  |
| Estimated value of requisite timber .....                                     |  | 11,149 | 6  |

Cost of timber per cubic yard would then be  $\frac{11,149\text{s.}}{1,533 \text{ cubic yards}} = 7/3.$

3. *Cost of supervision.*

Assuming that the aqueducts will take twelve months to build, and allowing £300 per annum for supervision of an engineer, the cost of supervision per cubic yard would then be  $\frac{6,000\text{s.}}{1,533 \text{ cubic yards}} = 3/11.$

4. *Cost of iron grilling.*

40½ tons of rod iron from ¼-in. to ¾-in. diameter at £11 .....

8,910 0

Cost of grilling per cubic yard would then be  $\frac{8,910\text{s.}}{1,533 \text{ cubic yards}} = 5/9\frac{3}{4}.$

8. *Cost of material in compo.*

Given 12 cubic feet of sand, and 1 cask of cement—in place 13½ cubic feet.

Sand costs 7s. 6d. per cubic yard on works ∴ 12 cubic feet costs .....

3 4

1 cask of cement costs on works .....

11 9

Cost of 13½ cubic feet .....

15 1

∴ 27 cubic feet of material in place would be .....

30 2

6. *Cost of bluestone concrete material.*

Given 10 cubic ft. stone, 6 cubic ft. sand, and 1 cask cement, equal in place 15 cubic feet.  
Blue metal costs on wharf 6/10 per ton.

Taking weight of bluestone at 170 lb. per cubic foot, and assuming 30 per cent. of void in bulk, 1 ton of metal would measure, say, 18.5 cubic ft., ∴ 27 cubic ft. would cost .....

£ s. d.

0 10 0

Carting to site of works .....

0 2 6

Cost of metal per cubic yard .....

0 12 6

If 27 cubic feet costs 12/6, 10 cubic ft. would cost .....

0 4 7½

6 cubic feet of sand, at 7/6 per cubic yard .....

0 1 8

1 cask cement .....

0 11 9

Cost of 15 cubic feet of material .....

0 18 0½

∴ cost of 27 cubic feet of material in place would be 32/5½.

7. *Average cost of cement structure per cubic yard.*

In the 2 aqueducts there are 358 cubic yards compo., at 30/2 .....

539 19 8

" " 1,175 " concrete, at 32/5½ .....

1,906 18 6

Cost of material in compo. and concrete .....

2,446 18 2

Cost per cubic yard would then be  $\frac{£2,446 \text{ 18s. 2d.}}{1,533 \text{ cubic yards}} = 31/11.$

8. *Cost of plant, &c.*

|  |      |    |    |
|--|------|----|----|
| Half value of two sheds, estimated at £100 .....                         | 50   | 0  | 0  |
| " office, " £100 .....   | 50   | 0  | 0  |
| " tools, " £20 .....   | 10   | 0  | 0  |
| Value of barrows worn out on work .....                                  | 15   | 0  | 0  |
| Service of watchman for 52 weeks at 36s. ....                            | 93   | 12 | 0  |
| Half value of 200 lin. ft. of water-pipe at 5d. per ft. ....             | 20   | 16 | 0  |
| Cost of water, at 1½d. per cubic yard of structure, = 1,533 at 1½d. .... | 9    | 11 | 7½ |
|  | £249 | 0  | 3½ |

Cost of plant per cubic yard would then be  $\frac{£249 \text{ 0s. 3½d.}}{1,533 \text{ cubic yards}} = 3/3.$

Summary.

J. Davis.  
7 Sept., 1896.

| <i>Summary.</i>   |  | £  | s. | d.              |
|---|--|----|----|-----------------|
| Estimated cost of material in compo. and concrete per cubic yard (see item 7) ..... |  | 1  | 11 | 11              |
| „ labour per cubic yard (see item 1) .....  |  | 0  | 17 | 8               |
| „ timber „ (see item 2) .....   |  | 0  | 7  | 3               |
| „ ironwork „ (see item 4) .....   |  | 0  | 5  | 9 $\frac{3}{4}$ |
| „ supervision „ (see item 3) .....  |  | 0  | 3  | 11              |
| „ plant, &c. „ (see item 8) .....   |  | 0  | 3  | 3               |
|   |  | £3 | 9  | 9 $\frac{3}{4}$ |
| Add 10 per cent. for profit .....   |  | 0  | 7  | 0               |
|   |  | £3 | 16 | 9 $\frac{3}{4}$ |
| Estimated total cost per cubic yard .....   |  | £3 | 16 | 10              |
| Say .....   |  | £3 | 16 | 10              |

16013. In the memorandum you read the other day dealing with this matter, you put down as your second item: "Ironwork, excluding grill, 18·2 tons, at £20"; is not that an enormous price? No.

16014. Where is that ironwork? It is the channel iron and the tie bars.

16015. Is that all? There is the grilling, the fitting, and all the rest of it. I think I have allowed the usual price for that kind of work.

16016. Does that amount include the iron which goes over the expansion joints? No.

16017. Then the iron in the expansion joints appears in item No. 3 in your memorandum No. 5? Yes.

16018. What do the expansion joints include? The bolts and the fitting in connection with them.

16019. And the mastic? The whole joint.

16020. Why did you take off 28 $\frac{1}{2}$  per cent. from these three items—bluestone concrete in piers, sandstone concrete in piers, and cement facings, 2 to 1? Because I regard the schedule rates as being the value of the work arrived at in open competition, and I say that you cannot get nearer to the value of the work than that.

16021. Take the item of 12,190 cubic feet of freestone ashlar at 3s. 6d.; you could not afford to take 28 $\frac{1}{2}$  per cent. off that price? The contractors undertook to do the work for 28 $\frac{1}{2}$  per cent. below that rate, and M'Sweeney and the other contractors backed them up, so that they must be right.

16022. The difference between Mr. Gilliver's schedule and the schedule of this contract in the items for excavation is excessive? You must take every contract by itself. There were circumstances in connection with No. 77 which did not occur in the next contract, No 117. There were circumstances, on the other hand, in No 117 which did not occur in No. 77. To arrive at one price for the whole of the excavation in the two works, because they happen to adjoin, would be folly.

16023. But they go through the same country;—the same sort of sandstone occurs in Contract 77 that occurs in Contract 117? Not necessarily.

16024. It is the same sandstone exactly, is it not, through both contracts? It is sandstone, but sandstone varies. In one case the excavation is put down at 28s., and in the other case at 60s., 57s. 6d., and 65s.

16025. Those are excessive prices, are they not? I think that if you take the two contracts, and deduct the percentage which appears in each case from the schedule rates, you will get at the relative value of the two works.

16026. But, as a matter of fact, 3s. 6d. for the ashlar is a very fair price, without taking 28 $\frac{1}{2}$  per cent. off? The office thought that 3s. 6d. was a fair price. That was Mr. Bagge's idea of the value of the work. The contractors disagreed with him to the extent of 28 $\frac{1}{2}$  per cent, Mr. M'Sweeney to the extent of 25 $\frac{1}{2}$  per cent, and so on, until you arrive at some contractors who did agree with him.

16027. The contractors do not take 28 $\frac{1}{2}$  per cent. off each item when they are drawing up their schedules—for instance, they take 20 per cent. off one item, 50 per cent. off another, and then strike a balance? I do not know what they do; it may be so.

16028. But do you not know that that is so, as a matter of fact? I have nothing to do with the contractors in that way.

16029. Coming to your memorandum No. 6, you have made a calculation in connection with Contract 79 as to the difference between guttering and gadding and blasting, as if there were an intention to do either guttering and gadding or blasting right through the contract,—have you not? I have made a calculation on the facts.

16030. But you have made it on the assumption that you were going to do the whole of the work, either by guttering and gadding, or blasting? That would be the case. My original proposal was to do the whole of the tunneling by means of guttering and gadding. We should have done the whole of the tunneling ordinarily with 4-in. charges.

16031. But the calculation you have made is that you might do the whole of the work either by guttering and gadding or by blasting? I have based the statement in my memorandum No. 6 on my minute relating to that matter.

16032. Lower down in your memorandum you say "When the whole of the work was finished, including the small extension at Ernest-street, which cost £1,220, another at the outfall, Long Bay, and some work in connection with the reticulation at Maclean-street, the total cost of the contract amounted to £40,023 10s. 3d. The amount of the tender for Contract 79 alone was £39,890. It will, therefore, be seen that there was a considerable saving upon the contract." What amount was there which was charged to Long Bay? The papers show that it was a small matter at the outlet. You will see, I think, that the amount was £120.

16033. Then how much was charged to Maclean-street? I do not think I could tell you that. It was a manhole, a short drive, and a short piece of reticulation. It was to make facilities for connecting the reticulation with the deeper shaft at that point—that is at the foot of Maclean-street, in Alfred-street. In Alfred-street there is a high and low level road, the reticulation had to be brought down from the high level to the low level, where the shaft in the main sewer was.

16034. How much would that cost roughly? I do not know: Perhaps as much as £150. It may have been £200, but I do not quite know the amount.

16035. Why are these amounts charged to a large contract like No. 79? Because they had to be done in connection with the contract.

J. Davis.  
7 Sept., 1896.

16036. *Mr. Smith.*] I think that when you were examined this morning in reference to this minute of Mr. Hickson's, upon page 125 of the Parliamentary Return, as to Contract 69, you said you had no doubt that the interview with the contractors had taken place before that minute was written and after the writing of your own minute? Yes.

16037. I think you said you had no doubt that Mr. Hickson wrote his minute on the spot as it were, just after seeing the contractors, and that that was his custom in dealing with such matters? Yes.

16038. If you look at the minute you will see that Mr. Hickson expresses himself in this way, "We cannot in fairness omit an item for which no doubt the price is absurdly high," &c.? Yes.

16039. Seeing that, do you not think it likely that he said as much at all events to the contractors? Yes, I am sure of that. But when I was asked the question by His Honor I stated what was practically the case. He did mention to me at the time the absurdly high price. He said that the time to complain of it, however, had passed, and that what we then had to do was to deal with the facts as they stood.

16040. On Friday last you were examined as to the preparation of the papers for Parliament, and something was then said about your exercising your discretion. I suppose that what you mean is that you understood that you were to substantially comply with the requirements of Parliament, but that you were to exercise a reasonable discretion in the selection of the papers? Yes.

16041. That is the usual practice? Yes.

16042. In the exercise of that reasonable discretion you did not consider that plans were papers within the meaning of the order? No; I have already pointed that out. At the beginning of my evidence to-day I said that Mr. Young said as much in Parliament.

16043. Mr. Young was of the same opinion himself, and pointed it out to the House? Yes.

16044. In fact I think the complaint of Mr. Parkes, among other things, was that too much matter had been printed? He seemed to think that we had not exercised our discretion sufficiently.

16045. With regard to the payments upon Contract 72, you were asked on Friday last where the money came from to make up the amount of £17,000 represented by the vouchers of January and February, 1892. You said in reply to question 15751, that you would have to look up the vouchers before you could say where all the payments referred to by Mr. Parkes came from. There can be no doubt, I suppose, but that they were all passed by the Auditor-General? They were all passed by the Auditor-General, and if you take my answer to Mr. Parkes' question 15756 you will see that it appears to have been given after he had handed to me the vouchers. I then said that the amount was paid from two votes, viz., £15,500 and £8,500, those two votes being for the work in question.

16046. But all the payments were passed by the Auditor-General? Certainly.

16047. At question 15806, reference is made to two clauses of the specification, one being the 5th section of clause 4, and the other special clause 3? Yes.

16048. As to the first one it is a general clause dealing with the omission of works? Yes.

16049. The other one deals, as it appears, with the suspension of a particular part of the work? The suspension or omission of the 13 and 27 chains of the lower portion of the channel.

16050. With the suspension or omission of that particular portion? Yes.

16051. You said in reply to question 15809, as to whether there was any chance of a man signing that contract having any claim, that there would be no chance whatever if the clause were put into operation with regard to the 13 and 27 chains? Yes.

16052. But the doubt was, although there were general words in the clause, whether it would enable you to stop other portions of the work? Quite so. Inasmuch as it was necessary in the opinion of the Department to specifically mention the 13 and 27 chains, it was admitted that the general clause would not be sufficient to eliminate a matter of perhaps 20 to 30 chains of the upper portion of the sewer.

16053. So that, although Mr. Hickson gave notice to the contractors of his intention to suspend or stop the portion of the work included in that clause, the Department felt they were not on sure ground at all? No; admittedly so, from the wording of the third clause of the specification.

16054. In answer to that clause put forward by Mr. Hickson and the statement that he could take action under that clause, you had the contractors' answer after taking the opinion of Mr. B. C. Simpson? Yes.

16055. You considered when you had that answer that you were not at all on safe ground in relying on that clause only? Yes.

16056. And for that reason you came to the conclusion that there was a claim which might be substantiated if it went to law? Yes, certainly; it is not the practice of the Department to rely upon that general clause in the cutting out of any large portion of the contract.

16057. *Mr. Gummow.*] As to the bluestone pitchers out at Marrickville, what was the quantity which you say was shown on the plans to be paid for? 32 square yards.

16058. How many were paid for? 35 square yards.

16059. A difference of 3 yards? Yes.

16060. Were you not satisfied that there were 35 square yards shown on the plan? No; only 32 were shown on the plans as they originally left the office.

16061. I mean on any plans that were sent in from the office—I do not mean the original signed plans? I am speaking of the signed plans. It was those plans upon which Mr. Hickson wrote his minute.

16062. But if the Department afterwards sent out plans showing a certain number of bluestone pitchers would not that go to show that that work was required to be done? I am not aware that such plans were sent out.

16063. But if they were, would it not show that the work was to be done? I am not aware that the plans were sent.

16064. You are satisfied in your own mind that only 32 square yards were shown on the plan? I am. I looked the matter up at the time, because it is an important question. I had looked it up since the Commission has been sitting, and I still say that when Mr. Hickson gave his decision the whole of the manhole covers were not shown to be fixed.

16065. In considering this question with Mr. Hickson, did you go into the price which the contractors had for timber? Yes. He said that, while this particular price was absurdly high, there were others equally low or at any rate very low.

16066. Do you know that, on any contracts let by the Sewerage Department, advances had been made on plant and material? Advances were made on material in all contracts where the contractors make application and where the Department could reasonably meet them.

16067.

16067. I am referring now to the Bondi and to the Double Bay and Rushcutter Bay contracts;—was any advance made on plant and material in those cases? Yes, on both.
16068. Was that plant and material necessarily on Government ground when the advances were made? Every care was taken in those days that, unless the contractors handed in a lease of private ground to the Department, the plant and material were on Government ground.
16069. Was any greater care taken then than has been taken latterly as regards advances on materials? No; when we advance now, the utmost care is taken to see that there is proper control over the stuff, whether it be plant or material.
16070. Who was the Engineer-in-Chief at the time that these former advances were made? Mr. Bennett.
16071. *Mr. Parkes.*] In connection with Contract 72, the claim that Carter, Gummow, & Co. put in was not for suspension, but was for loss, by withdrawal of the contract? I said on Friday that to begin with it was an omission, and it then resolved itself into a suspension, because the work was gone on with. Notice was given to Carter, Gummow, & Co. that a certain portion of the contract would be omitted.
16072. But they claimed on certain items for withdrawal? Yes.
16073. The items were—Rent of Knight's paddock, £10; sandstone for concrete, broken and stacked, £400; Portland cement, £958 15s.; loss on sale of Portland cement, £250; gratings, £87 10s.; manhole covers, £30; interest on expenditure, £64 4s. 6d.; valuation of plant on ground for completion of contract, £500; loss of profit on work withdrawn, £1,750;—is there one item there that did not disappear when the contract was continued? I would say this, that the claim would have to be put in a different form, supposing a claim to have been made. That claim was made on the supposition that the portion of the contract referred to in Mr. Hickson's letter of October was to be omitted. If Messrs. Carter & Co. had made a claim for suspension, they must have based their claim on totally different grounds, and therefore there would be different details.
16074. Where is their claim for suspension? There is no claim; there is nothing except the broad fact that they would have had a claim under the general conditions for the six months' suspension.
16075. You say that the channel that was cut down, Shea's Creek, was in the original contract? I say that it was shown on the original contract drawings.
16076. And did you take off a certain amount so as to prevent the work from going to the Public Works Committee? I have already stated what I know about that; I did nothing of the kind.
16077. But was that not done? What I say is, that Mr. Bruce Smith, the Secretary for Public Works at the time, ruled that the contract was to be reduced to the extent of £3,000, seeing that the tender amounted to £20,640 at schedule rates.

J. Davis.

7 Sept., 1896.

Charles Clymer sworn and examined:—

16078. *Mr. Davis.*] What is your position? I am inspector in the Sewerage Department.
16079. How long have you been in the Department? Over six years.
16080. What was the first job you went upon after joining the Department? The first job I went upon was the Alexandria Park stormwater sewer.
16081. Were you on that contract from the beginning to the end of it? Yes.
16082. Did you see all the concrete mixed? Yes.
16083. Did you see all the cement brought on to the ground? Yes.
16084. Can you say whether the whole of the cement brought on to the ground and put into the work was approved cement? Yes; no other cement was put in. I was notified of all the cement as it passed, and I know that it was used in the work.
16085. You saw every gauging of concrete mixed? Yes.
16086. Can you swear positively that the specified quantity of cement was used upon the work? Yes.
16087. Coming to the question of the thickness of concrete, you have seen the contract drawings? Yes; I had them before me for my guidance.
16088. You had also a copy of the specification? Yes.
16089. Did you see that the thickness of bluestone concrete shown upon the contract drawing was put in in every instance? Yes; I saw it all put in. I was very careful of that. I believe that the whole of the 9 inches was put in. We went as near as we could get. There may have been 8½ inches in some cases, but then in other cases there would be 10 inches. The average was fully 9 inches. I do not think that in any instance there can have been much less than 9 inches, and in many cases I am satisfied that there was more.
16090. What kind of bottom was it? It was a very bad bottom. As nearly as I can remember, at the distance of from 2 to 3 chains from the outfall it was all slurry, and from there to where the work joined the old Corporation sewer there was very good clean sand.
16091. The lower end of the channel being in very bad ground it is probable that the concrete there would sink into the ground to some extent before it got its proper bearing? Yes; it is highly probable that it would sink an inch or 2 inches in the ground. We had to be very careful in putting down the concrete there. We had boards for the men to stand upon when they were putting the concrete on the soft ground; but in spite of all the precautions we took, I have no doubt that a good deal of it would sink into the soft bottom.
16092. You are prepared to say that the contract, to the best of your knowledge, was carried out in accordance with the contract drawings, and the specification attached to the contract? Yes.
16093. Coming now to the question of cement returns, will you explain to His Honor what your practice is in making returns of the quantities of cement that are issued daily upon any contract of which you have had charge? The practice is to return the number of casks of cement issued during the day. In order to arrive at that, we usually take the number of casks brought down by the drays on to the board. These are counted up, and if any are left they are subtracted from the total. The balance is given as the quantity used during the day. This return is made as nearly correct as we can possibly get it. I do not know of any other way which would be more accurate.
16094. Have you compared the quantity which you know to have been in store in the shed with the quantity that you issued from day to day, deducting the latter from the former, and in that way checking yourself?

C. Clymer.

7 Sept., 1896.

- C. Clymer. yourself? It is a usual thing to have that done once a month, but I used to do it continually for my own information. I used to go over the thing, and arrive at an approximate idea of the quantity of cement in the shed. Once a month we had to show the resident engineer, when he was making up his certificate, exactly what had been done during the month, that is to say, exactly how many casks had come on to the work, how many had been used, and what the balance was.
- 7 Sept., 1896. 16095. So that the returns you make to the head office from time to time—now daily, but formerly weekly, and then again daily—are fairly accurate;—they represent generally the quantity of cement used in the work? Yes.
16096. You have no difficulty in swearing to that? Not the slightest.
16097. While your returns are not precise to a few casks, still they fairly represent the quantity of cement used in the work? They fairly represent that. It is possible that a mistake of from one to half a dozen casks may be made, but there would be no considerable error.
16098. Recently you have been in charge of Contract 77? Yes. I have been in charge of the aqueduct from the date of its commencement up to the present time.
16099. You had charge of the sandstone concrete in the piers? Yes; everything in connection with that.
16100. And of the concrete on the top of the piers? Yes.
16101. And also the Monier structure? Yes.
16102. What have you to say as to the quality of the sandstone concrete in the piers? It is the usual thing—5, 2, and 1.
16103. What about the quality of the stone? I consider that it is first-class.
16104. How many years experience have you had of freestone from the vicinity of Balmain? About thirty years, I suppose.
16105. And you would say, upon the strength of that experience, that you know good stone from bad stone? Yes. I do not think there is any kind of building material in regard to which I could not say whether it was good or bad.
16106. Would you say that the stone used in the sandstone concrete upon No. 77 was good sandstone, and that it complied with the specification attached to the contract? Yes; I consider that it would fully comply with the specification. The stone which we got out of the tunnelling would more than comply with it.
16107. What sand is being used on Contract 77? We are getting sand from two places at North Sydney—from Neutral Bay quarry and from the Gas Works quarry.
16108. That sand you know has been tested? A good many times.
16109. Quite apart from the testing of it, as an old builder who knows something about sand, what is your opinion of this sand compared with the Nepean sand? I should prefer it to the Nepean sand for some purposes. My experience of the Nepean sand is that for tensile strength it does not come up to good crushed sandstone. The Nepean sand is principally waterworn. The particles are round, and I consider that a round body mixed with cement will not give you the same bond which you would get from a body with sharp corners, say a hexagon or octagon shape. I consider that sand of that description would be much better in tensile strength than Nepean sand.
16110. Do you consider that the sand which has been used on Contract 77 has been clean—that it has been free from foreign matter? Yes.
16111. You have been upon Contract 77 from its commencement up to the present time? Yes.
16112. You have seen every centre erected? Yes.
16113. And you have seen the centres taken down? Yes.
16114. You have seen the grilling put in position? Yes.
16115. And you have seen the compo. or concrete, as the case might be, put in position? Yes.
16116. You have kept the time that has been put in upon these different kinds of work? Yes.
16117. Will you tell His Honor, calculating that a labourer would receive 7s. a day and a foreman from 9s. to 13s., or whatever it may be, what the cost of a length of the structure has been, taking a length, for instance, from the centre of one pier to the centre of the next pier—82 ft. 10 in.? Yes. I made a few notes as to that. They are as follows:—

ESTIMATED COST of labour in one complete span of 82-ft. 10-in. arch, Monier design.

|   | £   | s. | d. |
|---|-----|----|----|
| <i>1. Concrete and Compo.</i>   |     |    |    |
| To place compo. in main arch takes 11 men at 7s. and 1 man at 9s., a day .....                | 4   | 6  | 0  |
| To place concrete in spandrel arches, and piers, 11 men at 7s., 1 man at 9s., 2½ days ..      | 10  | 15 | 0  |
| To place concrete in main carrier, 11 men at 7s. and 3 men at 9s. per day, 1 day.....         | 5   | 4  | 0  |
| To place concrete in cover-plates, main arch (28), 4 men at 7s., 1 day .....                  | 1   | 8  | 0  |
| <i>2. Ironwork.</i>   |     |    |    |
| To fix grilling in main arch takes 6 men at 7s., 1 man at 10s., and 1 man at 12s., 1 day...   | 3   | 4  | 0  |
| To fix grilling in jack arches, 3 men at 7s. per day, 2 days.....                             | 2   | 2  | 0  |
| To fix grilling in main carrier, 4 men at 7s. per day, 2 days .....                           | 2   | 16 | 0  |
| <i>3. Timber.</i>   |     |    |    |
| To fix spandrel piers, boxes, and arch centerings, &c., 2 men at 9s. and 2 men at 7s., 4 days | 6   | 8  | 0  |
| To fix main carrier casings, 2 men at 9s., 1 man at 7s., 1 week.....                          | 8   | 15 | 0  |
| To remove the above, 1 man at 9s. and 1 man at 7s., 2 days.....                               | 1   | 12 | 0  |
| To fix main arch trestles, 12 men at 7s. and 1 at 9s., 1 day .....                            | 4   | 13 | 0  |
| To fix main arch laggings, 12 men at 7s. and 1 at 9s., 1 day .....                            | 4   | 13 | 0  |
| To fix main arch side boxing, 2 men at 9s., 1 man at 7s., 1 day .....                         | 1   | 5  | 0  |
| Taking down large centerings, 12 men at 7s., 1 at 9s., 1 day.....                             | 4   | 13 | 0  |
| Carrying odds and ends to next bay, 2 men at 7s., 1 day .....                                 | 0   | 14 | 0  |
| To erecting and removing scaffolding, 4 men at 7s. per day, 1 day .....                       | 1   | 8  | 0  |
|   | £63 | 16 | 0  |

CHAS. CLYMER, Inspector, Contract 77.

Small

C. Clymer.  
7 Sept., 1896

| <i>Small arches at ends of aqueduct.</i>                  |       | £ s. d. |
|---|-------|---------|
| To place concrete in six spandril arches (as before)..... |       | 10 15 0 |
| To fix grilling in six spandril arches (as before) .....  |       | 2 2 0   |
| To fix timber in six spandril arches (as before) .....    |       | 6 8 0   |
|   |       | -----   |
| Labour in six small arches .....                          |       | £19 5 0 |
| Labour in one small arch .....                            | (say) | £3 4 0  |

| <i>Labour in 82 ft. 10 in. lineal feet of carrier.</i>    |  | £ s. d.  |
|---|--|----------|
| To place concrete in one span of carrier (as before)..... |  | 5 4 0    |
| To place concrete in cover plate (as before) .....        |  | 1 8 0    |
| To fix grilling in carrier—one span (as before).....      |  | 2 16 0   |
| To fix timber for carrier boxing (as before) .....        |  | 8 15 0   |
| To removing timber boxing (as before) .....               |  | 1 12 0   |
|   |  | -----    |
| Labour in carrier per 82 ft. 10 in.....                   |  | £19 15 0 |

CHAS. CLYMER, Inspector, Contract 77.

16118. Take the work at the end of the aqueducts—the forty-two small end arches—what do you say has been the cost of the labour per arch? The labour in one arch would be equal to £3 4s.

16119. Then taking the carrier over the arches—what has been the cost of that as regards labour, taking the length of 82 ft. 10 in.? Nineteen pounds fifteen shillings.

16120. You are quite sure about the return? I am quite sure of it. I take a lot of notice of things of this sort. I am an old contractor, and I like to have the information for my own use. I may one day become a contractor again. I have made a number of notes from which I have taken out these figures. I have taken particular care, as it happens, in obtaining the information, although I did not expect to be called upon to give it to the Commission. I think the statements I have made as to the value of the labour are pretty accurate.

16121. Did you use any bag cement upon Contract 77? No.

16122. Do you know whether any bag cement was used upon Contract 118? Yes; I believe it was.

16123. Do you know of anything which occurred in connection with the bag cement on Contract 118? I only know this: that on one occasion Mr. Forrest asked me to let him have a few casks from off my job, as some of his bags in the shed were burst, and it was a difficult matter to carry the burst bags down to the board without wasting the cement. It is an understood thing that we have to see the casks destroyed, but I said that under the circumstances I had no objection to his taking a few casks into which to empty the contents of the burst bags, so that the cement might be carried to the concrete board without waste.

16124–25. The casks which you allowed to be taken up to the cement-shed were as far as you know used in that way? Yes. There were two lots of bag cement there—one which did not pass the required test and the other which did. The bags which they were using had passed the test. A good part of the other cement is in the shed now. Some of the bags of that cement were also broken, and they got a few casks to send some of it away to Sydney,—to the Post Office tunnel work I understood.

16126. *His Honor.*] They got a few casks into which to put some broken bags? Yes.

16127. *Mr. Parkes.*] Did Mr. Davis ask you to come here to give evidence? No.

16128. Did you come of your own free will? Yes.

16129. You had no communication with him before you came here? Yes.

16130. How did you come to have it? He sent out a messenger to say that I was to be examined here, and that I was to be prepared to report fully upon the whole of the work.

16131. Did you send him a report as to what your evidence would be? No. I was summoned on Friday last, and I was talking to Mr. Adams.

16132. Is Mr. Adams making up any calculations? I do not know.

16133. Did you give him your particulars? No.

16134. Did you give him any particulars? I gave him some particulars on the job. He helped me to measure some of the timber in order to check my estimates.

16135. You, some time ago, told Mr. Davis about the casks which you gave to Contractor Forrest into which to put the bags of cement? Yes. I was called upon to report about it. I did not tell Mr. Davis personally; I had to send in a report about the matter, because I had no business in the ordinary way to give the casks. Ordinarily, the casks are supposed to be destroyed.

16136. Were you threatened at all? No. But it is provided in the specifications that the inspector-in-charge shall see that all the casks are destroyed.

16137. You have spoken of there being bad cement upon Contract 118. On 20th September, 1895, Mr. Roberts, the cement tester for the Department, tested 700 bags. He afterwards tested 1,360 bags, which were condemned; and we then come from the 20th September, 1895, to the 12th February, 1896, when there were 500 casks of cement purchased for that job. Between that time there were 2,000 casks of cement sent on to the job? Very likely.

16138. Where was the bag cement? In the shed.

16139. Were not the 700 bags used between the 20th September, 1895, and the 27th September, 1895? Really, I could not tell you.

16140. You are sure it was not used? I could not tell you.

16141. Where do the 1,360 bags come in? That I could not tell you. I am not sure.

16142. Then you do not know, after all, whether there was passed or rejected cement in the shed? Of course I know, by seeing it there. There is a large portion of rejected cement there now.

16143. Where is this passed cement? It has been used, I suppose.

16144. Where was it used? I could not tell you.

16145. It would be used immediately after it was obtained, would it not? I could not say that; I do not think so. You might go on with a bit of concreting perhaps for a week, or perhaps for a day.

16146. Do you recollect 2,000 casks coming in? I have no idea as to that. I was upon Contract 77. Another inspector was in charge of No. 118. The cement for Contracts 77 and 118 was all stacked in the same shed, so that I had not absolute control over the whole of the cement which was in the shed.

16147. What was the name of the other inspector? Lockhead.

16148.

- C. Clymer.  
7 Sept., 1896.
16148. Would he have more control than you had? He would have more control than I had as regards Contract 118. I had nothing to do with Contract 118.
16149. Then you do not know whether condemned or passed cement went into that work? I have some idea, because I was going backwards and forwards continually, and one does not go about with one's eyes shut.
16150. Is the bag cement marked to show that it has been passed? No; you cannot mark bag cement. Cask cement, of course, will have the brand upon it. Most of the cask cement is branded before it comes on to the job.
16151. Why do you say "most";—does any come on to the job without the Government brand? Yes; there are 600 casks on the job now with no brand upon them.
16152. Why is it not branded? Because in a case of that kind I have to open two casks in every 100. Three samples are taken out of each cask; these are sent in to the office to be tested; if they pass the test required by the department I am notified. I am notified that it can be used upon the contract. It comes to the same thing.
16153. *Mr. Davis.*] You do not brand cement which is passed on the job? No.
16154. That is never branded? No.
16155. It is only that which is passed in warehouses or in bond that is branded? That is all.
16156. Do all the inspectors follow the same course that you do in sending in returns? Yes.
16157. When cement comes on to the job branded, from bond or a warehouse, do you send a return into the Department as to the quantity of cement you have there? Yes; the delivery notes for the cement are made up in triplicate. The man who does the branding has a book, and he fills in three delivery notes. Supposing twenty-five casks were going out to a job of Carter & Co.'s at Leichhardt, or wherever it may be, two of the delivery notes come on to the job; the contractor holds one, and I hold the other. The Resident Engineer would require me not only to note in my report that I had received the casks on a certain day, but he requires me at the end of the week to give him the delivery note, so that I am thoroughly checked in that way. That is the system adopted when any cement comes on to the ground ready branded.
16158. So there is no doubt about your returns being correct? I do not think so.
16159. *His Honor.*] Do you remember a man named Thomas Wright working on Contract 61? Yes.
16160. Do you know the man well? I cannot say that I did. He was not there constantly. He was there only a day or a day and a half at a time when he happened to be wanted.
16161. What was his work? He was a carpenter. The principal work he did was towards the outfall of the sewer. He fixed a few sets of ribs for perhaps 40 or 50 feet of sewer. He got these ready, and in the case of the last two lengths I asked him to nail the lagging on them, because I wanted to make a nice job of the barrel sewer. That would be the longest period he would be there at one time; and I suppose that would be about two days.
16162. Was he in the sewer itself, or was he working on the outside of the sewer? He never was inside the sewer. He was not there at all after the invert was built up to the springing. The ganger Allen would do the other half of the work.
16163. Wright, you say, had the fixing of the ribs? A portion of them near the outlet. He may have had about a chain to do. Wright was also there when there was a little technical work to be done in making the junction between the barrel and the main sewer.
16164. Was any mistake made in the levels near the outlet—that is, in the levels of the invert or the levels of the centres? Not that I know of.
16165. Did you ever hear of the pegs being found not to be true? No; I was very careful in having the pegs put in, and the Resident Engineer checked what I did.
16166. The bottom was very shaky? Yes.
16167. The bed at the outlet was slurry? Yes. There were some holes there in which the Chinamen had been in the habit of mixing their manure. Some of these were from 7 feet to 8 feet deep. We had to bail these out, and fill them in with sand and ballast before we could do anything at all.
16168. Were the pegs to show the level of the invert driven into the bed of the creek or gutter? They gave us a centre line of pegs. We know how far we are to excavate the ground, and the pegs help us to keep a true line. When we get down as nearly as we can to the correct depth the engineer will come along and will have pats of concrete put in for levels, and will give us the true centre line again.
16169. After that is it possible, in that shaky ground, for the level to change itself by sinking or rising? No; some of the pats took half a truck of concrete.
16170. Wright has sworn that something took place which resulted in a mistake in the levels in the bottom of the sewer, with the result that the concrete was finally put in from 3 to 6 inches in depth instead of 9 inches in depth;—what would you say as to that? I should say that he was wrong.
16171. Supposing he made a mistake in reference to that matter, can you explain his having got that idea into his head from anything which did take place? No. I cannot think of anything which would cause a sensible man to make an assertion of that kind. It would be no trouble to me to have the correct thing done, and I should not be likely to let a mistake of that sort pass. It was an open cutting. The work would all be done in daylight, and it is not at all likely that a mistake of that sort would occur.
16172. Such a mistake as that would not be likely to occur unless the inspectors were away altogether? I do not see myself how it could possibly be made.
16173. *Mr. Davis.*] Did you see any bag cement used upon Contract 77? No.
16174. What you said as to bag cement in answer to Mr. Parkes applied more especially to Contract 118? Yes; it was used upon Contract 118.
16175. *Mr. Gummow*] You had nothing to do with Contract 118, and what you state would be merely what you saw in walking over Contract 77? Yes; I had nothing at all to do with Contract 118.
16176. You know nothing officially as to what occurred on that contract? No.
16177. Do you know where the ribs for the Alexandria Park sewer were made? No; they were not made on the ground.
16178. The carpenters were not on the ground while they were making the ribs? No; no ribs were made on the ground.

WEDNESDAY, 9 SEPTEMBER, 1896.

Thomas Griffiths recalled and further examined:—

16179. *Mr. Davis.*] The witness Benson was asked by Mr. Parkes, Question 157, to describe to His Honor the nature of the work in a flushing-pipe on the Illawarra Road, and he said:—"I was connecting a 20-inch water-main. I had to join the two ends and to caulk them with lead. It was a water-supply pipe intended to flush out the sewer. The distance apart of the two ends upon which I had to fix the collar was too great. Sufficient length of pipe had not been allowed to permit of the two pipes coming properly into the collar. The collar barely covered them three-fourths of an inch on each side, whereas there should be 6 inches on each side if the caulking is to be properly done. You have to caulk with spun yarn first, and then run in your lead." You were in charge of Contract 69 at the time this work was done. What have you to say as to that? First of all, it was not a water-pipe; it was a sewer scour-pipe. It was a scour-pipe from the outlet of the siphon. The pipe was cut shorter than it was customary to cut it. At the same time, when the thimble was put over we had  $2\frac{1}{2}$  inches on each side for the lead. I have had prepared a sketch showing the nature of the work.

T. Griffiths.  
9 Sept., 1896.

16180. *His Honor.*] There were  $2\frac{1}{2}$  inches on each side you say? Yes.

16181. *Mr. Davis.*] In view of the fact that you had  $2\frac{1}{2}$  inches of joint, and, in addition to that, the whole pipe was surrounded by concrete, and, furthermore, that the pipe had to stand little or no pressure, that at the very worst it would have a head of from 2 to 3 feet only, would you say that although the pipes did not come together it was a fair job? I say that it was a very good job. It might have been better, certainly; but it was quite good enough for anything of the kind. The pipe is not under pressure at all, and it discharged into a sewer with a considerably larger diameter.

16182. Benson went on to speak about a flange joint at the same place underneath the concrete in which the bolts were not long enough. Mr. Parkes asked him, at Question 158, how far beyond the collar that would be, and he said:—"About 8 or 9 feet. Some of the bolts had only two threads for the nut, some three threads, and some only half a thread. In some cases the bolts would not go through at all. The bolts are supposed to go right through the joint, and the nut is screwed on the outside. We would hardly get a grip at all with some of the nuts." Do you know where that joint is? Yes; it is about 8 feet from the thimble, as stated by Benson. There are fifteen bolts in the flange, as you will see from the sketch, and the joint was tightly bolted up. The bolts were long enough, but on account of one or two of them being, I understood, of slightly less diameter it was decided to run in an additional lead joint—not that it was required at all. It is in the same line of pipe. The piping is under no pressure at all, and it has an additional cover of 8 feet of concrete. It is also surrounded by concrete.

16183. So that that flange joint would be considered a good job? I should certainly say so.

16184. Do you anticipate any evil results from the work as carried out according to the plan you have produced? I should think not.

16185. *His Honor.*] It is sandstone concrete? Yes; the bottom part of it.

16186. *Mr. Davis.*] At question 2183 a witness named Darcus, speaking of the siphon on the Illawarra Road, said, among other things:—"The pipes were put in much below the penstock chamber; my duty was to build this chamber, and when I came to put in the chamber I found that the pipes were out of the line of the main sewer. I had then to build the thing up as best I could. We had to bend the main sewer round so that it would come in." At question 2189 His Honor said, "What amount of deflection would there be?" and the witness said, "I suppose there would be about a foot." You know the inlet and outlet of the siphon on the Illawarra Road;—will you explain what took place? The sketch I produce shows a horizontal section of the outlet chamber of the siphon. At the point of intersection, the two centre lines—one of the siphon and the other of the outlet end of the sewer—form an angle at this manhole. The line is practically straight, the angle being  $179^{\circ} 16'$ . The thing was so nearly dead straight that it was forgotten that it was not actually straight, so they set out the line of the side of the manhole at right angles to the siphon line, which of course threw out the other side a matter of a few decimals of an inch. The two sides are built parallel, but on account of one line being on a different plane from the other the one is thrown out somewhat. The casting had to be fixed to meet the altered conditions.

16187. *His Honor.*] They ought not to have been parallel, in point of fact? No. The diameter of the penstock pipe is 3 ft. 9 in., and the size of the sewer at that point is 4 ft. 2 in. x 5 ft. 2 in.

16188. It was the 44 minutes in the angle that was forgotten? Yes; the angle, instead of being in the manhole, is now somewhat inside the sewer. While the diameter of the penstock is 3 ft. 9 in., the size of the sewer is 4 ft. 2 in. x 5 ft. 2 in., so that we had plenty to come and go upon. The biggest mistake that possibly could be made would be only a matter of  $2\frac{3}{4}$  inches. The casting would not be in the sewer at all if there had been a mistake of a foot. I do not think, as a matter of fact, that the mistake amounted to more than three-fourths of an inch. It is imperceptible as you walk along the sewer.

16189. *Mr. Davis.*] So that, instead of the angle being in the outlet well as shown on the contract drawing, it is about 10 feet inside the sewer that discharges into the outlet leading into the siphon? Yes.

16190. And that would cause the casting to be slightly out of line with the sewer beyond the length given? Yes.

16191. As a matter of fact, does it make any practical difference? It cannot.

16192. Would it be possible for you to discover the mistake if you were there? You could not discover it by a casual examination. Unless you knew of the existence of the mistake, if you like to call it a mistake, you could not discover it.

16193. It was imperative that the casting should be at right angles to the axis of the chamber as the penstock would not work otherwise, and that is the reason that it was put in in the way it was? Exactly.

16194. *His Honor.*] Originally the idea was to vary the form of the chamber. Instead of making it rectangular, it would be 44 minutes out? Yes.

16195. *Mr. Davis.*] You prepared the Schedule for Contract 77, which has been put in evidence, upon which moneys were advanced as payments during the progress of the work. In that Schedule you put down 70s. as the value of the Monier structure apart altogether from the ironwork. You put down in addition to the 70s. per cubic yard for the compo. work another price for the ironwork. Now that the work is practically brought to a conclusion, have you any reason to alter the opinion you formed practically before the work was commenced? I think that is a very fair price.

16196. You think subsequent events have proved to you that you were right when you decided upon 70s. apart from the ironwork? Yes.

16197.

- T. Griffiths. 16197. You have had some experience in the use of crushed sandstone as sand in addition to that which you have gained during the time you have been connected with the Sewerage Department? Yes; it is frequently used at home.
- 9 Sept., 1896. 16198. Will you tell His Honor your experience and opinion in regard to it? I think I have referred in my previous evidence to the Cardiff Water-works. That is one of the latest examples of water-works of a large character in the old country. Crushed sandstone was used in that work. Then the storage reservoirs and filter beds at Llenishen were also built of crushed sandstone.
16199. *His Honor.*] You mean that crushed sandstone was used in making the concrete? Exactly.
16200. *Mr. Davis.*] It shows beyond doubt what is thought of that class of sand? Yes; it is always considered a better class of work, that is, concrete made with that sand.
16201. You have had a good deal of experience in concrete mixing? Yes.
16202. Speaking generally as to the bulk which a given quantity of cement will make, what would you say;—would you say that it would be difficult to determine what it would make unless the precise circumstances were known? It is a variable quantity; you can never determine it exactly. Acting for the Board we allow a certain quantity for bluestone, and a certain quantity for sandstone, per cask. You have not only to know the average size of the stone but you have also to consider where the concrete has to be placed. You also have to consider the quantity of water which is used. There are several things to be considered.
16203. So that as regards the size of the stone, supposing it varied from  $\frac{1}{8}$  of an inch—taking the bluestone—to  $1\frac{1}{2}$  inch, that would be very favourable to the quantity which a cask of cement would make? Yes.
16204. And the same thing would apply to sandstone? Yes.
16205. And as to the quantity of water put into the concrete, that would also make a difference? Certainly.
16206. *His Honor.*] How would that affect it? In making compo., as long as you damp it you can compress the compo., but in making concrete the more water you add the more bulk you make.
16207. It crystallises afterwards, making really a different body from that which you would have in the case of crystallisation taking place from less water? Yes.
16208. There would be more equivalents of crystallised water? Yes. I also forgot to mention that it depends a great deal upon whether your concrete is enclosed in timber casing. That makes a lot of difference. For instance, in the case of the Sewerage Board we place all the bluestone concrete in wooden framing. The manholes are built conical. The walls are built inside a wooden frame. So you might say you get the exact size in that case, whereas if you come up against a rock surface, such as the rock on the side of the excavation, you would not get the exact quantity.
16209. You mean you would not be able to calculate the exact quantity? Yes; showing the difficulty of estimating how far a given quantity would go in the work.
16210. *Mr. Davis.*] Take the case where you are putting concrete in a situation where you have to ram it vertically and another case where you have to ram it horizontally, would that make any difference? That is just what I have been referring to. It depends, as I say, upon the part of the work into which the concrete has to go. I had in my mind just now what you are now asking me. If you were ramming vertically you could get the material much closer together than if you were packing it horizontally.
16211. Take a tunnel for instance;—would you say from your experience that there is any special difficulty in getting the concrete tight over the brickwork or otherwise? That is about the worst position in which you can put it in. You cannot get it quite tight. There are certain places which you will find that you cannot reach. For instance, you could not get a 2-inch gauge through a space only half an inch in width.
16212. So that concrete will go further in tunnel packing than if you were putting it between boards in the case of a pier? That is obvious.
16213. In the case of the Sewerage Board you have the same specification as to mixing that we have in the Sewerage Construction? Yes; 5, 2, and 1 in the case of the sandstone concrete, and 4, 2, and 1 in the case of the bluestone concrete.
16214. And the same sized stone? Yes; 2 inches for sandstone and  $1\frac{1}{2}$  inch for bluestone.
16215. The only difference is that you specify for the metal to be forked? Yes; our sandstone is forked.
16216. Whereas in the case of the Sewerage Construction Branch it is screened? Yes.
16217. By the forking you would take out a greater proportion of small stuff? Yes; a lot of small stuff is taken out of the sandstone in that way.
16218. Will you tell His Honor what in your opinion, taking all things into consideration, would be about a fair thing to allow for a cask of cement in bluestone concrete and also in sandstone concrete? Under the Board we allow 22 cubic feet in bluestone and 27 feet in sandstone concrete. We do not pay for that, but that is what we estimate.
16219. *His Honor.*] What do you mean when you say you do not pay for that? I mean that those are the figures for the purpose of making an estimate. We pay at per cube yard actual measurement; but in estimating the value we have to take into consideration the amount lost in the interstices of the metal.
16220. *Mr. Davis.*] And the figures you have given you consider would be a fair estimate for concrete work between boards? Yes.
16221. *His Honor.*] In sandstone concrete do you calculate for the absolute disappearance of the cement? No; there are 20 feet of metal, 8 feet of sand, and 4 feet of cement—or, in all, 32 feet.
16222. *Mr. Gummow.*] You say you estimate in your Department that the cement will make in the case of bluestone concrete 22 cubic feet, and in the case of sandstone concrete 27 cubic feet? Yes.
16223. And do the contractors, according to the prices they give, consider that your estimate is too high or too low? It all depends upon the circumstances. We never actually have any dispute as to the quantities; but I may state that the other day, since this inquiry has been in progress, we had a little difficulty with one man who said that the estimate was too low. It was a difficult piece of work, and the resident engineer could not well measure it. He said, "Will you take our gauging"—mentioning the quantities I have given. The man said that that was too low. Personally I have not had any difficulty with the contractors in that respect.
16224. But is it not the rule for contractors to be much below your estimate? Yes; always.
16225. So that the quantities in your estimate cannot be much too high considering that the contractors cut your estimate? No; I know of cases where sandstone has gone up as high as 30 feet, 16225.

16226. *Mr. Parkes.*] You say that sandstone concrete diminishes from 32 to 27 feet after mixing? Yes; T. Griffiths. measured in the work.
16227. After it has shrunk and become dry? That is the measured quantity in the work.
16228. It shrinks to that? Yes.
16229. And 28 feet in the case of the bluestone concrete shrinks to 22 feet? Yes.
16230. A cask of cement in the case of bluestone concrete goes to 22 feet, and in the case of sandstone concrete to 27 feet? Yes.
16231. As far as the ramming of concrete goes, no matter what its position may be, what percentage would that make in bulking? It is impossible to say.
16232. Would it make 50 per cent. difference? It all depends upon the position of the concrete. I gave you just now an instance of packing over a tunnel. The drive may be very nearly the exact shape of the sewer, and in that case, as I said, it would be impossible to put 2-inch metal through a  $\frac{1}{2}$ -inch space.
16233. But the drive would be only cut out in that way by means of guttering and gadding? Not necessarily. You do not blast out the exact shape. You have to scabble afterwards, and scabbling is practically the same as guttering and gadding. It is done without the use of powder.
16234. Still there are irregular cavities left in the case of blasting? Of course; in either case you cannot get it out to the exact shape.
16235. But in the case of blasting there would be considerable cavities—say from a foot to 15 inches? It all depends upon the ground. It may be jointed.
16236. You would have to pack those cavities with sandstone concrete? It all depends. You may come across a place where you could not push the metal through; that would mean the leaving of a cavity of whatever size it might be.
16237. But surely when you have a cavity you would brick only half way along it before you started to ram? The bricklayer would do that if he minded his own business properly.
16238. So that the cavities to which you refer would be well rammed? Exactly; and I do not mean to say that that has not been done. I was merely giving you an instance as to how cavities may occur in work.
16239. If the brickwork is built up tightly against the rock there is no chance of there being any grouting on the top? We invariably put in a joint of mortar at the back of the brickwork in such cases.
16240. Without any concrete? Yes; as there is no room for concrete.
16241. Suppose the cavity is so small that you had a difficulty in grouting the joint? We do not grout the joints.
16242. You merely put in a collar-joint between the brickwork and the rock? Yes.
16243. That is not concrete? No.
16244. Coming to the Monier arches, when that work was first started was it under Mr. Hickson? It was started under Mr. Darley and myself. I think Mr. Darley was away on leave, or had just returned. I had the supervision from the start. Mr. Smail was the acting Engineer-in-Chief during Mr. Darley's absence. I believe, as a matter of fact, that the work was set out under Mr. Smail, but it is one of those things which it would be somewhat hard to locate exactly.
16245. You cannot locate the exact time of the change? No.
16246. Was the first bay done under you? Yes.
16247. It was all compo.—aqueduct and everything, was it not? I think the first one we did was the approach on the Forest Lodge side. I remember that we asked the contractors to construct arches of various materials. That would be in the approach.
16248. But was not the first bay including the carrier built of compo.? Not that I know of. The first arch was of compo., but I think the carrier was of small bluestone concrete. I am referring now to one of the little arches.
16249. But what about the first section of the carrier? I think it was of compo. The other was of various proportions of fine bluestone concrete.
16250. There was a change made—it was determined not to carry out the whole of the carrier in compo.? Yes.
16251. Why was it done? Mr. Darley suggested it, I think. He thought it would be just as well to substitute the concrete as being a more water-tight material than compo.
16252. Were any tests made of that piece of compo., do you know? Yes; I believe a bulkhead of brickwork was built in for that purpose.
16253. And it was found that it would not hold water? That I could not say.
16254. At all events a test was made? I understood that it was.
16255. After that test was made Mr. Darley determined to adopt the concrete? No; it was after Mr. Darley and I gave up control that the thing was tested as far as I know.
16256. When did you and Mr. Darley give up control? I think Mr. Darley gave up control on about the first of April in this year. I think he held the position for about twelve months.
16257. And you made the change with him? I was kept on some time after, as I had to keep in touch with the work during the time Mr. Davis was getting back into his position.
16258. Who has control of it now? Mr. Davis and Mr. Millner.
16259. The change from the compo. to the concrete was made with Mr. Darley's consent? He made the change.
16260. Was it because he was dubious about the compo.? I do not think so. He had an idea that the other material would be more watertight because more cement was put into it.
16261. Would more cement be put into the concrete than was put into the compo.? Yes; the compo. was 3 to 1.
16262. And the concrete was 5, 3, and 2? Yes.
- 16262 $\frac{1}{2}$ . Would more cement be put into that than into the compo.? Yes.
16263. Take a yard of compo., 3 to 1, there would be much more cement put into that, would there not? No; certainly not. You have to consider the amount of mortar it makes in the concrete. That is where the strength lies; 3 to 1 mortar is not as good as 2 to 1 mortar, which are the proportions of compo. in the concrete.
16264. But as regards the swallowing up of cement the compo. takes the most? It does not swallow it; it is part of the compo.

- T. Griffiths. 16265. But you want more cement in the compo. than in the concrete? No; there is more in the concrete than in the compo.
- 9 Sept., 1896. 16266. Take 1 yard of compo., two casks of cement go to the yard? Yes, in the compo.
16267. How many go to the yard in concrete? I have never tried the gauging at all. The bluestone you referred to is not the bluestone which is generally used. The bluestone concrete you are now referring to contains all the dust and particles right up from a  $\frac{3}{4}$  gauge. The bluestone concrete in the carrier is not the bluestone concrete which is generally used in works.
16268. What sort of bluestone concrete is it? Well, it is bluestone which has passed over a  $\frac{3}{4}$  or  $\frac{3}{8}$ -inch screen.
16269. What is the size of the stone in 7, 3, and 2 concrete; is not that also fine concrete? I have never used any of the special concrete referred to in the specification.
16270. In making up your calculation as regards the compo. you put it down at £3 10s.? Yes.
16271. You also made a calculation as to special bluestone concrete, 7, 3, and 2? I do not think I did.
16272. Not in your schedule? I do not think so. It is a long time ago, and I could not say unless I had the papers in front of me.
16273. When you made your estimate of £3 10s. for the compo., did you not work on Mr. Bagge's estimate? I never saw Mr. Bagge's estimate.
16274. How did you make up your estimate then? From my own experience.
16275. What quantity of cement had you? I could not give you the details offhand.
16276. As to Contract 69, when did you come on to that work? Early in April, 1895.
16277. Practically, the work was completed then, was it not? No. The tunnel work was finished, but there was the syphon in the Illawarra Road and the Premier-street shaft to be done.
16278. Were you in charge when Benson did the work which you have referred to? Yes; I had general charge as supervising engineer.
16279. Did you see him doing the work? No.
16280. How have you ever seen the work he did? I must have seen it in making my inspection.
16281. But have you seen the actual work? I cannot say that I saw the pipes being laid, of course.
16282. You were not standing there when the work was being done? I should not necessarily be standing by when any part of the work on the contract was being done.
16283. At all events you did not see Benson doing his work? I do not remember seeing him do this particular part of the work.
16284. Did you make the plan of the work which you have produced? It is a plan of the work as actually carried out.
16285. Can you say definitely that the work was carried out with the difference in the joints that you show? The work was carried out exactly as it is shown upon this plan.
16286. Is it as you saw it? I did not see it.
16287. *His Honor.*] Who made out the plan? It is made out from particulars supplied by the inspector.
16288. Who drew it? One of the draftsmen.
16289. When? After these men, Benson and Darcus, gave their evidence, I had a report and sketch prepared from particulars supplied by the inspector.
16290. Your evidence upon this point then is only from an account given by the inspector? Yes.
16291. Who was he? Husband.
16292. He actually saw the work done? He supervised it.
16293. *Mr. Parkes.*] Were you present when Darcus did the work he referred to? As a matter of fact, I do not know who Darcus is. I saw men there several times fixing up the framing.
16294. Did you set out the work? No; I had no time for that.
16295. Did you see the irregularity in the levels? I do not think there was any irregularity.
16296. You have given evidence that they were out of parallel;—have you seen that it is so? I told *His Honor* that it would not be perceptible to anyone unless they were told that there had been a mistake.
16297. Have you seen the work since it has been finished? Yes; but not since this evidence has been given. If one were there one could not detect it.
16298. What is the width of the pipe? The diameter of the pipe is 3 ft. 9 in., discharging into a sewer 5 ft. 2 in. by 4 ft. 2 in.
16299. Did you know anything about its being out of level before you saw Darcus' evidence? It was not out of level; it was out of alignment.
16300. But did you know that there was any defect there until you saw Darcus' evidence? No; I should not be able to detect it now if I were on the spot, nor do I think anyone else would be able to do so.
- 16301-2. *His Honor.*] The two axes are correct;—they are as intended? Yes.
16303. There was no mistake in that;—the mistake was in constructing the chamber rectangular instead of with the two sides deviating by the small angle of 44 minutes? Yes.
16304. *Mr. Parkes.*] Mr. Darley was not very long in charge of the sewerage works, was he? About twelve months.
16305. That is the only time he was in charge of sewerage works? I could not say what his experience may have been, but he was in charge between April, 1895, and April, 1896.
16306. But part of that time he was away upon a holiday? To the best of my recollection he was due back on the 1st July; but he actually came back a week or a fortnight before his time was up.
16307. How many months out of the twelve was he absent on a holiday? I dare say about ten weeks.
16308. So that, practically, he was in charge of the sewerage works for only ten months? From nine and a half to ten months.
16309. His principal work has been in the Harbours and Rivers Department? General work, I suppose.
16310. How long have you been in the Service? Since the inception of the Board.
16311. How long would that be? We started in 1890. I commenced my duties on 2nd January, 1890.
16312. How long have you been in the Colony? Ten years.
16313. Prior to that what were you? A contractor's engineer.
16314. With whom? Jones and Jepson.
16315. Who are they? Large railway and public works contractors.
16316. With whom have you been in this country? I was Assistant City Engineer in charge of sewerage works at the time the works were handed over to the Water and Sewerage Board. I was transferred to the Water and Sewerage Board at that time.

16317. *His Honor.*] Who was in actual charge of the work upon Contract 69? From April, 1895, to its completion. Mr. Gibbs was the resident engineer in charge. The whole of the tunnelling had been done prior to my taking charge. Part of the syphon had also been done, but we completed it.
16318. Mr. Gibbs, then, can speak as to the actual facts in connection with the alleged defective work? Not more so than I have done. He could not say more than I have done. He could only speak of the work in a general way.
16319. Have you seen the work since you left the contract? I was through it from before the works were taken over from the contractors.
16320. You have spoken to-day, then, your own knowledge? Yes; but in regard to the work spoken of, as I have already said, I could not notice it in walking along it if my attention had not been directed to it. I made the final inspection of the whole work. The mistake which has been referred to this morning is so slight that it would be likely to escape anyone's attention, and it would not affect the sewer in any way either as to its stability or its efficiency.
16321. The angle put into the axis is too small to make any difference? It cannot make any difference.
16322. Have you compared different pieces of concrete one with the other? Yes.
16323. What do you say as to the piece I now hand you;—is it more dense or open than average concrete? The density would depend to a great extent upon the position in which the concrete is fixed.
16324. The piece I hand you was taken from the invert of a sewer on a bad foundation, where the ramming would be light? I should say then that it was very good concrete.
16325. You will see if you look at it with a glass that it is honeycombed? Yes; that would be the case unless you could ram it pretty tightly.
16326. Can you practically ram the air out of it altogether? No; I do not think so.
16327. The difference between lime mortar and concrete is that, in the one case, you have to do all the work at once. In the case of lime mortar the longer you leave it the better it gets so long as you do not let it dry? Yes.
16328. That is due to the fact that the air originally contained in it becomes practically dissolved in the water? Yes.
16329. So that the particles are practically brought into actual contact? Yes.
16330. In concrete you have to take the air as you find it? Yes; I should say that the piece of concrete that you hand me is a good piece. I see that the stone has been actually fractured in the taking of it out. With regard to my estimate of the value of the Monier work in Contract 77 I should like to explain that I have looked for the details, but I have not been able to put my hand upon them.
16331. Could you not put your estimate upon paper again in the course of the morning and hand it in later on? Yes; I will do so.

T. Griffiths.  
9 Sept., 1896.

George Alfred Fowle sworn and examined:—

16332. *Mr. Davis.*] What is your position? I am by occupation a bricklayer.
16333. What are you in the Department? An inspector.
16334. Where are you at present employed? I am at present employed upon the Newcastle suburban drainage.
16335. Were you employed upon Contract 79? Yes.
16336. Did you go right through with the brickwork, concrete, and cement rendering, done on that contract? Yes.
16337. And you started upon Contract 79A? Yes.
16338. As to the returns of cement which you make upon contracts, and which you made upon these two contracts particularly, can you vouch for their accuracy? Yes. In cases where other inspectors were employed under me, I took their word, but at the same time I always kept a check—that is, of the number of casks taken out of the cement shed and the number delivered on the site of the works. I occasionally took a check in that way in order to check the other inspectors.
16339. And having adopted these precautions, you think you can say that your returns are fairly correct? I can say that they are correct.
16340. They represent the quantity of cement used in the concrete, brickwork, and cement rendering, as far as Contracts 79 and 79A are concerned—I mean your own returns? Yes.
16341. You had chief charge on Contract 79? Yes.
16342. For a portion of the time you had Inspector Reid with you, had you not? Yes.
16343. Do you remember anything which occurred in November, 1893, in connection with Inspector Reid? I cannot, speaking from memory; but I have notes of pretty well everything that took place upon the contract. (*Vide Appendix No. 56*).
16344. Do you remember Reid's coming to you in November, 1893, in respect to anything he regarded as defective work? I cannot recollect the date.
16345. Can you remember anything which occurred in connection with the brickwork? Several things occurred in connection with Reid.
16346. Do you remember his coming to you and complaining of something which had happened to one of the bricks? Yes; I remember that on one occasion during a night shift, upon the up-stream side of No. 7 shaft, he had a complaint to make to me.
163447. What was the complaint? About bad workmanship.
163448. Did you investigate it? Yes; I went down next morning, as I usually do in such cases. I always take upon myself to pass the workmanship in the brickwork—that is, the finished workmanship. On this occasion, in making an inspection, I discovered at the particular spot to which Reid referred that a little piece had been chipped off one of the bricks—a piece the size of a finger-nail.
163449. While that might denote great care on his part, it did not, in your opinion, constitute bad workmanship? Certainly not.
163450. Do you remember anything that occurred at the latter end of January in respect of shaft No. 6? I cannot recall the dates.
163451. Do you remember any complaint which Reid made as to dry stone being put down a shaft? Yes.
163452. Will you tell His Honor briefly what occurred? It occurred at shaft No. 6 during the night shift. Inspector Reid had charge of the mixing of the concrete on the top of the shaft, and on the next day

G. A. Fowle.  
9 Sept., 1896.

- G. A. Fowle. day he saw me and made a complaint as to dry stone being put down in lieu of concrete. On this occasion I made an inspection of the work; speaking from memory, in February. The foreman brick-layer, Connors, accompanied me. I had the brickwork cut open on both sides of the shaft, and I found the work to be good. The concrete which had been put in between the rock excavation and the brickwork was in first-class condition, and I made a report to that effect to the resident engineer.
- 9 Sept., 1896. 16353. *His Honor.*] What had Reid reported to you? That dry stones had been put down in lieu of concrete.
16354. Did you make an examination of the exact spot as far as Reid could point it out to you? Reid declined to go down the shaft at this particular time. I know, from what I have seen from working at the trade myself, and from what I have seen since I have been in the Department, that in raising the staging you may have some surplus cement mortar; and a few barrowfuls of stone might be mixed with that surplus, instead of being wasted. That has been allowed in some cases.
16355. But did Reid refuse to go down with you when you were making your inspection? Yes, point blank.
16356. Upon what ground? I could not say on what ground. Whether he was frightened or not I do not know, but he declined.
16357. How did you go down? In the skip.
16358. Was the regular engine-driver there at the time? Yes; but as to whether the regular engine-driver would be there at night-time, I could not say positively.
16359. When you went down the regular engine-driver was there? Yes.
16360. And it was at that time that Reid refused to go down with you? Yes.
16361. Did he seem to be frightened, or what was the matter? He seemed, in my opinion, to be frightened, but I could not say whether he was or not.
16362. *Mr. Davis.*] Do you remember whether I afterwards came across to investigate the matter? Yes.
16363. Did you attend at the field office, with the resident engineer, with Reid, and with the contractors, with a view of arriving at some understanding as to what really did occur? Yes.
16364. And you were able to say on that occasion that you had examined the work and had found it perfectly right? It was in good condition. The face of the concrete was as smooth as a board. Reid himself will remember that.
16365. Do you remember Reid, being removed from Contract 79? Yes.
16366. How much work was there to do when he was removed? I find on going through my notes that there were about 30 feet of brickwork in shaft No. 5 to be completed. That was the whole of the brickwork upon No. 79 to be done after Reid was removed.
16367. So that, as a matter of fact, the necessity for Reid's presence, although he was removed, was virtually at an end? Yes, with the exception of the 30 feet to which I have referred.
16368. That was the whole of the brickwork which had to be done upon the contract? Yes.
16369. *Mr. Parkes.*] Were you upon Contract 79 during the whole of the time it was in construction? Yes.
16370. Did you go there the first day the work started? Yes.
16371. Did you finish up there? No, I did not finish the extension in, I think, Ernest-street.
16372. There were a number of reports sent in by you from Contract 79, forwarding samples of cement;—did you send in reports as to every parcel of cement which went over to the contract? A large quantity of cement had been delivered there previous to my going over.
16373. Where was it stored? In the contractors' yard.
16374. Where would that be? In Alfred-street, between shafts 4 and 5.
16375. In a shed? Yes.
16376. How many casks? I could not say from memory. I know that there was a large number. There was also a large quantity of bricks. I see from my notes that on June 15th, 1893, there were 853 casks there.
16377. There were 853 casks in the shed? Yes.
16378. Will you look up your notes and see when you went on to the job? That would be the date—June 15th, 1893.
16379. Not 1892? No.
16380. Was that the first cement put on to the job? It was what was on the works when I went over to take charge.
16381. What was the brand of the cement? I cannot say. I did not make a note of the brand.
16382. Was it branded cement? Yes.
16383. Did you have it tested? It was tested before I went there. The resident engineer instructed me that it was all tested cement.
16384. You cannot recollect the brand? No. I have no note of it.
16385. Did you have a sample taken of all the cement sent on to the job after that? Yes.
16386. Therefore there is no doubt but that you sent in reports as to the whole of the cement delivered on the job? There is no doubt about my knowing of all the cement that was delivered.
16387. And you returned to the office in your reports the right number of casks? Yes.
16388. Were the returns of the inspectors given to you daily? Usually in the evening.
16389. Would you check all your sub-inspector's statements? Occasionally I would go into the shed and check the number of casks there.
16390. Would there be any likelihood of mistakes in those returns? There were the daily reports, as I have said, of the inspectors under me, and I used to check those at least once a month for my return to the resident engineer.
16391. How did you carry out your check? By counting the number of casks which remained in the different cement sheds, and comparing that number with the returns which were made to me of the quantity which had been used daily.
16392. *His Honor.*] You compared your notes of what had been used daily with the difference between the number of casks there had been in the store and the number you found when you made your second count? Yes, there was a double check.
16393. *Mr. Parkes.*] The sheet I now hand you shows the way in which you made your return of cement to the office? Yes.

16394. There was no chance of untested cement coming on to the contract which you would not return G. A. Fowle. in this way? Not upon Contract 79. There were three cement sheds there, and I always had the quantity of cement in them checked. 9 Sept., 1896.

16395. Supposing Contract 79 was started in March, 1892, did you go on to the job before the work was set out, or when did you first go on to the work? When the construction was first taken up—the brick-work, the concreting, and the rendering.

16396. You went on to the job when the first cement was used there? Yes.

16397. And the certificate I hand you shows the way in which the returns were made up by you at all times? Yes.

16398. How many cement sheds were there, do you say, on Contract 79? There were three cement sheds altogether. One was in Berry-street at No. 11 shaft, another was in Alfred-street between shafts 4 and 5, and the other one was at No. 2 shaft.

16399. Will you tell me the names of the inspectors under you? There were, at different times, Harris, Gledhill, Wagg, Reid, Vincent, and Eyre.

16400. Do you recollect writing this letter on 19th February, 1894?

Contract 79, North Sydney,  
19 February, 1894.

Sir,

I beg to report that on several occasions I have had to complain about the time the sandstone concrete is mixed for packing brickwork in shafts. To-day two 20-foot mixings were made up at 2 p.m. at No. 5 shaft. This concrete will not be put down shaft for use till 5:30 p.m. I have instructed Connors (foreman), who has charge of this work, not to have the concrete mixed so long before being used. He states to me that he has to take his instructions from the firm. I saw Mr. Snodgrass last Friday and complained to him about this matter, when he promised it should not be mixed until one hour before it is required to be used. I spoke to Reid (contractors' representative) to-day, and he states that they shall mix the concrete when convenient for themselves.

Inspector Reid informs me that on Saturday last, 17th February, about 1 p.m., at No. 6 shaft, it required half mixing 10 feet of sandstone concrete to finish brickwork packing in shaft. Henderson, bricklayer working in shaft, was on mixing board, and started to assist labourer gauge the stone. Inspector Reid instructed Henderson to use the fork in place of shovel in filling gauge-box, as the stone, which is broken close to the mixing-board, is not free from refuse. Inspector Reid asked Henderson the second time to use fork. Henderson replied that it did not want forking. Connors, the foreman, came on the scene and said to Henderson, "Go on; do not take any notice of him, he's only a damned big buck navvy."

I have, &c.,  
G. A. FOWLE,  
Inspector.

Correct.—R. G. REID.

Yes.

16401. So things were not going on too nicely on the job after all? Undoubtedly they were not.

16402. You had some trouble with the contractors' men seemingly? We had the usual trouble.

16403. Did not Inspector Wagg also send in a strong complaint—stronger even than Reid's—concerning the contractor's foreman? Yes.

16404. Was not Reid, the contractor's foreman, a man who would take advantage of you every time your back was turned? I could not say that.

16405. But he would take a point? He would take a point if he could get it.

16406. Therefore, anyone would require to be rather particular on this contract? There is no doubt about that.

16407. If an inspector complained now and again it would be to his own detriment; it would not be to the advantage of the Government to have these men complaining about bad workmanship; that is to say, an inspector would gain nothing by being very strict? He would be doing his duty, I suppose.

16408. Would it not irritate you, as an inspector, if you saw men constantly trying to get the better of you? Yes.

16409. You would be pretty hot upon them? Of course I would rather see the work going on smoothly than having constant trouble.

16410. If you caught a man trying to do bad work would it not create a suspicion in your mind with regard to him? Yes.

16411. And you would often be suspicious of bad work perhaps where, as a matter of fact, bad work was not put in? Of course that sort of thing would tend to make an inspector suspicious.

16412. It would be possible to find good or bad work in different parts by taking out a brick here and there? I would not say that.

16413. What I mean is that a workman could not get in bad work in a whole shaft if an inspector was watching him? No.

16414. But if an inspector's back was turned now and again it might be so? If an inspector was away from his duty.

16415. An inspector might come back quickly and catch a man starting bad work, and might complain of him? Yes.

16416. And there might be a difficulty afterwards in locating the bad work in the shaft? There would be no difficulty in that.

16417. What would be the height of a shaft in this case? Somewhere about 150 feet.

16418. Do you say that they were pouring the material down from the top? Yes; they were working 60 or 70 feet from the surface, and the material was put down the shoot on to the stage.

16419. Inspector Harris had a mortal fear of these shafts, had he not? He was a bit scared on one or two occasions.

16420. They ran him up at a lively speed on one or two occasions? I think we all got scared at times.

16421. What did they do? In lowering us in the bucket sometimes the engine-driver—I do not know whether it was carelessness or what it was—would give us a sudden jerk in the shaft.

16422. At times let you down with a rush? I do not know about that, but they would jerk us about a bit.

16423. Did not Harris on one occasion make five or six rapid trips backwards and forwards in a shaft? I remember on one occasion his saying something about the way in which he was lowered down and brought up.

16424. He went up and down a number of times in quick succession, until he was stopped at the top of the shaft, and was glad to get out? Some kind of work was probably going on below, and the men down there were giving false signals to the engine-driver to stop, or to lower, or to pull up, as the case might be.

16425.

- G. A. Fowle. 16424. In other words, while they were doing a bit of bad work they kept the inspector in the shaft? They could not do bad work while he was in the shaft, because on this occasion they were working in the drive, and an inspector was down below. At this particular time Harris was looking after the rendering work. He came through, past the bricklayers. While he has nothing to do with that work, no doubt if he had seen anything going on which he thought wrong he would have reported it to me.
- 9 Sept., 1896. 16425. At all events, you say they kept him in the shaft some time? I do not know if they kept him there, but it is very probable that they played some trick upon him.
16426. Do you remember his going up and down the shaft a number of times in succession? Yes.
16427. Did he ask to be sent from that job? Not that I know of.
16428. Was he shifted? Yes; he was shifted. Both he and Wagg were removed; but I do not remember the dates.
16429. Can you recollect the reason why Harris was removed? I believe there was work opened up on other contracts. That was the reason.
16430. Who took his place when he was shifted? Inspectors Reid and Vincent took the place of Inspectors Harris and Wagg.
16431. How long was Vincent there? I think he started at the same time as Reid.
16432. But how long did he remain there. Did he go to 79A? I could not say. I was not there at the time.
16433. Was he upon 79A when you were there? No.
16434. How long were you upon 79A? I am afraid I cannot give you the dates from memory.

Thomas Griffiths recalled and further examined:—

- T. Griffiths. 16435. *Mr. Parkes.*] You have made an estimate of the cost of the Monier work upon Contract 77? I may explain that when I prepared my first estimate it was from my own experience of the various classes of work. I have in this estimate taken each item separately. They are as follows:—
- 9 Sept., 1896.

APPROXIMATE ESTIMATE of Cost of "Monier" Work, Contract 77, "Compo." portion in main arches.

|   | £     | s. | d. |
|---|-------|----|----|
| Cost of material, 3 sand, 1 cement, per cubic yard .....                                | 1     | 10 | 0  |
| Labour, mixing, and putting into position, per cubic yard .....                         | 0     | 8  | 0  |
| Cost of centering and framing, and use of plant, per cubic yard .....                   | 0     | 8  | 0  |
| Labour taking down, fixing, and refixing, centering and framing, &c., per cubic yard... | 0     | 8  | 0  |
| Preparing iron for grill, per cubic yard .....  | 0     | 2  | 0  |
|   | <hr/> |    |    |
|   | £2    | 16 | 0  |
| Supervision, profit, royalty, &c., 25 per cent. ....                                    | 0     | 14 | 0  |
|   | <hr/> |    |    |
|   | £3    | 10 | 0  |

T. GRIFFITHS, 9/9/96.

NOTE.—No allowance has been made for risk or guarantee.

George Alfred Fowle recalled and further examined:—

- G. A. Fowle. 16436. *Mr. Parkes.*] Can you now recollect when you went on to Contract 79A? I went on to the contract some time in February of last year, and I left on June 6.
- 9 Sept., 1896. 16437. What work was being done at that time on the job? Principally excavation. There was a small quantity of brickwork done.
16438. In what portions of the sewer was the brickwork done? Between shafts No. 17 and 18.
16439. Was it finished? It was only partly done.
16440. Was any done between the other shafts? Between 15 and 16 a portion was done.
16441. Was any other brickwork done between the other shafts? No.
16442. Was no work done between Nos. 11 and 12? No; the drive was not through.
16443. Who took your place? Inspector Andrews.
16444. Would he make his returns of cement in the same manner in which you made yours? I could not say.
16445. These returns are made in a certain way by order of the Department? Yes.
16446. Mr. Weedon, on 20th February, 1894, wrote a minute upon your letter of 19th February, to which you have already referred;—was he Supervising Engineer over the job? He was relieving Mr. Boys at the time. Mr. Boys was away on a holiday.
16447. Was Mr. Weedon over 79A while you were on the job? Partly.
16448. *His Honor.*] You saw a good deal of the contractors' manager, Reid, and also of the foreman bricklayer, Connors? Yes.
16449. First of all as to Reid;—what sort of man would you describe him as being? He is a man who is naturally irritable. He suffers a good deal from asthma. I have known him for ten or twelve years, and I know his disposition pretty well. He loses his temper instantly, and five minutes afterwards he will come to again. On the spur of the moment, sometimes, what with his asthma, and a few drinks which he may happen to have in him, he will let go.
16450. Is he given to putting too many drinks into himself occasionally? Yes.
16451. While he is on the work? Yes.
16452. But both asthma and thirst may be quite consistent with honesty;—what sort of a man was he with regard to pointing? I do not think there is any difference between Reid and the rest of them I have had to deal with. I have had worse men than Reid to contend with—far worse.
16453. And you have had better? Yes, far better.
16454. Then Reid is a man who will take a point if he can get it? Undoubtedly. I know Reid well. When I was working at my trade on public works some years ago I had him labouring for me.
16455. How did you find him then? Just the same as afterwards.
16456. Would he do bad work when no one was looking? He had no occasion to do bad work then he was merely labouring.

16457.

16457. But a labourer will sometimes do bad work? Upon this particular work he could not. He was simply passing the bricks and compo. along. He was doing no work that could be scamped.
16458. When as manager he could scamp work you think he may have done so? I have never caught him. He had nothing to do with construction. He merely gave orders.
16459. He had the general management, and gave orders to the men as to how they were to do the work? Yes.
16460. And you sometimes caught the men doing bad work? Yes.
16461. How did they excuse themselves;—did they say that the work was being done by order, or did you find that it was being done by order? No, it was due to carelessness, as a rule, on the part of the men. On some occasions, in the bricklaying, the men would race one another to see who could get through the quickest, in order to curry favour with the contractors. Of course the man who got through first with his length would be thought more of by the contractors. He might be thought to be a better man from their point of view than the others.
16462. *Mr. Parkes.*] Were there any prizes attached to this racing? I have never known of any in that work.
16463. *His Honor.*] That sort of thing would be approved by Reid, as far as you could see? Yes.
16464. How about the contractors themselves? I scarcely ever saw them interfere with the work—in fact they never did on any occasion. I have seen them come on to the works and go to the office, but that is all. I remember that after cautioning Reid about the mixing of the concrete I on one occasion approached Mr. Snodgrass, and he promised faithfully that the matter should be remedied.
16465. Was it remedied after that? No, it was not.
16466. Things went on in the same way? Yes. I saw Reid, the contractor's representative, and I could get no satisfaction from him. What Reid said I embodied in my report. After speaking to him I approached Mr. Snodgrass himself.
16467. Did you hear Mr. Snodgrass speak to Reid on any occasion? No.
16468. Whether Reid was acting on his own account in allowing work to be badly done, or whether he was acting under instructions, you could not tell, I suppose? No, I could not say.
16469. You had no means of discovering from Reid whether he was acting under instructions in getting work scamped? As far as Contract 79 is concerned, I do not think there was any scamping in any of the work on which I had charge.
16470. I understand you to say that there were attempts at it? Yes.
16471. And you think you nipped them in the bud? Every day there would be something to complain of, but you could not exactly call it scamping—wilful scamping is a very different thing from mere carelessness, for which you might have frequently to caution men.
16472. But carelessness goes with quick work, and often quick work is in the interests of the contractors? Yes.
16473. Was it carelessness, the result of quick work, that you were complaining of? Not as regards the mixing of the concrete.
16474. That would be a saving of cement? Yes.
16475. In point of fact, Reid was complained of on several occasions? Yes.
16476. Yet he was kept on? He was kept on all the time that I was there, but I might mention that on other works, with other contractors, the same sort of thing has taken place. I could not make an exception as regards Reid.
16477. As far as his being a manager is concerned, what sort of man was he? He was a good manager; there is no doubt about that.
16478. A man worth keeping? Yes; he was a good contractor's manager.
16479. As to Connors;—did you see much of him? Yes.
16480. What sort of man was he at work? He was an honest man; I have never proved him to be otherwise. As far as my personal dealings with him are concerned, I have never caught him scamping or trying to neglect work.
16481. You would put him down as a better class of man than manager Reid? Yes; I give Connors credit for being a more honest, steady, sober, man.
16482. As to Inspector Reid, was he a difficult man to get along with or not? There was this difficulty about him: he had a weakness, and that was for nagging. He was of a nagging disposition. He was a very strict man.
16483. A very honest man? Yes; I would take him to be an honest man. The only fault that I had to find with him—and I had to speak to him about it several times—was the injudicious way in which he would approach the men. He would have the last "spoke," and he would keep on speaking about a point. He would not caution a man and then let him rest, but he would be continually nagging and irritating him about it.
16484. He seemed to have no tact? Yes. Take the case of a man who is working in a sewer 3 feet 3 inches by 2 feet 2 inches. He has to twist himself about into all sorts of positions, and he has quite enough to put up with without being irritated in the way I have described. One thing would bring up another, and that would lead to words.
16485. I suppose the shafts upon Contract 79 are the deepest on any sewerage work which has been done since the Bondi work? Yes; taking the aggregate, they are the deepest on any contract, with the exception of the Bellvue Hill work.
16486. So that the work for the inspectors was rather more risky upon Contract 79 than on an average contract;—I mean going up and down the shafts, and that kind of thing? The work on Contract 79 was easier in some cases than upon 79 A. You would be hoisted and lowered up and down in a bucket on 79, and on 79 A you had to climb ladders in the shaft.
16487. The engine-driver would have a better opportunity to play tricks then on Contract 79? Yes.
16488. You were fairly strict, I suppose? Yes; I attempted to do my duty honestly and faithfully.
16489. Had you yourself any trouble with the men;—were any tricks played upon you in lowering you down the shafts, and that sort of thing? I do not know whether you can call it trickery. In going down any shaft in a bucket you would sometimes swing round, and when you were getting twisted too much you would naturally shout out to a man below to stop the bucket. The bucket would be flying round and the shaft might, perhaps, be full of steam and it would be impossible for you to see anything in front of you. Then if the man below signalled the driver to stop the bucket he might give you a sudden jerk.

- G. A. Fowle. 16490. The man would be simply doing his duty? Yes; I cannot say that I had any tricks played on me.
- 9 Sept., 1896. 16491. Would you say that Inspector Reid was a timid man? No. I never knew him to shirk his duty in going down below.
16492. But you said upon one occasion—I think at No. 6 shaft—that he would not go down? No, not on that particular occasion.
16493. On that occasion he seemed to be afraid of something? I do not know what it was, but he declined point blank, and said he would not go down.
16494. *Mr. Davis.*] As to the trouble which you say you experienced with the contractors' men on Contract 79, was it greater than you would experience upon other contracts with the men of other contractors? No; I have had worse contractors than Carter, Gummow, & Co. to deal with, as far as that goes.
16495. *His Honor.*] There can be worse men than Carter, Gummow & Co., you think? I promise you there can. You will see that from my reports in connection with other contracts.
16496. *Mr. Davis.*] When you complained to Mr. Snodgrass about concrete being mixed before it was required, according to what you said just now, no attention was paid to your representations. What action did you take then? I left the matter in the hands of the Resident Engineer.
16497. You reported the matter in accordance with your usual custom? Yes.
16498. And then action was taken? Yes, I think action was taken afterwards. I think the concrete was mixed within the hour as Mr. Snodgrass had promised.
16499. That was after the matter was represented to the Resident Engineer? Yes, I think I remember Mr. Weedon seeing the contractors about it.
16500. Had you any difficulty in locating the precise spot where the dry stone was supposed to have been put into the shaft? No difficulty whatever. It was only a matter of seven or eight hours work. It was a question of taking out a few bricks—holding what we call a *post mortem* examination of the work.
16501. From the notes in your book you would have no difficulty in locating any particular day's work? No; I sent in every day a report of the work in progress and the work which had been carried out on that particular day.
16502. Do you remember the conversation with Inspector Reid at the end of 1893, just before he came on to Contract 79? Yes.
16503. Do you remember where it took place? In Walker-street, close to Mount-street.
16504. Where were you going at the time? I was going down to the ferry boat.
16505. What did Reid say to you? I was on one side of the road with Inspector Harris, and Reid, with, I think, his father-in-law, was coming up from the ferry. He came across the road and I met him half-way. He said he had been into the office and that he was to be reinstated. He was all smiles, and he said that when he did get a start he would make it hot for some of them. I could not positively swear that those were his exact words, but he seemed very sore upon this particular occasion, and I remember telling Inspector Harris after leaving him, what he had said to me. I do not think I have seen him from that day to this.
16506. You said that 853 casks were stored in the contractors' yard upon Contract 79? Yes; that is the note I have in my book.
16507. Were they, as a matter of fact, stored in the contractors' yard? I could not say whether they were all in one shed or not.
16508. What you say is that 853 casks were on the ground when you went over to the contract; you do not pretend to say exactly where they were? No. I may have said to Mr. Parkes just now, that they were at Alfred-street, but I could not say positively that they were all in one shed.
16509. *Mr. Parkes.*] I suppose you counted the casks? As nearly as I possibly could. The note in my book is to the effect that there were 853 casks on the work on Thursday, June 15th.
16510. *Mr. Davis.*] Do you swear that the 853 in your note book represents the number of casks on the ground on the date you have put down there? Yes, that is the note I made.
16511. I see your note book has not the word "casks," there are merely the figures "853"? Yes.
16512. *Mr. Parkes.*] That would be casks of course? Yes.
16513. *Mr. Davis.*] Will you read out the note you have opposite the date on July 21st, 1893? Yes, "850 Wouldham and Try's, 500 Wouldham." Both of these were passed, and I have put opposite to them the letter "P"; that note is made as a sort of check upon the cement on that particular date. It would have been one of my usual checks upon the cement used in the work as compared with the cement delivered on to the work. The note I am reading you would give the total quantity of cement upon the work on that particular day. The note continues "500 Germania, 180 Germania, and 69 from stormwater channel." The last part of the note would mean that 69 were delivered upon the work from another contract.
16514. *Mr. Parkes.*] Who delivered it? I have no note of that.
16515. *Mr. Davis.*] You said just now to Mr. Parkes that the only cement brought on to the ground was that which you, yourself, submitted for testing;—on the face of the note you have just read, would that be the case? I did not submit the 853 casks to which my note refers.
16516. *Mr. Parkes.*] What other cement was there which you did not submit? I could not say.
16517. Could cement come to the job which you would not submit for testing;—as a matter of fact, did any come which you did not submit? Not to my knowledge.
16518. Might it be that sixty-nine casks, which, according to your note, came from the stormwater channel contract, were not approved cement? No.
16519. *Mr. Davis.*] If it were approved cement you would not submit it for test a second time? No.
16520. How would you know that it was approved cement? Because I had the certificate from the inspector upon that work, which was handed to the carter. As soon as the carter brought the cement on to the works he sent that certificate to me.
16521. *His Honor.*] As regards these other lots, they may have also come on to the works with certificates showing that they had been already tested, and you would not, of course, submit them to test again? No. That was often the case. Cement is frequently changed from one work to another. For instance, suppose a job were being completed at Waverley, if there were a surplus quantity of cement there, it would be sent to North Sydney.
16522. *Mr. Parkes.*] You would have a record of that;—for instance, you have a record of the 853 casks which were on the job when you went there? Yes.

16523. Were there any other parcels of cement which came on to the job while you were there in the same manner as those sixty-nine casks? Several parcels of cement came during the time I was there.
16524. Did you have them all retested? All the new cement.
16525. Was there any cement which came which you did not have tested? Not that I am aware of, unless it came from some other work.
16526. But did you see any which came from any other work? Yes; there were the sixty-nine casks which came from the stormwater channel contract, and which I have noted in my book as passed. I would never accept any cement which came in that way unless it were accompanied by a certificate from an inspector upon another work. When cement was delivered to me under such circumstances my rule was to put my initials upon each cask.
16527. But whenever cement came to you you would make an entry of it in your notebook, would you not? Yes, as a rule. I have 5,000 casks of cement entered up as used on this contract while I was there—1,850 casks on the brickwork, 2,133 in the bluestone concrete, 526 in the plastering, 142 in the sumps. There is some more which I have not totalled up, but that would be the quantity up to a certain date.
16528. *His Honor.*] What I understood you to have meant hitherto is this: you wish to explain that all cement used in the work you have either had tested, or, if it be cement which has been already tested, you have had a certificate showing that to be the case? Yes.
16529. You have not been speaking as to the whole of the quantities of cement which came on to the work? No.
16530. What you wished to explain before was that no untested cement went into the work? Yes.
16531. *Mr. Parkes.*] Would you not send in a return of all the cement which you had upon the job whether you had it tested or whether it came to you tested? No. There might have been occasions when I did not do that. In some cases I may have been at one end of the work, and a load of cement may have been delivered at the contractor's yard at the other end. In that case the nearest officer about as a rule would go and check it.
16532. Would he send you a report? He would tell me that the cement had been delivered.
16533. Therefore there really was no effective inspector's check upon the cement delivered on to the work? Oh, yes, there was a check.
16534. *His Honor.*] A check of what kind—a check to prevent untested cement from being used or a check to find out how much cement was used? I always knew the brands of cement in the shed. I used to look into the shed almost hourly as I went backwards and forwards on the job.
16535. *Mr. Parkes.*] But where is your total tally of the casks which came on to the job? I have given you the total number used on the job up to 1st February.
16536. But I am speaking of the total number which came on to the job? I have not the tally in this particular contract because I was taken away before the contract was complete, and, as I have already explained, when I went there, there was already a quantity of cement on the ground. On other contracts upon which I have been I have kept a tally from beginning to end of the work. When I was removed from Contract 79 there was the extension to which I have already referred to be done, and there was some work to do in No. 4 shaft. On the last contract I was on I kept a tally of the total number of casks delivered on to the work, and the total number used, from beginning to end of the job.
16537. *His Honor.*] So that you could tell exactly the quantity of cement that had been used in the work? Yes.
16538. Was that check kept for the purpose of comparison with the number of cubic yards of concrete paid for—was that the object of it? That was my own object.
16539. You knew that you could get roughly at the quantity of cement that ought to be in the work? I could get that from the resident engineer.
16540. Was the check kept for the sake of seeing whether the work had been done properly in regard to mixing? It was a check for a variety of purposes. I always kept an account for my own sake, taking an interest in the work. I was anxious in all cases to know the quantity of cement which went into the work.
16541. You were able to institute a comparison between the number of casks of cement which you had and the number of yards of concrete? Yes.
16542. *Mr. Gummow.*] In answer to Mr. Parkes, you said that Inspector Vincent came on to the job after Inspectors Harris and Wagg;—what was Vincent—what class of inspector? A second-class inspector.
16543. Was he not really what they call an overseer? The term was changed, if I remember rightly.
16544. Do you remember from the pay-sheets whether Vincent was as highly-paid an officer as Wagg and Harris? No, he was not.
16545. He was a cheaper officer? Yes.
16546. He was probably sent to the work for economical reasons? He was sent there because the work was getting slack and other work was being opened up elsewhere upon which first-class inspectors were required.
16547. A second-class inspector could do the work which remained to be done upon Contract 79? Yes; it was merely on the concrete board.

Joseph Davis recalled and further examined:—

16548. *His Honor.*] You desire to hand in some returns? Yes. These are the inspectors' returns of the cement used upon Contracts 69, 77, 79, 79A, and 118.

J. Davis.  
9 Sept., 1896.

George Chamier sworn and examined:—

16549. *Mr. Smith.*] I think you are a member of the Institute of Civil Engineers? Yes.
16550. You have had some experience in engineering works in these colonies? About twenty-seven years in Australia.
16551. In what colonies principally have you been? I was engaged upon the first railway made in Tasmania, and afterwards in connection with the Victorian Water Supply Department, also upon several railways in the same colony. I was also engaged upon railway work in South Australia and Western Australia, and I have been consulting engineer in Sydney for a firm of railway contractors,

G. Chamier.  
9 Sept., 1896.

- G. Chamier. 16552. You have acted both for the Government in these various colonies and for firms of contractors? Yes; I have acted as manager upon some large railway contracts.  
 9 Sept., 1896. 16553. I think you were in Adelaide for some years? I was in private practice there for seven years.  
 16554. When was that? From 1879 to 1886.  
 16555. From your experience I suppose you can tell us something about the rigging of schedules by contractors? Yes.  
 16556. You have prepared a memorandum on that subject? Yes; it is as follows:—

## MEMORANDUM ON SPECULATIVE PRICES IN TENDERS.

WHAT has been called "rigging a schedule" is a practice which, to a moderate extent, is very common with contractors and cannot well be prevented. Government Departments and Engineers discountenance the practice, but it is extremely difficult to disqualify tenderers for Public Works on that account, nor do I know of any instances in the other colonies where this has been effectually accomplished. The great objection to interfering with public tendering in this respect lies in the danger of striking at the important principle of fair and open competition, and the acceptance of the lowest tender.

Thus in attempting to avoid one evil, which is of a small extent, the authorities might run into a far graver one, which would be certain to raise an outcry among contractors and give rise to suspicions of favouritism.

Nor is it by any means easy, at times, to draw the line clearly between genuine and speculative prices for work, as so many circumstances have to be taken into consideration in making up a tender.

I can speak from considerable personal experience on this matter, as I have acted as engineer and manager for several leading firms of contractors in Australia, during the past twenty years, and have had many occasions of noticing how these things are managed. The process usually adopted is as follows:—

A contractor in making up his tender begins by setting down prices for the different items from his own practical knowledge of the cost of similar works elsewhere, or from such outside information as can be obtained on all the points involved. The list represents the actual cost of the works as far as they can be correctly estimated.

But it must be borne in mind that most of the data for such estimates are more or less uncertain, and that the expense depends on a variety of circumstances and contingencies, such as the time allowed for carrying out the work, the weather, the prices of materials, which are constantly varying, the fluctuations in the labour market, with the possibilities of strikes, the cost of plant and machinery, and many other things.

Then allowances have to be made for risk, delays, supervision, office charges, and the expense of management, bank rates, or interest on capital, and the contractor's profit. All these elements of cost have to be included in the schedule rates; they are sometimes spread as evenly as possible over all the items, raising the prices generally by a certain percentage, or else they are lumped on to a few special items, which may appear in consequence out of all proportion to the other prices.

Thus certain prices in a schedule may seem highly speculative when in reality they are not so.

From this amended schedule of prices the lump sum of the tender is obtained, and this amount is not afterwards varied.

The schedule, however, may be altered in many respects without affecting the total, and this is done for various reasons.

Sometimes a contractor is short of money, or it may be a matter of great importance to him to obtain as much payment as possible at the start of the job. To effect this, the prices for such items in the schedule which are likely to be carried out in the early part of the contract are largely increased, at the expense of other portions which generally stand over to the last.

Thus "clearing" and "fencing" are often rated very highly because these works have to be done at the start.

Then, in the schedules for important works a multitude of items are put down, which the contractor may have to do work under, but which are not always required. The contractor has no certain information to go upon, and he is therefore to some extent justified in putting down speculative prices. For instance, bridges and culverts may be ordered to be constructed of stone, brickwork, concrete, timber, or iron, and the engineer generally reserves to himself the full right of ordering any of these, or of altering the design from one style of construction to another, in any place and under all conditions. Now, the cost of works will vary very much according to the site and under varying conditions. It is quite necessary that such a power to alter the contract should be vested in the engineer, but it is difficult for the contractor to price the different works fairly under such circumstances. The element of risk is largely increased, and it has to be met. There is something to be said on both sides.

Of course the tendency is to modify the first draft of the schedule so as to increase the prices for such works as are most likely to be carried out, and to take a corresponding amount off other items which may not probably come into operation. If this is done to a moderate extent only, no reasonable exception can be taken to it, as by the provisions of the contract the tenderer is left in considerable uncertainty, but when the practice is carried to extremes it becomes highly objectionable. A contractor may back his judgment in framing his schedule. I will give an illustration from a case that came under my own knowledge. We will say that a long railway cutting, containing 20,000 cubic yards, and worth about 2s. 6d. a yard to take out, leads to a station-yard containing 5,000 cubic yards of light earthwork, worth about 1s. 6d. a yard only. The contractor, rightly judging that the station-yard will need to be largely extended, alters his first schedule rates so that the hard cutting is priced at 2s. a yard, and the station earthwork at 3s. 6d. The totals in both cases remain the same, viz., £2,875; and should no alteration take place in the original design there would be no difference in the cost to the Department. But the anticipated extension of the station-yard does occur; it is increased to four times the first quantity, and the contractor therefore makes a clear gain of £1,500 by the alteration.

It is a very common practice to put high prices on certain items which generally exceed the scheduled quantities, such, for instance, as side-cutting. I have known side-cutting rated higher than the heavy earthworks, although the latter would cost twice as much to take out. Sometimes, however, these speculative prices tell very much against the contractor. I knew one who, in his schedule, put cement down at 1s. a cask. It was not anticipated at the time that any cement would be needed on the works. Unfortunately for the contractor a considerable quantity of that material was ordered, and had to be supplied at this very unremunerative rate. Thus speculative tendering cuts both ways, and as a rule experienced contractors are very shy of adopting such methods on a large scale. Judging from my own experience for the past twenty-five years I do not think that much loss has been sustained by the Public Works Departments through speculative tendering. Some smart contractors have occasionally scored well by the practice, while others have lost heavily, and, upon the whole, the cost of the works has not been materially affected. Nevertheless the practice is a bad one, and should be checked as far as practicable, without interfering with fair competition. The plan that Mr. Hickson lately introduced for pricing schedules strikes me as the best attempt in this direction that I have ever known made.

GEORGE CHAMIER,  
 M. Inst. C.E.

16557. Did you look at the schedule for Contract 69 of Messrs. Carter, Gummow, & Co. and the prices it contained? I glanced through them.

16558. You noticed the item "bluestone pitching"? Yes; £50 a sq. yard.

16559. What would you say as to that? It is the most extravagantly priced item I have ever known.

16560. Do you think the presence of that price in the schedule would of itself justify the throwing out of the tender? No; I do not think so from my knowledge of the course generally pursued in the other colonies. It becomes a question as to where you are to draw a line. I have never known a line to be drawn at any particular price, and it would be very difficult to say that, if such and such a price were given for such and such items, a tender should be rejected. I do not see how you could possibly apply such a principle.

16561. Has your attention been drawn to the minute with regard to the striking out of this work when the mistake was discovered? Yes.

16562.

16562. Let me direct your attention to the minute which is printed upon page 382 of the evidence, and which is attached to Mr. Christie's memorandum No. 17; you will see Mr. Davis' minute and Mr. Hickson's ruling upon it? I think Mr. Hickson adopted the proper line of conduct. It is in accordance with the course which I have known to be taken elsewhere. G. Chamier.  
9 Sept., 1896.

16563. You mean where he says that in fairness the item could not be omitted? Yes; I think the Department having accepted the contract as it stood was bound to act up to it.

16564. With regard to the clauses referred to by Mr. Christie in this connection, and which appear upon the next page of the evidence, you will see two clauses No. 16 and No 17. Clause 16 empowering the engineer to substitute one class of the work for another, and the other clause being as to the omission of work. Those are ordinary clauses in Government contracts? Yes, they have been included in nearly all the specifications I have seen. They are not applicable I think to a matter of this sort.

16565. From what you know with regard to tendering here the practice is for probable quantities to be taken out by the office, and for tenders to be invited upon those prices? Yes, that is the practice, the quantities not being in any way guaranteed by the Government, and many of them being put in merely for the purpose of getting a price.

16566. Suppose a contractor who was tendering had an agent in the Department who was supplying him with information, would it be possible for him to obtain information in that way which would help him in the rigging of a schedule? Not that I am aware of. I do not see how private information could help a contractor at all in a matter of that sort.

16567. As a matter of fact all that is known to the Department is put forward in the probable quantities? That has been my experience; and frequently the alterations which have taken place have not been thought of at the time the contract has been let.

16568. In the case of these Government contracts moreover, it is not known who will be the engineer to supervise a particular contract? No. Frequent changes are made in the *personnel* of the Department, so it would not do for contractors to rely upon having any one man to deal with a particular work.

16569. It would not be possible you think for a contractor to get information of the kind I have indicated from the Department with the result that he would be put in a better position in tendering than would other contractors? I do not think so. Of course contractors always try to get as much information as they can, but I do not see how information from the Department would help a contractor in a case such as you refer to.

16570. So that even if there were collusion you do not see how that would assist in bringing about successful rigging? Not unless there were collusion with the Engineer-in-Chief.

16571. Who would have control of the job all through? Yes. Of course collusion with him might lead to any amount of corruption, but not in the case of any subordinate officer.

16572. In the course of your experience I suppose you have seen the arrangements which contractors have made with regard to their bonds and securities? Yes. There is not much of that done, as a rule, in the Public Works Departments in these colonies. It is very common in England, but here it is not the rule to accept bonds at all.

16573. But where bonds are taken, is it or is it not a usual thing for the sureties who lend their names to get something for it? They generally get a percentage on the profits. That is the consideration.

16574. With regard to this Monier system which we have heard so much about, have you ever seen any work of that kind? I have inspected the work which is being done at Johnstone's Creek.

16575. But have you studied the system itself? From books and from reports of work of this kind which has been carried out in Europe and in America. The work at Johnstone's Creek is the first work of the kind which I have actually seen carried out.

16576. What is your opinion of the system. Do you think it is a system which can be introduced with advantage? I do. I think it is a system which can be used with great advantage in many classes of work.

16577. You think that it is of a durable nature? I have always had a very high opinion of cement concrete. I have myself built a large number of works in cement concrete—culverts, dams, and such like, and I think the introduction of iron will be a great improvement. The system will enable the works to be carried out much more economically. Personally, I have very great faith in it.

16578. You know what has been done in regard to the work you inspected on Contract 77—you know the precautions which have been taken with regard to throwing the risk on to the contractors—what have you to say to that? As a rule, I should not approve of the principle of throwing the risk on the contractors, because I do not think it is a fair thing to do; but, in this case, the efficiency of the work resting so much on the quality of the workmanship, and the soundness of the work being the main consideration, I think it is quite a proper thing to do, that is, to throw an exceptional risk upon the contractors, making them responsible for the whole work.

16579. Do you think that three years is a sufficiently long period for which to require the contractors to guarantee the stability of the work? In three years time cement concrete always attains its greatest strength. It is not known to increase in strength after that period, consequently, three years would be ample to test the work in every respect.

16580. With regard to the security taken—the amount of the contract itself is £15,500—that being so, would you think that two sureties of £6,000 and a bond of £12,000 would be a fair thing in addition to a fixed deposit? It is a great deal more than is usual. It is nearly double the amount required.

16581. You think that that is a reasonable arrangement to make in conjunction with the throwing of the responsibility on to the contractors? I think it is almost excessive.

16582. *His Honor.*] That is even as regards the whole of the work; but, in point of fact, the amount of £15,500 is greatly in excess of the value of the portion in which the risk is involved? Quite so.

16583. *Mr. Smith.*] Did you ever hear of a similar instance? A case occurred in Adelaide, about sixteen years ago, which was somewhat similar. There were large gaps on the Nairn line of railway leading from Adelaide up to the hills, which had to be crossed. Bridges and embankments of the old type would have been costly, and an American firm offered to cross these gaps with the light trestle-work viaducts which are so well known in America. The system was quite unknown in the colony, but it was considered to be of advantage to have a sample of that class of work, and accordingly the contract was given to this American firm without tendering. The actual cost of the viaduct was rather lower than the cost of bridging the gaps in the ordinary way; but the prices for ironwork were nearly double the

- G. Chamier. the ordinary bridge-work prices upon the English system. That instance seems to correspond, to a certain extent, with the adoption of the Monier system upon this contract; and in this way—the price of the work may be considered excessive, but the lightness of the structure makes up for it. The viaducts to which I refer were regarded with grave suspicion at the time. In point of fact, I remember that some years afterwards a motion was made in Parliament to have them all pulled down and embankments substituted. It was thought that the public would never be convinced that they could with safety travel over such light and apparently spider-web structures. The motion was not carried, and, as a matter of fact, the viaducts are perfectly safe, although they may not look so.
- 9 Sept., 1896. 16584. That particular contract, I understand, was let without tendering? Yes; in order that the new system might be introduced into the colony.
16585. Have you examined the work upon Contract 77? Yes; I have been there on two occasions, and I have also examined the plans.
16586. What would you say as to the way in which the work is being done? It seems to me to be done remarkably well. The quality of the material also seems to be excellent.
16587. You say you looked at the plan as well as at the work itself;—what have you to say with regard to the margin of strength and all that sort of thing? I did not go minutely into the calculations of strength, but I satisfied myself that the work was amply strong for the purpose. I think it would have a margin of strength of at least 6 or 7.
16588. You have no reason whatever to doubt the stability of the work that is being done there? Personally I have not. At the same time, it must be admitted that the engineering profession was shown a little doubt on the subject, judging from the tenor of the discussions which have taken place. Personally, I have no doubt whatever as to the system.

FRIDAY, 11 SEPTEMBER, 1896.

George Chamier recalled and further examined:—

- G. Chamier. 16589. *Mr. Smith.*] At the conclusion of your examination on Wednesday you were speaking of the Monier system;—have you made any kind of estimate as to the cost of the Monier work which you saw in Contract 77? Yes.
- 11 Sept., 1896. 16590. First, as to material, did you obtain any quotation as to values, or what did you do? I obtained the best information I could on the subject, and I valued it principally upon my former experience in somewhat similar work.
16591. Did you go through your estimate more than once? I have been through it carefully.
16592. What do you make the cost of the work per cubic yard? I make the total cost of the compo. in place £4 a yard.
16593. *His Honor.*] Including the ironwork? Yes; and all charges that might fairly be put down to the contract.
16594. *Mr. Smith.*] It includes charges for patent rights, and also for the risk and guarantee for three years? I have gone upon the basis upon which I should have gone had I been called upon to make an estimate for a contractor doing the work.
16595. Did you obtain quotations for the material? Yes.
16596. Did you take the highest or lowest quotations, or what did you take? I have taken very low values.
16597. As to the labour,—what did you put down for that item? In the item “labour” I have included mixing, screening, wheeling to site, ramming in place, the fixing and removal of the lagging and side-boxing moulds, and small centering, also the fixing of the ironwork in position. I have put the whole down at 12s. a yard.
16598. How did you arrive at that? The only way in which I could arrive at it was by comparison with the cost of concrete work which I had carried out elsewhere, allowing for the difference in the amount of labour. This is quite a special work, involving more labour in the concrete itself, and a great deal more in fixing the timber and the iron grilling. The estimate is based mostly on prices which I have known to be paid for work of a somewhat similar character. The only correct way of getting at the cost of the labour would be to take the time of the men from the pay-sheets. I do not attach much value to an estimate of this sort, although I have taken great care with it.
16599. We have had an estimate from Mr. Davis as to the value of this work, in which he says that, taking the actual time, it would be 17s. 8d. a yard;—what would you say as to that? I should not be at all surprised to find that the work cost that.
16600. You think that would be a better estimate, taken from the actual time, than your own? Estimates of this kind are always uncertain. Of course, if you go to the pay sheets you reduce the cost to an actual certainty.
16601. So that by adding the extra 5s. 8d. your total would be brought up to £4 5s. 8d.? Yes.
16602. What was the amount which you said you had put down for the patent rights and risk? I find it very difficult to estimate. There is an exceptionally heavy risk—quite an unusual risk—thrown on to the contractors in this case, with a guarantee to rebuild the whole work if it shows any flaw whatever within three years, coupled with three years maintenance. Looking at it from an outside contractor's point of view, I have allowed 20 per cent on the actual cost of material and labor, and that comes to 11s. per yard.
16603. If you take that off the £4 5s. 8d., what do you get? From a contractor's point of view, I should strongly object to its being taken off, because I consider it a most essential part of the estimate.
16604. Did you look at the evidence given to the Commission by Mr. McCredie? Yes; I remember reading it through.
16605. Let me direct your attention to what he says in reply to Question 2629, as to the value of the compo. He says, “I make it up in this way: take 3 yards of sand at 2s. 6d., that would be 7s. 6d.”—what have you to say as to that? That is much below the value I put upon it. The strength of the concrete depends materially upon the quality of the sand. My estimate contemplates the very best class of sand that can be obtained—the best crushed sandstone—which I have put down at 7s. a yard. I think that a moderate estimate.
16606. In view of the finer sand which you would have to use in this particular work? Yes; it makes a considerable difference—a difference of 30 per cent. in the strength of the concrete.
- 16607.

16607. Then with regard to the other items, as to labour, for instance, he said "I allow 8s. 6d. for labour, covering, timbering, mixing, and everything in connection with it"? I should be very sorry to undertake a contract upon such an estimate. The cost of labour in ordinary concrete work which we put into walls or culverts is always reckoned at from 5s. to 6s. a yard—that is a standard rate; in fact, it has generally cost in work in which I have been engaged about 6s. There are a host of other items to allow for—office expenses, management, platforms, water, moulds, centering, scaffolding, and use of plant. Contractors' profit is generally put down at 15 per cent. So that if the 8s. 6d. is intended to cover the whole, I am afraid you have a basis upon which few contractors would care to undertake the work.
16608. So you do not agree with Mr. M'Credie in his estimate? I entirely disagree with him.
16609. He makes his total £1 10s. a yard? Mine is £4, so there is a difference of £2 10s. between us.
16610. I will ask you to turn now to Mr. Bagge's evidence on page 45. You will see that in reply to question 1635 he appears to adopt an expression used by Mr. Parkes. Mr. Parkes said, "It was your opinion that it would not be safe to construct the work on a risky patent," and Mr. Bagge says, "Exactly." I suppose you would not call it a risky patent? It is not risky. It is to some extent experimental; but we have seen such excellent reports of Monier work which has been constructed elsewhere, which has been subjected to heavy tests, that I am not inclined to consider it a risky experiment at all.
16611. If you turn to another portion of Mr. Bagge's evidence, upon page 47, you will see that in reply to question 1705, Mr. Bagge says that they tried to make a calculation as to whether the centre line of resistance would keep within the middle third of the arch ring, but that the key was not given them. Again, in reply to question 1742, he refers to the key, and says, "I told you that we had not the key in making our calculations." What have you to say as to that? I never before heard of a key to any calculation. The only sort of key which applies to arch work would be the depth of the keystone. I do not know whether that is what Mr. Bagge refers to, but certainly there is no key in ordinary calculations as to the strength of an arch. I really do not know what he means by the expression.
16612. As to the keystone itself in the arch, what have you to say as to that? The depth of the keystone in the arch cannot be obtained by calculation. The best mathematicians have, I believe, given up the attempt. A scale is adopted which has been obtained from practice, and which is recognised as safe. It varies generally from about 2 feet in depth in small arches to 4 feet in very big ones, and there is no particular co-efficient required, or anything which you could regard as a mysterious number which would have to be discovered in the matter. It depends purely upon the result of experience.
16613. With regard to the Monier system, how would you go to work in building an arch upon that principle? An arch upon the Monier system admits of being calculated much more closely, because it is a homogeneous mass. The necessity for allowing such great extra strength in the case of brickwork and masonry lies in the fact that there is a certain amount of uncertainty as to the strength of the different parts. They are not all exactly alike, and they sometimes do not fit together with the greatest nicety, but in the case of the Monier you could work it out as you would an iron arch with the pressure on the material. That is the reason why the system admits of being cut so fine.
16614. I suppose you would work upon experiments made all over the world? The experiments which have been made would give any clue that is required. That is the only key I can understand in the matter—a key obtained from actual practice.
16615. The practice being the number of experiments made in various parts of the world? Yes. The engineering journals are full of accounts of experiments in different countries.
16616. And in these experiments I suppose you always have exact dimensions and various tests of strength? We have everything required to arrive at correct results.
16617. Upon page 46 of his evidence, Mr. Bagge, in reply to question 1666, refers to the necessity for specialists in connection with a work of this kind. What have you to say as to that? I think he is putting forward a bugbear of his own imagining. There is no very special knowledge required in the matter. Of course the work wants care and the use of good material, but there is no mystery about it. There is no difficulty in making first-class work.
16618. You will see that, in reply to question 1674, he refers to special cement? That is another of his objections, and I think it is a very frivolous one. There is no such thing as special cement. A number of manufacturers vie with one another to produce the best article. The quality is determined by actual test and experiment. You can obtain just as good cement in Australia as in Germany or anywhere else. It is sold in the open market. It is entirely a question of test of strength. There is no particular brand that I know of which should be taken in preference to another.
16619. As to the tests applied in this colony, how do they compare with tests applied in other parts of the world? They are just as severe. I have read accounts of French, German, and American, tests, and I find that ours are quite as severe. The tests are published all over the world, and you will find manufacturers boasting that their cement will stand so many lb. to the square inch after a certain number of days. We know perfectly well what to expect in the matter; there is no mystery about it.
16620. Replying to question 1674, Mr. Bagge says that the arches must be carried on night and day until they are completed;—what have you to say as to that? I can see no earthly object in that.
16621. *His Honor.*] If what Mr. Bagge meant was that each individual arch had to be constructed in one piece, I suppose you would quite agree with that? Yes; but if he meant that the whole aqueduct had to be constructed in one piece, I can see no earthly object in it. He says in one place that there would be a fear of one arch toppling its pier over. That is absurd, because the centering takes the weight while the arch is in construction, and the same thing will apply to any class of construction—to brickwork and stone, as well as cement concrete.
16622. *Mr. Smith.*] If you turn to question 1779 you will see that Mr. Bagge makes the following statement in reply to Mr. Gummow: "What I mean to say is that you have to start a number of arches at the same time. You also have to start the cement work at both ends of each arch simultaneously. The work must continue until it is closed in the centre. It must go on night and day. It will not do to have any dry joints. There must be no joint in any part of the structure."? I cannot understand how he arrives at such a conclusion. I think it is important that every arch should be carried out without dry joints, but certainly not a series of arches.
16623. What have you to say with regard to advances to contractors. Have you heard of that being done on any of the contracts upon which you have been engaged either on behalf of Governments or contractors? Yes. A demand is generally made by contractors before the work has proceeded very far that

G. Chamier.  
11 Sept., 1896.

G. Chamier. that certain moneys held back should be returned to them. The practice in the other Colonies as far as I know—I am certain it is the case in South Australia—is that when the retention money amounts to the full sum of the deposit the deposit can be returned, the retention money being taken in place of it. There is a clause to that effect in the specification which I now produce. It is the specification of the railway from Nairn to the Victorian border. It is one of many specifications in which the same clause occurs.

11 Sept., 1896.

16624. *Mr. Parkes.*] Is that a Government specification? Yes.
16625. Compiled under you? No; I happened to have it in my possession.
16626. *His Honor.*] What is the date of it? 1st February, 1884.
16627. Was it a big work? A very important work, leading from Adelaide over the mountains to the Murray. I have a number of other specifications with the same clause.
16628. *Mr. Smith.*] Is it a usual clause? It is usual to the best of my knowledge.
16629. You are referring now to the clause relating to the return of the deposit money when the retention money amounts to a similar sum? Yes.
16630. And that you say is the usual practice? Yes; I have generally known it adopted. Then, of course, in reference to the retention money, too, it is a common occurrence for contractors to apply to the Department to have the money returned to them when the work is well advanced and when the Department has ample security in other respects, such as plant and material on the ground. When the Department considers that the Government has ample security, it has never in my experience made much difficulty in returning a portion of the retention money.
16631. *Mr. Gummow.*] You referred to the viaducts on the Nairn Railway as being a parallel case with the adoption of the Monier system in Contract 77? Yes.
16632. To what use is the viaduct to which you refer put? To carry the railway.
16633. For passengers? Yes.
16634. So that in that respect it is not a parallel case with our work? I alluded to it as the nearest approach to anything of the sort which had come under my notice.
16635. But the structure was regarded by some of the public as a dangerous looking structure, having regard to the fact that the railway running upon it had to carry passengers? Yes.
16636. There being a greater risk, if there were any risk at all, in using it in that way, than there would be in using these Monier arches for the carriage of sewage? Of course there was only a sentimental grievance against it. People did not like the look of it, and some objected to travel on the line. The viaduct certainly looked very rickety and flimsy.
16637. As to your memorandum upon speculative prices in tendering, you have set out a number of reasons as to how contractors put in prices upon the schedule items—I suppose that very often one schedule item depends upon another in its use and requirements? Yes.
16638. For instance, if you are doing tunnel work which has to be lined with brick and concrete or in which timber has to be left in, then before the lining of concrete and brickwork can be put in or before the timber can be put in a certain amount of excavation has to be taken out? Of course.
16639. If the brickwork is increased from one ring to two-ring work, must there not be a corresponding amount of excavation taken out to permit of the second ring of brickwork being put in? Yes; as a rule the excavation is sufficiently beyond the actual net size to allow of one or two rings of brickwork. It would not alter the design in the carrying out of the tunnelling.
16640. But if you are ordered to drive a tunnel for two-ring brickwork instead of one-ring brickwork, and if you are paid by the cubic yard, you would get paid for the extra cubic yards involved in the two-ring work? You would be paid for any extra excavation there might be.
16641. In that case a contractor, looking at the brickwork item, would say "if they order any more brickwork they must pay me for a corresponding amount of excavation"? Yes.
16642. A similar case would be where the timbering is left in and paid for—there must be a sufficient area taken out by means of excavation to cover the space occupied by the timber? Yes.
16643. So that that is taken into consideration by the contractor. He may have certain prices for timber, brickwork, and concrete; but those items cannot be used unless the extra excavation be taken out? That is so.
16644. As to the Monier arch. In calculating the strength of the masonry arch, do you use the theory of an elastic arch in making out your calculation? No.
16645. Do you in the case of an iron arch? Yes.
16646. In calculating for a Monier arch, would it come under the heading of the theory of an elastic arch to a certain extent? It would; and that is the reason why it allows of being made so much finer in dimensions.
16647. So that you have probably two or three or more methods of arch calculation in this class of work, seeing that it applies partially to masonry work, and partially to the system of iron arches? Yes; but I may say that in all work of this sort engineers rely mostly on the results of experience. In the case of iron, we can find out the strain on every bar exactly. You could never do that in any class of masonry.
16648. What is the reason you cannot do it in the case of masonry? Because masonry is only calculated to stand one kind of pressure—the compressive strain.
16649. And it has joints? Yes; which you never rely upon.
16650. They are not of the same nature as stone itself? That is so.
16651. With regard to continuity in construction—do you know of the use of this Monier system for warehouse floors, and work of that description? I have read most elaborate accounts of its being used in a variety of ways, and that is one of them.
16652. Do they in the case of floors use girders, and put this work in as a sort of jack arch between the girders? That is the design I have generally seen.
16653. Could there be continuity over the whole floor or would it not be broken by the web of the girders? It would be broken of course.
16654. There would be no continuity in the case of floor construction? No.
16655. And as regards viaducts and aqueducts and that class of work continuity is equally unnecessary? There could not be continuity in any case, because you must allow for expansion joints.
16656. As to returning the deposit and retention money to the contractors—do you consider that as regards future work contractors will take it into consideration if they find that a Government will assist them

them financially as far as practicable? I have frequently found that Governments—speaking of the other colonies—have wished to impress contractors favourably as to the manner in which they were going to treat them. If a Government were very harsh with contractors and took advantage of the specification they would find the contractors less anxious to do work for them. G. Chamier.  
11 Sept., 1896.

16657. The tenderers would probably put their prices higher if they thought the trouble to which they would be put would be greater? They would.

16658. So that indirectly it is of benefit to the Department to assist contractors? I think so. From a contractor's point of view—certainly.

16659. *Mr. Parkes.*] When did you leave South Australia? I think in 1890.

16660. What work did you actually carry out over there? When I left South Australia I had been acting as chief engineer for C. & E. Miller, the large contractors. I had been engaged on works in South Australia, Western Australia, and in the Northern Territory.

16661. How long were you in South Australia altogether? About 12 years..

16662. What work did you actually carry out there yourself? Several lines of tramway. I carried out the Parkside tramway, the Hyde Park tramway, and the Glenelg to Merino line. I superintended the construction of the Torrens dam, and I also had the Grange railway. I acted as consulting engineer for several firms of contractors who were carrying out large works at the time.

16663. Were these works Government works? No; not all of them.

16664. Were you in sole control? No; I was consulting engineer. The works to which I have referred were carried out by private companies. The Torrens dam was under the City corporation.

16665. What sort of material did you employ in that dam? Cement concrete.

16666. Was it a reservoir? It was a big dam across the bed of the Torrens, in a central position, near the city. It formed a sort of artificial lake.

16667. What work have you done in this Colony? I have simply acted as consulting engineer for firms of contractors. I have not carried out any works.

16668. You said you had had experience of a similar class of work to the Monier work;—will you describe what it was? The nearest approach to it was on some of the South Australian railways, where culverts were built of concrete. On the North-west Bend line most of the culverts were of concrete.

16669. Of what size would the arches of the culverts be? They would run from 2 feet to 10 feet.

16670. There was no iron associated with the concrete? No.

16671. Have you had any experience of work in which iron has been associated with concrete? Not with concrete; but I have seen a good deal of hoop-iron used in brickwork.

16672. Have you found that concrete in large bulk above ground shrinks? I have never heard of any shrinking in concrete. There is a certain amount of contraction and expansion. I do not see how shrinkage could take place. It is a hard brittle material.

16673. Is there much contraction in concrete after it once sets? No; I have not known of any shrinkage at all. There is a slight tendency to expansion in setting.

16674. Does it never contract after setting? I have never known of such a case.

16675. The cracks would occur from shrinkage, would they not? You cannot have any shrinkage in concrete; it is just as impossible as it would be in the case of glass. It is a hard, brittle substance. There may be cracking due to contraction and expansion from cold and heat. I believe that cracks have occurred in masses of concrete from that cause.

16676. You referred to a clause in the South Australian specification relating to the refund to contractors of retention money;—did you ever hear of a refund before the completion of the work or the expiry of the term of maintenance? What the clause provides is that when the retention money equals the amount of the deposit the deposit may be returned.

16677. Practically, then, the retention money takes the place of the deposit? Yes.

16678. Therefore the Government would have still a deposit in hand? Yes.

16679. You referred to the Nairn railway and the viaducts upon that line? Yes; the viaducts I alluded to are built upon the American trestle system.

16680. They are of iron, not concrete? Of iron.

16681. So that there is no comparison between that work and the Monier work? No; I was comparing the principle of the thing, not the work itself.

16682. You said you saw no difficulty whatever in doing first-class Monier work—that there was no mystery or impediment in connection with the system? That is my opinion.

16683. Therefore, under an engineer who understood the system, any contractor could do the work? Any contractor could do it provided he exercised the necessary care in the execution of the work.

16684. Provided the work were properly supervised? Yes.

16685. How long have you been in this Colony? I think a little over six years.

16686. You have not carried out any actual work here? No.

16687. You have acted here as consulting engineer? Yes.

16688. When you were in Adelaide do you recollect any inquiry into public works? There were so many. There was an inquiry going on nearly every year.

16689. Do you remember an inquiry by Royal Commission in 1880? I could not recollect it merely from the date. Perhaps you could tell me what the inquiry was about.

16690. Do you recollect a complaint as to the cost and defective nature of the public works in 1880, and a Commission of Inquiry being demanded? I really could not remember the circumstances, unless you gave me more details. There were so many inquiries. I myself gave evidence upon several of them, but I could not now specify any particular one.

16691. Did you not give evidence before the Commission which sat in 1880? I think I did. I was generally asked to give evidence when an inquiry was in progress.

16692. I refer to the Commission which remodelled the service? I could not identify it from memory.

16693. Do you recollect giving information before the Commission in 1880 concerning the mode of schedule tendering? It is too far back; I cannot be sure as to what took place speaking from memory.

16694. Do you recollect pointing out to the Commission the danger of schedules which contained imperfect quantities? I may have done so; it is very likely that I did, because it is a subject which I have often thought about.

16695. Do you recollect telling the Commission that schedules prepared in that way allowed of an engineer

G. Chamier. engineer ruining or benefiting a contractor according to his will? I cannot remember that particular circumstance you allude to, but it is quite possible that I said such a thing. No doubt it is in the power of an engineer-in-chief, under the form of contract you allude to, to make a contract almost ruinous to the contractor.

11 Sept., 1896.

16696. You advocated a change to stop any chance of what you term probable corruption; you advocated that at any cost the full data should be given to the contractors? I cannot remember the circumstance, but I do not see anything unlikely in my having said so.

16697. Do you recollect the form of schedule in South Australia? What I objected to, if I remember rightly, was this—that you placed the contractor in a difficult position where you asked him for prices (say) for a few yards of material, and where the engineer reserved to himself the right to order a change in the work without stating in what position the material was to be placed. It makes it exceedingly difficult for a contractor to price the work accurately under those circumstances. That is what I had in my mind; but I could not speak as to the wording of any particular answer which I gave at the time.

16698. Do you recollect stating that schedules of the description referred to allowed the engineer to substitute brick for stone or stone for brick, and so alter the material as to ruin or benefit the contractor? I do not remember making that particular statement, but it would be quite possible for an engineer to do what you say under the conditions named.

16699. There can be no doubt, therefore, but that the fullest data should be given to contractors? I think it is very advisable, and from the contractor's point of view I have always asked for it.

16700. Do you think that a contractor's tender ought to be accepted if it be clearly denoted on the face of it that the contractor is imposing upon the nature of the schedule which has been given to him? There you open up a difficult question, and I am not prepared to express an off-hand opinion upon it. The difficulty is that the public and the contractors expect open competition, and immediately you begin to raise points and restrict the contractors within certain limits you will raise a cry of favouritism and under-hand dealing. It seems to me that you are between two difficulties.

16701. But you did point out the danger attending this particular form of schedule to the South Australian Commission? I really cannot remember the evidence I gave on that occasion. It is a long time ago. There is considerable objection from the contractor's point of view in having to give prices without proper quantities being attached. It may lead to a very great loss. Take a railway contract. The specification may give a certain number of timber culverts in places where timber would be plentiful and they would be priced accordingly. The Engineer-in-Chief has full power to strike out that item and to substitute concrete and brick-work. Bricks might not be easily obtainable, and under those circumstances the work might be rendered almost ruinous to the contractor.

16702. The clauses in the specification are generally taken by the engineer literally, are they not? Well, from the contractor's point of view we do not look at it in that way. We bring in equity, as far as possible. If I were arguing the point before an engineer-in-chief, I should certainly ask him not to take the literal meaning of a clause in the specification, but to have regard to what is right between man and man. We take as little notice of the specification as we can.

16703. But ought not a specification to be prepared with that conciseness which will admit of its being accepted literally? I have heard a leading engineer say that a specification is meant for rogues. That is the basis upon which they are drawn up. They are never meant to be applied absolutely. They give enormous power to the engineer, which may be rightly exercised at times; but in the case of honest contractors, who do their work well, the specification is not enforced literally.

16704. You take the matter in this way—that an engineer is an arbitrator, who uses his discretion as to what is equitable between employer and employed? Yes; that is the view I take.

16705. *His Honor.*] Have you gone into the question of the watertightness of cement and concrete? Yes; I have had a good deal of experience in that matter, having built a number of dams and other works in concrete. I have seen a good deal of concrete work.

16706. What is the result of your experience? My belief is that concrete itself is slightly porous; in fact, experiments prove that water under considerable pressure will ooze through it, without, however, doing it any harm. After a short time the pores get filled in, and it becomes watertight of its own accord; but, by rendering the concrete with cement mortar, you can make it almost as watertight as any material that can be used—in fact, it is usually considered thoroughly safe. One-to-one mortar is almost as watertight as any material you could put on a wall.

16707. *Mr Parkes.*] Who asked you to come and give evidence before this Commission? Mr. Hickson.

16708. You knew Mr. Hickson well in South Australia? Yes, I have known him for the last seventeen years.

16709. You are a good old friend of his? Yes.

16710. *Mr. Smith.*] While you were in South Australia did you ever hear anything against Mr. Hickson—that is as to his capacity or his integrity? I never heard anything that I thought worthy of taking notice of.

16711. Have you as consulting engineer ever done anything for Carter, Gummow, & Co.? No.

16712. Do you know them at all? I do not think I have ever seen them at all.

16713. *His Honor.*] I understand that you are now practising privately? Yes.

16714. You are not in any way connected with the Department? No; I have acted for the Department in some arbitration cases, and also against the Department. I am not in any way bound to the Government. I would take a brief against them to-morrow if it were offered me.

Joseph Davis recalled and further examined:—

J. Davis. 16715. *His Honor.*] You desire to make a statement to the Commission? Yes. It is in reference to the list of cases in which the fixed deposit had been returned to contractors. Having looked into the matter, I find that there are three cases in the Sewerage Department in addition to the two cases mentioned in the list which has been already handed in. One is Contract 80, Messrs. Parry and Farley's, the amount being £1,100. Another case is Contract 75, Messrs. Parry and Farley's, the amount being £300. The third case is Contract 64, J. Carson's, the amount being £5,000.

11 Sept., 1896.

16716. *Mr. Parkes.*] Would that be the total number of cases? I could not say positively; there may be others. I have not been able to discover any more. It is very difficult to get some of these old papers.

16717.

16717. Could you give the dates prior to the completion of the contracts you have named at which these moneys were refunded? The papers in the cases of Contract 64 were laid upon the Table of the House last night, and we cannot therefore refer to those. The books show, however, that the deposit was returned on 30th July, 1894, and that the final voucher was paid on 6th May, 1896. As to Contract 75 the deposit was returned on 19th of May, 1892, and the final voucher was paid on 9th December, 1892. In the case of Contract 80 the deposit was returned on 2nd November, 1893, and the final voucher was paid on January 8th, 1894.

J. Davis.  
11 Sept., 1896.

16718. The final voucher is not always paid for something like six months after the contract is completed? It is due when the contract is completed.

16719. But have you in every case paid the final voucher when the contract has been completed? The date of the final voucher is usually the date of the expiry of the maintenance period, which is regarded as the date of the completion of the contract. In the case of Contract 64 there was some delay in paying the final voucher on account of a claim that was pending. That accounts for the long period which elapsed between the date of the return of the deposit and the payment of the final voucher. The deposit in that case, however, was repaid before the work was completed.

16719½. You hand in a statement showing the contracts of Carter & Co. and Carter, Gummow, & Co., the dates of signing the contracts, and the dates of the payment of the final vouchers? Yes; that statement has been prepared by Mr. Hungerford.

Robert George Reid recalled and further examined:—

16720. *Mr. Parkes.*] When you were an inspector upon Contract 79, were you on duty at night or in the day? I had night-work.

R. G. Reid.  
11 Sept., 1896.

16721. At the time you complained of the men putting dry stone down the shaft, were you on night-work or day-work? I was on night-work. I went on at 4 o'clock in the morning, and sometimes a little before, and came off at 8. Then I went on at 4 in the afternoon and came off whenever I had finished.

16722. When you complained to Inspector Fowle, what time of day was it? It was half-past 6 in the evening when I wrote out my report.

16723. At what time did you go off in the morning? I went off in the morning at about 8 o'clock.

16724. Were you on duty all night? I went off at 8 o'clock and came on the next morning at 4 o'clock.

16725. After you had sent in your report, when did you next see Inspector Fowle? I am not so sure that I saw Inspector Fowle on that particular day. I should imagine that he would get my report at about 9 o'clock.

16726. Did you see him during the day? I think I must have seen him that day. If he had had anything special to see me about he would have come to my house.

16727. Did you see him on the job? I could not say whether I saw him on the job. On some days I would not see him at all unless he had something special to see me about.

16728. Did he ask you to go down a certain shaft with him? He did not.

16729. Do you know that he went down the shaft on the day following your report? I did not know it.

16730. Until when? Until I read it in the *Evening News* the other day.

16731. He did not request you to go down and see the work—he never asked me to go? Connors asked me to go down on the night upon which I made my report at half-past 6, but Inspector Fowle was not there then.

16732. You are positive that you did not decline to go down? I certainly did not decline to go down; and if His Honor wishes it I will prove that inspector Fowle never asked me to go down. In connection with the report which I sent in in reference to the men sending down dry material, Mr. Davis, Mr. Boys, the resident engineer, Mr. Carter, Mr. Snodgrass, Inspector Fowle, and myself, held an inquiry. Inspector Fowle was present; and now in his evidence he says he immediately examined the work. If he immediately examined the work, it would be on the next day I presume; and why did he allow six or seven of us to hold an inquiry when he had the information up his sleeve that the work was all right. I should like to know why he kept it up his sleeve for two years and a half, in the meantime allowing men to be charged with something of which he says they are not guilty, and ultimately getting one of them temporarily suspended on a far more frivolous charge about a week or a fortnight afterwards.

16733. The inquiry you say was held a week after your report? About a week, I think; but I do not know the exact date.

16734. Were you present at the inquiry? Yes.

16735. What did Fowle say;—did he say anything? He never said anything.

16736. Did he say anything about his inspection? No. In addition to that, I may mention that Inspector Fowle must have sent in six daily reports between the date of my report of 31st January and the date of Mr. Davis' coming over to hold the inquiry. I challenge him to show that in any of those daily reports he said that I refused to go down the shaft and that he examined the work and found that it was all right.

16737. Inspector Fowle has given evidence that you were taken off the job when there were only about 30 yards of brickwork to be done, and that the work was in close proximity to its close;—is that so? I think the plan would show that when I was taken off the job numbers five and six shafts were working, and that the extension at Ernest-street was just ready to commence. It commenced a few weeks afterwards.

16738. Who took your place? Inspector Eyre.

16739. You mean the man who was called Dick Eyre? Yes.

16740. How long was he on the job after you left it? Between three and four months, I believe.

16741. Are you sure of that? I am only going by my meeting him when I was coming over in the boat. I could not swear that he was there.

16742. Can you tell us the exact date upon which you left the job? I believe it was on the 22nd February, 1894.

16743. Is there any further statement you would like to make in answer to the evidence of Inspector Fowle which you have seen published? No; I have no further statement to make. The only explanation is that Inspector Fowle may have mixed up the three reports—first, as to the dry stone going down the shaft; secondly, as to the broken brick; and, thirdly, as to the dirty metal. He may have mixed up

- R. G. Reid.  
11 Sept., 1896.
- those reports in some way, but I can say this, that he never asked me directly or indirectly to go down the shaft.
16744. *Mr. Davis.*] You say that Connors, the bricklayer, asked you to go down the shaft and examine the work in order, I presume, that you might be satisfied as to whether the work was bad or good? I could not say what his reason was. I believe his reason was that he did not think I would go down.
16745. In any case you did not? No.
16746. So that you are not in a position to say whether the work was bad or good? I am in a position to say that it was bad.
16747. You could see a matter of 100 feet below the surface, and could tell precisely whether the work was good or bad? I could tell the difference between concrete and dry material going down a shaft, and you have altered considerably if, when you knew that I had allowed dry material to go down, you would not either have suspended me or taken half-a-crown off my wages.
16748. Do you say that you were discharged from Contract 79 on 22nd February, 1894? I cannot say I was discharged; I was removed.
16749. Did you tell Mr. Parkes you were discharged? I did not.

Joseph Husband sworn and examined:—

- J. Husband.  
11 Sept., 1896.
16750. *Mr. Davis.*] You are an inspector in the Sewerage Branch? Yes.
16751. For how many years have you been an inspector in that branch of the service? Sixteen years.
16752. Had you anything to do with Contract 69? Yes.
16753. You were an inspector there? Yes.
16754. What did you look after? The tunnelling and the ironwork.
16755. That is to say the excavation of the tunnel and the laying of the syphon-pipes and the flushing-pipes in the Illawarra Road? Yes.
16756. Do you remember anything that occurred in connection with the scour-pipe? I do.
16757. I believe you have written a report about what did occur? Yes.
16758. You also have a sketch made? Yes.
16759. I believe you made the following report about 8th June, 1896:—

I HAVE the honor to call your attention to a statement made by a pipe-layer named "Benson," who gave evidence before a Royal Commission last week, in which he affirms a joint was made by him, where there was only about 1-inch hold in the thimble; and, seeing that the work in question was carried out under my supervision, I hereby beg to give this statement a direct denial, the circumstances of the case being as follows: The opening or space between the ends of the two pipes was 17 feet. To fill this up two lengths of pipe were obtained, one length being 10 feet long, and the other was cut to 7 feet long, but in cutting this pipe no allowance was made for the sockets, which consequently shortened the pipe 10 inches; and as the thimble is 15 inches long this allowed 2½ inches joint in the thimble at each end. Had this been an ordinary case of pipe-laying I could not have allowed this to pass, but seeing the pipe and joint had to be and was encased in a solid mass of concrete, as shown at A on annexed Plan in red, the said concrete being specially made for this purpose, and which was put in position under my direct supervision, I never leaving the work until it was completed. A statement is also made about some bolts, to the effect that the bolts were smaller than what was specified. The facts of the case are thus: the holes in flanges were 1½ inch diameter, and the bolts used were 1 inch diameter, as shown on Plan, and marked B in red, the bolts screwed up tight, after which a collar of lead was run round the whole of the joint encasing the bolts, as shown and explained by note on drawing, the whole length of pipe being embedded in concrete, as shown on Plan.

That is a correct explanation of what took place in connection with the scour-pipe at Illawarra Road? Yes.

16760-1. You consider that although the pipe was a little short and the bolts were a little small at the flange joints a good job was made? Yes.

16762. *Mr. Gummow.*] Did the contractors do this without your knowledge—did they scamp this work? I do not think the contractors knew anything about it. I did not speak to them about it.

16763. Was it under your supervision that the whole thing was done—was it done with your full knowledge? Yes.

16764. *Mr. Parkes.*] Do you recollect the date when you first went on to Contract 69? No.

16765. Did you go on to the contract from the commencement of the job? I was on and off it two or three times from the commencement.

16766. Did you not keep a diary? Yes.

16767. Have you it with you? No.

16768. Would your diary contain the dates upon which you went on and off the contract? Yes.

16769. What else would your diary contain? Nothing except particulars as to the driving.

16770. You were only inspecting the driving? Yes, and the ironwork I have already spoken of.

16771. Did you come off when the driving was finished? Yes; after I had finished the ironwork.

16772. How long were you on that? I could not tell you the dates unless I referred to my diary.

16773. Did you take any measurements of the driving? Yes.

16774. How did you measure it? With a tape.

16775. How was it done? From chain to chain.

16776. But in what manner did you measure the section of the tunnel? I did not take any sections. The engineer took the sections.

16777. Did you never take any section at all? No.

16778. What did you measure the length for? To see what we were driving per week.

16779. What was the material you drove through? Different kinds of material—rock and shale.

16780. Was there much shale? I could not tell you.

16781. It was a pretty wet drive? Yes; parts were very wet.

16782. That would denote that it was shale? In some parts the shale was wet.

16783. Did you go through any sandstone rock? Yes.

16784. How much? I could not tell you.

16785. Did you not take the measurement of it? Yes; but I did not keep the lengths myself.

16786. And you could not say from memory? No.

16787. Does not Contract 69 run into the triplicate pipe sewer that goes over Rockdale between Arncliffe and Cook's River? Yes.

16788. Have you ever noticed what a quantity of soakage water there is running down those triplicate pipes? No; I have not.

16789. How could that water get into the sewer of Contract 69; where does the water come from which is running down it at the present time? From the dead end I suppose, where the tunnel is finished up to the rock. J. Husband.  
11 Sept., 1896
16790. Is that the only place where it comes out? That is the only place I know of. I do not know much about the work.
16791. You have not seen the work since you left? No.
16792. Did you see any concrete work going on on the job? Yes.
16793. Did you send in any returns affecting the concrete? No; I was not in charge of that.
16794. How many cement sheds were there on the job? I could not tell you.
16795. Did you ever see them? I have passed them, but I could not tell you how many there were, or what they had in them.
16796. Do you know the situation of them? One of them was at the Illawarra Road—in the yard at the back of the "Empress of India Hotel."
16797. Were all the sheds in that yard? I do not know.
16798. Were they distributed over the work? They had different sheds, but I did not take particular notice of them.
16799. But surely an inspector on one of these works ought to know everything about them? I was not looking after that part of the work.
16800. But you could not walk over the work every day without knowing where the cement sheds were? I do not know anything about the sheds or cement.
16801. Have you been constantly in the Department for sixteen years? Yes.
16802. Without any intermission? Yes; I was in the Roads and Bridges branch at one time. I was on the Parramatta Bridge, and from there I came to the Sewerage branch.
16803. Is there any time during the sixteen years you have named when you were not engaged by the Government? No; I have been constantly engaged by them.
16804. *His Honor.*] As to the pipe-work to which you have referred—did you refer the matter to the engineer, or did you act entirely upon your own judgment? I spoke to the engineer about it, and he was quite satisfied.
16805. Who was he? Mr. Gibbs.
16806. He did not refer it any further, I suppose? No.
16807. He was satisfied at once and told you to go on with the work? Yes.

Arthur Edward Cutler sworn and examined:—

16808. *Mr. Davis.*] What is your position in the Department? I am Chief Draftsman in the Sewerage Construction Branch. A. E. Cutler.  
11 Sept., 1896
16809. You know the aqueducts which are being erected at Johnstone's and White's Creek on Contract 77? Yes.
16810. You have made some calculations as to the stability of the arches, the carrier, and the piers, under varying circumstances? Yes.
16811. Speaking generally, would you say upon the stress-sheet that you have prepared that the structure is a stable one? Perfectly stable under all circumstances.
16812. When the channel is running full what would be the average pressure on the crown of the 75 feet arches? 320 lb. to the square inch.
16813. What would be the average pressure at the springing? 304 lb. to the square inch.
16814. And the maximum at the springing? 491 lb.
16815. What would you say is the ultimate compression that compo., composed of 3 to 1 mortar, will stand? 2,000 lb.
16816. That is what is usually reckoned in all engineering works? Yes.
16817. So that the factor of safety in the arch, without taking the grill into consideration at all, would be how much? About 5.
16818. Taking into consideration the grill, it would be much more than that? It undoubtedly would be very much more than that.
16819. You have also calculated the strength of the side of the carrier? Yes.
16820. What would it be, running three-quarters full;—will you show His Honor the stress-sheet you have prepared? Yes.
16821. You have made a calculation as to the carrier with or without the iron work? Yes.
16822. Without the ironwork would the carrier collapse? No.
16823. Not even if the iron mesh were taken completely away? It might crack from expansion and contraction arising from variations of temperature.
16824. What would be the factor of safety without the mesh? Three.
16825. What would be the factor of safety with the iron mesh? It would vary from 10 to 15. It is not proportionately strong throughout. In accordance with the changes in the strains it would vary from 10 to 15.
16826. Taking the strains under the most adverse circumstances—that is, with a hurricane blowing, and with the channel three-quarters full, there would be a factor of safety in the channel varying from 10 to 15? Yes.
16827. The grillage, therefore, would have what effect? It would make the structure from three to five times as strong as it would otherwise be.
16828. In drawing this stress sheet what wind pressure did you take into account? 56 lb.
16829. What is that equal to? A hurricane at the rate of 150 miles an hour. That is excessive, of course, but it was taken so that we might be absolutely on the safe side. There is very seldom such a pressure as that.
16830. But that is what you took to arrive at the results you have given? Yes.
16831. A fair thing would be about how much? From 30 to 35 lb., equal to a hurricane of from 80 to 90 miles an hour.
16832. With 30 lb. pressure, or a hurricane of 80 miles an hour, what would be the factor of safety? It would be 4.
- 16833.

- A. E. Cutler. 16833. You have recently, from a professional point of view—that is, for the information of the profession—collected a number of facts in regard to the strength of the Monier structure in relation to other structures of a similar kind;—I believe you put this information in the form of a paper which you read before the Engineering Association? Yes. [*Vide Appendix No. 59.*]
- 11 Sept., 1896. 11834. Will you give us the comparative results obtained from the tests which have already been referred to in the evidence, taking brick, concrete, and Monier, structures? The several descriptions of arch were tested under exactly similar conditions. One was composed of brick, one of concrete, one of limestone, and one of Monier work.
16835. *His Honor.*] You are alluding now to the experiments made in Austria? Yes.
16836. *Mr. Davis.*] What was the span of the arch? Seventy-four ft. 6 in.
16837. So that it would be a similar span to that of the Monier arch in this particular contract? Yes.
16838. What was the strength of the Monier arch in relation to the brick arch? It proved to be five times as strong as the brick arch before it collapsed—that is to say, the load it carried was five times as heavy per unit of area as the load carried by the brick arch.
16839. What was the strength of the Monier arch in relation to the stone arch? It was four times as strong.
16840. And what in relation to the concrete arch? It was three times as strong.
16841. How long have you been in the Sewerage Branch? About six years.
16842. Before that where were you? Immediately before that I was working for the Treasury, and before that again I was working for M'Creddie Bros.
16843. Did you do any work for them in Queensland? Yes, a lot of work.
16844. Did you do any sewerage work there? Yes; I got out designs for the Tumbool divisional Board sewerage.
- 16845-6. There were two sewers in that scheme? Yes.
16847. Can you remember the designation of the sewers? Gaythorn-street was one and Cooksley-street was the other.
16848. Do you remember the length of the sewers? Not absolutely.
16849. Could you give us a rough idea of it? I am almost certain that neither of them could have been more than a mile long.
16850. In the aggregate then, the work would not be over 2 miles in length? No, I do not think it could have been over 2 miles.
16851. Do you remember the depth of the sewer? It was all shallow ground. I could not say the maximum depth. It was laid seven or eight years ago. I should not think, however, that the maximum depth would exceed from 20 to 25 feet. The average depth, I should say, would be from 8 to 11 feet.
16852. Could you say whether there was any tunnelling in the contract or not? I could not say absolutely; but to the best of my knowledge, there was no tunnel work.
16853. So that if a witness, Mr. M'Creddie, has said, speaking of this particular work, that in one case the length of the sewer was from 3 to 4 miles, and in the other case from 7 to 8 miles, that would be rather stretching it? If that were so, and if this were the particular sewerage work to which he referred.
16854. What was the packing or filling which was used over the sewer, do you know? I cannot say positively.
16855. But to the best of your recollection there was no tunnel-work? No.
16856. Would you say that there was any parallel whatever between that work in Queensland and the work carried out by the Sewerage Department of New South Wales, at North Sydney, with which you are acquainted;—I mean the work in Contracts 79 and 79A? Not the slightest. The sewer carried out for the Tumbool Divisional Board was similar to the ordinary barrel stormwater sewers which we carry out in Sydney.
16857. *Mr. Gummow.*] In connection with the stress-sheet you have produced, you say that the maximum strength per square inch is 491 lbs.? Yes.
16858. How did you arrive at that? Through a deviation which is shown in the stress diagram.
16859. What theory did you use? Schieffler's.
16860. Did you make out any calculations by the theory of elastic arches? A similar arch to those of the 75-foot span with a dead load coming vertically onto the arch ring was tested by the elastic theory, and the line of pressure very closely coincided with the line of pressure as I arrived at it by Dr. Schieffler's theory.
16861. In arriving at the 491 lbs. to the square inch did you use a wind pressure of 66 lbs.? No.
16862. What wind pressure did you use? The result I have given you is due to dead load, without wind pressure.
16863. *His Honor.*] Did you apply the wind pressure to the carrier only? No, to the arch as well. The wind pressure would affect that point, but it would not affect it wholly at that point, but right throughout the arch ring. Through the whole depth of the arch ring it would produce a bending moment, tending to bend the carrier and arch in a horizontal direction.
16864. *Mr. Davis.*] Regarding the arch and carrier as a girder? Not only as a girder, but as a continuous girder.
16865. *Mr. Gummow.*] Did you take this as dead load all over the arch, not allowing for any strength in the carrier itself? I took the load as coming on the arch at the points of support.
16866. You took the carrier and loaded your carrier as a dead load on the arch? Yes.
16867. You did not allow any strength for the material in the carrier itself? No; I took the load coming on to the arch ring at the piers that support the carrier.
16868. *His Honor.*] Without treating the carrier as a girder? Yes.
16869. In which relation, in point of fact, it has a very appreciable action? Yes; it strengthens the work without doubt.
16870. Where were these experiments made in Austria to which you have referred? At Puckersdorf.
16871. *Mr. Parkes.*] That is what is given in the books, is it not? The extract upon which these results are based was taken from the *Engineer*. I worked out the strains myself.
16872. Are these your own calculations? Yes.
16873. When did you make them? Four months ago.
16874. That is when you started to make them? The calculations as to the experimental arches were only finished three weeks ago.

A. E. Cutler.  
11 Sept., 1896.

16875. As to Mr. M'Credie's matter, you were an employee of his in Brisbane? Yes.
16876. Have you plans and measurements to prove the correctness of the information you have given as to the work which M'Credie Brothers carried out in Queensland? I have neither plans nor measurements. As I stated to Mr. Davis, I have spoken absolutely from memory.
16877. How long were you with M'Credie Brothers? I suppose about twelve months.
16878. Was the work to which you refer completed in that time? It was started, but it was not completed.
16879. How do you know that they did not go on with a further section? I told Mr. Davis that the sewerage work, which I knew to be carried out, was of the dimensions I gave.
16880. But what is the use of your giving these lengths if you do not know if they were the final lengths or not? I am referring now to the sewerage works carried out for the Tumbool Divisional Board, and those works finished up at the river. It is quite possible, however, that Mr. M'Credie may not have referred to that particular work.
16881. But may they not have continued the particular sewer of which you were speaking? It finished off at the river, and they could not have taken it further in that direction.
16882. Might there not have been branches? The sewer was to drain a flat. I cannot see how it could go any further than it did. To the best of my knowledge I have given you the right lengths.
16883. But you have no plans or measurements? No; if I had I could give you the lengths absolutely.
16884. You made that survey and prepared the plans? Yes, and I saw the work in progress.
16885. But it was not completed when you left? No.
16886. As to the test to which you have referred, I understand you to say that they are tests of your own made upon the basis of certain experimental arches? The calculations made by me were, as I pointed out, on the arches referred to in the extract from the *Engineer*.
16887. Do you remember Mr. Baltzer being in the office? Yes.
16888. Did you know that he was one of the holders of the Monier patent? No.
16889. Not at that time? No. I knew that Mr. Baltzer was connected with the Monier system, but in what respect I did not know.
16890. Was most of his energy and time devoted to planning the Monier system in the office? He did not devote any of his energies in the office to planning the Monier system.
16891. But there was some planning of the Monier system in the office;—there were some tests, were there not? No; the only test carried out by the Works Department was the test of the plate of which I think you have already been informed.
16892. Were not some Monier plates tested over at Gladesville? I believe the Roads and Bridges Department put down something of that description, but whether it was Monier work or not I do not know.
16893. Did Mr. Baltzer press the Monier work very much when he was in the office? No; I remember that in one case—I think contract 112—we got out alternative designs, one being Monier work, and the others ordinary concrete.
16894. Why did you make a distinction between the concrete and Monier work? Because they are distinctly different.
16895. What is the distinction? The concrete is purely concrete, and has no iron mesh in it at all. The consequence is that the whole structure, including the carrier, would be designed in such a way that a very slight, if any, tensile strain would be allowed for; whereas, when the iron mesh is in the carrier and other portions of the structure it can be calculated to stand considerable tensile strength without any fear of damage.
16896. When you designed 101 or 112 did you take out the quantities? No; personally, I had nothing to do with the quantities.
16897. Who took out the quantities? The quantities of 112 were taken out by Mr. Adams and Mr. Brammer. Mr. Evans may have assisted them, but I am not sure.
16898. Who took out the quantities of 77? I think the majority of those were taken out by Mr. Brammer.
16899. Who else? He may possibly have been helped by Mr. Evans; but I am of opinion that they were not checked. I think Mr. Adams was away on leave at the time. I am speaking absolutely from memory.
16900. Do you know who attached the prices in the case of 112? Mr. Bagge.
16901. In every case? Yes.
16902. He always put the prices to the quantities? Yes; he always priced up all the quantities.
16903. Would those prices have been seen by any officers of the Department? Only those directly concerned in designing the work would be likely to see them until tenders were called for—in fact Mr. Bagge was very careful with that kind of thing.
16904. Can you recollect when the schedule of No. 77 was made out? It would be hard to say, because No. 77 has been in hand, more or less, ever since I have been in the Department. There have been two or three changes in the design and quantities. It has been chopped and changed about, and the schedule itself has been altered several times, so that it would be very hard to answer your question definitely. The schedule was prepared three or four years ago, but it has been changed considerably.
16905. You recollect Carson's and Ahearn's contracts 64 and 101? Yes.
16906. The first plan and schedule for No. 77 were prepared at about the time those contracts were prepared? I think, in all probability, the first plan was, but I could not speak as to the schedule. I was not upon that work. Mr. Bagge did not let anyone see what he did in these matters. The first plan was prepared before the plans of 64 or 101, but it was superseded as being too extravagant.
16907. Then a reduced plan was made? Yes.
16908. At about what period? Considerably after 101 and 64 were let and carried out.
16909. In about 1895? Yes, about that.
16910. You see the plans of No. 64;—the carrier in that plan has double-pressed white brick and stone facing, with a concrete carrier? Yes.
16911. You notice the moulding in the stone? Yes.
16912. And the brick lining? Yes.
16913. Is not that exactly similar to the carrier of No. 77? The structure is different.
16914. But as to the form of design, taking the moulding, for instance? The string course is similar.
16915. It is of similar material? Yes; it is of stone in both cases.

- A. E. Cutler. 16916. The moulding of the string course and the depth is the same, is it not? The string courses are very similar, it is the same class of work.
- 11 Sept., 1896. 16917. The brick facing is the same, double pressed bricks are used in both cases? Yes, it is practically the same as far as that goes. Of course the two designs, as a whole, are distinctly different. The bricks and the stone are the same.
16918. As far as a carrier is concerned the designs are similar? There is the same class of carrier in both designs.
16919. But taking moulding for moulding they are almost the same? That is true; the mouldings are almost the same.
16920. Is not the brickwork the same? Yes, as far as the carrier is concerned they are practically the same work.
16921. And the string course that runs along the crown of the arch is of stone? Yes.
16922. In the case of No. 77, there is an elliptical arch shown instead of a segmental arch? Yes, in 77 the main arches are elliptical.
16923. They are a more costly arch to build than the segmental arches? Under certain circumstances, yes. I do not think the cost would be very much greater. I cannot see where much difference should come in between the cost of a segmental and elliptical arch.
16924. But do you not know from your experience as a practical man that there is a difference? It would depend wholly upon other features in the design. There ought not to be very much difference.
16925. Not as regards the striking of an elliptical arch? The carpenter's work in the striking of the arch is a small item in the total cost of constructing the work.
16926. Is there not more labour in an elliptical than in an segmental arch? There is perhaps a little more labour in striking the arch, but compared with the total cost of the job that does not amount to much. There would not be very much difference in cost. I doubt whether it would make any appreciable difference.
16927. But is not an elliptical arch more costly to build so far as material is concerned? If it be a small arch, yes; because you would want in all probability moulded bricks. In a large elliptical arch there would not be very much difference, because the bricks would remain ordinary bricks.
16928. Are the bricks in the elliptical arch not specified to be radiated in this case? As far as I know I think not. I did not design the work.
16929. *His Honor.*] Is it usual to use radiated bricks in arches of that size or not? No.
16930. *Mr. Davis.*] Mr. Parkes asked you when you prepared this stress sheet which you have put in, was it not a fact that a stress sheet similar to this, although not quite the same, was prepared before the Monier structure was accepted for Contract 77? Yes.
16931. And that stress sheet shows that the 75-foot arch under more unfavourable circumstances was perfectly secure and stable? Yes.
16932. *Mr. Parkes.*] When was that first calculation made? It was made at the time that the designs for Contract 112 were prepared.
16933. None were made after that? None after 112. It was for a 75-foot span, the same as in this case.
16934. *His Honor.*] Who made the calculation? Mr. Baltzer and Mr. Kern. I made one also for different sized arches at the same time.
16935. *Mr. Davis.*] To see which would be the most economical to adopt? Yes; all the calculations were got out to see which would be the most economical kind of arch.
16936. *His Honor.*] Were these calculations made, then, for the purpose of working out Mr. Bagge's report—I mean the report in which he compared two forms of concrete arch with the Monier arch? They were all made out for that particular contract.
16937. None of them were made out, then, for the Monier system, as applied directly? Yes, one was made out absolutely upon the Monier system.
16938. That was one of Mr. Bagge's schemes, but afterwards, when the tenders for Contract 77 were sent in, with an additional lump sum tender, involving the present Monier arch plan, no plans were made out for that of itself in any way? No; it was recognised that the arches were very similar; and, as the 77 strains would be lighter than those we calculated for 112, as far as I can remember, the thickness of the arch ring being increased from 10 inches to 12 inches, we thought there could be no question about the stability of 77.
16939. No. 77 appears conclusively to be stronger than the Monier plan that was worked out for Mr. Bagge's scheme? The dead load is much lighter in the case of 77 than it would have been in 112.
16940. And the arch also is in fact stronger? The arch ring, as originally designed in the office, was 10 inches at the crown. In the case of 77 it is 12 inches.
16941. The same thing applies to the springing? Yes.
16942. So that there is a little more stability in the arch and less weight to be borne? Yes.
16943. *Mr. Gummow.*] In making up these different plans for this report of Mr. Bagge you had nothing to do with the Monier system? No.
16944. You were instructed to make up a design upon another system in friendly antagonism to the Monier system? That was so.
16945. There was a certain amount of rivalry in the matter? There was a certain amount of rivalry between the two systems at the time.
16946. You were actually working on a system opposed to the Monier system? I was working against the Monier system.
16947. *His Honor.*] I do not exactly understand that? It occurred in this way: Mr. Baltzer had a certain design given to him by Mr. Bagge to carry out on the Monier system for Contract 112, and I had another design to get out which was not upon the Monier system, and I was naturally anxious that my design should, if possible, be carried out.
16948. Your design was No. 2? Mine were No. 1 and No. 2.
16949. Who worked out No. 3? Mr. Baltzer, with the aid of Mr. Kern and Brammer.
16950. By direction of Mr. Bagge? Yes.
16951. Do you know anything about the working out of the present No. 77—the lump sum plans;—do you know who worked them out, and at what time they were done? From what I know outside the Department, and from seeing Mr. Baltzer bring them to the office, on one occasion, to show them to me, I should say that Mr. Baltzer worked them out.
- 16952.

16952. Can you say whether he worked them out to any extent in the office? Not to any extent in the office. I only saw them once, and I fancy that when I saw them they were practically finished. A. E. Cutler.  
 16953. As far as you know, where were they worked out? As far as I know they were worked out by Mr. Baltzer at his residence. 11 Sept., 1896.
16954. As far as you know, they were probably founded in fact upon the other plans? They may have been founded upon them. In engineering, if you make one design it is only natural that the same design should run into two or three others of the same nature.
16955. As to Contract 77—I mean the original design—you say that it had been originally worked out very elaborately? Yes. It was somewhat similar to the design before you, but much more elaborate. There was considerably more freestone in the arch.
16956. How came the elaboration to be reduced? I have no official information on the subject, but I fancy that it was pointed out that 64 and one or two of those contracts were too elaborate; and 77 was originally designed before 64. That having been pointed out, it was thought necessary to reduce 77.
16957. 77 was reduced while 101 was actually going on—is that so? Yes; 101 would be in course of construction when 77 was reduced.
16958. But when the plans of 112 were in the office? I think 112 had just left when the alterations were made to 77.
16959. 77 being still kept as rather an ornamental plan;—you would call 77, as it appears before us, an ornamental plan decidedly? Yes; but for a Government work of that description I could not call it extravagant.
16960. It is much more so than 101? 101 was originally intended to be covered in with an embankment.
16961. It was not intended for beauty on its own account? No.
16962. It was intended to be covered? Yes.
16963. 77 was intended to stand out, to show itself? Yes.
16964. For a Government work of that kind, you think it was reasonably ornamental? Yes.
16965. Just fairly good-looking? Yes.
16966. *Mr. Davis.*] You were working in the same room as Mr. Baltzer during the whole time these designs were being prepared for 77? Yes.
16967. And at the time the tenders for 77 were received? Yes.
16968. So that you would have had every opportunity of seeing whether Mr. Baltzer prepared the design for the substituted plan in the office? Yes. We were in the same room the whole time.

Varney Parkes recalled and further examined:—

16969. *Mr. Smith.*] With regard to your substituted charges of 4th September, I understand that with regard to those in which Mr. Hickson, junior, is involved—the undue concessions alleged to have been given to this firm of contractors—they are now limited to three? Yes. V. Parkes.  
 11 Sept., 1896.
16970. One of those relates to the obtaining of Contract 79, and the other to the obtaining of Contract 77. Those were two of the old charges? Yes.
16971. And in addition to that we have one in regard to undue concessions alleged with regard to the Monier patent? Yes.
16972. As to that charge with regard to the Monier it refers to an improper minute—inaccurately stating the cost of a special test;—I should like you to tell the Commission what that minute was? I have placed certain evidence before the Commission, and it is not for me to be the judge of the strength or conclusiveness of that evidence.
16973. *His Honor.*] Mr. Smith has asked you a specific question with regard to a particular minute, and I think the question is a fair one? I will answer it by saying, all the correspondence or papers referred to in the Parliamentary return or which have been found during the Commission. I cannot be made the judge in my own case.
16974. I think the question is a fair one, because there is a specific minute mentioned in the charge, and you are asked to identify that particular minute. It is not a question of the strength of the evidence you have tendered? While identifying that minute, I would say that there is other correspondence in connection with it which I have adduced as evidence. I should like to alter that charge, and make the wording “improper minutes” instead of “improper minute,” because there are more than one relating to the matter.
16975. *Mr. Smith.*] Then I will ask you what were the minutes? The minutes are those disclosed in the papers concerning the Strathfield culvert, and the minutes disclosed in the papers referring to the letting of Contract 77.
16976. Does that include the minute of Mr. Hickson of 18th July, 1894, and which is referred to upon page 33 of the evidence—question 1260? Yes; it includes that and other minutes.
16977. Do you know of any minute with reference to a 15 per cent. royalty being allowed to these contractors? I know of none but these minutes of the Minister approving, and the evidence disclosed in the papers connected with it.
16978. You mentioned some minutes relating to Contract 77;—is there one word in any one of those minutes referring to the 15 per cent. royalty which you mentioned in your charge? There may not be.
16979. Do you know of any minute which has any reference to the 15 per cent. royalty? Possibly not, but I might adduce evidence during the course of the Commission tending in that direction.
16980. As regards Contract 77, Charge No. 1, you have made a slight alteration;—it refers to Carter, Gummow, & Co. submitting a plan of their own upon a patent held by them, and you have added the words “and an officer of the Department”;—did you ever hear of any other officer under the Government holding a patent? I did not. If I had heard of it you would probably have heard of it.
16981. In your statement the other day you referred to the Votes and Proceedings of the South Australian Parliament for the year 1879–80, from which you said that you had come to the conclusion that Mr. Hickson’s works had come to grief in South Australia;—you said that in consequence of something that Webster told you you looked up the reports? Yes.
16982. I think you referred to a Commission before which you said Mr. Hickson gave evidence? Yes.
16983. The volumes of the proceedings for 1879–80 are here, and I would ask you to be good enough to tell His Honor to what you refer? To the proceedings of the Royal Commission sitting upon Wells Brothers’ contracts for the Rivoli Bay and Kingston jetties. 16984.

- V. Parkes.  
11 Sept., 1896.
16984. You know that there was an arbitration with reference to those jetties, and that the contractors made some large claims against the Government? Yes.
16985. The award being in favour of the Government? Yes, as it certainly ought to have been.
16986. The award was to the effect that the contractors had no claim? As it ought to have been.
16987. You agreed with the award? Yes, certainly.
16988. Do you not, after all, mean the arbitration proceedings before which Mr. Hickson was examined? That is one case, but there are a series of cases. From the arbitration which sat in Wells Brothers case—I proceed to where there had to be alterations and rearrangements of the jetties. Ultimately the matter was discussed in connection with the Public Works Commission of 1880. That is all the knowledge I have of the matter at present. The facts are contained in the evidence given by Mr. Hickson himself, by Mr. Higinbotham, and by Wells Brothers and others concerned in the matter. Those are the particulars I read up some time ago.
16989. The evidence given by Mr. Hickson was given in the arbitration case? Yes.
16990. Mr. Hickson, as a matter of fact, was not examined before the Commission? No.
16991. So that when you stated that Mr. Hickson himself gave evidence before the Commission you must have been in error? I meant the arbitration in connection with Wells Brothers' contracts.
16992. The only evidence you referred to as having been given by Mr. Hickson is that given by him in connection with the arbitration on Wells Brothers' contracts? Yes. But I do not refer to his evidence alone.
16993. Are the speeches to which you have referred those which are reported in the South Australian *Hansard* for the Sessions of 1879–80? I was referring to Sir John Downer's address upon Mr. Hickson's conduct of business and to the speeches which are reported in *Hansard* for the Sessions of 1879–80. There are several speeches to which I referred, but I forget now whose they were.

MONDAY, 14 SEPTEMBER, 1896.

George Benson recalled and further examined:—

- G. Benson.  
14 Sept., 1896.
16994. *Mr. Parkes.*] I believe you wish to make a statement to His Honor? Yes; I desire to refer to the evidence of Inspector Husband. He said that a good job was made of the pipe work upon Contract 69, to which I referred in my evidence. I desire to contradict that statement.
16995. *His Honor.*] Husband said there was an overlap of  $2\frac{1}{2}$  inches on each side of the collar; he said also that the pipe was covered with concrete? I desire to contradict that statement as far as the  $2\frac{1}{2}$  inches is concerned. There was only three-fourths of an inch on each side. I myself did the job, and know exactly what there was.
16996. Husband also said that the pipe was bedded in concrete? Before I got out of the hole they had the concrete put on. That covered it all up, so that no one could see it.
16997. The difference between you and Husband is this: you still say that the overlap is only three-fourths of an inch on each side instead of being anything more? Yes. The collar is about 17 inches long, and there should be at least 6 inches of lap on each side to make a perfect joint. There should be only about half an inch between the two pipes. Instead of that there is about  $15\frac{1}{2}$  inches of space between them.
16998. Are you certain that the overlap is not more than three-fourths of an inch on each side? Yes; or  $1\frac{1}{2}$  inch adding the two sides together. The job of the flange joint was also slummed. The bolts were short.
16999. You mean that the work was slummed by using short bolts? They slummed it by getting me to run it over with lead to stick it. As a matter of fact it would not stick it. What they were really depending upon was the concrete. I can give you another instance affecting the main sewer pipe, which is 3 ft. 9 in. in diameter. When they came to the Sydenham Road they could not open the whole road at once. They therefore laid their pipes half way across the road, and when that had been covered in they opened the other half. They found that they were 2 inches too high for an 18 inch gas main there, and in order to get over the difficulty of sending into the Gas Company and getting the gas main raised, at a cost of some £12 or £15, they carried the pipe down at a slant, leaving the joint open at the top and all round—in fact it was only home at the bottom. The same thing had to be done when they were coming up the grade at the other side, only in that case the joint was open at the bottom.
17000. Did you make the joint? Yes, I made a good job of it. There is no doubt about that. Unless the bed sinks at any time it may be all right, but if the bed sinks the joint will be very easily drawn.
17001. Were the bolts long enough to take the nuts properly? It is not a flange joint. It is only a lead joint. It is in the main sewer. They endeavoured to make out that the other job was merely a mistake. What I say is that if that is so they are all mistakes.
17002. Is the other pipe to which you refer bearing on the earth. Yes, on the earth.
17003. Did you fill both joints in the case to which you have just referred? Yes.
17004. And you made as good a job of it as you could? Yes. I have only mentioned the matter to show that the firm did their work any way. I was only six or seven weeks working for them.
17005. *Mr. Parkes.*] What do you say was the size of the gas pipe? 18 inches. I remember repairing it once for the Gas Company higher up the road.
17006. What is the size of the sewer that goes under it? 3 ft. 9 in. as nearly as I can guess. In order to lay the main sewer correctly they would have to alter the level of the gas pipe.
17007. To a considerable extent? To the extent of 2 or 3 inches at the very least, but I daresay it would cost just as much as raising the pipe a foot.
17008. *His Honor.*] It would not be possible to raise the pipe bodily without breaking the joints? No. I suppose it would take two or three days, and, of course, the Gas Company would have to be paid for it.
17009. *Mr. Gummow.*] As to the raising of the gas main, who would have to do it? I should say the Gas Company. They would not allow anyone else to interfere with their pipes. [*Vide Appendix No. 78.*]
17010. But who would pay for the work? Your firm, I suppose.
17011. Are you sure of that? Almost.
17012. Would not the Gas Company charge the Government? The Government had nothing to do with their mains.

17013. Are you sure that the Company would charge our firm? Almost sure, any way.
17014. Was this work to which you have referred done under Government inspection—this bending down of the sewer 2 inches? Yes.
17015. It was not the contractors' own doing behind the back of the Department? I suppose they all knew about it. Mr. Forrest was there, and he would probably know about it.
17016. But the Department knew of it? I do not know about that.
17017. Did an inspector see the work done? Yes; he told me to make as good a job of it as I could, and I did so. The other joint to which I have referred is a ridiculous job.
17018. *His Honor.*] Do you not think the concrete would make it as solid a job as necessary? That is what they are depending on, but I do not agree with that. That is not the way to get through work.

G. Benson.  
14 Sept., 1896.

Robert Rowan Purdon Hickson recalled and further examined:—

17019. *Mr. Smith.*] For some time you were Engineer of Harbours and Jetties in Adelaide? Yes.
17020. Your appointment was made through the Agent-General, in London, on behalf of the Government of South Australia? Yes; by the late Mr. Dutton.
17021. When were you appointed;—I believe you have a letter from the Agent-General which will fix the date? Yes; I have the following letter, dated 5th March, 1876, from the Agent-General, in London, for South Australia, introducing me to the then Colonial Secretary of South Australia, the Hon. G. C. Hawker. The letter is as follows:—

R. R. P.  
Hickson.  
14 Sept., 1896.

I HAVE the honour to introduce to you Mr. Robert Hickson, C.E., Member of the Institute of Civil Engineers of Great Britain, the gentleman who I have already informed you, in preceding despatches, has been selected by me, in conformity with the authority given by you to me, to fill the important appointment of Engineer of Harbours and Jetties, at a salary of £950 per annum, as provided on the Estimates.

Mr. Hickson proceeds to the Colony with his family by the present mail steamer, his salary on full pay commencing on the day of embarkation, the 9th March.

I have paid to Mr. Hickson the agreed sum of £200 towards the cost of the passage money of himself and his family, which I have charged to the Parliamentary Vote undrawn preceding the 9th March.

In recommending Mr. Hickson to your very favourable reception, it affords me great pleasure to add my entire conviction that a more satisfactory selection for the important office Mr. Hickson is to fill could not possibly be wished for.

17022. You left by the mail indicated by the letter, and you took up your duties on your arrival in the Colony? Yes.

17023. And you continued there as Engineer for Harbours and Jetties until when? Until June, 1880.

17024. Why did you leave the Service? My branch, among others, was done away with. At that time there were several branches in the Public Works Department, and they were all done away with, the whole of the work being put under the Engineer-in-Chief for Railways, who had been there for many years, and who was an old public servant.

17025. That was intimated to you by a letter from the Treasury? Yes; a letter dated 7th June, 1880, as follows:—

I HAVE the honor, by direction of the Treasurer, to inform you that, with the view of placing all public works, as far as possible, under one Ministerial head, the Government have decided that all works of construction connected with harbours and jetties shall be placed under the control of the Honorable the Commissioner of Public Works, with the exception of deepening operations, which will be continued under the control of the Treasurer, and will be carried out under the supervision of the Marine Board.

This decision will result in the abolition of the Department of Engineer of Harbours and Jetties from the end of the present financial year, which terminates on the 30th June instant.

I am, therefore, to intimate that no provision will be made for your Department on the Estimates for the ensuing financial year, and the Treasurer desires me to express his regret that your services will, consequently, not be required after the 30th instant.

17026. In the report of the Secretary for Public Works, which appears in Vol. III of the proceedings of the South Australian Parliament for the year 1880, this matter of the abolition of your branch is referred to? Yes.

17027. Appended to the report of the Secretary for Public Works, of October 25th, 1880, there is a report by Mr. Thomas Higinbotham, dated 24th September, 1879? Yes.

17028. Which is Appendix No. 2 of the report? Yes.

17029. He refers to the jetties at Rivoli Bay and Kingston? Yes.

17030. That was a contract taken up by Wells Bros., was it not? Yes.

17031. Tenders were called in London? Yes.

17032. The plans themselves were prepared by Wells Bros.? Yes.

17033. That was all done before you took office? Yes.

17034. When you came out here you found the work advanced to that extent? Yes; the plans were almost complete.

17035. You, as Engineer for Harbours and Jetties, signed those plans? Yes.

17036. For identification, as part of the contract? Yes.

17037. The contract was then entered upon and a dispute arose with the contractors? Yes.

17038. And it was referred to arbitration? Yes.

17039. The arbitrators found against the contractors and in favour of the Government? Yes.

17040. The only question in that arbitration, I believe, was with reference to the plans? Yes; as to whether the fact of signing them made them Government plans or not.

17041. I believe the award is dated July, 1878? Yes.

17042. During the course of the contract you had to condemn, or rather you refused to pass, a part of the work? I made an alteration in it, strengthening it.

17043. Part of it was not strong enough, and you had it altered? Yes.

17044. But you were not at all responsible for the want of the strength in the part you condemned? No; it was not my design at all. It was designed in London by a man I never saw until he came to South Australia.

17045. *His Honor.*] Was it a timber pile jetty? No; it was a screw pile jetty.

17046. *Mr. Smith.*] During your term of office a Royal Commission was appointed, I believe, in connection with public works? It appears to be so from the Parliamentary papers. I did not know anything about it at the time.

R. R. P.  
Hickson.  
14 Sept., 1896.

17047. No report had issued while you were in the Colony? No; I was not called by the Commission to give evidence, and I did not know anything about it.

17048. You sent a wire to Adelaide to get all these papers? Yes.

17049. They sent you the report of Mr. Higinbotham, did they not? Yes.

17050. You have since ascertained that the report of the Commission issued on 13th October, 1880? Yes.

17051. It only deals with railways, and it appears in vol. 2 of the Proceedings of the South Australian Parliament for the year 1880? Yes.

17052. There has been no report of the Commission upon Harbours and Jetties as far as you can find out? No, I do not think so. I was not asked to appear as a witness.

17053. You were not examined by the Commission at all? No.

17054. But you were examined in the arbitration proceedings upon Wells Brothers' contract? Yes.

17055. And your evidence appears in the Blue Book containing the award? Yes.

17056. Is it true that any of your work in that Colony has, within your knowledge, come to grief? I do not know of a single instance. I have been in Adelaide very frequently since then, and I have travelled through the Colony.

17057. After you left Adelaide, I think, you were Consulting Engineer to the Melbourne Harbour Trust? Yes; I have been ever since I came to Australia.

17058. I think it was in September, 1891, that you received an appointment in this Colony? Yes.

17059. You had a telegram from Mr. Moriarty? Yes, I had a telegram from Mr. Moriarty offering me the position at Newcastle, and I accepted it.

17060. In 1888 you were appointed Acting Engineer-in-Chief for Harbours and Rivers? Yes.

17061. And on the retirement of Mr. Bennett you were appointed Engineer for Roads and Bridges and Sewerage? Commissioner for Roads and Engineer-in-Chief for Roads, Bridges, and Sewerage.

17062. In what year was that? June or July, 1889.

17063. *His Honor.*] After Mr. Bennett's death? No, before his death.

17064. *Mr. Smith.*] With regard to your son, he was employed in the Department previous to 1893? Yes. Perhaps I had better give His Honor the history of that matter from the beginning. My son served his time with Mr. Moriarty, and finished with Mr. Darley. He was one of the engineering assistants in the Sewerage Branch. In 1893 I was required by the Secretary for Public Works to reorganise the branch over which I presided. To give you some little idea of the importance of the branch I might mention a few facts in regard to it. It comprised about one-half of the whole staff of the Works Department, and the expenditure was about one-half of the whole expenditure of the Department. Out of a total of something like 5,000 contracts a year carried out by the Department, 4,000 passed through my hands, so that I had rather a large order when I was asked to reorganise the branch. However, I went through it carefully and submitted my report, which was approved by the Minister. My son's name was not included in that report as one of the retrenched officers. A few days after the report was sent in, I happened to be down in the Under Secretary's room—Mr. Barling was then Under Secretary—when he said, "I think it is only right to tell you of the report I have heard that while retrenching officers of old standing—married men—you have left out of the list of retrenched officers your son." I was rather surprised at that at the time, because I considered that I had done the duty entrusted to me fairly and honestly. I told Mr. Barling that what he said was quite correct, but I pointed out to him that my son was in a position in which he was doing fairly well, and that, as, if he left it, someone else would have to take his place, it never entered into my mind to retrench him. When I went home that night I thought over the thing again—I considered whether the fact of his being my son had influenced me in his favour. The result of my thinking it over that night, at all events, was that I made up my mind that I would recommend his retrenchment. So careful was I to prevent anything like home influence interfering with my determination in the matter, that I never mentioned it to a single person. I came into the office the next morning and wrote out a minute, recommending my son's retrenchment, and had it registered, so that it would be practically past withdrawal. I then sent word down to him and told him that I wanted to see him particularly. I explained all the circumstances of the case to him, and, like the loyal boy he has always been, he said "I will do as you like. I am young and strong and I can knock out a living for myself somehow. Am I to understand now that I can look out for employment where I like?" I said, "Certainly." I then went down to Mr. Lyne, the Minister, and he said the report had not come to him, but that if I had the least hesitation in my mind in regard to my son he would not allow it to go any further. I said I had made up my mind what I would do, and that I would adhere to my determination. The next morning my son came to me and said he had accepted an offer to go to Adelaide with Carter, Gummow, & Co. Mr. Carter happened to be in the office that morning, and I sent for him. I said "Is it true that you have a position for my son in Adelaide?" He said "Yes." I said "There is no mistake about it; you want someone?" He said his partner in Adelaide wanted an assistant, and that if he did not get this young man he would get someone else. He went on to state what he proposed to pay him. I stopped him at once, and I said "He is now your employee. You are offering to give him what he is worth, in your opinion, and it is nothing to me one way or the other." That is how the thing came about. A few days afterwards—I forget how soon—my son went to Adelaide. Those are the whole of the facts connected with his employment by Carter, Gummow, & Co. as far as I am aware of them.

17065. So that he was retrenched, not because of his want of capacity, but because you would not have it said that while other officers were retrenched he was kept on? That is the only reason. I might say that it was a severe blow to me, and that it was a very severe blow to him also, because he was getting on in the Department. He was, first of all, a staff officer, and that gave him a certain standing. He had a salary of £236 a year, and he had a camp and a cook, which really means that he had nothing to do but to clothe and feed himself. However, he left that position, and he went with Carter, Gummow, & Co., from whom he received £200. He had, out of that, to provide for himself and also to keep a horse at his own expense. I believe they afterwards increased his pay to £250 a year.

17066. It was the morning after your son had been retrenched that you saw Mr. Carter? Yes.

17067. You had not seen Mr. Carter before to have any conversation with him in connection with your son? I have had no conversation whatever with him. I do not think I have ever mentioned to either Mr. Carter or Mr. Gummow that I had a son in the Service. He never was on one of their contracts, and naturally the question never came up.

17068. The conversation which finally took place between yourself and Mr. Carter was just as you have described it? Yes.

17069. After that did you have any conversation with Mr. Carter as to your son? Yes; I said to him afterwards "I am sorry he is leaving the Service, but since he is leaving I am glad that he is with a respectable firm of contractors, as he will be able to learn a good deal with them. As he is now debarred from re-entering the New South Wales Service—because I would not on any consideration allow him to come back—perhaps he will have to take up contracting himself." Mr. Carter's reply to that was pretty short. He said "He is a great deal too young for that sort of work. In any case there is very little to be got out of contracting just at present."

R. R. P.  
Hickson.

14 Sept., 1896.

17070. That is all you remember as having passed between yourself and Mr. Carter? That is the whole thing as well as I can remember it.

17071. I will ask you to turn to Question 3406 in the evidence of Mr. Maddison. You will see that he gives an account of a conversation which took place between himself, Mr. Ewing, and Mr. Carter. He says "It amounted to this—that Mr. Hickson, junr., had been retrenched out of the Department, and that Mr. Hickson, senr., wished to find him employment of some sort, and had asked Mr. Carter if he could find anything for him to do or whether they would take him in as a member of the firm. The reply which I understand Mr. Carter made to that request was that Mr. Hickson, junr., could not be taken into the firm within five or six years." His Honor then asked, "That, I understand, was the account Mr. Carter gave you of what had happened," and Mr. Maddison replied in the affirmative. If Mr. Carter said anything of that kind would there be any truth in it? I did not see Mr. Carter in connection with my son until after he had been retrenched from the Service.

17072. So that whether Mr. Carter did or did not say what he is reported to have said the statement is absolutely untrue? Yes. Of course I do not know what may have taken place, or what Mr. Carter may have said.

17073. In the substituted charges you are charged with making undue concessions of three kinds by reason of your son being an interested party in this firm of contractors. The first charge is with reference to the Monier system. I will ask you to turn to Question 7436 in the evidence of Mr. Barling. You will see that reference is made there to a letter written by Mr. Carter on 2nd July, 1894, to this effect: "Referring to our conversation *re* the use of our patent system of bridge and culvert building, we hereby inform you that the royalty we require for the use of the same by your Department will be 15 per cent. on the cost of construction." Upon that you wrote your minute of 18th July, in which you said, "The Monier system of concrete arching has been patented in the Colony by Messrs. Carter & Co. Where applicable it reduces the cost of spanning an opening by about 50 per cent. The patentees are willing to allow the Department to use the patent on payment of a royalty of 15 per cent. on the cost of the arch. I recommend this for the Minister's approval. I might state I have just completed, with the permission of the patentees, a culvert on the Parramatta Road, built on this principle, with most satisfactory results, financially and otherwise." Do you remember writing that minute? Yes.

17074. Had you seen the contractors at all about the matter before they wrote that letter of 2nd July, or how did it come about that they said, "Referring to our conversation"? Mr. Carter mentioned the fact that he had taken out a patent for the Monier arches, which I knew had been patented on the continent. That is how it came about.

17075. Did you then discuss with the contractors the terms upon which they would be willing to allow the Government to use the patent? No; I do not think so. I think there was merely their offer without any discussion.

17076. They say in their letter, "Referring to our conversation"? I suppose that refers to the statement of the fact that they had taken out the patent. I do not know that they mentioned what percentage they would ask until the letter was written.

17077. It would appear from the letter that it was sent on to Mr. W. A. Smith, the engineer? Yes.

17078. So that the conversation therein referred to would probably be a conversation with Mr. Smith, but not with you? The conversation referred to would no doubt be with Mr. Smith. The only conversation they had with me related, as I say, to the statement of the fact that they had patented the thing.

17079. And upon that you wrote your minute of 18th July? Yes.

17080. In that minute you state that the patentees are willing to allow the Department to use the patent upon payment of a royalty of 15 per cent. on the cost of the arch? Yes.

17081. And you recommend that for the Minister's approval? Yes.

17082. At that time you had had a report from Mr. Smith as to the Parramatta Road culvert? Yes.

17083. At all events the work was far enough advanced to enable you to form a good opinion as to the nature and cost of it? Yes; and there was also my reading as to the Monier arch system generally.

17084. But you never induced the Minister to enter into an agreement to adopt this patent;—you never wrote any minute inducing the Minister to enter into an agreement with the firm? The minute you have quoted is the only minute I wrote, and there is nothing in that, because it was never acted upon.

17085. That was only obtaining the authority of the Minister to use the patent whenever it might be thought advisable to do so at a certain rate? Yes; in cases where it might be thought expedient.

17086. But there was no binding agreement between the Department and the contractors as to the adoption of the patent? No.

17087. The matter was still left entirely at large as to whether you would use the patent on any particular work or not? Yes.

17088. And, as a matter of fact, it had not been adopted upon any work, with the exception of the aqueduct on Contract No. 77 and the small culvert work on the Parramatta Road? Those would be the only two works.

17089. I think there was some work in which you had some idea of adopting it? Yes; I had it in my mind, at the time I wrote that minute, to design a Monier arch for the Kangaroo Valley bridge, the span between the cliffs being 230 feet. As it would have been the first bridge of the kind built in the Colony, I came to the conclusion that we would not do it, because, by getting out the plans ourselves, we should be throwing all the responsibility for the structure upon the Government. Although I was pretty well satisfied as to the suitability of the design for the work, I was not quite prepared to put the Government in that position, so we adopted another design of bridge altogether. In the case of the Johnstone's Creek and White's Creek aqueducts, I recommended the system, because we were putting the whole responsibility upon the patentees, and were leaving none with the Government.

17090.

- R. R. P. Hickson.  
14 Sept., 1896.
17090. The patent stood in the name of two of the contractors and Mr. Baltzer? Yes.
17091. With regard to the advisableness of allowing an officer in the Civil Service to be a patentee, has the question never been considered in the Department? Yes, frequently.
17092. I believe that, some years ago, on the motion of Mr. Bennett, the matter was referred to the Crown Solicitor? So I believe.
17093. With the result that a patent was issued? Yes; it was before my time.
17094. What is your own view in regard to the advisableness or otherwise of allowing a civil servant to become a patentee? I would not myself hold a patent against my employers, no matter who they were, but I never did and never would refuse the right to a subordinate officer who might, perhaps, be in receipt of a small salary. I would leave him to exercise his brains in patenting any article which he thought might be of advantage in the construction of any work with which he might be associated. As a matter of fact we have had two or three cases of men holding patents in the Department. For instance, the late Engineer for Bridges, who held a very responsible position, and who was a fairly high-salaried officer, held a patent for an expansion joint in connection with iron bridges, and the royalty in the case of that patent was £100 upon each bridge. He took out the patent before I came into the Department. Mr. Bennett and everyone knew about it. This officer received a royalty from the patent for several years, and afterwards sold his right to an outside firm. I am now referring to Mr. Macdonald. There is a young fellow in the office now who has taken out a patent for an opening bridge—a very neat construction it is too, I believe. As a matter of fact I believe we have no legal right to prohibit officers from taking out patents. I do not profess to give an opinion in the matter, but I think that on the grounds of expediency it would be most undesirable to prohibit young men from exercising their brains when they show any special qualification. I myself would never hold a patent against my employers, and I never have done it; but it might be said that I am in a different position, seeing that I have a larger salary and can afford for that reason, perhaps, to take a different view of these matters.
17095. In the old country it is not an unusual thing for officers of the Crown in various departments to hold patents; it is done in the army and navy for instance? Yes; men are continually taking out patents for arms and various things connected with warfare.
17096. The only minute you remember writing referring to a special test of the Monier system is that to which you have already referred, and the only special test you had in view is that on the Strathfield culvert? That was the only special test we had made.
17097. And the only minute you remember writing as to that is the minute dated 18th July in which you specially refer to it? That is the only minute I have written in connection with that.
17098. You do not quote the cost of it, but you say that it was attended with most satisfactory results financially and otherwise? Yes.
17099. The next undue concessions mentioned in the substituted charges relates to the obtaining of Contract 79;—will you refer to page 255 of the evidence. In this case Carter, Gummow, & Co. were the second lowest tenderers, Bond and Hudson being originally the lowest? Yes.
17100. On the page to which I have referred you you will see a memorandum by Mr. Christie; will you look at paragraph E—Mr. Christie there says, "One day prior to the date of the deposit being returned, viz., on 6th October, 1891, Mr. Hickson asked for the papers and wrote a minute recommending that fresh tenders be invited"—How does that minute of 6th October, 1891, read? "I recommend that fresh tenders be invited."
17101. It is not an unusual thing for the second lowest tender to be taken without calling for fresh tenders supposing the first tenderer drops out? No.
17102. It is a very common thing? Yes; the Board of Reference, with the exception of Mr. Barling, held rather strong views about it. We thought it hardly fair to invite fresh tenders for a work unless there were some alterations proposed to be made, because it placed the contractors at a disadvantage. I know that contractors themselves object to it very strongly. They say they have to go to the trouble of making out fresh tenders, and that their prices are known all over the place. They hold very strong views as to the inviting of fresh tenders. However, it has been done in some cases. There is no question about that.
17103. Then why, in this case, did you take the other course and recommend that fresh tenders be called? For two reasons—first, because there was a considerable time between the date at which the tenders came in and the date at which the minute was written; and, secondly, because there was a considerable difference between the lowest and the next tenderer—about £3,000, I think.
17104. That minute of yours of 6th October was submitted on 9th October? Apparently. Of course it would leave my hands, and in the ordinary way I should not know what became of it afterwards.
17105. It was not approved by the Minister, owing, I believe, to the want of money, until 22nd February, 1892? No; Mr. Lyne does not appear to have dealt with the matter until then.
17106. Then you wrote your minute of 22nd February, 1892? Yes.
17107. How does that read? "Since writing my minute of 6th October, 1891, complications have arisen with Carter & Co. *re* their Contract 72 having been stopped. They have made large claims on this account, some of which, no doubt, could not be entertained; but on some items they have made a good case. They are prepared, if they obtain this work, to waive all claims on No. 72. As their tender is a reasonable one, and some £3,000 below the estimate, I think it might fairly be accepted. If this course were adopted, work would be given at once to a large number of men."
17108. What were those claims in regard to Contract 72? They made a claim in connection with the stoppage of 72, amounting to something over £4,000.
17109. What was the nature of the claim; did you go into it? Yes.
17110. What was the conclusion you arrived at in regard to it? I thought they had a reasonable prospect of receiving about half of the amount if the case went to a jury.
17111. You formed that conclusion from a consideration of the facts of the case, and also from your experience of similar claims made against the Department? Yes.
17112. Is it not a fact that it is considered by the Department a risky thing to stop a contract like this;—that you render yourself open to damages? Yes, decidedly.
17113. There have been cases where claims of this kind have been substantiated? Yes, in one case, that of the Bondi sewer, the Department had to pay £3,000 for stopping the work for two and a half months. We had a similar case not long ago in connection with a punt which was to have been built for one of the rivers. It was decided afterwards not to build it, and the Minister was prepared to give a very large sum indeed

indeed for practically cancelling the contract. However we compromised the matter by letting the man build the punt for another place, and giving him an additional sum.

R. R. P.  
Hickson.  
14 Sept., 1896.

17114. Was it before or after you wrote the minute to which you have referred that you saw Mr. Lyne? I saw him on the morning of the day on which I wrote that minute.

17115. What took place at the interview? I think Mr. E. M. Clark was there—but I am not quite sure about it—with the view of letting the work go on without calling for fresh tenders. I think he mentioned the fact that he understood a claim had been made in respect of another contract. Mr. Lyne asked me if I knew anything about it. I said that I did, and I went up and brought down the papers to him. We talked the matter over, and the conclusion to which I, and, I think, the Minister also, came was that it would be better to let Carter & Co. take up Contract 79 at their own tendered prices, especially as they were £3,600 below the office estimate, than to run the risk of having an action and submitting the case to a jury, seeing that in cases of that kind the verdict generally goes against the Government. I think myself that it was a very good bargain.

17116. You think it was a good settlement of that claim? Yes.

17117. And it was upon that that Mr. Lyne wrote his minute of the next day? Yes; he wrote his minute on the following day. It is as follows:—"As Mr. Hickson thinks Messrs. Carter & Co. could make good a claim for something like £2,000 as compensation on Contract 72 (Munni-street partly), should they be willing to forego this claim their tender may be accepted for the construction of the main outfall sewer, North Sydney, £38,890, as worked out at schedule rates. If this firm will not agree to the condition imposed, fresh tenders to be invited."

17118. That is a correct statement of what took place, as far as you remember. You thought the firm could make good a claim for something like £2,000? Yes, I had formed that opinion.

17119. Will you refer to Mr. Davis's memorandum No. 4, upon page 504 of the evidence. You will see that in his first paragraph he deals with the stoppage of work upon Contract 72. I suppose you confirm what he there states as to the facts? Yes; I think that is a fair statement of the case.

17120. In the first place, when this work was stopped, you wrote on 13th October, 1891, giving notice that you were stopping it under your powers under the contract? Yes.

17121. At the same time you had some doubt, I believe, as to how far the clause to which you referred would be a protection to you in the case of a claim? Yes, I had considerable doubt.

17122. And you took that into consideration when you told Mr. Lyne that, at all events, the contractors could make out a claim for £2,000? Yes.

17123. You had not overlooked the fact that you had previously relied upon this clause? Certainly not.

17124. And you used it, as Mr. Davis pointed out, to beat the contractors off if you possibly could? Yes; I could not describe it better than Mr. Davis has described it. I should explain that it was not a question of paying over a sum of money. If it had been, I should have sent the matter on to the Crown Solicitor for his opinion.

17125. At the time you wrote that minute as to the acceptance of the tender of Carter, Gummow, & Co. for Contract 79, did you know that Bond and Hudson had been bought off in the way you have since heard? I never heard of that until it came out in evidence before this Commission. It is not a thing of which, in any case, I should be likely to hear.

17126. But, as a matter of fact, it did not come to your knowledge in any way? No.

17127. If you had heard of it, your action would have been different? I think I should have taken different action if I had heard of it.

17128. To come to the next undue concession—the permitting of Messrs. Carter, Gummow, & Co. to obtain Contract 77 in an improper manner to the advantage of the contractors and to the disadvantage of the Crown;—you have already been examined at some length as to the action of the Tender Board taken on the joint recommendation of yourself and Mr. Darley, who had considered the matter of the Monier patent? Yes. (*Vide Appendix No. 69.*)

17129. If you refer to page 207 of the printed papers you will see that on the 27th March, 1895, Mr. Young wrote a minute, in which he says:—"Before approving of this proposal I should like an estimate of the actual value of the work to be carried out by the contractors under the substituted scheme." That was minuted on to you, and you wrote the minute already referred to under date of 28th March, 1895, in which you say:—"To comply fully with the Minister's minute would mean the taking out of quantities in the plan submitted by Messrs. Carter and Gummow. This would take at least a week to do. I think, however, I can answer sufficiently for the Minister to come to a decision. When plans were being prepared for the extension of the sewers on to the sewage farm, estimates were made for the work on the Monier system, as well as on the Department's designs. The result was that the estimate of both works was practically the same. Applying that comparison to this case, it would mean that the Departmental estimate for the work under consideration would be £22,000.—ROBT. HICKSON, 28/3/95. Under Secretary." With regard to that matter the quantities have since been taken out and various estimates have been made of the value of this portion of the work? Yes.

17130. Will you refer now to Mr. Davis's memorandum No. 5 which appears upon pages 506 and 507 of the evidence? Yes.

17131. He gives there an estimate founded upon quantities which I understand were agreed upon? Yes.

17132. You have gone into that matter—you understand it? Yes. I have not taken out the figures myself, but I know how Mr. Davis has done it.

17133. Are you satisfied, if you had complied with Mr. Young's request, and had gone into the matter fully at that stage, as to how the estimate would have worked out? I believe it would have worked out exactly in the way I indicated in my minute—in fact it would have been a little higher than the amount stated in Mr. Davis's memorandum, because I see that Mr. Davis's estimate is £3 16s. 10d. a yard, whereas Mr. Bagge in making his estimate put down the amount at £4. If I had sent the estimate back to Mr. Bagge, he would have put in the same figures again, so that it would have worked out a little higher than the estimate Mr. Davis has given.

17134. The experience you have gained from the actual construction of the work confirms you in the view you then laid before the Minister? Yes; and if I had the same circumstances before me to-morrow I should take exactly the same action.

17135. I understand you to say, first of all, therefore, that there was no undue concession made in regard to anyone of these three matters referred to? Certainly not.

R. R. P.  
Hickson.  
14 Sept., 1896.

17136. In dealing with these matters were you influenced at all by the fact that your son happened to be in the employment of these contractors? Not in the slightest.
17137. Did it enter into your mind, in any way, in dealing with any of the three matters referred to? Not in any way. I hope I am above that sort of thing.
17138. I see that reference was made by Mr. Barling to the purchase of this patent. What have you to say as to that;—would it have been an advantage or not to the Department? I should not have done it at all, and, I think, he made a mistake in suggesting it. I understand that he himself has since been inclined to think that he made a mistake in that matter.
17139. You think it was better to pay a royalty than to buy the thing right out? Certainly.
17140. As to Contract 69 there are two charges there—charges 1 and 3—in respect of which Mr. Davis has given evidence upon page 496. You will see what he says in his memorandum, No. 1, with regard to speculative tendering? Yes.
17141. Do you agree with what he states there with reference to this matter? Yes.
17142. You have already given evidence as to the introduction by you of the new system of tendering. His Honor asked you about that some time ago? Yes.
17143. With regard to the item of £50 per square yard for bluestone pitching, which we have heard so much about, was that pointed out to you by Mr. Bagge? No; certainly not.
17144. And the first you heard of it was when Mr. Davis brought it under your notice, as he states, in his memorandum? The first I heard of it was the day on which he brought into my office the minute in his handwriting.
17145. Supposing your attention had been drawn to this item, which, I think in your former evidence, you have described as a most extravagant one, what action would you have recommended the Tender Board to take? That is a very difficult question to answer.
17146. Would you have thrown out the item? I do not think I should.
17147. Why not? What are the principles which would have guided you in determining a question of that sort from your point of view? I do not think it would have been fair to throw it out. I think it would have been a most inadvisable action for the Department to take—to alter the contractors' prices after their tender had come in. Of course, I need hardly say that I could not have taken out that particular item of £50 without increasing some of the other ridiculously low ones, and once that sort of work commenced it would be hard to say where it would end. Naturally the other contractors would strongly object to action of that sort. They would very fairly have said that had they known that that sort of work was to be done they would have liked, and should have been afforded an opportunity, to re-adjust their prices. The only thing that could have been done, now that I have had time to think about it, was to reject the whole lot of tenders and to adopt the system afterwards adopted, making it apply to this case. That, however, would have involved considerable delay. In the first place, I had not fully made up my mind then as to the advisableness of adopting this new system. I need not tell you that it is a very serious thing to alter a system which is in vogue all over the world, and which has worked fairly satisfactorily all through. It requires a good deal of consideration on the part of one engineer—who may be thought to have some fad on the subject—to alter a system such as that. I suppose I must have been six months thinking over the matter before I finally decided to adopt the change.
17148. So that on the whole you think you would not have been justified in throwing out this item, even if it had been pointed out to you? No. Of course it is easy to be wise after the event.
17149. With regard to the suggestion that these contractors must have got information from inside the Department, what do you say as to that? That is simply absurd on the face of it. Any person understanding how the Department is managed can see that that is simply impossible.
17150. Will you state shortly the course which is taken when tenders are called for in connection with any particular work? There are three sub-branches which deal with all contracts. There is the Survey Branch, which does all the field work and which knows everything in connection with it. Then, when the plans are plotted they are sent on to the Designing office. The work is there designed upon these plans, and the officers in that branch have not the remotest idea as to whether one portion may be left out, or another portion put in, or how the design will eventually be worked out. As soon as tenders are in and have been examined by them, the work is out of their hands and is sent on the Construction Branch. Suppose, for the sake of argument, some one in the Drawing Office was in the pay of a firm of contractors. He would first of all have to find out from the Survey Branch all the particulars as to what portion of the work was likely to be left out and what portion was likely to be put in. To do that it would be necessary for him to put himself in communication with every surveyor, because all connected with these contracts do some work in connection with them. Then, when a certain tender had been accepted, this person would have to go through the same operation with the Construction Branch, and he could not ask one Resident Engineer whether he would leave out this item or put in that, because he would not know who the Resident Engineer would be. He would have to go to every officer in the Construction Branch, and I have a good deal too much faith in the officers I have had there under me, from Mr. Bagge downwards, to think that such a thing would be possible. You will see, therefore, that before the supposititious person to whom I have referred could do anything, every officer in the Department would have to be mixed up in the business.
17151. Even then the information obtained might not be of much use, because the Resident Engineer in charge of the work might be changed? Quite so. I have just pointed out that the Resident Engineer would not be known.
17152. It comes to this, therefore, that even if the contractors did get information in the way you have suggested it could not be relied upon? No.
17153. The only person who could be squared with any advantage, according to Mr. Chamier, would be the Engineer-in-Chief? Then, again, I should have to square all my officers. I have not tried that, and I do not know what success I should meet with.
17154. You heard the evidence of Mr. Gilliver about the cutting out of a bridge on one of his contracts? I read it.
17155. I think the effect of his evidence was that you ought to have dealt with this item of bluestone pitchers in connection with Contract 69 in just the same way that you dealt with his bridge? That apparently is what he thought.
17156. Will you explain in what way the cases are not parallel? They are totally different cases. First  
of

R. R. P.  
Hickson.

14 Sept., 1895.

of all, I should tell you that the bridge ought not to have been put in. It was a mistake, and it was left out, not because it was a bad-paying or a good-paying item. I do not know whether the contractors would have lost or made anything upon it, but it was left out because, in my opinion, it was a work which ought not to have been charged to the ratepayers of Sydney. It was not required for the pipe line. All that we required was what we put in at the time—a trestle bridge. As regards a traffic bridge, I maintain that it would have been unfair to charge the ratepayers of the whole suburban area with the cost of such a bridge, which was required only for local purposes. As to the pitching, it was specified for, and the work had to be carried out. I certainly should not have been justified in taking it out because it happened to be a big paying item, unless at the same time I had been prepared to increase some of the low paying items, which would have been a most dangerous thing to do.

17157. Let me refer you to charge No. 2, under the heading of Contract 69. Allowing the contract to be taken up by Carter, Gummow, & Co. with an insufficient bond, and with ultimately breaking that bond by remitting the retention money, and writing a minute by which the Minister was deceived and induced to consent. In connection with that charge I should like to refer you to Mr. Davis' memorandum, which appears upon page 501 of the printed evidence;—you confirm that? Yes.

17158. You will see that Mr. Christie referred to the minute which was written by you with regard to these sureties in his evidence, on page 381; you will see that he states that Mr. Davis, in his minute, refers to the sureties by the names of the firms; they are referred to by the contractors, first of all, by the names of their firm; what have you to say as to that—that is, as to the way in which you would regard individuals who had given their names in a bond of this kind;—would you consider the firms of which they were members? Yes, certainly.

17159. And if the firms were strong firms, would you be content? Yes.

17160. So that there is nothing misleading in that minute in so far as it refers to those sureties in a general way by the names of the firms? No, certainly not. I, myself, certainly had no intention to mislead.

17161. Mr. Christie says, also, that the usual declaration as to the possession of property to the amount of the bond was not obtained;—was it usual to take a declaration when you knew the men? No declaration was taken at that time; it was not the custom to take them. I think Mr. Norrie introduced that practice.

17162. If you satisfied yourself on inquiry that the men were substantial men, it was not usual to take a declaration? No, it was not the custom.

17163. Let me refer you to Mr. Davis' memorandum No. 3, which appears upon page 502 of the printed evidence; you will see that it deals with the charges as to the advances on cement made to Messrs. Carter & Co. on Contracts 69, 79, and 79 A;—are the statements contained in that memorandum correct? Yes; I think they are quite correct.

17164. And the same with regard to the memorandum No. 6 that appears upon page 503 of the printed evidence—I mean the memorandum as to guttering and gadding? Yes.

17165. As to the matter of the unwatering of Contract 118, what have you to say as to that;—it was done under your instructions, was it not? It was done under my orders, and all I can say in regard to it is, that if I were put in a similar position to-morrow, I should do the same thing.

17166. It was Mr. Millner, the officer-in-charge of the contract, who first drew Mr. Davis' attention to the matter? I do not know who first drew his attention to it.

17167. At all events, Mr. Davis reported it to you, and you went out and looked at it? My attention was first drawn to it by the contractors, I think, and also by our own dredge-master. The dredge-master said to me "We are flooding the contractors out. I should like you to come out and have a look at it. We shall have to stop the dredge work or make some other arrangement." I went out the same day and went over the ground with Mr. Carter and the dredge-master. Of course it was at once patent to any person that we should have to take steps to prevent the flooding.

17168. You had brought the water there, and it was your business to take it off again? Yes.

17169. And you would take the same action to-morrow in similar circumstances? Yes.

17170. The clause in the specification as to unwatering had nothing whatever to do with a case of that kind? No; it does not follow that because you have a clause binding the contractor as to unwatering you are at liberty to turn a waterspout on to his work. The point is too absurd to admit of argument.

17171. I think Mr. Parkes in his evidence referred to what he called a parallel case, where he said the Department took exactly opposite action. Let me refer you to page 489, of the printed evidence, question 15,281. The document I hand you is a letter from Mr. Foord, the contractor in the case referred to by Mr. Parkes? Yes. Mr. Foord says, "I beg to inform you that, owing to being misinformed as to the locality of the Evans River scheme, I don't see anything but loss in it; so I don't see my way clear to accept the contract." The matter was referred to Mr. Carlton for report, and he says "I recommend that Mr. Charles Foord's deposit be forfeited, and the next lowest tender for scheme No. 2, that of Mr. Taylor, be accepted for the lump sum of £2,549 5s. 6d. We shall still be £150 inside our estimate for the work. I notice Mr. Taylor only deposited £14 instead of £26 with his tender." Mr. Darley, who was in charge of the work, concurred.

17172. *His Honor.*] What is the date of the contractor's letter? 14th March, 1895. Mr. Darley was then Engineer-in-Chief for Harbours and Rivers.

17173. You had not to deal with the matter? Not until afterwards, when another contractor went on with the job. I think Mr. Parkes must have been referring to Taylor.

17174. What became of Taylor? He was accepted as the contractor under Mr. Darley. The matter first came under my notice when Taylor came to tell me that he could not go on with the job.

17175. Why not? He had too low a price. That was really the reason. Perhaps I had better explain the matter. Alternative tenders were invited for cutting a channel through what is called the iron gates. It is not sand at all, but hard material, as the name implies. One design was for a broad and shallow channel and the other for a narrow and deep one. Mr. Darley recommended the acceptance of Taylor's tender for the narrow and deep channel. He started the work and took out the channel a certain depth, and he then came to the office and said he could not finish the work. He asked me, I being then in charge of the work, to let him take up the alternative design, for which he had not tendered at all. I told him in the first place that such a thing could not be thought of, and that in the second place it was not as good a channel. Mr. Parkes never came to see me with Mr. Taylor, but he came into the office to see Mr. Barling. I happened to be in the room at the time, and I explained the circumstances to Mr. Barling.

There

R. R. P.  
Hickson.  
14 Sept., 1896.

There was no question about silting up. It was a question of excavating the hard material. I understood that Mr. Parkes went away satisfied that the view I took was the correct one.

17176. What was done? Taylor threw the contract up.

17177. He made an application for compensation; he wrote a letter and he afterwards saw you? Yes; he wrote the following letter on December 12, 1895:—

12 December, 1895.

HAVING been dissatisfied with the measurements shown in returns made on my contract for widening and deepening the channel of Evans River, at Iron Gates, I decided to take an engineer from Sydney, to take measurements in conjunction with the Departmental officers; and after he had carefully measured and calculated the whole of the measurements taken, and checked same, he submitted his report to me of the work. I find there is only 150 cubic yards difference between them in the amount of excavation yet to be done, my engineer being that amount in excess of the Departmental engineer's calculation.

From observations and measurements carefully made of spoil banks where material excavated had been deposited, and after making due allowance for gain by removal, and without taking into consideration spoil deposited in deep water holes and other inaccessible places, he estimates that I have removed several thousand cubic yards more than I have been given credit for. The spoil banks have been entirely made up of material taken from above low-water level, which confirms my opinion that I have had a far greater amount of material to remove than was given in schedule of quantities for contractors' guidance to tender by, and not doubting at the time but that the quantities given were correct tendered accordingly.

It was not until I had removed a considerable quantity of the material in No. 1 and No. 3 on schedule, which gave me the impression that the quantities as given in schedule were incorrect.

As the quantity of material yet to be removed exceeds 5,085 cubic yards, the whole of which is practically below low-water level, and when this amount is deducted from quantities given in schedule, namely, 6,353 cubic yards, it only gives me credit for having removed 1,268 cubic yards.

I am confident that I have removed more than double that amount, as this material has been removed by dredging and other means and conveyed by punts to the deep water, where it has been deposited, which enables me to keep a check and to form a fair estimate of the quantity of material so removed.

Being now over time from 15th August to date, a period of eighteen weeks, and the penalties being levied and deducted from monthly payments, making the amounts payable to me so small as to be insufficient to even pay half working expenses.

And as I have already had a loss of over £1,000 on the work up to date, which renders me unable to meet present liabilities on the work.

In view of the above facts, I would respectfully request that you relieve me of the contract and allow me some fair compensation to meet existing liabilities.

That was sent on to Mr. Carleton on the 13th for report, and in the meantime Mr. Taylor saw me. I wrote the following minute, I find, "This telegram has been verbally confirmed by Mr. Taylor himself to-day. I recommend that the contract be cancelled. I have wired to Mr. Keele to advise as to the completion of the work. The question of Taylor's disqualification might be considered at the next meeting of the Board of Reference." The telegram there referred to would be a telegram which appears to have been detached from the paper. When Mr. Taylor was in my room talking to me, and asking for compensation for the apparent short measurement, I received the following telegram, "Mr. Napier went out to-day to Iron Gates to measure up for progress payment on Taylor's contract, but found the contractor and his men gone, and all the plant removed. He has left no one there to represent him, and, from information received, Mr. Napier has come to the conclusion that he has thrown up the contract." I showed Taylor that telegram, and I said "Is it true, Taylor, that you have actually taken away your plant, and have left the work?" He said it was the case, and I then said "Leave my room at once. You will have to apply to someone else for consideration."

17178. If you refer to page 335 of the printed papers in connection with Contract 79A you will see that on 22nd March, 1894, you wrote a minute which ends with these words, "I believe, however, if tenders were invited we could get work done under the office estimate"—that was your opinion at the time, and you still held that opinion when you saw the Minister? Yes. (*Vide Appendix No. 73.*)

17179. Mr. Lyne has been examined by the Commission, and has said in reference to the letting of that contract that he took the responsibility of it—is it not a fact that you were still of opinion that you could get the work done under the office estimate if you had called for tenders? I am under that impression still.

17180. In the next minute you said you had received an intimation from the Minister that he was prepared to let the contract to Messrs. Carter & Co. upon certain terms, and upon that you acted? Yes; Mr. Lyne gave me that information in the presence of Mr. E. M. Clark.

17181. So that there was no change in your mind at all? No; I never changed my mind about the matter.

17182. The contract was let, as Mr. Lyne told us, on his responsibility? Yes. Of course, he would not deny that.

17183. With regard to these papers you had nothing to do with preparing the Return for Parliament? No; I never interfered with that work at all.

17184. *Mr. Gummow.*] In connection with the alteration of the system of tendering—that is from the old system under which the contractors put in their own prices to the new system under which you put in prices—you said you gave that matter consideration for some time before making the change? Yes.

17185. Was it on account of the large prices that Carter, Gummow, & Co. put in that you finally decided that an alteration was necessary? Not entirely. You were all pretty much in the same boat.

17186. But, as a matter of fact, Carter, Gummow, & Co. did take advantage of the old system, and did put in large and small prices? Certainly.

17187. So that really when you made the alteration it was a blow at the contractors, and at Carter, Gummow, & Co., in particular? It was a blow at all the contractors.

17188. But Carter, Gummow, & Co. were taking advantage of the system? The change was not a blow at any contractors in particular. It was a blow at the system which I believed to be bad.

17189. As to the Johnstone's Creek works, and the cutting of the drain—is not the drain necessary at the present time for the carrying away of surplus water that falls on the area just above the creek? We could not carry out the extension of the storm-water sewer through the reclamation until that drain was cut.

17190. The contract of Carter, Gummow, & Co. came to a dead end; they had no outlet? When tenders were called they had an outlet, but when they started the work the outlet had been closed up by the reclamation works.

17191. Are you still keeping open the channel which you cut? Yes. The Minister approved the other day of an expenditure for widening and deepening it, and for cleaning it out.

17192.

17192. This particular channel? A part of it.

17193. Is that expenditure to the benefit of Carter, Gummow, & Co.? No; their work is finished, I understand.

17194. *Mr. Smith.*] I believe reports have been laid upon the Table of the House, from various officers, with reference to Contracts 101 and 64, which were referred to by Mr. M'Creddie in his evidence? Yes.

17195. Whose reports are they? They are reports by Mr. Carleton, Mr. Davis, Mr. Smail, and Mr. Darley. The following are the papers:—

R. R. P.  
Hickson.

14 Sept., 1896.

14 August, 1896.

I FORWARD herewith, for the information of the Minister, reports from Messrs. Davis, Smail, and Carleton, in connection with this work. Under ordinary circumstances, I would have deemed it sufficient to obtain Mr. Davis's report; but, considering the alarming statements that have been made in connection with these sewers, I thought it advisable, in addition to Mr. Davis, to have the work inspected by Mr. Carleton, who has had a very long experience in concrete work, and Mr. Smail, who, in addition to his experience in sewerage works, will be responsible for these sewers when they are handed over by the department to the Board.

I think the Minister will concur with me that the statements that have been made in connection with these works are totally unfounded, and what has taken place is what any engineer of experience would expect in similar construction.

It must be remembered these sewers have had a very severe trial, in that they have been lying idle for such a long time, and exposed to an extreme winter. I am of opinion that when they come to be used, and are subjected to the uniform temperature which is met with in all sewers in use, this contraction and expansion will practically disappear, and the sewers be perfectly watertight.

ROB. HICKSON.

13 August, 1896.

IN accordance with your instructions I examined the triplicate sewers at Arncliffe to-day in the company of Messrs. Smail and Davis, with reference to the cracks which have appeared in the concrete work of the arches and carriers.

Two kinds of concrete have been used in the structures—7 to 1 sandstone concrete in the spandrills of the arches up to the level of the crown of the extrados, 6 to 1 bluestone concrete in the lower half of the sewers, and 7 to 1 sandstone concrete in the upper half up to the top of the structure.

Two series of cracks present themselves—one a horizontal crack at the junctions of the different kinds of concrete; the other series appear as vertical and diagonal cracks, which, in some instances, run from top to bottom of the concrete, principally at junctions between what may be called new and old work, or where the concreting has not been carried on continuously.

The structure is decidedly massive, and neither kinds of cracks, in my opinion, imperil the stability or usefulness of the aqueducts.

The horizontal cracks between the two kinds of concrete might, I think, have been avoided by the use of one class of concrete throughout.

Both sets of cracks are due to variations in temperature; and the second set are common to all large masses of concrete which are exposed to a considerable range of temperature.

I do not consider any action necessary at present. There will no doubt be some slight leakage on the first admission of sewerage to the carriers, but I believe the cracks will soon become choked with sediment, and that the sewers will be practically dry externally within six months of their being brought into action.

It may, however, be found desirable hereafter to rake out a few of the more prominent transverse cracks and fill them in with mastic, so as to form permanent expansion joints. The cost of this would be trifling.

If, however, it is thought necessary to prevent any leakage of sewerage even at the commencement, this could be done now by putting in temporary bulkheads at each end of the aqueducts, and filling the sewers with water, when the sediment deposited by soakage through the cracks will soon close them up.

The few small cracks which are visible in the aqueduct between Rocky Point Road and the Illawarra Railway are so slight that they are of no practical importance.

I might mention that I had actual charge of a work where very similar action took place. A large concrete dam for the Orange Water Works, 30 feet in height, and nearly  $\frac{1}{4}$  of a mile long, was constructed during the summer months. On the first appearance of winter, cracks appeared in the dam, and leakage took place through them. The increase and decrease in the width of the cracks was readily detected by measuring the variation in the quantity of water passing through them, and this increase was clearly shown to be coincident with marked falls in the temperature. No remedy was considered necessary, and the cracks very soon became choked with sediment, and the leakage is now practically nil. The same result may be looked for with confidence in the Arncliffe sewers.

It has, I believe, been proposed to form a bank of earth or sand covering the whole structure. This, however, I consider an unnecessary expense.

H. R. CARLETON.

13th August, 1896.

IN company with Messrs. Smail and Carleton, this afternoon, I made an examination of the aqueducts across the Sewage Farm at Arncliffe, constructed under Contract No. 101, by Mr. John Ahearn, and aqueduct No. 3 lying between Rocky Point Road and the Illawarra Railway, constructed under Contract No. 64, by Mr. J. F. Carson.

They are both 6-ft. triplicate circular sewers, and are built on sandstone concrete piers, and 27' 6" span brick arches, the spandrills being sandstone concrete.

The sewer in the latter case is of brick and bluestone concrete, and the former, bluestone and sandstone concrete. The piers in the Contract No. 64 aqueduct are built upon piles, and those in Contract No. 101 on good clean firm sand.

There were several vertical cracks varying from 1-16th inch to 1-8th inch in width, and evidently occurring at the junction of two lengths of concrete, this being the point where the structure would be least able to stand the tensile stress which would be set up by the contraction.

There is also a small longitudinal crack extending more or less along the length of the aqueduct, at the springing of the arches of the sewer, where the bluestone concrete in the invert joins the sandstone concrete in the arches.

I am of opinion that no settlement has taken place, and that the cracks are caused by the contraction of the materials forming the structure.

In my judgment there have been two movements, to some extent independent of each other. Firstly, the material composing the aqueducts, arches, and spandrills, has shrunk longitudinally under the low temperature which has of late been experienced; and as the concrete was not sufficiently elastic to accommodate itself to this variation of temperature, vertical cracks have occurred at intervals along the length and at right angles to the axis of the sewer. If the aggregate width of the cracks is taken, it indicates that the movement is very slight, but even this has proved sufficient to cause fracture in so rigid a material.

Secondly, the expansion and contraction of sandstone and bluestone concrete are not equal, although the difference is so small that ordinarily it is imperceptible. This difference of movement, when taken for a long length of concrete, as is the case in question, so accumulates that it has had the effect of breaking the joint between the bluestone and sandstone concrete at the springing of the arches of the sewer. The cross section attached illustrates where the bond is broken between the two kinds of concrete.

Neither the vertical nor the longitudinal cracks will decrease the utility of the sewer, and for all practical purposes may be considered of no consequence, nor can it be said that the stability of the structure has been impaired. The cracks will completely close up during the summer, and before another winter the sewer will be in use, when the sewage will have the effect of keeping the concrete at a more uniform temperature, and make it not so liable to be affected by climatic changes.

It

R. R. P.  
Hickson.  
14 Sept., 1896.

It is very common for cracks to occur in concrete work. Indeed it would be difficult to find any of the length and magnitude of contract No. 101 where they have not occurred.

In practice it is found that should they at first cause an escape of water, in a short time they stanch themselves. No bad effects are therefore anticipated from those in question; but, before the sewer is used, it will be an easy matter, should it be considered necessary, to insert a mastic joint at the points where the vertical cracks have occurred. It will be little use otherwise repairing them beyond this, as in all probability the contraction will occur, only to a less degree, each winter. Last winter, in the portion of the aqueduct completed, this occurred, and, before the work was taken over from the Contractor, he was asked to repair them, but they reopened this year.

Regarding the aqueduct on contract No. 64, there are several small cracks at the base of the spandrels, but they are of so little moment that it is not considered they call for remark. They certainly do not militate against the stability, utility, or appearance of the work.

J. DAVIS.

13th August, 1896.

I VISITED the above works in company with Mr. Carlton and Mr. Davis, and after inspection of both Aqueducts, I beg to submit the following report, viz. :—

*No. 4 Aqueduct, Contract No. 101, John Ahearn, Contractor.*—I inspected these works several times during the latter part of the contract while acting as Engineer-in-Chief for the Minister, and noticed that the concrete showed signs of cracking at different points; these appeared at places where same could naturally have been expected in works of this nature, and carried out in such exposed positions to varying changes of temperature. When contract was approaching completion the then Supervising Engineer, Mr. Griffiths, reported that the Resident Engineer, Mr. Smith, drew his attention to certain movements in the arches and superstructure at far end. The work was inspected, and tests were applied, which would show whether the movement was due to defective foundations or otherwise. The levels taken by Mr. Smith clearly indicated that movements were not due to sinking of piers, even to the smallest extent. Paper tests also showed that no opening movement beyond that showing at the time occurred in the piers, nor has any occurred since. With regard to cracks in superstructure, the line of cracks shows what might be expected, and what has actually occurred in an aqueduct in the older portion of the farm, constructed by Mr. John Young, contractor, over ten years ago. The cracks referred to took place at the point of junction between two lengths where "racking back" occurred. This mode of joining lengths was the plan adopted, and has since been continued, in order to obtain as far as possible a homogeneous mass. Notwithstanding all precautions taken cracks afterwards appeared, but were not interfered with, as experience showed that any leaks which occurred in first instance eventually "took up," and aqueduct served the purposes for which it was intended. Observations of their length and that of main carrier for a period of ten years showed that cracks which could be easily detected in cold seasons, in hot weather it would be difficult to find. This clearly demonstrates that in concrete structures, where any partition occurs it is due to the natural contraction of the material, and further that the cracks open and close according to the temperature, assuming work has been faithfully carried out. In the light of experience I attribute the cracks in superstructure to contraction and not to defective work, as I have every reason to believe that the work has been faithfully executed. I think with the construction of the distributing chamber and connecting up of the triplicate sewers no longitudinal movement will take place, and that existing cracks are not detrimental to the stability of the structure. I think it would be advisable not to come to any conclusion until the hot weather sets in, when it could be settled beyond a doubt whether the cracks which now are visible will close up or not. If this takes place, which I think it will, the cracks could be attended to, and when sewage is flowing in sewer the internal temperature will be more uniform, and any weepage will take up, as it has in other cases. I am informed it is suggested that the superstructure should be removed and triplicate line of pipes substituted, also that existing structure should be covered with earth in embankment. I am of opinion that it would be wasting money to carry out either suggestion.

*Aqueduct No. 3, Contract 64, Carson, Contractor.*—This structure was closely inspected, and with the exception of a few hair-cracks in cement near springing of arches incidental to such work, there is no difference in the work now than when I last saw it a few years ago: the only deterioration was in the stone string courses which showed signs of fretting in one place, this can be prevented by coating the surface with oil. I do not consider there is any cause for complaint in this work.

J. M. SMAIL.

21 August, 1896.

I, THIS day, examined the condition of Contract No. 101, which has been reported to be exhibiting some defects. The length of this contract was about 28 chains, and consists of three 6-ft diameter sewers, forming a triplicate sewer, carried on 18-in. brick arches, 24 feet spans, resting on concrete piers, the superstructure above the arches being composed of rich blue-stone concrete up to line of centre of sewers, and above that of sandstone concrete of a poorer quality; the inside of sewers and external exposed face of concrete being rendered with cement mortar. Almost throughout the whole length of the carrier a horizontal crack or parting is visible in the rendering, along the line of junction of the two classes of concrete.

I attribute no importance to this defect—it is an eyesore certainly, but no more, for it is hardly traceable on the inside.

There is, apparently, a want of unison in the two materials, one probably contracting a little more than the other on the outside, where exposed to a range of temperature. In the interests of economy in designing large works, it would appear a very proper course to adopt, viz., to place a less expensive material where it has but little more to do than act as a covering; but, with the experience now, I think, for the first time gained, of the result of such an experiment, I would not repeat it, where placed in an exposed situation. I feel sure, however, that the defect will get no worse, and that it will give no further trouble.

There are, however, about six transverse cracks through the superstructure; three appear to go down to head of arch only, but three show right through arch and carrier. These cracks are due to contraction in the long line of concrete work, and there is evidence that they give and take a little with change of temperature—being more open on the southern, or shady side, than on the north, or warmer side.

Some of these cracks were visible before the contract was quite complete, the rendering having been cut out and replaced by the contractor, but the defect is still visible, and must remain so while the structure expands and contracts.

From my experience of concrete I know it is practically impossible ever to construct a long line of rigid work and prevent its cracking by contraction. In marine work, such as a continuous parapet on a breakwater, it is usual to provide dry partings at intervals, to allow of movement taking place, and thus avoid unsightly cracks, but in such works, of course, water tightness has not to be studied. In the structure in question, the cracks are an eyesore, but I do not look upon them as a serious defect; and, with proper treatment before the sewer is about to be brought into use, they can be made quite staunch and not likely to give any further trouble.

This carrier was practically completed when I took charge of the Sewerage Construction works last year; and, when on my first inspection I saw the cracks, I decided to leave them alone until shortly before the sewers were to be used, and then to open out along the line of transverse cracks, and stop them inside with mastic asphalt. This material has, in many similar cases, been used most successfully, notably so by Sir John Fowler, in stopping cracks which caused much trouble in a very large and high service reservoir connected with the Colombo Water Supply, where water has to be stored to a depth of about 50 feet; thus the mastic stopping has to resist a very high pressure; but, in the sewer in question, the pressure is very slight, so I have not the least doubt as to its success in permanently remedying the defect and preventing leakage.

One great advantage of the mastic is that it will allow the carrier to expand and contract with change of seasons, and still remain quite tight.

To sum up—I look upon the cracks as almost, if not quite, unavoidable, in such a rigid structure—at the same time, they are a more apparent than a real defect, and can be easily treated in a way that will permanently stop them from causing any trouble.

C. W. DARLEY.

WITH

22 August, 1896.

R. R. P.  
Hickson.

14 Sept., 1896.

WITH further reference to my minute of the 14th instant, I have the honor to report that in obedience to your instructions I made a very careful examination, to-day, of Contract No. 101, and also that portion of Contract 64 lying between the Illawarra Railway and the Rocky Point Road. These works form portion of the Western Suburbs 6 feet Triplicate Circular Outfall Sewer. The work comprised in Contract 101, which is about 28 chains in length, is constructed as follows:—

Concrete piers carried an average of 7 feet below the surface of the ground on to clean sand, brick arches 18 inches thick, and a superstructure as follows—spandrels, sandstone concrete, invert of sewer bluestone concrete, the upper portion of sewer sandstone concrete, and the whole covered with a coating of asphalt. The inside of barrels and external face of concrete is rendered with cement mortar.

The portion of Contract 64 referred to is constructed as follows:—

Concrete piers resting on a pile foundation, brick arches 18 inches thick, the superstructure differing from 101 in that the upper halves of the barrels are constructed in brick, and the sides of the aqueduct faced with brickwork; the barrels and external face of cement being rendered, and the top covered with asphalt.

In Contract 101, there are a number of horizontal as well as vertical cracks to be seen on the outside, and to a much lesser extent on the inside of the two external barrels, the centre barrel being practically without a flaw; while in Contract 64 there are only a very few horizontal hair-cracks on the inside and no vertical cracks to be seen. The horizontal cracks in both cases are undoubtedly due to the unequal contraction and expansion of bluestone and sandstone concretes and brickwork, and the vertical cracks in Contract 101 are caused by the contraction of the structure during the late cold weather.

Careful levels have been taken, and these show that no settlement whatever has taken place, and the cracks are therefore solely caused by the contraction of the material of which the structure is composed. In hot weather no doubt expansion will take place and the cracks close up. Indeed, evidence of this was to be seen to-day, as the substance washed into the cracks was being squeezed out, clearly indicating that the warm weather was causing expansion and closing them up. That no vertical cracks are to be seen in Contract 64 is probably due to the fact that the expansion and contraction are absorbed in the joints of the brickwork, and cannot therefore be detected.

When it is remembered that these sewers have not yet been put in use, and have not therefore been subject to the equable temperature that is found in all sewers in which sewage is flowing, and also that concrete contracts and expands almost exactly in the same ratio as iron, I think it will be admitted that what has happened is only what might have been expected.

I entirely agree with Messrs. Darley, Davis, Smail, and Carleton, that these cracks are of no importance, and that when the sewer is brought into steady use they will more than likely entirely disappear, or, if not, be easily and cheaply stopped by the aid of mastic joints. I might add that I examined the Orange Dam mentioned by Mr. Carleton, and I am confident that, if any one not understanding the action of concrete had seen the leaks in that structure, reports of a much more alarming character than even those circulated in regard to the Arncliffe Sewers could have been made.

It was observed when Contract 62 was in course of construction, that those portions of the triplicate sewer similarly designed to Contract 64, when exposed to the atmosphere, showed horizontal cracks at the junction of the bluestone concrete and brickwork, and I drew the attention of Mr. Oswald Browne, M.Inst.C.E., one of the leading sanitary engineers in London, who happened to be at the time on a visit to Sydney, to the matter. He then told me that contraction must be expected in such large concrete structures, but when the sewers came into use the cracks would close up with sediment and the sewer would be watertight.

A statement has been made that this work would have to be taken down and an iron pipe put up at a cost of from £20,000 to £30,000. It is difficult to understand how a person with any knowledge of concrete structures could make such an assertion. There would be no justification whatsoever for this expenditure, which could only be designated as a waste of public funds, or indeed for in any way interfering with the existing structure, except that it may, as I said before, be found desirable to fill up some of the cracks with mastic; but even the necessity for this trifling expenditure is very doubtful.

When I took charge of the Sewerage Construction Works the designs for the pipe structures across Wollie Creek and the Cook's River Valley had been practically settled upon. On carefully considering the matter, I thought that a cheaper design could be introduced between the Rocky Point Road and the railway; and, on going further into the portion of the work where sightliness had not to be taken so much into account, a still further reduction was made in Contract No. 101. That I have been successful in my efforts to secure economy in construction, while maintaining the efficiency of the work, is, I think, conclusively shown by the following comparison of cost:—

|  | £  | s. | d. |           |
|--|----|----|----|-----------|
| Iron-pipe triplicate sewer on brick arches as constructed across Cook's River and Wollie Creek Valleys...                          | 32 | 6  | 2  | per foot. |
| Bluestone concrete and brick triplicate sewer on brick arches, as constructed between Rocky Point Road and South Coast Railway ... | 16 | 18 | 10 | „         |
| Bluestone concrete and sandstone concrete triplicate sewer on brick arches, as adopted in Contract 101 ...                         | 10 | 19 | 0  | „         |

NOTE.—In order to ensure a fair comparison, the cost of these works has only been taken from the ground upwards.

A comparison has been made between the Wollie Creek and Cook's River Works and Contract No. 101, with a view of depreciating the latter. While there is no doubt the former are most substantial and slightly structures, I submit that it is quite possible to attain this end at too great a cost. There is not much engineering skill displayed in designing work without regard to cost, and I maintain that Contract No. 101 is a vast improvement, from an engineering point of view, on the pipe structures at Wollie Creek and Cook's River.

Taking these facts into consideration, I am quite satisfied that any engineer of experience will say that the economy effected in the construction of these works was a wise and judicious one, and would much more than compensate for a few apparent defects which, as Mr. Darley points out, are nothing more than eye-sores.

ROBT. HICKSON.

24 August, 1896.

WITH reference to the Minister's request to be furnished with a report as to the circumstances under which the works comprised in these contracts came to be carried out before they could be put to use, I beg to submit the following particulars for his information:—

The sewerage works for the western suburbs were sanctioned by Parliament in September, 1889, and it was the full intention of the department to carry out the scheme in such a way as to permit of portions of it, at any rate, being utilised and made revenue-producing before the works, as a whole, were completed. That is to say, it was proposed to first push on and complete the outfall works so that as each of the subsidiary main sewers were finished and connected therewith, they might be made use of.

The outfall works proper are comprised in four contracts or sections, viz., Contracts 62, 64, 101, and 112. The plans were proceeded with as quickly as could possibly have been done, and a tender was accepted for Contract 62 in July, 1890, the time for completion being two years from that date.

Contract 64 was the next to be undertaken. This was started in March, 1891, two years being allowed for completion, and No. 101 was let in December, 1893, to be completed in March, 1895.

The remaining section, viz., Contract 112, which is the extension of the main carrier across the sewage farm, was not, however, put in hand until March, 1895. The work is now in progress and the contract time expires on the 8th December next.

When this contract is finished the outfall works will be practically complete, and such portions of the sewers as are ready can then be utilised, and the same can be done with the succeeding portions of the work as they are finished.

The delay which took place in proceeding with Contracts 101 and 112 was quite outside the control of the department, and was entirely due to the difficulties which arose in connection with the obtaining of Loan funds. Had the money been available to permit of the contracts being let as the plans became completed, a delay of quite two years might have been avoided, and the outfall would long ago have been completed and in use.

The

R. R. P.  
Hickson.  
14 Sept., 1896.

The difficulties which I refer to may be said to have commenced about the end of 1891. At that time our funds began to run short, and between March, 1892, when Contract 79 (part of the North Shore works) was let, and December, 1893, when Contract 101 was accepted, no sewerage contracts of any importance were entered upon. Indeed it was only by adopting the expedient of paying contractors in Funded Stock that we were able to make a fresh start and push on with the works.

Matters, however, righted themselves during 1894, and we were able to proceed more satisfactorily, and I trust that with the improved financial conditions of the Colony we shall not experience any future trouble of this kind.

During the period of the delay to which I have referred, I many times drew attention to its effect in retarding the proper progress of sewerage construction work. I cannot, at the moment, refer to all my minutes on the subject, as they are so scattered amongst the many papers relating to the various contracts; and, as many of these papers are with the Parkes Inquiry Commission just now, they are difficult of access. I might, however, refer the Minister to my report of 18th September, 1893, in which the policy of the Department in regard to the sewerage construction work was reviewed, and the financial position, as it stood at that time, was, I think, very clearly set out. A few quotations from that report will not, perhaps, be out of place. I then said:—

“The financial aspect of the question, therefore, calls for serious consideration.”

“Seeing that the heaviest expenditure is involved in the construction of the main outfall sewers, that these must be undertaken first, although unremunerative, and that the cost of the sewers gradually diminishes as the limits of the system are reached, while the area drained increases, the best financial results would undoubtedly be obtained by completing the works to the payable limit as rapidly as possible. Realising this, and that it was of the greatest importance to reduce the burden of loan expenditure involved to a minimum, and to remove, as soon as possible, the incidence of the payment of interest from the Colony generally to the community benefited, it has been the policy of the Department to construct first those sections from which a revenue would be most immediately derivable.”

Again: “The great importance of proceeding with further sections of the Western Suburbs drainage is, I think, undoubted.”

“On the Main Western Outfall Sewer, which is the key to the whole western system, an expenditure of £185,257 has been incurred, and a liability remains on existing contracts of £26,100. In addition to these sums, £60,000 will be required for the completion of the sewer and the preparation of the sewage farm. No revenue whatever can be obtained from this expenditure of £271,357, over two-thirds of which has been already paid, till the most important branches have been completed.”

\* \* \* \* \*  
“I would suggest for the consideration of the Minister the advisability of making arrangements for the expenditure of a certain sum (the larger the better) annually for the carrying on of the works.

“With a definite sum to expend the Department would be enabled to so arrange the contracts as to lay out the money to the best advantage and to obtain the most speedy return.”

I could refer to other reports, but I think the foregoing will be sufficient to show that it was the intention of the Department to proceed with these works systematically, and in no haphazard fashion, and that the causes which led to our plans being upset, and one effect of which is that the works included in the particular contracts under consideration must for a time lie idle, were such as could not well have been foreseen or avoided.

R. R. P. HICKSON.

I attach special importance to Mr. Smail's report because he was the officer responsible for taking over the work. In putting the reports before the Commission, I should also like to say this—that the whole of them have been written separately—that is to say that the officers did not go into the reports together. I believe I am correct in saying that these reports were written at their own homes at night, and that the officers did not know until they had sent in their reports what each officer had said.

17196. *Mr. Parkes.*] Are they officers of the department? Yes; I hope we have officers of the department who are able to give straightforward, truthful, reports.

George Maddison recalled and further examined:—

G. Maddison. 17197. *Mr. Parkes.*] You wish to make a statement to His Honor? Yes, with reference to the books which were supposed to be kept. I understood that books were being kept by the firm, and the reason I have for saying so is that Mr. Carter said one day at Marrickville that he was the bookkeeper, and that if he had anything to do with the matter he would keep no books.

17198. *His Honor.*] When was that? Before our dissolution of partnership.

17199. At about what date? I could not state.

17200. About how long was it before you dissolved partnership? From two to three months, as nearly as I could say.

17201. *Mr. Parkes.*] Do you know as a matter of fact whether books were kept? That I could not say. I never saw any.

17202. Have you anything further to say? Only this: when the dissolution did take place Mr. Carter asked me if I had any objection to Mr. Gummow going through the books, and I said that I had not the slightest.

17203. Where were the books kept, supposing that there were any? I could not say. I remember Mr. Gummow asking some questions about the matter, and I remember telling him that we were quite agreeable to his going through the books to see that justice was done.

17204. Had you not access to all the books and to everything belonging to the partnership? I never bothered or made any inquiries about it at all. There is always a certain amount of trust among men.

John Christian Henry Rudolph sworn and examined:—

J. C. H. Rudolph. 17205. *Mr. Davis.*] What is your position in the department? I am resident engineer.  
17206. How long is it since you supervised any works of Carter, Gummow, & Co., or any members of the firm? Not since the beginning of 1892.

14 Sept., 1896. 17207. At the beginning of 1892, after you had ceased to have any supervision of work for the firm, did you borrow any money from Carter, Gummow, & Co.? Not from Carter, Gummow, & Co., but from Mr. Carter.

17208. How much did you borrow? £250.

17209. Will you tell His Honor the circumstances under which you borrowed the money? In April, 1892, I bought a property at Marrickville, and not having sufficient purchase money I borrowed £250 of Mr. Carter, who was a personal friend of mine, and whose family is on intimate terms with mine. I had previously asked different persons for the money, but at the time the Building Societies were closing, and my other friends were not in a position to make me the advance. I then went to Mr. Carter, and he obliged me with the money.

17210. Did your wife join with you in giving a note of hand? Yes; we gave Mr. Carter a note of hand signed by both of us promising to repay him the £250 in twelve months.

17211. Did you repay the £250? Yes.

17212. With or without interest? Without interest.

17213.

J. C. H.  
Rudolph.  
14 Sept., 1896.

17213. How did you repay it? In instalments about every two months.
17214. How did you yourself regard the transaction at the time;—did you think of it then in the same way that you do now for instance? Certainly not. I did not consider that I was doing anything wrong whatever. I regarded Mr. Carter as a private gentleman. I was well acquainted with him and his family, and I considered that he made the loan in order to help me and my wife.
17215. I suppose that if you thought you were doing wrong you would not have been likely to hand to Mr. Carter your salary cheques as you did on several occasions? Certainly not. I made no secret whatever of the matter.
17216. Is there anything else you wish to state to the Commission as to the transaction? No, I do not think so.
17217. *Mr. Gummow.*] From whom did you buy the property? From Mr. Reid the present Premier.
17218. In borrowing this money did you first go to Mr. Carter or to other persons? I first asked other persons, but as I explained just now they were not in a position to oblige me with a loan, their money being locked up.
17219. In getting the money from Mr. Carter did you consider that you were getting it from him personally or from the firm? I thought that I was getting it from him personally. I considered that the firm knew nothing at all about the matter.
17220. You repaid some of the money by your salary cheques;—how was the rest paid back? In cash.
17221. Did you repay the whole of the money yourself? Yes, to the best of my belief.
17222. *His Honor.*] How was it that you came to go to Mr. Carter particularly? Mr. Carter and his wife were both personal friends of mine. I had spoken to them not about purchasing this particular property but about changing from our house to a cottage. I was looking out for a place at North Shore, but I could not get anything at the time. At last I came across this place at Marrickville, and under the circumstances I have explained to you I spoke to Mr. Carter about the matter. He said he would see if he could oblige me with the money I required, and he ultimately did so.
17223. You had been living at North Shore? Yes.
17224. And Mr. Carter was living there? Yes, our families were on visiting terms.
17225. And from the fact of your living at North Shore you knew Mr. Carter? Yes.
17226. How long have you been out in the colonies? Sixteen and a half years.
17227. You had been out some time before this transaction occurred then? Yes.
17228. Did you marry out here? Yes.
17229. Your wife was well acquainted with Mrs. Carter? Yes.
17230. After you became married? Yes.
17231. How long were you living at North Shore? Over two years.
17232. During the whole of that time you were neighbours of Mr. Carter's? We were not living very far from them, but a neighbour of ours is a cousin to Mrs. Carter, and it was through them that we became intimate.
17233. Has Mr. Carter any reputation for liberality at North Shore or otherwise;—has he a reputation for instance for lending money? He was known to me to be a liberal man.
17234. And he being a friend of yours you thought he was a likely man to lend you money? I did.
17235. *Mr. Gummow.*] Did your wife not repay some of this money which you borrowed? I do not think so. I think I repaid the whole personally.
17236. Are you quite sure of that? To the best of my belief that is the case.
17237. With regard to your present position, has any action been taken in the matter—that is as to your salary or anything else—since this inquiry was started? Yes. I was informed that my salary had been reduced from £400 to £250.
17238. Have you been to the Public Service Board about it? I did not get a direct notice from the Public Service Board. As far as I can understand, it came from the Department.
17239. Have you been given any reasons at all for this reduction? No reason whatever.
17240. You had not been examined by the Public Service Board in regard to this matter? I had not.
17241. *His Honor.*] When was this reduction made? The first notice I received was on the 28th August. The paymaster then sent me out a pay-slip, asking me to sign for the reduced salary of £250.
17242. With no explanation? No explanation. I asked Mr. Davis for an explanation, and I was told that the Public Service Board had reduced my salary to £250.
17243. Are you still doing the same work? Yes.
17244. Have any other officers who are doing the same work as yourself been similarly reduced? Not that I know of; I do not think so.
17245. Have you made any inquiries with a view to find that out? I did not inquire about that.
17246. You have not heard of such a thing? No.
17247. What did you understand to be the reason for the reduction of salary—do you know of anything? I could not think of anything else but the transaction with Mr. Carter to which I have referred.
17248. That is all you know of or suppose? That is all.
17249. Have you been at any time called up for any breach of duty or for want of care in the performance of your duty? No; I do not think there is anything whatever against me.
17250. What are you by profession? A civil engineer.
17251. A qualified engineer? Yes. I am not registered, having no intention to enter the German Government Service, but I went through the University course.
17252. Consisting, I suppose, of attendance at lectures and going through a certain course of practical work? Yes.

George Anselm Henry Rowney sworn and examined:—

17253. *Mr. Davis.*] What is your position? I am an engineer in the Sewerage Construction Branch.
17254. You had charge of the concrete arches that were turned across the valley at Double Bay, in conjunction with Contract 53? Yes; I was resident engineer on that work.
17255. You saw the arches after they were turned;—you had them under your entire supervision from the time they were turned until they were out of the contractors' hands? Yes.
17256. Did any of those arches collapse? None of the arches in the sewer itself. A culvert under one of them subsided and cracked a little bit.

G. A. H.  
Rowney.  
14 Sept., 1896.

17257.

- G. A. H. Rowney.  
 14 Sept., 1896.
17257. With that exception did anything happen to the concrete that would lead you or anyone else to say that there was a collapse at that particular spot? No; there was no collapse there at all.
17258. *His Honor.*] Was there any settling of the arches more than they ought to have settled? In the arches of the sewer itself there was no settlement whatever. As regards the culvert, the bottom on one side was soft. The arch settled a little bit, and it was considered advisable to remove it and to construct a new one.
17259. Right through, or only the end of it? Only the end of it.
17260. What was the span of that arch? About 14 feet.
17261. Would that be the same span as the main arches? No; the main arches have a span of 20 feet.
17262. The culvert was under one of the main arches? Yes; it was not the same height as the sewer.
17263. What length of it had to be cut out and renewed? About 10 feet.
17264. *Mr. Parkes.*] How long were you upon No. 53? Two years and a half—while it was in progress.
17265. Do you recollect an inspector named Hamilton being there? Yes.
17266. What was he doing? He was there for about a month in charge of the brickwork.
17267. Only a month? Only a month, I think.
17268. Did he get into any difficulties? I believe he was suspended—I was not there on that particular day—for not looking after his work properly.
17269. In what way? I cannot say. I was not there when he was suspended.
17270. But you have heard of the nature of the work? Yes; I heard that it was for allowing brickwork to go in in an improper manner.
17271. Anything else? No. I could not say anything more definite than that the work was not put in in a proper manner—at all events, in a manner which agreed with his superior's ideas.
17272. Did you not hear something about insufficient cement? I cannot say anything more definite than I have already said.
17273. Was he removed at once? He was suspended during the pleasure of the Engineer-in-Chief.
17274. Do you remember an inspector named Vincent? Yes.
17275. Was he removed? Yes.
17276. What for? I found some inferior packing in one of the tunnels.
17277. How was it inferior? It was not packed tightly.
17278. Was there anything else? No, the material was quite good, but it was loosely packed. Instead of packing a drum which had been turned they proceeded to turn another drum; it would be about 3 feet in length.
17279. Was it not 9 feet? No.
17280. You are sure it was not? Yes.
17281. Was there ever a case on that contract in which 9 feet were found unpacked? No; the packing I have referred to is the only defective packing I found upon my work.
17282. What became of Vincent? He was removed from the contract.
17283. Where to? He was suspended, and virtually dismissed.
17284. Did he get on again? Yes, he was employed again.
17285. How long afterwards? I could not say.
17286. Where is he employed now? At North Shore.
17287. On one of Carter, Gummow, & Co's. contracts? No, on Butcher Brothers' contract.
17288. In connection with the packing to which you have referred;—who was the bricklayer? Reidelberg.
17289. Where is he? I do not know.
17290. Where did he go from this particular contract? I do not know.
17291. Did you recommend his dismissal? I pointed out the facts as I found them; I did not recommend the dismissal of anyone.
17292. Was the man taken away at once? Not for two or three days afterwards.
17293. Was he working there during the two or three days? I believe so.
17294. Who was the contractors' manager on that job? I think Mr. Snodgrass was the principal manager there.
17295. They had no contractors' manager? Not apart from a member of the firm.
17296. *Mr. Davis.*] Was Rogers there at all? He had nothing to do with that part of the work.
17297. *Mr. Parkes.*] Some cement was condemned upon that job? Yes; on several occasions.
17298. Where was it sent to when it was condemned? I could not say.
17299. Was it taken away? Yes.
17300. You are sure of that? Yes.
17301. Did you see it yourself? No; I did not see it myself, but the inspector's instructions are—that, when cement is condemned, it is to be removed.
17302. What was the brand of the cement? I cannot remember it.
17303. Do you keep a note of such things? We have a lot of cement sent out to us, of course, on a job of that kind, and we know whether it is condemned or not.
17304. Was there any book in which you would make a note of the condemned cement and of the brand? It would be among the papers of the contract, I suppose.
17305. Suppose there is no paper among the papers of the contract to that effect;—would there be a book? I do not know that there would be any book.
17306. The note would be among the papers of the contract? Yes.
17307. What would the papers be? There would be a report of the cement tests.
17308. Would there be any other papers? It would be noted upon that paper when the cement was condemned.
17309. Would you get a letter telling you that the cement was condemned? We should get a copy of the cement test, with a notification as to whether the cement was to be used or not.
17310. Would you not get a letter with that? We should be notified by the Engineer-in-Chief whether the cement was to be used.
17311. Do you recollect getting such a letter? We always got the cement test itself, and it is noted upon that whether the cement is to be used or not.
17312. *His Honor.*] In a minute, do you mean? Yes.

17313. I suppose you are aware of the fact that Mr. Bagge has positively sworn more than once that these particular concrete arches, and no others, altogether came to grief—that they were built of rubbish, and that the whole thing had to be rebuilt—what have you to say to that? No such thing occurred.

17314. You say that positively—you are quite sure of it? Yes.

17315. What did occur was the failure just at one end of the culvert? Yes. We had a drawing sent out by Mr. Bagge showing the crown of the arch to be removed and rebuilt.

17316. So you are quite positive that Mr. Bagge must have made some extraordinary mistake? Yes.

17317. *Mr. Parkes.*] You could locate the arch of the culvert on the plan? Yes.

G. A. H.  
Rowney.

14 Sept., 1896.

WEDNESDAY, 16 SEPTEMBER, 1896.

Robert Rowan Purdon Hickson was recalled and further examined:—

17318. *His Honor.*] You wish to make a statement in reference to the witness Rudolph? I desire to explain that with regard to Rudolph a mistake has been made. I made a point of seeing the Public Service Board yesterday with reference to this matter, and the mistake has been rectified. As long as he holds his present position he will be paid at the salary originally allotted to that office, viz., £400 a year.

17319. Then do I understand that the putting of his salary down on the Estimates at £250 was a mistake? Yes.

17320. How did the mistake originate? In this way: His connection with the contractors was brought by me officially before the Minister, and the Minister thought it advisable that he should be put in a position where he would not be brought into contact with the contractors, but that no change should be made until the proceedings of this Commission were over. Had he been put into the position indicated by the Minister the salary attached to that altered position would have been £250. Through some mistake the Civil Service Board understood that that was Rudolph's present position, and they therefore put his salary down at £250.

17321. Then I understand that at present, as far as you know, there is no intention of altering Rudolph's position? There is no intention of making any alteration until the proceedings of this Commission are over. What may be done afterwards I cannot say. I presume it will depend a good deal upon your Honor's report.

17322. Certainly the matter ought to stand over until my report has been presented. No action ought to be taken in the meantime. I had intended to ask for an explanation of what had been done, so that the explanation might appear as evidence in the case, because it has become a matter of public comment that Rudolph has had his salary reduced? The mistake occurred exactly in the way I have explained.

17323. *Mr. Gummow.*] You have said that no action will be taken until after the Commission is over;—if any minute has been made in the matter, would it bear upon Rudolph's case as regards the future? I could not tell you that. It depends upon two things—first of all upon the finding of the Commission, and then upon what view the Minister may afterwards take of Rudolph's action. I cannot, of course, bind the Minister to the extent of saying what would be done.

17324. *His Honor.*] I suppose it would depend ultimately upon the Public Service Board? I suppose it would be a question of obtaining their concurrence to whatever the Minister thought might be the right thing to do.

17325. *Mr. Parkes.*] You did write a minute suggesting that Rudolph should be made an example of, did you not? I wrote a minute to the effect that I thought it advisable that some action should be taken.

17326. To make an example for other officers? I forget the exact wording. It is very probable that was the wording of it.

17327. *His Honor.*] I am very glad that this matter has been settled in such a way that Rudolph will not be in any way affected, because I think you made a mistake in taking any action at all. I will not say anything more about the matter except this—that the Supreme Court would have made very strong comment upon any person, or body of persons, or upon any officer, who had dealt in any way with a witness in relation to evidence given in a case *sub judice*? I looked at the matter in this light—that as adviser to the Minister it is my duty to keep him posted up in everything which takes place in the office or affecting his officers. I merely stated the facts. I did not suggest any reduction of salary. I simply stated the facts as they presented themselves to me.

17328. Before Mr. Parkes begins his cross-examination upon your evidence of the other day, are there any facts you wish to add to that evidence? Yes.

17329. *Mr. Davis.*] Do you know what the practice is, and has been in the past, with regard to advances to contractors on material on the ground, but not in position? There has been no rule laid down about it, but it has been a common thing to make advances both on material and on plant.

17330. It has been the practice not only in this Colony but also in the other Colonies? Yes.

17331. The specification I hand you in connection with one of the South Australian railways is a case in point? Yes; it is the extension of the railway to the Victorian Border—the second section from the Murray to the Border.

17332. Will you state the nature of the provision in that specification as to advances on material? It provides for an advance at the rate of 75 per cent. on such material on the ground as may have been approved by the Engineer-in-Chief as fit and necessary for the work.

17333. You know that in the old specifications, in the Sewerage Branch at least, if not in other branches, provision was made for an advance not only on material but also on the plant? Yes, that is the case.

17334. It has been dropped out of later specifications, but, in respect of material, advances have been made very frequently? Advances have been made on material, and, as I say, they have also been made on plant.

17335. The papers I hand you are in connection with a contract for a training-wall on the Manning River;—was an advance made on plant in that case? An advance of £500 was made in that case on 16th May, 1895, the contractors being Granther & Co.

17336. *His Honor.*] That would be under Mr. Darley? Yes. I find that Mr. Darley signed it. I think the advance was made just about the time of the change.

17337. Here is the contract for a section of the Bondi sewer;—will you tell His Honor what was stipulated to be advanced in that case in respect of material and plant? Payments are made as follows:—90 per cent.

R. R. P.  
Hickson.

16 Sept., 1896.

R. R. P.  
Hickson.  
16 Sept., 1896.

cent. on the work actually done, performed, and fixed; 70 per cent. on the value of approved material on the ground; and 50 per cent. on the value of such plant as the engineer may approve of as fit and necessary for the work. That is Contract 8.

17338. *Mr. Parkes.*] Whose contract is that? Pritchard's.

17339. What would be the date of that? December, 1883.

17340. *Mr. Davis.*] That is the date of the signing of the bond? Yes.

17341. Here is another contract at the Clarence River? Yes. It was a contract which was let to the firm of Greig and Mondy for breakwater works on the northern side of the Clarence River in 1883. There were considerable advances made in that case. There was an advance made of £504 10s. 5d. on the value of the horses and plant, according to a list attached; and £337 19s., according to another list attached. Then there was an advance of £1,000 for plant, including a locomotive, rock drills, one 10-horse power boiler and pump, and one steam crane, complete.

17342. *His Honor.*] That would be under Mr. Moriarty? Yes; I was the officer-in-charge of northern district at the time.

17343. *Mr. Gummow.*] As to these advances on material—were they made generally to all contractors who wanted them? Yes; it was the usual thing to do. Of course, for works carried out, such as that at Mort's Dock, and in places like that, advances have been made when the material has not been on Government property.

17344. *His Honor.*] A bill of sale being taken? Yes.

17345. *Mr. Gummow.*] In the case of Carson's contract at Arncliffe, was not an advance made before the material came on to the ground—in fact, while it was being shipped from Home? On the ironwork, yes, I think so.

17346. *Mr. Parkes.*] Before it was in the possession of the contractors? Before it was landed here.

17347. The advances you referred to were 75 per cent. upon the whole value—they were not up to the full amount? There is no percentage. They were sewerage contracts.

17348. In former contracts you had not made advances up to the full value of the property? In Granther's case we did.

17349. Before the property was on the site? In Granther's case it was scattered over several miles between the quarry and the training wall.

17350. In respect of a great portion of the cement advanced upon in connection with the North Shore contract, it was on Grant's wharf, was it not? I cannot say from memory; but even if it were so, that would be no reason why it should not be advanced upon.

17351. In regard to the Adelaide matter, the advance was on material only and not upon plant, I understand? It is the common practice with all engineers to advance on plant and material. It is universally done in the old country. In the case to which you refer the advance is on such material on the ground as may be approved by the Engineer-in-Chief.

17352. At what rate? Seventy-five per cent.

17353. With reference to the Monier patent—when you made your minute in the first instance advising the Minister to accept the patent and to pay the contractors 15 per cent., was Mr. Carter at the time in your office? In the first place, I never wrote to the Minister advising him to accept the patent.

17354. You advised him to approve of it, did you not? I asked for his authority to use it where we thought it advisable to do so.

17355. And he gave you authority? Yes.

17356. On one occasion after that you paid £2 15s. for the use of the patent? As far as I know, we had paid nothing for it.

17357. After you had obtained the approval of the Minister you paid a royalty upon the patent in the case of the Callan Park work? Not to my knowledge.

17358. But you know now that the royalty was paid? No, I do not.

17359. Have you not seen the vouchers lately in connection with that matter? No; I do not sign the vouchers, I sign only the abstracts. It is quite likely that there may have been a payment to the extent you speak of.

17360. As a matter of fact you are bound, whenever the patent is used, to pay Carter & Co. 15 per cent. for the use of it? Whenever I use it myself. If I carried out a work by day-labour and used it I should be bound to pay for it. If I were carrying out a work by contract, I presume it would be for the contractor to make arrangements with the patentees.

17361. But the contractor will charge the Government? It is a matter between the contractor and the patentees as to what they will charge. I do not know what the patentees would charge any given contractor.

17362. But would not the Government be bound to pay Carter & Co. a royalty whenever the patent was used? Certainly not, unless I used it myself on a work which I was carrying out by day-labour. If I called for tenders for a work in which this patent was introduced the successful tenderers would have to make arrangements with the patentees. I do not know whether they would have to pay them 15 per cent., 100 per cent., or 1 per cent.

17363. Under the arrangement which you made with them, could the patentees not recover from the Government 15 per cent. in respect of any work of the Government into which the patent was introduced? I do not think so. It is a matter of law, but I do not think that that is the case.

17364. As to Contract 69, in which the item of £50 for bluestone pitchers occurs, did you look over the Schedule before you submitted it to the Board of Reference? It was submitted to me with the usual report. I glanced over it certainly. (*Vide Appendix No. 52*).

17365. But did you look at every item? No; there were something like 4,000 contracts a year going through my hands, and I could not do that.

17366. You did not look at each item in the Schedule? No.

17367. Did you alter the items 73, 74, 75, and 76 in respect of which a mistake was apparently made in putting down pounds for shillings;—is not the alteration in your own handwriting? I have no recollection of making the alteration, but I may have made it.

17368. Is not that your handwriting in the margin of the document I hand you? Yes.

17369. What does it say? "The rates quoted are shillings per cwt., not pounds."

17370. But the totals are right? Yes.

17371. The mistake made was putting in pounds instead of shillings? Yes.

17372.

R. R. P.  
Hickson.

16 Sept., 1896.

17372. And you corrected it? Yes.
17373. When did you make that correction? I could not say. It is not dated.
17374. You got the contractors to initial it? They signed it, but I do not remember when it was made. It was probably made after the tender was accepted. It was a clerical error, and, possibly, the correction was made some time during the progress of the work.
17375. *His Honor.*] Is this the original schedule filled in by Carter, Gummow, & Co.? Yes.
17376. Someone has put a query in pencil as regards "tons"; do you know anything about that? I think that was done during the progress of the works.
17377. If it had been "tons" instead of "cwts" the amounts would have been right? Yes; either in the one instance "tons" should have been given or in the other "shillings."
17378. The change from "tons" to "cwts" requires a change from "pounds" to "shillings"? Yes.
17379. *Mr. Parkes.*] You made the correction yourself? Yes; it is in my handwriting.
17380. With reference to your son—who first put him into the department? Mr. Moriarty.
17381. Was it done on your recommendation? No.
17382. How did the affair take place; did your son himself apply for appointment? No; Mr. Moriarty used to pay a visit about every quarter to Newcastle. On those occasions he stopped with me, and in the course of a conversation he asked me what I was going to do with my boys. He said, "You had better send one of them to me and make him an engineer." As a matter of fact, he did not go directly to Mr. Moriarty. He went to a bank for six months and was afterwards taken into the department.
17383. On what day did he enter the department? I should have to look it up. It was about a year before I came to Sydney. I should say, speaking from memory, that it would be about 1887; but I could not say positively. The Blue Book, however, will give you the exact date at once.
17384. When did he leave the department? In 1893.
17385. Did it appear to you that it was a more awkward position for him to take up—that of engineer for contractors who were doing work for the Government—than remaining in the office? In the first place he was taking up a position with contractors in another colony. He was not working for them here at all. Apart from that, however, I certainly was not going to tell him that he must not get employment anywhere.
17386. But in your evidence the other day you said you removed him from the department because you thought it an indelicate thing to keep him there when you were dismissing other officers? That was not my evidence; I removed him because a report to that effect was spread about. I think now that I made a mistake in taking any notice of the report, and that it would have been better to let him remain where he was. It certainly would have been better for him, because had he done so he would have been in a far better position than he is in now, and he would not have been knocked about to the extent he has been in the interval.
17387. But would it not appear to you that he was in a more awkward position, as far as your relationship with contractors was concerned seeing that the firm which he joined were doing a certain quantity of work for the Government, even although your son went to Adelaide? I do not know. It is entirely a matter of opinion.
17388. You had a conversation with the manager of the Bank of New Zealand in Adelaide as to Carter, Gummow, & Co.? Yes.
17389. You knew your son was with Mr. Gummow and with Mr. Gillan there? Yes.
17390. And you knew that Mr. Gillan was then a member of the firm of Carter, Gummow, & Co.? I do not know to this day who the members of the firm are. They are always changing about.
17391. But you asked the manager of the Bank questions with reference to the status of the firm of Carter, Gummow, & Co.? I said I asked questions as to the position of Mr. Gillan.
17392. You knew that Mr. Gillan was a member of the firm? In Adelaide, certainly.
17393. A member of the firm of Carter, Gummow, & Co.? Yes, in an Adelaide contract.
17394. You gave evidence on Monday to the effect that there were officers in your department who held patents? Yes.
17395. But have you allowed those officers to work in conjunction with contractors as partners in those patents to obtain Government contracts? No; I have not allowed that in any case which I am aware of.
17396. Would you allow it? I am afraid I do not quite understand your question.
17397. Would you allow an officer in your department to work in conjunction with contractors to obtain a Government contract when he was a partner with the contractors in a patent? I would not allow any of my officers, if I knew it, to work for contractors.
17398. Or to enjoy a contract in conjunction with contractors with whom he held a patent? I do not quite know what you mean. I do not say that I would debar an officer from holding a patent. For instance, he might be a partner in a patent which might be held by some outsider, whether a firm of contractors or any one else.
17399. You would allow him to work conjointly with those contractors in making out plans and in preparing estimates for tenders for public works? I have just said that I would not.
17400. In reference to the Minister's minute, as to the letting of Contract 79, and your own minute, you said in your evidence that Mr. Lyne's minute was written on the day following your own;—that was an error, was it not? I think it was written on the afternoon of the day on which my own minute was written.
17401. As a matter of fact they were both written on the same day? You will see the dates in the Parliamentary papers. I think I was quoting from them when I gave my evidence.
17402. The minutes were written on the same day? Yes.
17403. Was it before seeing Carter, Gummow, & Co.'s tender for Contract 69 that you decided to alter the system of tendering? The question of altering the system of tendering was under my consideration for a very long time—I think for nearly six months—and the change was made, I think, after the letting of the Marrickville contract.
17404. That was after you saw Carter, Gummow, & Co.'s rigged schedule? Not especially Carter, Gummow, & Co.'s, but the whole of them.
17405. Did it not make any impression upon your mind? Of course it did.
17406. It was the one which made you determine to instantly alter the system? It brought matters to a head.

- R. R. P. Hickson.  
16 Sept., 1896.
17407. Cook and Webb's contract was for an annual supply of ironwork, was it not;—it has been referred to as the first contract let under the new system? I forget which was the first contract. (*Vide Appendix No. 64.*)
17408. Are you not aware that the Treasury has for years past called for all its supplies upon a schedule upon which tenderers have been asked to tender at a percentage above or below given prices, or at par? Yes. The same thing applies to the Works Department.
17409. Then the change of system was not an innovation? Entirely as far as public works themselves are concerned.
17410. But in other departments it has been adopted for perhaps twenty years in connection with annual supplies? It has been done in the Works Department for years so far as annual supplies are concerned.
17411. This contract of Cook and Webb's was a contract for annual supplies, was it not? That I could not say, speaking from memory.
17412. It was for the supply of ironwork for sewerage contracts, was it not? I should have to see the specification before I could say whether it was for an annual supply or not. It does not appear to be very clear from the specification whether it was for an annual supply or not. It appears to be for a definite quantity of material for sewerage contracts.
17413. But, ordinarily, all these contracts for the supply of material are called annually? Ordinarily, that would be so, so far as the supply of material is concerned; but this is a different contract. It is not one of the ordinary contracts for a supply of material.
17414. It is for the supply of ironwork for all contracts, is it not? Yes.
17415. Sometimes you called for the supply of leather and other materials for use on contracts? For use in the department.
17416. Those tenders are called always on a system under which tenderers can tender at a percentage above or below prices or at par? Yes. That has been in force for years. I do not claim any originality in respect of the system itself. The originality lay in the application of the system to public works. That had never been done before. I got the Water and Sewerage Board to take the same course.
17417. They had been doing so before, had they not? Not on sewerage contracts.
17418. But on water contracts? I do not know about those.
17419. Do you not know that, as a matter of fact, the system had been applied by the Water and Sewerage Board to water contracts? I have heard it said that that is so, but I do not know it as a matter of fact.
17420. You say that Mr. Bagge did not point out the unprecedented nature of Messrs. Carter, Gummow, & Co.'s schedules for Contract 69? No.
17421. Did he point out to you, in connection with the schedule of 79, the excess upon the items of blasting? His minute will show you exactly what he did point out. (*Vide Appendix No. 65.*)
17422. He did not have any personal interview with you in reference to the matter? No; the tenders were examined by him quite independently of me, and he wrote his recommendation without seeing me in reference to the matter.
17423. Would he not be likely to call to see you at the time? I cannot call to mind any occasion when he has come to see me in order to explain anything in the schedule which he has not explained in his minute.
17424. But if it happened that he saw something extraordinary in the schedule, would he not come down to see you about it? He ought perhaps to do so, but he did not in this case.
17425. He would not write an ordinary report if anything struck him as being very remarkable, would he? Decidedly; it is his duty to write a report.
17426. Would he not come running down to you at once and say "Here is a nice state of things"? Certainly not; I have too high an opinion of Mr. Bagge to think that he would consult me as to whether he should write a certain minute or not.
17427. But supposing he were very much astonished? Then I suppose he would refer to the matter in his minute.
17428. But would he not be more likely to have an interview with you than to write you a letter? Certainly not.
17429. When you were first engaged to go to Adelaide, did you enter into any definite agreement as to terms? No; I was advised by Sir John Cooke, who nominated me, and who practically appointed me, not to make any engagement with a Colonial Government, because, as he said, it was quite likely that I should not care to remain there, and it would be better to have a free hand.
17430. You came out, then, without making any engagement at all? No engagement whatever, beyond that which is referred to in the letter before the Commission, as to the payment of my passage money.
17431. Upon what date did you go to Adelaide? In March, 1876.
17432. When did you leave? In June, 1880.
17433. Did you make application to the Government of New South Wales for an appointment? No.
17434. How was it that you came here? When I left South Australia, as I pointed out the other day, I was engaged for some little time in Melbourne—I was consulting engineer to the Melbourne Harbour Trust. I then came here on a visit on my way to Queensland. I was thinking at the time of going in for squatting pursuits. I was staying with Mr. Moriarty, and I told him that if I did not see my way to take up a station property, I had made up my mind that I would go Home. He said "Do not be in a hurry to go Home. I shall very likely be soon able to give you a good position here." I waited for a while, and he sent me a telegram offering me a position. I never made any application for it—in fact, I had almost made up my mind at the time that I would go Home.
17435. Did you not protest against the South Australian Government disbanding your department after bringing you from England? I think I did; but it is not of much use protesting against the action of a Colonial Government.
17436. Did you get any testimonial from the South Australian Government? There is a letter I put in the other day. That shows the reason why the department was done away with.
17437. Did you not apply for letters of testimonial from the South Australian Government? No; the letter already before the Commission was quite enough for me.
17438. You never asked the Government for any letters of testimonial? No.
17439. When you landed in South Australia, and took up your work, the first thing which came under your hand was a work in connection with the Rivoli Bay and Kingston jetties? No.
17440. What was the first work? The Victor Harbour breakwater. 17441.

R. R. P.  
Hickson.

16 Sept., 1896.

17441. But you had the work to which I had referred put into your hands six months after you arrived? It was, probably, about that, but I do not remember how soon.

17442. You know the firm of Wells Brothers, do you not? I knew them when I landed in Adelaide, but I never saw them before.

17443. They were the contractors who built the Rivoli Bay and Kingston jetties? Yes.

17444. Did you not know any of the Wellses before you came to the Colony of South Australia? No.

17445. Did you come out with one of them? No.

17446. One of them called upon you soon after you came to the Colony? Yes, I think so. One of the brothers, but I forget which.

17447-8. He introduced to you an agent of Wells Brothers, named Cheesewright, did he not? Yes.

17449. Mr. Cheesewright made the designs upon which Wells Brothers tendered for these works, did he not? He made a second lot of designs. The first lot were made in London.

17450. He made the second lot? I do not know whether he actually made them. He made some alterations on the first lot.

17451. You were cross-examined by Sir John Downer as a witness in the Wells Brothers' arbitration case? Yes. (*Vide Appendix No. 63.*)

17452. In your cross-examination you told him that Mr. Cheesewright made the plans, and that you lent him your office in which to make them—is not that so? Yes; I was instructed by the Minister to give him room in the office to do so.

17453. Mr. Cheesewright, on behalf of Wells Brothers, also made the tracings which were sent to England, and upon which tenders were called? I forget who made the tracings. They were made in the office. Probably Mr. Cheesewright made them.

17454. They were made from Wells Brothers' plans? From copies of Wells Brothers' plans.

17455. The Minister decided that tenders should be called upon the Government plans? Yes. I recommended the Minister to send these plans Home, so that tenders might be invited.

17456. Mr. Cheesewright's plans were sent Home, were they not? Yes; or Wells Brothers. I forget which.

17457. You told Sir John Downer that Mr. Cheesewright's plans were made in such a manner that none of the English contractors could tender upon them? So it turned out.

17458. But were they of such a character that no one but Wells Brothers could tender upon them? That is how it turned out.

17459. In explanation of that you also said that you did not consider it worth while bothering, as you considered that the only contractors who could get the work were Wells Brothers? The contract was practically, and to all intents and purposes, let to them before. They sent out plans in the first instance, and designs or copies of them were sent Home.

17460. No other contractors, you thought, could compete with them? I do not think they could.

17461. Ultimately, when they came to build these jetties, it was found that the piles were not long enough? Yes; the ground line that Mr. Cheesewright made was incorrect.

17462. And they could not build the jetty? Yes; it is built now and in use.

17463. But not the original jetty? Yes.

17464. Is it not a fact that the end had to be taken off and a new end put on? The piles were lengthened.

17465. Was not the jetty so narrow that it could not be used for shipping owing to the weight coming upon it? As far as I know it is just the same width as was originally designed.

17466. Have you seen the evidence given by Mr. Higinbotham before the Public Works Commission in Adelaide after you left? No; I have his report. I do not know whether he gave any evidence.

17467. In reply to Sir John Downer, you told the arbitrators in Wells Brothers' case that you went with Mr. Cheesewright to take the soundings and to go into other particulars? I do not think so. I think Mr. Cheesewright came with me; I happened to be going down.

17468. You recommended that his expenses should be paid for all the work he did? Yes.

17469. But the work he really did, as you admitted, was entirely for Wells Brothers, who were the only contractors who could get the work? The contract was practically let to Wells Brothers before I came to the Colony. I would suggest that Mr. Higinbotham's report should be put in because he explains that matter very fully.

17470. *His Honor.*] You say that the facts as set forth in Mr. Higinbotham's report are correct? Yes.

17471. *Mr. Parkes.*] The drawing, you said, was taken on September 13th, and possibly the first communication was in June—you arrived in June? In April, I think.

17472. From June, when Mr. Cheesewright first approached you, until the 13th September, he was preparing these designs and obtaining other particulars? No; he was carrying out another contract.

17473. Was it not your evidence that he worked at your office? During some of the time he was doing that; but he had another contract under the Government.

17474. What contract was that? The Tippiara Reef Lighthouse.

17475. Sir John Downer asked you whether you knew before Mr. Cheesewright sent in his design that the Government intended to invite tenders in England, and you answered that you could not say that you knew officially, but that practically you did know? I expect so. The thing happened so long ago that I forget the particulars.

17476. You said in answer to a question by Sir John Downer, that you could see that, owing to the incorrectness of the drawings, the piles would stick out from the jetty into the water like needles for most of the way? Yes, some of the piles were too short.

17477. Mr. Downer asked you whether Cheesewright prepared the plans for you, and you said that he prepared them for Mr. George Wells; you were then asked whether they were prepared in the Government office, and you said that he asked you to allow him to use your office, and that you did so;—is that correct? Yes.

17478. Then Sir John Downer asked: "I think you informed the Government that if Mr. Cheesewright had not done the drawings you would have had to employ someone qualified to prepare them; did you report to the Government that, from Mr. Cheesewright's extensive experience in these matters, you considered him the most competent person to supply information in connection with these jetties?" and you said, "Yes, I did; I considered him a very competent man";—is that correct? Yes; he was a competent man.

17479.

R. R. P.  
Hickson.  
16 Sept., 1896.

17479. Sir John Downer then asked: "I think you reported that if he had not done the work you would have been compelled to get some addition to the present staff, even supposing you could have got it done at all, which you thought was doubtful," and your answer is "Yes"? We had no one in the office who understood screw pile work at all.
17480. Had you not a Mr. John Wright in the office who understood it? Yes; but he could not give his time to it. He was my principal assistant.
17481. Did he not give evidence before the inquiry, and did he not say that he could take soundings, and that he did understand screw piles? Taking soundings and understanding screw piles are two different things; but as a matter of fact Mr. Wright did understand screw piles.
17482. He was your employee? Yes; but in a different district. He was my principal assistant, and he could not give the necessary time to the screw pile work.
17483. Sir John Downer then asked you how long after that it was that the plans were sent Home, and you said, "The plans were sent Home at the end of that year; I could not say from memory exactly when." Is that correct? I have no doubt that if it appears there it is correct.
17484. As a matter of fact, did Mr. Cheesewright make any borings? I do not know.
17485. Did you not admit that you saw him in a boat—that you knew he had been on the site of the Kingston jetty, but that you did not know whether he had been to the site of the Rivoli Bay jetty at all? Yes. I was going down to Kingston to a different work, and I left him at Kingston. Before I left one morning I saw him in a boat taking soundings. What else he did I cannot say.
17486. The original plans, I believe, were lost—I believe they could not be found? I think the originals were lost.
17487. On comparing the tracings with the lithographs it was found that great irregularities had taken place as regards the length of the piles? Yes.
17488. Which were sent Home—the tracings or the lithographs? I really forget now which went Home. I could not say now. Probably the whole lot went Home.
17489. There was another contractor whom you expected to tender, was there not—a Mr. Gibson? Yes.
17490. You knew him when you were in England? Yes; he used to do lots of work for us in England.
17491. His son was in your office? Yes; he was one of our inspectors.
17492. You told the arbitrators at that time that you thought that only Mr. Gibson would be able to tender, and that his son would be able to send him proper information? I forget. If it appears in the report of the proceedings I probably said so.
17493. What was the diameter of the screw piles on which the piers were to be built?  $4\frac{1}{2}$  inches, I think.
17494. What was to be the cost of the two piers? I forget now.
17495. Was it to be about £53,000? I really could not tell you.
17496. Was it not the fact that Wells Brothers tendered for the Rivoli Bay jetty at £23,000, and for the Kingston jetty at £30,000? If those figures are there they are probably correct.
17497. Mr. Tomkinson asked you this question, "Do I understand that Mr. Cheesewright had not been at Rivoli Bay at all?" and you answered, "I do not know whether he went to Rivoli Bay or not"; Sir John Downer then questioned you as to the wrought-iron that you would require? That is very likely.
17498. And it turned out that Sir John Downer had all your office papers; for instance, a memorandum as to the ironwork? Yes; I believe he got hold of them in some way. I forget how that matter was cleared up.
17499. In any case, it was found out that Wells Brothers were in possession of your office papers? Yes.
17500. How was the difficulty overcome with reference to these jetties? The arbitrators overcame it by not giving the contractors anything at all.
17501. And then the contractors threw up their contract? Yes, I believe they did.
17502. What ultimately took place? I think we finished the works ourselves.
17503. The Government finished them? Yes.
17504. And in finishing the works they altered the design entirely? Not to my knowledge.
17505. They had no remedy against the contractors? No. Of course the contractors were in the wrong.
17506. Did the Government seek to recover anything from the contractors? No.
17507. But they completed the works themselves? Yes; but I do not think they were completed in my time.
17508. They were completed after your time? Yes; I do not think they were finished when I left.
17509. Do you know whether, since you left, the light  $4\frac{1}{2}$ -inch piles have been injured by corrosion? I do not think it is at all likely. There is a lighthouse quite close to the jetties, erected a long time before the jetties were thought of, upon wrought-iron piles, and that, as far as I know, has not been affected. I know the light is still used; I have frequently seen it in passing.
17510. Did not any Minister of the Crown call upon you to explain your connection with Wells Brothers or with Mr. Cheesewright? No, certainly not.
17511. No Minister of the Crown? No; there was never any question about it.
17512. Of course, when a man is making a plan in a public office for a contractor, as against Government plans, he would naturally do his work in the interests of the contractor, would he not? I do not know how he could do so.
17513. Supposing the man were an agent for contractors, would he not make the plan to the interests of the contractors rather than to the interests of the State? I presume he would make the plan correctly.
17514. What do you mean by that? Just what I say—that he would make it correctly.
17515. But supposing he were the paid agent of the contractors, would he not study the contractors' interest rather than the interests of the State? There are only two ways of making a plan—making it wrong, or making it right. I presume the plan would be made right.
17516. Supposing he were making a plan in a case where there was no chance of competition from other contractors, would he not make it to the interest of the contractors who were paying him. How could he alter the facts of the level of the ground, the high-water mark, or the size of the piles? I do not understand what you mean.
17517. What would be the object of the contractors in making a plan? To have a plan upon which they could work, I suppose.
17518. And would not the contractors' agent, in making the plan, make it to the contractors' interest? You can only make a plan right or wrong. There is no question of making it to the contractors' interest or against the contractors' interest.

17519. But you must know, as a professional man, that plans can be so manipulated by a contractor's agent? I have not yet learnt that branch of engineering.

17520. But this was an experience of the kind, was it not? Not in the direction of manipulating plans.

17521. Did you not, in reply to Sir John Downer's questions, and when you were throwing the blame on to Mr. Cheesewright, say that he made the plans in such a manner that no other contractors but Wells Brothers could tender? He made plans which were shown afterwards to be incorrect, and if they were incorrect in the first instance, it would be difficult for another firm to tender.

17522. The object of Mr. Cheesewright in sending incorrect plans to England was to prevent other persons from competing with his employers? I should be very sorry to make such an insinuation in connection with Mr. Cheesewright.

17523. Were not Wells Brothers defeated upon the arbitration proceedings upon that plea—that Mr. Cheesewright had used his position to prevent competition from other contractors? I do not think so.

17524. Was not that the only reason;—did you not throw all the responsibility upon Mr. Cheesewright? For making plans. The contractors wanted to make the department responsible, but I said they were not responsible—that the plans were the plans of the contractors, and that they must be responsible for them whether they were right or wrong.

17525. Did you not point out that Mr. Cheesewright had made plans so that Wells Brothers would be the only tenderers? I did not put it in that way. I said that he had made the plans himself, and that he was entirely responsible for them, whether they were right or wrong.

17526. Did you sign the plans? Yes.

17527. As the Government engineer? Yes.

17528. *His Honor.*] Did you sign the plans to verify or to identify them? To identify them.

17529. *Mr. Parkes.*] As Government documents? As the plans for the work.

17530. *His Honor.*] To be tendered on? Yes.

17531. *Mr. Parkes.*] Did you sign the plans which went to England as Engineer for Harbours and Jetties? Yes.

17532. Where is Mr. Cheesewright? I have not the least idea.

17533. Is he in Adelaide now? I do not think so. I believe he is dead. He went to China. I know that he carried out some lighthouses in China. I have not seen him for years.

17534. Did you know him before you met him in South Australia? No.

17535. With regard to the Largs Bay works, did Wells Brothers carry those out? No.

17536. What were those works—there was a breakwater, was there not? No works were carried out in my time at all at Largs Bay.

17537. But Wells Brothers sent in a plan and specification, and a tender was prepared by Mr. Cheesewright? When I came to South Australia, Wells Brothers had the run of the whole engineering office. They sent in plans for all sorts of things, but the only ones that I had to deal with were for the Rivoli Bay and Kingston jetties. They sent in plans for lighthouses, which were erected upon their design and without any competition. I know they sent in a plan for the Largs Bay jetty, but it was not carried out in my time. Some work has been constructed there since, but I do not know who did it.

17538. Did not Mr. Wright take soundings and borings for these jetties? He took them, I think, before I came to the colony. I think so, but I am not quite sure. He was in South Australia long before I came. He was handed over by the Railway Construction Branch to me as one of my officers. I really do not know when he took the borings.

17539. There was a Mr. Notcutt, who, according to the evidence, understood screw piling? I speak subject to correction, but I think not.

17540. He took bores, did he not? I think not; Mr. Wright was the only one who took bores, as far as I can remember.

17541. Was it proposed that these jetties should carry a railway? No; they were to carry trucks.

17542. Still an engine would have to run across them? No; certainly not.

17543. Did you not put up some steam cranes on some part of these works? No.

17544. On some other works then? I have put up a lot of steam cranes in my time.

17545. Did you not put up some steam cranes at Port Adelaide or at Port Pirie? Some steam cranes were put up in the dockyard at Port Adelaide. I think there were some steam cranes put up also at Port Pirie, Morgan, and Goolwa.

17546. Were they from designs prepared by Mr. Cheesewright? No; they were not. I do not think he ever sent in a design for a crane.

17547. The steam derricks you put up did not work;—considerable alterations had to be made to them at Port Adelaide? No.

17548. Did you put up any at Port Adelaide? In the dockyard, but not on the wharfs.

17549. Those you put up would not work? Certainly they would.

17550. When the Rivoli Bay and Kingston jetties were subjected to the testing load it was found that they would not bear it? Not that I know of. As a matter of fact they did bear it, I think.

17551. Mr. Higinbotham said in his evidence before the Commission:—"The Treasurer wished me particularly to inquire into the connection of Mr. Hickson, the Engineer of Harbours and Jetties, with the designs for these two works." That is Mr. Higinbotham's evidence on 25th September, 1879. Did you have any communication with the Treasurer on the subject? No; not that I can remember.

17552. Mr. Higinbotham appears to have made inquiries as to how far the Engineer of Harbours and Jetties—that would be yourself—was responsible for the design, and he said "I confess I do not altogether approve of the course he pursued in the matter. I find that Mr. Hickson on his arrival here found the designs prepared, and that Messrs. Wells Brothers had given an estimate of the cost of construction." Those were the first designs, were they not? The first and second were both the same. The second designs were practically the same as the first.

17553. Mr. Higinbotham says in giving the same evidence:—"The decision of the arbitrators was entirely in favour of the Government. Subsequently on communication with the Marine Board it was determined to reduce the length of the jetty, and Mr. Hickson proposes to use the material saved in the lengths to double their previous widths, for a length of 450 feet from the end of each jetty towards the shore." The jetties appear from that evidence to have been reduced from 4,000 feet in length down to 450 feet, and to have been doubled in width? You are reading that evidence quite wrongly. They were reduced in length by 450 feet; they were not reduced to 450 feet. (*Vide Appendix No. 63.*) 17554.

R. R. P.  
Hickson.  
16 Sept., 1896.

R. R. P.  
Hickson.  
16 Sept., 1896.

17554. But they were widened for the whole of their length? Only for that 450 feet which was taken off the end of the 4,000 and put on to the end of the shortened length. The outer end was widened to the extent of that 450 feet.

17555. *Mr. Smith.*] That was upon your recommendation? Yes.

17556. *Mr. Parkes.*] Mr. Higinbotham was asked what was his opinion with regard to the design, and he said, "I think the design was too light with only 15 feet width at the end, which was at first proposed. I think it would be very likely that the end might be carried away in rough weather." He was then asked whether he did not object to iron, and whether he would not prefer jarrah, and he said that he would prefer jarrah? So would I, and I used it afterwards in all wharfs and jetties.

17557. Did you not send in a report to the Treasurer, upon the motion of some Member for papers, in which you said that you recommended iron, because you considered iron the proper thing to use? Cast-iron, not wrought iron.

17558. The material of which you constructed the jetties was questioned by Members of Parliament? Members of Parliament question all sorts of things. I do not remember there being any special question in that case.

17559. Do you not recollect sending in a report with regard to the iron? I do not remember it, but I might be able to identify it if you would show it to me.

*His Honor said the question before the Commission was not as to Mr. Hickson's ability. Even supposing, in the instance referred to by Mr. Parkes, he had recommended the very worst material, and in doing so had made a mistake, this Commission had nothing whatever to do with that.*

*Mr. Parkes said he understood that His Honor wished to limit the branch of the inquiry relating to South Australian matters as far as possible to a parallel case to that of the adoption of the Monier design in Contract 77. That being so, he would ask His Honor to admit as Appendices the evidence which had been given by Mr. Hickson before the arbitrators in the case of Wells Brothers, the evidence of Mr. Higinbotham before the Royal Commission upon Public Works, and also Mr. Higinbotham's report.*

*His Honor said that if there were no objection on the part of Mr. Hickson to the admission of the papers, or a portion of the papers, referred to by Mr. Parkes, they might be put in for what they were worth.*

*Mr. Hickson said he had no objection to the whole of the papers referred to by Mr. Parkes appearing either in the body of the evidence or as Appendices, whichever might be thought best. Perhaps he had better explain the facts. A question had been raised in South Australia as to a cargo of rails which was sent to the Railway Construction Branch in connection with the Port Augusta railway. It was a question as to whether the rails had been properly or improperly passed, and Mr. Higinbotham, who was then Engineer-in-Chief for Railways for Victoria, was asked to come to the Colony to report on the question. While Mr. Higinbotham was in the Colony, rumours got abroad—as they sometimes would when one thing was supposed to be wrong—that the whole of the public works carried out in the Colony had something wrong in connection with them, and he suggested to his Minister that as Mr. Higinbotham was in the Colony, he being a well-known engineer, he should be asked to report upon all the works he had undertaken; and the Colonial Treasurer of the day, Mr. Mann, who happened to be his Minister, approved of Mr. Higinbotham's making a report. It appeared from the papers that on the day after he presented his report he gave the evidence before the Royal Commission which had been referred to by Mr. Parkes.*

*His Honor said that since Mr. Hickson raised no objection to the admission of the papers, he would direct that they be printed as Appendices to the evidence. (Vide Appendix No. 63.)*

17560. *Mr. Parkes.*] Did you construct the Wallaroo jetty? No; I think it was constructed after I left.

17561. Was it started by you? I do not think it was. I should have to refresh my memory upon that point. It was intended to be started, I think; but the site chosen by the Marine Board was considered a bad one, and, as far as I can remember, the work upon the altered site was not commenced until after I had left.

17562. The following paragraph appears in the report of Mr. Mann, the Secretary to the Public Works Department:—"The charge of the important works which are connected with the improvement of our harbours and the construction of piers to render our coasts available for shipping has been placed in the hands of the Engineer-in-Chief. A few years ago it was considered advisable, by way of experiment, to create a department of Harbours and Jetties, and to appoint an engineer to take the exclusive charge of the construction of those works in conjunction with the direction of the dredging operations, which were carried on by the Marine Board. The change, however, did not work as satisfactorily as had been expected. The Government resolved, therefore, to abolish the new department, and to revert to the arrangement in existence before the Harbours and Jetties Department was created. Harbour works, lighthouses, and jetties, will therefore in future be constructed under the superintendence of the Chief Engineer, and the dredging under the direction of the Marine Board. The change was effected towards the close of the financial year." The same report says, in reference to the Wallaroo jetty: "Some difficulties have been met with in connection with this undertaking. The original contract entered into in August, 1879, was set aside, and a fresh one entered into for a structure on a site alleged to be more suitable than the one that had been chosen. After the work had proceeded to some extent it was found that the soundings taken were incorrect. A fresh site was therefore selected. The work which had been executed was abandoned, and a new agreement made with the same contractor for building a jetty on a fresh design on a new site." That was your work, was it not? No; that alteration was made after I left the Colony.

17563. But the original work was your work? Yes.

17564. Did Mr. Cheesewright design it? No.

17565. Were not Wells Brothers the contractors? No; I think Grant was the name of the contractor.

17566. Do you recollect that the soundings were found to be so incorrect that the work had to be abandoned? I have already explained that the site was found to be a wrong one. It was chosen by the Marine Board, and it had to be altered.

17567. Would you not have to take the soundings? One of my officers took the soundings.

17568. The report says that the soundings were found to be incorrect? I think the soundings for the later work were taken by the Marine Board's own officer.

17569.

17569. Did not the Minister in charge ask you to explain how it was that the soundings were incorrectly taken? I do not think so. There may be some papers which will explain the matter.

17570. *Mr. Smith.*] I find that I misled you the other day in asking you question 17117;—I refer to my question as to the date upon which Mr. Lyne, the Minister, wrote the minute referred to. I asked you whether he did not write it on the next day? Yes; I see that is an error. He wrote the minute on the same day.

17571. As to Mr. Gillan, I think you said that all you knew was that he was a partner in that particular contract which the firm had with the South Australian Government? Yes; of course, I only knew that from hearsay.

17572. You did not know that he was a member of the firm in any other sense? I knew he was not a member of the firm in regard to Contract 77.

17573. All you knew was that he was a partner in the South Australian contract? Yes.

17574. *Mr. Gummow.*] With regard to Mr. Gillan, do you know in the Department that he is, or ever has been, a member of the firm of Carter, Gummow & Co., in any of their contracts in New South Wales? I should have to look up all the contract documents to answer that question.

17575. With regard to Mr. Forrest, the paper upon page 272 of the Parliamentary return shows that Mr. Forrest was a partner of Carter & Co. in respect of Contract 72? It shows that, in respect of Contract 72, the firm consisted of Messrs. Carter, Snodgrass, and Forrest.

17576. Does it show that Mr. Forrest was a member of the firm in respect to Contract 79? The document to which you refer says: "And whereas the said contractors and the said George Forrest in carrying out the said contract made a claim for extra works in connection therewith, amounting in all to the sum of £4,050 9s. 6d., &c." It would appear that Mr. Forrest was not a contractor for 79, but that he was a contractor for 72.

17577. Does that support the position you took up in saying that you only know the contractors by the names of the partners given in their tender forms? Yes.

17578. So that, as far as George Forrest is concerned, can you show that he was a partner of Carter & Co. or Carter, Gummow, & Co. since that date? No. All that I can accept is the names which appear at the foot of the tenders. I do not know anyone else in the matter.

17579. The names of the partners put beside the name of the firm? Yes.

17580. Can you show whether Mr. Forrest has been a partner of the firm of Carter & Co. or Carter, Gummow, and Co. up to April, 1895? I should have to look through all the tender forms before I could answer that question.

17581. But you do not know that he was? No.

17582. Nor Mr. Gillan? No.

17583. You said that the Department of which you had charge in Adelaide was done away with, and that the whole of the works were put under one head? Yes.

17584. Do you know if they are all under one head now? Yes.

17585. The arrangement has not been altered since you left? No.

17586. There is one engineer-in-chief there for all the works? Yes.

17587. *Mr. Parkes.*] Are you aware that Mr. Forrest has been the contractor managing Contract 77, and that he has been supervising it since its commencement? I cannot say that I am officially aware of it. I have never been in charge of that contract.

17588. But you know, as a matter of fact, that Mr. Forrest is supervising it? I have been out to the contract twice as a visitor, and I have seen Mr. Forrest there, but what position he holds with regard to it I cannot say. There is no reason why he should not be manager on that contract as far as I can see.

William Julius Baltzer sworn and examined:—

17589. *Mr. Gummow.*] What are you? I am an engineer.

17590. You are an employee of Messrs. Carter, Gummow, & Co.? Yes.

17591. What were you doing before you came into their employ? I was in the Government service.

17592. For how long? I joined the service first in September, 1884, and I left of my own accord in March, 1889. I re-entered the service in December, 1889, and I was retrenched in October, 1895.

17593. For what reason were you retrenched? A Commission had been appointed and the whole of the service was reorganised.

17594. You were given notice that you would have to go? Yes; I received 6 months' notice.

17595. Did the Department give you the option of doing any other work? They gave me the option of having my salary reduced or leaving the service, and I said I would rather leave the service.

17596. You took your 6 months' leave and compensation? Yes.

17597. Have you any testimonials from the Department? I have testimonials from Mr. Bennett, Mr. Bagge, and Mr. Hickson. I have not copies with me now, but I could produce them.

17598. What salary were you receiving? £335.

17599. What were your duties? I was directly in charge of a certain number of draftsmen under Mr. Bagge.

17600. How long have you been in the employ of Carter, Gummow, & Co.? Since August or September, 1895.

17601. When you were in the Department, do you remember receiving a notice to get out a design upon the Monier system? Yes.

17602. What were the reasons for doing that? Mr. Bagge told me to get out a design upon the Monier system.

17603. But for what reason? He did not give me any reason. He only told me to get out a design.

17604. Were any other designs got out at the same time? There were two other designs.

17605. The design upon the Monier system was done under your supervision? Yes.

17606. Were you able to calculate all the necessary details in connection with it? Yes; I was able to calculate everything.

17607. Did you ever speak to Mr. Hickson about the system? I told Mr. Hickson at the time the patent was taken out that I had taken it out.

17608. Did you tell him that you were going to take it out? No; that I had taken it out.

17609.

R. R. P.  
Hickson.  
16 Sept., 1896.

W. J. Baltzer.  
16 Sept., 1896.

- W. J. Baltzer. 17609. You did not tell him of it before you took it out? No.
- 16 Sept., 1896. 17610. What did he say when you told him? He had no objection to it.
17611. You have lately been to Germany? Yes.
17612. With what object did you go there? I went firstly to see my relations, whom I had not seen for fourteen years. In the second place I went to inquire into a system of desiccating, also as to the Monier system and other work which might be advantageously carried out in the Colony.
17613. Did you get any information upon these matters in Germany? Yes.
17614. How did the information which you received at home agree with that which you already had with regard to the Monier system? I had most of the particulars in my hands before I left.
17615. Did you consider, after seeing what you did in Europe, that you were in a position to make a design upon the Monier system before you left? Yes.
17616. Do you think that the arch in the case of Contract 77 would have tumbled down if it had not had the iron grill in it? No.
17617. For what reason would it stand up? Because the line of the pressure-curve falls within the middle third. Under any circumstances; if even the sewer were running brim full.
17618. Could you calculate it? Yes.
17619. Mr. Bagge, in his evidence, said that you had no key to the calculation;—what have you to say as to that? I had everything necessary for calculation in connection with the structure.
17620. With regard to the cement used in the Colony, do you know to what test it is subjected? Yes. I was looking at the German conditions and comparing them with the conditions in use in the Public Works Department in this Colony, and I find that they are practically the same.
17621. Do contractors in Europe get special cement for structures upon the Monier system? No. They use the ordinary cement furnished by the factories.
17622. Do you know how long the factories have been in existence in Germany? The first factory was erected in 1855 at Stettin.
17623. Was a union formed by the cement companies? In 1877 they formed a union to protect themselves. That was done of their own accord.
17624. Did they then send their cement to Berlin to have it tested? No. Germany consists of a great number of States, and each State governs itself with the exception of one or two Imperial matters, for instance, defence, postal arrangements, and railways.
17625. While you were at home did you go into the question of what securities the departments held over the contractors or patentees in connection with these works? In Austria the contractors for the first bridge ever built upon the system there had to leave a deposit of 10 per cent. upon the cost of the structure for one year, and to maintain the structure for another two years.
17626. *His Honor.*] Maintenance for three years altogether? Yes.
17627. *Mr. Gummow.*] Is that the general rule with reference to structures which are in course of erection on the continent of Europe now? I should think so. I should imagine that the Monier Company, being the same in Austria as in Germany, would certainly object to more stringent conditions in Germany.
17628. The one firm hold the patent for the two countries? The company holds the patent for Austria and the southern parts of Germany.
17629. Is it M. Monier himself who holds the patent? No; it is held by a company.
17630. You got your information upon these points from Wayss & Co.? Yes.
17631. Do you consider that you are a specialist in this matter? Yes.
17632. With reference to the use of the Monier arch, did you see any buildings upon that system while you were at home? I saw one built at Gersheim in Germany, and also one at Vienna.
17633. Was that structure in one arch? At Gersheim there were three arches, and at Vienna one arch.
17634. In what way were they constructing the three arches;—were they building the whole of the three at one time? No, they built one arch on each day.
17635. They did not build the three arches all in one day? No.
17636. So that the building of the whole of the arches in the structure on the same day or continuously is not considered necessary by the Monier Company? Not at all.
17637. As to leaving the centres in;—how long are they left in in Europe? From four to six weeks according to the thickness of the structure.
17638. While the centres are in is there any thrust on the piers? No thrust whatsoever.
17639. In the Monier system at home are there any expansion joints? None at all.
17640. Have you read Mr. Bagge's report upon the three systems of construction? No; I do not remember it.
17641. In one paragraph of his report he says:—"In order to meet this difficulty the radius of the 75-ft. span arch of scheme No. 3 had to be so selected that the centre-line of forces should always keep within the middle third of the arch ring";—did you calculate it out when making your design, and keep the line of resistance within the middle third? Yes. Mr. Kern did so at the time.
17642. Are you satisfied that Mr. Kern's calculations are correct? Yes, perfectly satisfied.
17643. Did you check them? Yes; afterwards.
17644. Have you any sketch showing those calculations? Not in connection with that particular contract.
17645. Have you any in connection with the Monier system at all? Yes.
17646. Upon what system have you made your calculations? In the office it was done on Schieffler's theory. I worked them out upon the theory of the elastic arch.
17647. And how did they compare? Very favourably.
17648. Mr. Bagge, in his evidence, in answer to question 706, says: "Well, I was just saying that we tried to make a calculation, and could not do so";—is that correct? To a certain extent. I was in charge of a certain number of draftsmen, and was unable to leave my work. I could not neglect other work in order to do everything that was necessary in connection with this design. Another officer had therefore to take the calculations in hand, and he, not knowing anything of the theory of the elastic arch, had to resort to the common theory of the Voussoir arch.
17649. Mr. Bagge, in reply to His Honor, at question 1756, said, referring to the German Government: "They simply say, 'If you are going to adopt this patent in such and such a work, you must put down

W. J. Baltzer.  
16 Sept., 1896

75 per cent. of the value in cash securities. After the work has stood one year 50 per cent. of the contract money will be paid you; after it has stood for the second year another 25 per cent. will be paid you; after it has stood for the third year you will get the balance of your security." You will see from that that the State thinks there is some risk in the system;"—is that correct? I never heard of such a thing.

17650. Did you ever take into consideration the question of climate in Australia as compared with Europe? Yes; I consider that the climate here is much more favourable to the structure than is the European climate.

17651. In reply to question 3464, Mr. Bagge said: "This patent was taken out without my knowledge. I had no idea at the time that it had been taken out; but Mr. Hickson knew of it;"—is that correct? Mr. Hickson knew of it only after the patent had been taken out.

17651½. Is the system used generally in structures on the Continent? It is used very largely in building construction for floors, roofs, columns, cess-pits, water-tanks, bridges—in fact, in any structure in which formerly bricks or concrete have been used.

17652. You have some photographs illustrative of the use of the system? Yes.

17653. Where did you obtain those photographs? When I was on the continent of Europe recently.

17654. Had you any information on the subject before then? Yes; I wrote a treatise upon the Monier patent.

17655. When you were in Europe, did you hear of any structures likely to be built upon this system on a large scale? Yes; they were building a bridge in Austria with a span of 40 metres, or about 120 feet.

17656. Did they propose building a still larger structure than that? Yes; there was a scheme for a railway-bridge with a span of 120 metres, or 350 feet.

17657. *His Honor.*] A single span? Yes.

17658. *Mr. Gummow.*] You have heard of the Monier culvert which was built at Strathfield? Yes.

17659. Did you see the building? Yes; both during the construction and afterwards.

17660. Have you seen it during the last few months? No.

17661. How long is it since you saw it? It must be at least eighteen months.

17662. Was it in good order when you saw it? In splendid order.

17663. Did you ever hear that it had collapsed? No.

17664. As to Mr. Bagge, how did he always look upon the Monier system while you were in the office? He was always prejudiced against it, and latterly I never talked to him on the subject. I mentioned the matter to him at the commencement, and he snubbed me in such a way then that I thought it better to leave the thing alone.

17665. That was while you were in the office? Yes.

17666. Was that before the Monier arch which was designed in the office was done? A good time before that.

17667. As to other work, what sort of man was Mr. Bagge;—did he believe in keeping to old systems, or in going in for new ideas? When I told him about this system he told me that it was better to stick to old ideas, instead of trying to introduce fancy-work.

17668. Did you ever have any argument with him on the subject of introducing other ideas, quite independently of the Monier system? I often had arguments with him. If I wanted to make an alteration in a shaft, for instance, in a new contract, Mr. Bagge always objected. There was a great deal of difficulty in inducing him to consent to any alteration whatever.

17669. Did you explain to Mr. Bagge what you knew about the Monier system when you found him prejudiced, as you term it? I never talked to him beyond that, except when he himself brought the subject up.

17670. Did you give him all the information you had in your possession? No.

17671. Since you have been in the Colony, have you ever heard of any failure in the system at Home? No.

17672. While you were in the department you say you got out a Monier design for Mr. Bagge's report? Yes.

17673. Is the plan produced the design you prepared? Yes.

17674. For his report? No, not for his report. That was for Contract 77.

17675. Did you do that in the office? No.

17676. Where did you make it? At home.

17677. Is that your original drawing? Yes; those are my figures.

17678. Is that a drawing or a lithograph? It is my original drawing.

17679. And you are sure you did that at home? Yes.

17680. During your own hours or during office-hours? During my own hours.

17681. It was you who originally took out this patent in New South Wales? Yes.

17682. How long ago? I could not tell you, but I think it was in 1891 or 1892.

17683. You took in with you two partners? Yes; Mr. Carter and Mr. Snodgrass.

17684. What made you take them in with you? Because they were special friends of mine.

17685. Was that your only object? I knew them a long time, and while we were talking, sometimes on engineering matters, the subject cropped up.

17686. Who paid the necessary expenses? Mr. Carter.

17687. You did not pay anything? No.

17688. In taking in Mr. Carter and Mr. Snodgrass, did you consider that it would be of benefit to the working of the patent in the future? Decidedly.

17689. Did they pay you anything for joining in with you, you having all the information? No.

17690. Did you ever receive any money from them while you were in the department? No.

17691. Have you ever received any money from them or from anyone else for patent rights? No.

17692. While you were in the office, did you give any information to contractors of office business? No.

17693. With regard to the tests which had been made of this system;—have you seen any tests at all? Yes; I was present at the test made by Mr. Carter, at North Shore, and also at another test, which was made at Forest Lodge. Mr. Roberts also made some tests.

17694. Did you ever test any blocks for compression? Yes.

17695. The blocks were made of different kinds of sand? Yes.

17696. Did you assist to make those blocks? Yes.

- W. J. Baltzer. 17697. With regard to the watertightness of the system—do you consider that Contract No. 77 will be watertight? Perfectly watertight.
- 16 Sept., 1896. 17698. Do the photographs you have produced show any work upon this system constructed to hold water? Yes. There is an aqueduct among them—also reservoirs.
17699. At question 1752 Mr. Bagge, in paragraph 3 of the report which he read, says, “The patentees at Home are specialists; have a special staff of specially-trained workmen of many years’ experience in constructing models on the Monier system before they undertook the construction of models on this system;”—what have you to say as to that? If a person wishes to carry out this work he must certainly know the whole theory of construction; but he does not want special workmen. He wants very careful conscientious workmen who will carry out the work under his instructions. The work has to be carried out very carefully, but no expert workmen are actually required.
17700. As to the man in charge? The man in charge must understand the whole details of the system.
17701. In paragraph 6 of the same report, Mr. Bagge says, “Mr. Baltzer was not a specialist, and had extremely little, if any, practical experience of work, having, so to say, just left the University in Germany—in fact, what he knew of engineering he learnt from me in the Sewerage Office;”—is that correct? No.
17702. *His Honor.*] In what respect is it incorrect? I did not learn anything from him. I always studied a great deal at home.
17703. *Mr. Gummow.*] Did you study in the evening while you were in the department? Yes. I often made sketches of work upon different contracts at home. The sketches I now produce are some of them. They are in connection with some work which was done in 1891. They were made in my own time, at home.
17704. These are your own drawings? Yes; done in my own time.
17705. In taking Mr. Carter and Mr. Snodgrass in with you, as far as this patent is concerned, did you do so in order that they might assist you in designing, or was it their practical experience of work that you wanted? I took them in on the ground of their practical experience.
17706. In reply to question 7163 Mr. Bagge says, “Well, I know for a fact that the cement used for such work at home is not procurable in these Colonies for love or money;”—is that correct—cannot the cement be procured? Certainly it can be procured. The German manufacturers are only allowed to manufacture cement of a certain standard. If it does not come up to that standard their names are excluded from the Association, and they are published in the German newspapers, which would mean ruin to the manufacturer.
17707. Do you know if their cement comes out here? I ascertained the kinds of cement in use at home, and I found that the Germania and Henmoor brands are well-known cements on the Continent.
17708. Are those the cements which are being used by Messrs. Carter, Gummow, & Co. upon Contract 77? Yes.
17709. *His Honor.*] Is it the fact that in calculating the strength of these arches you ignored the grill, and that you calculated upon the assumption that they would stand without utilising the effect of the grill in them? Yes.
17710. As if they were compo. arches? Yes.
17711. That is to say that, resolving all your perpendicular strains into the line of the arch, you would find the compressive strength of the arch enough to resist them? Yes.
17712. So that the arch, in point of fact, does not act in any sense necessarily as a girder? Quite so.
17713. But, at the same time, if it were required to act as a girder it would do so on account of the grill? Yes.
17714. You did not require to assume an unequal load;—you assumed an equal load throughout? Yes.
17715. So that you wanted only the single grill? Only the single grill.
17716. And you say that the arches would in point of fact stand without it? Yes.
17717. That is the calculation you made? Yes.
17718. But you would not build such a structure without the grill, because the calculation would be rather too fine? Yes.
17719. *Mr. Gummow.*] What about the question of elasticity? That is shown in the test arch at Puckersdorf before it collapsed; it bent considerably.
17720. The grill is necessary to elasticity? It makes the structure much more elastic.
17721. *His Honor.*] In putting the expansion joints into the carrier over the piers you consider that there is enough elasticity in the rest of the structure, it being so open, to compensate without cracking for the utilisation of the expansion? Yes. If the arch should shift itself the greatest strain would be in the carrier over the pier.
17722. The carrier would probably alter its own form to a certain extent with the same increase of temperature that would tend to raise the arches? Yes.

---

FRIDAY, 18 SEPTEMBER, 1896.

George Christie recalled and further examined :—

- G. Christie. 17723. *Mr. Parkes.*] You have looked through the inspector’s journal in connection with Contract 72, and you have also looked through a list of the purchases made by Carter, Gummow, & Co. in respect of the same contract;—I believe you have also taken out of the journals of 53 a list of the cement which was transferred to that contract from Contract 72? I should explain that the journal in the case of Contract 72 has not been found. The extracts are not from that journal.

17724.

17724. Your extracts are taken from the journals of Contracts 53 and 79? Yes; I have prepared the following statement:—

G. Christie.

18 Sept., 1896.

List of Cement purchased and delivered at Contract 72, from 1st September, 1891, to 23rd June, 1892.

| Date.      | Vendor.                                    | Quantity. | Brand.     | Tested prior to 19 Nov., 1891. |
|------------|--|-----------|------------|--------------------------------|
| 1891.      |  | Casks.    |            |                                |
| October 2  | Parbury, Henty, & Co.                      | 597       | Camel      | No. 584, 6/10/91.              |
| " 8        | Henry Austin                               | 376       | Germania   | " 595, 14/10/91.               |
| " 12       | Parbury, Henty, & Co.                      | 396       | Wouldham   | " 596, 15/10/91.               |
| " 30       | Gibbs, Bright, & Co.                       | 252       | Gostling's |                                |
| November 6 | Henry Austin                               | 300       | Alsen's    | " 609, 11/11/91.               |
| " 13       | Parbury, Henty, & Co.                      | 1,000     | Camel      |                                |
| " 13       | Henry Austin                               | 407       | Germania   |                                |
| 1892.      |  |           |            |                                |
| April 30   | "  | 967       | "          |                                |

| " 23       | "  | 184       | "          |                                |
| June 23    | Burns, Philp, & Co., 118 less returned 109 | 9         | Elephant   |                                |

The following is a list of entries from the journal of Contract 53 relating to the cement transferred from Contract 72:—

STATEMENT of transfers of cement from Contract 72 to Contract 53, as per entries in journal for Contract 53.

|         |           |          |           |
|---------|-----------|----------|-----------|
| 23/5/92 | 10 casks. | 27/9/92  | 58 casks. |
| 1/7/92  | 24 "      | 18/10/92 | 19 "      |
| 6/7/92  | 5 "       | 26/10/92 | 24 "      |
| 16/7/92 | 3 "       | 3/11/92  | 12 "      |
| 6/8/92  | 5 "       | 4/11/92  | 12 "      |
| 19/9/92 | 12 "      |          |           |
| 21/9/92 | 24 "      |          | 208 "     |

The following statement has been prepared by me, showing the cement used on Contract 72 from the 15th February, 1892, until its completion:—

CEMENT used on Contract 72 from 15th February, 1892, till its completion; date of final certificate being 29/12/92.

|  |        |       |
|--|--------|-------|
| Stock on Contract, 15/2/92   | casks. | 1,300 |
| Subsequent Purchases—  |        |       |
| Per Hy. Austin's invoices—   |        |       |
| 30/4/92—Germania   | 967    |       |
| 7/5/92—"   | 994    |       |
| 23/5/92—"  | 184    |       |
| Per Burns, Philp, & Co.'s invoices—  |        |       |
| 23/6/92—Elephant   | 118    |       |
| Less returned  | 109    |       |
|  | 9      |       |
|  | 2,154  |       |
|  | 3,454  |       |
| Deduct—Removals to Contract No. 53, as per statement of extracts from journal, Contract 53 | 208    |       |
|  | 3,246  |       |

Memo.—The quantity estimated by Messrs. McCreddie and Thompson as required was 3,432 casks.

I have also a memorandum extracted from the journal of Contract 79. The entry appears upon page 70 of the journal of Contract 79, and is as follows:—

EXTRACT from Journal of Contract No. 79.

Mr. Boys, 15/5/93,—

Cement carted and transferred to Contract 90, Neutral Bay, 10 bbls., making a total of 130 bbls., 99 of which were not advanced on by the Department. The rest forwarded by consent.

William Julius Baltzer recalled and further examined:—

17725. Mr. Gummow.] You have your testimonials with you this morning? Yes. The following is from Mr. Bennett:—

W. J. Baltzer.

18 Sept., 1896.

I HAVE much pleasure in stating that Mr. W. Baltzer has been employed during the last four years and three months in the Sewerage Department as a draftsman, during which time I have found him very useful in drawing out detail plans of the sewerage works. He is a neat, intelligent, draftsman, and as such has given general satisfaction. I bear willing testimony to his being an industrious, steady, well-behaved, young man, who gives promise of success in his profession should he choose to follow it up. He leaves the Department entirely of his own accord.

The following is from Mr. Baggé:—

11 January, 1889.

Mr. W. Baltzer having been employed as an engineering draftsman in the Construction office of the Sewerage Department during the last four years and three months, chiefly under my charge, I willingly testify to his industry, intelligence, and steadiness, in all work entrusted to him; and taking into consideration the intricate nature of these works, with all its difficult details, and that Mr. Baltzer had gradually mastered the work, so as to enable him to execute designs of details in a very creditable manner, his leaving the Department, although entirely on his own accord, is a loss to me, which I much regret.

The following is from Mr. Hickson:—

3 May, 1895.

Mr. William Baltzer has for over ten years been employed in the drawing office of the Sewerage Construction Branch of this Department, and has directly designed many of the larger works carried out by the Branch. He has proved himself a resourceful and capable officer, and his architectural knowledge has been of great service.

I greatly regret that the necessity for retrenchment should deprive the Department of his services, and can confidently recommend him for a leading position in any drawing office.

17726.

- W. J. Baltzer. 17726. How long have you been in communication with the patentees of the Monier system in Austria and Germany? Since 1892.
- 8 Sept., 1896. 17727. As to the Monier arches upon Contract 77—do you consider that it will be possible to build those arches more economically in the future? Certainly.
17728. In what way? The Monier Company in Europe allow a strain per square inch of from 560 to 660 lb., and in this particular construction only 300 lb. was allowed. At the same time the iron has taken a great deal of the compression out. The coefficient of elasticity between the cement and the iron is as 1 to 40, so that in the event of the contraction working equally the iron would take up 40 times the strain of the cement mortar.
17729. Do you consider that the whole of the carrier is watertight? Yes, certainly. It has been proved by experiments in England that porous concrete can be made perfectly watertight by rendering it with 1 to 1 compo., or rendering it with pure cement to a thickness of one-tenth of an inch.
17730. What sand and stone material do they use in Europe in connection with this system—do they use pure sand? No, they use pebbles and broken stone up to the size of half an inch; but it all depends upon the size of the construction.
17731. With regard to oxidation, from any information which you have obtained, or from your own knowledge, do you consider that there is any risk of oxidation of the iron? Professor Bauschinger has made a number of tests, and he considers that the iron is perfectly protected by the cement mortar as soon as the mortar has set.
17732. You produce a plan showing the tests made in Austria in 1891 and 1892? Yes. It shows the position of the pressure-curve for a load of 78·5 tons.
17733. *Mr. Parkes.*] In the cases of fracture shown on that plan is the iron fractured in any case? Not in any case. That is the most wonderful part of the experiments.
17734. How do you account for that;—is it drawn at the junctions? It is deformed, but in no case has it been actually torn asunder.
17735. Is it drawn at the intersections? Not even at the intersections.
17736. What happened, then? Only the longitudinal bars were deformed. The transverse bars were not interfered with.
17737. *His Honor.*] The compression of the compo. making up for the deformity, I suppose? Yes.
17738. *Mr. Parkes.*] On the 3rd April, 1893, Mr. Armstrong, the agent for Messrs. Carter & Co., sent to the Secretary for Public Works the following letter:—
- I HAVE the honor to direct your attention to a patent, No. 4,084, issued on 3rd November, 1892, to Messrs. Carter, Snodgrass, and Baltzer, for the purpose of strengthening, and at the same time cheapening, the construction of sewer and other arches as described in such patent as “invention of improvements” in concrete, cement, and mortar, building, and other constructions and manufactures.
- I am desired by my clients to state that they are willing to dispose of their sole powers and rights granted in such patent, and to offer the same to your department for the sum of £1,500.
- You knew of that letter, did you not? I knew of it.
17739. Did you give instructions to Mr. Armstrong? I had nothing to do with Mr. Armstrong.
17740. It was only Carter & Co. who had to do with Mr. Armstrong? I do not know how the matter was arranged.
17741. You recollect the letter coming to the department? I heard of it.
17742. What was to be your interest in the patent;—had you an equal interest in the profits with Messrs. Carter and Snodgrass? Yes.
17743. Have you still that interest? It has been altered to a certain extent.
17744. In what manner? I receive  $2\frac{1}{2}$  per cent. upon the profits which are actually obtained upon contracts.
17745. While you were in the office you were to receive a third share of the profits? Yes.
17746. You said in your evidence the other day that Mr. Hickson had given you permission to take out this patent? I said I told Mr. Hickson after the patent had been taken out that I had done so.
17747. And he did not object to it? No.
17748. After Mr. Hickson had written asking whether Mr. Bagge knew anything about the patent, do you know whether Mr. Bagge then came to you? He did not come to me.
17749. He wrote a report concerning it on the 7th April, 1893, in which he pointed out that it required very careful construction, and in which he gave a general description of it;—did he get that information from you? I do not think so.
17750. Did he speak to you at all about it at that time? I had given Mr. Bagge information before.
17751. Before April, 1893? Yes.
17752. Did you tell him that you had this patent? Yes; he knew about it.
17753. *His Honor.*] Was it before you took the patent out, or after you had taken it out, that you first had a conversation with Mr. Bagge about it? I could not say whether it was before or after.
17754. *Mr. Parkes.*] When the estimates were being prepared for Contract 112, did you not make out an estimate for the Monier system;—that was your work, was it not? I had nothing whatever to do with the estimates.
17755. Did you make the drawings? Yes.
17756. Who made the estimates? Mr. Adams, I should think.
17757. You made out the drawings for Contract 77 upon the Monier system? Yes, at home.
17758. Did you show them to Mr. Hickson at any time? No, never.
17759. Did you ask Mr. Hickson whether you could make them out? No; I never asked anybody.
17760. When were they first given to Mr. Hickson? As far as I can remember, they were submitted with the contract.
17761. They were not shown to Mr. Hickson before that? Not as far as I know.
17762. Would the plans be put into the tender-box with the tender? I do not know. The only thing I heard was that Mr. Bagge, after the tenders had been sent in, showed the plans to different officers.
17763. What did he do that for? I do not know. That was his business.
17764. Did he make any comment upon it? I could not say. He never talked to me about it.
17765. You have put in a letter of recommendation or testimonial from Mr. Bagge? That was written in 1889. I could have got a letter at any time.

W. J. Baltzer.  
18 Sept., 1896.

17766. Did you make out an estimate for the Monier work to arrive at the sum of £15,500, the amount of Carter, Gummow, & Co.'s tender? No. I had nothing to do with that.
17767. You did not make out that estimate at all? No.
17768. Do you know who did make it out? I think Mr. Gummow made it out.
17769. Did he not speak to you about the prices he was putting in for the work? He may have done so, but I knew very little about the prices which were ruling outside. I could not form an opinion as to whether his prices would be correct or not.
17770. Did Mr. Hickson, after the tender had been submitted for the Monier system, speak to you about it at all? No, never.
17771. Did Mr. Hickson know at the time the tender was sent in that you were interested in the patent? Yes; he knew that.
17772. But he never spoke to you at all about it? Never.
17773. He never asked you whether or not you were still concerned in the patent? No.
17774. When you left the Department you paid into the banking account of Carter, Gummow, & Co. the sum of £175, your retiring allowance;—why did you pay that into their account? Mr. Carter was a personal friend of mine. I was leaving the country, and I thought the best thing I could do was to leave the matter in his hands.
17775. It was put into his hands nearly nine months before you left the country, was it not? No; the money was paid three or four weeks after I had left the Colony. That can be proved, I think, by the date on which I left.
17776. Your retiring allowance was not paid until some time after you had left the Colony? No.
17777. And that is why it appears as having been paid into their account at that time? Yes.
17778. You drew a salary from Carter, Gummow, & Co., from the time you left the Department? About four or five weeks after I left the Department I think I was engaged by them.
17779. What salary were they to give you? £250 a year.
17780. You were to be of assistance to them in connection with the Monier patent, or what was the arrangement? I had to do anything that came to hand.
17781. Do you know whether Mr. Hickson saw your drawings at all before they were submitted with the tender for Contract 77? I do not think so. To the best of my recollection the drawings were only handed over to Mr. Carter a day or two before the putting in of the tender.
17782. Only a day or two before? I cannot remember the exact date, but I know the time was very limited.
17783. Were any drawings made before that? That I do not know. There may have been two drawings.
17784. When you were making the drawings for the Monier arch, did you have any of the departmental drawings with you from which to obtain measurements or any data? No; I had everything necessary in my possession. I had made the thing before.
17785. What do mean when you say that you had made it before? I connection with Contract 112.
17786. When you designed the plans for 112? Yes. There were only the dimensions of the arches and of the little spandril arches to be considered in the matter.
17787. Were the plans for No. 77 made at the time that the plans for No. 112 were made? I could not tell you exactly. I think they were made afterwards. I think the plans for 112 were made before the tenders for 77 were actually called for. I think they were just about finished a month before the tenders were called for.
17788. When the drawings for No. 112 were made, was it the intention of Messrs. Carter & Co. to submit a Monier plan in that case? No.
17789. Did Carter & Co. tender for No. 112? I could not tell you.
17790. Why was not the Monier system tested in the case of 112? A design was made by the Department, and Mr. Bagge reported against it. He would not have it.
17791. I think you said that Mr. Bagge instructed you to make that design? Yes.
17792. Did he say that anyone had instructed him? He did not say; he merely instructed me. He did not give me any reasons. I think he said at the time that Mr. Hickson wanted a design.
17793. Would it not be strange under these circumstances for Mr. Bagge afterwards to report against the design, and to stop the work from being built upon that system? I do not think so.
17794. Not if he had given you instructions to make the design and the design turned out to be the cheapest? Three schemes were got out, and one had to be selected.
17795. But the Monier scheme was the cheapest, was it not? I could not tell you.
17796. As a matter of fact, Mr. Bagge says in his report that the Monier scheme would cost £6 6s. 8d. per foot; that No. 2 scheme would cost £6 16s. 11d. per foot—that being the scheme adopted—and the first scheme £9 11s. 5d. per foot, Ahearn's work costing £10 16s. 1d. per foot;—when he came to you to ask you to make the design did he not say anything as to the reasons why he was opposed to the Monier system? He often said before that it was of no use to make plans upon such a system, because it was impossible to carry out the work except by experts.
17797. Did he say that on this particular occasion? I could not say whether he said so on that occasion.
17798. Did he make any excuse for coming to you and asking you to make a design? No; he merely told me to make it.
17799. Why did he come to you? I suppose he knew that I knew something about the system.
17800. Did he say that to you? He did not say it to me; but he knew that I had considerable information on the subject.
17801. Did he make any remark to the effect that as you knew the system, and were well acquainted with it, you would be the best man to carry out the design, or anything to that effect? He may have said that.
17802. Did he say that Mr. Hickson had sent him to you? No; he said, as far as I can remember, that Mr. Hickson wanted different designs got out, and he told me to get out the Monier design.
17803. Did you make any reply to him? No; I set to work at once and got out the design.
17804. Did you not reply to him when he made this observation to you;—did you not make any remark to him? I do not think so.
17805. You do not recollect making any remark? I cannot say that I do.
17806. Do you know whether Carter, Gummow, & Co. had any promise as to the acceptance of the  
Monier

- W. J. Baltzer. Monier design before they sent in their tender for Contract 77? No; they never consulted me at all or spoke to me about any promise.
- 18 Sept., 1896. 17807. When you made the plan, did you think that they were going to get the work? When I first started upon the design I was acting mostly upon my own responsibility. I wanted to see how the thing would actually look.
17808. In that situation? Yes.
17809. *His Honor.*] You mean for Contract 77? Yes.
17810. *Mr. Parkes.*] Did you not know that the design was going to be used in connection with Carter, Gummow, & Co.'s tender? I did not know what the intention was at all, but I thought it not unlikely some use would be made of the design. What the intention was at the time I did not know.
17811. You told Mr. Carter, I suppose, that you were making the design? Yes.
17812. What did he say? Nothing in particular. He said, "All right; let us have a look at it."
17813. When did he ask for possession of it? That I could not tell you. Now I come to think of it, he did not ask for possession of it at all; I gave it to them.
17814. *His Honor.*] You mean us to understand that you made the design out on your own account? Yes; I told them of it at the time, and when it was finished I handed it over to them.
17815. You showed it to them as a good idea as applied to Contract 77? Yes.
17816. You thought it a good idea as applied to Contract 77, as it suited the features? Yes.
17817. *Mr. Parkes.*] When did you first hear that the plans had been handed in with the firm's tender? That I could not tell you exactly.
17818. Did you hear it before or after the tenders were opened? It might have been mentioned to me, but I could not say when.
17819. When you were retrenched from the Service did you not make some remonstrance? No; but I asked Mr. Hickson to be allowed to be examined before the Commission.
17820. What did he say? He asked whether I had any grievance to submit to them, and I said "No."
17821. Can you recollect roughly how many months before the tenders were sent in for Contract 77 you made the plan which was adopted? I cannot.
17822. Would it be six months? I cannot tell you the date.
17823. Was the design made soon after the plans for No. 112 were drawn? I do not actually recollect when the plans for No. 112 were made. It was made after that, no doubt. It is a difficult thing for me to recollect a matter which occurred two years ago.
17824. Contract 112 was let in February, 1895;—when did you leave the office—do you recollect? I left about May, I think.
17825. How long before you left the office were the plans for Contract 77 made out—I mean the Monier design? I could not tell you. It would be very difficult for me to tell you when the plans for 112 were first made, because sometimes contracts lay in the office for a considerable number of months. It would be very difficult for anyone to recollect exactly when the plans were made. Plans might be in the office six months before tenders were called for.
17826. You cannot recollect how long it was before you left the office when you made this particular plan? No.
17827. You could not say within months? No; there would be nothing to remind me of it. It was made at about the time tenders were called for Contract 77. That is all I can say.
17828. Have you received anything up to date in the shape of your partnership percentage in connection with the Monier work? Not a penny.
17829. No money has yet been paid you? No.
17830. You have received irregular sums from Carter, Gummow, and Co.;—in one case, I think you received £60? I have drawn money from the firm as I required it. I think I drew that £60 on the 1st January, to square accounts.
17831. On one occasion you drew £546, did you not? That was when I was at home.
17832. What was that for? That was for information with which the Monier Company supplied us.
17833. Did you pay them that amount for the information with which they supplied you? Yes.
17834. Was the whole of the amount used for that purpose? It was all used for that purpose.
17835. When you offered the Monier patent to the Government for £1,500, did not Mr. Hickson question you about it? No.
17836. He never said a word to you? No.
17837. Although he knew that you held the patent? Yes.
17838. What has been the greatest span of Monier arch work which you have seen actually used at home? About 40 feet.
17839. That is the greatest span you have seen? Yes.
17840. The photographs you have exhibited are of bridges of comparatively small span? A bridge with a span of 128 feet has been erected in Switzerland, and there are a great many with spans of 60 and 80 feet.
17841. You have not seen the bridge with the 128 feet span? No.
17842. Is that the greatest span you know of? Up to the present.
17843. Has it been standing well? Yes. I do not recollect the exact year in which it was erected, but it must have been standing fully six years.
17844. What is the oldest tests which have been applied to this system? I could not say exactly how many years; but this system came into use in Germany and Austria in 1886.
17845. Had they begun to build bridges at that time? I do not think they started at once to use it for bridges. It was used in the building trade in connection with floors and roofs.
17846. You cannot say when the first bridge was built? The first proper test as regards a bridge was made in 1889 at Matzleindorf.
17847. Would frost or snow affect the cement at all? No.
17848. Frost does not affect cement, does it? No.
17849. *His Honor.*] When there is elasticity enough to make up for contraction? Yes.
17850. If there were no scope for elasticity at all, of course it would be bound to go somewhere? Yes.
17851. *Mr. Parkes.*] Have you noticed whether any fractures have occurred in any of the works which you have seen? I did not notice any.
17852. I suppose you could have seen where the fractures had occurred had there been any shrinkage? Yes; I should have noticed it.
- 17853.

17853. *His Honor.*] Do I understand that, when you made the substituted plans for Contract 77, you had it in your mind that there would be some chance of their being used for that contract instead of the office plans? Yes. I suppose it was partly in my mind. W. J. Baltzer.  
18 Sept., 1896.

17854. How came you to think so;—how came you to think that there would be a chance of getting them in substitution for the departmental plans? I was greatly interested in finding out actually how the design would look in comparison with the office design.

17855. It was rather a troublesome work making out these plans;—it took a good deal of time? Yes.

17856. So that you must have had some idea in your mind that there was a fair chance of their being used? I thought there was a fair chance of it.

17857. What foundation had you for supposing that there would be a fair chance of getting the Monier design substituted for the departmental design? I thought we should be able to make a much cheaper design as compared with the office design.

17858. You knew that tenders were to be called upon the departmental design? Yes.

17859. Had you any reason to suppose or to hope that after the Department had made out this elaborate design, and had called for tenders upon it, there would still be a chance of getting it to accept an altogether different design? I could not exactly say. The only thing I thought was that the design would be considerably cheaper if the Monier system were used. My idea was that the cost of construction would be considerably cheapened.

17860. That is, you thought that the plans you were drawing would, when the quantities came to be taken out, show a much lower cost of construction than would the departmental plans prepared for Contract 77? Yes.

17861. You are aware that the lump sum tender was only £200 below the tender for the departmental design? Yes.

17862. That is not very much of a cheapening? The difference is not very great.

17863. It is hardly worth talking about it;—it is hardly worth considering in a sum of £15,000? I thought that if the Department would accept the design it would be a valuable experiment in construction, and that it would be of considerable use afterwards.

17864. You say that you could, in point of fact, having regard to what the arches had to bear, safely reduce your dimensions very much more? Yes.

17865. But in this case you took the large dimensions;—you worked out practically the same large dimensions which you worked out in the case of 112? Yes.

17866. A little larger? A little larger. I thought that everyone being accustomed to the heavier design it would have been inadvisable to submit a design of smaller dimensions, although we might know from our calculations that it would stand.

17867. You thought public sentiment would be against you? Yes.

17868. Not to say prejudice? And prejudice too.

17869. But knowing as you did that Mr. Bagge had set his face against the use of the Monier system in the case of Contract 112, and that he had a very strong opinion as to the risk of using it at all, did you not think there was a very small chance of getting the Department to accept your design in the case of Contract 77? I thought there was perhaps a small chance, but at the same time I thought it was worth trying.

17870. You thought it worth your while to have a shot at it? Yes.

17871. Had you received any information from anyone, which induced you to think that after all, in spite of Mr. Bagge's objection to the Monier system, there would still be a good chance of getting the Department to accept the substituted plan? No.

17872. Not from anyone? No.

17873. You know enough of English to know what getting the tip means? Yes.

17874. Had you not got the tip from anyone? No; as I informed you on Wednesday, I used to make designs at home. I think I made some designs in connection with Contract 77 as far back as 1891.

17875. In the proper sense, but not in the improper sense, of the word, you were a designing man? Yes.

17876. Will you tell me what led to your first thinking matters out in connection with the Monier system—I mean your first having it suggested to your mind that you would take out a patent? I used to take considerable pains in finding out everything I could about the system, and, having gone to the trouble of finding out everything I could, I thought I had a right to take out a patent.

17877. How did you first of all come to hear of it? From my brother at Home.

17878. In what capacity is he employed? I have several brothers. One is a teacher; the others are contractors and architects.

17879. Your family is in the engineering line? Yes; one of my relations is a Professor at the Technical School at Berlin.

17880. Is that the one who is teaching? No.

17881. You have another brother who is teaching? Yes.

17882. Is he teaching mathematics? No; zoology.

17883. So having seen the matter referred to in the papers, and having heard a good deal about the Monier system, it produced an effect upon your mind? Yes.

17884. And you thought it worth looking up? Yes.

17885. And you did then read it up? Yes. In 1892 I received a letter from the Monier Company, in which they offered me every information which would be of use in any works which were being constructed in this Colony.

17886. And then you thought of taking out the patent some time afterwards? I forget when it was taken out.

17887. Who suggested the idea to you? I thought of it myself.

17888. How did you come to go to Messrs. Carter and Snodgrass? Mr. Carter had been for a great many years a personal friend, and I therefore approached him on the subject.

17889. He had money and experience in material? Yes.

17890. You had not experience in material? No.

17891. And you thought that it would be a good plan to go to Mr. Carter or to some one like him whom you could trust—is that so? Yes.

17892. *Mr. Gummow.*] Are you an enthusiast over this Monier system? Yes.

17893.

- W. J. Baltzer.  
18 Sept., 1896.
17893. You have been for a number of years? Yes. I have occupied considerable time in collecting information. The book to which I referred on Wednesday took me a great deal of time to compile.
17894. In speaking to Carter & Co. upon the subject, did you not tell them that the system would be much cheaper than the present method of carrying out works? Yes.
17895. You always considered that it would be much cheaper? Yes.
17896. Did you consider that it could be advantageously employed in general structures in this Colony? Yes; I thought there would be a great saving from its use in many structures.
17897. That is what you had in your mind in submitting to them the design for Contract 77? Yes.
17898. You thought it would be cheaper than the Departmental design? Yes.
17899. Did you know what the estimate would turn out to be as regards either the Departmental or the Monier design—did you know what the prices would be? No; Mr. Bagge did all that kind of work.
17900. Did you know what prices Carter & Co. were going to put into their tender? I do not know now whether I ever saw the prices. Perhaps they were shown to me; but I cannot recollect at this moment.
17901. You considered, when you were getting out your drawing for the Monier system, that it would be much cheaper than the Departmental design,—is it not so? Yes.
17902. As to your drawing, you said that that was made out after the drawings for Contract 112? I said I did not quite know at what time it was made out, whether it was after Contract 112 or not.
17903. Do you know where I was living early last year? In Adelaide, I think.
17904. Do you remember my coming up here? Yes, I remember your being here one day.
17905. Before the tender for Contract 77 was sent in? Yes.
17906. Do you remember when you handed in the substituted plan to the firm? I know that at the time we had a conversation on the subject. I remember that I showed you the plans and calculations, and that you were perfectly satisfied.
17907. Do you remember whether the plan was ready for use even one day before it was put in, or whether you had not to work at it on the very day before the tender went in? I know that it was not ready a great many days before the tender went in.
17908. Do you know whether it was ready one day before? I could not say. I worked at it every night to get it finished.
17909. As to the submitting of the plan, you did not know that we were going to submit it even the day before? No; I did not know anything about it. I think I only heard of it after the tender had gone in.
17910. As to your going to Europe, what information did you want from the Monier Company? I went home in order to save expense in connection with experiments.
17911. You thought it would be possible to get all the information you required from the Monier Company? It had certainly taken me some years to collect the information we already had.
17912. Are you an enthusiast over things apart from the Monier patent? Yes; I had a good many things in hand.
17913. Which you are still working at and getting information upon? Yes.
17914. You submit them to the firm at times? Yes.
17915. As to this amount of £179, your retiring allowance, do you remember when you left Sydney to go to Europe? On 3rd March.
17916. Had the £179 been paid to you at that time? It was not ready at the Treasury. Some few days before I left I saw Mr. Kirkpatrick with Mr. Carter, and he told me at the time that the question had been raised as to who should pay the money—whether it should be paid by the Government or from the Superannuation Fund. He said at the time that the money might not be ready for a month or six weeks.
17917. At any rate, it was not in your possession at the time you left? No.
17918. You gave an order to Mr. Carter to draw it from the Treasury? Yes.
17919. And that is how it comes to be paid to Carter & Co.'s credit? Yes.

James Gillan sworn and examined:—

- J. Gillan  
18 Sept., 1896.
17920. *Mr. Gummow.*] What are you? I am a contractor.
17921. Where have you been residing during the last four years? In South Australia.
17922. When did you return to this Colony from South Australia? I landed here on the 14th of this month.
17923. When did you finish your work there? On about the 12th.
17924. During the four years you were in South Australia how many times were you in Sydney? Once.
17925. What did you come up for? To sign a bond.
17926. Did anyone come up with you? Yes; my wife.
17927. Did Mr. Hickson, junior, come up with you? No.
17928. Was he in Sydney at the time you were here? No.
17929. You said you came up to sign a bond;—in connection with what contract was it? No. 77—the Monier contract.
17930. What member of the firm did you meet here? Mr. Carter.
17931. Did you go with him to sign the bond? Yes.
17932. Did you fill in the bond? Yes.
17933. Did you read it through? Yes.
17934. And you were satisfied, on signing it, that you were worth £6,000? Yes.
17935. You have also made a declaration to the effect that you were worth that amount—is that correct? Yes, as far as I know.
17936. While you were in Sydney at that time you met Mr. Maddison and Mr. Ewing, did you not? Yes.
17937. How often? About twice.
17938. Do you remember any conversation at all with them? No.
17939. Did you have lunch with them? Yes.
17940. Then you must have had some conversation? We were talking about the works in general—as to how we were getting on in Adelaide—and one thing and another of that kind.
17941. Did you mention anything to Mr. Maddison about a partnership with young Mr. Hickson? No.
17942. Did you tell Mr. Maddison that you had seen a certain telegram from Carter to myself? No.
- 17943.

17943. Have you ever seen such a telegram upon the subject of young Mr. Hickson's partnership with the firm? No. J. Gillan.  
18 Sept., 1896.
17944. You are sure of that? Certain.
17945. You met young Mr. Hickson in Adelaide? Yes.
17946. When did you first hear of his coming to Adelaide, or anything about his being employed by the firm? I could not exactly tell you the date.
17947. Do you remember anything in connection with it? I remember your letting me know that he was coming up to assist you to look after the alignment and levels of the tunnels.
17948. Did I tell you that he was going to be a partner in the firm? No.
17949. I did not show you any telegram on the subject? No.
17950. With regard to the firm of Carter & Co., of New South Wales, have you ever been a partner in the firm in their contracts with the Government of this Colony? No; not in New South Wales.
17951. But you have been a partner of the firm in their contracts in South Australia? Yes.
17952. You signed plans and specifications in South Australia? Yes.
17953. Did you ever sign any here? No.
17954. *Mr. Parkes.*] When you opened a banking account in Adelaide did you transfer to that account £5,000 from the Sydney office? I could not tell you. I leave those matters to Mr. Gummow.
17955. Do you not know as a matter of fact that £5,000 was transferred? I could not tell you.
17956. Do you know that a banking account was opened there for the firm? Yes.
17957. There was no banking account there in connection with the firm before that particular account was opened? No.
17958. Is it not a fact that the moneys of Carter, Gummow, & Co. have been transferred back to Sydney now that the Adelaide contract is completed? It might be so for anything I know.
17959. But would it not be so? I do not know anything about it; I leave all such matters, as I tell you, to Mr. Gummow.
17960. Have you not an interest to the extent of £3,000 odd in the business of Carter, Gummow, & Co.? Yes.
17961. Is not that £3,000 distributed all over their business? I suppose so.
17962. Have you not, as a matter of fact, an interest in such profits as may arise from Contract 77? I expect so.
17963. But if there is a profit will you not ask for your share? Certainly, if there is any profit to be got.
17964. As to Messrs. Maddison and Ewing where did you say you met them? I met them for the first time at the Métropole.
17965. When you signed the bond for Contract 77, did you not then know that you would have an interest in any profit which might result from that contract? Certainly.
17966. Did you ever meet Messrs. Maddison and Ewing near the Post Office? No; I did not.
17967. Did you never say to Mr. Maddison or to Mr. Ewing "If I could do so, I should take my money out of the firm and leave it with you two fellows"? No.
17968. Did you not tell them that you had £1,000, but that you did not like to put it into Carter & Co.'s business? No.
17969. Did you not speak to them about their leaving that firm? Their leaving the firm was mentioned, and I remember telling them that I thought they had made a mistake.
17970. You are sure you never said a word to them about young Mr. Hickson coming over to Adelaide? Not to my recollection.
17971. You are sure you never said to one of them, or to both of them, that you had seen a telegram from Mr. Carter saying that it would be necessary to take young Mr. Hickson into the firm? Yes; I am sure of that.
17972. You are quite positive on that point? Yes.
17973. Absolutely certain? Yes.
17974. Did you have any conversation with them as to young Mr. Hickson at all? The subject may have been brought up, but I do not remember any conversation to that effect.
17975. Did you never say to them that he was of very little use as an engineer? No, I did not.
17976. Did you never speak to them at all as to his going to Adelaide, and as to his connection with the firm? I may have mentioned the matter in a communication—by letter.
17977. The original firm, when it built the reservoir at Potts' Hill, were Messrs. Gummow, Gillan, Ewing, and Canty? Yes.
17978. That was the old firm? Yes.
17979. You kept books in those days? That I could not say.
17980. Have you kept books in Adelaide? I have kept the time-book for the men.
17981. But not a ledger or a day-book? No.
17982. Each partner in the firm receives a salary of £43 a month? Yes.
17983. Where did you receive your £43 from? From S.A.
17984. Were there no profits arising from the business at all? That I could not tell you.
17985. How were the profits allotted? I leave those matters to Mr. Gummow.
17986. Was the whole thing done through the Bank-books? I think so.
17987. The Bank-books in the case of your Adelaide account are not like your Sydney Bank-books. The cheques are paid by number? Yes.
17988. How could you tell then what cheques you had paid away, to whom the cheques were paid;—how could anyone tell? I suppose I could tell by making inquiry at the Bank. It was the Bank who altered the Bank-books. I remember Mr. Gummow asking me if I had made the alteration, and I said, "No."
17989. The Bank you say made that alteration? Yes; Mr. Gummow asked me how the Bank-books came to be made up in that way.
17990. Who drew the cheques? I drew them while I was in Adelaide by myself.
17991. Did you draw them by numbers or in the names of the payees? I drew them in the names of the payees.
17992. And not by numbers? No.
17993. Then how came the Bank to enter the cheques up by numbers? I do not know.
17994. How would you know whether you got a fair share of the profits, or whether the business was properly

- J. Gillan.  
18 Sept., 1896.
- properly managed if you had no book from which you could see the income and expenditure? I trust Mr. Carter and Mr. Gummow.
17995. Absolutely? Yes.
17996. Have you seen Mr. Maddison or Mr. Ewing lately? Not since I came over.
17997. When did you come over? I landed here on Tuesday.
17998. When you came over to sign the bond for Contract 77 did you see Mr. Hickson? I did not.
17999. Do you know Mr. Hickson? I know him by sight; that is all.
18000. Have you ever spoken to him? Not to my recollection.
18001. Did you not see him in Adelaide? No.
18002. Did he not come to see you to ask you how his son was getting on? No; I never saw him there.
18003. You have never spoken to him in your life? I do not recollect doing so.
18004. Who were present when you signed the bond for Contract 77? Mr. Norrie and Mr. Carter.
18005. Anybody else? There was someone else there, but I could not say who it was.
18006. Have you a property at Marrickville called "Blinkbonnie"? No.
18007. Have you any property in New South Wales? No.
18008. Did you ever possess a property called "Blinkbonnie"? No.
18009. When did you last see Mr. Maddison and Mr. Ewing? I could not tell you the exact date; but I think it would be at the latter end of May, 1895.
18010. Did you ever write to them before this inquiry took place? Yes; we corresponded—before they drew out of the firm.
18011. Have you had any correspondence with them since then? No.
18012. Do you know that I made a statement in the Legislative Assembly upon their responsibility to the effect that you had told them that a telegram had been sent to Adelaide to the effect that Mr. Hickson's son must be taken into the firm at any cost? No.
18013. Did you not see a copy of the *Hansard* containing that statement? No.
18014. Did Mr. Gummow never show it to you? No.
18015. You never heard of it in any way? I might have seen it in the newspapers. I have received the *Sydney Daily Telegraph* regularly.
18016. Did you never have any conversation with Mr. Gummow about that matter? No.
18017. Or with Mr. Carter? Not that I remember.
18018. Did they not write to you to ask you whether it was true or not? Yes, Mr. Gummow wrote.
18019. When did he write? About four or five months ago.
18020. Was he not in Adelaide with you four or five months ago? No.
18021. What did he say in his letter? He said nothing at all.
18022. Have you that letter? No.
18023. Did he not say anything about Mr. Hickson's son? No.
18024. Do you know Mr. Snodgrass well? I do.
18025. Why did he leave the firm? That I could not tell you.
18026. Do you know where Mr. Snodgrass is? I do not.
18027. *Mr. Gummow.*] As to the bank pass-books, you say that an alteration was made from names to numbers;—did you order the bank to put the numbers in? No.
18028. Did you make out the cheques to particular numbers, or were they the bank's own numbers? I made out the cheques in the names of the persons to whom the money was due.
18029. In the names of the persons with whom you were dealing? Yes.
18030. Have you ever drawn any profits out of the firm of Carter, Gummow, & Co.? No, none.
18031. As to "Blinkbonnie" to whom does the property belong? To my wife.
18032. In talking of it generally, do not people refer to it as your house? They do.
18033. They always talk of it as if it were your house? Yes.
18034. Is not the rent paid into your credit? Yes.
18035. With regard to the money which was sent from New South Wales to South Australia, four years ago, to start the South Australian contract, had Carter, Gummow, & Co. any contract here at that time? No.
18036. With regard to drawing cheques, did you ever draw any cheques for the firm before I left Adelaide? No.
18037. Do you know anything about the business of the firm further than what I tell you? Nothing.
18038. And you do not bother about those things? No.
18039. What was your position in Adelaide? I was managing the work.
18040. You kept the time? Yes.
18041. And looked after the men? Yes.
18042. And you were not troubled in any way with the financial part of the business? Not at all.
18043. You did not know whether the firm had an overdraft, or whether their account was in credit? I did not.
18044. So that really all that you knew about the business you found out from me? Yes.
18045. And whether I told you a truth or an untruth, you were none the wiser? No.
18046. Do you know whether Mr. Hickson, junior, was ever a partner in the firm? No; he never was that I know of.
18047. What had young Mr. Hickson to do? His duty was to look after the levels and alignments of the tunnels.
18048. *Mr. Smith.*] When you were up here to sign the bond you made a declaration? Yes.
18049. You will see it upon page 213 of the Parliamentary return. It is as follows:—

## STATUTORY DECLARATION.

I, JAMES GILLAN, of Dulwich Hill, in the Colony of New South Wales, householder, do hereby solemnly declare and affirm that I am possessed of property to the value of £6,000 sterling and more, and that such property consists of cash at bankers, freehold and other property. And I make this solemn declaration as to the matters aforesaid according to the law in this behalf made, and subject to the punishment by law provided for any wilfully false statement in any such declaration.

Taken and declared at Sydney, this 27th day  
of May, 1895, before me,—

HAROLD F. NORRIE, J.P.

JAMES GILLAN.

Where

Where was the property to which you referred? It was in money matters—in the firm of Carter, Gummow, & Co., for instance.

J. Gillan.

18050. Where was the freehold property;—had you any freehold property? I had none.

18 Sept., 1896.

18051. Was there any other property? Not that I know of.

18052. So that the declaration is incorrect as to freehold property, at all events? Yes.

18053. Did you read that declaration before you made it? Partly. I did not go thoroughly into it. It was my firm belief at the time that I was worth £6,000.

18054. Did you not see in the bond reference was made to freehold property? I did not notice it at the time.

18055. *Mr. Parkes.*] On what date was it that you started the Adelaide job? About the beginning of September, 1892.

18056. The bank-book I hand you is a Sydney book, is it not? I could not say.

18057. It shows a transfer to Adelaide of £5,000, does it not? I never saw the book before.

18058. That was sent over to Adelaide on fixed deposit to carry out your work? It may be so.

18059. Afterwards did you not apply to have that £5,000 paid into your account in Adelaide? That I could not say. Mr. Gummow might have applied. I did not.

Frank Moorhouse Gummow:—

18060. *Mr. Parkes.*] Did you not transfer £5,000 from your account in Sydney to your Adelaide account? Yes.

F. M. Gummow.

18061. And afterwards you applied to the Adelaide authorities to have that money paid into your credit? Yes.

18 Sept., 1896.

18062. It was afterwards transferred back to your account in Sydney in large amounts at different times? £4,000 at one time and £1,000 at another.

James Gillan recalled and further examined:—

18063. *Mr. Gummow.*] Do you remember my coming over here early last year with reference to Contract 77? Yes.

J. Gillan.

18064. Do you remember my return? I do not know what date it was.

18 Sept., 1896.

18065. Do you remember my telling you that you were put down as a surety to the extent of £6,000? Yes.

18066. Will you tell His Honor exactly what occurred? You said I was worth so much in the pound, and you gave me all the particulars.

18067. Did I tell you that you had to come up to Sydney to sign a bond? Yes.

18068. Did you say that you were worth £6,000 before you left Adelaide? Yes.

18069. Did I tell you that the £12,000 bond was the extreme amount? Yes.

18070. Did I tell you that the three partners of the firm, yourself, and Mr. Forrest would have to pay the damage between us if there were any loss? Yes.

18071. That you would not be actually liable for the full amount of £6,000? No; that I should be liable for the amount of £3,000.

18072. You are sure of that? Yes.

18073. *Mr. Parkes.*] I suppose nobody read the bond over to you before you signed it? Mr. Carter and I read it over partly. We did not go into it particularly.

18074. Did you notice what it contained? I could not tell you now.

18075. You thought it was a bond to the amount of £6,000? Yes.

18076. You thought that if you signed that bond you must be worth £6,000? Yes; that I must be worth £6,000.

18077. *Mr. Gummow.*] Did you not always depend upon Mr. Carter and myself absolutely in financial matters? Yes.

18078. On my telling you to come up and sign the bond, did I consult you as to whether your name was to be put down? I asked you for the particulars and you let me know.

18079. What I told you, you believed to be true? Yes.

18080. You came up and Mr. Carter read over the bond with you? Yes.

18081. Did you take Mr. Carter's version of it—did you take what he said to be correct? I depended upon him just the same as I would upon you.

18082. *His Honor.*] No one in the office asked you any question as to how you made up the £6,000? No.

18083. They did not cross-examine you as to your means? No; they did not.

18084. *Mr. Parkes.*] Were you a stranger to them;—had you seen Mr. Norrie before? No; never.

18085. Had he seen or did he know you? I do not think so. He might have seen me in regard to different contracts. I could not say. I do not recollect having seen him.

18086. Did he put any question to you as to whether you had any connection with the contract? I do not recollect. He might have done so when he handed over the bond to be read and signed.

18087. You do not remember his asking you any question? No; I do not remember it.

18088. *Mr. Smith.*] I suppose he asked you the usual questions as to whether you had read the declaration and as to whether the contents were true? He might have done so. I do not recollect.

Joseph Davis recalled and further examined:—

18089. *His Honor.*] You desire to make a statement? Yes. It is in reference to the memorandum put in upon page 295 to the evidence of Mr. Christie. You will see that at the bottom of the page he refers to clause 20 of the general conditions. He says:—

J. Davis.

18 Sept., 1896.

On 23/3/93, Mr. Armstrong, as agent for Carter & Co., applied for a return of the deposit (£2,000), held by the Department. This application was refused. [See printed papers, Nos. 57 and 58, on pages 315 and 316.] The application was renewed by W. Armstrong, 21/4/93, and after it had passed through the hands of various officers, Mr. Hickson added a minute, as follows:—"A voucher has been signed to-day for work done, amounting to £1,453 9s.—R.H., 27/4/93." This

J. Davis. This minute of Mr. Hickson does not disclose the fact that, in the certificate he refers to, the department actually returned a portion of the retention money, viz., £222 17s. 7d., nor does it disclose that, to produce this amount of 18 Sept., 1896. £1,453 6s., the department had made an advance on 900 casks of cement at 16s., amounting to £720.

Further, by the ordinary reading of Mr. Hickson's minute, it would not appear to authorise any return of the retention money; but, as he quotes the amount, the certificate must have been before him, and it bears evidence that £222 17s. 7d. of the retention money had been returned.

I wish to say as to the amount of £222 17s. 7d., retention money, that the amount was over and above 5 per cent. of the amount of the contract worked out at schedule rates, and that, although the general conditions attached to the contract were the old general conditions, and therefore specified that 10 per cent. retention money was to be kept in hand, it was customary at that time upon all contracts, as shown by Mr. Hickson's minute, which is given in the printed papers, to return any money over and above 5 per cent., and in that way anticipate the new general conditions. With regard to the 900 casks of cement advanced upon, that was done, as the printed papers show, upon the authority of the Minister, and an agreement was drawn up authorising it.

18090. *Mr. Smith.*] What is that minute of Mr. Hickson's which is referred to upon page 296? That is the minute to which I refer.

18091. Mr. Christie states that the action of Mr. Hickson is at variance with his minute? I do not see in what way it is at variance with the minute. What I wished particularly to call attention to was that the sum of £222 17s. 7d. was returned in accordance with the practice of the department—that is to return anything over and above 5 per cent. in anticipation of the new general conditions.

18091½. The new conditions were in force at the date of Mr. Hickson's minute? But not upon this contract. They were generally in force—they were being anticipated upon all contracts.

18092. *Mr. Parkes.*] What is the date of the issue of the new general conditions? I could not give you the precise date this morning; but I could ascertain it.

18093. *His Honor.*] Were they approved by the Minister? They were the result of several conferences of the Board of Reference. The Minister asked the Board of Reference to look into the matter as one of the first things they did when they were appointed. One of their proposals was that only 5 per cent. retention money should be retained upon contracts at that time. Contract 79 was running, so that when the 5 per cent. was reached on that contract all the retention money over and above that amount was returned.

18094. Was there not a minute by the Minister? At the time he appointed the Board of Reference he specifically mentioned the general conditions in his minute.

18095. Could that be produced? I think so.

Charles O'Hanlon sworn and examined:—

C. O'Hanlon. 18096. *Mr. Davis.*] What is your position in the department? I am Road Superintendent at Queanbeyan, in the Roads Department.

18 Sept., 1896. 18097. For how long have you been in the Roads Branch of the Public Works Department? Since June, 1895.

18098. What were you before that date? Resident Engineer in the Sewerage Department.

18099. For how long before that? From October, 1889, up to June, 1895.

18100. Have you had to do with Carter, Gummow, & Co., or any member of the firm, professionally? I had charge of one of their contracts at North Shore in 1889 and part of 1890.

18101. On what date was that contract finished? About the middle of 1890, I should think. I could not state the exact month.

18102. Have you had anything to do with any of their works since then? No.

18103. Did you know Mr. Carter before you had to do with his contract at North Shore? Yes; I knew him about twelve months after I came to the Colony.

18104. You have been on friendly terms with him since, as well as before that date? Yes.

18105. You had some monetary transactions with Mr. Carter, had you not? Yes.

18106. On what date was that? 26th June, 1894, was the date of the first monetary transaction I had with him.

18107. Will you explain to His Honor precisely how it arose, and what was the nature of it? I had invested some money in the purchase of land for a residence. The money I had was not sufficient to buy the land and complete the residence. I found that what I had would not carry me through. I made arrangements with a connection of mine for the advance of enough money to complete the building, but owing to some flaw, the arrangement was not completed, and I was put into a corner for the want of money. Mr. Carter was a personal friend of mine at the time, and I spoke to him about it, having no idea at that moment that he would lend me the money. I spoke to him about it quite casually, and he at once said, "I will see you through"; and he advanced me sufficient money to complete the building. When the building was completed, he said I could get a mortgage and return the money.

18108. This friend of yours had failed you, and it was your intention, was it not, to do something of the kind with him? Yes; he was going to get the money from the bank.

18109. And you were to pay him back in a similar way? Yes.

18110. You afterwards took that course in regard to Mr. Carter? Yes.

18111. How much did you borrow? The amount was not altogether in cash; some was in material. The total amount was £600. The first instalment was paid on 26th June, 1894, and the final repayment was on 3rd October, 1894.

18112. Under what circumstances was the money repaid—how did you obtain the money for repayment? I obtained a mortgage on the property for £650. I got the mortgage through Johnson, Minter, and Simpson, and I then repaid the £600 direct to Mr. Carter.

18113. Have you anything further to say as to the transaction? Nothing except this: that it was an entirely friendly transaction. I did not see how it could influence me one way or the other, because I had no connection at all with those contractors.

18114. At the time you borrowed the money, on what work were you engaged? I was engaged all over the place. I had nothing definite to do. I was here and there. I was on survey work; I relieved Mr. Boys at North Shore. I was assisting at the Glebe, and I went all over the place. I had no definite job.

18115. It was in 1894 when you borrowed the money? Yes.

18116.

18116. About what time was it that you were engaged at Newcastle—it was about then, was it not? No; C. O'Hanlon. previous to that, I think. 18 Sept., 1896.
18117. Is there anything else you would like to explain? I might perhaps add that during the time I had the loan of this money Mr. Carter had the deeds of the land, and held the building as security.
18118. Did you pay him any interest for the money during the time you had it? No; I offered it to him, but he would not accept it.
18119. Do you think, in the light of subsequent events, that in the same circumstances you would act differently? I scarcely know how to answer that question. I suppose you mean, what would I do if a similar offer were made me in similar circumstances?
18120. In view of the way things have turned out, and you had the opportunity to take the same course, would you take it or not; you are supposed to be wiser to-day than you were two years ago? I should feel inclined to leave the matter entirely alone until I had money of my own with which to complete the work. I do not think I should be in such a hurry again.
18121. *Mr. Gummow.*] You are a personal friend of Mr. Carter? I should think so. During the whole of the time I have known him we have been very great friends.
18122. You are a married man? Yes.
18123. Your families visit one another? Yes; they did while I was in Sydney.
18124. Did Mr. Carter take any interest in the building of the house when it was in progress? No; he did not. I think he just came to see it when it was finished.
18125. Did Mr. Carter give you a wedding present when you got married? Yes; he gave me a spirit-stand containing three bottles.
18126. Did you accept it as a wedding present? Yes; and I was very much obliged for it too.
18127. *Mr. Parkes.*] On what contract were you Resident Engineer? On No. 60, at North Shore. It was a pipe contract.
18128. Not upon 79? No.
18129. And not at the Glebe? Not upon Mr. Carter's contract there. I was on a job of Lemon and Spencer's at the Glebe.
18130. What was the date of your mortgage from Johnson, Minter, and Simpson? I could not exactly tell you. I know that the money was repaid on the 3rd of October. I arrive at that date in this way: I borrowed £650, out of which Mr. Carter got £600 and I got £45 after paying legal expenses. The money was placed to my credit on 3rd October, and I conclude, therefore, that that was the date of the completion of the transaction.
18131. *His Honor.*] How long have you known Mr. Carter altogether? Since 1888. I came to the Colony in 1887.
18132. Were you living at North Shore after you first came to this country? I was living at Darlinghurst.
18133. How did you come to meet Mr. Carter? I met him casually; I was introduced to him in the street.
18134. By whom? I could not tell you.
18135. There was merely an introduction in the street? Yes. I heard that Mr. Carter was at the time in the Railway Department. I do not think he was a contractor.
18136. *Mr. Gummow.*] You lived at North Shore for some time? Yes; but not in 1888.
18137. When did you go to live there? In 1889. I then had charge of a contract at North Shore, and I went to live there for convenience sake. I was then a bachelor and could live where I liked.

Joseph Davis recalled and further examined:—

18138. *His Honor.*] You have looked into the matter of the general conditions of which you spoke just now? The document I produce shows the new general conditions. You will see that they were approved on the 5th February, 1894. They had evidently been under consideration twelve months or more beforehand. The papers show that there is a minute by the then Crown Solicitor, Mr. Ernest Smith, dated 21st June, 1892, in respect to these very general conditions, so that they must have been under consideration some eighteen months at least. I should be incorrect, however, in stating that they were in force on the date of the voucher referred to in Mr. Christie's memorandum, viz., April, 1893. They were anticipated. That would be the correct expression to use. J. Davis. 18 Sept., 1896.
18139. They were directed to be carried out by Mr. Bruce Smith, and his direction was subsequently confirmed by Mr. Secretary Lyne? Yes.

George Forrest recalled and further examined:—

18140. *Mr. Gummow.*] How long have you been in charge of Contract 77? Since the middle of January. G. Forrest. 18 Sept., 1896.
18141. You did not take charge of it when it was started originally, last year? No.
18142. You were not in charge at all last year? No.
18143. You had nothing to do with it then? No.
18144. Do you know Mr. Gillan? Yes.
18145. How many times have you spoken to him in your life? Not over a dozen, I think.
18146. Have you ever been on a job or on a work together? Never.
18147. With regard to books;—do you remember you and Mr. Snodgrass telling Mr. Carter that there was no necessity to keep books as far as you were concerned? No; I do not.
18148. You were upon Contract 69? Yes.
18149. Did anybody ever mention any bad work to you upon that contract;—did Darcus, for instance? No.
18150. Did you leave the whole of the matters connected with the contract to him? By no means.
18151. What was Darcus? A carpenter on the work.
18152. Working under you? Yes.
18153. Were you there daily to look after the work? Yes; I was there eight hours every day.
18154. Were you on the pipe contract that Carter & Co. had at North Sydney some few years ago? Yes.
18155. Do you remember a man named Tom Wright? Yes.
18156. Will you look at Question 2486; you will see there a reference to Inwood's matter;—do you remember some trouble with reference to some concrete between Wright and Inwood? Yes.

18157.

- G. Forrest. 18157. Do you remember going over there one Saturday evening with Inwood? No; it was on a Saturday afternoon when the row occurred.
- 18 Sept., 1896. 18158. Were you there at all? No; I was not within miles of the place.
18159. Do you remember whether you were sober at the time? Yes; I was perfectly sober.
18160. Did you ever assist Wright to unload cement upon any of the works? No.
18161. Did you ever assist anyone to do so? Never.
18162. If Wright says that you and Carter were half drunk, at any time, would that be true? No; Mr. Carter does not take it at all. I take a little now and again.
18163. *Mr. Parkes.*] Was Wright drunk? I have seen him drunk. He was drunk that afternoon right enough.
18164. *Mr. Gummow.*] Let me refer you to Question 3024;—did you ever have any drinks with Inwood? Many times.
18165. Did you always shout? Not always; I had many drinks with him before he entered the Service.
18166. Did you ever gamble with him;—did you ever play pitch-and-toss with him? No, never.
18167. You have not played 6d. or 1s. a corner for drinks with him? No.
18168. So that Inwood could not have won money from you? Not from me.
18169. Did you ever cheek Inwood and strike him? No.
18170. Did you ever hear of such a thing occurring in connection with Inwood? No.
18171. You did not hear of anyone else doing it? No.
18172. You made a statement before the Commission some time ago as to your property in New Zealand;—you said you had some property in M'Andrew Road and George-street, Dunedin? Yes.
18173. You still maintain that that is your property? Yes.
18174. Do you get any rent from it? The documents I produce are the returns I have received from my agent in New Zealand. You will see from them what the rent is.
18175. *His Honor.*] You receive the rent yourself? Yes; you will see that I received one of those returns this week.
18176. *Mr. Gummow.*] Is there any of your property on or near a tram-line? Yes; the one at the corner of George-street.
18177. Is that property in your own name? Yes.
18178. There is a report here from the Commissioner for Land and Income Taxes at Wellington, Mr. John McGowan, stating that the property is in Mrs. Forrest's name? It was in her name. It has been in my name for two years past. Mrs. Forrest willed it to me when she died, three years ago, on 16th January. It was conveyed to me in the month of May of the same year.
18179. So that at the time you signed this bond it was actually your property? Yes.
18180. Sir Robert Stout is your solicitor in New Zealand? Yes. Bradley and Sons put the matter through here.
18181. What rent do you receive from your properties? £100 a year.
18182. You estimated the value of your properties in New Zealand, including the vacant sections, at £2,500? I said I would not sell for less than that.
18183. You still consider that that is the fair value of them? Yes.
18184. *Mr. Parkes.*] Does one of the returns you have produced represent six months' rent? I ought to receive the returns every three months, but they are transmitted irregularly.
18185. For what portion of the year would this return of £30 15s. be for? The rates would probably have been paid from that amount.
18186. £52 5s. 6d. would be six months rent? Probably.
18187. *Mr. Gummow.*] Still you have property in New Zealand of the value you have represented? Yes; and it is in the street I mention.
18188. As to the signing of the bond for Contract 77, did you consider that you were running any risk? No.
18189. Did you think the structure was a sound one before you signed the bond? I did.
18190. Did you know that of your own knowledge? No; you and Mr. Baltzer told me about it. The Monier system was new to me at the time.
18191. In tendering, to whom do you leave matters? To you, absolutely.
18192. You have faith in my judgment as to prices and risk? Yes.
18193. In those matters you left the whole thing to me? Yes.
18194. You took my word that a certain tender was good enough? I took your word, of course. I thought that if it was good enough for you it was good enough for me.
18195. You knew that Mr. Carter and I also had a risk in the matter? Yes.
18196. You leave all financial matters to Mr. Carter and myself? Yes; everything.
18197. If you were told that your interest in the firm is worth £3,000, how would you know that it was so? I should take your word as that of an honorable man.
18198. You do not know anything apart from that? No.
18199. You fully trust me when I tell you that that is the value of your interest? Yes.
18200. *Mr. Parkes.*] Were you shown the plans for the Monier structure before the tender was sent in? No.
18201. You never saw the plans? I never saw the plans until I went on to the work.
18202. Did you know that the firm was going to tender for the job on the Monier system? I knew they talked about it.
18203. Who spoke to you about it? One of the members of the firm; I do not know which.
18204. Was it Mr. Carter or Mr. Gummow? I could not say.
18205. Did you know Mr. Baltzer in those days? Yes; I have known him for two or three years. I have not met him often.
18206. Did you know that he was making the plans for the Monier design? No.
18207. Did he not tell you who was making the plans for it? No. I knew that he was interested in it. If any one was making the plans I thought that either he or Mr. Gummow would be doing so.
18208. How long before you obtained Contract 77 did you know that the Monier design was to be sent in as a duplicate tender? I could not say.
18209. Did you know for any length of time beforehand? I could not say.
18210. But you did know before? I think so; but I knew very little about the matter.
- 18211.

18211. Did you anticipate that you were going to get the job on the Monier system? No; I had no idea of it. G. Forrest.  
18 Sept., 1896.
18212. Did you ever discuss the matter with Mr. Carter or Mr. Gummow? No.
18213. What contract were you on before you went to Contract 77? On 69.
18214. When 69 was completed you went straight across to 77? Two or three months afterwards. I was at Marrickville after the job was practically finished. I went to 77 a little after the new year.
18215. If Contract 69 had not been in existence you would have been supervising 77 all the same? I would have been assisting.
18216. Do you look upon the Monier system as a stable structure—as a structure without very much risk? Yes; I always thought a good deal of it, and I have had a little experience in building.
18217. Is it a difficult system to build? No.
18218. Is there any risk in it at all? I do not think there is any with careful work.
18219. Can ordinary workmen build it? Of course it takes a little time to get into it. They must be careful in construction, of course.
18220. What proportions of concrete were you mixing for the carrier? Ten, six, and one.
18221. Did you mix it yourself, or leave it to the men? I did not mix it.
18222. Did you sift the sand from the sandstone before you mixed up the concrete? Yes.
18223. It was sifted through what sort of sieve? A three-sixteenth sieve.
18224. Particles of half an inch could not go through? No.
18225. Was it always sieved? Yes.
18226. *His Honor.*] What do you mean by 10, 6, and 1? Ten of metal, six of sand, and one cask of cement.
18227. *Mr. Gummow.*] As to Contract 69;—did you sign the contract plan? No.
18228. As far as the Government were concerned you were not a partner in the case of 69? No.
18229. *His Honor.*] But as far as the drawing of profits were concerned you would come in then I suppose? Yes.
18230. *Mr. Gummow.*] Have you ever drawn any profits? Not yet.
18231. As to Contract 77; you went there early in the year;—why did you happen to go there;—was there any other partner there before you went? Mr. Snodgrass.
18232. You took his place? Actually I did.
18233. Do you remember whether you were a partner with Carter & Co., as far as the Government were concerned, in Contract 79 at North Shore? I could not say; I do not think so.
18234. You used to get your share of the profits, if there were any, and stand your risk? Yes.
18235. You left the whole matter to Mr. Carter? Yes.
18236. As to these Monier arches;—when you first commenced upon the work you did not know anything in particular about their construction? No; I took my instructions from you entirely.
18237. Did I come there and see each arch built for months from the very beginning? Yes.
18238. And Mr. Baltzer used to come too? Yes.
18239. *Mr. Parkes.*] The Bank-books show that you drew £43 a month salary as regularly as clock-work? Yes.
18240. There is an amount of £100 paid to Mr. Forrest and £583 to Mr. Carter;—what would those sums be;—would they not be out of profit;—the date is June, 1895? No.
18241. What would they be for? I might have borrowed the sum in my own case, but I do not know.
18242. And you would borrow it from the firm? I might.
18243. There are irregular items running through the firm's Bank-book of the same character;—would they be borrowings from the firm;—for instance, there is an item of £150 in the name of Mr. Carter;—what would that be? I have no idea.
18244. Was not a certain amount placed into your banking account in order to make up the amount put into your declaration;—was it not taken out of Carter & Co.'s account and put to the credit of your account? It was not.
18245. Did you not, at about that time, receive a sum of £350? No.
18246. Did you repay to the firm of Carter & Co. any sum of money;—did you transfer from your private account to the business account any sum of money? No.
18247. At no time? Not that I can remember.
18248. Upon April 11th, there is an amount of £50 in your name;—would not that be your profits as a partner? It might be two months' screw.
18249. You drew your screw just before that? Then I do not know what it would be.
18250. *Mr. Carter.*] What about petty cash? It might be that. I did not think of that.
18251. *Mr. Parkes.*] That, you think, would account for it? Yes.
18252. The irregular sums paid to you would be all for petty cash, you think? All in 1894 and 1895.
18253. All for petty cash? Yes.
18254. Even the amount of £100 would be for petty cash? I expect it was.
18255. *Mr. Gummow.*] What did you pay out of petty cash? I have paid as much as £30 a week to the Railway Department as freight for sand. Then there are all the timber accounts.
18256. These accounts had to be paid in cash? Yes. I paid nothing by cheque.
18257. Did the firm owe you anything;—did they borrow any money off you during the last six months? Yes. £250.
18258. Have you anything to show for it? Not a line. I have to trust you with much more than that.

MONDAY, 21 SEPTEMBER, 1896.

James Flood sworn and examined:—

18259. *Mr. Gummow.*] What are you? A carter at the present time.
18260. What were you before you started carting? I was contracting.
18261. Did you ever carry out any storm-water sewer work? Yes.
18262. I suppose you know what stone is required by the department for storm-water sewers? It must be the very best.
18263. Did you ever cart any stone from Annandale for Carter, Gummow, & Co.? Yes.
18264. Where did you get the stone? From Hayes' quarry, at Leichhardt. J. Flood.  
21 Sept., 1896.  
18265.

- J. Flood.  
21 Sept., 1896.
18265. Did you ever get any for them from Ferris' quarry? No; I do not know where that is.
18266. Did you come to us and offer to supply the stone? Yes; I went to Mr. Snodgrass.
18267. What did he tell you? He told me that he had partly let the stone, but that as he had known me so long, and as I was out of work, he would give me a show to cart it. He asked me where I could get it, and I told him. He then said I must get a sample.
18268. At what price did you offer to get it? I think it was 2s. 8d. He said I would have to get a sample and take it to the inspector. I got a sample, and he said it was very good stone, but he wanted some more of it. I brought some more, and I had then to wait a week while the stone went through the test.
18269. Did it pass? Yes.
18270. And did you supply similar stone to that? I did.
18271. About how much do you think you supplied? About 1,200 or 1,500 yards, as nearly as I can remember now.
18272. Did you ever cart the stone for any other Government sewerage contract? Yes; I carted for Phillips and Rhodes, and Holloway Brothers, also for John Ahearne, at Arncliffe.
18273. Was it similar stone? In the case of Phillips and Rhodes' contract at Petersham the stone came from the same quarry.
18274. Are you sure that all the stone with which you supplied us was of the best quality, and that it was equal to sample? Yes; it was the best bottom block. The Petersham and Leichhardt Council take the red stone from the top. They prefer it to the hard close-grained stone at the bottom. The quarrymen get rid of that all the year round to the Councils, and they then have the best bottom block stone left for sewerage contracts and other work of the kind. The department would not take the top block stone.
18275. Do you consider that the Government inspector was exact in seeing that the best stone was brought to the contract? They were very particular. If there were two or three red stones in your cart the inspector would not allow you to leave it. When you tipped it out of the cart he would make you put the red stones back again, and if the same carter brought any more he would be knocked off the job.
18276. How many loads a day could you bring? About ten.
18277. Do you know where Ryan's quarry is? No.
18278. Do you consider from your knowledge of contracts for the same class of work that the stone with which you supplied us was quite equal to any stone you have supplied to other contracts? I do not think better stone could be used than that which comes out of Hayes' quarry.
18279. Have you ever seen any of Ryan's stone? No.
18280. *Mr. Davis.*] You carried out a large storm-water sewer contract at Croydon among other works you have done? Yes.
18281. Do you consider, taking the stone used at Johnstone's Creek through and through, that it was quite equal to that which you used at Croydon? Yes, I do.
18282. The stone that you used at Croydon came from Canterbury? Yes.
18283. And the stone you carted to Johnstone's Creek was quite equal in quality to that? Yes.
18284. *Mr. Parkes.*] Will you tell His Honor how many contracts you have done under the Water and Sewerage Board—could you recollect them? I had a contract at Redfern, Waterloo, and Alexandria. Then I did a small job at the Circular Quay, and another one at the top end of Redfern-street.
18285. Did you do one at Ashfield? That was not under the Water and Sewerage Board.
18286. How many storm-water sewers have you built? I did one for the Railway Commissioners at Gunnedah, and a large one at Croydon.
18287. What was the cost of the largest? The Water and Sewerage Board's sewer was the largest; that was £17,690.
18288. What were those you did under the Works Department? In one case the contract was £12,500, and in another case £7,000.
18289. During the carrying out of these contracts did you ever get an advance upon your material or plant? No; I never asked for it.
18290. Did you ever get your deposit returned to you before the final completion of the job? No.
18291. Did you ever get your retention money returned to you? I could not say that.
18292. Do you recollect ever having had it returned to you? I do not remember.
18293. Did you ever buy cement from Carter, Gummow, & Co.? I have bought cement from Mr. Gummow, but he was not at the time a partner of Mr. Carter.
18294. Did you ever buy any off Mr. Carter? Yes, from Carter & Co.
18295. You paid them by cheque, I suppose? I think so.
18296. If a cheque appears in their pass-books from Flood, or Rutherford and Flood, it will be for cement? Yes, for nothing else, I think. I remember buying some waggons from Mr. Gummow at one time.
18297. But if there were a cheque in your name in the account of Carter & Co., it would probably be for cement? I cannot remember that it would be for anything else.
18298. Do you recollect when you bought cement from Carter & Co.? I think it was when I was on the Ashfield job.
18299. What would be the date of that? About four years ago.
18300. In 1892? Something like that, I suppose.
18301. Have you ever had a certain class of work taken out of your contracts, and other work substituted, or have you ever had your work altered in any way? I do not remember it. I do not think so.
18302. You cannot recollect about the date upon which you obtained the cement to which you have referred? No.
18303. Were there any considerable number of barrels? I could not tell you how much. I got a good bit, I think.
18304. Would it be as much as 500 barrels? It might be. I know that the firm did us a good turn in letting us have it, because we were stuck up for cement at the time.
18305. *His Honor.*] You could not get it in the market? None that had passed the required test.
18306. Carter & Co. had tested cement, I suppose? Yes.
18307. *Mr. Parkes.*] I suppose you would have some record of your cement purchases from Carter & Co.? Yes, they would be all in our books.
18308. Is the occasion to which you have referred the only occasion on which you bought cement from Carter & Co.? I think that was all.
- 18309.

18309. It was for 600 casks, was it not? I could not tell you the number of casks. Whatever the amount of the cheque may be it would be for cement. J. Flood.
18310. And you say that on no occasion did you receive any advance from the department upon your material or plant? No. 21 Sept., 1896.
18311. *His Honor.*] Did you ever get any cement from Carter, Gummow, & Co.? Not from Carter, Gummow, & Co.
18312. You obtained some from Carter & Co.? Yes; and from Gummow and Gillan. We considered they were doing us a good turn at the time. I know that they had not too much cement on their job when they obliged us. They let us have a few casks to keep us going.
18313. *Mr. Gummow.*] It was an obligation as far as we were concerned, not a business transaction? Yes.
18314. *Mr. Parkes.*] But you paid for it? Yes.
18315. You did not return the cement? No.
18316. *Mr. Gummow.*] Did you never return any to Gummow and Gillan? I think we did.
18317. *Mr. Parkes.*] But you did not return any of the 600 casks to Carter & Co.? No.
18318. The cheque for £300 appearing in one of the Bank passbooks would be for the purchase of that cement? Yes.
18319. *Mr. Davis.*] Did you get any extensions of Contract 76? Yes.
18320. How many? 76A and 76B.
18321. Two extensions? Yes.
18322. Can you remember the amount roughly? No.
18323. You got the extensions at your schedule rates? Yes.
18324. And they were considerable extensions? Yes.
18325. Do you remember the iron girders being eliminated from Contract 76? Yes.
18326. You also remember, perhaps, that it was questionable according to the drawing whether those girders should be put in or not? Yes.
18327. You thought that inasmuch as you had ordered them the department ought to meet you in the matter? Yes.
18328. And the department did meet you? Yes, they took the girders off us at what they cost us. It was not altogether clear that we should have to use them.
18329. It was discovered that the girders were to be put in if ordered? Yes.
18330. And you had overlooked that? Yes.
18331. And the department took them off your hands and paid you their cost or thereabouts? Yes.
18332. Did you get any assistance to move the department or the Minister to give you that concession? No, I think I went to you.
18333. You did not go to the Minister? No, not about the girders.
18334. You are sure about that? Yes; I only went to him, I think, in respect of the fines, but I would not be quite certain. It happened a long time ago, and I have never bothered my head about it from then till now.
18335. *His Honor.*] You had not much trouble about it then? No.
18336. You thought the arrangement was a fair thing, and the department did not take advantage of the words in the specification which they might have relied upon? Quite so.

Nicholas Ryan sworn and examined:—

18337. *Mr. Gummow.*] What are you? A quarry-master.
18338. Do you supply stone to different contractors? Yes.
18339. For what purposes is your stone used? We have various sorts. Some is building stone, and some is used for ballast. N. Ryan.
18340. It is used for general building purposes? Yes; and for ballast. 21 Sept., 1896.
18341. Do you remember whether any stone went from your quarry to Carter & Co.'s job at Annandale? Yes; I supplied some there.
18342. Who were the carters? M'Millan and Burcombe.
18343. Was the stone which they took away equal to the stone that had been tested from your quarry;—have you ever had any stone tested by the Sewerage Department? No; it was a very good quality of stone. I have here Professor Warren's tests of it.
18344. Was the stone taken away by M'Millan and Burcombe of similar quality to the stone referred to in that test sheet? Yes. We have four or five different sorts of stone. Some is suitable for building purposes, and some for ballast. The stone used for ballast is a very close-grained, hard stone. It is not suitable for building purposes; it is too hard.
18345. At all events the stone you supplied through M'Millan and Burcombe was equal to the stone which you supplied to other sewerage contractors? Yes.
18346. Do you supply stone from your quarry to other sewerage contractors? We have supplied stone to Rogers and O'Neil, and Johnstone and O'Rourke, and we have supplied it indirectly to other contractors.
18347. Do you know whether the stone carted by M'Millan and Burcombe was equal to the stone supplied to O'Neil and Rogers? As far as I know it was about the same class of stone.
18348. Do you know why M'Millan went to your quarry to get stone instead of going to the local quarries? Because, I suppose, it was better stone. I cannot say for certain.
18349. Did you ever tell O'Neil that the stone which was condemned on his contract was taken to Carter, Gummow, & Co.'s contract? No; I could not have said that, because I know nothing about it.
18350. Was any stone condemned on O'Neil's job taken back to your quarry? No.
18351. If it has been so stated it has been wrongly stated? Yes.
18352. So that Carter, Gummow, & Co. could not have used your condemned stone at half-price? Not in the case of my stone any way. No stone was condemned on O'Neil's job, or, if it was, I was paid for it. I know that I was paid for all the stone that I delivered.
18353. Is this statement correct—"Ryan says emphatically that he sold to Carter and Gummow, with the approval

N. Ryan.  
21 Sept., 1896.

approval of the Government officials, the whole of that stone to an enormous extent which was condemned on O'Neil's Contract 83"? That is false.

18353. Have you ever heard anything about that statement being made in the House? Yes; I read it in the daily press.

18354-5. Did you deny it in any way? I wrote to Mr. Parkes about it in the first place, telling him that it was incorrect. Mr. Parkes then sent to me to come over and see him. I went up to the House, and then I denied the statement.

18356. Did you ask him to give it a denial? I did; but I did not wish to be too hard, and I thought it would all come out at the Commission.

18357. *Mr. Davis.*] What was the exact quality of the stone you supplied to Carter, Gummow, & Co.? I could not tell you.

18358. Was it fine or coarse grained stone? I do not think there can have been any coarse-grained stone which went to them. The coarse-grained stone is used more for kerbing and guttering.

18359. Do you think the quality of the stone would be that given in items 1, 2, and 3, of Professor Warren's test-sheet? Most of it would, in my opinion, stand a test equal to that.

18360. The stone you supplied, in your opinion, would stand a test equal to No. 1 in that list, viz., 7,646 lb. per square inch, or No. 2, 7,365 lb. per square inch, or No. 3, 7,472 lb. per square inch? Of course, we did not test any of the stone we sent to them. The tests from which you are quoting are tests of stone picked out from different parts of the quarry.

18361. Do you know what the sewerage test is per square inch? I could not say.

18362. If it were 6,500 lb. per square inch, then the first three tests which I have quoted would exceed it? Yes; the stone referred to in the test-sheet was tested for building purposes.

18363. *Mr. Parkes.*] You came to me on the day before the Commission first sat, did you not? I think it was on the Thursday evening; the Commission started on the Monday.

18364. When we talked the matter over you told me, did you not, that the contractors had got your stone tested, and had then taken stone from other quarries? Yes; after they had carted stone from me for a while they took it from other quarries.

18365. On your tests? I cannot say that.

18366. It did not all come from your quarry? No.

18367. That is what you told me? Yes; I said that they stopped getting stone from me.

18368. Your quarry is perhaps the best in the city of Sydney? They reckon that it is the best in Sydney.

18369. The stone was used in this building, and also in the construction of the Post Office? I do not know about that; but the stone in the Public Works Office is all from my quarry.

18370. And the same applies to the Lands Office? All the big stone; also the stone which is being used in the Art Gallery now in course of erection.

18371. How many loads of stone did Carter, Gummow, & Co. take from you? I could not say; perhaps 300 or 400—perhaps 500—it might be more. I could not say what the quantity was.

18372. Could you not say from your books? No; we do not book ballast as a rule—we go by ticket. Quarrying ballast is not a paying game.

18373. Did you not tell me that O'Neil and others did the same thing;—that they got your bottom block stone tested, and then got stone from inferior quarries? No; what I said was that they got stone from other quarries, or from carters who go about buying stone and delivering it to contractors. O'Neil & Co. had been getting ballast from various quarries, and it had been condemned. They then came to me and asked me to supply them with ballast. I would not do so until they went to the inspector for his approval. I think I supplied them after that for all their jobs, and none of the stone was condemned as far as I know; at all events, I was paid for all of it.

18374. Did Carter & Co. also draw stone from other quarries? I think they were only drawing it from my quarry at the start. They carted some from me at the start. After a time they got it all from elsewhere—from the local quarries, I think.

18375. That is the statement you made to me? Yes.

18376. Did I not tell you that I would contradict O'Neil's statement to me in the House if you wished it, or that you could come down and give evidence before the Commission, and put the matter right there? Yes; I think I agreed to that, thinking that it would all come out at the Commission. I wanted it published so that the public would see the statement.

18377. I told you that at the time you applied to me? Yes. I understood that you were misinformed, or had been misled in some way by statements which had been made to you.

18378. You do not think that more than 500 loads were taken from your quarry? I could not be sure. Even if I looked it up, I do not think I could come to any definite conclusion. I know that they got more ballast from other quarries than they got from me.

18379. As to your refuse—is it not a common thing for carters to come to the quarry and take away your refuse? Yes. They pay us a small amount and take it away. If we cannot get anything for it we give it to them.

18380. As to refuse which you cannot dispose of otherwise than at a low rate—what rate do you get for for it? Sometimes 6d. and sometimes 1s. We got 1s. 6d. from Carter, Gummow, & Co. in the first place, but the price was afterwards reduced to a shilling.

18381. That rate applies to the stone with which you supplied them? Yes. I think the price is reduced on account of their getting stone handier to their works for less money.

18382. *His Honor.*] How far would your quarry be from the place where the works were going on? I think it would be about  $1\frac{1}{2}$  miles round the road.

18383. *Mr. Gummow.*] With regard to your quarry, you consider it the best round about Sydney? Yes.

18384. That is for building purposes? Yes. I have some stone which will stand a test equal to that which any stone in the Colony will stand.

18385. Is the stone you supply for concrete the same stone which is used for building purposes? No; the waste would go for concrete.

18386. If you were supplying stone for ballast, would you supply your best building stone? Certainly not. We have stone which is not altogether suitable for building, but which is suitable for ballast. It is too small for building, and we use it for ballast.

18387. Have you any idea how long M'Millan and Burcombe were carting from your quarry? M'Millan was not carting there long, but Burcombe was carting for several weeks afterwards. 18388.

18388. Would you be surprised to hear that they carted as many as 3,000 yards from your quarry? They may have done so. I could not say; but I should not think they carted anything like that. It was done by ticket. N. Ryan.  
21 Sept., 1896.
18389. You say you got 1s. 6d. at first, and 1s. afterwards? Yes.
18390. Did you give them inferior stone for the 1s.? No; it was the same quality of stone.
18391. You did not, when you reduced the price by 6d., give them an inferior article? No. The carters said they were getting the stone for less elsewhere, and that they could not draw it from me unless they got it at the same price, or something to that effect. I cannot remember the words.
18392. Burcombe did not draw regularly from your quarry, did he? No. He was drawing regularly, however, for a considerable time.
18393. For how long? It may have been two months or more.
18394. After that, what did he do? I cannot say. During the latter end of the time Burcombe was carting from my quarry M'Millan was drawing from various quarries round about Annandale.

Alexander M'Millan sworn and examined:—

18395. *Mr. Gummow.*] What are you? A carrier and contractor. A. M'Millan.  
21 Sept., 1896.
18396. You have been carting stone for Carter, Gummow, & Co. for some time, have you not? Yes.
18397. You carted a good deal of stone to their works at Johnstone's Creek? Yes.
18398. Where did you get it from? I got some from Ryan's quarry, and some from Meredith and Westbrook's.
18399. Where else? Some from Hayes's quarry.
18400. Anywhere else? Yes; Paling's quarry.
18401. Anywhere else? Yes; I got some from Benson, at Marrickville, and some from Swivel, at Marrickville.
18402. Do you remember a week before the contract for the Johnstone's Creek stormwater channel contract was let driving Mr. Snodgrass and myself round to different quarries? Yes.
18403. Where did we go? We went to Hayes's quarry.
18404. Do you remember telling us at what price we could get stone from there? Yes; 1s. 4d. a yard. We went to two quarries, I think.
18405. Do you remember after Carter, Gummow, & Co. had got the contract what price we were asked for the stone? Yes; one quarry wanted 1s. 11d., and the other 1s. 9d.
18406. What did you say to that? I said you could get Ryan's stone from Pymont for 1s., and that it had passed the test before.
18407. Is that the reason we did not deal with the local quarries in the first instance? Yes; you said it did not matter, and that you would rather give 1s. more than have the firm put to any inconvenience over the stone. You said you would rather give 1s. more and have the best stone.
18408. Did I tell you that we would not be put upon by any ring? You did; you said you would rather give 1s. more for the stone.
18409. And that is the reason why you went to Ryan's quarry instead of dealing with the local quarries? Yes; I also went to Meredith's at the same time to keep the works going.
18410. How far away from the works would Ryan's quarry be? Two miles.
18411. How many loads a day could you do from there? Four.
18412. Have you any idea how much stone you took from Ryan's quarry? We agreed for 2,000 yards in the first place. There was no stone available at the time, and Ryan said he would not undertake to take any stone out unless we would take 2,000 yards.
18413. Did you take 2,000 yards? I believe we took more, but I could not say exactly.
18414. Do you think you took 3,000? More than 3,000 yards, I fancy. The first order was for 3,000 yards.
18415. What were you paying Ryan? 1s. 6d.
18416. Did he charge you 1s. 6d. all through? No. When he was quarrying stone at first there was no other work to do, and he had to put men on to get the ballast out alone. He first charged 1s. 6d., and afterwards 1s.
18417. Did he give you the same class of stone for the 1s.? Yes.
18418. After getting out the building-stone? Yes.
18419. You did not go to Ryan's quarry in the first place because the stone was better;—that was not your idea when it was decided to take it from Ryan's quarry? No.
18420. You told Mr. Snodgrass that you could get the stone for 1s. 4d. at the Leichhardt quarries before the tenders went in? Yes.
18421. And after the tenders went in they wanted 1s. 9d. and 1s. 11d.? Yes.
18422. If they had supplied it for 1s. 4d., would you have gone to Ryan's quarry? No.
18423. It was only on account of their raising their prices that you went to Ryan's quarry? That was all.
18424. What prices did you get from the firm when you were carting from Ryan's quarry? 3s.
18425. Did you get 3s. when you were carting from the other quarries? For a certain portion of the time.
18426. And what did you get afterwards? 2s. 6d.
18427. What was the reason of the 6d. decrease in price? Because I got the stone latterly from Hayes's and Westbrook's quarries at 1s. 6d.
18428. They lowered their prices when they found that you could get the stone for a less price, and that we would not put up with their rise? Yes.
18429. Do you know from hearsay, or general knowledge, that the stone you got was the best stone? Yes, I know it was the best stone.
18430. How do you know that? Mr. Lougheed told me that Meredith and Westbrook's stone was used upon Owen's job at Balmain, and that it was the best stone in the district. He said that if I could get that stone it was all right.
18431. You got a good deal from that quarry? Perhaps 2,000 yards or more.

- A. M'Millan. 18432. Have you ever carted stone for other storm-water channel contracts? Yes; for almost every Government contract which has been let during the last four or five years.
- 21 Sept., 1896. 18433. So that you have a very good idea of what class of stone is required by the Government? I fancy so.
18434. Do you consider that the stone you carted to Carter, Gummow, & Co.'s contract at Johnstone's Creek was better or worse than the stone you had carted to other contracts? I think the stone supplied to that contract was more closely watched than the stone supplied to any other sewerage contract. The inspector would allow nothing inferior to pass. Mr. Millner, the engineer, was there every morning with Mr. Lougheed, and they examined the stone.
18435. Was any stone condemned on that job? Yes.
18436. How much? I think five or six loads. A heap was condemned, but after it was all turned over there happened to be a few small pieces in it. I think there was about five loads out of 150 tons.
18437. Who condemned the stone? Mr. Millner.
18438. What was done with it? It was first taken into a paddock and it was then carted away to make a track in Nelson's Lane, Annandale.
18439. Do you do general carting for our firm? Yes.
18440. Plant, cement, or anything of that kind, I suppose you cart? Yes.
18441. How long have you been employed by the firm of Carter, Gummow & Co.? Five years or more, I think.
18442. During that time have you carted much cement about from one job to another? Yes; thousands of casks, I suppose.
18443. Did you cart any sand to the Johnstone's Creek Contract? Yes, to the Storm-water Sewer Contract.
18444. Did you cart any for the other work there—the arches? I carted it from one part of the work to another—that is from White's Creek to Johnstone's Creek—backwards and forwards.
18445. But did you deliver any sand on to the contract itself? No.
18446. Did you deliver any to the storm-water channel contract at Johnstone's Creek? Yes.
18447. Do you cart by day-work, piece-work, or both? Both.
18448. *Mr. Davis.*] You know the quality of the stone which you got from Ryan's quarry? Yes.
18449. Do you consider it good? It is the best stone I have seen for a long time.
18450. Was the other stone which you carted on to Carter, Gummow, & Co.'s works at Johnstone's Creek equal to it, or was it inferior in quality? I believe that Meredith and Westbrook's stone stands a better test.
18451. What have you to say as to the stone from the other quarries from which you carted in comparison with Ryan's stone? The Marrickville quarries are all good. It is all tested stone. The stone was only taken from there to keep the job going. Hayes's stone is a good class of stone; it has been used in the sewerage contracts.
18452. Speaking of all the quarries in relation to Ryan's, would you say that the stone from those quarries comes up to Ryan's stone in quality? Yes.
18453. You are quite positive about that? Yes; not as a cutting stone, perhaps.
18454. Not as a dimension stone, but for knapping or cracking perhaps it would stand a better test? Yes.
18455. *Mr. Parkes.*] Do you keep any books? Yes.
18456. Have you your books with you? No.
18457. You have in your books records of the business transactions to which you have referred? No.
18458. How is that? Well, that is my business, I suppose.
18459. Have you not kept a record of the money you have received and the money you have paid out in your business? No.
18460. I thought you said you kept books? In a manner of speaking.
18461. *His Honor.*] What books have you kept? A time book. All the men are paid for the time they are working.
18462. *Mr. Parkes.*] Have you kept a book showing the moneys you have received? No; I have no partners. I am alone in the business.
18463. Have you a bank book? No.
18464. *His Honor.*] Do you not keep a banking account? No.
18465. *Mr. Parkes.*] How did Carter & Co. pay you—by cheque or by cash? I think I have received a cheque once or twice from Carter, Gummow, & Co.; but that is all.
18466. What did you do with the cheques? I went to the Bank of New Zealand and got them cashed.
18467. You did not pay them into any banking account? No; I got them cashed, and paid the men with the proceeds.
18468. *His Honor.*] Do you pay your men once a week? Yes; I paid the men at the same time that Carter, Gummow, & Co. paid me.
18469. The money would come into your hands and go out again, with the exception of a portion which you used for yourself? Yes.
18470. *Mr. Parkes.*] I suppose you gave Carter, Gummow, & Co. a receipt for the money? I never gave Carter, Gummow, & Co. a receipt for any money.
18471. You have never done so? No.
18472. How were you paid? I am paid for the time kept by the drays.
18473. How often? Every fortnight.
18474. Were you never paid otherwise than by the fortnight? If there were anything the matter with the account on any particular Saturday, it might go over until the following Saturday. In some cases it may have gone over for a month.
18475. In those cases, did you give Carter, Gummow, & Co. a receipt for the money? I have given them no receipt for anything.
18476. From whose quarry did you take the 150 yards of condemned stone? I took some of it from Hayes' quarry, some from Meredith and Westbrook's, and some from Ryan's."
18477. *His Honor.*] You say that the whole heap was condemned, and that it was then turned over? Yes.

18478. And that a part of it was finally condemned, and a part of it passed? Yes. The stone was all stacked, to be measured up for the work. When Mr. Millner came along he saw that there were a few bad stones, and he said, "Mac, I will not have that." I said, "I cannot help it. There has been a mistake somewhere. We cannot always be perfect." He said, "Well, I will not have it. It must all be turned over." It was all turned over and inspected, and whatever bad stone there was was put aside. The balance was re-stacked, measured, and passed.
18479. Do you remember how much stone was finally rejected? About five or six loads.
18480. *Mr. Parkes.*] Why was that stone condemned? Because it was not strong enough, I suppose.
18481. Was it soft or hard stone? It was soft, I suppose, or it would not have been condemned.
18482. You say you got the 150 tons from different quarries? Yes. This was a large job. It required about 100 loads of ballast a day, and one quarry could not keep it going. The particular stone to which you referred was brought in by the drays and stacked. It might have come from one quarry or another. I do not know where the few pieces of condemned stone came from.
18483. Were they all passed quarries? Yes.
18484. Will you say from which contracts you drew the cement, and to which contracts you took it? Most of my work was day-work, and when my drays were engaged in that way I sometimes would not know what they were doing. For instance, they would be told to go to North Shore or Marrickville, but what they would be doing I could not always say. I know that some cement was carted from Munni-street to North Shore.
18485. Did you cart it? I did not cart it all. I carted a portion of it.
18486. Can you say when you carted it? I suppose about four years ago.
18487. At what period of the job? I think it was at the start of the job at North Shore.
18488. And at about what part of the Munni-street job? When it was finished, I expect.
18489. How did you take it—by punt? Yes.
18490. How many loads did you take? I could not say; it was day-work. Carter, Gummow, & Co. paid the punt and everything in connection with it.
18491. Do you know where it was delivered at North Sydney? I could not say for a certainty. I was too busy on this side to go over myself.
18492. Are you sure whether it was carted when the Munni-street job was finished, or when it was stopped? I think it was taken from the second portion of the job, but I am not quite certain.
18493. Do you remember what brand of cement it was? No; I do not remember anything about that.
18494. Have you ever carted any cement from Munni-street back to Parbury, Henty, & Co.'s? I have never carried any cement back to Parbury, Henty, & Co.'s. I have carted from their place, but never to it.
18495. You could not recollect how much you did cart, could you? No, I could not.
18496. And you could not tell to what places they took it? No; I know it went to the North Shore job.
18497. You do not know where it was deposited? No. There were three or four different places at which to put it. It was all passed cement, and it was branded.
18498. *His Honor.*] As to the time, do you remember whether it was summer or winter when you carted that cement from the Munni-street job? I think it was in the spring, but I could not say definitely.
18499. *Mr. Gummow.*] How many carts had you in your employ about four or five years ago? About twenty-five.
18500. You did not do all the carting yourself? No.
18501. You did not do it personally? No.
18502. You had a number of horses and carts, and you employed men to do the work? Yes.
18503. Carter, Gummow, & Co. took some of the carts on day-work, did they not? Yes.
18504. And they ordered them where it suited them? Yes.
18505. They did not inform you where the drays were going? No.
18506. They paid you for whatever time the drays were at work? Yes.
18507. So that you could not tell where the drays were employed? No.
18508. Except that you knew that they might be in one suburb or another, you would not know what they were doing? No; not unless the men would tell me on the night before that they had to go to North Shore, for instance.
18509. Even then you would not know to what part of North Shore they were going? No.
18510. You merely kept a record to see what number of hours the drays worked a day? Yes.
18511. You received most of your money from Carter, Gummow, & Co. in cash? Yes; I may have been paid by cheque a couple of times, but that would be all.
18512. You never gave Carter, Gummow, & Co. receipts? No, never.
18513. *Mr. Davis.*] Do you remember the work at Munni-street being suspended? Yes.
18514. When you carted away the cement, was it before or after the suspension? Some was carted away immediately after the work was stopped. I know that the shed at the top of the hill was full. I think some cement was carted away both before and after the suspension.
18515. But the cement you have spoken of—was it carted away before or after? I fancy it was after.
18516. *His Honor.*] Not during the suspension? No, after.
18517. *Mr. Davis.*] You remember that the work was continued from above Mitchell's Road to the foot of Macdonald-street, and that it was then stopped for five or six months? Yes.
18518. Was the cement you carted away after that stoppage? Yes.
18519. *His Honor.*] You mean after the final completion of the whole thing? Yes.
18520. *Mr. Gummow.*] Did you cart any sandstone for the Shea's Creek contract? Yes.
18521. Did you cart any bricks? No.
18522. What I refer to would be clinker bricks, that is bricks which would be used for concrete;—did you cart any of those? No.
18523. The cement-sheds out at Shea's Creek were good large sheds? Yes.
18524. What do you think one of those big sheds would hold? About 5,000 or 6,000 casks—perhaps more. They were very large sheds.

Peter Hart sworn and examined:—

- P. Hart. 18525. *Mr. Gummow.*] What are you? A plumber and gas-fitter.  
 21 Sept., 1896. 18526. Have you ever done any work for Carter, Gummow, & Co.? Yes.  
 18527. Where? Being a local plumber, I have been called on to make necessary repairs to services which may have been broken during the progress of work.  
 18528. Had you a man named George Dawson living with you? Yes.  
 18529. Did you know that he was working for Carter, Gummow, & Co. at that time? Yes.  
 18530. Did you ever hear him speak about the firm? Yes.  
 18531. Will you tell His Honor whether you at any time heard him say anything against the firm, and what you heard him say? He made the assertion at my table that, if, after he had finished at North Shore, the company did not find him employment, he would make it damned "salt" for them; that he would make them sit up. Those were the words he used at my table. It was just after he had come from work, when we were having dinner.  
 18532. Was he living with you? Yes.  
 18533. Where? In Silver-street, Marrickville.  
 18534. Do you know what he referred to in any way;—had you any idea at the time? No; I did not come to any conclusion as to that, but I advised him at the time to be very careful what he did. I told him that he was likely to injure more than himself. He and I had some hot words about it. I thought his talking like that at my table was out of place.  
 18535. Was anyone else besides yourself present? Yes; a man named Charles King and my wife.  
 18536. Did Dawson speak like that on more than one occasion? Repeatedly, and it was always after he had come back from his work—in fact, he was always grumbling about his work after dinner was over.  
 18537. When was this;—can you give us any idea of the date? It must have been at the latter end of September, 1895.  
 18538. Could you give us any idea as to whether Dawson had done anything wrong, or whether he intended to do anything wrong;—how did you take it? I took it that he had some catch laid out to give him a hold on the Company.  
 18539. *His Honor.*] Did you gather what was the reason of his ill-feeling against the Company? No; he and I had some rather hot arguments about it. I told him to be very careful what he was doing. I told him it was not in place for him to take the bread and butter out of his own mouth. I said, "You are earning a livelihood through the Company, and you should keep your mouth shut."  
 18540. When did he first seem to speak in this way—to show any feeling against the Company? All through September. He told me he was idle for about a fortnight; he told me it was through the want of bricks.  
 18541. When he went off at the beginning of the fortnight was he supposed to be dismissed altogether, or was he to be taken on again;—did he know then that he was only off for a time? He was only off for a time, I understood, through the want of bricks to go on with the work.  
 18542. He knew that he was going on? Yes; he was not dismissed.  
 18543. Was it after or before that occurred that he first began to talk in this way? It was after that.  
 18544. Did it seem to rankle in his mind that he had lost a fortnight's pay? I could not say whether he had lost a fortnight's pay or not.  
 18545. He was paid so much a day, I suppose, was he not? Yes.  
 18546. And he did not get paid for that fortnight? That I could not be certain of.  
 18547. At any rate, his suspension seemed to start him grumbling? He was always grumbling more or less about the style of work he had to do.  
 18548. How long before that had he been lodging at your place? About six months before that.  
 18549. And during those five or six months had he shown any signs of grumbling about his work? Yes, he had always a good deal to say about his work.  
 18550. What sort of remarks did he make about his work during that time? He spoke about the dirty, wet, nature of the work.  
 18551. About the kind of work he had to do, you mean? Yes.  
 18552. But during that time did he grumble about the bad way in which the work was done—did he make any comment upon that, or was it merely about the difficult work he had to do? It was about the difficulty of the work. He never gave me a hint about anything else.  
 18553. And when this fortnight's loss of work took place he began to make these threats as to what he could do? Yes.  
 18554. He was taken on to the work again? Yes; and he continued talking about the completion of the job at North Shore.  
 18555. He was then working at North Shore, you say? Yes.  
 18556. How long did he stay with you after that fortnight? Up till Christmas Eve. He left my place at Christmas Eve to get married.  
 18557. Then he was in a better temper, I suppose? He ought to have been.  
 18558. But was he? Very far from it.  
 18559. Was he as cranky as ever up to the last? Yes.  
 18560. Did he pay you for his board and lodging, or did he leave you in debt? He left me in debt.  
 18561. How much did he owe you? At the time he left my house he owed me £2 11s.  
 18562. Has he ever paid you since? He sent me on the 16th and 30th of March two postal notes for 2s. 6d. each.  
 18563. Is that all you have got out of him? Yes; he is now indebted to me to the extent of £2 6s. I think his postal notes are still at home.  
 18564. Did he go on talking about more bad work after that fortnight—did he say anything about putting in more bad work? He never referred to any bad work.  
 18565. He only said that he could make the Company sit up—that he could make it "salt" for them; he did not say why? No.  
 18566. He never said, then, how it was or in what way he could make them sit up? No; since he has given evidence here, and after reading the reports of the proceedings in the *Sydney Morning Herald*, I can see pretty well what it was.

18567. You did not know until you saw it in the newspaper what he meant? No.  
 18568. He never gave you any hint of it? No.  
 18569. You did not ask him? No; I only cautioned him. He was not too well pleased with me for taking the liberty of cautioning him. He was talking very high over it.  
 18570. Was any allusion made in conversation to anything he had read in the newspapers about what was taking place in the Legislative Assembly? He mentioned it once. I remember he said he would go and see Mr. Varney Parkes.  
 18571. What did you say to that? I thought he was talking rather loud, and I did not pay any attention to him. I did not open up any conversation about the matter. He said he did not intend to be always working in the sewers, and that he might get a Government billet through it.  
 18572. You mean through telling something? Yes.

P. Hart]  
 21 Sept., 1896.

Charles King sworn and examined:—

18573. *Mr. Gummow.*] What are you? A labourer.  
 18574. Where are you working now? At North Shore.  
 18575. For whom are you working? For Carter, Gummow, & Co.  
 18576. Did you ever board with Mr. Hart, at Marrickville? Yes.  
 18577. Was Dawson boarding there? Yes.  
 18578. Did you have your meals together? Yes.  
 18579. Did you ever hear Dawson refer to the firm of Carter, Gummow, & Co. in an unkind way? Yes.  
 18580. Will you state what he said? He said that if the company did not find him employment when he had finished at North Shore he would make it damned "soft" for them.  
 18581. Did you know what he meant? No, I did not. All that I know is that he was working for Carter, Gummow, & Co. at the time, and that those were the words he used at the table one night.  
 18582. When was that? About the latter end of this month twelve months ago, as nearly as I can remember.  
 18583. *His Honor.*] You did not ask him what he meant at any time? No.  
 18584. Where were you working at the time? At Marrickville.  
 18585. And Dawson was working for the company at North Shore? Yes.  
 18586. Did it not interest you to find out what he was talking about? No.  
 18587. What sort of temper was he in at the time? It was at the table when he said it. He had been out of work for a while at the time. I did not ask him any questions about it.  
 18588. But there must have been something which set him off talking in that way, was there not? I do not know.  
 18589. Did you hear him say anything like that again, or was that the only time you heard him say it? That was the only time I can be sure of. He said it at the table.  
 18590. How long did you stay at Hart's after that occasion? Up to Christmas.  
 18591. Up to the time that Dawson left? Yes.  
 18592. You say you cannot be sure of any other occasion when he said anything like that? No.  
 18593. Have you any sort of recollection of his saying anything like it again? No.  
 18594. You are sure that that was the only time you heard him say it? Yes.  
 18595. *Mr. Parkes.*] What do you generally work at;—what is the nature of your labour? Anything I am sent to. I am filling trucks now.  
 18596. Did you ever work at mixing concrete? I have turned it over, and I have helped to put it in.  
 18597. Where were you working last? At North Shore.  
 18598. That would be up to the present time? Yes.  
 18599. Did Carter, Gummow, & Co. ask you to give evidence to-day? No.  
 18600. Did you offer to come and give evidence? Yes.  
 18601. *His Honor.*] To whom did you make the offer? I made the statement when a man came to Hart's and asked Hart if anybody else was at the table when Dawson said the thing I have told you of.  
 18602. Hart had told someone of it first? Yes.  
 18603. *Mr. Parkes.*] When did you leave Hart's? About six weeks after Christmas, as nearly as I can remember.  
 18604. In what month was it that Dawson made this statement? This time twelve months ago, as nearly as I can remember.  
 18605. In September of last year? Yes.  
 18606. Where have you mixed concrete? I only helped others to mix it. That was on the Marrickville job.  
 18607. Do you recollect what the proportions were? No, I do not. I had nothing to do with that. I had only just to mix it after it was gauged. I was on the board turning it over.  
 18608. That is all you had to do with it? Yes.  
 18609. Were you working on Contract 77? No.  
 18610. Were you working on the Johnstone's Creek storm-water channel? No.  
 18611. How long have you been working for Carter, Gummow, & Co.? On and off, for five or six years.  
 18612. *Mr. Gummow.*] Did you ever work at Bondi? No.  
 18613. Somebody, you say, called, and saw Mr. Hart;—do you know whether the person to whom you refer was sent to him by Carter, Gummow, & Co.? No.  
 18614. Had he anything to do with Carter, Gummow, & Co.? I do not think so.  
 18615. What was the man's name? I do not know. Hart told me that someone had been there, and that he had told him that I was present, and had heard Dawson make the remark. He asked me if I would sign my name to a paper, stating that I had heard it.  
 18616. Was he a solicitor? I do not know.  
 18617. *His Honor.*] You did not see the man? No.

C. King,  
 21 Sept., 1896.

## Sydney Booth sworn and examined:—

- S. Booth.  
21 Sept., 1896.
18618. *Mr. Gummow.*] What are you? A carter.  
18619. Do you cart for Carter, Gummow, and Co.? Yes.  
18620. What do you usually cart? Anything on the job. Cement, sand, or whatever may be required.  
18621. Is your work day-work? Day-work and piece-work both.  
18622. Did you ever see a man named Dawson on the work at North Shore? Yes.  
18623. Did you ever speak to him? I have had plenty of conversations with him.  
18624. Did he ever say anything against the firm? Yes; he said he would put the company away if they did not give him work at Annandale when he had finished at North Shore.  
18625. When did he say this? Some time when the job was finishing down at Milson's Point.  
18626. This was last year? About the end of last year.  
18627. Did you hear him say that more than once? Yes; on two or three occasions I have heard him say that.  
18628. Did he say that he intended to put the company away if they did not find him work? Yes.  
18629. Did you ever cart any sand from North Shore to Annandale? Yes.  
18630. How much? About 1,700 yards.  
18631. Where did you cart it from? From the Gas Works at North Shore.  
18632. From anywhere else? No.  
18633. *Mr. Parkes.*] You carted sand to North Shore from Mossman's Bay, did you not? No.  
18634. Was there any cartage from Mossman's Bay to Carter, Gummow, and Co.'s job at North Shore? There was sand carted, but I carted none.  
18635. Who carted it? There were different carters.  
18636. Was any carted by Burcombe? Yes; he carted some.  
18637. A great quantity was carted from there, was it not? I cannot say what quantity. I was on day-work at the time.  
18638. Did not the Mossman's Bay Council kick up a row about the cutting up of their streets by this carting? I could not say.  
18639. Burcombe, you say, carted a lot of sand from that place? Yes, and Webb.  
18640. Did you cart any cement from the Munni-street contract to North Sydney? No; not from Shea's Creek. I carted it from different jobs backwards and forwards—that is, from one job to another. I carted some from North Shore to Marrickville, and from Marrickville back to the Shore—also to Annandale from the Shore.  
18641. Did you cart any cement from the Annandale to the Marrickville job? No.  
18642. But you carted some from the North Shore job to Marrickville? Yes.  
18643. At different periods? Yes.  
18644. Did you ever do any carting for Parbury, Henty, & Co.? No.  
18645. How much would you take to the load—twelve barrels? I only took five at a load. I had a single horse.  
18646. Did you ever cart any cement to other contracts? No.  
18647. You only carted it between Marrickville, North Shore, and Annandale? Yes, and also in connection with the Milson's Point job.  
18648. How much did you cart? I could not say.  
18649. The Milson's Point job would be 79A? Yes.  
18650. You only carted it in connection with these particular contracts? That is all.  
18651. *His Honor.*] What was the sand carted from Mossman's Bay;—was it sand obtained on the spot, was it sand landed there, or what was it? I could not say. I think it was beach sand. I fancy it was.  
18652. *Mr. Davis.*] Was it not Balmoral Beach that the sand was carted from? Yes.  
18653. *Mr. Parkes.*] Was the sand not carted from Mossman's Bay itself? Not that I know of.  
18654. Did they not come down past the Rangers on to Mossman's Bay and take the sand away? I do not know. I never carted sand from there.  
18655. *His Honor.*] When you spoke of Mossman's Bay in reply to Mr. Parkes, you meant Balmoral? Yes. It is all under the one Council.  
18656. The sand was taken from the beach? Yes; as far as I know.

## John Carter re-called and further examined:—

- J. Carter.  
21 Sept., 1896.
18657. *Mr. Parkes.*] Was not sand carted from Mossman's Bay Beach to Contract 79? No, it was carted from Balmoral. There is no beach at Mossman's Bay. I do not think there is any sand there.  
18658. Did you not have a dispute with the Municipal Council of Mossman's Bay? Yes; I agreed with the Mossman's Bay Council to cart as much sand as I wished from Balmoral Beach, and to give them a certain number of yards of ballast in exchange. While the carting was going on the roads were being cut up—the Balmoral Beach road was especially cut up by the heavy traffic of our four-horse drays, and one or two of the residents complained. They also complained of the destruction of the foreshores by our digging of the sand out of the beach. After some correspondence and some personal interviews with the Mossman's Bay Council, we ceased carting from there. That is the history of that transaction as far as I can remember it.  
18659. *His Honor.*] What was the sand for? For concrete. We were working under the old specification under which we were allowed to use the Bourke-street drift sand.  
18660. Would not the sand you took from Balmoral contain sea salt? That is no detriment to underground work.  
18661. Not to concrete work? No.  
18662. But you would not be allowed to use it for mortar in buildings? No. There is always a certain amount of sweating in the sewer itself. I presume therefore that the department did not on that account object to the use of the sand.  
18663. The Balmoral Beach sand would be good sharp sand, I suppose? Yes; better sand than Bourke-street sand, and Bourke-street sand was provided for in our specification.  
18664. *Mr. Gummow.*] You had not to use Nepean sand? No.

18665. The sand was not specified to be equal to Nepean sand at that time? No. There was nothing in the old specification on that subject.

18666. With regard to Contract 69, do you know what the specification of that contract said in regard to sand;—was it the same as the specification for Contract 79? No; it was a new specification. It referred to Nepean or good quartz sand—I forget the exact words—equal to Nepean sand.

18667. Did you use any Nepean sand upon Contract 69? We started with Nepean sand.

18668. Whom were you getting it from? From the Emu Gravel Company.

18669. From any one else? We got some from Mr. T. R. Smith, brother of the present Secretary for Mines. There was jealousy or something of that sort on the part of the Emu Gravel Company, so far as Mr. T. R. Smith's sand was concerned, and the company wired down to the office stating that we were using inferior sand obtained from Mr. Smith. Not to put it too mildly, the company got their back up about it. I decided that we would not use any of the Nepean sand. We then bought a crusher and started crushing at once on our own account.

18670. Did you try to get the sand somewhere else in the first instance? Yes.

18671. Do you know from hearsay whether the Emu Gravel Company bought out Mr. T. R. Smith? I believe they did afterwards.

18672. Thereby creating a monopoly in Nepean sand? Yes.

18673. Did you go down the Illawarra line looking for sand? Yes; I went down to Shellharbour, and we spent a lot of time and money over it. One or two trial trucks were sent up, and it was scarcely good enough. It was a little bit dirty.

18674. What did you do then? We purchased a crusher and set to work on our own account.

18675. To crush sandstone? Yes.

18676. And the sand that you crushed from the crusher passed the test? Yes; it passed a good test, and we used no more Nepean sand.

18677. When you completed Contract 69 you removed the crusher to Contract 118? Yes.

18678. And you crushed stone there? Yes.

18679. And the sand from that stone passed the test? Yes; it all passed the test. The sand was used in the stormwater sewer.

18680. Was any used on Contract 77, do you know? No. The sand which we crushed was used upon contract 118.

18681. In regard to Contract 118, do you know anything about the top-cutting of that drain? Yes; I know the circumstances that brought it about. It was pointed out to me by Mr. Snodgrass that we were suffering a very great hardship from having the Harbour and Rivers Department pumping up sand and mud all over the site of our works. He advised me to go and see the proper authorities about it. We were entitled to a low-water mark, as well as to a high-water mark. I saw Mr. Davis and also Mr. Hickson in the matter. It was rather an urgent one, and they went out and inspected the site, and took immediate action. The result was the cutting of the drain. We bore a portion of the cost in order to expedite matters. We undertook to put in the necessary flood-gates. We had the necessary plant there; and the department had none. We therefore put in the flood-gate at the outlet of the temporary drain at our own expense.

18682. *His Honor.*] You mean close to the retaining wall? Yes; near the little Rozelle Bay wharf.

18683. *Mr. Gummow.*] Have you noticed that drain lately? Yes; I was there the other day.

18684. Is it in use now? Yes.

18685. Is it necessary now for Carter, Gummow, & Co.'s contract? No.

18686. It is simply used by the Government themselves? Yes; to carry off the reclamation water—to carry off the water which comes down the old channel, and also the new channel at Johnstone's Creek. I see they have punched a hole through the storm-water drain, and have diverted it into the temporary channel.

18687. Do you know anything about the ballast which was brought on to Contract 118;—did you take particular notice of it? I took an interest in it at first, while the dispute with the neighbouring quarries was going on.

18688. Did you know at the time why McMillan carted from Ryan's quarry;—had you anything to do with the question at that time? Yes, I had.

18689. Why did he go to Ryan's quarry? Because of the ring formed by the local quarrymen. It was somewhat on a par with that business of the Emu Gravel Company. We determined we would not be imposed upon. I was quite prepared myself to pay even two shillings more, getting the sand from North Shore, than to deal with these people.

18690. In other words, you would not be put upon by them? No. They quoted to us a certain price before we tendered, and they afterwards raised it.

18691. As to Contract 53, the Waverley contract, you were one of the contractors for that job? Yes.

18692. Do you remember going to Double Bay Valley and seeing the concrete arches which were built there by your firm? Yes; I was there on many occasions in those days. I used to visit the works more frequently than I do now, and I saw these arches in course of construction. I also saw the culvert being built. I knew when I heard Mr. Bagge endeavouring to locate the spot where the supposed damage had occurred upon this work that he was referring to the culvert. It was the culvert which was injured, not the arches. The collapse or partial collapse of the culvert was due to the faulty foundation of one end of it. It was replaced by us at the department's expense.

18693. As to Contract 72—do you remember the stoppage of the work at Macdonald-street? Yes, at the foot of Macdonald-street.

18694. You put in a claim in connection with that contract? Yes.

18695. Did you make out the claim? No. I gave Mr. B. C. Simpson the particulars, and upon them he based the claim.

18696. You yourself did not make up the claim at all? No.

18697. You left it all to Mr. Simpson? I left it entirely to Mr. Simpson. He is a consulting engineer and an arbitrator. In the circumstances I naturally went to a man of well-known standing and ability.

18698. Do you know whether there was much cement on the ground when the work was stopped? Yes; I know that the sheds were what we call running over with cement.

18699. Do you know if any cement was carted from that contract on to other contracts? Yes; it was carted here and there. Some went to North Shore.

18700.

- J. Carter. 18700. As to Contract 65 at the Glebe, you took it over from some other firm of contractors? Yes. We took it over from Cowdery and McLean. They had a badly arranged schedule.
- 21 Sept., 1896. 18701. What do you mean by that? They started to lose money from the jump. They had had very little experience in sewerage work.
18702. And you took the contract over from them? Yes.
18703. Did you make it pay? No; we lost money.
18704. Do you know anything about the making up of schedules? Very little; that is not my part of the business.
18705. As to Contract 77;—do you remember when you first saw the plans of the Monier design? No, I do not; I saw them before the tenders went in. I saw them on several occasions. I could not say when I first saw them.
18706. Did you go to Mr. Hickson before you put in your tender for that contract and ask him to look into the matter, and to give you the contract? No.
18707. Did you go to the Minister? Yes; I went to Mr. Young, and I told him that we proposed putting in a separate tender, and I asked him if it would be allowed. His reply was, as far as I remember it, "Put it in and let it take its chance."
18708. What reason had you for going to him? Because we did not want the plan to be thrown out unconsidered. I had to hand the plan in to someone. It could not go into the tender-box.
18709. To whom did you hand it? To Mr. McLachlan, the chief clerk.
18710. Did you see Mr. Barling? Yes. I asked Mr. Barling what was to be done with it, and he said I had better hand it to Mr. McLachlan.
18711. Were you at Mr. Barling's office before 11 o'clock? Yes.
18712. Did he say you had no business to be there before 11 o'clock? Yes; he treated me to a sort of lecture on the subject, and I explained to him that it was necessary to come before 11 o'clock as tenders were called for at 11. I saw Mr. Barling a little later on and he expressed his regret, if I may so term it, that he had spoken so sharply to me a few days previously. He did not seem to quite understand the circumstances.
18713. So then what really did occur when the plans were put in is strongly rooted in your mind? Quite so.
18714. It was not put in after the other tenders were put in? No; the tender was put into the box accompanying the plan which I handed to Mr. McLachlan a few minutes before 11 o'clock on the day of tendering.
18715. Have you any idea when we got the Monier plan? Yes.
18716. How many days before the tender went in? I think—in fact I know—that we got it on the morning of the day on which the tender did go in.
18717. From Mr. Baltzer? Yes.
18718. He had it ready before that? It was partially ready. It was pencilled out and all the strains and stresses were taken out. I know, however, that we had to rush him to finish it so that it might go in in a presentable form.
18719. You do not think it was ready on the day before the tenders went in? I am sure it was not—not the plan in its present finished state.
18720. Do you remember the firm putting in a tender on the Government design? Yes.
18721. We were the lowest tenderers upon that design? Yes.
18722. Had you any idea of taking up the work if the Department had accepted the tender? There was no alternative, as far as we were concerned. We never make a practice of backing down, in the first place, and in the second place we could have carried out the work without any loss. We should not have made any profit upon it, but there would not have been any loss.
18723. What was your idea of tendering in that way without any prospect of profit on the Government designs? It was simply in order that we might be the lowest tenderers.
18724. But what benefit was it to you to be the lowest tenderers;—where did the profit come in? In using up our plant, and in finding employment for all sorts of odds and ends which were lying about idle.
18725. What was your primary object in putting in a tender at cost price? In order that we might, if possible, be the lowest tenderers.
18726. Did you consider that if you were not the lowest tenderers for the Government design the Government probably would not look at the Monier design? We thought so.
18727. That point was considered? Yes; we determined to be the lowest tenderers, if possible, in each instance.
18728. And if the Department had accepted your tender upon the Government design you would have gone on with the work? Certainly; no alternative ever presented itself to us. We were fully prepared to carry out the work.
18729. You consider that having put in a tender you are morally bound to go on with the work unless some gross error has been made? Yes.
18730. You have always acted in that spirit? Yes.
18731. It is not usual for you to throw up a contract because your tender has been a bit too low;—you always go through with the work? Yes.
18732. You have not made money on some of your contracts? We lost heavily on the Waverley contract and on Contract 65. Some of our contracts have come out pretty near the mark. On others we have made a little profit. Others, again, have returned a fairly good profit.
18733. Did you make any profit on Contract 79, at North Shore? Yes; a good profit.
18734. As to Contract 79, you bought off Bond and Hudson? Yes.
18735. Had you any reason for doing that? I had several reasons; the idea originated with me in the first instance. We were very sore that a firm who had already thrown up a good contract which might have gone to someone else should also have come in on Contract 79.
18736. Did you get the one they first threw up? Yes; on open tender. We were always anxious to get the North Shore contract, having a lot of plant and machinery—hoisting engines, air-blowing plant, fans, pipes, and all sorts of things—about £3,000 or £4,000 worth altogether. We had also a large stock of cement coming forward, which we had bought in anticipation of our being allowed to use it on the Munnistreet sewer. We always thought that Bond and Hudson would lose money if they went on with the job,

job, and we were fairly confident that we could make something out of it. On these grounds I made a proposition to Mr. Bond after some considerable time had elapsed, and there was no sign of the Department accepting their tender, that they should withdraw, when we would take our chance of getting the work.

J. Carter.  
21 Sept., 1896.

18737. Do you know why the Department would not accept Bond and Hudson's tender at the time? No; I have no idea of it. I may have had an inkling of it.

18738. You had nothing to do with their tender not being accepted? Not the slightest thing.

18739. Do you remember a joint letter being sent in—a letter of protest by Carter & Co., and by Gummow and Gillan? Yes.

18740. Why did Gummow and Gillan join in the protest? Because you were the lowest tenderers for the Woolloomooloo job—I forget the number of the contract—which Bond and Hudson abandoned. The work was re-tendered for, and we got it, beating Gummow and Gillan.

18741. Were not Bond and Hudson the lowest tenderers, and Gummow and Gillan second? Yes.

18742. Did not Bond and Hudson throw up the work? Yes.

18743. The Department did not give it to Gummow and Gillan? No; it was re-tendered.

18744. When Carter & Co. beat Gummow and Gillan? Yes.

18745. Did you approach me on the subject of this letter of protest? I believe so.

18746. On what grounds? You were the aggrieved party in the first instance, and we thought that you should stand in with us in any action of the sort. There was a good deal of what I might term fishing tendering going on at that time. People were tendering with the object of seeing what Carter & Co.'s and Gummow and Gillan's prices were. If their own prices were anywhere near the prices of those two firms, they generally considered it good enough to go on with the work. If not, they used to try to get out of it. We objected to that sort of thing. That was the reason for our joint protest.

18747. All the tenders were posted up so that everyone could see them? Certainly.

18748. And the firm of Gummow and Gillan were very sore over the abandoned contract not being given to them? Yes.

18749. It was owing to that that you asked them to join in a protest against the firm who had upset them before? Yes.

18750. And they agreed to that? Yes.

18751. Have you anything further to say on the question of the settlement you made with Bond and Hudson? Well, I might explain what I did. I represented to Mr. Bond—and I represented it truthfully, as far as I know—that he was bound to lose money upon his tender, and that we could make money out of the work. We had a long discussion. Mr. Bond did not seem very anxious to go on. He was an old man, and he was not accustomed to the work. We finally agreed to the terms and conditions which have already been referred to in the evidence, to the effect that I was to pay him £750 cash down, job or no job, taking the risk. If our tender was accepted he was to get a further sum of £750.

18752. You did not know at the time you paid him the £750 that you were going to get the job? I had not the slightest idea.

18753. It was a speculation on your part? Yes; I plunged upon it.

18754. As to Contract 79A—how did you manage to get that;—did Mr. Hickson help you in any way? I did not see Mr. Hickson on the subject at all; I saw Mr. Young. It was the outcome of a conversation which some of the men had with Mr. Clarke in the first instance. As far as I can remember, they represented that work was getting scarce at North Shore, and that he should endeavour to have some of the sewerage work pressed on. I think the sewerage farm was the contract which was referred to first.

18755. Who was the Minister at the time? Mr. Lyne.

18756. You know nothing further about the contract matter than that you got the contract at Government schedule rates? Yes; of course we put in a price which was above the Government estimate; and Mr. Lyne, in the course of an interview I had with him, refused to deal on our lines. I think the suggestion came from him—I am almost sure it did—that if we were prepared to carry out the work upon the Department's estimate he was prepared to let it to us. I consulted with Mr. Snodgrass, who was then in Sydney, you being away in Adelaide; and after a good deal of hesitation and argument—for we considered that the Department's estimate was a very low one—we decided to accept the offer, having gone so far in the matter. It was more with the idea of keeping our plant and men together. Our office expenses and everything else were going on, and we took the work rather with that idea in our heads than with any other motive.

18757. You did not consider, then, that it was a very valuable job? Not by any means.

18758. It was not a 5 per cent. better job than the job Butcher Bros. got over there? No, nothing like it.

18759. As to Mr. Snodgrass—did he interview the Minister with you? I do not think so; I do not remember it.

18760. Did he interview Mr. Young, the Minister, at the time you went in to see him as to the Monier plan being put in? Yes; he did, I think.

18761. If Mr. Snodgrass did not, could he know anything about what the Minister said, except from you or myself? Certainly not.

18762. As to Mr. Snodgrass's power in the firm—had he any power or say in actually settling whether we would take up a job or whether we would not? No; except that he was consulted as a matter of courtesy.

18763. As a rule, who were left to judge in any question affecting the general business of the firm? It was left to you and myself. It was left to me before we joined. When the two firms amalgamated those sorts of questions were left to you and to myself jointly.

18764. So that we could deal with all important matters ourselves? Undoubtedly.

18765. Probably consulting the other partners? Sometimes.

18766. But if we did not consult them, we acted on their behalf? That is exactly so.

18767. They always agreed to our action? Yes.

18768. When you put in this Monier plan, was there any idea of sureties being required? No.

18769. Was any schedule put in with it? No; it was a lump sum tender.

18770. Do you remember after the tender was dealt with that the question of sureties arose? I do.

18771. Whom did you go to see on the question? Mr. Hickson.

18772. Did you protest against sureties being required at the time? Yes.

18773.

- J. Carter.  
21 Sept., 1896.
18772. What reasons had you for protesting? I thought that Mr. Hickson was treating us very harshly indeed in the matter, that he was, in fact, trying to impose such obligations and restrictions that it would be almost an impossibility for us to comply with them. I thought it was ridiculous to ask for £24,000 of security in respect of a piece of work which could not cost more than £7,000 or £8,000 to replace if it all collapsed.
18773. Was it not considered between us that if a contract like that was passed by the Tender Board the mere fact of their accepting it should have been a sufficient guarantee as to the stability of the work? Undoubtedly; we discussed the matter very fully.
18774. The matter of £12,000 was a very small matter compared with the reputation of the gentlemen composing the Tender Board? Undoubtedly; that was our argument. They had officially recognised the system. The plans we submitted were all that could be required, and we thought that quite sufficient. We thought that Mr. Hickson was going beyond the point to which he should have gone.
18775. He made you put up a deposit as well? Yes, a cash deposit.
18776. And he also wanted retention money? Yes.
18777. How much did they amount to? £1,500.
18778. So you do not consider that Mr. Hickson had extended any concession to the firm as regards the Monier contract? I certainly do not; it was the reverse.
18779. Then, again, the amount of sureties were put down at £12,000? Yes.
18780. Was that a fair amount to put upon the work, do you consider? No, it was an excessive amount. I think we once estimated the proper amount at about £8,000.
18781. You were so satisfied with the plans that you did not object? Not in the least. I did not mind then, having gone so far in the matter.
18782. You did not mind their forcing you to find securities? I did not mind whether the amount was £8,000 or £12,000; it was the principle of the thing that I objected to.
18783. Is there any other point in connection with that matter upon which you wish to say anything? No; I do not think so.
18784. Have you had anything to do with contracts in any other colony? Yes; in Tasmania.
18785. What did you do there? I was manager and shareholder in the construction of the Brighton to Apsley railway, 26 miles.
18786. What sized contract was that? It came to £100,000, I suppose, by the time it was finished.
18787. Did you get any advance on material on that contract? Yes; we received an advance on the ballast in the pit and on the sleepers which were all over the ground.
18788. On the contract? No; they were stacked in all directions. They were actually the property of the Government, but we adzed and bored them. We practically, therefore, received an advance upon labour. We received an advance on fencing material, bridge timber, or whatever might be lying about.
18789. Do you know whether that is the usual custom in Tasmania upon Government contracts? Yes; I do not think there has ever been any difficulty in the matter.
18790. Was the schedule of quantities adhered to? No. After we had signed the contract they altered the width of the line, and the direction in one or two instances was also altered—in one case by 20 or 30 feet. They began to pick and choose among the items, picking out the cheap ones and leaving us the others.
18791. You went on with the work just the same? Yes. We had to go on. I remember that in one instance they shifted a cutting 20 feet. It ran through river sand. There were about 200 or 300 yards of it, and they shifted us into about 12,000 or 15,000 yards of bluestone, and paid us the 1s. a yard which we were to have for the sand.
18792. What was the upshot of the whole thing? The matter went to arbitration.
18793. And how did it come out? It came out all right for the contractors. The award was decidedly against the Government for interference with the schedule. We received £32,000 under arbitration for alterations in the line, and for defective and misleading prices, and so on.
18794. I suppose you consider that if the Public Works Department of this Colony treated you in the same way you would have a similar cause for complaint? Undoubtedly. I think it is a very dangerous thing to interfere with a contract after it has been signed.
18795. Did you ever get a contract here in which your tender was accepted, and in which the work was not carried out? Yes, at Milson's Point; the present site of the Milson's Point railway station.
18796. What was the contract? It was practically the carrying out of the work as it now stands, with the exception of the station building. It was the removal of a large mass of rock, the building of the retaining wall, and so on.
18797. Was your tender accepted for that? Yes.
18798. And the work was then stopped? Yes; we never touched it, in fact.
18799. Did you get any compensation? Yes; ten per cent. on the amount of the tender.
18800. What was that? £6000. We got £600 compensation.
18801. From whom? The Railway Department.
18802. Was that done under the Minister? Yes; under Mr. Goodchap and the Minister.
18803. Who was the Minister? Mr. Sutherland.
18804. Were you ever engaged upon any contract in New South Wales which was stopped during progress? Yes; the Castlereagh-street sewer.
18805. What happened there? The contract was let in the ordinary way, providing for excavation by blasting, and after it had been in progress for some little time the property-owners along the site of the works objected very strongly. I think the then Governor of the Colony, Lord Carrington, objected to it. We were working down here, close to the Government House gates. The work was stopped by the Department pending a settlement as to the method by which it should be carried out.
18806. Was it stopped by an injunction of the Supreme Court? I fancy so; but I could not be quite sure. An injunction was applied for, I think. I fancy that Mr. Alex. Dean was one of the applicants. At any rate, the work was stopped pending settlement as to the method in which it should be carried out. If I remember rightly, guttering and gadding was first introduced upon that contract.
18807. What was the upshot of the matter as far as you were concerned? We were paid compensation. Our plant was taken over at a valuation, and the contract was re-tendered.
18808. Do you know who got it? Gummow and Gillan.
18809. You had nothing to do with it? No.

18810. Do you know whether they cut the work out from start to finish? I believe so.
18811. Upon the question of guttering and gadding, are you still as strong as you were in your belief as to the risk attaching to the men's lives? Yes; I have always taken a strong view of that matter. I have always taken a keen interest in the question, and I still maintain that I am right.
18812. As to the question of your generosity—you seem to have been generously inclined to two or three individuals. Is it usual for you to assist persons and to lend them money without charging any interest? Yes.
18813. Can you give any instances in which you have done so? I should prefer not to.
18814. *His Honor.*] But without giving names—you might leave the names out? Unfortunately or not for myself, as the case may be, I have done a good deal as to that sort of thing.
18815. *Mr. Gummow.*] Will you give the amounts? I once lent the sum of £600.
18816. Have you had it back? No.
18817. Had you anything to show for the £600 when you lent it? No.
18818. Did you get anything afterwards? Yes; I got a bill of sale. I found the man was playing a shifty game with me. I could not stand that, and I woke him up about it.
18819. Was he a personal friend of yours? No; I knew him casually in business; in fact, he was a building contractor. I assisted him with money to carry out one or two small contracts, but I found that he was shifty. I thought that he was not acting squarely and honestly as he should have done. I objected to that, and obtained a bill of sale over his household effects.
18820. What happened to the man? He died; he was killed.
18821. Did he repay you the money? No.
18822. Did you enforce your bill of sale? No.
18823. What did you do with it? I gave it to his wife, and she started a boarding-house with the furniture; that was the end of the matter as far as I was concerned.
18824. Can you name any other instances where you have lent or given over £100 to any persons without any security? Yes. I paid up considerably over £100 to a young fellow I knew at North Shore. I had known him for about twelve months. He had been making too free with the funds of the institution with which he was connected. I took an interest in him and paid up the amount of his embezzlement rather than he should get into trouble. I determined to pay up the money for him and give him another chance.
18825. Did you ever receive any of it back? No.
18826. Was he anything to you more than a fellow citizen? No, very little more. He had been inside my house three or four times. He had seen better days, although he was a young man, and I took a little interest in him.
18827. There are other amounts you have lent to different persons, are there not? Yes, but I do not know that I need particularise them.
18828. Is there anything you desire to say to his Honor; any statement you wish to make in regard to any contracts I have not referred to? No, I do not think so.
18829. You are not given to drink, as has been stated by a witness here? No; I was a teetotaller until I was 35, and I am next door to a teetotaller now. As to Wright's matter—if that is what you refer to—I might say at once that there is absolutely no truth in the statement he made. I should also like to say that I had the personal supervision of the North Shore contract, concerning which Wright gave evidence; in fact I should like to say that, so far as I know, all the statements made by the witness Wright, so far as Mr. Forrest's behaviour is concerned, were, to say the least of them, incorrect. Mr. Forrest is a steady, sober, man in every sense of the word. I saw him every day on that contract, and I know that he has never been the worse for liquor in his life. As to his gambling or supposed gambling with the inspectors I am sure there is absolutely no truth in that statement. Mr. Forrest is not a man of that kind.
18830. *Mr. Davis.*] When you put in your tender for Contract 77, the lump sum tender for £15,500, did you make an estimate of the cost of the work in arriving at that sum? I did not; but Mr. Gummow did. I never interfere with estimates. If Mr. Gummow is satisfied, I am satisfied.
18831. I think you said you handed in your plan to Mr. McLachlan, as chief clerk? Yes.
18832. Did you also know that he was Secretary to the Tender Board? Yes; although that did not occur to me at the time. I simply carried out Mr. Barling's instruction, if I may term it so.
18833. As to the practice of testing cement, up to a certain date was it not the custom of the department to require the contractor to cart on to any particular contract a good large parcel of cement—sufficient to last on the contract in question for fourteen days, and then to test it from the contractor's shed? Yes.
18834. That was the practice up to a certain time? Yes.
18835. Then some difficulty arose with regard to the passing of the cement; a large quantity of it was being imported by the merchants which failed to pass the test? Yes.
18836. Did they not complain that they considered they were put to a lot of unnecessary expense and trouble in carting the cement from the ship's side to the contracts, and then having in many cases to cart it back again in consequence of the cement not passing the test? Yes; there was a great deal of friction between the merchants and the department. There was very sore feeling on the part of the merchants against the department at the time. I remember that they held a meeting at which we as contractors were particularly invited to express our views on the subject. A number of alternatives were suggested, and I think the course which is adopted now has satisfied most of them.
18837. What was the resolution which was adopted? The putting of the cement in bond, if the merchants so desired it, and having it tested and branded, and then issued as the merchants required.
18838. So that the cement tested in bond and branded there before it left the stores might be carted to half a dozen contracts? Certainly; it is carted here, there, and everywhere, as far as I know.
18839. It would not be tested on the ground? Undoubtedly not.
18840. As to these stocks of cement you had on various contracts at the beginning of 1892, were they large? Yes; very large.
18841. Have you any notion as to how many casks of cement you had in stock at that date? No; I could not say definitely, but I should think there would be anything up to 6,000 casks. We always endeavoured to have our sheds fairly well filled. We have never been people who desired to have our works stopped through insufficiency of material.
18842. You have said in your evidence, I think, that you had at that time particularly heavy stocks? Yes; we had stocks in hand, and there were large orders to arrive. They were arriving every day, in fact.
- 18843.

J. Carter.

21 Sept., 1896.

- J. Carter.  
21 Sept., 1896.
18843. In regard to Contract 72, when Mr. B. C. Simpson put in your claim for the stoppage of the work, one item in it was for cement that you had in hand, amounting to how many casks? Two thousand untested, and 1,300 tested.
18844. That cement must have been in stock? Undoubtedly. At the end of 1891, or at the beginning of 1892, when that claim was made out, that cement was in stock. There may have been more.
18845. Do you remember asking that the 2,000 casks of untested cement might be subjected to the Departmental test? Yes; it is always better to have it tested, because you can then sell it.
18846. Was it tested by the Department eventually? Eventually.
18847. But not at that time? No.
18848. In making out your tenders what have you reckoned that a cask of cement will make in the case of bluestone concrete and sandstone concrete? I do not know from my personal knowledge, but I have often heard it discussed. I have been present on many occasions when tenders have been made out. I do not know from my actual experience and observation what it will make, but we have always taken it that in the case of sandstone concrete a cask of cement will make a yard, or up to 30 feet. We generally take it as a yard for estimating purposes.
18849. And what do you estimate that it makes in the case of bluestone concrete? From 22 to 23 feet.
18850. I suppose you would say that the circumstances under which the concrete is used, and the quantity of water used in it, would have to be taken into consideration in estimating what a cask would make? Yes; I know very little about it. I have taken a certain amount of interest in the matter, but that is all.
18851. I cannot ask you to say how many concessions you have had from the Department, but I will ask you whether you regard the action of the Department in respect to the substitution of guttering and gadding, or the proposed substitution of guttering and gadding, for blasting, as a concession? No; I regard it as a direct wrong. I was particularly sore upon that point at the time. When you, as I thought, attempted to use the specification and schedule in direct opposition to all sense of equity and right dealing, I was angry about it.
18852. But could you blame the Department, or did you blame them for making use of the prices you have given? I did.
18853. You said in your schedule that you were prepared to do work of a certain description for a certain price, and that you were prepared to do work of another description for another price. Could you blame the Department, seeing that they had power under the contract to do so, for electing to do the work in the cheapest way? Yes; I still blame the Department, and I say that you made use of your specification to attempt to carry out work in a manner in which it was never intended that it should be carried out. There was a lot of evidence that you never intended to carry out the North Shore contract, and that, I suppose, is the particular one to which you refer, by guttering and gadding. This consisted, among other things, of the length of time allowed for the completion of the work. We always considered that the item of guttering and gadding, if it were set down in the schedule, was to be applied to isolated lengths where that work was rendered necessary through the proximity of buildings, the existence of any illness in the district, or anything of that kind.
18854. Did you not recognise the right of the Department to do what they proposed to do by virtually allowing a sum of £1,300 to be deducted from your final certificate? If you like to look at it in that way you may do so. I do not take that view of the matter. It was a question of expediency with us. We did what is generally known as splitting the difference.
18855. I wish now to refer you to Mr. Maddison's evidence. He gave the following evidence in reply to question 3406:—

Will you tell His Honor what it was? It amounted to this—that Mr. Hickson, jun., had been retrenched out of the Department, and that Mr. Hickson, sen., wished to find him employment of some sort, and had asked Mr. Carter if he could find anything for him to do, or whether they would take him in as a member of the firm. The reply which I understood Mr. Carter made to that request was that Mr. Hickson, jun., could not be taken into the firm within five or six years.

What have you to say as to that;—the conversation is said to have occurred near the Bank of New Zealand, in Sydney? So far as any conversation with me, or the locality of any conversation with me goes, Maddison's statement is practically correct. I did meet him near the Bank of New Zealand, in Spring-street, one morning in company with Mr. Ewing, as far as I remember. After some casual remarks, one of them said, "I hear you have got another partner," or words to that effect. "Really," I said, "I do not think so. I know nothing about it. What do you mean?" One of them said, "I hear you have taken in young Hickson." I said, "That is quite incorrect"; and, if I remember rightly, I pointed out that such a course of action would have been impossible for me to take upon my own responsibility. I pointed out that there were seven members of the firm, or syndicate, or whatever you like to call it, and that that was quite sufficient for whom to obtain contracts without taking in an additional number. I think I explained to them that young Mr. Hickson had gone down to Adelaide to fulfil certain duties. I dare say I did. That was the end of the matter, as far as I know.

856. Did you observe what Mr. Maddison said as to what you told Mr. Hickson, senr.;—that you told Mr. Hickson, senr., that Mr. Hickson, jun., could not be taken into the firm within five or six years. That is what Mr. Maddison says; and Mr. Ewing, at question 3281, says:—

What did Mr. Carter tell you? Mr. Maddison asked Mr. Carter if it were true that Mr. Hickson, jun., had been engaged by the firm, and Mr. Carter said "Yes." Mr. Hickson, he said, wanted to join the firm, but he had told him that he had better wait two or three years.

? There is some misconception over that matter as far as Mr. Maddison and Mr. Ewing are concerned. I believe they are quite honest in their impression of the conversation, but they have an erroneous impression. I did not say anything of that kind at all. I always looked upon Mr. Hickson, junior, as a young man who wanted experience. It does not do to take an inexperienced man into a firm of contractors. Most of us have served some kind of apprenticeship, and some of us a long apprenticeship. Every man who is taken in has to do his share in some shape or form, and Mr. Hickson, junior, would have been utterly useless as a partner. It would have been a mistake to take in anyone like that as a partner, seeing that we could get his services for £4 a week. Men like Mr. Snodgrass and Mr. Gummow are indispensable members of a firm like ours, and would be taken in by anyone under almost any circumstances, but a young man like Mr. Hickson would be only of use to a limited extent in the matter of survey work and alignment,—otherwise he would have been an incubus.

WEDNESDAY, 23 SEPTEMBER, 1896.

Joseph Davis, recalled and further examined :—

18857. *Mr. Parkes.*] As to Contract No. 79, the advance on 900 casks of cement shown on certificate No. 13, under date of 27th April, 1893, would be the first advance made on cement upon the contract, would it not? I should have to refer to the vouchers. I could not speak from memory. Mr. Christie gave a list of the advances made in some of his evidence. I do not think it is incorrect. J. Davis.  
23 Sept., 1896.

18858. You think it is correct? I believe it is.

18859. You think, then, the advance I have given you would be the first advance? Probably.

18860. Can you produce Ministerial authority for the advance? You will see upon page 317 of the Parliamentary return a memorandum of agreement drawn up on the 3rd August, 1893.

18861. Is that not the only one which was drawn up in connection with that contract in reference to advances? I believe it was; I could not speak positively; but to the best of my belief—yes.

18962. Then, for the advances prior to that there was no Ministerial authority? What was the date of the first advance?

18963. The 27th April, 1893, as shown by your certificates? There does not appear to be any Ministerial approval of any advance as far as I can see from the papers. It seems that the difference between the advance to which you refer and the advance made after the 3rd August, 1893, was this: that we had a memo. of agreement in the latter case and not in the former; and, if the 900 casks of cement were stored upon the works, this agreement would be scarcely necessary. The agreement in question was taken more especially in regard to cement that could not be technically regarded as on the site of the works. The general conditions give us full control over any material and plant on the site of the works, so that the agreement in that case is not necessary.

18864. Then it would not be necessary in any case? Unless the cement or other material happened to be off the site of the works. In that case it would be.

18865. Suppose the 900 casks were stored at Grant's Wharf? I do not think, in the case of Contract 79, any was stored at Grant's Wharf. To the best of my belief it was not.

18866. Are you sure it was not? I am not positive, but I think that Grant's Wharf was used in respect of Contract 79 A.

18867. *His Honor.*] Where is Grant's Wharf? Near Milson's Point. I know that the contractors had large sheds before any cement was delivered on to Contract 79, and I presume the first advance made on cement would be in respect of the cement in those sheds. It happened a long time ago, and I could not possibly remember the details.

18868. But no Ministerial authority was ever obtained for any of these advances, was it? Not in every case. It was such a usual thing.

18869. Is there any one of these cases in which it was obtained? I do not remember any case.

18870. Can you produce a case in which Ministerial authority was obtained? No; I think the advance was regarded as being covered by the contract.

18871. No special authority was ever asked for? No; I fancy the contract gives power to advance on material, and that no special authority was required. The memorandum of agreement was taken, as I have already pointed out, to meet the case of cement and other material which happened to be technically off the site of the works.

18872. Will you point out the clause of the contract which authorises the Department to make an advance upon material? It is not specifically referred to in the old contracts, but it is certainly contemplated in the general conditions.

18873. Will you look at the specification and conditions of Contract 79 and show His Honor the clause? I think it is contemplated in the 7th paragraph of clause 18 of the general conditions; but there is another paragraph I think which deals with it more fully. The clause to which I have just referred reads as follows :—

No certificate given to the contractor for any purpose whatever during the progress of the work shall prevent the Engineer, at any time before the final payment, from rejecting any unsound material or improper workmanship which may be discovered in the work, or from requiring the contractor to remove or amend at his own cost any work which may be found not to have been performed in accordance with the contract, or from deducting from any money which may be due or become due to the contractor the whole amount which may have been paid to the contractor for such material or work.

18877. But that relates to material fixed in place? It does not say so.

18845. Will you show us the other clause to which you have referred? The general conditions attached to Contract 79 seem to be slightly different from those attached to Contract 69. I cannot find the corresponding clause in Contract 79.

18876. Contract 69 was the later contract by two years? In the case of 69 the clause I have in my mind is the second paragraph of clause 34, which appears upon page 120 of the Parliamentary return:—"The like liability also shall hold good as to the obligation of the contractor in the event of any advance being made to him from the retention money or on material on the ground and not *in situ*." That paragraph I am not able to find in Contract 79; but in respect to the whole of the contracts, most certainly that is what guided us. These general conditions were being changed just about that time very much.

18877. Will you read the clause to which you have just referred from the commencement? Yes. The first portion of it is as follows :—

34. The contractor shall complete the whole of the works comprised in this contract within seventy-eight weeks from the date of the acceptance of his tender; and in the event of their non-completion at the specified times, should the Engineer not have proceeded under clauses 31 and 32 of these conditions, or either of them, the contractor shall pay, by way of liquidated damages, and not as or in the nature of a penalty, the sum of twenty pounds sterling for every week, or for every part of a week, that shall elapse after such specified time, until their completion, and which sum or sums may be deducted from any money payable to the contractor under this or any other contract. The contractor shall have no right to a certificate for payment after the date specified in these conditions for the completion of this contract until the whole of the works shall have been properly completed to the satisfaction of the Engineer, unless the time for the completion of this contract shall have been extended by the Minister, in which case such extended time shall become the time for the completion of this contract; and it is to be expressly understood that the fact of the time having been extended shall not in any way be taken as a waiver of this contract, or as annulling or setting aside this contract in any respect, nor be taken as releasing the contractor from any of the responsibilities or obligations of this contract, which, in all other respects, shall remain the same as if the time had not been extended.

18878. Contract 69 was let two years after Contract 79;—is not that so? It was let later.

18879. Two years afterwards, was it not? Yes; I think so.

18880.

J. Davis.  
23 Sept., 1896.

18880. *His Honor.*] Perhaps you may not have noticed the beginning of section 14 of the General Conditions of Contract 79—

All approved materials, plant, and prepared work, brought upon the ground for use in or on the works shall be considered, and shall be, the property of Her Majesty the Queen until completion of contract; and contractor shall not take away, remove, or dispose of any such material or plant or prepared work without the written authority of the Superintending Officer.

I presume that that is what you have been alluding to. It appears to bear upon the question. The section says, "All approved material." So that before any work is done at all it would become the property of the Crown. Of course the Crown has the right to move the property under certain circumstances. Therefore, it might very well be contended that an advance upon such property would almost be contemplated by the very terms of the condition? Yes, your Honor.

18881. It is the property of the Crown then at once? Yes, quite so.

18882. *Mr. Norrie.*] You know that up to quite recently in connection with sewerage contracts it was specially provided that an advance of from 75 to 90 per cent. might be made upon material on the ground? Yes; and also on plant. It was left out of the special conditions, I presume, because it was provided for in the general conditions. On that account, I suppose, it was not specifically mentioned.

18883. *His Honor.*] This practice, I understand you to say, has been observed in relation to all contracts—to everybody's contracts? In the case of every contract when the contractor has made a request to have an advance made upon material it has been complied with so long as we could get possession of the material.

18884. The Crown in a sort of way buys the material from the contractors? Yes; anticipating the material's being *in situ*. Instead of paying 60s. per cubic yard for brickwork the cost of the brickwork is anticipated in the progress returns by advancing upon the material that will be used in the brickwork.

18885. As to Contract 118—that contract and the dredge work clashed with one another, as we have seen. I want you to explain how it was that such an accident came about as that the contract should be let, and that, at the same time, work should be undertaken by the Department which necessarily had the effect of clashing with the carrying out of that contract. Perhaps you can explain it rather more clearly than it has been explained hitherto—that is, the coincidence of time in the two cases? The explanation to my mind is very simple. It was contemplated that in order to carry out the sand dredging it would be necessary to cut the drain:—that was cut apart altogether from the storm-water channel. Supposing the storm-water channel had not been let at the time, it was then that the drain must of necessity have been cut to relieve the flat of the water pumped on to it by the sand pumps.

18886. But why was not the drain laid out and contemplated before any request was made by Carter, Gummow, & Co. to have it done to save them from being flooded? It only took place, perhaps, a couple of days before the drain received attention. It may have been that the drain would not have been cut for a week or two as soon as it was, supposing Carter, Gummow, & Co. had not been carrying out the work, but at the time we let the work to Carter, Gummow, & Co. we knew that in the ordinary course of things they would have no obstruction from the sand pump dredging; and, that being the case, we had no hesitation in accepting their tender.

18887. Was the sand dredging being done by the Department by labour or by contract? By day labour.

18888. And the dyke, I suppose, had been built before this? Yes, some time previously.

18889. The reclamation, I suppose, could not be effectively carried out without No. 118 being also carried out to a certain extent? No. The two works must go on together, because immediately the reclamation is finished, Contract 118 must be extended through the dyke across the centre of the reclamation. The two works, therefore, must be carried out simultaneously. That was the case at Neutral Bay, Careening Cove, and White's Bay, Balmain. In all these reclamations where a sum of money is approved for reclaiming land, a sum sufficient to carry out the storm-water channel is also provided.

18890. In these cases, how did you manage with the sand dredge water when they came to carry out the sand dredging? At Neutral Bay precisely the same difficulty occurred. There the bay was very much smaller. The ground that had to be reclaimed was smaller, and we arranged with the contractor to suspend his works until the reclamation was finished. The dredges were on the opposite side of the reclaimed area to the storm-water channel just as in the present case, and the water was allowed to flow off into the bay back again.

18891. So that, really, the cause of Carter, Gummow, & Co.'s having to make a request that something should be done to save them from getting flooded was simply that there was a little more delay than usual in undertaking that part of the reclamation work—is that so? Yes. I suppose, as a matter of fact, we ought to have looked after the business ourselves. We must have seen that it was requisite that that drain should be cut.

18892. The dyke had already intercepted the channel of the creek? It had completely blocked the channel; in fact, there was no channel at the site of the dyke. The dyke was put in deep water, and the stormwater from the land above flowed across the mud flats and got into the deep water on the land side of the dyke. When the reclamation was proceeded with the sand would be deposited on the inside of the dyke first.

18893. Did the water then flow out through an opening in the dyke at the north-west end of it? Yes; an opening was made in the dyke—indeed it was left in the dyke at the time it was constructed for this water to flow out, and on the occasion of Mr. Hickson's visit the water was flowing out from the sand-dredge through this opening.

18894. But with no regular drain carrying it round the head? No; it was evidently contemplated that a drain should be cut, from the fact of the opening having been left there.

18895. I suppose the principle is this—that you have to begin to drain off the water as far as possible from the exit of the sand and water from the pipe. You want to allow settlement to take place between the outflow of the sand and water and the point where the water discharges into the carrying-off drain? Yes; it is always arranged so that the sand will have time to deposit between the time the water leaves the pipe and the time it flows out on to the harbour side of the dyke.

18896. And then you intercept the sand by fascine work and that sort of thing? Yes.

John Carter recalled and further examined:—

18897. *Mr. Parkes.*] With regard to Contract 77, I should like to know when you first became acquainted with Mr. Baltzer? Ten years ago. J. Carter.
- 18897½. How long was it before you entered into co-partnership in respect of the Monier patent? I really could not say exactly. That was an outside affair, and I did not take particular notice of the date. I should say it would be about four or five years ago. 23 Sept., 1896.
18898. How did you come to be associated with him in the patent;—did he approach you, or did you approach him? It happened merely through the force of circumstances. We were always discussing engineering matters, new improvements, and that sort of thing. That applied to sewerage and other works, and one thing led up to another. Mr. Baltzer naturally spoke at great length on the Monier system. He thought it a fairly good thing as far as he could see, and we went into it.
18899. You agreed to take it up together? Yes; he had no time and no experience, I presume, in outside work. He was not in touch with the practical part of sewerage matters, and, as we were, he naturally sought our assistance.
18900. How long before you offered them to the Department had you the patent rights? Some considerable time. I really could not tell you how long.
18901. How long was it before you offered them for sale? Some considerable time.
18902. Do you recollect the date upon which you took out the patent? No, I do not.
18903. The date of your offer to the Government is shown in the Parliamentary papers, and the date of your taking out the patent will, of course, be shown in the patent papers? Yes.
18904. With reference to Contract 77, and Mr. Baltzer's getting out the Monier design, how long before you sent in your tender did you know that he was getting out that design? Really, I could not tell you.
18905. Was it a couple of months? Possibly.
18906. You interviewed Mr. Young, the Minister, before sending in your tender? Yes; a short time before the tender went in. We naturally wanted to make sure there would be no hitch in the matter, so we went to head-quarters at once. It was of no use to approach Mr. Hickson or Mr. Barling. They would simply have referred us to the Minister, so we went straight to him.
18907. Did you never speak to Mr. Hickson about it all? Not about the putting in of the tender.
18908. But you spoke to him about the Monier system? Certainly; because I invited him to the test at North Shore. I think we actually sent up a model arch, which is in the office now.
18909. Did you tell him that you would like to have the Monier system applied to Contract 77? No.
18910. You never had any conversation with him on that subject? No.
18911. Did you ask Mr. Baltzer to see him? No; he never saw Mr. Hickson to my knowledge.
18912. Did he ever tell you that he had a conversation with Mr. Hickson? He did not. I would like you to understand that our connection with Mr. Baltzer did not appear to us to be a very important matter, and, unless the necessity arose, we should have very few discussions with him. The probability is that we should not see him, except at infrequent intervals.
18913. But it was he who introduced the patent to you? Yes; and then it died, so to speak, for a while. It was an offshoot from our business. We never considered it of any great importance until we really had time to take it up.
18914. When you entered into it it was an offshoot of your business, and you agreed that Mr. Baltzer should have some interest in the patent? I think there was a verbal agreement or arrangement. He was quite willing to leave the matter to our sense of justice. I am connected with a great many patents, but I am inclined to think that in the first instance there was in this case only a verbal arrangement.
18915. Did you never have any conversation as to the value to your business which would accrue from the adoption of the patent by the Government? We did not.
18916. Not with Mr. Baltzer? No. I might tell you, while I think of it, that the offer made by Mr. Armstrong was made entirely without my knowledge. I knew nothing of it as an offer until afterwards.
18917. Who guided Mr. Armstrong in the making of it? I did. I said to him, "We have a good patent; we might possibly do something with it with the Government." I do not know whether you will remember it, but the Government were offered a patent tram-grip at the time, and that set us on the track. Mr. Armstrong is a friend of mine, and I remember speaking to him on the steamer one morning as we were coming across about the Monier system. As far as I can recollect, what he said was, "Let me have a look at the patent. I will think it over." The next intimation I had was that he had made an offer of the patent to the Government for £1,500. I myself objected to it. I thought the figure was too low, but as the offer had been made I stood to it.
18918. With reference to the tendering—did you put in the tender on the Monier system on the day on which the Board of Reference sat? I put it in on the day on which the Tender Board met.
18919. The Tender Board met to consider it? To consider tenders. There is a difference between the Tender Board and the Board of Reference.
18920. You said in your former evidence that the plan was not completed until the day on which it was put in, did you not? Yes, to the best of my belief, and I believe it is true. It was not completed twenty-four hours before it was put in—I am certain of that.
18921. Then how did your firm make up their estimate upon it? We had the plan in pencil.
18922. Did you make your estimate upon the plan in pencil? Yes.
18923. Did Mr. Baltzar assist you? He did not.
18924. Who made up the estimate? Mr. Snodgrass and Mr. Gummow.
18925. And you yourself? No.
18926. You made it up off the plan in pencil? Yes.
18927. And without any detail specification to show you what the work would be? We had the detailed specification of the departmental design. We had all the information as to the tunnelling and the piers. We had all the information except that in regard to the Monier arches, and it was a simple matter to arrive at an estimate of the value of the arches.
18928. Did you see the drawing in pencil? Certainly; Mr. Gummow investigated it thoroughly while it was in course of preparation. He was brought over specially from Adelaide to go into the matter.
18929. What portion of the incomplete drawing was in pencil? It was a complete pencil drawing, but we could not send in a pencil drawing with our tender.

- J. Carter. 18930. Did you never see the drawing when it was incomplete—before all the pencil work was upon it? Certainly.
- 23 Sept., 1896. 18931. A portion was on it? Yes. It was referred to Mr. Gummow to use for comparison and checking. We were not going to take Mr. Baltzer's design as a correct design without investigating it.
18932. Was there any other drawing but that one? Not that I am aware of. There may have been a drawing of stresses and strains; there probably was.
18933. Have you got the figures showing how you made up your original estimate? Mr. Gummow may have.
18934. Are they in existence now? I think so. Mr. Gummow generally keeps all those things. Of course, we do not keep everything of that kind.
18935. Could they be produced? I could not tell you. You had better ask Mr. Gummow that question. I do not know anything about that part of the business. For instance, I have a tender in my hand just now, but I do not know how Mr. Gummow made it up. He probably kept the details in the case to which you refer, because it was the first estimate of the kind.
18936. *His Honor.*] You think Mr. Gummow may have the papers? Yes, I should think so.
18937. *Mr. Parkes.*] In connection with this same contract, did you have any conversation with Mr. Hickson after the tender was accepted? I do not think so.
18938. None at all? Only in connection with the bond. Naturally I interviewed him then.
18939. Did you not go into an estimate with him at all after the tender had been received? I did not.
18940. Did he ever question you about it? No; and I should not have given him the information had he done so.
18941. Did any officer of the department ask you how you made up the estimate? No; and it would have been a superfluous question as far as we were concerned. I should think anyone would know that they would not be likely to get the information.
18942. In what way would it be a superfluous question? Well, I would not tell Mr. Davis, Mr. Hickson, or anyone else, how we made up our tender.
18943. Not if you were asked? No; I should say let them find out for themselves.
18944. As to the Bond and Hudson matter;—when you saw Mr. Bond did he resist your offer? I suppose he did what any other business man would do in the circumstances. He stood off a bit to see whether he could get something more—whether he could make a better bargain. He naturally wanted to make the best bargain he could.
18945. He resisted your offer at first? I would not put it in that way; he naturally wanted time to consider the matter. I did not offer him £750 straight off. I tried first to persuade him to give up the contract without giving him anything. I did not rush to him with £750 at once. I saw him on several occasions.
18946. Had you not some knowledge that you would receive Contract 79 when you gave Mr. Bond the £750? I had not the faintest idea; in fact, as the correspondence and papers in the Public Works Department will show, we very nearly lost the work.
18947. Did you call upon Mr. Hickson on the very day upon which tenders were to be called? It is very possible.
18948. And you represented to him the claim you had in respect of Contract 72? I expect so.
18949. As to Contract 72, did you tender for that on the plans which included the drain which was afterwards cut down Shea's Creek? Really I could not say unless I saw the drawings.
18950. When you signed the contract plans was the drain which runs down the bed of Shea's Creek shown on those plans? If it is on them now it was on them then.
18951. But was it on them? That is the only answer I can make. I do not remember.
18952. You must remember the contract? Not necessarily.
18953. Was the contract originally for the cutting of that drain? I can only make the reply that if the drain is shown on the plans now it was shown on the plans then. Whether it was as wide as it was afterwards cut out is another matter. I do not think it was. Whether the drain was actually in existence on the plans or not I cannot say.
18954. What was the width to which it was cut? A considerable width.
18955. Do you recollect it? I have no idea of it.
18956. Was it 30 feet? Wider than that. At the top I should think it would be nearer 50 feet.
18957. Would it be 75 feet? I could not say.
18958. What was the width of the channel that discharged into it? I have not any idea.
18959. Was it 12 feet? I could not tell you.
18960. It was not more than 12 feet, was it? I should think it was.
18961. It was about 12 feet? More at the outlet, I think.
18962. Was it 14 feet? It is of no use asking me. I do not know.
18963. You have seen the contract? Yes, five years ago. I have never been there since.
18964. Do you think the width would exceed 15 feet? At the outlet I should think it might be 15 or 20 feet. I saw it when it was in a filthy state—when it was timbered up. That is all I know about it. You must recollect that I took no active interest in the construction of the work. I have a general idea of what is going on in the construction, and that is all.
18965. Did you tell Mr. Barling at any time that you were going to tender on the Monier system? No; except when I went to see him as to the putting in of the tender. I wanted someone to take charge of the plan.
18966. You told him then? I wanted to know what was to be done with the plan.
18967. What did Mr. Barling say to you? He was rather snappy with me, and, as far as I remember, he ordered me out of the room for coming before 11 o'clock. I think he said, "Take it to Mr. McLachlan. It is of no use giving it to me," or something to that effect.
18968. Did he say anything else about your submitting the Monier design? He did not.
18969. How was it that subsequently you changed the construction from *compo.* to concrete? By reason of the experiments we were carrying out. We were carrying out the work regardless of cost to ourselves, because we were anxious to arrive at the very best result. We wished to obtain the very best experience we could in the matter. We made some tests, and we concluded that the alteration to which you refer would be beneficial, and obtained Mr. Darley's consent to it.

18970. Was it not Mr. Darley who instructed you first of all to make the alteration? Not as far as I know. J. Carter.
18971. Was it you or he who made the first suggestion? I do not know that there was any suggestion. The thing grew up out of a series of tests. Mr. Darley took a great interest in the construction, and we naturally did the same. It was as the outcome of a series of tests that the alteration was made. 23 Sept., 1896.
18972. In the case of the Victoria-street sewer, which Bond and Hudson tendered for, and which they finally threw up, did you ever approach Bond and Hudson on that occasion and ask them to increase their tender? No.
18973. You got that contract? Yes.
18974. Prior to the date upon which Gummow, Gillan, & Co. joined Carter, Snodgrass, & Co., had you not some sort of business connection in respect to Contract 79? No connection whatever. I do not remember anything like it. You must be in error.
18975. If, in the books of Parbury, Henty, and Co., when Contract 72 was going on, there is an entry for cement charged to Carter, Gummow, & Co., that would be the same firm, would it not;—did you ever deal in cement together? No.
18976. Did you have any stores together? No stores whatever.
18977. Did you have any business connection before you joined? We might have exchanged plant. I might have bought some of their plant and they might have bought some of ours. It is a common thing among contractors to buy each others plant. I have sold plant twelve months back and have bought it at the present time. Contractors' plant is constantly changing hands. I might say that up to the time Carter & Co. and Gummow and Gillan joined forces they were severely antagonistic. It was simply a question of which one would beat the other. I have repeatedly heard Mr. Gummow say that the only firm he ever considered in tendering was ours, and we took exactly the same stand as to theirs. We actually cut each other's throats.
18978. As to the cement which you say was removed from Contract 72, can you recollect where you had it moved to? I have no idea. We had it shifted while the works were in suspension, or afterwards.
18979. While the works were suspended, you say? Yes.
18980. Is that when you had most of the cement shifted? I could not tell you. It was shifted; that is all I know.
18981. In your claim you say, "Loss on resale of 2,000 casks of cement"? Yes.
18982. And "1,300 casks of cement on site"? Yes.
18983. What were the 2,000 casks;—it says, "Loss on resale of 2,000 casks"? That was an awkwardly expressed clause, as far as I can see. It should have been, "Loss on the forced sale of cement on ground." We had naturally to pay for the cement tested and untested in the sheds, and had we been compelled to sell that cement we should have had to sell it at a loss, it being untested. You have also to consider that it was in a far away locality—Shea's Creek—and that probably there would be heavy cartage.
18984. *His Honor.*] You did not in fact resell it? No; we should have been compelled to resell it if we had not got the other contracts. It was an anticipatory loss, but it was a loss all the same. If we had ceased work then, and had not got the North Shore contract, that cement would have been sold at a considerable loss to us. We had heavy stocks arriving.
18985. *Mr. Parkes.* If there appears in Parbury, Henty, & Co.'s books, about November, 1892, an entry of 7d. a barrel for the resale of 1,900 odd casks of cement, what would that transaction be? I have no recollection of any such transaction. I do not think it ever took place. Mr. Henty might be able to explain it to you.
18986. But if such an entry appears in their books, can you not recollect what it would be for? I cannot.
18987. When Burcombe took that cement which he took from Contract 72, where did he deliver it? At North Shore.
18988. On what part of North Shore? On Contract 79.
18989. At the sheds? At various sheds.
18990. Where were the sheds fixed? Along the line of sewer. There were three or four sheds.
18991. And he would deliver it there? Yes; he could not deliver it anywhere else.
18992. What about M'Millan's deliveries—where were they? On the site of the works. It is quite possible that he may have delivered the cement at the board. If it was tested cement it might not go into the sheds at all. If we were sending tested cement, as we frequently do, from one contract to another, it might be taken direct to the board.
18993. They say they took hundreds of barrels? They probably took thousands. We were constantly conveying cement from one site to another.
18994. How many thousands do you think they may have taken? I could not say. The carting would extend over four or five years. They must have carted a very large quantity. We were locked up at Shea's Creek with a very big stock.
18995. I wish you would tell His Honor how much money Mr. Forrest put into the original purchase of the "Lodge" property, at North Shore? An equal amount to Mr. Snodgrass and myself. It was paid out of the firm's account.
18996. In those days the firm consisted of more than three? Yes.
18997. Does the property not belong to the firm's account? No; to Carter, Snodgrass, and Forrest.
18998. Is not the property, as a matter of fact, paid for with money out of the firm of Carter, Gummow, & Co.? No.
18999. Was not the mortgage money obtained upon it paid into the account of Carter, Gummow, & Co.? I do not think so. If it was, it was simply a cross entry. The property belongs absolutely to Carter, Snodgrass, and Forrest, and always has; it was paid for with their money.
19000. But the fact still remains that the money was paid out of the firm of Carter, Gummow, & Co., and that you have not replaced it? It never came out of the firm of Carter, Gummow, & Co.
19001. It came out of the firm of Carter & Co., did it? The original purchase money.
19002. And it appears in the accounts as a debit against Carter, Gummow, & Co.? It has nothing whatever to do with Carter, Gummow, & Co.
19003. When did you buy the property? About three or four years ago. I think we bought it just before we joined Gummow and Gillan.
19004. It was Carter, Gummow, & Co. who bought the property, was it not? No; Carter & Co.
19005. But if it appears to be so from their bank-books that must be right, must it not? No; it is absolutely

J. Carter.  
23 Sept., 1896.

- absolutely impossible. Carter, Gummow, & Co. have nothing whatever to do with the property. It is the sole property of Carter, Snodgrass, and Forrest, and it was paid for out of Carter & Co.'s account.
19006. Regularly every quarter you pay a sum by way of interest to Sir William Manning, do you not? Yes; the interest upon the mortgage upon the property.
19007. At the present time you are paying Sir William Manning interest upon the loan upon the Lodge property? Yes; Carter & Co. are.
19008. Who do you say are paying it? Carter & Co.
19009. But they have no banking account now? Oh, yes they have.
19010. Apart from Carter, Gummow, & Co.'s account? Yes.
19011. I thought you said in your former evidence that they had no account, and that the account ceased when Carter & Co. amalgamated with Gummow and Gillan? I said it ceased except for the purposes of receiving rent and paying interest. It is still open for the purpose of paying the interest on the Lodge property.
19012. Those bank-books you have not handed in? Yes; they are there.
19013. But they run only to 1892? No; they go up to 1896.
19014. Has the interest been paid out of Carter & Co.'s account? Yes.
19015. And you say that Mr. Forrest and Mr. Snodgrass have an equal share in the property with yourself? They have.
19016. *Mr. Davis.*] Referring to the stock of cement which you had upon Contract 72, it is a fact, is it not, that you had between 3,000 and 4,000 casks of cement on the ground at the time the work was suspended, or immediately afterwards? Certainly.
19017. Did you not ask for 2,000 of those casks to be tested? Yes.
19018. And for the time being you were refused the test on the ground that it might give you something to go upon in connection with your claim? Yes. I believe that was your reason for refusing to test it.
19019. What was the first contract Carter, Gummow, & Co. had in the Sewerage Branch? No. 69.
19020. That firm had nothing whatever to do with Contract 79? No; 79 was Carter & Co.'s contract.
19021. As to the adoption of concrete in the carrier of 77, which is more costly, compo. or concrete? Concrete.
19022. And in spite of that you were willing to adopt it because you considered that it would make a better job, and Mr. Darley agreed? Yes, I do not think there was any correspondence on the subject. It was simply the outcome, as I have explained, of a series of tests.
19023. Are you sure that the earth channel below the outlet of the concrete channel upon Contract 72 was constructed larger than is shown on the contract drawings? No, I am not. I have very little recollection of the earth channel at all.
19024. Supposing the bottom width of the earth channel is 21 feet, with suitable slopes, is it not likely that the reduced quantities of the concrete channel and the earth channel would be similar? Probably. You must have a bigger carrying area in an earth channel than in a concrete channel.
19025. On account of what? On account of the friction. A concrete channel carries water with much less friction than does an earth channel. An earth channel is also bound to silt up to a greater or less degree in the case of storms, and you must make provision for that.
19026. As to the advances on material and the refund of retention money, do you know what the practice is in South Australia? Yes.
19027. Will you tell His Honor what it is? They advance on material, and they refund the retention money. I know that some considerable time ago we applied for some £5,000 of retention money, which was refunded to us.
19028. So that the practice in the Sewerage Branch is not dissimilar to the practice in other colonies? The practice of advancing on material and refunding either the deposit or retention money is universal as far as I know. We have never had any difficulty anywhere in that matter. It is done everywhere.
19029. As you are aware, one or two witnesses have alleged that certain defective work has been done in connection with your contracts—you remember, for instance, the evidence of Dawson and Darcus, and one or two others;—what have you to say with regard to that—has any defective work been done to your knowledge? No.
19030. Or by your direction? Not in any shape or form. I know absolutely nothing about it.
19031. What quantity of concrete would have made good the holes to which Dawson called attention as having been left? As far as I know, we expect to put it all back for £2 or £3. I have not been down to see exactly what is wanting.
19031. Even if Dawson had done this defective work at your instigation, the utmost saving to you would have been about £2? Yes.
19032. But it turns out that he did it for his own purposes? So I believe.
19034. It has been insinuated—I do not know in reference to whom—that an officer of the department had something to do with betting or some connection with racing affairs;—will you tell His Honor whether it has been your practice to keep any racehorses? No, I am not a racing man.
19035. Does any member of your firm keep racehorses? No.
19036. *His Honor.*] Keeping racehorses is one thing and betting is another? I do not do either as far I know; in fact, I very seldom go to horse races. Bicycle sports have a greater attraction for me.
19037. *Mr. Davis.*] You have been putting in tenders for sewerage works for how many years? Seven or eight years.
19038. You have put in dozens of tenders during that time? Scores of them.
19039. Will you swear absolutely that in the preparation of these tenders you received no assistance or hint whatever from any officer of the department? I swear that absolutely.
19040. And that the preparation of the tenders was entirely apart from and independent of any officer of the department? Exactly. I never thought we had any need to go to the office, even if we had had an opportunity, to obtain assistance in that direction.
19041. You pride yourself that you know a great deal better than the office what the value of work is? We do, naturally.
19042. So that you do not want to go to the office to get assistance in that way? No.
19043. In fact, I suppose you think that if you had gone to the office you would probably have been misled? We should not have obtained information which would have been of any use to us. I am certain of

of that. You must remember that we devote all our time to nothing but acquiring information and experience in regard to the one matter of underground sewerage work.

J. Carter.  
23 Sept., 1896.

19044. What have you to say as to the bluestone pitchers in the case of Contract 69 ;—do you say that you had no information as to the small quantity which was included in the schedule? No information whatever.

19045. *His Honor.*] Will you explain the whole affair as far as you know it? The tender was made up by Mr. Snodgrass; and honestly I do not think I knew that a certain price was put opposite this particular item until after the tender was in. Mr. Snodgrass made it up entirely on his own responsibility, Mr. Gummow being absent at the time in Adelaide—in fact, it was Mr. Snodgrass' duty to make it up. The only thing that I have ever been consulted about in reference to our tenders is as to the amount of profit we should put in. Our tenders are made out on business lines. The actual cost is arrived at apart from any schedule or anything else the Government may hand over to us. We do not depend upon them. We depend upon our own information. Then comes the question as to what shall be added on to the actual working cost for plant, supervision, contingencies, and profit. It was only when the question of these additions came to be considered that I was called on to look into the matter.

19046. What was your work, then, in relation to tendering and the carrying out of contracts before Mr. Gummow came into the firm—that is, while you were Carter & Co.? My work lay in seeing that all the material was provided at the lowest possible rates, and to the best advantage in every way, and that it was delivered on to the ground in sufficient quantities to keep the work going. I had also to represent the firm with the department in the cases of dispute and to settle financial matters with the bank. Contractors often want overdrafts, and all these matters have to be attended to. For years I do not think I was ever 3 feet below the surface in the case of our underground contracts, except, perhaps, for final inspection.

19047. *Mr. Davis.*] When did it first come to your knowledge that the price of £50 had been put into the schedule for these bluestone pitchers? Soon after the tender was in. Perhaps a day or so afterwards. I often met Mr. Snodgrass at the bank, and I would then ask him what was the amount of the cheque he required. In those days, under the old system, we had to base the amount of the cheque upon the lump sum of the tender. It was not as now.

19048. As to the £50, when did you hear of that? I heard of it after the tender was in. It is quite possible that I may have heard it on the same morning. I cannot say precisely. It may have been then or a day or two afterwards.

19049. *His Honor.*] Did Mr. Snodgrass tell you of the matter as a good joke—that is, how he had jumped at the mistake of the department? I think he said it was good business. Mr. Snodgrass took out all the quantities himself and estimated the probable quantities. Looking down the various items, he often told me where he thought we should make our point. It was our business to look after these various items.

19050. The number 12 in connection with the item of bluestone pitchers, the proper number being 30, would strike you as being an obvious mistake on the part of some one? Yes; it was presumably a mistake. Mr. Snodgrass would know that the practice of the department was to surround the manhole covers with pitchers in almost every case, and if there were twenty or thirty shafts there would naturally be that number of pitchers.

19051. Do you remember that Mr. Snodgrass told you that he had bowled out the department? Yes; no doubt he did. We often discussed such matters.

19052. Did it not strike you that the putting in of the price of £50 might be a dangerous point to take? I honestly thought that we went too far in that matter—that the amount was excessive; but it had been given in, and there was an end of it. If I had been there when the tender was made out I should have felt inclined to put in, say, £20; £50 was an excessive amount.

19053. You would have been afraid that it might have wrecked your tender? No; but one does not like to exceed a good price, because it leads to disputes, and disputes over prices between the department and contractors are never very paying or pleasant to either side.

19054. You did not have any dispute with Mr. Snodgrass over the matter? No; we never disputed. Every man in the firm did the best he could according to his view, and there was an end of it. If a mistake was made we all stood up to it.

19055. *Mr. Davis.*] Was there any other shot you made in that tender ;—did you make a shot in connection with the cement rendering? Yes.

19056. Did you hit the mark in that case? We were a little bit off the mark. Mr. Snodgrass estimated what he considered would be the amount of cement rendering required, and put in a good price for it, viz., 5s. The usual price would be 2s. or 2s. 6d., but he considered that at least the quantity set down in the Government schedule would be carried out. As it happened it was not.

19057. *His Honor.*] He made a bad shot in that case? We did not always come off, but that was in the business.

19058. *Mr. Davis.*] He estimated that the arches would be rendered, and it was decided just about that time that it was unnecessary to render the arches, and, as a consequence, it was not done in this case? No.

19059. It was not shown to be done in the drawings, and Mr. Snodgrass had not taken that into account? No.

19060. So that, if you made a point in regard to the £50 for bluestone pitchers, you did not make any in the other case? No; we are not always right any more than is anyone else.

19061. What about the timbering—why did you put down 1d. for timbering ;—can you explain that? I prefer not to explain it. I have only a general idea of these things.

19062. *His Honor.*] You mean, I suppose, that you prefer not to explain it because you think you cannot do so correctly? Yes; I do not do these things. I only get my information from other members of the firm. I do not know their reasons. I do not know how they arrive at these things, and I do not want to guess at anything.

19063. You think that you may perhaps make a mistake? Yes. I have a good idea of why it was done, but that is not actual knowledge.

19064. *Mr. Andrews.*] Would Mr. Gummow be able to explain it? Yes.

19065. *Mr. Parkes.*] In your schedule you tendered for cement facing at 5s. a yard, and the Government put down 11,600 yards at 2s. 6d., did they not? Yes.

19066. And you were paid for 12,000 yards at 5s.? I do not think so.

19067.

- J. Carter.  
23 Sept., 1896.
19067. Does not that appear in your final voucher? I do not think so. We have exceeded the office quantity, but as far as Mr. Snodgrass was concerned, he expected to exceed it very considerably. He would not be satisfied with 11,000 or 12,000 yards.
19068. *Mr. Davis.*] He went on the same lines as in the bluestone pitchers; he expected that the quantity in the schedule would be considerably below the quantity which would appear in the final certificate? Yes. There is no use in putting an excessive price upon an item which will work out exactly as shown in the schedule. You want to put an excessive price upon an item which is likely to be exceeded.
19069. *Mr. Parkes.*] But there was no diminution in the number of yards of cement facing? If the final certificate says that there was not, I suppose there was not; but I do not understand that that was the case. I understand that there was about a thousand yards under the schedule quantity. I am only trusting to my memory, and it is quite possible that there may have been a small increase.
19070. *His Honor.*] An increase generally means a loss somewhere else—that is to say, something else has to be kept down;—if you put one thing up you have to put another thing down, in order to make up for the increase; otherwise you would not keep your total low enough? Quite so.

William Henry Warren, sworn and examined:—

- W. H. Warren.  
23 Sept., 1896.
19071. *His Honor.*] I believe you wish to make a statement to the Commission? Yes. It has reference to Mr. Bagge's evidence. In reply to Question 13163, he made certain statements. One of these was that I was at one time in his office. That would be about fifteen and a half years ago. That statement is true. The rest of the statements, as far as they concern me, are entirely untrue. For instance he says "When the position of Professor at the University was advertised he asked me what I thought of it; I said 'By all means take it. I am afraid you will never be a civil engineer.'" I may say that I did not consult anyone whatever about that matter—in fact, I remember that Mr. Bennett was rather annoyed that I had not spoken to him about it. There was no conversation whatever between us on the matter. Then, in reply to the next question, he says, "I said to Professor Warren, 'You are a Dublin University man; you ought to be a good calculator.'" I am not a Dublin University man, and, as a matter of fact, he never said anything of the sort to me. I was at the Royal College of Science in Dublin, and at the Victorian University in Manchester. Further on Mr. Bagge says that Mr. Cardew, Mr. Hammer, and he himself, made calculations with me. Mr. Cardew did not. Of course it was my duty to make various calculations, but it is absolutely untrue to say that I made a calculation and got stuck in the way Mr. Bagge describes. That is entirely untrue.
19072. *His Honor.*] You did not get bogged? No.
19073. *Mr. Davis.*] Do you know about the failure of the Bondi sewer? I heard of it. That was due to the pumping, not to any defect in the strength of the arches.
19074. You inspected the sewer during construction? Yes.
19075. What is your opinion professionally as to the cause of the accident? Well, they were simply pumping the sand away and undermining it.
19076. It would have been impossible for it to have been caused as alleged by Mr. Bagge? Yes. Had there been another foot of thickness in the arch it would have been just the same. There was running sand at that particular spot, and you could pump it just like water.
19077. What was the pump working for? To keep the water out so that they could get the concrete in. There was a channel underneath, and it was necessary to keep the water out, because otherwise the flow of water would have interfered with the work.
19078. It was while the sewer was in course of construction that this thing happened—not afterwards, when it was in working order? That is so.
19079. *His Honor.*] They were pumping out the sumps, in fact, and the subducts were working too vigorously sucking in the sand? Yes. It was a difficult piece of work—one of the most difficult pieces of work they had in the Sewerage Department.
19080. Did you make any calculation at all as alleged by Mr. Bagge? I made a calculation as to the thickness of the sewer, and I made it out to be 3 feet, knowing full well that it might be too thick. No man living could make an exact calculation even now.
19081. Were not others engaged upon that calculation, as Mr. Bagge says? None that I checked with.
19082. Were not the gentlemen he named making that same calculation? Mr. Cardew at that time, I think, never made any calculations whatever as to construction. He was engaged entirely upon survey work. The whole of Mr. Bagge's version of the matter is a mass of mistakes, and he ought to be ashamed of himself for making such statements.
19083. You are sure that the gentlemen he mentioned were not making this particular calculation with you? Mr. Hammer may have made a calculation, but I have no recollection of it. I do not remember the circumstances at all. The sewer was 3 feet thick. I remember making a section of it.
19084. Have you seen much of Mr. Bagge of late years? No; I have not seen him for four or five years. I do not think I have seen him more than once or twice since I left the department.
19085. When you used to see a good deal of him in that way in the old days, does your recollection serve you as to whether he was then a man of accurate memory? He was a comparatively old man even then.
19086. Had his memory begun to get shaky at that time? I should hardly like to say that.
19087. You did not notice it then? No.
19088. As to whether that is the case now or not, you cannot say unless you take the evidence to which you have referred as a criterion? No, I do not wish to reflect in any way upon Mr. Bagge. I merely wished to explain that he had made these inaccurate statements.
19089. You do not wish to suggest that he voluntarily made these inaccurate statements;—what you suggest is that he made a mistake? I suggest nothing as to why or how he made the mistake. I merely say that the statements are untrue.

John Carter recalled and further examined:—

- J. Carter.  
23 Sept., 1896.
19090. *Mr. Parkes.*] I find that the quantity of cement facing in the case of Contract 69 was reduced from 11,600 yards in the schedule to 10,683 yards according to the final certificate;—those are the figures, are they not? Yes, I believe so. 19091.

19091. Your 5s. a yard was in excess of the price of all the other tenderers, was it not? I could not tell you that. J. Carter.

19092. For instance, the price of the Department was 2s. 6d., you had 5s., John Ahearn had 2s. 6d., Kerle and Kerle had 3s., Mackenzie and Son had 3s., M'Sweeney had 1s. 6d., Holloway Bros. had 1s. 6d., Carson had 1s. 6d., and so on? I expect those figures are correct. 1s. 3d. was the best item for the contractors as it turned out. We lost money on the 5s.

23 Sept., 1896.

19093. How did you do that? Because we had adjusted the amount to some of the other items.

19094. Can you tell me what other items specify cement facing? No other items; but the price was adjusted upon other items to allow us to put 5s. upon cement facing, upon the supposition that that item would be increased. As it turned out it was decreased, therefore we lost in both ways.

19095. *His Honor.*] Would the omission of the facing increase the cost of the brickwork at all by increasing your work in pointing? We had naturally to exercise a good deal more care in striking the joints and facing the work up than we should do if the work were afterwards to be covered with plaster.

19096. *Mr. Davis.*] You had nothing extra for that? No; we lost in every way through the item not being exceeded.

Thomas Edward Spencer sworn and examined:—

19097. *Mr. Davis.*] What are you? A contractor.

19098. Have you carried out any sewerage contracts? Yes; I carried out Contract 50 and Contract 67—Contract 50 being at Bourke-street and Riley-street, Woolloomooloo, and Contract 67 at the Glebe. T.E. Spencer.

19099. Upon these contracts you have used very large quantities of cement, both in brickwork and in bluestone and sandstone concrete? Yes; and in rendering.

23 Sept., 1896.

19100. I suppose it was necessary for you to keep in a general way an idea of what a cask of cement would make in both bluestone and sandstone concrete? Yes.

19101. Will you tell His Honor what your experience has been in the Sewerage Department with their specification in respect to these two kinds of concrete? I have always estimated that a cask of cement would make a yard of sandstone concrete, and that a yard of bluestone concrete would take about a cask and a fifth.

19102. That would be about 22 feet to the cask? Yes; we established that as a guide upon the Woolloomooloo contract. I do not know whether you or Mr. Smail were supervising the work at the time, but we measured a gauge of concrete in which a cask of cement was used. The stone was measured according to specification, under the superintendence of an inspector, and it measured, as nearly as possible, 22 feet. We adopted that afterwards as the gauge.

19103. And you were paid for concrete, where it was impossible to measure it, upon that gauging? Yes.

19104. That applied to all the bluestone concrete which could not be measured? Yes; Mr. Gledhill was the inspector who supervised the measurements.

19105. You considered that that was about a fair thing? Yes; we decided that it was about a fair thing.

19106. But even that measurement would fluctuate according to the position in which the concrete was used, and according to whether it was rammed horizontally or vertically? Yes; it would fluctuate even on the board itself. You could not measure two yards which would go exactly alike. The size and shape of the stone would cause a fluctuation.

19107. Still, taking all things into consideration, in the case of tunnel work, you consider that the measurement you have given is a fair thing? Yes.

19108. Have you had an engineer named Chiene in your employ? No.

19109. You do not know anything about him? No; absolutely nothing.

19110. I thought he said in his evidence that he had been in your employ? If he did he was wrong.

19111. Did you have Inspector Reid supervising your work? Yes; for a portion of the time.

19112. Did you form any opinion of him? I think we formed an opinion that he really did not know much about the work.

19113. Did he endeavour to do his duty? I think so, in accordance with his own opinion of his duty. He was always there, but the men used to complain to me that he hindered them in their work.

19114. In what way? Well, supposing they were putting timber in down below, he would insist upon having it done in his way, and it was often their opinion that his way was not correct. Then they would argue the matter out. There would then be five or six men standing idle for half an hour. I would then complain of the length of time occupied in the putting in of the timber, and the men generally said it was Reid's fault. I do not think I ever complained to you about it; but I know I was very much annoyed about it.

19115. You consider that he endeavored to do his duty, but sometimes he was too particular;—was that it? Yes—that he was deficient in knowledge. That was my opinion of him.

19116. *His Honor.*] You spoke just now about the gauging of cement; you do not mean, I suppose, that the quantities were afterwards allowed on that basis;—they were allowed on measurement, were they not? Yes, where it was possible to measure them. There were some cases where it would be absolutely impossible to measure accurately, and then we used to take the gauging, and allow a cask of cement to 22 feet of concrete.

19117. The Engineer agreed to that? Yes; it was agreed to by the Department and myself.

19118. In all cases where measurements could be made you were allowed upon those measurements? Yes.

19119. Did you ever tally the actual measurements against the measurement as it would have come out upon the basis you have given? Yes.

19120. Did you find that they fitted? I found in the case of the Glebe contract that they tallied within eleven casks of cement upon the whole work.

19121. How many casks were used? About 2,800. I think I paid for eleven casks more than ought to have been used upon the basis of the measurements, but that could easily be accounted for by waste in one way or another.

William

William Greenwood sworn and examined :—

W.  
Greenwood.  
23 Sept., 1896.

19122. *Mr. Davis.*] What are you? A civil engineer by profession; but I am a contractor now.
19123. You have been engaged for a number of years in carrying out concrete work in this country and also in England? Yes.
19124. You have had experience in sewerage work both here and in England? Yes; I have done sewerage work at home as well as here.
19125. Have you carried out any contracts for the Sewerage Branch of the Public Works Department? I think only one for the Sewerage Branch.
19126. Have you carried out any for the Water and Sewerage Board? I have done pipelaying for them, but I do not think I have carried out sewerage for the Water and Sewerage Board.
19127. You know the Sewerage specification for sandstone concrete? Yes.
19128. What have you found from your experience that a cask of cement will make in the case of sandstone and bluestone concrete? It depends upon the material.
19129. You would say that it would vary very much? Yes.
19130. What would make the difference? I have seen material delivered in Sydney go into sewerage work in bluestone concrete that would not make perhaps 20 feet of concrete. I have seen what you would call 1½ inch material delivered with all the shivers taken out of it; that would not bulk in the box, but had it been delivered as it left the crusher, with everything in except the ½ inch screening specified, it would bulk considerably.
19131. Would you say also that the position in which concrete has to be put would have anything to do with the bulking of it;—supposing, for instance, it has to be put in over the arch of a sewer where you have to ram it horizontally, and then supposing, on the other hand, that it had to be put in between boxing where you could ram it vertically, would the two positions have anything to do with the bulking? If it went in upon the top of the centerings in a sewer in a tunnel it would have to be rammed horizontally, and then you could not ram it tightly if it were thin work.
19132. And a cask of cement would go much further under those conditions than under conditions where you could ram vertically? It would not make more concrete, of course, when it left the platform, but it would fill up more space.
19133. Inasmuch as it had to be rammed horizontally? It could not be rammed as tightly, even in the case of a railway tunnel where it runs 1 ft. 6 in. thick. You would not be able to get it in tightly.
19134. Would you say that the quantity of water had anything to do with the quantity of concrete which a cask of cement would make? It would make a material difference. I have known work to be done for the Corporation which has varied as much as from 10 to 12 per cent. I know that when the inspector made me use less water I gained so much in the cube yard. I know that directly he told me to put in dry concrete I gained directly as regards the quantity of material. The concrete would not be so dense as if it were put in wet.
19135. You know the kind of work which is carried out by the Sewerage Branch, and you know also the specification;—what would you say, in view of the specification and the material used, that a cask of cement would make in the case of bluestone and sandstone concrete? It depends upon whether a contractor knows his business, or upon whether he is new to the work. Take the case of 1½ inch metal. Some contractors would use it without any small stuff in it at all, but a contractor who is up to his work knows better than that. He would take care to include as much small stuff as he could. Take material coming from Kiama, if there had been a demand for screenings for asphalt, you would find a lot of the small stuff taken out. You buy it by measurement, not by weight. You can tell whether you have been robbed of the screening by the measurement. If the small stuff is not in, then the sand and cement will not bulk it. They simply go to fill the interstices. In my own case I should take good care that they did not rob me of the screenings. I should take care that I got all the stuff that came from the crusher with the exception of ½ inch screenings, as provided by the specification. Some contractors, on the other hand, would take the stuff without the screenings, and that, of course, would make a difference in the bulking.
19136. In your judgment they would lose? There is no question about that. Some of them find it out before they have finished their contracts.
19137. Which, in your opinion, would make the best concrete? The stone with all the fine stuff in.
19138. That would make better concrete, you think, than stone with all the fine stuff eliminated? If all the small stuff is in, you get solid concrete. If it is taken out, you will get a certain amount of honey-combing.
19139. Can you express an opinion as to the quantity which a cask of cement will make? It ought to make 22 feet of concrete in the case of bluestone.
19140. What would it make in the case of sandstone if all the small stuff were left in and if only the sand were eliminated? The same thing applies there. It depends upon whether the stone is hand-broken or whether it is broken by a crusher. If it were broken by hand, there would not be very much small stuff in it. If it were crushed you would have a greater proportion of small stuff.
19141. Suppose the stone to be broken by a crusher, what would a cask of cement make? If it were broken by a crusher a cask of cement ought to make a cube yard.
19142. What would it make if the stone were knapped? It would depend upon whether it were hard stone or soft stone. If it were soft stone it would make more fine stuff in breaking.
19143. You seem to think that the conditions under which concrete is made would be so various that it would be almost impossible to arrive precisely at the quantity which a cask of cement would make? Yes.
19144. You think it would vary considerably in different places under the same contract? If I were going to make up a tender I should have regard to the quarry from which I intended to obtain the stone. The harder the stone the less small stuff there would be in it.
19145. And under those conditions you would allow for more cement? Yes; then there is another consideration—a great deal depends upon the manner in which the box is filled. If a man is strange to the work, and if he fills from the corners, and having first got in all the rough stone, puts a little fine stuff on the top, the concrete made from that gauging will not bulk as much as concrete made from a gauging in which the small stone had been mixed thoroughly with the bigger stone throughout the box.
19146. You have carried out woodblocking contracts both for the Corporation and for the Government? Yes; I have done the bulk of the Harbours and Rivers woodpaving, and one-third of the corporation work.

19147.

19147. Did you get any extension at any time from the Government in any of their works—I mean an extension of your contract? Yes. Take the case of the Circular Quay wood-paving. I think the contract was about £22,000 when I took it. When we got to the French wharf there was an application for an extension, and the Government gave me the 30 per cent. of additional work at contract price.

W.  
Greenwood.  
23 Sept., 1896.

19148. You obtained an extension of that particular work 30 per cent. over and above the amount you had signed for in the contract? Yes.

19149. *Mr. Carter.*] Do you know the firm of Carter, Gummow, & Co.? I know Mr. Gummow.

19150. You would say that the firm consisted of men of some experience, and that they would be likely to know how much a cask of cement would make in sewer work? As far as sewer work is concerned, they are more experienced, probably, than any other firm in Sydney.

19151. *Mr. Parkes.*] If you were mixing for concrete, and you put in the larger material first as you have described, and then put the siftings on the top of it, you would still have a further process, because it has to be mixed three times dry, has it not? It is mixed twice dry.

19152. That would mix the large and small stuff pretty uniformly? Yes; but you would not make more of it. It would not increase the bulk. If the stone were mixed as you suggest, it would not bulk as much as if the fine stone were run right through the box.

19153. You think that after you had mixed it it would decrease in bulking? It would be bound to decrease if it were put in the box as you suggest.

Andrew Eaton sworn and examined:—

19154. *Mr. Davis.*] What are you? A contractor.

19155. Have you carried out any work for the Sewerage Branch of the Public Works Department? Yes.

19156. You have a contract now? Yes.

19157. For how long have you been carrying out work in the Sewerage Branch? About three years.

19158. You have, necessarily, watched pretty closely the quantity of cement that you have used in your work? Yes; we have checked the quantity of cement against the Engineer's measurements every month.

19159. So that you are in a position to say what a cask of cement will make in bluestone concrete and in sandstone concrete under the conditions in which you have carried out your work? Yes.

19160. Will you tell His Honor what your experience has been? In the case of the Croydon job, 5,000 yards of concrete ran out at 26 feet to the cask in the case of sandstone concrete. At Double Bay, 3,500 yards ran out sometimes a little over 26 feet, and sometimes at 26 feet.

19161. And what about the bluestone concrete? At Croydon, a little over 1,200 yards ran out at 23 feet, and at Double Bay 400 yards ran out at 23 feet.

19162. That is all storm-water sewer—open work? Yes.

19163. And the concrete was put in between boards? Yes.

19164. You were able to ram all the concrete vertically? Yes.

19165. Did you have in your employ a man named Chiene? For a short time.

19166. Will you tell His Honor what was your experience of him? He did not suit us; we got rid of him.

19167. What was your reason for getting rid of him? He was unsatisfactory in every way.

19168. Could you tell us in what way? There were so many ways in which he was unsatisfactory. I could not very well describe any particular thing.

19169. *His Honor.*] What was the way in which he was most unsatisfactory? It was principally the way in which he set out the work. There were other things in connection with it. He did not suit us. We only gave him the work because when he spoke to us he said he was very hard up and we should be doing a charity if we gave him a job—if we could find anything for him to do. We said we would look round and see what we could do, and we finally engaged him provisionally at 15s. a day. After the first day we saw that he would not suit, and as things went on we found him altogether unsatisfactory and got rid of him.

19170. Is there any other reason for your doing so besides the fact that he was not able to do the work? There was a reason.

19171. Are you at liberty to give it? One of the principal reasons was that he deceived the engineer in one of his measurements. When I saw a copy of the voucher I pointed out the mistake to Chiene, and he asked us what it mattered to us whether it was right or wrong so long as we got the money. I said that that was not the way in which we did our work, and that the best thing he could do would be to get the voucher altered. At the next measurement, instead of making any alteration, he left things as they were, and I would not put up with that.

19172. *His Honor.*] Was he putting in excessive measurements? He measured a length of sandstone concrete as bluestone concrete.

19173. *Mr. Parkes.*] I suppose you were highly indignant at that? I was, because it was bound to be found out sooner or later, and then our voucher might be kept from going through. We do not engage men to do what is wrong; we engage them to do what is fair. As a matter of fact, the mistake was seen the very next time a measurement was made.

19174. *His Honor.*] Did Chiene say that he had made a mistake;—did he excuse himself on that ground? When I pointed it out to him he said he thought he was doing us a good turn in getting the sandstone concrete measured under a different item in the schedule. I have kept the two vouchers showing where the error was made and where it was corrected.

19175. Is Chiene a thirsty soul? When a person does not drink himself I fancy he is not able to form an opinion as to whether another man drinks or not. Chiene never asked me for a drink, but he borrowed money from some of the men on the job. I did not know that until we had got rid of him.

19176. When you got rid of him did you find out that that was one of his weaknesses? Yes.

19177. That he was a thirsty soul? Yes; I did not know it at the time.

19178. *Mr. Parkes.*] Did you ever see Chiene drunk upon your works? No; I was seldom on the works. The control of the works was left principally to the foreman on the job.

19179. Did you see Chiene on the works at all? Yes.

19180. Was he sober when you saw him? Yes, as far as I could judge.

A. Eaton.  
23 Sept., 1896.

- A. Eaton. 19181. What did he say in explanation when you represented to him that he had returned sandstone as bluestone concrete? What I have just told you—that he thought he was doing us a good turn in getting the sandstone concrete measured under an item in the schedule for which we were getting a higher price.
19182. Did he say he had ever done that on any job? I did not speak to him about it. I said it did not suit me.
19183. Did he say he had made a custom of doing that on any other job? No. When we left the engineers' office he came up to the tram with me. He showed me a copy of the voucher in pencil, and I showed him where the mistake was.
19184. You said just now that he made the measurement with the engineer? He and the engineer made it up in the engineers' office.
19185. Who was the engineer? Mr. Henderson.
19186. Did he not go down to look at the work? I suppose he had a look at the work. He was a new man altogether. It was the first job of that description that he had to look after.
19187. Did he find out that the sandstone concrete was paid for as bluestone concrete? He found it out afterwards.
19188. Did he find it out before you did? He spoke to me about it.
19189. Before you spoke to Chiene? No; it was after I had got rid of Chiene.
19190. He spoke to you about it first? Yes.

Joseph Davis recalled and further examined:—

- J. Davis. 19191. *His Honor.*] A clear explanation of the functions of the Tender Board and the Board of Reference has not yet been given; will you explain the functions of the two bodies? The Tender Board is composed of the Minister as President, of the Under Secretary, as Vice-President, and of the heads of branches; and their province is to receive tenders on stated occasions, and to declare the result in the presence of the public. The tenders are then passed on to the officers concerned—that is to say, if it happened to be a sewerage tender it would go on to the head of the Sewerage Branch, and so on. Then, at the next meeting of the Board of Reference, the tender would be submitted to the Board for consideration by the officer concerned. The Board of Reference is composed of the Under Secretary, as President, and of the heads of branches, and they recommend to the Minister the acceptance or non-acceptance of the tender. In addition to dealing with tenders—for dealing with tenders is a very small part of the work they have to perform—they deal with all matters, technical and otherwise, which arise in the Department—in short with any matter concerning which the Minister wishes to obtain their opinion. They deal also with any matter which may arise in connection with any one of the branches and which may be referred to the Board by the head of the branch; also with any matter concerning which the Under Secretary may require the opinion of the Board before submitting it to the Minister: so that while the constitution of the Board of Reference is similar to that of the Tender Board, the two bodies are quite distinct. The Board of Reference does not, of course, include the Minister. I think that briefly explains their functions.
19192. *Mr. Norrie.*] The Tender Board deals exclusively with tenders? Yes.
19193. And the Board of Reference with matters generally affecting the Department? Yes.
19194. The Chief Clerk of the Department is Secretary to the Tender Board? Yes.
19195. And Mr. Holliman is Secretary to the Board of Reference? Yes.

FRIDAY, 25 SEPTEMBER, 1896.

Charles James Henty sworn and examined:—

- C. J. Henty. 19196. *Mr. Gummow.*] What are you? A merchant.
19197. Of what firm? Parbury, Henty, & Co., of London and Sydney, and James Henty & Co., of Melbourne.
19198. You deal largely in cement—you import large quantities? Yes.
19199. And you sell it to contractors and to other persons? Yes.
19200. Were you a bondsman for Carter, Gummow, & Co. for one of their contracts? Yes.
19201. If it has been stated that Mr. Henty, who supplied the firm with cement, was a bondsman for the firm, that would apply to you? Yes.
19202. If it has been stated in respect to that particular contract that one of the sureties was a supplier of cement, and the other a supplier of iron;—would that apply to you? Yes. I was surety for the contractors in respect of Contract 69. There were two sureties, as far as I can remember.
19203. What have you to say as to this statement—that “there were two sureties of a very doubtful nature”—is that correct, as far as you are concerned? No; distinctly not.
19204. Do you know for what amount you were a surety? £4,600 odd, I think.
19205. Would you have met that liability if you had been called upon to do so? Certainly I would. I do not undertake anything I am not willing to meet.
19206. Did you ever hear that the contractors received any of the retention money back during the progress of the work? No; not that I can recollect. I do not think I did.
19207. If they did receive any back would you try to make it an excuse for breaking your portion of the contract? I should be sorry to make any excuse. If I once signed a contract, I should not go back upon my signature.
19208. Do you consider that you were liable right up to the end of the contract for the bond you signed? Until such time as I was properly released I consider that I was liable. Whether that release took place at the end of the contract or before I do not know myself, but I do not wish to shirk any liabilities.
19209. Have you had inquiries made by the Commission as to your cement deliveries to Carter, Gummow, & Co.? A few.
19210. Did you supply any invoices? Copies of invoices were supplied.
19211. Did your staff supply them? Well, that is a point upon which Mr. Christie and I do not quite agree, and with His Honor's permission I should like to explain the matter. I received His Honor's note on the 20th June. It was an extremely awkward date, because we were starting our annual balance. I explained

C. J. Henty.  
25 Sept., 1896.

explained to Mr. Christie that it would be very awkward for us to put any of our staff on to the work, and I asked him whether he could send one of his clerks down. He said he was too busy to do so, and we mutually arranged to get outside aid, and that any clerk from outside who compiled the returns should have every facility for doing so. As a matter of fact, a clerk came in, and if there was anything which he could not readily trace I did my level best to help him in the matter.

19212. Have you the original returns with you? Yes; I believe they have been handed to the Commission by Mr. Christie.

19213. Are they the returns made out in your office? Yes.

19214. With regard to the deliveries, do you know whether the deliveries given in that return are correct as regards the places and other details? The bulk of them I should say were correct. There were one or two items upon which Mr. Christie and I disagreed, and I last night went through them again, taking this return as a basis. I then drew up a sort of summary, which I think pretty well explains the position.

19215. Have you it with you? Yes; it is a tabular statement; it shows the number of casks, and, as nearly as possible, the localities to which they were delivered. [*Vide Appendix No. 75.*]

19216. *His Honor.*] Does it exhibit any difference which may exist between the result you arrived at and the result which Mr. Christie arrived at? Yes.

19217. That is what it is arranged to show? Yes; there is a little difference between Mr. Christie and myself. The item of 832 casks is the principal item.

19218. *Mr. Parkes.*] Is there any difference between the two totals of the quantity of cement delivered on to all contracts? None whatever. We credited Carter, Gummow, & Co., with 832 casks of cement, which had been returned; but I am not in a position to say where it actually came from. I have included it as probably returned from Marrickville, but I am not in a position to swear where it all came from.

19219. Did you tell Mr. Christie where it came from? No, I think we put down Marrickville with a query.

19220. As to the delivery of these different quantities of cement—did you guarantee them as correct when Mr. Christie previously went to your office? I cannot say that I guaranteed them as correct. It is a big undertaking in respect of a lot of cement like this. I should be very sorry to guarantee it cask for cask. I went through the items yesterday with Mr. Christie, and I think we then agreed to the doubtful items.

19221. If Mr. Christie, in answer to my question 8510, "Did the firm give you particulars of the delivery definitely?" said "Yes," would that be correct? Up to a certain point the particulars given would be correct. Some of the items were queried. I should not like to say that the return was absolutely correct.

19222. Am I to understand that at the time to which I refer, or at the present time, you could guarantee the delivery of the whole quantity? I can say this—that we have traced, as far as we could trace them, the orders. Some of this cement has been delivered by order. Some of it has been delivered to carters, and some of it has been lightered. We can trace from the carters' receipts the carting of some of it to different places. I have no hesitation in saying that the return is correct in respect of those places where we have been able to trace it. As to the lightered portion—having access to the lighter books and accounts—we can say that those entries are correct. There are, however, some items which are doubtful. For instance, there is an item which was delivered in the first instance from Dalton's bond. Mr. Holden, who made out this return, I believe, ascertained that it was delivered to Molloy to cart to Marrickville.

19223. *Mr. Parkes.*] Is that the only one? There are one or two very small items, which are not very material. There is another item of 134 casks delivered to Molloy, the carrier, for Marrickville, and then, of course, there is the item of 832 casks.

19224. Those are the whole of the items that are queried? That is all that are of any consequence. There are fifty casks queried in connection with North Shore;—200 out of a delivery of 250 were charged to North Shore; but I am not positive as to the whole quantity, and I would not swear concerning anything about which I am not positive.

19225. Do you know when Carter, Gummow, and Co. buy cement off you whether they buy it for any particular contract? Sometimes the contractors will mention a definite job, and at other times the entry is simply so many thousand casks to Carter, Gummow, & Co.

19226. Does it say where the cement is delivered to? It is delivered wherever the contractors may direct. For instance, we have a contract running now with Phillips and Rhodes in connection with their sewerage and ventilating shafts. The contract covers delivery to anywhere Phillips and Rhodes may direct. All-round contracts are often taken like that.

19227. Do you deliver at the same price everywhere? In connection with these contracts I have averaged the prices, taking the long distances with the short distances. We sell for city delivery, and if there is any carting outside the city boundary that would be a matter of arrangement between the carriers and ourselves. We charge the contractors that price on. They pay the extra cartage.

19228. Have you not had a transaction with Carter & Co. lately for 6,000 casks city delivery? About what date?

19229. About the middle of last year? Yes.

19230. That delivery extended over some time? Yes. I forgot the exact quantity. We have a contract with Carter, Gummow, & Co. which is under delivery now.

19231. You usually contract for city delivery, and then charge the contractors whatever sum there may be above that? Yes.

19232. So that it is immaterial to you where the cement is delivered? Quite so.

19233. Do contractors buy off you subject to any test? Subject to the Government test.

19234. And if the cement does not pass the test, who has to stand the loss of delivery and return? The importers, I am sorry to say.

19235. The contractors do not? No.

19236. So that it would be of no benefit to them to try to use condemned cement, or to force it on? No, I cannot see where any benefit would come in, because if they were to do that they would forfeit their claim upon the importers in the event of any trouble arising.

19237. Have contractors ever bought any cement off you other than subject to Government test for any Government work? Not for any Government work.

19238. Not for any work connected with the Sewerage Department? No.

19239. Do you know whether the cement you issue to any contract is used upon that contract, or whether it may be shifted to other contracts at the contractors' own option? I could not say at all what becomes of the cement

C. J. Henty, cement when it leaves our hands. After that we do not know what becomes of it unless we receive notice that it has been condemned, and then we know very quickly.

25 Sept., 1896.

19240. Have you ever had a conversation with Mr. Carter upon the question of the firm's keeping books? Yes.

19241. What kind of conversation was it? It was not very serious. It was a chaffing or jocular conversation more than anything else.

19242. When was it? It must have been from three to four years back. There was at the time I think a fair sized cheque standing out, and Mr. Carter came into the office. I made some jocular remark as he passed my door, saying, I think, that I was glad to see him. He said, "I suppose you think I have a cheque with me." I think, therefore, that I can fix the time of the conversation by the amount of the cheque. On looking over these returns I am inclined to think that the conversation must have occurred some time prior to any of the dates included in it.

19243. Have you any idea how long ago it was—was it two years ago? I think it must have been over three years ago.

19244. Before there was any talk of this Commission? Yes. I think there was from £2,000 to £3,000 owing at the time. I thought I could trace the time by the amount in this return; but the conversation must have occurred prior to any date contained in this return, that is prior to May, 1892.

19245. What was the conversation;—can you remember the substance of it? It started in the way I have already stated. Of course, I cannot swear to the exact words. Mr. Carter said he had not brought a cheque, but that he would go to the Bank and see if he could get one. I think I then told him that he need not do that, and asked him whether he had had his Bank balance that morning. He then said that he did not know how the firm stood financially until he went up to the Bank. It then came out in the conversation that he did not keep any books in connection with the firm. That struck me as being very funny. I told him I thought it was wrong not to keep books, and he then explained to me his reasons for not doing so. The reasons were these—the creditors were very few. He mentioned cement, iron, and a few other items; I forget exactly what they were. He pointed out that a monthly statement would show what was owing, and that the payments from the Government would show what they had already had on the contract and the balance owing, the Bank passbooks showing the credits and debits. It seemed to me to be a happy-go-lucky way of doing things. As far as I can remember it, that was the substance of the conversation.

19246. So that after that conversation you were satisfied that the firm did not keep books? That was the inference I drew.

19247. Did you do business with them afterwards? Yes.

19248. Did you ever have any trouble about getting your cheques? None whatever.

19249. Do you ever have any fear about not getting them? No.

19250. Did you find out anything about the firm;—did you make any inquiries concerning them? I cannot say I did. I understood from people who had been trading with you prior to my coming to Sydney that you had always paid your way; and, as you had always paid your way with me, I took you as I found you.

19251. There was a cheque paid to Parbury, Henty, & Co., on November 6th, 1895, for £2,946;—for how long was that amount running before it was paid, do you know? The average of the deliveries of that payment would be about the end of September.

19252. Did Mr. Carter ever offer you any cheque before the time when he paid you the £2,946? Several times Mr. Carter has offered to square up, and I have told him that there was no hurry, and that we were not in want of money. In this case he may have offered me a cheque or he may not. I may say that Mr. Carter and myself are good business friends. We chaff a good deal in business hours, I am afraid.

19253. *His Honor.*] You trust each other? Certainly; I trust Mr. Carter, and I hope he does the same to me.

19254. *Mr. Gummow.*] You were not at all afraid of not receiving payment from the firm? No, never.

19255. Did you know the position of the firm at that time;—did you know how they stood financially? I did not know their actual financial standing. I always looked upon them as sound men. They always paid their way with me. I never had the least trouble with them.

19256. Had you any connection with the firm in regard to any of their contracts other than the signing of the bond for them? None whatever.

19257. You did not assist them in any way? No, never. I may say at once that I am not allowed to interest myself in anything outside my own business according to our deed of partnership.

19258. Would you like to make any statement as to the question of your being a surety for the firm, and with regard to the question of your being doubtful financially? I thought it was rather a rough thing to say.

19259. *Mr. Parkes.*] You will see if you look at the wording of the speech in *Hansard* that the observation refers to the manner in which the sureties were taken? I have not read *Hansard*, but I saw your remark published in the newspapers. You may remember that I mentioned it to you, and I understood you to say that you did not wish to throw any slur on my standing financially or anything of that sort.

19260. If Mr. Gummow were to read the whole of the sentence in *Hansard* you would see exactly what was meant? I merely wish to have any insinuation of that kind—if there were such an insinuation—clearly explained. It is a matter of importance to a man like myself who is trading in many foreign countries and whose signature is known in London, India, China, and on the Continent of Europe. It is rather a nasty observation to have floating about. I may mention that when I saw it I had written a letter to the newspapers concerning it; but, seeing that the whole matter was *sub judice*, I determined not to have it published, hoping that there would be an opportunity to obtain a withdrawal of the statement here.

19261. *Mr. Gummow.*] Mr. Parkes in his speech said "Now the very first contract I turn up here, although the specification provides for a cash deposit to be put down on the Secretary for Public Work's authority, they are allowed to substitute two sureties of a very doubtful nature";—do you not consider that the word "surety" there applies to you? It certainly looks like it.

19262. *Mr. Parkes.*] But if you punctuate the sentence and read it differently you will find out how it does apply? I have not read it; it was owing to several persons talking to me about it that I felt a little warm about it at the time.

19263.

19263. *His Honor.*] I suppose they chaffed you about it? Yes; it was more good-natured chaff than anything else. I took the first opportunity, when Mr. Christie introduced me to Mr. Parkes, to tackle him about it. C. J. Henty.  
25 Sept., 1896.

19264. *Mr. Parkes.*] You will see that the sentence has reference only to the change of method—that is, from a cash to a personal security—and also to sureties being taken who were suppliers of material to the contractors? I should be quite satisfied if you would state definitely that you did not wish to throw any doubt upon my financial standing.

19265. Certainly I did not? Then I am quite satisfied.

19266. You will see that no names are mentioned? But even so, most persons would know that I am one of the largest suppliers of cement to all Government contracts.

19267. *Mr. Gummow.*] I will ask you to refer to what is said upon page 27 of *Hansard*. In the same speech Mr. Parkes says, “On the Engineer’s advice the Secretary for Public Works substituted two surety bondsmen, namely, Mr. Scrutton, who supplied the iron to these contractors, and Mr. Henty, who supplied the cement”? Yes, I see that my name is mentioned. What I really wish is that my name should be cleared of any suspicion of my not being a man of sound means, or of my being of a doubtful character in any way. Mr. Parkes, I understand, has already said that he does not wish to cast any slur upon my character, financially or otherwise, so that I am quite satisfied, and I suppose His Honor is also satisfied.

19268. *His Honor.*] As far as I am concerned, you need not trouble yourself at all? Then I hope the Press will make a note of what has been said on the subject.

19269. *Mr. Gummow.*] Mr. Parkes was in error in stating that he did not mention your name in the speech? Yes; he certainly referred to me.

19270. *Mr. Parkes.*] But I had no intention of saying that you were a doubtful man. All I wished to say was that the bonds were of a doubtful nature? I took it to be a personal matter, or I should not have tackled you in the way I did.

19271. I should have said doubtful men instead of bonds of a doubtful nature if I had intended what you suggest? I think I ought to say that the observation as published in the Sydney papers was noticed by my friends in Melbourne.

19272. Your name was not mentioned in the Sydney papers, was it? Yes.

19273. I will set the matter at rest by asking you if at the time you signed that bond you would have been able to make a statutory declaration that you were worth cash equal to £4,600 over and above your just debts and liabilities? I had not £4,600 lying in the bank at the time, but I was in a position to raise it, of course.

19274. But you were not in a position to make a statutory declaration that you had that amount in cash at the time? I had not that amount to my credit at the bank at the time, but I was worth it, of course.

19275. In connection with these returns which were prepared in your office, the only assistance Mr. Christie had was that of the son of your bookkeeper, was it not? Yes.

19276. He was brought in at your suggestion? That is not quite the right way in which to put it. I suggested that an outside clerk should be brought in, and Mr. Christie guaranteed his expenses.

19277. You recommended this young man? Yes; because he was the son of my bookkeeper. No firm cares to have any person called in haphazard to look over their books.

19278. Mr. Christie said himself, did he not, that he would not take the responsibility of doing the work, for fear he would be challenged. Since the return has been made out Mr. Christie has told me that he considered it my work, and not his. It is only splitting hairs, as far as I can see.

19279. As a matter of fact the son of your bookkeeper worked with his father in getting this information,—that is, the father assisted him, did he not? Very little, if at all.

19280. Still, I suppose he would refer to his father? No; if he was in doubt he referred chiefly to Mr. Christie or to myself. If there were any matter in which I could help him I put him in the way of getting the information. I think his father was pottering about there one morning for some time. If you know the man you will know what I mean when I say that he was pottering about.

19281. There is no doubt that the whole of the figures in Mr. Christie’s return are correct with the exception of the two items of delivery you spoke of? As far as the extracts from the ledger are concerned they are without doubt correct. I checked them myself. As far as the quantities and prices of the cement are concerned they are without doubt correct. As to the deliveries, their correctness would be dependent to a great extent on outside information; but, as far as I can see, they are practically correct. The information has been inferred in some instances. The information we have points to the place where the cement was delivered in those instances; but I cannot positively swear that it did go there.

19282. Take the 832 casks which were returned from Marrickville;—your charge is 8d. for cartage in that case, is it not? Yes.

19283. And you have made a charge of 8d. in this instance? Yes.

19284. That would indicate, would it not, that it came from Marrickville? No; not definitely, because 8d. is charged in the case of North Shore as well. Mr. Christie and I were talking about this item last night, and we agreed to query it as “probably Marrickville.”

19285. It came from one place or the other? I could not say. I had better explain how this credit came to be made. At the time there was a great deal of cement being chopped and changed about. Mr. Davis will know that at that time the rejects were very heavy, and most importers of cement had a great deal of trouble to keep contracts going—so much so that I brought several thousands of casks from Melbourne to keep pace with our orders, and lost heavily over it. There was a shipment per “Talavera” which we were using as a sort of sink; instead of keeping all our shipments open we put all our returns under the heading of one ship, and then we only kept one account sales back to square the others. This credit note, which shows the return of 832 casks, is a credit note out of that shipment. The cartage is put down to a contract which we then had running with Carter, Gummow, & Co., and that is how the 8d. cartage gets in. It looks as if it came from Marrickville, but I should not like to swear that it did, because I am somewhat in doubt about it.

19286. Molloy carted it? Yes.

19287. If Molloy says that he carted a certain quantity of cement from Marrickville that would settle the doubt? Yes; he would know a great deal better than I do. In going into the matter we found that many items of the cartage account fitted in, so to speak, with the invoices. I believe Mr. Christie has a copy of Molloy’s cartage account.

19288.

C. J. Henty. 19288. I would like you to read the summary of cement deliveries which you prepared with Mr. Christie last night? Yes; it is as follows:—  
25 Sept., 1896.

|  |       |   |        |
|--|-------|---|--------|
| <i>North Shore—</i>                        |       |   |        |
| Definite.....                              | 4,200 |   |        |
| Probable.....                              | 100   |   |        |
|  |       | — | 4,300  |
| <i>Marrickville—</i>                       |       |   |        |
| Definite.....                              | 7,367 |   |        |
| Probable.....                              | 128   |   |        |
|  |       | — |        |
|  | 7,495 |   |        |
| Probable returned.....                     | 832   | — | 6,663  |
| <i>Annandale, Leichhardt, and Rozelle—</i> |       |   |        |
| Annandale.....                             | 5,924 |   |        |
| Leichhardt and Rozelle.....                | 595   |   |        |
|  |       | — | 6,519  |
| <i>Waverley—</i>                           |       |   |        |
| Definite .....                             | 100   |   |        |
| Probable .....                             | 150   |   |        |
|  |       | — | 250    |
| <i>Sundries—</i>                           |       |   |        |
| Drummoyne .....                            | 24    |   |        |
| Garson Bros. ....                          | 150   |   |        |
| Not traced .....                           | 64    |   |        |
|  |       | — | 238    |
|  |       |   | —      |
|  |       |   | 17,970 |

19289. Mr. Christie's statement then varies very little from yours? The chief difference is in respect of the 832 casks and the item of 66 casks.

19290. It only varies in respect to the delivery in those cases? Yes.

19291. Not in the totals? No; the totals cannot be wrong, because our ledgers show them, and the books cannot lie.

19292. There is no doubt, for instance, about the delivery of the 6,519 casks to Annandale, Leichhardt, and Rozelle? No, there is no doubt in my mind about that.

19293. What date is given in your return as regards the 832 casks? 150 on 25th July, 1894, 98 on 27th August, 1894, and 584 on 7th September, 1894. Those are all stated as "*ex Talavera.*"

19294. What is the date of the first delivery to Annandale? 10th September, 1895, 800 casks.

19295. Among your accounts against Carter & Co. there is a return of 2,000 casks, 7½d. being charged for loss on resale;—can you explain that? It is not a return; it has never been delivered. There were 2,000 casks of cement that came in to us if my memory serves me right, and instead of delivering to Carter, Gummow, & Co. we cancelled the sale and charged them the difference between our selling price to them and the then market price.

19296. Do you recollect the date upon which the contract was made for that supply? No.

19297. Had it been any length of time in hand? That I could not say.

19298. The quantity is not exactly 2,000; it is 1,925, is it not? There is an item of 1,000 casks, the date of which is 29th November, 1892. Then there is an item of 925 casks also under date 29th November, 1892. Those are the two credit notes.

19299. Was that cement tested in the stores, or was it sent to the job and tested? I cannot say.

19300. On what date was it invoiced? On 24th October, 1892.

19301. Do you remember where it was delivered to? I should not like to say for certain. It was invoiced on 24th October, 1892, and it was credited on 29th November, 1892. As to the delivery, it does not appear to have been traced. It was simply debited and credited.

19302. What is the loss with which you charged the contractors on both of these items;—what did you charge in the case of the 1,000 casks? I have only a total credit—£31 5s. Speaking from memory, I think the charge was 7½d.

19303. Do you recollect what the charge was in the case of the 925? We debited them at 10s. 10½d., and we credited them at 10s. 3d.

19304. That would be 7½d. for the 1,925 casks? It looks like it.

19305. *Mr. Gummow.*] Were the 1,925 casks included in the return you gave to Mr. Christie? No; one item has cancelled the other.

Joseph Davis recalled and further examined:—

J. Davis. 19306. *Mr. Smith.*] With reference to this matter of the new general conditions;—you stated in your evidence the other day that the new general conditions were approved on the 4th February, 1894? Yes.  
25 Sept., 1896. 19307. That was when formal Ministerial approval was received for the whole lot of them? Yes.  
19308. But you have searched the minutes of the Board and have ascertained upon what date this particular clause relating to retention money—I mean the payment clause—was passed by the Board? Yes; on 28th December, 1891, as far as can be gathered from the minutes.  
19309. And after that, in anticipation of the final approval, that clause was acted upon? Yes.  
19310. The minute of Mr. Hickson's, to which you referred the other day, afforded only one instance, among many others, in which the operation of that clause was anticipated? Yes.

19311.

19311. You have prepared a report as to the cement? Yes; I have made a memo. showing briefly the way in which I regard the question of cement, as it has been put before this Commission, in connection with the quantity which would be used in the works. It is as follows :—

J. Davis.  
25 Sept., 1896.

Referring to the evidence given by Mr. Christie as to the amount of cement purchased between the 1st January, 1892, and 30th June, 1896, wherein he states that the contractors have purchased for Contracts Nos. 69, 79, and 79A, 13,431 casks, and assuming this to be approximately correct, I have made the following calculations, based upon the data attached hereto, viz. :—

Sandstone concrete—1 cask of cement makes 27 cubic feet of material in place.  
 Bluestone " " " " 22 " " " " " " " " " " " " " " " "  
 Brickwork in 1 ring—Mortar, " 10 per cent. of bulk—1 cask of " cement makes 8 2/3 cubic feet mortar.  
 " " 2 rings— " " 15 " " " " " " " " " " " "  
 Cement facings, 5/8 inch thick—1 cask of cement makes 8 2/3 cubic feet of material in place. "

| Material.               | Unit.        | Quantity paid for. | Constant. | Casks. | Total. |
|-------------------------|--------------|--------------------|-----------|--------|--------|
| Contract No. 69—        |              |                    |           |        |        |
| Sandstone concrete..... | Cubic yds... | 1,031              | 1 00      | 1,031  | 8,387  |
| Bluestone concrete..... | "            | 4,844              | 1 23      | 5,958  |        |
| Brickwork, 1 ring.....  | "            | 480                | 0 311     | 149    |        |
| Brickwork, 2 rings..... | "            | 1,441              | 0 467     | 672    |        |
| Cement facing.....      | Square yds.  | 10,683             | 0 054     | 577    |        |
| Contract No. 79—        |              |                    |           |        |        |
| Sandstone concrete..... | Cubic yds... | 1,872              | 1 00      | 1,872  | 4,642  |
| Bluestone ".....        | "            | 1,724              | 1 23      | 2,120  |        |
| Brickwork, 1 ring.....  | "            | 522                | 0 311     | 162    |        |
| Cement facing.....      | Square yds.  | 9,034              | 0 054     | 488    |        |
| Contract No. 79A—       |              |                    |           |        |        |
| Sandstone concrete..... | Cubic yds... | 717                | 1 00      | 717    | 2,577  |
| Bluestone ".....        | "            | 1,290              | 1 23      | 1,587  |        |
| Brickwork, 1 ring.....  | "            | 302                | 0 311     | 94     |        |
| Cement facing.....      | Square yds.  | 3,317              | 0 054     | 179    |        |

The total, therefore, based upon the above, would be 15,606 casks for the three contracts.

I have also taken the inspector's daily returns for the same contracts, and find that the number of casks returned used was as follows :—

| <i>Inspector's Returns.</i> |                  |
|-----------------------------|------------------|
| Contract No. 69 .....       | 7,965 1/2 casks. |
| "    No. 79 .....           | 5,384 1/2 " "    |
| "    No. 79A.....           | 2,269 " "        |
|                             | 15,619 " "       |

These returns, however, for the reasons already given in evidence, cannot be relied upon absolutely, but should be within about 5 per cent. of the quantity actually used.

If the quantity in stock on Contract 72 only on the 1st January, 1892 (which may be ascertained from the claim already referred to in the evidence, page 256, in respect to Contract No. 72) be taken into consideration and then be added to the quantity given by Mr. Christie, say 2,200 casks, the total quantity used in the three contracts under review would be as follows :—

|   |        |
|---|--------|
| Quantity certified to by Mr. Christie ..... | 13,432 |
| Add from stock from Contract No. 72.....    | 2,200  |
| Total .....                                 | 15,632 |

Mr. Burcombe, in his evidence, page 488, question 14,238, states that he carted over 2,000 casks of cement from Contract No. 72 to Contract No. 79.

It will further be seen by Mr. Boys' report of the 19th November, 1891, and my minute thereon, that on that date the contractors had an excess of 2,000 casks on the job.

Public Works Department, Sewerage Branch, Sydney, 19 November, 1891.

STORAGE OF CEMENT, CONTRACT No. 72.

J. Davis, Esq., Supervising Engineer.

Sir,

Messrs. Carter & Co. have informed me that they have stored 2,000 B. barrels of cement on the Munni-street to Shea's Creek contract, and require it to be tested. This quantity is in excess of the amount required to finish the present work, and I have refused to bring the samples.

Yours, &c.,  
J. W. BOYS.

91/2799  
S

Department of Public Works, Roads and Bridges and Sewerage Branch,  
Sydney, 19 November, 1891.

CONTRACT No. 72.—STORMWATER CHANNEL FROM MUNNI-STREET TO SHEA'S CREEK.

Contractors ask that 2,000 casks of cement be tested, which will not be required on work at present sanctioned.

The contractors, I understand, have delivered 2,000 casks of cement on the Shea's Creek work more than will be required to finish the concrete and rendering to its junction with Macdonaldtown Channel, and they are asking for this to be tested. It appears to me that, if we tested this cement, it might be used by the contractors against the department in connection with the claim they have made for part of the channel being cut out of their contract, and I should like, before doing anything in the matter, the instructions of the Engineer-in-Chief.

Mr. Bagge.

J. DAVIS.

For the consideration of the Engineer-in-Chief.—C. H. OHLFSEN-BAGGE, 19/11/91. The total extra required is £9,000.—R. H., 20/11/91. Submitted.—J. B., 25/11/91. As

J. Davis.  
25 Sept., 1896.

As there is considerable doubt as to the quantity of cement delivered upon any particular work, and lest there should be some question as to the quantity of cement in stock on Messrs. Carter & Co.'s contracts, on the 1st January, 1892, I have prepared a statement of the quantity of cement which I calculate should have been used on the whole of the contracts let to Carter & Co., and Carter, Gummow, & Co., based upon the previous data :—

| Material.                 | Unit.        | Quantity paid for. | Constant. | Casks. | Total.        |
|---------------------------|--------------|--------------------|-----------|--------|---------------|
| <b>Contract No. 53—</b>   |              |                    |           |        |               |
| Sandstone concrete .....  | Cubic yds... | 922                | 1·00      | 922    | 3,103         |
| Bluestone concrete .....  | "            | 1,393              | 1·23      | 1,713  |               |
| Brickwork, 1 ring .....   | "            | 224                | 0·311     | 70     |               |
| Brickwork, 2 rings .....  | "            | 259                | 0·467     | 121    |               |
| Cement facing .....       | Square yds.  | 5,139              | 0·054     | 277    |               |
| <b>Contract No. 56—</b>   |              |                    |           |        |               |
| Sandstone concrete.....   | Cubic yds... | 346                | 1·00      | 346    | 1,642         |
| Bluestone concrete .....  | "            | 756                | 1·23      | 929    |               |
| Brickwork, 1 ring .....   | "            | 111                | 0·311     | 34     |               |
| Brickwork, 2 rings .....  | "            | 298                | 0·467     | 139    |               |
| Cement facing .....       | Square yds.  | 3,598              | 0·054     | 194    |               |
| <b>Contract No. 60—</b>   |              |                    |           |        |               |
| Bluestone concrete .....  | Cubic yds... | 293                | 1·23      | 360    | 405           |
| Sandstone concrete.....   | "            | 83                 | 1·00      | 8      |               |

| <b>Total.....</b>    |        | <b>44,630</b>      |

J. DAVIS, 25/9/ 6.

19312. In regard to the supervision of the three contracts which have been specially referred to by Mr. Parkes in connection with the question of the shortage of cement—I mean Contracts 69, 79, and 79A—you have had prepared a list showing who were the engineers and inspectors engaged upon those contracts? Yes.

19313. The list shows the dates of the appointments, and for how long they were held? Yes; as far as it is possible to ascertain the dates from the books. The list is as follows:—

J. Davis.  
25 Sept., 1896.

## SEWERAGE Construction Branch.—Officers employed on Contracts Nos. 69, 79, and 79A.

| Name.                    | Position.               | When engaged.                     |
|--------------------------|-------------------------|-----------------------------------|
| <i>Contract No. 69.</i>  |                         |                                   |
| Mr. Millner .....        | Resident Engineer ..... | From commencement to April, 1895. |
| Mr. Gibbs .....          | Inspector .....         | „ April, 1895, to completion.     |
| Mr. Tudgay .....         | Inspector .....         |                                   |
| Mr. Husband .....        | „ .....                 |                                   |
| Mr. Eyre .....           | „ .....                 |                                   |
| <i>Contract No. 79.</i>  |                         |                                   |
| Mr. Boys .....           | Resident Engineer ..... | From beginning to end.            |
| Mr. Weedon .....         | „ .....                 | Relieved Mr. Boys once or twice.  |
| Mr. Fowle .....          | Inspector .....         | January, 1893.                    |
| Mr. Parsons .....        | „ .....                 |                                   |
| Mr. Wagg .....           | „ .....                 |                                   |
| Mr. Loughheed .....      | „ .....                 | February, 1894.                   |
| Mr. Harris .....         | „ .....                 |                                   |
| Mr. Eyre .....           | „ .....                 |                                   |
| Mr. Reid .....           | „ .....                 | November 18th, 1893 (started).    |
| Mr. Vincent .....        | „ .....                 | „ „ „                             |

19314. You have every confidence in the officers whose names appear in that list? Yes.

19315. And you have every reason to believe that the utmost care was taken in the supervision of these three contracts? I am satisfied that that was the case.

19316. I suppose this particular question as to the quantity of cement which is used, is one to which great attention is paid? I think it is evident from the information which I have just given—namely, that we are able to look back for six years and say precisely to pretty well half a cask what cement has been used—if allowance be made for the difficulty in collecting the information for the returns—I think that shows pretty clearly that we have exercised considerable care, not only as regards the quality of the cement used, but also as to the quantity used. The facts which I have just read out tally with what has occurred upon other contracts which have not been let to these contractors.

19317. *Mr. Gummow.*] Did you obtain the same particulars with regard to other contracts? Yes.

19318. Have you any particulars, for instance, as to the contracts of Mr. M'Sweeney, Mr. Carson, Mr. Ahearne, Mr. Gilliver, and Messrs. Phillips and Rhodes—can you give me any particulars at all in the case of those contracts? I could not give you them all, but I can give you some. Take Mr. Gilliver's contract for instance. There has been a correct tally kept in the case of his work at Coogee, and also at Parramatta. In the Coogee work a cask of cement made in sandstone concrete 28½ cubic feet, and in the Parramatta contract 26½ cubic feet. I should explain that in the Parramatta contract rather a different material was used; I believe it was pebbles, not sandstone. There were the same proportions, but the difference in material would make a slight difference. I know that in the case of Mr. M'Sweeney's Contract 62, a very similar contract to those carried out by Carter, Gummow, & Co., and Carter & Co., the amount being £60,000, and 17,000 casks of cement being used, the cement came to precisely the quantity upon which I have based my calculation.

19319. In making up the details of these calculations, do you find that the batches vary very much? Considerably. It depends entirely upon the kind of work you are carrying out as to what a cask of cement will make. In some instances a cask of cement made more than I have put down, but I have tried to arrive at a basis which can be relied upon—which we can stand by.

19320. Can you say how far a batch has gone? To over 30 feet.

19321. How do you explain that? Well, Carter & Co.'s, and Carter, Gummow, & Co.'s works have been partly tunnels and partly storm-water channels; and in that context it is necessary to bear in mind that in the case of storm-water channels a cask of cement will make less than in tunnels, in consequence of the concrete having to be put into the tunnels in a horizontal position. If you take a storm-water channel you will probably get from 26 to 27 cubic feet to a cask in sandstone concrete. If you take a tunnel it will go over 30 feet. For that reason and the other reasons I have given I have taken 27 feet, so that we may be able to stand by the estimate.

19322. Your estimate that a cask of cement will go from 27 feet up to 30 feet applies to other contractors? Yes.

19323. The varying conditions of the metal make a great difference? They make all the difference.

19324. To say nothing of the dampness and position of the concrete? Yes; there are so many things to be taken into consideration. You may make half a dozen batches of concrete and you will find they will all vary one from the other. Suppose you start upon a heap of metal, and you make your first gauge from the tail end, you get all the large stone; that would not make so much as it will make when you get into the heart of the metal and put the smaller stuff into the box with the larger stone. You will find that when you get into the heart of the metal it will make from 15 to 20 per cent. more concrete per cask than your first gauging.

- J. Davis. 19325. You state that you cannot get within from 15 to 20 per cent., having regard to the varying conditions, of the exact quantity which a batch will make? I am perfectly satisfied that you cannot.
- 25 Sept., 1896. 19326. *Mr. Parkes.*] When did you start making this comparison between the cement delivered and the cement put into the work;—when did you make these tests? I have made no tests. I heard that one was made. I believe that Carter, Gummow, & Co. made one in the presence of one of our inspectors. I believe that a cask of cement made 29 feet in the case of sandstone concrete, but I have made no tests myself.
19327. Did the inspector upon McSweeney's job not make a test? I know nothing of it.
19328. Did he not make a test? I do not know. I know that I have made none myself. I should regard tests in a matter of this sort as utterly ridiculous.
19329. Did you ever make any calculations of this kind before this Commission sat? Yes; when I had immediate charge of work. I was then on the works constantly, and I always kept a check of the quantity of cement used for my own information.
19330. On the basis you have given? Yes. I repeat that the quantity made depends very much upon the conditions and circumstances under which you use the concrete.
19331. Did you keep the tally you have spoken of on a basis of this sort—that a cask of cement would make 27 feet in the case of sandstone, and 22 feet in the case of bluestone concrete? From my experience I consider that I have estimated the quantity very low, taking all things into consideration.
19332. As to the minutes relating to Contract 72, and the quantity of cement which was supposed to be there, have you the original minutes? I believe they are in my room, but I am not sure. There are no other minutes besides those which I have read, except that Mr. Hickson has written two or three words which do not appear to have any connection with the matter.
19333. There is a minute also by Mr. Bagge and several others. In the absence of the original, will you accept Mr. Christie's copy as correct? Yes.
19334. Did you make up your returns in respect of Contracts 69, 79, and 79a from the material in the final vouchers? Yes.
19335. Did you take cognisance of the cement rendering? Yes.
19336. That is in your list? Yes.
19337. *His Honor.*] The specimen of the concrete which has been exhibited to the Commission, and which was taken from the Alexandria contract, I understand you to say is a good average sample of bluestone concrete? Yes. In some cases the stone would be a little finer than that—in fact, I believe it was so on that job. I think one witness said that it was. I remember at the time the work was constructed that stone was being got from Emu Plains, and was crushed at Newtown. It was particularly fine. This is rather a coarse sample.
19338. Would this particular piece of concrete be rammed more lightly than usual on account of its being put on to a bad bottom? No; I think that is a fair sample of the ramming it gets. It is very difficult to ram concrete at all if you make it wet, because the moment you begin to ram the water comes to the surface and you have to stop.
19339. If you look at this sample with a glass you will see that it is like a sponge; it appears to be full of air bubbles? That is the case with all concrete, and it must necessarily be so on account of the superabundance of water you have to put into it. This takes up a certain amount of space, and when it evaporates holes are left.
19340. Are not these small holes to be accounted for by the air? No; by the water, I think. It requires very little water to crystallise cement—not more than one-half of what you would put into concrete.
19341. At any rate something, whether it be water or air, finally causes the concrete to take the form of a sponge? That is so.
19342. And the varying quantity of that would determine the varying bulk—that is where the variation would probably come in? It might come in in that sense, but it will come in more especially in connection with the size of the stone.
19343. A good deal depends upon the pressure which can be put on, and the extent to which the compo. can be squeezed in between the stones effectively—upon the pressure put upon every part of the compo.? Yes.
19344. You would not have actual cavities, but in different pieces of concrete you would have varying sizes of bubbles? Yes. If you put in concrete dry it is very difficult to get the compo. distributed, and you will find a patch of compo. with very few stones in it, and another patch where there is very little compo., and where it is very nearly all stone. That is the case in the packing over the arch of tunnels, where you cannot put in a large quantity of water; if you did, when the centres were struck the water would run out of the concrete, and would wash out the joints of the brickwork. Consequently the concrete has to be put in dry. That being so, the concrete over the arch of tunnels would not be so solid as elsewhere.
19345. It would be very spongy? Very spongy indeed.
19346. Have you examined compo. to ascertain whether it contains scarcely-perceptible bubbles? Compo., where the minimum quantity of water is put in, can be made practically solid. There will be few, if any, small bubbles. But compo. made of the consistency in which it is used by bricklayers and plasterers would almost always contain a greater or less number of small bubbles.
19347. What is the case with 3 to 1 compo.? I made an experiment, if it can be called an experiment, which did not quite tally with our experience. I found from that experiment that 13 feet of sand and a cask of cement could be rammed without much trouble to 11½ feet, so that the 13 feet of sand, plus the 4½ feet of cement, came down to 11½ feet.
19348. But experience brings the matter back to what you said—that it is to a great extent the mechanical action of the stone in the concrete which prevents you from bringing it down to the condition to which compo. is brought? Yes, that is so.
19349. *Mr. Smith.*] The clause relating to payment was clause 23 in the old conditions, and it is now 30? It would appear from the minutes of the Board of Reference of the 21st September, 1891, that the Board proceeded with the further revision of the draft general conditions. Clauses 16 to 23 were dealt with according to the minutes, and the Board then adjourned. On 28th September, 1891, the next meeting of the Board, there is this entry:—"General conditions of contracts. The Board then proceeded with the revision of the draft general conditions. Clauses 24 to the end were dealt with, and the order of the clauses rearranged." The Secretary was directed to have the corrections made, and submit a revised

19350. *His Honor.*] Have you found the meeting at which the revised copy was submitted? The next entry in the minute-book referring to the matter is under date of 11th November, 1891, and is as follows:—"General Conditions of Contract. Messrs. Barling and Darley were authorised to finally revise the draft clauses which had been prepared, and thereafter submit them for the consideration of the Crown Solicitor for his advice." The matter would then probably go to the Crown Solicitor. I have endeavoured to ascertain this morning, as far as I could, when it was that the new general conditions were first incorporated in the sewerage contracts. I find that some five or six months before the Minister approved of the general conditions as a whole they were being used. J. Davis.  
25 Sept., 1896.
19351. *Mr. Smith.*] Here is the tender of one Blair, dated 9th May, 1893, in the Roads and Bridges Branch. The contract appears to contain clause 30 of the general conditions? Yes; the new general conditions were attached to that contract. The reason that they were not incorporated in the sewerage contracts sooner than they were was simply that the sewerage works were suspended. The first contract in which the new general conditions appeared would be about October, 1893, I think, so far as those works were concerned.
19352. So that although in sewerage contracts the payment clause appears to be No. 18, it is quite clear that clause 23, mentioned in the Board's minutes of September, refers to the payment clause, that being the number used in the Harbours and Rivers, Military Works, Railway Construction, and Water Supply and Sewerage contracts? Yes; at the time the Board of Reference took this work in hand every branch was using its own general conditions. The object, as I understand from the Minister's minute, was that one set of general conditions should be used throughout the Department.
19353. *Mr. Parkes.*] Are the minutes you have quoted entered up in a new book, or is that the book which has been used right through? This book is the one which has been used by the Board of Reference from 2nd February, 1891. That was the first meeting of the Board of Reference after its constitution by Mr. Bruce Smith's minute.
19354. To what date does that run? The last entry in this book is under date of 10th May, 1895. There is another book in use now.

Henry Johnston sworn and examined:—

19355. *Mr. Parkes.*] What are you? Foreman for John Molloy, carter. H. Johnston.  
25 Sept., 1896.
19356. Do you yourself cart, or do you supervise the carting? I supervise the carting and the men.
19357. Do you keep complete records of the places to and from which you cart? The clerk in the office does that. I do all the outside work.
19358. On 10th July, 1894, some cement was carted from Carter, Gummow, & Co.'s works to M'Ilwraith's wharf—practically back to Parbury, Henty, & Co.'s? To M'Ilwraith's wharf.
19359. Back to Parbury, Henty, & Co.'s? To M'Ilwraith's wharf, on account of Parbury, Henty, & Co.
19360. Do you recollect how many casks there were? I could not say from memory. It is a good while back.
19361. You have your books with you? Yes.
19362. You could tell us from them, could you not? There is this entry:—"66, Carter, Marrickville, 10th July, to M'Ilwraith's wharf." Then on the 11th there is also "40, Carter"; on the 13th again "44"; and again on 4th August, "62, Carter & Co." That does not state Marrickville, but the others do.
19363. Was that last number not carted from Marrickville? I could not say for certain. It might have been that the cement was going from Marrickville. Probably it would be.
19364. The accounts would show where it was carried from? They would give you no more information than I have already given you. It would be the same as is contained in this book.
19365. But would they not show the places to and from which the cement was carted? No.
19366. Will you read the particulars of the accounts? Sixty-six on the 10th, Carter & Co., Marrickville, to M'Ilwraith's Wharf; on the 11th, 40; on the 13th, 44.
19367. Look at the account from 4th August to 8th August? That is 62, Carter & Co. to North Coast Company; 24, Carter & Co. to Hogg & Co.; 12, Carter & Co., Railway—that would be Darling Harbour. The entry shows you, as you see, where the cement went to, but it does not say where it came from.
19368. Between 6th and 21st September there were fifty casks—where was that carted from? I cannot say.
19369. What about the 442 casks? That was carted to M'Ilwraith's wharf.
19370. Where was it carted from? It simply says, "Carter & Co."
19371. But where was it from? It does not state.
19372. The charge was 5d? Yes.
19373. And the charge on 10th July was also 5d.? Yes.
19374. Would not that lead you to suppose where the cement on the latter date came from? There were different contracts going on, and I cannot say positively where it did come from.
19375. At that particular time were you carting from any other place beside Marrickville? Not backwards.
19376. But for Carter & Co. I mean? I was not doing it for Carter & Co.
19377. Not for Parbury, Henty, & Co.? No; I do not think I was carting for them from any other place.
19378. Did you cart from any other contract of Carter & Co.'s but Marrickville at that time? No; I do not think so. I think that was the job from which we were carting at that time, but I cannot be sure.
19379. That is the only contract from which you were carting at that time? I think so.
19380. Have you in your employ any of the men who carted any of this cement? I could not say, speaking from memory.
19381. Do the entries to which I have referred you make a total of 832 casks? I could not say; I have not made it up.
19382. The list of figures I hand you tallies with your books, and is correct? Yes; it makes 832.
19383. It was all carted pretty close to one date;—that is, between July and September? Yes.
19384. And it could not have been carted from any other place but Marrickville? It might have been.
19385. But you were not carting from any other place but Marrickville at that time, were you? Not backwards.
- 19386-7. *Mr. Gummow.*] How many of the casks to which you have referred can you say definitely from your

- H. Johnston. your books came from Marrickville? The sixty-six, the forty, and the forty-four, under the dates 10th, 11th, and 13th, July, respectively.  
 25 Sept., 1896. 19388. So that there are 600 odd out of the 832 concerning which you cannot say definitely where they were carted from? No.  
 19389. Did you tell anyone that they came from Marrickville? I told Mr. Christie that they might have come from Marrickville.  
 19390. But you did not say definitely that they did? No.  
 19391. Your books do not show it definitely? No.

Charles James Henty recalled and further examined:—

- C. J. Henty. 19392. *His Honor.*] You wish to make a statement? Yes; there would appear to be a mistake of 150 casks in the total of 832, according to the books which have been produced. There are 150 casks which Molloy says definitely came from Marrickville. I think it is only right to say, in fairness to Mr. Holden, who made out these particulars, and I think Mr. Christie will bear me out in what I am saying, that, the "Talavera" being at M'Ilwraith's wharf, we sent him down to the wharf to make inquiries about these returns. I do not think he made inquiries of Molloy as to the returns.

John Carter recalled and further examined:—

- J. Carter. 19393. *Mr. Gummow.*] You heard Mr. Davis' evidence this morning as to the cement on the general contracts that you have had from 1890? Yes.  
 25 Sept., 1896. 19394. Have you interested yourself in finding out from your bank pass-books how much cement you think you have had during that time;—what do you consider that you have had? About 48,000 casks is our number.  
 19395. Delivered generally all over your works? Yes.  
 19396. *His Honor.*] Within what time? From the inception of our business up to the 30th June, 1896. That would apply to Carter & Co. and Carter, Gummow, & Co.  
 19397. *Mr. Davis.*] Your calculation covers the same term as does my statement? Yes.  
 19398. That would be from the 1st January, 1890, to the 30th June, 1896? Yes.  
 19399. *Mr. Gummow.*] That is the cement which has been used on your Government contracts? Yes.  
 19400. There are some exceptions, are there not—there is some cement, for instance, which you sold;—do you remember that? Yes, we sold to several persons.  
 19401. Do you remember any instances? We sold some to Danaher & Co., railway contractors, also to Flood and Rutherford, Wilmot and Morgan, and Gummow and Gillan.  
 19402. Where did you get those particulars from? From our bank pass-books.  
 19403. Do you know anything about the cartage from one contract to another as a general thing? Yes; I have already stated that it is a common practice with our firm to cart cement in large quantities from one contract to another simply for the expeditious carrying out of the work. It very often happens that, through the failure to pass of a parcel of cement which has been stored on one contract, we have carted large quantities of cement from other contracts which we have had in hand in order to keep that particular contract going. It is a very risky matter when you have an open channel, such as a stormwater channel, to leave it standing waiting for cement to pass. We have always found that it has paid us better to cart cement to the job, irrespective of the cost, from the nearest available store.  
 19404. Have you ever heard, in connection with your contracts, of the men waiting on material, as it is called—that is to say, if they did not see a sufficient quantity of material on the ground they would not push on very hard, would they? Quite so. If there is a big stock of cement, for instance, the men work away energetically. If they find that the supply is from hand to mouth, they naturally slacken up. It is always to our advantage, therefore, to keep a good stock in hand. The men, naturally, do not like to be stood off for two or three days waiting for cement.

Frank Moorhouse Gummow sworn and examined:—

- F. M. Gummow. 19405. *Mr. Andrews.*] You are a Civil Engineer? Yes.  
 25 Sept., 1896. 19406. You are a C.E. of the Melbourne University? Yes.  
 19407. That was the highest degree in engineering conferred by the University? Yes; it was.  
 19408. Have you had any practical experience as a Civil Engineer? Yes; it is thirteen years since I passed.  
 19409. Have there been any Government contracts in New South Wales with which you have been connected as an engineer, apart from the contracts of Carter, Gummow, & Co.? Yes; I was on contract No. 7, the Bondi sewer. That was for £186,000, I think. I was 21 when I went to that work. They paid me £520 a year.  
 19410. When did you first have any connection with the Government as a contractor? Either in 1886 or 1887—I am not quite sure of the year. I first tendered for a work with Mr. Rochester, at Belmore Park. I never had anything to do with the contract, because I retired from it before it commenced.  
 19411. What was the next contract you had? The Hyde Park sewer. Then we had the excavation of the Potts' Hill reservoir. We also did the sewer down Castlereagh-street to Macquarie-street, and the sewer through Camperdown, and also at Potts' Point.  
 19412. As to the Potts' Hill reservoir, had the contractors anything to do with the concrete at the bottom of that? Nothing whatever.  
 19413. So that Mr. Parkes was in error when he stated that the concrete which your firm put into the bottom of the Potts' Hill reservoir was defective. You will see his statement on page 32 of *Hansard* of the present session? We did not put any bottom in the Potts' Hill reservoir at all.  
 19414. It was not put in by reason of defective work? No; we merely did the excavation for the contract.  
 19415. *Mr. Parkes.*] And the embankment? Yes.  
 19416. *Mr. Andrews.*] What was your first connection with the firm of Carter & Co.? In the Adelaide contract, in August, 1892.  
 19417.

19417. You sent in a joint protest with Carter & Co. as to the acceptance of Bond and Hudson's tender for Contract 79? Yes. (*Vide Appendix No. 70.*)

19418. Will you explain why you did that? Gummow and Gillan, a separate firm from Carter & Co., tendered for Contract 56 at Woolloomooloo. Bond and Hudson were the lowest tenderers, and Gummow and Gillan were the second. Bond and Hudson were much lower than Gummow and Gillan in their tendering. For some reason they refused to take up the work; and fresh tenders were called, Carter & Co. finally getting the work, and Gummow and Gillan running second again; we felt very sore, the whole of our prices having been exposed, at the idea of the Government not giving us a chance to take up the contract when Bond and Hudson threw it up. When 79 was tendered for Carter & Co. were second to Bond & Hudson. Mr. Carter came to me, and he said "You were very sore over not getting that contract at Woolloomooloo. Will you join us in writing a letter of protest in connection with Contract 79." I said I certainly would, and that I did not think it right that men should put in tenders, throw them up, and then probably exercise some influence to get back their preliminary deposit. I told him I was quite prepared to join him in writing a letter pointing to that effect, and suggesting either that that practice should be stopped, or that a stop should be put to the practice of showing everyone's prices, that not being fair play. We therefore signed a letter of protest. I think I wrote it.

19419. Up to that time neither you nor Mr. Gillan had had any connection with Carter & Co.? No; as far as Contract 79 was concerned it made no difference whether Carter & Co. or any other firm got it; but we felt sore at the idea of Bond and Hudson, who had upset us on a previous occasion, acting as they were doing, and that was really the reason.

19420. When you obtained the Adelaide contract you undertook the personal supervision of it? Yes; with Mr. Gillan.

19421. And from that date up to eighteen months ago you exercised no personal supervision in respect of any contracts in New South Wales? No, none.

19422. What was the first New South Wales contract in which you were interested as a member of the firm of Carter, Gummow, & Co.? The Marrickville contract—No. 69.

19423. Did you prepare the estimate or tender? No.

19424. Was it ever submitted to you in detail before it was sent in? No; I never saw it before it went in. A week or so afterwards Mr. Snodgrass sent me down a copy of the tender, but I did not know about the prices, or indeed anything about it, before it went in.

19425. Between the time of the tenders going in and the present time, you have had an opportunity to look through the schedule? Yes. I have looked through the items.

19426. *His Honor.*] Do you consider the schedule a risky one in respect to some of the items? No, not as a contract. I presume you mean by a risky tender a tender where there would be a chance of loss?

19427. I mean a gambling one? It is speculative as to how much profit we should make. No one could tell when we put in the tender what amount of profit we should make out of it.

19428. *Mr. Andrews.*] Is not that the case in all tenders? Certainly.

19429. *His Honor.*] Only this tender was exceptionally speculative in regard to some of its items? I cannot say that, except in regard to one item, it was very speculative. The item as to bluestone pitchers is speculative, but there is no risk attached to that.

19430. *Mr. Andrews.*] What I wish you to explain is this—there are a number of items in the schedule which are apparently absurd—for instance, there are subducts, 1d., timbering at 1d.;—there are various items of that kind, and I want you to explain how it is that, in your opinion, these items are not absurd? Take the first four items—they are all put down at one price. They relate to open trenches. In respect of those items there is possibly a risk, on paper; but as we had all the borings and brickholes in the vicinity to go by, it was plain to anyone putting in a tender that the ratio of quantities could not be very much astray, and even if you did strike more rock than was anticipated, the difference in price between the rock and the soft ground is not a very large item in 2,000 or 3,000 yards. As to item No. 5, it must be taken in conjunction with item No. 21 and item 32. These three items depend one upon the other, because, in a large tunnel like this, if it is in soft ground it needs timbering, and if you put the timber in you cannot take it out. It is probable that in making up the price of No. 5 the cost of the timber was put on to the excavation price and kept off item 21. Then again item 32 can be done cheaply because you have a large body of concrete to put in in a large excavation. It is probable then that the price of bluestone concrete in item 32 was kept down, and an extra profit put on to item No. 5. As to item No. 6, our experience as contractors has told us that the department do not go in for guttering and gadding if they can get the work done in any other way, and unless there are very strong reasons for doing it by guttering and gadding. Item 7 is avoided on account of the extra cost of supervision—at least that has been our experience. Item No. 8 is the usual way of carrying out the work. The same reasoning applies to items 9, 10, and 11, as applies to 6, 7, and 8. And again with regard to the whole of the items 9, 10, and 11, disputes often arise between the department and contractors as to what is rock and what is not rock. It is a difficult question to settle, and if possible we endeavoured to keep our prices the same for soft as for hard, in order to avoid any unpleasantness. As to items 12, 13, 14, and 15, there is no doubt that the person who made up the tender considered that these quantities were excessive, and how the Government arrived at them we do not know. It is plain to see from the plan that they were excessive; and the prices were kept very low. If the shafts had been made very large then the cost of excavating would be greatly decreased per cubic yard, and there is nothing to show that they would have been greatly increased. Undoubtedly the prices have been kept down on account of the excessive quantities shown. As to item No. 16, from the price put in no doubt Mr. Snodgrass must have anticipated an increase in the quantity over and above that shown. In this matter the department cannot assist you in any way. You cannot be absolutely sure of your figures. It would depend upon what the ground is when you opened it up how the quantities turned out. You can only judge it from local experience. I do not know whether His Honor would like me to go through the whole schedule.

19431. *His Honor.*] Take the items to which you wish specially to call attention? As to items 17, 18, and 19, the same reasoning applies to them as applies to items 12 to 15. Item 21 depends upon item 5. If item 5 is greatly enlarged item 21 has to be enlarged. There is no doubt there was a great deal more of item No. 5 than was anticipated by the department. If item No. 5 had been greatly reduced there would have been very little of item 21. Item 21 depends absolutely upon item 5. As to the subducts,  
items

F. M.  
Gummow.  
25 Sept., 1896.

items 23 to 27, you cannot have those items used unless the items 5 to 11 are used, or unless some of those items are used. The use of subducts depends upon the excavation, and the price of our excavation for subducts would more than compensate for the cost of the excavation and the cost of the subducts, so that if the whole contract from end to end had had subducts in it we should have made, rather than lost, money upon that item. Item No. 32, bluestone concrete, is below the Government estimate, but it is a good deal above the real cost. Then, again, you cannot have an increase in the bluestone concrete unless you have an increase of excavation. Therefore the prices which have been put in for excavation have to be considered. Cement facing is put down at a high price. Looking at the plan, and judging from what Mr. Snodgrass informed me, he anticipated there would be an increase of cement rendering. Our experience had been that sewers are rendered all round. The plans for Contract 69 showed rendering up to the springing only, or at any rate the cement rendering would be brought higher up the sides, even if it were not brought right round, so that it was anticipated that this would be probably an increased quantity from our previous experience of works. The question of bluestone pitchers was undoubtedly a mistake in the department, and from what I can learn and see Mr. Snodgrass took advantage of it. He knew that there must be 12 yards of pitchers, and that, according to the plans, there must be considerably more. As to item 43, the removal of material, our experience has shown that we can get a great deal of it carted away for nothing. The Government do not require it, or have not required it, upon a number of contracts. The price is put down low because it often costs very little to get it removed. Councils and other bodies are always very glad to get it. Item 44 is seldom used. That is why a low price is probably put down there. In looking through the schedule, it is apparent that the bulk of the profit has been put on to the excavation, the cement rendering, and the pitchers, so that items 46 to 85 were put in at the cost price which was charged us by Mort's Dock Co. These items represent about £10,000. That would be the amount charged by Mort's Dock Co. to us, and we put all that in for the £10,000. There is no profit there. There is actually a loss for fixing. I think that is all which it is necessary for me to say as to the schedule.

19432. Now, bearing that explanation in mind, do you, as a civil engineer, think that the Government would have been justified in refusing to accept that tender simply by reason of the charge for bluestone pitchers? Certainly not.

19433. If you were in private practice, would you recommend a client to reject it by reason of such a charge? No. If I made up a specification and schedule I would stand by it. It is handed to the contractor to put in his prices against the quantities, which are probably correct, as far as you know, at the time. If a contractor takes to speculation, that is his risk. He may make an error, and may have to pay for it instead of making any gain. In tendering for work about which I do not know as much as I do of sewerage work, I tender, as a rule, at a fair cost and profit on each item. I do not know sufficient of the work, and the probabilities of the carrying out of the work, to take to speculation. In sewerage works, however, Mr. Snodgrass and I had more experience than had anyone else in the Colony, and we took to speculation.

19434. Could any information given by any officer in the department have helped Mr. Snodgrass in any way in the making out of the tender? Certainly not.

19435. Would it be of any assistance to contractors, under any circumstances, to get information from any officer in the department? That is rather a general question. I do not know of any case where any benefit could arise. The plans and schedules are made in the office by the office hands, and the work is carried out under different circumstances. You do not know who will be the supervising engineer before your tender goes in. You do not know also what inspectors you are going to get. Some engineers have great ideas of brickwork, and others again are great believers in concrete. One man will say one-ring work is good enough where another will require two-ring work. There are all those questions to be considered, but they do not come in when you are putting in your tender.

19436. So that any information which you might receive from an officer of the department you do not think would help you in the putting in of your tender? No; we pride ourselves that we know more than do the Government officers when we are going to tender.

19437. Had you any connection with Contract 79A—the North Shore Extension? Not as far as the Government were concerned, but I had privately. It was an extension of Carter & Co.'s Contract 79, and I had nothing to do with that. When Carter & Co. got the contract, however, they handed it over to Carter, Gummow, & Co. to work, and take the risk or profit, whatever it might be. Personally I had nothing to do with it, but I was a shareholder as far as the commercial world was concerned.

19438. You consider that the contractors are the persons only who sign the tender? Yes; I have always been led to believe that by the department. I have had experience as an engineer on contracts, and I have been told by Government officers that they could put me off in twenty-four hours if they liked—that I was nobody as far as they were concerned—that they could shift anybody—that they dealt only with those who had the contract, and that they recognised no one behind the scenes.

19439. Did you make up the estimate for Contract 77? With Mr. Snodgrass, yes. I ought to explain that there were seventeen main arches. I took the cost of four as my data, and when I found that they practically agreed day by day I did not bother any more. I thought I could tell from that what the cost of the other thirteen were.

19440. *His Honor.*] You assumed that the cost of the four would give you a fair average? Yes. I ought also to explain that the men were working eight and a-half hours a day and saving their Saturday. The arches at White's Creek are a little bit smaller in width, there being a smaller-sized sewer there, than are the arches at Johnstone's Creek. The quantity of 1,325 yards is not the whole total of the concrete and compo., but the estimate which I made as to the four arches at White's Creek. That would make a small difference. There may be 25 or 30 yards of concrete more than I have considered in my calculation. As to the blacksmith's work, it is almost impossible to get that item exactly, because the blacksmith is engaged in sharpening tools, drills, picks, and that sort of thing, as well as doing other work. He also has two men to assist him.

19441. *Mr. Andrews.*] When were the figures upon which your calculation is founded taken by you? At the time the work was going on.

19442. How long ago was it? In February or March.

19443. Before this Commission was granted? Yes.

19444. And it was taken really for your own information? Yes.

19445. Under the departmental and Monier designs? Yes.

19446.

F. M. Gummow.  
25 Sept., 1896.

19446. You have been in charge of that contract from the start? I have been on it. My position was this: Mr. Snodgrass had charge of 77 up to the end of last year. My connection has been more in the nature of a consulting engineer giving any assistance I could and attending to Adelaide affairs. Mine has been a roving commission. Mr. Forrest has since been in charge of the contract, and I have assisted him and consulted him in any matter in which he had need of my advice.

19447. Did you, for your own information, during the progress of the work, check the cost of the Monier portion of it? Yes.

19448. Will you tell us what you make the actual cost of the Monier work to be per yard? What I did was this: when an arch was to be turned, I would be there all day to see how long the men worked. I knew what the men were getting, and how many cubic yards there were in the arch, and, knowing that, I was able to get at the cost of an arch. The same applies to the jack arches. I used to watch them, and if I were not there during the whole time myself, I asked Mr. Forrest to make a note of the time the men were employed. I did not keep an exact cost of the work from day to day, but I wanted to know how things were going, and what the work was actually costing a yard.

19449. The result of your checking was what? I have made up a statement; it is as follows:—

CONTRACT No 77.—Monier Structure.

| <i>Concrete and Compo.—</i>   |  | £                             | s. | d.       |
|---|--|-------------------------------|----|----------|
| 17 main arches at 24.5 cb. yds. = 416.5 cb. yds. at 4/3 .....                               |  | 88                            | 10 | 0        |
| 1 man at 9/- = 9/-  |  |                               |    |          |
| 1   "   8/6 = 8/6   |  |                               |    |          |
| 4 men at 8/- = 32/-   |  |                               |    |          |
| 7   "   7/- = 49/-  |  |                               |    |          |
| £4/18/6 for 8 hours a day ;   |  |                               |    |          |
| " 8½ " = £5/4/8 ;   |  |                               |    |          |
| or, per cb. yd. = $\frac{£5/4/8}{24.5} = 4/3.$  |  |                               |    |          |
| 25 sets spandrils and piers at 13.33 cb. yds. = 333.3 cb. yds. at 4/4 .....                 |  | 72                            | 4  | 4        |
| 1 man at 9/- = 9/-  |  |                               |    |          |
| 1   "   8/6 = 8/6   |  |                               |    |          |
| 2 men at 8/- = 16/-   |  |                               |    |          |
| 3   "   7/- = 21/-  |  |                               |    |          |
| £2/14/6 for 8 hours a day ;   |  |                               |    |          |
| " 8½ " = £2/17/11 ;   |  |                               |    |          |
| or, per cb. yd. = $\frac{£2/17/11}{13.33} = 4/4.$   |  |                               |    |          |
| 25 lengths of main carrier at 20.5 cb. yds. = 512.5 cb. yds., at 5/7 .....                  |  | 143                           | 1  | 5        |
| 1 man at 9/- = 9/-  |  |                               |    |          |
| 1   "   8/6 = 8/6   |  |                               |    |          |
| 4   "   8/- = 32/-  |  |                               |    |          |
| 7   "   7/- = 49/-  |  |                               |    |          |
| 1 horse at 9/- = 9/-  |  |                               |    |          |
| £5/7/6 at 8 hours a day ;   |  |                               |    |          |
| " 8½ " = £5/14/2 ;  |  |                               |    |          |
| or, per cb. yd. = $\frac{£5/14/2}{20.5} = 5/7.$   |  |                               |    |          |
| 25 lengths of cover plates at 2.5 cb. yds. = 62.5 cb. yds. at 13/10.....                    |  | 43                            | 4  | 7        |
| 1 man at 9/-  |  |                               |    |          |
| 1   "   8/6   |  |                               |    |          |
| 1   "   8/-   |  |                               |    |          |
| 1   "   7/-   |  |                               |    |          |
| £1/12/6 at 8 hours a day ;  |  |                               |    |          |
| " 8½ " = £1/14/6 ;  |  |                               |    |          |
| or, per cb. yd. = $\frac{£1/14/6}{2.5} = 13/10.$  |  |                               |    |          |
| To put on 25 lengths of cover plates, at 2.5 cubic yards = 62.5 cubic yards, at 41/5 =..... |  | 129                           | 8  | 6        |
| 1 man, at 9/- for 3 days = 27/-   |  |                               |    |          |
| 1   "   8/6   " = 25/6  |  |                               |    |          |
| 1   "   8/-   " = 24/-  |  |                               |    |          |
| 1   "   7/-   " = 21/-  |  |                               |    |          |
| £4/17/6 at 8 hours a day ;  |  |                               |    |          |
| " 8½ " = £5/3/7 ;   |  |                               |    |          |
| Or per cubic yard = $\frac{£5/3/7}{2.5} = 41/5.$  |  |                               |    |          |
|   |  | Total, 1,325, cubic yards, at |    | 476 8 10 |
| Or per cubic yard = $\frac{£476/8/10}{1,325} = 7/2.$  |  |                               |    |          |

PER ARCH—IRONWORK.

NOTE.—Nothing allowed for profit, guarantee, &c.

MONDAY, 28 SEPTEMBER, 1896.

Frank Moorhouse Gummow recalled and further examined:—

19450. *Mr. Andrews.*] Do you remember how much timber was used for the centerings during the construction of the aqueduct at Johnstone's Creek and White's Creek? I think I have put an amount in for that in my estimate.

19451. For how many centres? Four.

19452. Were they there during the whole of the time the arches were being turned? Yes.

19453. Did you use sandstone from the crusher for the concrete or compo. in connection with the aqueducts in Contract 77? No; we used North Shore quarry sand throughout for that—no sand from the crusher.

19454. No sand whatever from the crusher was used on that job? No.

19455. You used sand from the crusher where? On the storm-water channel—Contract 118.

19456. *His Honor.*] Is the sand from the quarry, which you refer to, sand which would come from stone broken in quarrying, or what sand do you refer to? It is soft sandstone. It is blown down, and in falling it is broken up into sand. What is not broken up in that way is broken by boys with a hammer. The sand is sieved, and would then be sent over to our works.

19457. That would be from the Gas Works? Yes; from the Gas Works' yard at North Shore.

19458. *Mr. Andrews.*] Have you had any practical experience in regard to sand? I have had experience of different kinds of sandstone spreading over the last thirteen years.

19459. Do you consider the sand from North Shore of first-class quality? Undoubtedly. In order that we might arrive at a decision as to the best sand to use we made a number of tests. The sand was put through the Government testing machine to arrive at the best sand for compression, and, in every case, it was shown that the North Shore quarry sand was the best. These tests were made from briquettes or blocks made up for us. We wanted to be satisfied that we were getting the best sand.

19460. You were anxious to obtain the best material possible? Undoubtedly. With regard to the cement, we ordered "Germania" for the first work until we were satisfied that "Hemoor," another German brand, was equally good, and we afterwards used "Hemoor" and "Condor." It was proved from tests, that we made ourselves, that they were splendid cements.

19461. Your firm put in two tenders for Contract 77—one upon the departmental scheme, and the other upon the Monier scheme? Yes.

19462. Assuming that the Government had asked you to carry out the work upon the departmental scheme, was it the intention of the firm to carry it out? Certainly.

19463. Had you any intention at any time of refusing to carry out the works upon the departmental scheme? No; none at all.

F. M.  
Gummow.  
28 Sept., 1896.

19464. Do you consider that it would have been injurious to you, as a firm, to refuse to carry out the work when you had once obtained it by open tender? I do, most certainly.
19465. Do you know Thomas Williams, the contractor? Yes.
19466. Have you had many conversations with him during the last few years? Very few during the last four years. Probably three or four at the most.
19467. Did you, at any time, tell him that had the Department asked you to carry out 77 upon the Departmental design, you would not have done it? No; certainly not. I am not in the habit of telling Williams, or other contractors, my business.
19468. Did you ever tell him anything which, to your mind, would bear the construction which he apparently placed upon something you said? No; nothing. I have heard of this matter before, and I have read the report of his evidence. The only way in which I can account for the matter arising in his mind is this—that it is his habit, in talking, to put questions and at the same time to suggest the answers. That is the only way in which I can account for his arriving at such a conclusion. It is his natural way of talking. In putting his question, he will suggest his own idea as to what the answer should be.
19469. If Williams stated that a conversation to that effect took place near the stone-crusher, and that Mr. Marr, a traveller for Scrutton, was there at the time, would that be true;—do you remember any conversation with Williams at any time when Mr. Marr was standing near? I remember talking to Williams on an occasion when both he and Marr were at the crusher.
19470. You have no doubt that he is in error in stating that you then told him that your firm would not go on with the contract on the Departmental scheme, if called upon to do so? I am absolutely sure upon that point. I remember the conversation, but I said nothing of that kind. In making up our estimate for the Government design, the prices put in were cost prices. Our idea was to get as low as possible in our tender for the Government design, so that, if we were called upon to go on with it, we could just carry it out without losing any money. We considered that, if we were not the lowest tenderers for the Government design, the Tender Board might not look at our tender upon the Monier design.
19471. So you are sure that you could have carried out the departmental design at the price at which you tendered? Undoubtedly we could.
19472. Although you might not have a profit? Quite so.
19473. You were prepared to give your time rather than have your reputation as contractors affected by your throwing up the contract? Certainly.
19474. You were also in charge of Contract 118? I was generally supervising it.
19475. The unemployed cut a drain so as to take the water away from part of that contract? Yes.
19476. Will you explain to the Commission why the Department cut that drain? Mr. Snodgrass mentioned to me, in the first instance, that we were getting swamped out through the Harbours and Rivers Branch pumping water and sand on to the site of our works, and he suggested to Mr. Carter and myself that we should see the Department, and get them to make an outlet for the water. Mr. Carter, I believe, saw Mr. Hickson. I met Mr. Hickson, Mr. Davis, and Mr. Carter, on the site of the works. They walked over the works, and Mr. Hickson said, "Well, you will have to make the floodgates and fix them, and we will cut the drain necessary to drain off the water."
19477. Was that a risk which you consider you were bound to take under your contract? Certainly not; the risk we took was the risk from natural floods or natural drainage, not water which other persons might choose to put on to the ground. It can be seen now what the use of the channel is; it is an absolute necessity for the drainage of the place.
19478. Do you consider it probable that any contractor when tendering would put a price in his tender for the cutting of a drain? No; I do not see how he could anticipate such a thing when there was a large natural creek there.
19479. Was the work which was done by the Harbours and Rivers Branch at Rozelle Bay commenced at the time tenders were put in? I believe it had been commenced; but it had not interfered with the natural channel.
19480. These two contracts were the only ones over which you had any personal or direct supervision? Yes; they are the only ones I dealt with here. I am supervising the outfall contract at North Sydney at the present time.
19481. As far as you know, was there any defective work done upon either of these two contracts? No.
19482. As far as you know, was there any defective work done upon any contract carried out by the firm? Not as far as I know.
19483. Has it been your desire as one of the members of the firm always to carry out your contracts faithfully—as well as they could possibly be carried out? Yes. That can be easily proved by the Government officers. I might say this—that Mr. Davis and other officers of the Department, when I have given my word that certain things should be done to satisfy the Department, have regarded my word as being as good as if the thing had been in writing. They have said so to my face.
19484. Have not all the other members of the firm agreed with you in that mode of proceeding? Yes. We have never had any difficulty in that way. If it were necessary for a thing to be done, we have always agreed to do it, and have done it.
19485. As to young Mr. Hickson, do you wish to add anything to your former evidence upon that branch of the inquiry? I do not know what further I can say.
19486. That is to say, there was at no time any serious intention of making him a partner? No, never.
19487. While he was engaged by the firm in Adelaide, and also at Johnstone's Creek, he had to perform regular and proper duties? Yes.
19488. His position was not a sinecure? No.
19489. Have the Department, from your point of view, made any concessions whatever to your firm? None whatever. They have always fought their side, and we have fought ours. Sometimes we have won, and sometimes they have won; but they have made us no concessions—in fact, it has always been a case of dragging all we could out of them.
19490. Has Mr. Davis been particularly lenient to you? No, he has been rather the opposite. He has been the most severe of them.
19491. Is it the practice in South Australia to allow advances to contractors on material? Yes.
19492. Is that provided for in their conditions? Yes.
19493. Have you had experience in any of the other colonies—in Victoria for instance? Not in the carrying out of works.

F. M.  
Gummow.  
28 Sept., 1896.

19494. You do not know whether it is the practice in that colony to make advances on material? No.  
19495. Do you know whether it has been the practice in this Colony? I might say, in regard to Victoria, where I have tendered—and I think I am right in saying so—that their conditions provide for an advance on material. I never got a contract there, and I cannot be positive on the point; but I think I am right in saying so.

19496. Do you know whether it is the practice of the Department here to make advances on material to other contractors? I have heard so; I do not know it of my own absolute knowledge.

19497. You have been told so by other contractors? Yes.

19498. You have read Mr. Christie's evidence and report as to the financial position of the firm of Carter, Gummow, & Co.? I have seen some of it. I think I have read it through pretty well.

19499. Are you satisfied from your own investigation that the firm has always been in a sound financial position? Absolutely. That statement of Mr. Christie's deals only with some of our liabilities. It does not seem to touch upon our assets at all. It is a statement only in part.

19500. What do you mean by that? He does not seem to have entered into the matter sufficiently to see what assets we had.

*Mr. Parkes:* There was no intention as far as I am aware of proving that you were an unstable firm. The evidence was adduced only to show the reason that Mr. Weedon's money was paid into the firm's account.

*Mr. Andrews:* The assumption was that the firm were wanting money, and it was pointed out that this particular £2,000 came in very conveniently.

*Mr. Parkes:* It was intended to show, of course, that at that particular period the money came in very conveniently.

19501. *Mr. Andrews.*] Then I will put the matter in this way—Was it necessary at the time this £2,000 was borrowed by Mr. Carter from Mr. Weedon that the firm should have the money? I do not quite understand your question.

19502. Mr. Parkes now says that the effect of Mr. Christie's report is that the money was very convenient to the firm at that time? Undoubtedly, at 6 per cent. It would be convenient to us to get more money on the same terms to-day or to-morrow; but it was not absolutely necessary. We had a good credit balance in Adelaide, and, speaking personally, I could have put in between £2,000 and £3,000 of my own money at that time, at a day's notice, if it were wanted. In fact, I might go further, and say that I could have put in £5,000 without any security whatever on my own account.

19503. Do you know whether any other members of the firm could have helped financially? I think Mr. Gillan could, from what I have seen of his statements. I see he had a thousand pounds. I do not know about Mr. Forrest or Mr. Carter. All I want to show, as regards this £2,000, is that it was useful to get it at 6 per cent.; but it is quite a mistake to say that it was absolutely necessary for the firm. Speaking personally, I could have provided it without any trouble, only I could do better than 6 per cent. with the money I had got out.

19504. As far as you know, the firm had no dealing with Mr. Weedon in the matter at all? None.

19505. It was a loan to Mr. Carter, and he subsequently paid it into the credit of the firm? Yes.

19506. Have you anything to say as to Mr. Christie's report, which appears upon page 433—I mean his memorandum No. 19, as to the financial position of Mr. Gillan and Mr. Forrest when they gave separate bonds in the penal sum of £6,000 each? In the first place, I had nothing to do with Mr. Gillan's or Mr. Forrest's signing those statutory declarations. I was away in Adelaide. As to Mr. Gillan's declaration, I informed him that his interest as partner of Carter, Gummow, & Co.—that is, in the surplus assets of the firm—was £3,100.

19507. Is there anything more you wish to say as to that? Of course, in the £3,100 there would be included his share in the house in the Illawarra Road. That is the only freehold property he owns in connection with the firm, that I know of.

19508. There were some other matters, I believe, in Mr. Christie's reports concerning which you wish to say something? Only this—that his reports to my mind are not final; they are only partial, and in some cases they may be said to be inaccurate. Take the case of his report upon page 383, paragraph (e), "The Department's estimate of quantities, taken from the schedule, is 12 square yards. Mr. Hickson's minute practically authorises payment only for that quantity, which would have equalled a cost of £600." Mr. Hickson's minute, from the way in which I read it, does not say any such thing. It provides for the payment of the quantities shown in the drawings. How Mr. Christie came to make that statement I do not know. Then again, on page 214, there is a memo. "re the delivery of cement on Messrs. Carter & Co's. and Messrs. Carter, Gummow, & Co's. contracts from 1st January, 1892, to 30th June, 1896." If you turn to page 587, you will find a list of cement "purchased and delivered at Contract 72 from the 1st September, 1891, to 23rd June, 1892." In this latter memo. you will see items of 967; 994, 184, and 9 casks, under dates in 1892. In comparing the two reports you will see that there must be a misstatement in one or the other, because these items 967, 994, 184, and 9, were not included in Mr. Christie's previous report.

19509. *Mr. Parkes.*] But the first memo. does not deal with Contract 72 at all, does it? It says "Memo. re the delivery of cement on Messrs. Carter & Co's. and Messrs. Carter, Gummow, & Co's. contracts, from 1st January, 1892, to 30th June, 1896."

19510. But if you read the memorandum you will see that it eliminates Contract 72. It deals only with the North Shore contracts, with the Marrickville contract, and with the Annandale and Leichhardt Contract? No doubt the intention is to eliminate Contract 72, but it does not say so. The heading of the memorandum implies that it deals with the delivery of cement on all the contracts between the dates named. I mention the matter to show that Mr. Christie's statements are only partial.

19511. But he completes the statement in his subsequent memorandum, does he not? I do not see where he says so.

19512. Does he not complete it by his memorandum with reference to the cement on Contract 72? That may be, but the first statement is only a partial statement.

19513. *Mr. Andrews.*] Are there any other inaccuracies or misstatements which you desire to point out in the reports of Mr. Christie? I have not noticed any others. I have not read his evidence through, but, in glancing at it, I saw these apparent inaccuracies.

19514. Do you know whether it is the practice of contractors to shift material from one job to another?  
Yes;

F. M.  
Gummow.  
28 Sept., 1896.

Yes; wherever it may be required. The idea is to always keep sufficient stock of material in hand upon a contract, so that the men may not think that they are working themselves out of a job.

19515. Will you explain what you mean? If they see that the work is likely to be stopped for three or four days they steady down and sometimes put difficulties in the way. At all events, they do not work in the same way in which they would work if they saw plenty of work in front of them. We always have that trouble to contend with upon our contracts.

19516. Has Dawson applied to you for employment since he finished the North Shore job? Yes; he applied to me for work down at Johnstone's Creek.

19517. *His Honor.*] He got work there, did he not? Yes. I spoke to the ganger, Bandeen, about the matter, and Dawson afterwards got employment. I might explain this with regard to Dawson coming to me personally: He boarded at a boarding-house at Potts' Hill where the partners of the firm used to get their luncheon. Dawson was always about the house in the luncheon hour, and, of course, from speaking to a man in that way, one would get to know him better than one would ordinarily do from seeing him upon contracts. I suppose that is how it is that Dawson came to me personally. He knew me personally, whereas I speak to very few of the men upon the contracts.

19518. Did you notice whether he was a skilled man at his work? He was a good man. He had to do shovelling into drays at Potts' Hill. He was a very good worker. Some of the men were on piecework there, and he always earned good wages. At that time he was a blue-ribbon man, and he was steady at his work.

19519. Have there been times when he was not steady, or when he dropped the blue ribbon? I have heard so. I have heard that he has dropped the blue ribbon, but I could not say positively. I always looked on him as a very good man myself. He worked for us in South Australia.

19520. What do you know about his finally leaving the firm;—I mean on the last occasion of your giving him any work? On the occasion to which I have referred, when I got him work through Bandeen. I do not know when he left, but I believe it was when Contract 118 was completed.

19521. You did not see him again after the occasion to which you have referred? Not to speak to.

19522. *Mr. Andrews.*] Would any information which you are likely to get in the office help you in making out your tenders? No; we could get nothing more than we could get from the contract drawings so far as that is concerned.

19523. Is it likely that any one officer of the Department could furnish you with details which would help you? I do not know of a single point upon which he could assist us. The whole of the information is given on the plans. The bores are the only information which you may say are foreign to the drawings, and they are specially put in.

19524. Is there any other point upon which you have any statement to make concerning which I have not asked you a question? I cannot think of anything else.

19525. Will you refer to Question 5033 in the evidence of Mr. Gilliver. He says that there was another instance in which Carter, Gummow, & Co. sent in a lump sum price, and that it was on a job in which Gilliver and Curtis were the second tenderers. He said he thought it was Contract 107? He must refer to the job running through Stanmore which Mr. McSweeney has. I do not know the number of it. We put in two prices as stated, one at schedule rates and the other a lump sum.

19526. Why did you do that? We were sore with the Department for altering the system of tendering from the old system that was in use upon Contract 69, and we thought we would show the Tender Board that if tenders were called for in a lump sum instead of on the new system they could get their work done a good deal more cheaply. We put in tenders in the two ways really to see whether the Board would not alter the system of tendering. The present system does not suit us at all.

19527. The lump sum tender was the lowest? Yes.

19528. And it was rejected by the Department as not being in accordance with their regulations? I do not know.

19529. At all events it was not accepted? No; as I say, we fought the Department. We did not work with them. We fought them all the time, and that was our object in putting in this tender. We wanted at that time to upset their system.

19530. The rejection of your lump sum tender would show that the Government were not inclined to give you any concession except under very special circumstances such as existed in the case of Contract 77? They did not give us the contract, and I presume that what you say is the case.

19531. *His Honor.*] As an engineer, you might be able to say something concerning a point referred to in Mr. W. A. Smith's report on the Monier culvert at Strathfield. He seems to say that the Bordenave or Sidero cement system had been known for forty years in France, and that it was practically identical with the Monier system. Have you gone into that question at all? I have read of the Sidero system.

19532. What is it? I could obtain you the particulars easily enough; but, speaking from memory, it is a system of using girders instead of iron bars. They depend more upon the iron than upon the cement mortar, the mortar being used merely as a stiffening body.

19533. Is it an analogous system to the Melan system? I do not know that system at all.

19534. It is a system of small iron girders, at short intervals of about 3 feet, passing through from the intrados to the extrados of the curve or arch, only slightly covered for protection above and below with cement mortar, the iron being in T sections? I have heard of the system. I have also read of the Sidero system. I should not like to express an opinion with regard to it; but I know that it differs from the Monier system.

19535. Radically? Yes.

19536. It is only analogous in the embedding of the iron at certain intervals in cement mortar or strong concrete? That is so.

19537. But it does not apparently study the peculiar principle of applying the tensional strength of the metal only where the tensional strains come in, does it? Of course it does take up the tensional strains. I believe it does act in that way.

19538. But only the tensional strains, without taking the metal into the compressive strains? I should not like to express too strong an opinion upon that point. I have read of the system, but I would rather not go into the details. I know that it differs a good deal from the Monier system.

19539. I suppose you would define the Monier system as one in which the metal is applied in a very distributed form—in such a way as to utilise merely its tensional strength, utilising in compression members

F. M.  
Gumow.  
28 Sept., 1896.

members the compressive strength of the cement mortar, or concrete? Yes; and also that the iron, in view of the cross-rods being used, distributes the pressure from one rod to another; which is not the case in the other systems. There is a distribution of the strains, and an elasticity is in consequence given to the system.

19540. It also specially utilises the tremendous adhesion between the metal and the compo.? Undoubtedly.

19541. So as to distribute strains much more perfectly? Yes.

19542. And prevent cracking? Yes; it relieves the particular point of stress.

19543. At any point of stress the stress is distributed? Yes; it is a more elastic body. The better the pressure is distributed over it the less strain there is at the point of contact.

19544. And there is no doubt, in relation to Mr. Dean's evidence, that if you were to build on the Monier system a plate without any curve and to use the metal near the soffit of the material, and if there were expansion of the material—that is, the cement mortar, or the concrete—the effect would be to do exactly what Mr. Dean says occurred in his opinion owing to contraction, that is, by curving the whole body upwards, to draw the ends away from the supports. It would put a camber on. The metal would not expand, whereas the cement mortar would expand? They expand and contract together.

19545. But I mean expansion in setting. If you had expansion in setting that would be the effect, would it not? I have never seen any expansion in the work.

19546. You say that it does not occur? Our experience is that it does not occur.

19547. Mr. Dean says that the drawing away from the girders or supports was due, in his opinion, to contraction after setting or to contraction in setting—contraction in the final setting? Our experience is that the work does not show any contraction.

19548. You say that the body is always absolutely the same throughout after the first setting? We have had experience of the work from January until now, and I believe there is no sign of any contraction in the arches.

19549. But there is expansion, is there not, in the setting of the cement—for instance, plaster of Paris expands considerably in setting. Do not some of the cements do the same? We have not any way of proving that they do. We cannot see the expansion practically.

19550. If the cement contains a little anhydrous lime it will expand in setting? I have seen, in making tests, a little blistering or cambering.

19551. That would be from unequal expansion, not from contraction? Yes. I have never seen it practically in the carrying out of work. All our cements are tested. They would not be passed if they did expand.

19552. Once cement bodies have set, then, the only contraction and expansion would be due to changes of temperature? Certainly.

19553. Which is a small variation, the same as would take place in iron? Yes.

19554. It differs so slightly that the elasticity of the body would compensate for the difference? Yes.

19555. You have never seen any actual change in size in setting? No; I have noticed in boxes sometimes that there has been a slight contraction away from the woodwork when the cement has set; but whether it is due to the wood's contracting away from the concrete or not I could not say. I could not say whether it would be due to that, or whether to the cement.

19556. You have not measured for that? No; but I have noticed a slight division between the woodwork and the concrete.

19557. At any rate you can say that the Sidero cement system, although analagous to the Monier system, differs from it in its main principle? Yes.

19558. It could not be called an anticipation of the same system? No.

19559. *Mr. Andrews.*] The arches at Johnstone's and White's Creeks are at present perfect as far as you can see? Yes.

19560. If any witness has said that they are falling down he is making a mistake? Yes.

19561. *His Honor.*] As to the test arches you made at Johnstone's Creek, they are there now? Yes.

19562. They were made with Nepean sand, were they not? No, with North Shore sand.

19563. With hand-crushed sand? Yes.

19564. You are sure of that? Yes; the sand came from North Shore. We took some of the mortar used in the construction of these arches and put it into boxes and made cubes of it. These cubes were brought to the Department so that we might see how the tests would come out. In one arch we used "Hemoor" cement, and in the other "Condor." We wanted to see whether there was any difference between the theory and practice. The Department made tests of the cubes.

19565. In both instances North Shore sand was used? Yes, with different cements. The "Condor" cement was a brand which we did not know so much about as we did of the "Hemoor," and we wanted to be quite sure of it.

19566. I understand you to say that North Shore sand is the sand which you have been using throughout in these arches? Yes, and also in the carrier.

19567. *Mr. Andrews.*] In all the work which has to do with the Monier system? Yes. We got a little Balmain sand over to test it, but it did not go so high in the Government test as did the North Shore sand.

19568. *His Honor.*] You did not use it at all? A little was used in the piers to see how it would go. It is a good, white, quartz sand.

19569. Is it broken sandstone? Yes. We made half-a-dozen tests of different sands. From the North Shore we got the white crushed sand and the yellow crushed sand. We did not like the look of the yellow sand as well as we did that of the white; so we tested it. We found that there was practically little difference in the two tests. Then we tried the Balmain sand—yellow and white. We also tried some white sand from Annandale, and we tried sand from the crusher. They were all tested with cement from the same cask. We found that the North Shore white sand was the best, and that the North Shore yellow sand was very close to it. I think the sand from the crusher came third, and that the Annandale sand was the poorest. We did not look round any further. We simply took the North Shore sand.

19570. You thought you could not do better? Yes, previous to that we made a test with Nepean sand. I will not say that it was the best Nepean sand; but it turned out that the crushed sand was a good deal stronger. We did not take selected samples. We merely took samples from the heap delivered

to

F. M.  
Gummow.  
28 Sept., 1896.

to us. We did this for our own information and not to pass any test for the Department or anyone else.

19571. Had you heard of the merits of the North Shore sand in other work, or how did you come across it? Mr. Carter could answer that question better than I could. He got the sand before I came back to Sydney.

19572. *Mr. Carter.*] You know, as a matter of fact, that we are always hunting about for sand—making experiments with it, and so on? Yes.

19573. And that we got the North Shore sand in that way? Presumably. We always endeavoured to get the best material. We do not consider the price so much when we are getting a good article, and we will not be put upon by any persons who try to form rings against us.

19574. *Mr. Davis.*] Speaking of the Monier arches, it is a fact, is it not, that it would be very exceptional for the tension of the arches to be brought into play at all? Very, with the load that is there.

19575. What would you say would be the advantage of the Monier system, taking the aqueducts at Johnstone's Creek and White's Creek as an example? The advantage of putting the iron in the arch is not that you anticipate putting the iron under tension, but you must allow for a certain factor of safety in your work. You want to make your arch as elastic as possible, to resist any changes in temperature.

19576. Is it not a decided advantage to have an arch as elastic as a Monier arch would be, and is it not a special advantage which you claim for these arches at Johnstone's Creek? Undoubtedly. The material in these arches is of an improving nature rather than of a deteriorating nature. It varies from stone-work in that it is really strengthening day by day up to a certain period—that is, as far as we know.

19577. What I want you to speak to is this: Supposing you took a concrete arch, with concrete spandrels and a concrete carrier, you would have, to all intents and purposes, a monolith; and, if at any time expansion took place, there must of necessity, unless provision were made in the way of an expansion joint, be a crack occurring;—in the case of the Monier system would not the elasticity provide for a contingency of that kind? Yes; a solid concrete mass such as you speak of must necessarily act similarly to cast-iron. When it is cooling you will find that the thin part often contracts or cools more quickly than does the thick part, and, through that, a fracture occurs. That I consider is the weak point in making a body very thick in some places and very thin in others. These arches being almost of the same thickness throughout, and having the iron in them, form an elastic body which will give and take with the changes of temperature or with the load.

19578. You have there all the advantages of an elastic arch, with this addition—that you have a material specially favourable for compression? Yes; undoubtedly.

19579. And at the same time you have an enduring material which will continue to improve with age? Yes.

19580. You have spoken of the new system of tendering;—you said that, speaking for your firm, you were not particularly favourable to it? We are the very opposite; we are decidedly against it.

19581. You have had a good bit of experience in tendering, have you not? Yes.

19582. Have you ever come across this system before? I remember seeing it in connection with the water-pipes of the city and suburbs, under Mr. Trevor Jones, a good while back.

19583. You mean the water supply under the Water and Sewerage Board? Yes; that is the only instance in which I have seen it.

19584. In the course of your evidence, I think you have said that a contractor having special experience in connection with any particular kind of work would have an advantage in preparing his tender over a man who had had no experience in that work? Certainly.

19585. What would you say would be the effect of this new system, bearing that in mind, and taking your own firm as a firm which has had special experience in tendering for sewerage work—would you compare favourably or otherwise with an inexperienced firm under the new system? I think we compare unfavourably with an inexperienced firm.

19586. And under the old system you consider that you had an advantage over an inexperienced man? Certainly.

19587. Would you have very much, if any, advantage over an inexperienced man under the new system;—will you tell His Honor what has been the effect of the new system upon your firm—whether you have not been affected more than has any other firm of contractors by the adoption of the new system? We consider that we have been the cause of the alteration. It may have been conceit on our part, but we considered that it was a blow at us particularly. No doubt our firm have taken every advantage of the old system of tendering, and we were able to do so from the experience we had of sewerage work. I might say that I have been doing sewerage work since 1883. I was engaged then upon the Bondi sewer. Mr. Snodgrass was upon an adjoining contract at the same time. There was no one in New South Wales who had such experience of the work as we had. We often at that time, as engineers, compared notes on the schedules, and when we took to contracting ourselves we studied the schedules very particularly. We always took out all our own quantities, and then compared them with the Government quantities, studying the likely points of increase or decrease. We then arranged our schedule in such a way that if there were any alteration at all—any deviation from the probable quantities—we should make by it, and if the probable quantities were adhered to we should not lose at all. There are so many items in the schedule which depend for their use one upon one another.

19588. An inexperienced man would not be able to do that, and to that extent he would be at a disadvantage? Unless he had experience he would not be able to take the chance of putting a big profit upon one item and perhaps cost price upon the next.

19589. *His Honor.*] Gambling with the items, as it were? It is not altogether gambling; it is speculating.

19590. *Mr. Davis.*] The more the firm contracted the more experience it gained in this direction? Yes; the advantage we should have over a man who does not take out quantities is that we could really see what percentage we could take off or put on to each item, and then average it. If you do not take out quantities, that is not the case, and in tendering you would not know what you were doing.

19591. Supposing that in the new system the rates are so fixed that they correctly give the value of the work with a percentage for profit, it is a mere matter of arranging what profit you require and putting in your tender accordingly? That is so.

19592. *His Honor.*] If the engineer is right in his estimate the whole thing comes out satisfactorily to everyone;

F. M.  
Gummow.

28 Sept., 1896.

everyone; but if he is rather high on one item and rather low in another in comparison with the actual cost, the thing does not work well for anybody? You have to take out the quantities very carefully and study what quantities are likely to be used.

19593. It is an equation with a lot of unknown quantities? Yes; but your experience assists you to judge quantities fairly. I remember that in the case of the contract at Willoughby Bay there was one item which we considered was high priced, and that if we made any profits at all it would be on this particular item. On some of the other items we should lose, because we took 30 per cent. off the original schedule. A man who did not go into the quantities could not judge that from looking at the prices merely as set down.

19594. *Mr. Davis.*] In the case of the tunnel contracts there is in every contract plenty of room for difference of opinion? Undoubtedly.

19595. That is shown by the fact that we get tenders varying from sometimes (say) 0 to 25 per cent. below? Yes, they vary considerably.

19596. Coming to Contract 77, did you assist in the preparation of the tender? Yes; Mr. Snodgrass really prepared it. I went through it and approved of the items or altered them as the case might be.

19597. What was the price you put down as the prime cost for the Monier structure? The Monier mortar I put down at 70s.

19598. Can you tell His Honor what you estimated would be the prime cost of the work when you put in your tender for £15,500? The cost was about £14,700 as nearly as I can remember.

19599. *His Honor.*] The cost to you? Yes, including plant and supervision.

19600. *Mr. Davis.*] So that you put on a profit of about £750? Yes, from that to £800.

19601. Now that you have carried out the work are you confirmed in the opinion you had when you put in your tender, or otherwise? The work is not completed yet, and it is difficult to say what the general contract will make, because the two contracts, 77 and 118, have been worked pretty much together. We have had the same supervision for the two contracts, and the same yard expenses.

19602. But taking the price of the Monier structure per cubic yard, are you confirmed in your opinion? The Monier structure itself is a little cheaper than I anticipated. I had already put in my estimate for that part of the work. It is a little cheaper than 70s., excluding the iron work.

19603. Do you know enough of the affairs of Mr. Gillan and Mr. Forrest to say whether the declaration they made at the time Contract 77 was let to your firm was correct? No; I only speak with regard to their affairs in the firm. I do not know anything outside of that. I might further mention this—that I was under the impression at that time that the house at Dulwich Hill was Mr. Gillan's property. We had always looked upon it as his property.

19604. Apart from the fact of Mr. Gillan's not having any freehold property, as turns out to be the case, he has an interest, I believe, in the Illawarra Road property. Do you think he was correct in saying that he was worth £6,000? Yes; from what I know of his affairs. I have looked through his statement. As to the £1,000 deposit, we borrowed £400 off him and I believe he has the rest of it. I gave him the information as to his interest in the firm being worth £3,100. He has a further sum of £1,000 in the firm in addition to his interest of £3,100, and I might mention how that arose. Mr. Gillan was my partner originally. I did not consider that he was as advantageous to the firm as I was, and I thought he ought to put in a little more money, and he therefore put in the £1,000 actually on my behalf. I did not put in that amount but he put it in for me.

19605. *Mr. Parkes.*] Then it absolutely belongs to you? No; he holds a promissory note for it from the firm.

19606. But he bought an interest, as it were, in your superior value? He bought it, but I do not know whether he has much security.

19607. *Mr. Davis.*] The firm gets the use of the £1,000? Yes. It is Mr. Gillan's property. He has put it into the firm on my behalf, but he holds a promissory note for it.

19608. The firm gets the use of the £1,000 of Mr. Gillan, and he gets the use of your brains? Yes.

19609. *His Honor.*] When he goes out Mr. Gillan will take the £1,000 away with him, I suppose? Yes.

19610. In estimating the value of Mr. Gillan's interest in the firm, you do not include that £1,000? No. It is really a debt owing by the firm to him, but my share in the firm, instead of being £3,100, as Mr. Gillan's is, will be only £2,100, because I have not put in the extra £1,000 of capital.

19611. Which you would have put in if you had not got Mr. Gillan to put it in? Yes. I might mention that when I was a partner of Mr. Gillan, Mr. Maddison, and Mr. Ewing, I never put a penny into the firm. I put in only brains. They found the capital, and before any profits were distributed they got their capital back. We had a deed of partnership, which would show that they had to put in all the money necessary, and receive it back before profits were distributed.

19612. It was a loan without interest, as it were? Yes. They had in the firm their £2,000 or £3,000, and that, at so much interest, made up for the difference in value of their supervision as compared with mine. We all drew the same salary. I suppose they liked to get some salary, for fear there would be no profits. As against that, they had to put in the capital.

19613. *Mr. Davis.*] Did Mr. Hickson or I ever have any financial dealings with you or with any member of your firm? Certainly not with me; nor, as far as I know, with any member of the firm.

19614. Did we ever go into any "specs" together? No. There have never been any transactions between us except in our relations as Government officers and contractors.

19615. *Mr. Parkes.*] Tenders have already been called by the department for a section of the Balmain sewer running beyond Mr. Gilliver's contract, have they not? Yes.

19616. You tendered for that work? Yes.

19617. You were the lowest tenderers? Yes.

19618. Is not the specification entirely altered? I think not.

19619. Are there not only two classes of excavation? If you hand me the schedule I could tell you.

19620. Only two classes of material are mentioned—is not that so? I cannot say without seeing the schedule.

19621. Did you not make up the tender? Yes.

19622. Then you must recollect what is in the schedule? I prefer to see the schedule itself.

19623. Were not more numerous bores taken—were they not taken right through the strata to the bottom of the sewer? They are not more numerous than usual, I think. In some parts none are shown at all.

19624.

F. M.  
Gummow.  
28 Sept., 1896.

19624. But they go right to the bottom, do they not. There are complete borings? The borings are about the same as I have usually seen in sewer contracts. In places they are below the invert of the sewer, but that would be in soft ground. It is usual to go through soft ground until rock is struck, or until they get to the invert of the work. In some cases the bores may be a couple of feet below the invert. In those cases probably the man who was boring would not know the exact depth of the invert.
19625. *His Honor.*] He would mean, I suppose, to stop at the invert? Yes.
19626. *Mr. Parkes.*] As to Mr. Christie's report *re* the delivery of cement—as a matter of fact the report upon page 294 deals only with the three contracts, 79, 79A, and 69? I believe so, from reading the bottom portion of the report.
19627. It was not complete, and that fact is shown on the face of the report, is it not? The report to which I referred just now would lead one to suppose, at a first glance, that it dealt with the delivery of cement upon the whole of the contracts.
19628. But the report to which I have referred you applies to only the three contracts I have named? I presume that that was intended, but I do not think it is so stated.
19629. Further research would bring forth the report as to the cement delivered upon Contract 72? Undoubtedly. But, reading the first report as it stands, without reference to the second report, I should take it that the whole of the delivery amounted to 21,572 casks.
19630. You will remember that we objected to putting in the total because our researches were not complete? Mr. Christie did not make that statement to my knowledge.
19631. But that was the object apparently of deferring the complete report? I do not know.
19632. Was there any cement delivered on to your job other than that disclosed in these purchases? Taking Carter & Co.'s bank-book, I should say yes.
19633. Did you purchase from any persons other than those whose names have been disclosed? I do not think so; but, looking at the bank pass-books, I should say that a good deal more cement has been purchased from Henry Austin than is stated.
19634. But if Mr. Austin has submitted returns from his ledger they would not be incorrect, would they? I do not say that the return is incorrect as far as it goes. My contention is that Mr. Christie's report is only a partial report, and that Carter & Co. have paid to Henry Austin for more cement than is shown there. I think that is disclosed by the bank pass-books.
19635. Were they cash transactions? They were paid by cheque.
19636. Did you never pay the firm in bills? Yes.
19637. And those bills would become due six months after the purchase? I could not say the date, but I am satisfied, from going through the bank-books and from speaking to Mr. Carter, that a great quantity of the cement charged in 1892 was delivered in 1892.
19638. But suppose the bank pass-books have been looked at, and that proper accounts have been made out; that the payments to Henry Austin & Co. are shown to be by P.N., the P.Ns. being at six months' date—that would be for cement bought some time previously, would it not;—for instance, there are a series of P.Ns. totalling £3,850;—that would be for cement bought previous to 1892? It could be so. I do not know whether it is so or not. I think you will find that some cheques were paid a good deal later.
19639. *His Honor.*] I understood that the list of purchases was taken to be correct? As far as it goes.
19640. I mean that it was taken to be an exhaustive list of purchases within the time to which it applies? My contention is that there was a further quantity of cement bought during that time..
19641. I understand you to be referring to Contract 72. But upon Contract 72 there were, I understand, large transfers of cement to Contract 79? I know nothing of that matter. I had nothing to do with that contract.
19642. *Mr. Parkes* ] The accounts of Henry Austin & Co. disclose the fact that there were various large amounts paid by P.N.;—that would be for forward delivery of cement? Yes, but I think there were other deliveries besides those. I know what the P.Ns. are, and from those we can tell that a great deal of cement was delivered in 1892 that was paid for in 1892. For instance, I see that on August 11th 409 casks were delivered at Waverley,
19643. *Mr. Davis.*] What you complain of is that the cement said to have been delivered upon these three contracts is represented as being the whole of the cement purchased? Yes; and there is a later statement which appears upon page 587, from which it would appear that there were three more invoices applying to 1892.
19644. Those not being included in the first statement? Quite so.
19645. *Mr. Andrews.*] Your complaint is that the first statement is misleading? Yes; one of the statements must be wrong.
19646. *Mr. Parkes.*] Do you recollect anything about the delivery of cement on Contract 72? I know nothing about that.
19647. Were you not upon 72? No; I was not connected with 72 in any way.
19648. On May 21st, 1892, a certain amount of cement was delivered to Gummow & Gillan by Henry Austin & Co.;—that was paid for by Carter, Gummow, & Co.'s cheque, was it not? No.
19649. On April 30th, 1892, 619 casks were sent to Gummow & Gillan, and were paid for out of Carter & Co.'s account? Yes.
19650. Were Carter & Co. and Gummow, Gillan, & Co. working together then? No; there was no connection. They were separate firms.
19651. Then why should that cement be paid for by Carter & Co.? I believe that Carter & Co. had a contract with Henry Austin & Co., and transferred this amount to Gummow and Gillan, Henry Austin & Co. holding Carter & Co. liable for the amount.
19652. Did you pay Carter & Co.? I hope so.
19653. Do you recollect doing so? I see there is a payment to Carter & Co. of £321 17s. 3d. under date of 3rd June. There had been a transfer in April of 619 casks to Gummow and Gillan. We appear to have paid Carter & Co. on 3rd June. Again, on 22nd August, there was a payment to Carter & Co. of £200 11s. 6d.
19654. Were you trading together after May, 1892? In about August, 1892.
19655. As to the letting of Contract 77, you were sent for specially to come across to make up the tender? Yes.

19656.

F. M.  
Gummow.  
28 Sept., 1896.

19656. When you came across, did you consult any officer of the department as to the prices? No.  
 19657. Had you any communication at all with Mr. Hickson? No.  
 19658. You never asked him whether you could put in the Monier tender or not? No.  
 19659. You never had any words with him in any way on that subject? No.  
 19660. Nor with any officer of the department apart from Mr. Baltzer? No.  
 19661. What did Mr. Carter say to you when you came across, and when he asked you to make up the tenders? I do not recollect what he said particularly. I remember going across to the North Shore office, and Mr. Snodgrass had there the plan and also his estimate. They asked me to look through it and see what I thought of it. That is what it amounted to. I went through the estimate and criticised it.  
 19662. Do you know where the estimate is now? Yes.  
 19663. Have you the original one? Yes.  
 19664. Can you produce it? Yes. It is rather a ragged looking document, but it is the one which was made up at the time.  
 19665. In whose handwriting is it? A boy named Norman Burkett copied it for Mr. Snodgrass. It is the estimate which Mr. Snodgrass made out.  
 19666. *Mr. Parkes.*] The total, I see, is £14,677 10s.? Yes. There is an error of £100 in the addition. It should be £14,777 10s.  
 19667. *His Honor.*] You say you went through the estimate;—to what conclusion did you arrive? We differed on some points. For instance, in the quantities attached to the first two items. You will see that Mr. Snodgrass's quantity for the tunnel in lineal yards was 750. On the margin you will see that I have written in pencil 723. Then, in regard to item No. 2—shafts—Mr. Snodgrass estimated 100 lineal feet, and I had written in the margin 49. The entire estimate is as follows:—

## CONTRACT No. 77.—Estimate of Cost on Monier System.

|   |        |      |  | £     | s. | d. |                          |       |      |  | £       | s. | d. |
|---|--------|------|--|-------|----|----|--------------------------|-------|------|--|---------|----|----|
| Tunnel, lineal yards .....                        | 750    | 85/- |  | 3,187 | 10 | 0  | Gully covers .....       | 4     | 20/- |  | 4       | 0  | 0  |
| Shafts, lineal feet .....                         | 100    | 35/- |  | 175   | 0  | 0  | Blue pitchers .....      | 8     | 30/- |  | 12      | 0  | 0  |
| Monier, mortar .....                              | 1,070  | 70/- |  | 3,745 | 0  | 0  | Sandstone pitchers ..... | 320   | 6/-  |  | 96      | 0  | 0  |
| Sandstone concrete .....                          | 1,800  | 23/- |  | 2,070 | 0  | 0  | Two-rail fence .....     | 50    | 20/- |  | 50      | 0  | 0  |
| Iron, $\frac{3}{4}$ and $\frac{1}{2}$ , ton ..... | 44     | 10/- |  | 440   | 0  | 0  | Two-rail and wire .....  | 100   | 8/-  |  | 40      | 0  | 0  |
| Tie-bars .....                                    | 2      | 15/- |  | 30    | 0  | 0  | 24-in. pipes .....       | 120   | 30/- |  | 180     | 0  | 0  |

19668. *His Honor.*] I understand that you made your own calculations from the data upon which Mr. Snodgrass had been working? Yes.  
 19669. He is an engineer, I understand? I do not think he has been through any particular course, but he is a practical man, who has been with contractors for a long time. He has been through the drawing office, and he has had to go through a course of mathematics, but he has never passed any particular examination. He has been through a practical course of engineering with good engineers.  
 19670. Under good practical engineers? Yes. I believe he gained his experience principally upon railways in New Zealand, under a very large English firm—Brassey and Betts—who had work to do there. He went through the mill, you might say, including practical working in the office, and also outside. He can do instrument work, and everything of that kind. He is thoroughly capable. I do not think he could go into the higher mathematics, but that would be about the only thing he has not studied. He is capable as regards all general mathematical questions.  
 19671. *Mr. Parkes.*] I see that in Mr. Snodgrass's estimate sandstone concrete is put down at 23s. a yard—is that a fair value? I should say so.  
 19672. Shaft excavation is put down at 35s. a lineal foot? That is made up in a peculiar way. It includes the concrete as well.  
 19673. The tunnel, I see, is put down at 85s. per lineal yard;—would that include the brickwork? The brickwork and the concrete, but not the rendering.  
 19674. You have put down rendering at what? At 2s. a yard, the quantity being 12,000 yards.  
 19675. You have not your original estimate upon the departmental scheme for Contract 77? No; I have been looking for that, but I cannot find it.  
 19676. You have put down cast-iron at £10 a ton, and  $\frac{3}{4}$  and  $\frac{1}{2}$  in. iron-bars are also put down at £10 a ton? Yes.  
 19677. I suppose that was the market value at the time? Yes; I think you may take that as the fair market value.  
 19678. Had you any piling under the foundations of your piers? Yes; 1,300 odd feet. The Government specified 900, I believe. Mr. Snodgrass and I agreed in the main, though not in the details. Mr. Snodgrass's prices were a little too low, but then he had his quantities a little too high, so that the one balanced the other. Finally, when we made up our tender for the Monier design, we put it at £15,500, so as to be a little below our estimated cost of the Government design.  
 19679. You bought the timber for the job solely from Guy & Co.? Yes.  
 19680. If Guy & Co. shows for the two works, 77 and 118, a total of £568 5s. 2d., that would be the total amount paid? If that is what it shows.  
 19681. If Guy's accounts contain a great deal of timber which would be used for keeping back the earth on Contract 118, that would considerably reduce the total of £568? I do not think any timber was used on Contract 118 for keeping back earth.  
 19682. Did you ever see the work? Yes.

- F. M. Gummow.  
28 Sept., 1896.
19683. Was it not timbered back? No.
19684. Was not the earth timbered back while the excavation was being made? No; it stood all right without being timbered.
19685. Is it not specified to be timbered back? If necessary.
19686. *His Honor.*] Was the excavation taken out a good deal larger than the channel? We took it out about 9 inches wider than the outside of the concrete, but we did not get paid for that. If we found that by battering it a foot in 5 feet it would stand better, we would do it and save the timbering.
19687. It would be cheaper to take out the extra stuff than to timber? Yes. The excavation would be only from 2 feet to 4 feet.
19688. And not deep enough to be dangerous? No.
19689. *Mr. Parkes.*] You built cement sheds? Yes.
19690. And some of the timber would go into that work? Yes.
19691. You did not start the Monier arches in July, 1895; you did not start them until January, 1896? That is so.
19692. Then the timber delivered on July 10th, 16th, 17th, 18th, 25th, and up to the end of the month, and all the timber delivered in August and September—in fact up to the time the Monier arches were commenced—would be used for Contract 118, would it not;—am I not right in supposing that? No; you are wrong.
19693. Why? Because the centres were ready probably two months before we started building the arches. The carpenters were at work upon the centres some time beforehand getting everything prepared.
19694. In September, Guy & Co. charged for Oregon at the rate of 9s. per 100 feet superficial? That would not apply, I think, to the timber we used there. The 9s. would be for 1½ inch stuff. All the heavier timber would be charged at 11s. or 12s. The timber you refer to is light scantling. That would not be heavy timber.
19695. Will you point out the items to which you refer? Yes. You will find 5 x 2 at 11s., 3 x 1 at 11s., 4 x 2 at 11s., 4 x 3 at 11s., 12 x 1½ at 11s., 12 x 1 at 11s., 12 x 3 at 11s., 3 x 1 at 11s., and so on.
19696. I think if you go a little further on you will find that the rates are cheaper—that is, when you come to the end of 1895? December 13th, 6 x 4½ at 11s., 9 x 4½ at 11s., 10 x 1½ at 11s., 4 x 4 at 11s., then there are 12 x 5, 12 x 3, and 14 x 3, at 11s., and so on into 1896.
19697. *His Honor.*] Some of the small sizes are at 11s.;—were there two qualities? No; they charge different prices. It would depend upon whether we got trade-sized or special sized timber.
19698. The lower prices, I suppose, would be for the trade size? Yes.
19699. *Mr. Parkes.*] But the 1½-inch stuff would be the planking which you first of all used in the piers of the aqueduct? A lot of Oregon planking was used in the piers.
19700. And you afterwards took that Oregon timber and used it in the Monier structure? No; very little of it. If you had had our experience you would find that people in the neighbourhood would take a good deal of that.
19701. At all events, the total which you paid Guy & Co. for timber for both works was £586? Yes.
19702. And the material used for the piers you must have again used, as far as it was left, for the arches? Certainly; if any were left we should use it if it would come in.
19703. *His Honor.*] It would be none the worse for having been used in the piers, as a general rule? Not if you continue using it directly.
19704. The wood would also be very convenient for firewood, I suppose? Yes; that has been our experience over there. As to the centerings, there is a lot of labour to be put on to them, and there is also a lot of ironwork. That would have to be added on to the timber.
19705. *Mr. Parkes.*] Take the two Contracts—117 and 77; in the one case the excavations are 100 per cent. more than in the other schedule;—suppose the officers of the Department issue a schedule which is entirely in error, how would the contractor adjust it? By charging his percentage above or below.
19706. If there is an item 100 per cent. too high the contractor will take off something? He would take off what he considered would leave him a fair working price.
19707. And if he found an item too low he would add on a percentage? Yes.
19708. That is the way you make out your estimate? Yes.
19709. And then you make an average? Yes; on the total quantities.
19710. *His Honor.*] I suppose that in point of fact you make up your total first of all altogether independently of the Government prices? Yes; we take the plan and take off all measurements with sections, and calculate what we think the quantities and the prices will be. Then we add on our price for supervision, plant, and profit, and see what the total comes to.
19711. That would give you a primary basis for your percentage reduction? Yes; we take the quantities which we calculate will be used and multiply them by the departmental prices and see what the difference is in the two lump sums. In that way we get at the difference in the percentages.
19712. And you modify that afterwards on speculative grounds? Yes; in every contract there are different circumstances. There are a number of things to be considered.
19713. *Mr. Parkes.*] You are speaking now of the late system of tendering without quantities? Yes.
19714. But take the case where quantities are given? We take our own quantities and go by them.
19715. You do not accept the Government quantities? No.
19716. So that, after all, it is quite useless for the Government to provide the quantities? They may have been useful to other persons, but they are of no use to us. We should never use them.
19717. *His Honor.*] I suppose that in speculative tendering you assume that other persons may be guided by the Government quantities? Yes; we could see that they were. We could often find out that that was the case. Suppose a man got a contract. We find out six months afterwards that he had 50s. a yard for concrete. We see what sort of price we had, and we judge then whether he has gone on the basis of equal profit on every item. We always keep our eyes and ears open to see and hear all we can.
19718. *Mr. Parkes.*] As to the floodgates on Contract 118,—were you paid for those gates by the Department? No.
19719. You put them in at your own expense? Yes.
19720. As to the advance on plant that you have spoken of in South Australia,—had you advances made you on both plant and material? No; only on material.
19721. Not upon plant? No; but they gave us back the retention money whenever we applied for it, before the completion of the work, on three different occasions.
- 19722.

19722. *His Honor.*] At what times were those? The deposit was £5,000, and when the retention money came to a little over £5,000 we wrote in asking for the deposit. I saw the Engineer-in-Chief, and he said "Will the retention money suit you as well?" I said it would, and he then said "We will give you the £5,000 retention money." And we took it. F. M.  
Gummow.  
28 Sept., 1896.
19723. *Mr. Parkes.*] Still he had the £5,000 deposit? Yes.
19724. Until the final completion? Yes; they have still got it. At the beginning of this year the Engineer was over here, and I told him that we wanted some more money. He said "Write in and we will see how much we can give you." Within a few days after we had written in they gave us £1,000 out of £1,800 standing as retention money.
19725. *His Honor.*] As further accumulated retention money? Yes; and in the following month they gave us another £1,000.
19726. So that they were content at any rate at intervals to bring themselves down to their deposit? Yes.
19727. *Mr. Parkes.*] You say you made up your estimates of the cost of the Monier work which you handed in the other day as the work proceeded? Yes.
19728. But, in your wages-book, you have the two contracts, 118 and 77, mixed up;—how, under those circumstances, could you arrive at your estimate? I made it upon what I observed on the works without any reference whatever to the time-book.
19729. You made no reference to the time-book? No, not further than this:—I would ask Mr. Forrest, who was with me, what he was paying the men for the particular work, the cost of which I desired to obtain.
19730. Did you make a special note of that? Yes; I made a note of it in a little penny time-table book, I think.
19731. You made special entries to find out the cost? Yes.
19732. At the time that the work was going on? Yes.
19733. Not day by day? No. It was whenever I thought fit to go on to the work to see what was going on.
19734. And that is how you made up your calculation? Yes.
19735. From information also which you obtained from Mr. Forrest? Yes.
19736. Nearly altogether from information which you obtained from Mr. Forrest? No. Perhaps I had better explain to you exactly what information I did obtain from Mr. Forrest. Supposing, for instance, I went on to the ground at 3 o'clock and saw that the men were making cover-plates, I would say, "How long have they been at it?" He would say, "They started at 2 o'clock." I would then stop there until they were finished, and from the information I obtained in that way I would estimate what the cover-plates had cost. So far as the arches were concerned, I was there during the whole time they were being turned.
19737. As to the cement you were buying at that time;—you were buying at 10s. a cask, and were paying 1d. a cask for delivery on the job? No; more than that for delivery on the job.
19738. Was it not 1d.? No. There was about three quarters of a mile lead, and I should say it would be from 3d. to 4d.; but I could not be sure of the cost.
19739. You were buying Try's cement for Contract 118, at the rate of 9s. 6d.? Yes. You must bear in mind, with reference to the cement generally, that it was equal to 10s. 3d. ordinary cost.
19740. But on the job? No; 10s. 3d. was the cost, less  $2\frac{1}{2}$  per cent. It was 10s. net.
19741. That is what you paid? We paid 10s. 3d., less  $2\frac{1}{2}$  per cent; that is the way you have to take it.
19742. The  $2\frac{1}{2}$  per cent. is taken off just the same? No. We had to take it to the shed, to stack it, and to bring it back again on to the works.
19743. What did Mr. Baltzer say to you when he presented the plans of the Monier work? I could not tell you. I do not think he presented it to me; I think Messrs. Carter and Snodgrass had it when I came to the office.
19744. A completed plan? As far as all the details are concerned.
19745. A finished plan? No; as far as I can remember it wanted some more printing. There were two or three little odds and ends to be done to it.
19746. Apart from the printing it was finished? It was finished as far as all the knowledge I wanted was concerned; but it was not complete so far as tendering was concerned.
19747. Were there two plans or one? There was only one plan of the design. Mr. Baltzer had a sheet of stresses and strains, to show that the thing had been properly gone into.
19748. Did he go into the quantities with you? No.
19749. Did he have a chat to you about the prices which were to go in;—did he go into the quantities? The quantities I got were those I obtained from Mr. Snodgrass. I checked them through to see what they would come to.
19750. Do you recollect when it was determined that he should not have a third share in the Monier patent, but that a percentage of  $2\frac{1}{2}$  per cent. should be allowed to him? Yes.
19751. When did that change take place? Early this year.
19752. Before the Annandale work was started? No.
19753. After that? Yes; early this year.
19754. After he left the office? Certainly—five or six months afterwards. The arrangement was made through Billyard, Andrews, and Moseley.
19755. A deed was drawn up with reference to his interest in the partnership? Yes.
19756. You thought that there was a good profit in this patent? I hoped so; I do not know yet.
19757. You took an interest in it,—it was not a thing you did not care a rap about? No; I took a great interest in it. More than half my time during the latter half of last year was given to the subject; we wished to make sure of it. The other partners left it to me to judge whether it was worth while to spend money over it, and I think my advice was taken on the subject.
19758. I suppose you had a good number of interviews with Mr. Baltzer during that time? Yes.
19759. Was he as interested in the matter as you were? More so.
19760. He was very anxious to make a profit out of it? No; I do not think so. He is an enthusiast in any matter of that kind. He has other ideas in hand. He is always speaking to me about various German patents.
19761. But he is anxious to make money out of these patents? Certainly.

F. M.  
Gummow.  
28 Sept., 1886.

19762. He is not merely idling his time away? No; we were paying him in the meantime.
19763. He looked for a fair profit until this change took place, under which he received only  $2\frac{1}{2}$  per cent.? I could not say what his idea was before that, and I do not know whether it was considered at all.
19764. *His Honor.*] What was the reason for the change? It is a very difficult matter for us to keep a separate account of the profit arising out of any particular use to which this system is put. Suppose it is used for floors in a building. The probability is that we should send a plant from our works. We had the plant in hand, and we could not charge it partially to a third or fifth party. It is very difficult to keep such an account separate, and, as it might lead to disputes, we agreed with Mr. Baltzer to give him  $2\frac{1}{2}$  per cent., so that as regards every bit of work of the kind which we got he would be sure of that amount.
19765. You agreed to give him  $2\frac{1}{2}$  per cent. upon all those portions of your work involving the Monier system? Yes. We found that it would save us a great deal of trouble in the keeping of accounts, and Mr. Baltzer would get a definite amount whether the job paid or not. Supposing we were going to erect a building in which there was £500 worth of Monier flooring, Mr. Baltzer would get  $2\frac{1}{2}$  per cent. on that £500.
19766. He would not get a percentage on the whole cost of the building? No; only on the cost of that particular construction.
19767. So that you still have to take out the particular construction, but not with such an elaborate calculation as you would otherwise have had to make? We take out the cost of the particular construction. When we are estimating for the work Mr. Baltzer is there to see what is done. He knows, for instance, that the Monier work will run into a thousand pounds. Therefore he knows at once what he is going to get upon it. We should not have to keep an account of that particular construction apart from the general construction. That was the reason for the change.
19768. *Mr. Parkes.*] When Mr. Baltzer went away to England was it understood that he was to get further particulars with reference to the Monier system? His idea for some time had been to go home.
19769. He himself wished to go? Yes; we had spent a good deal of money in tests, and Mr. Carter and I considered that it would be cheaper in the long run to send Mr. Baltzer to Europe to get all the particulars. We thought that would be a great deal better than the expenditure of a considerable sum of money in finding out the different points for ourselves.
19770. And you paid him a certain sum of money to go home? We told him to go home, as the people in Europe, in writing to us, did not know what was wanted in Australia. We thought that on the whole it was better for him to go home, and we gave him £200 for his expenses.
19771. The rest of the money was for finding out the information? Yes. For instance, he was to go to the Berlin Exhibition and to desiccating works, and he was to pick up all the information on that and other subjects which he could in Germany.
19772. You gave him a cheque for £508? Yes; the £8 was the exchange.
19773. Did you not send in a model of the Monier arch to the department? No.
19774. Have they not a model? Yes; I believe so.
19775. Has not their model cracked? I could not tell you.
19776. Have you not seen it yourself lately? I have seen it there for about two years.
19777. Has it not cracked from contraction? I do not think so, if it has cracked at all. It is on the floor up near the Under Secretary's. If it has cracked, it has been probably due to carrying the thing about on the pedestals. It has been there, to my knowledge, a couple of years, but I have nothing to do with it, personally or otherwise.
19778. *His Honor.*] You paid for the flood-gates for the drain on Contract 118? Yes.
19779. Did you contend that you were not bound even to do that? Mr. Hickson was over at the works, and he said "I think you should put up the flood-gates for your own benefit when the tide comes up."
19780. What is the object of the flood-gates? They are to keep the tide back. We did not object to provide them to prevent the tide from coming on to our work. We were working below high tide.
19781. So that in dry weather they would be an advantage to you? Yes.
19782. If you had been working in the original channel of the creek you would have put a flood-gate there? Yes.
19783. Having that defined channel cut, it became convenient to put up the flood-gates to prevent the tide from interfering with your work? Yes.
19784. *Mr. Davis.*] As to your lump sum tender for Contract 107, do you remember the precise circumstances under which that tender was put in? All that I can think of is that we put in a lump sum tender to show that our lump sum was lower than the sum worked out at schedule rates less the percentage.
19785. Do you remember that a large proportion of the sewer shown on the contract drawings was eliminated before tenders were invited, but that the schedule contained the quantities for the portion which was eliminated? Yes; I believe there was something of that kind.
19786. And you, taking advantage of that, put in a lump sum for the work left? Yes; I believe that was the case now you mention it. The idea, as I said before, was to crush out the percentage system if we could.
19787. Your lump sum was for the balance of the work left in the contract, but not for the work contained in the schedule? Our lump sum was made out in quantities which we took off the plans without reference to the Government quantities.
19788. On the work contained in the contract drawings after the portion to which I have referred had been cut out? It was on the work shown on the contract drawings re-advertised.
19789. That would show the difference between the schedule rate at which you tendered and the lump sum? I could not tell you what was cut out. I remember that there was some portion cut out now you mention it. We were satisfied to do the work for the lump sum.
19790. *Mr. Andrews.*] Your agreement with Mr. Baltzer was entered into a day or two before he left for Europe? Shortly before he left for Europe—I do not know exactly how long before.
19791. Was any timber taken to Johnstone's Creek other than that which you purchased from Guy & Co.? Yes.
19792. The £500 odd which we have heard about represented the new timber purchased for the job? Yes.
19793. The balance of the timber which you had used at North Shore and Marrickville was also taken to Johnstone's Creek? Yes.

F. M.  
Gummow,  
28 Sept., 1896.

19794. *Mr. Parkes.*] Is timber of that description worth carrying about? We carried it about.
19795. *Mr. Andrews.*] You know your own business best. You know when it pays you better to buy new timber than to cart about the old timber? Of course.
19796. *Mr. Parkes.*] From what jobs could the old timber which was taken to Contract 77 have come? From Marrickville and North Shore.
19797. When was the Marrickville job completed? Not until about September of last year.
19798. What would the timber be used for in the case of the Marrickville job, apart from that left in the ground? There would be a lot of use for timber there. There were excavations, and timber would be put in to support the sides.
19799. You did not draw that out, did you? In the open cuttings we did, but not in the tunnel.
19800. Did you back up the open cuttings with timber in the case of No. 69? Yes. I had nothing to do with the contract, but I only know it from just going over there. The ground is clayey, shaly, ground, and you need toms from one side to the other and waling. There were a few lengths here and there where there was not close timbering.
19801. From what other job could the timber have gone? From 79 and 79A.
19802. What would you be using the timber for upon Contract 79? There would be a lot of Oregon in the poppet-heads and in the timbering round the shafts.
19803. Would you use that in centerings and things of that sort in the aqueducts? No; but it might be used for trestles, and there would be odd bits for cutting up. There are a lot of odds and ends requiring timber. It would be difficult to say at a moment's notice what it would be used for. If you were on the job you would soon see the uses to which it could be put. There was also some timber which we had stored in Fowler's yard, at Camperdown, which was used on the job.
19804. *Mr. Andrews.*] You are sure that timber was removed from North Shore, from Marrickville, and from Fowler's yard to that contract? Yes.
19805. Is it not a common practice with contractors to sell material, and cement in particular, to other contractors? We have done so; I do not know whether it is the common practice or not.
19806. Other contractors have bought from you? Yes.
19807. So that the fact of Carter & Co.'s having paid for cement which was delivered to Gummow and Gillan does not prove that there was any partnership between the two firms at that time? As a matter of fact there was none. The circumstances you allude to go to show that Henry Austin & Co. intended to keep Carter & Co., and did keep them, to their contract, and that Gummow and Gillan were an offshoot with whom they had nothing to do.
19808. *Mr. Parkes.*] As to the profits which Mr. Maddison and Mr. Ewing drew, were they all drawn from Contract 69? No; in making up a balance-sheet I think 79A was taken into consideration. It was going on at that time, and they were shareholders in that.
19809. Were they not shareholders in Contract 79? No.
19810. Then the whole of the profit which they drew would come out of 69 and 79A? No; some would come from Adelaide.
19811. You were not paying profits on the Adelaide job at that time? So far as that goes, we were not paying profits on any contract, but we estimated the value of our assets over our liabilities, and we paid them their share.
19812. They drew out the large sum of £2,000 apiece? I think their share was about £3,000 each.
19813. That was fine profit for seven partners to come from the two contracts, 69 and 79A? If it were so; but £2,000 of the amount was original capital, which was returned to them.
19814. On what date did they put it in? In August, 1892.
19815. Did you all put in your capital at that time? I did not put anything in.
19816. You are referring now to the time at which the money was put into the firm by these two partners? Yes.
19817. Is the payment shown in the bank-books? Yes. There is an amount of £5,000 placed on fixed deposit.
19818. Was not that an overdraft? No.
19819. Was it not transferred to Adelaide? It was sent as a deposit receipt to Adelaide. Then on August 20th I see a sum of £1,000 was sent to Adelaide.
19820. The bank-book says: "Amount of credit established at Adelaide branch";—what did that consist of? That is the £5,000 deposit receipt, I presume. I imagine that the £5,000 was paid here, and that the bankers credited it to the Adelaide branch. The £5,000 deposit was drawn on that. It was not a £5,000 overdraft in Adelaide.
19821. *His Honor.*] Did the bank hold the deposit receipt? No; the Government held the deposit receipt, and the bank paid us the interest.
19822. *Mr. Parkes.*] During the time Mr. Maddison, Mr. Ewing, Mr. Snodgrass, Mr. Forrest, Mr. Carter, Mr. Gillan, and yourself, were carrying on business you all drew your salary of £43 a month regularly? While we were working.
19823. Does not that appear from the bank-books to have been drawn regularly? No.
19824. Is not the document I hand you a letter of credit upon Adelaide? Yes; it is the amount of the credit established at the Adelaide branch—£5,000.
19825. You arranged for an overdraft here, and had the credit placed to the Adelaide account? We paid the money here, and the bank, presumably, told their branch at Adelaide to give us credit for £5,000.
19826. Then what was the £5,000 drawn out of your bank for? That is against the £5,000 standing to our credit here. Instead of our taking the money over, the bank made the necessary entries.
1927. You sent £5,000 from here to Adelaide? That is apparently what was done.
19828. What would be the deposit put into the bank? I suppose you mean the fixed deposit of £5,000 in Adelaide.
19829. What made the deposit in the bank here? I presume it was put in by members of the firm. It would be shown by Gummow and Gillan and Carter & Co.'s bank-books. For instance, I see that in August 18th, 1892, Gummow and Gillan paid to Carter & Co. £1,000; on August 22nd they paid to Carter, Gummow, & Co. £2,500, and so on.
19830. Could you tell us exactly what Mr. Ewing and Mr. Maddison paid in? £2,000 each.

F. M.  
Gummow.  
28 Sept., 1896.

19831. Where is it shown? Through Gummow & Gillan's account. You will see the following payments: £2,500 on August 22nd, £1,000 on August 18th, £500 on October 8th, £1,000 on March 23rd, 1893. That makes up the £5,000. You will see from another book of Gummow & Gillan's that on August 18th they paid £1,000. They had two bank-books at that time—accounts No. 1 and No. 2.  
19832. And you say that Mr. Maddison and Mr. Ewing each withdrew the sum of £2,000 capital? Yes.  
19833. *Mr. Andrews.*] At the time of your payment to Mr. Maddison and Mr. Ewing there was no ascertained profit on any of the jobs. The Murrickville job was not finished, 79A was not complete, and the Adelaide job was incomplete? Yes.  
19834. The amount you paid to them was an estimate of profit as against ascertained profit? Certainly.  
19835. When did Mr. Snodgrass leave the firm? In January of this year—about the middle of January. His balance was made up to the end of last year.  
19836. Practically he left on the 31st December last? Yes. But he received a salary up till the end of March or April,  
19837. Do you know where he is now? He was in New Zealand when I last heard of him.  
19838. Had he gone there to live permanently? Yes.  
19839. *His Honor.*] He could be found if required I suppose? Yes. His wife, I understand, is here. I think she is leaving for New Zealand in about a fortnight.

John Carter recalled and further examined:—

J. Carter.  
28 Sept., 1896.

19840. *Mr. Andrews.*] As one of the members of the firm of Carter & Co., and Carter, Gummow, & Co., has it always been your endeavour to carry out your contracts well and faithfully? Yes.  
19841. And have you exercised the utmost care upon all the contracts you had anything to do with? Yes, as far as my part of the work is concerned—that is, in the purchasing of good material, and in the payment of good wages, and so on.  
19842. And if the department have required you to make any alteration in the work you have been always willing to comply with their request? Yes. We have been always willing to meet them.  
19843. In any way whatever which was fair? Yes.  
19844. Until this Commission was commenced, had you ever heard any serious complaints of defective work upon any of your contracts? No.  
19845. *Mr. Parkes.*] You heard of the Waverley job? We never had any serious defective work there. I do not call a pothole of 3 feet a serious defect, and that is the only defective work I heard of as being found there.  
19846. *Mr. Andrews.*] The evidence of Mr. Bagge came to you quite as a surprise? Undoubtedly.

WEDNESDAY, 30 SEPTEMBER, 1896.

Robert Rowan Purdon Hickson recalled and further examined:—

R. R. P.  
Hickson.  
30 Sept., 1896.

19847. *Mr. Parkes.*] I desire to know whether you knew Mr. Snodgrass well? Not very well. I have seen him several times as a contractor.  
19848. Had you many interviews with him about business matters? Very few interviews, because Mr. Carter himself, or Mr. Gummow, if he happened to be here, nearly always came to me concerning matters of business.  
19849. As to Contract 77, did you before the tenders were sent in have any conversation with Mr. Snodgrass in connection with the substituted plan? None whatever. I did not know that they were going to send in a substituted plan at all; I did not see it until after the tenders were received.  
19850. You knew nothing about it up to that time? No; I had no idea they were going to send it in.  
19851. You did not have any interview upon the subject with Mr. Gummow or with Mr. Snodgrass? No.  
19852. In connection with Contract 79, did you see Mr. Snodgrass with reference to it before it was let—I mean the original 79 contract? I suppose I saw the contractors some time or other before it was let.  
19853. But did you have any conversation at all with Mr. Snodgrass about the firm's having got that contract? No; I would never do such a thing with any contractor.  
19854. You had no conversation at all with him on that subject? Certainly not.  
19855. Did you see Mr. Snodgrass or Mr. Gummow in connection with the matter either before or after the tenders were received for Contract 77? I am not sure. I do not think I saw Mr. Snodgrass. Of course I saw Mr. Carter as to the surety question.  
19856. Only with regard to the surety question? Yes.

FRIDAY, 2 OCTOBER, 1896.

Louis Blayney Mitchell sworn and examined:—

L. B.  
Mitchell.  
2 Oct., 1896.

19857. *His Honor.* What are you? I am a civil engineer and contractor.  
19858. Where have you been living? In Melbourne.  
19859. You have been exercising your profession in Melbourne? Yes, for the last two years.  
19860. Before that were you living in Sydney? Yes; I was employed on the Great Southern Line in New South Wales at one time.  
19861. Were you employed by the Department? No; I was employed by Mr. M'Sweeney, the railway contractor.  
19862. I understand that you have come here to give some evidence touching a matter to which attention was called in the newspapers the other day? Yes. I happened to pick up the *Sydney Morning Herald* yesterday morning. I had just come from Melbourne, and I thought that, as I happened to know something about Mr. Carter, I might be able to give you some assistance.  
19863. Will you kindly state what you know of your own knowledge? As far as I am personally concerned, I may state that I know Mr. Carter to be one of the most generous men I have ever met.  
19864. For how long have you known him? For the last four years.

19865.

19865. Can you tell me of any special instances, from your own knowledge, of his generosity and liberality? I know of one matter, which is connected with myself; it was a private matter between myself and another gentleman.

L. B.  
Mitchell.

2 Oct., 1896.

19866. Have you any objection to state the circumstances? I could state them privately to your Honor, but I do not wish the details to be published, as they affect a gentleman who was at one time in Sydney, and who cleared out and left things in the lurch.

19867. Leaving the name of that gentleman out of the question, could you mention the circumstances? They relate to a bill I had for £50; I wanted money to pay this bill; I was short of it, and I went to Mr. Carter; he gave me the money, and he has never troubled me for the money.

19868. How long ago was it that this thing happened? It was just before I went to Melbourne, about two years ago.

19869. You had then been acquainted with Mr. Carter for about two years? Yes.

19870. Had you been intimately acquainted with Mr. Carter, or only generally? I had met him in the tender room, and that sort of thing. I knew him to be a very friendly man.

19871. Had you had any business connection with him? No, not then.

19872. Not at the time he helped you in this way? No; it was after that that I had a business connection with him.

19873. Did he volunteer this assistance, or did you ask him? I asked him for the assistance, because I was at the time in some trouble.

19874. Had you to press him very much? Yes. I saw him three times about it. Finally he gave me the assistance because I was in a hole and could not get out of it. I wanted to leave Sydney and go to Melbourne on business. I could not get away with my family.

19875. Did Mr. Carter receive any benefit at the time from the transaction? No.

19876. He had merely the loss? Yes; the money has never been repaid him yet.

19877. What was your reason for going to Mr. Carter;—was it from anything you knew or had heard of him? I just knew him as a friend. I always found him a most generous man.

19878. Then he had that reputation? He always had that reputation, I think. Of course, I would not ask him to do a thing such as he did for me unless I was stuck in a corner.

19879. Mr. Carter has never since troubled you in the matter? No.

19880. *Mr. Parkes.*] Was this gentleman who you say let you in for £50 connected with Mr. Carter in business? In no way whatever.

19881. Did Mr. Carter know him? No; I do not think so, until I introduced him to Mr. Carter.

19882. He did meet him then? Yes.

19883. Was this money you lent to the gentlemen of whom you have spoken lent in the way of a business transaction? It was money which he had borrowed from me.

19884. How did Mr. Carter pay you? He gave me a cheque.

19885. What is the date of the cheque? I could not tell you. It happened two years ago. I think it was a cheque, but I am not absolutely sure.

19886. The amount was £50? Yes.

19887. *Mr. Gummow.*] As to this other gentleman of whom you have spoken; had Mr. Carter anything whatever to do with him? No.

19888. He had no business transactions with Mr. Carter. He was simply introduced to Mr. Carter by you? That is all.

Henry Charles Mitchell, sworn and examined:—

19889. *His Honor.*] What is your position? I am secretary to the Chamber of Commerce in Sydney.

19890. You know Mr. Carter? Yes.

19891. How long have you known him? About ten or eleven years.

19892. You have come here, I understand, in consequence of something you saw in the newspapers? Yes.

19893. Will you tell me what you yourself know of Mr. Carter in that relation? I know that he acted as a friend to a person who was almost a stranger to him—a person he had only known about two or three years, and whom he knew through my introduction. He advanced to this person moneys without any security—absolutely on good faith. By degrees the moneys so advanced amounted, in round figures, to £600. The gentleman to whom this money was advanced died, and his affairs were very much involved. Shortly before his death, however, he gave Mr. Carter a bill of sale over his household furniture and effects. Mr. Carter was subsequently spoken to, and was told that he had better take the furniture. He did so; but he held the furniture for the widow, whom he had never seen, and of whom he knew absolutely nothing. He settled the furniture upon her and her children. I do not think he ever saw the lady in his life. He had only known the gentleman, to whom he advanced the moneys, in the way of business; and the amount, as I say, came finally to £600, in round figures. It may have been £20 more or less.

H. C.  
Mitchell.

2 Oct., 1896.

19894. What should you say would be the value of the furniture? It cost, at least, about £800.

19895. Was it good furniture? Yes, A1 furniture.

19896. It might have sold for £200 or £300? If I had the money, I should be very glad to give £400 for it now. It included a piano, which, to my own knowledge, cost £100.

19897. That is one example of Mr. Carter's generosity;—do you know of any other special example? Of my own absolute knowledge, no. I have heard, however, of another matter. It is of rather a delicate nature. I would not object to telling your Honor privately.

19898. I will not ask you for the details, but had it something to do with some one who behaved in a dishonest way, or who got into trouble? No; it was the case of a gentleman who occupied a very high position, and who fell into distressed circumstances. Mr. Carter, having known him for some years, in the total absence of any claim upon him, contributed something to his support.

19899. Substantially? Yes, and regularly.

19900. There is no relationship of any kind between them? No.

19901. Can you mention any other matter? I know myself that whenever Mr. Carter has been asked for £1 he has generally given it. It has often happened in my own office. If he has there been asked to contribute to a deserving case he has almost invariably said "Yes."

19902. The money has come out of his pocket as a matter of course? Yes; he has done that on more than one occasion.

19903.

- H. C. Mitchell.  
2 Oct., 1896.
19903. Apart from your own knowledge, you know from general repute what is Mr. Carter's character for generosity? Yes. The first time I met him was in connection with a piece of land. He was surveying then. I had bought this piece of land, and I asked him whether he would survey it for me. Although I had only known him for a very little time, he said "All right, old man," and surveyed it. I have asked him dozens of times for the account, but he has never sent one in. That would be ten years ago. I had only just begun to speak to him, but had known him by sight for some time before.
19904. That circumstance, and the others of which you have told me, indicate the general repute in which Mr. Carter is held? Yes; I have heard a lot of people, long before this inquiry was thought of, say—perhaps it was not very complimentary to him—that he was a good-natured fool.
19905. *Mr. Gummow.*] Have you ever heard Mr. Carter speak of the question of keeping books? I have.
19906. When was it? It must be between four and five years ago.
19907. Will you tell His Honor what happened? There was some action going on in the law courts between two contractors. I think it was the Amoses. If I remember rightly it was a question of disputed accounts. The brothers had quarrelled, and incidentally I said to Mr. Carter "What books do you keep?" He said "None at all." I then said "You have two or three partners. Supposing a couple of you were in a drive and got killed, how would the other men behave to your widows?" He replied "I trust them and they trust me." I remarked "That is very foolish." He said "What is the use of book-keeping? We find that books are kept, and, when it comes to a crisis or a row, men will say that certain entries should never have been made, or that they were made without their knowledge and consent. It is all rubbish. I trust my partners and my partners trust me." He also told me that none of their transactions were very large, and that their bank-books showed each transaction. He said that if the firm had three contracts going they would keep three separate accounts; but that they kept no books whatever. I am able to fix the time of the conversation, because I know that it was before my partner was killed, and he has been dead for over three years.
19908. *Mr. Parkes.*] What are you in business? I am Secretary of the Chamber of Commerce, and a broker.
19909. You have acted as a broker for Mr. Carter for what number of years? I think since he had his second contract. It must be between six and seven years.
19910. You have bought all his cement and things of that sort? Yes.
19911. *Mr. Gummow.*] You are here, I suppose, to tell the truth irrespective of any business connection which you have had with the firm? Yes; I have nothing to gain by doing the other thing anyway.

Trenham Old sworn and examined:—

- T. Old.  
2 Oct., 1896.
19912. *His Honor.*] You are a civil engineer, living at North Shore? Yes.
19913. You know Mr. Carter? Yes; I have known him for over twenty-five years. I can only speak generally with reference to him—that is, as to his generosity. I cannot mention any names, but, in a general way, I have known him to do a great many charitable actions of a private nature in the way of relieving distress. Whenever there has been any local subscription, I have always mentioned Mr. Carter to those who have been going round with the list as a likely donor.
19914. Feeling pretty sure that the collector would not knock at his door for nothing? I have felt pretty sure that he would not. I do not say that Mr. Carter will give to anything. I do not suppose he would allow his generous impulses to run entirely away with his judgment.
19915. That, at all events, is the repute in which he is held? That is the repute in which I have held him, and I know that he is held in the same repute by many other residents of North Shore.
19916. He has a reputation for liberality? Yes.
19917. And good nature? Yes.
19918. Do you know of any instances of Mr. Carter's generosity? I know of several instances, but I could not mention the names.
19919. Quite apart from the names, can you mention any special instance of Mr. Carter's generosity? I have known him to assist several old school-fellows who have got rather down in the world. He has assisted them to get away. I have known him to do that in a couple of instances.
19920. Giving them substantial help? Yes; paying their fare to wherever they reckoned they could better themselves. I have also known him to help workmen who were suitable to the kind of work he had on his jobs, and who could not get work to do elsewhere, by putting them on to one of those jobs; or, if he could not do that, by trying to find employment for them.
19921. *Mr. Gummow.*] Have you anything to do with the subscriptions to the local hospital? No; but I believe the firm have always supported the local hospital well. I have heard so; but I myself am not connected with the institution.

John Alcock sworn and examined:—

- J. Alcock.  
2 Oct., 1896.
19922. *His Honor.*] What are you? At the present time I am carrying on a tanning business.
19923. Do you know Mr. Carter personally? Yes; I worked for him on the Brighton to Apsley line in Tasmania years ago. It was piece-work.
19924. Is that the only business transaction you have had with him? Yes. I came here to-day, however, in consequence of seeing a paragraph in the newspapers inviting anyone to come forward and say anything which they knew about Mr. Carter as a man likely to do another a good turn. That is the way in which I took it.
19925. What have you to say of Mr. Carter from that point of view? Well, he has paid me money on more occasions than one when it was not coming to me.
19926. For work you were doing? No; he gave it me freely. When I asked him for £5 he would give me £10.
19927. Was it an advance? There was no mention of it at the time. I did the work for him afterwards. I have asked him for money more than once, and when I have asked him for it he has generally handed me more than I have asked for.
19928. By way of an advance you mean? There was no mention of its being an advance; but I treated it as such. I do not think many men would give me money which was not coming to me. He handed me the money of his own free will.
- 19929.

19929. You took that as showing that Mr. Carter was very free with his money? Yes; when I saw the paragraph in the newspapers I thought that if I could do any good by mentioning the circumstance I would do so. I have only seen Mr. Carter once since the occasion to which I have referred, and I did not know that it was the same Mr. Carter for whom I had worked until I made inquiry. J. Alcock.  
2 Oct., 1896.

19930. At the time to which you referred, what reputation had he among the men for liberality or otherwise? He had a good reputation. All the men gave him a very good name.

Richard Adams sworn and examined:—

19931. *His Honor.*] What are you? I am a cab proprietor. I also have livery stables, &c. R. Adams.  
2 Oct., 1896.

19932. Do you know Mr. Carter? Yes.

19933. How long have you known him? For the last fifteen years, or a little more. I knew his father.

19934. You have come here in consequence of a notice which you saw in the newspapers? Yes.

19935. Will you tell me what you know in that connection? I have never had any business transactions with Mr. Carter, and I have never been employed by him; but I happen to know of a family at the Glebe whom Mr. Carter some years ago almost kept. The unfortunate man happened to lose his position after the maritime strike. He went to Mr. Carter on one occasion, on the death of one of his children—he lost three children altogether—and I know that Mr. Carter then gave him £5. Within two years he went to Mr. Carter and asked for employment. Mr. Carter could not give him employment, but he gave him a pound; in fact, from time to time he has assisted the whole family. I know he has almost supported the family. I know of other instances of a similar kind, over at the Shore. Mr. Carter has a most generous way of assisting persons who are really in need. I am not ashamed to say that some years ago he assisted a very intimate friend of my own—a relative on my wife's side.

19936. To a substantial extent? To the extent of something like £10—not all in one amount, but in different amounts on various occasions.

19937. The person to whom you refer was in no way related to Mr. Carter? In no way related. Mr. Carter always had the name for generosity. I knew his father also; he also had the reputation of being a most generous, good-hearted, old man.

TUESDAY, 6 OCTOBER, 1896.

Francis Antill Pockley sworn and examined:—

19938. *His Honor.*] You are a medical man practising in Sydney? Yes. F. A.  
Pockley.  
6 Oct., 1896.

19939. You have known Mr. Carter for some years? Yes; pretty well all my life. We were school-fellows over thirty years ago.

19940. Will you tell me what you know of him in relation to his character for liberality, generosity, and that sort of thing? I think he is about the most generous and liberal man I ever knew.

19941. Can you give any special instances? Yes; I can give one. It has occurred to me quite recently. I have not a very good memory for these things, but I happen to recollect this particular instance. It was a case in which two children, the sons of a gentleman at North Shore, in a spirit of mischief, got into a place where explosives were stored for use in connection with Carter & Co's sewerage works. They were playing there, and an explosion resulted which blew off the hand of one of the children, and which also resulted in the loss of one of his eyes. There were four doctors in attendance upon him for a long time, especially with reference to the eye, which they were naturally anxious to save. Mr. Carter, although neither the contractors nor their workmen were to blame, voluntarily came forward and defrayed the whole of the expenses in connection with the case.

19942. The parents, I suppose, were poor people? No, they were not.

19943. Is there any other instance you can mention? I can remember another instance, which I may as well give for what it is worth, inasmuch as it shows that Mr. Carter can be generous to his foes as well as to his friends. He had a very good claim for damages against a very powerful corporation, which had grievously wronged and insulted him, and he withdrew from all proceedings because the corporation apologised. I think under the circumstances—and I knew them all—very few other men in Mr. Carter's position would have withdrawn, considering the indignity and the insult he had received. I may say that even as a schoolboy Mr. Carter was always generous and liberal, sharing everything he had with his friends and mates. He is generous and liberal in a marked degree—in fact, I think it is as natural to him to be unselfish as it is to most men to be the reverse.

19944. Since you are here, there is one question which I should like to ask you as a medical man;—I should like to know whether you have ever gone into the question of the effect of what is known as guttering and gadding—that is, the dispersion of fine sandstone dust upon the lungs? I have no personal experience in the matter, but I know from my reading that it is very injurious. I know, of course, that there have been cases in which injury has resulted to stonemasons from the cause you mention.

19945. Is there any comparison, do you know, between the effect of fine sandstone dust and coal dust upon the lungs? They both produce forms of phthisis.

19946. Which is the worse of the two? I could not say. I think it would be more a question of the amount of than the nature of the particles.

19947. Is it possible to keep them out of the lungs in any way? It is possible to keep them out, to a large extent, by using respirators; but workmen will not use them.

19948. It is difficult, perhaps, for them to do so under the circumstance of the short supply of air? Not only that, but I may mention what occurred in Sheffield, where among the knife-grinders the average duration of life is very short. Respirators were recommended, and, it being found that these to some extent mitigated the danger, there were more applicants for employment. As a consequence, wages fell, and the men thereupon declined to wear the respirators, preferring a shorter life and higher wages.

19949. And that argument, you think, might apply to miners? It might.

19950. As to the comparative effect of the fumes of blasting powder and of fine silica dust, what have you to say as to that? I could not say what the comparison would be.

19951. What should you say as a matter of opinion? It would depend, I should say, upon the explosive which was used for blasting. For instance, I know that the fumes of roborite are injurious. I do not

F. A.  
Pockley.  
6 Oct., 1896.

know anything of a special nature about the other explosives; I do not know whether the fumes of blasting powder are specially injurious, but I should not be inclined to think they were.  
19952. Chemically, there is no particular reason why the fumes of blasting powder, as ordinarily used, should be very injurious? No; the so-called fumes would be only fine particles of carbon and burnt sulphur.

19953. Sulphide of potassium? Of course there would be nitrate of potash in the powder. I do not exactly know what would be the constituents of the blasting powder used; but the quantity of particles would be so much less than the particles of fine dust from the sandstone that I should think the so-called fumes would not be nearly so injurious as would the dust.

William Valentine Miller sworn and examined:—

W. V. Miller.  
6 Oct., 1896.

19954. *His Honor.*] What is your present position? I am a civil engineer. I am doing a little commission business at present, but no engineering.

19955. You were at one time employed in the Public Works Department? Yes.

19956. Up to what time? Until the 31st October, 1893.

19957. In what capacity? Recently as resident engineer in Glen Innes. Prior to that I had served in the Railway Construction and Survey Department.

19958. But you were more recently employed as road engineer in the Glen Innes district? Yes.

19959. The road engineers used to be called road superintendents? Yes; and they were afterwards called resident engineers.

19960. You left the Department, I understand, in consequence of retrenchment? Ostensibly.

19961. You addressed a letter to the Commission in consequence of a notice which you saw in the newspapers the other day? Yes.

19962. Will you tell me how long you have known Mr. Carter and what you know about him? I knew him when I entered the Railway Department in 1881. We were in the same office—that is, in the railway survey. We knew one another casually, that is all; we were simply office acquaintances.

19963. Has your acquaintance continued since then? I saw a little of Mr. Carter afterwards. Of course whenever we saw one another we spoke. We were friendly, but we were not intimate friends at any time.

19964. Can you speak as to Mr. Carter's general reputation for liberality? I have heard that he is a very liberal man indeed; but I can speak most confidently upon the point from my own knowledge. Since my retrenchment in 1893 I and my wife and family have suffered considerable hardship. We were almost entirely without means of support, and we were, to a large extent, dependent upon the assistance which we received from friends and acquaintances of one kind or another. Mr. Carter, as I have already mentioned to your Honor, had no intimate friendship with me at all. He was friendly with me in precisely the same way that he was friendly with other office companions. I wrote to him in April of this year pointing out that we expected some money from England, some money which was due to my wife, and asking him whether he could manage to make me a temporary advance of £10, offering at the same time, if he would do so, to pay any commission or interest which he might consider fair. I received a letter from him, in which he said that he would be very glad indeed to advance the money required. I accordingly waited on him and received from him a cheque for £10. He refused to take any kind of consideration for it. I wanted him to take interest, because, as I pointed out to him, some months might elapse before I should be able to return it. He said, in a jocular way, that he was not a money-lender. He absolutely refused to take any consideration. I never had any business connection with Mr. Carter, therefore it is impossible to suppose that he could have been influenced by any but philanthropic and generous motives. I may remark that I returned him the money as soon as I was in a position to do so—that was on August 7th last.

19965. In the meanwhile did he ever ask you for it? No; he never made the slightest reference to it.

19966. Had you, while you were in the Department, any work to do in relation to Mr. Carter's contracts? None whatever; I never had any business connection with him.

19967. Is there any other matter you would like to mention in relation to the question before this Commission? In regard to the contracts under discussion, of course, I know nothing. Your Honor has the letter which I addressed to you, and if you desire to ask me questions upon the matters referred to in that letter I shall, of course, be glad to answer them.

19968. The question is whether you have any knowledge of any facts which are in any way relevant to the questions which are before this Commission? I take it that this Commission is only in connection with a few contracts.

19969. The questions before the Commission are connected with any contracts in which any members of the present firm of Messrs. Carter, Gummow, & Co. have been concerned? I know nothing whatever about any of them. You might have noticed, in the letter which I addressed to your Honor, I expressed an opinion, but the information I could give might not be considered in any way relevant to the inquiry.

19970. The opinion which you expressed in your letter may be founded upon facts which are relevant to the inquiry? But the facts are not in connection with any of these contracts. That is the difficulty, to my mind.

19971. Are they indirectly connected with them? They, of course, affect the position of Mr. Hickson to a certain extent. It is a matter for your Honor's consideration as to whether you will go into the question or not. I am most anxious to get the matter ventilated, and have done my best to ventilate it on various occasions, but have failed entirely. I have suffered very much indeed from my retrenchment, and I believe that I have suffered wrongfully. If your Honor went into my papers you would see that I had endeavoured to do my duty both in the Railway Department and in the Roads Branch. I have letters from different officers in the Departments with which I have been connected, and they all speak very highly of me. I have a university degree, and as far as I know there is nothing whatever against me. Yet I was retrenched from the service by Mr. Hickson, and was thrown, with a large family, on to the world. Considering that on account of my family I was bound to remain in Sydney, I think I was treated in a shameful manner. I think the way in which I was treated, and all the matters connected with my treatment, go to show that Mr. Hickson is not a fit and proper person to be the head of the Public Works Department.

19972.

19972. On what ground? On the ground that he cannot manage the department properly; that he has no efficient control over it. There is no reason whatever why I should have been singled out, as I was, for retrenchment. W. V. Miller.  
6 Oct., 1896.

19973. Do you think that Mr. Hickson, as far as ability is concerned, is not a proper person to hold the office he holds? Yes.

19974. Does your opinion extend beyond the question of ability, or is it limited to that? Well, ability is a very large word. I am not talking of Mr. Hickson's professional ability only. I hold that at the time to which I refer he was not fit to hold the position of chief of the department.

19975. You are referring now to the question of Mr. Hickson's ability to command, not to the question of his honesty or integrity? Quite so.

19976. In your opinion, Mr. Hickson has shown a want of that knowledge which a man in charge of a large department such as the Public Works Department ought to have;—is that it? Yes; I say that he has shown a want of judgment of character.

19977. *Mr. Davis.*] You were very sore about your retrenchment? Very sore indeed; and I am so still.

19978. You have agitated a good deal in reference to the matter, and you have endeavoured, as far as you have been able to do so, to get back again? Yes.

19979. Has it been your opinion at any time, since you have been retrenched, that politics had anything to do with your retrenchment? It is rather difficult to say what you mean by politics. I think they had a great deal to say in the matter from this point of view—that a man may be open to be got at by an efficient and good lobbyist. It does not depend altogether upon the question of his trying to do anyone a political turn, but he may be too weakminded to hold his own. That is my opinion of Mr. Hickson. I do not think he is a fit person to be the head of the Works Department.

19980. Did you at any time think that the fact of the late Minister for Works being in office had anything to do with your retrenchment? I think it is possible that it had to a certain extent.

19981. You do not know what opinion the superior officer immediately over you formed of your professional ability immediately before your retrenchment? He sent word to me—he took care to do so—that my retrenchment was in no way owing to him.

19982. You served under Mr. Statham? Yes.

19983. And you know what he thought of your professional ability? Yes. I have no objection to state what his opinion was. His opinion was that I was the worst officer in his division, and that I was utterly incapable. He refused to be responsible for the work in the Glen Innes District as long as I remained in the division.

19984. Mr. Statham was the divisional engineer? Yes.

19985. So that you had to do with him directly? At one time I had.

19986. The opinion you have mentioned to the Commission was the opinion he formed of you? Yes.

19987. In the face of that opinion, are you at all surprised that you should have been retrenched? I am very much surprised.

19988. Does it not occur to you that you have been a little unjust in speaking of Mr. Hickson in the way in which you have spoken of him this morning? The facts of the matter are these: When I was sent to the Glen Innes District it had recently been transferred from the charge of Mr. Statham to that of Mr. Stillwell. Mr. Stillwell, when he took charge of the Glen Innes, Tenterfield, and Armidale, Districts, found that they were in a most deplorable state of mismanagement—that they had been mismanaged for years. If your Honor were to look up the reports of Mr. Stillwell, who was one of the most energetic and capable officers the department has ever known, you would be able to form an opinion of the extent of the mismanagement. I replaced Mr. Norman Hay. Mr. Hay, although naturally a brilliant young man, was unfortunately addicted to drink—in fact, the whole district had been mismanaged for a number of years. The roads were in a most unsatisfactory condition, as Mr. Stillwell's reports will, I believe, very fully show. The officer at Tenterfield and the officer at Grafton were both expecting to be got rid of. They were both shaking in their shoes. I had that from Mr. Statham himself. He said: "Mr. Williamson is expecting to be dismissed, because of the manner in which the district, in the opinion of Mr. Stillwell, has been mismanaged." Mr. Donnelly also expected to be turned away from the same cause. When I took charge of Glen Innes District I received precise instructions from Mr. Stillwell that reforms were necessary, and that the whole management of the work must be started on a new footing; that we were no longer to make the roads in the way in which they had been made—in all sorts of shapes and forms. Having received these instructions, I did my best to carry them out. I went to work energetically, and started to take levels. I took proper sections of the roads, and did all I could to bring the contractors down to the position in which they ought to have been, for they had had the upper hand for years. I honestly did my duty, and what was the result? The officer at Tenterfield had political influence, and the officer in the south, Mr. Donnelly, also had political influence, his brother being a Member of the Assembly. The result was that in a very short time Mr. Stillwell was removed from the district, and Mr. Statham was put back again. In what kind of a position was I who had done my best to do my work? Every bit of work I had been doing since I had been there was a reflection upon Mr. Statham.

19989. That is the way in which you put it generally? Yes. I can prove that Mr. Statham wrote a letter insinuating that I was a thief, before he had even seen me, the foundation for the insinuation being that I was absent from Glen Innes on roadwork for a couple of days, and that I had charged for those two days. He said that without the most convincing proof he would refuse to pass the voucher. I think my retrenchment under these circumstances showed a want of knowledge on the part of Mr. Hickson—that he paid no heed to the difficulties in which I was placed through the sending back to the division of Mr. Statham.

19990. *His Honor.*] In what year was Mr. Statham sent back to the district? In the year in which I was appointed—in May, 1890.

19991. That was ten months after Mr. Hickson had been appointed Commissioner for Roads? Not long after that.

19992. So that the work which had been done so badly had mostly been done under Mr. Bennett? I suppose it had.

19993. In point of fact, did not Mr. Hickson, when he took the works over from Mr. Bennett, try to go in for a good many reforms and improvements in roadmaking and in management generally? I do not know whether he did or not. I have never spoken to Mr. Hickson except on one or two occasions, and then only for

W. V. Miller. for a minute or two. I know very little about him outside of my department, but I feel it very much, considering the number of offices with which I have been connected, that I should be treated in the way in which I was treated by him.

6 Oct., 1896.

19994. Still he was comparatively new to the work at that time? I believe he was.

19995. *Mr. Davis.*] What you blame Mr. Hickson for is lack of judgment in perceiving your ability and perseverance? What I say is that he relied on Mr. Statham in a position where the facts alone ought to have shown him that Mr. Statham was not reliable. Any reasonable man would have understood the difficult position in which I was placed.

19996. *Mr. Parkes.*] I presume you came here this morning more with the object of ventilating your own grievance than to give a character to Mr. Carter? That is not the fact. I came here because I consider that Mr. Carter behaved to me in the most generous manner. Immediately I saw His Honor's intimation published in the newspapers, I felt it my duty to address him a letter on the subject.

George Lyell sworn and examined:—

G. Lyell. 19997. *His Honor.*] What are you? A quarryman.

19998. I believe you know something about the sand that was supplied to Contract 118, at Johnstone's Creek—the storm-water channel contract? Yes.

19999. What do you know about it? I supplied a lot of stone to several of the carters there; and I know that it was good stone.

20000. What quality of stone was it? It was equal to the Pyrmont stone—first-class block.

20001. Was any bad stone supplied from your quarry for this contract? To my knowledge, there is no bad stone in the quarry. If there were, the carters would not take it. They would know that it would be thrown out by the inspector, and that there would be a row about it.

20002. The carters, you say, were very particular as to the stone they took from your quarry? Yes.

20003. How much of the stone required for the contract was supplied from your quarry, do you think? I think I supplied 800 or 900 loads. I supplied Meredith, Burcombe, and McMillan.

20004. Where is your quarry? In White-street, Leichhardt.

20005. How far would that be from the storm-water channel? Not more than half a mile.

20006. Do you remember when you began to supply the stone? I believe it was about this time last year.

20007. And you continued to supply it for how long? Up to the time the job was finished.

20008. When was that? I last supplied McMillan about two months ago.

20009. Do you know what other stone has been supplied to the same contract? I know that McMillan was getting it from other places.

20010. Can you speak from your own knowledge as to the quality of that stone? It was of good quality.

20011. Are there any other facts of which you desire to inform the Commission in relation to this inquiry? No, except this—I may state that I am a disinterested party. I know neither Carter, Gummow, & Co. nor Mr. Parkes in the matter.

20012. It was only in consequence of the notice which you saw in the newspaper that you addressed a letter to the department? Yes.

20013. Do you know anything about mining? Yes; I have done mining in Victoria, New South Wales, and Queensland.

20014. Have you had anything to do with the driving of tunnels for sewer work? I have not done any driving for sewer work, but I have worked in copper-mines, and that would be pretty much the same. I was working for six years in the Mount Hope copper-mine.

20015. You know something about the practice of supplying air? Yes.

20016. What is the practice? Various methods are used. Sometimes a fan is used; sometimes a channel is cut down the end of the hole; sometimes a divider is used; sometimes what is called a wind sail; and sometimes a fire shaft.

20017. Where a fan is used, what is the practice as between the contractors and the workmen as to fixing the pipes and working the fan? If I were to take a sub-contract from another contractor, then, unless there was a special clause in the agreement to the effect that he was to supply the air, I should have to take the responsibility of doing that.

20018. Where the contractors supply the pipes and also the fan, but leave the work to the sub-contractor, what is the practice as to the working of the fan and the laying of the pipes? Unless it is specially mentioned in the agreement that the contractor is to do it, you have to fix the pipes and work the fan yourself.

20019. That is the regular practice where there is no distinct contract as to who shall do it? Where there is no distinct agreement made.

20020. *Mr. Parkes.*] Do you own a quarry? Well, I have taken up a piece of land at Leichhardt from Paling & Co., and have opened a quarry on it.

20021. Why did you come here? I saw a notice in the newspapers, and I therefore wrote to the department. I was also sent for by the department.

20022. To say what? What I have said this morning.

20023. That you supplied stone to this contract? Yes.

Frederick Joseph Cahill sworn and examined:—

F. J. Cahill. 20024. *His Honor.*] What are you? A land and estate agent.

20025. You have come here to give evidence on what subject? I have come here in answer to the request of the Commission that persons would come forward who knew anything of Mr. Carter—that is, in connection with his generosity.

6 Oct., 1896.

20026. Will you tell me all that you know in that relation? I have known Mr. Carter mainly in connection with a certain institution at St. Leonards. We were fellow-members of the committee at one time. Mr. Carter has always had the name of being a very generous man, and the secretary of this particular institution gave us at one time—that is, about two years ago—a little trouble. We found that he was about

about £60 short in his accounts. We went into the matter, and Mr. Carter said, among other things, that it would be hard lines to put the fellow in gaol; that he would not like to see him go to gaol. He lived opposite the institution to which I referred at the time, and his own wife and the secretary's wife seemed to be on friendly terms. Mr. Carter said that, on account of the man's wife, he would not like to see anything happen to him, and he suggested that we should square things. We did not see how we could do that, and the next stage of the matter was the receipt by us of a duplicate deposit slip for the full amount of money. Upon subsequent inquiry we found that Mr. Carter had paid the money unknown to us. He seemed to have nothing to gain by it. The secretary was a comparative stranger to Mr. Carter. He did not seem to know him any better than he was known to the rest of the committee. The way in which he put it was this—that he did not like to see such a nice little woman as the secretary's wife, who was also a friend of his own wife, put in the position of having her home broken up in such a disgraceful way.

20027. He apologised in a way for doing it? He did as a matter of fact.

20028. What was the amount, did you say? Between £50 and £60. The man had no money at all, and, I believe, Mr. Carter sent his wife home to her people in Tasmania, and gave him enough money to take him to Melbourne. Another institution at North Shore has asked me to hand your Honor a letter.

20029. Apparently something of the same kind occurred in connection with that institution, the details of which are not within your knowledge? Except that I have heard it spoken of from time to time. I knew that Mr. Carter had paid some money, and, from what I can see, there does not seem to be any prospect of his getting it back; in fact, I remember saying to him "Is there any chance of your getting a refund of that money you paid some time ago?" He said "I do not know; they seem to be a poor lot. I do not suppose I shall get any of it."

20030. Are there any other particular cases that you know of? I know that Mr. Carter has from time to time given money to the School of Arts to help it along.

20031. That he is, in effect, a liberal man? I have always found him so, and I have always heard him spoken of as such. I know that he is never appealed to in vain in connection with any charitable purpose.

Frank Moorhouse Gummow recalled, and further examined:—

20032. *His Honor.*] You desire to make a statement to the Commission? I have produced, in accordance with your Honor's request, tracings and the manuscript in connection with the Monier system which were shown to Mr. Hickson some time ago. Some of the plates are missing. They were taken out in order that they might be traced for lithographs. (*Vide Appendix No. 57.*)

20033. And the tracings you supply are the tracings of the missing plates? Yes; some of the pages of the manuscript are missing, but you will find the matter there contained reproduced in the typewritten book.

20034. So that the two books together will reproduce everything which was shown to Mr. Hickson in relation to the Monier system? Yes. Mr. Carter, as a matter of fact, handed the book to Mr. Hickson. But I know that Mr. Hickson had it.

20035. Have you the negatives of the photographs? They are all at the photographers.

20036. They can be handed over to the Government Printer, I suppose? Yes. I might mention that the smaller book which I now produce is the first document which was got out in connection with the system. That would be in 1893, and it is the book which was shown to Mr. Bagge. Mr. Baltzer informs me that Mr. Bagge never saw the second and larger book. He saw merely the first book; and that would be all the information he would have on the subject. (*Vide Appendix No. 58.*)

20037. I understand that the first book contains a shorter description of the system? Yes; the larger book is an improvement upon it: and a third book, which has been produced, is a still greater improvement. The third book was got out at the end of last year.

20038. I suppose Mr. Carter can describe exactly how the second book came to be shown to Mr. Hickson? Yes.

20039. Was either of these books shown by you or by Mr. Carter to Mr. Bagge? No; the small book was shown to him by Mr. Baltzer. I have produced it in order to show the extent of Mr. Bagge's information on the subject. You will see that he had not nearly all the information which Mr. Baltzer had in his possession.

20040. Is that all that you have to say on the subject? Except that both of the books were in my hands in 1894.

20041. *Mr. Parkes.*] Were these books prepared by Mr. Baltzer? Yes; both of them.

20042. During the time he was in the department? Yes.

John Carter recalled, and further examined:—

20043. *His Honor.*] Will you explain the circumstances under which the book which Mr. Gummow has produced came to be shown to Mr. Hickson? Yes; I remember this manuscript very well. It is in Mr. Baltzer's handwriting. It is, in fact, his translation from German literature on the subject. He showed it to me in the first instance. I read it through thoroughly, and took it to Mr. Hickson some years ago. I should say it would be three years ago or more. I took it to him just to let him have a look at it, thinking that it would be likely to interest a man in his position. When I got it back from him I cannot say.

20044. Was that before or after the offer of Mr. Armstrong to sell the patent? It was before that.

20045. You merely showed it to Mr. Hickson as a matter of ordinary interest? Just as I would show to a man in his position anything which came under my notice, and which I thought likely to interest him as an engineer.

20046. For how long did Mr. Hickson keep the book? For some considerable time.

20047. For weeks or months? For months. It was a good time. I suppose he kept it simply because I did not call for it, as much as anything else. The probability is that I forgot about it for some time. I fancy, now I think of it, that Mr. Baltzer reminded me that the book was out of our possession. It must be three or four years ago.

20048. It was after you had taken out the patent? Yes.

20049.

F. J. Cahill.  
6 Oct., 1896.

F. M. Gummow.  
6 Oct., 1896.

J. Carter.  
6 Oct., 1896.

- J. Carter.  
6 Oct., 1896.
20049. Did Mr. Hickson return you the book personally or did you find it in the office? Mr. Hickson gave it to me.
20050. Did he make any comment upon it? There was probably some discussion about it; it is not likely he would simply hand the book back to me without saying anything; he would naturally say something about it, but I have forgotten what it was.
20051. I suppose that, on the occasion when you did get the book, you went to call for it? Yes.
20052. *Mr. Gummow.*] Do you remember lending the book to any other architects or engineers? I think I lent it several times.
20053. Did you ever lend it to the City Architect? Yes; he had it several times. He was anxious to introduce the system into the George-street markets. He told me that the thing had been hanging fire for twelve months for the want of information, and that he had been unable to obtain it. He explained to me that even at the last moment he had seriously considered the advisableness of altering the design, with a view to the use of the patent. I lent him the book, and I had a number of interviews with him on the subject.
20054. *His Honor.*] What had he in the design in the way of fireproof material in the flooring? Terra cotta lumber, fixed in between iron girders.
20055. Flat arches? Yes. I do not know much about it, except that terra cotta lumber was to be used. I know that we tried the lumber for Mr. M'Rae in the furnace out at Annandale.
20056. It did not turn out well? No; it was not up to the imported article; it had been locally manufactured.
20057. *Mr. Parkes.*] The sawdust was not burnt out of it? I presume that that was what was the matter; it crumbled up into so much dust.
20058. *Mr. Gummow.*] The city markets were let to a contractor before you showed this book to Mr. M'Rae? Yes; that was the obstacle as far as I know. It would have been an interference with the contract. Mr. M'Rae certainly held out every hope of the thing being used in the future if he had the opportunity to use it.
20059. You also took the book down to Melbourne at one time? Yes, to show it to you.
20060. You let me have it for two or three months, before I was an interested party in the matter? Yes.

Joseph Davies recalled and further examined:—

- J. Davis.  
6 Oct., 1896.
20061. *His Honor.*] One of the witnesses—especially Melville—and other witnesses also have alluded to the fact that the men used to come to work some two hours or so before the inspectors came on to the job;—was that the fact? It is not the fact, and if Melville did it I can only say that if the Department had known it before he would not have stopped in his position as long as he did. The inspectors have strict orders to be on the works during the whole time there is any work going on—that is, work which requires their supervision—so that, supposing, as often happens, a piece of concrete is commenced and cannot be finished in eight hours, and the contractors have to stop an hour and a half or two hours longer, as the case may be, the inspectors have also to stop during that time. They are not allowed overtime, but they get consideration for it, it being provided that they are to be paid for public holidays in consideration of the extra time they work. They are supposed to be on the ground when the contractors commence work, and they are not supposed to leave it until work is finished.
20062. Melville said that the inspectors were not supposed to be on the ground until 9 o'clock in the morning, whereas the workmen would begin their work at 7 o'clock in the morning? That is all nonsense. The inspectors, to my own knowledge, are there every morning at the time the workmen are there.
20063. And if an inspector chooses to stay in bed too long and comes on to the work at 9 o'clock in the morning he is not doing his duty? No; a permanent arrangement of that kind would be utterly ridiculous.
20064. I suppose that if an inspector were found doing that kind of thing he would be run out of the department at once? Yes.
20065. The question has been raised as to the amount of waste which takes place in rendering. Suppose that the soffit of the sewer as well as the invert is rendered, there would be a good deal of dropping from the soffit—is that dropping, in point of fact, wasted? No, it is picked up again with the plasterer's trowel and put back. The plasterers have the compo. brought into the invert of the tunnel, and they use it from there, the invert of the tunnel being cleaned before they start to plaster. I have found in some cases little pieces of candle grease; but, apart from that, no dirt could get into the compo. It would be perfectly proper to use the droppings.
20066. It would not be proper to leave bits of compo. which had fallen from the soffit of the arch on to the finished invert? No; the invert is finished the last of all—and for this reason—that the men have to stand on the invert while they are plastering the sides and soffit. When they have gone through between two shafts, they would start in the centre and work up each way and put in the invert of the finished sewer the last thing, so that there may be no traffic over it. It frequently happens that, by some mistake, a workman has not known that the plasterers had been at work, and in some of those cases the invert has been so seriously damaged by traffic that it has had to be taken up again. In some cases—and this has been the experience of all contractors to a greater or less degree—a small or a large quantity of water may come down the invert before the plastering is set and may wash away some of it.
20067. But the point is that the whole thing must be left absolutely smooth and finished as the men work backwards? Yes.
20068. So that they could not waste any rendering? No; I should say that there would be no waste in connection with plastering in that way. It is not like plastering the side of a house.
20069. What about the waste in using cement mortar in putting in the arching? There could be very little waste in the arching, because in the small sewers the arching is on a drum, the centering of which is enclosed, over the whole surface, with close lagging. The drums are used for turning the arching, and they are brought forward as each length is finished. I do not see, therefore, how there could be much waste in that connection. Necessarily there is a little waste. I cannot quite explain it, but it is the fact that after the bricklayer has finished, and after the bluestone concrete has been put in, the tunnel requires to be cleaned out before the plasterer commences. By some unaccountable means there is a little waste, but it is not a very serious thing.
- 20070.

20070. I suppose it would be so much to the interest of the contractors to prevent the waste of cement as available material that it is brought down to a minimum? Yes; the contractors look after their interests in that way.

20071. *Mr. Parkes.*] When they are building the arching I suppose they must take the centres away before they tuck-point the work? It is not tuck-pointed. It is simply cut and struck.

20072. But they take away the drum, do they not, before doing that? A drum is long enough to enable the workmen to lay four bricks—that would be 3 feet; and immediately that length is turned and pointed the centering is struck. That enables the men, while the compo. is green in the joints, to clean off the brickwork and do any necessary touching up; so that, while the labourer is packing one drum, the brick-layer is pointing the other.

J. Davis.  
6 Oct., 1896.

THURSDAY, 8 OCTOBER, 1896.

Edward Hungerford recalled and further examined:—

20073. *Mr. Davis.*] You received instructions from the Commission to look for the journal of Contract 72 some three or four weeks ago? Some time ago—I could not say how long.

20074. Will you say what you did when you received those instructions? I went down to the then Custodian of Plans, and, as far as we knew, we searched through every corner and pigeon-hole in the plan-room where such books as journals would be likely to be kept. We turned over quite a hundred books, I should say, but did not succeed in finding this particular journal.

20075. You know that there has been considerable confusion in consequence of the repeated changes which have been made within the last few years in the location of the Sewerage Branch? Yes. Of late years we have been moved about a great deal.

20076. What has been the result as regards papers and plans and books generally in the branch? They are very hard to find.

20077. Did you look for the site plan of Contract 72 in conjunction with Mr. Scanlan? No; that would be outside of my province.

20078. *His Honor.*] You might give a short account of all the moves through which the branch has gone within the last few years, with the approximate dates? In 1889 the branch was moved to Lincoln's Inn Chambers, in Elizabeth-street, from this office. It was afterwards moved next door to those chambers. Then in February, 1893, the branch was brought up to one part of this building. I think we were afterwards moved into three different parts of the building. In March, 1895, the branch was moved down to the Water and Sewerage Board's offices in Pitt-street, and about nine months after that to Riley's Buildings, in Bathurst-street. Now it has been moved back here again.

E.  
Hungerford.  
8 Oct., 1896.

James Watson Fraser sworn and examined:—

20079. *Mr. Davis.*] What is your position in the department? I am Custodian of Plans.

20080. You received certain instructions yesterday afternoon? Yes.

20081. What were they? To find the general plan for Contract 72.

20082. Did you also make a search for the journal of Contract 72 in the plan-room? I did.

20083. You eventually discovered it? Yes.

20084. Where did you find it? In a cabinet.

20085. Was it with other books? No, it was not.

20086. It was not in a place where it would be likely to be looked for? No; it was with some old sewerage papers.

20087. Do you also produce the register of the plans? Yes.

20088. Will you turn to the registration of the plans of Contract 72? Yes; it shows that the general plan for Contract 72 was handed to the Commission on the 21st May of this year.

20089. *His Honor.*] I see there is a note opposite the entry of the plan to this effect—"Mr. Davis, Royal Commission";—in whose handwriting is that;—it appears to cover Drawing No. 1, the ground plan? It is in the handwriting of Mr. Scanlan.

20090. Do you think that assuming the "upper portion extended" to have been really not an extension, but only a delayed completion of the original scheme, the "general plan" alluded to here would be likely to show the whole subject matter of the contract, including what would be shown upon the plans which are entered under the heading of "upper portion extended"? I think it is very likely that it would.

20091. You do not think that a tracing would be likely to be entered here under the heading of the general plan? No; there would be no entry of any tracing here. The registers of tracings and heliographs would be kept in a separate book altogether.

20092. All that you can say is that this book, if it be correctly kept, indicates where the plan is? Yes.

20093. And according to the book the plan has passed into Mr. Davis's possession, apparently for the purposes of the Commission? Yes.

20094. Of course, at that particular time, that is the 21st of May, you yourself had not custody of the plans? No; and I may say that if we have wanted anything hitherto, and it has been entered in the register as having been sent to the Royal Commission, it has invariably been found in the Board-room.

Michael M'Mahon sworn and examined:—

20095. *His Honor.*] You have been living at M'Mahon's Point for some years? Yes; for the past twenty-five years.

20096. During which time you have known Mr. Carter? For a great portion of that period.

20097. You have come here to-day voluntarily to say something in reference to the notification which you saw some days ago in the newspapers? Yes.

20098. Will you tell me what it is you wish to say? About two years ago, on Christmas Eve, a friend of mine, whom I knew to be very hard up, came to me for relief, and, as I could not myself relieve his necessities at that time, I suggested to him the name of Mr. Carter. I know that when he mentioned the matter to Mr. Carter that gentleman gave him £7—handing him, in fact, all the money he had in his pocket at the time—and that he subsequently gave him another £3. I know as a positive fact that Mr. Carter has not asked the man for the money from that day up to the present time.

J. W. Fraser  
8 Oct., 1896.

M. M'Mahon.  
8 Oct., 1896.

20099.

- M. M'Mahon. 20099. How long ago was the money given to him? About two years ago.  
 8 Oct., 1896. 20100. Was this person a stranger to Mr. Carter? He was merely an acquaintance—nothing more. He happened to be a gentleman living at North Shore.  
 20101. Can you mention any other case? Yes. It is the case of a plasterer who used to work for me. He was very hard up, and he came to me for assistance, as a number of other persons were in the habit of doing. I used to relieve their necessities when I could afford to do so; but I received a knock in the commercial crisis a few years ago, as did a number of other persons, and I suggested Mr. Carter's name to this person also. I told him that I knew Mr. Carter to be a very kind and liberal man, and I said I was sure that if he explained the matter to him he would render some assistance. The furniture was mortgaged up to the hilt, the interest had accumulated, and the man was, of course, afraid of losing it. Later on I met the man in William-street, and he told me that Mr. Carter had very kindly taken the matter up for him.  
 20102. You mean that he had saved his furniture? Yes. I do not know whether the man repaid the money to Mr. Carter or not; but he told me that he was in great distress, and he would certainly have lost the furniture had not Mr. Carter come to his rescue. Those are the only two cases of which I can speak from my own knowledge; but I know, from hearsay, that Mr. Carter has been very generous, and that very few persons have gone to him in trouble whom he has not assisted. That is the common report.  
 20103. That was the reputation which he had two years ago—it is the reputation he has at the present time? Quite so. He was known to be a successful contractor; he was regarded as being a well-to-do person, and, knowing him to be generously inclined, persons frequently went to him for assistance.

FRIDAY, 9 OCTOBER, 1896.

Joseph Davis recalled and further examined:—

- J. Davis. 20104. *Mr. Parkes.*] Can you tell me how your value of 12s. 2d. for subducts is arrived at in the case of Contract 69;—how did you arrive at that value? In the first place, I ascertained from the specification what was included in the price for subducts—items 24, 25, 26, and 27. As regards items 24 and 25 it is stated in the schedule that they are for subducts in more or less hard material, including dry or cement jointing for stoneware pipes. Items 26 and 27 refer to water charged, loose, ground, as specified in clause 8, and include hardwood boxes, with packing, and dry or cement jointing for the pipes. They are of 6-inch and 9-inch internal diameter. In the case of items 24 and 25 it does not state that the price is to include the packing over the pipes—the packing that has to be put in between the top of the pipes and the lower side of the lining of the sewer—but I assumed, for the purposes of comparison, that that was stated, so that there should be no doubt on the point. In addition to the prices given for these items in the tenders named in my list upon page 499 of the evidence, the cost of the excavation is included. First of all, for items 24 and 25, I have taken the material specified from 5 to 11 in the schedule, and by that means I have ascertained the cost of the excavation, under Carter, Gummow, & Co.'s schedule, under John Ahearn's schedule, and so on right through, using the same items in each case.  
 9 Oct., 1896. 20105. *His Honor.*] The question is how you arrived at the amount of excavation per lineal yard—the average depth and width? I took what is specified and shown in the drawings. I should have to get my papers to say precisely how the amount was arrived at.  
 20106. You went by the drawings? Yes.  
 20107. I suppose the amount of excavation would vary a little according to the distance of the shafts from one another, and according to the running grade of the sewer itself? Yes, it would vary; but I have taken an average. What that average was I could not tell you precisely now. I have allowed for what would have to be taken out and paid for if subducts had been carried out.  
 20108. Would the excavation be considerably larger than the internal [diameter of the pipes? It would have to be large enough to put the sockets in, and the sockets, I suppose, would be probably  $2\frac{1}{2}$  inches larger than the internal diameter of the pipes.  
 20109. By sockets do you mean the flange rings of the pipes? Yes; I have taken the precise cost of the subducts to the Department under the several tenders. I have first of all taken the price for the subduct itself, which includes in the one case boxing and a 4-inch stone packing over the boxing, and in the other case the pipes and the filling, with no boxing; and the excavation, which clearly has to be paid for according to the schedule.  
 20110. The filling is paid for separately? I think there would be a doubt about that in regard to items 24 and 25. It does not appear to be included in those prices; and it is possible that if we had carried out subducts under items 24 and 25, we should have had to pay the contractors for the dry stone packing, as it is not mentioned. However, I have not taken that into consideration. If I had taken it into consideration, it would have made the subducts a little more costly. The comparison would have been the same.  
 20111. *Mr. Parkes.*] I will ask you to read clauses 104 and 105 of the specification, which appear upon page 94 of the Parliamentary return? They are as follows:—  
 104. Sub-ducts to be constructed, when decided on, along lines of tunnels and open trenches, commencing on each length midway, or thereabouts, between two working shafts or faces, 33 inches below invert of main sewer, branches, &c., or as shall be directed at the time, and having a fall towards each working shaft or face, of such gradients as may be determined at the time, after the thickness of sewer-lining required for each length between shafts or faces has been ascertained and ordered. Subducts of 9 inches, or of a greater or less internal diameter, if directed, to be laid immediately underneath the timber floor of tunnel or open trench, or at sides of sewer, in hardwood boxes varying in size and dimensions as shown on drawing. Said boxes to be laid straight and true to levels decided upon, and the pipes to be laid therein, upon, and surrounded by, sandstone chippings and quarry refuse. Dry stone packing to be put over pipes, as specified in clause 21.  
 105. In solid and disintegrated rock the excavation for subduct to be executed as shown on cross-sections, and as shall be directed, and the subduct to consist of glazed stoneware spigot and faucet pipes of 9 inches internal diameter, more or less, as the case may be. The pipes to be jointed dry, and the filling above same up to underside of sewer lining to be of dry stone, hand-packed, as above described. The Engineer may also, if he deems it necessary, order the pipes to be jointed, altogether or in part, with tarred gasket  $1\frac{1}{2}$  inch deep, and cement mortar  $1\frac{3}{8}$  inch deep, the mortar to be prepared of one part cement to two parts of sand.  
 20112. That is included in the items 23 to 27? No; it is not. What is included in those items is stated in the schedule. This specification is in regard to the way in which the work is to be done. It has no reference

J. Davis.

9 Oct., 1896.

reference whatever how the work is to be paid for.

20113. If you turn to the schedule at page 63 you will see this item: "Subducts, as specified in clause 8, of 6-inch and 9-inch internal diameter";—that is pretty clear, is it not? Yes; it is clear that it includes the pipes and the jointing in the case of items 24 and 25, and the pipes, the packing, and the hardwood boxing and jointing, in the case of items 26 and 27, but not the excavation. The excavation is included under the item of excavation, as I can show you.

20114. *His Honor.*] That is quite clear, I think; the word "subduct" occurs in the item of excavation? Quite so. What I say is that the comparison which is made in my evidence upon page 499 shows what would have had to be paid had the subducts been carried out.

20115. And you say that you have put it down at a rather lower amount than it might be—at a lower amount than, according to your construction of the specification, contractors might be entitled to claim? Yes.

20116. In some cases? Yes; in the case of items 24 and 25.

20117. Because in those cases a contractor might contend, and possibly effectually, that he had a right to be paid for the hand-packed filling? Yes; that is my view.

20118. But you have left that out? Yes.

20119. *Mr. Parkes.*] You will see that the schedule refers you to clause 8 of the specification, and that clause 8 again refers to clauses 104 and 105, the clauses you have already read? Yes.

20120. So that really the only thing you could claim would be that the excavation item should be added? That is all I claim; but I say that clauses 104 and 105 simply state how the work is to be done, whereas the schedule tells us how it is to be paid for.

20121. *His Honor.*] Does the question of margin apply at all to the item for excavation? No.

20122. If the contractor blew out too much rock, that, as far as the excavation is concerned, would be done at his own loss? Yes; he would not receive a penny for the excavation or for the removal of the excavated material. The only consideration he gets is that he is allowed a little extra in the lining. It is thought that it is not practicable to take out these tunnels to the precise size ordered; but in order to keep the contractor in check he is told first of all that he will not be paid for any excavation that he has done over and above what is ordered; and, secondly, it is considered reasonable that he should be allowed a little extra in the lining.

20123. *Mr. Parkes.*] How comes it then that in contract 69 this excavation was paid for to the outside of the timbering? That is another matter entirely.

20124. *His Honor.*] That appears in the specification? Yes; the margin has to do with blasting, and blasting only.

20125. *Mr. Parkes.*] Was there not blasting in the case of contract 69? The fact that timber was required was proof positive that there would not be blasting.

20126. *His Honor.*] The contractor, I suppose, might have to use struts in the case of loose ground, but that would be a different thing from ordinary timbering? Yes; the timber would be taken out as the brickwork and concrete are put in.

20127. The whole question resolves itself into this: whether your calculations are correct as to excavation? Yes; what I say is that I have taken a fair average for the excavation, and that I have used the same quantities in each case. I have got out a comparison under exactly the same conditions for the seven tenders.

20128. Is blasting allowed at all in the taking out of rock for subducts, or has the rock to be taken out by handwork? It has to be taken out by handwork, to all intents and purposes. At the top they might put in a few small shots. They would use a hand-drill and put in a small quantity of powder to take off the subduct just at the bottom of the tunnel, but the lower portion would have to be taken out with picks.

20129. Because, I suppose, blasting might blow away the floor too much? Yes; you simply want a small cut, wide enough to put in your pipes.

20130. I will now ask you a question or two upon a matter which has cropped up in my mind on going through the evidence. Mr. Bagge, at page 407, question 13162, alluded to some occasions on which concrete lining had not been put in, and in which other material had been used instead of concrete. He said that in consequence of that, or that after that, there was a discontinuance of the system of putting in concrete lining. I understood him to mean that the substitution of other material for concrete had its origin about that time. In Mr. Millner's evidence, upon page 420, question 13535, he mentions the packing of the Emily-street branch with what he calls "muck" instead of concrete; but he gives no further explanation of that. I want to know whether these witnesses are referring to one and the same occasion, or how Mr. Bagge's evidence can be explained, as far as your knowledge goes? What Mr. Millner refers to there I can say, from own knowledge, is shale.

20131. By "muck" he meant shale? Yes; it is usual to pack tunnels through shale with the material which is excavated, and that was done in the case of the Emily-street branch.

20132. But was there a departure from the former practice at that time, or had it been usual to pack with the excavated material before that time? That has always been the custom in the case of shale.

20133. And not to pack with concrete? No, except in two or three cases where we have had to go under heavy houses. I remember that in the case of the Elizabeth-street sewer, opposite Belmore Park, we had to remove part of the foundations of houses in order to get in the sewer, and in that case we packed the whole of the tunnels solidly with concrete; but it is only done in such cases.

20134. Then what does Mr. Bagge allude to; he said that you were disgusted at finding that the work had been done in that way, and that in consequence of that a new departure was instituted;—that is what his evidence implies? Yes; I remember the circumstances. It was in connection with Contract 83—a contract of O'Neil and Rogers—a branch of Contract 69. It was let at the same time as was Contract 69. I was out there one day, and I found that the men at the top of one of the shafts were mixing what they said was concrete, but which, in my opinion, was simply sand and stone. I stopped the work. I saw that this material was being put down and was being used, and I told the contractors that they were not to do anything more until I had had an opportunity to examine the whole of the work. It was late in the evening when I made this discovery, and on the next day I went below and had some of the work removed. The first 2 or 3 feet of the work were excellent; and I had an idea how that came about, although I need not mention it now. On going beyond

J. Davis. that point, however, I came to packing which was precisely of the same nature as the mixture which I had seen at the top of the shaft. I had a good long length of this taken out, and I found that it was all the same kind of work. The principal partner was at the time in Tasmania, so, after consultation with the other partner, I said, "Perhaps, in fairness to your absent partner, it would be better to do nothing more in the matter until he has returned." We waited, accordingly, until he came back. I then put a man on the job with instructions to take down any work of the same description as that which I had seen, it being impossible for me to remain there during the whole of the time. The contractors sent some men to take down the work, and they took down a large quantity of it. Then the principal contractor came to me and he said he did not think he would take down any more. I said, "Very well; you can please yourselves about that, but until we are satisfied that there is no more of that kind of work done, we cannot allow the work to proceed. If you proceed with the work you will do it at your own risk. Moreover, we cannot pay for it." A number of interviews took place, and finally he made a proposal that if I would allow the brickwork to stand—the brickwork was excellent; it was only the packing that was questionable—he would accept payment for the packing, not as sandstone concrete, but as ordinary filling. The matter was submitted to the Minister, and was sent on one or two occasions to the Crown Solicitor. The whole thing was thoroughly gone into, and finally it was decided that for the whole of the packing that had been done the contractors were to be paid at the rate of 1s. per cubic yard, instead of at the price for sandstone concrete. That was carried out, and that, I think, was the circumstance to which Mr. Bagge refers. I ought, perhaps, to say that in my judgment—and it is not a recent judgment, but an opinion I have held for a long time—this concrete packing was unnecessary. Mr. Bagge, on the other hand, thought otherwise, and continued to specify it. When this matter occurred upon O'Neil and Rogers' contract, I wrote a minute upon the whole matter, and the Engineer-in-Chief approved that in future sand should be used for packing the brickwork over the arches in the tunnels instead of sandstone concrete. That is the history of the thing.

20135. Sand is specified in the departmental plan for Contract 77? Yes. The whole of the contracts from that time have been let with the specification for sand, and not sandstone concrete, packing in the case of tunnels.

20136. Except, I suppose, in exceptional cases where concrete may be ordered? In exceptional cases we retain the power to order concrete.

20137. Mr. Parkes.] What was the date upon which O'Neil and Rogers' contract was let? It was let at the same time as Contract 69. The two contracts were running continuously. O'Neil and Rogers' contract was finished a little before Contract 69, but the two contracts were working at the same time. I could not give you precise dates.

20138. The two contracts were started at the same period, both being upon the same specification as regards concrete? I think there would be similar specifications. I have not compared them in that respect, but it is probable that they would be similar, because they would be drafted at about the same time.

#### TUESDAY, 13 OCTOBER, 1896.

Edward Mann Clark sworn and examined:—

E. M. Clark. 20139. His Honor.] You are the representative of the Electoral District of St. Leonards in the Legislative Assembly? Yes.

13 Oct., 1896. 20140. You were the representative of the original Electorate of St. Leonards? Yes; and afterwards of Willoughby, and then again of St. Leonards.

20141. You took, I think, a great deal of interest in the improvement of North Shore generally, and especially in reference to the matter of sewerage? Yes; I have always taken an interest in any matter tending to the improvement of the district.

20142. You were asked, I suppose, by different persons, to see that the sewerage works were pushed on at a reasonable rate? I have always been more or less troubled at times by workmen. They always come to me in connection with any work in the district calculated to give them employment. They are always worrying me about that. They did worry me, I think, about one of the contracts which form the subject of this inquiry.

20143. As to Contract 79—the contract beginning at Mount-street and going down to the end of the sewer at Long Bay;—what do you know of that? I took a particular interest in that work municipally and otherwise—in fact, I have always taken an interest in the entire sewerage system. I am, even now, fighting for other sewerage works in the district.

20144. Do you remember Messrs. Bond and Hudson being the successful tenderers for a contract which hung fire for some time—the original 79? I know the contract. I was under the impression that Carter, Gummow, & Co., were the successful tenderers.

20145. You remember the fact that that work did hang fire for some considerable time? Yes.

20146. Do you remember writing to the department upon the question, suggesting that, as the work was urgent, the successful tenderers, whoever they were, ought to be compelled to take it up at once? I have a slight recommendation of a letter to that effect.

20147. The letter which appears upon page 270 of the Parliamentary return I hand you is the letter you wrote? Yes; that is my letter.

20148. You do not actually remember writing it, I suppose? No. I have so many letters of that kind to write, I do not remember writing this particular one; but it is apparently mine.

20149. You wrote again a fortnight afterwards, hurrying up the matter, as it were? Yes.

20150. You have a general recollection of writing some letters dealing with the question? Yes, in connection with that particular contract. At that time I was always writing to the department, because it was the beginning of the sewerage work in the district, and there was a general anxiety that it should be pushed on.

20151. At that time were you acquainted with Mr. Carter? I knew Mr. Carter, but I had never had any conversation with him on sewerage matters.

20152. Did you know him intimately? Not intimately; I knew him as an old resident of the district. I have never had any conversation with him at all. I knew that he was connected with the municipality in various matters, but I never had any conversation with him before writing the letters to which you have referred.

20153.

20153. Did you know him at that time to be a contractor? I could not say if I knew him to be a contractor at that time. I do not think I did. E. M. Clark.
20154. You know that his firm afterwards obtained the particular contract concerning which you wrote, and that they carried it out? Yes. 13 Oct., 1896.
20155. But, up to the time of his actually getting the contract and beginning the work, did you know that he was a tenderer for it or not? I did not know that he was a tenderer.
20156. At that time did he ever come to you and ask you in any way to further his interest in relation to that contract? No; he never came to me at all.
20157. All your action in relation to the pushing on of that work was in the interest of the district, and because workmen came to you asking you to get some work under weigh if possible? It was not only the workmen; but the residents of the district generally were anxious that the work should be proceeded with. It was really on these all-round representations that I urged that the work should be pushed on.
20158. You did not take action at the request of Mr. Carter or of any other person who saw you on his behalf? No.
20159. The work was then undertaken and went on? Yes.
20160. And then some time afterwards there was an extension—the work known as Contract 79A? Yes; but of course I do not know the contract by that number. I know the work to which you refer, I think.
20161. Do you remember anything about the early history of that extension? Yes; representations were made to me in a similar way as to that work, and one day I met Mr. Carter. I told him it had been represented to me that some of his men would be very shortly out of work if the extension were not carried out. I asked him whether he could go on with it—whether he would take it up if I could get the Secretary for Public Works to give the contract to him. He said he would be very glad to take it up, and then I interviewed the Secretary for Public Works, Mr. Lyne, in the matter. Mr. Lyne said that Carter, Gummow, & Co. had always been a very respectable firm of contractors, and that if the work could be carried out by them he saw no reason why they should not have the extension, provided they would carry it out at a price satisfactory to the department.
20162. It was you who first spoke to Mr. Carter, and not Mr. Carter who first spoke to you? I first mentioned the matter to him.
20163. He said he was willing to do the work? Yes.
20164. Did you afterwards interview Mr. Lyne with Mr. Carter on the subject? I had two or three interviews with Mr. Lyne on the subject, because the question of cost had to be considered. The cost on the schedule rates for the previous job would have been £16,400, but the department were not prepared to give that amount. The departmental estimate, I think, was £12,800, and Carter, Gummow, & Co. offered to carry out the work for £13,700. There was considerable parleying between the department and the firm as to whether the work should be taken up for £12,800 or not. Finally, it was taken up at that figure, I believe.
20165. And so you came to see Mr. Lyne on the subject? Yes; once or twice. I am not sure whether I did or did not see him once—I think I have a slight recollection of it, but it would only be for a minute or two—with Mr. Carter; but I should not like to swear that I did so. I have a slight recollection of having gone to him with Mr. Carter.
20166. Can you recollect what took place on the occasion when you and Mr. Carter saw the Minister together? There was a conversation of only a short duration between Mr. Lyne and Mr. Carter, I think, upon the question whether Carter, Gummow, & Co. should take up the work at the departmental estimate of £12,800. That was the whole of the conversation which took place, as far as I can remember.
20167. Mr. Lyne would not go over that amount? No; he insisted that if the work were carried out it must be carried out at the departmental estimate.
20168. And was Mr. Carter then doubtful as to whether he would come down to that estimate or not? I do not think that he agreed to it immediately—that is, while we were there; but shortly afterwards he did agree to carry out the work at the departmental estimate.
20169. And that was the last you had to do with that contract? Yes.
20170. During the time in which you were in any way dealing with either of these two contracts did you see Mr. Hickson? I think Mr. Hickson came into the room one day when I was speaking to Mr. Lyne on the subject.
20171. Was that as to the last contract? Yes; I never saw Mr. Hickson at all in connection with the former one. I think it was when the department were dealing with the last contract; and then he only came into the room to bring the papers in connection with the matter, so that Mr. Lyne might have them before him.
20172. Did he join in the conversation at all? I do not remember that. As far as my memory serves me, I think Mr. Hickson rather showed himself opposed to the letting of the contract to Carter, Gummow, & Co. in the manner in which it was proposed to let it. I have a slight recollection that that was the real gist of any conversation which may have taken place.
20173. Were you personally acquainted with Mr. Hickson? Yes; I knew him very well.
20174. So that you would have remembered the circumstance if there had been any conversation? I have so many of these things to think about, and so many conversations take place in reference to them, that it is very hard to remember any particular conversation. I am rather a busy man politically, and I often forget things of this kind.
20175. *Mr. Davis.*] Did you have any conversation, directly or indirectly, with any officer of the department with respect to Contracts 79 or 79A? I had no conversation at all with any officer of the department in regard to those contracts.
20176. The whole of the business, as far as you were concerned, was done by Mr. Lyne? Entirely with Mr. Lyne.
20177. *Mr. Andrews.*] You were both member for the district and Mayor of North Sydney at the time you made these representations to the department? Yes; I was returned to Parliament in June, 1891, and I see that one of the letters is dated in July. It shows that I was anxious, as the representative of the district, to get the work pushed on. I should like, if I may be permitted to do so, to supplement the evidence I have already given by a statement as to something which occurred in regard to the Monier system of construction. I remember having a conversation with Mr. Young and with Mr. Carter once in regard to that matter. It arose in this way: Mr. Carter came to me and said that he was anxious to send in an alternative tender upon  
the

E. M. Clark. the Monier system for a contract at Johnstone's Creek, the job upon which the Monier system has since been adopted. He said he would like to see the Minister to ask him not to declare his tender informal if he put in an alternative tender for the carrying out of the work upon the Monier system. I went with him to see Mr. Young. Mr. Young said he had no objection whatever to the firm's sending in an alternative tender, and that he did not see any reason why it should be declared informal, but that he would let the whole matter stand on its merits.

13 Oct., 1896.

20178. *His Honor.*] That was the only occasion upon which you saw the Minister on that subject? Yes.

20179. *Mr. Parkes.*] You also wrote to the Minister with the object of obtaining an extension of the Marrickville contract for Carter & Co.? Yes; I might say that at the time one of the works was gradually nearing completion. A large number of men who were working for Carter, Gummow, & Co. came to me with reference to the letting of further contracts. I may mention that I also, on behalf of the men, urged that certain work should be carried out by day-labour. There was at that time an agitation in favour of the butty-gang system. The men were anxious to have some of the work carried out upon that system, and I remember urging that some of the work should be carried out in that way.

20180. You wrote two or three letters about the Marrickville contract? Yes. (*Vide Appendix No. 79.*)

20181. *His Honor.*] Did Mr. Carter approach you on that subject? No; you can well understand that, the men having approached me with reference to the carrying out of the butty-gang system, Mr. Carter, as a contractor, being naturally opposed to the system, would not be likely to do so. I was really approached by the men. I suggested that as Carter & Co. were carrying out work of the kind, if this additional work could be carried out upon the same favourable terms, it might be the means of giving them employment.

20182. What was the particular work referred to? I think it was some extension of the Marrickville contract. I could not give you the particular number.

20183. Was the extension granted or not? It was not granted, I believe.

20184. I understand that you were in no way moved by the contractors in making the application in connection with that work? No.

20185. You were simply moved by the men themselves? Yes.

20186. They were afraid of getting out of work? Yes. I think that at the same time I asked a question in the House in regard to the carrying out of the work now being carried out by the Postal Department, the laying of the underground telephone wires. I asked the Postmaster-General to consider the advisableness of carrying out the work by day labour, and it was at my instance, I think—I mean partly in consequence of my question—that he carried out that work in the manner in which he is now doing it. That was done virtually on the representation of some of the very same men who were working for Carter, Gummow, & Co.

John William Townsend Boys sworn and examined:—

J. W. T.  
Boys.

13 Oct., 1896.

20187. *His Honor.*] You are an engineer? Yes.

20188. You have been and are still employed by the Department of Public Works? Yes.

20189. You were in charge of Contract 79, were you not? Yes.

20190. At its inception? Yes.

20191. In what capacity? As resident engineer.

20192. As sole resident engineer? Yes.

20193. Had you before then been upon Contract 72? Yes.

20194. At what time did you leave Contract 72? I am uncertain about the date.

20195. Did you come straight on to Contract 79? I am not quite sure.

20196. I want to know what you know as to the question of the transfer of any cement from Contract 72 to Contract 79;—as a matter of fact, did any cement go from one contract to the other? There were some small parcels which were sent to other contracts from Contract 72, of which there were records.

20197. Do you now remember, apart from the records, whether any of these parcels were actually sent to Contract 79? I cannot say.

20198. Do you remember when the cementing work first began upon Contract 79? I cannot say from memory.

20199. About how long would it be after the date of the commencement of the work? I cannot say positively, but I should think it would be about fifteen or sixteen months afterwards.

20200. After the beginning of the work? Yes.

20201. Would that time have elapsed before any cement went on to the work at all? No; there was cement there.

20202. You mean that that time would elapse before any cementing was done? Yes.

20203. How long had any cement been waiting there before the cementing work was begun? I could not say positively.

20204. Then you cannot say positively whether any cement did actually go from Contract 72 to Contract 79? No.

20205. You kept journals, I suppose? Yes; on both contracts. On looking at the journals I can find no record of any cement delivered from Contract 72 to Contract 79, although there are records of deliveries to sundry other contracts. Flood and Rutherford, for instance, had two or three parcels of cement from Contract 72.

20206. I believe that when Contract 72 was discontinued there was a large quantity of cement in stock upon the contract? I heard so. I did not actually see it. I did not go into that particular shed.

20207. In point of fact, considering that Contract 79 was started some considerable time after Contract 72 was discontinued, and that cement would not be wanted upon Contract 79 until all the excavation was done, would it not be very improbable that any cement would go to that contract from Contract 72? I do not think it would be improbable, supposing that the contractors had land upon Contract 79, and that they were paying a rental for land upon Contract 72.

20208. You think they might transfer the cement for the sake of storing it more cheaply on Contract 79? Yes.

20209. But you have no recollection of it? No.

20210. And you have no recollection of the arrival of the first cement which did come on to Contract 79? No.

20211. Do you remember a man named Burcombe, who was drawing for Carter & Co.? Yes; I recollect a man of that name.

20212.

20212. Have you had any recollection of his teams arriving on the site of Contract 79 with cement from anywhere? No. J. W. T. Boys.
20213. It would be a three-horse team if such a thing did occur;—do you think you would remember that? I scarcely think I should, because so many teams would be carting at the time. 13 Oct., 1896.
20214. You would not notice it even if the cement had come from a distance instead of from the wharf? I should not know any more of it had it come from a distance, than had it come from the wharf. It would come in the same direction.
20215. All that you would notice would be that a certain quantity of cement would arrive? Yes, speaking generally; but I should not notice particularly the number of teams, or anything like that.
20216. You worked upon Contract 72 and also upon Contract 79, and you would have an idea of the distance between the two contracts. I suppose it is about correct to say, is it not, that from the place of deposit of cement upon Contract 72 to the place of deposit of cement on Contract 79 the distance would be almost, if not quite,  $6\frac{1}{2}$  miles;—did you ever take the distance out? No; but it could be easily measured approximately on the map.
20217. The pace of travelling of a team with cement, I presume, would not be more than  $3\frac{1}{2}$  miles an hour at the most? I could not say.
20218. I suppose that the maximum would be  $3\frac{1}{2}$  miles an hour? I do not think they would go any faster.
20219. The teams travel, I suppose, between sunrise and sunset? That is according to the management; I could not say.
20220. The practice would be not to arrive on the ground with cement until well after 9 o'clock in the morning, I suppose, unless the cement had been brought from a very short distance? They might arrive at almost any time. Supposing, for instance, it were a moonlight night, and they were pressed, they might cart them.
20221. Do they cart at night on some occasions? I dare say they might. I have never seen them. I cannot say for certain.
20222. As to the work upon Contract 79, you made an estimate, I believe, at Mr. Davis' request in connection with the question of how the sewer could be constructed—as to the relative cost of different thicknesses of margin;—you remember that? Yes.
20223. That estimate is correct, I suppose? Yes; as correct as I could check it.
20224. At all events it is approximately correct? Yes.
20225. As to the overlapping of accounts in connection with the Bondi work, do you remember some charges which were incurred at Bondi being amalgamated with the accounts of Contract 79? I do remember some charges of that kind.
20226. Do you remember the circumstances? There were some tools charged, and some cement was also charged as far as I can recollect.
20227. How did that arise, do you remember? Yes; they required a little passed-cement, and the contractors on 79 were able to supply it.
20228. For some work at Bondi? Yes.
20229. Then how was it that the accounts were not kept separately—that the Bondi account was amalgamated with the account of Contract 79? Because the charges would all go into one big account. They would all go into the same account eventually.
20230. They were merely amalgamated for convenience sake? Yes.
20231. It made no difference, because the money would be paid eventually to Carter, Gummow, & Co. by the department in some form? Not necessarily. The amount might be paid to anyone else who did the work.
20232. But the work being done by Carter & Co., it would go into one account to which all sewer charges whether in connection with Carter & Co.'s contract, or any other contract of theirs, would be charged—is that so? Yes.
20233. Was this work at Bondi, do you remember, a sewerage matter or a road matter? A sewerage matter, I believe; but I cannot speak positively as to that.
20234. The amount would be paid by the same department ultimately in any case? Yes.
20235. You were continuously upon Contract 79, I understand? Yes.
20236. But you were relieved at one time by Mr. Weedon? Yes.
20237. Were you relieved by him more than once? I think I was relieved twice, but I could not say unless I looked at my diary. It was when I went on my holidays, in one case for three weeks, and in the other case for a month.
20238. Were you upon Contract 79A? Yes; I commenced it.
20239. Who took it over from you? Mr. Weedon.
20240. And he continued upon it? As long as it was in the charge of the department.
20241. A change was afterwards made, and Mr. Darley took over the construction, and then Mr. Weedon left? Yes.
20242. Do you remember reporting upon some complaints which were made about bad ventilation? Yes; upon Contract 79.
20243. What did you find to be the facts of the case? I found that the deep shafts, with the exception of No. 12, had fans driven by steam, and that in the comparatively shallow shafts they were intended to be driven by hand, but the hand-pumps had not been fixed at that time. The principal cause of complaint was at shaft No. 12. I see from my diary that I requested the contractors to have the hand-pumps applied at once.
20244. There was no engine to work the fan at shaft No. 12? No engine was ever put there.
20245. No engine was required there for other purposes? No.
20246. Was the hand-fan worked after that? Almost immediately.
20247. Had it not been supplied at all when the complaint was made? I do not think it was fixed. It was there on the ground.
20248. As far as you know, as a matter of practice, should it have been fixed by the contractors, or by the men themselves, the fan being supplied by the contractors? It is a mere matter of arrangement with the men. It is a contractor's matter, and not a matter for the department to interfere with, unless there were bad complaints.

- J. W. T. Boys.  
13 Oct., 1896.
20249. When you did go into the question you insisted upon the fans being fixed by the contractors, I understand? Not necessarily. I insisted that it should be fixed.
20250. Who fixed it when it was fixed? That I cannot say.
20251. You cannot tell whether the men or contractors actually did it? No.
20252. Had the pipes been supplied? Not before then,
20253. They were not on the ground then? They were not fixed.
20254. Where were they? They were either in the yard or on the ground—I cannot say which.
20255. They were available, but they were not fixed—that is what you wish to say? Yes.
20256. So that, whether it was the duty of the men under the circumstances to fix the pipes and fan themselves, or whether it was the duty of the contractors, you cannot say;—it would depend, you say, upon what arrangement was made between them? Yes.
20257. And as to the working of the fans—how were they worked? The hand-fans were worked by the men.
20258. By the men themselves? Yes.
20259. That was the regular practice? Yes.
20260. When the fan for shaft No. 12 was supplied, where did it come from? That I cannot say.
20261. Had it to be got, or did it appear to be on the ground close by, where it could be secured in a short time? I cannot say whether this particular fan was in the possession of the contractors at the time, but fans can be procured at once if necessary.
20262. There was no delay in procuring this particular fan? No.
20263. *Mr. Davis.*] Speaking generally of the ventilation upon Contract 79, was it on the whole, speaking from your experience in sewerage works, such as has been generally provided by contractors? Yes; it was very fair throughout.
20264. Where the fans at the deep shafts are driven by engines there could be no question about the ventilation? It was excellent.
20265. In fact, it was a case of the men taking care lest they took cold? Well, it was pretty strong. It would blow a candle out very quickly if you did not guard it.
20266. Where you found that the ventilation was to some extent defective on the date of your report of 6th August, 1892, did you find any difficulty in getting it rectified? No difficulty at all when attention was drawn to it.
20267. You said in your report, "I have heard no complaints on the score of bad air from any of the men, with the exception of those at No. 12 shaft;"—do you remember writing that? Yes.
20268. Is that correct? Yes.
20269. And No. 12 shaft, at the time of your report, had been standing for how many days;—would it be ten days? I cannot speak from memory, but whatever I have written in my report would be correct.
20270. Do you know why it was stopped? There was a dispute about payment, I think, but I cannot say positively.
20271. Coming to the small quantity of material which was supplied upon Contract 79 for the Bondi work, do you know whether the Bondi work was carried out by me or by the Roads Branch? It was carried out by you.
20272. Do you happen to know whether it did or did not form a part of the Bondi Sewer scheme? I understand that it formed a part of the Bondi scheme, but what part I do not know.
20273. Whether the material was supplied from North Shore and Marrickville, or from any other source, so long as it was within the area which would eventually have to be administered by the Board of Water Supply and Sewerage, it would make no difference so far as the accounts were concerned? Not in the least.
20274. Do you happen to know whether the sewerage debt is dealt with separately or as a whole after the works are transferred to the Board of Water Supply and Sewerage? It is dealt with as a whole.
20275. So that, supposing the £11 ls. had been paid from the Vote taken for the sewerage works at North Shore and some of it had been expended at Bondi, that would in effect make no difference? Not the least.
20276. As to the transfer of cement from Contract 72 to 79, first of all I would like you to speak as to the position of things at the time the work was suspended upon Contract 72. I would like you to read the entry in your journal under date of 5th December, 1891, upon page 42. It is as follows—"Concreting outfall, plastering, &c. The contractor intends driving sheet-piling at face of outfall on Tuesday morning. The inspector finds that there are only 1,689 barrels in the three sheds, viz., 300 Alsen, 958 Camel, 431 Germania; total, 1,689. It was reported that there were 2,200 barrels;"—what would that entry refer to? It would refer to passed cement. The 1,689 barrels, I take it, would be passed cement in the three sheds.
20277. Will you look at page 42 of the journal again, and read the entry under date of 26th November? Yes.—"Alsen cement passed; concreting, filling in, and plastering."
- 20277½. The journal also states how much was passed on that day? Yes; there it a note in the margin, "300 Alsen."
20278. Does that 300 correspond with the entry made on 5th December? It is the same number.
20279. Does it confirm you in your opinion that the 1,689 casks of cement entered under date of 5th December were passed cement? Yes.
20280. In addition to that, have you any recollection of any other cement at about that time on Contract 72? Yes; there was some cement passed previous to that, and recorded.
20281. But have you any recollection of writing a minute, asking that some cement might be tested? I remember speaking about some other cement, and I declined to test it because it was more than we required on that contract.
20282. Do you remember writing this minute: "Messrs. Carter & Co. have informed me that they had stored 2,000 barrels of cement on the Munni-street to Shea's Creek contract, and require it to be tested. This quantity is in excess of the amount required to finish the present work, and I have refused to bring the sample?" Yes; I remember that.
20283. Does that minute refer to the same cement as the entry under date of 5th December in the journal? No.
20284. These 2,000 casks refer to cement which had not been tested, and which the contractors wanted to be tested? Yes.

J. W. T.  
Boys.  
13 Oct., 1896.

20285. When the work was suspended on Contract 72 you gave up control? Yes.
20286. Would you be likely to have any record of what occurred after you gave up control? No; I should not have any record at all. As soon as I leave the work I have nothing more to do with it.
20287. Can you give us any idea as to where the 2,000 casks of cement to which you have referred as being untested were stored. You refer in your entry in the journal, under date of 5th September, to three sheds containing the 1,689 casks;—where would the 2,000 casks be stored? I cannot say positively from memory, but I feel sure that it was right up at the top end, in Munni-street.
20288. In Knight's paddock? I forget the name of the paddock; there were four sheds altogether.
20289. Will you tell His Honor where they were? There was one down on the rising ground, near the swamp—that is, almost at the outfall of the concrete channel. Then there was one opposite the boiling-down place; another close to Mitchell Road; and a fourth up at Munni-street.
- 20289½. To the best of your belief the 2,000 casks would be stored at the upper end? I think so.
20290. Do you know what the practice has been with regard to the carting of cement backwards and forwards on these contracts;—will you tell His Honor briefly what has taken place from your own knowledge and experience? The inspector in charge of the work has orders, as the cement goes out, to brand it. He generally does so, and he takes a description of the maker, and the number of the cask, and forwards it to the inspector on the job to which the cement is going. The other inspector enters the receipt of such and such cement from such and such a contract.
20291. *His Honor.*] If cement has not been passed is anything of that kind done? We have nothing to do with that. If it is under test it is not allowed to go.
20292. If the cement had not been passed at all would the department take cognisance of any transfer of it? No.
20293. *Mr. Davis.*] Do you remember anything which occurred in connection with the packing of shaft No. 6 on Contract 79? I remember one of the inspectors complaining about some dry stone being put down, and an inquiry being made. We tried the shaft afterwards. I gave orders to my inspector to go and see whether such a thing had been done—whether the dry stone could be found in the work, and he could find nothing of the sort.
20294. Did that inspection take place before I came to look into the matter;—I suppose you remember my coming over? You came over at 9 or 10 in the morning after I had sent in a report on the matter.
20295. How long was it after I came before you had the work examined? I could not say.
20296. You are quite sure that you had it examined? Yes.
20297. And you are quite sure also that you found that it was all right? Yes.
20298. You have been resident officer upon Contracts 72, 79, and 79A, and on others? Yes, on Butcher's Contract, which was a sort of reticulation work on Holterman's Estate.
20299. Were you not resident engineer on the Neutral Bay and Careening Cove work? Yes; and on the storm-water work at Balmain, and Lemon and Spencer's Glebe sub-main contract.
20300. Many of these works were carried out by other contractors than Carter, Gummow, & Co.? Yes.
20301. Did you notice any difference in the practice in regard to the contracts of which you have just spoken as compared with the practice observed on the contracts of Carter, Gummow, & Co.? No, they were all on the same footing.
20302. Can you say, with regard to Contracts 79, 79A, and 72, whether, so far as your supervision goes, the proper quantity of cement, the specified quantity, was used? I should have to leave 79A out of my answer, as no concreting was done on that contract under me; but, as to the rest, the concreting was done in the usual way with the quantities specified.
20303. Did you ever find on either of these jobs that less cement than the quantity specified was being put into the work? No, I personally tested the work. I frequently tested it when I went over it. I tasted some of the concrete, and you could taste the cement strongly. The work set well, proving that there was plenty of cement in it. A week after the concrete had been put in you would find it so hard that you would have great trouble in picking it out.
20304. *His Honor.*] What sort of a man did you find Inspector Reid to be? He was what you would call a decent fellow, but he had a peculiar way—in fact his way was very unpleasant indeed. He always wanted the last word in any argument. He frequently raised arguments, and he invariably wanted the last word. He was very troublesome in that way, but I believe him to be a thoroughly honest man.
20305. But cantankerous? Yes.
20306. Did you find that he did not get along well with the men? Yes, I found them always at logger-heads over petty little things. I dare say there were faults on both sides, but Reid could not leave things alone, and he was always wanting, as I say, to have the last word in everything even with myself. I warned him several times that if he had any complaints to make he must make them straight out and say definitely what he wanted, and that if he could not do that, I should have to report him; but he continued his nagging and argument.
20307. Which was more irritating to the workmen, I suppose, than even sailors' language emphatically applied? A good deal, I think. I know that he used to irritate me a good deal with the very same mannerism.
20308. *Mr. Carter.*] Referring to Contracts 79 and 72, the work on those contracts, as far as you are aware, was always faithfully performed? Yes.
20309. Did you ever find the contractors reluctant or hesitant in carrying out anything you asked them to do;—supposing, for instance, a piece of work was not quite right, they would not hesitate to put it right if you asked them to do it? No; they carried it out at once if there were any complaints.
20310. Referring to the question of cement on Contract 72, you said that there were four sheds;—do you remember if there were any more than four? I cannot recollect any more at the time I was there.
20311. Do you remember one under the railway line? That was put there after I left the work. I saw it there.
20312. That would make five in all? Yes.
20313. The top shed, which, I may tell you, was in Knight's paddock, was a very large one? Yes.
20314. How many casks do you think it would hold—3,000 or 4,000? Speaking from memory, I should say you could stock there between 2,000 and 3,000.
20315. Do you remember our putting 40 feet on to that shed to take in cement which was not required for the contract? No; I seldom went round that way.

20316.

J. W. T.  
Boys.  
13 Oct., 1896.

20316. There were 1,689 casks of tested cement in the three sheds, and there were also 2,000 casks of untested cement, as I gather from your journal;—is that correct? I believe so.
20317. You would not take official notice of the 2,000 casks unless you were asked to test it? No.
20318. We could do as we liked with it? Yes.
20319. Referring to the carting of cement, one of our carters (Burcombe) has been here, and has told us that he made three trips a day between Shea's Creek and North Shore, taking, in company with other carters, the 2,000 casks of untested cement. I would ask you to say if you have ever seen cement being carted through North Shore at 9 or 10 o'clock at night? Never.
20320. Have you not, when you have been going to the theatre at night, noticed brick carts going up and down the Milson's Point Road? I have not noticed them.
20321. Do you not know that carters start at 4 o'clock in the morning and leave off when they can? I know that.
20322. And that a carter's hours of labour are not eight, but are often sixteen to eighteen? Yes.
20323. So that it would not be out of the way to make three trips a day from Shea's Creek to North Sydney? No; they could do it, I should say.
20324. *His Honor.*] Do you think they could cover 39 miles a day with a dray, loaded one way and unloaded the other? They do it with timber in the country, and I do not see why the teams here should not do it. I know the timber teams do it in the country, having from 1 to 2 tons to carry.
20325. Of course, the time necessary for feeding, loading, and unloading, would have to be taken into consideration? Yes; I have known them to start at 3'30 or 4 o'clock in the morning and to get home after their last load at 10 o'clock at night.
20326. Using the same team or two teams of horses? I cannot say, but I think the same team. I know that they have got so covered with dust that one could scarcely recognise them again.
20327. *Mr. Carter.*] You know our manager, John Reid? Yes.
20328. Did you ever find him averse in any way to carrying out your orders? He was not averse to carrying out my orders.
20329. But he might possibly object to Inspector Reid's orders? Yes; he objected to orders direct from the inspectors. He wanted his orders from me.
20330. *Mr. Parkes.*] The journals produced would set forth the dates upon which you left Contract 72, and entered upon Contract 79? The journal of 72 will show when I left that contract, and the journal of 79 will show when I began there. I may say that I had an assistant at the time.
20331. Who was the assistant? *Mr. O'Hanlon.* He was on 79 for a couple of days or so, helping me to start the shafts.
20332. The note which appears upon page 48 of the journal of Contract 72 would be your final note in that journal? Yes; that would be the last of my writing in the journal.
20333. What is the date of that? 26th February, 1892.
20334. The journal of 79, starting upon page 2, would be in O'Hanlon's writing, would it not? Yes.
20335. Would that be the date upon which you took charge? Practically it would. I probably sent him there a day or two in advance. I may not have gone on to the ground for several days after that. He would be sent there to get ready.
20336. What is the date of the first entry? 14th March, 1892.
20337. That will fix the date of your leaving Contract 72 and going on to Contract 79, will it not? I might have had some other work coming in between. It would not mean that these were the only contracts that I went on to.
20338. But it would fix the dates of your having a knowledge of the one or the other? Yes.
20339. I would like you to read again your entry on page 42 of the journal of Contract 72, and also the entry which appears upon page 41, under date of 16th November? The entry under date, 16th November, is as follows:—"Filling in at back of timbers, plastering, &c. The contractors have stored on the works 2,000 barrels of cement samples, which they desire to have tested. The cement is not required. Awaiting instructions from Mr. Davis." There is a marginal note, "Referred to Engineer-in-Chief.—J.D."
- 20339½. After that there was very little work to complete upon the job? Not much.
20340. How many barrels of cement will it take to complete it? It would be impossible to say.
20341. Would it take more than 200? I should fancy so. There was a lot of plastering to be done at the outfall.
20342. How many barrels would you think would be required? I could not hazard a guess.
20343. Would it take 1,000 barrels? I could not say.
20344. Would it take 800? I could not make a guess, because I really forget whether the jack-arching was rendered, or whether the lower part of the sewer was rendered. I know that there was some work left to the last.
20345. Was there a fair amount of work to be done in cement? A fair amount of work.
20346. Will you now read again the entry under date of 5th December, on page 42? Yes; "concreting outfall, plastering, &c. The contractor intends driving sheet piling at face of outfall on Tuesday morning. The inspector finds that there are only 1,689 barrels in the three sheds, viz., 300 Alsen, 958 Camel, 431 Germania—1,689, total. It was reported that there were 2,200 barrels."
20347. Did that not refer to the report which you formerly read? No; it is evidently in connection with a conversation I had had with the contractors. They had 2,000 barrels which they wanted tested, and the 1,689 barrels were tested cement.
20348. But your entry says, "It was reported that there were 2,200 barrels?" That would probably be in conversation. The information that the contractors had stored the 2,000 barrels referred to in my entry of 16th November would come from my inspector. The information as to the 2,200 barrels would come from the contractors.
20349. *His Honor.*] I understand you to say that the 2,000 barrels was an assertion made in relation to untested cement? It had nothing to do with tested cement. It had to do with untested cement, and I had nothing to do with that.
20350. *Mr. Parkes.*] Does the entry on 16th November refer to the cement mentioned in your minute? I think I have muddled up the two things. I really cannot say positively what the 2,200 barrels in my entry of 5th December referred to. I cannot exactly remember the conversation, but I remember that there

J. W. T.  
Boys.

13 Oct., 1896.

there was untested cement and tested cement. I remember also that there were four sheds. I mentioned in my entry of 5th December that those sheds contained tested cement, and the untested cement must have been in the fourth shed.

20351. But the three sheds would be on the work, whereas the fourth shed would be off the work, in Knight's paddock? No; they were all on the length of the contract. The contract was to be stopped at a certain point if the Engineer-in-Chief should so decide, but we should take the paddock to which you refer as being included in the contract.

20352. But you say you never entered the fourth shed to see what was in it? No; I did not bother about it.

20353. Will you read out the names of the passed cement referred to in your entry of 5th December? Alsen, Camel, and Germania.

20354. If in Henry Austen's return of cement under date of 6th November there is an entry of 300 barrels of Alsen's cement delivered on to this contract, that would represent the barrels to which you have just referred, would it not? I have no record of that.

20355. This information is taken from the merchants' books; it shows also that on 13th November Parbury, Henty, & Co. delivered 1,000 barrels of Camel cement;—that would also be the 958 barrels, would it not? I cannot say.

20356. Alsen's cement was tested on 11th November, 1891;—you have a record in your book of that, have you not? No; there is no record here.

20357. But if there is a certificate in the office book showing that it was tested on 11th November, that would be correct? Yes; but I have not entered it here.

20358. As to Parbury Henty's delivery of the 1,000 barrels of Camel, that would agree with your entry, would it not? I cannot say. I have no record here.

20359. What is the number of barrels of Camel cement in your entry? 958.

20360. What is the date of it? 5th December.

20361. Then if under date of 6th November there is in Parbury, Henty, & Co.'s books an entry of 1,000 casks of Camel cement, that is likely to be the same, is it not? It might, or it might not be. I could not say.

20362. On 13th November, Henry Austin delivered 407 barrels of Germania, so that you will see the three entries of Alsen, Camel, and Germania, seem to tally with your entries? They do not.

20363. But approximately? Yes.

20364. If the records of the department show that the 1,000 barrels of Camel cement were not tested, and that the 430 barrels of Germania were not tested, your note would be wrong? Not necessarily. Do you mean to say that no other cement had been sent to the contract before that?

20365. I have a complete record of the cement deliveries to the contract, taken from the merchants' books; and there are no deliveries entered in those books other than the three to which I have referred. Therefore, the entries would be likely to correspond with the entries in your journal? I do not think they do.

20366. But the figures are approximately the same? Approximately.

20367. Is it not possible that your inspector may have counted them wrongly? That is on the cards, of course.

20368. Then we have the fact that, according to the books of the department, neither the Camel nor the Germania was tested? I think the Germania was tested. I have an entry under date of 17th September, that 150 barrels of Germania had passed.

20368½. But you must give us dates after November to be relevant;—can you give us any explanation? I cannot, except that the cements mentioned in my entry on 5th December are tested cements. The only explanation I can offer is that the cements there referred to had been previously tested.

20369. Will you please turn to page 50 of your journal;—you will there see Inspector Inwood's remark as to the Camel cement? I see that, under date of 23rd April, there is in this entry, "Inspector Inwood took fourteen samples of the Camel brand cement for setting tests."

20370. That would be after the second portion of Contract 72 had been started? That would be in Mr. Weedon's time.

20371. But after the second portion of the contract had been started? I believe it would be.

20372. Was any cement delivered on to the job after you had made the entry which you have read? Not that I know of.

20373. You never saw any delivered? No; I should have left the work. I should not have seen it.

20374. Refer now to page 32 of the journal of Contract 79;—you will see there, I think, the first entry of cement delivered on to that contract? There is this entry, "900 barrels Wouldham cement passed, Red Cross brand."

20375. Would not that be the first cement which came on to the contract? That I could not say.

20376. Will you look through the journal? There is an entry on 14th September, 1892.

20377. Of how many casks? It does not say. It simply says, "Cement delivered, Red Cross Wouldham."

20378. That is the first cement you would have a note of on the contract? Yes.

20379. Will you now turn to page 70 of the journal of contract 79;—you will see there an entry under date of May 15th, 1893? Yes; it is as follows: "Only one shift working at 12; three shifts working in Nos. 1, 3, and 4; Nos. 5, 6, 7, and 11, working two shifts; scabbling at Nos. 3 and 10. Cement carted and transferred to Contract 90, Neutral Bay, 10 barrels, making a total of 130 barrels, 99 of which were not advanced on by the department. The rest have been forwarded by consent."

20379½. That would leave the 900 barrels referred to in your note? That I cannot say. I have a notion that it is some other cement.

20380. If Parbury, Henty, & Co., on September 21st and 24th, delivered 999 casks to North Shore of Wouldham cement, the same brand, that would be identical, would it not? It does not say so.

20381. But you have a note on 20th October of 900 barrels of Wouldham? Yes.

20382. Would not the 999 barrels delivered on 21st September and 24th be identical, then, with that? That I could not say.

20383. But it would probably be so, seeing that the brand is the same? It probably would.

20384. Upon Contract 72 the brands were Alsen, Camel, and Germania? Yes.

20385. But in this case the brand is Wouldham? Yes.

- J. W. T.  
Boys.  
13 Oct., 1896.
20386. Can you tell the Commission at what time the horse-ferry at North Shore ceases running? I could not.
20387. If cement were stored upon Contract 72, and were untested when it came to Contract 79, you would have it tested? I should have all the cement on 79, of which I knew nothing tested.
20388. Unless you had a certificate of test coming with the cement? Yes; I might get verbal notice, of course.
20389. But you would have it tested if it were untested? Yes.
20390. Do you recollect at the period of the suspension, before you left Contract 72, any of the 2,000 casks of untested cement going away to Carter, Gummow, & Co.'s jobs? I do not recollect any cement going away at that time. I probably should not see it, because just about that time I should be in the office making up the final voucher.
20391. If cement were going away would not the inspector report it to you? He would inform me.
20392. But he did not do so? Not that I can remember.
20393. If you refer to page 44 of the journal of Contract 72 you will see, under date of 21st December, 1891, this entry: "72 barrels of Germania and Alsen brands for Iron Cove storm-water left to-day; total, 198 barrels; and 9 barrels Germania for Carter & Co.'s Glebe contract"? Yes.
20394. That would be 207 casks leaving the work at that time? Yes.
20395. You have given evidence that Flood and Rutherford had cement from the contract;—do you know of any other contractors who had any? I cannot recollect any. They might have had a few barrels. One would not think anything of a man coming down and taking a dray-load. Of course, the inspector would make a note of it.
20396. The practice is to make an advance upon the cement stored on these contracts, is it not? Yes, if it is asked for. I do not do it upon my own hook, as it were, but if I have authority I make the advance.
20397. If you turn to certificate No. 13 of Contract 79, you will see an advance upon 900 barrels of cement at 16s.? Yes; that would be in April, 1893.
20398. The certificate I hand you is your certificate? Yes.
20399. What is the number? It is the fifteenth progress return.
20400. On how many barrels of cement have you advanced on that certificate? On 870.
20401. Prior to September, 1892, did any of your inspectors report to you that Burcombe was fetching cement to Contract 79 from Contract 72? I cannot say positively. They might have done so, or they might not.
20402. Have you any recollection of it? No.
20403. *Mr. Davis.*] Some cement was delivered to Contract 90 from Contract 79; do you know whether it was returned to Messrs. Carter & Co;—was it a loan or was it sold? That I cannot say positively.
20404. You do not know whether it was returned or not? No.
20405. *His Honor.*] Whose contract was No. 90? W. W. Johnstone's.
20406. Is the journal supposed to show the arrival of cement on the ground or not? It is supposed to be shown, but I am sorry to say I have slipped one or two entries which I ought to have made. Therefore, the journal is not perfect.
20407. *Mr. Parkes.*] But I suppose that Inspector Fowle's record of cement, if it agrees with your journal, will be correct, supposing he counted the barrels? If he counted them.
20408. He would have close inspection of the cement, would he not? Yes.
20409. *Mr. Davis.*] Supposing Inspector Fowle did not speak as to any cement before September;—then he would not have anything to say as to what seems to be an element of doubt in your mind? No.
20410. *His Honor.*] The books do not indicate any removal of cement from Contract 72 to Contract 79? No; there is no indication.
20411. *Mr. Davis.*] Will you look at the journal of 72 and tell His Honor precisely what the 2,000 casks in the entry of 16th November refer to? That entry refers to some cement which I refused to have tested, and which I did not see at all. It is described as 2,000 barrels.
20412. How did you know that there were 2,000 barrels? Probably the inspector would say verbally that there were 2,000 barrels.
20413. What you say is, that although you did not see the 2,000 barrels, it was reported to you that they were there? Of course, I should not have anything to do with it under the circumstances.
20414. *His Honor.*] It being untested cement? Quite so.
20415. *Mr. Davis.*] To what does your entry under date of 5th December refer? I believe that 1,689 barrels refers to tested cement.
20416. *His Honor.*] That is where the 2,200 barrels are mentioned? Yes.
20417. I understand that that 2,200 is, as far as you can see, intended to apply to tested cement? Yes.
20418. Which was found to consist of only 1,689 barrels? Yes.
20419. Had that 1,689 barrels which had been put down at 2,200 barrels anything whatever to do with the 2,000 casks referred to in your entry of 16th November? No, I am pretty sure it has not; but I really cannot swear to it. The entries are not complete enough to enable me to be positive upon the point.
20420. *Mr. Davis.*] The thing happened a long time ago, and it is difficult to remember precisely what did take place; but as the matter is one which I should like to have cleared up, I will ask you whether you could go so far as to say that it is improbable that the 2,000 casks referred to in your entry of 16th November are the same casks as those referred to in your entry of 5th December? I cannot say that it is improbable, but I do not think they are; I cannot recollect.
20421. Supposing Mr. Christie has correctly given the evidence which appears upon page 587, and that on 6th November Henry Austin delivered 300 barrels of Alsen's cement; that on 13th November Parbury, Henty, & Co. delivered 1,000 barrels of Camel cement; and that on 13th November Henry Austin delivered 407 barrels of Germania,—would it have been possible, between 13th November and 5th December, to send in samples and get the cement passed? That would be twenty days. It would be possible to get the cement tested in that time if it were sent in at once.
20422. Is it not customary to pass cement upon a twenty-eight days test? It is customary.
20423. And if that custom were followed in this instance there would not have been time to get the cement passed? No.

20424. *Mr. Parkes.*] Then how is it that on November 6th 300 barrels of Alsen's cement were delivered and were passed on November 11th, five days afterwards? The entry does not say that Alsen's cement was tested. It says the contractors were storing.

J. W. T.  
Boys.

13 Oct., 1896.

20425. Is there not a record in that note of the cement having been sent in for test? No.

20426. At all events the certificate bears date of November 11th, and the cement was delivered on November 6th. That would show that there would be plenty of time for testing if there were an interval of 20 days? That may be.

20427. Will you indicate upon a plan the position of the sheds in which the cement was stored? Yes.

20428. On November 10th there is an entry of Alsen's cement having been passed, is there not, in the journal of Contract 72? No. On November 26th you will find an entry "Alsen's cement passed," and in the margin it says "300, Alsen."

Joseph Davis recalled and further examined:—

20429. *His Honor.*] Can you speak definitely and of your own knowledge as to the position of the cement sheds upon Contract 72? I know from my personal knowledge and from visiting the works two or three times a week that there were four sheds upon the contract, and that, in addition to that, the contractors stored cement, not a very large quantity perhaps, under one of the arches of the Illawarra railway where it passed Macdonald-street. The sheds were as indicated by Mr. Boys, one near the outfall of the concrete channel, a second below Mitchell Road, a third above Mitchell Road, and a fourth in what is called Knight's paddock, at the top of Macdonald-street.

J. Davis.

13 Oct., 1896.

20430. Of what size was the shed at Knight's paddock? It was a very large one.

20431. Capable of holding how many casks? I should say 2,000. I did not measure the shed, but it was a large one. I know that the shed was erected for the accommodation of the cement which was refused to be tested.

20432. Before the refusal to test, I suppose? Yes.

20433. The cement which was intended to be used upon the upper part of the work? Yes. The shed was intended for cement for the work along Macdonald-street and up to Munni-street, in anticipation that that work would go on. It was thought that it would be convenient to the site of the works.

20434. I should like you to refer to the voucher for Contract 69, which appears upon page 133 of the Parliamentary return;—does that voucher differ from the final voucher? I do not think it differs materially.

20435. There are some discrepancies which I find it difficult to understand. Look, for instance, at the item of timber. The estimated quantity of timber is 9,000 cubic feet, and the actual quantity is 9,818? Something like that.

20436. Then the quantity of excavation in ground requiring timbering is enormously in excess of the estimated quantity, and what I fail to understand—I do not know what the explanation of it is—is how it comes about that 9,000 feet of timber was estimated for what appeared to be such a very small amount of excavation requiring timber. The amount of excavation, it actually turned out, required approximately 9,800 feet of timber;—can you explain that? To begin with, the quantity of timber given is highly problematical. It is impossible to say whether timber will be required to be left in the open cutting or not. A percentage of the 9,000 cubic feet would be allowed for the open cutting, and as a matter of fact there was no timber left in.

20437. It was anticipated that a good deal of timber would be left in the open cutting? We have to provide for an emergency of that kind. In this particular instance I know that no timber was left in the open cutting, so that it all went to supplement the timber provided in the schedule for the tunnel, and in that way, when the quantity of timber was ultimately worked out, it did not exceed the quantity provided in the schedule to any material extent.

20438. In the tunnel excavation the estimated quantity was 9,780 cubic yards, the actual total being 13,294 cubic yards; that is a very large increase. It was not due to any further work which was done, but was due to the fact that a great deal of the country which was excavated required timbering, the excavation being larger than was anticipated in the original schedule? That is the explanation, your Honor. The reason that the timber was not proportionately increased was simply due to the fact which I have mentioned, that in the probable quantities included in the schedule there would be a proportion of the 9,000 cubic feet for open cutting. That was not used. Therefore, it went to the credit of the tunnel.

20439. The excavation in open trench in the schedule is estimated to come out at the total of 22,815 cubic yards. In the 16th progress return the total given is 18,888 cubic yards;—that puzzles me very much? The explanation of it is this: that probably more of the ground than was anticipated did not require timbering. In the ground which requires timbering it is provided in the specification for trenches to be 6 inches wider than if there is no timber required, and the excavation has to be paid for to the outside of the timbering, so that it was not that there was any less sewer put in. It was simply that the ground proved to be harder than was anticipated, and, therefore, the trench would not be so wide. To the best of my recollection, that is what occurred.

20440. I find the following clause in the specification of Contract 72: does not this clearly provide for the construction of the open channel:—

If the 13 or 27 chains of the outlet end of proposed storm-water sewer (as provided in clause 3) should not be excised from present contract, then, pending the completion of proposed ship-canal to its junction with proposed storm-water sewer, an open channel, when ordered, to be excavated to such gradients, depths, and cross sections, from the junction of the two channels to the present head of said ship-canal, a distance of about 32 chains, as shown on drawing No. 1, and as shall be determined at the time.

? Yes, your Honor, I knew that the clause was somewhere in the contract, but I could not find it at the time. One cannot remember all these things.

FRIDAY,

FRIDAY, 16 OCTOBER, 1896.

George Christie recalled and further examined :—

- G. Christie. 20441. *Mr. Parkes.*] Since you made your last researches as to the quantity of cement used upon Contracts 79, 79A, and 69, you have perused an additional journal, relating to Contract 72, which throws some light upon the subject? Yes.
- 16 Oct., 1896. 20442. You have searched that journal for certain minutes? Yes.
20443. And from the journals of Contracts 72 and 79 you have compiled a statement of facts—that is, the facts contained in the journals? Yes.
20444. The statement which you will put before the Commission this morning is drawn from what? It is drawn from the departmental records of papers, the contract journals, the records of the traders' accounts, books, and invoices, and from the contractors' bank pass-books.
20445. And have you taken into consideration the daily returns of the inspectors? Yes.
20446. Which Mr. Davis said were correct within 5 per cent? Yes.
20447. In fact, the whole of your data are drawn from official documents ;—is not that so? From official and other documents.
20448. Is anything assumed in your report? No.
20449. *His Honor.*] I understand that it is a tabulated statement of what you have found in the various documents and books to which you have referred? Yes.
20450. *Mr. Parkes.*] I will ask you to read the memorandum? It is as follows :—
- MEMO. No. 21, *re* the shortage of cement on Contracts 79, 79A, and 69, compiled from the departmental records, the contractors' bank pass-books, traders' invoices, departmental tests of cement, &c.

As to the stock of cement on Contract 72 on 5th December, 1891.

- (a) In the journal of this contract, at page 42, under date 5th December, 1891, Resident-Engineer Boys has the following minute :—

“The inspector finds that there are only 1,689 barrels in the three sheds, namely :—

|     |            |
|-----|------------|
| 300 | “Alsen's”  |
| 958 | “Camel”    |
| 431 | “Germania” |

1,689 Total.

It was reported that there were 2,200 barrels.”

- (b) These parcels of cement correspond with the three last deliveries of cement prior to the stoppage of the work (*see* page 587 of the printed evidence).
- (c) That the 300 casks “Alsen's” cement *had been tested* is shown by certificate No. 609, which was registered on 19th November, 1891. The “Camel” and “Germania” cement *were untested* at date of Mr. Boys' minute of 5th December, 1891, as above, but were tested subsequently, as per certificates Nos. 670 (18th March, 1892), 700 “Camel,” and 668 (16th March, 1892), 360 “Germania.”
- (d) In the Contract Journal on 11th November, 1891, Mr. Boys made the following entry, “Contractors are storing 2,000 barrels of cement in sheds on the work.” It was at this date that the above-mentioned 1,000 casks “Camel” and 407 casks “Germania” cement were in course of delivery, as shown by the invoices furnished as Appendix.
- (e) A further reference is made to these deliveries of cement in an entry by Mr. Boys on 16th November, 1891, as follows :—The contractors have stored on the works 2,000 barrels cement, samples of which they desire to have tested. The cement is not required. Awaiting instructions from Mr. Davis.”
- (f) Subsequently—*viz.*, on the 5th December, 1891—Mr. Boys wrote the minute on this matter which appears at the beginning of this memo., setting forth a stock of 1,689 casks cement, consisting of “Alsen's,” “Camel,” and “Germania” brands.
- (g) From the 5th December, 1891, cement was (as shown by the official progress payments) used on the progress and completion of the first section of the contract, and 207 casks were transferred to Iron Cove and Glebe contracts. On 15th February, 1892, Messrs. Carter & Co., in their claim, charge for the value of 1,300 casks in stock.

As to resales and transfers of cement from Contract No. 72, &amp;c., from November, 1891, to 15th February, 1892.

- (a) *Resales* :—
- |  |            |
|--|------------|
| To Flood and Rutherford .....  | 800 casks. |
| (Paid by cheque, £467 6s., 16th November, 1891).   |            |
| To Danaher, Taylor, and Britton .....  | 600 casks. |
| ( <i>See</i> Mr. J. Carter's evidence, page 211 ; and payments, 22 February, 1892, £292 5s. 2d. ; and 7th March, 1892, £8 4s. 7d.) |            |

*Transfers* :—

|                         |            |
|-------------------------|------------|
| To Ironcove Creek ..... | 198        |
| Glebe .....             | 9          |
|                         | 207 casks. |

(*See* entry in Contract Journal, page 44, 21 December, 1891.)

1,607 casks.

- (b) Messrs. Carter & Co., in their claim of 15th February, 1892, charge for loss on resale of 2,000 casks, not for cement stored on the contract.

As to the first deliveries of cement on Contract 79.

- (a) The first deliveries of cement to this contract were as follows :—

|                            |                       |
|----------------------------|-----------------------|
| 21st September, 1892 ..... | 50 casks, “Wouldham.” |
| 24th September, 1892 ..... | 699 “ ”               |
| 21st September, 1892 ..... | 250 “ ”               |

Making a total of 999 casks of “Wouldham” brand cement. And until 30th June, 1893, this was all the cement delivered on this contract, as shown by invoices in Appendix.

- (b) The first test of cement for this contract was on 11th October, 1892, No. 779, of 900 casks “Wouldham” cement (*see* schedule of Mr. Roberts's tests in Appendix).
- (c) On 15th May, 1893, Resident-Engineer Boys wrote the following minute in the Contract Journal—“Cement carted and transferred to Contract 90, Neutral Bay, 10 barrels—making a total of 130 barrels—99 of which were not advanced on by the department, the rest having been removed by consent.”
- (d) The first advance on cement was made in Progress Certificate No. 13, 27th April, 1893, on 900 casks. This advance was continued on Progress Certificate No. 14. But in Progress Certificate No. 15, 27th June, 1893, the quantity advanced on was reduced to 870 casks consequent upon the removal of the thirty-one casks (the balance of the 130 referred to in Mr. Boys's minute quoted above).
- (e) The first progress certificate in which there is payment shown for any work requiring the use of cement is No. 15, of 27th June, 1893; and Inspector Fowle was, during the period covered by that certificate, appointed as inspector over that class of work. (f)

(f) When Inspector Fowle entered on his duties, he, on 15th June, 1893, as per his evidence (questions 16376 and G. Christie. 16509), took stock of the cement then on the contract, and found a total of 853 casks.

(g) This 853 casks exactly tallies with the deliveries to date, less removals and quantity used, as follows:—

16 Oct., 1896.

|                                       |                     |
|---------------------------------------|---------------------|
| Total deliveries .....                | 999 casks Wouldham. |
| Deduct—                               |                     |
| Removals to Contract 90 .....         | 130                 |
| Used as per inspector's reports ..... | 16                  |
|                                       | — 146               |

Balance ..... 853 in stock.

(h) The further deliveries of cement to this contract appear in the invoices in Appendix.

The total of 853 casks, which you have just mentioned, tallies with the note made by Inspector Fowle in his note-book? Yes.

20451. Will you read the two items of the claim made in respect of the cement upon Contract 72 at the time of the suspension of the contract? In the claim of the contractors, dated 15th February, 1892, there occur these items:—"Portland cement (1,300 casks, at 14s. 9d.), £958 19s.; Portland cement (loss on sale of 2,000 casks, at 2s. 6d.), £250."

20452. Will you refer to the three minutes read by Mr. Boys the other day in the journal of Contract 72? I presume you refer to the minute of 11th November, 1891, of the 6th November, 1891, and on the 5th December, 1891. They refer to cement then being delivered on the contract, or which had recently been delivered there as set out in the first part of my memorandum of this date.

20453. Do the records of tests throw any light upon the question of the 2,000 barrels of cement, which were supposed to be stored upon the contract, and which are referred to in one of Mr. Boys' minutes? Yes; it is stated in the journal that there were 1,689 casks of which 300 casks had been tested. The tested would be Alsen. The Camel and Germania were not tested until March, just prior to the commencement of the contract.

20454. Is that denoted in any official records? In the records of cement tests.

20455. Therefore, it would seem that of the 1,689 casks referred to in Mr. Boys' third minute all but 300 casks were then untested cement? Yes.

20456. According to the test-book kept by Mr. Roberts for the department, all Carter & Co.'s cements seem to have been tested upon this work, do they not? Yes.

20457. Coming to the progress vouchers of Contract 79, upon which an advance on cement appears. There is an advance upon cement in progress voucher No. 14, 900 casks; and in No. 15 that 900 casks is reduced to 870 casks;—is that not so? Yes.

20458. Does that not indicate that 900 casks alone could be the cement in stock? Yes.

20459. Is there any evidence contained in any of the books you have looked up of an advance upon 2,000 casks? No.

20460. Is there any evidence at all to indicate that 2,000 casks, in addition to the 999 casks which were delivered on that contract, were there? There is evidence to the contrary.

20461. What is it? There is the direct evidence of the delivery, and there is the direct evidence of Inspector Fowle counting the cement. There is the further fact that the advance was reduced from 900 to 870 casks, because 30 were transferred.

20462. *His Honor.*] There was nothing more apparently to fall back upon, you say? No.

20463. *Mr. Davis.*] In reference to Contract 72 you have said that the 2,000 casks which have been referred to were not stored upon that contract;—will you tell me upon what ground you make that statement? On the ground set forth in my memorandum.

20464. In paragraph (b) under the heading of "resales and transfers" you say "Messrs. Carter & Co. in their claim 15th February, 1892, charge for loss on resale of 2,000 casks—not for cement stored on the contract";—will you point out where in their claim you find that the contractors state that the cement is not stored upon the contract? They simply claim for 1,300 casks on the ground, and not for 2,000 casks additional to their stock.

20465. Am I to understand, then, that you make the statement that the 2,000 casks of cement were not stored upon the contract, apart altogether from the claim of Carter & Co.? I do, and I make it from the fact of the sales and transfers of cement, and from the fact that from the work on the contract, and from the cement delivered to it, they could not have had that quantity there.

20466. Will you tell us, first of all, what there is in that claim as put forward by Carter & Co. to lead you to the conclusion that this cement was not stored upon the work, taking the claim by itself? I take it that, if Carter & Co. claimed for the full value of certain cement upon the job, they had that cement there, or something to represent the quantity—that is, as to the 1,300 casks. As to the second item, the loss on the resale of the 2,000, they had not that cement on the job, but they made that loss upon it. They say, for instance, "Loss on resale."

20467. That is the inference you draw? Yes.

20468. You would not draw this inference—that the fact that 1,300 casks had been approved and accepted by the department was a sufficient reason for the firm claiming the full value of the cement; and that, inasmuch as the department refused to test the 2,000 casks represented to be stored upon the ground, that the contractors would, therefore, have no such claim in respect of that; the consequence being that they put in a nominal claim of 2s. 6d. a cask? Your question is rather a long one, and is difficult, on that account, to answer. You are assuming that the 1,300 casks were tested. I say that it was not tested cement; so that that destroys your question altogether.

20469. Do you say that the 1,300 casks were not tested? A small portion of the balance of Alsen's may have been tested, but very little of the total was tested cement.

20470. On what ground do you say it was not tested? Because all but the two last deliveries of cement were untested, and those deliveries agree exactly with what Mr. Boys states to be the stock included in the 1,689 casks. He says it was tested cement, but it is clear that it was not.

20471. I suppose you have been through the cement test-book, No. 2, have you? Yes.

20471½. Do you recollect test 609? Yes; it is referred to in my evidence.

20472. I think you have said that that 300 casks of Alsen's cement correspond with 300 casks of cement named in Mr. Boy's entry? Yes.

20473. Did you notice test 595, which mentions 390 casks of Germania for Contract No. 72? Yes; that is the delivery of 376 casks from Austin, on 8th October. It was tested on 14th October.

20474.

- G. Christie. 20474. Have you any proof whatever that that 390 casks did not form part of the 1,300? Yes; because it was not delivered until a month after that test.
- 16 Oct., 1896. 20475. But you assume what is perhaps not quite correct;—you say that the 1,300 casks were all delivered after the 11th November, 1891;—I ask you again are you sure that the 390 casks were not part of the 1,300 casks? Yes.
20476. Were you on the ground on the 11th November, 1891, and do you know from your own knowledge that there was no cement on the ground at that time? I was not on the ground.
20477. Did you notice the test 584, of 6th October, 1891? Yes.
20478. How many casks is it? 597.
20479. What brand is it? Camel.
20480. Does that brand correspond with the cement set down as being on the ground in Mr. Boy's journal on the 5th December? No.
20481. But it is the same brand, is it not? It is the same brand.
20482. Is test 595 of Germania also the same brand as some of the cement referred to in Mr. Boys' minute? Certainly.
20483. As to the 500 casks of "Camel," have you any proof that that 500 casks did not form part of the 1,300 casks mentioned in Carter & Co.'s claim? I have this proof—that cement was required to continue the work.
20484. But I ask you whether you have any proof that the 500 casks of cement, Camel brand, which was tested on the 6th October, did not form part of the 1,300 casks claimed for by Carter & Co.? I would say that it is sufficient proof that cement would be required to carry on the work.
20485. Were you on the ground to see that all the cement was used up on 11th November, 1891? No.
20486. Practically, therefore, you have no proof of it? Yes; I have the proof obtained from the papers and books.
20487. You say in paragraph (B), under the heading of "Stock of cement on Contract 72, on 5th December, 1891," "These parcels of cement correspond with the three last deliveries of cement prior to the stoppage of the work" (see page 587 of the printed evidence);—will you kindly refer to that evidence? Yes. The three deliveries are those of 6th November—Henry Austin, 300 casks of Alsen; 13th November—Parbury, Henty, 1,000 casks of "Camel"; 13th November, 407 casks of Germania.
20488. To begin with, how do you know that that thousand casks were untested? It is clearly so.
20489. But how do you know it? Because there is no record of a test at that time. There is a subsequent record of a portion of it.
20490. How do you know that the 407 casks of Germania were untested? Because in each case I have compared the deliveries with the tests judging from that, the two parcels to which I have referred were untested.
20491. That is what you believe? Yes.
20492. Will you show that these quantities correspond with the quantities referred to in Mr. Boys' minute—for instance, how does the 300 casks of Alsen's cement compare with his entry;—does it correspond with it? Yes.
20493. Another entry of his is 958 casks of "Camel"—does that correspond with the 1,000 casks? Yes.
20494. How can you say that;—in what way does it correspond? As regards the approximate quantity.
20495. You would say that 958 casks corresponded with 1,000? Yes, of the same brand.
20496. That is what you call accurate accounting? It is accurate phraseology.
20497. To say that 958 casks correspond with 1,000 casks? Yes.
20498. Then take the Germania;—do the 407 casks agree with 431—do they correspond? They do.
20499. According to your mind? According to anyone's mind, I should think.
20500. Will you read question and answer 16376 of the evidence of Inspector Fowle? Yes; they are as follows:—
16376. How many casks? I could not say from memory. I know there was a large number. There was also a large quantity of bricks. I see from my notes that on 15th June, 1893, there were 853 casks there.
20501. Will you now read Question and Answer 16509? Yes:—
16509. *Mr. Parkes.*] I suppose you counted the casks? As nearly as I possibly could. The note in my book is to the effect that there were 853 on the work on Thursday, 15th June.
20502. Will you now read the next question and answer? Yes; they are as follows:—
16510. *Mr. Davis.*] Do you swear that the 853 in your note-book represents the number of casks on the ground on the date you have put down there? Yes; that is the note I made.
20503. You would conclude from that that Inspector Fowle took stock at that date? Yes.
20504. That is the conclusion you would form? Yes.
20505. And that in that 853 casks he had all the cement which was on the ground at that date;—you think that is a fair conclusion to draw? Yes.
20506. Will you now read Question and Answer 16513? Yes; they are as follows:—
16513. *Mr. Davis.*] Will you read out the note you have opposite the date on 21st July, 1893? Yes. "Eight hundred and fifty Wouldham and Try's, and 500 Wouldham." Both of these were passed, and I have put opposite to them the letter "P"; that note is made as a sort of check upon the cement on that particular date. It would have been one of my usual checks upon the cement used in the work, as compared with the cement delivered on to the work. The note I am reading you would give the total quantity of cement upon the work on that particular day. The note continues, "Five hundred Germania, 80 Germania, and 69 from stormwater channel." The last part of the note would mean that 69 were delivered upon the work from another contract.
20507. So that soon after the date of the 15th June, 1893—that is, on the 21st July, 1893, it is evident from the same reliable source from which you quote—that is, Inspector Fowle's rough pocket-book, that the stock was materially increased? Yes; but the cause of it was that on the 13th June, 1893, Parbury, Henty, and Co. delivered 500 casks, and Henry Austin, on the 5th July, delivered 400 casks—Parbury, Henty, & Co.'s being Wouldham, and Henry Austin's being the 400 Germania referred to.
20508. I suppose you can vouch for the figures which you have put in as the total deliveries of cement in Contract 79. Yes.
20509. To the best of your belief they are accurate in every respect? Yes.
20510. I suppose you would stand by them? Yes.
20511. Will you turn to page 294 of your evidence? Yes.
- 20512.

20512. How many casks of cement do you say had been delivered on to Contract 79? The evidence to which you have referred me is as to the cement tested, not as to the deliveries of cement. The heading is, "Statement of the quantities of cement tested by the Department of Public Works for Contracts 79, 79A, and 69." G. Christie.  
16 Oct., 1896.

20513. A tabulated list follows that heading? Yes, of cement tested.

20514. And certified to by Mr. Roberts? Yes.

20515. How many casks do you make the total in regard to Contract 79? 5,050 casks, tested.

20516. What was the date of the last parcel of cement which was tested in respect to Contract 79? 6th April, 1894.

20517. Will you now read the entry which appears in the journal of Contract 79 for the 8th May, 1894? Yes; it says, "Run short of cement."

20518. What would you take that to indicate? It means this—that the contractors had estimated that a certain quantity would be required to finish the job, the last progress payment on which was made on May 7th, and that they may have wanted a few casks to finish up. The final certificate had been given, but there were probably little odd jobs to do.

20519. Seeing that the last delivery, according to your tabulated statement, was made on 6th April, 1894, and we have a note in the journal under date of 8th May, 1894, "Run short of cement";—what would you say that that indicated? I should say that they got a little from Contract 69.

20520. What would you say that the note in the journal indicated? That a few casks of cement were wanted.

20521. Would you say that the cement which had been delivered on the 6th April, 1894, had been exhausted? Yes; but they only wanted a small number of casks to finish the contract. Contractors such as these would not put themselves in the position of having their works stopped through their running short of cement. If a large quantity of cement had been required they would have had it over there.

20522. Turn to the next date—May 9th, in the same year, in the journal of 79—what does that say? "Cement arriving from Contract 69."

20523. So that it would appear from the entries made on the 8th and 9th May, 1894, that to begin with the cement ran out on the 8th, and that on the 9th a fresh supply was obtained from Contract 69? It proves that there were no more direct sales, and that there was a transfer from Contract 69. It would appear from those entries that the cement upon Contract 79 had run out, and it further established the fact that there was no delivery of a large quantity, but that a small quantity only was required, that being drawn from Contract 69. That does not affect the totals in regard to this cement question because we are dealing with the three contracts together.

20524. I am speaking now of Contract 79;—will you read the note under date of 26th May, 1894? I see it says, "Men run out of cement."

20525. I suppose that would bear the same construction as the note under date of 8th May? Seeing that the last progress certificate had been dealt with on the 7th May, there would not be much more cement required.

20526. You have read through this journal, I presume, from the 8th May, 1894, right up to the end of the contract? I may have done so a long time ago, but I have not done so recently.

20527. Judging from what you find there—that is, the number of entries each day with regard to concrete, brickwork, and plastering, from the 8th May to the 10th August of the same year;—would you say that a large quantity of cement was used between those two dates? I think we had better take the inspectors' reports. I would say, in view of the last progress certificate's having been given, a small quantity of cement only would be required.

20528. Taking the inspectors' reports, what quantity of cement would you say was used upon the contract from the 8th May to the completion of the work? About 140 casks.

20529. That would have to be added to the 5,050 casks to which you have already referred? Yes.

20530. So that in your total, if you can rely on the tests and also upon the inspectors' returns, the total quantity used upon Contract 79 would be 5,200 casks or thereabouts? Yes; that seems to be the case.

20531. If you refer to my evidence, upon page 631, you will see that I have made a calculation in regard to the quantity used upon Contract 79? Yes.

20532. Will you give the total opposite Contract 79? 4,642.

20533. *His Honor.*] That is an estimated quantity? Yes.

20534. *Mr. Davis.*] You will see from the heading of the statement that it is a calculation of the quantity which should have been used, taking the sandstone concrete, the bluestone concrete, the brickwork, (one-ring), and the cement facing? That is the heading.

20535. Will you look below and see what number is given in the inspector's returns in regard to Contract 79? 5,384½ casks.

20536. As having been used? Yes.

20537. So that the 5,384½ casks would not be very different from the 5,200 casks you have previously spoken of? It is evident that the figures are near one another.

20538. Now inasmuch as the quantity paid for, as you yourself have said in the evidence, does not include the quantity of concrete which was put into the lining, do you think that that would be a reason for the total calculation at 4,642 being different from the total given in the Inspector's returns? I am not prepared to go into engineering calculations at all.

20539. But it is evident, if we know that 5,020 casks were sent to Contract 79, and that when that was exhausted a further 150 casks were sent, that, let the cement come from where it may, according to my calculation and according to the returns, there has been ample cement supplied to Contract 79? No.

20540. Will you give your reasons for that answer? I cannot see that the contract could be really separated from Contract 79A.

20541. *His Honor.*] I understand that quantities have been given for 79 as distinct from 79A? Mr. Davis has made a calculation for 79 as distinct from 79A, but I have not.

20542. *Mr. Davis.*] I am dealing with Contract 79. Cannot you answer my question without reference to the other contracts? I can only deal with those two particular contracts together.

20543. *Mr. Gummow.*] Do you know anything about how long cement is often left upon contracts before it is used; have you had any experience of the accumulation of cement on contracts? Yes.

20544. Would it be surprising to you to find that cement, after it has been tested, might be allowed to remain

G. Christie. remain in the sheds six months, the contract in the meantime being in full working order? It is possible that it might be so, but no one would leave material lying unnecessarily long anywhere, because it represents money.

16 Oct., 1896.

20545. Still there could be an accumulation you think? It might happen under certain circumstances.
20546. You have gone through the banking accounts and vouchers of Carter, Gummow, & Co. and Carter & Co. as far as possible. Can you explain these promissory notes of Henry Austin, dated 20th February, 12th February, and 18th February—that is, as to the supply they were intended for, and when that supply took place? The three promissory notes you have handed me are promissory notes given by Carter & Co. for cement purchased from Henry Austin—on 12th February, 175 casks, £110 16s. 8d., delivered to Glebe; 20th February, 464 casks, £295 16s., delivered to Waverley; 18th February, 434 casks, £276 13s. 6d., delivered to Waverley. There is a slight difference, due probably for charges for duty stamps.
20547. You are satisfied that they went to the places you state? Yes.
20548. You said that in respect of Contract 79 the contractors would use sufficient foresight not to allow themselves to fall short of cement if they were wanting a quantity? I should think that would be so.
20549. Does that inference of yours hold good in respect of Contract 72? Yes.
20550. You think the same contractors would exercise foresight in regard to that contract? Yes.
20551. So that if they had use for the cement they would take every care that they had sufficient accumulated to keep them going? Yes.
20552. For all the work they had to do? Yes; but you had nothing at the time the work was stopped.
20553. You think they would take precautions not to let themselves run short? I presume so.
20554. *Mr. Parkes.*] There is evidence that the sale referred to in the claim of Carter & Co. in respect of Contract 72 actually took place? Yes.
20555. There is evidence as to sales to Flood and Danaher and as to the removals to other contracts? Yes.
20556. Which exhausted what quantity of cement? 1,607 casks.
20557. Now is there any record in the merchants' books which you have perused showing the sale of 2,000 casks over and above the balance reported by Mr. Boys in his minute—I mean the balance of 1,600 odd? Yes. In the accounts of Parbury, Henty, & Co. there are two credits representing, in one case 925 casks, and in the other case 1,000 casks, for cement which had been ordered but which was not delivered, for which Carter & Co. paid to Parbury, Henty, & Co. for cancelling sale 7½d. per cask.
20558. *His Honor.*] Do you remember the dates? There is a charge of 7½d. on 925 casks ordered and cancelled under date of October 24th, 1892, and in regard to the 1,000 casks there is a charge of 7½d. on November 29th, 1892.
20559. After the suspension of Contract 72 you have a complete record of the cement delivered there, have you not? Yes.
20560. Was that cement absolutely required? The statement shows that, including the 1,300 in stock, and adding to it the deliveries, there would be 3,454 casks gross available. The removals were 208 casks, and there was a sale to Flood of 350 casks and subsequent sales, making approximately 2,900 casks remaining upon the contract for the finishing of it. Mr. McCredie and Mr. Thompson estimated that the quantity required was 3,432 casks.
20561. That total, then, would correspond with Mr. Davis' estimate pretty fairly? I have not compared them.
20562. *His Honor.*] It is under Mr. McCredie's estimate? Yes, by 530 casks.
20563. *Mr. Parkes.*] Will you repeat the names of the brands of cement upon Contract 72 at the suspension of work—the cements reported by Mr. Boys to be in stock? Alsen, Camel, and Germania.
20564. What is the brand of the cement advanced upon and recorded as being used upon Contract 79? Wouldham.
20565. Supposing that cement were taken from Contract 69 to Contract 79, that would not affect the total of the three contracts in respect of which I made a charge of deficient use of cement? No; these three contracts were selected to be dealt with because we could get a definite start and a definite finish. They come in one with the other in that way.
20566. As a matter of fact, only Contracts 69 and 79 could have interchanged cement? Yes.
20567. *Mr. Gummow.*] As to 1,925 casks credited by Parbury, Henty, & Co., how long was that after the first stoppage of Contract 72? It would be twelve months after the notice.
20568. *Mr. Parkes.*] That was only the date of entry in the ledger? Yes. From what I gather, it may be that this was only an adjustment that had been pending for some time, it being recorded at those dates.
20569. *His Honor.*] Did not the books show the particular sales in respect of which the adjustments were made? Yes; but there was no delivery. The cement was not delivered.
20570. Do not the books show the date of the contract of sale? No.
20571. They would show only the delivery? Yes.
20572. *Mr. Davis.*] But if there were a general adjustment in October, 1892, is it not rather peculiar that the adjustment to which you refer as having taken place in November should not have taken place at the same time? The two were just about the same time.
20573. If what you assume is correct? The adjustment was really made in November in each case. They had evidently rendered the invoices to Carter & Co. in October, and the two adjustments were made in November.
20574. *Mr. Gummow.*] Is it likely that Parbury, Henty, & Co. would leave the matter for twelve months? No; but you had had some settlements in the meantime.
20575. You referred to Danaher's getting about 600 casks? Yes.
20576. Do you know where it came from? The payment for it was made in February, 1892.
20577. But do you know where the cement was delivered from? I have not a record of that.
20578. Had that cement anything at all to do with Shea's Creek contract as far as you know? From the evidence referred to I should say that the cement was carted across from Marrickville.
20579. Where do you find that? I think Mr. Carter gave some evidence relative to a sale to Danaher, but I am not quite sure.
20580. Can you find his evidence upon that point? I cannot just now.
20581. *Mr. Parkes.*] Are you not referring to a sale to Flood? It may be so. I turned up certain evidence on this matter, but I do not think I made a note of the folio. 20582.

20582. Would not the date of February, 1892, show you that this cement must have come from Shea's Creek? Yes; it was at the time of the stoppage. G. Christie.
20583. *Mr. Gummow.*] Is that the only reason you have for considering that the cement which was sold to Danaher came from Shea's Creek;—have you only the date to go upon? That is one reason. I have looked up certain evidence upon the matter, but I cannot put my finger upon it at the present moment. 16 Oct., 1896.
20584. Are the other statements which you have made founded upon no better facts than you can adduce in this instance? The facts, I think, have been pretty well tested to-day. I think you have gone through them all.
20585. Will you read question and answer 7654? Yes; they are as follows:—
7654. Then there is a cheque by Danaher, Taylor, and Britten for £300 9s. 9d.? Yes; that was for cement.
20586. Is there any other reference as to where the cement came from? There is no reference there, of course. The date is February.
20587. Had Carter & Co. other contracts on at that time? Yes; I think you had some cement sent to Waverley just about that time.
20588. I suppose you have looked up the contract notes which Carter & Co. made with reference to cement;—do they state anything about the delivery—that is, as to where the cement is likely to be delivered? I have not my records with me.
29589. Have you ever seen the contract notes? I have not seen the contract notes.
20590. Have you any idea as to whether Carter & Co., in buying cement for a particular contract, buy a total quantity, the deliveries extending over certain months of the year? From what I can remember of the transactions, they would order a large quantity at the time.
20591. *His Honor.*] To be delivered where ordered on each particular occasion? Yes; sometimes the place is specified and sometimes not.
20592. *Mr. Gummow.*] How do you know then where the cement was to be delivered? I am speaking now from memory of what I had before me.
20593. But did you see the contract notes? No; I am speaking from some records which I obtained from the broker, Mr. Mitchell.
20594. He had copies of the contract notes? He had the principal facts, I think.
20595. Presuming that Carter & Co. enter into a contract for 5,000 casks of cement, the deliveries extending over certain months of the year, I suppose you know it takes a few months to get the cement out? Yes.
20596. It is probably three or four months on the water coming out? I could not say about that, but I should say that you could get it out within four months if you wanted it.
20597. When it arrived, do you not think the contractors would be bound by their contract to take it? Yes.
20598. They cannot put it off for two or three months further? They would be bound to take the cement if it were imported specially for them.
20599. So that Carter & Co. would be obliged to take the cement as it arrived if they had a contract for that time? Yes.

Frank Moorehouse Gummow re-called and further examined:—

20600. *His Honor.*] Of course you have had a long experience in the use of cement? Yes.
20601. If cement is fit to pass the test at all, it must be pretty well free from any excess, at any rate, of anhydrous lime? Yes.
20602. It would be just in its prime at that time? Yes.
20603. How long will it bear keeping after that without risk of the lime's becoming combined with carbonic acid? You mean taking ordinary cement that will pass the test?
20604. Yes. Supposing it has passed the test, it begins at once slowly to deteriorate through the free lime combining with carbonic acid, does it not? Yes. If it were in casks in a compressed state I do not think you would see any difference in the casks for twelve months. There might be a little difference near the staves, but it would not affect the cask as a whole. It would deteriorate quickly, of course, if it were exposed to the air, but compressed as the cement is in the cask it is not practically affected.
20605. Still it is a fact, is it not, that the great point is to catch the cement, as it were, on the hop; to use it just after it has passed the test, or as soon after it has passed the test as possible? Not necessarily; we have had casks which have been too new, which have had too much free lime in them, and we have had to keep them for three or four months and then get them re-tested.
20606. But, supposing the cement to have passed the test, the object would then be to use it as soon as possible? Of course we have not had it re-tested after it has been once tested; but we have never found any weakness in the work through using cement that we have had in hand for, say, six months.
20607. What rule does the department make as to the use of cement after it has been tested;—is there any limit of time? No.
20608. Then, if a contractor chooses to buy a lot of cement, to store it, and to keep it for two or three years after it has had the test brand put upon it, would the department allow it to be used without re-testing? As far as I know. I have never heard anything to the contrary.
20609. Of course you would not keep the cement for that long period if you could help it? It is a matter of finance. That would be the main reason as far as the contractors were concerned.
20610. Then, if a contractor has large stock of cement, and suddenly finds that he has no use for it, assuming that, whether it is tested or not, it is fit to pass the test, he will not keep it on his hands if he can possibly get it off on any reasonable terms? Certainly not.
20611. That is the regular practice? I have never had experience in that matter. We have always been able to use all the cement we have purchased. If I had 1,000 casks more than I required I should look out for a market to get rid of it or for another contract which would take it up.
20612. As a rule, when cement has come all the way from Europe it would not suffer from the defect of having too much anhydrous lime? No; it is always considered to be in a sound condition if it comes out by sailing boat. Sometimes if it comes out by steamer it is not so. I have spoken to Mr. Roberts, the cement-tester of the department, with reference to that matter. He said to me on some occasions that cement sent in for test was too new, and that it wanted keeping a little longer. It would probably turn out that that cement had been brought out by steamer direct from the works.

F. M.  
Gummow.  
16 Oct., 1896.

F. M.  
Gummow.  
16 Oct., 1896.

20613. Being only about six weeks on the journey? Yes, whereas a sailing vessel would be probably four months. The department now make us take a 28-day test instead of a 7-day test. That tends to keep the cement from use longer after manufacture than otherwise would be the case. Perhaps I had better explain to you the way in which cement sometimes accumulates in a shed. You may have a thousand casks of cement in hand. You may not be using very much, perhaps only 200 or 300 casks a month. Perhaps another shipment of your contract with the merchants will come to hand, and you stack that in front of the cement you are using. It is probable that this new cement may be passed and used before you would use the old tested cement. I have seen cement kept in that way upon our own works fully six or nine months. Fresh cement has been used, because the old cement happened to be at the back of the shed.

20614. It would not be a good plan to adopt if you could help it? No; but you cannot regulate your contracts to time in the same way that ships come out to time. You anticipate often that you will be ready for, say, heavy concreting in March; but you may not, perhaps, be ready until May, for some unforeseen reason. Your cement, however, will arrive all the same.

20615. The shafts on Contract 79 were very deep, and were through hard sandstone. The tunnelling was also through hard sandstone. How soon would you anticipate that upon a contract of that kind you would want to use your first cement after beginning the work? I should say there were shafts upon Contract 79, although I had nothing to do with it, which would vary from 80 feet to 150 feet in depth. In that case you would have to drive probably only 6 chains between the shafts. In other cases you might have to drive 8 or 10 chains. You do not start concreting until you have holed through from one shaft to another. You may be able to commence at the shallow shafts and short drives in from four to six months before you would be in a position to commence in the other parts of the work. We always endeavour to prevent our concreting from getting into one lump if we can, carrying it on as steadily as possible through the contract, the object being that the work may be in the hands of one gang of concreters instead of several.

20616. So that you would get the short shafts done as quickly as possible? Yes. By this means you turn over your material as well as your wages, and by getting one gang of concreters, instead of two or three, you get a better class of men. The same thing applies to bricklaying and plastering. It does not do to have all your finishing work coming on in a heap.

20617. How soon would you have expected upon Contract 79 to get any cement work going after the start? I should not think it would be before six months after the commencement of the contract.

20618. So even if you were certain of getting that contract, and you had cement in hand, you would be doubtful about holding the cement for use upon the contract? Under ordinary conditions certainly. A good deal would depend upon how the market was with regard to cement—that is, whether there was a big supply in the market, and also upon how prices were.

20619. As to that, you do not know what was happening at the end of 1891 or at the beginning of 1892? No; I could not tell you that. There are such a number of circumstances which might arise at the time that it would be very difficult for me to say now what would be the reasons for taking action at that particular period.

20620. Of your own knowledge you know nothing about the fact of the storage or the use of cement on the contract; but there might have been a storage of cement on the site of Contract 79 at its inception by Carter & Co.? Yes.

20621. You had nothing to do with that contract? No.

John Carter sworn and further examined:—

J. Carter.  
16 Oct., 1896.

20622. *Mr. Gummow.*] As to the 600 casks of cement which Danaher, Taylor, and Britten, purchased from Carter & Co., from where was it delivered? From the Glebe contract.

20623. It did not come from Shea's Creek at all? Certainly not. It was taken out of the Glebe yard, and a distinguishing mark was painted upon it by the Government inspector. It was then sent down to the wharf and taken off to Danaher's railway contract. The whole of the facts connected with the transaction are clearly impressed upon my memory.

20624. Do you remember who was the Government Inspector upon the Glebe contract? Gledhill. I remember he painted every cask we sold to Danaher with a big red Broad-arrow. That is how I came to remember the transaction.

20625. As to the purchase of cement, do you remember if you made any lump contracts with any firm or whether you made contracts for the particular works you had in hand? The practice with regard to the purchase of cement is to purchase it at once, directly a tender is accepted—the whole of the cement estimated to be required for the contract.

20626. And how were the deliveries to be made? We arranged the deliveries as we thought they would be required. For instance, on one contract we might want 10,000 casks of cement, the delivery to begin in three months, and to proceed at the rate of 3,000 a month. In another contract we might want the delivery to begin in six months, and to proceed at the rate of 1,000 a month, or even 1,000 every second month. We endeavour to regulate the supply according to the demand, but we invariably purchase the whole of the cement required in one lot. If we have a contract which will take 50,000 casks we purchase cement immediately, to arrive, perhaps, over two years. By doing that we get it at a lower price, and we obtain better results in every way.

20627. Do you know whether, at the particular period to which I have referred, there was much demand for cement? Not a great deal, as far as I know.

20628. Do you pay cash for the cement? No; I pay in P.Ns. or cheques, just as it suits.

20629. You have always been a believer in having big stocks of cement on hand? Yes.

20630. Your firm has afforded a marked contrast to other contractors in that way? Yes; I believe in having plenty of material.

20631. Is there any other statement you desire to make to the Commission? Yes; I desire to say a few words with reference to our claim in respect of Contract 72. Mr. Christie seemed to think that the 2,000 casks of cement was not in stock in addition to the 1,300 casks of passed cement when we made our claim, and I wish to distinctly and emphatically state that that cement was on the ground. The 1,689 casks which Mr. Boys referred to in his journal was passed cement. The difference is accounted for by the

J. Carter.  
16 Oct., 1896.

the amount which had been used. The quantity was reduced to 1,300 casks at the time the claim was made. No doubt we used 300 or 400 casks in plastering and finishing up the contract.

20632. The claim was made up by Mr. B. C. Simpson? Yes.

20633. Upon what facts did he make it up? Upon some facts and figures with which I supplied him.

20634. You supplied him with the two items of 1,300 casks and 2,000 casks? Yes.

20635. So that you were satisfied that they were the quantities in hand at that time? Yes; I know it as an absolute fact.

20636. You put down 2s. 6d. a cask as the probable loss on 2,000 casks? Yes.

20637. From that it would appear, then, that the market must have been going down? The market, undoubtedly, was going down, because it has been going down ever since steadily. Not only that, but you must remember that the cement was stored in a very out-of-the-way place at Shea's Creek, and if we wanted to sell it to any other contractors we should have to load it and cart it some considerable distance. We should have had to sell it at a lower rate than we should have received for tested cement. All these items added together go to make up the 2s. 6d.

20638. Do you not buy your cement from merchants upon the understanding that they guarantee the test of it? Yes; but in this case it was not the merchant's fault. We wanted the cement tested, but the department refused to test it.

20639. Therefore, in that case, you bought the cement from the merchants without getting it tested? Yes; we endeavoured to get the cement tested by the department, but, although we failed to get the test, the merchant, of course, had to be paid.

20640. As to the cartage of cement from 72 to 79—I think you have heard the evidence of the witness Burcombe, who was brought here by Mr. Parkes;—what have you to say as to the carting of that cement—have you any recollection of the occurrence? I recollect that it was carted, but I do not remember the quantity. I know that we were carting cement for a considerable time to North Shore from Shea's Creek. I know that the weather was wet, and that the ground at Knight's paddock shed was in a boggy state. I was asked by the carters to pull the back of the shed out to let them get at the cement in that way. I am almost sure, however, that Burcombe in his evidence made a mistake as to the time of the year at which the cement was carted.

20641. *His Honor.*] In what respect? I think it was carted much later in the year than he said. One of my reasons for making such strenuous efforts to obtain Contract 79 was in order that we might successfully deal with the matter of cement coming forward. We had no idea that the Shea's Creek contract was to be gone on with, and we were brought face to face with the question of getting rid of the cement we had already provided. Those are the whole of the facts with regard to that cement transaction. The cement was carted to North Shore and was stored there. I cannot speak as to the exact date, but I am almost confident that Burcombe made a mistake as to the time at which it was carted.

20642. *Mr. Gummow.*] Do you know how many carters were on? I have no idea. I know that they were carting out of that shed for weeks, and that it was wet, miserable, weather. I remember also that we had to put 40 feet on to the Knight's paddock shed in order to take delivery of cement which we were not using. When the contract was stopped we were still taking delivery of cement. Some of this remained in Knight's paddock for months after we had finished the contract.

20643. *His Honor.*] You mean after you had finished the extension? Yes. There was a considerable quantity of cement in the shed. There was no other place to which it could possibly go except Contract 79. We had no other contract in hand.

20644. Then you would have had too much cement actually for the contract in its entirety? No doubt.

20645. How is that? It is hard to estimate within 500 or 1,000 casks what will be required. I do not say that there were 2,000 or 3,000 casks left, but I know that the shed had a considerable quantity of cement in it, and that we paid rent for it for a long time.

20646. *Mr. Gummow.*] Latterly, did you not make two contracts of 6,000 casks each with two different people for Contracts 118 and 77? Yes.

20647. Had you not found from experience that you could not use that 12,000 casks? Yes.

20648. So that it is not an unusual thing to make a mistake in your estimate of the quantity required? No. And as I have already explained, we always endeavoured to obtain plenty of material. We are continually obtaining contracts, and if we had a thousand casks more than we wanted upon Contract 79, we should know that it would be of use for the next contract. We do not cut the quantity down to half-a-dozen casks.

20649. Is it not a usual thing with merchants to ask you whether you can take a thousand casks from them, over and above your contract quantity, just to relieve them of storage in the city? Yes; it is a common occurrence.

20650. And you would pay them four or six months afterwards? Yes.

20651. You have done that in the past? Yes. We have at the present time to take delivery of cement for a contract we have not signed. It is a large quantity—from 1,500 to 2,000 casks. We shall not want it for the next six months, but we are going to store it to oblige the cement merchant.

20652. Is it not a fact that at times when no other contractors, comparatively, have any cement you frequently have a good supply? Yes, undoubtedly.

20653. With regard to the cartage of cement, you have heard Burcombe's statement that he made three trips a day from Shea's Creek to North Shore;—what have you to say to that? The fact that Burcombe made these three trips is pretty well known to me. Burcombe, especially, was noted as being a very hard man on his men and horses. It is a matter of public knowledge that carting firms sometimes generally start their carts at 4 o'clock in the morning, and end the day whenever they can, sometimes at 8, 9, or 10, o'clock at night. The exceedingly long hours and hard work which Burcombe's men had to undertake was a matter of comment amongst the other men. I think Burcombe was a little wrong in saying that he made three trips a day every day. I think his practice might have been, as I know has happened in many other instances, to make three trips one day, and two or two and a half trips the next day. I might explain that in this way: The man would start in the evening on his third journey, and he would come down as far as the stables, and then unhitch and leave the cement there for the night. That is what they would call a short day. On the next day he would take it over to North Shore, and on that day he might make three trips. It frequently happens that they make three trips on one day, and on the next two and a half, and so on. I know that that is the practice in brick and sand carting, and with other heavy drawing.

20654.

- J. Carter.  
16 Oct., 1896.
20654. *His Honor.*] What do you say as to the distance between the two places? It is about 6 miles going right up to the yard and taking the road which I think the men would be likely to take going from the Knight's paddock shed. It seems a long way, but, knowing Burcombe as well as I do, I should say that he is very likely to have made the three trips. Mr. Boys said the other day that he did not remember seeing cement and brick carts on the Milson's Point Road late at night, but when we have been riding on the tram together, we have seen cement and brick drays going up as late as 8 and 9 o'clock.
20655. Although they would have made a start early in the morning? Yes. The hours some of these carters work their men, and for comparatively small wages, are astonishing.
20656. *Mr. Gummow.*] Is it not a fact that the brickcarts are often on the contracts in the morning before the men are there to count the bricks which come off the carts? Yes; and it is a very common experience to leave men to count the bricks after dark, and on Saturdays up to 7 or 8 o'clock in the evening. I believe some of them would cart on Sunday if you would allow them.
20657. *Mr. Parkes.*] In speaking of the long hours of the men, you have not taken account of the fatigue of the horses? I do not recognise horses in the matter; but I do know that the men work for these long hours repeatedly.
20658. You would have to allow three hours a day for feeding the horses? They must be fed, certainly.
20659. Where was Danaher, Taylor, and Britten's contract? It was the railway from Lismore to The Tweed.
20660. The cement was sent there? Yes.
20661. Did they buy the cement on the same date on which they paid you the cheque? I really could not tell you. I do not think it is at all likely that they would pay for it on the day on which they got it.
20662. But it would be pretty close to that date, I suppose? No. Now you remind me of it, I think that Danaher allowed the payment to stand over for a long time, and apologised to me afterwards about it. It was a friendly transaction. He paid when it suited him, I suppose. I knew that I could get payment when I wanted it. He had plenty of money.
20663. Did you yourself see the 2,000 casks of cement in the Knight's paddock shed at the time your claim was made in respect of Contract 72? I did.
20664. Was it there in the month of March when Contract 79 was let? Yes.
20665. Where was the cement delivered by Burcombe at North Shore? It was delivered to No. 1 engine-shed at Cameray Park. A small quantity would go there. The bulk of it would go into the main shed at Alfred-street, near the reserve.
20666. Did you have the cement tested before it left No. 72? I do not think so.
20667. Did you apply to have it tested when it went on to 79? Undoubtedly, otherwise it would not have been allowed to be used; but it does not follow that it was tested as a parcel from Shea's Creek.
20668. But it was tested, you say, upon Contract 79? Undoubtedly, or it would not have been allowed to be used.
20669. Did it all go by horse-ferry? Yes; there would be no other way in which it could go.
20670. Would you pay the ferry fees, or did Burcombe pay them? We should pay those fees.
20671. By cheque? No, certainly not. We rarely paid the men's wages by cheque.
20672. But I mean the ferry fees? They would be charged in Burcombe's account.
20673. *His Honor.*] They would be paid on each occasion he crossed, I suppose? Yes; Burcombe would come and collect £1 or £2 from petty cash for the payment of the ferry, and it would be accounted for at the end of the fortnight.
20674. Would the Company charge by the week? No; Burcombe came to us from time to time for the money.
20675. *Mr. Parkes.*] There were not monthly tickets? No.
20676. You bought from Henry Austin, and had delivered on the Glebe job on 12th February, 1892, 175 casks? I could not tell you.
20677. If that entry appeared in Henry Austin's books, that would be correct? Yes.
20678. That was the last purchase you made upon the Glebe contract? I could not tell you, but whether it was so or not, it does not follow that we had not a thousand casks in the shed at the same time.
20679. But had you, as a matter of fact? I could not say.
20680. You could not say from your own knowledge that you had? I have not any idea. I know that we always had plenty of cement, and that is all I care about. I do not care whether there are 1,000 or 2,000 casks over, so long as we have enough to complete the works we have in hand.
20681. Did you deliver to Danaher, or did Danaher take delivery himself? We delivered to the wharf, but it was his lookout when the cement got aboard the steamer.
20682. Who were the carters who drew the cement? It would be impossible for me to say. I remember on one or two occasions that we were taking delivery of cement from merchants—from Henry Austin, probably—and the lorries which brought out that cement took loads back to the wharf for Danaher. By this means a saving was effected to both Danaher and ourselves. It did not happen very often, but it did happen. Who the carters were I cannot say. Probably Burcombe would be one of them.
20683. Did you, upon Contract 72, obtain an advance upon your cement? We did not, as far as I can remember. I think we applied for it, and the department refused it.
20684. When did you deliver Flood's cement on that contract, on the second occasion in 1892, when he paid to you a cheque for £200 odd? I could not say.
20685. That cement was sent across to Ashfield, was it not? No; I do not think so, but I would not like to say definitely. I am positive about the cement we supplied to Danaher, because of the marking of it, because we took so much trouble with it, and because of its delivery to the wharf. Those circumstances all impress that transaction upon my mind, but I am not sure about the other transactions, because they were ordinary occurrences. I think that some of the cement which we let Flood and Rutherford have went from the Glebe.
20686. Do you recollect the brand of cement you sold to Danaher? I do not.
20687. If you took such care, as you say you did, in the marking of it, would you not be likely to have noticed what brand it was? The brand of the cement had nothing to do with our putting the distinguishing mark upon it. We did not care what brand of cement it was so long as it was passed cement. I have not the slightest recollection as to whether it was Camel, Germania, or Wouldham. We were buying four or five brands at that time. I remember the sewerage inspector climbing on to the cart and painting on the arrow with red paint.

J. Carter.  
16 Oct., 1896.

20688. *Mr. Gummow.*] There is a voucher from Danaher showing that there was paid into the credit of Carter & Co., on 9th December, 1891, a cheque for £130;—you must have delivered the cement a good deal before that? Yes, undoubtedly. I know that we gave him long credit. He was away in Lismore.
20689. *His Honor.*] What would you call long credit? Perhaps it would be six months, perhaps more.
20690. *Mr. Gummow.*] Mr. Parkes referred you to an entry of some 160 casks of cement at the Glebe in February, 1892? Yes.
20691. There is a cheque paid in by Danaher for £292 5s. 2d. on 22nd February, 1892. Can you recollect going to Mr. Mitchell's office, and asking him whether he could let you know something about Danaher's cheque? Yes.
20692. Can you remember the date when Mr. Danaher was written to and asked for the cheque for Carter & Co.? Yes; I think it was Christmas Eve.
20693. The cheque was outstanding a good while? Yes; Mr. Mitchell, I understood, wrote on his own authority; it struck him that it was time we were paid.
20694. That circumstance helps you to remember that Mr. Danaher was a long time paying the cheque? Yes; I could not say whether he had six or eight months' credit, but I know it was a long credit.
20695. You say that it is impressed strongly upon your mind that the cement went from the Glebe contract? Yes.
20696. And you remember that it was for railway purposes? Yes.
20697. And that the Railway Department was very particular about taking cement from the Sewerage Department? Yes; I remember Mr. Danaher's asking me to call up and see Mr. Deane, in order that we might ascertain what could be done in the way of making an arrangement whereby Mr. Danaher could be supplied with this cement, as, if it could not be supplied, his works would be entirely stopped owing to the want of it. You cannot do very much in the case of railway embankments until the culverts are built, and Mr. Danaher experienced great difficulty in getting cement passed. I took some trouble in the matter, and finally obtained Mr. Deane's consent to the transfer.
20698. So that that particular transaction in cement was very strongly impressed upon your mind? Yes; I have a very clear recollection of the whole of the facts.
20699. But that would not be likely to be the case with regard to the cement which you supplied to Flood and Rutherford? No; that was an ordinary transaction such as might occur half a dozen times in the year. I might not know anything about it until it was over.
20700. *Mr. Davis.*] Reference is made in the journal of Contract 72 on the 21st December to 198 barrels of cement leaving for Iron Cove Creek;—would not that be Flood and Rutherford's? Yes; it was to go to the Iron Cove stormwater works. Your mention of the Iron Cove reminds me of the Careening Cove cement which was spoken of the other day. We sold to Mr. Johnson some 130 casks. I think that was returned to us and not paid for. It was a transaction in connection with Contract 79. The cement was stored in the small shed at the top end of William-street.
20701. *His Honor.*] Do I understand you to say that almost the whole of the 2,000 casks of untested cement upon Contract 72 actually went to Contract 79? There is no doubt at all in my mind about that.
20702. You had, you say, upon Contract 72, when you started again, some 1,300 casks of tested cement? We had 1,300 casks of tested cement. That is shown in the claim which we sent in, and I should have tried, if the claim had been thrashed out, to insist upon the department's taking that cement themselves. I contend, as I have contended all along, that when once they have tested cement for a work, that cement is their property. When we have put it on the job for them, and it has been tested, they must be considered to have taken delivery of it. The 2,000 casks were certainly not their property. It had not been tested. The department themselves took the same view as we did in that matter, and refused to test it. To my mind, it is very definite, according to the journal, that the two lots were separate. Besides, Mr. Boys distinctly mentions three sheds. He refers to the three lower sheds along the line of sewer which were actually working. The Knight's Paddock shed was at the top end of the work which was cut out. Cement was waiting there for the work to get up to it. Mr. Boys spoke distinctly of the lower sheds on the work from which the cement was being used.
20703. How soon after starting the upper part of the work would it be when you would first want cement upon it? We should want it almost immediately. Then the 1,300 casks would be brought up from the other sheds.
20704. But you would use a great deal more than 1,300 casks? Yes; but I do not think there is any dispute as to our getting more cement in after the work had been begun.
20705. Do you know when you finished Contract 72 finally? I should think about four or five months after we began. If we began in March, we should probably finish in August or September.
20706. How was it that it became necessary to shift the 2,000 casks? We did not know that the Government were going on with Contract 72.
20707. It was shifted sometime after you had begun? Some of it. But we had another shed under the railway arch which would take a good deal of cement. Mr. Boys appears to have forgotten that. It was not a big shed, but it would hold a fair quantity.
20708. But if you had 2,000 casks stored upon 72, near where the work was going on, and if you had other cement which you had contracted for coming in, how was it that that other cement was not delivered to Contract 79 instead of being delivered to Contract 72;—how was it, under those circumstances, that the cement was taken across from Contract 72 to Contract 79? We took delivery of cement on Contract 72, as fast as it came to hand.
20709. But when did you take delivery of it;—was it not actually after Contract 79 had been given to you? It does not follow, because we only claimed for 2,000 casks of cement in the claim which has been referred to, that there was no more than 2,000 casks there. The 2,000 and the 1,300 casks were all that was required, and it had nothing to do with the department if we chose to deliver 5,000 casks. What we claimed upon was tested cement sent to finish the contract. It does not follow that there were not 4,000 casks in the sheds.
20710. The 2,000 casks would not be the limit of the cement in the various sheds? No; we mentioned the quantity required for the work to be done. As the papers will show, we were getting delivery of cement in large quantities, and we had to take it out there. Another reason we took it there was that an extension was in contemplation going from the end of our first contract right through Newtown and Erskineville, and we thought we would store the cement out there, and, if the worst came to the worst, that we could sell it to the successful contractors for the next section.

20711.

- J. Carter. 20711. Was that gone on with? Yes.  
 16 Oct., 1896. 20712. But not immediately afterwards? No; but we know a good deal about what is going on in the sewerage line. We see the surveyors at work, and we hear that tenders are ready to be called for as the result of deputations and one thing and another. We often take these things into consideration.  
 20713. I understand that you did not get any advance upon the cement which was brought down to Contract 79? No.  
 20714. Can you explain how it was that some time afterwards, when you did get an advance, there were 800 odd casks? Yes; it seems to point to the fact that Burcombe carted the cement at a much later date, because if it had been on the ground there is no doubt we should have asked for an advance upon it. I felt sure at the time Burcombe was giving his evidence that he was making a mistake in the date.  
 20715. *Mr. Davis.*] Will you refer to the entry in the journal, under the date of 22nd April, after the resumption of work upon Contract 72? Yes; it says, "fresh quantity of cement arriving on the work, Germania."  
 20716. According to the journal, the work was resumed on the 19th April;—is not that so? Yes.  
 20717. So that two days after that, you were delivering more cement? Yes.  
 20718. Will you look at the entry under date 27th April? Yes; it says "Required samples for testing 339 casks, Germania brand cement, sent to office."  
 20719. On 3rd May, you will find another entry as to cement? Yes; it says, "Samples from 600 casks, Germania, a cement sent in for test."  
 20720. Will you now read the extract, under date of 11th May? Yes; "Samples from 1,030 casks of Germania cement sent to be tested."  
 20721. So that it is pretty evident that large quantities of cement were being delivered on to the ground just about that time? Yes.  
 20722. Looking at the record of cement tests, on 9th March, 1892, how many casks were tested for Contract 72? 360 casks.  
 20723. On the 16th March, how many casks? 700 casks.  
 20724. On 28th April, how many? 339.  
 20725. On 4th May, how many? 390 casks.  
 20726. And on the same date, there was a further test? Yes; 600.  
 20727. On 12th May, how many? 1,030.  
 20728. On 12th June, how many? 194.  
 20729. On 18th July? Ninety.  
 20730. On 29th July? 200.  
 20731. On 1st September? 410.  
 20732. How many casks would appear from that to have been tested on Contract 72, after the resumption of the work at beginning of 1892? 4,300 casks.  
 20733. So that if I calculated that about 3,000 casks were required, and the inspector's reports showed that 3,000 casks were used on the works after the resumption, there would be a balance left even after that, which would not be used upon the works? Yes, from 1,000 to 1,300.  
 20734. Do you remember when the extension was given to you upon Contract 72, that it was verbally agreed to take the unemployed on to that contract if it were given you? Yes; I do recollect the circumstances now.  
 20735. And did you not get your men from the Labour Bureau? Yes; I believe we did. Mr. Forrest was there, and he was supplied with a list. I had forgotten that.  
 20736. It was one of the conditions, therefore, upon which you got the work, that you employed men from the Labour Bureau? Yes; I think that is correct.  
 20737. *Mr. Gummow.*] With regard to Burcombe, have you seen him at all, or have you had a talk to him? No; I have lost the run of him for some time. I find that he is working, not for us, but that he is carting for someone else who is working for us. He has lost his own carts and everything else.  
 20738. Have you got any information from him? I have never spoken to him on the subject.  
 20739. Have you supplied him with information? No.  
 20740. So that, as far as this statement is concerned, he is stating what he believes to be the fact? Yes; as far as I know. I have never spoken to him directly or indirectly on this or any other subject for a very long time. I have lost sight of the man altogether.  
 20741. So that when he was brought here by Mr. Parkes you did not know what evidence he was going to give at all? No; I had not any idea.  
 20742. *Mr. Parkes.*] Can you swear that all the parcels of cement to which you have referred passed the test? Certainly not.  
 20743. *His Honor.*] As to the deterioration of cement, can you give us any information as to that? Well, it may deteriorate to some extent, as your Honor's questions to Mr. Gummow seemed to suggest, but that does not concern us. It is a matter for the department. We certainly have never had any intimation that we were not to keep tested cement. As Mr. Gummow stated, it often happens, through force of circumstances, that we do keep it. If there are 200 or 300 casks of tested cement lying in a shed, and a shipment happens to come in, then, if the tested cement is not urgently required at a short date, the new cement would be put into the shed on the top of it, and when it had been tested we should haul away at the contents of the shed indiscriminately. Cement will accumulate in that way, and it often happens that cement which has been tested for some time will be covered up by newer cement which has also been tested.  
 20744. The department make no rule as to the use of cement which has been stored for some time? No.

Joseph Davis called and further examined:—

- J. Davis. 20745. *His Honor.*] You wish to make a statement? Yes. I have examined certificates of the cement submitted for test from 9th March, 1892, to the 1st September, 1892, for Contract 72, and I find that  
 16 Oct., 1896. there is nothing on the certificates to denote that the cement was rejected. Judging from the tests of strength which the cement stood it certainly passed the tests.  
 20746. The conditions appear to have been complied with? Yes.  
 20747. *Mr. Parkes.*] Can you yourself swear that the parcels are correctly given? That the numbers of casks given in the tests are correct—no, I cannot.  
 20748.

20748. *His Honor.*] What do you say then? That the cement would be counted by the inspectors at the time they sent in the samples. That number would be conveyed to Mr. Roberts, and would be transferred to the test-book. J. Davis.  
16 Oct., 1896.

20749. But you cannot, of your own knowledge, swear that the number of casks in each case is correct? No; in this connection I should like to refer your Honor to page 294 of the evidence. The following evidence was there given by Mr. Christie:—

10064. The book containing the cement tests by the Department is very carefully kept, is it not? It seems to be.
10065. The name of the contract to which cement is delivered is inserted? Yes.
10066. The name of the contractor is also inserted? Yes.
10067. Also the number of casks? Yes.
10068. And to show with what care the book is kept, there are only two alterations in the number of casks affecting tests in which Carter, Gummow, & Co. were concerned? Yes. There are two quantities indefinite in that respect. In one case 700 in red ink is put over 500, and in another case 600 is marked for 500. In neither of these cases do the certificates affect the return I have handed in.

Your Honor will see from that evidence that Mr. Christie appeared to regard the tests, as recorded in the book, as being on the whole reliable.

20750. *Mr. Parkes.*] I should like you, Mr. Davis, to swear to each one of these certificates in routine as containing passed cement, commencing with the continuation of the contract in April, 1892. I suppose the second contract would not start until April? No; I find upon looking through the tests that, as regards the test under date of 4th May—I mean test 682—there is some doubt as to whether the 390 casks there referred to were for Contract 72 or for Flood and Rutherford's contract.

20751. What is the brand of cement in that case? Globe brand.

20752. Was there any Globe brand upon Contract 72? I cannot say; there may have been. That particular test is the only doubtful one in the whole of those which I asked Mr. Carter to refer to.

20753. You are aware that according to Mr. Boys' journal there was a transfer of 282 casks to Waverley? I am not. What I am aware of is that cement has been carted about in some unaccountable manner from contract to contract. We could never keep any proper check upon it.

MONDAY, 19 OCTOBER, 1896.

David Graham Snodgrass sworn and examined:—

20754. *Mr. Gummow.*] What are you? A contractor.
20755. You were a partner in the firm of Carter, Gummow, & Co.? Yes.
20756. Are you still a partner in the firm of Carter & Co.? No.
20757. Are you a partner in the firm of Carter, Gummow, & Co. at the present time? No.
20758. When did you retire from the firm? About the end of last year; I forget the exact date.
20759. Prior to becoming a contractor, what were you? Contractors' manager and engineer.
20760. For whom? Latterly for Mr. Edward Pritchard.
20761. Upon what works? On the Bondi sewer—the Double Bay and Rusheutter Bay's sections.
20762. Previous to that you were employed by contractors in New Zealand? I was manager and engineer for the first section of the Otago central railway.
20763. You were educated under engineers and under railway contractors in New Zealand? Yes. I was about twelve years under an engineer on railway contracts in New Zealand.
20764. Do you consider that you are a capable engineer for any public works contract? I think so.
20765. Have your employers always been satisfied with you as an engineer, as far as you know? They have always expressed themselves so.
20766. So that if it has been stated that you are not a capable man to look after contracts, would that be true or otherwise? It would be untrue.
20767. With regard to the sewerage works of Sydney generally, do you consider that you are capable of looking after any contract which might be carried out in connection with them? Yes.
20768. As a contractor you would not have to employ any man to do any work which you would not be capable of doing yourself in the engineering and managing line? I could do anything required upon sewerage contracts.
20769. With regard to the making up of tenders, are you capable of doing that kind of work? Yes, decidedly.
20770. Do you pride yourself on what you can do in that direction? Yes, particularly.
20771. With regard to the Waverley contract, had you anything to do with it personally? Yes; I made out the tender.
20772. Had you anything to do with the practical carrying out of the work? Yes; I put the job in working order. Then I used to go once a month and make up the quantities of work done, as a check against the Government engineer, for the purpose of getting our progress payments.
20773. Do you remember some arches being built down in the Double Bay Valley? Yes.
20774. Do you remember what they were built of? The piers, I think, were of sandstone concrete, and the arches were of bluestone concrete; but I could not be positive.
20775. Do you remember if they collapsed? Not one of the arches in connection with the sewer; but there was a culvert across the creek there—I think that was built entirely of bluestone concrete—in connection with which the foundations were not very good. The ground was excavated to a good depth, until the foundation was considered to be sufficiently good. Then the culvert was put across. It had set for some considerable time, and then the centering was withdrawn. Then, to all appearance, one of the walls sunk slightly, and caused a crack somewhere about the springing of the arch. (*Vide Appendix No. 82.*)
20776. Did you pull the arch down? No; we got instructions from the department to put tie-rods through, to screw them up thoroughly, and to cut out enough room where the crack had taken place to make the work good. 20777.

D. G.  
Snodgrass.  
19 Oct., 1896.

D. G.  
Snodgrass.  
19 Oct., 1896.

20777. Do you remember a man named Hamilton on that work? Yes.
20778. Do you remember any defective work, or anything of that kind, in connection with what he did? I do not remember any defective work, but I remember his getting into a row for defective bricks. I consider myself that the bricks were as good bricks as were ever put into the works; but Mr. Davis did not hold the same opinion as I did, and he kicked up a row with Hamilton for allowing them to be used, with the result that they were pulled down. (*Vide Appendix No. 83.*)
20779. Were the contractors paid for that work? They were not paid for either putting it in or taking it out. The work was condemned. Ten or twelve thousand bricks alongside the work, ready to be put in, were also condemned, and the contractors carted them away.
20780. You said that none of the arches were pulled down; is that correct? Quite correct.
20781. So that if it has been stated that some of the arches collapsed, would that be true? Decidedly not. Even the culvert arch did not collapse. It cracked slightly from the cause I have mentioned.
20782. Do you remember a man named Reidelberg on the works? Yes.
20783. Do you remember anything occurring in connection with his work? I remember his being accused of not packing the brickwork properly.
20784. Did you take any action, or had you anything to do with the matter? Mr. Carter and I took action as the heads of the firm, although we were not in immediate charge of the job at the time. We suspended the man, and had him taken off the work.
20785. *His Honor.*] Who was in immediate charge of the work at the time? A man named Rogers, who was then a partner. We bought him out. I could not say, now I come to think of it, whether we bought him out before or after this thing occurred. But while he was a partner he was in immediate charge of the works, and after we had bought him out I think we left him in charge of the works until they were finished.
20786. *Mr. Gummow.*] Do you remember a pipe contract you had at North Sydney? Yes.
20787. Who was in charge of it? Mr. Forrest and Mr. Carter.
20788. Had you anything to do with it? I used to go once a month and meet Mr. O'Hanlon, the Government engineer, to make up the quantities with him. That is all I had to do. I did not take any measurements or do anything of that sort. They were taken before I went there. I used to settle the quantities with Mr. O'Hanlan, but I had nothing to do with the carrying on of the work.
20789. As to Contract 61—the Alexandria contract—had you anything to do with that? Only in the same way—that is, making up the quantities. When we were preparing to start the job I gave the carpenters instructions about making the ribs—that is, I drew the shape of the ribs for the concreting. I had nothing to do with the carrying on of the actual work.
20790. So that you cannot tell us anything about the actual work upon Contracts 60 and 61? No.
20791. But you had to do with the setting out of the ribs? Yes.
20792. By whom was that done? I do not remember the carpenter we had on that job.
20793. Do you remember a man named Tom Wright? Yes.
20794. Do you think he was the man? I dare say he might have been. I think he was, now I come to think of it; but I am not quite sure.
20795. You remember Wright? Yes, well.
20796. What is your opinion of him? He was a good carpenter, but he was a cantankerous sort of fellow.
20797. Did he take a drop too much to drink sometimes? Yes; like some of the rest of us, he had that little failing.
20798. You had a contract at the Glebe, I believe? Yes.
20799. Did you get that upon your original tender? No.
20800. How did you get it? We bought out the firm of Cowdery and McLean. They had been working at it for some four months. They had done between £400 and £500 worth of work, and they had put up a cash deposit of £1,500. We bought them out for £625.
20801. Did you get departmental sanction to that? Yes.
20802. Had you anything to do with that work directly? Yes.
20803. Were you in charge of it? I was in immediate charge; but I seldom went down in the tunnels except to measure up with Mr. Rudolph, the Government engineer.
20804. Did you ever give instructions for the doing of bad work on that contract? No.
20805. Did you ever see any done? No.
20806. Do you remember a man named Chiene being employed upon the contract? Yes.
20807. What was he? I employed him as an engineer.
20808. How long was he in your employ, do you remember? Two years, I think. He may have been a month or two over that period, but we engaged him for two years.
20809. Can you tell His Honor anything about Chiene;—what is your opinion of him as regards his work? He is a slow-going man, as regards the taking out of quantities, but he seems to be able to do the work fairly well. He is rather independent sometimes. When he gets a few pounds he sometimes goes away on the spree, and as a consequence he will make mistakes sometimes.
20810. Had you anything to do with the Shea's Creek contract? Very little. I used to go down on a sort of visit to it once a fortnight or so.
20811. Who was in charge? Mr. Forrest.
20812. What did you do when you went down;—what were your duties? I did not go down as a matter of duty at all. I used to go down to see how the work was going on, and to have a yarn with Mr. Forrest.
20813. Had you anything to do with the measurements? I made up all the measurements on every contract we had.
20814. Were you paid twice for any of the work? No; in fact I do not think we were paid sufficient measurement on the excavation on that particular contract. We accepted the original cross-sections for the excavation, and judging from the time it took us to do the work and the quantities we were paid upon, I am certain that we lost some thousands of yards of excavation.
20815. *His Honor.*] On what part of the excavation did you lose? There was an old creek running down there, and we had to widen and deepen this creek to get the work in. These cross-sections were taken every chain or so, some years before we got the contract, and the ground had altered in the meantime. I am positive that we lost some thousands of yards in the excavation.
20816. Was it open excavation work? Yes.

20817.

D. G.  
Snodgrass.  
19 Oct., 1896.

20817. There was an earthen channel and there was a concrete channel also ;—are you now speaking of the concrete channel or the earth channel? I am speaking of the concrete channel. The earth channel was in swampy ground, and that had not altered. There was no original creek in the earth channel.
20818. What sort of ground was it? The earth channel was in nasty wet ground. It was soft, boggy, stuff—in fact I remember sending Chiene down one day to take cross-sections. He happened to step in between the reeds, and went in up to his middle. The men had to take up the stuff in buckets sometimes.
20819. Were you paid for all the flood water that went down there? We were not paid anything for the water, and there was plenty of it at times.
20820. So that if any one has said that you were paid for the flood waters that would not be correct? No; I wish we had been.
20821. Were you paid twice over for the excavation? No.
20822. Were you paid twice over for the filling? No.
20823. So that any statement to that effect would be utterly untrue? Entirely untrue.
20824. Do you remember the amount of that particular contract? No; I think it came to about £27,000 or £28,000 at the finish, but I do not remember what the tender was.
20825. Will you look at the schedule of Contract 72, which appears upon page 160 of the Parliamentary Return, and tell me how much the excavation there given is? The original probable quantities give 26,200 yards; the filling is given as 12,000 yards.
20826. What are the figures in the final certificate? 53,410 yards of excavation, and 27,961 yards of filling.
20827. How do you account for the great increase in the excavation and filling in the final voucher as compared with the probable quantities? I do not exactly know how it did occur.
20828. Does it look as if you were paid twice over? Some people might think so, but I know that it was not the case. I have often seen cases in which the quantities carried out were more than double the quantities given in the original estimate.
20829. *His Honor.*] If you came to think of the relation of the earth channel to the rest of the work would that enlighten you on the point? They may not have included the earth channel in the original quantities. I could not say for certain whether that was so or not, although I think that that omission was probably the reason of the increase.
20830. *Mr. Gummow.*] Do you know what the Government do in making up their schedules ;—have you any idea of how they make them up before you see the tender form? Not in the least.
20831. So that you could not speak as to that particular? No.
20832. Do you remember whether, when you were going to start that contract, there was an outlet for the concrete portion of the sewer? There was no outlet without cutting the earth channel.
20833. Were you then ordered to cut the earth channel? Yes.
20834. Have you any idea of what quantity of excavation, speaking from memory, there would be in the earth channel? About 20,000 yards.
20835. So that the addition of the earth channel to the concrete channel might make up the quantity upon which you were finally paid? Yes.
20836. In any case you are satisfied that you were not paid twice over? Not for a single yard. We were not paid for as much excavation as we did on that job—we lost money on it.
20837. Will you look at the item iron girders, as shown in the schedule, and tell me how many cwt. are shown? Seventy-four cwt.
20838. Will you look at the quantity in the final certificate and tell me what that is? 400 cwt.
20839. Can you remember how that increase came about? Yes; the work went through the Cooper Estate, and there was one place between two portions of swamp where there was a kind of peninsula of dry land. The original plan provided for the carrying of an open channel through that peninsula, and I think Mr. Buckland, the manager of the Cooper Estate, objected to having an open channel there. He wanted the place left so that he could have traffic across, and he would not allow the work to go on until the Government agreed to cover that portion of the work. We were ordered to cover it with iron girders and to fill in up to the level of the original ground.
20840. Was that the only reason of which you can think for this increased quantity? That is the only reason that I can imagine.
20841. You know of no other reason? No.
20842. The contractors did not ask the Government to put it there? No.
20843. Did the Government put the extra quantity of iron work there to please the contractors? Certainly not.
20844. Do you remember whether the Shea's Creek contract was stopped? Yes.
20845. Where was the end of the work at the time of the stoppage? Just about the junction of what we called the Macdonald Park sewer with the Shea's Creek sewer.
20846. Do you know the reason for the stoppage? I understood it to be because there was only a certain amount of money for the job, and that that money was exhausted.
20847. Can you remember the date approximately when the work was stopped? No.
20848. Did you ever go on with the work? Yes; some months afterwards. There was a long interval—I should say four or five, or perhaps six, months.
20849. Do you remember making a claim against the Government in respect of the stoppage of the contract? Yes.
20850. Had you anything to do with the getting out of the details of the claim? Yes.
20851. Do you recognise the document I hand you as the claim which was put in ;—do you remember anything about it? Yes; I think I made it up, and that Mr. Carter copied it.
20852. Whose handwriting is the document in? Mr. Carter's.
20853. Do you know whether you had any outside assistance in connection with the making up of that claim? Yes.
20854. Who helped you? Mr. B. C. Simpson.
20855. Do you remember whether, when you made up that claim, you had any cement in hand? Yes, we had an immense quantity of cement in hand. I could not remember how much now, because it happened a good many years back, but we had a large quantity of cement in hand.
20856. Is there anything which would bring to your mind the quantity of cement you had? The only thing

D. G.  
Snodgrass.  
19 Oct., 1896.

thing I can remember is that we had some sheds full, and as more cement was coming in we had to get more iron in order to build more sheds to hold it.

20857. You remember that distinctly? Yes.

20858. Will you look at the claim, and tell me whether any reference is made in it to cement? Yes; there are two items having to do with cement—one item is 1,300 barrels, and the other 2,000 barrels.

20859. Would you have both of those quantities on the ground? More than that, I think. I believe we had between 4,000 and 5,000 casks upon the job.

20860. Do you know why it was then that you put in a claim of only 3,300 casks? I should say that that would be the estimated quantity required to finish the portion of the work in respect of which we were making the claim. We used to get in a good stock of cement and take it to the most suitable shed, and cart it from there round to the different works as required.

20861. You consider, therefore, that you had upon Contract 72, at any rate, the quantity required, if not more? I am certain we had more than that quantity.

20862. If you required only 3,300 casks to finish the job, how is it that you had so much more coming in? We bought rather much at that time.

20863. Did you buy for a particular contract or did you make a general contract to supply cement? Sometimes we used to buy more than we intended to use in anticipation of our getting other contracts. If the market was low we used sometimes to overbuy.

20864. Can you tell His Honor why you did not sell all this cement again when the job was stopped? I think we had other contracts going on. Carter & Co. had one or two other contracts.

20865. Is it a general practice with you to cart cement from one contract to another? Yes; we carted it from the Glebe to North Shore, from the North Shore to the Glebe, from the Glebe to Shea's Creek. It was moved about in all kinds of ways. We were constantly shifting cement backwards and forwards.

20866. What was your reason for that? We sometimes used to get in a larger stock of cement than we required at the time, and we did not know then the most suitable place in which to put it; or perhaps we had an available shed upon one job and not upon the job upon which the cement would be first required.

20867. Can you remember what became of the cement at Shea's Creek? Not all of it. I fancy we carted some to Waverley. I know that we carted a lot to North Shore, but I do not know how much.

20868. Can you say who carted it? Burcombe used to do all our North Shore work.

20869. Did anyone else cart there besides Burcombe? I do not think so.

20870. At any rate, you are quite sure that there was this large quantity of cement on the ground at the time? I am sure we had considerably more than is stated in the claim.

20871. With regard to the concrete, what sort of stone had you to use? The best sandstone. It had to be approved by Mr. Davis, and he was pretty particular about it too.

20872. Did you use any material in place of sandstone? Broken bricks were used at Shea's Creek.

20873. Do you consider that they would be as good for the concrete as would the sandstone? Better.

20874. Did they cost you as much to break? I think they cost us more to break than did the stone. The reason for getting the bricks, if I remember rightly, was that we could not get the stone fast enough.

20875. It was not done on the score of economy, then? No; I do not think so.

20876. Did you get just the common house-bricks or clinker-bricks? The reason the bricks could be got at the price we paid for them was that they had been burnt all to pieces and were useless for building purposes.

20877. Do you remember now who were the partners in that particular contract? I could not say from memory. On looking at the papers I see that the partners were Carter, Snodgrass, and Forrest.

20878. Do you remember who were the contractors for Contract 79? I do not remember exactly, but I have an idea that they were Mr. Carter and myself. I see from the papers that that is so.

20879. And not Mr. Forrest? No.

20880. Do you consider that if any dispute had arisen, or there had been any business transaction necessary as between the contractors and the department, that the department would have looked to Mr. Forrest in regard to Contract 79? No.

20881. What reason have you for saying that? Because they would not recognise him as a partner in the job.

20882. Have you any experience or knowledge which you think justifies you in giving that answer? Yes; in connection with condemned pipes, Mr. Hart, of the Standard Brick Works, complained to Mr. Davis about some of the pipes being condemned. He tried to argue the point, but Mr. Davis said he would have nothing to say to him in the matter as he was not the contractor.

20883. When you were in the employ of Mr. Pritchard you were manager and engineer? Yes.

20884. Was it ever hinted to you that you were not a contractor, and that the department could get you removed at any time because the names did not happen to show that you were a partner in the job? Yes.

20885. You are satisfied that the department would not recognise anyone but the parties who are shown in the particular contract? Certainly I am. They would not recognise anyone else unless a written authority were given.

20886. You say that you and Mr. Carter were the contractors for No. 79? Yes.

20887. Was there anyone else at all who was a partner in that contract? No.

20888. So that Mr. Gillan and myself had nothing to do with it? Nothing whatever.

20889. At no time whatever? At no time whatever.

20890. Had we anything to do with any of the contracts you have already spoken of? Nothing at all.

20891. Do you remember tendering for Contract 79? Yes.

20892. Do you remember who were the lowest tenderers? Bond and Hudson; we were second.

20893. Do you remember whether any objection was taken by you to Bond and Hudson's tenders being accepted? Yes; I objected to it.

20894. On what grounds? That they had refused to take up the contract upon which they had tendered before, and in connection with which they were the lowest tenderers. The departmental regulation said that, in the case of contractors refusing to take up a job after the Government had accepted their tender, they would be debarred from tendering, subject to the Minister's pleasure.

20895. Do you know what contract it was which Bond and Hudson had thrown up? Yes; the Woolloomooloo contract.

20896.

D. G.  
Snodgrass.  
19 Oct., 1896.

20896. Who were the second lowest tenderers in the original tendering for that contract? I think Gummow and Gillan were the second tenderers, and that we were the third on the first tendering. On the second occasion of tendering Bond and Hudson were the lowest tenderers, Carter & Co. were the second, and Gummow and Gillan were the third.
20897. Do you consider that it was fair play to Gummow and Gillan to have the job re-tendered? I did not think so at the time, but I was pleased afterwards that it came out so.
20898. Do you remember, when it was found that Bond and Hudson's tender for 79 was the lowest, raising an objection to the acceptance of their tender? Yes.
20899. What action did you take? If I remember rightly, we saw Mr. Barling in his room, and spoke to him about it, and he said that we had better put our objections in writing.
20900. Why did Gummow and Gillan sign that letter of protest as well? I cannot say just now;—I do not remember.
20901. Had they anything to do with the contract, or was it any advantage to them to sign the protest, as far as any benefit they were likely to derive from it was concerned? Not as to that contract. They might have expected some ulterior benefit in future tendering.
20902. You bought Bond and Hudson off? Yes; after a time.
20903. Do you remember anything about the negotiations? Yes; I remember that we agreed to give them £750 down and a P.N. for another £750, upon the condition that we got the contract. We agreed to give them that amount if they would throw up their tender.
20904. Did you know that you were going to get the job when you made that offer? No;—in fact, after completing the arrangements, Mr. Carter and I went to the "Australia Hotel," and I remember saying to him "This looks like a bit of gambling. It looks like the tossing of a coin for £1,500."
20905. Did you make up that tender for that contract? Yes.
20906. Did you fix the schedule yourself? Yes.
20907. Did Mr. Carter have anything to do with it? Nothing whatever.
20908. Did you get any assistance from the department in making it up? No; I do not see that they could give me any assistance.
20909. You consider that you know more about the making up of tenders than does the department? Yes; more than any man in the department.
20910. How did you come to put such a price on soft ground excavation? I had an idea that the quantity would turn out to be more than the Government estimated it at.
20911. Did you put down any bores to test the ground? Yes.
20912. And that was a better indication than you could get from the department? Better than I could get from the plans, certainly.
20913. And on the strength of putting down the bores, you fixed your prices; is that correct? Yes.
20914. Do you know a man named Reid who was an inspector on that job? Yes.
20915. What sort of man was he? He seemed to act as if his idea of his duty was more in the direction of trying to get the men to do bad work than to prevent them from doing it. He seemed to me to try to induce the men to do bad work so that he might be able to report it.
20916. You have found inspectors do that kind of thing? Yes, more than once.
20917. They prefer, you mean, to get the contractors into trouble if possible than to get good work done for the benefit of the country? Yes.
20918. Do you remember Reid's complaining while he was on the North Shore contract? Yes.
20919. Do you remember his once complaining about a chip off a brick? Yes. He complained about a brick being put into the work which had a chip off it about the size of three peas.
20920. Is that the usual kind of complaint he would put in? Yes; that was Reid's usual style.
20921. Do you remember once offering him a drink? I cannot say that I do; I may have done so twenty times, but I should not be likely to remember things of that kind.
20922. You like a drink yourself now and again, do you not? Yes.
20923. Are you sociably inclined? Yes; too much so, I dare say.
20924. So that it is likely that you did offer Reid a drink? Yes. I suppose there is hardly an inspector who ever worked on our jobs that I have not asked to have a drink.
20925. Did you ever shout for the men? Yes, a number of times.
20926. Do you ever remember taking the men over to an hotel—the "Queen's," I think—and their coming back with some bottles under their arms and going into the engine-room and having a few drinks and songs together? Yes, I can remember that.
20927. It was about Christmas time, was it not? I do not remember now.
20928. It was not an unusual thing for you to do—to shout for the men? It was quite a common thing.
20929. Can you tell His Honor the reason why you were so anxious to get the North Shore contract and why you offered Bond and Hudson the money you did? I thought, from the way the schedule was arranged, that we would make a good profit out of it.
20930. Had you much cement in hand at the time? A lot of cement. We must have had between 4,000 and 5,000 casks.
20931. Had you much hoisting plant in hand? We had four winding engines, and the contract only required seven.
20932. Where were these? At Waverley.
20933. Was that job nearly finished? Yes.
20934. *His Honor.*] You had deep shafts and hard ground at Waverley? We had hard ground, and the shafts were about 200 feet deep.
20935. *Mr. Gummow.*] Do you remember Mr. Davis writing to you to inform you that you had to gutter and gad out the whole of the contract? Yes; and I strongly objected to it.
20936. On what ground? That it would cause the deaths of a number of men.
20937. Do you consider that it endangers the health of the men? I consider that it endangers their lives. I reckon that I have had thirty men who have died on my hands and have not done half a mile of guttering and gadding.
20938. You consider that guttering and gadding is much more dangerous to them than the shooting? It is a hundred times more dangerous. I reckon that any man who works constantly at guttering and gadding for twelve months will not live for three years.

D. G.  
Snodgrass.  
19 Oct., 1896.

20939. What happens to him? Well, I am not a medical man, and it is rather difficult to answer the question. But I know that the men appear to contract a disease, which resolves itself into a form of consumption. They get gradually weaker and weaker. They get less and less breath, until they are not able to walk up the slightest hill. Finally, they lie down and die. It used to cost us a good few pounds to keep them going—that is, to keep them alive. They used to come down to us at the works, when they were able, and get some help from us. Besides giving them money ourselves—Mr. Carter generally used to do that—we used to get up subscription lists and collect money from the other men; we heading the lists ourselves.
20940. Did you raise this objection to guttering and gadding when the department wanted the work carried out in that way? Yes.
20941. Did you get out a list of the names of men who had died through the effects of guttering and gadding? Yes; the list was shown to Mr. Hickson and Mr. Davis.
20942. As to the ventilation of the tunnels—taking the North Shore Contract, for example—how did you arrange with your men about that;—what was the method of procedure? I gave them the machinery—that is, the winding engines—which were driven by steam. I fixed the fan and the pipes down the shaft and the men themselves used to fix the pipes as they drove the tunnels.
20943. Who blew the air? The engine drivers.
20944. That would be where you had engines; but what was done where you had no engines? We fixed a hand fan, and the men used either to blow air themselves or hire a boy to do it. They would generally hire a boy.
20945. It was part of their contract then? Yes.
20946. You had nothing to do with that? No; I used merely to fix the fans and the pipes down the shafts. The pipes in the drives were fixed by the men themselves.
20947. So that if the men failed to do that it was their own fault? Yes.
20948. Do you remember having in your employ a man named Jack Reid? Yes.
20949. What was he? Walking ganger, I presume, would be the appropriate term for him.
20950. What sort of man was he as regards looking after the work? He was a pretty good man; very attentive and trustworthy.
20951. Did he take a glass at any time? Yes.
20952. Have you anything to say with regard to him? No; I do not know that I have.
20953. Do you remember a man named Dawson, a bricklayer's labourer? I remember that there was a bricklayer's labourer named Dawson, but I should not know him if I met him in the street now.
20954. Was he a good man, do you know? I suppose he must have been a pretty good bricklayer's labourer or he would not have been with the gang. As a rule the bricklayers' labourers were considered amongst the best men on the works.
20955. You paid them well? We paid them higher wages than we paid the average run of men.
20956. Had they heavy work to do? Yes; I suppose theirs would be as heavy work as any on the job.
20957. Do you remember getting Contract 79A? Yes.
20958. How did you get it? From the Minister without tendering for it.
20959. Was it a tip-top job which if put up to tender would have gone from 20 to 40 per cent. less? I do not think it would have gone 5 per cent. less.
20960. Was it given to you upon your original schedule for Contract 79? No.
20961. Upon what schedule did you get the work? Upon a schedule made up by the department.
20962. Do you remember the contract you had at Marrickville? Yes.
20963. Did you make up the tender for that contract? Yes.
20964. Did anyone besides yourself see the tender before it was put in? No one, with the exception of Jack Reid, saw it. He checked the additions.
20965. Did Mr. Carter see it? No.
20966. Did I see it? No; I think you were in Adelaide.
20967. You made out the tender upon your own idea? Upon my own responsibility entirely.
20968. Did Mr. Carter know the amount which was put down in the schedule before the tender was put in? No; he did not know what the total amount was until I asked him for a cheque for our preliminary deposit.
20969. What did Mr. Carter do in these matters? He looked after the financial business, buying the material, paying the men, and things of that sort.
20970. Is he anxious about the profit? Sometimes when we were putting in a tender he would say "How much have you put in for profit?" I would tell him, and he would then sometimes say "That is not enough, is it?"
20971. Is that all he troubled himself about? That is all.
20972. Will you look through the schedule of 69 and explain to His Honor any points which you consider require explanation or any points which His Honor would like explained. Take, for instance, the first four items;—how did you come to put them down at the one price? I thought that all those quantities would turn out considerably less than shown, and, instead of actually putting down the actual values opposite to them, I put in a low price, and carried the difference on to some items which I thought would probably be increased. That is the common way of making up tenders under conditions such as those upon which this job was tendered for. The first four items I thought would be considerably decreased. The next item—No. 5, soft ground excavation—I thought would be increased. The next three items I thought would be increased, and I put a good price opposite to them. The next three items—9, 10, and 11—are practically one, and the same thing applies to them. As to items Nos. 12, 13, 14, and 15, it seemed to me evident that they would be decreased, and therefore the price is small. Item No. 16 I thought would be considerably increased, so I put a very large price opposite that. The next items—17, 18, and 19—I thought would be decreased. Of course I am speaking from the prices I see here now. I cannot speak definitely from memory of what I thought at the time, because it is some years ago since this thing happened. The next item, No. 20, I expected would come out at somewhere about the quantity shown. The next item is one which requires no price at all, but the tender would have been informal if we had not put in a price. That item depends upon the quantity of soft ground tunnelling, for which I had allowed a pretty liberal price.
20973. *His Honor.*] That would cover the timber? Yes. The next item is a matter of indifference; it

D. G.  
Snodgrass.

19 Oct., 1896.

is only a small quantity. I come now to subducts. The specification provides that the subducts have to be cut out, and the quantity excavated is paid for in tunnel work, so that that pays for the subducts. No price for them is therefore necessary.

20974. You had a good price for excavation? Yes. If you allow a good price for excavation you have a good price for subducts. That applies to items 23, 24, 25, 26, and 27. I do not think I need go through the whole of these items, but coming to item 34, cement rendering, that is an item I expected to be considerably increased. Unfortunately for us, we fell into the mud over that.

20975. *Mr. Gummow.*] What were the grounds of your expectation? I took out the quantities, and, according to my idea, there would be about 15,000 yards of rendering, but it turns out that there were only 10,000. We received instructions from the Government not to render the brick arches. I had made up my estimate, including the rendering of the brick arches, and I thought about 15,000 yards would be required. I thought we were going to get a good plant out of that item, but it did not come off.

20976. What have you to say about item 36? The probable quantity given in the schedule is 12 cubic yards, but I estimated that from 34 to 36 cubic yards would be required, and I put down £50 a yard.

20977. As to items 33 and 34, what have you to say? As regards those items, we put down, as a rule, a small price, because we reckon that the price for excavation includes the removal of surplus spoil.

20978. Have you anything to say as to items 46 to 82? We got a tender from Mort's Dock for the supply to us of all our ironwork, and we added some £40 or £50 for our own trouble.

20979. With regard to the item for guttering and gadding in hard sandstone, when you made up this tender, had it been the practice of the department to make you do guttering and gadding? It was only done in case of necessity.

20980. What do you mean by that? Cases were it would be dangerous to important buildings over the sewer to blast.

20981. With regard to the surplus material, had you to remove all surplus material yourselves on these contracts generally? No; very often we got paid for the stuff. Persons would come and ask us to let them have some stuff, and we charged them so much a load for it.

20982. Do you at times let them take it away for nothing? Yes; in fact, on that very job we arranged with the Marrickville Council to take the rubbish away. We give them whatever we can spare of the good stone, providing they cart the rubbish away. [*Vide Appendix No. 80.*]

20983. As to the extra quarter of a mile lead, what do the department do with regard to that, as a rule? They generally say that they will let you do what you like with the stuff, allowing half a mile lead.

20984. This penny for every quarter of a mile extra is not often paid? Very seldom, that I know of.

20985. The excavation, as a rule, is close to the temporary spoil bank? Yes; I do not know of a case where it has been necessary to remove it from the spoil bank. I have seldom seen in the final certificate any item for extra lead.

20986. Supposing you are allowed to leave the stuff on the ground, are you paid anything then? For the first half-mile lead.

20987. What have you to say about the bluestone pitchers at £50 a square yard? I suppose that the whole of that item, less the cost of putting in the pitchers, would be profit. We do not work for nothing. We expect to get some profit out of it.

20988. You cut down other prices to allow for that? Yes.

20989. So as to bring your total lump sum down? Yes.

20990. As to the payment for these bluestone pitchers, do you remember having any dispute about them; do you remember anything arising in connection with them? Yes; Mr. Davis said the item would be cut out altogether, that we should not get anything for it; but I said the department could not do that.

20991. What action did you take then? When Mr. Davis refused to put the item in the certificate, Mr. Carter and I went to Mr. Hickson about it. At first he said he did not think we had a right to get paid for it; but, after reading the specification, he said that he did not see how to get out of it, and the Government would have to pay for it, but that he would pay only for the quantity shown in the approximate quantities. Then I pointed out to him that the quantity shown there was mentioned as being only approximate, but that the work was to be paid for according to the quantities as actually executed. He then said that the work would have to be paid for, but that he would not order any stone to be put round manholes where it could be avoided; that the stone would have to be put in where shown on the plan, but that he would not order any to be put in in any case where it was not so shown.

20992. *His Honor.*] What did you say to that? I was satisfied. We put in the pitchers where they were shown upon the plan, and got paid for them.

20993. *Mr. Gummow.*] Did you not put in any more than were shown upon the plan? No.

20994. *His Honor.*] Did you not finally, under Mr. Darley, put in a few more than were shown upon the plan? Not to my knowledge, at any rate.

20995. *Mr. Gummow.*] Do you know a man named Darcus, a carpenter? Yes.

20996. Was he a foreman? No.

20997. Had he charge of any men? No more than a carpenter would generally have with a concrete gang. The carpenter fixes the ribs, and he will tell the men how the lagging and things should be put on, but he has no authority over them.

20998. Has he anything to do with ordering them in their work, or telling them what concrete is to be put in? No.

20999. Did you have to appeal to him when you wanted to know anything about the engineering on the carrying out of the work? Hardly.

21000. You were quite capable of doing it yourself without his assistance? Yes; I taught him a good deal of what he knows now about sewerage work.

21001. Where? On the Rushcutters' Bay contract.

21002. He was under you there? Yes. He knew scarcely anything about the work then. He did not know how to make a common rib for an ordinary sewer, and I taught him how to do it.

21003. You were his boss, were you? Yes.

21004. Do you remember any sewers being altered from a duplicate to a single sewer? Yes; on the Marrickville contract.

21005. Can you remember whether any ribs had been made for the duplicate sewer? Yes; a number of them. I forget now how many.

21006.

D. G.  
Snodgrass.  
19 Oct., 1896.

21006. Do you remember going to Mr. Davis, with regard to the making of these centerings? Yes. I objected to an alteration being made in the design without our being paid for the work we had already done upon the original plan. It was thereupon agreed that we should get paid for making the ribs.

21007. Do you remember what they cost, roughly? I have no idea. As far as I can recollect, I told Darcus to make up the cost of the ribs.

21008. Did you suggest to him that he should charge 500 per cent. more than they were worth? No; I told him to make up all the timber and iron and his own time.

21009. As a matter of fact, what did you think of Darcus himself while he was in your employ? He was a thoroughly good tradesman, but an interfering fellow.

21010. Did you engage him? Not at Marrickville. If I could have helped it—I could have helped it in a way, but I should probably have had a dispute with some of my partners had I objected to his being on the works—I would not have had him there.

21011. He was not a particular friend of yours;—he was not a person to whom you would trust your confidence, supposing you intended to work some little swindle? No, certainly not.

21012. At Question 2202 you will find that Darcus gave this evidence:—

What did Mr. Snodgrass tell you to do? He expected me to put on about twenty times the amount.

I said, "That is the correct thing; you can do the rest."

? That is a lie.

21013. Do you remember measuring up the Premier-street shaft chamber? Yes.

21014. What sized chamber was it? A good big chamber. It was hardly as big as this room, but it was somewhere near it.

21015. Do you remember taking the cross-section in connections with it? Yes. We had rather an awkward job. The ribs were set for the concrete work, and it was hard to get at the measurement. Mr. Gibbs and I went out to measure the work up together. If I recollect rightly, Darcus did the measuring, and Mr. Gibbs and I put the figures down. Darcus had to measure off the ribs. He had to climb about all over the place, but I told him to do the best he could. We put the measurement at specified places all round the ribs. Darcus got a stick, and put it up from the ribs out to the rock.

21016. Did you take cross-sections in the usual way? Yes, as is always done.

21017. Had you your ribs set up at specified places? They had to be set up in specified places, in accordance with the design for the concrete.

21018. Did you take measurements from each rib? Measurements were taken from each alternate rib, if I recollect rightly. I asked Mr. Gibbs where he would have the measurements taken, and it was he who suggested each alternate rib.

21019. So that whatever was done in the measurement was done with the sanction of the department? Yes.

21020. You took the measurements regularly at specified distances? Yes; we arranged to take a certain number round a half-circle. I forget what the number was now, but I think it was five or six, and we took the average from those. The measurements were all taken at the same angle of the ribs, to whatever point the rock would come to. We might have gained or lost by it, but it seemed to us to be the fairest way of doing the work. It was not an exact measurement, but it was the nearest approximation we could get.

21021. Did you pick out the big holes when measuring? No; we took them in radial lines, as they came.

21022. If Darcus has stated that you told him to do the best he could, would that mean that he was to take all the big holes? No. If I said it at all, what I meant, I suppose, was that he could do the best he could in climbing about the ribs, because it was an awkward place to get at. He was talking about making stages for the measurement, but that would have taken about half a day at least, and Mr. Gibbs would not have waited. The work would probably have had to stand over for two or three days longer.

21023. Was there any inspector there? Yes; I think Tudgay was there, and wherever he could get up on to the centering he checked Darcus in his measurements. He had a candle, so that he could watch where Darcus was holding the stick, to see that he did not overstep the mark.

21024. If you were taking the sections of the chamber again, as a Government officer or inspector, would you consider that you were taking the fairest course to obtain an approximate measurement if you repeated what you did on the occasion to which you have just referred? I daresay we might have got a little closer by taking sections at each rib instead of at alternate ribs. Anyway, we got a close approximation.

21025. Did you consider it a fair approximation for both sides? As far as we could get it. I could not tell whether we gained or lost by it.

21026. Do you remember the iron pipe laying down there? I saw a little of it.

21027. Could you say anything with regard to that work, as to whether it was properly done? On several occasions I was down with Mr. Griffiths when they were laying pipes. I thought they were putting in thoroughly good work, and Mr. Griffiths thought so too.

21028. If, in the laying of the pipes, you came across a gas or water pipe which had to be removed, who would have to bear the expense of removing it? The Gas Company if it were a gas-pipe, and the Water and Sewerage Board if it were a water-pipe.

21029. The contractors had nothing whatever to do with the expense? No.

21030. So that the removal of the pipe did not make any difference to them? It made a difference to them in this way—that if they came to a pipe which was unanticipated they might have to knock off their men for a day or two.

21031. But they would not have to pay for the removal of the pipe? No.

21032. So that if any method was adopted by the department of getting round, over, or under a pipe, it would not be a saving to the contractors? No; that was done on several occasions where pipes came across the middle of a shaft. The shaft in those cases has been removed a foot or two to allow of the work being carried on without altering the pipe.

21033. Do you remember Emily-street, on the Marrickville contract? Yes.

21034. Do you know what the packing over the top of the brickwork was done with in that case? Shale.

21035. Why? Because it was considered good enough for the work. We were ordered to do it with shale.

21036. Were you paid for it as concrete? We were not paid for it at all.

D. G.  
Snodgrass.  
19 Oct., 1896.

21037. Why? We only had 1s. a yard for it, and the quantity was so small that the trouble of making it up, it seemed to me, was greater than the value.
21038. You got paid for it as surplus at 3d. per yard? Yes.
21039. Do you remember the Monier arch work in Contract 77? Yes.
21040. Do you remember who made up the schedule in the case of that contract? I made up the schedule both for the Government design and for the Monier design. If I recollect rightly, you went over the schedules before they were finally sent in. I am not sure about that. I am sure, in any case, that I made up the estimate for the departmental design upon my own responsibility.
21041. What did you make it off? The specification, I think.
21042. That is with regard to the departmental design? Yes.
21043. But with regard to the Monier design? Mr. Baltzer had made a design—in fact, he was nearly being late with it. He had scarcely got it finished when it was time to put the tender in.
21044. Do you remember making up the tender for the departmental design? I have a slight recollection of it, but I cannot remember the particulars.
21045. Were you prepared to go on with it at the price at which you had tendered? Yes; we would have gone on with it if our tender upon that design had been accepted.
21046. Would you have made any money upon it? We should not have lost money, but we should not have made any. We might have made £100 or £200, but I am sure that we should not have lost.
21047. Do you remember telling anyone that if the department had accepted your tender upon the departmental design you would not have gone on with the work? I cannot remember saying it, but I may have done so. If I did say so, it would probably have been to some rival contractor.
21048. You think you may have said so to someone? Yes, it is very likely.
21049. For what reason would you have said it if you really had no intention of refusing to carry out the work? It was only a bit of bluff.
21050. That is quite a usual thing with you? Yes; I think, if I remember rightly, I have done the same thing with you when we have been tendering against one another.
21051. Is it not the practice among a number of contractors to try to pump one another when they meet in the street—is it not a little way they have got? Yes.
21052. I presume you do not tell everyone what your business is? I do not.
21053. Do you know a contractor named Thomas Williams? Yes.
21054. Did you ever tell him that if your tender upon the departmental design for Contract 77 had been accepted by the Tender Board you would not have taken up the work? I cannot remember telling him so, but it is quite possible that I may have done so.
21055. What was the object you had, supposing you said such a thing to him? Mere bluff.
21056. Did you ever tell him, in reference to the bluestone pitchers, that you saw the schedule of quantities before it was printed, and that you had it fixed up to suit yourselves? No. I never in my life saw a departmental schedule of quantities before it was printed.
21057. Had you the run of the Government offices in any way, so that you could get in to see all these things? No.
21058. You are quite satisfied that you have never seen the MSS. of schedules before they were printed? Never once.
21059. And you did not tell anyone that you had seen them, and that you had got them fixed up to suit yourselves? No.
21060. Can you recognise the handwriting on the document I hand you? It is your own, I believe.
21061. Look at it again;—do you think it is my handwriting? Now I come to look at it, I think it is Norman's, but it does not look like his writing either.
21062. Can you recognise any of the prices, and do you know where Norman or anyone who wrote the document would have been likely to get them? They might have got them from an estimate I made up.
21063. Can you recognise the document in any way, either as to prices or quantities;—is there anything on the face of it which brings it to your mind as being a copy of your estimate? I can remember the prices I put in for the tunnelling and the sandstone concrete on the Monier contract. I remember those prices, right enough.
21064. Where was I at the time you made up that estimate? I fancy you were in Adelaide, but I could not say definitely.
21065. Is the document I have handed you a copy of your own estimate? Yes; it appears to be a copy of my estimate.
21066. Do you remember whether I agreed to it? I am certain that you agreed to it before we put it in.
21067. What price had you there for mortar? 70s.
21068. Do you consider that a fair price to put down for mortar? It is just about a fair price. I do not think it can be done for many shillings less.
21069. Can you remember the price you put in for the departmental design? No; but I think it was some £600 or £800 more than our price for the Monier design.
21070. Do you remember the percentage below the Government schedule for the departmental design at which we tendered? It was 28½ per cent. below, I think, but I am not quite certain.
21071. The price then would amount to £15,757? Very likely.
21072. What was the price of the lump-sum tender? £15,500, I think.
21073. How did you arrive at that £15,500? We made up an estimate of the probable cost—£14,677, I think, it came to—and we put in the difference as profit.
21074. Why did you fix upon the £15,500? We wanted to have our tender upon the Monier design below our tender on the departmental design.
21075. And you say you put in your tender upon the other design at cost price? Yes.
21076. What was your object in tendering at cost price;—did you not want any profit? We had an idea that if we could do the work for less upon the Monier system, and if it could be made as efficient a job, the department would accept the design.
21077. Had you any reason for knowing that they would? I think the Minister for Works said that, providing the Monier system could be carried out efficiently at a cost cheaper than could the departmental design, he had no objection to it.
21078. Did he tell you that? No.
21079. Where did you get that knowledge from? Mr. Carter told me.

21080.

D. G.  
Snodgrass.  
19 Oct., 1896.

21080. That the Minister was willing to accept the tender upon the Monier design? That he was willing to consider our design—that if it proved to be as efficient as, and cheaper than, the departmental design, he would take it into consideration anyhow.
21081. Do you know the regulations for tendering? Yes.
21082. Do you know that the department could throw out a tender which was not sent in upon particular lines? Yes; that was the reason, I take it, why Mr. Carter went to the Minister beforehand. He wanted to have the thing under consideration.
21083. Do you remember if the probability was discussed by Mr. Carter, yourself, and myself, as to whether, if we were not the lowest tenderers for the departmental design, the Monier design might not be looked into? Yes; I remember that distinctly.
21084. Do you think that that idea had any bearing upon our putting in our tender upon the departmental design at cost price? That was the sole reason.
21085. You say you would have been quite prepared to go on with the departmental design if the department had refused to accept your tender upon the Monier design? Yes.
21086. Do you remember who tendered for the Monier design—who were the parties who tendered upon it? Mr. Carter, Mr. Gummow, and Mr. Snodgrass.
21087. Do you consider that the department looked to Mr. Forrest and to Mr. Gillan in connection with that contract? They had no power to look to them under that tender.
21088. Did they make you sign as Carter, Gummow, and Snodgrass, individually and collectively? Yes.
21089. You did not sign as Carter, Gummow, & Co.? No.
21090. Each party, then, would be responsible to the department for the contract? Yes.
21091. And in that case the department could not look to Mr. Forrest or Mr. Gillan? Certainly not.
21092. Do you know whether in any contract with which you were connected, as a member of the firm of Carter, Gummow, & Co., in New South Wales, Mr. Gillan's name is shown in the departmental papers;—did he sign any of the papers, do you know? No; I am pretty sure that he did not.
21093. Do you know whether Mr. Forrest signed with Carter & Co. after the Shea's Creek contract;—did he sign for Contract 79? No; I do not think so.
21094. If he did not sign for that contract, would the department have any right to look to him in any way? Certainly not.
21095. Did you consider that when the names of Mr. Forrest and Mr. Gillan were sent in as sureties? Yes; we discussed that matter.
21096. And you considered that the department had nothing whatever to do with them? Nothing whatever.
21097. Do you know what sand was used in the Monier work upon Contract No. 77? Up to the time I left Sydney the sand was being brought over from North Shore. There were some hundreds of yards in a heap ready for use at the time I left Sydney. We got North Shore sand specially, because, on testing it, we found it the best sand we could get for the Monier work. We considered that the price was no object, so long as we got the very best possible material.
21098. As regards that particular work, the firm was determined to get the very best possible article? Yes.
21099. Do they consider the cement? Yes; they considered the cement for a long time, and they determined, for the Monier work, to get Germania cement.
21100. Do you remember Contract 118, at Johnstone's Creek sewer? Yes.
21101. Did you make up the tender for that? Yes; by myself, I think.
21102. Do you remember walking over the ground with me? Yes. I remember thinking that the tide was in at the time, but it turned out afterwards that, instead of what I saw being the tide, it was the Government pumping sand and water from the harbour over the breakwater and filling the whole place up.
21103. Do you remember speaking about the drainage of this water from the work during the time you were managing partner there? Yes; I remember saying to Mr. Carter one day that I thought it was not reasonable that we should have to keep pumping water out while the Government were pumping it in, and that their doing so would almost give us an action against them.
21104. Do you remember what course was taken? I think Mr. Carter went into the office, and saw Mr. Hickson. At any rate, Mr. Hickson came out, and, as soon as he saw what was being done, he said that that sort of thing would never do, and that the drain should have been cut some time ago to allow the water to drain away without carrying away the silt that was being pumped up for the reclamation.
21105. Did he make any concession to us in cutting that drain? No, decidedly not; because he had no right to pump water on to our works.
21106. Do you remember what the Johnstone's Creek sewer was built of? Sandstone concrete.
21107. Do you remember obtaining the sandstone for that contract? Yes.
21108. Were you given any trouble in connection with it? I went to a quarry in the neighbourhood, and got a quotation for stone which was guaranteed to come up to the Government standard. When I was prepared to go on with the work, I went round and told the quarrymaster to start sending us the stone. He had agreed to supply it at 1s. 6d.; and he said, if I recollect rightly, that he would send some in at once. I think I said to him "Put on as many carts as you like. You can cart it in as fast as possible." After waiting three or four days, no stone came, and I went to the quarry to see what was the matter. The man then said that he could not supply the stone at the price he had agreed upon, and he wanted 3d. a yard more. I said "I will not give the job to you at all." I then looked all round the country, and I finally hit upon Ryan's quarry. His stone had been used for different sewer work, and had passed the Government test. I agreed to take it at 2s. a yard, a higher price than that for which the man in the district had offered to supply the stone.
21109. What was the reason for that? I thought the first man was trying to take an advantage of me. He offered me the stone, in the first place, at a fair price, and he afterwards thought that we should be forced to deal with him; that he had us under his thumb. I preferred to give a higher price for the stone, and to be independent of the man.
21110. You did not pay the higher price because the first stone you agreed to get was not good enough? No.
21111. Did you get the whole of the stone required from Ryan's? No; from various quarries.
21112. How was that? We used to get a man named McMillan, who had a number of carts, to supply the stone; but he could not get enough at Ryan's quarries, and he therefore went to other quarries where the stone was up to standard.

D. G.  
Snodgrass.  
19 Oct., 1896.

21113. Do you remember a man named Flood? Yes; he supplied a lot of stone.
21114. Did he supply it cheaper? Yes; I think he did.
21115. Do you know where he got it? At a quarry in Annandale, I think.
21116. Do you consider that it was as good stone as the other? It was just about as good. It was stone which had been passed by the Government more than once. It came up to the required standard.
21117. Were you always particular to watch that the people who delivered the stone gave you a material which was up to the Government standard? Yes; because if inferior stone came in, it caused us a lot of bother.
21118. Did you then get stone cheaper than the stone originally ordered from Ryan's quarry, on account of the stone's being an inferior stone? No; all the stone was up to the mark.
21119. Do you know whether the quarries in the neighbourhood came down in their prices when they found that you were independent of them? Yes; they then offered to supply the stone for less money.
21120. Had you anything to do with the building of the Monier arches? No; except the building of the ribs.
21121. But you had nothing to do with the building of the arches themselves? Nothing whatever.
21122. In purchasing a material like cement, do you purchase it at your own risk, or at the risk of the merchant? At the risk of the merchant. We buy it subject to its passing the Government test.
21123. And if it does not pass, what then? The merchant has to pay for the carting out to the work and the carting away again. I remember that we have sometimes given the cement-carters a hand in loading when cement has been condemned, and we have charged the merchants with the men's time.
21124. Do you remember a culvert being built on the Parramatta Road, near Strathfield? Yes; on the Monier system.
21125. Did it collapse? No; but it was not well put together. The men who built it did not understand the system, and carried out the work very badly. About eight days after the first half was built I was informed, however, by the foreman, a man who was working under the Government on day-work, that a 22-ton waggon passed over it.
21126. Did the work collapse? No; there was not a sign of fracture.
21127. And you never heard of it's collapsing? No.
21128. Yet you do not consider that it was well built? No; the mortar was badly put round the iron. I made a man cut off a lot of it one day while I was there.
21129. As to the question of books, do you know what books the firm ever kept? Carter & Co. never kept any books whatever, and I do not think Carter, Gummow, & Co. kept any either.
21130. How did they keep things going? I think they relied upon their bank pass-books.
21131. How did you pay the men? We had pay-sheets, and we put paper-fasteners through each fortnight's sheets and stuck them in the pigeon-holes while the job was in hand. When we had finished the contract we used to burn the papers in connection with it.
21132. As to dealing with the merchants, how did you do that? We either paid cash or P.N.s., and when the P.N.s. became due they were met.
21133. You really kept no ledger? No.
21134. Did you always meet all the bills and payments you had to make? Yes.
21135. With regard to the connection of young Mr. Hickson with the firm, do you remember anything about his first employment by the firm? I was down in Adelaide, giving you a hand with the carrying out of the work there. I could not stop there myself, and young Mr. Hickson came down. I had to come back here, and Mr. Hickson went down there to assist you in the alignments and levels.
21136. You yourself had nothing directly to do with the employment of young Mr. Hickson? No.
21137. Who employed him? Mr. Carter.
21138. How long do you think you were in Adelaide assisting me? Three months.
21139. Had you other duties to perform here? Yes.
21140. So that you could not be kept down there? Certainly not.
21141. Did you consider that young Mr. Hickson came in your place to assist me? I daresay you could have done the work yourself, but, as I often told you, I did not see why you should graft night and day to do work when we could afford to pay for assistance.
21142. As a matter of fact, were you and Mr. Carter not always speaking to me about doing more work than I should do? Yes; I would often say to you "Why do you not get someone else to make up the pay-sheets instead of messing away your time at that?"
21143. It was a standing joke between us that I did more work than I need do? Yes.
21144. After young Mr. Hickson had been to Adelaide he came up to Sydney, did he not? Yes.
21145. Do you remember his employment by the firm in Sydney? Yes; I had him with me on the Johnstone's Creek sewer, taking cross-sections and levels.
21146. Did he do his work properly? Yes; he was sometimes a bit slow, but I think he was fairly accurate and efficient. I have had worse engineers working with me than young Mr. Hickson.
21147. Do you know what salary he got? Yes; £4 a week for a considerable time, and then his salary was raised to £5.
21148. Do you consider that he earned his salary? I should not like to do the work he did at Johnstone's Creek for £5 a week.
21149. You do not know what his duties were in Adelaide—you had nothing to do with him there? No.
21150. Do you know of any telegram or letter being sent down there as to young Mr. Hickson's connection with the firm? There was none that I know of.
21151. Was he ever a partner in the firm? Certainly not.
21152. Had you any idea of taking him into the firm as a partner? No; and I would not hear of anyone else doing so either.
21153. Not in any firm with which you were connected? No.
21154. So that there is no foundation for the report that that was to be done? No; and I do not see how a report of that sort could arise. I do not know of any idea on the part of any member of the firm of taking him as a partner.
21155. Did he get anything beyond his salary? I believe he got three months' screw in lieu of notice.
21156. Where did you hear that;—were you a member of the firm at the time? I think I heard it before I went away to New Zealand.

- D. G. Snodgrass.  
19 Oct., 1896.
21157. Do you know of your own knowledge that young Mr. Hickson got that? No.
21158. You did not give it to him yourself? No.
21159. You simply heard that he got it? Yes.
21160. It was not part of your money? No.
21161. You severed your connection with the firm at the end of last year? Yes.
21162. You are no longer a member of the firm of Carter, Gummow, & Co.? No.
21163. Do you remember Mr. Bagge? Yes.
21164. You knew him when he was in the department? Yes.
21165. Do you remember, after he had been retrenched, hearing anything about him? I remember meeting him at Rushcutters' Bay one day, when he spoke to me about starting a poultry farm, and asked me about a carpenter. I think he also said something about getting the material. I told him of the name of a carpenter I thought would suit him very well. I am not quite sure now whether he asked me or whether I offered to buy the material for him. Anyhow, I did it upon my own responsibility. I did not suppose that any member of the firm would make any objection. I afterwards purchased the stuff for him. It came to about £170 as nearly as I can recollect.
21166. Did you make any profit out of the transaction? No; we merely handed on the invoices we got from the merchants. It was only a friendly transaction.
21167. It was not a business transaction at all? No.
21168. What did you do it for then? Well, Mr. Bagge was an old man. He was out of a billet, and I do not think he was too wealthy; and I thought I might save him a few pounds if I bought the stuff for him. If he himself had gone to the timber merchants I thought it possible that the merchants might charge him a high price for what he wanted. As we were dealing in a large way, of course we could get the stuff wholesale.
21169. Did he ever, while he was in the department, do you such a good turn that you should have been so kind to him afterwards? I do not think he ever did me a good turn.
21170. Did he ever do you a bad one? Yes; in a way, I think he has done so.
21171. Do you know whether he had any prospect of getting ready money? He had a retiring allowance which he expected to get, and I said it was on the strength of that that I would get the stuff for him.
21172. Do you think he himself had any credit at all? I do not think so.
21173. You thought it would be easier to order the stuff for Mr. Bagge than to listen to him, telling you what stuff he required, or asking you to assist him in ordering it? Yes; I thought it was much better that he should make up a list, and give it to us to send on. Mr. Bagge is very deaf, and he is a very hard man to talk to.
21174. Do you know Mr. O'Hanlon? Yes.
21175. What was he when you knew him? An engineer in the department.
21176. Do you remember whether he was on any of your contracts? Yes; on the North Shore contract—60, I think, was the number.
21177. Do you remember his getting married? Yes.
21178. Do you remember whether Mr. Carter gave him a wedding present? Yes; I think it was three spirit bottles in a stand.
21179. Do you remember assisting Mr. O'Hanlon in the same way that you assisted Mr. Bagge? I remember Mr. Carter coming to me and telling me that he was going to lend Mr. O'Hanlon some money. I was not asked to do it.
21180. Do you remember assisting Mr. Rudolph? It happened, I think, in the same way. Mr. Carter did it. He did not ask my permission, or anything of that sort. He did it "on his own."
21181. You knew of it? Yes.
21182. Do you remember a transaction with Mr. Weedon? Yes.
21183. Had you anything to do with that? No, I was not spoken to about it.
21184. As to the concrete work—do you know what the quantities are in the mixing of bluestone concrete? Sixteen feet of stone, 8 feet of sand, and a barrel of cement.
21185. Do you know what the mixing of bluestone concrete will make, speaking roughly? From 21½ feet to 22 feet.
21186. And what will the mixing of sandstone concrete make? As nearly as possible, a cubic yard.
21187. Are those the figures you took, as a rule, to make up your estimates? Yes.
21188. Had you a share in any property at North Shore? Yes.
21189. Where is it? The property in which Dr. Kyngdon is living.
21190. What is it called? The "Lodge" property.
21191. Who are the shareholders in it? Mr. Carter, Mr. Forrest, and myself.
21192. Do the three of you own equal shares? Yes.
21193. Have I had anything to do with it? Nothing whatever.
21194. Have you any interest at all in the firm of Carter, Gummow, & Co. at the present time? An interest in something we are trying to get in Adelaide.
21195. But you are not a partner in the firm? No; I signed a dissolution of partnership some time ago.
21196. Do you hold any other property with Mr. Carter and Mr. Forrest? A section in Miller-street belongs to the three of us.
21197. Do you know a man named Harry Labrees, who worked on the Glebe contract? Yes.
21198. Have you ever spoken to him? Yes; many times. He was working with me for five or six years.
21199. Did you ever tell him that there was any suspicion that he was doing bad work, and that the department had a special eye upon him? No.
21200. Did you ever know of any such suspicion? No; I never heard of it.
21201. As far as you know, was there any defective work done upon any of the contracts with which you are connected? No.
21202. It has been your desire, as a member of the firm, to have the work properly done? Yes.
21203. Have you endeavoured to have it properly done at all times? I think so. I think the department can testify that our work has always been done as well as any work of the kind could be done.
21204. *Mr. Davis.*] I suppose you have kept yourself in touch with what has been going on upon this Commission? I have not heard a word about it from the time I started away from the Colony until Mr. Carter and I were talking about it yesterday afternoon for a short time. With that exception, I know nothing

D. G.  
Snodgrass.

19 Oct., 1896.

nothing of it. I have not seen a Sydney newspaper for the last five or six months until yesterday morning, nor had I had any letters from anyone in Sydney telling me about the Commission.

21205. You said just now that you could make up a schedule better than could any officer of the department? Yes; and I think so still.

21206. In fact, I think you pride yourself that you can make up a schedule to suit the contractor as well as can anyone? Yes.

21207. You know that there was a change made in the system of tendering? Yes.

21208. Will you tell His Honor how you regard it? I do not like it at all. It gave men who had no experience in the carrying out of works as good a chance as had men who had spent a lifetime in learning how to do it.

21209. Can you tell His Honor how the change of system affected Carter, Gummow, & Co. in tendering? Carter, Gummow, & Co. were the most experienced contractors in their line in Sydney, and the change gave other contractors, who had less experience, just as much chance of getting a job as had Carter, Gummow, & Co.

21210. So that, while the department was not able to make up schedules in the same expeditious and advantageous way that Carter, Gummow, & Co. could do, they were able to cope with the firm? Yes; that is the reason I left the firm. I thought it was not good enough to carry on contracting under the system you had introduced here.

21211. I ask you again whether you received any assistance from any officer of the department in preparing your tenders? No. I should not consider any officer of the department capable of giving me assistance.

21212. Is there anything that any officer of the department could give you in the way of information which would have been of assistance to you? No.

21213. Take the 12 square yards of bluestone pitchers in Contract 69—did any officer of the department call your attention to that? No.

21214. Did any officer of the department call your attention to the probable quantity of rendering? No.

21215. Was your object in putting in a big price for cement rendering the same object that you had in the case of the bluestone pitchers? Exactly the same.

21216. Have you had any financial dealing with either Mr. Hickson or myself, or are you aware of your firm having had any financial dealings with either of us? To my knowledge there have been none.

21217. You are aware of no private financial dealings with either Mr. Hickson or myself on the part of any member of the firm? None; and if the firm had had any such dealings I am certain that I must have known of them.

21218. I suppose you would regard your schedule of Contract 69 as about as flagrant an instance of the rigging of schedules as any you have had experience of? I do not think it is a flagrant case of rigging at all. I think it is a cleverly made up schedule.

21219. Are you surprised to find that, in putting in such a tender, you made a rod with which to whip your own back? I had to compete against the rest of the contractors, who did exactly the same thing. The one who fixed up his schedule most cleverly, of course, would be the most successful. There is no exception to the practice among the contractors in Sydney. I think our schedule in Contract 69 was about the second-best schedule which has been made up in Sydney. There was a schedule for a pipe contract at the Glebe made up by Mr. Williams, which was a still better schedule.

21220. What would you regard as "better" as applied to a schedule under those circumstances? The one out of which the most profit could be made with the least money.

21221. That is to say, the best final certificate out of the lowest lump sum tender? Yes. This "rigging," as you call it, is a common custom in the four Colonies in which I have been.

21222. It is the custom, you say, to rig the schedules in much the same way as you rigged yours in the case of Contract 69? I cannot say that I have seen as much as that done in the other Colonies, but on one contract upon which I was employed—the Otago Central Railway—there was a good tender made out. I made it out myself.

21223. Did Mr. Baltzer give you any information in respect to any of these contracts? No.

21224. No information that was of any assistance to you? No.

21225. Was Mr. Baltzer in the employ of the firm before he was retrenched? Well, he designed the plan for the Monier arches at Johnstone's Creek. I went round two or three times to the place where he was staying, and sat with him while he was drawing the plan.

21226. The plan was drawn in Mr. Baltzer's own house? Yes.

21227. Did he get anything from the firm for that work? I cannot tell. He had not up to the time I left it. He may have received something since.

21228. *His Honor.*] Do you not regard the £50 for bluestone pitchers as carrying the principle of rigging a little too far? I do not know. Before that a tender had been accepted where the price was 1s. or 2s. a yard for rock excavation, and 10s. a yard for soft ground excavation. That was under the Water and Sewerage Board.

21229. But there the speculation was on something which the contractor thought he knew better about than did the department, and which nobody could be certain about? I thought I knew better about the pitchers than did the department.

21230. Did you not see that there must have been a mistake? I tendered on the contract in Bourke-street some years ago, before I met Mr. Carter at all. It was for the altering of twenty manholes in Bourke-street. There was a small amount of concrete and brickwork. The twenty manhole covers were to be fixed, and I tendered to do the work, putting in 10s. a cwt. for fixing the iron. The department had put down 20 cwt. of iron instead of 20 tons. It was a clerical error, but I took advantage of it, and made £100 profit out of a £50 job.

21231. It was a similar case of clerical error? Yes.

21232. You think it fair to take advantage of clerical errors? I do in open tendering.

21233. Because anyone else may do so? Yes; you must remember that I am competing against other persons in that respect.

21234. *Mr. Davis.*] Was the job to which you have just referred under Mr. Smal? Yes.

21235. *Mr. Parkes.*] Were you upon Contract 72 during the whole of the time it was in course of construction? No; I only went down and visited it once a fortnight or so.

21236.

D. G.  
Snodgrass.  
19 Oct., 1896.

21236. You only went there to visit it? Yes; and to make up the measurements.
21237. Could you say where the cement sheds were upon that job? There was one down near the far end of the job. There was one near the boiling-down establishment; one near the junction of the Macdonald Park and Munni-street; one in Munni-street; and one in Knight's paddock.
21238. How many altogether? Five, I think.
21239. When you were concluding that contract—that is the first portion, which Mr. Hickson stopped—you were still buying cement? No; I do not think so.
21240. Was cement being delivered? It was coming out under a contract we had made at the commencement of the work.
21241. Did your contract compel you to take cement whether the work was going on or not? Yes.
21242. What is the nature of those contracts? You agree to take a certain number of casks of cement making up approximately the number you want for particular contracts.
21243. Do you pledge yourselves to the merchant to take the whole of the casks whether you want them or not? Yes; practically we do. If we find, when we are getting near the end, that we want 100 or 200 less sometimes we approach the merchant and get him not to deliver them. But if the casks were on their way out—if they had been shipped from Europe—we should be obliged to take them. In fact, we paid the Cullen Bullen Company £125 to get out of an agreement which we had with them to supply us for the Waverley contract. The quantity was approximately 3,000 casks, and we had, I think, about 1,000 or 1,500 to come. We then determined to use another brand of cement, "Germania," which has turned out, I think, to be the best brand which ever came to Sydney. We wanted to get out of our bargain with the Cullen Bullen Company, and they made us pay £125 to get out of it.
21244. Was the Cullen Bullen cement condemned? A great deal of it was. Some of it was passed and used.
21245. Who were the merchants delivering at Contract 72? I fancy Parbury Henty, but I could not say. I had very little to do with the supply of material.
21246. Henry Austin was also delivering, was he not, as well as Parbury Henty? Yes; he supplied a lot.
21247. Were those the principal persons off whom you purchased? Yes.
21248. Did you yourself see the quantity of cement which was stored upon Contract 72 at the stoppage of the first portion of the work? Yes.
21249. Where was most of it stored? I think in the Knight's paddock shed, but I am not sure.
21250. You saw Burcombe shifting the cement, did you not? Yes.
21251. Did you notice from what shed he took it? No; I was at North Shore then. I was carrying on the North Shore Contract 79.
21252. And you would see the cement coming to North Shore? Yes.
21253. Where did Burcombe put it? In the cement shed in Alfred-street.
21254. You are sure of that? Yes.
21255. Could you tell us about how many casks Burcombe took across? No; I could not say now.
21256. What kind of dray had he? A two or three horse dray—I am not sure which.
21257. Was this cement taken over at the stoppage of the first portion of the work? No.
21258. When was it taken? Some months afterwards; I do not know how long.
21259. Cement was being delivered on 30th April, 7th May, and 3rd June, in parcels of 967, 994, 184, and 9, 9 being the last lot. If you had that cement stored on the ground, why were you taking delivery of these other cements? I do not know, I am sure. It happened some time ago.
21260. For instance, you bought this cement on 30th April under order from Henry Austin, and on 7th May and 23rd May;—why did you not send that cement direct to North Shore and keep the cement on Contract 72 which you had already there? I cannot explain the reason now. There was a reason for it at the time, no doubt.
21261. You recollect Flood's buying some cement from Contract 72? Yes.
21262. What shed did he take it out of? I could not tell you that; I did not see it taken away.
21263. He took something like 800 casks? I do not know the number.
21264. He paid a cheque for £400 odd? Yes; I remember his paying that amount.
21265. How did the firm pay Burcombe when they paid him? The amount due to him was put in the pay-sheets.
21266. He was paid as a labourer? Yes.
21267. You said in your evidence that cement was carted from the North Shore to the Glebe;—at what time would that be? I cannot tell you.
21268. Can you recollect when the first cement was used on the North Shore job? No.
21269. Were you on the North Shore job from the very first;—from the excavation? No; I was in New Zealand.
21270. You were there when the North Shore excavation commenced? Yes.
21271. About what time did you go to the North Shore contract;—it was when the cementing was starting, was it not? No; that did not commence for a long time afterwards.
21272. How long were you in New Zealand? I was three months away.
21273. It is the custom of contractors to sign the certificate with the engineer for each payment? Yes.
21274. If you signed a certificate upon this contract on the 12th June, 1892, that would be when you first went on to the job, supposing Mr. Carter to have signed the previous certificates? I expect it would be that; but sometimes, when I was on the job, Mr. Carter may have signed certificates. I may have been away somewhere for the time being.
21275. Was the claim which was put in for Contract 72 shown to you before it was made up? I myself supplied the headings upon which the claim was made up.
21276. There is an item in it of 1,300 casks of cement on the job? Yes.
21277. And there is an item of loss on sale of 2,000 casks? Yes.
21278. If you were making up such a claim, would you not have counted the casks of cement and put in the entire quantity? It is rather difficult to count casks of cement in a shed; but, in any case, we could not claim for as much cement as we liked to store upon the job. We could only claim in respect of as much cement as would be required to complete the contract.
21279. You have put in a claim for 2,000 barrels stored in the Knight's paddock shed; but that was not on the job? If it was not on the job, it was in a convenient place for the working of the job.

D. G.  
Snodgrass.  
19 Oct., 1896.

21280. That would be for the second portion when you got it? The second portion was in the original contract. It was all one contract. What you call the second portion was an uncompleted portion of the original contract, with which we were ordered not to go on as the money was exhausted. There were not two contracts, or two parts of the contract. It was all one contract, from the outlet to Munni-street.
21281. But on 13th October, 1891, Mr. Hickson wrote, stating that from the want of funds he would withdraw the upper portion of the contract? We claimed that he had no power to withdraw it.
21282. And ultimately it resolved itself into a suspension? Yes.
21283. Nevertheless your claim refers to withdrawal? Yes.
21284. For withdrawal, absolutely? Yes.
21285. Do you know a firm called Taylor, Britton, and Danaher? Yes.
21286. Do you remember their buying cement of you? I cannot remember much about it, but I think they got some cement from us.
21287. The evidence is to the effect that they bought 600 casks of cement;—where did it go from? I could not tell you. I have not the least idea now; it happened so long ago.
21288. When you first took up Contract 72, did you anticipate getting the channel which was excavated down the bed of the proposed ship-canal? I thought we might get it.
21289. But it was not included in the contract you signed? It was shown on the plan, but I do not think there was a sufficient quantity in the schedule to cover it.
21290. You did not sign from that point? Yes; we did. It was all in the plan we signed, I think.
21291. But it was not absolutely included in the contract? There was nothing to show that it was not.
21292. When you received Contract 79, do you know whether Mr. Carter, before speaking to Bond and Hudson about buying them off, saw any of the officers of the department? I could not say whom he saw or anything about it. I have no knowledge of his having seen anyone in connection with the matter—in fact, I am pretty certain that he did not see anyone.
21293. Did you ever have any words with any officer of the department on the subject? Not in connection with that.
21294. It was rather a big lump of money to give away on the chance of getting the contract, was it not? As I said a little while ago, I regarded it as a toss of the coin for £1,500.
21295. If you were as shrewd in money making as in the making up of schedules, you would not have tossed up a coin for £1,500? I am not as shrewd in money matters as I am in making up schedules.
21296. You must have been pretty certain of getting the contract? I thought, after the arrangement was made, that it was a risky thing to do, and for some considerable time afterwards I had made up my mind to lose the £750.
21297. There was no conversation which you know of about obtaining a contract until Mr. Carter came to interview Mr. Hickson with the claim which has been referred to? There was no mention of our getting the North Shore job until we put in our claim in respect of Contract 72.
21298. That claim you regarded as a lever with which to obtain Contract 79? Yes.
21299. Were you present when Mr. Carter had the interview with Mr. Hickson on the subject? I do not think so.
21300. Did Mr. Carter tell you what had happened? No doubt he did, if he had an interview with Mr. Hickson in regard to the matter, but I do not remember definitely that he had one. If he had an interview it would be most likely that Mr. B. C. Simpson would be with him.
21301. Did you ever hear what transpired at the interview? I must have heard whatever transpired, because, if there were anything of that sort going on, Mr. Carter would be sure to tell me. I do not remember, however, what he said.
21302. As to Contract 77;—did you ever hear Mr. Carter mention an interview with any public officer prior to the date of your putting in your substituted tender? No.
21303. Did you yourself have any interview with any public officer in reference to that matter? No.
21304. Did you ever speak to Mr. Hickson on the subject? No.
21305. Did you ever speak to any officer of the department on the subject? Not in regard to that contract.
21306. Excepting Mr. Baltzer? Excepting Mr. Baltzer, but he was interested in the patent itself.
21307. Did Mr. Baltzer ever have a conversation with you about the probability of your getting the work? No; I do not think he did. He would not be likely to know anything more of the probability of our getting the work than we should ourselves. He had no influence in getting us the work.
21308. Do you not think Mr. Baltzer was going to a great deal of trouble in the matter if he did not ultimately see that he would get the job? I do not think he considered the trouble at all in connection with that matter. He was merely taking his own part as a shareholder in the patent. He was trying to make it a success, I presume.
21309. Would it be his duty to try to get the design accepted? He had nothing to do with getting it accepted or otherwise. He had no say in the matter.
21310. But it would be to his interest to get it accepted? Yes.
21311. Did he never discuss with you the probabilities of your getting that contract? No.
21312. Did he discuss the prices? No; not to my recollection.
21313. When you sat with him at his own house speaking about this work, would you not be likely to discuss the profit which would probably be made upon it? No; because I had not the prices made up then.
21314. In regard to Contract 79, did not all the members of the firm of Carter, Gummow, & Co. receive benefit from it? The only persons who received any benefit from Contract 79 were Mr. Carter, Mr. Forrest, and myself.
21315. Did Mr. Gummow, Mr. Gillan, Mr. Maddison, and Mr. Ewing receive nothing whatever? Nothing from Contract 79.
21316. But in keeping the books, were not the moneys from Carter & Co.'s account transferred to the Banking account of Carter, Gummow, & Co.? No; when we joined with Carter, Gummow, Gillan, & Co. we had to put an even amount of capital down.
21317. On what date did you join? Four years ago, I think.
21318. Was there not an arrangement between you from the start, in October, 1892, that you should draw at the rate of £43 per month. That would be Mr. Gummow, Mr. Gillan, Mr. Maddison, Mr. Ewing, Mr.

D. G.  
Snodgrass.  
19 Oct., 1896.

Mr. Carter, Mr. Forrest, and yourself? While we were in employment. But if any of the partners were out of employment, and had no contract to carry on, they only drew half the amount.

21319. But if the money were drawn regularly by all of you except Mr. Gillan, who, I presume, drew in Adelaide, that would show that you participated in all these contracts? In all the contracts we were carrying on.

21320. You were probably in all the contracts, whether your names appeared or not;—for instance, Mr. Forrest, whose name did not appear in connection with Contract 79, participated in it? Yes.

21321. And Mr. Gummow, out of the general business account, participated? But only out of the moneys of the firm of Carter, Gummow, & Co. He did not participate in the profits of Contract 79. He did not get one three-penny piece out of that contract.

21322. Was not the money for No. 79 transferred to Carter, Gummow, & Co.'s account? No; it never was.

21323. In connection with Contract 79A, which was an extension of 79, Carter and Co.'s contract, the moneys passed through the Treasury as Carter & Co.'s? When we were carrying out 79A we had become the new firm of Carter, Gummow, & Co. The money in respect of that contract, therefore, was paid by the Treasury to Carter & Co., and transferred from them to Carter, Gummow, & Co.

21324. Did you make up the estimate for the departmental design on Contract 77? Yes.

21325. Do you know where it is—have you it? No.

21326. Have you a copy of it? No.

21327. You said that Mr. Bagge did you a bad turn;—what was it? Well, I believe the Monier system would have been in general use in the Colony had it not been for Mr. Bagge.

21328. How is that? Because he ran it down all the time.

21329. He did not run it down, did he, except in so far as he thought it necessary that there should be a good test of the system before it was adopted—that it should have a good trial? He said at once that it was of no use at all, without taking into consideration any trial.

21330. If you read his written reports you will see that all he advocates is that a proper trial should be given to the system? I have not seen his written reports; but I heard him say that the system was no good.

21331. Is there any other reason for your saying that Mr. Bagge did you a bad turn? No.

21332. He did you no other bad turn? No.

21333. Do you recollect Mr. Bagge's going out to Contract 53—the Waverley contract? Yes.

21334. Were you present at the time? I was on the job at the time, but I was not present with Mr. Bagge and Mr. Davis. I was there a few minutes after they had left.

21335. Then you did not see Mr. Bagge there at all? Yes; I saw him from the top of the hill.

21336. There was on Contract 72 a section of the work which was filled by deposit from flood-waters, was there not? I do not remember any; I do not think so.

21337. Are you sure of that? I cannot remember that there was any deposit from flood-water. I do not think there was.

21338. In reply to one of Mr. Gummow's questions, you said that the residue of the spoil taken from Contract 69 was given to the Marrickville Council;—was the stone or material taken out of the job used for concrete? Some of it.

21339. In Contract 77 and the Annandale jobs generally was stone out of the cuttings used in concrete? The stone out of the tunnels at Annandale was used for concrete, and very good stone it was, too.

21340. In regard to Mr. Weedon's matter, do you know anything about his lending £2,000 to the firm? I know Mr. Carter made an arrangement to borrow £2,000 from Mr. Weedon.

21341. Some of the property in which you are interested formed part of the security? I believe it did.

21342. Part of the North Shore property formed part of the security? Yes.

21343. What did Mr. Carter say to you about the matter when he was borrowing the money? He told me that Mr. Weedon had £2,000, which he was talking about investing in building, but that he did not think it was a good time to do so, especially as he might be shifted about the country anywhere. I understood that he asked Mr. Carter's advice about investing the money in some way, and Mr. Carter thereupon said that he would take it himself, and give him interest upon it. After he had agreed to that, Mr. Carter told me about it.

21344. And then the money was used by the firm? Yes.

21345. How did you obtain Contract 79A;—did you approach the Minister? Mr. Carter did that business.

21346. You yourself knew nothing about it? I knew that he had been to the Minister once, and I remember that on another occasion I went with him. When we were sitting talking to the Minister, he called Mr. Hickson down and asked him what was the departmental estimate for the job. Mr. Hickson said that it was £12,800, or something like that. Mr. Lyne then asked Mr. Carter whether he would be willing to do the work for that amount of money. Mr. Carter said that he would, and Mr. Lyne then said, "Very well, Mr. Hickson, that is sufficient." Mr. Hickson suggested that if tenders were called for the Minister would probably get the work done for less money than the departmental estimate, but Mr. Lyne said that calling for tenders would take a considerable time, and that if the departmental estimate was a fair one, and the contractors were willing to do the work at that price, they having the plant and men available, it was better that work should be proceeded with.

21347. Mr. Carter was with you, was he not? Yes.

21348. And Mr. E. M. Clark, the member for St. Leonards? Yes.

21349. Did you ask Mr. Clark to introduce you to the Minister? I believe Mr. Carter did; but I did not.

21350. As to young Mr. Hickson—was there at any time any discussion about taking him into the firm? Never.

21351. There was no probability of his getting into the firm? Not the slightest.

21352. Did he himself ever want to get into the firm, do you know? I never heard so. He may have had such an idea. I do not think, as far as I know, that he ever expected to be in the firm. I do not see that he had any ground for such an expectation.

21353. What was the date of your retirement from the firm of Carter, Gummow, & Co.? I cannot tell you the exact date; but I signed a dissolution of partnership, and that would give the date, I daresay. You have it in evidence probably. Mr. Andrews could tell you the date, because he drew out the dissolution of partnership.

21354. You took out only £2,000? No; I do not think so.

21355.

D. G.  
Snodgrass.

19 Oct., 1896.

21355. You repaid £2,000 to the firm lately, did you not? Yes.
21356. You drew it out and repaid it? Yes.
21357. Why did you repay the £2,000—have you still an interest in the firm? No; but I had drawn £2,000 more than had Mr. Carter or Mr. Forrest.
21358. During the course of all the contracts? Yes.
21359. And you repaid that proportion? Yes.
21360. Of your own knowledge, you cannot speak as to the quantity of cement which was upon Contract 72 at the time of the suspension? No.
21361. *Mr. Gummow.*] With regard to signing the measurement book, can any member of the firm sign it? Yes.
21362. It would not have been necessary for you to have been present on the occasions referred to by Mr. Parkes? No. In fact, I was very likely to be away, and if Mr. Carter was away he might give Reid an order to the Government engineer to allow him to sign for the firm. On several occasions he signed, I believe.
21363. Are you of a speculative turn of mind? I think so.
21364. In giving Bond and Hudson the £750 you absolutely risked it? Yes, absolutely.
21365. You were willing to let it go under any conditions, whether you got the contract or otherwise? It would have gone right enough if we had not got the job.
21366. Did you know when you gave Bond and Hudson the £750 that you were going to get the job? No; and for months after that, I was very much afraid that we should not get it.
21367. It was merely a speculation? Yes.
21368. Regarding Mr. Baltzer, does he know anything about prices? Nothing, according to my idea. He may think he knows as much as I do about them, but I do not think he does.
21369. Would you be likely to discuss the prices of things with him? No; I should regard it as waste of time.
21370. What was Baltzer's duty in regard to the Monier contract? He had simply to make the design.
21371. As to the salaries paid to individual members of the firm, you are quite positive as to Mr. Gummow, Mr. Gillan, Mr. Maddison, and Mr. Ewing, getting nothing from Carter & Co.'s contracts? Certain.
21372. You are quite satisfied that they had nothing to do with Contract 79? Yes.
21373. Or Contract 72? Yes.
21374. Or any previous contract? Or any previous contract.
21375. What was their first connection with the firm of Carter & Co.? On the job we got at Adelaide.
21376. What was the first contract we got together in New South Wales? No. 69—the Marrickville contract.
21377. On no contract previous to that had we anything to do with Carter & Co.? No.
21378. As to the stone which came out of the tunnel on Contract 77, where was it used? On No. 118.
21379. Did you give any security to Mr. Weedon for £2,000? No. I did not see Mr. Weedon in connection with it. I never spoke to him about it.
21380. You had nothing whatever to do with it? Nothing whatever.
21381. Mr. Parkes said that you received a cheque for £2,000;—can you detail the circumstances showing how that £2,000 came to be paid to the account of Carter, Gummow, & Co.? Mr. Gillan, Mr. Maddison, Mr. Ewing, and Mr. Gummow, had paid more than their share of the capital of Carter, Gummow, & Co. I received a cheque from Carter, Gummow, & Co. as portion of my share, that is, for £2,000, and I gave it back to Carter & Co. in payment of the £2,000 I had had. I suppose that Carter & Co. then paid the cheque into the account of Carter, Gummow, & Co. to pay some of their liabilities.
21382. In connection with 79A, to whom did the Treasury pay the money? Carter & Co.
21383. Whose money should it really have been? Carter, Gummow, & Co.'s.
21384. So that Carter & Co. would have to make transfers to Carter, Gummow, & Co. now and again? Yes; but they did not do it regularly. They sometimes let it accumulate.
21385. It amounts to this: that Carter, Gummow, & Co. gave you a cheque for £2,000 on account? Yes.
21386. And you owed that amount to Carter & Co. because you had had advances to that sum? Yes.
21387. Carter & Co. then paid the amount back to Carter, Gummow, & Co. on account of the 79A advances? Yes.
21388. So that it does not show that you have in any way an interest in the firm of Carter, Gummow, & Co.? I had none at all, excepting our interest in Adelaide. There is a matter in dispute at the present time, and if we gain our contention, I shall get a share of what is received. If we do not gain our contention, I shall have no interest at all in the firm of Carter, Gummow, & Co.
21389. *Mr. Parkes.*] Were Mr. Maddison, Mr. Ewing, and Mr. Gillan, the people who had the most money when you made up the firm? I do not know whether Mr. Carter had more money than they had or not.
21390. Why did they put in more money to make up the capital of the firm if they were not good moneyed people? I suppose that was the case.
21391. *Mr. Gummow.*] Did the firm of Carter, Gummow, & Co. put more money in than did the others? We put in half each at that time.
21392. Was it not an amalgamation of the two firms? Yes.
21393. Each side had to put in a certain sum? Yes. There was an equal amount put in on each side.
21394. So that this transfer of money was actually a transfer of money which the Treasury paid into Carter & Co.'s account, but which should have been paid into the account of Carter, Gummow, & Co.? Yes.
21395. It had nothing to do with the capital of the firm? No.
21396. Besides this £2,000, did you get any other money from the firm? Yes; £1,100.
21397. Making a total of £3,100? Exactly. I fancy I must have had some more money besides that, but I do not remember it at this moment.
21398. You received some salary after you had left the firm? Yes; three months' salary.
21399. Besides that salary and the £3,100, did you not receive any further share? I do not remember any.
21400. I presume you could tell from the deed of dissolution;—do you know what amount was in the deed of dissolution? No; I know that I received my share, whatever it was.
21401. *Mr. Parkes.*] You said that you trembled in your shoes after you had paid Bond and Hudson the £750? Yes.
21402. For a month after? No.

21403.

- D. G. Snodgrass.  
19 Oct., 1896.
21403. After the expiry of that month, what removed your fears? I said several months.
21404. When were your fears removed? When we got a notice that our tender was accepted.
21405. *His Honor.*] As to Chiene, do you remember his meeting with an accident? Yes.
21406. After that accident, was there any difference in the old man? He seemed to me what is generally called a little bit balmy. Sometimes he was right enough, and sometimes he was half silly.
21407. Have you seen him since you left the firm? Yes; he is quite broken down now.
21408. He never seemed to recover his old form? No.
21409. So that his memory would be likely to be defective? It must be defective now, I should say.
21410. You had a conversation with Mr. Hudson about his chance of making a profit out of Contract 79 if he got it? Yes.
21411. What was that conversation? I told them that they had a badly arranged schedule, and that, although they might have put in sufficient in their lump sum, supposing the schedule to have been properly arranged, still, as it was arranged, the work would be likely to so turn out that they would not make anything on the job if they took it up.
21412. Do you remember having any special conversation with Mr. Hickson on the subject of guttering and gadding as compared with blasting in relation to Contract 79? Yes.
21413. Had you that conversation with Mr. Hickson by yourself? No; Mr. Carter was with me.
21414. What was the conversation? We strongly objected to carrying out the work by guttering and gadding, because, had we done so, it would have cost the lives of hundreds of men. I already explained that I showed to Mr. Hickson and Mr. Davis a list of men who had died from the effects of guttering and gadding.
21415. Then do you remember some compromise being arrived at? Yes.
21416. How did you look upon that? I regarded it in this way; that we had to make the most out of a bad job—that we could not help ourselves.
21417. You conceded 2 inches of concrete lining which you expected you would have to put in? Yes.
21418. How much do you estimate that that would probably take off your final voucher? I do not remember what the estimate was.
21419. Had you at the time an idea of what that work was worth? Yes; I must have had.
21420. But you do not now remember what the amount was? No.
21421. There was an estimate made by Mr. Boys, I believe, on which a calculation was made, and upon which Mr. Davis and Mr. Hickson acted? Yes.
21422. But you cannot recollect now how the matter stood? No.
21423. You consider that you had a substantial reduction in that alteration? Yes; I consider that it was not a fair reduction.
21424. You thought you were got at by the department? Yes.
21425. As to the stone at St. Leonards, you remember the question which arose between the Municipal Council and the contractors? Yes.
21426. The contractors had allowed the stone to be taken away? Yes; we sold the stone at four shafts to the Waverley Council for 6d. a load. After we had been carting away for some time we received a letter from Mr. Davis, ordering us to allow the Woollahra Council to take the stone from the Edgecliff Road shaft, in their borough, and intimating that we would not get paid for the carting of the surplus spoil from that shaft. We let them take it away, but we reckoned that we had to be paid for the carting of the surplus spoil all the same, because the surplus spoil item means the first half mile. It may be a foot or a yard, or any distance, so long as the stuff is taken out of the tunnel.
21427. That is the way in which you read it? Yes; whenever they order us to leave the stuff within half a mile that item is carried out. I took the order to mean the mouth of the shaft, and that we were to let the Woollahra Council take it away. We claimed the full amount, but a settlement of the matter was finally made by Mr. Hickson. Mr. Davis said that we were not to get anything for it. We claimed the full amount—1s. 3d. per yard. Mr. Hickson said that we were certainly entitled to a reasonable profit on the schedule item, and he estimated that reasonable profit at 6d.
21428. How did that question come into the North Shore affair? In the case of the North Shore affair we got paid the surplus spoil; but, by an arrangement with the department, at the commencement of the carting of the surplus spoil, we asked for a tip. We always asked for a place to tip the stone, and we were told that we could dispose of the stuff as we liked, and that we should get the half-mile cartage. We arranged with the Council to take a great portion of the stone. We sold some, and we carted some away ourselves.
21429. The Council, I understand, paid your carters for carting it? They paid their own.
21430. Did the Council not pay you yourself? No; they had their own carters carting that away.
21431. Not your carters at all? No.
21432. What are you doing now? Surveying in New Zealand. I have applied for a license for an explosive manufactory, but I have not started it yet, and, in the meantime, I am surveying. There is plenty of work just now to be done in New Zealand by mining surveyors. They are in great demand.
21433. When do you intend to go back? Not before next week, I think.
21434. Is that on account of there being no steamer before then, or is it on account of your own business detaining you here? The steamer goes on Wednesday, but, having come here, I thought I might do a little business, and on that account I propose to stay on a day or two longer.
21435. Your work at the present time being surveying in New Zealand? Yes.
21436. How was the excavation on the earth channel upon Contract 72 disposed of? Instead of being thrown on the side—close to the channel—if that had been done it would have bulged in the sides, and the channel could not have been kept open—we agreed to take it out to a certain distance—I think 2 chains—and stack it there, provided we got paid half the price for filling.
21437. That was the arrangement? Yes.
21438. The ordinary arrangement for the disposition of the spoil would have been alongside the cutting? Yes.
21439. The temporary spoil bank would have been there? Yes.
21440. That you would not have been paid for under the circumstances of the contract;—it would have come under the heading of excavation? Upon that contract we had to get paid for all the stuff that was excavated twice, either as re-filling or as spoil.

21441. For all the stuff taken out of the earth channel as well? We got paid for that as excavation, and also under the item of re-filling. And the difference between the re-filling and the net amount of excavation was paid for as surplus spoil. The specification says the amount to be paid for as surplus spoil shall be the difference between the amount of re-filling and the total amount of excavation.

21442. How were you paid then? Half re-filling.

21443. Instead of surplus spoil? Yes. It was a special arrangement that, provided we did the extra wheeling, we should get paid under the item of filling, but at half price.

21444. If you had put the stuff close to the excavation, how would you have been paid? We should have been paid for it as filling or as surplus spoil.

21445. You were paid altogether 3s. a yard? Yes.

21446. *Mr. Parkes.*] Will you look at page 162 of the Parliamentary return, and tell me how you made up the amount? The difference between excavation and filling will explain it. Those two amounts should be the same, but, instead of making a new item at 6d. a yard, the quantity was divided by 2. The amount was put in as a shilling. I think the papers which were made out by Mr. Boys will show that.

21447. If you look at the original tender which appears upon page 139 of the Parliamentary return, you will see that filling is put in at 12,000 yards, and excavation at 26,200 yards;—where is the earth-channel spoil put down at 6d. in the final voucher? It was paid for under item No. 2, filling.

D. G.  
Snodgrass.  
19 Oct., 1896.

Joseph Davis called and further examined:—

21448. *His Honor.*] I believe you undertook to supply at the request of Mr. Parkes the date of the discontinuation of the practice of making advances on material? Yes, I have not yet supplied the information; but I will endeavour to supply it to-morrow.

J. Davis.  
19 Oct., 1896.

TUESDAY, 3 NOVEMBER, 1896.

George Scott Chiene recalled and further examined:—

21449. *His Honor.*] I believe you wish to make an explanation to the Commission? Yes; about some G. S. Chiene statements made by Mr. Eaton.

21450. What is the explanation? In the first place, Mr. Eaton says that I asked him to give me a job out of charity. As a matter of fact, I went to Mr. Eaton after Mr. Rumble, the engineer, had spoken to him about me. Mr. Eaton also charged me with making a wrong measurement of concrete. In explanation of that I have to say that I never saw the specification, and that I did not know where the bluestone concrete commenced or how much of it was to go in—in fact, I understood that the whole of the walls of the sewer were in bluestone concrete, and that the bottom of the work was in sandstone concrete. When this certificate which has been referred to was made up, Mr. Eaton and I came away in the tram together. When we were there Mr. Eaton asked me how much bluestone concrete I had got in, and I handed him a rough certificate which I had with me, and told him. He said to me, "You have got too much." I told him that he could not alter it then, but that the quantity could be altered in the next certificate. When the next certificate came in Mr. Eaton asked me to get as much as I could. He afterwards said to me, "What about the bluestone concrete?" I told him that if Mr. Henderson did not allude to it I would not do so. I knew, of course, that the quantities had to be checked and re-checked, and that the mistake would be found out in the final certificate. That was on the 6th. On the 12th, Mr. Eaton gave me £2, and asked me to come out again on the 13th to lay out a curve. That was in February, 1896. I did not go out on the Thursday, because it had been raining overnight, but I went out on the Friday and found that the curve had been put in. On the Saturday I sent in my resignation and waited for an answer. On the 21st of February I sent in an application to the Secretary for Public Works, and I also wrote a letter to Mr. Henderson telling him that I wanted to see him. Mr. Henderson sent me a telegram, which I did not receive until too late. It was as follows:—"Just received your letter. Meet you at 12, General Post Office." I saw Mr. Husband, the inspector, the next day, and he told me about the telegram. I told him that I wanted to see Mr. Henderson about a wrong measurement. I afterwards wrote to him and told him where the mistake had been made. That is all I have to say as to that matter. With regard to the allegation that I frequently borrowed money, I have to explain that from the 18th January to 12th February I never received anything from Mr. Eaton. I borrowed 1s. from the foreman to pay my fare. I borrowed another 1s. from one of the carpenters, and I borrowed a third 1s. from another carpenter. I borrowed 3s. from Mr. Eaton himself, because he asked me to get out at the works at a quarter to 8 in the morning.

21451. *Mr. Parkes.*] What salary did he give you? Fifteen shillings a day. He pleased himself as to the days upon which he employed me. As a matter of fact, when I sent in my account to Mr. Eaton he refused to pay it, and I sued him in the District Court, and lost the action. Mr. Eaton talked about a certificate being wrong. The certificate was wrong, so far as the bluestone concrete was concerned. At 14 per cent. below schedule Mr. Henderson made the amount £61. I told Mr. Eaton of this, and as the sum was £493, he at once said, "At 14 per cent. it ought to be £70." I showed him the amount of £69 2s. 3d. in the certificate. When I afterwards saw him he told me that that was right, and that that was the amount the Government had paid him. When I gave him the correct certificate he gave me back the one I now produce, and kept the wrong one.

21452. *His Honor.*] Are the pencilled figures his? Yes.

21453. What are they supposed to represent? Nails or something he wanted to order. There are some other calculations there. I do not know what they are.

21454. Who is Mr. Rumble? One of the Government engineers.

21455. You received a letter from him to Mr. Eaton? Yes; it is as follows:—"Dear Chiene,—If you will see Eaton, the contractor, on Tuesday next, at 10 o'clock a.m., on the job at Double Bay, he has promised me to do anything he can, without, of course, injuring himself. He has never employed a man before, and the job without a doubt is cut fine. On no account miss this appointment which I have made for you. I think you are certain to get something out of it."

21456. That means that Mr. Rumble sent you to Mr. Eaton on the off-chance of your getting something

- G. S. Chiene. to do when you really wanted something to do badly? I do not know whether Mr. Rumble asked Mr. Eaton to take me out of charity or not. I myself never said anything to Mr. Eaton about charity, although, as a matter of fact, it was a charitable action.
- 3 Nov., 1896. 21457. *Mr. Davis.*] Did Mr. Rumble have anything whatever to do with the Double Bay work? Yes.
21458. In what way? He laid out the kerb line of the manholes at Double Bay.
21459. Was he the resident engineer there? No.
21460. What was his position when he gave you that letter? I understood that he was an engineer in the Water and Sewerage Construction Branch.
21461. Do you know that, as a matter of fact, Mr. Rumble, at the time you have spoken of, was a surveyor? I understood that he was doing all kinds of work.
21462. How many certificates did you make out at Double Bay in conjunction with Mr. Henderson? Two.
21463. Was the mistake rectified while you were on the works? On the 21st February I wrote to Mr. Henderson, and told him that I wanted to see him.
21464. Did you see him then? No.
21465. Did you see him at all? Yes, afterwards.
21466. What did you say to him? I told him about a mistake in the certificate. He asked me to write to him about it, and I did write.
21467. Did he say that he had found out the mistake before you communicated with him? He told me so this morning, but he never said so before.
21468. When you told him did it appear to be news to him? I understood so at the time.

Robert Rowan Purdon Hickson recalled and further examined:—

- R. R. P. Hickson. 21469. *His Honor.*] I wanted to ask you a few questions as to your recollection of the history of Contract 72. First of all, do you remember what Contract 72 was to be in its entirety—that is to say, where was it to end? At the canal.
- 3 Nov., 1896. 21470. At that time was it expected or supposed that when Contract 72 came to be constructed the canal would have reached that point? Yes.
21471. The canal itself? Yes.
21472. You remember when the plans were prepared for No. 72? Yes.
21473. About how long would it be before it was begun? I think a very short time before, but I could not say definitely without looking through Mr. Bagge's journal.
21474. Was it before the injunction was got out against the Harbours and Rivers Department, stopping the canal from coming up from the southward? I think not. I think it must have been after that.
21475. After the injunction? I fancy so; but, of course, I should not like to be certain about it without reference to the documents.
21476. The date of the injunction was, I think, 1889? Yes; I think April, 1889.
21477. That was an injunction obtained by McNamara, with the object of preventing the canal, which, of course, had nothing to do with Contract 72, from coming any further up from the bay? Yes, further than a certain point.
21478. For fear of the draining of his dam by percolation? Yes.
21479. That injunction stood actually until April, 1894? Yes.
21480. And during the time you say that that injunction was standing the plans for Contract 72 were got out? I think they must have been got out during that time. The work was commenced in 1891, and I think it is more than likely that the plans were got out at that time.
21481. If the plans were got out after the injunction was obtained, you could see that the canal would not be there? No, we did not know that, because we anticipated that an arrangement would be made to get the canal pushed through as quickly as possible.
21482. You thought that some arrangement would be made to get the injunction dissolved? Yes; you must remember that the injunction was got out against another branch of the department. I myself did not know exactly what was going on, but the Minister was anxious to get the canal pushed through, and it was thought by the time we had let the contract the canal would have been completed.
21483. But, in point of fact, at the time the contract was ready to let you found that the canal was not there at all? It had not moved an inch.
21484. It was necessary, then, to have an outlet; and you provided an outlet, or rather two outlets, along the line of Macdonaldtown Creek? We provided an outlet to Macdonaldtown Creek.
21485. But Macdonaldtown Creek, while it might have been an outlet, was not a sufficient one? There was an outlet; but we lowered Macdonaldtown Creek considerably, so that the level we had for the bottom of our sewer had no outlet unless a canal was made, or unless a cutting were made to the canal where it ended.
21486. Then the plans were prepared with the canal shown, were they? Yes.
21487. Now this is the point—the original quantities were taken out, I suppose, from the original plans? Yes.
21488. And those original quantities ended off at the termination of the concrete channel as originally proposed? Yes.
21489. In fact, where it ends now? Practically where it ends now.
21490. When the tenders were called for the contract were they for the whole of the contract, including the channel? Yes; at that time we knew that the canal was not cut, and that it would not be cut.
21491. I want you to explain, then, how it is that the original quantities were left in—the old probable quantities, exclusive of the channel—at the time tenders were called for, and, in fact, at the time the contract was let? I am afraid I could not tell you that. I should have to get the chief draftsman and the engineer-in-charge to explain that. I really could not explain it myself.
21492. When the tenders came in it was found that the lowest tender was over £20,000? Yes.
21493. And that tender being over £20,000, some arrangement had to be made, had it not, to avoid bringing the work under the notice of the Public Works Committee? I cannot say as to that.
21494. It was done, was it not, by making an arrangement for an outlet along the course of Macdonaldtown Creek, instead of the proposed earth channel? Yes.

21495,

21495. That is the way in which it was done? Yes.

21496. And by doing that the sum of £3,000 was, in theory, knocked off? Yes; something of that kind was done.

21497. Mr. Davis was called as a witness in the case of MacNamara against the Secretary for Public Works at a late stage of the proceedings—that is, on the motion for a new trial—and he then produced some minutes, explaining matters exactly, and showing the transaction—that is, the £3,000 being knocked off, and the approval of that by Mr. Bruce Smith, who was then Secretary for Public Works? I do not know of that. I was only a witness in the case. I do not know what Mr. Davis's evidence was.

21498. At any rate, you know that that is what happened—that Mr. Bruce Smith was requested to approve of the knocking off of the £3,000, with the object of preventing the work from coming before the Public Works Committee? With the object of not delaying it.

21499. A certain amount of delay would have ensued had the matter come before the Public Works Committee? Yes.

21500. In point of fact, was not the explanation of the earth channel's not being added to the probable quantities, that if it had been added to the probable quantities those quantities would have shown beyond all possibility of doubt that the lowest tender for the whole work, including the earth channel, must be something over £20,000? I do not think so. The leaving out of that portion of the work was done in the drawing office, immediately under Mr. Bagge, and I do not think he had what you suggest in contemplation at all. This arrangement that you have spoken of was made in the Ministerial branch of the office by the Under Secretary and Mr. Bruce Smith. Mr. Bagge probably knew nothing about it at all.

21501. But surely, in the ordinary course of things, Mr. Bagge, when told to add to the contract this large addition of earth channel, would naturally have also increased the probable quantities to represent it? I do not think that mattered very much, because, the contract being at Schedule rates, he had to pay at those rates, whether for 1 yard or 100 yards. We do not put the quantities in at all now.

21502. But at that time the probable quantities were given for the sake of making a comparison between the different tenders? Yes.

21503. The excavation on the line of the swamp was rather a different kind of excavation from the usual run of excavation on the line of the sewer part of the work? Yes; it was much more costly.

21504. Why was it more costly? Because it was much more difficult to get the men into the place.

21505. It was sludgy? Yes; it was most difficult to get the men to stand on it. I remember that when I went out there I had to have planks put down in order to get along at all.

21506. That being so, would it not have been in the ordinary course to have put into the schedule a head for this particular excavation, apart from the excavation into which the concrete channel had to be put, and into which the sewer had to be put;—would it not have been, in the ordinary course, a natural thing to put in a distinct head for this excavation per cubic yard? I do not think so; the difference was not so great as that. It was not so great as to warrant the making of a special item of it.

21507. It would have the effect rather of complicating the tendering to put two distinct kinds of work under the same general head? Yes; it would have been a difficult thing to do that. Take the upper end of the storm-water channel. No doubt the excavation there was fairly good, but when you got down towards Shea's Creek it became gradually worse and worse until you got to Shea's Creek itself. It was practically a swamp; and it would have been very difficult to draw the line between fairly good excavation and other excavation. If you divided the excavation at all you would probably have had to divide it into three or four lengths—good, not quite as good, bad, and so on.

21508. But instructions must have been given at some stage to Mr. Bagge to get the plans out for the earth channel when it came to be a necessary addition to the whole work? Yes, no doubt.

21509. Do you not remember that at some time instructions were given to him not to add the earth channel to the probable quantities? I do not think such instructions were given. I have no recollection of them.

21510. Would he not have added them as a matter of course if he had not been told not to do so? Not necessarily, because the contract was a schedule-rate contract.

21511. But would he not do so in order to show what the contract was;—anyone who did not very carefully examine the plans and compare the probable with the actual quantities would have been likely to be misled as to the whole of the quantities belonging to the earth channel—that is, on the plans as they were exhibited? Yes; as quantities.

21512. If a man looked at the plans, and took out his own quantities, he would arrive at a more or less accurate result;—if he looked at the plans, and did not take out the quantities, but relied upon the probable quantities, he would certainly be misled? As to the total quantities.

21513. Therefore a contractor might be misled in the form in which he tendered? I do not see that he could be misled in the form in which he tendered, because he would probably go down and see the nature of the work. There was a certain portion of the excavation shown in the schedule which was actually in Shea's Creek, and the contractor could see exactly what the nature of the material was. The other portion of Shea's Creek was not worse than that portion, while it was worse than the ground higher up the creek.

21514. You have no recollection at all as to how it came about that the probable quantities were not increased? I have not.

21515. You are positive that it was really not done for the purpose of saving the contract from coming under the cognisance of the Public Works Committee? I do not think it was. All the particulars as to the quantities were taken down in the drawing office, and I am almost certain that Mr. Bagge did not know anything about this arrangement at all. It was practically made in the Ministerial branch of the department.

21516. The knocking off of the £3,000 was the result of an order coming from the Ministerial branch? Yes.

21517. Then the idea was that the concrete channel might end, either where the present outflow is—that is, where the sliding doors, as they are called, are—or somewhat further up, some little distance above where the end of the closed work is to be found at present? Yes.

21518. Where it was considered there were convenient points in the channel of the Macdonaldtown Creek? Yes.

21519.

R. R. P.  
Hickson.

3 Nov., 1896.

- R. R. P. Hickson.  
3 Nov., 1896.
21519. But I understand that, as soon as the work was let, the first thing that was gone on with was the earth channel, as a matter of course? Yes; to be an outlet.
21520. Was it not, in point of fact, known that, although these two outlets as probable points of departure were provided, neither of them would really be of any use, and that it would be practically impossible to end the work effectively at either of those two points? I am afraid I do not quite follow your question.
21521. It was provided that the contract itself—that is, the lower part of it—at either the 13 or 27 chains, might not be constructed at all, and that the outlet might be at one of those two points. Yet there never was any question, apparently, after the contract was let, as to where the work was to begin. It began, as a matter of course, apparently, with the earth-channel—the bottom of the whole affair. I want to know whether it was really ever expected that the work would satisfactorily end at either of the two points named? No; the outlet would have to be in the canal.
21522. Was there any *bona-fides*, then, in putting in the provision as to the leaving out of the portion of the work beyond the 13 or the 27 chains;—was it anticipated that the work could ever be satisfactorily carried out upon either of those two bases? I do not think either would have been a satisfactory outlet. At the same time there could have been an outlet on the old Macdonaldtown sewer, going towards M'Namara's Dam.
21523. You mean the old creek? Yes.
21524. That was supposed to be a natural watercourse? Yes; I quite admit that it would not have been a satisfactory one, but it could have been used as an outlet.
21525. It was necessary to deepen that creek for some distance down from the outlet, otherwise the sewage would have been backed up? Yes.
21526. The work appears to have been begun, without any question at all, near the injunction line—in fact, the work must have passed through the injunction line? That is so. I think there were sluice gates at the injunction line, to let the sewage from Shea's swamp out.
21527. That is where the work was actually begun by Carter & Co.? Yes.
21528. They began from the lower end? Yes.
21529. Do you remember now whether there was ever any deliberation or any question as to whether the work should begin there, or as to whether it should begin at either of the other two points? As soon as we were actually ready to start we found that the canal was not there, and we had to make an outlet, in order to make a complete job of it.
21530. Unless you had ended at one of the other two points? It was only a temporary work, and it was not very satisfactory, I admit, although it would have done something.
21531. It comes to this, then—that this provision was really put into the contract to get over the difficulty, and it was never intended that either of these two points should be used as the lower end? It was never intended that the work should be ultimately ended there, because it was intended to bring it right into the canal.
21532. The £3,000, I understand, came off the work between the mouth of the concrete channel and the upper one of these two points. That was the idea in connection with this estimate of £3,000? Yes.
21533. The earth channel, of course, was an additional work, not appearing in the estimate at all, and, in fact, not appearing in the probable quantities. Therefore, if the work had been made to end at the 27 chains, instead of £3,000 coming off, what would have come off the sum finally to be paid would have been something like £9,000? I cannot say from memory what the amount would have been.
21534. So that, beginning the work as it did begin, it was quite obvious, at the inception, that the sum of £15,500, and a good deal more, would be swallowed up? Yes.
21535. If the work had been continued up to the head at Munni-street? Yes.
21536. Was it not, then, for the purpose of placating the Minister, and with no intention of really ever ending the work off at either of these two points, that this provision was put into the contract—in other words, it was really a nominal provision? I would not like to say that without knowing exactly from the records of the drawing office how the quantities were got out, and how the estimate was arrived at.
21537. Who would be able to give us that information? I do not know whether Mr. Davis would be able to do so or not; but I presume Mr. Bagge would be the person best able to give you information on the subject.
21538. I suppose you yourself know, as a matter of fact, that the whole cause of action, in the case of McNamara against the Secretary for Public Works, was the making, not of the sewer, but of the concrete channel and the earth channel? I do not know that that is the case. So far as we are concerned, we did not take any water from McNamara.
21539. It is another question whether you did or did not take water—what McNamara rested upon was the work you had done? He did not get his injunction upon that ground.
21540. But apart from the injunction the cause of action was not founded upon any work that had preceded the injunction. That work was stopped, and it was stopped until the injunction was dissolved? McNamara said, I understood, that damage had been done by making the canal up to that point.
21541. What he said was that he was afraid that substantial damage would be done if the canal were continued further? I went down there with Mr. Darley, long before the storm-water sewer was commenced, to see whether the damage was done to his work by the making of the canal up to the injunction point, and at that time he was very strong in insisting that damage had been done there.
21542. That you had already done damage? Yes; that was his strong point—that we sucked water away from his dam.
21543. But his action rested upon the work which was done above the injunction line? I do not think that. I think it was the whole thing. The damage which had been done there, and the damage which he alleged was done by the sewerage works.
21544. *Mr. Davis.*] If you will read your minute, which appears upon page 514 of the evidence, in reply to question 15718, you will see that it gives precisely the reasons for the work being carried out in the form in which it was carried out? Yes; that minute was written by me in 1892.
21545. What was the amount of the lowest tender for the contract? Carter & Co.'s tender of £20,650.
21546. You do not remember what the estimate was? I could not say without looking at the papers.
21547. Will you look at drawing No. 3 of Contract 72, the contract drawing signed by the contractors and attached to the contract. You will see there details of the outlet of the channel where it enters the Shea's Creek swamp? Yes.

21548. The detail sketch shows where it enters the canal? Yes.  
 21549. Full provision is made in the detail drawing for the discharge of the channel into the canal? Yes.  
 21550. The object, evidently, being that the channel was to discharge into the canal? —  
 21551. Therefore it was presumed that a canal would be constructed at the time these drawings were prepared? Yes.  
 21552. Do you think that that could be the reason why the quantities that were given for the excavation of that channel along the centre line of the canal were not included in the schedule? That was the reason.  
 21553. The sketch in drawing No. 3 clearly proves what was in the mind of the officer in charge when he got out the quantities? Yes.

[*His Honor: I do not think you need trouble about the original scheme, Mr. Davis. The question is, why the probable quantities were not increased to meet the scheme as it was finally to be carried out.*

[*Mr. Davis: What I wanted to show your Honor was that it was not likely that provision would be made at the outlet of the channel for discharging into the canal, and that at the same time provision would be made for cutting the channel along the canal.*]

R. R. P.  
Hickson.

3 Nov., 1896.

Andrew Eaton sworn and examined:—

21554. *His Honor.*] Having heard Chiene's evidence this morning, is there anything you wish to say? I did not quite catch all he said; but I might perhaps be allowed to explain that Mr. Rumble was sent down by the department to lay out a new line, a slight alteration having been made in the original plan. While he was doing this he spoke of Chiene. He said he was very hard up, and it would be a charity to give him something to do. After talking the matter over with him, I told him to tell Chiene to come and see me. Chiene came down and missed me on the job, and came round to a sewer we were doing at Potts' Point. We met in the grounds of the Bishop's residence, and he there told me that he would come to me for 10s. a day. I said I would not like to cut him down; that I only wanted temporary assistance, and that if he liked to come I would give him 15s. a day, but that it would be only for two or three days a week. So far as the vouchers are concerned, the voucher I now hand you is the first one he gave me. The mistake is from 27 chains 44 feet to 28 chains 30 feet, being a distance of 52 feet. That would be 10·86 by 52 by 2. He gave me the voucher in the tram, and on looking through it I found out the mistake. I put these figures on it at the time—10·86 x 52 by 2. It ran out at nearly 40 yards; instead of being bluestone concrete it should have been freestone concrete.

21555. In whose handwriting was that voucher? Chiene's.  
 21556. Who wrote the word "cancelled" across it? Chiene. I found out that it had not been rectified in the second voucher. The third voucher I myself made up, but I have not been able to find it.

21557. In that voucher, was the mistake rectified? No; it was rectified in the fourth.  
 21558. When do you say that the mistake was first found out? I found it out on the day on which the voucher was made out, when we were in the tram together.

21559. When did you mention this to the inspector? I mentioned it to the inspector before the second voucher was made up, but I did not mention it to the engineer.

21560. How was it that you did not mention it to the engineer at once? I left it to Chiene to rectify.

21561. And he did not do so? No.

21562. And it was then that he had the conversation with you? Yes. The second voucher was made up in February. I asked him to meet me on the 11th February. I could not meet him on that date, and I sent word out to him that he was not to do anything until I had seen him. I saw him on the 12th February, and it was then that I told him that I would have no more to do with him, at the same time offering to pay him what was owing to him.

21563. He then sued you in the District Court;—how did that come about? We offered him what was due to him, but he refused to take it, and at the same time made an exorbitant demand in respect of a number of days upon which he had not been engaged by us.

21564. Did you pay into Court the amount which you admitted owing to him? No; we had already paid him. When he was going away on the 12th February, after I had told him that I would have nothing more to do with him, I gave him £2. I told him that I did not want to be hard upon him. I had always paid him what was due to him, and I have the butts of the cheques showing the payments.

21565. *Mr. Gummow.*] Did you ever inform Mr. Parkes that Chiene would be a good witness for him to get at this inquiry? No.

21566. Did you ever inform Mr. Parkes, by letter or otherwise, of anything in connection with Carter, Gummow, & Co.'s works? No.

21567. *Mr. Parkes.*] Did you ever tell Mr. James Alderson that Chiene would be a good witness for me? No.

21568. Did you ever say so to your brother, Mr. James Eaton? No.

21569. You are sure of that? Quite certain.

21570. Then how should I be likely to know? I do not know what you know.

21571. Did you never tell Mr. James Alderson and your brother, Mr. James Eaton, that you and Mr. Carter were the only two contractors who had observed the insertion of "cwts." for "tons" in the case of the Long Cove contract? No.

21572. You are sure of that? Quite certain.

21573. Are you absolutely sure that you never told Mr. James Alderson or your brother that Chiene would be a good witness for Mr. Parkes to call before the Commission? I never mentioned Chiene's name to my brother or to Mr. Alderson.

21574. Supposing I received this information from those gentlemen, based upon statements which they said you had made to them, what would you say to that? All that I can say is that I never mentioned Chiene's name to my brother or to Mr. Alderson.

21575. Did you ever mention the Long Cove contract to either of them? Yes.

21576. Did you not tell them that you and Mr. Carter were the only two contractors who had recognised the error in that contract? I did not say that we were the only two.

21577. But you told them all about it? Yes.

21578. Did you say that you expected to get a good thing out of it? Yes.

A. Eaton.

3 Nov., 1896.

- A. Eaton. 21579. *His Honor.*] A good thing in what way? Here is the schedule of the Long Cove Creek storm-water channel. When the work was advertised I found that a mistake had been made by inserting "cwts." instead of "tons." That, of course, would make a large difference. I saw my brother, Mr. J. W. Eaton, and asked him to see Mr. James Eaton about it. Of course, I thought that in all probability the error had not been noticed, and I thought that if I put in a tender for the job the price would be so low that it would be noticeable.
- 3 Nov., 1896. 21580. Mr. Carter did not get any benefit by it—he had to alter it? I had determined to stand by the schedule.
21581. You would have kept the department to the "cwts."? Yes; I should have tried to do so. I spoke to my brother about putting in a tender for the job, so that there should not be a great discrepancy between our tender and the other tenders which went in. That was before the tenders went in. I found out afterwards that there were two tenders besides Carter & Co.'s which were lower than ours. I saw then that the error had been noticed by others. I remember speaking to Mr. Alderson about the matter coming over in the Mossman's Bay boat, in the course of a general conversation, but I never mentioned Chiene's name to either my brother or to Mr. Alderson. I remember saying what a good thing I had lost, because I was under the impression that I was the only one who had noticed the error. I had found out afterwards that there were three below us.
21582. Carter & Co. do not appear to have tendered upon the assumption that they were going to keep the department to the mistake? I do not know what they intended. If I got the job I should certainly have tried to keep them to it.
21583. It is the sort of thing which contractors think fair to catch the department on the hop in a clerical error? If the department catch contractors on the hop they do not hesitate to keep them to their agreement, and if that sort of thing cuts one way it ought to cut both ways. If I said anything to my brother at all about Chiene it would have been to the effect that he was an altogether unsatisfactory man, and that I had had to get rid of him.
21584. *Mr. Gummow.*] You did not give information to your brother upon either subject with the object of its being taken to Mr. Parkes? No; I do not remember speaking to him at all about Chiene.
21585. *His Honor.*] I suppose that at some time you may have told your brother in conversation about Chiene? No, not at any time.
21586. Not in the course of ordinary conversation? I do not think I ever spoke to him about Chiene at all. I certainly did not speak of him as a witness. I only saw my brother James once in the course of several months.
21587. Is he also a contractor? Yes.
21588. Might you not have cautioned him about Chiene? No; he was not in the same line of work.

Joseph Davis recalled and further examined:—

- J. Davis. 21589. *His Honor.*] You heard the questions I asked Mr. Hickson this morning with reference to Contract 72;—is there any information you can give the Commission on that matter—the leaving out of the addition to the probable quantities which would have been expected upon the contract? Yes; I think I can tell you pretty well what did occur. To begin with, it was contemplated that the canal would be excavated by the time the channel would be ready to discharge into it. It is true that there was an injunction stopping the work, but it was contemplated that there would be a motion to dissolve the injunction and that the canal would be proceeded with. It was thought that by the time the channel was finished in all probability the canal would be ready to receive the drainage. When the works were commenced it was found that there was no chance at all of that. It was then decided that to give an adequate outlet it was necessary to cut a channel down the centre of the proposed canal. That was the first work put in hand. It was shown on the general plan, and it was also mentioned in the specification that this work might be carried out; but the chance of its being carried out seemed to Mr. Bagge, who prepared the specification and schedule, to be so remote that he left the quantities out of the schedule.
- 3 Nov., 1896. 21590. Why did he think that the chance of the work's being carried out was so remote? He thought he had three strings to his bow. He thought, first of all, that the canal would be constructed and that it would provide a proper outlet for the channel. In the original drawings he had made full preparation, in the event of the canal's being made by the time the channel was ready to be put in hand. The second string was this—he thought he had an outlet where Macdonaldtown Creek leaves the course of the channel at the site of the stop-board, and then he also had an outlet at Mitchell's Road into the creek bed. So that although we had not sufficient money to carry out the whole of the work, it was considered that we had ample provision made in the specification for varying the contract in any way which might be thought proper. First of all, with regard to the canal, the reason why it was not available was simply because it was not constructed; and with regard to the outlets at the 13 and 27 chains, the reason they were not available was that they were not there.
21591. In what way—were they not deep enough? Either the surveyor or one of the draftsmen made a mistake in the cross-section, and, I presume, misled Mr. Bagge, who considered he had an outlet at the 13 or 27 chains. When they came to carry out the work it was found that there was not such an outlet as had been supposed, and the only thing which remained was either to cut a race along the course of the Macdonaldtown Creek and through the Chinese gardens, to get an outlet in that way, which meant that the race would have terminated in M'Namara's dam, or have the work carried out as it has been—that is to say, with the channel extended along the course of Macdonaldtown Creek, through the sandhills, across Shea's Creek into the swamp, with an earth channel cut along the centre of the swamp along the site of the proposed canal, terminating below M'Namara's dam.
21592. Who was the surveyor? Mr. Corbett.
21593. After the suggestion was made about the knocking off of the £3,000, and after it had been approved, had he been sent down to find out what could be done? No; he made a survey in the first instance. The plan was prepared in 1890. It was known that we had not enough money to carry out the whole of the work, and provision was made in the contract to cut off the lower portion—that is, at the 13 or 27 chains, as the case might be. It was thought that we might get a specially good tender in, and, in that case, we could afford to carry out more of the work, or, if we got in a very good tender indeed, that the whole of the work might be carried out. If, on the other hand, as was expected from the rates then ruling, we got in a high tender, it might be necessary to eliminate the 27 chains of the work included in the

the schedule of quantities. When the work came to be carried out, as I have already explained, it was necessary, if there was to be a proper job made, not to eliminate anything from the lower end, but to commence the sewer at the line of injunction, and work upwards as far as we could get with the money available. That brought us to the bottom of Macdonald-street, and that is where the work was stopped in October, 1891, until further money was voted.

21594. Do I understand that it was you who discovered that a mistake had been made in the levels? I would not like to say I took the levels; but, when I came to carry out the work, I imagine I sent my officer down to lay out the work with a view of stopping at Mitchell-road, because I knew that we had only £15,500, and some small amount to come from another Vote for the Macdonaldtown Park sewer—about £17,000 in all—the tender being for £20,000 odd. At the time Mr. Barling asked the question whether the tender could be reduced it was not known that there could be no outlet at Mitchell Road. It was presumed that there would be an outlet there, and that the contract could be reduced to that extent.

21595. That was found out, you say, as soon as the work was taken in hand? Yes. It was found that the outlet would perhaps go along the course of Macdonald Creek into M'Namara's dam.

21596. And that would have involved a lot of trouble, and would have been finally a useless work? Yes. So that, taking everything into consideration, it was decided to anticipate the canal to the extent of excavating the earth channel, and to construct a channel as originally shown on the drawings, beginning at the canal and working upwards as far as the money would go.

21597. And then some part of the original plan was cancelled; but that cancellation must have taken place, I suppose, when the addition of the earth channel was made? The word "cancelled" was written across the contract drawing after the work was all finished. It is the custom of the office, when a work is finished, to show on the original drawings the work as executed, and if a portion is not carried out we write across that portion the word "cancelled" in red. If there are any small alterations in the work as carried out they also are shown in red. We, therefore, have a complete and perfect record of the work as executed. That word "cancelled" across the outlet of the channel was written in after the whole of the work was finished. That would be some time in 1892—in May or June, I think.

21598. *Mr. Norrie.*] Before the sewer was cut arrangements had been made between the tenants and the owners of the fee simple to allow the excavation to be taken out? I do not know what arrangements were made between the occupiers and owners. I know we made an arrangement with the owners, through Mr. J. R. Hill, to allow us to carry out the work conditionally upon our putting in a little extra work, amounting to about £600.

21599. *His Honor.*] Instead of going in for resumption, and the expense incidental to that, the department thought it would be simpler and cheaper to make arrangements with Mr. Hill to do the work with permission? Yes.

21600. Therefore certain concessions were made, of which the stop-board was one, the covering of the sewer under the sand-hills being another, and a flume across the channel where Shea's Creek is supposed to cross it being a third? Yes.

21601. *Mr. Norrie.*] It is quite a usual thing in the Sewerage Department to obtain permission to construct a sewer instead of resuming the land? Yes. For instance, we never resumed land from Mr. Cooper for storm-water channels. He has regarded the channels through his property as being so eminently to his interest that he has always given us facilities for constructing them, provided his property was not directly injured.

21602. It is quite clear that when M'Namara obtained the injunction in 1889, the injury he afterwards complained of was not anticipated? Quite so. The injunction had reference to the canal.

21603. And not to the sewerage works? No.

21604. *His Honor.*] Do you say that, so far as your knowledge of the matter goes, the failure to add the probable quantities of the earth channel was not the result of a little deliberation on the part of the office, with a view to keep the work out of the clutches of the Public Works Committee? There was no deliberation whatever except in so far as we knew that we should not be able to carry out £20,000 worth of work for £15,500, unless the contractors were of a very different mind from ourselves.

21605. What was your estimate? I endeavoured to find it this morning, but I could not succeed in doing so. It amounted to close upon £20,000.

21606. Your estimate excluded the earth channel? Yes. We got a tender a little over our estimate if I remember rightly. We knew, seeing that we had not enough money, that, before the Minister would accept the tender, provision must be made to reduce the contract. Beyond that there certainly was no thought of evading the provisions of the Public Works Act.

21607. It was only after tenders were received, then, that provision was made fixing the two points to which you have referred? Provision was made before the question was asked whether it had been made or not. When it was found that the tender was over £20,000 the Minister asked whether the contract could be reduced, and he was told that it could, but the idea of making that provision was not to bring the work below £20,000. We estimated that it would cost more than £20,000; but the reason we had for making provision for the reduction of the contract was that we had not sufficient money to carry out the full work.

21608. Provision was made for a reduction of the contract, so that you might try to keep down to the £15,500? Yes.

21609. *Mr. Norrie.*] That provision was made before tenders were called? Yes.

21610. *His Honor.*] That accounted for the two points being fixed;—if you had a certain definite sum you would have fixed upon one point, but as you had an uncertain sum you fixed upon two? Yes; that is the reason we have the two points. We thought that if we got a specially favourable tender we might carry out the whole work, down to the canal; and that if, on the other hand, we got the tender which we expected we might receive, we could eliminate the 27 chains. If, on the other hand, we got a tender between the two, we could take off the 13 chains; so that we were prepared for every emergency.

21611. Were all the papers relating to this matter returned from the Equity Court? That I cannot say. I know that during the hearing of the case several papers were mislaid, and I do not think they were ever found.

21612. I understood you to say that the order for the reduction of the contract by a sum of £3,000 came from the Ministerial branch of the department? Yes; the tender was accepted by Mr. Bruce Smith upon the condition that the contract was reduced by £3,000.

21613.

J. Davis.  
3 Nov., 1896.

- J. Davis.  
3 Nov., 1896.
21613. Who first called attention to the fact that the tender was over £20,000? The tenders would go on to the Minister, I presume.
21614. And it was in the Ministerial branch of the department that attention was called to that matter? Yes.
21615. The fact was, that there were two distinct operations going on as far as that reduction was concerned in your part of the department;—there was the money difficulty, irrespective of the question of £20,000, more or less; and then, when the tenders actually came in, and it turned out that the lowest tender was over £20,000, there was the other difficulty, which was raised by the other branch? Yes.
21616. And when the matter came down to your branch of the department, your former action fitted into the difficulty which had come down from above? Yes; that is precisely what occurred.
21617. In asking you some questions the other day about the schedule of Contract 69, I omitted some questions which I had intended to ask you; I would ask you to turn to page 76 of the Parliamentary return;—I take it that in the case of items Nos. 12, 13, 14, and 15, the words “solid rock,” in inverted commas, refer to a part of the longitudinal section? Yes.
21618. So that that defines a particular piece of country, as it were? Yes.
21619. The total quantities of the four items, 12, 13, 14, and 15, come to 1,465 yards? Yes.
21620. These pieces of excavation, I understand, are roughly estimated to be split up in this way? Yes; that would be for the shafts in the length classed “solid rock.”
21621. In the final return the quantities come out under the two heads 12 and 14, 14 being 4-inch charges of powder, at 91 and 404, the aggregate being 495. There was a difference, by way of reduction, of 970 cubic yards between the estimated quantities and the final voucher; that is what I cannot understand? It depends upon the size at which the shafts are sunk. Provision was made in this case, I think, to sink shafts up to 12 x 5, but when we came to carry out the work we had the shafts put down at 6 x 5.
21622. Do you remember that that was so? If you refer to page 97 of the Parliamentary return you will see that the shafts vary from 6 x 5 to 18 x 8. Take the Premier-street shaft. Several witnesses have said that, instead of the shaft being made 18 x 8, it was made 12 x 5. The difference of excavation between these two sizes would be included in Contract 69. No excavation, however, was carried out there in connection with that contract, and that of itself would be a big item of saving.
21623. Did that come within the classification of “solid rock”? Yes; that is the explanation.
21624. The reduction being made for the sake of economy in this case? Yes.
21625. Had you anything to do with the making out of the schedule for Contract 112, or was the putting in of the prices entirely Mr. Bagge’s work? I possibly had something to do in advising him. He generally asked my advice as to the prices, but he had the responsibility. He either adopted my view, his own, or someone else’s.
21626. One price struck me as being so low that I could hardly understand it—that is, the price of special bluestone concrete in the carrier, including the iron;—the price is set down at £1 15s.? The special bluestone concrete to which you refer involves no centering of any consequence, and that would reduce the price of the material. At the same time the price does seem low.
21627. It seems very low as compared with the estimate in the case of the Monier work? You must remember the thickness of the walls of the carrier in the case of Contract 112. You have some measurement there; but in the case of No. 77 there is a great deal of work and very little measurement.
21628. What is the thickness of the arch in the case of No. 112? Sixteen inches at the springing, and 12 inches at the crown.
21629. With a span of about 50 feet? Yes. In fixing these prices you have to take all the surrounding circumstances into consideration. What may appear to be a high price in one case would be really a low price in another case. You could not make your prices nearly uniform for even the same class of work. You must take all the surrounding circumstances into consideration, or you would be led astray.
21630. I think 50s. was the price fixed for ordinary bluestone concrete in the case of 79A, was it not? Yes.
21631. And 30s. for sandstone concrete? Yes; but that was in the tunnelling, and it was a very small sewer. Most of it was 4½ inches thick.
21632. Involving a great deal of work in comparison with the measurement? Yes. Now I come to look at the original schedule I find that the price of £1 15s. for special bluestone concrete in the case of No. 112 is a clerical error. The amount should be £2 15s.
21633. A good deal has been said about windage;—I suppose the fact is, that in constructing a large, massive, sewer like that in Contract 101, the designer would not trouble his head about windage at all? It would scarcely come in with such a big base as that; but it would have to be taken into consideration in the case of No. 77.
21634. In the departmental plan as well as in the substituted plan? Yes.
21635. In that case windage would be a considerable element? Yes; it is an element you would have to reckon with in making your calculations.
21636. In calculating the weight I suppose you take the sewage as of the specific gravity of water—you do not add anything, and I presume you also take the carrier as gorged? No; there is an overflow for the three-quarter level of the sewer.
21637. So that you take it as three-quarters full? Yes.
21638. *Mr. Parkes.*] As to the Premier-street shaft, I thought you said in your former evidence that it was excavated in a former contract—that of Carson’s? Yes; that is what I said in effect this morning. The enlargement from 12 x 5 to 18 x 8 was included in Contract 69; but it was not carried out, and consequently there was that much saving.
21639. Are you sure that the excavation was not made, although the walls were not placed in? The work passed out of my hands before it was finished; but, to the best of my knowledge, certainly not. Before I gave up the work I gave instructions that the shaft was not to be enlarged.
21640. Can you swear positively that it was not enlarged? No, not beyond what I have said. There was no alteration made in the shaft except at the top after I gave up charge.
21641. And you say that the enlarged excavation was not carried out? Yes.
21642. In your plans is there any rock shown in that Premier-street shaft? It is all rock pretty well to the surface.
21643. It is not shale? No; sandstone rock.

21644. Will you refer to item 16 in the schedule of Contract 69, "Less hard excavation in road surfaces";— is that also in the shafts? Yes; that would be in the shafts. J. Davis.  
3 Nov., 1896.
21645. That class of excavation is greatly increased, particularly in item 16? The aggregate comes out at an increase of 108.
21646. But item 16 is greatly increased; there is an increase of 170 to 539? Yes; that would be increased simply because the material classed under item 16 was found—that is to say, "Less hard excavation."
21647. It was found that you had to increase that excavation? It is the description of excavation that was found instead of rock. That accounts for the increase.
21648. *Mr. Gummow.*] As to a shaft in rock 6 x 5, what area would that be? Thirty square feet.
21649. And with regard to a shaft in soft ground where timber would be required, what area would that be? That would be 63·75 square feet.
21650. More than double the area in the case of the shaft in rock? Yes.
21651. So that for every foot of shaft excavated in soft ground you would get double the quantity of excavation paid for? Yes.
21652. And that would account for the difference? That is the reason for it. The more soft ground which was met with in the shaft the more would the aggregate be increased under that particular class of excavation.
21653. And it would be double what it would be in the case of rock? Yes.
21654. *Mr. Parkes.*] Your borings, as far as they went, clearly indicated what was rock and what was shale? They would do that certainly; but I scarcely think they would indicate the precise line between the hard rock and soft rock, and the hard shale and the soft shale. That could only be decided when the shafts are sunk.
21655. But in preparing your schedule, would you not have the notes before you? The longitudinal sections would be before the quantity surveyor, and in those sections would be shown the whole of the information available. The surveyor would use his judgment as to what to include in one item and what in another, but it would be quite impossible for him to say how the ground would turn out in the end.
21656. He would have the report of the officer who took the borings? No. All the information from the taking of the borings would be shown on the longitudinal section, and he would judge of the kind of ground through which the bore passed by the material brought up by the auger.
21657. *His Honor.*] Would the boring machine bring up a core or only broken material? In soft ground, such as clay, you might put in an auger and bring up a core, but you would not do so in hard ground. In that case the material would be punched to powder and would be lifted in that way.

## WEDNESDAY, 4 NOVEMBER, 1896.

Robert Rowan Purdon Hickson recalled and further examined:—

21658. *His Honor.*] You wish to make a statement to the Commission? Yes. Before Mr. Parkes proceeds with his cross-examination I should like to correct a statement which I inadvertently made yesterday. I had quite forgotten the circumstances connected with the reduction of the expenditure in the case of Contract 72. As a matter of fact, the question was brought before the Public Works Committee in connection with the Johnstone's Bay stormwater sewer. I had quite forgotten that. The question of the stormwater sewers was brought under my notice by a minute of Mr. Bruce Smith, dated 17th September, 1890. The minute is a long one, and I will not take up your Honor's time by reading it. R. R. P.  
Hickson.  
4 Nov., 1896.
21659. What is the substance of it? It refers to the building of stormwater sewers generally for the whole of the suburbs of Sydney in connection with the sewerage scheme. My report is rather a long one; but, to come to the point in question, the Committee, after drawing attention to my minute, in reply to the minute of Mr. Bruce Smith, say:—

To these suggestions the Cabinet assented, subject to the necessary provision being made by Parliament, and subsequently Parliament voted for these sewers £278,401 in two sums—£201,531 in the Estimates for 1891, and £76,870 in those of 1892. Of the total amount, £208,283 was for works forming part of the Western Suburbs scheme, and most of the money on those works, as on the others included in the votes mentioned, will be expended without any previous reference to this Committee, for the reason that in all instances but two the estimated cost of the sewers is under £20,000.

I may mention that all the sewers alluded to here are stormwater sewers.

The two cases in which the estimated cost of such as according to the Public Works Act makes it necessary that the works should be referred to the Committee are the sewers discharging into Johnstone's Bay, and a sewer from Munni-street, Newtown, through Macdonaldtown, to Shea's Creek. The latter, it was first thought by the authorities of the Department of Public Works, would not cost £20,000, and, under that impression, the work was commenced, and is now being carried on. It was not, therefore, referred to the committee. The sewers discharging into Johnstone's Bay are consequently the only work under the Votes so far passed by Parliament for the construction of stormwater sewers respecting which the Committee will make inquiry.

So that, as a matter of fact, so far from trying to evade the Public Works Act or to hide this matter in any way, we ourselves brought it before the Public Works Committee, showing that the cost of the work would be really more than £20,000. I had quite forgotten that circumstance when I gave my evidence yesterday.

21660. *Mr. Parkes.*] The date of the injunction obtained by M'Namara was April, 1889, was it not? Yes.

21661. And Contract No. 72 was signed on the 16th March, 1891? Yes, 1891.

21662. On 13th March, Mr. Tillet wrote this minute to the Under Secretary:—

It has just come to my knowledge that in carrying out the works of the Munni-street to Shea's Creek sewer, a part of which is along the centre line of the proposed Shea's Creek canal, and is itself an open channel, the material from the open channel is being disposed in such a position as, in the event of the Shea's Creek canal being extended to Buckland-street, the whole of this material will have again to be removed. It may be possible that this material can be so disposed as to make one moving sufficient. I would suggest that, the Engineer-in-Chief for Roads and Bridges attention be drawn to the matter.

That was sent to the Under Secretary on 16th March, the date of the signing of the contract. On that same date Mr. Davis wrote this minute:—

Before this work was commenced last week I saw the importance of not only cutting our channel in such a way that ultimately it would form part of the proposed canal, but also that the earth excavated should be so deposited that it would not have to be moved a second time. I therefore asked Mr. Boys to see Messrs. Tillet and Williams, of the Harbours and Rivers

R. R. P.  
Hickson.  
4 Nov., 1896.

Rivers, and to ascertain from them what distance from the side of the canal they would require the excavated material deposited, so as to be clear of their work. Mr. Boys understood that if we kept 25 feet outside of the edge of the canal there would be sufficient room for the canal banks. I gave our contractors instructions accordingly. Since receiving Mr. Tillet's minute I have seen him, and he informs me that there will probably be an excavation 736 feet wide at the point where our storm-water channel joins the line of canal. The ground is of such a soft nature that I do not think it practicable to move our excavated material clear of the 750 feet proposed canal resumption except at great expense; and, as it does not appear that the cross-section of the excavation for the canal is definitely settled, I recommend that our contractors be allowed to go on depositing the earth parallel with the canal, leaving 25 feet from the edge of the canal for the future bank?

That is quite correct. I see that upon Mr. Davis's minute I wrote, "I should be glad if Mr. Tillet would see me about this." Apparently he did see me, because later on I wrote, "Arrangements made with Mr. Tillet as to the disposal of this material."

21663. As a matter of fact, the contractors commenced their work at the injunction line, did they not, according to the documents? Yes. Of course they had to take up the work from the bottom to get the outlet.

21664. They really commenced the work some time before the contract was signed? Work is often started before a contract is signed, but you may be sure they did not get possession of the ground until after the contract was let, at all events.

21665. They must have made considerable progress with the work to admit of these minutes being written? The tender was accepted on the 28th February, and the last minute you have read was not written until March 16th, upon which date the contract was signed.

21666. The plans are signed as made on the 23rd January, 1891? Mr. Bagge signed them apparently on that date. I suppose that would be after he had checked them, and had gone through them.

21667. If you turn to page 514 you will find a minute by you in which you say, "This tender was accepted on the understanding that the cost of the work be reduced so as to bring the cost of the work within the amount allowed, without reference to the Public Works Committee." That minute is dated 5th February, 1892, and it follows Mr. Nardin's minute of the 23rd October, 1891. It seems to have been the first intimation given to the Minister of the excess of work. Was the Minister, Mr. Bruce Smith, ever consulted about the change in the contract? I think that was set out in the minute to which I have already referred, which was read before the Public Works Committee in June, 1892. In that minute I said: "Another channel in Macdonaldtown at a cost of about £8,500 will be necessary."

21668. I was referring to the contract according to the understanding with the Minister. That was to be for £15,500, starting at the canal to be made by the Harbours and Rivers Department. I want to know whether the further portion was referred to the Minister for his authority? I am almost certain that it was, because I had authority for some years to approve of extras up to £500, and everything over £500 in the way of extras would, as a matter of course, go in some form to the Minister. I do not know where the minute is at this moment, but I am certain that it went to the Minister in some form.

21669. Then why would that minute of yours of February, 1892, explaining the need for the extra vote, be written? I think that explains itself.

21670. I find that Mr. Barling, on the 28th of October, 1891, wrote this minute:—

ON the Loan Estimates for 1890 the following votes were taken:—

Macdonaldtown Park Stormwater Sewer, from Swanson-street to Ashmore-street; thence from Ashmore-street to Macdonald-street—£8,500.

Stormwater Channel from Munni-street, Newtown, through Macdonaldtown Park to Shea's Creek—£15,500.

The work comprised in the first item is shown on the accompanying plan marked "A" to "B." It is being carried out by Messrs. Parry and Farley, and is nearly completed. The cost will be about £6,500, leaving a balance on the vote of about £2,000.
